To the Right Honourable

EDWARD

Lord Herbert of Cherbury and Castle-Island, and one of His Majesties most Honourable Council of War.

My Lord,

T is not the far-fetcht Pedegree of Noble Anceftors nor those Honors your Lordship deservedly possesses, that make me crave your Patronage to this my Labour; but it is that Heroick mind, enriched with the choice endowments of Nature and Art, and that earnest affection wherewith your

Honour entertains all Sciences, Arts, and Artists, with that exquisite Judgement which sees into the inner man, which embolden and incite me to sue for your Honours assistance, in protecting the fame of him, who by your many favours is made yours. I know the seeming and self-pleasing Wisdom of our Times, consists much in cavilling and unjustly carping at all things that see light, and that there are many who earnestly hunt after the Publick Fame of Learning and Judgement, by this easily trod, and despicable Path, which notwithstanding they tread with as much Considence as Folly; for that oft-times which they vainly and unjustly brand with Opprobry, out-lives their Fate, and flourishes when it is forgot that ever any such as they had being.

I know your Lordships disposition to be far dissenting from these men, and that you rather endeavour to build up the Fame of your Learning and Judgment upon a strong laid Foundation of your own, than Herostratus-like, by pulling down any, how soe ver fair built Fabrick of another. I heartily wish that your Honour could propagate this Good, and that all Detractors might be turned into Actors, and then I know it would much mitigate their rigour in censuring others, when as they themselves were also exposed to the same

Hazard.

The Epistle Dedicatory. I think it impertinent to acquaint your Honour with the Nature of the Work, my Pains in Translating, or the Benefit that may enfue thereon, for that I know your Honour ignorant of nothing in this kind; neither doubt I of your favourable acceptance of the good Will of him, that thinks himself much bonoured by being Yours, THOMAS JOHNSON. House entertains I Sciences where and driver of a three con concert which fees min the same many make and controllen and word I would define in force we the face are many who complete hour speed for I which I am of to and Judgament, by this casts and defought Pale, which that of secures which they a into and windly bread with Opper out-wise their Feter and pass the second is for at the sec I know your Let lines all colline to be for delineme were other when or they then they were forestell to the

Have here for the Publick Good taken pains to subject my self to Common Cenfure, the which I doubt not but to find as various as the Faces of the Cenfurers; but I expect no thanks, nor hunt after other praise, than that I have laboured for my Countries good, if that deserve any. I fear not Calumniation (though fure to hear of it) and therefore I will not Apologize, but inform thee of some things concerning the Author, his Work, and the Reason that induced me to the Translation

thereof, with some few things besides. For the Author, who was principal Surgeon to two or three Kings of France, he was a man very well versed in the Writings of the Ancient and Modern Phylicians and Surgeons, as you may evidently find by fundry places alledged in his Works. For his Experience or Practice (the chief help to attain the highest perfection in this Art) it was wonderful great, as you may collect by his Voyages recorded in the last part of his Work; as also by that which James Guilleman Surgeon to the French King, a man both learned and judicious in his Profession, avers, speaking of his own Education and Progress in the Art of Surgery. I so laid (*faid he) the first Foundation of this Art in the * In his Epi-Hospital of Paris, being as it were, an ample Theatre of Wounds and Diseases of hefore the Laall kinds, that for two whole Years, during which time I was there conversant, no-time Edicion of thing was consulted of, nothing performed, the Physicians and Surgeons being pre-thin Author. fent, whereof I was not an Auditor or Actor. There flourished at these Times, and yet doth. Authors Described Surgeon to the most Christian King, the Auand yet doth, Ambrose Parey, Principal Surgeon to the most Christian King, the Author of this great Work, most renowned for the most gracious favour of Kings, Princes and Nobles towards him, for his Authority amongst his equals, for his Chirurgical Operations amongst all men. Therefore I earnestly endeavoured to be received into his Family, as unto another Machaon, or Podalirius: Once admitted, I fo by all dutifulness and due respect acquired his Favour, that he, unless I were present, and affifting, did nothing (fuch is his natural gentleness and curtesie to all such as are studious of the Art) at home or abroad, in the Field, in the Tents, or lastly in this famous City of Paris, about the Bodies of Dukes, Noblemen, or Citizens, in whose Cure, he by the ardent desire of them all, had still the prime place.

Now for this Work, hear what this same man in the same place affirmeth further: I not content with these means, which may seem sufficient, and too much, as desirous, to fatisfie my long thirst, determined to trie whether I could draw or borrow any thing from Strangers, which our men wanted, to the fuller knowledge of Surgery. To this purpose I travelled over Germany, and then for four years space I followed the Spanish Army in the Low-Countries; whereas I did not onely carefully cure the wounded Souldiers, but also heedfully and curiously observed what way of curing the renowned Italian, German, and Spanish Surgeons observed, who together with me were implayed in the Located Spanish Surgeons of the wounded and lick with me were imployed in the Hospital, for the healing of the wounded and fick. I observed them all to take no other course than that which is here delivered by Parey. Such as did not understand French, got some pieces of this Work for large rewards turned into Latin, or such Languages as they understood, which they kept charily, and made great store of; and they esteemed, and admired, and embraced this Work alone, above all other Works of Surgery, &c. Our Author also himself, not out of a vain-glorious oftentation, but a mind conscious of the truth of his affertion, affirms thus much of this Work. I have (faith he) fo certainly touched the mark whereat I aimed, that Antiquity may feem to have nothing wherein it may exceed us, befides the Glory of Invention; nor Posterity any thing left, but a certain small hope to add some things, as it is easie to add to former Inventions. Thus much concerning our Author, and the excellency of his Work.

Now come I to the Translation, the which, as defiring more a publick Good than private Praife, I have performed plainly and honeftly, labouring to fit it to the capacity of the meanest Artist; for these are they to whom I chiefly commend this Work, and from whom I expect acceptation. I being by the earnest persuasions of

fome of this Profession, chiefly and almost wholly persuaded and incited to take this pains, who knowing the difability of understanding this Author in Latin or French, in many of the weaker Members of the large Body of their Profession, dispersed over this Kingdom, and the rest of his Majesties Dominions, whose good and increase in knowledge may be wished, that so they may be the better enabled

to do good to fuch as shall implore their aid in their Profession.

There are some I know will blame me for Englishing this Work, as laying open the Mysteries of a worthy Art to the unworthy view of the Vulgar. To such I vid. Asl. Gel. could answer as * Aristotle did to Alexander: but for the present I will give them these reasons which I think may satisfie any but the purposely malicious. The first is drawn from the goodness of the thing, as intended for those that want such Guides to direct them in their Art; for it is commonly granted, that Bonum quo communius eo melius. Secondly, it hath been the custom of most Writers in all Ages and Countries thus to do: Hippocrates, Galen, and the other Greeks, writ in their Mother Tongue the Mysteries of their Art. Thus did Celsus, Screens, and others in Latin: Mesue, Avicen, Serapio, and others, in Arabick: as also, to go no farther, our Author writ this Work in his Native French, and learned men have done the like in this, and all other Arts. And it is a great hinderance to us in these days, that we must be forced to learn to understand two or three Tongues before we can learn any Science, whereas the Ancients learned and taught theirs in their Mother Tongue: fo that they fpent a great deal less time about Words, and more upon the Study of that Art or Science they intended to learn and follow. Thirdly, I must tell you, that, Ex libris nemo evafit Artifex, No man becomes a Workman by Books: fo that unless they have had some insight in the Art, and be in some fort acquainted both with the terms of Art, as also with the knowledge and use of the Instruments thereto belonging, if by reading this, or any other Book of the like nature, they become Surgeons, I must needs liken them (as Galen doth another fort of men*) to Pilots by Book onely: to whose care, I think none of us would commit his safety at Sea ; nor any any if wife, will commit themselves to these at Land or Sea either, unless wholly destitute of other.

The other things whereof I must give you notice, are these. The Figures in the Anatomy are not the same used by my Author (whose were according to those of Vesalius) but according to those of Banbine, which were used in the Work of Dr. Crook; and these indeed are the better and more compleat. Also pages 1 48 thought it better to give the true Figure of the Helmet flowered Aconite, mentioned out of Pliny, than to referve the feigned Picture of Matthiolus which in our Author was increased with the further fiction of a Helmet. I have in some few places in the Margent, which you shall find marked with a Star, put short annotations, for the better illustration of that which is obscure, &c. I have also in the Text to the fame purpole, here and there put two or three words, contained in these limit [which I find here and there turned into a plain Parenthesis, especially toward the latter end of the Book; but the matter is not great. Further I must acquaint you that the Apology and Voyages, being the last part of this Work, and not in the Latin, but French Editions, were translated into English out of French by George Baker, a Surgeon of this City, since that time, as I hear, dead beyond the Seas.

This is all, Courteous Reader, that I have thought necessary to acquaint thee withal concerning this, which I would defire thee to take with the same mind that it is prefented to thee, by him that wisheth thee all happiness,

Thomas Johnson.

THE AUTHORS EPISTLE DEDICATORY

HENRY III.

The most Christian King of France and Poland.

Decembers of Mans Body we fee the members of Mans Body by a friendly confent are always bufied, and stand ready to perform those Functions for which they are appointed by Nature for the preservation of the whole, of which they are parts; fo it is convenient that We, which are as it were Citizens of this Earthly Common-wealth, should be diligent in the following of that Calling which (by Gods appointment) we have once taken upon us: and content with our prefent Estate, not carried away with Rashness and Envy, defire disferent and divers things whereof we have no knowledge. He which doth otherwife, perverts and defiles with hated confusion the order and beauty, on which this Universe confists. Wherefore when I considered with my self that I was a Member of this great Mundane Body, and that not altogether unprofitable; Iendeavou. red earnestly that all Men should be acquainted with my duty, and that it might be known how much I could profit every Man. For God is my witness, and all good men know that I have now laboured fifty years with all care and pains in the Illustration and Amplification of Chirurgery; and that I have so certainly touched the mark whereat Laimed, that Antiquity may seem to have nothing wherein it may exceed us, befide the Glory of Invention; nor Posterity any thing left but a certain small hope to add some things, as it is easie to add to former Inventions. In performance whereof, Thave been so produgal of my self, my watchings, faculties, and means, that I spared neither time, labour, nor cost, whereby I might satisfie and accomplish my own Desires, this my great Work, and the Desires of the Studious. Neither may we doubt but their Studies would at length wax cold, if they onely furnished with the Theorick and Precepts in Schools, and that with much labour, should fee no manual operation, nor manifest way of performing the Art. For which cause I feeking the praise and profit of the French Nation, even with the hinderance of my particular Estate, have endeavoured to illustrate and increase Chirurgery, hitherto obscure either by the infelicity of the former Ages, or the envy of the Professors; and not onely with Precepts and Rules, but being a lover of Carved Works, I beautified it with 300 Forms, or Graven Figures, and apt Delineations, in which whofoever shall attentively look, shall find five hundred Anatomical or Organical Figures belonging to the Art, (if they be reckoned particularly.) To every of these I have given their Names and shewed their Use, left they should feem to have been put in vainly for Oftentation or Delight. But although there be few men of this Profession which can bring so wuch authority to their Writings

either with Reason or Experience, as I can; notwithstanding I have not been so arrogant, but intending to publish my Work, I first communicated it with Men the most excellent in the Art of Physick, who gave me greater encouragement to per-

9

The Authors Epistle Dedicatory.

feEt and publish it, that it might be in common use : professing they wished nothing more, than that it might be turned into Latin, by which means it should be known to foreign Nations, that there is no kind of Learning which is not delivered with great dexterity of Wit in this Kingdom over which you rule. And thus much I dare boldly affirm, that there is scarce any, be he never so stately or supercitious, but that he may here find some thing which may delight him, and by which he may better his knowledge. Therefore I doubted not to confecrate this Book unto your Majesty, both as a Pattern and Treasury of my Labours, as well in respect of my duty, who am Yours by Nature and Education, as that I might manifest to all, your Highnesses exceeding bounty towards me, in placing me (having heretofore enjoyed the Office of Principal Chirurgeon under three Kings, your Majesties Predecessors) in the Same dignity, and that of your own accord. And moreover I did conjecture that it would fall out, as now it doth, that this my Work carried through the World by the Fame of your Majesties Name, should neither fear the face nor view of any, supported by the Favour and Majesty of a most invincible Monarch and most Excellent and Renowned Prince. Neither did King Charles IX. of happy Memory, incited by the relation of the most gracious Queen his Mother, refuse to read it, being he understood it proceeded from him, who having happily passed all his time in private and publick imployments, and conversed with all men of all forts, was judged most worthy to obtain this favour, as to have the Front of this Work adorned and beautified with the splendour of his prefixed Name. I, encouraged by this hope, defired that my request should pass as by a certain continuation and succession from a most Powerful, to a most Invincible King; and do wholly consecrate these my Labours taken for my Countries good unto your Sacred Majesty. God grant that your Majesty may have happy success of all your Enterprises abundantly added to Neftors Tears.

THT some cuber is the infelicity of the former ages, on the entry of the received notionally with Preceive and water, but being a letter of Carved It can, I beautiful it with 100 loves, or courses lower, and are Deli-

THE

PREFACE.

Oft Men derive the Original of Physick from Heaven; for those who hold the best opinion of the Creation of the World, assisting, the Elements being created and separated each from other, Man being not as yet made; incontinently by the divine Decree, all Herbs and Plants, with infinite variety of the Flowers endued with various Sents, Tasts, Colours, and Forms, grew and sprung forth of the Bowels of the Earth, enriched with so many and great Virtues, that it may be thought a great offence to attribute to any other than the Deity,

the benefit of so great a blessing so necessary for so many uses. Neither could Mans capacity ever have attained to the knowledge of these things without the guidance of the Divine Power. For God the great Creator and Fashioner of the World, when sirst inspired Adam by the breath of his mouth into aliving and breathing Man, he taught him
the Nature, the proper Operations, Faculties and Virtues of all things contained in the
circuit of this Universe. So that if there be any who would ascribe the glory of this invenmion to Man, he is condemned of ingratitude even by the judgment of Pliny. But this
knowledge was not buried in obtivion with Adam: but by the same gift of God was given
to those whom he had chosen and ordained for Physick, to put their helping hands to others
that stood in need thereof. Which opinion was not onely received in the common manner
and by the tacite consent of all Nations, but consumed by Moses in the Scripture. Which Gen. 1.
thing Jesus the son of Strach, the wisest amongst the Jews, hath consumed, saying, Homour the Physician with the honour due unto him, for the Most High hath created
him because of necessary: and of the Lord cometh the gift of Healing. The Lord
hath created Medicins of the Earth, and he that is wise will not abhor them. Give
place and honour to the Physician, for God hath created him; let him not go from
thee, for thou hast need of him. The Græcians who sirst seems more fully and with
greater same to have prosessed the Art of Physick, do in a manner consent with this opimion, in acknowledging Apollo to have been the Inventer thereof, neither did they it
without areasonable cause. For whether by Apollo they may understand the Sun, who
by its gentle and vital heat doth bring forth, temper, and cheriff all things; or else some
in prastice the Medicinal Vertues of Herbs; in which sense the loved brings him in speaking
thus:

Herbs are of mine invention, and through all The World, they me the first Physician call.

The original of Physick arising from those beginnings, shall always be celebrated as celestial, and was increased principally after this manner. After Apollo, Æsculapius his son instructed by his Father, reduced this Art being as yet rude and unlgar, into a little better and more exquisit form, for which cause he was reputed worthy to be accounted as one of the Gods. At the same time slourished Chiron the Centaure, who for that he excelled in knowledge of Plants, and taught Æsculapius (as many report) their Faculties, is thought by Pliny and some others to have been the Inventer of Physick. Æsculapius Plint, and two sons, Podalicius and Machaon, who following their Fathers steps, and professing Physick, didprincipally beautisse and practise that part thereof which is called Chiravegery, and for that cause were accounted the Inventers thereof. After those Asclepiades less this Art much enlarged, as bereditary to his Posterity; by whose study and diligence, that part of the Art was invented and annexed, which by a more curious skill searcheth and cureth those diseases which lie hid within the body. Hippocrates the Coan the son of Heraclidas, born of the noble race of Asclepiades, Prince of the Physicians that were before him, persected Physick, and reduced it into an Art, and wrote divers Books thereof in Greek. Galen succeeded him six hundred years after, who was a Man most samous, not onely for his knowledge in Physick, but also in all other Sciences, who faithfully interpreting every thing that was observe and difficult in the Writings of Hippocrates, enlarged the Science with many Volumes. Thus therefore was the beginning, thus the increase and persecting the Art of Physick, as much as can be hoped for from Mans Industry. Although indeed we cannot deny but that experience hath much

The Preface.

profited this Art as it hath and doth many other. For as men perceived that some things were profitable, some unprofitable for this or that disease, they set it down, and so by diligent observation and marking of singularities, they established universal and certain Pre-cepts, and so brought it into an Art. For so we find it recorded in ancient Histories, before the invention of Phylick, that the Babylonians and Ailyrians had a Custom amongst them to lay their sick and diseased persons in the Porches and Entries of their Houses, or to carry them into the Streets or Market-places, that such as passed by and faw them, might give them counsel to take those things to cure their Diseases, which they had formerly found profitable in themselves, or any other in the like affects, neither might any pastby a sick man in silence. Also Strabo writes that it was a custom in Greece that those which were sick should resort to Esculapius his Temple in Epidaurus, that there as they slept, by their dreams they might be admonished by the god what means they should use to be cured; and when they were freed from their Diseases, they writ the manner of their Instrmities, and the means by which they were cured, in Tables and fastned them to the Pillars of the Temple, not onely for the glory of the god, but also for the profit of such as should afterwards be affected with the like Maladies. All which Tables (as Fame reports) Hippocrates transcribed, and so from those drew the Art of Physick, Beasts also have added much to his Art. For one Man was not onely instructed by another, but learned also much from brute Beast's; for they by the onely instinct of Nature have found out divers Herbs and Remedies, by which they freed and preserved themselves from Instrmities, which might presently be transferred to Mansuse. Wherefore considering that such and so many have concurred to bring this Art to perfection, who hereafter dare call in question the Excellency thereof? chiefly if he respected the subject thereof, Mans Body, a thing more noble than all other Mundane things, and for which the rest were created. Which thing moved Herophilus in times past to call Physicians, The Hands of the gods. For as we by putting forth our hand, do help any man out of the Water and Mud into which he is fallen: even so we do sustain those that are thrown down from the top of Health to the gates of Death by violence of Diseases, with happy Medicins, and as it were by some special and divine gift deliver them out of the james of Death. Homer the Prince of Greek Poets affirms, That one Physician is far more worthy than many other Men. All Antiquity gave Physicians such honour, that they worshiped them with great veneration as gods, or the jons of their gods. For who is it which is not much delighted with the divine force of healthful Medicins, with which (we see by daily experience) Physicians, as armed with Mercuries Rod, do bring back those languishing souls which are even entering the gates of Death? Hence it cometh to pass that the divine Poets of ancient Times, as Orpheus, and Museus, and Hesiod, and the most renowned Philosophers, Pythagoras, Plato, Aristotle, Theophrastus, Chryfippus, Cato Cenforius, and Varro effeemed nothing more excellent than to excel in the knowledge of Medicins, and to testifie the same by written monuments to Posterity. For what can be more noble and worthy of a generous disposition than to attain to that by the benefit of Phylick, that adorned with the ornaments of dignity thou maist have power over other men, and favoured of Princes, Kings, and Emperours, maift appoint and prescribe to them those things which are profitable to prescribe health, and cure their difeases? But if thou look for benefit by Sciences, then know that the Professors hereof have beside sufficient gain, acquired much honour and many friends. Hippocrates coming to Abdera to cure Democritus of his Madness, not onely the men of the City, but also the women and children, and people of every Age, Sex and Rank, went forth to meet him, giving him with a common confent and loud voice, the title of a Tutclary Deity and Father of their Country. But the Athenians, for ficeing their Country from the Plague, with triumphant pomp celebrated Plays to his honour, and bountifully set upon his head, as if he had been a King, a Crown of Gold weighing 1000 pieces of their golden Coin, and erected his Statue for a perjetual Monument of his Piety and Learning. Erafistratus the Nephew of Aristotle by his daughter, received, freely given him by Ptolomy King of Egypt, for the cure of his Son, 100 talents of gold. The Emperour Augustus bonoured Antonius Musa with a golden Statue. Quintus Stertinius yearly received out of the Emperours Treasury 12500 pieces of gold. In the time of our Grand-fathers, Petrus Aponensis called Conciliator, was so samous through all Italy for his knowledge in Phylick, that he could scarce be intreated to come to any man of saskson that was fick, unless he gave him 50 Crowns for every day he was absent from home: but when he went to cure Heronius the Bishop of Rome, he received 400 Crowns for every day he was absent. Our French Chronicles relate in what credit and estimation James Cotterius the Phylician was with Lewis XI. King of France; for they report be gave him Monethly out of his Treasury 10000 Crowns. Phylick in times past hath been in

In what efleem Physicians have formerly been.

The Preface.

fuch Esteem with many famous and noble Personages, that divers Kings and Princes delighted with the Study thereof, and desirous to attain glory thereby, called sundry Herbs after their own names. For so Gentian took its name of Gentius King of Illyria; Names girch the Herb Lyfimachia of Lyfimachus the King of Macedon, the Mithridatick Herb or Scordium of Mithridates the King of Pontus and Bithynia, Achillea of Achilles, Centory of Chiron the Centaure, Artemifia of Artemifia the Queen of Caria. Attalus King of Pergamus, Solomon of Judwa, Evax of Arabia, and Juba the King of Mauritania, were not onely inflamed with a defire of the knowledge of Plants; but either they have written Books of it, or for the great commodity of Posterity, invented by their skill, many choice Antidotes compounded of divers Simples; neither the desire of Learning this most noble Science is yet altogether extinct; as may appear by that Indian Plant Tobacco, called by some the Noble Herb, Catharines Herb, and Medices Herb, but commonly the Queens Herb, because Catharine Medices the Mother of our King, by her singular study and industry made manifest the excellent vertue it bath in curing malign Olcers and Wounds, which before was unknown to the French. For these worthy men understood that their glory, thus fastened and ingrassed into the deep, and as it were ever-living Roots of Plants, would never decay; but should be propagated to all Posterity in many succeeding Ages, growing up with their sprouting and budding Shouts, Stalks, Flowers, and Fruits. Neither did these samous men whilest they adorned this part of Physick, suffer the other, which treats of the Dissection of Mans Body, be buried in oblivion, and without their knowledge; as instructed with the Precepts and Learning of the Wisest Men, how artificial and unimitable by mortal hand this Fabrick of our Body is. Neither is it probable that Apis, Osiris, and Ptolomy Kings of Egypt, Solomon, Alexander the Great, Mithridates, Attalus, seeing they dedicated themselves wholly to the contemplation of Natural things, neglected the use of Anatomy, and being men most desirous to know themselves, to have been ignorant of the structure of their own Bodies, being the habitation of their Souls immortal, and made to the Image of God: seeing they observed with certain judgement the different lights of the Sun, Moon, and Stars; and passed over so many Lands, so many Seas, so many Regions, so far remote one from another, by ways so terrible by reason of cold, uncouthness, darkness, by rocks, by fire and fword, with great labour, charge, and danger of life, onely that they might satisfic their minds thirsting after the knowledge of things; and to have left untouched a thing truly

noble, admirable, and most worthy of knowledge, easie to be attained by any, and to be acquired without any danger of life or fortunes.

Seeing there be three parts of that Physick which at this time we profess; Chirurgery, Physick is discussed into which the second second secon which by the use of the hand, Diet which with the convenient manner of feeding and or three parts. dering the body, and Pharmacy that by Medicins attempt to expel Diseases, and preserve Health; The prime Phylicians do not without reason contend which of these may be accounted the chief. Certainly Herophilus had Pharmacy in such esteem, that he thought Medicins were first mixed and administred to the Sick by Apollo (whom Antiquity thought a great Deity.) And Pliny had so good an opinion of Diet, that he exclaims, The true Remedies and Antidotes against Diseases, are put into the Pot andeaten every day by the poor People. Verily all learned men confess, that the manner of curing which which is performed by Diet, is much more facil and prosperous than that which is done by Medicins; as those things which sought with much labour and cost are taken with much loathing, and taken are several part by tretained they oft work with much lamuch loathing, and taken are scarce retained, but retained they oft work with much labour and pain: Which things long ago moved Asclepiades to exclude the use of Medicins as hurtful to the stomach. Tet if we will believe Celsus, neither of these parts merit the preheminence, but both of them give place to Chirurgery. For seeing that Fortune is very powerful in Diseases, and the same Meats and Medicins are often good and often vain, truly it is hard to say, whether the health is recovered by the henest of Diet and Pharmacy, or by the strength of the body. Moreover in those cases in which we most prevail with Medicins, although the prosit he most manifest, yet it is evident that health is often sought in vain even by these things, and often recovered without them. As it may be perceived by some troubled with sore Eyes, and others with Quartan Fevers, who having been long troubled by Physicians, are healed without them. But the effect of Chirurving been long troubled by Physicians, are healed without them. But the effect of Chirurgery as it is very necessary, so it is the most evident amongst all the parts of Physick. For who without Chirurgery can hope to cure Broken or Luxated parts, who Wounds and Ulcers, who the Falling of the Matrix, the Stone in the Bladder, a Member insessed with a Ganorene or School & Resides, this part also is the most evident. a Gangrene or Sphacele's Besides, this part also is the most antient; for Podalirius and Machaon following their General Agamemnon to the Trojan Wars, yielded no small comfort to their Fellow-Souldiers. Whom notwithstanding Homer affirms not to have given any help in the Pestilence, nor in divers other Diseases, but onely were accustomed

The Preface.

The excellent to heal Wounds by Instruments and Medicins. And if the difficulty of learning it are cy of Chirur- gue the excellency of the Art, who can doubt but Chirurgery must be the most excellent, gue the excellency of the Art, who can doubt but Chirurgery must be the most excellent, seeing that none ought to be accounted a Chirurgeon, or which can perform his duty without the knowledge of Diet and Pharmacy? But both the other can perform their parts without Chirurgery, if we may believe Galen. But if we consider the matter more nearly according to truth, we shall understand those three parts have a certain common bond, and are very near of kindred, so that the one implores the aid of the other; neither can the Physician do any thing praise-worthy without the conspiracy and joint consent of these three; therefore in ancient times there was but one Performer and User of all the three Parts. But the multitude of men daily increasing, and on the contrary, Mans life decreasing, so that it did not seem able to suffice for to learn and exercise all the three, the Workmen divided themselves. Wherefore that which happens to any man either by lot, or counsel, that let him follow, maintain and onely use, as mindful how short his life is, and how long the Art. property of the Arts.

A Table of the Contents of the Three Tracts.

669

- Tr. 1. R Eckens up the branches or propagations of the Vena porta, or the Gate-vein, and explains an Aphorism of Hippocrates, that makes very much to the purpose
- 2 Treats of the superiour, or ascendent Trumb of the Vena cava or Hollow vein, and the branches which it seatters through the head
- 3 Shews bow the axillary vein is distributed through the
- 4 Explains the lower, or descendent Trunk of the bollow
- 5 Reckons up the propagations and branches of the outer Hiseal branch differninated through the crus, or great foot, that reaches from the lower part of the buttock to the end of the toes
- An Explanation of the Table of the Veins.

Tract.II. Concerning the Arteries.

- Tract. I. Shews the upper or afcendent Trunk of the great Artery, with its propagations that are distributed through the bead
- 2 Declares the History of the axillary Artery being distributed through the arm

- 3 Sheros the inferiour or descendent Trunk of the great Artery, and the propagation thereof through the middle and Lowest bellies
- 4 The propagations of the outer Iliacal branches which are distributed through the crus or great foot, containing the thigh, leg, and foot

An Explanation of the Table of the Arteries

Tract.III. Concerning the Nerves.

- Tract. 1. Of the Nerves of the Brain 2 Concerning the Nerves of the Spinal Marrow properly so ealted, and first of those of the Rack-bones of the neck 35
- 3 Concerning the Nerves of the Marrow of the Rack-bones of the Cheft
- 4 Concerning the Marrow of the Rack-bones of the Loins 5 Concerning the Nerves of the Marrow of Os factum, or
- the great bone 6 Concerning the Nerves which are distributed through the
- 7 Of the Nerves that are diffributed through the crura or thighs, legs, and feet 40
- An Explanation of the Two Tables of the Nerves

INTRODUCTION or Compendious Way

CHIRURGERY.

BOOK I.

CHAP. I.

What Chirurgery is

HIRURGERT is an Art, which teacheth the way by reason, how by The Definition the operation of the hand we may cure, prevent and mitigate Diseases, on of Chirur-which accidentally happen unto us. Others have thought good to describe gery. it otherwise; as, That it is that part of Physic which undertaketh the cure of Diseases by the sole industry of the Hand; as by cutting, burning, sawing off, uniting fractures, restoring diffocations, and performing other works, of which we shall hereafter treat. Chirurgery also is thus defined by the Author of the Medicinal Definitions: The quick motion of an intrepid hand joined with experience; or, An artificial action by the hand rurgeon, used in Physic, for some convenient intent. Yet none must think to attain

to any perfection in this Art, without the help of the other two parts of Phylic; I fay, of Diet and Pharmacy, and the diverse applications of proper Medicines, respecting the condition of the Caufes, Diseases, Symptoms, and the like Carcumstances, which comprehended under the names of things natural, not natural and befide nature, (as they commonly call them) we intend to describe in their proper place. But if any reply, that there be many which do the works of Chirurgery, without any knowledge of such like things, who notwithstanding have cured desperate Diseases with happy such seefs: Let them take this for an answer, That such things happen rather by chance, than by the industry of the Art; and that they are not provident that commit themselves to such. Because that for fome one happy chance, a thoufand dangerous errors happen afterwards, as Galon (in divers plates of his Method) fpeaks against the Empirics. Wherefore feeing we have fet down Chirurgery will now they what, and of what return the constraints of items. will now shew what, and of what nature the operations of it are.

CHAP. II. Of Chirurgical Operations.

We things are proper to the duty of a Chirurgeon; To take away that which is superfluous; The name of to restore to their places such things as are displaced; to separate those things which are joined together; to join those that are separated; and to supply the defects of nature. Thou shall experience assist and harmily attained the knowledge of the subjects by long used much exercise, then far more caffly and happily attain to the knowledg of these things by long use and much exercise, than more needing of Books, or daily hearing of Teachers. For speech, how perspectous and elegant ranges than the have examples of taking away that which abounds, in the Amputation or cutting of a singer, Examples of any have six on one hand, or any other monthrus respect that may expect out to be sufficient to the six of taking away that which abounds, in the Amputation or cutting of a singer, Examples of any have six on one hand, or any other monthrus respect that may expect out in the looping of taking areas.

We have examples of taking away that which abounds, in the Amputation or cutting of a majory assumptes of if any have fix on one hand, or any other monthrous member that may grow out; in the lopping off taking away a putrefied part inwardly corrupted; in the extraction of a dead child, the fecondine, mole or fuch that which is like bodies out of a morphous words. In religious of all Turpose, as Wens, Warts, Polypus, Cana putrefied part inwardly corrupted; in the extraction of a dead child, the fecondine, mole or fuch like bodies out of a womans womb: In taking down of all Turnors, as Wens, Warts, Polypus, Cancers and flethy excreteences of the like nature; in the pulling forth of bullers, of pieces of mail, of darts, arrows, shells, fplinters, and of all kind of weapons in what part of the body foever they be. And he taketh away that which redounds, which placks away the hairs of the eye-lids which trouble the eye by their turning in towards it: who cuts away the web, posselling all the *Adnata, and the part of the *Cornea: who letter the forth suppurated matter: who taketh out stones in what part foever of the body they grow; who pulls out a rotten or otherwise hursful tooth; or cuts a nail that runs into the field; who cuts away part of the *Uvula*, or hairs that grow on the eye-lide; who toever of the body they grow; who pulls out a rotten or outcome number tooth; or cuts a nail that runs into the fielh; who cuts away part of the **Dvala*, or hairs that grow on the eye-lids: who taketh off a Cataract; who cuts the navil or foreskin of a child newly born; or the skinny carun-

Examples of placing those things which are out of their natural site, are manifest in restoring dis-Examples of placing those things which are out of their natural site, are manifest in restoring dis-located bones; in re-placing of the guts and gall fallen into the cods, or out of the navis or belly by re-placing, a wound; or of the falling down of the womb, fundament or great gut, or the eye hanging out of

as each of proper place.

But we may take examples of disjoining those things which are continued; from the singers grow- Example of ing together, either by some chance, as burning; or by the imbecillity of the forming faculty; by the separating disjunction of the membrane called Hyman, or any other troubling the neck of the womb; by differ things josted.

Replace to proper place.

Examples of uniting things disjoined.

Examples of fupplying de-fects.

ction of the ligament of the tongue, which hinders children from fucking and speaking, and of that which hinders the Glans from being uncovered of the foreskin; by the division of a various vein, or of a half-cut nerve or tendon, cauling Convullion, by the division of the membrane ftopping the auditory paffage, the nofe, mouth or fundament, or the flubborn flicking together of the haus of the eye-lids. Refer to this place all the works done by Causties, the Saw, Trepan, Lancet, Cupping-glaffes, Incifon-knife, Leeches, either for evacuation, derivation or revultion fake.

The Chirurgeon draws together things feparated, which healeth wounds by flitching them, by boltring, binding, giving refit to, and fit placing the part: which repairs fractures; refloring haxated parts: who by binding the veffel, flayeth the violent effusion of blood: who cicatriceth cloven lips, commonly called Hare-lips: who reduceth to equality the cavities of Ulcets and Fifula's.

But he repairs those things which are defective either from the infancy or afterwards by accident, as much as Art and Nature will furfer; who fets on an ear, an eye, a note, one or more teeth; who fills have a for the related to the

the hollowness of the palat eaten by the Pox, with a thin plate of gold or filver, or fuch like; who supplies the defect of the tongue in part cut off, by some new addition: who saftens to a hand, an arm, or leg with fit ligaments, workman-like : who fits a doublet bombafted, or made with iron plates to make the body streight; who fills a shoo too big with cork, or fastens a stockin or fock to a lame mans girdle to help his gate. We will treat more fully of all these in our following Work. But in performing those things with the hands, we cannot but cause pain: (for who can without pain cut off an arm or leg, or divide and tear a sunder the neck of the bladder, restore bones put out of their places, open ulcers, bind up wounds, and apply cauteries, and do fuch like?) notwithflanding the matter often comes to that pass, that unless we use a judicious hand, we must either die,or lead the remnant of our lives in tribeguas the perpetual mifery. Who therefore can justly abhor a Chirurgeon for this, or accuse him of crucky? og defire they may be ferved as in antient times the Romans ferved Archagatus, who at the first made him free of the City; but prefently after, because he did somewhat too cruelly burn, cut, and perform the other works of a good Chirurgeon, they drewhim from his house into Campus Martius, and there fronch him to death, as we read it recorded by Sectar Cherman, Plurarch's nephew by his daughter. Truly, it was an inhumane kind of ingratitude, so cruelly to murder a man intent to the works of so necessary an Art. But the Senate could not approve the act; wherefore to expiate the crime as well as then they could, they made his Statue in Gold, placed it in Esculapius his Temple, and dedicated it to his perpetual memory. For my part, I very well like that faying of Celfie: A Chirurgeon must have a strong, stable and intrepid hand, and a mind resolute and merciles, so that to heal him he taketh in hand, he be not moved to make more hafte than the thing requires; or to cut lefs than is needful; but which doth all things as if he were nothing affected with their cries; not giving heed to the judgment of the vain common people, who fpeak ill of Chirurgeons because of their ignorance.

In Prof. 1.7. The proper-ties of a good Chirurgeon.

Indications,

tural pertain.

Chirargeon.

CHAP. III. Of things Natural.

Hat the Chirurgeon may rightly and according to Art perform the forefaid works, he must fee before his eyes certain Indications of working: Otherwife, he is like to become an Empiric whom no Art, no certain reason, but only a blind temerity of fortune moves to holdness and These Indications of actions are drawn from things (as they call them) natural, not-natural action. we must draw and befide-nature, and their adjuncts, as it is fingularly delivered of the Antients, being men of an excellent understanding. Wherefore we will prosecute according to that order, all the speculations of this Art of ours. First therefore, things Natural are so termed, because they constitute and contein the nature are called naare called naof mans body, which wholly depends of the mixture and temperament of the four first bodies, as it is
To what pare shewed by Hipperater in his Book de Nat. humans: wherefore the consideration thereof belongs to that part of Phylic, which is named Phyliologia; as the examination of things not natural to Dietetice or Diet, because by the use of such things it endevors to retein and keep health: but Therapentice, or the part which cures the Diseases, and all the affects beside nature, challenges the contemplation of those things which are not agreeable to nature. But the things which are called Natural, may be reduced to seven the last the first which are comes into their courses the contemplation of those things which are called the reduced to seven the last the first which are contemplation of those things which are called the reduced to seven the last the second to the contemplation of the reduced to seven the last the second to the second the second to the se things not nathings befides heads: befide which there comes into their fellowship, those which we term, Annexed.

CHAP. IV. Of Elements.

What an Element is.

understood by

N Element (by the definition which is commonly received among Phylicians) is the leaft and most simple portion of that thing which it composeth : or, that my speech may be the more plain, The four first and simple bodies are called Elements; Fire, Air, Water and Earth; which accommodate and subject themselves as matter to the promiscuous generation of all things which the Heavens engirt, whether you understand things perfectly or unperfectly mixed. Such Elements are only to be conceived in your mind, being it is not granted to any external sense to handle them in their pure and absolute nature. Which was the cause that Hippocrates expressed them not by the

names of fubfiances, but of proper qualities, faying, Hot, Cold, Moift, Dry, because fome one of why wip, exthese qualities is inherent in every Element, as his proper and effectial form, not only according to which the excess of latitude, but also of the active faculty; to which is adjoined another simple quality, and Elements by by that reason principal, but which notwithstanding attains not to the highest degree of his kind, as these names of you may understand by Galen in his first Book of Elements. So, for Example sake, in the Air we observe two qualities, Heat, and Moisture, both principal, and not remitted by the commixture of qualities are in any contrary quality, for otherwise they were not fimple. Therefore thou main fay, what hinders each Element, that the principal effects of heat shew not themselves as well in the Air, as in the Fire? Because, as we faid before, although the Air have as great a heat according to his nature, extent, and degree, no otherwise than Fire hath, yet it is not so great in its active quality. The reason is because that the Why the Air and dulled by society of his companion and adjoying quality, hears not to calfactory force in the Air is hindered, and dulled by fociety of his companion and adjoyned quality, that is, Humidity which abateth the force of heat, as, on the contrary, drinefs quickneth it. The as the Fire. Elements therefore are endued with qualities.

Names of the Air Substances Water Earth Sis Hot and dry Cold and moift Cold and dry. Names of the qualities.

These four Elements in the composition of natural bodies retain the qualities they formerly had, How the Elebut that by their mixture and meeting together of contraries, they are fornewhat tempered and mens may be abated. But the Elements are so mutually mixed one with another, and all withall, that no simple be mixed part may be found; no more than in a mass of the Emplaister Diaesleithess you can shew any compound bo-Axungia oil, or Litharge by it felf; all things are fo confused and united by the power of heat, mix- dies, ing the finallest particulars with the finallest, and the whole with the whole, in all parts. You may know and perceive this concretion of the four Elementary fubflances in one compound body, by the power of mixture, in their diffolution by burning a pile or heap of green wood: For the flame expreffes the Fire; the finoak, the Air; the moiliure that fweats out at the ends, the Water; and the Why of the afters, the Earth: You may eafily perceive by this example fo familiar and obvious to the fenfes, what diffoliation is, which is faceceded by the decay of the compound body s on the contrary, you may know that the coagmentation, or uniting and joyning into one of the first mixed bodies is such, five, that there is no part fincere or without mixture. For if the heat which is predominant in the fire, should remain in the mixture in its perfect vigor, it would confurne the rest by its permicious neighbors, the like may be fill of Call of Main and Call of Call bourhood; the like may be faid of Coldness, Moisture, and Driness; although of these qualities, two have the title of Active, that is, Heat and Coldness, because they are the more powerful; the other two Paffive, because they may feem more dull and slow, being compared to the former. The temperaments of all fublunary bodies arise from the commixture of these substances and elementary qualities, which hath been the principal cause that moved me to treat of the Elements. But I leave the force and effects of the Elementary qualities to some higher contemplation, content to have noted this, that of these first qualities, (so called, because they are primarily and naturally in the sour first bodies) others arise and proceed, which are therefore called the second qualities: as of many, these Heaviness Lightness regions distributed by the four Elements, as the Heat, or many, these, Heaviness, Lightness, variously distributed by the four Elements, as the Hear, or why the first Coldness, Moistness or Driness have more power over them. For of the Elements, two are called qualities are light, because they naturally affect to move inwards; the other two heavy, by reason they are to called. light, because they naturally affect to move apwards: the other two heavy, by reason they are so called, carryed downward by their own weight. So we think the fire the lightest, because it holds the what the fecond qualities water which lies next to the Air, which is next to it in fite, we account light; for the are, the heaviest of them all. Hereupon it is that light hodies, and the light parts in bodies, have most means light, the heaviest of them all. Hercupon it is, that light bodies, and the light parts in bodies, have most of the lighter Elements; as on the contrary heavy bodies have more of the heavier. This is a brief description of the Elements of this frail world, which are only to be discerned by the understanding, to which I think good to adjoin another description of other Elements, as it were arising or flowing from the commixture of the first: For besides these, there are faid to be Elements of generation, and Elements of generation, and Elements of generation. rowing from the commixture of the first: For belides these, there are fand to be Elements of generation, and Elements of mans body. Which as they are more corporal, so also are they more manifest to the sense. By which reason Hippocrates being moved, in his Book de Nature bumans, after he had described the Nature of Hot, Cold, Moist, and Dry, he comes to take notice of these by the what the Elements of composition. Wherefore the Elements of our generation, as also of all creatures which ments of generation are sense and manshinguists blood. But the Elements of our bodies, are seed and menshinguists blood. have blood, are feed and menfraous blood. But the Elements of our bodies, are the folid and neration are, fimilar parts, arifing from those Elements of generation. Of this kind are bones, membranes, What the Elements, veins, arteries, and many others manifest to the eyes, which we will describe at large in bodies.

CHAP. V. Of Temperaments.

Temperament is defined, a proportionable mixture of hot, cold, moift, and dry; or, It is a What a remconcord of the first disagreeing faculties. That harmony springs from the mixture of the personent is four first bodies of the world. This whether Temperament or Concord is given to Plants and brute Beafts for the beginning of their life, and so consequently for their life and form. But as Plants are inferiour in order and dignity to beatls, fo their *life is more bale and infirm, for they have only a * growing faculty, by which they may draw an Alimentary juyce from the earth, as from their Mo- what the life there breafs, to preferve them and their life, by which they may grow to a certain bigness; and perform in lastly, by which they may brine forth, their like for the perpenual continuous of their bind. For laftly, by which they may bring forth their like for the perpetual continuance of their kind. But

the * life of beafts, have to the three former, the gift of fense annexed : by benefit whereof, as

perfectly perform their duties. But the vicious Temperament doth three manner of ways corrupt

4 *Anima, What

in beafts. comes from a-

The manifold Temperamene, at Past fuch evident harm to the actions, but that it formwhat hinders them, fo that they cannot fo well and A Temperadiss

by a certain inward knowledg they flun those things that are hurtful, and follow those which profit them; and by the power of their will, they move themselves whither they please. But the foul of man far more perfect and noble than the reft, arifeth not from that earthly mixture and temper of the Elements, but acknowledgeth and bath a far more divine off-fpring; as we shall teach hereafter. They divide a Temperament at the first division, into two kinds; as, one a temperate, another an division of a untemperate. The untemperate is of two forts: The one wholly vicious, which hath altogether exceeded the bounds of mediocrity: The other, which hath formwhat firayed from the mediocrity of temper, but notwithflanding is yet contained within the limits of health: as that which brings no

the functions, either by weakning, depraying, or abolishing them. For fo, Super, or associal ment, diminisheth and sloweth the quickness of motion; Convultion deprayes it; the Palsie abolisheth it, Ad pendus, vel and taketh it away. The temperate Temperament is also divided into two kinds; which is either

Ad pardus, vel and taketh it away. The temperate transport is an orbitate into two kinds; which is either ad justitian. to equality of weight or justice. It is called a Temperature to weight which arise throm the equal force of exactly concurring qualities, and, as placed in a perfect ballance, draws down neither to this nor that part. They think the example of this Temperament to appear in the inner skin of the fingers ends of a man element of purities. For seeing the most exquisite touch relides there, they ought to be free from all excels of contrariety; for otherwife being corrupted by too much heat or cold, moisture or drines, they could give no certain judgment of the tangible qualities. For which thing Nature bath excellently provided in the fabrick and coagmentation of the parts, of which the thing Nature Like For it is composed of hot and moist flesh, and therefore fost, and of a tendon and nerve cold and dry, and therefore hard; which are not only equally fitted and conjoyned, but wholly con-

tion.

The Tempe

The kinds of

tempers.

fuled and mixed together, by which it comes, that removed from all extreams of oppolition, it is placed in the midft, as a rule to judg of all the exceffes that happen to the touch. So it was fit, the eye, which was to be the inftrument of fight, should be tinctured with no certain colour, that it might be the lefs deceived in the judgment of colours. So it was convenient the Hearing should not be troubled with any diffinct found, whereby it might more certainly judg of equal and unequal founds, not diflinguished by a ratable proportion; neither was it fit the tongue should have any certain taste, less the access of that taste should deceive it in knowing and judging of so many different tastes. The temperature tempered to justice, is that, which although it is a little absent from the exact and severe parility of mixed qualities, yet hath that equality which doth fully and abundantly fuffice for to per-form all the functions fitly and perfectly, which nature doth require; wherefore we can judg no otherwife of it than by the integrity of the Actions. For hence it took its name; for as distributive Justice equally gives to every one rewards, or punishment according to their deferts; fo Nature, having regard to all the parts of the body, gives them all that temper which may fuffice to perform those du-ties, for which they are ordained. Let us for an example consider a Bone, no man doubts, but that, like as the other similar parts of the body, proceeds from the mixture of the four Elements: but nevertheless nature weighing the use of it, and ordaining it to support the rest of the body, would have more of the terrene and dry Element infused into it, that it might be the stronger and firmer to fustein weight. But a Ligament, seeing it was made for other uses, hath less of that earthly driness than the bone, but more than the fleth, altogether fitted to its nature. So it hath seemed good to nature to endue all the parts of the body, not only with an equal portion, but also proportion of Elements and qualities; we call that a Temperament to justice: and we say, that it is in Plants, brute Beafts, and all natural bodies, which enjoy that temper and mediocrity, which may be agreeable to their nature. Hereupon by comparison arise eight kinds of intemperate tempers: As

temperate in {Driness and } Moifture. Hot and Dry Four Compounds Cold and Moit Mail Heat and temperate in -(Cold and Dry. Cold. But these Temperaments are either of the whole Body, or of some part thereof;

(the Brain Principal, as the Liver the Heart And that either Of the rest of the parts composed of other which have no principality in the body.

Again, such Temperaments are either healthful, which suffice persectly to perform their actions; or unhealthful, which manifestly hurt them, the signs whereof may be read described by Galen. And you must observe that when we say the body, or any part of it, is hot; we understand more hot than pr. co, in dree is fit for one of that kind which is tempered to justice; as when we fay a man hath a hot liver, we mean his liver is hotter, than a man justly tempered should have; for all other tempers, whether of the whole body, or any of the parts thereof, are to be referred to this; and in the cure of difeases we must look upon it, as the mark, and labour to preferve it by the use of convenient things, as much as lies in our power. Wherefore, because it is very necessary to know the distinction of Temperaments, I have thought good in this place, briefly to handle the Temperaments of the parts of the Body, Ages, Seafons of the year, Humors, and Medicins. Therefore the temperaments of the parts of our body are of this nature, not only by the judgment of the touch of a mans hand, which is juftly tempered, who is often deceived by flowing heat, which spread from the heart into all the body, imparts a certain kind of hear, to all the parts) but also by the rule of their reason, composure, and substance, as

medica.

What the hody are.

A Bone is the most dry and cold. A Grifle lefs than it. A Ligament less than a Grifle.

A Tendon is fo much drier and colder than the membrane, by how much it, in the fame temper, exceeds a Vein and Artery. Then follow the harder Veins: for the fofter are in a middle temper of dryness and moisture, like as the Skin; although all, both foft and hard are of Wherefore all these parts of their own nature are cold and without blood: although the Veins and Arteries wax hot, by reason of the heat of the blood they contain, which notwithflanding also borroweth that heat from the heart, as a part most hot, and softer than the skin; the Liver next followeth the heart, in the order of the hotter parts, which is far softer than the skin it felf: for if, according to Galeur opinion, the heart is somewhat less hard than the skin, and that is far harder than the liver, as appears by touching them, it must necessarily follow that the liver much de Temper, exceeds the skin in foftness; I understand the skin, simple and separated from the skin lying under it, to which it firmly cleaves. The slesh is more moits and hot than the skin, by reason of the blood dispersed in it. The spinal marrow is colder and moister than the skin; but the brain so much exceeds it in moisture, as it is exceeded by the fat. The lungs are not fo moist as the fat? and the spleen, and kidneys are of the like nature, and nevertheless they are all moister than the skin.

According to the divertiries of ages, the temperaments both of the whole body, and all its parts, The tempera-undergo great mutations; for the bones are far harder in old men than in children, because our life ments of ages. takengo great intrauous; for the bones are far harder in old men than in chaoren, became our life ments of ages, s, as it were, a certain progress to drines; which when it comes to the height, confequently canfeth death. Wherefore in this place we must speak of the Temperaments of Ages, when first we shall what an age is. Therefore an Age is defined, A space of life in which the constitution of the body of its self and own accord, undergoeth manifest changes. The whole course of life hath four such Ages. The first is Childhood, which extends from the birth to the eighteenth year of age, and bath a hot and would be such as a self-be and would be simple of the food age, and hath a hot and moift temper, because it is next to the hot and moist beginnings of life, seed, and blood. Youth followeth this, which is prolonged from the eighteenth to the twenty sith year, and is temperate, and in the midst of all excesses. Mans estate succeedeth Youth, which they year, and is temperate, and in the midit of all exceffes. Mans effate fucceedeth Youn, which us, deny to extend beyond the thirty fifth year of age; in its proper temper it is hot and dry; whereby it cometh to pass that then the heat is felt more acid and biting, which in Childhood seemeth milds because the progress of the life to driness, hath much wasted the native humidity.

Then succeeds Old-age, ever divided into two parts; the first whereof extends from the thirty Old-age divides the state of the first whereof extends from the thirty Old-age divides the state of the first whereof extends from the thirty of the state of the state

Then faceceds Old-age, ever divided into two parts; the first whereof extends from the thirty fifth, to the forty ninth year; those of this age are called Old-men, (but the commonly call them middle ded into two ag'd men.) The latter is, as it were divided by Galen into three * degrees; the first whereof are those, * Three dewhich are in the fectord degree of Old-age cannot do, because of the debility of their now decay-icond part of ing strength: but those which are in the last degree, are afflicted with most extream weakness and Old-age, milery, and are as much deprived of their sense and understanding, as of the strength of their bo-. milery, and are as much deprived of their fendes and understanding, as of the strength of their bodies; whereof arose this Proverb, Old men, twice Children. Those Old men of the first rank are pleafant and curreous; and those we say, are beginning to grow Old, or in their green Old-age; those of the second fort delight in nothing but the boord and bed; but old decrepit men of the last order, think of nothing else, than their graves and monuments. Their firm and solid parts are of old men have a cold and dry temperature, by reason of the decay of the radical moisture, which the inbred heat their solid causeth in the continuance of so many years. Which thing may happen in a short space, by the vehement slame of the same natural hear, turned by seavers into a tiery hear. But if any to prove Old hement flame of the fame natural hear, turned by feavers into a fiery heat. But if any to prove Old men moift, will object, That they cough oft, and fpit much, I will answer him, as an old Doctor case faid. That a pitcher filled with the cough of the c once faid; That a pitcher filled with water, may pour forth much moisture; yet no man will deny but that fuch a veffel of its own terrene nature and matter is most dry; should men may plainly be affirmed to be said to be firmed to be moift, by reason of their defect of heat, and abundance of excrements. But this description of ages is not to be taken so strictly as always to be measured by the spaces and distances of years;

for there are many which by their own mildemeanour feem elder at forty, than others do at fifty. Laftly, the famous Philosopher Pythagorus divided mans life into four ages, and by a certain pro- 6 comparion portion compared the whole course thereof to the four scasons of the year; as Childhood to the of the four portion compared the whole course thereof to the four seasons of the year; as Childhood to the of the lour Spring, in which all things grow and sprout out, by reason of plenty and abundance of moissure. ages to the And Youth to the Summer, because of the vigor and strength which men enjoy at that age. And four seasons of the gifts, or constant age, to Autumn; for that then after all the dangers of the fore-passed life, the gifts of discretion and wit acquire a seasonableness or ripeness, like as the fruits of the earth enjoy at that seasonable seasonableness or ripeness, like as the fruits of the earth enjoy at that seasonable seasonableness or ripeness, like as the fruits of the earth enjoy. at that feafon. And latily, he compares Old-age to the fierile and fruitlefs Winter, which can eafe and confolate its tedioutness by no other means, than the use of fruits gathered and fiored up before, which then are of a cold and troublesome condition. But for extreme Old-age, which extends to eight or a bundle of the condition of the conditi

fore, which then are of a cold and troublefome condition. But for extreme Old-age, which extends to eighty or a hundred years, it is so cold and dry, that those which arrive at that decrepit age are troublefome, harsh, touchy, froward, crabby, and often complaining, until at the length, deprived of all their senses, tongue, seet, and understanding, they doting return again to childishness, as from the staff to the start. And thus much of the Temperaments of ages.

But now in like manner we will explain the Temperatures of the seasons of the year, which are the temperatures the Spring, Summer, Autumn, Winter. The Spring continues almost from the twelfth or of the seasons of the seasons of the seasons of the year, which are the seasons of the year, as answering in proportion to the temperatures of the four ages. For if the matter come to a just trial, all men will say, How the Spring is temperate, as that which is in the midst of the excess of heat, cold mostlure, and driness; spring is temperatures. the Spring is temperate, as that which is in the midft of the excess of heat, cold moisture, and driness: not only by comparison, because it is hotter than Winter, and colder than Summer; but because it perage. hath that quality of its own proper nature. Wherefore it is faid of Hippocrates, The Spring is most Approx. 9-sell-3-

Apher. 20.

6

How Winter increases the native heat.

The tempera-ture of the Blood, of Medicines.

wholeforn, and leaft deadly; if fo be that it keep its native temper, from which if it decline, or fuccced a former untemperate feafon, as Autumn or Winter, it will give occasion to many difeafes described by Hipportates; not that it breeds them but because it brings them to fight, which before lay hid in the body. Summer is comprehended in the space of almost four months; it is of a hot and dry temper, a breeder of such diseases as proceed from choler, because that humour at this time is heaped Autumn une-their courfe. The beginning of Autumn, is from the Spring; but all fuch difeafes do specially run the like space of time as the Spring. But when it is dry, it hath great inequality of heat and cold, for the mornings and evenings being very cold, the noondays on the contrary are exceeding hor.

Wherefore many diffeafes are in Autumn, and them long and deadly affected it then the first and cold. Wherefore many difeafes are in Autumn, and them long and deadly, especially if they incline to-wards Winter; because all daily and sudam changes to heat and cold are dangerous. The Winter possesses the remnant of the year, and is cold and mostly, it increases natural heat, this up the appearance of the year, and is cold and mostly, it increases natural heat, this up the appearance of the year. tite, and augments Phlegm. It increases heat by Antiperillasis, or contrariety of the encompasting air, which being then cold, prohibits the breathing out of heat: whereby it happens that the heat being driven in and hindered from diffipation, is firengthened by co-uniting its forces. But it augments Phlegm, for that men are more greedy, the Appetite being increased by the firengthened heat: from whence proceeds much crudity, and a large flore of diseases, especially Chronic or Long, which spread and increase rather in this Winter-season than in any other part of the year. To this discourse of the temper of the seasons of the years, is to be revoked the variety of tempers which happens every day; which certainly is not to be neglected, that there may be place of election, especially if nothing urge. For hither belongs that faying of Hipperater; When in the same day it is one while hot, another cold, Autumnal distasts are to be expected. Therefore an Indication taken from hence is of great consequence to the judgment of diseases; for if it agree with the disease, the disease is made more contumations, and difficult to cure. Whereupon the Patient and Physician will have much trouble; but if on the contrary it reclaim and different the health of the Patient is will have much trouble; but if on the contrary it reclaim and differt, the health of the Patient is fooner to be expected. Neither is it a thing of lefs confequence to know the cultoms and habits of the Places and Countrys in which we live; as also the inclination of the Heavens, and temperature of the Air. But let us leave these things to be considered by Natural Philosophers, that we may de-The tempera-liver our judgment of the temperaments of Humours. Blood, as that which answers to the Air in proportion, is of a hot and moit nature, or rather temperate, as Galen tellines; for, faith he, it is certain and fure, that the Blood is neither hot nor moift, but temperate, as in its first composure none of the four first qualities exceeds other by any manifest excess, as he repeats it upon the 39th Sentence. Sent 36 feet. 1. Phlegm, as that which is of a waterish nature, is cold and moift; no otherwise than Choler being The temperator of a hery temper, is hot and dry. But Melancholy affimilated to earth, is cold and dry. This which we have spoken in general of Phlegmand Melancholy, is not always true in every kind of the said.

From whence Humours. For salt Phlegm is of a hot and dry temperature; as also all kinds of Melancholy which we judg of the have arose or sprung by adultion from the native and alimentary, as we will teach in the following temperature. Chapter. Now the temperaments of Medicines have not the fame form of judgment, as those thing which we have before spoken of, as, not from the Elementary quality, which conquering in the contention and mixture, obtains the dominion; but plainly from the effects, which taken or applied, they imprint in a temperate body. For fo we pronounce those things, hot, cold, moist, or dry, which produce the effects of Heat, Coldness, Moisture, or Driness. But we will defer the larger explication of these things to that place, where we have peculiarly appointed to treat of Medicines; where we will not fimply enquire whether they be hot or cold, but what degree of heat and cold, or the like other quality: In which fame place we will touch the temperature and all the nature of Taftes, because the certainest judgment of Medicines is drawn from their taftes. Hithertoof Temperaments; now we must speak of Humors, whose use in Physical speculation is no less than that of Temperaments.

CHAP. VI. Of Humors.

The knowledg of the Hume is necessary. Lib. De natura Hamana,

O know the nature of Honors, is a thing not only necessary for Physicians, but also for Chirurgeons, because there is not disease with matter which arise not from some one, or the mixture of more Humors. Which thing Hippocrates understanding, writ, every Creature to be either sick or well according to the condition of the Humors in the body. And certainly all putrid feavers proceed from the putrefaction of Humors. Neither do any acknowledg any other original or distinction of the differences of Abscelles or Turnors: neither do ulcerated, broken, or otherwise wounded members hope for the reflauration of continuity, from other than from the fweet falling down of Humors to the wounded part. Which is the caufe that often in the cure of these affects, the Phylitians are necessarily bushed in tempering the blood, that is, bringing to a mediocrity the four Humors composing the mass of blood, if they at any time offend in quantity, or quality. For whether if any thing abound or digress from the wonted temper in any excess of heat, cold, viscosity, grosness, thinness, or any first blice quality, poor of the continued of the part of t nels, or any fuch like quality, none of the accustomed functions will be well performed. For which The helps of cause those chief helps to preserve and restore health have been divinely invented; Phlebotomy, or blood-letting, which amends the quantity of too much blood; and Purging, which corrects and draws away the vicious quality. But now let us begin to speak of the Humors, taking our beginning from the Definition.

What an Hu-

An Humor is called (by Phylicians) what thing foever is liquid and flowing in the body of living The manifold led because it is fit to defend, preserve, and suffain the life of a Creature. Quite different is the nadwision of Humanifold led because it is fit to defend, preserve, and suffain the life of a Creature. Quite different is the nadwision of Humanifold led because it is fit to defend, preserve, and suffain the life of a Creature. Quite different is the nadwision of Humanifold led because it is fit to defend, preserve, and suffain the life of a Creature. Quite different is the nadwision of Humanifold led because it is fit to defend, preserve, and suffain the life of a Creature. Quite different is the nadwision of Humanifold led because it is fit to defend, preserve, and suffain the life of a Creature. Quite different is the nadwision of Humanifold led because it is fit to defend, preserve, and suffain the life of a Creature. Quite different is the nadwision of Humanifold led because it is fit to defend, preserve, and suffain the life of a Creature. Quite different is the nadwision of Humanifold led because it is fit to defend, preserve, and suffain the life of a Creature. Quite different is the nadwision of Humanifold led because it is fit to defend, preserve, and suffain the life of a Creature. mentitious: The Alimentary which is fit to nouriff the body, is that Humor which is contained in the veins and arteries of a man which is temperate and perfectly well; and which is underflood by the general name of blood, which is let out at the opening of a vein. For Blood otherwise taken, is an Humor of a certain kind, diffinguished by heat and warmness from the other Humors comprehended together with it, in the whole mass of the blood. Which thing, that it may the better be understood, Thave thought good in this place to declare the generation of Blood by the efficient and material causes. All things which we eat or drink, are the materials of Blood; which things drawn the into the bottom of the Ventricle by its attractive force, and there detained, are turned by the force and efficient of concochion implanted in it, into a fubfiance like to Almond-butter. Which thing, although it apbut one and like it felf, yet it confilts of parts of a different nature, which not only the variety of meats, what the cir-but one and the fame meat yields of it felf. We term this Chylus, (when it is perfectly concocled law is. in the flomach.) But the * Gate-vein receives it driven from thence into the fmall Guts, and fucked in * Vesa porta. by the McCeraic-veins, and now having gotten a little rudiment of change in the way, carries it to by the Michael which and now having gotten a little fedulation of change in the way, carries it to the Liver, where by the Blood-making faculty, which is proper and natural to this part, it acquires the absolute and perfect form of Blood. But with that Blood, at one and the fame time and action all the Humors are made, whether alimentary or excrementitions. Therefore the Blood, that it may perform its Office, that is, the faculty of nutrition, must necessarily be purged and cleanled from the too excrementitious Humors: of which the bladder of Gall draws one, which we call yellow Choler; and the Spleen the other, which we term Melancholy. Thefe two Humors are natural but not alimentary or nourithing, but of another use in the body, as afterwards we will shew more at large. The Blood freed from these two kinds of Excrements, is sent by the veins and arteries into all parts of the body for their nourilliment. Which although then it feem to be of one fimple nature, yet not-withflanding it is truly fach, that four different and unlike fubflances may be observed in it, as, Blood, cless of Colore properly fo named; Phlegm, Choler, and Melancholy, not only diffinct in colour, but also in taste, effects, and qualities. For, as Galen notes in his Book de Namera humans, Melancholy is acid or fowr, Choler bitter, Blood sweet, Phlegm unfavoury. But you may know the variety of their effects, both by the different temper of the nourished parts, as also by the various condition of the diferent temper of the nourished parts, as also by the various condition of the diferent temper of the nourished parts, as also by the various condition of the diferent temper of the nourished parts, as also by the various condition of the diferent temper of the nourished parts, as also by the various condition of the diferent temper of the nourished parts, as also by the various condition of the diferent temper of the nourished parts, as also by the various condition of the diferent temper of the nourished parts, as also be tempered and mixed amongst themselves in a certain proposition, which we have the proposition of the different temper of the nourished parts and the nourished parts are the nourished parts. themselves in a certain proportion; which remaining, health remains; but violated, diseases follow.

For all acknowledg, that an Oedema is caused by Phlegmatic; a Scirrbus, by Melancholic; an Ergfipelus, by Choleric; and a Phlegmans, by pure and laudable blood. Galen teaches by a familiar example of new wine presently taken from the Press, that these four substances are contained in that one mass and mixture of the blood. In which some considerance from the Press, that these four substances are contained in that one mass and mixture of the blood. one mass and mixture of the blood. In which every one observes four diffinet Essences i for the flower of the wine working up, fwims at the top, the dregs fall down to the bottom, but the crustle and watery moiflure, mixed together with the fweet and vinous liquor, is every where diffused through the body of the wine: the flower of the wine, represents Choler, which bubbling up on the superficies of blood, as it concretes and grows cold, thineth with a golden colour; the dregs, Melancholy, which by reason of its heaviness ever sinketh downward, as it were, the mud of the blood; the cnode and watery portion, Phlegm: for as that crude humour, except it be rebellious in quantity, or subborn by its quality, there is hope it may be changed into Wine, by the natural hear of the Wine; so Phlegm, which is blood half concocted, may by the force of native heat be changed into Phlegm it to the other two humors, whereby it might be severed from the blood: But the true and perfect liquor of the wine represents the pure blood, which is the more laudable and perfect portion of both humors of the confused mass. It may easily appear by the following Scheme, of what kind they all are, coptacle,

Where the Blood is per-

-	Nature.	Confiftence.	Colour.	Tafte.	ule.
Blood is	Of Nature airy bot and most, or rather tem- perate.	Of indifferent con- fiftence, neither too thick nor too thin.	Of Colour, red rosie or crim- son.	Of Tafte fiveet.	Of fuch use, that it chiefly screes for the mounthment of the slighty parts, and carryed by the vessels imparts heat to the whole body.
Phlegm is	Of Nature wa- tery, cold and most.	Of Confidence, liquid.		Of Tafte, fineet, or ra- ther unfa- tory i for we commend that water which is unfavory.	all the other cold and mailt
Choler is	Of Nature fiery, but and dry.	Of Confistence, thin:	Of Colour,yel- low or pale,	Of T.A.	It provoketh the expulsive faculty of the Guts atte- ments the Phlegm cleaving to them, but the Alimen- tary is fit to nowish the parts of like temper with it.
Melan- choly is	Of Nature earthly, cold, and dry.	Of Confishence, gross and muddy.		Of Tafte, acide, four or biting.	Stirs up the Appetite, non- rishes the Spicen, and all the parts of like temper to it, as the honer.

quantity

fame Heat is the efficient

cause of all fame time.

8

Blood hath its nearest matter from the better portion of the Chylas: and being begun to be laboured in the veins, at length gets form and perfection in the Liver; but it hath its remote matter from meats of good digetion and quality, feafonably eaten after moderate exercise; but for that, one age is better than another, and one time of the year more convenient than another. For blood is made more copioufly in the Spring, because that season of the year comes nearest to the temper of the blood, by reason of which the blood is rather to be thought temperate, than hot or moill ; for that Lib. 1. de temp. Galen makes the Spring temperate, and befides, at that time blood-letting is performed with the best fuccefs: Youth is an age very fit for the generation of blood; or, by Galens opinion, rather that part of life that continues from the 25, to the 35, year of our age. Those in whom this Humor hath the dominion, are beautified with a frell and rose colour, gentle, and wel-natured, pleasant, merry, and facetious. The generation of Phlegm is not by the imbecillity of heat, as some of the Ancients thought; who were perfuaded that Choler was caused by a raging, Blood by a moderate, and Phlegmand Melancholy by a remits heat. But that opinion is full of manifest error: for if it be true, that the Chylar is laboured and made into blood in the fame part, and by the fame fire, that is, the Liver; from whence in the fame moment of time should proceed that strong and weak heat, seeing the whole mass of blood, different in its four effential parts, is perfected and made at the same time, and by the same equal temper of the same part, action, and blood-making faculty; therefore from whence have we this variety of Humors? From hence; for that those meats by which we are nomissed, enjoy the like condition that our bodies do, from the four Elements, and the four first Qualities: for it is certain, and we may often observe. In what kind soever they be united or joyned together, they retain a certain hot portion imitating the fire; another cold, the water; another dry, the earth; and lafily, another moift like to the air. Neither can you name any kind of nourithment, how cold foever it be, not Lettuce it felt, in which there is not some fiery force of heat. Therefore it is no marvail, if one and the fame heat working upon the fame matter of Chylas, varying with fo great diffimilitude of fubitances, do by its power produce fo unlike humors, as from the hot, Choler; from the cold, Phlegm; and of the others, fuch as their affinity of temper will permit.

Melancholy.

What motions are in each

The Melan-choly Humor doth not cause but whet the

There is no cause that any one should think that variety of humors to be caused in us, rather by the diverfity of the active heat, than wax and a flint placed at the fame time, and in the fame fituation of climat and foil, this to melt by the heat of the Sun, and that fearce to wax warm. Therefore that diverlity of effects is not to be attributed to the force of the efficient cause, that is, of Heat, which is one, and of one kind in all of us; but rather to the material cause, seeing it is composed of the conflux, or meeting together of various fubstances, gives the heat leave to work, as it were out of its store, which may make and produce from the hotter part thereof Choler; and of the colder and more rebellious, Phlegm. Yet I will not deny, but that more Phlegm, or Choler may be bred in one and the fame body, according to the quicker, or flower provocation of the heat; yet neverthelefs it is not consequent, that the Original of Choler should be from a more acid, and of Phlegm from a more dull heat in the fame man. Every one of us naturally have a fimple heat, and of which is the worker of divers operations, not of it felf, feeing it is always the fame, and like it felf, but by the different fitnefs, pliablenefs, or relifiance of the matter on which it works. Wherefore Phlegm is generated in the same moment of time, in the fire of the same part, by the efficiency of the fame heat, with the rest of the blood, of the more cold, liquid, crude, and watery portion of the Chylus. Whereby it comes to pass, that it shews an express rigure of a certain rude or unperfect blood, for which occasion nature hath made it no peculiar receptacle, but would have it to run friendly with the blood in the same passages of the veins, that any necessity happing by famin, or indigency and in defect of better nourithment, it may by a perfecter elaboration quickly affurne the form of blood. Cold and rude nourithment make this humor to abound principally in Winter, and in those which incline to old age, by reason of the similitude which Phlegm bath with that season and age, The effect of It makes a man drowlie, dull, fat, fwollen up, and haftneth gray hairs. Choler is as it were, a certain heat and fury of humours, which generated in the Liver, together with the blood, is carryed by the veins and arteries through the whole body. That of it which abounds, is fent, partly into the guts, and partly into the bladder of the gall, or is confumed by transpiration, or fweats; It is somewhat probable that the arterial blood is made more thin, hot, quick, and pallid, than the blood of the Veins, by the commixture of this Alimentary Choler. This Humor is chiefly bred and expel'd in youth, and acid and bitter meats give matter to it: but great labors of body and mind give the occa-The effects of from It maketh a man nimble, quick, ready for all performance, lean, and quick to anger, and also to concoct meat. The Melancholic humor, or Melancholy, being the groffer portion of the blood, is partly fent from the Liver to the Spleen to nourifh it, and partly carried by the vessels into the rest of the body, and spent in the nourishment of the parts endued with an earthly drines; it is made of meats of gross juyce, and by the perturbations of the mind, turned to fear and sadness. It is augmented in Autumn, and in the first and crude Old-age; it makes men sad, harsh, constant, froward, envious and fearful. All men ought to think, that such Humors are wont to move at set hours of the day, as by a certain peculiar motion or tide, Therefore the blood flows from the ninth hour of the night, to the third hour of the day; then Choler to the ninth of the day; then Melancholy to the third of the night; quarter of the the reft of the night that remains, is under the dominion of Phlegm. Manifest examples hereof appear in the French-Pox. From the elaborate and absolute mats of the blood, (as we faid before) two kind of Humors, as excrements of the second concoction, are commonly and naturally separated the one more gross, the other more thin. This is called either absolutely Choler, or with an adjunct, yellow Choler. That is called Melancholy, which drawn by the Spleen in a thinner portion, and elaborate by the heat of the Arteries, which in that part are both many and large, becomes nourithment

to the part; the remnant thereof is carried by the veiny Veffel into the orifice of the ventricle, whereby

it may not cause but whet the appetite, and by its astriction strengthen the actions thereof. But yellow

Choler drawn into the bladder of the gall, remains there to long, till being troublefome; either in

quantity or quality, it is excluded into the guts, whereby it may cast forth the excrements residing in them; the expulsive faculty being provoked by its acrimony, and by its bitterness kills the worms that are bred there. The fame Humor is accustomed to die the urine of a yellow colour. There is another ferous Humor, which is not fit to nourish but profitable for many other things, which is not A ferous an excrement of the fecond, but of the first concoction. Therefore nature would that mixed with wheysile hat the Chylm, it should come to the Liver, and not be voided with the excrements, whereby it might allay the grofiness of the blood, and ferve it for a vehicle; for otherwise the blood could scarce pass through the capillary veins of the Liver, and passing the simous and gibbous parts thereof, come to the hollow vein. Part of this ferous humor, separated together with the blood which serves for the nourishment of the Reins, and straight carried into the bladder, is turned into that urine which we daily make; the other part thereof, carried through all the body together with the blood, performing the like duty of transportation, is excluded by sweats into which it degenerates. Besides the forenamed, the Arabians have mentioned four other humors, which they term Alimentary and fecondary, Humors, as being the next matter of nourithment, as those four the blood contains, the remote. as being the heat hatter of houndaring, as thought the book which hangs ready to fall like to lit-given no name to the first kind, but imagin it to be that humor, which hangs ready to fall like to lit-tle drops in the utmost orifices of the veins. They call the fecond kind, * Dew 5 being that humor, * Res. which, entred already into the substance of the part, doth moissen it. The third they call by a barborous name, Cambium, which, already put to the part to be nourified, is there failned. The fourth named Gluten, or Glew, is only the proper and fubitance-making humidity of the fimilar parts, not their fubriance. The diffinction of the degrees of nutrition recited by Galen in his books of Natural faculties, answer in proportion to this diffinction of humors. The first is, that the blood flow to the part that requires nourithment; then that being there arrived, it may be agglutinated; then laftly, that having loft its former form of nourithment, it may be affirmilated.

Those humors are against nature, which being corrupted, infect the body and the parts in which Humors athey are contained by the contagion of their corruption, retaining the names and titles of the humors, gainft nature. from whose perfection and nature they have revolted, they all grow hot by putrefaction, although they were formerly by their own nature cold. And they are corrupted, either in the veins only, or within and without the veins; In the veins Blood and Melancholy; but, both without and within the veins, Choler and Phlegm. When blood is corrupted in its thinner portion, it turns into Choler, Jaco what Hawbern in its thicker, juto Melancholy, for the Blood becomes soldier to the property of the p when in its thicker, into Melancholy; for the Blood becomes faulty two manner of ways, either by more the the corruption of its proper substance by putrefaction, or by admixtion of another substance by info-blood when it corrupts. The Melancholy humor which is corrupted in the veins, is of three forts: The first is of a degenerate. Which it becomes adust, acid and biting. The other ariseth from that Choler which resembles the choly Humor volks of case, which by adustion becomes leak-coloured, then correlated the contract of a blowish green. yolks of eggs, which by adultion becomes leek-coloured, then aruginous, or of a blewilh green, corrupted, is then red, and laftly black, which is the very worlf kind of Melancholy, hot, malign, eating, and ex-ofthree kinds, ulcerating, and which is never feen or voided with fafety. The third comes from Phlegm putrefying in the veins, which first degenerates into falt Phlegm, but straight by the strength of extraneous heat degenerates into Melancholy.

Phlegm not natural is

bred, either

Acid and very crude, as which hath had none or very little impression of heat, but that which it first had in the

Salt, which is bred by the fweet, putrefying and adult, or mixture of adult and falt particles.

Waterith, as is that thin moisture which diffils from the

brain by the nostrils.

Mucous, as when that waterith is thickned into filth by

the help of some accidental or small heat. Glaffie, or * Albuminous, refembling molten glafs, or * Albuminous of four forts;

rather the white of an egg, and is most cold.

Gypsea, or Plaister-like, which is concrete into the hardness and form of chalk, as you may fee in the joints of the fingers in a knotty gout, or in inveterate diffillations upon the

Lungs,

[In the Veins, as the *Vitelline (like in confidence to the yolk of a raw egg) * Vitelline,

[In the Veins, as the *Vitelline (like in confidence to the yolk of a raw egg) * Vitelline, which the acrimony of firange heat breeds of yellow Choler, which fame in difeafes altogether deadly, degenerates into green, arruginous, and laftly into a blue, or colour like that which is died by wood.

The first is called Porraces, or leck-coloured, refembling the juice of a leek in greenness.

The fecond aruginofa, or aruginous, like in colour to verdigreafe.

The third bluith, or woad-coloured, like the colour died by woad.

The fourth red, differing in this from blood, whose colour it imitates, that it never cometh into knots, or clods

The fifth very red, generated by the excels of the former, which causeth burning feavers.

The kinds of fuch Choler, are often cast forth by vomit in diseases, the strength of the disease being past; being troublesom to the parts through which they are evacuated, by their bitterness, acrimony, and bitings

Choler not natural is bred, either

Or in the capacity of the upper belly, as the ventricle, and this is of five kinds.

In the Veins, and is either

Or without the

Veins, and is

cither

Such as the

The manner and discases of Sanguine

perions.

The figns of a Sanguine Person.

Think it manifest, because the matter and generation of slesh is principally from blood, that a man of a fleshy, dense, and solid habit of body, and full of a sweet and vaporous juice, is of a Sanguine complexion. And the same party bath a slourishing and rosie colour in his face, tempered with an equal mixture of white and red; of white, by reason of the skin lying utmost; of red, humor is, fach is the colour. because of the blood spread underneath the skin: for always such as the humor is, such is the colour in the face. In manners he is curious, gentle, easie to be spoken to, not altogether estranged from the love of women, of a lovely countenance and smooth forchead, seldom angry, but taking all things in good part; for as the inclination of humors is, fo also is the disposition of manners. Eut blood is thought the mildeft of all humors; but the firong heat of the inward parts maketh him to eat and drink freely. Their dreams are pleafant, they are troubled with difeafes ariting from blood, as frequent Phlegmons and many fanguine puttles breaking through the skin, much bleeding, and menffriious fluxes. Wherefore they can well endure blood-letting, and delight in the moderate use of cold and dry things; and lastly, are offended by hot and moilt things. They have great and strong Pulfe, and much urine in quantity, but mild of quality, and of an indifferent colour and fubfiance,

The Signs of a Choleric Person.

Choleric are not common ly fat. The manners Choleric per-

Holeric men are of a pale or yellowith color, of a lean, flender and rough habit of body, with fair veins and large Arteries, and a firong and quick pulle: their skin being touched, feels hot, The manners and diseases of whole body. They cast forth much choler by stool, vomit, and urine. They are of a quick and nimble wit,flout,hardy and sharp vindicators of received injuries,liberal even to prodigality, and somewhat too defirous of glory. Their fleep is light, and from which they are quickly waked: their dreams are fiery, burning, quick, and full of fury; they are delighted with meats and drinks which are force-what more cold and moift, and are subject to Tertian and burning feavers, the Phrentie, Jaundife, Inflammations, and other Choleric putiles, the Lask, Bloody flux, and bitterness of the mouth.

The signs of a Phlegmatic Person.

The manners and difeates of Phlegmatic perions.

Hofe in whom Phlegm bath the dominion, are of a whitish coloured face, and fornetimes livid and fwollen, with their body fat, foft, and cold to touch.

They are molefied with Phlegmatic difeases, as Oedernatous tumours, the Droplie, Quotidian feavers, falling away of the hairs, and Catarris falling down upon the Lungs, and the Afrona Arteria, or Weafon: they are of a flow capacity, dull, flothful, drowlie; they do dream of rains, friows, floods, (wirning, and fuch like, that they often imagine themselves overwhelmed with waters; they vomit up much watery and Phlegmatick matter, or otherwise spit and evacuate it, and have a foft and moift tongue

And they are troubled with a dog-like honger, if at any time it should happen that their insipid Phlegm become acid; and they are flow of digestion, by reason of which they have great store of cold and Phlegmatic humors; which if they be carried down into the windings of the Colic-gut, they

From whence noise or rum-bling in the pro-

eaute marmaring and noife, and fornetimes the Colic.

For much wind is cafily caufed of fuch like Phlegmatic excrements wrought upon by a fmall and weak heat, fuch as Phlegmatic persons have, which by its natural lightness is diversly carried through the turnings of the guts, and diffends and fwells them up, and whiles it firives for paffage out, it caufeth murmurings and noifes in the belly, like wind breaking through narrow paffages.

Signs of a Melancholic Person.

From, or by what their

Veins are fwollen.

He face of Melancholy persons is swart, their countenance cloudy and often cruel, their as-Difeases fami- The face of Melanchoty perions is twart, their countries of the Spleen, Hz-far to Melan- T spect is fad and froward; frequent Scirrhus or hard swellings, tumors of the Spleen, Hzcholy persons morrhoids, Variees (or swollen Veins) Quartan seavers, whether continual or intermitting; Quintan, Sextan, and Septiman feavers: and to conclude, all fuch wandering feavers or agues fer upon them. But when it happens, the Melancholy humor is fharpened, either by adultion, or commixture of Choler, then Tetters, the black Morphew, the Cancer limple and ulcerated, the Leprous and filthy feab, fending forth certain fealy and branlike excrefences, (being vulgarly called St. Manis his evils) and the Leprotie it felf invades them; They have fmall veins and arteries, because coldness bath dominion over them; whose property is to firaiten, as the quality of heat is to dilate. But if at any time their veins feem big, that largeness is not by reason of the laudable blood contained in them, but from much windiness; by occasion whereof it is fornewhat difficult to let them blood; not only, because that when the vein is opened, the blood flows flowly forth, by reason of the cold flowness of the humors; but much the rather, for that the vein doth not receive the impreffion of the Lancet, fliding this way and that way, by reason of the windiness contained in it, and because that the harsh driness of the upper skin, relials the edge of the infirument. Their bodies feem cold and hard to the touch, and they are troubled with terrible dreams, for they are observed to feem to fee in the night Devils, Serpents, dark dens and caves, fepulchres, dead corpfes, and many other fuch things full of horror, by reafon of a black vapor, diverfly moving and diffurbing the brain, which also we fee happens to those who * fear the water, by reafon of the bitting of a mad Dog. You thall find them froward, fraudulent, parlimonious, and coverous even to baseness, flow speakers, fearful, fad, complainers, careful, ingenious, lovers of folitariness, man-haters, obstinate maintainers of opinions once conceived, flow to anger, but angred not to be pacified. But when Melancholy hath exceeded natures and its own bounds, then by reason of putrels of the pacified. then by reason of putrefaction and inflammation all things appear full of extreme sury and madness, to that they often cast themselves headlong down from some high place, or are otherwise guilty of their own death, with fear of which notwithstanding they are terrified.

Their dreams. " Hydrophobi. Their man-MCC1-

But we must note, that changes of the native Temperament, do often happen in the course of a From whence mans life, fo that he which a while agone was Sanguine, may now be Choleric, Melancholic, or the change of Phlegmatic; not truly, by the changing of the blood into fuch Humors, but by the mutation of Diet, temper, and the course or vocation of life. For none of a Sanguine complexion, but will prove Choleric, if How one may he cat hot and dry meats, (as all like things are cherifbt and preferved by the ufe of their like, and contraries are destroy'd by their contraries) and weary his body by violent exercises and continual labors, lerie. and if there be a suppression of Choleric excrements, which before did freely flow either by Nature or Art. But wholoever feeds upon Meats generating groß blood, as Beef, Venifon, Hare, old Cheefe, and all falt Meats, he without all doubt fliding from his nature will fall into a Melancholy temper; especially, if to that manner of Diet, he shall have a vocation full of cares, turmoils, miscries, strong and much study, careful thoughts and fears; and also if he sit much, wanting exercise, for so the inward heat, as it were defrauded of its nourithment, faints and grows dull, whereupon groß and droffie humors abound in the body. To this also the cold and dry condition of the place in which we live, doth conduce, and the suppression of the Melancholy humor accustomed to be evacuated by the Hemorrhoids, courfes and floo

But he acquires a Phlegmatic temper, whofoever ufeth cold and moift nourithment, much feeding, who before the former meat is gone out of the belly, thall furf his paunch with more, who presently after meat runs into violent exercises, who inhabit cold and most places, who lead their life at ease in all idleness; and lastly, who fuster a supportion of the Plegmatic humor accustomably evacuated by vomit, cough or blowing the nofe, or any other way, either by Nature or Art. Certainly it is very convenient to know these things, that we may differn if any at the present be Phlegmatic, Melancholic, or of any other temper; whether he be fuch by nature or necessity. Having declared those things which concern the nature of Temperaments, and deferred the description of the parts of the Body to our Anatomy, we will begin to speak of the Faculties governing this our life, when first we shall have shown, by a practical demonstration of examples, the use and certainty of the aforefaid Rules of Temperaments.

CHAP. VII.

Of the Practice of the aforefaid Rules of Temperaments.

Hat we may draw the Theorie of the Temperaments into practice, it hath seemed good for Four bounds avoiding of confusion which might make this our Introduction feem obscure, if we would or regions of profecute the differences of the Tempers of all men of all Nations, to take those limits which the world. Nature hath placed in the world; as South, North, East and West, and, as it were, the Center of those bounds, that the described variety of Tempers, in colour, habit, manners, studies, actions, and form of life of men that inhabit those Regions situated so far distant one from another, may be as a surery life which we may cortainly indeed for a transferance in verticular, as be shall are fure rule, by which we may certainly judge of every mans temperature in particular, as he thall appear to be nearer or further off from this or that Region. Those which inhabit the South, as the Africans, Æthiopians, Arabians and Egyptians, are for the most part deformed, lean, dusky-colored, and pale, with black eyes and great lips, curled hair, and a small and shrill voice. Those which inhabit the forces of the Northern parts, as the Septhians, Massevites, Palonians, and Germans have their faces of color white, temperatures mixt with a convenient quantity of blood, their skin soft and delicate, their hair long, hanging down in particular, and spreading abroad, and of a yellowish or reddish colour; of stature they are commonly tall, and of the well-proportioned, fat and compact habit of body, their eyes grey, their voice strong, lond and bigs. and spreading abroad, and of a yellowith or reddith colour; of stature they are commonly tait, and of a well-proportioned, fat and compact habit of body, their eyes grey, their voice strong, loud and big. Southern peo-what swart, are well-favoured, nimble, strong, hairy, slender, well in slesh, have their faces some-what swart, are well-favoured, nimble, strong, hairy, slender, well in slesh, with their eyes resembling of the Northern color of Goats-eye, and often hollow-eyed, having a clear, shrill and pleasing voice.

The Southern people are exceeded so much by the Northern in strength and ability of body, as The Southern their strength and ability of body, as the people prevail.

The Southern people are exceeded to much by the Northern in irrength and ability of body, as the southern they furpals them in wit and faculties of the mind. Hence is it you may read in Hiltories, that the people prevail Scythiaux, Goths and Vandals vexed Afric and Spain with infinite incurfions, and most large and fa-Northern in mous Empires have been founded from the North to South; but few or none from the South to the firength.

North. Therefore the Northern people thinking all right and law to confift in Arms, did by Duel only do not be the Northern people thinking all right and law to confift in Arms, did by Duel North. Therefore the Northern people thinking all right and law to confift in Arms, did by Duel only determin all causes and controverses arising amongst the Inhabitants, as we may gather by the antient Laws and Customs of the Lombards, English, Burgundians, Danes and Germans; and we may see in Sano the Grammarian, that such a Law was once made by Fronts King of Demosts. The which Custom at this day is every where in sorce amongst the Mossoviter. But the Southern people have always much abhorred that fashion, and have thought it more agreeable to Beasts than Men. Wherefore we never heard of any such thing used by the Assirant, Egyptians, Peoficials or Jens: But moved by the goodness of their wit, they erected Kingdoms and Empires by the only help of Learning and hidden Sciences. For seeing by nature they are Melancholic, by reason of the driness of their temperature, they willingly addict themselves to folitariness and contemplation, being endued with a singular sharpness of wit. Wherefore the Ethiopians, Egyptians, Africans, Jens, Phanicians, Persons, Assirant, Assirant, Assirant, Assirant, Assirant, Assirant, Assirant, Assirant, Assirant who live and religious facrifices of the gods: Even so for the Heavens, and first brought in the worthip and religious facrifices of the gods: Even so far that the Arabiant who live and religious. Only by stealth, and have only a Wagon for their House, do boast that they have many things diligently and accurately observed in Astrology by their Ancestors, which every day made more accurate and copious, they as by an hereditary right, commend to posterity, as it is recorded by Loo the The Northern gentry and accurately observed in Annough of the abundance of hypers and blood. The Northern African. But the Northern people, as the Germans, by reason of the abundance of humors and blood, fismous Warby which the mind is as it were oppreft, apply themselves to works obvious to the senses, and which riers and Armay be done by the hand. For, their minds opprest with the earthly mass of their bodies, are easily effects.

drawn from heaven and the contemplation of celeftial things, to these inferior things, as to find out Mines by digging, to buy and cast metals, to draw and hammer out works of Iron, Steel and Brais, In which things they have proved so excellent, that the glory of the Invention of Guns and Printing belongs to them.

The endov ments of fach as inhabit between them.

The Northern overcome, but the victory. The abondance of Counfellors and Lawyers from France and Italy.

people,

The Northern

barous. and Southern have each

their cruel-

tics.

Val. Max. 1.9.

The difeases of the Sonthern people.

Mointraners.

The people who inhabit the middle regions between these are neither naturally fit for the more abstrufe Sciences, as the Southern people are; nor for Mechanic works, as the Northern; but intermeddle with civil affairs, commerce and Merchandizing. But are endued with fuch firength of body as may fuffice to avoid and delude the crafts and arts of the Southern Inhabitants; and with fuch wisdom as may be sufficient to restrain the sury and violence of the Northern. How true this is, any one may understand by the example of the Garthaginians and Africans, who when they had held Italy for fome years by their fubtle counfels, crafty fleights and devices yet could not cfcape, but at length their arts being eluded, and they fpoil'd of all their fortunes, were brought in fubjection to the Romans. The Gestes, Humas and other Northern People have fpoiled and over-run the Roman Empire by many incurfions and inroads, but deflitute of counfel and providence, they could not keep those things which they had gotten by Arms and Valour. Therefore the Opinion of all Historians is agreeing in this, that good Laws, the form of governing a Common-wealth, all politic Ordinances, the Arts of disputing and speaking have had their beginnings from the Greeks, Raman and French. And from hence in times past and at this day a greater number of Writers, Lawyers and Counsellors of State have sprung up than is all the whole world besides. Therefore that we may attribute their gifts to each Region, we affirm that the Southern People are born and fit for the fludies of Learning, the Northern for Wars, and those between both for Empire and Rule. The Italian is naturally wife, the Spaniard grave and constant, the French quick and diligent; for you would fay he runs when he goes, being compared to the flow pace of the Spaniard, which is the cause that Spaniards are delighted with French Servants for their quick agility in dispatching business. The Eastern people are specially endued with a good, firm and well-temper'd wit, not keeping their counsels secret and The manners hid. For hafte is of the nature of the Sun, and that not the day which is next to the riting of the Eaftern the Sun is counted the right fide and florough and partly in all the which is next to the riting of the Sun is counted the right fide and fironger; and verily in all things living, the right fide is always the more firong and vigorous. But the Western people are more tender and esteminate, and more close in their carriage and mind, not easily making any one partaker of their secrets. For the West is as it were subject to the Moon, because at the change it always inclines to the West, whereby it happens that it is reputed as nocturnal, finisher and opposite to the East; and the West is The Eastwind less temperate and wholsom. Therefore of the Winds none is more wholsom than the East-wind, which blows from the West with a most fresh and healthful gale; yet it seldom blows, but only at

The Northern people are good eaters, but much better drinkers, witty when they are a little moitlpeople great eaters and drinkers. In the Inhabitants of the South, who are to be and much addicted to all forts of wicked Luft. Arightle in his Problem faith, that those Nations counted harare barbarous and cruel, both which are burnt with immoderate heat, and which are opprest with exceffive cold, because a fost temper of the Heavens softens the manners and the mind. Wherefore both as well the Northern as Scythians and Germans; and the Southern, as Africans, are cruel; but these have this of a certain natural stoutness and foldier-like boldness, and rather of anger than a wilful defire of revenge; because they cannot restrain by the power of reason the first violent motions of their anger by reason of the heat of their blood. But those of a certain inbred and inhumane pravity of manners wilfully and willingly premeditating they perform the works of cruelty, because they are of a sad and melancholy nature. You may have an example of the Northern cruelty from the Transfiltranians against their feditious Captain George, whom they gave to be torn in pieces alive and devoured by his Souldiers, (being kept falling for three days before for that purpose) who was then unbowelled, and roited, and fo by them eaten up. The cruelty of Hamibal the Captain of the Carthaginians may fuffice for an inflance of the Southern cruelty. He left the Roman Captives wearied with burdens and the length of the way, with the foles of their feet cut off; But those he brought into his Tents, joyning brethren and kinsmen together he caused to sight, relieve was faristiced with the oldestore he brought all the victors rooms. blood before he brought all the victors to one man. Also we may see the cruel nature of the Southern Americans, who dip their children in the blood of their flain enemies, then suck their blood, and banquet with their broken and fqueafed Limbs.

And as the Inhabitants of the South are free from divers Plethoric Difeases, which are caused by abundance of blood (to which the Northern people are fubject) as Feavers, Defluxions, Tumors, Madnels with laughter, which caufeth those which have it to leap and dance, (the people commonly term it S. Vittus bis evil) which admits of no remedy but Mulie : fo they are often molefled with the Frense, invading with madness and fury; by the heat whereof they are often to ravisht and carried beside themselves, that they foretel things to come; they are terrified with horrible dreams, and in their fits they fpeak in strange and forein tongues; but they are so subject to the scurf and all kind of scabs and to the Leprosie as their homebred disease, that no houses are so frequently met withal by fuch as travel through either of the Mauritania's, as Hospitals provided for the Lodging of Lepers. Those who inhabit rough and mountainous places, are more brutish, tough and able to endure labour, but such as dwell in Plains, especially if they be moorish or fennish, are of a tender body, and sweat much with a little labour; the truth of which is confirmed by the Hollanders and Fristlanders. But if the Plain be fuch as is fcorched by the hear of the Sun, and blown upon by much contrariety of winds, it breeds men who are turbulent, not to be tamed, definous of fedition and novelty, flubborn, impatient of fervitude, as may be perceived by the fole example of the Inhabitants of Narbon, a Prowince of France. Those who dwell in poor and barren places are commonly more witty and diligent

and most patient of labors; the truth of which the famous wits of the Asbenians, Ligarians and Romans, and the plain country of the Bassians in Greece, of the Campanians in Italy, and of the rest of the Inhabiters adjoining to the Ligarian Sea, approves.

CHAP. VIII. Of the Faculties.

Faculty is a certain power and efficient cause, proceeding from the temperament of the part, What a Faint-Animal is feated in the proper temperament of the Brain, from whence it is distributed by the Norving, another Sensitive, the third Principal. The Sensitive consists in five external Senses; Sight, Hearing, Taske, Smell and Touch. The Moving, principally remains in the Muscles and Norves. ing, Tafic, Smell and Touch. The Moving principally remains in the Muscles and Nerves, as the fit infirmments of voluntary motion. The Principal comprehends the Reasoning Faculty, the Memory and Fantalie. Galen would have the common or inward Senfe to be comprehended within the compass of the Fantasie, although Aristotle diffinguish between them.

The Vital abides in the heart, from whence heat and life is diffributed by the Arteries to the whole body; this is principally hindred in the diffeafes of the Breaft; as the Principal is, when any diffeafe affails the Brain; the prime Action of the vital faculty is Pulfation, and that continued agitation of the Heart and Arteries, which is of the Heart and affaits the Brain; the prime Action of the vital faculty is Pullation, and that continued agration of the triple are the Heart and Arteries, which is of threefold are to the body: for by the dilatation of the Heart and of the Pulle. Arteries, the Vital Spirit is cherished by the benefit of the Air which is drawn in ; by the contraction thereof, the vapors of it are purged and fent forth, and the native heat of the whole body is

The last is the Natural Faculty which hath chosen its principal feat in the Liver, it spreads or care The natural ries the nourifhment over the whole body; but it is diffinguilht into three other faculties; The Generative, which ferves for the generation and forming of the Iffue in the womb; the Growing or Interesting of the Iffue in the womb; the Growing or Interesting for the generation and forming of the Iffue in the womb; the Growing or Interesting for the Iffue in the womb; the Growing or Interesting for the Iffue in the womb; the Growing or Interesting for the Iffue in the womb; the Growing or Interesting for the Iffue in the womb; the Growing or Interesting for the Iffue in the womb; the Growing or Interesting for the Iffue in the womb; the Growing or Interesting for the Iffue in the womb; the Growing or Interesting for the Iffue in the womb; the Growing or Interesting for the Iffue in the womb; the Growing or Interesting for the Iffue in the womb; the Growing or Interesting for the Iffue in the womb; the Iffue in the If creating faculty, which flourisheth from the time the Issue is formed, until the perfect growth of the folid parts into their full dimensions of length, heighth and breadth. The nourishing faculty, which flance; for Nutrition is nothing effe but a replenishing or repairing whatfoever is wasted or emptied. What Nutri-This nourifling faculty endures from that time the Infant is formed in the womb until the end of life, tion is. It is a matter of great confequence in Phylic, to know the four other faculties, which as Servants Four other Faattend upon the nourishing faculty; which are the Attractive, Retentive, Digeffive and Expulsive culties attend upon the nourishing faculty; which are the Attractive, Retentive, Digeffive and Expulsive culties attend upon the nourishing faculty. The Attractive draws that Juice which is fit to nourish the body; that, I fay, which by rishing Facultown the meat fearce chewed, and the drink fearce tasted, into the gnawing and empty stomach.

The Retentive faculty is that which retains the requisitement over attracted, and the following and empty stomach. The Retentive faculty is that which retains the nourithment once attracted, until it be fully laboured and perfectly concocted; and by that means it yields no small affiftance to the Digeflive faculty. For the natural heat cannot perform the office of concoction, unless the meat be embraced by the The necessity part, and make forme flay therein. For otherwife the meat, carried into the fromach, never acquires of the recention of Chylar, unless it fray detained in the wrinkles thereof as in a rough paffage, until the tive-faculty. time of Chylification. The Digettive faculty affimilates the nourithment, being attracted and detained, into the fubfiance of that part whose faculty it is, by the force of the inbred beat and property. disposition or temper of the part. So the stomach plainly changes all things which are eat and drunk into Chylus, and the Liver turns the Chylus into blood. But the Bones and Nerves convert the red and liquid blood, which is brought down unto them by the capillary or finall veins, into a white and folid fubitance. Such concoction is far more laborious in a Bone and Nerve, than in the Mufculous fleth. For the blood being not much different from its nature, by a light change and concretion turns into fleth. But this Concoction will never fatisfie the defire of nature and the parts, unless the nourithment, purged from its excrements, put away the fifth and drofs, which must never enter into the fiabitance of the part. Wherefore there do not only two forts of excrements remain of the Two excrefirst and formal Company of the part. first and second Concochon, the one thick, the other thin, as we have faid before; but also from ments of every the third Concochon, the one thick, the other thin, as we have faid before; but also from ments of every the third Concochon, the third Concoction, which is performed in every part. The one of which we conceive only by conceition, times by five ass, fometimes by a thick fatty habitance fraining the thirt's fometimes by the generation of hairs and nails, whole matter is from fulliginous and earthly excrements of the third Concoction. Wherefore the fourth faculty was profiled probled, might yield no finall help to provide the concoction. tion of hairs and nails, whose matter is from fuliginous and earthly excrements of the third Concoction. Wherefore the fourth faculty was necessary which might yield no finall help to nourishment;
it is called the Expulsive, appointed to expel those superfluous excrements which by no action of heat. The work of
can obtain the form of the part. Such faculties ferving for nutrition are in some parts twofold; as the expulsive
veins; Others only attending the service of those parts in which they remain, and in some parts
all these four, as well common as proper, are abiding and residing as in those parts we now mentioned; some wish the four proper have only two common, as the Gall. Spleen. Kidneys and Bladder. oned; fome, with the four proper have only two common, asthe Gall, Spleen, Kidneys and Bladder, Others are content only with the proper, as the familiar and mufculous parts, who if they want any of these four faculties, their health is decayed either by want of nourishment, an ulcer, or otherwise, The like tinnatural affects happen by the deficiency of just and laudable nourithment. But if it hap- by what depen those faculties do rightly perform their duty, the nourishment is changed into the proper part, grees the part of the proper part of the part of and is truly affamiliated as by these degrees. First, it must flow to the part, then be joined to it, rishment is then agglutinated, and hifly, as we have faid, affimilated. Now we must speak of the Actions attrailated.

CHAP. IX.

Of the Attions.

What an Acti-on is-An Action and

Napural Acti-

1.4

N Action or Function is an active motion proceeding from a faculty; for as the faculty depends on the Temperament, fo the Action on the faculty, and the Act or Work depends upon the Action by a certain order of confequence. But although that the Words, Action and Act or work are often confounded; yet there is this difference between them, as that the Action figan Act or work are difnifies the motion used in the performance of any thing; but the Act or work, the thing already done
and performed: For example, Nutrition and the Generating of fielh are natural Actions; but the
parts nourifled, and a hollow ulcer filled with fielh are the works of that motion, or action. Wherefore the Act arifeth from the Action, as the Action arifeth from the Faculty, the integrity or perfection of the inflruments concurring in both. For as, if the Faculty be either defective, or hurt, no Action will be well performed: fo unless the instruments keep their native and due conformity (which is their perfect health, the operator of the Action proper to the instrument) none of those things, which ought to be, will be well performed. Therefore for the performance of blameless and perfect actions, it is fit a due conformity of the instrument concur with the faculty. But Actions are two-fold: for they are either Natural, or Voluntary. They are termed Natural, because they are performed not by our will, but by their own accord, and against our will: As are, that continual motion of the Heart, the beating of the Arteries, the expulsion of the Excrements, and such other like, which are done in us by the Law of Nature whether we will or no. These Action flow either from the Liver and Veins, or from the Heart and Arteries. Wherefore we may comprehend them under the names of Natural and Vital Actions. For we must attribute his Action to each faculty, left we feem to constitute an idle faculty and no way profitable for use. The unvoluntary vital Actions, are the dilatation and contraction of the Heart and Arteries, the which we comprehend under the sole name of the Pulse: by that they draw in, and by this they expel or drive forth. The unvoluntary vital actions be,

Generation,
Growth, and
Which proceed from the Generative,
Growing, and
Nourifhing
Faculty.

What Generation is.

Generation is nothing else than a certain producing or acquiring of matter, and an introducing of a substantial form into that matter: this is performed by the albitance of two faculties; of the altera inditantial form into that matter: this is performed by the admande of two factures, of the aftering, which doth diverfly prepare and difpole the feed and menfituous blood to put on the form of a
Bone, Nerve, Spleen, Fleth, and fuch like: of the Forming faculty, which adorns with figure, fite,
and composition, the matter ordered by so various a preparation.

Growth is an inlarging of the folid parts into all the dimensions, the pristine and ancient form remaining safe and sound in figure and solidity. For the perfection of every growth is judged only by
the folid parts; for if the body swell into a mass of stellh, or fat, it shall not therefore be said to be grown:

What Growth

but then only when the folid parts do in like manner increase, especially the bones, because the growth of the whole body follows their increase, even although at the same time it wax lean and pine away.

What Nutriflon is.

Nutrition is a perfect affimilation of that nourifhment which is digefted, into the nature of the part which digefts. It is performed by the affiftance of four fubfidiary or helping actions, Attractive, Retentive, Digettive and Expulsive.

Action voluntary. " Anima fenti-

ens.

The voluntary actions which we willingly perform, are fo called, because we can at our pleasure hinder, stir up, slow or quicken them. They are three in general, the sensative, moving and principal Action. The fentitive * Soul comprehends all things in five fentes, in Sight, Hearing, Smell, Tatle, Three things must necessarily concur to the performance of them, the Organ, the Medison or Mean and the Object. The principal Organ or Instrument is the Animal Spirit distused by the Nerves into each feveral part of the body, by which fuch actions are performed. Wherefore for the prefent we will use the parts themselves for their Organs. The Mean is a Body, which carries the Object to the Instrument. The Object is a certain external quality, which hath power by a fit Medium or Mean to fit my and alter the Organ. This will be more manifest by relating the particular functions of the Senfes by the necessary concurring of these three.

How Sight is performed,

Sight is an action of the feeing faculty, which is done by the Eye, fitly composed of its coats and humors, and so consequently the Organical body of this Action. The Object is a visible quality brought to the Eye. But such an Object is two-sold; for either it is absolutely visible of itself, and by its own nature, as the Sun, the Fire, the Moon and Stars; or defires, as it were, the help of another that it may be actually such; for so by the coming of the light colours, which were visible in power only, being brought to the Eye, they do seem and appear such as they actually are. But such Objects cannot arrive at the Eye, but through a clear and illuminate Medium, as the Air, Water, Glass, and all forts of Crystal.

How Hearing.

The Hearing hath for its Organ the Ear and Auditory paffage, which goes to the flony-bone furnished with a Membrane invefting it, an Auditory Nerve, and a certain inward fpirit there contains.

Now Smelling.

ed. The Object is every found arising from the smitten or broken Air, and the Collision of two bo-dies meeting together. The Medium is the encompassing Air which carries the found to the Ear. Smelling (according to Galen's opinion) is performed in the manullary processes produced from the proper substance of the brain, and stated in the unprepared of the pole; although others had the the proper substance of the brain, and seated in the upper part of the nose: although others had rather smelling should be made in the very soremost ventricles of the brain. This Action is weak in man, in comparison of other Creatures: the Object thereof is every smell, or sumid exhalation breathing out of bodies. The Medicon by which the Object is carried to the noses of Men, Beatls and Birds, How the Taft, is the Air ; but to Fishes the Water itself. The Action of Taste, is performed by the Tongue,

heing tempered well and according to nature, and furnished with a Nerve spread over its upper part from the third and fourth Conjugation of the Brain. The Object is * Taste, of whose nature and * saper, kinds we will treat more at large in our Antidotary. The Medium by the which the Object is so carried to the Organ, that it may affect it, is either external or internal: The external is that spatcarried to the Organ, that it may affect it, is either external or internal: The external is that fpattle which doth, as it were, anoint and fupple the tongue; the internal is the fpongy flesh of the
tongue it felf, which affected with the quality of the Object, doth presently to possess the
nerve that is planted in it, that the kind and quality thereot, by the force of the spirit, may be
carried into the common sense. All parts endued with a nerve, enjoy the sense of the spirit, may be
carried to the common sense. All parts endued with a nerve, enjoy the sense of the spirit, may be
carried to the common sense. All parts endued with a nerve, enjoy the sense of the spirit, may be
carried to the common sense. All parts endued with a nerve, enjoy the sense of the spirit which
lieth under the Cuticle, or scarf-skin; we have formerly noted, that it is most exquisite in the
chin vehicle investe the ends of the singuest. The Object is every tradeable guality whether it has skin which inverts the ends of the ingers. The Object is every tractable quality, whether it be of the first rank of qualities, as Heat, Cold, Moisture, Dryness, or of the second, as Roughness, Smoothness, Heaviness, Lightness, Hardness, Softness, Rarity, Density, Friability, Unctuosity, Grofiness, Thinness The Medium by whose procurement the instrument is affected, is either the

skin or the fleth interwoven with many Nerves.

The next Action, is that Motion which by a peculiar name we call Voluntary; this is performed of motion, and accomplished by a Muscle, being the proper Instrument of voluntary Motion. Furthermore, every motion of a member possessing a Muscle, is made either by bending and contraction, or by extension: Although generally there be so many differences of voluntary motion, as there are kinds of site in place; therefore Motion is said to be made upward, downward, to the right hand, to the of fite in place; therefore Motion is faid to be made upward, downward, to the aggic mand, to the left, forward and backward: Hither are referred the many kinds of motions, which the infinite variety of Mufcles produce in the body. Into this rank of voluntary Actions, comes Respiration, or How Respiratorathing, because it is done by the help of the Muscles, although it be chiefly to temper the heat tion may be a of the Heart. For we can make it more quick or flow as we please, which are the conditions of a voluntary motion.

Laftly, that we may have fornewhat in which we may fafely reft and defend our felves against the many questions which are commonly moved concerning this thing, we must hold, that Respiration is undergone and performed by the Animal faculty, but chiefly inflituted for the Vital.

The principal Action and prime amongst the Voluntary, is absolutely divided into three, Imagi- The third nation, Reafoning and Memory. Imagination is a certain expressing and apprehension, which discerns and diffinguisheth between

the forms and shapes of things sentible, or which are known by the senses. Reasoning is a certain judicial estimation of conceived or apprehended forms or figures, by a mutual collating or comparing them together.

Memory is the fure florer of all things, and as it were the Treafury which the mind often unfolds and opens, the other faculties of the mind being idle and not imployed. But because all the forementioned Actions, whether they be Natural, or Animal and Voluntary, are done and performed by the help and affine. the help and affiffance of the Spirits; therefore now we must speak of the Spirits.

CHAP. X.

Of the Spirits.

He Spirit is a fubtil and airy fubliance, raifed from the purer blood, that it might be a ve- whar a Spirit hicle for the faculties (by whose power the whole body is governed) to all the parts, and is the prime instrument for the performance of their Office. For they, being destitute of its fweet approach, do presently cease from action, and as dead, do rest from their accustomed labours.

From hence it is, that making a variety of Spirits according to the number of the faculties, they spirits three-have divided them into three; as one Animal, another Vital, another Natural.

The Animal hath taken his feat in the Brain; for there it is prepared and made, that, from The Animal than the Spirit. thence conveyed by the Nerves, it may impart the power of fende and motion to all the reft of the Spirit, thembers. An Argument hereof is, that in the great cold of Winter, whether by the intercepting them in their way, or by the concretion, or, as it were, freezing of those spirits, the joynts grow fliff, the hands numb, and all the other parts are dull, destitute of their accustomed agility of moti- why so called on, and quickness of sense. It is called Animal, not because it is the * Life, but the chief and * Animal, prime influment thereof: Wherefore it hath a more subtil and airy substance; and enjoys divers names, according to the various conditions of the Symposius, or seas of the sense which is printe intument thereof: Wherefore it hath a more liabil and any monance; and enjoys divers names, according to the various condition of the Senfories, or feats of the fenfes, into which it enters; for that which caufeth the fight, is named the Vilive: You may fee this by night, rubbing your eyes, as fparkling like fire. That which is conveyed to the Auditory paffage, is called the Auditive or Hearing; that which is carried to the inftruments of Touching, is termed the Tactive;

and to of the ren.

This Animal spirit is made and laboured in the windings and foldings of the Veins and Arte-How it is of the brain, of an exquisite subtil portion of the Vital brought thirther by the Carotide Actorie, made or sleepy Arteries; and sometimes also of the pure air, or sweet vapour drawn by the Nose in or fleepy Arteries; and fometimes also of the pare air, or tweet vapour drawn by the Note in breathing. Hence it is, that with Ligatures we flop the paffage of this fpirit, from the parts we intend to cut off. An Humour which obliructs or flops it paffage, doth the like in Apoplexies and Palics, whereby it happens that the members fituate under that place do languish and feem dead, for the like in Apoplexies and formations. fornetimes deflitute of motion, fornetimes wanting both fende and motion.

The Vital spirit is next to it in dignity and excellency, which hath its chief Mansion in the left The Vital ventricle of the Heart, from whence, through the Channels of the Arteries, it flows into the whole Spirit. body, to nourith the hear which relides fixed in the fubtiance of each part, which would perith in

thort time, unless it should be refreshed with heat flowing thither together with the spirit. And because it is the most subtil next to the Animal, Nature (lest it should vanish away) would have it contained in the nervous coat of an Artery, which is five times more thick than the coat of the Veins, as Galen, out of Heropbilme, hath recorded.

16

What the It is furnished with matter from the flabtil exhalation of the blood, and that air which we draw matter of it is in breathing. Wherefore, as it doth eatily and quickly perish by immoderate diffipations of the fpirituous substance, and great evacuations; so it is easily corrupted by the putrefaction of Humors, or breathing in of pestilent air and filthy vapours; which thing is the cause of the so sudden death of those which are insected with the Plague. This Spirit is often hindred from entring into some part, by reason of obstruction, fullness, or great inflammations; whereby it follows, that in a short space, by reason of the decay of the fixed and inbred heat, the parts do easily fall into a Gangrene, and become mortified,

There is some doubt of the Natural Spi-

The Natural spirit (if such there be any) hath its station in the Liver and Veins. It is more gross and dull than the other, and inferiour to them in the dignity of the Action, and the excellency of the use. The use thereof is to help the concoction both of the whole body, as also of each several part, and to carry blood and heat to them.

Fixed Spirits.

The radical moiflure.

Befides those already mentioned, there are other Spirits fixed and implanted in the fimilar and prime parts of the body, which also are natural, and Natives of the same place in which they are seated and placed. And because they are also of an airy and siery nature, they are so joyned, or rather united to the Native heat, that they can no more be separated from it than stame from heat; wherefore they with these that flow to them, are the principal Instruments of the Actions which are performed in each several part: And these sixed Spirits have their nourishment and maintenance from the radical and first-bred moisture, which is of an airy and oily substance, and is, as it were, the foundation of these Spirits, and the inbred heat. Therefore without this moisture, no man can live a moment. But also the chief Instruments of life are these Spirits, together with the Native heat. Wherefore this radical Moisture being diffipated and wasted (which is the feat, fodder and nourithment of the Spirits and heat) how can they any longer fubfift and remain? Therefore the confumption of the natural heat, followeth the decay of this fweet and fubfiance-making moisture, and confequently death, which happens by the diffipating and refolving of natural heat.

But fince then these kinds of Spirits, with the natural heat, is contained in the subfiance of each

fimilar part of our body (for otherwife it could not perfift) it must necessarily follow, that there be as many kinds of fixed Spirits, as of fimilar parts. For because each part hath its proper temper and increase, it hath also its proper Spirit, and also its own proper fixed and implanted hear, which here hath its abode, as well as its Original. Wherefore the Spirit and hear which is seated in the bone, is different from that which is impact into the fubiliance of a Nerve, Vein, or fuch other fimilar part is because the temper of these parts is different, as also the mixture of the Elements

The use and necessity of the Spirits.

from which they first arose and sprung up. Neither is this contemplation of Spirits of small account, for in these confist all the force and efficacy of our Nature.

These being by any chance dissipated or wasted, we languish; neither is health to be hoped for, the slower of life withering and decaying by little and little. Which thing ought to make us more diligent, to defend them against the continual efflux of the threefold substance. For if they be decayed, there is left no proper indication of curing the difease; so that we are often constrained, all other care laid aside, to betake our selves to the restoring and repairing the decayed powers. Which is done by meats of good juyce, easie to be concocted and distributed; good Wines, and fragrant finells.

What the remedy for the diffipation of the Spirits. What the remedy for op-preffion of the Spirit is.

But fornetimes these Spirits are not diffipated, but driven in and returned to their fountains, and fo both oppressand are oppress, whereupon it happens we are often forced to dilate, and spread them abroad by binding and rubbing the parts. Hitherto we have spoke of those things which are called Natural, because we naturally consist of them; it remains that we now say somewhat of their Adjuncts and Affociates by familiarity of Condition.

The Adjuncts and Affociates to things natural; are,

Age: Of which, by reason of the similatude of the Argument, we were confirmined to fpeak, when we handled the Temperatures. Colour: Of which we have already spoken.

The Conformation of the Inframental parts. Time: whole force we have also confidered. Order of Diet, and condition of Life.

CHAP. XI.

Of the Adjuncts of things Natural.

What fex is.

EX is no other thing than the diffinction of Male and Females in which this is most obfervable, that for the parts of the body, and the fite of these parts, there is little difference between them; but the Female is colder than the Male. Wherefore their spermatical parts are more cold, foft, and moift; and all their natural actions less vigorous and more deprayed.

The nature of Of Eurochs.

The Nature of Eunuchs is to be referred to that of women, as who may feem to have degenerated into a womanith nature, by deficiency of heat; their finooth body, and toft and thrill voyce do very much affimilate women. Notwithstanding you must consider, that there be some manly Women,

which their manly voice, and chin covered with a little hairiness, do argue, and on the contrary, these are some womanizing or womanish men, which therefore we term dainty and effeminate.

The Hermaphrodite is of a double nature, and in the middle of both Sexes, seems to participate Of Hermanical Contractions of the contraction of the

of both Male and Female.

The Colour which is predominant in the habit and superficies of the body, and lies next under Colour the the skin, shews the Temperament of what kind soever it be; for, as Galen notes in Comment, ad bewrayer of the temperament.

Aphw. 2. Sell. 1. Such a colour appears in us, as the contained Humor hath. Wherefore if a Rose the Temperament. hew colour the checks, it is a fign the body abounds with blood, and that is carried abroad by the plenty of Spirits. But if the skin be died with a yellow colour, it argues Choler is predominant; if with a whitish and pallid hew, Phlegm; with a fable and duskle, Meanicholy. So the colour of the Excrements which are according to nature, is not of the least colour. For thus, if an allow being fact that white the colour of the least colour for the Ulcer being broken fend forth white matter, it argues the foundness of the part from whence it flows; but if fanious or bloody, green, blackilh, or divers colours, it shews the weakness of the folid part, which could not affirmilate by concoction the colour of the excrementitious humor. The like reason is of unnatural Tumors: For, as the colour, so the dominion of the Humor causing or accompanying the Swelling commonly is.

The conformity and integrity of the Organical parts is confidered by their figure, greatness, number, lituation, and matual connexion. We confider the figure, when we say, almost all the external on of the organical parts of the body are naturally round, not only for shew, but for necessity, that being smooth, and ganical parts, on way comered, they should be less obnoxious to external injuries. We speak of Greatness, when we say, some are large and thick, some lank and lean. But we consider their Number, when we observe some parts to abound, some to want, or nothing to be defective or wanting. We infinuate site and Connexion, when we start, whether every thing be in its proper place, and whether they be decently fitted, and well joyned together.

We have handled the varieties of the four Scasons of the Year, when we treated of Tempera-

We have handled the varieties of the four Scalons of the Year, when we treated of Temperaments. But the confideration of Region (because it hath the same judgment that the Air) shall be referred to that disquilition or enquiry which we intend to make of the Air, amongst the things Not-

The manner of life, and order of Diet, are to be diligently observed by us, because they have Diet great power either to alter, or preserve the Temperament. But because they are of almost infinite variety, therefore they fearer form politible to fall into Art, which may profecute all the differences of Diet and Vocations of life. Wherefore if the Calling of Life be laborious, as that of Husbandman, Mariners, and other fuch Trades, it friengthens and dries the parts of the body. Although though those which labour about Waters, are most commonly troubled with cold and most diffeales, although they almost kill themselves with labour.

Again, those which deal with Metals, as all forts of Smiths, and those which cast and work brals, are more troubled with bet diffeales as Fearers. But if their Calling be fuch, as they be much and

are more troubled with hot discases, as an torts of Smiths, and those which can and work brais, are more troubled with hot discases, as Feavers. But if their Calling be such, as they lie much, and work all the day long sitting at home, as Shoo-makers; it makes the body tender, the sich effeminate, and canfeth great quantity of excrements. A life as well idle and negligent in body, as quiet in mind, in all riotousness and excesses of Diet, doth the same. For from hence the body is made subject to the Stone. Grand and Great

made subject to the Stone, Gravel and Gout.

That Calling of life which is performed with moderate labour, clothing and diet, seems very The common than denvenient to preferve the natural temper of the body. The ingenious Chirurgion may dides of an frame more of himself that may more particularly conduce to the examination of these things indifferent. Therefore the things natural, and those which are near or neighbouring to them being thus briefly declared; the Order seems to require, that we make enquiry of things Not-natural.

CHAP. XII.

Of things Not-natural.

He things which we must now treat of, have by the later Physitians been termed Not-natural; because they are not of the number of those which enter into the constitution or composure of mans body; as, the Elements, Humors, and all such things which we formed the body already made and composed. Wherefore they were called by Gason Preserves and defend the body already made and composed. Wherefore they were called by Gason Preserves because by the due use of them the body is preserved in health. Alloshey may be called Doubtful, and Neuters; for that rightly and fitly used, they keep the body healthful, but inconsiderately, they they cause diseases. Whereby it comes to pals, that they may be thought to pertain to that part of Physick which is of preserving health, not because some of these things should be absolutely and of their own nature wholsom, and others unwholsom; but only by this, that they are, or prove so by their convenient, or preposterous use. Therefore we consider the use of such like things from four conditions, Quantity, Quality, Occasion, and Manner of using: It thou shalt observe these, thou shalt attain and effect this, That those things which of themselves are, as it were, doubtful, shall bring certain and undoubted health. For these four Circumstances do so far extend, that in them, as in the perfection of Art, the Rules which may be prescribed to preserve health, are contained. But Gason in another place, hath in four words comprehended these things which are put into the body, either by the mouth, or any other way; as the Air, Meat and Drink, the body with a diverse touch of its qualities of heat, cold, mositure or driness. Expelled, are what things applied, are those which must touch the body, as the Air now mentioned, affecting the body with a diverse touch of its qualities of heat, cold, mositure or driness. Expelled, are what

things foever being unprofitable, are generated in the body, and require to be expelled. To be Done, are labour, reft, fleep, watching, and the like. We may more diffinely, and by expression of proper Names, revoke all thefe things to fix:

Meat and Drink. Labour and Reft. Which are Sleep and Watching. Repletion and Inantition; or things to be expelled, or retained and kept. Perturbations of the Mind.

CHAP. XIII.

Of the Air.

for life the Air

IR is so necessary to life, that we cannot live a moment without it; if so be that breathing, and much more transpiration, be not to be separated from life. Wherefore it much conduceth to know, what Air is wholsom, what unwholsom, and which by contrariety of qualities fights for the Patient against the Discase; or on the contrary, by a similitude of qualities shall nourish the Discase, that if it may seem to burthen the Patient by increasing or adding to the Difeafe, we may correct it by Art. So in curing the wounds of the head, especially in Winter, we labour by all the means we may to make the Air warm. For cold is hurtful to the Brain, Bones, and the wounds of these parts; and heat is comfortable and friendly. But also the Air being drawn and the wounds of these parts; and hear is comfortable and friendly. But also the Air being drawn into the body by breathing when it is hotter than ordinary, doth with a new warmth over-hear the heart, lungs, and fpirits, and weaken the firength by the diffipation of the Spirits too much attenuated; fo being too cold, in like manner the firength of the faculties faints and grows dull, either by fuppression of the vapors, or by the inspissation or thickning of the Spirits.

Therefore to conclude, That air is to be esteemed healthful, which is clear, subtil and pure, and free and open on every side, and which is far remote from all Carion-like smells of dead Carkasses, or the steep of any suppression thing whatsoever. The which is far distant from standing Pools and Fens. and

What Air is

ftench of any putrefying thing whatfoever: The which is far diffiant from flanding Pools, and Fens, and Caves, fending forth ftrong and ill vaporsmeither too cloudy nor moift by the nearness of some River.

Caves, tending forth firong and ill vaporspicither too cloudy nor moin by the nearnets of forme River. Such an Air, I fay, if it have a vernal temper, is good againft all difeafes, That Air which is contrary to this, is altogether unhealthful; as that which is putrid, that up, and preft by the firaitness of neighbouring Mountains, infected with forme notion vapor. And because I cannot profecute all the conditions of Airs, fit for the expelling of all difeafes, as which are almost infinite; it shall suffice here to have set down, what we must understand by this word Air.

Physicians commonly use to understand three things by the name of Air: The present state of the Air, the Region in which we live, and the season of the Year. We spoke of this last, when we treated of Temperaments. Wherefore we will now speak of the two former. The present state of the Air, one while for some small time, is like the Spring, that is temperate; otherwhiles like the

Three things are underflood by the name of the Air.

Aphor-4-fell. 2. The force of the Winds.

the Air, one while for fome fmall time, is like the Spring, that is temperate; otherwhiles like the Summer, that is hot and dry; otherwhiles like the Winter, that is cold and moift; and fometimes like the Autumn, which is unequal; and this last constitution of the Air is the cause of many diseases. When upon the fame day, it is one while hot, another cold, we must expect Autumnal diseases. These tempers and varieties of constitutions of the Air, are chiefly and principally stirred up by the Winds; as which being dissussed over all the Air, shew no small force by their sudden change. Wherefore we will briefly touch their natures: That which blows from the East, is the East-wind, wherefore we will briefly touch their natures. and is of a hot and dry nature, and therefore healthful, But the Western wind is cold and moist, and therefore fickly. The South-wind is hot and moist, the Author of putrefaction and putrid difeafes. The North-wind is cold and dry, therefore healthy: Wherefore it is thought, if it happen to blow in the Dog-days, that it makes the whole year healthful, and purges and takes away the feeds of purges of the few Winds is the feature of the few Winds is the feature of the few Winds. of putrefaction, if any chance to be in the Air. But this description of the four Winds, is then only thought to be true, if we consider the Winds in their own proper nature, which they borrow from those Regions from which they first proceed. For, otherwise they affect the Air quite contrary, according to the dispositions of the places over which they came; 2s, Snowy places, Sea, Lakes Bisers, Woods, or fandy Plains, from whose they may be require the process with which faculties, than Lakes, Rivers, Woods, or fandy Plains, from whence they may borrow new qualities, with which they naturally they may afterwards possess the Air, and so consequently our bodies.

Hence it is we have noted the Western-wind unwholsome, and breeding diseases, by reason of the proper condition of the Region from whence it came; and fuch that is cold and moilt: The Gafewar find it truly to their fo great harm, that it feldoms blows with them, but it brings fome manifest and great harm, either to their bodies, or fruits of the earth. And yet the Greek and Latins are wont to commend it for healthfulness, more than the rest. But also the rising and setting of forne more eminent Stars, do often cause such cold winds, that the whole Air is cooled, or infected with force other malign quality. For vapors and exhalations are often raifed by the force of the Stars, from whence Winds, Clouds, Storms, Whirlwinds, Lightnings, Thunders, Hail, Snow, Rain, Earthquakes, Inundations, and violent raging of the Sca, have their original. The Geographers, yet Hippocrates could not omit it, but that he must speak formething in his Book de Acre & Acres ; where he touches, by the way, the description of the neighbouring Regions, and

From this force of the Air, either hurtful, or helping in difeases, came that famous observation of Guido of Cauliss, That wounds of the head are more difficult to cure at Paris, than at Avigno

wholfome. What force Stars have upon the Air.

of it felf un-

How the winds acquire other

è

and the plain contrary of wounds of the legs; for the air of Paris, compared to that of Avignor, is cold and moifi, wherefore hurtful and offenfive to the wounds of the head. On the contrary, the fame Air, because it obscures the spirits, incrassates the blood, condensates the humors, and makes them less fit for defluxions, makes the wounds of the legs more case to be healed, by reamakes them lefs fit for defluxions, makes the wounds of the legs more cafie to be healed, by reafon it hinders the courfe of humors, by whose defluxion the cure is hindered. But it is manifely, for those of the
that hot and dry places make a greater diffipation of the natural heat, from whence the weakness
of the powers; by which same reason the Inhabitants of such places do not so well endure bloodletting; but more easily suffer purgation, though vehement, by reason of the contumacy of the
humor, caused by driness. To conclude, the Air changes the Constitutions of our bodies, either
by its qualities, as if it be hotter, colder, moister or drier; or by its matter, as if it be grosser, or
more subtil than is sit, or corrupted by exhalations from the earth, or by a sudden and unaccustomed
alteration, which any man may prove, who makes a sudden change out of a quiet air into a flormy. alteration, which any man may prove, who makes a fudden change out of a quiet air into a fformy, and troubled with many winds. But because, next to the Air, nothing is so necessary to nourish mans body, as Meat and Drink, I will now begin to speak of them both.

CHAP. XIV.

Of Meat and Drinks

Hat this our Treatife of Meat and Drink may be more brief and plain, I have thought good to part it into thefe heads, as to confider the goodnets and illnets of both of them, their quantity, quality, cuftom, delight, order, time; and to accommodate them all to the ages and feafons of the year. We judge of the goodnets and pravity of meats and drinks, from the condition of the good or vicious humours or juyce which they beget in us. For evil juyce caufeth many difeases. As on the contrary, good juyce drives away all difeases from the body, except the fault happen from some other occation, as from quantity, or too much excess. Wherefore it is principally necessary, that those who will preserve their present health, and hinder the access of fault nappen from fome other occation, as from quantity, or too much excets. Wherefore it is principally necessary, that those who will preserve their present health, and hinder the access of diseases, feed upon things of good nourishment and digestion; as, are good wine, the yolks of eggs, good inilk, wheaten bread well baked, the flesh of Capons, Partridge, Thrushes, Larks, Veal, Matton, Kid, and such like other, which you may find mentioned in the Books which Galea writ, de Alimentorium facultatibus; where also be examines those which are of evil juyce by their manifest qualities; as Actimopy. Bitterpels, Salmels, Acidity, Harshoos, and such like.

de Alimentorium facultatibus; where also he examines those which are of evil juyce by their manifest qualities; as Acrimony, Bitterness, Saltness, Acidity, Harshness, and such like.

But unless we use a convenient quantity and measure in our meats, howsoever laudable they be, Their quantity with the first of their quantity; but we may be this known the force of quantity on both parts, because often the possenous quality of meats of ill nourishment doth not hurt, by reason they were not taken. The quantity for as Hipperrates saith, If any give meat to one sick of a Feaver, he gives strength to the well, and increases the disease to the sick, especially if he do not use a mean. Wherefore it is a thing of not the nause of their is a large relation made in Sest. 1. of the Aphorisms of Hipperrates; where he teacheth, the there is a large relation made in Sell. 1. of the Aphorifins of Hipperater; where he teacheth, the fick must feed more largely in the beginning of long difeases, whereby they may be enabled to enperiously of the disease, and last to the state thereof. But in sharp and violent diseases, which presently come to their height, we must use a state thereof. But in sharp and violent diseases, which prefently come to their height, we must use a stender diet; but most stender, when the disease is in the height: And besides, all our consultations in this kind, must be referred to the strength of the Patients. But those who enjoy their perfect health, must use a quantity of meat, agreeable to their evacuation and transpiration; for men, by reason of the strength of their heat, and the more copious diffipation of the triple fubfiance, have greater appetite than women; altogether by the fame reason, that young people, and such as grow, need more frequent and plentiful nourishment than old men and also amongst young men of the like age, some do rightly require more copious nourishment than others, that is, according to the quantity of their evacuations and custom. Certainly for Gluttony, it is such as may be extended to all; but we all should take so much meat and drink, that our pendiary ways of preserving health; not to be over-filled with mear, and to be quick to work: gard to the quantity of meats. Neither must those who are found or fick, have less repart to the qualities of their meats; and those are either the first, as heating, cooling, moistening, ing according to the condition of their nature. The manner of our diet is not only to be framed according to these, but also to be varied; for the present state of such as be in health, requires to be those which are hot and moist; and cold and dry to old men, as to those who are cold and dry, if age, show green and new begun howsever it be, his of itself, as it tween a disease, it seems to be ease, mature, that is, hot and moist; that so we may defer, as much as we can, the cause of death, cold their contraries, as those things which are contrary to their and drines, which halten the destruction of that age. For we must resist the service, when meat as mach meat as you give to the sick, you add so much strength to the disease. And the fame is the conserver in the contraries, as much meat as diffipation of the triple fubfiance, have greater appetite than women; altogether by the fame reafon, their contraries, as those things which are contrary to nature. For otherwise, as much meat as you give to the sick, you add so much strength to the disease. And the same is the cause why his a most diet is convenient for all such as are sick of Feavers, because a Feaver Apper, 16. is a dry different attract. Therefore we must diligently pry into the nature of the discase, that know- sell. r. ing it, we may endeavour to abate its fury by the use of contraries.

But if Custom (as they say) be another nature, the Physician must have a great care of it, both

The force of

Aphor. 91. 0/1.2.

49ber. 38. 94. 2.

Accustomed meats are more grateful, and fo, by that means, monourithing.

in found and fick. For this fometimes by little and little, and infentibly, changes our natural temp rament, and inflead thereof gives us a borrowed temper. Wherefore if any would prefently or fuddenly change a Custom, which is fometimes ill, into a better, truly he will bring more harm than good; because all fudden changes (according to the opinion of Hippocrater) are dangerous. Wherefore it necessity require that we should withdraw any thing from our Custom, we must do it by little and little, that so nature may by degrees be accustomed to contraries without violence, or the diflurbance of its usual government. For that meat and drink which is somewhat worse, but more pleafant and familiar by cuftom, is to be prefeared (in Hippocrates opinion) before better, but lefs pleafant and accustomed. Hence is it, that Countrey-men do very well digest Beef and Bacon, which commonly they use; but will turn into nidoralent vapors, Patridg, Capons, and other meat of good nourithment, sooner than change them into good and laudable Chylus. The cause of which thing is not only to be attributed unto the property of their fironger, and as it were, burning heat, but much more to Custom; which by a certain kind of familiarity, causeth that means of hard digeslion, are easily turned into laudable blood. For the force of Custom is so great, that accustomed meats are more acceptable; whereby it comes to pass, that while the stomach delights in them, it more straitly embraces them, and happily digells them, without any trouble of loathing, vomitmore ing, or heaviness. All the contrary, meet and happen in the use of meats, which are unpleasant to the taste and stomach. For the ventricle abhorring those things, makes manifest how it is troubled by its acid and nidorulent belchings, loathing, naufeoufnets, vomit, heavinets, pain of the head, and trouble of the whole body. Wherefore we must diligently enquire, what meats the Patient chiefly delighted in, that by offer-

ing them, his appetite languishing by reason of some great evacuation, vomit, or the like, may be stirred up. For it will be better and more readily restored by things acceptable, though they be somewhat worse, as we noted a little before out of Hippocrates. By which words he plainly taught, that it is the part of a good and prudent Phylician to subscribe to, and please, the palat of his Patient.

But feeing that Order is most beautiful in all things, it is truly very necessary in eating our meat; for how laudable foever the meats be in their quantity and quality, howfoever familiar by use, and grateful by custom; yet unless they be eaten in due order, they will either trouble or moleit the fromach, or be ill, or flowly and difficulty concocted; wherefore we must diligently observe, what meats must be eaten at the first, and what at the second course; for those meats which be hard to concoct, are not to be eaten before those which are easie of digettion; neither dry and astringent things, before moistening and looting.

But on the contrary, all flippery, fat and liquid things, and which are quickly changed, ought to go before, that fo the belly may be moifined; and then aftringent things mult follow, that the ftomach, by their help, being that and drawn together, may more firaitly comprehend the meat on every fide, and better perform the Chylification by its proper heat united and joyned together.

For this cause Hippoerates, Lib. de Villu in scinis, commands those things to be always eaten in the morning, which are fit to loofen the belly, and in the evening such as nourish the body. Yet notwithflanding drink ought not to precede or go before meat, but on the contrary, meat muli precede drink, by the order preferibed by him.

Neither ought we in our eating to have less care of the time, than we have of the order; for the time of eating of such as are healthful, ought to be certain and fixt; for at the accustomed hour, and when hunger presses, any found man, and which is at his own disposure may eat, but exercise and accustomed labours ought to go before; for it is fit, according to the Precept of Hippocrates, that labour precede meat, whereby the excrements of the third concoction may be evacuated, the native heat increased, and the solid parts confirmed and strengthened, which are three commodities of exercife very necessary to the convenient taking of meat. But in fick persons we can scarce attend and give heed to these circumstances of time, and accustomed hour of feeding; for that indication of giving meat to the fick, is the best of all, which is drawn from the motion of the discase, and the declining of the fit: For if you give meat in Feavers, specially the fit then taking the Patient, you nourish not him, but the Difease. For the meat then eaten, is corrupted in the stomach, and yields fit of a Feaver. fit matter for the disease: For meat (as we noted before out of Hipperster) is strength to the found, and a difease to the fick, unless it be eaten at convenient time, and diligent care to be had of the ftrength of the Patient, and greatness of the disease.

But neither is it convenient that the meat should be simple, and of one kind, but of many forts, and of divers dithes dreffed after different forms, left nature by the continual and hateful feeding upon the fame meat, may at length loath it, and so neither straitly contain it, nor well diget it; or the stomach accustomed to one meat, taking any loathing thereat, may abhor all other; and as there is no defire of that we do not know, so the dejected appetite cannot be delighted and stirred up with the pleasure of any meat which can be offered. For we must not credit those supervisions or too nice Phylicians, who think the digettion is hindred by the much variety of mean

The matter is far otherwise, for by the pleasure of what things soever the stomach allured doth require, it embraces them more firaitly, and concocts them more perfectly. And our nature is defirous

Moreover, feeing our body is composed of a folid, moift, and airy substance; and it may happen, that by fo many labours, which we are compelled to undergo and fuffain in this life, one of these may finiter a greater diffipation and lofs than another; therefore the flomach is necessarily compelled to feek more variety, left any thing should be wanting to repair that which is waited. But also the age and scason of the year, yield Indications of feeding; for some things are convenient for a young. Indications of man, forme for an old; forme in Summer, forme in Winter. Wherefore we ought to know what befrom the age. fits each age and feafon. Children need hot, moift, and much nourishment, which may not only

The order of eating our meats.

We must begin our meals with moift or liquid meat.

The profit of labour before meat.

We must not

Variety of meats.

Why variety of mosts is good.

futfice to nourifly, but increase the body. Wherefore they worst endure fasting, and of them especially those who are the most lively and spiritful. With old men it is otherwise; for because their heat is small, they need little nourishment, and are extinguished by much. Wherefore old men easily endure to fast; they ought to be nourished with hot and most meats, by which their folid parts now growing cold and dry, may be heated and moittned, as by the fweet nourithment of fuch like meats. Middle ag'd men delight in the moderate use of contraries, to temper the excess of their too acrid heat. Young people as temperate, are to be preferved by the use of like things.

The manner of Diet in Winter must be hot, and inclining to driness. Wherefore, then, we may Indication more plentifully use rost-meats, strong wines, and spices; because in the Winter-scason we are from the time troubled with the cold and profil air, and at the strong hour ment have much be to the cold and profil air, and at the strong hour ment have much be to the cold and profil air, and at the strong hour ment have much be to the cold and the strong hour ments have much be to the cold and the strong hour ments have much be to the cold and the strong hour ments have much be to the cold and the strong hour ments have much be to the strong hour ments and the strong hour ments have the strong hour ments and the strong hour ments are the strong hour ments and the strong hour ments are the strong hours ments and the strong hours ments are the strong hours are the strong hours

troubled with the cold and moift air, and at the fame time, have much heat inwardly; for the in- of the year, ner parts, according to Hipperates, are naturally most hot in the Winter, and the Spring, but searverish in Summer; so the heat of Summer is to be tempered by the use of cold and most things, and much drink. In the temperate Spring, all things must be moderate; but in Autumn, by little and little, we must pass from our Summer to our Winter diet.

CHAP. XV.

Of Motion and volt.

Ere Phylicians admonishus, that by the name of Motion, we must understand all forts of what Motice Exercises, as walking, leaping, running, riding, playing at Tennis, carrying a burthen, fignificant the like. Friction or rubbing is of this kind, which in times past was in great of and effect, neitheir at this day is it altogether neglected by the Pheiysians. They mention many kinds of it, but they may be all reduced to three; as, one gentle, another hard, a third indifferent; and Three kinds of that of the whole body, or only of some part thereof. That Friction is called hard, which is made by Frictions. the rough, or firong prefitire of the hands, fpunges, or a coarfe and new linnen cloth: It draws Bard, together, condenfates, binds and hardens the field, yet if it be often and long uled, at length it ratios, diffolves, attenuates, and diminishes the flesh, and any other substance of the body; and also it causeth revulsion, and draws the defluxion of humors from one part to another. The gentle Fri-Gentle, chion, which is performed by the light rubbing of the hand, and such like, doth the contrary; as, fostens, relaxes, and makes the skin smooth and unwrinckled; yet unless it be long continued, it doth none of these worthy to be spoken of. The indifferent kinds, consisting in the mean betwixt Indifferent the other two, increased the field, swells or puss up the habit of the body, because it retains the blood and spirits which it draws, and suffers them not to be distiputed.

The benefit of Exercise is great, for it increases natural heat, whereby better digestion follows, The use of and by that means nourithment, and the expulsion of the excrements; and laftly, a quicker motion of exercises the fpirits, to perform their office in the body, all the ways and parlages being cleanfed. Befides, it firengthens the respiration, and the other actions of the body, confirms the habit, and all the limbs of the body, by the matual attrition of the one with the other, whereby it comes to pals they are not

of quickly wearied with labour. Hence we fee, that Country-people are not to be fired with labour. If any will reapthefe benefits by Exercife, it is necessary that he take opportunity to begin his what the fired certain times according to the certain plant of the certain times according to the certain times a

Wherefore the best time for exercise will be before meat (that the appetite may be increased by augmenting the natural heat) all the excrements being evacuated, lest Nature being hungry and empty, do draw and insuse the ill humors contained in the guts and other parts of the body, into the model habit, the line of the body into the model habit. the whole habit, the Liver, and other noble parts. Neither is it fit prefently, after meat, to run into exercife, left the crude humours and meats not well concocted, be carried into the veins. The measure and bounds of exercife must be, when the body appears more full, the face looks red, five at begins to be a face to be a property of the and a bounds of exercise that be, when the body appears more run, the face flow, they begins to break forth, we breath more firoughy and quick, and begin to grow weary; if any continue exercise longer, fulfiness and weariness attails his joynts, and the body flowing with five turning ters a loss of the spirituous and humid substance, which is not easily repaired; by which it becomes the quality of exercise which is not easily repaired; by which it becomes the quality of exercise which is not easily repaired; by which it becomes

The quality of exercise which we require, is in the midit of exercises so that the exercise must be quality of be neither too flow and idle, neither too firong nor too weak, neither too hafty nor remife, but which exercise, may move all the members alike. Such exercise is very sit for found bodies. But if they be differnmay move all the members alike. Such exercise is very sit for found bodies. But it they be distempered, that fort of exercise is to be made choice of, which by the quality of its exects, may correct the distemper of the body, and reduce it to a certain mediocity. Wherefore such men as are stuffed with cold, gross, and viscous humors, shall hold that kind of exercise most int for them, which is strong exertione the first and second concoction, which they may know by the yellowness of their urin. But let further as abound with thin and cholerick humors, chuse gentle exercises, and such as are free from contention, not exercising the finishing of the second concoction, for the more acrid heat of the fuch as abound with thin and enotence manors, cause genue exercises, and such as are free from contention, not expecting the finishing of the fecond concection, for the more acrid hear of the folid parts delights in such half-concected juices, which otherwise it would so burn up all the glutinous fubilished thereof being wasted, that they could not be adjoyred or fastined to the pairs. For the repeating or renewing of exercise, the body should be so often exercised, as there is a delire to eat. For exercise stirs up and revives the heat which lies buried and hid in the body; for digestion cannot be well performed by a flaggith heat, neither have wearny benefit by the meat we cat, unlefs

The last part of exercise begun and performed according to Reason, is named, The redering of the Antiquarda bedy, which is performed by an indifferent rubbing and drying of members; that fo the fweat break-

ing forth, the filth of the body, and fuch excrements lying under the skin, may be allured and drawn out; and also that the members may be freed from tiffness and weariness. At this time it is commonly used by such as play at Tennis.

What discommodities proced from Idlenefs.

22

But, as many and great Commodities arise from exercise conveniently begun and performed, so great harm proceeds from Idleness; for gross and vicious juyces heaped up in the body, commonly produce crudities, obstructions, stones both in the reins and bladder, the Gout, Apoplexy, and a thousand other diseases.

CHAP. XVI.

Of Sleep and Watching.

Hat this our speech of Sleep and Watching, which we now intend, may be more plain, we will briefly declare, what commodity or difcommodity they bring; what time and what hour is convenient for both; what the manner of lying must be, and the choice thereof; what the dreams in fleeping; and what, pains or heaviness and chearfulness after fleep may portend Sleep is nothing elfe than the reft of the whole body, and the cellation of the Animal faculty from fense and motion. Sleep is caused, when the substance of the brain is possessed, and after some fort overcome and dulled by a certain vaporous, sweet, and delightsome humidity; or when the What fleep is. fpirits, almost exhaust by performance of some labour, cannot any longer sustain the weight of the body, but cause rest by a necessary consequence; by which means, nature may produce other, from the meat by concoction turned into blood.

Sleep fitly taken, much helps the digeflion of the parts, because in the time of reft, the heat being the worker of all concoction is carried back to them, together with the spirits. Neither doth sleep only give case to the wearied members, but also lessess our cares, and makes us to forget our labours.

The night is a fit time to fleep and to take our reft in, as inviting fleep by its moisture, tilence, and darkness. For the heat and spirits, in the thick obscurity of night, are driven in and retained in the center of the body; as on the contrary by the daily, and as it were, friendly and familiar light of the Sun, they are allured and drawn forth into the superficies, and outward part of the body; from whence they leave fleeping, and begin to wake. Befides also, which makes not a lit-tle to that opportunity and benefit which we look for from fleep, the night season suffices for the work of just and perfect concoction. Which is one reason, amongst many, that sleep in the day time may be hurtful. For we are wakened from our sleep by the heat and spirits, called forth to the skin either by the light, or noise on the day time, before that the concoction which was begun be finithed. But, that fleep cannot but be light which comes without necessity of fleeping. Wherefore the concoction being attempted, but not perfected, the floragh is filled with crudities, difleended with acid or four belchings, and the brain troubled with grofs vapors and excrementations
humidities. From whence proceed pain and heaviness of the head, and flore of cold difeases. But although fleep on the night time be wholfome, yet it is fit that it be refrained within the limits of an indifferent time, For that which exceeds, hinders the evacuation of excrements both upwards and downwards: But in the mean time the heat, which is neverible, draws from them some portion or vapour, into the veins, principal parts and habit of the body, to become matter for force dif-ease. We must measure this time, not by the space of hours, but by the finishing the work of con-coction, which is performed in some sooner than in other some. Yet that which is longest is perfected and done in feven or eight hours. The ventricle subsiding and falling into its felf and its proper coats, and the urine tinchured yellow, gives perfect judgment thereof. For on the contrary, the extension of the stomach, acid belching, pain of the head, and heaviness of the whole body, thew that the concoction is unperfect.

In fleeping we must have special care of our lying down; for first we must lie on our right side, that fo the meat may fall into the bottom of our flomach, which being flelly, and lefs membranous, is the hotter, and more powerful to affimilate. Then a little after we must turn upon our left fide, that fo the Liver with its Lobes, as with hands, may on every fide embrace the ventricle, and as a fire put under a kettle, haften the concoction. Laftly, towards morning it will not be unprofitable to turn again upon our right fide, that by this fituation the mouth of the florach being opened, the vapours which arise from the elixation of the Chylus have freer passage. Lying upon the back is wholly to be avoided; for from hence the Reins are inflamed, the Stone is bred, Palfies, Convultion, and all the difeafes which have their original from the defluxion into the fpinal marrow, and to the used to lie fo, if they be not troubled with defluxions into the eyes; for so the humor will more easily the into the provided to lie fo, if they be not troubled with defluxions into the eyes; for so the humor will more easily the provided to lie for the humor will more easily the lie for the humor will more easily the lie for the humor will not the lie for the humor flow into the part affected. But thus the work of concoction is not a little furthered, because by that form of lying, not only the inward heat is contained and gathered about the Ventricle, but the encompating warmness of the fost feathers of the bed aids and affifts it.

Neither are the Dreams which we have in our fleep to be neglected, for by the diligent confideration of these, the affections and superfluous Humors which have chief power in the body are mar-vellously known. For those who have raging choler running up and down their bodies while they fleep, all things to them appear bright, fluming, fiery, burning, full of noise and contention. Those who abound with Phlegm, dream of floods, fnows, thowers, and inundations and falling from high darkness, finodks, caves, and all black and diffinal things. But those whole bodies abound in bloods, from the carth, thick and observed the content of the carth, thick and observed the content of the carth, thick and observed the carth, thick are carth, thick and observed the carth, thick are carth, the dream of marriages, dances, embraces of women, fealts, jetis, laughter, of orchards and gardens and to conclude, of all things pleafant and fplendents

Also we must observe how the Patient doth after sleep, whether more lively and chearful, or more heavy: for, by the opinion of Hippocrates,

> Cum labor a somno est., lethalem collige morbum : Sin profit fomnus, nibil hinc lethale timendum of.

Apper. t. fell. 2.

Pain fleep enfuing, an ill difeafe doth flow; But if fleep profit bring, no harm from thence will flow.

And as fleep, so watching, if it exceed measure, is hurtful; for it hurts the temperature of the brain, weakens the senses, wastes the spirits, breeds crudities, heaviness of the head, falling away of the slesh, and leanness over all the body; and, to conclude, it makes Ulcers more dry, and so confequently rebellious, difficult to heal and malign. There are many other things may be spoken of sleep and watching, but these may suffice a Chirurgeon.

CHAP. XVII.

Of Repletion, and Inanition or Emptinesis.

Here are to be short, two forts of Repletion, or of all excess; one is of a simple quality, The kinds of without any defluxion, or society of any humor, as appears in differences without mark. Repletions, or ter: The other is of quantity and mass, the body being differed with two much meat, or rather of Excest quantity of humors; from whence proceed an infinite number of diseases. They call too great quantity of humors; from whence proceed an infinite number of diseases.

the Repletion of meats, Satiety or Fulness; and it is of two kinds: The one which is called * Re-Sad wires * Repletion or Fulness to the veffels; the other Repletion to the firength.

We judge of Satiety to the veffels, by the differntion and swelling of the veins, and entrals, as the fromach. We call Satiety to the firength, when the body is loaded with more meats than it can well bear. But also there is a double Repletion of humors. For either it is of some one humors, or of all the humors; they call this by a peculiar mame, Pletbora. For Galen defines Pletbora to be an excess of all the humors. For if at any time he define a Pletbora to be an excess of blood only; then cap. 6. verily by the name of blood, he understands an equal comparehension of the four humors as it is verily by the name of blood, he understands an equal comprehension of the four humors as it is taught in Phyfick Schools,

The Repletion which is caused by some one humor, is termed by Galen in the place before-mentioned, Gacoebymia (that is, an evil juice) whether the Repletion proceed of a Cholerick, Memia is,

lancholick, Phlegmatick, or ferous Humor.

Now Inanition or Evacuation, is no other thing than the expulsion or effusion of humors which The kinds of are troublesome, either in quantity or quality. Of Evacuation, some are universal, which expel Evacuation, some are universal, which expel Evacuation. fuperfluous humous from the whole body; fuch are Purging, Vomiting, Transpiration, Sweats, Phle-botomy. Some particular, which are performed only to evacuate fome part, as the Brain, by the nose, palat, eyes, ears; the Lungs, by the weazon; the Stomach, by vomit and flool; the guts, by flool; the Liver and the Spleen, by urine and ordure. These Evacuations are sometimes performed by nature, freeing it self of that which is troublesome to it; otherwhiles by the Art of the Physi-cian in imitation of parage. cian in imitation of nature

And again, one of these is good and requisite, when only the humor which is hurtful either in quantity or quality, is evacuated: The other not requisite, or immoderate, when the profitable humors, together with the unprofitable, are expelled.

But what Evacuations some these has a second and and alone either by the scratching and

But what Evacuations foever these be, they are expelled.

But what Evacuations foever these be, they are performed and done, either by the scratching and the skin, as when a Cholerick, Salt or Serous Humor, or some windiness lying between diese of mothe skin and the flesh, cause itching. For by scratching the skin, it gets passage out, which is manifest by the efflux of a serous matter burning, or causing scabs and ulcers, if the humor be somewhat ingestoss; but insensible and not so manifest, if it be windiness, the skin by that rubbing being rarised, and the gross statement of Wherefore they do ill, who binder their Patients from scratchand the groß flatulency attenuated. Wherefore they do ill who hinder their Patients from feratching, unleis they feratch fo cruelly and hard, that there may be danger (by reason of the great heat and pain thereby could be formed by the could be formed

pain thereby caufed) of fome defluxion or falling down of humors into the partpain thereby caused) of force defluxion or falling down of humors into the part.

Or these Evacuations are performed by much matter evacuated from an opened Bile, or running Ulcer, a Fistula, or such like sores. Or by sweats which are very good and healthful, especially in sharp diseases, if they proceed from the whole body, and happen on the critical days. By Vomit, The sore of which often violently draws these humors from the whole body, even from the utmost joynts, which vomits, as in all who are suppurated either in the sides or langs. By Salivation, or a Phlegmatick shux Salivation, by the mouth, as in those who are troubled with the French-pox. By sneezing and blowing the nose; for by these, the brain oppress with mostlure, disburtheneth it self, whether it be done without, or with the help of stemutatories and errhines; wherefore children, and such as have somewhat mostly brains, purge themselves often this way. By hicket and bekking; for by these the windines of the whole of the windines of the windines. brains, purge themselves often this way. By hicket and belching; for by these the windiness contained in the stomach, is often expelled. By urine, for by this not only Feavers, but which is more body is also purged by

· For there have been some troubled with the Pox, in whom a flux of the vicious and venenate hu-For there have been some troubled with the roas, at whom a max or the victors and venenate humor could not by Unctions of Quick-silver be procured, either from the mouth or belly; yet have been wonderfully freed by abundance of Urine, both from danger of death and their disease. By bleeding; for nature hath often found a way for grievous diseases, especially in young bodies, by bleeding at the roas and by their courses in women. By a flux, or lack paragraphs to the roas interbleeding at the note, and by their courfes in women. By a flux, or lask, purgations, fweats, inclu-

fible Evacuation and Transpiration; for so tumors, the matter being brought to suppuration, do fometimes vanish away and are dissolved, both of their own accord, as also by dissolving or discusfing Medicines. We do the fame by Exercise, Diet, Hot-houses, long sleep, walking, and shedding of tears. By fucking, as with Cupping-glaffes, and Horfe-leeches, in wounds made by venemous bitings.

We must obferve three Evacuation.

In all fuch kinds of Evacuations, we must consider three things, the quantity, quality and manner of Evacuation. As for an example, When an Empiema is opened, the matter which runs out, ought to be answerable in proportion to the purulent matter, which was contained in the capacity of the breatis; otherwife, unless all the matter be emptied, there may happen a relapse; the matter should be white, foft, equal, and nothing stinking: Lastly, you must let it forth, not all together, and one time, but by little and little, and at several times; otherwise, not a little quantity of the spirits and heat doth flow together with the unprofitable matter, and so consequently a dissolution of all the powers.

CHAP. XVIII.

Of the Perturbations or Paffions of the Mind.

Why the Pai-fions of the mind are cal-led Accidents. Their force.

He Perturbations are commonly called the Accidents of the Mind, because as bodily accidents from the body, fo may these, be present and absent from the Mind, without the corruption of the fubject. The knowledge of these must not be lightly passed over by the Chirurgeon; for they stir up great troubles in the bodies, and yield occasion of many and great diseases; of which things, joy, hope, and love, may give an apparent testimony. For by these motions the heat and fpirits are fometimes gently, fometimes violently diffused over all the body, for the enjoying of the prefent, or hoped for good. For then the heart is dilated, as to embrace the thing be-loved, and the face is died with a role and lively colour. For it is likely, that the faculty it felf is ftirred by the object, by whose power the heart it self is moved.

From whence they have their force.

For it is first necessary, before we be moved by any Paslions, that the Senses in their proper seats, in which they are feldom deceived, apprehend the objects; and straight, as Meffengers, carry them to the common fenfe, which fends their conceived forms to all the faculties. And then, that each faculty, as a Judge, may afresh examine the whole matter, how it is, and conceive in the presented objects some shew of good, or ill, to be defired or shanned. For, What man that was well in his wits, did ever fall into laughter, unlefs he formerly knew, or faw formewhat faid or done, which The reason of might yield occasion of laughter? Therefore Joy proceeds from the heart, for the thing causing Mirth or Joy, being conceived, the faculty moves the heart, which shaken and moved by the faculty which hath dominion over it, is dilated and opened, as ready to embrace the exhilarating object. But in the mean time by the force of that dilatation, it fends forth much heat, and spirits together with the blood into all the Body. A great part of which coming to the face, dilates it, the forc-head is smooth and plain, the eyes look bright, the checks become red, as dyed with Vermilion, the lips and mouth are drawn together, and made plain and fmooth y forme have their cheeks dented with two little pits (which from the effects are called laughing cheeks) because of the contraction or curling, which the mufcles fuffer by reason of their fulness of blood and spirits; all which, to be

The effects of Joy.

brief, is nothing but to laugh

Joy recreates and quickens all the faculties, fiirs up the fpirits, helps concoction, makes the body to be better liking, and fattens it, the heat, blood and spirits flowing thither, and the nourishing dew or moisture, watering and refreshing all the members; from whence it is, that of all the Palfions of the mind, this only is profitable, to that it exceed not measures for immoderate and unac-cultomed joy carries to violently the blood and spirits from the heart, into the habit of the body, that fudden and unlook'd for death enfues, by a fpeedy decay of the firength, the lafting fountain of the vital humour being exhausted. Which thing principally happens to those who are lefs hearty, as women and old men.

Anger.

Anger caufeth the same effusion of heat in us, but far speedier than Joy; therefore the spirits and humors are so enflamed by it, that it oftens causes putrid Feavers, especially if the body abound with any ill humour.

Sorrow.

Sorrow, or Grief, dries the body by a quite contrary way to that of Anger, because by this the heart is so straitned, the heart being almost extinct, that the accussomed generation of spirits cannot be performed; and if any be generated, they cannot freely pass into the members with the blood; wherefore the vital faculty is weakned, the lively colour of the face withers and decays, and the body waftes away with a lingering Confumption.

Fear.

Fear in like fort draws in and calls back the fpirits, and not by little and little, as in Sorrow, but fuddenly and violently; hereupon the face grows fuddenly pale, the extreme parts cold, all the body trembles or shakes, the belly in some is loosed, the voice, as it were, stays in the jaws, the heart beats with a violent pulfation, because it is almost oppress by the heat, strangled by the plenty of blood, and spirits abundantly rushing thither: The hair also stands upright, because the heat and blood are retired to the inner parts, and the utmost parts are more cold and dry than a stone; by reason whereof the utmost skin and the pores, in which the roots of the hairs are fastned, are drawn together.

Hippeer, libiq. de Marty Shame.

Shame is a certain affection mixed, as it were, of Anger and Fear; therefore, if in that conflict of, as it were, contending Paffions, Fear prevail over Anger, the face waxeth pale (the blood flying back to the heart 1) and thefe or thefe Symptomes rife, according to the vehemency of the contracted and abated hear. But if on the contrary, Anger get the dominion over Fear, the blood runs violently to the face, the eyes look red, and fornetimes they even fome at the mouth.

There is another kind of Shame, which the Lating call Vercentdia (we, Shamefafiness) in which

there is a certain flux and reflux of the heat and bloud, first recoiling to the heart, then presently there is a certain flux and reflux of the heat and bloud, first recoiling to the heart, then presently rebounding from thence again. But that motion is so gentle, that the heart thereby suffers no opposition, nor defect of spirits; wherefore no accidents worthy to be spoken of, arise from hence: this affect is samiliar to young Maids and Boys, who is they blush for a fault committed unawares or through carelessness, it is thought an argument of a vertuous and good disposition.

But an agony, which is a mixt pation of a firong fear and vehement anger, involves the heart in An Agony. the danger of both motions; wherefore by this pathon the vital faculty is brought into very great danger. To these fix Passions of the Mind all other may be revoked, as Hatred and Discord, to Anger; Mirth and Boatting to Joy: Terrours, Frights, and Swoundings, to Fear; Envy, Defpair, and Mourning, to Sorrow.

By these it is evident how much the Passions of the mind can prevail, to alter and overthrow the state of the body; and that by no other means, than that by the compression and dilatation of the heart, they diffuse and contract the spirits, bloud, and heat; from whence happens the dislipation

The figns of these Symptoms quickly shew themselves in the face; the heart, by reason of the Why the first thinnels of the skin in that part, as it were painting forth the notes of its affections. And certainly the figns of Pafface is a part so fit to disclose all the affections of the inward parts, that by it you may manifestly know mind appear an Old man from a Young, a Woman from a Man, a temperate person from an untemperate, an Ethiopian from a Indian, a Frenchman from a Spaniard, a Sad man from a Merry, a Sound from a Sick, a fecret and hid in our hearts, may be understood by the Face and Countenance.

Now we have declared what commodity and discorprodity may redound to the man from these the safe of

Now we have declared what commodity and difcommodity may redound to the man from these fore-mentioned Passions, and have shewed that anger is profitable to none, unless by chance to some dull by reason of idleness, or oppress with some cold, clammy and phlegmatick humour; and Fear convenient for none, unless peradventure for such as are brought into manifest and extream danger of their life by some extraordinary sweat; immoderate bleeding, or the like unbridled evacuation: mitted to his charge into any of these Passions, unless there be some necessity thereof, by reason of any of the fore-mentioned occasions.

CHAP. XIX.

Of things against Nature, and first of the Cause of a Disease.

Aving treated of things Natural and not Natural, now it remains we speak of things (which What things are called) against Nature, because they are such as are apt to weaken and corrupt the state against Nature are called) against Nature, because they are such as are apt to weaken and corrupt the state against Nature of our body. And they be three in number: The Cause of a Disease, and a Symasse.

The Cause of a Disease, and a Symasse.

The Cause of a Disease, and a Symasse.

What, and wided into Internal and External. The External, Original, or Primitive, comes from some other causes of disease, and outwardly, into the body: such be meats of ill nourishment, and such weapons as hose safes be.

The Primi-

The Internal have their effence and feat in the body, and are fubdivided into Antecedent and tive case.

Conjunct. That is called an antecedent cause, which as yet doth not actually make a Difease, but Internal antecedent, and the conjunct of the property conjunction of the property of goes near to cause one; so Humours copiously slowing, or ready to flow into any part, are the aneedent cause of Discases. The Conjunct is that which actually causes the Discase, and is so immediately joined in affinity to the Discase, that the Discase being present it is present, and being absent junct.

Again, of all fuch Caufes, fome are born together with us, as the over-great quantity and malign quality of both the feeds, and the mentruous bloud from difeafed Parents, are caufes of many Difeafes, and specially of those which are called Hereditary.

there happen to us after we be born, by our diet and manner of life, a firoke, fall, or fuch other like. Those which be bred with us, cannot be wholly avoided or amended, but some of the other may be avoided, as a firoke and fall; some not, as those which necessarily enter into our body, as

may be avoided, as a firoke and fall; fome not, as those which necessarily enter into our body, as
Air, Meat, Drink, and the like.

But if any will reckon up amongst the internal, inherent, and inevitable Causes, the daily, hay The congenit, hourly distipation of radical moisture, which the natural heat continually preys upon; I do not or inevitable gainfay it, no more then that division of Causes celebrated and received of Philosophers, divided center of deaths into Material, Formal, Efficient, and Final; for such a curious contemplation belongs not to a fice him.

Wherefore that we have written may suffice him.

CHAP. XX. Of a Difeafe,

What a Difcafe is, and how various A Diftemperature.

Difease is an affect against Nature; principally, and by it felf hurting and depraying the action of the part in which it resides. The Division of a Difease is threefold; Distemperature, Ill Conformation, and the Solution of Continuity.

Differt.perature is a Difease of the similar parts differting, and changed from their proper and native temper. That digression from the native temper, happens two ways; either by a simple diftemperature from the excels of one quality; and this is fourfold, Hot, Cold, Moift, and Dry : or by a compound diffemperature, by the excels of two qualities, which also is fourfold, Hot and Moift, Hot and Dry; Cold and Moift, Cold and Dry. Again, every Differnper is the fault of one simple and single quality, as an Inflammation; or hath some vicious humours joined with it, as a Phlegmon. Again, a Diftemperature is either equal, as in a Sphacele, or unequal, as in a Phlegmon, beginning or increasing.

III Conforma-

Ill Conformity is a fault of the organical parts, whose composure is thereby depraved. This hath four kinds; the first is, when the figure of the part is faulty, either by nature or accident, or fome cavity abolished; as if a part which Nature would have hollow for fome certain use, do grow or close up. Or laftly, if they be rough, or fmooth, otherwife then they should, as if that part which should be rough, be smooth, or the contrary. Another is in the magnitude of the part increased or dimi-nished contrary to Nature. The third is in the number of the parts increased or diminished, as if a hand have but four, or elfe fix fingers. The fourth is in the fite and mutual connexion of the parts; as if the parts which should be naturally united and continued, be pluckt afunder; as happens in Luxations; or the contrary. The third general kind of Difease, is the solution of continuity, a Disease common both to the similar and organical parts, acquiring diversity of names, according to the variety of the parts in which it refides.

Solution of Continuity.

CHAP. XXI. Of a Symptom.

What a Symprom is,

E do not in this place take the word Symptom in the most general acceptation, for every change or accident which happens to man belides his own nature; but more refervedly and specially, onely for that change which the Discase brings, and which follows the Discase as a shadow doth the body.

Three kinds thereof.

There be three kinds of a Symptom properly taken. The first is, when the action is hurt; I say hurt, because it is either abolished, weakned, or depraved, so blindness is a deprivation or abolishing of the action of Seeing; dulness of light, is a diminution or weakning thereof; and a suffusion, such as happens at the beginning of a Cataract, and when they think Flies, Hairs, and fuch like bodies

fly to and frobefore their eyes, is a depravation of the fight.

The fecond is a simple affect of the body, and a full fault of the habit thereof being changed, happening by the mutation of fome qualities: fach is the changing of the native colour into a red by a Phlegmon, and into a livid and black by a Gangrene; fach is the filthy flench the Nofe affected with a Polypus fends forth; the bitter taffe, in fach as have the Jaundice; and the rough and rugged skin in them which are Leprous.

The third is the fault of the overmuch retention of Excrements which should be expelled, and expulsion of such as should be retained; for the evacuation of a humor profitable both in quantity and quality, is against nature, as bleeding in a body not full of ill humours, nor Plethorick; and also the retention of things hurtful in fubflance, quantity, and quality, as the Courfes in Women, the Urine, and the Stone in the Bladder.

CHAP. XXII.

Of Indications.

What Indication is.

He knowledge and exercise of Indications befits that Chirurgeon, whom no blind rashness of Fortune but Reafon,no Chance but Counfel, directs in the undertaking and performing the works of his Art. For an Indication is a certain fafe and fhort way, which leads the Phyfician, as by the hand, to the attainment of his purposed end, of preferving the found, or curing

See Mithed.

For Galen doth define an Indication to be a certain infinuation of what is to be done, or a quick Cap.7. Lib. de and judicious apprehention of that which may profit or hurt. And as Faulconers, Mariners, Plowope fecta cap. men, Souldiers, and all manner of Arrigans, have their profit or hurt. men, Souldiers, and all manner of Artizans, have their peculiar terms and words, which are neither known, nor used by the vulgar s fo this word Indication is proper and peculiar to Phylicians and Chirurgeons, as a term of Art not vulgar; by confideration of which, as by force fign or fecret token they are admonished what is to be done to reflore health, or repel an imminent danger.

The kinds of Indications,

There are three prime and principal kinds of Indications, every of which is fubdivided into many other. The first is from things Natural. The second from those things which are termed Not Natural. The third from those things which are contrary to Nature. Things natural shew they must be preserved by their like, and in the compass of these are contained all the Indications which are drawn from the nature of the Patient, that is, from his firength, temper, age, fex, habit, cufforn, diet.

Things not Natural may be doubted as uncertain; for one while they indicate the fame things with things natural; that is, they co-indicate with the strength, temper, and the rest; otherwhiles they consent with things against Nature, that is, they co-indicate with the Discase. Wherefore Ling Market. Gales when he faith that Indications are drawn from three things; the Difease, the nature of the 149.9. Patient, and the encompating Air; by proposing the familiar example of the Air, he would have us to understand the other things not Natural, because we may shun or embrace them more or less as we will our felves; but we must whether we will or no endure the present flate of the Air. Therefore the Air indicates formething to us, or rather co-indicates; for if it nourish the Difease, as conspiring with it, it will indicate the same that the disease, that is, that it must be preserved in the

Things contrary to Nature indicate they must be taken away by their contraries; therefore that Indicational we may more accurately and fully handle all the Indications drawn from things Natural, we must drawn from note, that fome of these are concerning the strength of the Patient; by care to preserve which, we are often compelled for a time to forsake the cure of the proper Disease; for so, a great shaking happening at the beginning of an Ague or Fever, we are often forced to give fuftenance to the Patient, pening at the beginning of an Ague of Pever, we are often forced to give full ename to the Patient, to firengthen the Powers shaken by the vehemency of the shakings, which thing notwithstanding lengthens both the general and particular fits of the Ague. Other pertain to the temper, other respect the habit, if the Patient be slender, if fat, if well sletched, if of a rare, or dense constitution of body. Other respect the condition of the part affected in substance, consistence softness, hardness, quick or dull sense form significant properties. From all these dull fenfe, form, figure, magnitude, fire, connexion, principality, fervice, function or use: From all these, as from notes, the skilful Chirurgeon will draw Indications according to the time and part affected: for the fame things are not fit for fore eyes, which were convenient for the ears; neither doth the phlegmon in the jaws and throat admit the fame form of cure, as it doth in other parts of the body; For none can there outwardly apply repercultives, without prefent danger of fuffocation. So there is What the construction of the foreign of the parts which in fite are near the principal, Neither must disions of the parts which in fite are near the principal, Neither must disions of the thou cure a wounded Nerve and Muscle, after one manner. The temperature of a part, as Moifiure always indicates its preservation, although the disease be moift, and give indication of drying, as an ulcer. The principality of a part, always indicates a lateral and the disease and the di uker. The principality of a part always infinuates an Indication of aftringent things, although the diffeafe require diffolying, as an obstruction of the Liver; for otherwise, unless you mix aftringent things with diffolying, you will so diffolye the strength of the part, that hereafter it cannot suffice for suppositions. fanguification. If the texture of a part be rare, it shews it is less apt or prone to obtanction; if dense, it is more obnoxious to that Disease, hence it is that the Liver is oftner obstructed then the Spleen. If the part be fituate more deep or remote, it indicates the medicines must be more vigorous and liquid, that they may fend their force so far. The sensibleness, or quick sense of the part, gives indicated on milder Medicines, they consultant more than considerable of the part, gives indicated the medicines of the part of the cation of milder Medicins, then peradventure the figns or notes of a great Difeafe require. For the Indications Physician which applies things equally sharp to the horny tunicle of the eye being ulcerated, and to from the leg, must need be counted either cruel or ignorant. Each Sex and Age hath its Indications, for Ages.

Ages and Age hath its Indications, for Ages and Age hath its Indications, for Ages Ages and Ages are curable in youth, which we must not hope to cure in old age; for hoariness and Ages an great distillations in very old men, admit no digestion, as Hippocrates faith;

Apbur.40: 11.21

Nunquam decrepitus Bronchom coquit, atque Coryzam. The feeble Sire, for Age that hardly goes, Ne'r well digefts the hurtful Rheum or pofe.

Moreover, according to his decree, the Difeafes of the Reins, and whatfoever pains moleft the Aphron. 1684. bladder, are difficultly healed in old men; and also reason persuades that a Quartan admits no cure in Winter, and scarce a Quotidian; and Ulcers in like manner, are more hard to heal in Winter; that hence we may understand certain Indications to be drawn from time; and to increase the credit of the variety and certainty of Indications, forme certain time, and feafons in those times command us to make choice of Medicins; for, as Hippocrates tellifies;

Aphar. 5. fell. 4.

Ad Canis ardorem, facilis pargatio non est. In Dog-days heat it is not good, By purging for to cleanfe the bloud,

Neither shalt thou so well prescribe a stender diet in Winter, as in the Spring, for the air hath its Indications. For experience teaches us, that wounds of the head are far more difficultly and pal Indications; for some Medicins are onely to be used at the beginning and end of Discases others are the increase and vigour of the Discase. We must not contenn those Indications which are drawn from the vocation of Life, and manner of Diet; for you must otherwise deal with the rainful drawn from the vocation of Life, and manner of Diet; for you must otherwise deal with the painful From our Husbandman (when he is your Patient) which leads his life sparingly and hardly, than with the Paintul tizen, who lives daintily and idlely. To this manner of life and diet may be referred a certain secret. and occult property, by which many are not onely ready to vomit at eating of fome meats, but from feerer and occult property, by which many are not onely ready to vomit at eating of fome meats, but fremble over all their bodies when they hear them but fpoken of. I knew a prime Nobleman of properties the French Nobility, who was fo perplext at the ferving in of an Eel to the Table, at the midit of diner ner and amongst his friends, that he fell into a swound, all his powers failing him. Galon in his vice of those Physicians he used, he drank a great draught of cold Water in the intolerable heat of a from his childhood, perpetually abstained from cold Water.

For as much as belongs to Indications taken from things against a transfer of the form taken from t

things against

For as much as belongs to Indications taken from things against nature; the length and depth things against nature is the length and depth things against nature.

of a wound or ulcer indicates one way; the figure cornered, round equal and fmooth, unequal and rough, with a hollowness ffreight or winding, indicate otherwise, the fite right, left, upper, lower in another manner, and otherwise the force and violence of antecedent and conjunct causes. For oftentimes the condition of the cause indicates contrary to the Disease, as when abundance of cold and groß humours caufe and nourish a Fever. So also a Symptom often indicates contrary to the Difcase: in which contradiction, that indication must be most effected which doth most urge; as for example fake, If fwounding happen in a Fever, the feverish burning shall not hinder us from gi-ving Wine to the Patient,

ways follow the Indication which is from the Discase.

Wherefore these Indications are the principallest and most noble, which lead us, as by the hand, to do these things which pertain to the cure, prevention and mitigating of Difeases. But if any object, that so curious a search of so many Indications is to no purpose; because there are many Chirurgeons, which fetting onely one before their eyes, which is drawn from the effence of the Difeafe, have the report and fame of skilful Chirurgeons, in the opinion of the vulgar; but let him know that it doth not therefore follow, that this Indication is sufficient for the cure of all Discases; for we do not always follow that which the effence of the Difease doth indicate to be done. But chiefly, then where none of the fore-recited Indications doth relift or gain-fay. You may understand this by the example of a Plethora, which by the Indication drawn from the effence of the thing, requires Phle-botomy; yet who is it that will draw bloud from a child of three moneths old? Besides, such an Indication is not artificial but common to the Chirurgeon with the common people. For who is it that is ignorant, that contraries are the remedies of contraries? and that broken bones mult be united by joyning them together? But how it must be performed and done, this is of Art and peculiar to a Chi-rurgeon, and not known to the Vulgar. Which the Indications drawn from those Fountains we pointed at before, abundantly teach; which, as by certain limits of circumstances, encompass the Infa what parts we may hope for refittution of the loft fubstance, and in which is the part of a skilful Chirurgeon to know and pronounce. Wherefore he will not vainly beflow his labour to cure the nervous pare of the Diaphragma or Midriff being wounded, or the Heart, or finall Guts, Lungs, Liver, Stomach, Brain, or Bladder; and that I may speak in a word, Empericks are not much more skilful then the common people, although they do so much extol themselves above others by the name of experience. For although experience be another instrument to find out things with reason, yet without reason it will never teach what the fubfiance of the part in which the difeafe lies, may be a or what the action, use, fite, connexion, from whence special and proper Indications are drawn; with which the Chirargeon being provided and instructed, shall not onely know by what means to find out a remedy, but also, left he may seem to mock any with vain promises, he shall discern what Discases are uncura-ble, and therefore not to moddled withall.

without a Guide. Indications in

cales.

fon is like a

blind man

floring of fo-

lution of con-

tinuity. Experience without rea-

But implicit or intricate Difeales require each to be cured in their feveral order, except forms one of them be desperate, or so urge and press that the Physician think it necessary after a prepoflerous order to begin with it, although often he be forced to make fome one of these Diseases incurable, or give occasion of causing some new one; into which straits we are necessarily compelled to fall, when (for example) we determine to pull, or take away fome extraneous body; for the performance whereof we are compelled to enlarge the wound. So we are forced by necessity to open the neck of the bladder, (that so we may draw forth the stone therein contained) with a wound which often degenerates into an uncurable Fiftula. For that Difease which threatens danger of prefent death is of fuch moment, that to flum that it may be counted a fmall matter, and commodious for the fick, to bring in other Difeafes, though incurable. For if a convultion happen by pricking a Nerve, which we cannot heal by any remedies, then by cutting the Nerve attender we end the convultion, but deprive the part into which that Nerve did go, of the use of some voluntary motion. So if in any great joint there happen a Luxation with a wound, because there is danger of convulsion by trying to reflore and set right the luxated part, we are forced for shumning thereof, to attend the wound only, and in the mean time to let alone the Luxation. Otherwise, in implicit Difeases, if there be nothing which may urge, or call us from the ordinary cure, we must observe this order, that beginning with that affect, which hinders the cure of the principal Disease, we profecute the reft in the fame and their proper order, untill all the Difeases being overcome, we shall restore the part affected to its integrity. Therefore let us take for an example, an Ulcer in the Lega a Varia, (or big-swollen Vein) and a Phlegmonous tumor round about it; and lastly, a body wholly plethorick and filled with ill humours; Order and Reason require this, that using the advice of some learned Phytician we prescribe a convenient diet, and by what means we may bring him to an equality by purging and blood-letting, and then we will scarifie in divers places the pare where it is most swollen, then presently apply Leeches, that so we may free it from the burden of the conjunct matter; then use Cauteries to help the corruption of the bone, and in the mean time change the circular figure of the ulcer into an oval, or triangular; then at the length we will undertake the cutting of the Varix, and cure the ulcer which remains according to Art, and so at the length cicarrize it. In all this whole time the Patientshall neither walk, nor stand, nor fit, but lie what we quietly, having his Leg orderly and decently rouled up. But if (as it often happens) the temper must do when of the hurt part be different from the temper of the whole body, the manner of curing must be fo tempered, that we increase the dols of hot or cold medicins, according to the ratable proportion of the Indications requiring this or that, therefore imagine the part ulcerated to be fuch, as the parts of the Indications requiring this or that, therefore in again, as the temper of that it is two degrees drier then the just temper; but the whole body to exceed the fame temper the whole boin one degree of humidity: Reason and Art will require, that the medicin applied to the ulcer be drier by one degree then that which the part would otherwise require if it were temperate.

An example of Indications Difeates.

the temper of the part is dif-

But on the contrary let us suppose thus; the whole body to be one degree more moist than the temper requires, and the ulcerated part to be one degree drier: truly in this case the Medicin that is ap—An artificial replied to the Ulcer by reason of the part it self, shall not be increased in driness, but wholly composed conjecture is any truly in the like of much force and tempered to the Indication of the Ulker, because the force of the moisture exceeding in the like

and tempered to the Indication of the Ulcer, because the force of the moisture exceeding in the like of much to degree, doth counterpoise the superfluous degree of drines. But it is more easie by an artificial confidence in Indication To these so many and various Indications, I think good to add two other; the one from similingten. We draw Indication from Similitude, in Discases which newly spring up and arise, as which thid, wherefore they shall be superfluous their contraries, as long as their Eisence is unknown and they seem to have an agreeing similitude of Symptoms and Accidents; our Ancestors did the same in curing the French-Pex, at the first beginning thereof, as long as they affimiliated the Cure to that of in curing the French-Pox, at the first beginning thereof, as long as they affimilated the Cure to that of the Leprofe, by reason of that affinity, which both the Diseases feem to have. But we follow crafty Indication of devices and subtle counsels, when the Effence of the Diseases we meet with, is wholly secret and hid, a subtle devices and subtle counsels. cither because it is altogether of a hidden and secret nature, and which cannot be unfolded by manifest qualities, or else resides in a subject which is not sufficiently known to us, nor of a Physical contemplation, as the Mind. For then, we being destitute of Indications taken from the nature of the thing, are connelled to turn contemplations and confidence and they say that templation, as the Mind. For then, we being defittute of Indications taken from the nature of the thing, are compelled to turn our cogitations to imposfures and crafty counsels; and, they say, this deformed than the Chimera so much mentioned and selfcome, which are often more monstrous and will not think much to recite two Examples. A certain man troubled with a Melancholick Disease, the Physicians omitted nothing, by which they might hope to take this mad opinion out of his mind. But when they had in vain tried all Medicines, at length they devised this crafty, but profitable device: nodding and drawn down by that weight, he might be admonished of his errour.

It is reported, another molested by the obscurity and darkness of the fame Disease, did verily bemonstrous opinion, until that binding up his eyes, they miscrably bruised and scratched his forehead.

monfirous opinion, until that binding up his eyes, they miferably bruifed and feratched his forehead with the bony roughness of the lower parts of an Oxes homs, that so he begun to believe by the painful drawing of the bloud that ran down his face, that those bloudy homs were foreibly plucked that the bony roughness of the lower parts of an Oxes homs, that so he begun to believe by the from him. from him. Ingenious Chirurgeons in imitation of these examples may in like cases do the like. For that case requires a man of a quick apprehension and advice, who may give manifest proof of his diligence and skill by medicinal stratagems, as who forthwith can politically devise stratagems of divergence.

But now coming to the end of this our tract of Indications, we must chiefly and principally ob- Indications to be done; other cosindications which indicative, which absolutely and of themselves command this Indicative. to be done; other co-indicative, which indicate the fame with the Indicative, and jointly flow it to Repagnant. to be done; other co-indicative, which indicate the fame with the Indicative, and jointly linew it to Repognant, be done, but in forme fort fecondarily and not primitively. Some are repugnant, which of them- Correpugnant, experiments of their own nature perfuade quite contrary to that the indicative primitively did perfuade againft the indicative, as the co-indicative confent to and maintain them. Let this ferve for an example of them all:

A Pletbers, or plenitude of humours, of its own nature, requires and indicates bloud-letting, the Spring time perfuades and co-indicates the fame; but to this counfel is quite opposite and repugnant

Wherefore these four must be diligently weighed and considered when we deliberate what is to be done, and we must rather follow that which the indicative or repugnant sheward declare, as what the Disaster and Branch of the Disaster against their third the reliable the conditioning or corresponding the Difeases and firength of the Patient require, than that which the coindicative or correpagnant the patient require, than that which the coindicative or correpagnant that perfusate, because they have a weaker and but secondary power of indicating, and not effential and primitive. But because the kinds of Indications are so many and diverse, therefore that the diffinguish them has this following Scheme.

fhould be of a quick appre-

A TABLE OF INDICATIONS.

For whose preservation, oftensimes the proper cure of the dilease must be neglected; for where these fail, it is impossible the Chirurgeon should perform what he desires and expects. From the (trength and faculties of the Patient, Of preservation of which the Chi-From the temperarargem must have care, and if they swerve from equality, to reduce them to that which ment; as if the Cholerick, Patientshall be Flegmatick, Melancholick, formerly they naturally were.

Erom the habit of the body, as the Patient shall be

Dainty and delicate.

Slender and weak.

Low of stature.

CHAP. XXIII.

Of certain wonderful and extravagant ways of enting Difesses.

A S Monsters happen sometimes in Nature, so also in Diseases, and in the events and cures of Monstroat Diseases. I understand by Monsters certain marvellous successes in Diseases, or certain ways of curing them, which swerve from Art, and happen besides Reason, Nature, and common use.

Alexander ab Alexandro and Peter Gilius** tell, that in Apulia a place in Italy, they have a certain The wonder-kind of Spider very frequent, the Natives call it Tarantula, Petrus R bedius calls it Phalangium. The Inhabitants find these Spiders in the first heat of Summer so venerate and deadly, that whomsoever they touch with their virulent biting, he presently, without he have speedy remedy, deprived of all sense and motion falls down; or certainly, if he cscape the danger of death, he leads the remainst of his life in madness. Experience hath sound a remedy by Musick for this so speed and deadly a Disease. Wherefore, as soon as they can, they fetch Fidlers and Pipers of divers kinds, who by playing and piping may make Musick; at the hearing whereof he which was fallen down by reason of the venemous bite, rises chearfully, and dances so long to their measures and tanes, until by the painful and continued shaking and agitation of the whole body, all the malignity is diffipated by transpiration and sweats.

Alexandor adds, That it happened once in his fight, that the Muficians, their wind and hands failing them, ceafed playing, and then the Dancer prefently fell down as if he had been dead; but by and by the Mufick beginning anew, he rose up again and continued his dancing till the perfect diffipation of the venom. And that it hath happened besides, that one not perfectly healed, certain reliques of the Disease yet remaining, when a long time after he heard by chance a noise of Musicians, he presently fell a leaping, and dancing, neither could be be made to leave before he was perfectly he presently fell a leaping and dancing, neither could he be made to leave before he was perfectly

Some affirm according to the opinion of Afelepiades, that fuch as are frantick are much helped Musick gives with a fweet and musical harmony. Theophrafius and Aulus Gellius fay, that the pain of the Gout cafe to pain, and Sciatica are taken away by Musick. And the facred Scripture tellines, that David was wont by the fweet found of the Harp to refresh and cafe King Saul when he was miferably tormented by his evil spirit. Herodotus in Clis tells, That Crassis the King of Lydis had a Son which of a long time could not speak, and when he came to many cliate was accounted doubt; but when an enemy with cvilfpirit. Herodotas in Clio tells, That Crafia the King of Lydia had a Son which of a long time could not fpeak, and when he came to mans cliate was accounted dumb: but when an enemy with his drawn Sword invaded his Father (overcome in a great fight, and the City being taken in which he was) not knowing that he was the King, the young man opened his mouth endeavouring to cry A firong person, and with that firriving and forcing of the spirit, he broke the bonds and hindrances of his tongue, tarbation of and spoke plainly and articulately, crying out to the Enemy that he should not kill King Crafia. So both the Enemy with-held his fword, and the King had his life, and his Son had his speech always after. Platareb in his Book, Of the Benefit to be received from our Enemies, tells, That a Thessalian called ries.

Process, had a certain invectoral and incurable Ulcer, in a certain part of his body, which could not be begun afresh, the Wound and Ulcer were both healed.

healed, before he received a wound in a conflict in the fame place, and by that means the cure being begun afresh, the Wound and Ulcer were both healed.

Quantum Fabium Maximum, as Liny writes, was long and very sick of a quartan Ague, neither could Chance sometime Fabium Maximum**, as Liny writes, was long and very sick of a quartan Ague, neither could Chance sometime with the Assertion of the Lord of Art, until skirmishing with the Assertion exceeds broger, he shaked off his old severish heat, by a new heat and ardent defined of fighting. It was credibly reported to me of late by a Gentleman of the Lord of Lanssed's Chamber, that there was a French on the Bank of the River Wexel, to take away the irksomness of his sit, was thrust in jest into the River by a friend of his that met him by chance, by which (although he could swim, as he also knew that thrust him in) he conceived so great fear, that the Quartan never troubled him after. King Henry the Second commanded me to go from the Camp at Amiens to the City Declan, that I might cure those

him in) he conceived so great fear, that the Quartan never troubled him after. King Homy the Second commanded me to go from the Camp at Amiess to the City Declay, that I might cure those that were hurt in the conflict with the Spaniards: the Captain S. Arbin, although at that time he had a fit of a Quartan Ague, yet would he be present at the fight, in which he being shot through the side of the neck with a Ballet, he was strucken with such a terrour of death, that the heat of the Fever was assumed by the cold fear, and he after lived free from his Ague.

Franciscus Valeriola the samous Physician of Arles tells, That John Berlam his stellow-Citizen trous object with a Palice of one side of his Body for many years, his house taking fire, and the shame coming he had, and presently recovering the strucken with a great fear, studdenly raised himself with all the sonce the house, and was presently cured of his Discase; Sense and Motion being restored to the part, so that afterward he went upright without any sense of pain, who lay unmovable for many years before. He tells the like in the same place of his Constin John Sobination; he was a long time lame at Avignon, by reason that the Nerves of his Hams were shrunk and drawn up, so that he could not go; fore. He tens the fixe in the fame place of his Coulan Jank Somana, he was a long time fame at Avignon, by reason that the Nerves of his Hams were shrunk and drawn up, so that he could not go a being moved with a vehement and sudden passion of anger against one of his Servants whom he endeavoured to beat, he so stirred his body, that forthwith the Nerves of his Hams being distended, deavoured to beat, he fortiffed his body, that torthwith the Nerves of his Hams being diffended, and his Knees made pliant, he began to go and fland upright without any fenfe of pain, when he had been crooked about the space of fix years before, and all his life time after he remained found.

Galen tells, he was once fetched to flanch the bleeding for one who had an Artery cut near his Captain, the defended and these he his means he was cured without any dames of an describe (i.e.).

Ancle, and that by his means he was cured without any danger of an Aneurifina (i.e.) a relaxation of cur, var. por a veinous veifel; and belides, by that accidental wound he was freed from a molt grievous pain of his fargular wiff. Sciatica happened according to reason, by the evacuation of the conjunct matter, by the Artery of the dream cures the Sciatica.

Ancle

Ancle of the same side being opened; yet because it was not cut for this purpose, but happened only by chance, I judged it was not much differenting from this argument.

Pliny writes that there was one named Phalerens, which cafting up bloud at his mouth, and at the length, medicines nothing availing, being weary of his life, went unarmed in the front of the Battel against the Enemy, and there receiving a wound in his Brest, shed a great quantity of bloud, which gave an end to his spitting of bloud; the wound being healed, and the vein which could not contain the bloud being condenfate.

At Paris, Anno 1572. in July, a certain Gentleman being of a modelt and courteous carriage, fell into a continual Fever, and by that means became Frantick, moved with the violence of which, he cast himself headlong out of a window two stories high, and fell first upon the shoulder of Valuera the Duke of Alexant Phylician, and then upon the pavement; with which fall he cruelly braifed his ribs and hip, but was reflored to his former judgment and reason. There were present with the Patient besides Valterra, witnesses of this accident, these Phylicians, Alexa, Magnin, Durelus, and Martin Difference of the particular of the p The fame happened in the like Difeafe, and by the like chance, to a certain Gafaya, lying at the house of Agripps in the Paved Street.

Othermanaus Doctor of Physick of Mempelier, and the King's Protesfor, told me that a certain Carpenter at Broquer a Village in Switzerland, being frantick, cast himself headlong out of an high window into a River, and being taken out of the Water was presently restored to his understanding.

dow into a River, and being taken out of the Water was prefently reliored to his understanding.

But if we may convert Casualties into Counsel and Art, I would not cast the Patients headlong out of a window, but would rather cast them suddenly, and thinking of no such thing, into a great Cistern filled with cold Water, with their heads foremost, neither would I take them out until they had drunk a good quantity of Water, that by that sudden fall and strong fear, the matter causing the Frenzy might be carried from above downwards, from the noble parts to the ignoble; the postbility of which is manifest by the fore-cited Examples, as also by the example of such as bit by a mad Dog, fearing the Water, are often ducked into it to cure them.

the last recited Cures.

CHAP. XXIV.

Of certain jugling and deceisful ways of Curing.

Ere I determine to treat of those Impostors, who taking upon them the person of a Chirurgeon, do by any means, either right or wrong, put themselves upon the works of the Art is but they principally boast themselves amongst the ignorant common fort, of setting bones which are out of joint and broken, affirming, as fally as impudently, that they have knowledge of those things from their Ancestors, as by a certain hereditary right; which is a most ridiculous section: for our minds when we are born, is as a smooth Table, upon which nothing is painted. Otherwise what need we take such labour and pains to acquire and exercise Sciences? God hath endued all brute Ecasts with an inbred knowledge of certain things necessary for to preserve their life, more than Man. not heredita-

But on the contrary, he hath enriched him with a Wit furnished with incredible celerity and judgment, by whose diligent and laborious fatigation, he subjects all things to his knowledge. For it is no more likely that any man should have skill in Chirurgery, because his Father was a Chirurgeon, than that one who never endured sweat, dust, nor Sun in the Field, should know how to ride and govern a great Horfe, and know how to carry away the credit in tilting, onely because he was got by a Gentleman, and one famous in the Art of War.

A most impudent fort of Impollors.

Three things necessary for the cure of a

Luxation.

Sciences are

There is another fort of Impostors, far more pernicious and less sufferable, boldly and infolently promifing to reflore to their proper unity and feat, bones which are broken and out of joint, by the onely marmaring of fome conceited charms, fo that they may but have the Patients name and his girdle. In which thing I cannot fufficiently admire the idleness of our Countreymen so easily crediting so great and pernicious an errour; not observing the inviolable Law of the ancient Physicians, and principally of Divine Hippocrates, by which it is determined, that three things are necessary to the setting of Bones differenced and out of joint; to draw the bones assunder, to hold the bone receiving simply immovable with a strong and steddy hand; to put the bone to be received into the cavity of the receiving. For which purpose the diligence of the Ancients hath invented so many Engines, Clossocomies and Bands, left that the hand should not be sufficient for that laborious Work. What therefore is the madness of such Impostors to undertake to do that by words which can scarce

What therefore is the madnets of tuch Imponors to undertake to do that by words which can learce be done by the firong hands of fo many Servants, and by many artificial Engins?

Of late years another kind of Impoliure hath fprung up in Germany: they beat into fine powder a flone which in their mother-tongue they call Bembrueb, and give it in drink to any who have a bone broken or diffocated, and affirm that it is fufficient to cure them. Through the fame Germany there wander other Impotors, who bid to bring to them the Weapon with which any is hurt; they lay it up in a forest place and free trees resife, and put and apply medicines to it, as if they had the lay it up in a fecret place and free from noife, and put and apply medicines to it, as if they had the Patient to drefs, and in the mean time they fuffer him to go about his bufinefs, and impudently affirm that the wound heals by little and little, by reason of the Medicin applied to the Weapon.

But it is not likely that a thing inanimate, which is desirate of all manner of sense, should feel the effect of any Medicin and less probable by much, that the incounded party should receive any healther.

effect of any Medicins and less probable by much, that the wounded party should receive any benche from thence. Neither if any should let me see the trust of such juggling by the events themselves and my own eyes, would I therefore believe that it was done Naturally, and by Reason, but rather by

In the last affault of the Castle of Hesdin, the Lord of Marigner the Elder, was shot through the

Breft with a Musket bullet. I had him in cure together with the Phylicians and Chirurgeons of the Emperour Charles V. and Emanuel Philibert the Duke of Sawy, who because he entirely loved the wounded Prifoner, caufed an Affembly of Physicians and Chirurgeons to confult of the best means for his cure. They were all of one opinion, that the wound was deadly and incurable, because it passed through the midft of his Lungs, and besides had cast forth a great quantity of knotted bloud into

the hollowness of his Breft.

There was found at that time a certain Spaniard, a notable Knave, and one of those Imposiors, who would pawn his life that he would make him found; wherefore this Honourable Personage being in this desperate case, was committed unto his care. First of all, he bid they should give him the Patients shirt, which he tore into shreds and pieces, which presently framing into a Croft, he laid upon the wounds, whispering some conceived or coined words, with a low marmar. For all cather things he wished the Patient to reflectment, and to use what diet he pleased. So the would do other things he wished the Patient to rest content, and to use what diet he pleased, for he would do that for him, which truly he did. For he eat nothing but a few Prunes, and drunk nothing but finall Beer, yet for all this the wounded Prince died within two days; the Spaniard slipt away, and fo scaped hanging. And whilest I opened the body in the sight of the Phylicians and Chirurgeens to embalm him, the signs and accidents of the wound did evidently and plainly appear to be as we had those heals extensional contents of the contents of the second did evidently and plainly appear to be as we had those heals extensional contents of the second did evidently and plainly appear to be as we had those heals extensional contents of the second did evidently and plainly appear to be as we had those heals extensional contents of the second did evidently and plainly appear to be as we had those heals extensional contents of the second did evidently and plainly appear to be as we had those heals extensional contents of the second did evidently and plainly appear to be as we had those heals extensional contents of the second did evidently and plainly appear to be as we had those heals extension the second did evidently and plainly appear to be as we had those heals extension the second did evidently and plainly appear to be as we had the second did evidently and plainly appear to be as we had those heals extension.

And there be also other jugling Companions of this Tribe, who promise to cure all wounds with What wounds Lint, or Tents, either dry or macerated in Oil or Water, and bound to the wound, having mammared may be cured over some charm or other, who have had sometimes cool success, as Lean witness. But the wounds overly by lint, constructions of tents, either dry or inaccrated in Oil or Water, and bound to the wounds, having maintained over force charm or other, who have had forcetimes good faceefs, as I can witness. But the wounds onely by it upon which trial was made were simple ones, which enely required union, or closing for to perfect and water. So verily the bones of Beatis when they believe, grow together by the enely benefit of ulcer, inflammation, contribute and fracture of a hone, you must hope for no other from Tents, or Lines, nor Charms, than death. Therefore the common fort, who commit themselves to these mon profit of the Citizens: for whose good and Judice sale a product Maniferty country to derrive

Impostors to be cured, do not only injure themselves, but also hurt the Common-wealth, and the common profit of the Citizens; for whose good and Justice sake a pradent Magistrate ought to deprive Impostors of all freedom in a free and Christian Commonweal.

Witches, Conjurers, Diviners, Soothsayers, Magicians, and such like, boast of curing many Discases; but if they do or perform any thing in this kind, they do it all by sleights, subtilities, and for-saiden Arts, as Charms, Conjurations, Witcheries, Characters, Knots, Magical Ligatures, Rings, Images, Poyssons, Laces tied across, and other damnable tricks, with which they pollute, pervert, and defame the prime and sacred Art of Physick, and that with the danger of mens lives. Who certainly are to be banished by the Laws of our Countrey, especially seeing it is decreed in Mose Law, Fowls, or a Sorcèrer, or a Charmer, or that consulteth with Spirits, or a marker of the slying of past-18.

Fowls, or a Sorcèrer, or a Charmer, or that consulteth with Spirits, or a Soothsayer, or that these abominations the Lord thy God doth cast them out before thee. But the miracles of our Lord all Art, are a Soothsayer, and of his Saints and Apostles in curing, Diseases beyond Nature and Jefus Chrift the Son of God, and of his Saints and Apolities in curing. Difeases beyond Nature and all Art, are of another kind, which we ought to believe so firmly and constantly, that it should be sight to the blind, hearing to the deas, power to go to those sick of the Palsie, to drive forth Devils, Ghost other Miracles which exceed the condition and Law of Nature; whom here we carnestly interest to free and protect us from unclean Devils, and the Spirits of Diabolical deceit, and to give treat to free and protect us from unclean Devils, and the Spirits of Diabolical deceit, and to give us the mind that we may will and be able always to afpire to Heaven, and faften the hope, fafety, and

The End of the First Book.

BOOK

BOOK II.

Of Living Creatures, and of the Excellency of Man.

of brute Beafts

Some fludow Beath.

Efore I come to speak of the Anatomy of Mans Body, I have thought fit to fay a little of the Nature of brute Beafts. There is between Beafts a great deal of difference by Nature; for of these some are hardy and bold, others fearful; some wild and savage, others tame; some walking in herds, others wandring alone; some covered and defended with shels and scales; as the Crocodile, the Tortois, and many kinds of Fifh; others have flings and prickles.

The Horse hath his hard and strong hooss, his Crest (as being a generous Beast) before with a thick and harsh Mane. The defence of the magnanimous Lion are his Teeth, his crooked Paws and Tail. Bulls are formidable by their Horns. The Boar by his Tusks standing out, as it were natural Hunt-The Hare being a timorous Creature, is naked and unarmed; but in recompence thereof Nature hath made her nimble and fwift of foot. For what the more noble and couragious Bealts have in Arms, is supplied in the scarful by nimbleness and celerity. Infinite are the other endowhave in Arms, is supplied in the fearful by nimbleness and celerity. Infinite are the other endowments of brute Bealts, and such as can hardly be imagined or described. For, if we diligently search into their Nature, we shall observe the impressions and shadows of many Vertues, as of Magnanimity, Prudence, Fortitude, Clemency, and Doeility: for they entirely love one another, tollow those things that are good, shun those that are hurtful, and gather and lay up in store those things that are necessary for Life and Food. Lassly, They give undoubted presages of the Weather and Air. They have taught men many things, and are of a most exquisit and quick sense; of rare Art in Vocal Musick, prudent and careful for their young, and faithful Lovers of their Native Soil. They are religiously observant of the Rights of Friendship and Chastity. They have their Weather and the proposed they are prepared both to invade and to desend themselves being invaded. They pons whereby they are prepared both to invade and to defend themselves being invaded. They submit themselves to the Discipline of Man, practise and imitate his Speech, and mutually prattle and chant one to another. They have a kind of Weal-publick amongst themselves, and know how to preferve their prefent welfare, and to depel the contrary, being in this their own Counfellors, and nortutored by Man. Yea, Man is beholden to them for the knowledge of many wholfom things. The confideration of which bred fo great a doubt amongst the ancient Philosophers, that it was a question amongst them, Whether Beasts had use of Reason, or no? Therefore also the wise Solomon sends us for examples of partitiony and diligence unto the Ant or Pismire; and Esais in exprobration of the People of Israel for their ingratitude and rebellion against God, sends them to the Ox and Afs; for they do not onely know, but reverence their Mafters.

But from whence is the knowledge of these Medicins wherewith the Art of Physick is so richly Lib.8. Cop. 27. adorned, but from brute Beafts? as Pliny affirmeth. The infallible vertue of the Herb Dillamans, adorned, but from brute Beauts? as Piny annuell. The billiance vertice of the Pielamans, indrawing Darts out of the flesh, was taught us by the Hart, who wounded with the Huntsman's Darts or Arrows, by means hereof draws out the Weapons which remain sticking in her. Which is likewise practised by the Goats of Candy, as Aristotle writeth. The wonderful effect which Celandine hath upon the fight, was learnt by the practice of Swallows, who have been observed with it to have befine ared, and fo firengthened the eyes of their young. Scrpents rub their eye-lids with Fennel, and are thought by that means to quicken and reftore the decaying fight of their eyes. The Tortois doth defend and firengthen her felf againfit the biting of Vipers, by eating of Savory. Bears, by eating of Pifmires, expel that Poifon that they have contracted by their use of Mandrakes.

The craftiness And for correction of that drowfiness and floth which grows upon them by their long fleep in their of Bears.

Dens, they eat the herb of Arm (i.) Cuckopint. But the Art they use in the inticing and catching of Pismires is very pretty: they go softly to the holes or hills of the Pismires, and there lay themselves all their length upon the ground, as if they were dead, hanging out their Tongue wer with their foam, which they draw not again into their mouth before they feel them full of Pifmires, which are entited by the fweetness of the foam: And having taken this as a purging Medicine, they expel by the guts those ill humors wherewith they were offended. We see that Dogs give them-felves a Vomit by eating a kind of Grass, which is from thence called Dog grass. Swine, when they find themselves sick, will hunt after Smalt, or River-Lobsters. Stockdoves, Blackbirds, and The Bird themfelves of grofs humours by taking of Pellitory of the Wall. The Bird like the Stork) taught us the use of Clysters. For when he finds himself oppressed with a burden of hurrful humours, he fills his Bill with Salt Water, and fo purgeth himfelf by that part by which the Belly is best discharged. The invention of the way of removing the Cataract of the eye we must Clyffers. The invention yield into the Goat, who by firiking by chance against the thomy bushes, pulls off the Cataract of removing a which hinders the fight, and covers the ball of the eye, and so recovers his fight. The benefit of Phlebotomy we owe unto the Hippopatamus or River-horse, being a kind of Horse, and the Inhabitant of the River Nilus; who being a great devourer, when he finds himself furcharged with a great deal of blood, doth by rubbing his thigh against the sharp Sands on the Bank side, open a Vein, whereby the superfluous blood is discharged, which he stoppeth likewise when it is fit, by rowling himself in the thick mud. The Tortois having chanced to cat any of the slesh of a Serpent, doth make Orion. A prefervative dreadful and non-sparing force of Lightning; for they were of opinion that the Wings of an Eagle were never struck with Lightning, and therefore they put about their heads little wreaths of these der.

Clyfters.

k il

C- US h Feathers. They were perfuaded the fame thing of the Seal, or Sea-Calf, and therefore were wont to encompass their bodies with his Skin, as a most certain sateguard against Lightning. It were a thing too long and laborious to speak of all those other maniments of life and health (observed here and there by Ariffolle and Pliny) which we have learnt of brute Beafis. I will therefore end this Chapter, after that I have furth added this. That we are beholden to Beafis not onely for the skill of curing Difeases, and of preservation of Health, but for our Food, our Rayment, and the Ornament and Beautifying of our Bodies.

Of the Faculty of brute Beafts in Prefaging. The first knowledge and skill of Prognottication, and observation of Weather by the Air, was first delivered unto us from Bealts of the Land and Water, and 6. first delivered unto us from Beasts of the Land and Water, and from Fowl. For we fee in What the back caily observation, that it is a fign of change of Weather when Lambs and Rams do but at one another with their Horns, and playing wantonly do kick, and keep up their heels. The fame is thought to be prefaged when the Ox licks himfelf against the hair, and on the sudden fills the Air with his lowing, and smells to the ground, and when he feeds more greedily than he used to do. But if the Pilinires in great multitudes fetch their prey to haltily, that they run and tumble one upon another in their narrow paths, it is thought a fign of rain; As is also the busic working of Moles, and the Cats rubbing and firoking of her head and neck, and above her ears with the bottom of her feet.

Also when Fishes play and leap a little above the Water, it is taken for a fign of rain. But if the The fign at tempest. Whereby the Mariners fore-warned, use all care possible for the satety of themselves and at hand, their Ships, and, if they can, cast Anchor. And it is sufficiently known what the loader croaking of Froes than ordinary portends. of Frogs than ordinary portends.

But the faculty of Birds in this kind of prefaging, is wonderful. If Cranes flie through the Air without noife, it is a fign of fair Weather; and of the contrary if they make a great noife and fly ftraglingly. As also it Sea-Fowl fly far from the Sea, and light on the Land. The cry or scrieching of Owls portends a change of the present Weather, whether foul or fair. Platarch faith, that the loud cawing of the Crow betokens Winds and Showrs, as also when he staps his tide with his Geefe and Ducks, when they dive much, and order, and prune, and pick their Feathers wings. Geele and Ducks, when they dive much, and order, and prine, and pick their realises with their Beaks, and cry to one another, fore-tell rains, and in like manner Swallows, when they fly follow about the Water that they wer themselves and their wings. And the Wren, when he is observed to sing more sweetly than usual, and to hop up and down. And the Cock when he chants, or rather crows presently after the setting of the Sun. And Grats and Fleas, when they bite more then ordinary. If the Heron soar aloft into the Air, it betokeneth fair Weathers after the contrary he fly close by the Water, rain. If Pigeons come late home to the Dove-house, it is a sign of rain. If Bats fly in the Evenine, they fore-show wer. Weather, And lastly the Crocodile lays fign of rain. If Bats fly in the Evening, they fore-flew wet Weather. And laftly the Crocodile lays The Crocoher Eggs in that place which must be the bounds of the overflowing of the River Nilses; and there-her eggs flew fore he that first meets with these Eggs, tells the rest of the Countrey People, and show high the bounds of the show high the bounds of the show high the bounds of admiration, that in this Monster there should be that strong faculty of presaging.

Any Sea-fifthes, when they feel a temperate coming, do gravel or balast themselves, to the end How Fifthes they may not be toffed up and down at the pleasure of the waves. Others, when the fury provide for the pleasure of the waves. of the Sea is at the height, hide themselves in the holes of Rocks. But in that they fwim against the fiream, they do it for this cause and reason, that the force of the stream and the flood may not stake from them, and strike off their scales and that their oils. take from them, and firike off their feales, and that their gills may not fill with water which would flow they thinder their fwimming, and intercept their respiration. As by the same advice Granes fly against swim against the Wind where their respiration. the Wind; whereas if they should fly down the Wind their Feathers would be displaced and broken, the stream,

The indufiry of Birds in the building of their Nofts.

The indufiry of Birds in the building of their Nofts is fuch, that it doth far exceed the Art and Of what Skill of all Masons and Architects, from whence it is become a Proverb, That men know, build their kind of soft things but make Birds Nofts. They are built within with Wool and Feathers, and such a round fort, things, which are as a kind of a Pallet for the young ones. Swallows build their Nofts in the what shape firske against them, and likewise more capacious. They chuse their matter out of Dirt and Chaff, (infirike against them, and likewise more capacious. They chuse their matter out of Dirt and Chaff, (interlacing it with many Straws) as it were, their Plaster or Lime. Those that build in Treesdo make choice of the foundest Boughs, as if they meant to have them as a fire foundation for the building which they should creek thereon. The Cock and the Hen do by turns sit over their Eggs, and like-wise steek their meat, interchanging each others labour; neither do they ever forsake their youngs wife fetch their meat, interchanging each others labour; neither do they ever loriage their young, before they are able to get their own living. I had at my house a great number of Sparrows Netts in earthen Pots; and when the young ones begun to wax pretty big, and to be covered with Feamight delight our felves in beholding the care of the old ones in the feeding of their young; for they feed them every one in order, skipping none, neither will they (to the wrong of the relt) give one two parts, although he gape, and be importunate for it; dividing most justly to every one his own share, according to the exact rule of distribution. And oftentimes for experiment. I would one two parts, although ne gape, and be importante for it; dividing most justly to every one his own share, according to the exact rule of distribution. And oftentimes for experiment, I would make trial with a frange Sparrow of the fame age, laid near, or put among the reft of the young ones, whether the old ones would feed the firanger, as if it were legitimate. But this as a firanger and a Baltard they would fuffer to flarve, skipping it when it gaped after the meat. And in like man-ner Lambs and young Kids do in the Fields, in the midit of a great Flock, run every one to his own Dam ; who being most certainly able to distinguish between the Legitimate and a Bastard, will not fuffer her felt to be fuckt, but by her own young.

How the Spidert weave.

Of the Industry of Spiders. The Spider spins her Web with wonderful Artifice, hanging and fastening it to every tack, or star that is night, drawing of his thread, and running upwards and downwards, and every way. And although the diligence of the Chamber-maid beats down and mars this pendulous and new-begun work, yet her feat and her hold the Spider keeps fill; neither doth fhe, nor will she defift from the work the hath begun, but in a very thort time weaves a great deal more unto the ruines of her former work, than can be unweaved again with much labour. So that from hence all Cloth and Linner Weavers, all Embroiderers and workers with the Needle (you will eafily think) have learnt their Arts. if either you observe the exactness of the weaving, the fineness of the thread, or the continuation and indisfoluble knitting together of the whole Web; for, being abrupt, and troubled with no ends of threads at all, it resembles a thin membrane, anointed with a kind of glew, whereby when the prey is entangled, the Spider runs prefently in, and as it were draws her nets and infolds, and takes the captive after the manner of Huntímen. If this were not daily feen with our eyes, it would be thought fabulous

How they catch their prey.

Bees chile themselves a King.

Of Bees. I Cannot pass in filence the great industry of Bees: For having established a kind of Weal-publick, they make election of a King, who is such a one, as in procedity of body, and excellency of scature exceedeth all the reft. He is remarkable by his short wings, his streight legs, his grave gate; and in flead of a Diadem or Regal Crown, either he hath no fling, or elfe doth not use it, which is the Artillery of the reft. He never goeth unattended out of the Hive, but alway, environed with a Princely Retinue, the rest of his Train following after, neither goes he at any time abroad, but upon urgent affairs which concerns the whole State. His progress is fore-warned by the voice and found of Trumpets, and as it were with finging, and they all drawnigh. Every one gets as near to his person as he

Their pitch—On what place foever he alighteth, there they forthwith pitch their Tents. If he chance to die, ing their tents, they go not abroad to feed, but fland all mourning round about the corpfe; then carry him out of the Hive, and (as it were follow his Hearfe and bury him: and laftly, having with following perquies for their formed all the feveral rites and obsequies, they chuse themselves another King, for without a King they cannot live. He then taketh care of all things, having his eye every where, whileft that the reft intend the performance of the work. And fupervising all, giveth them encouragement, and chastifeth negligence. For their time of going forth for food, they chaste a clear and fair day, their justice, for they have a natural faculty of prefaging of the Weather. They are such observers of Justice and equity, that never, either with their sting, or by any other way, do they molest any Creature, neither do they exercife and prepare their Spears against any, but for the safeguard of themselves and their

Their watch.

Their divers imployments.

Of the Care of Bees. Hey manage and order their affairs in this manner; in the day-time they appoint before their Gates a Station of Watchmen and Guarders. In the night they reft from their labours, fo long, till that one (who is appointed to this charge) by one or two hums, as by the found of a Trumpet, rouzeth all the reft. Then come they together to observe what is the state of the Weather, which if they foresee will be fair, then abroad go they into the Fields and Pastures. Some therefore bring into the Hive little fascicles of Flowers on their thighs; others water in their mouth, and others a dewy moifture gathered on their bodies. These are met by others, who receive their burdens, which they dispote in their due and proper places. Those that are sent out into the Fields for food, are the youngest and the smallest: and therefore if the wind chance to rise any thing high, they expect the solutions which the solutions without the solutions which they dispose and the solutions which they describe any thing high, they expect the solutions which the solutions which they describe any thing high, they expect the solutions which they describe any thing high, they expect the solutions which they describe the solutions which they descri pect until it cease, and that the force and violence thereof be over. But if it continue violent, then do they ballast themselves with a little stone, slying close by the ground to prevent their being driven to and fro by the wind. They are exceeding diligent in all their business, and do punish the sloth of the Lazy oftentimes with death. Some of them are the Builders, others polish the Building, and the

The building in their arched Hives is with wonderful artifice, being made with two doors, one to come in, and the other to go out at. They have all things alike, left that the inequality, either of their food or labour, should give occasion of diffension. Their care is, that their bouses may show both state and handsomness. Idle Drones, born for nothing but to eat, and consume the fruits of their labours, they chase from their Hives. Those that chance to lose their stings are utterly disabled, and in a short time their guts come out that way, and they die. They bring to the Owners wonderful increase of Wax and Honey.

Ariflomachus a diligent obser-ver of Bees.

They punish Sloth with ba-

Aristomachus the Philosopher doth boast, that for fifty eight years together, he had with great care been a nourisher of Bees, onely that he might better attain to the knowledge of their state and Of Pismires and Ants.

Either truly is the indufiry, diligence, and experience of the Pifmire lefs worthy of admiration than that of the Bees. Infomuch as that Solomon bids the fluggard to take an example of diligence from the Pifmire. Truly, if experience did not witness it, it would feem incredible, that formall a Creature should be able to store up such abundance of Corn, to dispose and manage her office in that they have such a feet by the control of the store of t affairs in that good order that we see she doth. Play faith, that they have among them the form they said upon a grain they have a mind to carry away, how they set to it, and lift it with head wonderful and shoulders. And how, lest the Corn which they carry to their Store-house, should put forth and grow, they him it at one end. If it has so that they cannot carry it into their best had and so well-grow, they him it at one end. If it has so that they cannot carry it into their best had a and grow, they bite it at one end. If it be fo big that they cannot carry it into their little hole; they divide it in the middle. If it be dampifh, they lay it out to dry in the Sun and open Air. When the Moon is at the full they follow their work in the night; when the doth not thine, they take their rest, whereby they them themselves to have some knowledge of heavenly things. Pliny at-

fameth that they have their fet Fairs and Markets, whither they come in great companies, and where they use to establish Leagues of Amity and Friendship one with another. And when one marks them well, would be not think that they were in conference one with another, and that they did discourse among themselves of their business? Do we not see that the often trampling of their little feet delt was a set of the companies. feet doth wear a path even upon hard flint flones

From whence we may note, what in all kind of things is the affect of the affiduiry. They fay also There is nother they perform the rites of burial one unto another, after the manner of men. What words thall I be arrained by use (faith Plutarch) to express sufficiently the diligence and industry of the Pismires? There is dispense. not among all the great things in Nature, a fight of greater wonder than these: For in the Pifmires are seen the marks of all Vertues. Their great meetings argue that they maintain a kind of

Their alacrity in the undergoing of their labours, feem to flew their fortitude and magnanimiately; and laftly, they are eminent examples of Temperance, Providence, and Juffice. Their matual all vertex expressions are the properties of the properties of the properties of their narrow paths) that is, he will give him the way, that he may the better go on in his intended journey. They say, that the first entrance into their hole is not streight, but full of many diverticles and crooked paths, which in the end will bring you to three little Cells; in one of which they have their conventicles, in the other they lay up their Provisions; and in the third they bury the cathafter of Conventicles, in the other they lay up their Provisions; and in the third they bury the carkaffes of their dead. This doth *Planarch* speak concerning Pismires.

Ith the Industry of these Creatures I shall not unfitly join that of the Silk-Worm, of whose pains and care, both in the making of their Neits, and the spinning of their thred and bottoms (wherewith Kings are fo magnificently adorned) Philosophers have written very strange

And who can chuse but wonder at those great endowments of Skill and Knowledge, and that Diligenee the exceeding industry (the Mother of formuch Wealth) in the little Body of so small a Creature? The Mother of Wealth, providence therefore of God doth not onely appear in this, that he hath adorned each Creature with a peculiar and proper endowment, but in this especially, that on the least Creatures of all, he hath belowed the appear in this capacity, that on the least Creatures of all, he hath bellowed the greater portion of Skill, Industry, and Ingenuity, to supply their defect of bodily

Of the love of Beatls one towards another, and to their Toung.

PLutareb writeth, That all kind of Creatures bear a fingular love, and have a kind of care of those of Partridges that are generated of them, and the industry of Partridges this way is much commended; for in preferring during the time that their volume constant weak and makes to the theory to be upon their took Vegen. that are generated of them, and the industry of Partridges this way is much commended, not in preferving during the time that their young ones are weak and unable to fly, they teach them to lie upon their their Young backs, and to hide themselves among the clods on the ground, that so being almost of the same colour, they may not be discerned by the Falconer. But it notwithstanding they see any body coming, and that he is near them, they do with a hundred dodges and stoopings of themselves, as if they were weary with slying, entice him away from their young to follow after them, and when they have were weary with flying, entice him away from their young to follow after them, and when they have their purpose, they then, as if they had recovered fome fresh strength, sly quite away: Who can but In Florida, they of the West Internal State of the West Internal S

In Florida, part of the West-Indies, they have a Beast, which for the variety and deformity of it I cannot pass over in silence; the Natives call it Successib, the Cannibals Su. It keeps for the most about the River and the Natives call it Successib, the Cannibals Su. cannot pais over in filence; the Natives call it Successath, the Cannibals Su. It keeps for the most part about the Rivers, and the Sea-shore, and lives by prey. When he perceiveth that he is pursued by the Huntsman, he gets his young ones upon his Back, and with his Tail, which is very long and broad, he covereth them, and so slying, provideth both for his own and their fasety; neither can ha is to run, into which at unawares he tumbles headlong.

This Picture of him here, I drew out of Theress Colinography.

How Hares provide for themselves and their Young, for fear of Hunters. Neither are those things less wonderful that are reported of Hares, for when they would go to their seat, they sever their young, and commit them to the trust of divers places, it may be two acres assunder one from another, lest peradventure a Huntsman, a Dog, or any Man should chance to come that way, and they might be in danger to be lost at once. And then after they have traced up and down, hither and thither, and every way, that the Dogs may not trace them, nor the Huntsman prick them, they take a leap or two, and leap into their forms.

Nor inferior to this is the craft of the Hedg-hog; for when the Fox purfueth him, and is now at his heels, he rowls himfelf up in his prickles like a Chefnut in the outward shell, so that every part being rounded and encompassed with these sharp and dangerous pricks, he cannot be hurr; and so saves

himself by this trick. For his young he provides in this manner:

The care of In the time of Vintage he goes to the Vines, and with his feet he firikes off the Boughs and the fledg-hog Grapes, and then rowling his body makes them flick upon his prickles, and fo doth (as it were) take to provide for his burden upon his back, and then returns to his hole; you would think that the Grapes did move her Young.

of themselves; the prey he divides between himself and his young.

The Picty of

Of the affection of Birds, and of Dogs towards their Masters.

The young Stork provides for the old, which is disabled by age; and if any one of their equals come to any mischance that he is not able to flie, they will give him their affistance, and bear him on their backs and wings. And therefore this affection and piety towards the old one, and (as it were) brotherly love towards their equals, is commended in the Stork.

The Hen in any kind of danger gathers her Chickens under her wings, and (as it were) with that guard, defends them as well as the can. For their fake the expoteth her felf to the cruelty of the fiercest Beasts; and will slie in the eyes of a Dog, a Wolf, or a Bear, that by chance offers to meddle

with her Chickens.

The fidelity of Dogs.

But who is there that doth not admire the fidelity and love of Dogs towards their Mafters, whereby they recompence them for their keeping? A Dog will never fortake his Mafter, no, if he be newer fo hardly used. For there is no man can find a flick hard enough to drive that Dog clean away from him which hath once taken a love to him. There is no kind of Greature that doth more certainly and readily remember his Mafter; he will know the voice of all the houshold, and of those which frequent the house. There cannot be a trustier Keeper (as Gieero himself faith) than a Dog is; I speak not of their faculty of smelling, whereby they follow their Masters by the foot, and find them; neither do I speak of those infinite examples of the fidelity of Dogs, which were too long to rehearse.

Doves free from adultery.

Turties never

Pigeons, as well the Cock as the Hen, although they are all very venereous, yet they know no adultery; yea, and the Hen will be ar with the frowardness of the Cock, neither will the ever leave him, but reconciling him unto her by her officious diligence, bring him to his wonted dalliance and kiffes; neither is the love of either of them less towards their Young.

There is the like mutual bond of love between Turtles; for if one of them die, the furviver never folicits Hymen more, neither will be ever chufe other feat than a dry withered Bough.

Sec. 7

Def the Lamprey.

Lift that the heat of affection may feem to lie quenched under the Waters, let us by one example, (it were an infinite thing to speak of all) see in what kind of mutual love the Creatures of the Water come short of those of the Land. The Lamprey of all the Creatures of this kind doth worthily bear the praise for its piety towards those of whom it was generated, its affection towards those that are generated of her; for first she breeds Eggs within her, which in a short time after are spawned. But she doth not as soon as her young ones are formed and procreated, bring them straight-way forth into the light after the manner of other Fishes that bring torth their Young alive, but nourishest two within her, as if she brought forth twice, and had a second brood. These she doth not put forth before they are of some bigness, then she teacheth them to swim and to play in the Water, but suffers them not to go far from her; and anon gapes and receives them by her mouth into her bowels again, suffering them to inhabit there, and to feed in her belly so long as she thinks sit.

Cofmograph. Tom.2. Wh.19. cap-7The Savage or Brute Beafts may be made tame.

There reporteth, that the Emperour of the Turks hath at Caire (it was once called Mamphis) and at Contaminable, many favage Beafts kept for his delight, as Lions, Tigers, Leopards, Antilopes, Camels, Elephants, Porcupines, and many other of this kind. These they use to lead about the City to flew. The Masters of them are girt with a Girdle hung about with little Bells, that by the noise of these Bells the people may be fore-warned to keep themselves from being hart by these Beafts. But in hope of reward, and of gifts, they shew them to Ambastadors of strange Nations, before whom they make these Beafts do a thousand very delightful tricks, and in the interim they play their Countrey Tunes and Musick upon their Pipes and other Instruments, and make many sports in hope of gain.

Dut it is far more wonderful that the Creatures of the Water thould be made tame, and be taught by the Art of Man. Among which the chiefest are held to be the Eel. The same things also are reported of the Lamprey. For, we have it recorded, that Marin Crassian had a Lamprey in his Fish-pool that was so tame and so well taught, that he could command her at his pleasure. Therefore as a domestical and tame Beast he gave her a mane, by which, when he called her, the would come. And when this Lamprey died, he mourned for her in black, as if the had been his daughter. Which when his Colleague Cnear Domitius objected to him by way of reproach, he replying told him, That he had buried three Wives, and had mourned for none of all them three.

Of the strongth, piety, decility, elemency, chastity, and gratitude of Elephants.

A Mong the Beasts of the Field, there is none more vast, more strong, or more to be feared than the Elephant. His strength is sufficiently thewn by those towered Gastles of armed men which he catries, and servely rushesh with into the Battail. The Roman Souldiers, being otherwise of undanated spirits, yet in that battail which they fought against Pyrrbue, being terrihed with the visit-

nefs and immanity of these Bodies, which they had never before seen, presently turned their backs and sted; which notwithstanding, it is a wonderful thing what Stories Natural Philosophers tell of the Vertues of the Elephant.

40 Lib.8.cap.1.

The Religion of the Elephant. Plindib.8. c.5.

Pliny writeth, that an Elephant cometh very near to the understanding that Men have, and that he hath a rude kind of knowledge of Language; that his facility and obsequiousness is wonderful; that his memory in the performance of his wonted duties, is no lefs wonderful. And for Religion (Plutarch faith) that they pray unto the Gods, and sprinkle and purge themselves with falt water; and that with great reverence they worship the Sun at his rifing, lifting their trunks up towards Heaven for want of hands. Pliny addeth, that they do with the like reverence worship the Moon and the Stars. For it is related in the Hiftory of the Arabiant, that at a New Moon the Ele-phants go by Troops down unto the Rivers, and there wash themselves with water; and being thus purged, kneel down and worthip the Moon, and then return to the Woods; the eldeft going first, and the other following after according to their age. Plut areb reporteth, that it hapned once, that among the Elephants which were taught at Rome, against the Panegyrick Shows, there was one that was formething dull, and not so docile as the rest, which made him be despised by his sellows, and often beaten by his Master: But that this Elephant, that he might supply by diligence what he wanted in wit, was often-times observed in the night, by the light of the Moon, to be practiting and coming what he learnt of his Master in the day time. For they were wont to be taught to make Letters, and also to present Garlands to the Spectators, and other such like tricks. But they can never be brought to go aboard a Ship, to be carried over the Sea into any strange Land, unless their Master give them his word to affure them that they shall return again to their own native foil. They never hart any one that doth not first provoke them. They never gender but in private, out of fight; an argument of their modelty.

The providence of the Lion in his going.

Of the Lion, the Ichneumon, and those other Beasts which are not easily terrified. The Lion when he goes, hath his claws always clutched, and (as it were) put up in their flieaths, not onely because he would leave no mark in his feet, whereby he may be traced and so taken, but because by continual walking he should wear off, and blunt the points of his Claws. Bulls when they fight, charge one another with their horns, and like valiant Souldiers provoke and animate one another to the Battail.

The greatest are terrified by the leaft.

The Ichneumon feems to imitate the most valiant Souldier in his preparation and access to battail; for he bedawbs himfelf with mud, and doth (as it were) buckle and make tite his Armour, espe cially when he is to encounter with the Crocodile; who although he be a vaft Beaft, is put to flight by this little Creature. And this truly hath been observed to be by the singular Providence of Nature, that the most vast Creatures are terrified by the least things, and such from whence there can arise no danger; so they say, the Elephant doth startle at the grunting of a Hog, and the Lion at the crowing of a Cock; although it be reported of the Lion, that no fear can make him turn his face. These kind of sears, terrors, and afrightments, arising upon light and most ridiculous occasions, we find as well in the ancient as modern Histories of our Times, to have dispersed and put to slight mighty Legions of Souldiers, and most potent Armies.

Cocks are

Ocks are Kingly Birds, and therefore Nature hath adorned them with a Comb, as with a Princely Diadem; and wherefoever they come, their magnanimity and courage makes them Kingly and Princely Diadem; and wheretoever they come, their martial voice they fright the neartial Eleds. Kings. They fight with their Beaks and their Spurs, and with their martial voice they fright the state of Beafts.

Conies have dermining.

Of Conies. Onies have taught us the Art of undermining the Earth, whereby the most losty Cities and Structures reaching to the very Skies, are by taking away their foundation levelled with the ground.

Marene Varro writes, that in Spain there was a Town, and that no mean one, which flanding on a fandy ground, was so undermined by a company of Conies, that all the Houses tumbling and falling down to the ground, the Inhabitants were fain to depart and feek new dwellings.

Of Wolves. The deceirs MEn have learnt the Arts of waging war now the appointed, and then one of them runs and ambufues Men and lie in ambufu near the Towns which they have appointed, and then one of them runs and ambufues the Dogs. And making, as if he run away, incites the Dogs to fol-En have learnt the Arts of waging War from the Wolves, for they come out by Troops, unto the Town and provokes the Dogs. And making, as if he run away, incites the Dogs to fol-low him, until he hath gotten them unto the place where their ambush lieth, which on a sudden appeareth and rusheth out upon them. And so they kill and eat all, or as many of the Dogs as they are able to catch.

The craft of the Fox,

Of the Fox. N fubtiley and craft the Fox exceedeth all other Beafis: When in the chafe the Dogs are at his heels, he berays and bepiffes his tail, and fwings it in the face and eyes of the Dogs that follow him, and so blinding them, in the mean time gets ground of them. To setch the Hens down from their Perch, be hath this device; he shakes and Iwings his tail upwards and downwards, as if he meant to throw it at them; which they searing tumble down, and he takes up one of them for his prey. His wariness when he passes over a River that is frozen, is wonderful; for he goes fortly to the bank, and lays his cast to liften if he can heavele poile of the Water running underlying. the bank, and lays his ear to liften if he can hear the noise of the Water running under the Ice: For, if he can, back he goes, and will not venture to passover. The knowledge of which thing he could never meetly by his subtility and craft artain unto, but that of necessity he must have forme faculty of reaforning joined with it; which by diffcourfe, and by proving one thing by another, arrives at this conclusion: Whatfoever is liquid and maketh a norfe, is in motion; whatfoever

The Fox fon with himI.

d aboth p.p. and gas a

liquid is in motion, is not concrete and frozen; that which is not concrete and frozen, is liquid; whatfoever is liquid, will not bear a heavier body; whatfoever will not bear a heavier body, cannot with fafety be adventured on; and therefore back again must Fgo, and not pass over this River.

That men are taught by Beafir to polith and to whet their meapour, and to lie in ambulb.

Soldiers are careful to keep their Weapons from ruft, and therefore they carry them to the Amourers to be polithed. But in this care, many Beafis are nothing inferiour unto them; for Boars whet their tusks against they fight. And the Elephant knowing that one of his teeth is doubled with digging at the roots of Trees to get meat, keepeth the other sharp, and touches nothing with it, preserving it for his combat with the RHINOCEROT his Enemy. But the craft of

The craft of rot about to fight with the Elephant.

the Rhinocerot is very remarkable, that being in continual comity with the Elephant, at the time when he prepares for the battel, he whets his horn against a Rock, as it were with a Whetstone; nor (if he can chuse) will he strike any other part of the Elephant but the belly, because he knows that part of the Elephant is so tender, that it may be easily pierced. This Beast is in length equal to the Elephant, but in height he is inferiour unto him, by reason of the shortness of his feet; he is of a palish yellow colour, and full of many spots.

Of Swine. S Wine, if, in the Woods, they hear any one of the fame Herd with them crying out, they first make a ftand; and marshalling their Forces, haste all, as if they had been warned by the found of a martial Trumpet, to the affidiance of their fellows.

The love of Fishes one to another.

Of the Fifther Scarus and Anthia. D Lutarch reports of the Sears, that when one of them chances to fwallow a hook, and be taken, the rest of the same kind come to his rescue, and shearing the line with their teeth, set him at liberty. But the readiness of the Ambie to the mutual affistance of one another, is yet more manifest ; for by casting the line upon which the hook hangeth on their back, with the sharpness of their Fins they cut it afunder, and so set free themselves and their captived fellows.

Of the Pilot-fift.

There is a great kindness between the Pilot-fish and the Whale; For, although in bulk of body the Whale for far exceed him, yet he leads the Whale, and goes always before him as his Pilot, to keep him from running himself into any straight or muddy place, whence he might not easily get out. And therefore the Whale always follow him, and very willingly suffers himself to be a like the first himself to be a like the first himself. The Whales led by him, it being for his own good. And, in like manner, he gets into the Whales mouth, and Pilot or Guide there lodging himself, sleeps when he sleeps, and leaves him not either by day or night.

Cranes order themselves in ranks.

The Sentine! Crane.

Ranes when they are to take a long journey into forme Countrey cross the Seas, put their company in so good order, that no Captain can put his Souldiers in better. For before they stirr out of any place, they have (as it were) their Trumpets to call them together, and encourage them to flie. They come together, and then flie up on high that they may see afar off, chusing a Captain whom they are to follow. They have their Serjeants to (ake care of their ranks, and keep their nightly Watches by turns. Plutareb tells us, that the Crane, which is appointed to stand Sentinel for all the rest, holds a stone in her soot, to the end, that if she chance to give way to Nature and sleep, the may be awaked by the noise of the falling stone. The Leader, lifting up his head, and stretching out his long neck, looks about him far and wide, and gives warning to the rest, of any danger that may be all them. The strongest lead the way, that they may the better with the slapping of their wings break the sorce of the Air, and this they do by turns. And that they may the easilier prevail against the force and opposition of the Winds, they dispose their company into a ping of their wings break the force of the rais, and this they dispose their company into a calilier prevail against the force and opposition of the Winds, they dispose their company into a Wedge in the form of the Greek letter Δ , or a triangle; and being skilful in the Stars, they fore-see when tempests are coming, and sly down to the ground to keep themselves from the injury of the approaching from.

The care of Geefe that their gagling do them no harm.

Of Geefe. The Geefe of Sicily do with great wariness take care, that by their keeking and their noise, they do not expose themselves to the rapacity of Birds of prey: for Platareb saith, that when they are to fly over the hill Taurus, for sear of the Eagles that are there, they hold stones in their mouths to keep themselves from gagling, until that they come unto a place where they may

The craft of

Of Dragons.

N Either are the Dragons lefs crafty; for thus do they overcome those vast and otherwise inwhen they fear no such matter, and involve their legs with the twines of their tail, in such fort, The cractor of their tail, in fuch fort, ing against when they fear no such matter, and involve their legs with the twines of their tail, in such fort, the Elephine, that they are not able to go forward, and stop their nostrils with their heads, so that they cannot the Elephine, that they are not able to go forward, and stop their eyes, and wheresoever they find the skin most tender there fetch their breath; they pull out their eyes, and wherefoever they find the skin most trender there

Like. C.11.12. they bite and suck the bloud until they make them fall down dead. Pliny faith, that there are Dragons found in Æthiopia of ten cubits long, but that in India there are Dragons of an hundred foot long, that fly to high that they fetch Birds, and take their prey even from the midft of the

man-fish in raking her prey.

Of the Fift called the Fifherman. This fifth is called the Fiftherman, because he hunts and takes other Fishes, which he doth almost by the same cunning which the Cuttel uses; for he hath hanging at his throat a certain bag, like the Wattels of a Turkey-Cock, This when he listen he casteth out, and layerth before the little to the listen and listen an Fishes for a bait, and then by little and little draws it up again, until he catch for food the little Fishes feifing upon it as a prey.

ċ

Of the Cuttel Fift.

Onderful is the craft of the Cuttel-fishes, for they carry a bladder at their neck full of a black The craft of Juice or Ink, which they pour forth as foon as they feel themselves taken, that so they may the Cuttel to blind the eyes of the Fishermen, as Plut arch faith, and as Ariticale witnesseth, they with their long Libe, de Hill. fangs do not onely hunt and take little Fishes, but oftentimes also Mullets.

B Rute Beafts are naturally fo furnished with Arms that they have no need to get, make, or bor-

And forme of them nevertheless are so furnished with such Arms, that they captivate those which hold them Prisoners; an example of this is the Torpedo, which doth not onely hurt by touch, but also by the Net being between, he breaths such a quality from him as stupistes the hands of the Fishermen, so that they are forced to let go their Nets, and so let him go; moreover if it touch a Ship it makes it star. There writes that the Profes Bay towards Archit, nourishes a Fish count in length and thick it flay. There writes, that the Persian Bay towards Arabia, nourishes a Fish equal in length and thick-cosinger, towards and fire our Porcupine, with which the fights against all kinds of Fish. If a than chance but to be lightly hurt either with these, or his teeth, he will die within 24 hours.

Of the Fish Utelif. HE faith moreover, that as he was carried by force of tempest through the Atlantick Ocean, he faw this Fith, having (as it were) a Saw in his forehead of three foot long, and four fingers broad, armed on each fide with sharp spikes; they call it Vielif in their Countrey speech.

Of the Fift Caffilly.

Here is another Fift to be feen in the Arabian Gulf which the Arabians call Caffilly; it is two foot long, and many broad; it hath a skin not much unlike a Dog-fifth, but armed with fpikes, one whereof he carries in his forchead a foot and half broad; in tharpnets and force of cutting not much thort of a graver or chiffel: with this weapon, when the is opprett with hunger, the affails the first Fish the meets, neither doth the give over before the carry her as a prey whither the pleafe, as Town 1.02.5.

Rabs and Lobsters, though in the quantity of their body they be but small, yet they use their forked Glaws before, not onely in feeding, but also in defending themselves, and affail-Of Crabs.

Define a decility of Beafer, and first of the Dog.

Beafer ape to learn those things which men defire, whereby they shew themselves not wholand represent the property of the would represent the property of the would represent the property of the exceeded all admiration in that, that taking a sportice Medicin, he exceeded all admiration in that, that taking a sportice Medicin, he exceeded the simple deads for first, as taken with a giddines in his head he begun to tremble, then presently fell down, and lying on the ground, as it were contracted his dying be sitted according to divers parts of the Theatre, the Fable so requiring. But when he, by those things that were said and done, knew it was time to rise, he first begun to move his Legs by little and little, as if he had been wakened from a sound sleep; then presently with his head a little listed up, he looked this way and that way, to the great admiration of all the beholders; and sinally rose up, and went samiliarly and chearfully to him he should. Than which tight the Emperour Vestalian (who was then present in Marcellar his Theatre) never saw any which more delighted himself. Vestassian (who was then present in Marcellas his Theatre) never saw any which more delighted him-

Of the Ape.

An Ape is a ridiculous Cxeature, and which makes men much sport in imitating their actions. Gal. lib. 1 de endeavour to personn many other things proper to men. I temember I saw in the Duke of Soutier house a great and curst Ape, who because he much troubled many, had his hands cut off, who suffering himself to be cured, when the wound was cicatrized, he grew more mild and docile. Wherefore eloathed in a green Coat, and girt over his loins with a Girdle, he carried hanging thereat a Case of Master-Cook to teach, because he had taken up his lodging in the Chimney-corner, he was taught was upon his back and loins, and much was abated of his daily allowance; for, as Persus faith, The much exceeded all the Apes of his time in the glory of his Witsand there was none counted more skilbelly is the Mafter of Arts, and Sharpner of Wit. By these means he profited so in a short time, that he much exceeded all the Apes of his time in the glory of his Wit; and there was none counted more skilful in leaping and dancing to the Pipe, running up a Pole, and nin, bly leaping through his Masters Legs. To conclude, he performed all the actions of a strong Ape, and very reverendly carried up Dithes with the Waiters and Servingmen, and made clean the Dithes and Platters by licking, and did nucleoned the Dithes and Platters by licking, and did nucleoned to the Dithes and Platters by licking, and single nucleoned to the Dithes and Platters by licking, and single nucleoned to the Dithes and Platters by licking, and single nucleoned to the Dithes and Platters by licking, and single nucleoned to the Dithes and Platters by licking, and single nucleoned to the Dithes and Platters by licking, and single nucleoned to the Dithes and Platters by licking, and single nucleoned to the Dithes and Platters by licking, and single nucleoned to the Dithes and Platters by licking, and single nucleoned to the Dithes and Platters by licking, and single nucleoned to the Dithes and Platters by licking, and single nucleoned to the Dithes and Platters by licking, and single nucleoned to the Dithes and Platters by licking. Dithes with the Waiters and Servingmen, and made clean the Dithes and Platters by licking, and did much other drudgery, to that he was commonly called Mafter John Do-all. At Dinner and Support litting in a Chair, he faid Grace, and caffing his eyes up towards Heaven, and rouled them this way and that way, and fmote his Breft with the flumps of his hands with much lamentation, and imitated Prayer by the gnashing or beating together of his teeth. He would turn up his tail to any that

that offended him, for his Coar fearce covered half his buttock, left he should have defiled it) he made much other pattime, always going upright by reason of the cutting away of his hands, unless at any time through weariness he were forced to set on his Buttocks.

The Camel'ss a very domestical and gentle Beast, and which is easily tamed and taught all kind of obedience and service; although some of them are cruel, wild, and troublesom by biting and striking such as they meet, no less then untamed Horses. There is no need to house them.

Camels both tame and wild

in the night, for they may be left in the plain fields in the open and free air, feeding upon the not charges worfe undergo or carry their burdens. They are not put to carry burdens before they be four years old. The drabians geld them young, that they may enjoy their labour the longer; neither being cold.

I.

fs

illi n

gelt, do they rage for Love or defire of Venery. At the putting in of the Spring they endure hunger and thirst for eight days together; they are so duriful, that at the beek of the Turkish Slaves, or but touched on the neck with a Twig, they presently kneel on the ground to take up their burden, neither Cameli know do they lift themselves up before they find that they have a sufficient load laid upon them. Those when they that have but one bunch upon their back are of Africk, but she have two bunches are of Asia or burden to ride upon, as our Horses are. They love nothing so well as Beans, and yet they live content with to carry burselin handfuls of Beans for a day. The greatest wealth of the Arabians consists in Camels, and so does, and to they estimate their riches, not by the quantity of Silver or Gold, but by the number of Camels. The Turkish Emperour (There being the reporter) made a Captain over the herds of his Camels, giving him a great troop of African and Christian Slaves, that they might be the better looked unto. I have heard it reported (saith Thevet) by certain Arabian, African, and Jewish Merchants who were present, at that time when Sultan Selim, the first of that name, belieged Came in Agypt, (which a mighty in former times was called Momphis) that there then was in that Emperours Army fixty thousand troop of Camela. in former times was called Monphis) that there then was in that Emperours Army fixty thousand troop of Ca-Camels, belides a mighty company of Mules.

Of raveness Birds.

Directly the stake view of Falconers teaching ravenous Birds, how with fwift wings carried aloft The diligence performance whereof, they often too freely foar up to the Clouds, fo that they carry themselves out of the Falconers light, with a desire to Sun themselves, neglecting in the mean time their designed

The Heron when the fees her felf kept under, and below the Falcon, carried up by his firong The fight of wings with a marvellous fwiftness, with her Beak, which is long and tharp, hid under her wings, the Heron and named upwards, the receives the Falcon blinded with the heat of fight, and defire of prey, care-Falcon. lefty flying down and rufhing upon him; fo that he often ftrikes him through the gorge, fo that oft-times they both fall down dead to the ground. But if the Falcon without harm escape the deceits by Art, and the happy turning of his body, and the Heron be not call down, the Faulconer calling her back with naver so load a voice, yet by setting up her Feathers she dares her to the pre-

That Birds have taught us Musical Tunes.

The Nightingales are fweet and excellent fungers, tuning their notes with infinite quaverings, and divertities of founds, fo prettily and fweetly, that humane industry can fearce equal the fweetness thereof, by fo many musical Instruments; so that we say, he sings like a Nightingale, who varies his voice with much variety. In which thing Birds much excel men, because they have that admirable sweetness of singing from Nature it self without any labour of learning; which men can scarce attain to in any School of Musick, by having their cars a thousand times plackt by the hands of a curst Master.

Beafts know one another by their voice, so that they may feem to talk and to laugh together. The voice so whilest fluttering with their ears, they plack in their noses with a pleasant aspect of their eyes; and as speech is given to men. So Rinds have their natural voice, which is of the same use, as were dumb; nor the Egyptian understand it no more than if they were deas. Wherefore an as deast, when dangers, how many troubles they undergo because they cannot express their minds, and require when any of the Members, and to abuse they understand to the allistance of the supprison of the fame understand to the fame when the Egyptian is dumb and deast to a Septian. This those which travel well understand, how many we have a understand it no more than if they were deast. Wherefore an as deast, when dangers, how many troubles they undergo because they cannot express their minds, and require known Landau to call the rest of the Members, and to abuse the gestures of the Head, Eyes, Hands, and Feet. Truly the condition of brute Beasts is not for miscrable, seeing that all of the same kind wheresome, Spaniard, Egglishman, Polonian and Greek, speaking amongsi themselves in their Native Tongues, voice of Men or of Beasts.

Inets, Larks, Pies, Rooks, Daws, Crows, Stares, and other fach like Birds, fpeak, fing, whifile, Farrars are wondrous skilful imitaters of mens voices; and very merry, but specially when they have drank a imitaters of Mans voice.

tle Wine.

Plutareb reports that there was a Barber at Rome who kept a Pie in his shop, which spoke ex- A talking Pie. Platarch reports that there was a Barber at Rome who kept a Pic in his shop, which spoke exA talking Pic.

Ceeding well, and that of her own accord, none teaching her, when she first heard men talking

A talking

Cefar taken with the novelty of this spectacle, bought this obsequious Bird with a thousand pieces of Silver. Pliny and Valerias have reckoned up amongst prodigies, Oxen and Asses that have spoken. I omit infinite other things recorded by the Ancients, Plata, Aristotle, Pliny, Platarch, and other Philosophers of great credit, of the docility of Beasts, and their admirable felicity of understanding. Which things, if untrue, these learned men would never have recorded in Writing, left so they might brand with vanity (than which nothing is more base) the rest of their Writings to posterity in all enfuing Ages.

Of the Sympathy and Antipathy of Living Creatures among st themselves.

A Horie fears a Camel.

Having briefly described the understanding of brute Beasts, it seems not impertinent to set downsome things more worthy of knowledge, happening unto them by reason of Sympathy and Antipathy; that is, mutual agreement and disagreement, which happens not onely to them living, but also dead, by a certain hidden property, through occasion whereof some desire, others shan, and others prosecute one another even to death. In testimony whereof, the Lyon the King fears a Cock. of Beafis excelling all other in courage and magnanimity, fears the Cock, for he is not onely terrified by his prefence, but also by his crowing being absent. So an Elephant fears an Hog; but he is so afraid of Mice and Rats, that he will not touch the meat that is given him, if he smell that it hath been defiled with such Creatures. There is deadly hatred between the Elephant and Rhinocerot; yet when the Elephant is furious and angry, he becomes quiet and calm at the fight of a Ram. A Horfe is fo afraid of a Camel, that he cannot endure his fight. The Dog hates the Wolf, the Hart flies the Dog. The Snake flies from and fears a naked man, and follows him being clothed. There is deadly hatred between the Afpis and Ichneumon; for he when he hath rouled himfelf in the clay, dries himfelf in the Sun, and fo being covered over (by doing thus divers times) as it were with shells or armour, he enters into combat, thretching out his Tail, and presenting his Back, well he get correctionity to check his advertice by learning and fostening on her Jaws, by which were with their or armour, he enters into combat, liretening out his Tail, and pretening his Back, until he get opportunity to chook his adverfary by leaping and fastening on her Jaws, by which firatagem he also kills the Crocodile, The green Lizard is a capital enemy to the Serpent, but most friendly to Man, as Erashaws with effeth by many Histories concerning that matter, in his Dialogue of Sympathy and Antipathy. There is a great deal of harred between a Man and a Wolf, which is most manifest by this, that if the Wolvestiris fee a Man, his Voice is taken away, and his intended cry hindered. If the Weasel intend to fet upon the Aspis that most venemous Serpent, the arms her self by eating Rue, as a most certain Antidote. The Ape sears the Torpedo, as Erashaw manifests by a pleasant History in the forementioned Dialogue; where also be pretily shows the deadly fefis by a pleafant. History in the forementioned Dialogue; where also he pretily shews the deadly hatred between the Serpent called Areus and the Toad. The like hate is between the Owl and Crows, so that the Owl dares not go out, sly abroad, or seek her food unless by night. The Water or River Fowl are assaid of the Falcon, that if they but hear her bells, they had rather be killed with staves and stones, then take wing to slie into the air. So the Lark yields her self-to be taken had with staves and stones, then take wing to slie into the air. So the Lark yields her self-to be taken by a Man, left the fall into the Talons of the Hobby. The Caffril, or Merlin, is naturally a terrour to Hawks, so that they both shun his voice and presence.

The Enmity between the Nices and The discord between the Lamb and Wolf, is not ended by Death.

What Fowl fear the Falcon.

Cheese that Mice will not gnaw.

The Kites are all at perpetual enmity with the Crows, wherefore the Crow always gets away the Kites provision. All kind of Pullen fear the Fox. The Chicken fears neither a Horse nor an Elephant; but, fearce hatched, it presently runs away at the voice or fight of a Kite, and hides it selfunder the Hens Wings. The Lamb and Kid slie from the Wolf when they first see him, neither doth Death give an end to that hatred, but it supervives their Funeral. An experiment whereof (they say) is, that if one Drum be headed with Wolves skins and another with Sheeps, and beaten up together, you shall scarce hear the found of the Drum covered with Sheep skins. And besides, if you string one Harp with Strings made of Sheeps guts, and another with Strings of Wolves guts, you cannot bring it to pass by any Art, to make them agree and go in one Tune. It is reported from the experiments of many men, that if a Wolves head be hanged up on high in the place where Sheep are, that they will not touch the Grass, how good and fresh foever it be, nor rest quiet in any place, but turnultuoufly run up and down, until all fuch kind of terrour be taken away. The hate betwixt Mice and Weafels appears by this, that if you mix never fo little of the brains of a Weafel in the Rennet, with which you crudle your Cheefe, the Mice will never gnaw or touch that Cheefe. The Linnet doth fo hate the Bird Florus, that both their blouds put into one vessel cannot be mixed together. A Wolves head hung up in a Dove-house, drives away Poll-Cats and Weasels. The Panther and Hyana burn with so great hatred, that if both their skins be laid one against the other, the Panthers will shed the hair, the hairs of the Hyana remaining entire and not moved; which thing, they fay, happens to the Feathers of other Birds, if any one chance to tie them up in a bundle with the Eagles. Let these sufferences of the Eagles. fice for fome few examples of many, of the Antipathy amongst Beasts. But of the Sympathy and confent of Beasts amongst themselves, I think needless to write any thing, being it is sufficiently known to all, that one Jay affociates another, and the cruel Bears agree amongst themselves, and Beasts of fame species do wonderfully confent one with another.

That Man excell all Bealts.

That Man excell all Bealts.

The Man over Bealts, which I have so long intended. Neither would I that Epicures, and other, too much natural and materiate Philosophers, so take those things I have written of the endowments of Bealts, as though we should think there were no difference between Man and Bealt. Thad no fach meaning, no fuch intention; but onely that man should not become too stately, or too ingrate in less acknowledging God to be the Author of so many benefits with which he abounds. For whatsoever we have largely spoken of Bealts, wet there is no comparison, between Bealts and Many, for there is no comparison, between Bealts and Many, for there is no great a difference because. That Man excells all Beafts. Beafts, yet there is no comparison between Beafts and Man; for there is too great a difference between them. For Mans mind is adorned with Religion Juffice, Produce, Magnanimity, Faith Piety, Modelly, Clemency, Fortitude, and other Vertues as Lights which thine much more bright in Man

than Beafts. For they are fornetimes all in forne one Man, each whereof are thought great in Beafts. For feeing that Man is made to the Image of God, it cannot be, how much foever he defile himfelf Man bears with the pollution of Vices, that he can fo obscure that inbred light, but that always some beam Gods Image. of the Divine Wifdom will be inherent and fline in him. But although by collation to fome Beafts, he may feem a defective and weak Creature; yet no fortitude nor firength of Beafts can be fo great as to equal the fortitude of Man. For God hath engraven in Man the Character of his Divine Viras to equal the fortifude of Man. For God hath engravers in Man the Character of his Divine virtue, by the affifunce whereof, he might have all Beafis under and obedient to him. And though by that we have formerly faid, Beafis may feem to have a certain shadow of reason, yet that small light is not sit for many and divers uses, but there is onely given them so much providence as should be sufficient for them and the preservation of their bodies. But men have Reason given them to crop the state of Europe Life (as Lettering faith), whereby it comes to rate that Man goods. fufficient for them and the prefervation of their bodies. But men have Realon given them to crop or gather the Fruits of Eternal Life, (as Lathantias faith) whereby it comes to pats, that Man onely, amongft fo many Creatures, hath fenfe and understanding of Divine things. Which Cierro thought to be known by that, because Man onely had a certain knowledge of God in his mind. Wherefore he was enriched by God with Reason, Speech, and Hands, as helps for the performance of all his Actions; moreover by his singular and almost divine Wit be easily excells all brute Beasts. For first, Reason Man high ships his onide he homested things proceed by the process of the things become the same as the same of the process of the same of the sam being his guide, he invented things necessary for life, fitly imposed names on the things invented be ven names fitting their Natures, framed Letters and Characters, invented all Liberal Arts and Handy-grafts, and things found means to measure the Land and Sea. He hath observed and drawn into an Art the spaces of the Celeftial Globe, the diffinctions of the Stars; the changes and orders of Days and Nights, of Times and Seafons; the rifing and fetting of Stars, and their power and effects over thefe lower Bodies. Laftly, He records in writing to perpetual memory that which concerns his own Nature, or the Nature of other things, the Precepts and Ordinances of Life and Manners; by which fingular gift, we can now confer with Socrates, Plato, Arifforde, and other Philosophers of ancient Times, as if they were living,

What benefit Man hath by reason of his native Nakednass and Ignorance.

B Ut as Mans Body is by Nature naked and unarmed, so is his Mind like a smooth Table in which Galcap.4.11th, fupply of his Ignorance, Reason and Speech. And by these three being, as it were, the Ministers tism, of infinite variety of things, he clothes and defends his Body with all things needful, and enriches his Mind with the knowledge of Astronal Sciences. New School Reason by Warrange how with his his Mind with the knowledge of Arts and Sciences. Now if he had certain Weapons born with him, he should use them onely if he should be born skilful in any Art, he would meddle with none else. Therefore, because it was more expedient to use all forts of Weapons with the Hand, and be At the Hand skilful in all Arts at the refore he will be been reposition and in the last section of the section skilful in all Arts; therefore he must be born wanting and ignorant of all. Arighate very wirtily is the Infra-called the Hand the Inframents of Inframents in imitation of which speech, one may rightly af-firm, that Reason is the Art of Arts; speech the Hand in worth exceeds the other Inframents, if firm, that Reason is the Art of Arts: for as the Hand in worth exceeds the other Instruments, be-Reason is the cause it can make, handle, and fit them for use; so Reason and Speech, though names of no Art, yet Art of Arts, comprehend and encrease all Arts. Therefore Man, seeing he hath his Mind instructed by Art, it hat is, by Reason, it is fit he should have his Body defended with a Weapon or Instrument, that is, the Hand; which in agility and excellency should excel all other Instruments. For so Man hath his Hands in stead of all Weapons which he may use in Wassed Porce and Instruments. his Hands in flead of all Weapons, which he may use in War and Peace, as the Inflarments of all Arts; he wants not the Bulls Horns, the Boars Tusks, the Horses Hooss, nor, to conclude, any Arms of any other Beast. For by the benefit of his Hands he can handle other Arms far more profitable and fafe; as a Lance, Sword, Spear, Halberd; but Man alfocan use at some distance the Bow, Sling, and Hand-gun, when the Horn and the Hoof cannot be used but near at hand. But some may say, a Lion exceeds a Man in (wiftness of Foot; what then? is Man therefore inferiour to him? no, for by the means of his Hands, and the guidance of his Reafon he bridling and riding upon a Horfe, out-runs the Lion, and being Victor follows him to and again as he himfelf pleafes, or vanquished flies away; and from the Horfes back, as from a Tower, wounds the Lion with what Weapons he pleafes. To conclude, Man is abundantly provided with means to defend himfelf from the violence of all other Beafts. For this purpose he doth not onely harness himself as with brazen Walls, but also makes Ditches and Bulwarks, he makes by the ministry of his Hands all kind of Weapons, weaves himself Garments, easts into the Water and draws forth Nets to catch Fifth; and to conclude, he performs all this particular and the water and draws forth Nets to catch Fifth; and to conclude, the performs all things to his own contentment, and having that priviledge granted him by God, he Man under rules over all the Earth; all things which lie hid in the bowels of the Earth, which go, or creep upon God is the Earth, which fwim in the Sea, and flie through the Air, or are any where that up in the compass person of the Skie, are in Mans dominion.

King and Emperour of the

How wonderful God bath showed bimfelf in making Man.

Ods Deity and Providence hath principally shewed it self in the Creation of Man; neither his Man is the end have them to live and have their being onely for Mans sake, that they might servehim. There-date things. fore Man is, if we diligently consider all his endowments, a certain Pattern and Rule of the Divine Majefly and (if I may fo fay) Artifice. For being made to Gods Image, he is as it were his Coin, ex-Man a little Majefly and (if I may to fay) Artince. For being anade to Gods Image, he is as it were his Coin, exceeding the capacity of all humane understanding. Which seemed a just reason to the ancient Philosophers that he should be called Microsofinus, or a little World, because the particles of all things contained in the compass of Heaven and Earth, are contained in his Mind and Body, that in the mean size of the particles of the particles of all things contained in the compass of Heaven and Earth, are contained in his Mind and Body, that in the mean time I may in filence pass over his Soul, more great and noble than the whole World.

Why Nature hash not given Man the faculty of Presaging.

Man is not the Air and Stars.

This icems the reason, that Men by the instinct of Nature do not foresee the future seasons and dispositions of the Heaven and Air; because, seeing they have received certain sparks of prudence from God, by whose care and guidance they are led to the knowledge of things by no deprudence from God. printence from God, by whote care and guidance they are led to the anowicing of things by no de-ceitful but certain judgment, being not obnoxious to the conditions and changes of Times and Seafons, as Beafts are: Wherefore knowing all these airy changes to be placed under them, that is to say, their minds; according as occasion serves and their minds defire, they give themselves to mirth when the air is wet, stormy, and dark; and on the contrary in a clear and fair season, to a serven and grave meditation of things fublime and full of doubt. But Beafts accommodating themselves to that disposition of the Air which is prefent and at hand, are lively or sad, not from any judgment, as Men, but according to the temper and complexion of their bodies following the inclinations of the Air, and of the humours one while diffused, another while contracted. Neither ought we to One Man will blame Man, because he can imitate the voice of Beasts, but rather much commend him, that he counterfeit can infinitely wreft and vary one thing, that is, his Voice; for Men can bark like Foxes and Dogs; infinite varie- grant like Hogs, whet and grind their teeth like Boars, roar like Lions, bellow like Bolls, neigh like tios of Beafis, Horfes, knack their teeth like Apes, how like Wolves, bray like Affes, bleat like Goats and Sheep, mourn like Bears, Pigeons, and Turtles, keek and gaggle like Geefe, hifs like Screents, cry like Storks, caw like a Grow, and crow like a Cock, clock like Hens, chatter as Swallows and Pies, fing like Nightingales, croak like Frogs, imitate the finging of Wafps and humming of The power of Bees, mew like Cats. The finging of Birds fearce feems to merit the name of Mufical, compared to the Harmony of Men, fitted and tuned with infinite variety of Voices. For with this they poffefs the Ears of Kings and Princes, provoke and temper their wrath, and carry mens minds beyond themselves, and transform them into what habits they please. But if those cruel Beastis have any humanity, they owe it all to Man: For he tames Lious, Elephants, Bears, Tigers, Leopards, Pan-

That Man may attain unto the knowledge of all Voices and Tongues.

Man not onely the imitater, but the inter-Preter of the Voices of Beafts and Birds,

thers, and fuch other like.

The docility of Mans Wit is fo great, and facility of the body obeying that divine gift of Wit, fuch, that he is not onely able to learn to fpeak the Tongues of divers Nations differing in fo many peculiar Languages; and not onely to imitate and counterfeit the voices of all Beafis though many pectinar Languages; and not onely to imitate and countertest the voices of all Bealts though fo much different from Man, which many flattering and jugling Companions, followers of other mens Tables will do; but also be able to know and understand both what they pretend and fignise. In confirmation of which thing, they cite the Philosopher *Apalonius* most famous in this kind of Study and Knowledge, He walking on a time amongst a company of his Friends through the Field, and seeing a Sparrow come flying and chirping much to diversother Sparrows sitting upon a Tree, is reported to have said to those which were with him, That Bird which came flying hither, told the other in her Language, that an Assalded with Corn was fallen down at the City Gate. ther, told the other in her Language, that an Afs laded with Corn was fallen down at the City Gate, and had thed the Wheat upon the ground. Wherefore Apollonius, and all his friends which were with him went thither to fee whether it were fo, and found that it was fo as he had told them, and observed that the Sparrows, moved thereto by the coming of the other, were eating up the grains of Corn shed on the ground.

But for Crows and Pies artificially taught to counterfeit mens Voices, it is too finall a thing, that for that cause they should contend with men. For they have quickly babled all they have learnt with longer coft and labour, tedioufly finging ftill the fame fong, and whatfoever they prate they do it without Senfe, Understanding, or any Reason for what they say. But Man always contemplating formewhat more high, still thinks of greater things than these present, and never ress. But burning with an infinite and endless desire of Knowledge, he doth not onely cover to know those things which appertain to food and cloathing, but by caffing his eyes towards Heaven, and by the light of his mind, he learns and understands things Divine. Which is so certain an Argument of the celestial original of our Soul, that he which considers those things, can no ways doubt, but that we have our minds scasoned by the universal Divine Understanding. But now it is time for us to feet upon the Description of the Body, the habitation and fit Instrument of all the Formalian Color. fer upon the Description of the Body, the habitation and fit Instrument of all the Functions of the

But for that I have written of the Religion of Elephants, if I must speak according to the truth of the matter, we cannot say, they worship God, or have any sense of the Divine Majetty. For how can they have any knowledg of sublime things, or of God, seeing they wholly following their we said, Elephants have not how to meditate on celestial things? Now for that they behold and turn themselves to the Moon by night, and to the Sun in the morning, they do not that as worshipping, or for that they conceive any excellency or divinity in the Sun; but because Nature so requiring and leading them, they feel their bodies to rejoyce in that light, and their entrails and humors to move and stirr them to it. Therefore when we attributed Religion to Elephants, we said it rather popularly, than truly, and more that we might exhort men to the Worship of God, than that we thought Elephants had any knowledge of Divine Worship implanted in their minds.

The end of the Second Book.

BOOK III.

Of the Anatomy of Mans Body.

Following the custom and the manner of such as before me have written of Anatomy, will first, (that I may make the minds of the Readers more attentive and defirous of these studies) declare how necessary it is, and also how profitable; and then thew the order to be observed in it, before I come to the particular description of mans body.

The neceffiry of the know ledg of Anato

Furthermore, how Anatomy may be defined, and the manner of the definifick; that is, whereby they may be able to preferve the prefent health of the body, and the parts thereof, and drive away difeafes. For how can either Physician or Chirurgeon preferve health by the parts thereof, and drive away difeafes.

Initio lib. de

the use of the like things, which confists in the temperament, conformation and natural union of the parts; or expel the difease which hurts those three, by the like use of their contraries, unless he shall know the nature and composure of the body, and understand, as by the rule of this know-ledg, how much it swerves from the nature thereof? Wherefore it is excellently said of Hipportates, that the Phyfician, called to cure the fick Patient, cught diligently to confider, whether those things

that are in him, or appear to be in him, be like or unlike, that is, whether the Patient be like himfelf and his own nature in all his parts and functions, temperature, composure and union; that he may preferve those which are yet contained in the bounds of nature, and restore those that are gone zib. at affray. Which thing Gales hath also confirmed, specially where he faith, He must well know the

1. de loc. affe-His, & lib. 3. nature and flructure, or composite of the bones, who takes upon him to reflore them broken or dis-located to themselves and their proper seats or places. Moreover, seeing that healing doth not only consist in the knowledg of the disease, but as well in prescribing fit medicines, and like application of them to the body and the parts thereof, all which by their natural diffinilitude, do require unlike medicines, according to Galens opinion: I prethee tell me, Who can perform this, which is ignorant of the description of the whole and the parts thereof, taught by Anatomy? We may say the like of the Apothecary, who ignorant of the fituation of the parts in the body cannot apply Em-

Why, when the liver is hot the flomach is commonly cold.

plaifters, Ointments, Cataplains, Fomentations, Epithemes, bags to the fit places, as to the futures of the skull, to the Heart, Liver, Stomach, Spleen, Reins, Womb, or Bladder, For example: Let us imagine the Liver to be troubled with a hot differuperature, but on the contrary, the ftomach with a cold (which commonly happens, feeing the Liver hotter than ought tobe, fends up many vapours to the head; from whence cold humours fall into the flornach) if hot things to be applied to the flomach by the Phyficians prescription, be by the Apothecary, making no difference, applied, to both the flornach and neighbouring liver, (which may chance, if he be ignorant, that the flornach bends fornewhat to the left fide under the breast-blade; but the liver so takes up the right fide of the body,

that with a great part thereof, it covers almost all the stomach) will be not be much offend by increafing the hot difference of the liver, and not thereby giving case, or help to the difease? Shall not, by this his ignorance, the Patient be frustrated of his defire, the Physician of his intent, and the Medicine of its effect? By these examples I think it most manifest, that the Anatomical knowledg of the parts of the body is exceeding necessary to all Physicians, Chirurgeons, and Apothecaries, who will practife Phyfick with any praife, to the glory of God, and the benefit and good of man, for whose fake we have writ these things, and illustrated them by figures, subjecting the parts to the

eye, and fitly put them in their proper places.

But Anatomy is commodious four manner of ways: The first is, because thus we are led to the knowledg of God the Creator, as by the effect to the cause; for, as we read in St. Paul, The invisible things of God are made manifest by the visible. The second is, that by means hereof we know the nature of mans body, and the parts thereof, whereby we may more easily and certainly judge and the parts of second health. The third is that by the homeless of the body and in and determine of fickness and health. The third is, that by the knowledg of the body and its parts, and together therewith it affections and diseases, we may prognosticate what is to come, and fore-tel the events of diseases. Lasily, the fourth is, that, considering the nature of the diseased part,

we may fitly prescribe medicines, and apply them in their due place.

Now we must declare in what order Anatomy may be fitly delivered; but first we must observe, there is a threefold method: The first is called of Composition, being very commodious for the teaching of Arts, which Aristotle hath used in his Works of Logick, and natural Philosophy, the order and beginning taken from the land and read founds to the more approach. order and beginning taken from the leaft and most simple, to the more compound. The second of Division, fit for the inventing or finding out of Sciences. Galen hath followed this order in his Rocks of Anatomical Administration and the followed this order in his Division, it for the inventing or finding out of Sciences. Galen hath followed this order in his Books of Anatomical Administrations, and of the use of the parts. The third of Definition, which sheweth the nature and effence of things, as appears by Galen in his Book de Arte Parts. And become this order doth also profecute the divisions, therefore it is commonly accustomed to be comprehended in the compass of the second. Therefore I will follow this in my Anatomical Treatise, dividing mans body into its parts, which I will not only subject to the eye in the way of knowing them, but also to the mind in the faithful understanding them. For, I will adjoyn those thangs that are delivered of them by Galen in his Book of Anatomy-Administrations, with these which he hath taught in his Books of the use of the parts. For there he fitly lays the

those which he hath taught in his Books of the use of the parts. For there he fitly lays the parts of mans body before our eyes, to the sense. But here he teaches to know them, not to see them; for he shews why, and for what use, they are made, Having briefly handled these things,

The knowledg of Ana-tomy, is com-modious four manner of ways.

There is a threefold me-

The Authors

we must declare what Anatomy is a that, as Gierra faith out of Plata's Phedra, it may be understood of what we diffute. And because we attain that by definition (which is a short and plain speech, consisting of the Gense and Difference of the things defined, being the effectial parts, by which the nature and effence of the thing is briefly and plainly explained) first we define Anatomy, then presently explain the particular parts of the definition.

Wherefore Anatomy (if you have regard to the name) is a perfect and absolute division, or ar- what Anatowherefore Anatomy (if you have regald to the hante) is a pericer and automate divinion, or artificial refolution of mans body into its parts, as well general as particular, as well compound as my infimple. Neither may this definition feem illegitimate; fpecially amongit Phylicians and Chirurgeons. For, feeing they are Artizans humiliated to the fense, they may use the proper and common qualities of things for their effeutial differences and forms. As on the contrary, Philosophers How a definimay refuse all definitions as spurious, which consist not of the next Genw, and the most proper, tion differs and effential differences. But feeing that, through the imbecillity of our understanding, such difterences are unknown to us, in their places we are compelled, in defining things, to draw into one many common and proper accidents, to finish that definition which we intend: which for that cause we may more truly call a description, because for the matter and effential form of the thing, it prefents us only the matter adorned with certain accidents. This appears by the former definiit preferrs is only the matter adorbed with certain accidents. This appears by the former demin-tion, in which Division and Resolution stand for the Genue, because they may be parted into divers others, as it were into species. That which is added over and besides, stands in place of the diffe-rence, because they separate and make different the thing it self from all other rash and unarrissical diffections. We must know, an artificial division, is no other than a separation of one part from another, without the hurt of the other, observing the proper circumspection of each of them; which it they perish or be defaced by the division, it cannot be said to be artificial. And thus much may fuffice for the parts of the definition in general.

For as much as belongs to the explication of each word; we faid, of Mans body, because as much as lies in us, we take care of, preserve the health, and depel the diseases thereof: By which it may Physick. appear that mans body is the fubject of Phylick, not as it is mans, or confids of matter and form, but as it is partaker of health and fickness.

We understand nothing else by part, according to Galen, than fome certain body, which is not Gal. 118.1. de wholly disjoyned, nor wholly united with other bodies of their kinds; but so, that, according to the part. his opinion, the whole be composed therewith, with which in some fort it is united, and in some kind feparated from the fame, by their proper circumfeription. Furthermore by the parts in general, I underfiand the head, breaft, belly, and their adjuncts. By the particular parts of thole, I underfland, the fimple parts, as the fimilar, which are nine in number, as a griftle, bone, ligament, membrane, tendon, nerve, vein, artery, mufculous fleft; forme add fibers, lat, marrow, the nails, and hairs; other omit there are constant. and hairs; other omit them as excrements: But we mail note that fuch parts are called fample, rather in the judgment of the fenfe, than of reason. For if any will more diligently consider their nature, they shall find none absolutely simple, because they are nourished, have life and sense, either manifest or obscure, which happens not without a nerve, vein, and artery.

But if any shall object, that no nerve is communicated to any bone, except the teeth; I will an How the bone fwer, that nevertheless the bones have sense by the nervous fibers, which are communicated to them by the Periofteum, as by whose mediation the Periofteum is connext to the bones, as we see it happens to those membranes, which involve the bowels. And the bones, by this benefit of the animal fense, expel the noxious and excrementitious humors from themselves into the spaces between them, and the Periofeam, which, as indued with a more quick fense, admonisher hus, according to its office and duty, of that danger which is ready to scile upon the bones, unless it be prevented. Wherefore we will conclude according to the truth of the thing, that there is no part in our body fimple, but only force are so named and thought, according to the sense; although also otherwise force may be truly named Simple, as according to the peculiar and proper flesh of each of their. The combined is the parts are called Compound, which are made or composed by the mediation, or imposed or organizately of these simple, which they term otherwise organizat, or instrumental; as an arm, leg.

And here we must observe, that the parts are called simple and similar, because they cannot be divided into any particles but of the same kind; but the compound are called dissimilar from the quite compound. quite contrary reason. They are called infrumental and organical, because they can perform such actions of themselves, as serve for the preservation of themselves and the whole; as the eye of it actions of themselves, as serve for the preservation of themselves and the whole; as the eye of it self, without the affiltance of any other part, seeth, and by this faculty defends the whole body, as which cannot of it self perform that act. Whereby we must understand, that in each instrument at the coats, part we must diligently observe four proper parts. One by which the action is properly performed, as the Crystalline himor in the eye. Another, without which the action cannot be performed, as the nerve and the other humors of the eye. The third, whereby the action is better and the other humors of the eye. The fourth, by which the action is true. formed, as the nerve and the other humors of the eye. The fourth, by which the action is pre-more conveniently done, as the tunicles and mufcles are. The fourth, by which the action is pre-ferved, as the eye-lids and circle of the eye. The fame may be faid of the hand, which is the proper inframent of holding; for it performs this action, First, by the muscle, as the principal part; econdly, by the ligament, as a part without which fuch action cannot be performed. Thirdly, by secondly, by the ligament, as a part trade of these parts, the action is more happily performed; the bones and nails, because by the benefit of these parts, the action is more happily performed; Fourthly, by the veins, arteries and skin, for that by their benefit and use, the reft, and so confe-

But we must consider, that the instrumental parts have a fourfold order. They are faid to be Four forts of of the first order, which are first and immediately composed of the simple, as only the authors of inframental forme one action, of which kinds are the muscles and vessels. They are of a second, which constitute of these seconds are the first order. of these first simple, and others besides, as the singers. They are counted of the third rank, which are

parts are nine.

are composed of parts of the second order, and some besides, as the hand taken in general. The fourth order is the most composed, as the whole body, the organ and instrument of the Soul. you must observe, that when we say, the muscles and vessels are simple parts, we refer you to the sense and sight, and to the understanding comparatively to the parts which are more compound; but if any confider their effence and conflitution, he shall understand they are truly compound, as we faid before. Now it remains, that we understand, that in each part, whether simple or com-Nine things to pound, nine things are to be confidered; as, fublitance, quantity, or magnitude, figure, composition, number, connexion, (by which name, we also understand the original and intertion) temperature, action and use; that by the confideration of these things, every one may exercise the Art of Phytick, in preferving health, curing difeases, or foreseeing their events and ends.

Why the three principal parts are so called.

But also we must note, that of the organical parts, there be three, by whose power the body is governed; which for that cause they call regent and principal, because they govern all the rest; they are the Liver, Heart, and Brain. But they are called principal, not only, because they are necessary for life, (for the stormach, wind-pipe, lungs, reins, bladder, and such like parts perhaps are equally as necessary for life;) but because from each of these three, some force, power and faculty, or also matter necessary for the whole body, flow over all the body, when no such thing proceeds from the rest of the parts. For from the Liver a matter set for nourishment is distributed by the veins through all the body; from the Heart the vital force, disfused by the arteries, imparts life to the whole body; from the Brain by the nerves a power or faculty is carried through all the parts

of the body, which gives them sense and motion. Lib. de arte me-

Galen would have the Telticles to be of this kind, not for the necessity of the individual, or peculiar body, but for the prefervation of the Species or kind. And moreover, in his Book de Semine, comparing the Testicles with the Heart, he makes them the more noble by this reason, that by how much it is better to live well and happily, than fimply and absolutely to live, by so much the Testicles are more excellent than the heart; because with them we may live well and pleasantly, but with this famply live; as we see by the example of Eunuchs, and such as are gelt, by which the Tetticles seem rightly to be accounted amongst the principal parts; for Nature seeing it desired, that this its work should be immortal, for the attaining of that immortality which it intends, frames those parts, like as prudent founders of a City, who do not only procure to furnish their City with many Inhabitants, so long as they are in building it, but also that it may remain in the same state and condition for ever, or at least for many ages. And yet notwithstanding of so many Cities built in the first memory of man, there remains none, whose same and state, together with the Builders name, is not decayed and perished. But this humane work of nature, fiands yet fecure for these many thousand of years, and shall endure hereafter; because it hath found a way, by which every one may fubfittute another in his place before he depart. Hence it is, that all Creatures have members fit for generation, and pleafures inferted in those members, by which they might be entited to mutual embraces and copulations. But the mind, which hath dominion over those members, hath an incredible defire of propagating the iffue; by which also brute Beasts incited, defire to propagate their kinds for ever. For seeing that Nature understands, all these her works considered particularly by themselves, are frail and mortal, it hath done what it could to recompence that fatal necessity of dying, by a perpetual fuccession of Individuals.

Hitherto we may feem to have abundantly shewed what necessity of knowledge in Anatomy belongs to all Artizans in Phyfick, and also what order is to be observed in the same; and lastly, how it is defined, and the reason of the parts of the definition. Wherefore it remains that we prosecute what we have taken in hand; which is, that we shew and declare how to know all and every the parts of mans body, how many, and what they be, and to understand wherefore they be. For although the true knowledge of Anatomy may be perfected by the fight of the eye, and touching and handling each part with the hand, yet nevertheless the labour of describing Anatomy is not unprofitable. For by reading, such as have often exercised themselves in the diffecting of mens bodies, may refresh and help their memories; and such as have not, may make plain and easie the way to the understanding of Diffections.

CHAP. I.

The division or partition of mans Body.

Y reason the partition of mans body can hardly be understood, if the distinction of the proper faculties of the foul be not understood, for whose cause the body enjoys that form (which we fee) and division into divers Instruments: Therefore I thought good in few words to touch that distinction of the faculties of the foul, for the better understanding of the partition of the body, which we intend. Wherefore the foul, the perfection of the body, and beginning of all its functions, is commonly diffinguished, and that in the first and general division, into three faculties, which are, the Animal, Vital and Natural. But the Animal is divided into the principal, sensitive and motive: Again, the Principal is diffinguished into the imaginative, reasonable and memorative: And the Senfitive into feeing, hearing, finelling, tafting, and touching: But the Motive into progreflive and apprehensive. And the Vital is divided into the dilative and contractive faculty of the heart and arteries, which we know or understand by the pullifick faculty. But the Natural is parted into the nutritive, auctive, and generative faculties; which three perform their parts by the help and ministry of five other faculties, which are, the attractive, retentive, con-coctive, affimilative and expulsive.

The use and function of the pares ferving for generation.

What the Soul how many faculties it is

After the felf-fame manner, the organ or infirument of the foul, to wit, man's body, at the first All the parts division is diffinguished into three parts, which from their office they call Animal, Vital and Names body are diffinguished. tural. These again, according to the sub-division of the subalternal faculties, are divided par-into shree. ticularly into other parts; fo that any one may know the organ of each faculty, by the property of the function. For, while other Anatomitts divide man's body into four universal and chief parts, they diffinguish from the three first, those which they call the Extrematies; neither do they teach, to what rank of the three prime parts each Extremity should be reduced. From whence many dif-

to what rank of the three prime parts each Extremity inould be reduced. From whence many difficulties happen in reading the writing of Anatomifts; for flunning whereof, we will profecute, as we have faid, that diffinction of man's body, which we have touched before.

Wherefore, as we faid before, man's body is divided into three principal and general parts, Animal, Vital, and Natural. By the Animal parts, we understand, not the parts pertaining to the head, which are bounded with the crown of the head, the collar-bones, and the first Vertebra of the head, the staff that also the arresponding the parts and influences of the least that also the arresponding the parts are here called Animal. the breaft, but also the extremities, because they are organs and influments of the motive-faculthe breatt, but also the extrematies, because they are organs and initialments of the motive-facul-ty; Hippocrates feems to have confirmed the fame; where he writes, Thole who have a thick and Lib.6.Epid. great heads, have also great bones, nerves, and limbs. And in another place he saith, those who have great heads, and, when they stoop, shew a long neck, such have all their parts large, but chiefly the Animal. Not for that Hippocrates would therefore have the head the beginning and cause of the magnitude and greatness of the bones and the rest of the members; but that he might they the consilier, and private extracts. thew the equality, and private care, or government of Nature, being most just and exact in the fabrick of man's body, as, if the hath well framed the head, it thould not be unlike that the idly or carelessy neglected the other parts which are less seen. I thought good to dilate this passage, less any might abuse that authority of *Hippocrates*, and gather from thence, that not only the bones, membranes, ligaments, grifles, and all the other animal parts, but also the veins and arteries depend on the head as the original. But if any observe this our distinction of the parts of the body, he will understand, we have a far other meaning,

By the Vital parts, we understand only the heart, arteries, lungs, wind-pipe, and other particles what parts annexed to these. But by the Natural, we would have all those parts understood which are con- are called tained in the whole compass of the Perioneum or Rim of the body, and the processes of the Ery- vital.

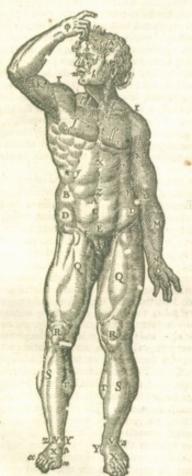

Those description of the Testical Control of the Perioneum of the body and the processes of the Ery- vital.

Those description of the Testical of the Perioneum of the body and the processes of the Ery- vital.

**Those description of the Testical of the Testical of the Perioneum of the Perione call Containing; they must be reckoned in the number of the Animal, which notwithstanding, we must thus divide into principal, fensitive, and motive; and again, each of these in the manner sol-lowing: For first, the principal is divided into the Imaginative, which is the first and upper part of the brain, with its two ventracles, and other armexed particles, into the reasoning, which is a part of the brain, being under the solution of the animal parts. the brain, lying under the former, and (as it were the top thereof with its third ventricle; into the Memorative, which is the eerebellum or after-brain, with a ventricle hallowed in its fibifiance. Secondly, The Sentitive is parted into the vifive, which is in the eyes; the auditive in the ears; the finelling, in the nofe; the tasting, in the tongue and palat; the tactive, or touching which is in the body, but most exquisite in the skin which invests the palms of the hands. Thirdly, the motive is divided into the Progressive, which intimates the legs; and the Comprehensive, which intimates the hands. Laftly, into imply-motive, which are three parts, called bellies, for the greatest part terminating and containing; for the Vital; the instrument of the faculty of the heart, and dilatation of the vital. the arteries, are the direct or fireight fibers, but of the Confirictive the transverse; but the three kinds of the of fibers together, of the Pullifick': Or, if you please, you may divide them into parts serving for parts. Respiration, as are the lungs and weazon, and parts serving for vital motion, as are the heart and arteries, furnished with these sheers, which we formerly mentioned. The division of the natural of the natural parts remains, which is into the nourithing, auctive, and generative, which again, are diffributed into attractive, universal and particular retentive, concochive, distributive, assigning and expellive. The attractive, as the gullet and upper orifice of the ventricles the retentive, as the particular recentive, as the body of the ventricle, or its inner coats, the distributive, as the three small courses, the expelliper as the three small courses. ner coat; the diffributive, as the three finall guts; the expullive, as the three great guts; we may fay the fame of the Livers for that draws by the metaraick and gate-veins, retains by the may fay the fame of the Liver; for that draws by the mefaraick and gate-veins, retains by the narrow orifices of the veins dispersed dirough the substance thereof; it concocts by its proper fields; distributes by the hollow vein, expels by the spleen, bladder of the gall, and kidneys. We also see the parts in the Testicles divided into as many functions; for they draw by the preparing vessels; retain by the various crooked passages, in the same vessels they concoct the feed by the power of their proper substance and faculty; they distribute by the esculatory, at the glandules called Prostate, and the horns of the womb, supplying the place of prostates: Lassly, they particular attraction, retention, concoction, distribution, assumation of each part, that depends of the particular temper, and, as they term it, occult property of each similar and simple part, ed by the assistance of the three forts of fibers; but the special, by the several are performing to their field, arising from their temperature, which we may call a specifick property. Now ty of their fleth, ariting from their temperature, which we may call a specifick property. Now ty of their fleth, ariting from their temperature, which we may call a specifick property. Now in the composition of man's body, Nature principally aims at three things. The first is, to create parts necessary for life, as are the heart, brain, and liver. The second, to bring forth other for the better and more commodious living, as the eyes, nose, ears, arms and hands. The third is, the better and more commodious living, as the eyes, note, ears, arms and hands. The third is, for the propagation and renewing the *species* or kind, as the privy parts, tefticles and womb. And this is my opinion, of the true diffinction of man's body, furnished with fo many parts, for the performance of fo many faculties; which you, if you pleafe, may approve and follow. If not, or many follow the common and vulgar, which is, into three bellies or capacities, the upper, without many following the head, head, and lower belly) and the limbs or solute. In which, by head, which is the head, head and lower belly) and the limbs or solute. middle, lower, (that is, the head, breaft, and lower belly) and the limbs or joints. In which, by body, the head we do not understand all the Animal parts, but only those which are from the crown

of the head to the first vertebra of the neck, or to the first of the back; if, according to the opinion of Galen, Lib. de Offibus, where he makes mention of Enarthrofis and Arthrodia, we reckon the neck amongst the parts of the head. By the breast, whatsoever is contained from the collar bones to the ends of the true and bastard, or short ribs, and the midriff. By the lower belly, the rest of the trunk of the body, from the ends of the ribs to the share-bones; by the limbs, we understand the arms and legs. We will follow this division in this our Anatomical Discourse, because we cannot follow the former in diffecting the parts of mans body, by reason the Animal parts are mutually mixed with the Vital and Natural: And first of the lower belly.

YY The inner ankles, σφυρά ZZ The outward ankles. α α The toes of the feet. ε The place under the inner ankle, where the vein called Saphena is opened.

Why the belly is not bony.

Nature would not have this lower belly bony, because the ventricle might be more easily dilated by meat and drink, children might grow the better, and the body be more flexible. It is convenient we begin our Anatomical Administration from this; because it is more subject to putrefaction than the rest, both by reason of its cold and most temperature, as also by reason of the feculent excrements therein contained. Yet before we go any further, if the Anatomical Administrations

I.

In every of which three parts there be two lateral or fide-parts to be confidered, as in the Epi- The Hypersimide, the right and left Hypersimide, which are bounded above and below, in the compass of the drid. midriff, and the flort-ribs. In the umbilical the two Lambares (forme call them Latera fides) which, on both fides from the lowest parts of the breast, are drawn to the flanks or hand-bones; the two His. or flanks bounded with the brack and the characteristics. in the Hypogostrium, the two Ilia, or flanks bounded with the hanch and share-bones. Neither am In the Hypogajimon, the Hia, or flanks, which the Greeks call Λα, 6ες, fignific all the empty parts, from the ends of the ribs, even to the hanch-bones, whereupon they also call them Kondris, as if you the chas of the ribs, events, as it you should fay, empty-spaces, because they are not encompassed with any bone. Yet I thought good, thould fay, empty-spaces, because they are not encompanied with any bone. Yet I thought good, that this doctrine of dividing the belly should be more distinct, to call the parts which are on each fide the navel, Lumbures, and those on the lower parts of the lower belly, Hiz, slanks. But we must observe, that the Ancients have been so diligent in deciphering the containing parts, that as exactby as might be, they defigned the bowels contained in the belly, which being divers, lie in fundry places; for the greater portion of the liver lies under the right Hypocondrium, under the left almost all the ventricle and spleen. Under the Epigastrium the lower orifice of the ventricle, and the

fmaller portion of the liver; in the Lumbares, or fides, in the right and upper part the right kidney; in the lower part towards the flank, the blind gut; in the middle part thereof the collick and empty guts. In the upper part of the left fide lies the Kidney, in the middle part, the reft of the empty and colick guits. Under the region of the navel, lies the girdle or upper part of the kall, the colick-gut thrufting it felf also through that way. Under the Ilia, or flanks, the right and left, lie the greater part of the gut, Ilean, the horns of the women big with child, and the spermatick vessels in men and women. Under the Hypogastrium in the lower part lies the right, or strait gut, the bladder, womb, and the reft of the kall.

note of the part affected by the place where the pain is.

If we know, and well underfiand thefe things, we shall more easily discern the parts affected by the place of the pain; and cure it by fit application of remedies, without the hurting of any part. The diffinction of fuch places, and the parts in those places, as seeming most profitable, I have thought good to illustrate by the placing the two precedent figures, in which thou hast deciphered, not only the forefaid parts, containing and contained, but also of the whole body, and many other things which may feem to conduce to the knowledge of the mentioned parts.

CHAP. II.

Of the containing parts of the Epigastrium, and the preparation to Anatomical Administration.

The contain ing parts of the belly.

He containing parts of the Epigastrium, are the Epidermis, or thin outward skins the true skins the stelly or fatty Pannicle, the eight muscle of the Epigastrium, with their common coat, the rim of the belly, the five vertebra's of the lours, all the holy-bone, the hanch-bone, thare-bone, the white-line and midriff. Of these parts, some are common to the whole body, as the three first; the other, proper to the parts contained in the Epigastrium taken in general. Which that you may fee in their order, first you must cut round about the navel, to the upper superscients of the muscles, that so we may keep it, till such time, as occasion shall offer it self, to thew the umbilical vessels lying in that place, which are one vein, two arteries, and the Urashw (if it be there.) Which being done, you must draw a strait line from the chest, over the breast-blade, even to the share-bone, which may divide the common-containing parts, even to the white line.

Then presently it will be convenient to draw two other lines a-cross or overthwart, of the like depth on each hand, from the circumference of the navel, even to the fides, that so on each part we may draw the skin more commodiously from the parts lying under it; the fight of which otherwise it would hinder. These things being done, the skin must be divided from the parts lying under it from the defigned circumference left about the navel. We must teach how the skin is twofold, true and falfe, and render a reason of the name, which we will every where do, as far as the thing will fuffer, and it shall lie in our power. And in doing or examining these things, it will be convenient diligently to enquire into the nine things mentioned in the Preface. We will begin with the skin, because that part is first obvious to our senses.

CHAP. III.

Of the samost Skin or Cuticle.

The skin twofold, From what parts the skin cannot be feparated.

He skin being the first part, and spred over all the body, is twofold, that is, the true, and baffard skin: The true is called by the Greeks Derma, which may almost every where be pulled from the parts lying under it, which it invests, except in the face, ears, the palms of the hands, foles of the feet, fingers, and privities, where it flicks fo close that it cannot be separated, The baftard skin (which first of all we will declare, because it first presents it felf to our light) is

by the Greeks called Epidermis, because it covers the true skin, they term it commonly the Cuticle. The fubliance of it is excrementitions, and (as it were) a certain dry flouring, or production of the The fubliance of it is exercine particular, and (as it were seed, is apparent by this, that as it is eafily loft, fo it is eafily repaired, which happens not in parts truly spermatical. This outmost thin skin, or The matter fo it is eafily repaired, which happens not in parts truly fpermatical. This outmost thin skin, or of the Cuticle, may two manner of ways be made apparent; by it felf, and separated from the other, as by burning with fire, or ardent heat of the Sun (in fome delicate bodies, and fuch as are not accufromed to be converfant in Sun-shine.) The quantity in thickness is very small, but the extent is most large, because it covers all the skin. The figure of it is round, and long, like those parts which it invefts. The composure of it is obscure; yet because this Cuticle is the excrement of the true skin, we say it hath its matter from the excrementitious superfluity of the Nerves, Veins, Arteries and Substance of the true skin.

The number.

The compo-

fure.

The quantity. The figure.

The tempera-

It is in number one, like as the true skin which it outwardly covers, that it might be a medium between the object and fixed ficulty of Touching, diffused over all the true skin, which every where lies under it. For the temperature, by the common confent of Phylicians, it is in the midft of all excess; for, that seeing it is the medium between the object and faculty, if it should be hotter, colder, moither, or drier, it would deceive the faculty by exhibiting all objects, not as they are of themselves, but as it should be; no otherwise than as to such as look through red or green spectathemselves, but as it mound be; no otherwise than as to taken as sook shough red or green spectacles, all things appear red or green. Wherefore for this reason it was convenient the Guticle should be void of all sense. It hath no action in the body, but it hath use; for it preserves and beautifies the true skin, for it seems to be given by the singular indulgence of nature, to be a muniment and ornaments to the true skin. This Providence of Nature, the industry of some Artizans, (or rather Curtizans) doth imitate; who, for to feem more beautiful, do fimooth and polish it.

The ufc.

By this you may understand, that not all the parts of the body have action, yet have they their use, Why the Cabecause, according to Aristate's opinion, Nature hath made nothing in vain. Also you must note, be reflored in that this thinskin or Cuticle being loft, may every where be regenerated, unless in the place which fears, is covered with a fear. For here the true skin being deficient, both the matter and former faculty of the Cuticle is wanting.

CHAP. IV.

Of the true Skin.

He trueskin, called by the Greek Derma, is of a Spermatick substance: Wherefore being The substance. once loft, it cannot be reflored as formerly it was. For in place thereof comes a fear, which Magnizade. is nothing elfe but fleth dried beyond measure. It is of sufficient thickness, as appears by the separating from the flesh.

But for the extent thereof, it encompasses the whole body, if you except the eyes, ears, nose, privities, fundament, mouth, the ends of the fingers where the nails grow, that is, all the parts by which any excrements are evacuated. The figure of it is like the Cuticle, round and long, with Figure.

which any excrements are evacuated. The figure of it is like the Cuticle, round and long, with Figure. its productions, with which it covers the extremities of the parts.

It is composed of nerves, veins, arteries, and of a proper flesh and substance of its kind, which we Composed have faid to be spermatical, which artiseth from the process of the secundine, which lead the spermatick vessels even to the navel; in which place each of them into parts appointed by Nature, fend forth such vessels as are spred abroad and distused from the generation of the skin. Which also, the similarde of them both, that is, the skin and membrane Cherian, do argue. For as the Cherian is double, without sense, encompassing the whole Infant, lightly fastened to the sirst coat, which is called Amaior; so the skin is double, and of it self insensible (for otherwise the nerves were added in vain from the parts lying under it) ingirting the whole body, lightly cleaving to the slethy Pannicle. But if any object, That the Cuticle is no part of the true skin, seeing it is wholly different from it, and easily to be separated from it, and wholly void of sense: I will answer, These Arguments do not prevail. For, that the true skin is more crass, thick, sensible, vivid and steshy, is not from it, and eafily to be feparated from it, and wholly void of tente: I will answer, These Arguments do not prevail. For, that the true skin is more crafts, thick, fenfible, vivid and fleshy, is not felf is void of of it felf, being rather by the attiffance and admixture of the parts, which derived from three principal it receives into its proper fubflance; which happens not in the Cuticle. Neither, if it flould happen, would it be better for it, but verily exceeding ill for us, because so our life should lye int and open to receive a thousand external injuries, which encompass us on every side, as the violent and contrary access of the four first qualities

There is only one skin, as that which should cover but one body; the which it every-where doth, Connexion. except in those I formerly mentioned. It hath connexion with the parts lying under it by nerves, weins and arteries, with those subjacent parts put forth into the skin investing them, that there

may be a certain communion of all the parts of the body amongst themselves. It is cold and dry in its proper temper, in respect of its proper flesh and sabitance, for it is a sper-matical part. Yet, if any consider the sinews, veins, arteries, and sleshy threds which are mixed in its body, it will feem temperate, and placed (as it were) in the midit of contrary qualities, as which hath grown up from the like portion of hot, cold, moift and dry bodies. The ufe of the skin is to keep fafe and found the continuity of the whole body, and all the parts thereof, from the violent affault of all external dangers; for which cause it is every where indued with sense, in others more dull according to the dienity and peceffity of the parts which it ingirts. more exact, in others more dull, according to the dignity and necessity of the parts which it ingirts, that they might all be admonished of their safety and preservation. Lastly, it is penetrated with many pores, as breathing-places, as we may see by the flowing out of sweat, that so the arteries in their diastole might draw the encompassing air into the body, for the tempering and nourishing of the fixed inbred heat, and in the systole expel the fulliginous excrements, which in Winter, supposed The resson by the cold air encompassing us, makes the skin black and rough. We have an argument and exwint the Mother, who without respiration live only for some pretty space by transpiration. the Mother, who without respiration live only for some pretty space by transpiration.

CHAP. V.

Of the fleshy Pannicle.

Fter the true skin, follows the Membrane, which Anatomifts call the flefhy Pannicle, whose what a Mem-A Fter the true skin, follows the Membrane, which Anatorians can the nearly Pannicle, whose what a Membrane that we may more easily profecute and declare, we must first shew what a Membrane is brane is, and how many ways the word is taken; then, wherefore it hath the name of the Whyix is she Pannicle. A Membrane therefore is a simple part, broad and thin, yet strong and dense, called a contrast to making the which may easily, without any great danger, be extended and contrasts considered. flethy Pannicle. A Memorane therefore is a number party broad and thin, yet litrong and denfe, called a cost, white and nervous, and the which may eafily, without any great danger, be extended and contractformerimes the contracts in its called a Coat, which is, when it covers and defends fome part. This is called flethy and flethy and the country and design and defends for party. the Pannicle; because in some parts it degenerates into flesh, and becomes musculous, as in a man sary Panithe Pannicle; because in some parts it degenerates into ment, and becomes muscusous, as in a man only taken from the collar-bones, to the hair of the head, in which part it is therefore called the broad muscle, whereas in other places it is a simple Membrane, here and there intangled with the fat lying under why beasts it, from whence it may seem to take or borrow the name of the farty Pannicle. But in Beasts have this Pannicle it took that name, because in those a fleshy substance maketh a great part of this Pannicle) nicle wholly include the product of the pannicle in the pannicle it appears manifestly stelly and musculous over all the body, as you may see in Horses and Oxen, stelly or must that by that means being moveable, they may drive and shake off their flies, and other troublesome

The flibflance.

things, by their shaking and contracting their backs. These things considered, we say, the stelly Pannicle in its proper body, is of a nervous or membranous fubflance, as that which hath its original from the coat Amnios (which is next to the Infant) dilated near to the navel, and stretched forth for the generation of this Pannicle; in which thing I think good to note, that as the membranes Chorion and Amnios naturally interwoven with fmall nervous fibers, encompals and inveft the child as long as it is contained in the womb; so the skin and the fleshy Pannicle, knit together by such like bands, engirt the whole body.

tude & figure.

Therefore the fleshy Pannicle is equal in magnitude and like in figure to the true skin, but that it lies under it, and is contained in it, in some places mixt with the far, in others increased by the slich interwoven with it, and in some other is only a simple Membrane.

Number. Composure.

The composition of it is such, as the sight of it presents to our eye, that is, of veins, arteries, nerves, and the proper slesh, some whites mixed and interlaced with fat, and sometimes with musculous flesh. It is but one, by reason of the use we shall presently shew; it is situated between the skin and fat, or common coat of the mufeles, annexed to thefe, and the other parts lying under it, by the veins, nerves and arteries, afcending from these inward parts, and implanting themselves into the fubfiance thereof, and then into the true skin.

The temperature thereof is diverse, according to the variety of the parts interwoven with it. The use of it is, to lead, direct and strengthen in their passage, the vessels which are disseminated into the true skin, and the whole superficies of the body. But in Beasts it hath another commodity, that is, it gives a thaking or trembling motion to their skin and back, for that cause which we former-

cause of fat.

CHAP. VI.

Of the Fat.

He Fat coming near the condition of an excrement, rather than of a part (as we faid, when we treated of the fimilar parts) is of an oily fuftance, bred of the airy and vaporous portion of the blood, which fweating through the pores of the coats, or mouths of the veifels, becomes concrete about the membranes, and nerves, and cold bodies, and turns into fat by the cold-ness of the place. Whereby we may know, that cold, or a more remiss heat, is the efficient cause The substance, of fat, which is manifest by contemplation, not only of creatures of divers kinds, but also by those of the fame species and fex, if so be that the one be colder than the other.

By which we may understand, that the fat is the more or less in quantity, according to the dif-The compofiste.

The fite, that portion of the blood which we formerly mentioned, intermixt with certain membranes, nerat the opening common coat of the Mufcles.

Otherwife it is diffused over all the body, in fome places more,

of a Body, Feb. in forme left, and the persons had its particular parts. For its composition, it confists of
the fitter with certain membranes, nerat the opening common coat of the Mufcles.

Otherwife it is diffused over all the body, in fome places more, in fome lefs, yet is always about the nervous bodies, to which it delights to cleave. Most Anatomifts enquire whether the fat lie above or beneath the fleshy Pannicle. But me-thinks, this question is both impertinent and idle; being we often fee the fat to be on both fides. (a) It is of a middle temper between heat and cold, being it arifeth of the more airy portion of the blood; although it may feem cold in respect of the efficient cause, that is, of cold by which it concretes. For the reft, moissure is predominant in the fat. (b) The use thereof is, to moissen the parts which may become dry by long fafting, vehement exercife, or immoderate heat; and befides, to give heat, or keep the parts warm. Although it do this last rather by accident, than of its own nature, as heated by exercise, or by some such other chance; it heats the adjacent parts, or may therefore be thought to heat them, because it hinders the diffipation of the native and internal heat; like as cold heats in Winter, whereby the bellies are at that time the hotter. I know, fome learned Phylicians of our time fiffly maintained, that the fat was hot; neither did they acknowledge any other efficient cause thereof, than temperate heat, and not cold. But I think it best to leave the more subtil agitation of these questions to natural Philosophers. But we must note, (e) that at the joynts which are more usually moved, there is another fort of fat, far more folid and hard, than that which we formerly mentioned, often found mixed with a vifeid and tough humor like the white of Eggs, that so it might be sufficient for a longer time to moisten these parts, subject to be hurt by driness, and to make them flippery, and so fitter for motion; in imitation whereof they usually greate hard bodies, which must be in frequent motion, as Coach-wheels and Axletrees. And there is another kind of far, which is called Schoon, fearn, in one thing differing from the ordinary fat, that it is much drier; the moifter and fofter portion of the fat being diffapated by the raging hear of the place. For it is found principally about the (d) Midriff, where there are many windings of arteries and veins; and it is also about the reins, loins, and bafur of the heart. The fat is wasted by long faiting; is dried and hardened by vehement exercise, and immoderate heat. Hence it is, that it is much more compact in the palms of the hands, and foles of the feet, about the eyes and heart, fo that it refembles the flesh in density and hardness; because by the continual motion and strong heat of these parts, the thinner portion being diffipated and diffused, the more gross and terrestrial

and five inches: which I thought good to remember in this place, both for the rarity of the thing, as also because it was increased by report, and the place miftaken; some faying the Oscutam or

Kall was fo thick, which was false; for it did not much exceed of that part, in other fit men. remains. (a) The Tem-

per, (6) The use, (a) The solider fat or seam, (d) In what parts, and for what cause the fat is more dense.

CHAP. VII.

Of the common Coat of the Mufeles.

Ext under the fat, appears a certain coat, spread over all the muscles, and called the com- The substance mon coat of the mulcles; it is of a nervous fubflance, as all other membranes are. The The quantity quantity and breadth thereof is bounded by the quantity of the mufcles which it involves, and fits it felf to, as that, which encompasses the muscles of the Epigastrium, is of equal largeness with the same muscles. The figure of it is round: it is composed of verns, nerves, arteries, and its peculiar flesh confishing of three forts of fibers; the beginning of it is from the Periodeum, in that part where the bones give ligaments to the mufcles; or, according to the opinion of others, of the nervous and ligamentous fibers of the muscles, which rifing up, and diffused over the flethy superficies thereof, are united for the generation of this coat. But this membrane arising from the Periosteum (as The original every membrane which is below the head, takes its original from the Periosteum either primarily, by the interpolition of no medium, or fecondarily) is firetched over the mufcles by their Tendons. But if any object, that this membrane, pluck'd from the belly of the mufele, may feem to end in a ligament: I will answer, that it is the condition of every nervous part, so to bind or fatter it fels to another part of his own kind to flay, fo that it can fcarce be pluck'd from thence. We fee the The number. proof hereof in the Peritoneum or rim in the Epigastrium, or lower part of the lower belly. That which covers the mufcles of the Epigastrium, is but one, unless you had rather part it into two, the right and the left distinguished by the interposition of Linea Alba, or White-Line. It is situate be. The fac. twixt the fat and the mufcles; for it is faftened above and below to these parts with fibers, which in finalness and finences exceed the Spiders web. But by its vessels, it participates with the three principal parts, and is of a cold and dry temper. The use of it is, to contain the muscles in their na- The use. tural union, and to keep them, as much as in it lies, from putrefaction, which may happen to them from pass or matter, which is often cast forth of the similar parts into the empty spaces and distances of the muscles. Wherefore going about to separate the fat of the Epigaltrium (where you must begin the dissection of mans body) you must have a care that you hurt it not with your knise, but that, before you touch the muscles, see you artificially take it away, that you may the more easily feparate the mufcles, lying under it, diftinguished by a manifest space at the White-Line, which is What the made by the meeting together of the proper coats of all those muscles.

CHAP. VIII.

What a Muscle is, and how many differences there be thereof.

Muscle is the inftrument of voluntary motion; and simple voluntary motion is performed fix manner of ways, upwards, downwards, forwards, backwards, to the right hand, and to the left; but the compound one way, which is circularly, the which is performed by the continual fuccession of the motion of the musicles ingirting the part. Such a motion Fal- slow the circoners as when they firetch forth their hand, and have their Hawk. We have some parts, which calar motion have motion without a musicle, but they motion is performed. have motion without a mafele, but that motion is not voluntary; fuch parts be, the heart, itomach, guts, both the bladders, (that is, that of the gall, and that of the urine) and divers other which have the motions of attraction, expulsion, and retention, by the means of the three forts of n-bers; for they draw by the right, expel by the transverse, and retain by the oblique. The dif- From whence ferences of mufcles, which are many and diverse, are taken from their substance, original, infer-the differences tion into the part which they move, form or figure, holes or openings, magnitude, colour, fite, kind of fibers, their conjugation or connexion, heads, bellies, tendons, opposition in action and office. Some in subfrance are nervous, venous, arterious; because they have manifest nerves. Differences of muscles from veins, and arteries; as the Midriff, the Intercollal, or Epigaffrick mufeles, and many more, and that for their difference from other mufeles, into which neither nerve, nor vein, or arteries are flance. manifelly inferted, although fecretly they admit them all for fense and motion, life, and nou-rishment; such are the muscles of the wrist, the wormy muscles of the hands and teet; for if there be any nerves observed in them, they are very small. Some had rather make the difference of muscles thus, that some of them are fleshy, some nervous, others membranous. From their original; some arise from the bones, as those which move the hands, arms and legs; others from muscles from prifles as the muscles of the threat others, from membranes which invest the tendens are the third erion. grifles, as the mufcles of the throat; others, from membranes which invest the tendons, as the their original. wormy muscles of the hands and feet sothers from ligaments, as the extenders of the fingers; others, from other muscles, as the two lower muscles of the Yard which proceed from the Sphineter muscle of the fundament. Others have no original, as, the membrane, which we call the flethy Pan-nicle, assumes flesh in certain places, and degenerates into a muscle; such are the Cromster, or hang-ing muscles of the testicles, the large muscles of the face; and if you please, the midriff as that which is composed of two coats; the ope, encompassing the ribs and the Pernoneum, hath sless in the midst between the two membranes. And moreover, feme mufcles have their original from one only bone, between the two membranes. And moreover, there arise of many bones, as the oblique descending, as those which bend and extend the cubit; others arise of many bones, as the oblique descending, the Dorfal, and many muscles of the neck, which arise together from many spondyls, and sides of fpondyl. There be others, according to the opinion of forme men, both from the bones and grifles of the Pubis at the right or direct mufcles of the Epigafrium, yet by their favour I think other-wife. Because by the Anatomical and received axiom, A muscle is there thought to take his be-muscle but ginning, from whence he receives a nerve; but these muscles take a nerve from the intercostal in original.

Differences of muscles, wherefore their original ought to be referr'd to the fides of the breast-blades, as shall be shewed in due place. From their insertion arise these differences; some are inserted into a bone, as those which move the head, arms, and legs; others into a grifle, as those of the Throtle, eye-lids, note, and the oblique afcendent muscles of the Epigastrium; forme into a bone and grifle both, as the right muscles of the Epigastrium and the midriff: Some into the skin, as the muscles of the lips; others into the coats, as the mufcles of the eyes; others into ligaments, as the mufcles of the yard. But these differences following may be drawn both from their infertion and original. For some muscles arising from many parts, are inserted into some one part, as divers of those which move the arm and the shoulder, which arising from many spondyls, are inferted into the bone of the shoulder, der, and the shoulder-blade. Others arise from one part, and insert themselves into more, as, those which arise from the bottom of the shoulder-blades are extended and inserted into some eight or nine of the upper ribs, to help respiration; and the benders and extenders of the singers and toes: Others, arifing from many bones, are inferted into as many, as forne of those which serve for respiration, to wit, those which we call the hinder Saw-muscles, and the Somissians, which sends a tendon into all the ribs. Others have their original from many bones, and end in grifles of the feven ribs, as those two which lie under the Sternen. Moreover, also these differences of muscles may be drawn from the original and infertion, that fome proceed from bones, and are inferted into the next bone, to help and firengthen the motion thereof, as the three mufcles of the hip; Others arise from an upper bone, and are not inferted into the next, but into fome other, as the long mufcles. Some are named from the part they move, as the temporal mufcles, because they move the temples: Others from their office, as the grinding mufcles; because they move the skin as a Mill, to grind afunder the meal. From their form or figure; because some are like Mice, other like Lizards which have their Differences of Differences of muscles taken legs cut off; for that they imitate in their belly, body, or tendon, the belly or tail of fuch creatures; from their and from whence the name of Musculus and Lacertus are divided. Such are those which bend the wrift, and which are fathened to the bone of the leg, and which extend the foot; others are triangular, as that which lifts up the arm, called Epomis or Deltoider, and that which draws the arm to the breaft, called the pectoral muscle. Others quadrangular, as the Rhomboides, or Lozenge-muscle of the shoulder-blade, and the two hindsom-muscles serving for respiration, and two of the wrists which turn down the hand; others conful of more than four angles, as the oblique descending, and that muscle which joyns it self to it from the shoulder-blade; others are round and broad, as the midriff; others circular, as the Sphincter-mufcle of the fundament and bladder; others are of a pyramidical figure, as the feventh mufcle of the eye, which compaffes the optick nerve in beafts, but not in men; others have a femicircular form, as that which thuts up the eye, feated at the leffer corner thereof; others refemble a Monk's cowl, or hood, as the Trapezius of the shoulder-blade Befides, others at their first original are narrow, but broad at their insertion; as the Saw-muscle of the shoulder, and the transverse of the Epigastriam; others are quite contrary, as the three muscles of the hip; others keep an equal breadth or bigness in all places, as the intercostal muscles and those of the wrist; others are long and slender, as the long muscle of the thigh; others are long and broad, as the oblique defeending mufcles of the Epigastrium; others are directly contrary, as the Intercoftal, which are very narrow. From their perforations; for fome are perforated, as the midriff, which hath three holes, as also the oblique and transverse of the Epigastrium, that so they may give paffage forth to the preparing spermatick veffels, and to the ejaculatory veffels, the coat Erythroides affociating and firengthening them; others are not perforated. From their magnitudes for fome are most large, as the two mulcles of the hip; others very small, as the eight small muscles of the neck, and the proper muscles of the Throtle, and the wormy muscles; others are of an in-different magnitude. From their colours for some are white and red, as the temporal muscles, which have Tendons coming from the midft of their belly; others are livid, as the three greater muscles of the calf of the leg, which colour they have by the admixtion of the white, or tendinous nervy coat with the red flesh; for, this coat by its thickness darkning the colour of the flesh, so that it cannot thew its redness and fresh colour, makes it seem of that hvid colour. From their situation; for fome are superficiary, as those which appear under the skin and sat; others deep in; and hid, as the fmooth and four twin mufcles; forme are firetched out, and (as it were) spred over in a firait and plain paffage, as the mufcles of the thigh which move the leg, except the Ham-mufcles others oblique, as those of the Epigakrium; othersome transverse, as the transverse of the Epigafirmon; where you must observe, that although all the fibers of the muscles are direct, yet we call

Differences from their perforations. From their

magnitude. From their

D

huckle bone; in fome it is nervous and fleshy, as in the internal and external mufele of the arm. Befides, fome have one head, others two; as the bender of the elbow, and the external of the leg s others three, as the three-headed mufcle of the thigh, But we must note, that the word nerve or offices three, as the three-headed minicie of the tingui, but we mainthout, that the word nerve or finew is here taken in a large fignification, for a ligament, nerve and tendon, as Galon faith (Lib. de Offibur;) and moreover we must observe, that the head of a muscle is one while above, another while below, otherwhiles in the midft, as in the midriff, as you may know by the infertion of the nerve, because it enters the muscle by its head.

From their belly also, there be some differences of muscles taken; for some have their belly im- From their From their belly allo, there be some currences of manages taken; for some nave their beny improvementately at their beginning; as the muscles of the buttocks; others at their infertion, as the belly midriff; others just at their head, as those which put forth the eals of the leg; in others it is somewhat further off, as in those which draw back the arm, and which bend the leg; in others, the belly had been also the fact the fact the midriful to the leg; in others, the belly in the intercostal muscles. extends even from the head unto the tail, as in the intercofial mufeles, and those of the wrift; in others, it is produced even to their infertion, as in those of the palms of the hands and foles of the feet; fome have a double belly diffinguished by a nervous substance; as those which open the mouth, and those which arise from the root of the lower of process of the shoulder-blade.

Moreover the differences of mufcles are drawn also from the tendons, for some have none, at From their least which are manifest, as the muscles of the lips, and the sphincrer-muscles, the intercostal, and tendons those of the wrist; others have them in part, and want them in part, as the midrist; for the midrist risk wants a tendon at the ends of the shorter ribs, but hath two at the sirst Vertebra of the loins in which it is terminated; others have a tendon indeed. But some of these move with the bone, forme not, as the must less of the eyes; and besides, some of these have broad and membranous tendons, as the must less of the eyes, and Etigrassium, except the right, must be a problem on these have are think and the same than the same thinks are thinks are thinks are thinks are thinks. dons, as the mufcles of the eyes; and betides, fome of thete have broad and membranous ten-dons, as the mufcles of the eyes, and Epigrafinum, except the right mufcles; in others they are thick and round, as in the benders of the fingers; in others they are lefs round, but more broad than thick, fuch is the tendon arifing from the twin mufcles, and Solem of the leg; others have thore tendons, as the mufcles which turn down the hand; otherforne long, as those of the palms of the hands, and foles of the feet; befides, others produce tendons from the end of their belly, which tendons are manifely others from the midtle as the temporal mufcles. tendons are manifelt; others from the midft, as the temporal mufcles

Befides, also others diffuse many tendons from their belly, as in the hands the benders of the fingers, and extenders of the feet. Othersome put forth but one, which formetimes is divided into many, as those which bend the third articulation of the foot; otherwhile many muscles by their meeting together make one tendon, as the three muscles of the east of the leg, and those which bead the cubit and leg. All tendons have their original, when the nerves and ligaments differred through the flefhy fubriance of a mafele, are by little and little drawn and meet together, until at last carried to the joynt, they are there fashed for the fit bending and extension thereof. From the From their contrariety of their actions; for fome parts have contrary mufeles, benders and extenders, other action have none; for the cods and fundament have only lifters up. From their function; for fome are From their made for direct motions, as those which extend the fungers and toes; others for oblique, as the function.

Suminaries of the hand, and the December 1 where 2 from both as the professal mulcle, which Supinators of the hand, and the Pronators; others perform both, as the pectoral modele, which moves the arm obliquely upward and downward, as the upper and lower fibers are contracted; and also out-right, if all the fibers be contracted together, which also happens to the Deltaides and Testering. Trapezius. I have thought it good to handle particularly these differences of muscles, because that to each part; and if any occasion be, either to make incision, or future, we may be more certain, and also the application of remedies to each part; and if any occasion be, either to make incision, or future, we may be more certain,

CHAP. IX.

Of the parts of a Muscles

Aving declared the nature and differences of a mufele, we must note that fome of the parts. The compound and universal, others simple or particular. The compound are the pound and head, belly, and tail. The simple are ligaments, a nerve, sielh, a vein, artery, and coat. For simple parts pound parts, by the head, we underlined the head property and criminal of a mufele, which is of a mufele. head, belly, and tail. The fimple are ligaments, a nerve, flesh, a vein, artery, and coat. For fimple pares the compound parts; by the head, we understand the beginning and original of a muscle, which is of a muscle, one while ligamentous and nervous, otherwhiles also fleshy. By the belly, that portion which is absolutely fleshy: By the tail we understand a tendon consisting partly of a nerve, partly of a ligament which are fix in number, three are called proper, and three common. The proper are a ligament cretion of blood. The common are a vein from the liver or trunk ariling from thence; an artery proceeding from the heart, a coat produced by the nervous and ligamentous sibers, forceding over cretion of blood. The common are a vein from the liver or trunk arising from thence; an artery proceeding from the heart, a cost produced by the nervous and ligamentous fibers spreading over the fuperficies of the muscle. But for the simple use of all such parts, the nerve is (as it were) the whituse each principal part of a muscle, which gives it sense and motion, the ligament gives strength, the sless simple partiprincipal part of a mulcle, which gives it teme and motion, the ligament gives firength, the fleth imple particular contains the nervous and ligamentous fibers of the mulcle, and firengthens it, filling up all the cle hath in a planted in them; and, to conclude, defends it from all external injuries; for, like a fan, it opposeth planted in them; and, to conclude, detends it from an external injuries; for, like a fan, it opposets it felf against the heat of the Sun; and is a garment against the cold; and is as a cultion in all falls and bruites; and as a buckler of defence against wounding-weapons. The vein nourithes the muscle, the artery gives it life, the coar preserves the harmony of all the parts thereof, left they should be the muscles; as we see it hapneth in a Gangrene, where the corruption hath invaded this members, by the heathing cost of the more acid matter or filth.

CHAP. X.

A more particular inquifition into each part of a Muscle.

The nature of a ligament.

Aving gone thus far, it remains, that we more particularly inquire into each part of a Muscle, that (if it be possible) nothing may be wanting to this Discourse. Wherefore a ligament properly fo called, is a simple part of mans body, next of a bone and grifle, the most terrestrial, dry, hard, cold, white; taking its original immediately, or by the interposition of fome medium from the bones or grifles (from whence also the muscles have their beginning) whereby it comes to pass, that a ligament is void of sense, unless it receive a nerve from some other place; for so the ligaments which compose and strengthen the tongue and yard, are partakers of fense, and it inferts it felf into the bone and grisle, that so it may bind them together, and firengthen and beautifie the whole joint or connexion; (for these three be the principal uses of a The threefold ligament) then diffusing it felf into the membranes and muscles to strengthen those parts. A use of a liga-nerve, to speak properly, is also a simple part of our body, bred and nourished by a gross and what a nerve phlegmatick humour, such as the brain, the original of all the nerves, and also the Spinal marrow endued with the faculty of feeling, and oftentimes also of moving. For there be divers parts of the body which have nerves, yet are delittute of all voluntary motion, having the sense only of feeling, as the membranes, veins, arteries, guts, and all the entrails. A nerve is covered with a double cover from the two membranes of the brain, and besides also with a third proceeding from the ligaments which fatten the hinder part of the head to the Vertebra's, or elfe from the Perierani-

We understand no other things by the fibers of a nerve, or of a ligament, than long and

flender threds, white, folid, cold, ffrong, more or lefs, according to the quantity of the fubiliance, which is partly nervous and fenfible, partly ligamentous and infenfible. You must imagine the fame of the yelly fibers in their kind; but of these threds some are strait for attraction; others ob-

lique, for retention of that which is convenient for the creature; and lastly, fome transverse, for expulsion of that which is unprofitable. But when these transverse threds are extended in length, they are lessened in bredth; but when they are directly contracted, they are shortned in length. But when they are extended all together as it were, with an unanimous confent, the whole member is wrinkled as contracted into it felf: as on the contrary it is extended when they are relaxed. Some of these are bellowed upon the animal parts, to perform voluntary motions; others upon the vital to perform the agitation of the heart and arteries; others upon the natural for attraction, retention, and expulsion. Yet we must observe, that the attraction of no similar part is performed by the

help of the forefaid fibers or threds, but rather by the heat implanted in them, or by the flunning of emptines, or the familiarity of the fubfiance. The fleth also is a simple and fost part, composed of the pure portion of the blood infinuating it self into the spaces between the fibers, so to invest them for the uses formerly mentioned. This is (as it were) a certain wall and bulwark against the

them for the uses formerly mentioned. This section which are the section of the property mentioned injuries of heat and cold, against all falls and bruifes, as it were, a certain fost pillow or cushion yielding to any violent impression. There be three forts of slesh; one more ruddy, as the musculous slesh of perfect creatures, and such as have blood; for the slesh of all tender and young things

having blood, as Calves, and also of all forts of fish, is whitish, by reason of the too much humidity of the blood. The fecond kind is more pallid, even in perfect creatures having blood, fuch is the flesh of the heart, stomach, weafon, guts, bladder, womb. The third is belonging to the

What we језтепров

mean by the nervous and fibers.

By what power the fimilar parts principally draw or attract. What, and of how many forts the flesh

> entrails, or the proper fubfiance of each entrail, as that which remains of the liver (the veins, arteries and coat being taken away) of the bladder, of the gall, brains, kidneys, milt: Some add a fourth fort of flesh which is spongy, and that they say is proper to the tongue alone. A vein is the veffel, pipe or channel of the blood, or bloody matter; it hath a spermatick subfrance, confifts of one coat compoled of three forts of fibers.

What an arte-An artery is also the receptacle of blood, but that spirituous and yellowish, confisting in like manner of a spermatick substance: But it hath two coats with three forts of fibers, the utmost whereof is most thin, confisting of right fibers, and fome oblique: But the inner is five times more thick and denfe than the utmost, inverwoven with transverse fibers; and it doth not only contain blood and spirit, but also a serous humor, which we may believe, because there be two emulgent arteries as well as veins. But the inner coat of an artery is therefore more thick, because it may contain blood which is

Why an artery and dense than a vein.

The mutual

where it is

manifest.

What a vein

ry is.

more hot, fubtil, and spirituous; for the spirit, seeing it is naturally more thin and light, and in perpetual motion, would quickly fly away, unlefs it were held in a ftronger hold. There is other reason for a vein, as that which contains blood, gross, ponderous, and flow of motion. Wherefore if it had acquired a dense and gross coat, it could scarce be distributed to the neighbouring parts: God, the maker of the Universe, foreseeing this, made the coats of the vessels contrary to the consistence of the bodies contained in them. The Anastomosis of the veins and arteries, that the veins and which they remarkable, by benefit of which they mutually communicate and draw the matters contained in them, and fo also transfuse them by infentible paffages, although that Anafromofis is apparent in the vein and artery that meet together at the joynt and bending of the arm, which I have fornetimes shewed in the Physick Schools, at fuch times as I there diffected Anatomies.

a muscle hath its beginning or head,

But the action or function of a muscle is either to move or confirm the part according to our will into which it is implanted; which it doth when it draws it felf towards its original, that is to fay, itshead. But we define the head by the infertion of the nerve, which we understand by the manner of the working of the mufcle.

CHAP. XI.

Of the mufeles of the Epigastrium, or lower Belly.

Ow feeing that we have taught what a muscle is, and what the differences thereof are, and what simple and compound parts it hath, and what the use, action and manner of action in each part is, it remains that we come to the particular explication of each

muscle, beginning with those of the lower belly, as those which we first meet withal in diffection.

These are eight in number, four oblique, two on each fide, two right or direct, one on the right, Eight muscles another on the left fide; and in like manner two transverse. All these are alike in force, magnitude priori. and action, so mutually composed, that the oblique descendant of one side, is conjoyned with the

other oblique descendant on the other side, and so of the rest.

We may add to this number the two little supplying or affisting muscles, which are of a Pyramidal form, and arise from the share-bone, above the insertion of the right muscles: Of the oblique muscles of each side the one ascends, the other descends, whereupon it comes to pass, that descends they are called the oblique descendant and ascendant muscle. Those oblique which we first meet Their subthey are called the oblique defeendant and alcendant mancie. Those oblique which we first finer unwith, are the defeendant, whose substance is partly fanguine, partly spermaticks for they are stance.

fleshy, nervous, ligamentous, veinous, arterious and membranous. Yet the fleshy portion is predominant in them, out of which respect Hippocrates is wont to express the muscles by the name ness and siFleshes; their greatness is indifferent between the large and the small smuscles; their figure is three gare.

They are consolided the fore-mentioned parts, they are two in number; their fite is obTheir compe fquare. They are composed of the fore-mentioned parts, they are two in number; their fite is oblique, taking their beginning from the touching of the great faw-mufele, and from the fixth and feveuth true ribs, or rather from the spaces between the fix lower ribs, and rather on the forepart of the muscles, than of the ribs themselves; from whence shunning the Verebra's of the loins, the fleshy parts of them are terminated in the external and upper eminency of the haunch-bone, and the membranous end in the lower eminency of the blare-bone and the white-line. Yet Colombus diffenting from this common description of the oblique muscles, thinks that they are only terminated in the white-line, and not in the share-bone. For (faith he) wherefore should they be insterted into the share-bone which is not moved? But because it would be an infinite labour and trouble to fet down as how the sure of property of all Authors of Angroupe. It have showed in the trouble to fet down at large the feveral opinions of all Authors of Anatomy; I have thought it furficient for me to touch them lightly by the way. Their connexion is with the oblique atcendant lying under them, and with the direct or right. Their temperament is twofold, the one hot and mexion. Their temperament is twofold, the one hot and their temperament is twofold. ingamentous and rendinous portion. Their action is to draw, the parts into which they are interted Their action, towards their original, or elic to unite them firmly. Yet each of these privately and properly draws the hip in an oblique manner towards the Caridage Southformis, or breast-blade. Then follow The oblique the oblique ascendant, who have the same substance, quantity, figure, compositive, number and ascendant, temper the descendant have. They are fituate between the descendant and transverse with whom Their site and they have connexion, especially by the vessels which are brought from the parts beneath. All the connexion, selection is to the least of the bastard-ribs, which they seem to admit above and below, being steply extent to the south and they become they feem to admit above and below, being flethy even to the fourth, and then becoming membranous, they take their way to the white-line, with a double aponeurofus, which paffes through the right muscles above and below, as we may plainly fee from the navel downwards. In their flethy part they draw their original from the spine of the haunch-bones a little lower than the descendant end in their flethy part. But for their membranous parts, they arife before from the share-bone, but behind from the spondyls of the holy-bone, and Vertebra's, of the loins obliquely ascending upwards to the white-line, into which they are terminated by an aposturofis or membranous tendon (which feems to penetrate the right mufele upwards and downwards, especially under the navel) but by their fleshy part at the ends of all the baliard ribs, which they feem to receive above and below. And because these muscles are terminated in the white-line, they have also another use, yet such as is company to all the number of the Fernal form that the part of the part of the formula of yet fuch as is common to all the mufcles of the Epigestrium, that is, to press down the guts. Their action action is (if they perform it together) to draw and dilate the breast; but if their actions be separate, they draw the cheft to the hip with an oblique motion. After these follow the right muscles, The right fo called, because they descend according to the length of the body, and because they have right muscles of the or strait fibers.

We will fay nothing (to flum prolixity, which in all other places we will avoid) of their fubflance and other conditions, which they have common with the fore-mentioned mufcles. They are Their fite.

fituate in the eminentest or extuberating region of the belly, bounding the Epigastrium taken in
general, (or the superficiary belly;) they are divided by the manifest intercourse of the white-line,
even to the navel, in which place they seem to be united even to the place of their insertion. They
draw their original not from the share-bone, as some would have it, but according to the insertion
of their nerves from the sides of the Garillago Scaniformis, and the ends of the fixth, seventh and
eighth ribs; but they end in the share-bone, where they make a common tendon sufficiently strong
and short. Sylvius, Vesalius and Columbus think they arise from the share-bone, because they cannot
be inserted into that bone, because it is unmoveable. You may perceive in these muscles certain neryous and transverse intersections, oftentimes three in number for the strength of these muscles, (of vous and transverse intersections, oftentimes three in number for the strength of these muscles, (of vous and transverte interfections, oftentians three in manufer for the irrength of these mulcles, (of which Galen makes no mention, although they may be seen in Apes.) And also in the inner side of these muscles you may see four veins, and as many arteries, of which some creep upwards, others their matches you may be tour veins, and as many attenes, or which tome creep upwards, others run downwards. The upper, called the Mamillary, defeend from the Axillary by the fide and lower parts of the Sternan, the flenderer portions thereof being distributed by the way to the Mediationan, and about the fourth and fifth rib to the dugs, from whence they take their name.

That

The meeting together of the Epigaftrick and mamillary veins and arteries.

That which remains breaking out by the fides of the breaft-blade, inferts it felf into those mustcles, exceping along, even almost to the navel; in which, place they are manifestly united (that is, the veins with the veins, and arteries with the arteries) with the Epigastrick, which afcend from the upper part of the Iliack; on each fide under the faid mufcles, until they meet with these four mamillary verfels. That you may find the concourfe of the veins and arteries about the navel, you must follow both the upper and the lower somewhat deep into the fieth, pressing the blood on both fides from above downwards, and from below upward, until you shall find the exosculation of these vessels, which will appear by this, That the blood will slow from this into that, and from that into this; otherwise you can scarce perceive it, by reason of the smalness of such vessels which want blood. But that by the benefit of such concourse of the vessels, the matters may be communicated and transported both from the womb to the dugs, and again from the dugs to the womb, appears in Nurses who want their courses, when the trilk comes into their dugs, and on the contrary lofe their milk when their courfes flow plentifully. Otherwife to what purpose should there be fuch concourse between the vessels of the paps and womb? for there are veins and arteries dissused to the sides of the womb from the root of the Epigastricks; for indeed the Epigastricks. ftricks which in their afcent meet with the mamillary, go not to the womb, though they be next to them, and arise from the same trunk with the Hypogastrick vein of the womb. The action of these muscles is, to move or draw near together the parts of the Hypogastrium to the Precordia, or Hypochondries. Their use, in Columbus opinion, is, to draw the breast downwards, so to dilate it. At the end of these, nature hath produced two other small muscles from the upper part of the share-bone, of a triangular figure, for the fafety of the thick and common tendon of the right muscles; whereupon they are called Succenturists, or Assisters.

FIG.

The Pyramidal or affifting mufcles. The transverie mufcles of the Ecleafrian.

Some (moved with I know not what reason) would have these two small muscles to help the crection of the yard. Columbus thinks they should not be separated from the right, and that they only are the sleshy beginnings of the right. But on the contrary, Fallopius manifestly proves them different and separate from the right, and shews their use. The transverse remain to be spoken of, so called by reason of their sibers, which make right angles with the sibers of the right muscles.

They have a quadrangular figure fituate upon the greatest part of the Peritonaum, to which they Their figure flick fo close that they fearce can be separated. They take their original from the production of and size, the loins, the eminency of the haunch-bone, the transverse productions of the Vertebra's of the loins, and the ends of the bastard-ribs; contrary to the opinion of many, whom the insertion of the nerve convinces, but they end in the White-line, as all the rest do.

Their action is to pass the gurs, especially for the expulsion of excrements.

Their action is to pass the gurs, especially for the expulsion of excrements.

Their action.

Their action.

Their action.

Their action.

The action is to pass the gurs, especially for the expulsion of excrements.

The action is a common in the parts lying under them, and ferve for the strengthening of the voice, as experience shows in those who found Trumpers and Cornets.

Therefore these muscles do equally on every side press the belly; but the midrist, the intercostal muscles of the Epiges strengthening according to the pressure of the strengthening strengt

mufcles affifting it, doth drive from above downwards, from which confpiring contention follows the excretion of the excrements by the fundament; but unlefs the midriff should affift, these muscles would press the excrements no more downwards, than upwards to the mouth.

Although to this excretion of the excrements, it is not sufficient that the Epigastrick, Midriff, why when and intercostal muscles press the belly, but the muscles of the throttle must be also thut. For the the mouth is contained in the contained and intercostal muscles press the belly, but the muscles of the throttle must be also that.

mouth being open, the excrements never go well forth; because the vapors do pass out of the mouth, which being refrained and driven to the midriff, by firetching it powerfully throsts down the excrement. Wherefore Apothecaries when they give glytters, bid the Patient to open his mouth, that the glytter may easily go up, which otherwise would scarcely go up, the mouth being shut; because so, we should have no place empty in us, into which the glytter might be admitted.

Of the White-line, and Peritonaum or Rim of the Belly.

The White-line is nothing elfe, than the bound and extremities of the mufcles of the Epigaffri- What the now, diffinguishing the belly in the midst into two parts, the right and left. It is called White, Whate-line is. both of its own colour, and also for that no fleshy part lies under it, or is placed above it. It is broader above the navel, but narrower below, because the right muscles do there grow into one. Now we What the Permusit treat of the coat or membrane, Peritoneum or rim of the belly; it is so called, because it is ritaneam is. that the down all the lower belly, and particularly over all the parts contained in the ventricle, to The fibitiance which also it freely lends a common coat. It hath a spermatick substance, as all other membranes and quantity. have; the quantity of it in thickness is very small, (for it is almost as thin as a Spiders web) yet differing in divers places in men and women; for men have it more thick and strong below the navel, that so it may contain the extension of the stomach, often stretched beyond measure with meat and drink. On the contrary, women have it fo thick and firong below their navel, that it feems double, that fo they may more eatily endure the differition of their womb, caused by the child contained in it. But above the navel, men and women have the Peritaneum of an equal firength, for the felf fame reason. The longitude and latitude of it is known by the circumscription of the belly.

The figure is round and formewhat long it puts forth forme productions, like finger-stalls, both The figure. for the leading and firengthening the spermaticie vessels, and the cremaster muscles of the festicles, and, belides it, the ejaculatory veilels; as also to impart a coar to the terticles, and all the

It is composed of stender, membranous and nervous fibers, certain small branches of veins and ar- The compositeries concurring with them, which it receives for life and nourillment from the adherent parts.

This membrane is one in number, and befides every where one and equal, although Galen would The number. have it perforated in that place where the spermatick vessels descend to the testicles: But, in truth, Lib. desemble the must not think that a hole, but rather a production, as we faid before.

The later Anatomitis have observed, the coat Perisoneum is doubled below the navel, and that by the spaces of these reduplications the umbilical arteries ascend to the navel-

It is fittuate near the natural parts, and compaffes them about, and joyned by the coat, which The fite and it gives them, as also on the fides, it is joyned to the Vertebra's of the loins, from whose ligaments connexion. (or rather Periodium) it takes the original: On the lower part, it cleaves to the share-bone, and on the upper to the midriff, whose lower part it wholly invests; on the fore or outer part it sticks fo choic to the transverse muscles, that it cannot be pluck'd from them but by force, by reason of the complication and adhesion of the fibers thereof with the fibers of the proper membrane of these muscles; which membrane in Galen's opinion proceeds from this Peritaneum, so that it is no mar-Lik. 6, Malk, well that we may more castly break than forester these two castes. It is of temperature cold and dry vel that we may more eafily break than separate these two coats. It is of temperature cold and dry, as all other membranes.

It hash many uses, the first whereof is, to invest and cover all the parts of the lower belly, use, fpecially the kall, left it should be squeezed by great compressures and violent attempts into the empty spaces of the muscles, as it sometimes happens in the wounds of the Epigastraum, unless the lips of the Ulcer be very well united; for then appears a tumor about the wound by the guts and kall thrusting without the Paritoneum into shote spaces of the muscles; from whence proceeds

Another use is, to the further casting forth of the excrements by pressing the ventricle and guts on the forcide, as the midriff doth above, as one should do it by both his hands joyned together.

The third use is, it prohibits the repletion of the parts with flatulency after the expulsion of the excrements, by firaitning and preffing them down,

The fourth and last is, that it contains all the parts in their feat, and binds them to the back-bone, principally that they should not fly out of their places by violent motions, as by leaping, and falling from on high.

Latily, we must know, that the rim is of that nature, that it will cafily dilate it felf, as we fee in Dropfies, in women with child, and in tumors against nature.

Lib. 4. de afa partium, A cause of fruftrating conception.

Fter the containing parts, follow the contained, the first of which is the Epiploon, (or Kall) so called, because it (as it were) swims upon all the guts. The substance of it is fatty and spermatick, the quantity of it for the thickness is diverse, in diverse men, according to their temperament. The latitude of it is described by the quantity of the guts. It is in figure like a purse, because it's double. It is composed of veins, arteries, fat, and a membrane, which fliding down from the gibbous part of the ventricle, and the flat part of the gut Duodenum and Spleen over the guts, is turned back from the lower belly to the top of the Colon. It is one as we faid covering the guts. It hath its chief connexion with the first Vertebra's of the Lions, from which place in Bealts it feems to take a Coat, as in men from the hollow part of the Spleen, and gibbous of the ventricle, and depressed part of the Dundenson; from whence doubled, it is terminated in the fore and higher part of the Colick-gut. Which moved Gaster to write, that the upper part of the membrane of the Kall was annexed to the ventricle; but the lower, to the laxer part of the Colick-gut. From the Vessels of which parts it borrows his, as also the nerves, if it have any. The temper of it in lean bodies is cold and dry, because their Kall is without fat; but in fat bodies it is cold and moift by reason of the far. The use of it is two-fold: The first is to heat and moiften the guts, and help their concoction, although it do it by accident, as that which through the denfity of the fat, hinders the cold air from piercing in, and also forbids the diffipation of the internal heat. Another use is, that, in want of nonrishment in times of great famine, fornetimes it cherishes, and (as it were) by it dew preserves the innate heat, both of the ventricle and neighbouring parts, as it is written by Galen. Moreover, we must observe, that in a rupture or relaxation of the Perinneum, the Kall falls down into the Scroum, from whence comes that rupture we call Epiplocele. But in women that are somewhat more fat, it thrusts it felf between the bladder and the neck of the womb, and by its compression hinders, that the feed comes not with full force into the womb, and fo frustrates the conception. Besides, when by a wound or some other chance; any part of it be desective, then that part of the belly which answers to it, will afterwards remain cold and raw, by reason of the fore-mentioned causes.

CHAP. XIV.

Of the Ventricle or Stomach.

Ow we must speak of the stomach; the receptacle of the food necessary for the whole Whitthe venbody, the feat of appetite, by reason of the nerves dispersed into its upper orifice, and tricle is.

The substance thereof is rather spermatick than sanguine. The mignibecause that for one fleshy membrane, it hash two nervous: The quantity or magnitude of the ven-tricle is diverse, according to the various magnitudes of bodies, and gluttony of men. The figure The figure of it is round and somewhat long, like a Bag-pipe. The storach is composed of two proper coats, The compand one common from the Peritonaum, together with veins, sinews, and arteries; the innermost of its proper coats is membranous; woven with right fibers, for the attraction of meats; it is extended and propagated even to the mouth thereof, whereby it comes to pass that the affections of one part may easily be communicated to the other by fymputhy or confent. This coat hath its original from the membranes of the brain which accompany the nerves defeending from the third and fourth the confent of the confent of the mouth thereof. And in like fort from other productions defeending by the paffages of the head, from whence also another reason may be drawn from that, which they common- and flomach. It bring from the previous of the first ly bring from the nerves of the fixth conjugation; why in wounds of the head, the flomach doth for foon fuffer by confent with the brain? The exterior or outer is more flethy and thick, woven with oblique fibers, to retain and expel. It draws its original from the Perseranium, which affoon as it comes to the gullet, takes unto it certain fieldy fibers. There be nerves fent into the florach from the fixth conjugation of the brain, as it shall be shewed in its proper place. Veins and arteries are spread into it from the Coding the Cod are spread into it from the Gastriea, the Gastropiplaides, the Goronaria and Splenick, from the second, third and fourth distribution of the Vena-porta, or Gate-vein; and the third of the descendent

artery to the natural parts, affoon as it paffes forth of the midriff.

It is one in number, The greater part of it is fituated on the left fide, between the Spleen, the hollownels of the liver and the guts, that, affifted by the heat of fuch neighbouring parts, it may more that a great part of the floranch lies on the left fide. But Infpection it felf and Reafon, makes me Lib. de afa derogate from Galen's authority: for, because there is more empty space on the left fide, by reafon the Spleen is lefs than the Liver, it was fit it should lie more on the left fide. The more proper connexion of it is with the gullet and guts, by its two orifices; with the brain, by its nerves; with the liver and spleen, by its veries, which the large liver and spleen by its nerves; with the liver and spleen, by its veries, which the large liver and spleen. the liver and fpleen, by its veins; with the heart by it arteries; and with all the natural parts by its common membrane.

The temper of the ventricle in men of good habit, is temperate, because it is almost composed of The temper, the equal commixture of fanguine and spermatick parts; or according to Galen's opinion, it is cold Lib. 9. Math. of it self, and by the parts composing it; and hot by the vicinity of the bowels. But in some it is hotter, in others colder, according to the diverfe temper and complexion of divers bodies. That flormach is to be thought well tempered, that powerfully draws down the meat and drink, and embraces and retains them to drawn, until by concochion and elixation, they thall be turned into a juyce like cream (which the Greeks call Chylos i) and lastly, which doth strongly send from it, and repel the excrements of this first concoction.

The fromach is known to be hotter by this, that it better concocts and digeffs coarse and hard Notes of a hot The fromach is known to be hotter by this, that it better concocts and digefts coarfe and hard Nores of meats, as Beef, hard Eggs, and the like, than foft meats ealie of digeftion, which it corrupts and fromach turns into belchings. For fo a young Chicken, is fooner burnt than well roafted at a great fire. The fromach which is colder, defires much meat, but is flow in concocting them, especially if they be cold and hard of digeftion, which for that earlie quickly turn flower. The action of a well conditioned fromach is twofold, one common, another proper. The common is to attenuate, mix and digeft the means taken in at the mouth, for the nutrition of it felf and the whole body, after the liver hath performed its duty, which before it be done, the ventricle only enjoys the fweet pleasure of the Chylus, and comforts it felf against the impurity of the adjacent parts, whereof it is called which is convenient; but to expel whatfoever shall be contrary, either in quantity or quality, or in the whole subfance.

It hath two orifices, one above, which they commonly call the flormach and heart, the other lower, which is called the *Pylorus*, or lower mouth of the flormach. The upper bends to the left fide near the back-bone; it is far more large and capacious than the lower, that fo it may more commoditionally receive means half-chewed, hard and grofs. Which Gluttons call down with great greedincis; it hath an exquifite fenife of feeling, because it is the feat of the appetite, by reafon of the nerves incompassing this orifice, with their mutual imbracings; whereby it happens that the ventricle in that part is endued with a quick fenife, that perceiving the want and emptiness of meat, it may fit up the creature to feek food. For albeit nature hath bestowed four faculties on other parts, yet they are not fenished of their wants, but are only nourished by the continual sucking of the veins, as Plants by juyce drawn from the earth.

by juyce drawn from the earth.

This orifice is feated at the lifth Various of the cheft, upon which they fay it almost refts. Yet

This orifice is feated at the lifth Various of the cheft, upon which they fay it almost refts. Yet

The fite.

The fite is place the gullet perforates the midriff, and makes this upper orifice. The lower orifice bends rather to the right fide of the body, under the cavity of the liver. It is far firaiter than the upper, left any thing flould pass away before it be well attenuated and concocted; and it doth four ring of that by the help or affiliance of, as it were, a certain ring, like to the fpluncter muscle of the functions ring of the pluncter. that by the help or affifiance of, as it were, a certain ring, like to the sphincter moscle of the sun-dament, which some have thought a glandule made by the transposition of the inner and fleshy

The fubflunce.

The falling down of the flomach.

thembrane of the ventricle into that which is the outer of the gats. I know Columbus laughs at this glandulous ring, but any one that looks more attentively, shall perceive that Pylorus is glandulous. The stormach in its lower and inner side, hath many folds and wrinkles, which serve to hold and contain the meats, until they be perfectly concocted. In the ventricle, we observe parts gibbous and hollow; the hollow is next to the liver and midriff; the gibbons is towards the guts. Now we must note that the ventricle, when it is much refolved or loofed, may slide down even to the navil near the bladder, the which we have observed in some bodies diffected after their death.

The third and fourth Figures.

The first figure shows the fore-fide of the stomach and gullet.

CHAP. XIV.

Of the Guts.

Their fulflance.

yaw,

He Guts the inftruments of diffribution and expulsion, are of the same substance and composure with the stomach, but that the site of the coats of the stomach is contrary to those of the guts. For that which is the innermost coat of the stomach, is the outermost of the guts, and fo on the contrary. The figure of the guts is round, hollow and capacious, force

Their number. The Durdt-

more, forme lefs, according to the diverse bigness.

But for the quantity of the guts, forme are finall, forme great, more or lefs, according to the varieties of bodies. But they are fix in number: For there be three small; the Duodenum, the Jejunum, or empty gut, and the Henn. Three great, the Blind, the Colick, and the Right-gut. All which have had their names for the following reasons; the furth, because it is extended the length of twelve singers, like another stomach, without any turning or winding; of which great pessit is found in great hodied men. Such a wave more trequently to be mer without in Galatti. neis it is found in great bodied men, such as were more frequently to be met withal in Galei's time, than in this time of ours; in which, this gut is found no longer than seven, eight or nine singers at the most. The cause of this length is, that there may be a free passage to the Gate-vein coming out of the liver, as also the artery and nerve which run into it. For seeing that this out L

is 15. d ft

gut may femetimes rife to the top of the liver, it would posses the space under the bladder of the gall (with which it is often tinchured) if it had any revolutions that way, which is the passage for such like vessels. Others give another reason of this sigure, which is, That there should be nothing to hinder the easie and sit distribution of the perfectly concected Chylus to the liver.

The second is called Jepanan, or the empty-gut, not because it is absolutely so, but because it The Jepanan, contains little in comparison of the other. There is a triple cause of this emptiness, the first the multitude of the research weight and arteries which are about it, whereaver there is a present and

multitude of the meferaick veins and arteries which are about it, whereupon there is a greater and quicker diffribution of the Chylur. The fecond is the vicinity or neighbourhood of the liver, firong-quicker diffribution of the Chylur. The fecond is the vicinity or neighbourhood of the liver, firong-ly drawing the Chylur contained in it; the third is the flowing down of the Cholerick humor from the bladder of the gall into it, which ever and anon by its acrimony cleanfes away the filth, and by continual flowing folicites it to expulsion. The third is called Hean, because it lies between the Hum. His, or flanks; it differs nothing from the reft in fubflance and magnitude, but in this one thing that there is more matter contained in it than in the reft, by reason of the pancity of the vessels terminated in it, that it is no marvel that there can be no exact demonstration made of them. The fourth is called Cecum, or the blind, because it bath but one passage to send our and receive in the Ceram. matter. This gut hath a long and firait production, which according to the opinion of fome (though altogether erroneous) often falls down into the Servium in the rupture, or relaxation of the rim of the belly; for, that production in the lower belly ftroughy fricks to the Peritonaum, or rim, which hinders fuch falling down. But Galen feems by fuch a blind-gut to have meant this long and narrow production; and certainly, so thinks the common fort of Anatomists; but here Vesalius juilly reprehended Galen. Wherefore Sylving that he might free Galen of this fault, would have us by the blind-gut to understand the beginning of the colick-gut. The fifth is called Color (or color, colick-gut) because it is greater and more capacious than the rest. The fixth and last, the right-gut, by reason of the rightness or straitness of the passage. This, in Beasts, especially, hath a certain Restant. fame(s in it to make the paffage flippery, and left the guts flould be exulcerated in the paffage, by the sharpness of hard and acrid excrements.

The fite of these guts is thus: The Dusdenium upon the back-bone bends to the right hand; the Their size. Jejunium possesses a great part of the upper umbilical region, and diffuses it self into both sides with windings, like to those of the gut Heam, even to the slanks. The gut Heam is situate at the lower part

windings, like to those of the gut Heam, even to the manks. The gut Heam is lituate at the lower part of the umbilical region, going with many turnings and winding, even to the hollownesses of the holy bone, above the bladder and side parts of the Hypogastriam, they call the stanks.

The blind bends to the right hand, a little below the kidney, above the first and fourth Versebras of the loss. The Colon or colick-gut is crooked or bent, in the form of a Sephian-bow, filling all the space from the blind-gut, below the right kidney, even to the hollowness of the liver, and then it goes by the gibbous part of the flomach above the finall-guts, even to the hollowness of the Spleen; from whence fliding under the left kidney, with fome turnings, it is terminated upon the Variebra's

By all which turnings and windings of the colick-gut, it is caffe to diffinguish the pain of the The diffinguish stone of the kidneys, which remain text in one certain place, from the colick wandring through on between those crooked passages we mentioned. The right-gut tends with an oblique site towards the left the stole in hand, upon the holy-home areas to the very simplement. They have all one and a common companies the belief in the stole in hand, upon the holy-bone even to the very fundament. They have all one and a common connexitie the kidneys. on; for they are all mutually joyned together by their coats, because there is but one way from the Their coagullet even to the fundament; but they are joyned to the principal parts by their nerves, veins nexion.

But a more proper connexion is that, where the Dusdensin on the upper part of it, 19 portion the Pylorus; but on the lower part to the Journal, and the parts lying under it, by the coat of the Periumenon. The Jejuman, or empty-gut, is joyned to the Dusdensin and Hom. The Hem, with the empty blind-guts. The blind with the Hom and Colon, and with the right fide of the back-bone Why vomiting happens in the color. The Colon with the blind and right-guts, and in his middle part, the color. where it is tied more firsitly. The Colon with the blind and right-guts, and in his middle part, with the kidneys and gibbous part of the flomach; whereby it comes to pass, that being diffended

with wind in the colick, it over-turns and preffes the flomach, and fo causes vorniting,

Lastly, the right-gut is annexed with the colick-gut and fundament. At the end whereof there The Sphiater is a profele for the lower the lower the most is a profele for the lower the low Laftly, the right-gut is annexed with the colick-gut and fundament. At the end whereof there is a mulcle faffined, of figure round and circular, called the Sphinter, ariling from the lower Ver-models of the contents. tebra's of the holy bone and rump; by the benefit of which, as of a door or gate, the excrements are refirained at our will, left man born for all honelt actions, without all thame, in every time and place, thould be forced every where to eafe his belly. For fach as have loft the benefit of this mufele place, thould be forced every where to eafe his belly. For fach as have loft the benefit of this mufcle by the Pallie, have their excrements go from them against their wills. There is a body fituate at the end of the right-gut, and of a middle fubfiance between the skin and fielh, as it were arising from the mixture of them both, like the extremities of the lips, of the fame use with the Sphindler, but that it is not altogether fo powerful. But there are also certain veins fituate about it called the Harmorrhoidal; of which we will speak in their place.

Belides, there are two other models that descend to the end of this gut, being broad and membranous on each side, one arising from the side and inner parts of the share and hip-bones, which inferted above the Sphindler pull up the fundament falling down, wherefore they are called Levatores Levators Ani, or the lifters up of the fundament. Wherefore when as either they are too weak, or resolved, or the fundament oppressed with the weight of slegmatick, falt, cholerick and tharp humors, the gut is scarce restored into its place, that there is need of the help of the singers for that purpose.

Pole.

The guts follow the temper of the flomach. Their action is the diffributing the Chylus by the The action of meleraick veins (which of duty belongs to the three small guts) and the receiving the excrements of the Chylus, and retention of them, till a fit time of expulsion, which belongs to the third quarter.

Politically, the Grand water finish up the work of conception. quarter. Belides, these small guts shaish up the work of concoction, begun in the stomach, al-

though they be not altogether made for that use. But nature is often accusiomed to abuse the parts of the body for fome better ufe.

Their fibers.

But we must note, that for the composure of the guts, they have only transverse fibers, for expullions fake, unless that at the beginning of the Colon, and the end of the right gut, you may see certain right fibers added to the transverse to strengthen them, less these guts should chance to be broken and torn by the passage of hard excrements, and the laborious endeavour of expulsion, (specially in brute beafts.)

How the guts But if any ask, how they have retention, being they want oblique fibers; he may know, that become fit to the feets are retained in the right-gut, by the force of the Sphintler-muscle, but off-times in the blind, by their hardness and abundance, whereby they stick in the passage; but in the rest, by Their length reason of their conformation into many windings and turnings. The length of the guts, is seven times more than the length of the whole body: to this length they have windings, lest the nourishment should quickly slide away, and less men should be with-drawn by gluttony from action and contemplation. For so we see it comes to pass in most Beasts, which have one gut, stretched firait out from the flomach to the fundament; as in the Lynx, and fuch other Beafts of infatiable

CHAP. XV.

Of the Mesentery.

The fubftance. Magnitude. Figure. Composure.

Fter the guts follows the Mcfentery, being partly of a fatty, and partly of a spermatick subfiance. The greatness of it is apparent enough, although in some it be bigger, and in some
letter, according to the greatness of the body. It is of a round sigure, and not very thick.

It is composed of a double coat arising from the beginning and root of the Peritonaum. In the
the midst thereof, it admits nerves from the Costal of the fixth Conjugation; veins from the Vens
Ports, or gate-vein; arteries from the descendent artery, over and besides a great quantity of fat
and many glandulous bodies, to prop up the division of the vessels spread over it, as also to moisten
their substance. It is in number one, situate in the middle of the guts, from whence it took its their fubitance. It is in number one, fituate in the middle of the guts, from whence it took its name. Yet some divide it into two parts, to wit, into the Meserem, that is, the portion inter-woven with the small guts, and into the Meserelon which is joyned with the great. It hath connexion by its veilels, with the principal parts, by its whole fubflance with the guts, and in some

The connexi-

Namber

The temper.

fort with the kidneys, from whose region it seems to take its coats.

It is of a cold and moist temper, if you have respect to his fatty substance; but if to the rest of the parts, cold and dry.

The action and use of it is, to bind and hold together the guts, each in his place, left they should The action rafuly be folded together, and by the Meferaick-veins (which they term the hands of the liver) and me. carry the Chylus to the liver.

In which you must note, that all the meseraick veins come from the liver, as we understand by All the mesethe diffection of bodies; although fome have affirmed, that there be fome veins ferving for the rack vein nourithment of the guts, no ways appertaining to the liver, but which end in certain glandulous bodies, difperfed through the mesentery, of whose use we will treat hereafter.

CHAP. XVI.

Of the Glandules in general, and of the Pancreas, or Spreet-bread.

Glandule is a simple part of the body; fornetimes of a spongy and soft substance, some-Substance of times of a dense and hard. Of the fost Glandules are the Tonfilla (or Almonds, like in the glandules fulfishers of a define and fisher. Of the first Olandards, Tofficles, Profiste. But the denfe and ha rd are the Partides, and other like. The Glandales differ amongst themselves in quantity quantity and figure, for some are greater than other some, and some are round, and others plain, as the Thyo figure.

Others are compounded of veins, nerves, arteries, and their proper fielh, as the Almonds of the Composition, ears, the milky glandules in the breasts and the testicles. Others want nerves, at least which may be feen, as the Paratides, the axillary, or those under the arm-holes, and others. The number of glandules is uncertain, by reason of the infinite multitude and variety of sporting nature. You shall Numbers find them always in those places, where the great divisions of vessels are made, as in the middle ventricle of the brain, in the upper part of the cheft, in the mesentery, and other like places.

Although othersome be seated in such places, as nature thinks needful to generate and east forth

of them a profitable humor to the creature; as the Almonds at the root of the tongue, the kernels in the dugs, the spermatick vessels in the secretary, and at the sides of the womb; or where Nature hath decreed to make emunctories for the principal parts, as behind the ears, under the arm-holes, and in the groins. The connexion of glandules is not only with the veffels of the parts concurring to their composition, but also with those, whose division they keep and preserve. They are of a cold temper, wherefore Phylicians fay, the blood rierudeferre, i.e. to become raw again in the dugs, when it takes upon it the form of milk. But of these some have action, as the Almonds, which pour Temper, our spattle useful for the whole mouth, the dugs milk, the testicles seeds others, use only, as those only, as those whole mouth, the dugs milk, the testicles seeds others, use only, as those which are made to preferve, under-prop and fill up the divisions of the vessels. Besides this, we have spoken of glandules in general, we must know, that the Paneress, is a glandulous and fleshlike body, as that which hath every where the thape and refemblance of fleth. It is fituate at the flat end of the liver, under the Dandenson, with which it hath great connexion, and under the gatevein, to ferve as a Bulwark both to it and the divitions thereof, whilit it fills up the empty spaces of the Panbetween the verfels themselves, and so hinders, that they be not pluck'd afunder, nor hurt by any The fites violent motion, as a fall or the like.

CHAP. XVII.

Of the Liver.

Aving gone thus far, order of diffection now requires, that we thould treat of the diffribu-tion of the gate-vein; but, because it cannot well be understood unless all the nature of the liver from whence it arifes, be well known, therefore putting it off to a more fit place, we will now speak of the liver. Wherefore the liver (according to Galen's opinion, lib, de Formsfartus) is the first of all the parts of the body, which is finished in conformation. It is the shop and author of the blood, and the original of the veins; the substance of it is like the concrete mud of the blood, the The substance of it is like the concrete mud of the blood, the The substance of it is like the concrete mud of the blood, the The substance of it is like the concrete mud of the blood, and the original of the veins; the substance of it is like the concrete mud of the blood, the The substance of its like the concrete mud of the blood, and the original of the veins; the substance of it is like the concrete mud of the blood, and the original of the veins; the substance of it is like the concrete mud of the blood, and the original of the veins; the substance of it is like the concrete mud of the blood, and the original of the veins; the substance of it is like the concrete mud of the blood, and the original of the veins; the substance of it is like the concrete mud of the blood, and the original of the veins; the substance of it is like the concrete mud of the blood, the The substance of its like the concrete mud of the blood, the the substance of its like the concrete mud of the blood, the substance of its like the concrete mud of the blood, the substance of its like the concrete mud of the blood of the b quantity of it is diverle, not only in bodies of different, but also of the same species; as in men and quantity, amongst themselves, of whom one will be gluttonous and fearful, and another bold, and temperate or fober; for he shall have a greater liver than this, because it must conceive and concoch a greater quantity of Chylus: yet the liver is great in all men, because they have need of a great quantity of blood for the repairing of so many spirits, and the substantistick moisture, which are refolved and diffipated in every moment by action and contemplation. But there may be a two- Why Cowards are refolved and diffipated in every moment by action and contemplation. But there may be a two-fold reason given, why such as are fearful have a larger liver. The first is, because in those the vital have great faculty (in which the heat of courage and anger resides) which is in the heart, is weak; and therefore the defect of it must be supplied by the strength of the natural faculty. For thus nature is accustomed to recompence that which is wanting in one part, by the increase and accession of another. The other reason is, because cold men have a great appetite; for by Galen's opinion In arte parva, colded increase the appetites by which it comes to pass that they have a greater enversion of the Incother reason is, because coardinate to the state of th the, by which plenty the liver is nourined and grows sarger. Some Beafts, as Dogs and Swine, the liver divided into five or more Lobes, but a man hath but one Lobe, or two or three at the most; and these not so much diffinguished, as which cherish the upper and hollow region of the ventricle, with embracing to help forward the work of concoction. Therefore the liver is almost content with one Lobe, although it is always rent with a fmall division, that the umbilical vein piercing into the roots and fubliance of it, may have a free puffage; but also oftentimes there is, as it were, a certain finall Lobe of the liver, laid under that umbilical vein, as a cushion.

The figure.

The figure of the liver is gibbous; rifing up and fmooth towards the midriff; towards the flomuch is the fimous or hollow fide of it fornewhat unequal, and rough by reason of the distance of the Lobes, the original of the hollow-vein, and the fite of the bladder of the gall.

The compo-

The veffels.

The number

The connexi-

The temper.

The action.

The liga-

The composition of the liver is of veins, nerves, arteries, the coat and proper subflance thereof which we call the gross and concrete blood, or Paranelyma. Veins and arteries come to it from the navil; but nerves immediately from these which are disfinsed over the stomach according to Hippoenater; yet they penetrate not very deep into its fubflance; for it feems not to fland in need of fuch exact fenfe, but they are distributed upon the coat and furface thereof, because this part made for difiribution over the whole body, keeps to it felf no acrid or malign humor; for the perception of which it should need a nerve, although the coat investing it, sends many nervous fibers into its subflance, as is apparent by the taking away of the coat from a boiled liver; we must think the fame of the other entrails. The coat of the liver is from the Peritoneum, waxing small from the umbilical vein, when it divides it felf for the generation of the gate and hollow veins, as is observed by Galen, Lib. de format. Farms. The liver is only one, fituate in the greater part on the right side, but with the lesser part on the left, quite contrary to the flomach. Its chief connexion is with the flomach and guts, by the veins and membranes of the Peritoneum; by the hollow vein and artery, with the heart; by the nerve with the brain; and by the fame ligatures with all the parts of the whole body. It is of a hor and moift temper, and fuch as have it more hot, have large veins and hot blood; but fuch as have it cold, have finall veins, and a difcoloured hew. The action of the liver is the conversion of Chylus into the blood, the work of the fecond concoction. For although the Chylus entring into the meferaick veins, receive fome refemblance of blood, yet it acquires not the form and perfection of blood, before it be elaborate, and fully concoct in the liver. It is bound and tied with three firong ligaments, two on the fides in the midft of the baffard ribs, to bear up its fides, and the third more highand ftrong, descending from the blade, to sustain its proper part, which with its weight would press the lower orifice of the ftomach, and so cause a falling or drawing down of the sternon and collar-bone. And thus much may fuffice for its proper ligaments, for we before-mentioned its common 5 the veins, arteries, nerves, and coat of the Peritoneum, by which it is knit to the loins and other natural parts. But we must note, that besides these three proper ligaments, the liver is also bound with others to the bastard-ribs; as Sylving observes in his Anatomical observations, and Hollering in his Practice, c. de Plurit,

> CHAP. XVIII. Of the Bladder of the Gall.

The fobfiance greatness and gure thereof. The composiconnexion.

Temper. Action.

The channels of the Gall.

Lib. 2. de Tem-

Ow we must come to the bladder of the gall, which is of a nervous substance, and of the bigness of a small pear vit is of figure round, with the bottom more large, but the fides and mouth more narrow and ftrait. It is composed of a double coat, one proper, confisting of three forts of fibers, the other from the Perinmeum. It hath a vein from the Porta or gate-vein, and an artery from that which is diffused into the liver, and a nerve from the fixth conjugation. It is but one, and that hid on the right fide under the greater lobe of the liver, it is knit with the touching of its own body, and of the puffages and channels made for the performance of its actions with the liver; and in like manner with the Duodenum, and not feldom with the fromach also, by another poffage; and to conclude, to all the parts by its veins, nerves, arteries, and commen coat. It is of a cold temper, as every nervous part is. The action of it, is to feparate from the liver the cholerick humor, and that excrementitious, but yet natural, by the help of the right fibers, for the parifying of the blood, and by the oblique fibers, fo long to keep it being, until it begin to become trouble form in quantity, or quality, or its whole fubstance, and then by the transverse fibers, to put it down into the Duodenon to provoke the expulsive faculty of the guts. I know, Fallopine denies the texture of so many fibers, to be the minister of such action to the gall. But Vefalius seems sufficiently to have answered him. The bladder of the gall hath divers channels: for coming with a narrow neck, even to the beginning of the gate-vein, it is divided into two patfages, the one whereof fuffering no divi-fion, is carried into the Duodenum, unlefs that in fome it fend another branch into the bottom of the flornach, as is observed by Galen, which men have a miserable and wretched life, being subject to cholerick vomitings, especially when their stornachs are empty, with great pains of their stornach and head, as is also observed by Galen, cap. 74. Artis Med. The other, coming our of the body of the liver, divides its felf into two or three paffages, again entring the fubflance of the liver, is divided with infinite branches, accompanying to many branches of the gate-vein through the fubflance of the liver, that to the blood unless it be most elaborate and pure, may not rife into the hollow-vein, all which things Diffection doth manifefuly teach.

CHAP. XIX.

Of the Spleen or Milt.

Ut because we cannot well show the distribution of the Gate-vein, unless the Spleen be first taken away and removed from its feat: therefore before we go any further, I have thought The Secgood to treat of the Spleen. Therefore the Spleen is of a foft, rare, and spongious substance (whereby it might more early receive and drink up the dregs of the bloud from the Liver) and of a flesh more black than the Liver. For it resembles the colour of its muddy blond, from which it is it is generated. It is of an indifferent greatness, but bigger in some than in other-some, according to the diverse temper and complexion of men. It hath, as it were, a triangular Figure, gibbous on that part, it slicks to the Ribs and Midriff, but hollow on that part next the Stomach. It is composed of Compositions a Coat, the proper Flesh, a Vein, Artery, and Nerve. The membrane comes from the Peritoneum, the proper flesh from the feces or dregs of bloud, or rather of the natural melancholy humour, with which it is nourished. The fourth branch of the Vens Ports or Gate-vein, lends it a Vein; the first branch of the great Descendent Artery, presently after the first entrance without the Midrist, lends it an Artery. But it receives a Nerve from the left Coftal, from the fixth conjugation on the inner part, by the roots of the ribs; and we may manifefly fee this Nerve, not onely dispersing it self through the Coat of the Liver, but also penetrating with its Vessels the proper Flesh thereof, after the self same manner, as we fee it is in the Heart and Lungs. It is one in number, fituate on the left fide between the Stomach Number and the Baffard-ribs, or rather the Midriff which defcends to the roots. For it oft-times cleaves to the Sire. Midriff on its gibbous part by a Coat from the Peritomeson, as also on the hollow part to the Stomach, both by certain Veins which fends it into the Ventricle, as also by the Kall. It hath connexion, Connexion, either primarily or secondarily, with all the parts of the Body by these its Vessels.

It is of a cold and dry temper; the action and use of it is to separate the Melancholick humor, Temper and

which being feculent and droffie, may be attenuated by the force of many Arteries differed through with fulfilling feculent and droffie, may be attenuated by the force of many Arteries differed through with the fulfilling. For by their continual motion and native heat, which they carry in full force with them from the Heart, that grofs bloud puts off its grofsnefs, which the Spleen fends away by paffages fit for that purpose, retaining the fubtler portion for its nourithment. The paffages by which it purges it felf from the grofsnefs of the melancholy bloud, are a Vein a fending from it into the Stormach to fit up the arrestite he is force of the melancholy bloud, and a change from it into the Stomach to ftir up the appetite by its fourness, and firengthen the substance thereof by its aftriction; and also another Vein, which sometimes from the Spleen-branch, sometimes from the Cate-vein, plainly under its orifice, descends to the Fundament, there to make the Hamorrhoidal Veins,

CHAP. XX.

Of the Vena Porta or Gate Vein, and the distribution thereof.

He Gate-vein, as also all the other Veins is of a spermatick substance, of a manifest largeness, The Subof a round and hollow Figure, like to a Pipe or Quill. It is composed of its proper Coat, for and one common from the Peritenceum. It is onely one, and that fituate in the limous or G hollow part of the Liver, from whence it breaks forth (or rather our of the Umbilical Vein) into the Number and midft of all the Guts with which it hath connexion, as also with the Stomach, Spleen, Sphineter of Site. the Fundament, and Peritoneum, by the Coat which it receives from thence. It is of a cold and dry Temper temper. The action of it is to fuck the Chylus out of the Ventricle and Guts, and so to take and carry Action. it to the Liver, until it may carry back the fame turned into blood for the nutriment of the Stomach, Spleen, and Guts. This Gate-vein coming out of the fimous part of the Liver, is divided into fix Division branches, that is, four fample, and two compound again divided into many other branches. The thereof into 6 first of the simple ascends from the fore-part of the trunk of the bladder of the Gall by the passage of branches, of the Choler and this distribution which, four the Choler(and are marked with g g) with a like Artery for life and nourithment, and this distribution which, four is known by the name of Cylice Gamelle, or Cyslick Twins. The second called the Gastrica or Stomach Vein, arising in like manner from the forepart of the Trunk, is carried to the Pylorus and the simous or back part of the Stomach next to it.

The third is called Gastrepiples, the Stomach and Kall-Vein, which coming from the right fide of the gate-vein goes to the gibbous part of the stomach next to the Pylorus and the right fide of the kall.

The fourth going forth from behind on the right hand of the Gate-vein, ascends above the root of Gastrepiples. The fourth going touth from bening on the light hand of the Oute-vein, alcends above the root of Gaßreplant the Mcferaick branch even to she beginning of the Gut Jejumin along the Gut Duodenson, from the Whence it is called Intestination, or the Gut-vein. And these are the four sample Branches. Now we

The first is splenick, which is divided after the following manner. For in its first beginning and Two com-The first is tplenick, which is divided and the common state of the Stomach, which by the back-part of pound, the Stomach ascends into the upper and hollow part thereof; to which place, as foon as it arrives, games splished. it is divided again into two branches, the one whereof climbs up even to its higher orifice, the other cas, feeding deficends down to the lower, fending forth by the way other branches to the fore and back parts of forth, the Stomach. These engired and on every fide encompass the Body or the Ventricle, for which cause

Memorrhoidalis Enterna.

I have fometimes observed this coming forth of the Trunk, a little above the orifice of the splenick branch. But this fame fplenick branch on its lower part, produces the branch of the Hæmorrhoidal Veins, which defcending to the Fundament above the left fide of the Loins, diffuses a good portion thereof into the least part of the Colick Gut, and the right Gut, at the end whereof it is often feen to be divided into five Hæmorrhoidal Veins, fometimes more, fometimes lefs.

Gastrepiplois major sinistra.

Silvius writes that the Hemorrhoidal branch descends from the Mesenterick: and truly we have fometimes observed it to have been so. Yet it is more sutable to Reason, that it should descend from the Splenick, not onely for that we have feen with our eyes that it is so, but also because it is appointed by Nature for the evacuation of the excrementitious melancholick humor. But this fame splenick branch out of the middle almost of its upper part, produces the third branch going to the gibbons part of the Stomach and the Kall; they term it the greater, middle, and left Gattrepiplais. But on the lower part towards the Spleen, it produces the simple Epiplois or Kall-vein, which it diffuses through the left fide of the Kall. Moreover from its upper part, which touches the Liver, it fends forth a short branch called Vas breve, or Venosium, to the upper orifice of the Ventricle for stirring up the ap-

Epiplois fin-Var breve fin

Lib. 4. de 11/4 Partium.

We have oftentimes and almost always observed, that this Vein-vessel, which Galen calls Vas Bre-De, comes from the very body of the Spleen, and is terminated in the midft of the Stomach on the left fide, but never pierces both the Coats thereof. Wherefore it is somewhat disficult to find, how the melancholy juice can that way be poured, or fent, into the capacity of the Stomach. Now the splenick branch, when it hath produced out of it those five fore-mentioned branches, is wasted and disperfed into the fubiliance and body of the spleen.

II. Ramus mifeste-reus divided into three

Then follows another compound branch of the Vena Porta, called the Mesenterick, which is divided into three parts; the first and last whereof goes to the Blind-gut, and to the right and middle part of the Colick gut, divided into an infinite multitude of other branches. The fecond and middle is wafted the Ilson, as the third and greater in the Jejumon or Empty-gut. It is called Mefenterick, because it is diffused over all the Mesentery, as the Splenick is in the Spleen. And thus much we have to say of the division of the Gate-vein, the which it at any time thou shalt find to be otherwise than I have fet down, you must not wonder at it, for you shall searce find it the same in two bodies, by reason of the infinite variety of particular Bodies, which (as the Philosophers fay) have each their own, or peculiar gifts. Our judgment is the fame of other divisions of the Vessels. Yet we have fet down that which we have most frequently observed.

CHAP. XXI.

Of the Original of the Artery, and the division of the Branch descending to the Natural Parts.

Hefe things being thus finished and confidered, the Guts should be pulled away; but seeing that if we should do so, we should disturb and lose the division of the Artery descending to the Natural Parts; therefore I have thought it better to handle the division thereof, before the Guts be plackt away. Therefore we must suppose, according to Galens opinion, that as all the The original Veins come from the Liver, so all Arteries proceed from the Heart. This prefently at the beginning is divided into two branches, the greater whereof descends downwards to the Natural Parts upon the Spine of the Back, taking its beginning at the fifth Vertebra thereof from whence it goes into the following Arteries. The first, called the Intercostal, runs amongst the intercostal Muscles, and the diffances of the Ribs and Spinal Marrow, through the perforation of the Nerves on the right and left hand from the fifth true, even to the last of the Bastard Ribs.

Artery, is into Antria ister-

of Arteries. The division of the great descendent

> This in going this progress makes seven little branchings, distributed after the forementioned manner, and going forth of the trunk of the descendent over against each of the intercostal Muscles.

Phrenica.

Callaca.

The fecond being parted into two, goes on each fide to the Midriff, whence it may be called, or expressed by the name of the Diaphragmatica, or Phrenica, (i.) the Midriff Artery. The third being of a large proportion, ariling from the upper part of the Artery, prefently after it hath paffed the Midriff, is divided into two notable branches, whereof one goes to the Stomach, Spleen, Kall, to the hollow part of the Liver and the Gall; the other is fent forth to the Mefentery and Guts after the fame manner, as we faid of the Meferaick Vein, wherefore it is called the Calisca, or Stomach Artery. But we must note, all their mouths penetrate even to the innermost Coat of the Guts, that by that means they may the better and more easily attract the Chylus contained in them.

Emulgent. Spermatica.

The fourth carried to the Reins, where it is named the Reignal or Emulgent, because it sucks fit matter from the whole mass of bloud.

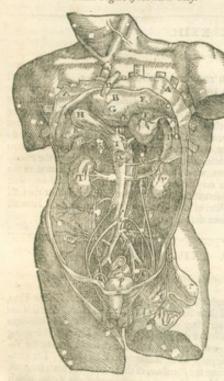

The fifth is fent to the Tefficles with the preparing Spermatick-veins, whence also it is named the fpermatick Artery, which arifes on the right fide, from the very Trunk of the defcendent Artery; that it may affociate the spermatick Vein of the same fide, they run one above another, beneath the hollow Vein; wherefore we must have a great care whilest we labour to lay it open, that we do not hurt and break it.

6. The fixth going from the fore and upper part of this descendent Artes?

**Remarrhaidalia morrhoidal Veins to the Fundament; prefently from his beginning, fending forth certain branches for melitarical alongst the Colick Gut, which by **Anastomossis* are united with other branches of the Colick Gut, which by **Anastomossis* are united with other branches of the Colick Gut, which by **Anastomossis* are united with other branches of the Colick Gut, which by **Anastomossis* are united with other branches of the Colick Gut, which by **Anastomossis* are united with other branches of the Colick Gut, which by **Anastomossis* are united with other branches of the Colick Gut, which by **Anastomossis* are united with other branches of the Colick Gut, which by **Anastomossis* are united with other branches of the Colick Gut, which by **Anastomossis* are united with other branches of the Colick Gut, which by **Anastomossis* are united with other branches of the Colick Gut, which by **Anastomossis* are united with other branches of the Colick Gut, which by **Anastomossis* are united with other branches of the Colick Gut, which by **Anastomossis* are united with other branches of the Colick Gut, which by **Anastomossis* are united with other branches of the Colick Gut, which by **Anastomossis* are united with other branches of the Colick Gut, which by **Anastomossis* are united with other branches of the Colick Gut, which by **Anastomossis* are united with other branches of the Colick Gut, which by **Anastomossis* are united with other branches of the Colick Gut, which by **Anastomossis* are united with other branches of the Colick Gut, which are united with other branches of the Colick Gut, which are united with other branches of the Colick Gut, which are united with other branches of the Colick Gut, which are united with other branches of the Colick Gut, which are united with other branches of the Colick Gut, which are united with other branches of the Colick Gut, which are united with other branches of the Colick Gut, w The fixth going from the fore and upper part of this descendent Artery, descends with the Hxry; for whofoever shall look more attentively, he shall often observe that Veins are so united amongst themselves, and also Arteries, and fornetimes also the Veins with the Arteries. For Anastanossus is a communion and a communicating of the Vessels amongst themselves by the application of their mouths, that fo by mutual supplies they may case each others defect. But they call this the lower Mcferaick Artery.

The feventh proceeding from the trunk with fo many branches as there be Vertebra's in the loins, goes to the loins, and the parts belonging to them, that is the spinal marrow of that part, Lambaria and other parts encompassing these Vertebraes, whereupon it is stilled the Lumbaris, or Loin-Artery.

The eighth maketh the Iliack Artery, untill fuch time as It departs from the Peritoneum where the Crural Arteries take their original. This Iliack Artery fends many divarications towards the Iliacs, Holy bone where it takes its beginning, and to the places lying near the Holy bone, which, because they run the same course as the Iliack Veins, for brevities take we will let pass further mention of them rill we come to the take Iliack Veins. them till we come to treat of the Iliack Veins.

CHAP. XXII.

Of the distribution of the Nerves to the Natural parts.

IT remains that before the bowels be taken away, we show the Nerves sent to the critrails and Na- The Original tural parts, that as wife and provident men we may seem to have constrained and Na- The Original It remains that before the bowels be taken away, we show the Nerves tent to the critrails and Na- The Original tural parts, that as wife and provident men we may seem to have omitted nothing. First we of the Nerves alongst the Gullet, and the sides thereof, as those at the roots of the ribs on both sides within. But when they are passed through the Midrist, those which are distributed amongst the Natural parts follow the turnings of the Veins and Arteries, but specially of the Arteries. Wherefore if you have a mind to follow this distribution of the Nerves, you must chiefly look for it in those places, in which the Artery is distributed amongst the Guts above the Loins.

These Nerves are but small, because the parts serving for nutrition, needed none but little Nerves Their Magni-for the performance of the third duty of Nerves, which is in the discerning and knowing of what is tude and the troublesom to them. For unless they had this sense, there is nothing would hinder, but these bowels, troublerom to them. For uniers they had this leady according would impact, but there bowers, necessary for life, being possessed with some hurtful thing, the Creature should presently fall down dead, but we have this benefit by this sense, that as soon as any thing troubles and vellicates the bowels, we being admonished thereof, may look for help in time.

And befides, if they were deflitute of this fense, they might be gnawn, ulcerated, and putrified by the raging acrimony of the excrements falling into, and flaying in them; but now (by means hereof) as foon as they find themselves pricked or plucked, presently by the expulsive faculty they endeavour to expel that which is troubleforn, and so free themselves of present and future

CHAP. XXIII.

The manner of taking out the Guts.

Hen the Guts are to be taken out, you must begin with the right Gut. And you must divide it, being first straitly tied in two different places, at a just distance about four fingers from the end, with a tharp knife between two ligatures. Then you must shew its proper Coats and Fibres, and that common one which it hath from the Periton eron. This being done, you must in like manner bind the trunk of the Gate-vein as neer the original as you can; that fo all his branches being in like manner tied, there may be no fear of effusion of bloud: you must do the like with the Coeliack Artery at the left Kidney, and in the lower Mefenterick, which descends to the right. Gut with Hemorrhoidal Veins. This being done pull away the Guts even to the Duedenon, which being in like manner tied in two places, which ought to be below the infertion of the Porus Cholagogue, or passage of the Gall, that you may shew the oblique insertion thereof into that Gut, for the obliquity of its insertion is worth observation, as that which is the cause that the Gall cannot flow back into its bladder by the compression of this Gut from below upwards. Then all these windings of the Guts may be taken away from the body.

CHAP. XXIV.

The Original and Distribution of the descendent Hollow Vein.

Ecause the rest of the natural parts, do almost all depend upon the descendent Hollow Vein, therefore before we go any further, we will shew its Original and Distribution. We faid before that all Veins proceeded from the Liver, but yet in divers places. For the Gate-vein goes out of the hollow part, and the Hollow Vein out of the gibbous part of the Liver, which going torth like the body of a Tree, is divided into two great branches; the lesser of which goes to the Vital and Animal parts, and the extremities of these parts, as we shall show in their place. The greater, descending from the back part of the Liver above the Vertebraes of the Loins to the parts beneath, goes in the manner following. The first division thereof is to the membranes of the Reins, which come from the Peritoneum. Wherefore there it produces the Vene adjuste, or fatty Veins, to called, The first division thereof is to the membranes of the Reins, which because they bring forth a great quantity of fat in those places; Of these fatty Veins there is a diverse original; for the right doth oftentimes arise from the right emulgent, because it is higher; but the less comes from the very trunk of the Hollow Vein, because the emulgent on that side is lower; and

you thall fcarce fee it otherwife,

The second, being the Kidney or Emulgent Veins, go to the Reins, which, at their entrance, or a little before, is divided into two branches, like as the Artery is, the one higher, the other lower, and thefe again into many other through the fubftance of the Kidneys, as you may learn better by Ocular Inspection than by Book. They are thick and broad, that the scrous humour may without impediment have freer passage. Their original is different; for the right emulgent oftentimes comes forth of the Hollow Vein fornewhat higher than the left; that feeing their office and duty is to purge the mass of bloud from the cholerick and serous humour, that if any part thereof slide by the one, it may not so scape, but fall as it were into the other. Which certainly would not have happened if they had been placed the one just opposite to the other. For the serous or wheyish humour would have fizid as equally ballanced, or polifed, by reason of the contrariety of the action, and traction or drawing thereof. But we must remember, that in diffecting of Bodies, I hove oftentimes found in fuch as have been troubled with the Stone, feven emulgent Veins, and so many Arteries; four from the left fide coming from divers places, of which the latt came from the Iliack; three from the right hand likewife in divers places.

The third division is called the Spermatick or Seed Vein, it goes to the Tellicles; the original thereof is thus; that the right arises on the fore-part of the trunk of the Hollow Vein; but the left most commonly from the emulgent. Belides, you shall formetimes find that these have companions with them, to the right emulgent; but to the left, another from the Hollow Vein; in fome but on one fide, in others on both. But also I have sometimes observed the left emulgent to proceed from the Spermatick or Seed Vein.

The fourth, because it goes to the Loins, is called Lumbaris; which in his original and infertion is wholly like the Artery of the Loins. But there are four Lumbares or Loin Veins on each fide, that

is, one in each of the four spaces of the five Vertebraes of the Loins:

The fifth division makes the Ilinee, until, passing through the Peritoneum, they take the names of Crural Veins: These are first divided into the Musculous, so called, because they go to the oblique ascendent and transverse Muscles, and to the Peritoneum. Sometimes they have their original from the end of the Trunk. And the fame Iliacs are divided into the Sacra, or Holy; which go the foinal marrow of the Holy bone through those holes, by which the Nerves generated of this marrow, have their paffage.

The original of the Hollow Vein. It is divided into two Trunks, The division of the greater

Thirdly, The Iliace are divided into the Hypegastrice, so called because they are distributed to all the parts of the Hypegastrium, or lower part of the lower belly, as to the right Gut, the muscles thereselves of, the musculous skin (in which place they often make the external Hemorrhoidal, ordained for the date the Hamiltonian described the Hamiltonian described to the Hamiltonian described the Hamiltonian described to the Hamiltonian described purging of fuch bloud as offends in quantity, as those other, [that is, the inward Hemorrhoidal] which mornisidales defeend from the right Gut from the Gate-vein by the spleenick branch, serves for cleaning that extenses which offends in quality,) to the Bladder and the neck thereof, even the end of the Yard, to the Womb, and even to the neck of the Womb and utmost part of the Privities, from whence it is likely the Courses break forth in Women with Child and Virgins. But this fame Vein also sends a portion without the Epigastrium by that perforation which is common to the Share and Haunch-bones, which, ftrengthened by the meeting of the other internal Crural Vein, defeends even to the Ham; but in the mean time, by the way, it is communicated to the mufcles of the Thigh, called Obturatores, and other

Fourthly, The Hises produce the Epigsfrice, which on both fides from below afcend according to the length of the right muscles, spreading also by the way some branches to the oblique and transverse Epigsfrice.

mufcles, and also to the Peritoneum.

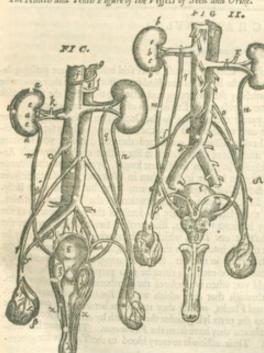

Fifthly, These Iliace produce the Pudenda, or Veins of the Privities; because they go in Women to their Privities, and in men to the Cods ; where they enter that flethy Coat filled with Veins, and Padrade. going to the skin of the Yard they take their beginning under the Hypogaprice.

CHAP. XXV.

Of the Kidneys or Reins.

Ow follow the Kidneys, which that they may be more eafily feen, (after that you have diligently observed their fituation) you shall despoil of their fat, if they have any about them, as also of the membrane they have from the Peritonium. First, You shall shew all their conditions, beginning at their fubstance.

Magnitude Figure.

Composition

and round, almost resembling a semicircle, and they are lightly flatted above and below. They are partly hollow and partly gibbous; the hollow lies next the hollow Vein, and on this side they receive the emulgent Veins and Arteries, and send forth the Ureters; their gibbous part lies towards the loins. They are composed of a coat coming from the Peritomann; their own peculiar slesh, with the effusion of bloud about the proper Vessels, (as happens also in other entrails) generates a small Nerve, which springing from the Costal of the sixth Conjugation, is disfused to each Kidney on his side into the coat of the Kidney it self, although others think it always accompanies the Vein and Artery.

Number. Site. But Fallopine, that most diligent Author of Anatomy hath observed that this Nerve is not onely oftentimes divariented into the coat of the Kidneys, but also pierces into their substance. They are two in number, that if the one of them should by chance be hurt, the other might supply those necessities of Nature for which the Kidneys are made. They lie upon the loins at the sides of the great Vessels, on which they depend by their proper Veins and Arteries, and they slick to them as it were, by a certain second coat, lest that they might be shaken by any violent motions. Wherefore we may say that the Kidneys have two coats, one proper adhering to their substance, the other, as it were, coming from the Perionamo on that part they slick to it. The right Kidney is almost always the higher, for those reasons I gave, speaking of the original of the emulgent Vessels. Columbus seems to think the contrary: but such like controversies may be quickly decided by the Eye. They have connexion with the principal Vessels by the Veins, Nerves, and Arteries; by the Coats with the Loins and other parts of the lower selly, but especially with the Bladder by the Ureters. They are of a hot and moist temper, as all sleshy parts are. Their action is to cleanse the Mass of the Bloud from the greater part of the second and cholerick humour. I said the greater part, because it is needful that some portion thereof should go with the alimentary bloud to the folid parts, to serve in stead of a vehicle, lest otherwise it should be too thick.

Temper-Action.

Connexion.

Befides, you must note, that in each Kidney there is a cavity bounded by a certain membrane, encompassed by the division of the emulgent Veins and Arteries through which the Urine is strained partly by the expulsive faculty of the Kidneys, partly by the attractive of the Ureters which run through the substance of the Kidneys on the hollow side, no otherwise than the Porus cholagogue through the body of the Liver.

Their Strai-

CHAP. XXVI.

Of the Spermatick Veffels.

Ureters.

Ow we should have spoken of the Ureters, because, as we said before, they are passages derived from the Kidneys to carry the Urine to the Bladder. But, because they cannot be distinguished and shewed, unless by the corrupting and vitiating the site of the spermatick Vessels, therefore I have thought it better to pass to the Explication of all the spermatick parts.

And first of all you must gently separate them, (that so the Declaration of them may be more

Their Sabflance. Quantity.

Figure and Composure,

Number.

casic and manifest) and that from the coat which comes from the Peritomenom, and the fat which invests them even to the Share-tione, having diligently confidered their fite, before you separate them. Then you shall teach that the substance of these Vesses is like to that of the Vesses and Arteries. Their quantity is small in thickness, but of an indifferent length, by reason of the distance of their original from the Testicles. They are longer in Men than in Women, because these have their Testicles hanging without their Belly, but Women have them lying hid within their Belly. Their figure and composition of the Vesses and Arteries, except in this one thing, that from that place where they go forth of the great capacity of the Peritomenon, they are turned into many intricate windings, like crooked swoln Vesses, even to the Testicles. That the spermatick matter in that one Tract, which yet is no other than bloud, may be prepared to concoction, or rather be turned into Seed in these Vesses, by the irradiation of the faculty of the Testicles. These vesses are fix in number, sour preparing, and two ejaculatory, of which we will speak hereafter. Therefore on each fide there be two preparing Vesses, that is, a Vesses and Artery, arising as we told you when we spoke of the distribution of the hollow Vesses. Their fite is oblique above the Loins and Flanks, whilest they run down between the ends of the Share and Haunch-bone, they are knit to the parts lying under them, both by certain Fibers which they send from them, as also by the membrane they have from the Peritomenon. They have like temperature as the Vesses and Arteries have. Their action is to carry bloud to the Testicles for generating of Seed.

Sice.

CHAP. XXVII.

Of the Testicles, or Stones.

Their Subflance. Magnitude and Figure. Composition He Testicles are of a Glandulous, white, soft and loose substance, that so they may the more easily receive the spermatick matter: their magnitude and sigure equal, and resemble a small Pullets Egg somewhat slatted; their composure is of Veins, Arteries, Coats, and their proper sless. Their Veins and Arteries proceed from the spermatick Vessels, their Nerves, from the sixth Conjugation, by the roots of the Ribs, and out of the Holy-bone. They are wrapped in four Coats, two whereof are common, and two proper. The common, are the Service of

skin

skin of the Cods, proceeding from the true skin; and the flethy Coat, which confids of the flethy Pannicle in that place receiving a great number of Veffels, through which occasion it is so called. The proper Coats are first the Erysbrois arising, from the process of the Perismenn, going into the The Coat Secretary together with the special veffels, which it involves and covers; this appears red both Erysbrois. Scretum together with the Ipermatick Veffels, which it involves and covers; this appears red both Entirement by reason of the Veffels, as also of the Crematicr-muscles of the Testicles; then the Epididymis or The Epididythe Testicles, is as it were, a certain effusion of matter about the Veffels, as we faid of other entrails. But you must observe, that the Epididymis encompasses the whole Stone, except its head, in which place it strikes to the Epididymis, which is continued through the whole substance of the Testicle.

This Epididymis or Dartas was therefore but about the Stones, because the Testicles of the medium. place it firikes to the Epididymis, which is continued through the whole inputance of the Tetricles. This Epididymis or Dartor was therefore put about the Stones, because the Tetricles of themselves are loose, spongious, cavernous and soft, so that they cannot safely be joined to the spermatick Vestels, which are hard and strong. Wherefore Nature, that it might join extreams by a fit Medium, or mean, formed this Coat Epididymis. This is scarce apparent in Women by reason of its smalless. The two forementioned common Coats, adhere or sick together by the Vessels not onely or mean, formed this Coat Epididiums. This is rearee apparent in women by realon of its Imalness. The two forementioned common Coats, adhere or flick together by the Veffels not onely amongst themselves, but also with the Erythris. You must besides observe, the Cremaster-muscles for the faild substance with other muscles, small and thin, of an obseque and broad figure, arising from the membrane of the Peritoneton, which (as we fail before) assume she falls are strongly and the coats. They are figure from the membrane of the Peritoneton. composition is like other muscles. They are two, on each side one. They are fituate from the ends of the Flanks even to the Stones. They have connexion with the process of the Pointenan and Teflicles. Their temper is like that of other mufcles. Their action is to hang and draw up the Tellicles towards the Belly, whence they are called hanging mufcles. The Teticles are most commonly in the Kidneys, for forne have but one Kidney. They lie hid in the Serotaur at the very roots of the Share-bone, connexed to the principal parts of their Veffels, with the neck of the Bladder and Yard but by their Coats they adhere to the parts from whence they have them. They are of a cold and Temper, moilt temper, because they are glandulous; although they may be hot by accident, by reason of the multitude of the Veffels flowing thither. Those whose Testicles are more hot, are prompt to Venery, and have their Privities and adjacent parts very hairy; and belides, their Tefficles are very large and compact. Those on the contrary that have them cold, are flow to Venery, neither do they beget many children, and those they get, are rather female than male; their Privities have little hair upon them, and their Testicles are small, soft, and flat. The action of the Testicle is to generate Seed, to Action. them, and their Tenness are iman, not, and nat. The action of the Tennes is to generate Secu, to corroborate all the parts of the Body, and by a certain manly irradiation to breed or increase a true masculine courage. This you may know by Eunuchs, or such as are gelt, who are of a womanish nature, and are oftentimes more tender and weak than Women. As Hippocrates teaches by example

CHAP. XXVIII.

Of the Varicous Bodies or Parastates, and of the ejaculatory Vessels, and the glandulous or Prostates.

He Varicous Paraflate are nervous and white bodies, like as the nerves, wound and close Their Subwoven amongst themselves; they are stretched even from the top to the bottom of the stance. Testicles, from whence presently by their departure they produce the Vasa ejaculatoria, or For that which I call Paraflate, that is, as it were the head of the Testicle, being, as it were, like anomany Anatomists, understand by the Epidialymis the proper Coat of the Testicles, of which thing I the Seed from departing out of the preparing into the leading Vessels, before it shall be most perfect than Galies. Which is also windings the bloud looks pure, but in the last it is not fored, but somewhat whitish. For Nature commonly doth thus delay the matter in its passage, either by straitness or obliquity, which it de-He Varicous Paraflate are nervous and white bodies, like as the nerves, wound and close Their Subcommonly doth thus delay the matter in its paffage, either by firaitness or obliquity, which it defires to make more perfect and elaborate by any new concoction; this we may learn by the foldings of the Rete mirabile, the windings in the Guts, the wrinkles in the bottom of the Stormich, the straitof the Rese mirabile, the windings in the Guts, the wrinkles in the bottom of the Stomach, the straitness of the Pylorus, the Capillary Veins dispersed through the body of the Liver's Certainly Nature
and figure round, tending in the making of the spermatick Vessels. Their quantity is visible, Their Quandteries, which they enjoy from the Vessels of the Testicles, from the Epidispuns, or the Coat, from
the Perionaum, and their proper substance. Their temper is cold and dry. They be two in number, one to each Testicle. But these Varicous bodies are called Parasitate, Additions, because they
simpersically assist, and are knit to the Testicles according to their length, or long ways. Out of Vasasicalsthe Parasitate proceed the Vasa ejaculatoria, or leading Vessels, being of the same substance as their
Progenitors, that is, folid, white, and as it were nervous. Their quantity is indifferent, their figure
forated by any manifest passage, unless by chance in such as have had a long Gunaritate.

They
have like temper as the Parasitates, between which and the Proglates they are seated, immediately forated by any manifelt panage, times by chance in tuch as have had a long Generibus. They have like temper as the Paragrates, between which and the Proflates they are feated, immediately knit with them both, as both in the Coat, and the other Veffels with the parts from whence they

But we must note, that such like Vessels coming out of the Parastates ascend from the bottom of But we must note, that usen like veneral contains out the Paragrans accord from the bottom of the Stones even to the top, in which place meeting with the preparing Veffels, they rife into the Belly by the fame passages, and bind themselves together by nervous fibres, even to the inner

Veffels

capacity of the belly; from whence turning back, they for fake the preparing, that fo they may run to the bottom of the Share-bone, into the midft of two glandulous bodies, which they call Projected fituate at the neck of the bladder, that there meeting together, they may grow into one passage,

and Action.

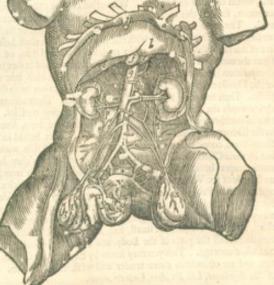

For thus of three passages, that is of the two leading Vessels, and one passage of the Bladder, there is one common, one in men for the cashing forth of Seed and Urine. A Cammele rifing like a Crest at the beginning of the neck of the Bladder, argues this uniting of the paffages, which receiving this fame paffage which is fufficiently large, is oft-times taken by fuch as are ignorant in Anatomy for an Their Number unnatural Caruncle, then especially when it is fwollen through any occasion. These leading Vessels are two in number, on each fide one. Their action is to convey the Seed made by the Tetticles to the Proflates, and fo to the neck of the Bladder, fo to be cast forth at the common passage. But if any ask whether that common paffage made by the two leading Veffels between the glandulous Bodies be fo obvious to fenfe or no: We answer, it is not manifest, though reason compel us to confess that that way is perforated by reason of the spermatick, gross, and viscous matter carried that way. But peradventure the reason why that passage cannot be seen, is, because in a dead carkass all small passage ges are closed and hid, the heat and spirits being gone; and the great appear much less, by reason all the perforations fade, and fall into themselves. Yet certainly these passages must need be very strait even in a living Man, seeing that in a dead they will not admit the point of a needle. Wherefore we need not fear, left in fearthing, whileft we thrust the Catheter into the Bladder, it penetrate into the common passage of the leading Vessels which runs within the Caruncle, unless peradventure This Caruncle by forne chance, as a Gonorrham, or forne great Phlogmon, it be much dilated befides Nature. For I This Carance must be observed and di-must be observed and di-thing should admonish us, that in searching we take great care that we do not rashly hurt this Ca-runcles for being somewhat rashly handled with a Carbeter, it casts forth bloud, especially if it be infrom a hype-face figure of the famed. But also the concourse of the spirits showing with great violence together with the Seed, shely exercing the forward such ejaculation thereof performed through these strait passages by the power of

the imaginative faculty in the Act of Generation.

After the leading Veffels, follow the Profise, being glandulous Bodies of the fame fubiliance and temper that other Glandules are. Their quantity is large enough, their figure round, and formewhat long, fending forth on each fide a foft production of an indifferent length. They are composed of Veins, Nerves, Arteries, a coat (which they have from the neighbouring parts) and lassly their proper field, which they have from their first conformation. They are two in number, fituate at the root of the neck of the Bladder, fornewhat firaitly bound or tied to the fame, to the leading

Veffels, and the parts annexed to them. But always observe, that every part which enjoys nourish- An Anatom ment, life, and fense, either first or last, bath connexion with the principal parts of the Body, by the cal Axiom. intercourse of the Vessels which they receive from thence

The use of the Profiates is to receive in their proper body the seed laboured in the Testicles, and Their uses to contain it there, until it be troubleforn either in quantity or quality, or both. Befides, they contain a certain oily and viscid humour in their glandulous body, that continually diffilling into the passage of the Urine; it may preserve, it from the acrimony and sharpness thereof. But we have obferved also on each side other Glandules, which Rondeletins calls Appendices Glandulose, glandulous Rond, in ne dependences to arise from these Proflates, in which also there is feed referved.

CHAP. XXIX.

Of the Vresers.

Ow it scens fit to speak of the Ureters, Bladder, and parts belonging to the Bladder. The substance, Therefore the Ureters are of a spermatick, white, dense, and solid substance, of an indifferent bigness in length and thickness. Their Figure is round and hollow. They are posare of two Coats, one proper consisting of right and transverse Fibres which comes from the ureters.

Nerves and Arteries from the reighbouring of the Common, from the Peritoneum; besides, they have Veins,

Nerves, and Arteries, from the neighbouring parts.

They be two in number, on each fide one; they are fituate between the Kidnies (out of whose Number and hollow part they proceed) and the Bladder. But the manner how the Ureters insert or enter them. Site. felves into the Bladder, and the Porus Cholagogus into the Duodenson, exceeds admiration; for the Ureters are not directly but obliquely implanted near the orifice of the Bladder, and penetrate into the inner space thereof; for within they do, as it were, divide the membrane, or membranous Coat of the body of the Bladder, and infimuate themselves into that, as though it were double. But this is opened at the entrance of the Urine, but flux at other times, the cover, as it were falling upon it, so that the humour which is fallen into the capacity of the Bladder, cannot be forced or driven back; no not so much as the Air blown into it can come this way out, as we see in Swines Bladders

blown up and filled with Air.

For we fee it is the Air contained in these which fills them thus neither can it be pressed forth but

For as this Skin or Coat turned in by the force of the humour gives way, fo it being preffed out by the body contained within, thrufts its whole body into the paffage as a floople; like to this, is the

infertion of the Ports Chologogus into the Guts.

The Ureters have connexion with the above-mentioned parts, with the mufcles of the Loins, upon Connexion. which they run from the Kidneys to the Bladder.

Wherefore nothing hinders, but that the stone sliding through the Ureters into the Bladder, may flupifie the Thigh as much as it did when it was in the Kidney. They are of a cold and dry

Their use is, to serve as passages or channels, for carrying the Urine into the Bladder.

Temper and

CHAP. XXX.

Of the Bladder.

He Bladder is of the same substance that the Ureters, that is, nervous, that so it may be the The substance

more early dilated.

It is of a large proportion, in fome bigger, in fome lefs, according to the difference of Age and labit of body. It is of a round Figure, and as it were, Pyramidal.

It is composed of two Coats, one proper, which is very thick and strong, composed of the three forts of Fibres, that is, in the inner side of the direct, without of the transverse, and in the midst of each side one, from the Hypogastrick Vessels above the Holy bone; also it hath Nerves on each side from the sixth conjugation mixt with the Nerves of the Holy bone. For these Nerves descend it is but one, and that situate in men in the lower belly appent the right Gut, and below the standard one, and that situate in men in the lower belly appent the right Gut, and below the standard one, and that situate in men in the lower belly appent the right Gut, and below the standard one, and that situate in men in the lower belly appent the right Gut, and below the standard of the Holy bone.

from the Brain even to the end of the Holy bone.

It is but one, and that fituate in men in the lower helly upon the right Gut, and below the Sharebone; but in Women between the Womb and that bone, to which it cleaves with his membranous ligaments, as it doth to the Yard by its neck, and to the right gut by its common Coat and proper

Veffels. It is of a cold and dry temper.

The use and action thereof is by the Fibers continually to draw the Urine, and contain it as long Temper, use as need requires, and then to expel it by the neck, partly by compression either of it self, or ra- or action, there to the muscles of the Epigastrium and Midrist; because this motion, seeing it is voluntary, can the total state of the annual state which the Bladder wants; partly by the dilutesian and contain it as long Temper, use ther to the mufcles of the Epigatrium and middan, became this motion, feeing it is voluntary, cannot be performed unlefs by a mufcle which the Bladder wants; partly by the dilatation and relaxation of the Sphincter mufcle composed of transverse Fibers, like the Sphincter of the Fundament, tion of the Sphincter marche component of the Bladder, that the Unine flow not out against our will. But the Bladder, as it fills, is dilated; but as it is emptied, it is contracted like a purie. may eafily observe this muscle in a Sows bladder: it is stretched from the orifice of the Bladder, may easily observe this branche in a sows based on the Privities in Women; but in Men it is terminated in the Penameum as foon as it hath left the right Gut.

Befides, this trusfile is thus far

stretched forth, that the Urine by its compression should be wholly pressed out of the Bladder, which by too long stay would by its acrimony do some harm. This is the common opinion of Anatomists concerning the Sphincter of the Bladder, which nevertheless Fallopius allows not of. For (faith he) if this muscle should be fituate beneath the glandulous bodies, the Seed in copulation could never be cast forth without some small quantity of Urine. Wherefore he thinks that this muscle is situate above the Proflates, and that it is nothing else but the beginning of the neck of the Bladder, which becomes more fleshy whilest it is woven with transverse fibers.

The neck of the Bladder.

For the neck of the Bladder: it differs nothing in fubftance, composure, number, and temper from the Bladder, but onely in quantity, which is neither fo large, nor round in Figure, but formewhat long together with the Yard, representing the shape of the letter S. It is placed in men at the end of the right Gut and Peritoneum, riling upwards even to the roots of the Yard, and with it bending it felt downwards; in Women it is flaort, broad, and streight, ending at the orifice of the neck of the

The cor xion and use thereof.

Womb between the nervous bodies of the Nymphe.

In men it hath connexion with the Bladder, the ejaculatory Veffels, the right Gut and Yard, but in Women onely with the neck of the Womb and Privities. The use of it is in Men to cast forth Seed. and Urine, in Women onely Urine. But we must note that the Share-bones must be divided and pulled afunder in that part where they are joined, that fo you may the more exactly observe the fi-tuation of these parts. Besides you must note, that by the Peritoneson, we understand nothing else, in Men and Women, than that space which is from the Fundament so the Privities, in which the fearn is called Taurus.

CHAP. XXXI.

Of the Tard.

The fobflance, gure of the

Ow follows the declaration of the privy parts of Men and Women; and first we will treat of Mens. The Yard is of a ligamentous fubiliance, because it hath its original from bones. it is of an indifferent magnitude in all dimensions, yet in some bigger, in some less; the Figure of it is round, but yet formewhat flatted above and beneath.

It is composed of a double Coat, Nerves, Veins, Arteries, two Ligaments, the passage of the Urine,

Composured and four Muscles. It hath its Coats both from the true Skin, as also from the fleshy Pannicle; but

the Veins and Arteries from those of the lower part of the lower belly which run on the lower part of the Holy-bone into the Yard, as the seminary Vessels run on the upper part.

The ligaments of the Yard proceed on both sides from the sides and lower commissions of the The ligaments. Share-bones; wherefore the Yard is immediately at his root furnished with a double ligament; but these two presently run into one spongy one. The passage of the Urine situate in the lower part of the Yard, comes from the neck of the Bladder between the two ligaments.

For the four Muscles, the two side-ones composing or making a great part of the Yard, pro- The Muscles ceed from the inward extuberancy of the Hip-bone, and presently they are dilated from the original, and then grows less again. The two other lower arise from the Muscles of the Fundament, and accompany the Urinary paffage the length of the Peritanesson until they enter the Yard; but these two Muscles cleave so close together, that they may seem one, having a triangular

The action of these four Muscles in the act of generation is, they open and dilate this common Their Action passage of Urine and Seed, that the Seed may be forcibly or violently cast into the Field of Nature; and befides, they then keep the Yard fo ftiff that it cannot bend to either fide.

The Yard is in number one, and fituate upon the lower parts of the Share-bone, that it might be more slift in crection. It hath connexion with the Share-bone and neighbouring parts, by the particles of which it is composed. It is of a cold and dry temper. The action of it is to cast the Seed into the Womb, for prefervation of mankind.

The head of it begins where the tendons end; this head from the Figure thereof is called Glans The Nuc. and Balanne, that is, the Nut; and the skin which covers the head, is called Preparium, that is, the fore- The Preparium. skin. CHAP. XXXII.

Of the Spermatick Veffels and Testicles in Women.

Ow we should treat of the Privy parts in Women, but because they depend upon the neck

Ow we should treat of the Privy parts in Women, but because they depend upon the neck and proper isody of the Womb, we will first speak of the Womb, having first declared what difference there is between the spermatick Vessels and Testicles of Men and Women. Wherefore we must know that the spermatick Vessels in Women do nothing differ from those in Men magnitude and Distribution; for Women have them more large and thort.

It was fit they should be more large, because they should not onely convey the matter fit for generation of Young and nourishment of the Testicles, but also sufficient for the nourishment of in Women. Where you must note, that the preparing spermatick Vessels, a little before they come in Women, as we said in Men, goes into the head of the Testicle, through which it sends a stender also into the Coats of the Testicles for life and nourishment, and not onely into the Coats, but also into leading Vessels. But the bigger branch descends on each side by the upper part of the Womb alfointo leading Veffels. But the bigger branch defeends on each fide by the upper part of the Womb between the proper Coat and the common, from the Perioneum, where it is divided into divers branches. By this difference of the spermatick Vessels, you may easily understand why Women cast

For their Tetticles, they differ little from Mens but in quantity; for they are leffer, and in In what their Figure more hollow and flat, by reason of their desective heat which could not elevate or lift Tetlicles distant up to their just magnitude. Their compositre is more simple; for they want the Seventon or fer from Mens Cod, the flather County of the Seventon or fer from Mens Cod, the flather County of the Seventon or fer from Mens Cod. them up to their just magnitude. Their compositive is more simple; for they want the Screttom or fer from Mens Cod, the fleshy Coat, and also, according to the opinion of some, the Erythroides; but in place thereof they have another from the Peritoneum which covers the proper Coat, that is, the Epiditudes of Dartos. Silvius writes, that Womens Testicles want the Erythroides; yet it is certain, that besides their peculiar Coat Dartos, they have another from the Peritoneum, which is the Erythroides, that is as much as the Vaginalis, of sheath. But I think that this hath sprung from the misunderstanding that place in Galea, where he writes that Womens Testicles want the Epididymis. For we must not understand that to be spoken of the Coat, but of the Varicous Parasitates (as I somerly said.) They differ nothing in number, but in site; for in Men they hang without the belly at the Share-bone above the Paritoneum; Women have them lying hid the Womb.

But these Testicles are tied to the Womb, both by a Coat from the Peritaneum, as also by the leading Vessels descending to the Horns of the Womb; but to the rest of the body, by the Vessels and the Nerves arising from the Holy-bone and Costal Nerves. They are of a colder Temper than Mans. Temper.

The ejaculatory, or leading Vessels in Women differ thus from Mens; they are large at the Their ejaculatory or substance, so that you can force different these form Vessels. beginning, and of a Veiny confidence, or substance, so that you can scarce discern them from tory Vessels. beginning, and of a Veiny confidence, or lubrance, to that you can fearce differn them from tory veness the Coat Peritoneum, then prefently they become nervous, and wax fo flender, that they may feem broken or torn, though it be not fo; but when they come nearer to the Homs of the Womb, they are again dilated; in their own conditions, they agree with Mens, but that they are always they are again dilated; They have a round figure, but more intricate windings than have more intricate windings that these windings might supply the defect of the Varicous Parastates. They ings.

are feated between the Tefficles and Womb; for they proceed out of the head of the Tefficle, then prefently, armed with a Coat from the Peritoneum, they are implanted into the Womb by its Their Site.

CHAP. XXIII.

Of the Womb.

He Womb is a part proper onely to Women, given by nature in flead of the Scrutum, as wherein the the neck thereof, and the annexed parts in flead of the Yard; for that if any more exactly Privy parts in confider the parts of generation in Women and Men, he shall find that they differ not from those in women have hid within, both by the fingular providence of Nature, as also by the defect of heat in Women, which could not drive and thrust forth those parts, as in men. The Womb is of a nervous and membranous substance, that it may be more easily dilated and contracted, as need shall from those in

require.

The magnitude thereof is divers, according to the diversity of Age, the use of Venery, the flowing The substance of their Courses, and the time of Conception. The Womb is but small in one of unripe Age, having and magninot used Venery, nor which is Menthraous; therefore the quantity cannot be rightly defined.

The figure of the Womb is absolutely like that of the bladder, if you consider it without the productions, which Herophilm called Horns, by reason of the similitude they have with the horns of The figure.

The simple are the the Womb. The figure of the Womb is absolutely like that of the bladder, it you conneer it without the productions, which Herophilus called Horns, by reason of the similitude they have with the horns of The horns of Oxen at their first coming forth. It consists of simple and compound parts. The simple are the the Womb. Veins, Arteries, Nerves, and Coats. The Veins and Arteries are four in number, two from the pre-Composure. The Veins and Arteries are four in number, two from the pre-Composure. The Veins and Arteries are four this manner. paring spermatick Vessels, the two other ascend thither from the Hypogastrick, after this manner.

The Veins First, These Vessels before they ascend on each side to the Womb, divide themselves into two branches, from which othersome go to the lower part of the Womb, othersome to the neck thereof, by which the mentitrious bloud, if it abound from the Conception, may be purged.

Nerves come on both files to the Womb, both from the fixth Conjugation, descending by the Nerves.

Nerves come on both fides to the Womb, both from the fixth Conjugation, defeending by the Nerves length of the back-bone, as also from the holy bone, which prefently united and joined together, afternd and are distributed through the Womb, like the Veins and Arteries.

The utmost or common Coat of the Womb proceeds from the Peritoneum, on that part it touches The Coats, the holy bone; but the proper it hath from the first conformation, which is composed of the three forts of Fibers, of the right on the inside of the attraction of both feeds, the transfer of without to ex-

forts of Fibers, of the right on the infide of the attraction of both feeds; the transverse without to expel, if occasion be; the oblique in the midit, for the due retention thereof.

The Womb admits no division, unless into the right and left side, by an obscure line or feam, such as we see in the feration, but scarce so manifest; neither must we after the manner of the Ancients, No Cells in the imagine any other Cells in the Womb. For by the Law of Nature, a Woman at one birth can have Womb.

no more than two. An Argument hereof is, they have no more than two Duess. If any chance to no more than two. An Argument hereof is, they have no more than two Dugs. If any chance to bring forth more, it is befides Nature, and fomewhat monfirous, because Nature hath made no pro-

Nature both placed the Womb at the bottom of the Belly, because that place forms most fit to re- The fite. ceive the feed, to carry and bring forth the Young. It is placed between the Bladder and right Gut, and is bound to these parts much more firaitly by the Neck than by the Body thereof; but also befides it is tied with two most strong lightnesses on the fides and upper parts of the Sharehouse on which fides, it is tied with two most strong ligaments on the fides and upper parts of the Sharebone, on which it feems to hang; but by its common Coat from the Peritoneum, chiefly thick in that place, it is tied to the Hollow bone, and the bones of the Hanch and Loins.

By reason of this strait connexion, a Woman with child feeling the painful drawings back, and as it were, convulsions of those ligaments, knows her felf with child. It of a cold and moist temper, rather The temper by accident than of it self. The action thereof is to contain both the seeds, and to cherish, preserve, and nourish it so contained, until the time appointed by Nature; and also besides, to receive and evacuate the menstraous bloud. The compound parts of the Womb are the proper Body and Neck thereof. That Body is extended in Women big with child, even to the Navel, in some higher, in

In the inner fide the Coryledones come into our confideration, which are nothing elfe than the ori- The Coryledones and mouths of the Veins ending in that place. They scarce appear in Women, unless presently sits. after child-bearing, or their mensional purgation; but they are apparent in Sheep, Goats, and Kine, at all times like Wheat-come, unless when they are with young; for then they are of the bigness of hafel nuts; but they also they six Women and are like a vide piece of flesh of a fineer and a at all times like Wheat-coms, unlefs when they are with young; for then they are of the bigness of hafel nuts: but then also they swell up in Women, and are like a rude piece of flesh of a singer and a specific this shapeless flesh, according to the opinion of some, is reckoned amongst the number of Coats Arteries, whence the umbilical Vessels proceed, so in Women this shelly lump is woven with Veins and and Arteries, whence such Vessels have their original. Which thing, how true and agreeable to really reproved.

There is one thing whereof I would admonish thee, that as the growth of the Catyledoner in Beafts There is one thing whereof I would aumonian thee, that as the growth of the Catyledoner in Beafts are not called by the name of Charian, but are onely faid to be the dependents thereof; fo in Women fuch fwollen Catyledoner merit not the name of Charian, but rather of the dependences thereof.

This Body ends in a certain firaitness which is met withall, in following it towards the Privities, Theorifice of in Women which have born no children, or have remained barren force certain time, for in such as the Womb. in Women which have born no children, or have remained barren fome certain time, for in fuch as the Womb are lately delivered you can fee nothing but a cavity and no flraitness at all. This flraitness we represent the proper orifice of the Womb, which is most exactly that after conception, especially until the orifice of it flow not forth, nor be corrupted by entrance of the air; for it is opened to send forth the Seed, and not always exist from the Courses and serous humours which are heaped up in the Womb in the time of their being women with Child.

The neck of the Womb.

From this orifice the neck of the Womb taking its original, is extended even to the Privities. It is of a mufculous fubflance, composed of fost flesh, because it might be extended and contracted, wrinkled, and firetched forth, and unfolded, and wrefted, and fhaken at the coming forth of the child, and after be reftored to its former foundness and integrity. In process of age it grows harder, both by use of venery, and also by reason of age, by which the whole body in all parts thereof becomes dry and hard. But in growing and in young Women it is more tractable and flexible for the necessity

Its Magnitude. Composition.

The magnitude is sufficiently large in all dimensions, though diverse, by reason of the infinite variety of bodies. The sigure of it is long, round, and hollow. The composition is the same with the Womb, but it receives not so many Vessels as the Womb; for it hath none but those which are sent from the Hypogastrick Veins by the branches ascending to the Womb. This neck on the infide is wrinkled with many crefts, like the upper part of a Dogs mouth, so in copulation to cause greater pleafure by that inequality, and also to shorten the act.

Number and

It is onely one, and that fituate between the neck of the bladder and the right Gut, to which it closely sticketh, as to the Womb by the proper orifice thereof, and to the Privites by its own orifice; but by the Vessels to all the parts from whence they are fent.

Temper.

No Hymra.

It is of a cold and dry temper, and the way to admit the feed into the Womb, to exclude the Infant out of the Womb, as also the menstrual evacuation. But it is worth observation, that in all this paffage there is no fuch Membrane found as that they called Hymen, which they feigned to be broken at the first coition. Yet notwithstanding Columbus, Fallspins, Wierus, and many other learned men of our time think otherwise, and say, that in Virgins a little above the pussage of the Urine, may be found and seen such a personal Membrane, placed overthwart, as it were, in the middle way of this neck, and perforated for the paffages of the courfes. But you may find this false by experience; it is likely the Ancients fell into this errour through this occasion, because that in some a good quantity of bloud breaks forth of these places at the first copulation.

From

But it is more probable that this happens by the violent attrition of certain Veffels lying in the in-From whence ward fuperficies of the neck of the Womb, not being able to endure without breaking to great extention as that nervous neck undergoes at the first coition. For a Maid which is marriageable, and breaks forth between the property and biggest that Many shall find an first and breaks forth hath her genital parts proportionable in quantity and bigness to a Mans, shall find no such effusion of in some bloud, as we shall shew more at large in our Book of Generation.

This neck ends at the Privities, where its proper orifice is: which privy parts we must treat of, as first coition, being the productions and appendices of this neck. This Pudendum or Privity is of a middle substance, between the flesh and a nerve; the magnitude is sufficiently large, the figure round, hollow, long, It is composed of Veins, Arteries, Nerves, descending to the neck of the Womb, and a double Coat proceeding from the true Skin and sleshy Pannicle; both these Coats are firmly united by the slesh coming between them; whereupon it is faid that this part confitts of a mufculous Coat. It is one in number, fituate above the Peritonesem. It hath connexion with the Fundament, the neck of the Womb and Bladder, by both their peculiar orifices

It hath a middle temper, between hot and cold, moift and dry. It hath the fame use as a mans Preparition or fore-skin, that is, that together with the Nymphe it may hinder the entrance of the air, by which the Womb may be in danger to take cold. The lips of the Privities called by the Greeks Πτιρυγοίματα, by the Latines Ale, contain all that region which is invested with hairs; and because we have fallen into mention of these Nymphe, you must know that they are, as it were, 1771076.

productions of the musculous skin, which descend on both sides from the upper part of the Sharebone downwards, even to the orifice of the neck of the bladder, oft-times growing to fo great a bigness, that they will stand our like a Mans Yard. Wherefore in some they must be cut off in their young years, yet with a great deal of caution, lest if they be cut too rashly, so great an effusion of bloud may follow, that it might cause either death to the Woman, or barrenness of the Womb, by reason of the refrigeration by the too great effusion of bloud. The later Anatomists, as Columbus and Fullopius, besides these parts, have made mention of another Particle, which stands forth in the upper part of the Privities, and also of the urinary pussage, which joins together these Wings we formerly mentioned. Columbus calls it Tentigo, Fullopius Cleitoris, whence clottus, Tentigo, Tealopius Cleitoris, whence clottus, which specialist is an observe part, let those which define to know more of it. because it is an obscene part, let those which desire to know more of it, read the Authors which I cited.

CHAP, XXXV.

Of the Coats containing the Infant in the Womb, and of the Navel.

He Membranes or Coats containing the Infant in the Womb of the Mother, are of a fperma- Their fubtick and nervous fubfiance, having their matter from the feed of the Mother. But they flance magni-are nervous, that fo they may be the more eafily extended, as it shall be necessary for the tude, figure, and compo-They are of good length and bredth, especially near the time of deliverance, they are round fure. in figure like the Womb.

Their composition is of Veins, Arteries, and their proper substance. The Veins and Arteries are distributed to them (whether obscurely or manifertly, more or fewer) from the Womb by the Cotyledones, which have the same office, as long as the Child is contained in the Womb, as the Nipples or Paps of the Nurses after ivis born. For thus the Womb brings the Cotyledoner, or Veins degenera-

ting into them through the Coats like certain Paps to the Infant that up in them.

These Coats are three in number, according to Galen; one called the Chorian, Secundine, or Af- The number. ter-birth; the other Allantoides, the third Animos. I find this number of Coats in Beafts but not in Women, unless peradventure any will reckon up in the number of the Coats the Cotyledones, (wollen up and grown into a flethy mais, which many skilful in Anatomy do write; which opinion notwithfranching we cannot receive as true. I could never in any place find the Allantoides in Women with child, neither in the Infant born in the fixth, feventh, eighth, or in the full time, being the nineth Moneth and Moneth, although I fought it with all possible diligence, the Midwives being fet apart, which might have violated fome of the Coats.

But thus I went about this bulinefs: I divided the dead body of the Mother crofswife upon the region of the Womb, and taking away all impediments which might either hinder, or obscure our diligence, with as much dexterity as was possible, we did not onely draw away that Receptacle or Den of the Insant from the inward surface of the Womb, to which it stuck by the Cotyledones, but we also took away the first Membrane which we called Cherion, from that which lies next under it, we allo took away the first Membrane which we called Charles, from that which hes next under it; called Americs, without any rending and tearing; for thus we poured forth no moisture, whereby it might be faid, that any Coat made for the containing of that humour, was rent or torn. And then we diligently looked, having many Witneffes and Spectators prefent, if in any place there did appear any distinction of these two Membranes, the Allamoides and Americs, for the separating the contained

But when we could perceive no fuch thing, we took the American filled with moisture on the up-per fide, and having opened it, two fervants holding the apertion, that no moisture might flow out of it into the circumference of the Chevian, or Womb, then prefently with Spunges we drew out by little and little all the humidity contained in it, the Infant yet contained in it, which was fit to come forth, that so the Coat Annies being freed of this moissure, we might see whether there were any other humour contained in any other Coat belides. But having done this with fingular diligence and fidelity, we could fee no other humour, nor no other feparation of the Membranes

He shews by three several reasons that there is no Al-Lesteides.

So that from that time I have confidently held this opinion, that the Infant in the Womb is onely wrapped in two Coats, the Charion and Amaior. But yet not fatisfied by this experience, that I might yet be more certain concerning this Allanteides, having passed through the two former Coats, I came to the Infant, and I put a quill into its Bladder, and blew it up as forcibly as I could, so to try if by that blowing I might force the Air into that Coat which we questioned, as some have written. But neither thus could I drive any Air from hence through the Navel into the controverted Coat, but rather I found it to fly out of the Bladder by the Privities. Wherefore I am certainly perfuaded that there is no Allantoides. Moreover I could never find, nor fee, in the Navel, that passage called the Unatour, which they affirm to be the beginning and original of the Coat Allantoides. But if it be granted that there is no such Coat as the Allantoides, what discommodity will arise hereo? specially feeing the Sweat and Urine of the Infant may eafily, and without any discommodity be received, collected, and contained in the same Coat, by reason of the small difference which is between them. But if any object that the Urine by its sharpness and touching will hurt the Infant : I will answer, There can be no fo great tharpoels in the Urine of fo fmall an Infant; and that, if there be any, it is tempered by the admixture of the gentle vapour of Sweat.

Befides, If you confider or have regard to the use of such an humour (which is to hold up the Child, left by its weight it break the ties, by which it is bound to the Womb;) we thall find no humour more fit for this purpose than this serous, as which by its thickness is much more fit to bear up a weight, than the thin and too liquid Sweat. For fo we fee the Sea or Salt-water carries greater weights without danger of drowning than fresh Rivers do. Wherefore I conclude that there is no need that the Urine should be kept and contained in one Coat, and the Sweat in another. The Ancients who have writ otherwife, have written from observations made in Beatls. Wherefore we make but onely two Coats, the Cherion and Amnies; the one of which, feeing it contains the other, they both fo encompass the Child, that they vest it on every side.

Fallopius in some fort seems to be of this opinion; for he onely makes two Coats, the Chorion and Annion's but he thinks the Infant makes the Water into a certain part of the Chorion, as you may perceive by reading of his Observations. Both these Coats are tied between themselves by the intercourse of most stender nervous Fibers, and small Vesselspenetrating from the outer Cherion to the in-ner Amnior. Wherefore unless you warily handle these Coats, you may easily tear the Amnior in separating it. They are of the same temper with other Membranes. Their use is different; for the Charion is made both for the prefervation of the Veffels which it receives from the Womb for the generating of the umbilical Veins and Arteries, as also to keep whole and fafe the parts which it invelis,

But the Annies is to receive and contain the excrementations and ferous humours, which the Child that up in the Womb is accustomed to evacuate. But this Coat is very thin and foft, but firong and fmooth, left by its touch it might hurt the Infant, whereupon it is called the Lambskin Coat.

Their temper and use.

CHAP. XXXV.

Of the Navel.

What the Na-

The Navel is the center of the body.

The Figure and Compofure.

Lib. de format.

He Navel follows these Coats: It is a white body, somewhat resembling the wreathen Cord, or Girdle of the Franciscan Friers, but that it hath not the knots standing so far out, but onely fwelling in certain places, refembling a knot, onely lifted up on one fide; it arises and takes its original from a fleshy mass, which we expressed by the name of swelling Cosyledones, and goes into the midft of the lower Belly of the Infant, yea verily into the midft of the whole Body, whole root it is therefore faid to be. For even as a Tree by the root facks nourithment from the Earth, fo the Infant in the Womb draws its nourithment by the Navel. The greatness of it in breadth and thicknels, equals the bigness of the little finger. But it is a foot and a half long, so that children are brought forth with it encompassing their middle, neck, arms, or legs. The Figure of it is round. It is composed of two Arteries, one Vein, and two Coats. It hath these Vessels from that great multitude of capillary Veins and Arteries, which are feen difperfed over the Chorium. Wherefore the Vein entring in at the Navel, penetrates from thence into the hollow part of the Liver, where divided into two, according to Galen's opinion, it makes the Gate and Hollow Veins. But the Arteries carried faiss is stere, by themselves the length of the Navel, cast themselves into the Iliace, which they make, as also all other, that from thence the Vital spirit may be carried by them over all the Infant. It hath its two Coats from the Cherian.

But seeing they are mutually woven and conjoined without any medium, and are of a sufficient firength and thickness over all the Navel, they may feem to make the Infants external Skin and flethy Pannicle. I know very many reckon two umbilical Veins, as also Arteries, and the Urachur, There is onely by, or through which the Urine flows into the Coat Allantaides. But because this is not to be found one Vein in a in Women, but onely Beatts, I willingly omit it, because I do not intend to mention any parts, but but no graches shiply proper to humane bodies. Yet, if there be any which can teach me, that these parts, which I but no graches shiply proper to humane bodies. bat no strates think proper to brute Beafts, are to be found in Women, I will willingly confefs that to his credit,

The other things that may be required concerning the Navel, as of its number, fite, connexion, temper, and use, may eafily appear by that we have spoken before. For we have apparently set down the use, when we faid the Navel was made for that purpose, that the Infant may be nourished by it, as the Tree by the root, by reason of the continuation of the Vessels thereos, with the preparing spermants Vessels made by God for that purpose. tick Veffels made by God for that purpose: To whom be honour and glory for ever and ever. Amen.

The End of the Third Books

BOOK IV.

Treating of the Vital parts contained in the CHEST.

The PREFACE.

Aving finished the first Book of our Anatomy, in explanation of the Natural Parts contained in the lower Belly: Now Order requires that we treat of the Brest's that to the parts in some fort already explained (I mean the Veins and Arteries) may be differenced after the same order and manner, without interposition of any other matter,

and befides also, that we may the more exactly and chearfully there the rest of the parts which remain, as the Head and Limbs, knowing already the original of shose Vessels which are dispersed through them. To this purpose we will define what the Chest is, and then we will divide it into use parts. Thirdly, in these we will consider which parts contain, and which are contained; that so we may more happily saids our intended Discourse. more happily finish our intended Discourse.

CHAP. I.

What the Thorax or the Cheft is; into what parts it may be divided, and the nature of these parts.

He Thorax, or Cheft, is the middle Belly, terminated or bounded above with the Collar bones, below with the Midriff, before with the Sternan or Breft, behind with the twelve Verebraes of the Back, on both fides, with the true and Bastard Ribs, and with the intercostal and intercartilagineous Muscles. Nature hath given it this structure and composition, intercoftal and intercartilagineous Muscles. Nature hath given it this structure and composition, left that being a desence for the Vital parts against external injuries, it should hinder respiration; in parts of the which is no less needful for the preservation of the native heat difficient by the vital spirits, and shut up in the Heart, as in the Fountain thereof, against internal injuries, than the other someonentioned parts against the external. For if the Chest should have been all bony, verily it had been the stronger, but it would have hindred our respiration or breathing, which is performed by the dilating and contracting thereof. Wherefore less one of these should hinder the other, Nature hath tramed it, partly bony and grisly, and partly sleshy. Some render another reason hereof, which is, That Nature hath framed the Chest, that it might here also observe the order used by it in the Fabrick of things, which is, that it might conjoin the parts much disagreeing in the chest partly being and sleshy substances which course we see it hath observed in the connexion of the Fire and Water, by the interposition of the Airs of the Earth and Air, bythe Water placed bethe Fire and Water, by the interpolition of the Air; of the Earth and Air, bythe Water placed be-

The Cheft is divided into three parts, the upper, lower, and middle, the collar-benes cor- The number tain the upper, the Midriff the lower, and the Sternov the middle. The Sternov in Galen's opinion of the bones is compoled of feven bones, I believe by reason of the great statute of the people that lived then, of the statute. Now in our times you shall oft find it compact of three, four, or five bones, although we will not deny, but that we have often observed it (especially in young bodies) to consist of seven or eight

Wherefore those who have fewer bones in number in their Sternon, have them larger, that they might be sufficient to receive the ribs, This is the common opinion of the Sternon. Yet Fallopius hash described in his Observation of the Sternon back in his hath described it far otherwise; wherefore let those who desire to know more hereof, look in his Ob-

At the lower part of the Sternon there is a grifle called commonly Fureula, and Malum granatum, Cavillago facility or the Pomegranate, because it resembles that fruit; others call it Cartilago scutiformis, that is, the Brest-blade.

It is placed there, to be (as it were) a Bulwark or defence to the mouth of the Stornach, endued with most exquisit sense; and also that it should do the like to that part of the Midriss which the Liver bears up in that place situate above the orisice of the Ventricle by the ligament coming between, as a super part of the liver.

Liver bears up in that place intuate above the orifice of the Ventracte by mengament coming between, defcending from the lower part of the fame grifle into the upper part of the Liver.

The common people think that this Grifle fornetime falls down. But it fo adheres, and is united to the bones of the Sterney, that the falling thereof may feem to be without any danger, although oft-times it may be fo moifined with watery and ferous humidities, with which the orifice of the Stomach abounds, that (as it were) foaked and drunk with these, it may be fo relaxed, that it may feem to be out of its places. In which case it may be pressed and forced by the hand into the former relace. to be out of its place; in which case it may be pressed and forced by the hand into the former place and feat, as also by applying outwardly, and taking inwardly aftringent and drying Medicins to ex-

This Grifle at its beginning is narrow, but more broad and obtufe at its end, formewhat referrabling the round or blunt point of a Sword, whereupon it is also called Cartilago Enfiguraria, or the

Sword-like grifle. In some it hath a double, in others a single point.

In old people it degenerates into a Bone. Now because we make mention of this Grifle, we will show both what a County of the c both what a Grifle is, and how, many differences thereof there be, that henceforward as often as we thall have occasion to speak of a Griffle, you may understand what it is

What a Grifle

A Grifle is a fimilar part of our bodies, next to a Bone most terrestrial, cold, dry, hard, weighty, and without fense, differing from a Bone in driness onely, the which is more in a Bone. a Grifle being loft, cannot be regenerated, like as a Bone, without the interpolition of a Callur.

The differen-

The differences of these are almost the same with Bones, that is, from their consistence, substance, greatness, number, site, figure, connexiou, action, and use. Omitting the other for brevity sake. I will onely handle those differences which arise from site, use, and connexion. Therefore Grisles either adhere to the Bones, or of, and by themselves make some part, as the Grisles of the Eye-lids called Tars, of the Epiglesis, and Throttle. And others which adhere to Bones, either adhere by the interposition of no medium, as those which come between the Bones of the Sternen, the Collar-bones, the Share and Haunch-bones, and others; or by a ligament coming between, as those which are at the ends of the Bastard Ribs to the Sternen by the means of a Ligament, that by those Ligaments being softer than a Grisle, the motions of the Chest may be more quickly and safely performed. The Grifles which depend on Bones, do not onely yield ftrength to the Bones, but to themselves, and the parts contained in them, against such things as may break and bruise them. The Grisles of the Steror, and at the ends of the Baffard Ribs, are of this fort.

Their twofold

By this we may gather, that the Grifles have a double use, one to polish and levigate the parts to which that flippery (moothness was necessary for performance of their duty) and for this use ferve the Grifles which are at the Joints, to make their motions the more nimble. is to defend those parts upon which they are placed, from external injuries, by breaking violent asfaults, by formewhat yielding to their impression, no otherwise than soft things opposed against Cannon-shot. We will profecute the other differences of Grifles in their place, as occasion shall be offered and required.

CHAP. II.

Of the containing and contained parts of the Cheft.

The division of the Cheft into its pacts.

He containing parts of the Cheft are both the Skins, the fleshy Pannicle, the Fat, the Brefis, the common Coat of the Muscles, the Muscles of that place, the fore-mentioned Bones, the Coat investing the Ribs, and the Displragms or Midriff. The parts contained are the Mediaftinum the Pericardium or Purse of the heart, the Heart, the Lungs and their Vessels. Of the Containing parts, fome are common to all the Body, or the most part thereof, as both the Skins, the fleshy Pannicle and Fat. Of which being we have spoken in our first Book, there is no need now further to infift upon: Others are proper to the Cheft, as its Mufcles (of which we will speak in their place) the Brefts, the fore-mentioned Bones, the Membrane investing the Ribs, and the Displragma or Midriff.

We will treat of all these in order, after we have first shewed you the way how you may separate the Skin from the rest of the Chest. Putting your Knife down even to the perfect division of the Skin, you must draw a straight line from the upper part of the lower Belly, even to the Chin; then draw another firaight line, overthwart at the Collar-bones even to the Shoulder-blades; and in the places between the Collar-bones: (if you defire to flum prolixity) you may at once separate both the Skins, the fielhy Pannicle, the Fat, and common Coat of the Muscles, because these parts were shewed and spoken of in the diffection of the lower Belly.

Yet you must referve the Bress in diffecting of the Eodies of Women's wherefore from the upper parts of the Brefts, as artificially as you can, feparate onely the Skin from the parts lying under st, that so you may show the Pannicle which there becometh fleshy and musculous, and is so spred over the neck and parts of the Face, even to the roots of the hairs.

CHAP. III.

Of the Brests or Dugs.

Their fub ffance.

He Brefts, as we faid, when we fpoke of the Nature of Glandules, are of a glandulous fubfrance, white, rare, or spongious; in Maids and Women that do not give suck, they are more folid, and not fo large.

Magnitude. Composure. Wherefore the bigness of the Dugs is different, although of a sufficient magnitude in all. Their Figure is round, somewhat long, and in some fort Pyramidal, their composure is of the Skin, the fielhy Pannicle, Glandules, Fat, Nerves, Veins, and Arteries, descending to them from the Axillaris under the Sternen, betwixt the fourth and fifth, and fometimes the fixth of the true Ribs.

And there they are divided into infinite Rivulets by the interpolition of the Glandules and Fat,

by which fit matter may be brought to be changed into the Milk by the faculty of the Dugs.

We will speak no more of the Nature of the Glandules or Kernels, as having treated of them bewhich Glan-fore; onely we will add this, that fome of the Glandules have Nerves, as those of the Brests, which dules have they receive from the parts lying under them, that is, from the intercoftal, by which it comes to pass, Nerves, and that they have most exquisite sense. Others want a nerve as those which serve only for division of the which have veffels, and which have no action, but only use.

They be two in number, on each fide one, scated at the fides of the Sternon upon the fourth, fifth, and

Their conne-

Wherefore they have connexion with the mentioned parts with their body, but by their veffels with all other parts, but especially with the womb by the reliques of the mamillary veins and ar-

teries, which defeend down at the fide of the Breft-blade; in which place these Veins infimuating How the brefts themselves through the substance of the Muscles, are a little above the Navel conjoined with the and womb Epigelfricks, whole original is in fome fort opposite to the Hypogelfricks, which fend forth branches each with to the Womb. By the meeting of these it is more likely that this commerce should arise, than from other. other, and those almost capillary branches, which are sometimes seen to descend to the Womb from the Epigastrick.

They are of a cold and moift tert.per; wherefore they fay, that the bloud by being converted into Their temper Milk, * becomes raw, flegmatick, and white, by the force of the proper fleih of the Dugs. Their * Kernadelinia action is to prepare nourithment for the new-born Babe, to warm the Heart from whence they have and use.

received heat, and to adom the Breft.

By this you may know that fome Glandules have action, others use, and some both. At the top of the Dugs there are certain hillocks, or eminencies called Teats or Nipples, by sucking of The Nipples, which the Child is nourished through certain small and crooked passages, which though they appear manifest to the sight, whilest you press out the milk by pressing the Dug, yet when the milk is pressed out, they do not appear, nor so much as admit the point of a Needle, by reason of the crooked ways made by Nature in those passages for this use, that the Milk being perfectly made, should not slow out of its own accord against the Nurses Will. For so the Seed is retained and kept for a certain time in the Proflates.

CHAP. IV.

Of the Clavicles or Collar-bones, and Ribs.

F we should handle these parts after the common order, we should now treat of the Muscles of the Ghest which move the Arm, and serve for respiration, and which first offer themselves to

But for that they cannot be fitly shewed, unless we hart the Muscles of the Shoulder-blade and Neck, therefore I think it better to defer the explanation of these Muscles, until such time as I have shewed the rest of the contained and containing parts, not onely of the Chest, but also of the Head, that having finished these we may come to a full demonstration of all the rest of the Muscles, be-ginning with these of the Head, which we first meet with, and so prosecuting the rest even to the Muscles of the Feet, as they shall seem to offer themselves more fitty to diffection, that so, as much as lies in us, we may thun confusion.

Wherefore to return to our proposed task; after the aforesaid Muscles, come the Collar-bones,

Sternon, and Ribs.

But that these parts may be the more easily understood, we must first know what a Bone is, and whence the differences thereof are drawn.

Therefore a Bone is a part of our Body most terrestrial, cold, dry, hard, wanting all manifest sense, What a Bone

if the Teeth be excepted.

If aid [manifeit fenfe,] that you may underfined that the parts have a double fenfe of Touching. A double the one manifeit, fuch as refides in the Flesh, Skin, Membranes, Nerves, Teeth, and certain other fense. parts; the other obscure, yet which may suffice to discern the helping and hurting tactile qualities, such sense the Bowels and Bones have; for very small Fibers of the Nerves are differentiated to these parts by mediation of their Coat, or Membrane, I fay, fo fmall that they can fearce be differmed by

the eyes, unlefs (as Galen faith) by plucking fuch Coats away from the parts.

But it is no marvail, if Nature would have these parts in like manner to have such small Veins, why the contrary to the Lungs and most part of the Muscles, onely to yield so much nourishment to the part. Bones have as should be needful; for seeing the substance of the Bones is cold, hard, dense and solid, it wastes such small veins.

the lefs.

Wherefore they need not fo much bloud for their nourithment, as the hot and fost parts; and befides the Lorentz Description Voice or Arteries, but draw fit nourithment, onely by the force of fides the leffer Bones have neither Veins or Arteries, but draw fit nourishment, onely by the force of the attractive faculty implanted in them-

the attractive faculty implanted in them.

The differences of Bones are taken from many things, as from their *Apophyles*, *Epiphyles*, Grilles, Whence the Necks, Heads, Solidity, Cavity, Eminencies, Marrow, Confidence, Bignels, Number, Figure, Site, difference of Bones may be stored to the Bones of the Bones, to which

We will profecute all these as they shall offer themselves in the demonstration of the Bones; to which taken.

The Clavicles are two very hard and solid Bones, without any great or notable cavity, fituate on The Clavicles are two very hard and solid Bones, without any great or notable cavity, fituate on The Clavicles and the between the side and upper part of the Sterness and top of the Shoulder-blade, for the strength or Collarand stability of these parts, whence they take the name of Clavicles, (from the Greek Kasel, bones, which sometimes are the strength or collarand stability of these parts, whence they take the name of Clavicles, (from the Greek Kasel, bones, which sometimes are supported by the strength of the strengt which fignifies a Key, or any other Bar or fastning of a Door.) They carry the shape of a Surgeons Levatory.

But you must note that the Clavicles feem to be fashed to the Sternen by the mediation of a grisly bone, Moreover the space and cavity contained within the Collar-bones, is called by the Latines jugulum, by the French the Upper Furenla, because the Jugular Veins pass that way; it slicks to the
Upper Process of the Shoulder by a Grisle, which Galer calls the small Grisle-bone, although it be Ob. 13, de 1856. nothing elfe but a production of the Os juguli.

For the Sternon, which we faid is framed of divers Bones, as fometimes 3, fometimes 4,5,6,7, and fornetimes 8; you must note they are very spongy and full of pores, and of a far softer consistence than the Collar-bones, wherefore more subject to corruption so besides, they are mutually joined by interposition of Museles. Their use is to be as a shield to defend the Vital parts.

The Ribs are 24 in number, on each fide 12, seven of these are called true or perse? Ribs, be- The Ribs.

cause they make a circle, at the one end joined to the Sternon, on the other to the Vertebraer; the other are called Bastard, or short Ribs, because they fall short in their way, and come not to the Sterother are called Baltard, of most reads, because they fail these way, and come not to the Sternow; but they are fashed on the fore-fide of the Sternow by Grisles and Ligaments, but on the backpart to the transverse Vertebraer of the Back-bone, and to the fides of the faid Vertebraer. But the thort Ribs are onely knit to the Vertebraes, wherefore that part of the Vertebraes is called the roots of

Their Confiftence,

The exterior, or fore-part of the Baffard or (hort Ribs, is grifly, that they should not be broken, and that they might be the eafier lifted up in the diffentions of the Stomach filled with meat. They are of a confiftence fufficiently hard, yet more towards their root than at the Sternon, where they come nearer together, and are more hardly broken; they are fmooth both within and without, but in the midft they have fome fign of being double, or hollow, to receive the Veins and Arteries, which nourith their bony fubthance; they are fashioned like a Bow; their use is the same with the Szernon, and befides, to carry and firengthen the Mufcles ferving for respiration.

CHAP. V.

The Anatomical administration of the Sternon.

He Coat investing the Ribs, which the common Anatomists call Plears, is the last of the containing parts of the Cheft, which because it lies hid in the inner part thereof, it cannot be thewn unless by pulling afunder of the Sternon; wherefore we must now show the manner of opening the Steraga, that hereby they may not violate the original or infertion of any of the Muscles. Wherefore first you must understand, that he which will shew in their proper place their original and infertion of the pectoral Muscles, of the Mastoides, of the two Muscles of the Bone Hyais, of the Muscles subclavii, and intercartilagines, ought first of all to separate all the pectoral Muscles from the Sternon, and the Grifles from the true Ribs; then to cut the Ligaments, next the Bones themfelves, even from the fixth true Rib to the Clavicles.

And then shewing the Mediastinion stretched under the Sternov all the length thereof, he must separate the Sternow with his Knife, and bend it up to the Clavicles, and there cut it, referving together with it the four Muscles, that is, the two Mastoider, and the two moving the Bone Hyois, because they either wholly, or for the most part, arise from the Sternon.

Laftly, The Clavicles being fornewhat thrust upwards, the Grisles must on each fide be turned outward toward the Arm; that so the containing parts of the Chest may not be onely open to view, and be easily shewed, but also the Muscles may be contained in their place, until they come to be

And because the Collar-bones must be lifted up very high, that the recurrent nerves may be more ea-And because the Collar-bones man be firsted up very high state the recurrent nerves may be more ca-fily feen, and the distribution of the Veins and Arteries, the two small Subclavian Muscles, one on each fide must be shewn by the way, who have their original from the inner and fore-part of the Clavicles and an oblique descent to the Sterma, towards the grisle of the first rib.

For the Clavicles cannot be thus separated, but that these Muscles must be violated and spoiled. Also you may divide the Storms in the midst, that you may shew the inward pectoral Muscles whole having feparated the Muscles which arise from the upper part. All which things being performed as they ought, we must come to the Coat investing the Ribs, and then to the Medissimum, as arising

CHAP. VI.

Of the Plcura, or Coat investing the Ribs.

What the membrane in-verting the ribs is

In original.

He Tunica Subsestatis, or Coat investing the Ribs, being the last of the containing parts of the Chest, is a large and a broad membrane answerable in proportion of use and action to the Peritmeum of the lower Belly. For as the Peritmeum generally and particularly covers all the natural parts, binding and holding them in their places, so this Coat invests all the Vital parts in general, because it is stretched over all the inside of the Chest, but in particular whilest it gives

It hath its original from the Periodenon (or, as others will have it, from the Perioranium) investing the Vertebraes of the Cheft at the roots of the Ribs. Wherefore it flicks very fall to the Ribs, scarce to be separated, as also to all the parts bounding the Chest, and contained in it.

Vessaline reprehends Galen, because he said, that this was double on both sides; yet Columbus defends

Galen, and verily it is feen to be double in the inner part of the Cheft, under the Ribs and the Muscles

of the Ribs, that in that space there may be way for the Veins, Arteries, and Nerves.

Some have made it twofold, and divided it into the internal and external; as those which have Whether, as there is a twofold Pleurifie, alfo a double Pleare.

made two forts of Pleurifies, the true and buftard; placing the external above the Ribs and intercoflad Mufcles; but the internal under the Ribs, Mufcles, Diaphrogma, and Sternar.

But we to fluor ambiguity, intend onely to profecute those things which are manifest to the eyes;
wherefore we say, that the Ribs are lined on the infide with a double Coat; One which immediately
and firmly flicks to them, on every fide called the Reinform which is common to them, and other and firmly flicks to them on every fide called the *Periofteon*, which is common to them and other Bones. The other which lies upon that *Periofteon*, and on the infide invefts all the Ribs, whence is it called the Subcofialis tunica. The fubfiance, temper, and composure, are the same, as in other

The magnitude in length, as also the Figure, is the same with the compass of the inner part of the The Magni-Cheft; the thickness of it, is very little. The Coat is commonly called the Plana, from the name tude and Floor of the part which it covers or lines, (for the Greek call the Ribs HARPA,) and in like manner that gure, which happens betwixt the Periostrum and this Plana, is called either a true or bastard Pleurisie.

CHAP. VIL

Of the Mediastinum.

Ow we must speak of the parts contained in the Cheft, seeing we have already handled and Magnithe containing: beginning with the Mediastinum, as being a part which in diffection first tude; presents it self to our sight. The Mediastinum is of the same shaftance, thickness, composure, number, temper, as the Plants. For the substance of the Mediastinum is membranous, and though it be stretched all the length of the Cheft, yet it is of a small thickness, receiving Veins, Nerves and Arteries from all the parts to which it is knit, like as the Plants doth a last a feasiell. and Arteries from all the parts to which it is knit, like as the Plawa doth; but especially from the Mammillary Vessels, deteending under the Sternon.

It is in number one, but it is made of two Membranes produced from the Subcostal: for this ascending on each side by the hollowness of the Chest to the Sternon, and then at right Angles, is restricted to the hollowness of the Planck back in the hollowness of the hol

to the bodies of the Vertebraes, whence the Plana hath it original.

In that reflection there is so much distance between each Membrane as may be sufficient to receive two fingers. For otherwise, seeing that they cannot penetrate through the Heart, it was fit each fide of the Pleura should turn to the Pericardium, that so they might arrive at the appointed place without offence. Neither yet is that space void and empty, but woven with many small nervous Fibers. Co-Immbas adds, that that place is often filled with a certain humour befides Nature, which you may draw

out, or evacuate, by opening the Sternon.

Yet I would gladly learn of Columbia by what figns we may know that fuch an humour is contained there. For the Figure, the Mediafinum with the Pleura on each fide, repreferts the Figure of The Figure a Leather Bottle, whose flat fide is the Mediafinum, whose other fide the Pleura; the bottom that part of the Pleura which is next the Midriff; the mouth the upper part of the Pleura at the first Ribs. We thewed the fite and connexion of the Medisstinum, when we declared its original.

The use thereof is to separate the Vital parts (as it were) into two Cels, the right and left, that if The Use,

peradventure it happen that the one be hurt, the Creature may live by the benefit of the other.

And it hath another use, which is, to propand hold up the Pericardium, that it fall not upon the Heart with its weight, but toffed with the motions of the Heart and Cheff, it may move to this or

CHAP. VIII.

Of the Diaphragma or Midriff.

Lthough the Midriff may feem to be accounted rather a part containing than contained, yet what the for commodities fake, we have deterred the demonstration thereof till now. Therefore, it Midrist isis a Muscle round and long, terminating the lower part of the Chest.

It is of the fame fubftance, composition, and temper, as the Muscles of the Epigastrium; it is made its substance, compositions of two Coats, the lower whereof is from the Pertineson, and the upper from the Plears. Which see, getting to them flesh, but not there, but in their circumference, by the benefit of the bloud brought thither by the Veins and Arteries diffributed through it, turn into a Muscle's whose middle is neryous and membranous, but the extremities by which it is inferred, one while fleshy, as in that part next to the Bastard-Ribs; another while tendonous, as where it touches the first and second Vortebrage of the Loins, for it ends in them by two Tendons manifest enough. It is one in number, interposed with an oblique site betwirt the Natural and Vital parts. It hath connexion with the lower Connexion art of the Storage and Short-ribs, and the two sixt Vertebrage of the Loins, but by its Coats and Vessels with the parts from whence it received them.

The extent thereof is equal to the converse of the lower part of the Cheft. The length of it is from Coursely.

The extent thereof is equal to the compais of the lower part of the Cheft. The length of it is from Quantity. the Breft-blade, even to the first and second Vertebra of the Loins. The thickness is diverse, for it is far thicker in its flethy extremity than in its nervous original.

far thicker in its fieldy extremity than in its nervous original.

The action thereof is to help the expulsion of the Excrements by the mutual affishance of the Epi-Action.

gastrick Muscles: but the chief use is for respiration, of which it is one of the prime instruments.

This partition the Ancients called Phrents, because the inflammation thereof caused like symptoms, Why the Diastrick inflammation of the Brain, by reason of the large Nerves on each fide one, which come to it phrasmatically and primarily from the third, fourth, and fifth Vertebraes of the neck. This Muscle differs called Phrents in three places, to give a fine called Phrents. from other Muscles, especially in figure. It is perforated in three places, to give way or passage to the

CHAP. VI.

Of the Lungs.

Their Subftance. Quantity. The Lobes thereof.

He Lungs are of a foft fubflance and flefhy, rare and like a Sponge, of a various colour pamered; their quantity is fufficiently large, for most commonly they are divided into four lobes, disjoined with a manifest and visible division, on each fide two, whereby they may be the more eafily opened and contracted, and the Air may the better enter.

Befides also in large bodies, who have a very great Cheft, there is found a fifth lobe, arising from the fecond lobe of the right fide, as a culhion or bollier to bear up the Hollow Vein afcending from

In little Men who have a shorter Chest, because the Heart is so near as to touch the Diaphragma, this lobe is not feen, yet it is always found in Dogs

Figure.

Composition.

The Lungs represent the figure or shape of an Oxes foot or hoof; for like it they are thicker in their basis, but slenderer in their circumference, as you may see in blowing them up by the weazon, with your mouth or a pair of bellows. They are compounded of a Coat coming from the Plenta which on each fide receives fufficient number of Nerves from the fixth conjugation; and also of the Vena arterisfa coming from the right Ventricle of the Heart, and the Arteria venofa from the left, as shall be thewed in the Anatomy of the Heart; besides the Aspera arteria or Weazon coming from the Throat; and laftly, its own flesh, which is nothing else than the concretion of cholerick Bloud poured out like foam about the divisions of the foresaid Vessels, as we have said of other parts.

The body of the Lungs is one in number, unlefs you will divide it into two, by reason of the variety of its lite, because the Lobe of the Lungs stretched forth into the right and left side do almost involve all the Heart, that so they may defend it against the hardness of the bones which are about it, they are tied to the Heart chiefly at its basis, but to the roots of the ribs, and their Vortebraer by the Coat it hath from thence; but by the Vessels to these parts from whence they proceed. But ofttimes prefently from the first and natural conformation they are bound to the circumference of the Ribs by certain thin and membranous productions which defcend from thence to the Lungs, otherwife they are tied to the Ribs by the Pleura.

The flicking of the Lungs to the Ribs.

Their nourish-Micne.

The nourithment of the Lungs is unlike to the nourithment of other parts of the Body; for you cannot find a part equally rare, light, and full of air, which may be nourished with blood equally thin and vaporous. In temper they incline more to heat than to cold, whether you have regard to their composure of cholerick bloud, or their use, which is to prepare and alter the air, that it hurt not the Heart by its coldness. The Lungs is the infirmment of Voice and Breathing by the Weazon or Wind-pipe. For the Lobes are the infirmments of Voice, and the Ligaments of Respiration. But the Ligiments of Throttle is the chief infirmment of the Voice; for the Weazon or Throttle is the chief infirmment of the Voice; for the Weazon or Throttle is the chief infirmment of the Voice; for the Weazon or Throttle is the chief infirmment of the Voice; for the Weazon or the Voice is the Weazon or the Voice is the Chief infirmment of the Voice. the Larine or Throttle, is the chief infirument of the Voice; for the Weazon first prepares the Voice for the Throttle, in which it being in fome measure formed, is perfected in the Palate of the Mouth, as in the upper part of a Lute, or such like Instrument, by the help of the Gargarean or Uvula, as a certain quill to play withall.

But as long as one holds his breath he cannot speak, for then the Muscles of the Larinx, Ribs, the Diaphragma, and the Epigastrick Muscles are pressed down, whence proceeds a suppression of the Vocal matter, which must be tent forth in making or uttering a Voice.

Nature would have the Lungs light for many reasons; the first is, That seeing they are of themfelves immoveable, they might be more obsequious and ready to follow the motion of the Cheft; for when it is straitned, the Lungs are straited and subside with it; and when it is dilated, they also are dilated, and fwell fo big, that they almost fill up all the upper capacity thereof.

Another cause is, That by this their rarity they might more easily admit the entring air at such

Another caute is, times as they have much or fudden necessity, as in running a Race.

And lastly, That in Pleurisies and other purulent abscesses of the Cheft, the Par or matter poured forth into the capacity of the Cheft, may be fuckt in by the rare substance of the Lungs, and by that means the fooner fent forth and expectorated,

The use of refpiration or breathing.

why the

Lungs are light.

> The use of Respiration is to cool and temper the raging heat of the Heart. For it is cooled in drawing in the breath by the cool air, and in sending out thereof by avoiding the hot fuliginous vapour. Therefore the Cheft performs two contrary motions, for whileft it is dilated it draws in the encompassing the air, and when it is depressed, it expels the fullginous vapour of the Heart; which any one may eafily perceive by the example of a pair of Smiths Bellows.

CHAP. X.

Of the Pericardium, or Purfe of the Heart.

Whence it hath its mat-BEC.

He Pericardium is (as it were) the house of the Heart, which arising at the basis thereof (either the Ligaments of the Vertebraer fituate there, or elfe the Veffels of the Heart yielding it mat-ter) is of a nervous, thick and denfe fubfiance without any Fibers. It retains the Figure of the Heart, and leaves an empty space for the Heart to perform its proper motion. Wherefore the bigness of the Pericardium exceeds that of the Heart.

It confilts of a double Coat, one proper, of which we have spoken; another common, coming from the Pleara; and also of the Veins, Arteries, and Nerves; the Vessels partly coming from the Mamillary, partly from the Diaphragma, chiefly there where it touches it; the Nerves come on each fide from the fixth conjugation.

It is onely one, placed about the Heart, and annexed to it at the basis thereof by its Membranes, Number and to the original of the Lungs, and the Vertebrass lying under them, and by the Vessels to the parts connexion.

to the original of the Lungs, and the Periodical lying under them, and by the Velicis to the parts from whence it received them. It is of a cold and dry temper, as every Membrane is.

The use thereof is to cover the Heart, and preserve it in its native humidity, by certain natural modifiance contained in it, unless you had rather say that the modifiance we see contained in the Periodians, is generated in it after death by the condensation and concretion of the spirits. Although this seems not very likely, because it grows and is heaped up in so great quantity in living bodies, that it hinders the motion of the Heart, and causes such palpitation, or violent beating thereof, that it often softeness a man. it often faffocates a man.

For this Palpitation happens also to hearty and flout men, whose hearts are hot, but bloud thin and From whence waterish, by reason of some informity of the Stomach or Liver; and this humour may be generated the waterish, by reason of some informity of the Stomach or Liver; and this humour may be generated the water of vapours which on every side exhale into the Pericardian from the bloud boiling in the Ventricles humour or of the Heart, where kept in by the denfity thereof, they turn into yellowith mouthure; as we fee it tained in the happens in an Alembeck.

Nature would have the Pericardium of a dense and hard confisience, that by the force thereof the The Confi-Heart might be kept in better state; for if the Pericardium had been bony, it would have made the stence. Heart like Iron by the continual attrition; on the contrary, if it had been folt and fungous, it would have made it spongy and fost like the Lungs.

CHAP. XI.

Of the Heart.

He Heart is the chief Manfion of the Soul, the Organ of the Vital Faculty, the beginning What the of Life, the Fountain of the Vital Spirits, and so confequently the continual nourisher what submotion of the Vital Hear, the first living and last dying; which because it must have a natural stances than any other part of the Body.

The fielh thereof is woven with three forts of fibers, for it hath the right in the inner part defeend. The three ing from the basis into the point, that they might dilate it, and so draw the bloud from the Hollow forts of Fibers Vein into the receptacles thereof, and the breath or air from the Lungs by the Asteria venofa; it hath the transverse without, which pass through the right at right angles, to contract the Heart, and so drive the Vital Spirits into the great Astery Aosta, and the cholerick bloud to the Lungs by the Vena asteriosa for their nourishment; It hath the oblique in the midst to contain the air and bloud drawn thicher by the fore-mentioned Vessics, until they be sufficiently elaborate by the Heart.

All these Fibers do their parts by contracting themselves towards the original, as the right from the point of the Heart towards the Basis, whereby it comes to pass, that by this contraction of the Fibers the Heart dilated becomes shorter, but broader, no otherwise than it is made more long, and narrow by the contraction of the transverse; but, by the drawing of the oblique, it is bessent in that part which looks towards the Versebrases, which chiefly appears in the point thereof.

It is of an indifferent bigness, but yet in some bigger, in some less, according to the diverse terms Vein into the receptacles thereof, and the breath or air from the Lungs by the Asteria verofa; it hath of the Heart,

It is of an indifferent bigness, but yet in some bigger, in some less, according to the diverse term-por of cold or hot men, as we noted in the Liver.

The figure thereof is pyramidal, that is, it is broader in the bafis, and narrower at his round Figure.

It is composed of the most dense shesh of all the body, by the effusion of bloud at the divisions and Composition, foldings of the Veffels, and there concrete, as it happens also to the other entrails. For the bloud being there a little more dried than that which is concrete for the making of the Liver, turns into a feel of the findings of the Liver, turns into a flethy substance more dense than the common flesh, even as in hollow Ulcers, when they come to ci-

It hath the Coronal Veins and Arteries, which it receives either on the right fide from the Hollow The proper Vein, or on the left from the Balis at the entrance of the Artery Aorts. You cannot by your eye vessels.

Yet I have plainly received of front of the Coronal of the Artery Aorts. You cannot by your eye vessels.

Yet I have plainly enough observed others in certain Beasts which have great hearts, as Swine; The Nerves, they appeared seated under the fat which covers the Vessels and Bass of the heart, less the human substance of these parts should be dissolved and diffipated by the burning heart of the Heart. Whereby you may perceive that the hear of the Heart is different from the Elementary hear, as that which fuffers fat to grow about this entrail, where other wife it doth not concrete, unless by cold, or a remifs heat, which thing is chiefly worth admiration.

The Heart is one alone, fituate most commonly upon the fourth Vertebra of the Chest, which is in Number and the midst of the Chest. Yet some think that it inclines somewhat to the left side, because we there. Site, feel the motion or beating thereof; but that happens by reason of its left Ventricle, which being it is filled with many Spirits, and the beginning of the Arteries, it beats far more vehemently than the right. It required that seaton the decree of Nature, because that region is the most safe and armed, and besides it is here on every side covered (as it were with the hands of the Lungs.

It hash connection with the fore-mentioned Vertebrase, but by the parts consecution with the

It hath connexion with the fore-mentioned Vertebrass, but by the parts composing it, with those Connexion whence it hath them; with the Lungs by the Vena arterissa and the Arteria Venosa; and lastly, with all the parts of the body by the Arteries which it fends to them all.

laftly, with all the parts of the body by the Arteries which it tends to them all.

It is of a hot and most temper, as every fielby part is. The action thereof is, first to prepare Temper and the bloud in its right Ventricle, for the fit nourishment of the Lungs; for from hence it is that Gase Action.

Vital Spirits in its left Ventricle for the rafe of the whole body:

But this Spirit is nothing effection at Spirit is.

certain middle fubfrance between Air and Bloud, fit to preferve and carry the native heat, wherefore it is named the Vital, as being the Author and preferver of life. In the inner parts of the heart there prefent themselves to our consideration, the Ventricles, and the parts contained in the Ventricles and between them; such are the Valoule, or Valves, the Vessels and their Mouths, their distribution into the Lungs, the Wall or Partition, and the two productions or Ears of the Heart; which because they are doubtful, whether they may be reckoned amongst the external or internal parts of the Heart, I will here handle in the first place.

The Auricula cordis, or Ears of the Heart.

Therefore these Auricula or Ears, are of a fost and nervous substance, compact of three forts of Fibers, that fo by their fortness they might the more eafily follow the motions of the Heart, and so break the violence of the matter entering the Heart with great force when it is dilated. For otherwise by their violent and abundant entrance they might hurt the Heart, and (as it were) overwhelm and sufficiently in the heart with great force when it is dilated. focate it; but they have that capacity which we fee given by Nature, that fo they might (as it were) keep in flore the Bloud and Air, and then by little and little draw it forth for the use of the necessity the Diaffele, ad fagam vacui, for avoiding of emptines; I will answer, That that drawing ip, or attraction, is caused by the heat of the Heart, which continually draws these matters to it, no otherwise then a Fire draws the adjacent Air, and the slame of a Candle the Tallow which is about the wick for nourishments fake. Whilest the Heart is dilated it draws the air, whilest it is drawn together, or contracted, it expels it. This motion of the Heart is absolutely natural, as the motion of the Lungs is animal. Some add a third cause of the attraction of the Heart, to wit, the similitude of the whole fubftance. But in my judgment, this rather takes place in that attraction which is of bloud by the Vene coronales for the proper nourithment of the Heart, than in that which is performed for attraction of matters for the benefit of the whole Body.

Their magnitade and number.

These Ears differ in quantity, for the right is far more capacious than the left, because it was made to receive a greater abundance of matter. They are two in number, on each side one, situate at the basis of the Heart: The greater at the entrance of the Hollow Vein into the Heart, the less at the entrance of the veinous and of the great Artery, with which parts they have both connexion. We have formerly declared what use they have, that is, to break the violence of the matters, and besides

to be stays or props to the Arteria venosa and great Artery, which could not sustain so rapid and vio-lent a motion as that of the Heart, by reason of their tenderness of substance.

Their use.

The partition between the Ventricles of the Heart.

Why the right Ventricle is more capacious and less compact.

The Ventricles are in number two, on each fide one, diffinguished with a fleshy partition strong enough, having many holes in the superficies, yet no where piercing through.

The right of these Ventricles is the bigger, and encompassed with the foster and rarer slesh; the lest is the lesses, but is engirt with a threefold more dense and compact slesh; for the right Ventricle was made for a place to receive the bloud brought by the hollow Vein, and for distributing of it, partly by the Vena arteriosa into the lungs for their nourithment, partly into the less Ventricle by sweating through the wall or partition, to yield matter for the generation of the Viral spirits.

Therefore because it is needful there should be so great a quantity of this bloud, it was likewise sit that there should be a place proportionable to receive that matter. And because the bloud which was to be received in the right Ventricle was more thick, it was not so needful that the slesh to contain it should be so compact; but on the contrary, the arterious bloud and vital spirit have need of a more dense receptacle, for sear of wasting, and less they should vanish into air; and also less room, that so the heat being united, might become the stronger, and more powerfully set upon the elaboration. that fo the heat being united, might become the fironger, and more powerfully fet upon the elaboration of the bloud and spirits.

The action of the right Ven-

Therefore the right Ventricle of the Heart is made for preparation of the bloud appointed for the nouriflment of the Lungs, and the generation of the vital spirits, as the Lungs are made for the mitification or qualifying of the Air. Which works were necessary if the Physical Axiom be true, That like is nourifled by like, as the rare and spongious Lungs with more subtil bloud, the substance of the Heart gross and dense, with the veinous blood, as it flows from the Liver, that is grofs.

The action of the left Ven- be fufficient.

And it hath its Coronal Veins from the hollow Vein, that it might thence draw as much as should

But the left Ventricle is for the perfecting of the vital spirit, and the preservation of the native

Of the Orifices and Valves of the Heart.

The uses of the four orifices of the Heart.

There be four Orifices of the Heart, two in the right, and as many in the left Ventricle; the greater of the two former gives paffage to the Vein, or the bloud carried by the hollow Vein to the Heart; the leffer opens a paffage to the Vena arteriofa, or the cholerick blood carried in it for the nourithment of the Lungs.

The larger of the two other makes a way for the distribution of the Artery Aorta, and the vital fpirit through all the Body; but the leffer gives egress and regress to the Arteria venesa, or to the air and fuliginous vapours. And because it was convenient that the matters should be admitted into their proper Ventricles by these orifices, by the Diastole, to wit, into the right Ventricle by the greater orifice, and into the left by the leffer; and because on the contrary it was fit that the matters thould

The Valves-

be expelled by the Syftole from their Ventricles, by the fore-mentioned orifices.

Therefore Nature to all these orifices bath put eleven Valves, that is to say, six in the right Ventriele, that there might be three to each orifice; five in the left, that the greater orifice might have

three and the leffer two, for the reason we will presently give.

These Valves differ many ways: First in action; for some of them carry in matter to the Heart,

others hinder that which is gone out, that it come not back again. Secondly, they differ in fite: For those which bring in, have membranes without, looking in; those which carry out, have them Action, within looking out. Thirdly, in figure; for those which carry in, have a Pyramidal figure, but Figure. those which hinder the coming back again, are made in the shape of the Roman Letter C. Fourthly, in substance; for the former for the most part are fleshy, or woven with fleshy fibers into certain fleshy knots ending towards the point of the heart: The later are wholly membranous. Fifthly, Numbers they differ in number: for there be only five which bring in, three in the right ventricle at the greater orifice, and two in the left at the leffer orifice; those which prohibit the coming back, are fix in each ventricle, three at each orifice. Laftly, they differ in motion : for the fiethy ones are open- Motion. ed in the Diagiole, for the bringing in of blood and ipirit, and contrariwife are that in the Sytale, that they may contain all, or the greater part of that they brought in. The membranous on the contrary are opened in the Systele to give passage forth to the blood and spirits over all the body, but that in the Diastole, that that which is excluded might not flow back into the heart. But you but that the bedy on the desired and spirits over all the body. shall observe that Nature hath placed only two Valves at the orifice of the Arteria venosa, because why there be it was needful that this orifice should be always open, either wholly, or certainly a third part there. Valves at the or, that the air might continually be drawn into the heart by this orifice in Inspiration, and fent orifice of the forth by Exspiration in the contraction of the heart. Whereby we may gather this, that there is arrain verse. but one third part of that air we draw into the heart in breathing, fent forth again in the form of wapor in Expiration, because Nature would have but one third part of the oritice to lye open for its paffage out. Therefore the Exspiration or breathing out, and the Systele of the heart and arteries, is shorter than the Inspiration, so that we may truly say, that the Inspiration, or drawing the breath in, is equally folong as the Exspiration is together with the rest, which is in the midst between the two motions.

CHAP. XII.

Of the distribution of the Vena arteriola, and the Arteria venosa.

Aving hithertofhewed the original of the veffels of the heart, we must now speak of their distribution. The Vena arteriofa, or the arterious vein; and the Arteria venofa, or the are divided into two large branches; one of which goes to the right, and the other to the left hand, the one lying crofs-ways over the other, the vein always riding over the artery, as you may underfiand better by the fight of your eyes, than by reading of Books. Thefe branches at their entrance the Lungs are divided into two other large branches, and each of them go to his peculiar Lobe ways lies under the Lungs, and thefe against we have lies under the right of the Lungs, and thefe against we have large branches, and each of them go to his peculiar Lobe ways lies under the Lungs, and the contract of the Lungs, and the contract of the Lungs are divided into two other large branches, and each of them go to his peculiar Lobe ways lies under the Lungs. of the Lungs; and these again run almost into infinite other branches, dispersed in the places over

These vessels have acquired their names by reason of that Transmutation of consistence, whereby, the composure of a vein degenerates into an artery, and that of an artery into a vein, for the counmodity of life. For this is a miracle of prudent Nature to change the coats of the veffels of the
Lungs, producing a vein which in its body should imitate an artery, and an artery which should refon why the
prefent a vein: For if the Vox arteriofa should have retained its proper consistence, the arterious arterious, or blood which is carried by it from the Heart to nourill the Lungs, might by reafon of its fubtilty pe-like an artery-netrate through, and flow away by reafon of the rarity of the veinous texture: And fo Nature flould never have attained her conceived end, that is, to nourish the Lungs, by reason of the continual motion of their contraction and dilaration.

For nourithment cannot be affimilated to the part, unless it be put and cleave to it. Wherefore it was fit, that Nature should make the body of this vein folid, that it might be immovcable, unshaken and stubborn (in respect of a vein which by its softness would have been too obsequious and yielding to the agitation of the Lungs) that fo it might have nourithment, which might be diftraced into all parts thereof, and which might neither be drawn by its Distrole, nor driven back into the heart by its Syrole. But the artery bath the confidence of a vein, that by that veinous foffneds according to the necessity of Nature, it might be the more readily contracted and dilated, to bring the air in, and carry the vapours forth of the heart. Here we meet with a difficulty, which is, by what way the blood is carried out of the right and left ventricle of the heart.

Only thinks that there has a large transfer and well as the like a win.

Galer thinks that there be certain holes in the partition made for that purpose; and verily there like a vein. are such, but they are not perforated. Wherefore Columbus hath sound out a new way, which is, By what way are fuch, but they are not perforated. Wherefore Columbus hath found out a new way, which is, By what way that the blood is carried to the Lungs by the Vens arteriofs, and there attenuated; and carried blood may from thence together with the air by the Arteris reason to the left ventricle of the heart; this he pass out of the writes, truly very probably. Botallus, in his Treatife de Catardo, hath found out a third way, to wit, a vein, which he calls Arteriaram autrix, that is, the nurse of the arteries, which creeps a little above the coronal to the right car of the heart, and then goes into the left car thereof. But The vein calls a little above the coronal to the right car of the best little above the coronal to the right car of the heart, and then goes into the left car thereof. But yet I am very much airaid, that this vein observed by Botallus, is that vessel observed by Fallo- led the Nurse yet I am very much alraid, that this feel of the Aorta, and by which all the vital blood is carried of the Name for the forming and nouriflment of the Lungs while the Infant is yet in the womb. Of which Faller is the Aorta, at the Aorta is the forming and nouriflment of the Lungs while the Infant is yet in the womb. Of which Faller is the Aorta at the Ao also Galos makes mention, but it had lain hid from his time to this day, but that Fallopius raised up the memory of it again.

Axillaris. Humeralis. Jagularis in-Into what parts the Japlaris interna goes.

parts the Faeularis externa

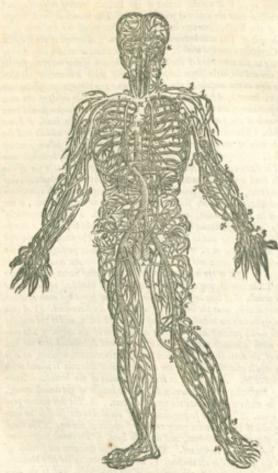

He hollow vein rifing out of the gibbous part of the liver, and refembling (according to Galen) the body of a Tree, is divided into two notable branches, but not of a like bignefs. For the greater, by the hind-part of the liver upon the back-bone, and by the way, receives certain other branches from the fubflance of the liver, which enter not into the great trunk with the reft. You may often fee this descendent branch even to the back-bone, upon which it lies in this its descent, covered with the subtrance of the liver, so that it may seem that branch proceeds not from that common trunk together with the ascendent, although indeed it always doth. But the leffer branch afcends to the upper parts, and is distributed after this manner following: For first arising into the midriff, it bestows two small veins upon it, on each side one, which from that part are called *Phrenice*. But from thence when it arrives at the right car of the heart, it makes the Coronales, the Coronal or Crown-veins, which compais the bafis of the heart in manner of a crown. Thirdly, entring formewhat more deeply into its right ear, in its Vina Arteriofa greater part it produces the Vena arteriofa. Fourthly, lifted up above the heart, on the right fide it produces the vein Azygos or fine pari (that is, without a fellow) which defeending to the fourth rib, (reckoning from above downwards) nouriflieth the intercoftal mufcles, and also the membranes of the eight lower ribs, on both fides, fending a branch into each of the mufcles at the lower part of the rib, which may be fufficient for their nourithment. Ecfides also oftentimes, especially in little men, this vein Azygos nourishes all the spaces between all the ribs by the like branches, which it fends in the fame manner to the four ribs. Moreover also, this Azygor fometime, though but feldom, is found double, that is, on each fide one. Here you must chiefly observe, that this vein, after it hath nourished the spaces between the lower ribs, in its remainder descends under the Diaphragma, and is joyned on the left fide to the Emulgent vein; by which it is manifest how an Abfects may be critically evacuated by the urine, in a Pleurisie. But this same Azygas is more depressed on the right side, and meets with the Vene lumbares, but especially with one of them which goes down to the thigh, whereby Fallopius gathers, that it is very convenient in the beginnings of Plearifies, to open the Vena poplinir, the vein of the ham. Fifthly, above the Azygai (when it is wanting there) it fends forth the branch called Intercollalis to the other spaces between the upper ribs; although this is fometimes feen to come from the Azillaris, which Sylvins calls the Subclavia.

Sixthly, it brings forth the Manmaria, fo called, because in their greater part they run to the dugs between the fourth and fifth ribs, for the uses formerly mentioned, men and women have on each fide one of these coming from the Subelavie. They are sometimes sound to proceed by a certain common orifice from the hollow vein, before it be divided into the fubelavian branches, but it is rather in beafis than in men; these veins descending by the sides of the Sternon, yield nourishment to the two inner muscles of the chest, to the seven intercollal muscles of the true ribs, to the Sternon non it felf, and to its ligaments and griffles, as also to the Mediaglianon and the upper part of the right muscles, and the adjacent parts. Seventhly, it produces the Cervicalia, which on both sides through the holes of the productions of the Vertebra's of the neck, ascends to the head, see the light muscles are the contractions of the Vertebra's of the neck, ascends to the head, see the light muscles are the light muscles of the productions of the Vertebra's of the neck, ascends to the head, see the light muscles of the light many finall branches into the fpinal marrow through the holes by which the nerves pass; and also into the membranes, ligaments, griftles, bones, and neighbouring mufcles. Eighthly, the Muf-eulofa, or mufculous, which also arising out of the Subclavie, is divided into two other branches: The one whereof goeth upon the breaft to the paps nourifhing the fore-most muscles; wherefore in a bastard-pleurisie, cupping-glasses may be stilly applied in this place.

The other branch descends to the upper muscles of the chest, but specially to that which is the desired. The Teach is the desired.

the other branch defected to the apper limiters of the click, on specially to that which is called Latifinairs. The Tenth is the Axillaris. The Eleventh the Humeralis, of which we will treat in their place. The Twelfith and laft is the Jugularis properly so called, which is twofold, the internal and external. The internal being the leffer, doth presently on both sides from this very thank and but the fides of the April Article of March 2019. beginning afcend by the fides of the Afrera Arteria, or weazon, even to the mouth and skull, yielding nourithment to the parts by which it paffes, as to the next membranes and nerves. But when it comes to the bafir of the Cranium, it is divided into two branches; the greater whereof going back along the basis of the Cranistan to the hind-part thereof, sending a branch to the long muscle fituate upon the afophagus, it enters the Cranium with the small Carotides through the hole of the nerves of the fixth conjugation, where they become one common vessel, The lesser sending a slip to the organ of hearing by the hole called Cocum (or the Blind) also enters the Cranium, and is fpent in the thicker mening near to the hole of the third and fourth conjugation of nerves. The external Jugular vein being greater and fairer, most commonly susple, yet sometimes double, either prefently at his beginning, or a little after, afcends superficially on both sides of the neck, between the broad muscle, or fleshy pannicle, being there easie to be discerned, and other muscles situate at the sides of the neck, into which, as also into the skin, it fends certain branches for neuroliment.

The Figure of the bollow vein, whole and freed from the rest of the body.

A The trunk of the bollow vein. The lower A A, at this place of the liver, is feated the left part of the vein, and distributeth branches to the left fide.

P. denote the left fide.

Y and R sometimes such that the sides of the cheft, and the sides of the sides of the cheft, and the sides of the sides of the cheft, and the sides of the sides of the cheft, and the sides of the sides of the cheft, and the sides of the sides of the cheft of the cheft, and the sides of the sides of

ed at 1, with the branch of the Basilica marked with x. in The Basilica which on the right hand is called Hepatica, on the left hand Lienaris. In 0 A branch of the Basilica going to the beads of the musicles of the cubit at 11, and to the musicles themselves at 0. P A notable branch of the Basilica running obliquely, and helpowing furcles upon the musicles that iffur from the external protuberation. This branch descended beginning to the Basilica internal protuberation. best with the fourth nerve. q Division of the Balilica into two branches, and that which is noted with q, it ever accompanied with an artery. I A branch of this vein bestowed upon the arm. t A branch of the Basilica which together with the branch of the Cephalica marked with h, makes the mediana or middle vein marked with a. u A branch of the Basilica going to the inner head of the arm. xx A branch issuing out of the some with a. u. A branch of the Basilica going to the inner head of the arm. xx A branch issuing out of the former that creepeth along unto the wrift, and toward the little singer conjoyating it self with a branch of the Cophalica. y A vein running out note the skin at the outside of the chait. Upper 2. a propagation issuing out of a branch of the Basilica x, going to the inside of the arm. on The median or common vein. B The partition of the median vein above the wrist. This division should have been made above y. y The external branch of the partition which goeth to the outside of the head. B From which issued a small branch to the inside. The internal branch under to make to must demind the middle and the ring singer is especially disposed. q. The vein of the thumb dispersed into the mountainet or hillock, which is conjoyn d with the branch noted with 3. 2 The trunk of the bollon-vein from which issue branches unto the parts seated under the liver. In The stay vein casted Adipola sinistra, which goeth wnto the fast of the kidneys. 3: The two Emulgents which lead whey-blood unto the kidneys. Must be two Germanical veins leading the matter of the seed unto the toticles. V The brighning of the bolden vessel to the rack-bones, to the marrow of the back, to the musseles that the upon the loss, and to the Peritonzum. The bisheration of marrow of the back, to the mufcles that he upon the loins, and to the Peritonzum. o The hifterestion of the hollow vein into the Hiack branches, polich hifterestion is not unlike.

Muscula superior, a transverse branch going to the muscles of the Abdomen, and to the Peritonaum. Po The division of the lest verse branch going to the muscles of the Abdomen, and to the Peritonzum. Po The division of the left Iliack vein, into an inner branch at β, and an after at α. τ Muscula media, the after propagation of the branch β. Distributed through the muscles of the coxa and the thin of the builtock. An inner propagation of the same branch β, which goeth unto the holes of the boly-bone. ΦΦ The vein called Sacra, which goeth unto the upper boles of the boly-bone. χ.\ The vein Hypogatirical distributed to the bladder, to the muscles of the fundament, and the neck of the womb. ω A vein arising from the inter branch marked with α, which is joyned with some branches of the internal vein, near the boles or perforations of the share-bone. 31 A vein which when it is passed the share-bone, distributed one branch into the cup of the coxecutix, and to the muscles of that place. In Another small branch which runneth under the right at the inside of the thigh. X The concrete or meeting of the fore-seid vein, with a branch marked with char. 2, and distributed into the left. gress or meeting of the fore-faid vein, with a branch marked with char. 2. and distributed into the leg. grejs or meeting of the fore-jaid vein, with a branch o perfectating the Peritonzum, whereto, as also the migles of the Abdomen, and the skin it offereth branches, the chief branch of this vein is joyned with the descending mammary above the navel at M. \(\Delta \) Pudenda an inner propagation of the branch. \(\Gamma \) Running overthwart mate the privities. \(\Otin \) Saphsena or the ancle-vein or the inner branch of the central trush, which compatible the infection of the least of the least of the least of the skin unto the tops of the tree. \(\Otin \) The find interior trush, ming everthwart unto the privities. Θ γ Saphæna or the ancle-vein or the inner branch of the crural trunk, which creepeth through the infide of the leg under the skin unto the tops of the toes. Λ The first interior propagation of the Saphæna offered to the grain. Ξ The atter propagation thereof divided to the foreside or outside of the thigh. Ω The second propagation of the Saphæna going to the skin of the whirl-hone, and unto the ham. Φ The fourth propagation of the Saphæna going to the skin of the whirl-hone, and unto the ham. Φ The fourth propagation of the Saphæna dispersing his muscles forward and backward. Ψ Branches from this unto the foreside of the inward and le, to the upper part of the foot, and to all the toes. Ω Wichias minor, called also Muscula interior the utter branch of the crural trunk divided into the muscles of the coxendix, and to the skin of that there. Ω And this also may be called Muscula. I The exterior and lesser which satisfy his to lowe of that place. 12 And this also may be called Muscula. 1 The exterior and leffer which passet into some muscles of the leg. 2 The interior, greater, and deeper unto the muscles of the thigh, 3 4 The vein called Poplitea, made of two crural veins divided under the knee. 5 From this, a furcle is reached upward noto the skin of the thigh, 6 but the greater part runs by the bent of the knee under the skin as far as the heel. 7 Alfo to the skin of the outward ankle. 8 The vein called Suralis, or calf-vein, because it runneth unto the nunfeles that make the calf of the leg. 9 The division of the Sural-vein into an exterior trunk 9, and an interior 14. 10 11 The division of the exterior trunk under the knee into an external branch, which along the brace attaineth unto the mufcles of the foot, 11 and an internal. 12 13 14 Which descending along the carefule of the leg to the upper of the foot is cloven into divers branches, and in the back of the foot mixeth cathide of the leg to the upper of the foot is cloven into afters oranceer, and in the back of the foot mixeth is felf with Poplitca, or the ham-vein 20. 15 The interior branch of the Sural-vein which runneth into the back-fide of the leg. 16 A branch bereof descending to the inside of the beel, and the great toe, and is divided into divers surcles. 17 Ischias major issuing out of the internal trunk at 14, and running through the musicles of the easif. 18 A propagation beroof to derived unto the upper part of the foot, and affording two surcles to every toe. 19 The remainder of the inner inner trunk, behind the inner ankle approaches to the bottom of the foot, and is consumed into all the toes. 20 The committion of the vein Poplitea with the small or ealf-branch at 13.

Where the external Jugular-vein may be fitly opened in the inflammations of the parts of the mouth.

But when it arrives to the basis of the lower part of the head, it is divided into more branches, one whereof is carried to the muscles of the bone Hyois, the Larinx, the tongue and the lower part of the tongue (in which place it is commonly opened in the Squinances, and other inflammations of the mouth) and to the coat of the nose. Another is carried to the Dura mater, passing on both sides through a hole, situate under the bone mastades; and besides, ascending to the bone of the back-part of the skull, it comes obliquely to the upper part of the stuture Lambdoides, where these branches meeting together, pass into the reduplication of the Dura mater, dividing the forepart of the brain, that so, joyned and united, they may make the Torcular; the third ascendent is distributed upon the back-part and basis of the lower jaw, to the lips, the sides of the nose, and the muscles thereof; and in like manner to the greater corner of the eyes, to the fore-head and other parts of the face, and at length by meeting together of many branches, it makes in the fore-head of the vein which is called vena resta, or vena frantis, that is, the fore-head vein. The

Pesa tella.

fourth afcending by the glandules behind the ears, after it hath fent forth many branches to them, is divided into two others, one whereof paffing before, and the other behind the ear, are at length fpent in the skin of the head. The fifth and last wandring over all the lower part of the head going to the back-part thereof, makes the Vens pupis, which, extended the length of the head by the Vens pupis, fagittal future, at length goeth to far, that it meets with the Vens frontis, which meeting is the cause, that a vein opened in the lore-head, is good in griefs of the hinder-part of the head, and so on the contrary. But we must observe, that in the Cranium of some, the Vens pupis by one or more manifest passages, sends some portion thereof to the inner part of the head, so that the Vens pupis being opened, may make revulsion of the matter which causeth the internal pains of the head.

CHAP. XIV.

The distribution of the Nerves, or Sinews of the fixth Conjugation.

Ecause the distribution of the Arteries cannot be well shewed, unless we violate those perves. Three pair of which are carried over the chest, therefore before we shew the distribution of the arteries, nerves of she we will, as briefly as we can, prosecute the distribution of these nerves. Now the fixth conjugation brings forth three pair of nerves; for patting out of the skull, as it comes down to the cheft, it by the way fends forth fome branches to certain muscles of the neck, and to the three ascendent muscles of the Laring on each fide of the Sternen, and upon the clavicles. Then the remainder descending into the cheft, is divided on each fide into these three pair. The first pair makes the Kannus costalis. The second, the Ranus recurrent. The third pair, the Ranus sostalis. The second, the Ranus recurrent. The third pair, the Ranus sostalis, or costal branch, is so called, because descending by the roots Ranus costalis. of the ribs, even to the holy bone, and joyning themselves to these which proceed from each of the Secondary of the secondary of the first pair the results of the first pair. the Vertebra's of the spine, they are carried to all the natural parts.

The Recurrent, or recurrent, is also so called, because as it were starting up from the cheft, it runs Recurrent, upward again: But these two recurrent nerves do not run back from the same place; but the right from below the artery, called by fome the Axillary, by others Subclavian, and the left from beneath the great artery, defeending to the natural part. But each of them on each fide afcending along by the weazon, even to the Larinx, and then they infinnate themfelves by the wings of Cartilgo faniformic, and Thyroider into the proper mufcles, which open and that the Larinx.

By how much the nerves are nearer the original, to wit, the brain, or spinal-marrow, they are An anatomical by to much the fofter. On the contrary, by how much they are further abfent from their original, they are so much the harder and stronger, which is the reason that nature would have these
recurrent nerves to run back again upwards, that so they might be the stronger to perform the Why Nature
motions of the muscles of the Larinx. But the Stomacheut or stomach-branch is so called, be-would have the
cause it describes to the storage have received. cause it descends to the stomach or ventricle. For this branch descending on both sides by the vocal nerves sides of the gullet, sends many branches from it into the inner substance of the lungs, into the coar Ramas Stands thereof, into the Pericardium and heart, and then coming into the upper orifice of the flomach, it chicatis spent in many branches, which folded after divers manners and ways, chiefly makes that mouth or florrach, which is the feat of the animal appetite (as they term it) and hunger, and the judger of things convenient or hurtful for the florrach. But from thence they are diversly differinated over all the body of the ventricle.

Moreover the fame branch fends forth fome fmall branches to the liver and bladder of the gall, giving each part by the way, so much sense as should be sufficiently necessary for it. Here you must note, the flornach branch defcends on each fide one, knit to the gullet, and by the way they divide themselves into two branches, each of which goes to the opposite fide, that it may there joyn it self to the nerve of that fide. To which purpose, the right is carried above the gullet, the left below it; so that these two stomatick become four, and again these four presently become

CHAP. XV.

The division of the Arteries.

The artery arising forth of the left ventricle of the heart, is presently (the two coronal arteries being first spread over the substance of the heart) divided into two unequal branches. The greater whereof descends to the lower parts, being distributed, as we formerly mentioned in the third Book, Chap. 22. The lesser ascending to the upper parts, is again divided into two other unequal branches, the lesser of which ascending towards the less that the right torth no artery from it, until it arrive at the ribof the chest, where it produces the Subclavian artion of the less to the substance of the less to the substance of the lesser of the lesser of the lesser of the substance of the lesser of the substance of the lesser of the lesser of the substance of the lesser of the lesse forth no artery from it, until trainive at the floor the cases, which it produces the Subclavian artery, which is distributed after the manner following.

First, it produces the intercostal, and by it imparts life to the three intercostal muscles of the four upper ribs, and to the neighbouring places.

Secondly, It brings forth the mammillary branch, which is distributed as the mammillary

Thirdly, the Cervicalis, which ascends along the neck by the transverse productions to the Dura mater, being distributed as the Vena Cervicalis is.

Subclavian artery into the,

Corvinsia.

If The umbilical artery. o The cles to each toe.

Fourthly, passing out of the cheft from the back-part of the cheft, it fends forth the mufculofa, Whereby it gives life to the hind-mufcles of the neck, even to the back-part of the head.

Fifthly, having wholly left the cheft, it fends forth the two Humeraria, or shoulder-arteries, the one whereof goes to the muscles of the hollow part of the shoulder-blade, the other to the joynt of Humeraria dathe arm and muscles situate there, and the gibbous part of the shoulder-blade.

Sixthly and lastly, it produces the Theracia, which is also twofold a for the one goes to the foremuscles of the cheft, the other to the Lastiffmus, as we said of the vein, the remnant of it makes the plex.

Theraciae datheracy of the tide.

Axillaris of that fide.

The other greater branch likewise ascending, by the right side, even to the first rib of the chest, The distributions also the subclavian of that side, which, besides those divisions it makes on this side, like those right subclavian of the left side, hath also another which makes the right and left Carotides, or sleepy arteries, an artery. which afcending undivided with a nerve of the fixth conjugation and the internal jugular vein, by The Caretida, which according undivided with a nerve of the fixth conjugation and the internal jugular vein, by The Caretidas, the fides of the Affers Arteria, or wind-pipe, when they come to the Pharinx, they are divided on or fleepy arteriach fide into two branches, the one internal, the other external. The internal and greater is fent to the Pharinx, Larinx, and tongue; then entring into the head by the long hole and back-part of their division, the upper jaw, it fends many branches to the note, eyes, the infide of the temporal musicles, and to tion of the internal branches of the remainder of this branch going by the fide-holes of the ternal branch fame, that it might there make the Pleaser admirabilities we fee. And then it is spent upon the basis of the fleepy of the brain abundantly diffused over the ternal meninx, or Pia mater, and then the membrane or Pleaser Chronides. The external or lefter branch of the fleepy arteries. Chroider. The external or leffer branch of the fleepy arteries goes to the cheeks, the temples, and the external behind the ears; laftly, it fends a branch into the long mufcle of the neck with which the internal branch of the Jugular-vein infinuates it felf into the Dura mater, entring by the hole of the nerves of the fixth fleepy arrery conjugation.

But we must note, that there be more veins in a mans body, than arteries; and befides, that the veins are far thicker. For there is no need for preferving the native heat in the parts themselves, either of so many, or so large instruments of that kind. Therefore you may often find veins without arteries, but never arteries without veins.

But we understand, that an artery is companion to a vein, not only when it touches it, or adheres to it by common membranes, as usually it happens: but also when it is appointed together with the vein for the use of the same part.

CHAP. XVI.

Of the Thymus.

He Thymar is a glandule, of a foft, rare, and fpongious fubiliance, of large bigness, fittiate in the furthest and highest part of the chest, amongst the divisions of the subclavian or

the right nerve to the right Axillary Artery.

QQ The right recurrent nerve. R A revolution of small branches of the left nerve unto the descending of the great artery.

SS The left recurrent nerve.

Compolure.

It is composed of veins from the internal Jugular, of arteries arising from the Carotides, and of nerves, proceeding from the recurrent branch of a double membrane, of which the external comes from the Peritoneum; the internal, which is the stronger and woven with the right fibers, from the inner coat of the mouth, the which is common with the inner coat of the afopbagus or gullet. And also it consists of round grisles, yet not drawn into a perfect circle, composed in manner of a channel, and mutually joyned together in order, by the ligaments that proceed from their fides

Why the back part of the weazon is ligamentous.

Why the forepart is grift-

The number and fite. The division of the weazon through the lobes of the lungs.

These same ligaments perfect the remnant of the circle of this Aspera Arteria, on that part next the gullet, which is thought to be done to this end; that that foftness of a ligament, might then give place, when we swallow harder and greater gobbets of meat. Of the two forts of ligaments which are annexed to the griftles of the weavon, some tie and fasten together the rings or circles which give means both to it and these circles to be drawn in length; othersome bring these grifles into a perfect circle, which also yield them means of dilatation. These ligaments cover the inner fuperncies, but the grifiles are placed without, to relift the incursion of external injuries. But we must note, that by this communion of the inner coats of the weazon and gullet, we reap this benefit in the commodiourness of the action, that one of these parts being depressed, the other is lifted up, like a rope running in a wheel or pully. For thus whilest the gullet is depress to swallength the gullet is depressed to swallength the state of the swallength of low any thing, the weazon is lifted up; and on the contrary, when the ftomach rifes up in vomiting, the weazon is depret. It is only one, and that feated between the Larinx, (from which it takes its beginning,) and the lungs in which it ends; first dividing it self into two large branches, the right and the left; and besides, each of these entring into the substance of the lungs, is again divided into two others; to each of the lobes one; and, to conclude, these besides into infinite others, through the substance of the lobes.

All these branches are griffly over to the sade. They are fitnate between the ends of the

All these branches are griftly even to the ends. They are situate between the ends of the Arteria venosa, and the Vena arteriosa, that the entrance of air into the heart by the Arteria veno-connexion with these in the ends, or utmost parts thereof, but by the other parts compassing it, action is to carry the air to, and vapours from the lungs; that by dilating, but this by pressing the eristles together.

The temper and action.

CHAP. XVIII.

Of the Gullet.

He OEsophagus, or Gullet, which is the passage of the meat and drink, is of a middle sub- The substance. france between flesh and finews, because it confists of one nervous membrane, and another fleshy. The nervous is placed the innermost, and is continued to the inner coat other fleshy. The nervous is placed the innermost, and is continued to the inner coat of the mouth even to the lips, (whereby it comes to pass, that the lips tremble in diseases which are ready to be judged by a critical vomiting) and to the inner part of the Aspera Arteris; it consists of right Fibers for the attraction of the meat, which we see is sometimes so quick and forcible in lungry people, that they have searce time to chaw it, before they find it, to be plack'd down, as it were, with hand, The fleshy coat placed without is woven with transverse fibers, to halten the going of the meat into the stomach, and for expulsion in vomitting and breaking of wind. These two coats are continued with the two coats of the stomach, and have the like fite. Belides, the surface pattern as a vein from the gate and hollow ascendent veins a nerve state. two coats are continued with the two coats of the florach, and have the like fite. Belides, the fare. gullet hath these parts composing it, as a vein from the gate and hollow ascendent veins a nerve from the fixth Conjugation, an artery from that which creeps alongs the bottom of the florach with the Vena Gastrica, or else from the arteries ascending the hollow part thereof; but also, belides all these vessels, it may have a third coat from the membrane investing the ribs, or Plana. The magnitude of the gullet is large enough, yet some be bigger, some less, according to the valieties of bodies. The figure of it is round, that so it might be more large to swallow meat, and less subject to offence. It is placed between the back-bone and weazon from the roots of the tongue even to the stomach. But as it descends alongst the back-bone, when it comes to the fourth Vertebra of the cheft, it turns to the right side, to give way to the great Artery Aorta, and the descendent artery; then it turns to the less fide to the stomach, or mouth of the ventricle. Nature hath saftened it to the Displacement with strong membranous ties, lest that, if it had lain upon the ardent artery; then it turns to the left fide to the flomach, or mouth of the ventricle. Nature hath faftened it to the Disphragma with firong membranous ties, left that, if it had lain upon the artery, it fhould have hindered the paffage of the vital fpirit to the lower parts. It is only one, and that tied to the fore-mentioned parts, both by its veffels and membranes. It is of temper rather cold than hot, as all those parts, which are more nervous than fleshy, are. The action thereof is to draw and carry down the meat, and to cash forth such things by ventit as trouble the stonation. Here you must note, that whilest we swallow down, the gullet is drawn downwards, and why we can the weazon upwards, which is the cause that we cannot sup and blow, swallow and breather, to not sup and gether at the same instant; which we must think to happen by Gods singular providence, to whose blow at one name be glory for everlasting. Amen.

The End of the Fourth Book.

BOOK

BOOK V.

Of the Animal parts contained in the Head.

CHAP. I.

A general description of the Head.

Aving hitherto declared two general parts of mans body, that is, the natural and vital, it is now fit to betake our felves to the laft, that is, the animal, beginning with the head.

Wherefore we will first define the head, then divide it into its pares; thirdly, describe each of these parts; fourthly, demonstrate them after the order they offer themselves to our light in diffection.

What the place.

The figure.

The division thereof.

The head therefore is the feat of the fenfes, the palace and habitation of reason and wisdom, from whence, as from a fountain, infinite actions and commodities arife. It is feated above the reft Why feated in of the body, that the animal spirit from thence, as from a Tower, may govern and moderate the whole body, and perform all actions according to the prefcript of nature. By the head we under-ftand all that which is contained from the crown of the head to the first Vertebra of the neck. The best figure of the head is round, lightly flatted on each fide, extuberating formething to the

fore and hind-part thereof. For from hence is taken an argument of the goodness of the fenses on the contrary, those which are exactly round, or acuminate, and sharp towards the rop, are not thought good. The head is divided into the face, forehead, temples, the forepart, the crown, and hind-part.

By the face we understand, whatsoever is contained between the eye-brows and the lower part of the chin. By the forehead, all the space from the eye-brows even to the coronal future. temples, whatfoever is hollowed from the leffer corner of the eye, even to the ears. By the forepart of the head, whatfoever runs in length from the top of the forchead, or the coronal future, even to the future Lambdoider, and on each fide to the Offa petrofa, the flony bones, or fealy futures. By the crown we lignifie a certain point exquifitely in the midit of the fagittal future, which is fufficiently known. By the Occiput or hind-part of the head, that which is terminated by the future Lambdoides

and the first Vertebra of the neck. Of all these parts there be some simple, some compound; besides, some are containing, some containing. Of the containing, some are common to all the parts of the head, as the skin, the slethy The containpannicle, and perioranium; others are proper to certain parts, as the fleshy pannicle to the neck, face, forehead, and skin covering the evanium, the common coat of the muscles to the fat and face; the skull and both the Meninger to the brain. ing parts of Head.

The parts contained, are the fubfiance of the brain, the four yentricles, and the bodies contained in them, the nerves, the mammillary processes; the Pleans Charoides or Rete admirabile; the Glandula bafilaris, and others, of which we will fpeak hereafter.

We must now speak of the containing parts beginning with the skin; for the order of teaching requires, that we take our Exerdinm from the more simple; but first we will say something of the

What the hair

The use there-

The parts

The hair is nothing elfe than an excrement generated and formed of the more grofs and terrent portion of the superfluities of the third concoction, which could not be wasted by infensible tranfpiration. The benefit of it is, that confurning the grofs and fullginous, or footy excrements of the brain, it becomes a cover and ornament for the head.

This hair of the head and eye-brows have their original from the first conformation of the infant in the womb, the rest of the hairs of the body arise and grow forth as the body grows and becomes more dry, of which fort are the hairs which cover the chin, arm-holes, groins, and other parts of our bodies.

CHAP. II.

Of the mufculous skin of the Head (commonly called the hairy fealp) and of the Pericranium.

What the hairy scalp is.

He skin which covers the skull, and is covered with the hair, is far more fleshy, thicks hard, and dry than any other part of the body, especially which wants hair. The skin but is as it were, lost in them, or grown into one with them, as in the lips and forehead with the fleshy pannicle, wherefore it is there called musculous; in other places it adheres to the griftles as on the sides of the nostrils and corners of the eyes, whereupon it is there called griftly.

It hath connexion with the Perievanium, because joyned to it, it receives nerves from the first and fecond Vertebra of the nock.

irs connexion. and fecond Vertebra of the neck, and from the third conjugation of the brain, which are different nated through all its substance, whereby it comes to pass, that the wounds, contusions and into the control of the property of the needed and the control of the property of the needed and the control of the property of the needed and the control of the property of the needed and the control of the property of the needed and the needed a posithumes, that happen in or upon this skin, are not to be neglected.

The * Pericranium, (but I suppose it should be the Peristram) is a most thin membrane, which * Our Author next and immediately covers all the bones of the body, and this on the head is called by a peculiar (with name the Pericranium, by reason of the excellency of the Cranium or skull; in other bones it is termed the Periodenon: And as the Perioranium takes its original from the Craffa mening, propagating it the Perioranied the Periofeum: And as the Perioranum takes its original front the Graya months, propagating the Perioranie felf by certain firings or threds fent forth by the futures and holes of the skull, fo all other mem- on and Perioraniem, or Craffa mening, fending forth firm: but Vistanciana, or Craffa mening, fending forth firm for the fending for the fendin their productions, as well by the holes or passages of the head, as by those of the spinal marrow or back-bone it felf even to the holy bone. guish them, making the Perieranian thin and soft, and the Perinftenn most thin and nervous, and of most exquisite sense.

Of which this is an argument; for in what part foever of the body a membrane is hurt, prefent- Why the Of which this is an argument; for in what part 10ever or the body a memorane is nurt, presently the hurt or fenfe thereof comes to the Craffa menium. For fo those who have but their little toe hurt, of must not be

when they fneeze or cough, perceive an increase of their pain, by the passage thereof to the brain.

* The use of this Pericanium is to cover the skull; and to give notice of things hurtful, by the power of the quick sense which it is endued withal, and the Periodeum doth the like in other bones. power of the quick fense which it is endued withal, and the recognism countries means other bones. Befides, it suffains and fastens by the sutures the Crassa mening to the skull; lest it should fall by reasame nature. fon of its weight upon the Pis mater, and fo hurt it, and hinder the pullation of the brain and arteries that are plenteously spread through both the Moninger. Wherefore the Perieranium hath most firait connexion with the Crassia moning, because it takes the original from thence.

We must think the same of the other membranes of the body, which thing is very notable in the folution of the continuity of the membranes.

CHAP. III.

Of the Sutures.

He Sutures do few or faften together the bones of the skull; thefe be five in number. Three, and are true and legitimate; two, falle and spurious. The Coronal, the first of the true Sutures, is feated in the forepart of the head, descending downwards overthwart the forepart of the head to the midit of the temples; it is so called, because Corolla, that is, wreaths, crowns,

or garlands are fet upon that place.

The fecond is called the Sagnitalis, or right future, as that, which running through the crown, divides the head into two equal parts, as with a strait line, running the length of it from the coro-

nal to the Lambdoides or hind-future.

But this third Suture Lambdoides is so called because it represents the capital Greek Letter Lambdo But this third Suture Lambdoides is so called because it represents the capital Greek Letter Lambdo But this third Suture Lambdoides is so called because in or as always, but as for the greater part, A. You must understand this description of the sutures, not as always, but as for the greater part, to be thus. For there be forme skulls that want the foremost future, othersome the hind, and forme- Some skulls times fuch as have none of the true futures, but only the falle and spurious. And also you shall some- want surures. times find the fagittal to run to the note.

And oft-times there be three or four futures in the back-part of the head, so that indeed the number of the futures is not certain. Which also we find observed by Cornelius Celfus, where he writes, celf. lib. c.40. that Hippocrates was deceived by the futures by chance; for that he conjectured, that the bones of the back-part of the head, were broken; because his Probe, thrust to the roughness of the second future Lambdoides, flaid as at a cleft made in the hone by a stroke.

The other two are called the false, stony and scaly futures, by reason they are made by a scaly conjunction of the bones, but not by a toothed faw or comb-like connexion. But if any ask, Why conjunction of the bones, but not by a toothed taw or comb-like connexion. But it any asa, which the head conflits not of one bone, that fo it might be the fitronger? I answer, It is, that fo it might be the fater both from internal and external injuries. For the skull, being, as it were, the tunnel why the skull of the chimnely of this humane fabrick, to which all the finoaky vapours of the whole body afcend, conflits of distributions. The favorence should have had no pullage forth. if it had been composed of one bone, these vapours should have had no passage forth.

Wherefore the groffer vapours pass away by the futures, but the more fabril by the pores of the skull; some have their futures very open, but others on the contrary very close.

Therefore nature hath otherwise compendiously provided for such as want sutures: For it hath in what hodies made one or two holes, some two singers breadth from the Lambdoider, through which the Vena put and by what pir enters into the skull, and they are of that largeness, that you may put a points tag into them, that mean, the value hath been careful to provide for man against internal injuries; And in like manner against external; for it hath made the head to consist of divers bones, that when one is broken, the other may within the besselect the violence of the stroke being staid in the division of the bones.

nal; for it hath made the head-to consist of divers hones, that which one is broken; the other may within the be fafe, the violence of the firoke being staid in the division of the bones.

Whereby you may know; that if the skull chance to be broken in the opposite fide to that which In what men received the blow, that it happens either by reason of the defect of sutures, or else because they are one part of unperfect, and too firmly closed; otherwise it is impossible such fractures should happen by reason of the head, being stricken, which breaks the violence of the blow that it can go no first be the separation of the bones, which breaks the violence of the blow that it can go no further.

And certainly, as it is rare to find a skull without futures, fo it is rare to find fuch kind of fra- broken And certainly, as it is rate to man diligently observe the futures and fire of them, left they be de-theres. Therefore Chirurgeons must diligently observe the futures and fire of them, left they be de-why we must ctures. Therefore Chirurgeons must dialgently contained and inte or them, left they be decived, and take them for fractures, or unawares apply a Trepan to them, whence by breaking the nor apply a veins, arteries and nervous fibers by which the internal parts communicate with the external, there Trepan to the may enfue increase of pain, a violent defluxion of blood upon the Crassa mening, and the falling faures.

Therefore Chirurgeons must dialgently obtained them, whence by breaking the nor apply a nor apply a may enfue increase of pain, a violent defluxion of blood upon the Crassa mening, and the falling faures. fequently a deadly interception of the pultion of the brain.

the membranes propare is hure in any part of the body, the head is affected by confent. " Thouse of the Perierani-Their use and

& Bregnatis.

off a parrella, or the toxly-bone.

Or Sphemider, or the wedgbone.

Os Ethmoldes, ar Cribrofan.

The three bones of the Auditorypassage.

By what means a Chirurgion may conjecture that there are extraordinary certain places The skulls of fuch as inhabit the Southern countreys, are and denic. We must obferre the exruberances befides narture, which are in some skulls. The fice and fubiliance of the Diplot.

He Cranium, or Skull covering the brain like an Helmet, is composed and confids of seven bones; of which some are more dense, thick and hard than othersome. The first is the Os Occipine, or nowl-bone scated in the back-part of the head, more hard and thick than the rest, because we want hands and eyes behind, whereby we may keep or save our selves from fasting. This bone is circumscribed, or bounded by the suture Lambdoides, and the *Os basilare. The eminencies, and, as it were, heads of this bone are received into the first Vertebra; for upon this the head is turned forwards and backwards, by the force of fourteen muscles and strong ligaments,

which firmly tie these heads of the nowl-bone in the cavities of this first Vertebra.

The second bone of the skull is in the fore-part, and is called the Os coronale, or Os frontis, the fore-head-bone; it hath the second place in strength and thickness. It is bounded by the coronal suture, and the ends of the wedg-bone: In this tore-head bone there is often found a great cavity under the upper part of the eye-brows, filled with a glutinous, gross, viscid and white matter or

fubfiance, which is thought to help to elaborate the air for the fende of finelling.

Chirurgeons must take special notice of this cavity; because when the head chances to be broken in that place, it may happen, that the fracture exceeds not the first table; wherefore being ignorant of this cavity, and moved with a false persuation that they see the brain, they may think the bone wholly broken, and so press the Moninger, whereupon they will dilate the womb, and apply a Trepan and other instruments to list up the second table of the bone, without any need at all, and with the manifest danger of the lise of the Patient.

The third and fourth bones of the skull, are the Offa parietalia, or Bregmatis, having the third place of density and thickness; although this density and thickness be different in divers places of them. For on the upper part of the head, or crown (where that substance turns not to a bone in children, until they have all their teeth, so that it feels soft in touching, and through it you may feel the beating of the brain) these bones are very tender, so that oft-times they are no thicker than ones nail, that so the most and vapourous excrements of the brain, thut up where the greater portion of the brain resides, may have a freer passage by the brains. Diaglose and Systole. These two fequare bones are bounded above with the fagittal sure, below with the scaly, on the fore-part with the coronal, and on the hind-part with the Lumbdoides.

the coronal, and on the hind-part with the Lambdoides.

The fifth and fixth bones of the skull, are the two Offa petrofa, flony or fealy bones, which are next to the former in strength. They are bounded with the false or bastard-suture, and with part of the Lambdoides, and wedg-bone.

The feventh is the Os fibruides, bafilare, or Cuntiforms, that is, the wedg-bone. It is called Bafilare, because it is (as it were) the bafir of the head. To this the rest of the bones of the head are fitly fastned in their places. This bone is bounded on each side with the bones of the forehead, the stony bones, and bones of the now! and palat. The figure represents a Bat, and its processes her wings.

There is befides these another bone at the basis of the forehead-bone, into which the mammillary processes end; the Greeks call it without its, the Latines, Cribrosium and Spongiosium, the spongy-bone; because it bath many holes in it not perforated in a direct passage, as in a five, but winding and anfractuous, that the air should not by the force of attraction, presently leap or ascend into the brain, affect it with its qualities, before it be elaborated by its lingring in the way. There are besides also, six other little bones lying hid in the stony bones at the hole or auditory-passage; on each side three, that is to say, the Locus or Anvil, the Mallosius or Hammer, and the Stapes or stirrop, because in their figure they represent these three things; the use of these we will declare hereafter.

But also in some skulls there are sound some divisions of bones, as it were collected fragments, to

But also in some skulls there are sound some divisions of bones, as it were collected fragments, to the bigness almost of ones thumb, surnished and distinguished by their proper commissures, or sutures, which thing is very sit to be known to a Chirurgion in the use of the Trepan.

Verily he may give a conjecture hereof, whilft he feparates the Pericranium from the skull, for the Pericranium is with greater difficulty pluck'd away from the futures, because the Craffa menines hath straiter connexion therewith by his nervous fibers fent forth in such places. The skulls in women are softer and thinner than in men, and in children more than in women, and in young men more than in men of a middle age. Also the Ashiopians and Black-moors, as also all the people inhabiting to the South, have their skulls more hard and composed with sewer sutures.

Therefore, as it is written by Hippernete, such as have their skulls the softer, the symptomes in fractures, are more dangerous and to be feared in them. But the skull by how much the softer it is, by so much it more easily and readily yields to the perforating Trepan. Moreover in some skulls, there be bunches standing out besides nature, made either round or cornered, which the Chirurge-on must observe for two causes; the first is for the better consideration of a blow or fracture. For in these bunches or knots, the solution of the continuity cannot be, if it seem to be stretched in length, but that the wound must penetrate to the inner parts. For in a round body there can be no long wound, but it must be deep, by the weapon forced the deeper; because as a round body touches a plain but only in punso, in a prick or point: So whatsoever falls only lightly or superficially upon it, touches a point thereof. But on the contrary, a long wound must be upon a plain surface, which may be but only superficial.

Another cause is, because such bunches change the figure and site of the sutures. And the Chirurgeon must note, that the skull hath two tables, in the midst whereof the Diploc is; which is a spongy substance into which many veins and arteries, and a certain stethiness are inserted, that the skull should not be so heavy, and that it might have within it self provision for the life thereof; and lastly, that there might be freer pussage out for the suliginous vapours of the brain.

The upper table is thicker, denfer, ftronger and fmoother than the lower. For this as it is the flenderer, to it is the more unequal, that it may give place to the internal veins and arteries, (which make a manifest impression into the second table on the inside thereof) from which brashches enter into the skull by the holes which contain the eyes. Which thing faftens the Graffa me-

For in great Contusions, when no fracture and fulfure appears in the skull, by reason of the great There may be concussion or shaking of the brain, these vessels are often broken, whence happens a flux of blood a deadly rupconcussion or shaking of the brain, these vesses are often broken, whence happens a stux of blood between the skull-and membranes, and lastly death. But it is fit the Ghimirgeon take good heed to the tender and fost substance of the Diploc, that when he comes to it, having passed the first brain without table, he may carefully use his Trepan, lest by leaning too hard, it run in too violently, and hart the membranes lying underneath it, whence convulsion and death would follow. To which danger I have found a remedy, by the happy invention of a Trepan, as I will hereafter more at large and in the use of the freed. declare in handling the wounds of the head.

CHAP. V.

Of the Meninger, that is, the two Membranes called Dura mater and Pia mater.

He Craffa menine is one of the first and principal membranes of the body; it goes forth by Why the book the futures and holes of the nerves that proceed out of the skull; and it passes forth by the is perforated bone Ethnoides perforated for that purpose, to carry smells to the brain, and purge it of excrementitious humors. This fame Craffa meninx invests the inner coat of the nose; also it passes forth of the great hole through which the spinal marrow passes, vested with this Graffa menina, with all the nerves and membranes. For which canse if any membrane in the whole body be hurt, by reason of that continuation which it hath with the Meninger, it straight communicates the hurt to the head by consent. to the head by confent.

The Craffa maning is thicker and harder than all other membranes in the body; whereopon The con-it hath got the name of the Dura mater; befides also, it begirts, produces and defends the other fillence of the membranes.

The use of it is to involve all the brain, and to keep it when it is dilated, that it be not hurt by the hardness of the skull. For the course of nature is such, that it always places some third thing of a middle nature, betwixt two contraries. Also the Grassa menines places from their difficulties, which is, that it carries the veins and arteries, entring the skull for a long space. For they infinuate themselves into that part, where the dualities are fielded. More forwards the brain from the ate themselves into that part, where the duplicate or folded Manager separate the brain from the Cerebellum, and so from thence they are led by the sides of the Cerebellum, until they come (as it were) to the top thereof; where being united, they infinuate themselves into that other part of the Crassa monion, where, in like manner being duplicated and doubled, it parts the brain at the top into the right and left. These united veins run in a direct passage even to the forehead, after the manner of the sagittal suture: They have called this passage of the mutually insolded veins, the Torontor or Press, because the blood which nourishes the brain, is pressed and drops from what the there has been by the inspirite months of these sages. Therefore also benefic another not the Course of the C thence by the infinite mouths of these small veins. Therefore also here is another use of the Cras- Tarcalar it. fa mening, to diffinguish the brain by its duplication, being it thrusts it felf deep into its body, into two parts, the fore and hind, and presently to separate the same into the right and less that one part being hurt, the other may remain fale and found, performing its duty to the creature. One part of as we see in some that have the Palse. Calambia observed that the Marian was double, and we the brain being

rily I have found it true by my own fight. The other Meninx or membrane of the brain, called Pia mater, is most stender, interchased with creature alive. divers veins and arteries, for its own and the brains nouriflment and life. This doth not only infiflence of the

CHAP. VI.

Of the Brain.

Ow followeth the brain, the beginning of the nerves and voluntary motion, the infirmment of the first and principal faculty of the Soul, that is, the Animal and Rational, brain is. Man hath this part in greater plenty than any other Greature, for it almost fills the whole skull. But if it should have filled it all, the brain could not be moved, that is, dilated and con- The quantity? tracted in the skull. It is of a cold and moift Temperature. The laudable temper of the brain is temperature and external fenfes; the indifferency of fleep and waking, the maturity or ripenels of judgment, and constancy of opinions, from which, un-Jels it meets with better and more probable, it is not calle to be moved.

Dura meninx. HHH The thick membrane reflected downward.

The action of the brain is to elaborate the animal spirit and necessary sense serving, the whole body, and to subject it self as an instrument to the principal faculties, as to reason. The brain is twosold, the fore and hind. The hind by reason of its smallness is called the *Cerchellum*, (the little or after-brain.) But the fore by reason of its magnitude, hath retained the absolute name of the brain. Again, this fore-brain is twosold, the right and the left, parted by that depression which we formerly mentioned, of the *Manager* into the body of brain. But this division is not to be here so absolutely taken, as though the brain were exactly divided, and separated into so many parts; but in the sense we say the liver and the lungs are divided a pretty way, whereas at their Basis they have one continued body. The outward surface of the brain is soft, but the inward hard, callous and very smooth; when on the contrary, the outward appears indented and unequal with many

windings, and creited, as it were, with many worm-like foldings.

The action.

Number.

CHAP. VII.

Of the Ventricles and Mammillary Processes of the Brain.

Por the easie demonstration of the Ventricles of the Brain, it is convenient you cut away a The substance large portion thereof, and in your cutting, observe the blood sweating out of the pores of of the brain is porous, and brain are heaped up, to be presently strained out, and sent away by the hollow passage. In the blood, substance of the brain you must observe four ventricles, mutually conjouned by certain gassages. The four ventricles, which the society and with the strain of the same sent the sa by which the fpirits endued with the *species* of things sensible, may go from one into another. The tricles thereof first and two greater, one on each side are placed in the upper brain. The third is under them in the middle part of the brain. The fourth and last at the foreside of the Cerebelhon, towards the the middle part of the brain. The fourth and last at the forefule of the Coronaum, towards the beginning of the spinal marrow. The two foremost are extended the length way of the brain in the form of a semicircle, whose homs look or bend outwards. They are spacious and large, because it was meet the spirits contained there together with their excrements, should be there puritate of the upfield and cleansed; but in other ventricles, the pure and already elaborate spirits are only received. The spirits are spirits and specific the pure spirits are only received. These ventricles are white and smooth in their inner superficies; but, that on each side they have an extuberancy at the midft of the femi-circle, fituate at the basis of the pillar of the middle veri-tricle towards the note under the Septum lucidum, or clear partition, fevering or parting in funder these two ventricles.

The Septum lucidum, or clear or thin partion, is nothing elfe than a portion of the brain indifferently folid, but very clear, that so through this partition the animal spirits contained in these two lacidam Ventricles, may mutually pass and be communicated, and yet no other groffer substance may pierce the thin denfity thereof.

The shird Figure represents the Cerebellum with the wormy Processes separated from it.

AB The right and left part of the After-brain.

CD The Anterior and Posterior regions of the middle

art of the After-brain. E The Anteria wormy process. F The Potierior wormy process.

GG In this place the After-brain did grow to the spinal

H The cavity in the spinal marrow maketh the fourth ven-

IK The Anterior and Polierior processes of the bain, called Vermi-formes, or the wormy proceffes.

Wherefore it is not to be feared, that the water contained in one of the ventricles may pass to Why the Pal-the other through this partition, as I have oft-times observed to the great admiration of the specta-is not presenttors in the dead bodies of fuch as diad of the Pallie, in which I have found the ventricle of that ly communifide which was taken with the Palife much dilated, according to the quantity of the water contained therein, the other being either wholly empty and without any; or certainly no fuller than other, in any other, dead through any other occasion. For some affirm, that there is a certain kind of waterill moisture always to be found in the ventricles, which may be made by the condensation of the animal spirits by the force of the deadly cold. But these two first ventricles of the brain go into one common paffage, as both the bellows of a fornace, whereby the fpirit inftructed with the species of things, goes into the under or middle ventricle from the former. In these fame first ventricles, the Plexas charvides is to be considered, and in like manner the passage by which the grosser

excrements are driven or fent into the pituitary glandule.

This Pleass choraides is nothing elfe, but a production of the Pis mater diversly folded with The Pleast the mutual implication of veins and arteries woven in the form of a net. These vessels are of choraidus, magnitude and capacity sufficient, both to yield life and nourishment to that particle to which the context of the production of the primal solution of the particle to which the particle of the production of the primal solution of the primal solution. they are fastened, as also for the generation of the animal spirits, as which take fit matter from the veins stretched forth into the same Plexus, the hind-artery and vein Tovenlar; and also from the air entring into the brain by the mammillary processes. But the mammillary processes are certain common ways for conveyance of the air and smells, into the brain, and carrying of excrements from the brain.

For thus in them who have the Catarrh and Goriza, or Pofe, neither the air, nor finells can pe- The Preceditat For thus in them who have the Catarriana Gorges, of the confiction of the air, nor intells can permetrate into the brain; when frequent freezings enfue, the brain firongly moving it felf to the expansion of that which is troubleforme to it. But of the excrements of the brain, whether bred there, or proceeding from forme other part, forme are of a furnid and vaporous nature, which breathe infenfibly through the futures of the skull; others are grofs and vifeid, of which a great part is expel-

fenfibly through the futures of the skull; others are gross and vitcid, of which a great part is expel-ted by both these productions, or through each of them. For thus in the Pose you may see some who have one of their notirils stopt, the other running, and some who have both obstructed. The most proper benefit of the two first ventricles of the brain is to entertain the Phantasie, as in a con-venient seat and habitation, seeing the mind there estimates and disposes in order the species of things brought in from the external sense, that so it may receive a true judgment of them from rea-son, which resides in the middle waysiels. fon, which refides in the middle ventricle.

The third ventricle is feated between the hindermost extremities of the former ventricles, and the last ventricle of the Cerebellium. In this, fix parts present themselves to our consideration, that is, the Pfalloides or Arch, the Concernm or pine glandule, the battocks, worm-like productions, the basion and passage which is from this middle into the last and findmost ventricle. The Pfalloides or Arch, is nothing else, but the cover of the middle ventricle, resembling a roof, born up with the parts to be considered three stays or pillars, the one whereof is extended to the nose under the Septem heidens; the two other on each side one, look toward the back-part of the brain. This is the reason of this figure which is outwardly convex, and inwardly concave, to wit, that there might be free space for that which is outwardly convex, and inwardly concave, to wit, that there might be free space for that motion which the animal spirit inwardly produces, and besides, that it might more easily suffain the six, or archis, burthen of the brain lying upon it. For an arched figure is the most convenient of all other to such the use thereof.

The Constrium, or Pine-glandule is a finall glandule of the fame substance with the brain, round What the Coand formewhat long, like a Pine-apple, from whence it hath the name: This glandule is feated narismor photographic against a small hole which descends to the lowest ventricle. It hath this use, to strengthen the glandule is division of the vessels led thither with the production of the Pia mater for the generation of the animal spirits, and the life and nourishment of the brain.

The Nates, or buttocks, are fubjected, or placed, under this glandule, that is, bodies of a folid What the and white fubflance drawn out in length like a childs buttocks, especially in Ecasis, and chiefly in a tocks are.

These buttocks have such a folid substance, that so they may keep open and free the passes. theep. These buttocks have such a folid substance, that so they may keep open and free the pasfage, or channel, that runs down from the middle to the lower ventricle, by means of which the brain participates with the Cerebellum.

The Worm is a production of the Cerebellion, or after-brain, to wit, a portion of the fame being What the in the top, or beginning, and as it were in the entrance thereof, being like many little circles, or worm is. wheels mutually knit together by flender membranes, and it is so called because it resembles those thick white worms which are found in rotten wood. It doth, as it were, perform the office of a Porter to the formerly mentioned paffage, that it may give way and entrance into the Cerebellion, to a neceffary quantity of spirits, when need requires; left that, if they should rush with a sudden violence into the Gerebellum, they might confound the imprinted notions of things to be remembred.

The Pelvis, or Bason, is a passage appointed for the carrying away of the gross excrements by the palat; and is so called, because it hath the similitude and use of a bason, or tunnels it descends consounded from the third ventricle into the glandule which is feated between the processes of the wedg-bone with the Tun-called the faddle thereof, as you may perceive by putting in a spathern. Now there remains the nel-last of the fix parts proposed to our consideration in the third ventricle, that is, the channel or pas-

This channel deficending in its original from the bafon, goes from thence under the buttocks into The Channel the laft ventricle, the Menness being perforated; which, that you may flew, it is fit you put the from the third end of a Spathern through it. The benefit of a third ventricle, is, that it may be as a Tribunal or ventricle.

Judgment-feat, to the reafoning faculty, when the mind will draw conclusions from things feen.

The fourth ventricle feated in the place we formerly mentioned 3 it is lefs than the reft, but more folid; less as that which was not to receive the spirit before it was purined, and cleansed from all impurities; but more solid, that it might contain it the safet. The use thereof is, to be as a treasury and store-house of the opinion, and judgments which reason shall decree, that when need requires, we may setch and draw them from thence as laid up in store. I know Galen and the Greek Phylicians have not fo diffinguished in places, the three forementioned faculties; but have written, that they all are all over-confused through the whole substance of the brain, which opinion also Fernelius in his Pathologia hath renewed. Yet I had rather follow this opinion, as commonly received and celebrated by the Arabian Physicians.

The mammillary processes are the instruments and passages of Smelling, being of the same subflance with the brain, and like nerves, which run out from the hind-horns of the upper or fore-most ventricles of the brain to the Eshmoides and spengy bones of the nose, that hence they may receive the diverse kind of smells, and carry them into the brain. But although they be like nerves, yet they are not accounted nerves, because they go not out of the skull.

CHAP. VIII.

Of the seven Conjugations of the Nerves of the Brain, so called, because they always show the nerves conjugated and doubled; that is, on each side one.

He nerves are the ways and inftruments of the animal spirit and faculty, as of which What a nerve those spirits are vehicles, as long as they are contained in the brain; they consist of the or sinew is. only and simple marrowy substance of the brain, or spinal marrow. But passing forth of the brain, the have another membranous substance which involves them, joyned with them from the two membranes of the brain; and according to the opinion of some Anatomists, they have also were the two membranes of the brain; and according to the opinion of some Anatomists, they have also were the two membranes of the brain; and according to the opinion of some Anatomists, they have also were the two membranes of the brain; and according to the opinion of some Anatomists, they have also were the two membranes of the brain; and according to the opinion of some Anatomists, they have also were the two membranes of the brain; and according to the opinion of some Anatomists. the brain, the nave another manner and according to the opinion of fome Anatomists, they have all nerve have a to a third from the ligaments, drawn as well from divers others, as from thefe by which they are third memtied to the Vertebra's; yet this opinion feems abfurd to me, feeing fuch a membrane, as that which brane from is infentible, wholly repugns the condition of a nerve, which is to give fenfe to the parts to which of the Pett-

The magnitude of the nerves is different, according to the diverse necessity of sense incident to Their magnithe parts into which they are inferted. Their figure is round, and long, like to a Conduit-pipe tude. Their figure is round, and long, like to a Conduit-pipe tude. Their figure and figure is the membranes of the brain, with which the nerves are covered, being dilated and firetched over them, after the fame manner that the processes of the Peritoneum involves the

Their use,

fpermatick veffels, with which they go down to the tefticles, and take life and nourithment by the capillary veins and arteries, which defeend to them with the membranes. They are made for this use, that they may impart sense to the sensitive parts, and motion to those that are fit to be Theirnamber. moved. All the nerves defeend from the brain either mediately, or immediately; their number is feven and thirty pair, or conjugations; whereof feven have their original immediately from the brain, the other thirty from the fpinal marrow.

The first conjugation of the nerves.

The first Conjugation of the nerves of the brain is thicker than all the rest, and goes to the eyes. to carry the visive spirit to them. These arising from divers parts of the brain, in the middle way before they go out of the skull meet together cross-wife, like the Iron of a Mill (which is fathred in the upper flone) going into one common paffage with their cavities not visible to the eye; that fo the spirits brought by those two nerves may be communicated, and they are mutually joyned and meet together so, that being driven back from one eye they may slie back into the other. An argument whereof may be drawn from fuch as aim at any thing, who shutting one of their eyes see more accurately; because the force of the neighbouring spirits united into one eye, is more firong than when it is disperfed into both. This conjugation, when it comes into the glassie humor, is fpent in the structure of the net-like coat which contains this humor on the back-parte

The feventh Figure shearing the eighth Conjugation of the Nerves of the Brain.

call the Mammillary processes. D 1 The beginning of the spinal marrow out of the basts of the brain.

F 12 A part of the spinal marrow when it is ready to issue out of the skull.

F 1 2 The mammillary processes which serve for the fenfe of Smelling.

GG 1 2 The optick nerver.

H 1 The coition or union of the optick nerver. II 12 The cost of the eye whereinto the optick nerves are extended.

KK 12 The second pair of the finers ordained for the motion of the eyes

LL 12 The third pair of finews, or, according to the most Anatomists, the leffer root of the third

MM 12 The fourth pair of finews, or the great-er root of the third pair.

N 2 A braneb of the third conjugation derived to the mufculous skin of the fore-head.

O 2 A branch of the Same to the upper jan. PP 2 Another into the coat of the noffrils.

Q 2 Another into the temporal mufcles. R 2 A branch of the fourth conjugation crampled like the tendrel of a vinc.

\$ 2 A branch of the same reaching unto the upper reeth, and the gums.

T 2 Another of the same to the lower-jaw. V 2 A surcle of the branch T, to the lower lip.

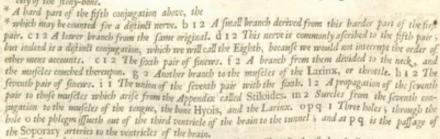

XX 2 Another furcle from the branch T, to the roots of the lower teeth.

YY 2 The affumption of the nerves of the fourth conjugation unto the cost of the tongue.

Z 12 The fourth pair are vulgarly so called which are spent into the coats of the palat.

1 2 The fifth pair of finews which belong to the bearing.

Φ The Auditory-nerve, Spread abroad into the cavity of the stony-bone

The fecond conjugation goes into many parts, at its passing forth of the skull; and in the bottom of the circle of the eye it is distributed into the feven muscles moving the eyes.

The third is twofold, in the passage out of the skull, it is likewise divided into many branches

FIG. II.

The fecond Conjugation. The third eonjugation.

of which fome are carried to the temporal mufcles, into the Meffetener, or grindling mufcles, into the skin of the face, forchead and nofe; Otheriome are fent into the upper part of the check, and the parts belonging to it, as into the teeth, gums, and the mutcles of the upper lip; and those which are called the round, which incompass the mouth on the inside; the last are wasted in the coat of the tongue, to bellow upon it the fense of tailing.

The fourth conjugation is much finaller, and is almost wholly wasted upon the coat of the Pa. The fourth conjugation is much finaller, and is almost wholly wasted upon the coat of the Pa. The fourth conjugation is much finaller.

The fifth as its original, and having not as yet passed forth of the skull, is divided into two, and The fifth confends the greater portion thereof to the hole of the ear, or passed of hearing, that it may support jugation, the auditory faculty; and it sends forth the other lesser portion thereof to the temporal muscles by. the paffage next to it; by which the fecond conjugation paffes forth,

The fixth being the greatest next to the first, passing entire forth of the skull, imparts some small The fixth branches to certain mufcles of the neck and throttle, and then defcending into the cheft, it makes conjugation. the recurrent nerves; and difperfed over all the parts of the two lower bellies, it paffes even to the

bladder and tefticles, as we showed in the former Book.

The feventh inferted and fpent upon the mufeles of the bone Hysis, the tongue, and fome of The feventh the throttle, to give them motion; it paffes forth of the skull by the hole of the nowl-bone as conjugation. the extuberancies thereof.

CHAP. IX.

Of the Rete Mirabile, or wonderful Net, and of the Wedge-bone.

He Animal spirit is made of the vital, sent from the heart by the internal sleepy arteries to The existence of the brain. For it was requisite, that it should be the more elaborate, because the action of the animal spirit. What the sme teries in many places running cross one another, in the form of a Net divers times doubled; (where the property had the property than that the spirit by longer delay in these Laborate had the property than the state of the property than the spirit by longer delay in these Laborate had the property than the spirit by longer delay in these Laborate had the property than the spirit by longer delay in these Laborate had the property than the spirit by longer delay in these Laborate had the property than the spirit by longer delay in these Laborates had the property than the spirit by longer delay in these Laborates had the property than the spirit by longer delay in these laborates are spirit by the spirit by longer delay in upon it had the name of the wonderful Net) that so the spirit by longer delay in these Labyrinthian or Maze-like turnings, might be perfectly concocted and elaborated, and attain to a greater fitness

to perform the animal functions.

This wonderful Net fituate at the fides of the Apaphyles clinicides, or productions of the wedge. The fire and bone, is two-fold; that is, divided by the pituitary glandule, which is fituate between the faid number.

Apophyles clinicides, having the wedge-bone lying under them, next to the Craffa menium, being perforated on the right and left tide, next to which lyebones as a rare as a foonage even to the palat, but which the phases is represed by the results and there have been a being that finitely the palat. by which the phlegm is purged by the mouth and note; and there-hence, I think, that spattle flows, which such as have a most brain, continually spit out of their mouth.

Small branches derived unto the throttle, or Laviux. h The bifurcation of the nerve into two branches, iii An inner branch hanging to the rack-hones, and strengthening the intercostal nerves, and is therefore called intercostalis. kk Sureles of the utter branch going to the bests of the muscles, to the breast-hone, and to the collar-hones. Im Branches of the right nerve l, making the right recurrent nerve. In The infertion of the recurrent finews into the mufcles of the Larinx. op Branches of the left nerve making the fertion of the recurrent finews into the muscles of the Laxinx. Op Branches of the left nerve making the left recurrent finew p. q q Branches from the fixeth conjugation going to the coat of the lungs. T Small nerves of the beart, and of the purse thereof called the Pericardium, as also some approaching to the coats of the lungs. I Nerves on either side sent to the stomach. The right stomach-nerve going to the left orifice of the stomach. We derive from the branch u. The left stomach-nerve going to the right orifice of the stomach. X A nerve from the branch u, passing into the hollowings of the liver. Y The nerve belonging to the right side of the kell. I The nerve belonging to the colicie-gut. A nerve implanted in the right side of the bottom of the stomach. A nerve belonging to the liver and bladder of gall. A nerve reaching to the right sidence. A branch reaching to the McCenterium and the guts. A branch sprinkled to the right part of the bladder. A branch going through the left part of the kell. Surcles derived to the colici-gut and the kell. Small branches inserted into the Splen. A nerve approaching to the left side of the bottom of the stomach. A herve belonging to the left side of the bladder. A branch belonging to the left side of the McCentery and the guts. A branch which attained to the left kidney. Small nerves creeping through the left side of the bladder. The seven pair of sinews. A branch derived from nerves creeping through the left fide of the bladder. The seven pair of snews. A branch derived from the sixth conjugation to the muscles which arise from the process called Styloides. A branch of the seventh conjugation which goeth to the masseless of the tongue, of the bone Hyois, and of the throttle, or Larynx. S A conjunction or coition of the sixth and seventh pair into one nerve.

Whether the Rete mirabile differs from the Plexus cho-

What the Apo-physis elimides are certain productions of the Os busilare, or wedg-bone (called the fad-physis elimides dle thereof) between which, as I faid, the pituitary glandule lies with part of the wonderful Net. There is a great controversie amongst Anatomists concerning this part; for, Vefalius denies that it is in man, Columbus admits it; yet he feems to confound it with the Plexus choroides. Truly, I have observed it always after the manner, as Sylvins alledges against Vefalius. It remains, that we recite the perforations of the skull, because the knowledg of these much conduces to the underflanding of the infertions of the veins, arteries and nerves.

CHAP. X. Of the boles of the inner Bafis of the Skull.

N the first place are reckoned the holes of the bone Ethmoides; then those of the Optick-nerves. Thirdly, of the nerves moving the eyes. Fourthly, of that portion of the nerves of the fourth conjugation which go to the temporal muscles. Fifthly, are reckoned those holes scarce visible, fituate under the pituitary glandule, by which the spittle is evacuated. Sixthly, that hole which is in the wedg-bone made for the entrance into the internal sleepy Arteries, compofing the wonderful Net, and then passing into the brain by a great Slit. That perforation which we reckon in the seventh place is commonly double, made for the entrance of one of the branches of the internal Jugular-vein. The eighth hole is formewhat long, of an oval figure, by which, part of the third conjugation, and all the fourth conjugation paffes forth. The ninth are the auditory paf-fages. The tenth are very fmall holes, and give way to the vein and artery going to the auditory paffage, above the forumen eseum. In the eleventh place are reckoned the perforations which yield paffage forth to the fixth pair of nerves, to part of the fleepy arteries, and of the internal jugular. In the twelfth, those which yield a way out to the seventh conjugation. The great hole of the nowlbone through which the spinal marrow passes, is reckoned the thirteenth. The fourteenth is that which most commonly is behind that great hole, by which the Cervical veins and arteries enter in.

CHAP. XI. Of the perforations of the external Basis of the Brain.

Here is a hole on each fide at the eye-brows, by which paffes a fmall nerve from the third consugation coming out of the cavity of the orb of the eye, and going by the forehead bone to the eye-brows, that it may give motion to the two mucles of the upper eye-brow and forehead. Yet oftentimes the hole is but to be feen on one lide, often-times there is a cleft in ftead thereof, other-whiles it is not perforated nor cleft at all. The feetond is the perforation of the eyeater corner of the eye on of the greater corner of the eye, by which a portion of the nerves of the third conjugation defeends to the coat of the nofe; in this hole the Glandula Lacrymalis is feated. The third is feated under the eye, that it may give way to the other portion of the nerves of the third conjugation going to the part of the face, and the teeth of the upper jaw. The fourth is at the beginning of the palat, amongst the cutting and shearing-teeth, through which a vein, an artery, and the coat of the palat paffes out. In the nith order, are reckoned the perforations of the palat, by which the nerves descend from the fourth conjugation, to give or cause the taile. In the fixth order are rankG.Zr.

ed the holes of the palat ferving for the respiration, and the flegm falling from the brain by the nothrils. And there is a cleft under the yoke-bone ascending into the orb of the eye, by which there is a way, as well for the nerves of the third conjugation to the temporal mufcles, as also for certain veins and arteries. But also, there is noted another hole at the mammillary process, which is not perforated in the judgment of the sense. Belides, there is thought to be unother at the hind root of the same process, by which a certain small vein passes from the Jugular to the Torentar. But I have only noted these three passages by the way, because there is so much variety in them, that nothing can be certainly faid of them.

CHAP. XII.

Of the Spinal Marrow, or Pith of the Back,

He fpinal marrow is like a river running from the fountain of the Brain. This fends nerves What the foil for fense and motion to all the neighbouring parts under the head, spreading its branches nal marrow is: as from the body of a tree. These branches, as we shall hereafter shew, are on each side thirty. This same spinal marrow is covered with the two membranes investing the brain, diffinguish. The coats of the spinal marrow is covered with the two membranes investing the brain, diffinguish. thirty. This tame Ipinal marrow is covered with the two memoranes inventing on the figure of place, as in the Brain. But also it hath another membrane added to these, being marrow, very hard and dense, which keeps it from being broken and violated by the violent bending of the body forwards and about. The diseases of this marrow do almost cause the like symptomes, as the The diseases. difeases of the brain; for they hurt the sense and motion of all the parts lying beneath them; as, for from the hurt-example, If any of the Vertebra's of the back-bone be moved out of their place, there follows a ing of the place. differtion or wrelling afide of the marrow, but then especially if it happen that one of the Vertebra's nal marrow, be ftrained, fo sharp and bitter a compression urges the marrow by reason of the bony body of the Vertebra, that it will either rend it, or certainly hinder the pussage of the spirit by it. But by these states the state of the spirit by it. fame holes of the Vertebra's the veins and arteries go to the spinal marrow for to give life and nourithment to it, as the nerves by them pass forth into all the lower parts of the body.

The end of the Fifth Book

BOOK VI.

Treating of the Muscles and Bones, and the other Extreme parts of the Body.

The PREFACE.

Eradventure some may monder that I have ended my Fifth Book of Anatomy, be-fore I have fully described all the parts of the Head, the which seemed, as it were, only appointed for that purpose. Therefore I must yield a reason of this my in-tention. I have a desire, in one Treatise, and, as it were, at one breath, to profe-tention. The property of the Mustles. Wherefore, he must be part of the Head not

tention. I have a desire, in one Treatise, and, as it were, at one breath, to prosecute the Anatomy of the Muscles. Wherefore, because the parts of the Head not
yet described, principally consist of the Muscles, therefore I desired to comprehend
them together with this same description of the extreme parts of the body; beginning at the upper part of the face; to wit, the eyes: But having sirst described
the bones of the face, without the knowledg of which it is impossible to show the
original and insertion of the Muscles. We have formerly noted, that by the face is meant whatsoever lies
from the eye-brows even to the chin. In which there is such admirable industry of Nature, that of the infinite multitude of men you cannot find two so like, but that they may be distinguished by some unlikeness in their faces; also, it hath adorned this part with such execusifite beauty, that many have died
by longing to enjoy the beauty desired by them. This same face albeit is little exceeds half a son, yet
it indicates and plainly intimates by the sudden changes thereof, what affections and passions of hope,
fear, sorrow and delight possess by the sudden changes thereof, what affections and passions of hope,
fear, sorrow and delight possess of much moment, let us return to the Anatomical description thereof:
Which that we may cassiy and plainly perform, we will begin with the bones thereof; whereby, as we formerly said, the original and insertion of the Muscles may be more certain and manifest to m.

CHAP. I.

Of the Bones of the Face.

Eones in each orb of the eye.

the Muscles must be so al-The endow ments of the The Countenance is the bewrayer of the will.

What the Zywhat use it hath. The Ægilogs. of the note, The two inner ones of the palar.

He bones of the face are fixteen or feventeen in number. And first, there be reckoned fix about the orbs of the eyes, that is three to each orb, of which one is the bigger, another leffer, and the third between both; each of these touch the forehead-bone in their upper Befides, the greater is joyned with a future to the process of the stony-bone, and so makes the Zygowa, that is, the Os Jugale, or Yoke-bone, framed by Nature for prefervation of the tem-poral mufele. The leffer is feated at the greater corner of the eye, in which there is a hole perforated to the nofe, and in this is the glandule in which the Ægilops doth breed. The middle is in the bottom, or inner part of the orb, very flender, and as it were of a membranous thinnefs: Then follow the two bones of the nofe which are joyned to the fore head-bone by a future, but on the forefide between themselves by harmony. But on the back and hind-part with two other bones, on each fide one, which defcending from the bone of the forehead (to which also they are joyned by a future) receive all the teeth. These two in Galous opinion are seldom found separated. But there are the thickest of all the bones of the face hitherto mentioned, knit by a future with the greatest bone of the orb, on the back part with the wedge-bone, on the inner fide with the two little inner bones of the palat, which on the infide make the extremity thereof, whereby it comes to pass, that we may call these bones the hinder, or inner bones of the palat. They reckon one of these bones the eleventh, and the other the twelfth bone of the head; these two little bones on their fides next to the winged productions of the wedg-bone, receive on each-fide one of the nerves of the fourth conjugation, which, in the former Book, we faid were fpent upon the mem-

And in Galen's opinion there be other two in the lower jaw, joyned at the middle of the chin; although fome think it but one bone, because by the judgment of sense there appears no division or Separation therein. But you may see in children how true this their supposition is, for in men of perfeet growth it appears but one bone, these two are reckoned for the thirteenth and fourteenth bones. Now these two bones making the lower jaw, have in their back-part on each fide two producti-Two productions, as they lie to the upper jaw, the one of which reprefents the point of a Sword, and is called the Gorsse: Thee other is obtuse and round; which is inserted into the cavity seated at the root

of the process of the stony-bone, near to the passage of the ear.

This may be firained to the fore-part by violent gaping, by retraction of the mufcles arising from the wing-like processes, and ending at the lower angles of the broader part of the fame jaw.

This jaw is hollow, as also the upper, especially in the back-part, being filled with a white and glutinous humor, conducing to the growth of the teeth. This hence hath its matter from the blood brought thither by the vessels, veins, arteries and nerves from the third Conjugation entring here by a passage large enough. Whereby it comes to pass, that this part is not only nou-sished and lives, but also the teeth receive sorter for the benefit of the nerves entring thirder with rished and lives, but also the teeth receive sense by the benefit of the nerves entring thither with

The two bones of the izw.

ons on each fide of the lower jaw. The Luxation of the lower filled with marrowy hu-

a beating pain may be perceived in the Tooth-ach, because the defluxions may be by the arter in that Why the ries; or rather because the humor flowing to the roots of the teeth, may press the artery in that why the place: Belide also you may see some appearance of a nervous substance in the root of a tooth bearing pain. newly pluck'd out.

But also you must consider, that this jaw from its inner capacity produces at the fides of the The nerves of chin two nerves of a sufficient magnitude, over against the lower Dog-teeth, and the first of the the lower law smaller grinding teeth, as I have noted in the description of nerves of the third conjugation. I must be obser-have thought good to put thee in mind of these, that when thousshalt have occasion to make invest. cilion in these places, thou mayest warily and discreetly handle the matter, that these parts receive

There remains another bone feated above the palat, from which the griftly partition of the nofe The bone of arifes, being omitted of all the Anatomifts, for as much as I know. Now therefore that you may the note above

the better remember the number of the bones of the face, I will here make a repetition of them.

There are fix of the orbs of the eyes, at each three. The feventh and eighth we may call the orb.

Nafel, or Nofe-bones. The ninth and tenth the Jaw-bones. The eleventh and twelfth are called the inner bones of the palat. The thirteenth and fourteenth, the bones of the lower Jaw. The partition of the noie may reckoned the fifteenth.

Now it remains, having fpoken of thefe bones, that we treat of the Teeth, the Eye-brows, the Skin, the fleshy pannicle, the muscles s and lastly, the other parts of the Face.

CHAP. II.

Of the Teeth.

He teeth are of the number of the bones, and those which have the most, have thirty two, The reeth are that is, fixteen above, and fo many below; of which in the forepart of the mouth there bones. are four above, and as many beneath, which are called Inciforii, cutting or thearing teeth, to cut in funder the meat, and they have but one root. To these are joyned two in each The shearing jaw, that is, on each fide of the other one, which are called the Canini denter, Dog-teeth, because teeth, they are sharp and strong like Dogs-teeth; these also have but one root, but that is far longer The Dogthan the other have.

Then follow the Malaret, or grinders, on each fide five; that is,ten above, and as many below, that The grinding they may grind, chaw, and break the meat, that fo it may be the fooner concected in the floranch; teeth. for fo they vulgarly think, that meat well chawed is half concocted; those grinders which are fathed into the upper jaw, have most commonly three roots, and oft-time four. But these which are why the up fathed into the lower, have only two roots, and foractimes three, because this lower jaw is harper grinding der than the upper, fo that it cannot be so easily hollowed, or else because these teeth being fixed teeth have and firmly seated, needed not so many flays as the upper, which, as it were, hang out of their more roots. feats. The shearing-teeth cut the meat, because they are broad and sharp; the Dog-teeth break it because they are tharp pointed and firm: but the Grinders being hard, broad and tharp, chaw teeth, and grind it assumes. But if the Grinders had been smooth, they could not fitly have performed their duty; for all things are chawed and broken assumer more easily by that which is rough

and unequal. Wherefore they fliarpen their Milliones when they are smoother than they should be, by picking The teethare them with a sharp Iron. The teeth are fastened in the Jaws by Gemphofis, that is, as a take or fastened in the nail, fo are they fixed into the holes of the jaws; for they adhere fo firmly thereto in fome, that jaws by Gonwhen they are plack'd out, part thereof follows together with the tooth; which I have often ob- poofs.

The faffening is before the plack'd out, part thereof follows together with the tooth; which I have often ob- poofs.

The faffening is before the plack'd out, part thereof follows together with the tooth; which I have often ob- poofs. is befides firengthred with a ligament, which applies it fell to their roots together with the nerves into the law is and vessels. The teeth differ from the other bones, because they have action whilst they chaw to be observed the meats because being lost they may be generated, and for that they grow as long as the party lives; for otherwise by the continual use of chawing, they would be worn and wasted away by one another. You may perceive this by any that have loft one of their teeth; for that which is opposite to it becomes longer than the rest, because it is not worn by its opposite. Betides also, they are more hard and solid than the rest of the bones, and indued with a quick sense by reason of the teeth differ nerves of the third conjugation which insert themselves into their recots; for if you rub or grind from the other nerves of the third conjugation. nerves of the third conjugation which infert themselves into their roots; for it you rub or grind from the other a tooth newly puck'd out, you may see the remains of the nerve; they have such quick sense, bones, that with the tongue they might judg of taties. But how feel the teeth, seeing they may be filled the teeth have without pain? Fallepius answers, that the teeth feel not in their upper or exterior part, but only sense, by a membrane which they have within. And the teeth have another use, especially the foreteeth, which is, they serve for distinct and articulate pronuntiation; for those that want them. The sotteeth feels is sense, as also such as have them too short, or too long, or ill-tanked. Besides chile help for the faulter in speaking, as also such as have them too short, or too long, or ill-ranked. Besides chil-help for the dren speaking distinctly before they have their fore-teeth. And must note, that the Infant as yet arriculation of the residence of t that up in its Mothers womb hath folid and bony teeth; which you may perceive by diffecting it the voice. prefently after it is born.

But even as there are two large cavities in the forehead-bone at the eye-brow, filled with a vifcous humour, ferving for the fmelling; and in like manner, the air that up in the mammillary proceffes is for hearing: So in the jaws, there be two cavities furnished with a viscid humor for the nourithment of the teeth.

CHAP. III.

Of the Broad Mufele.

Ow we should profecute the containing parts of the face; to wit, the skin, the sleshy pannicle and fat; but, because they have been spoken of sufficiently before, I will only describe the fleshy pannicle, before I come to the diffection of the eye, that we may the more eafily understand all the motions performed by it, whether in the face or forehead, First, that you may more easily see it, you must curiously separate the skin in some part of the face. For unless you take a good head you will pluck away the sleshy pannicle together with the skin, as also this broad muscle to which it immediately adheres, and in some places so closely and

firmly, as in the lips, eye-lids, and the whole forehead, that it cannot be feparated from it. Na-ture hath given motion, or a moving force, to this broad muscle, that whilft it extends or contracts it felf, it might ferae to flut and open the eye. It will be convenient to feparate the mufcle thus freed from the skin, beginning from the fore-part of the clavicles even to the chin, afcending in a right line, and shen turning back as far as you can; for thus you shall shew how it mixes it self

with the skin and muscles of the lips.

There are no Muscles appointed to ope n and flut the eye, for broad mufcle only. Divers reasons to that purpole.

When thou shalt come to the eyes, thou shalt teach how the eye is that and opened by this one muscle, because it is composed of three forts of fibers; although by the opinion of all who hitherto have written of Anatomy, those actions are faid to be performed by the power of two muscles appointed for that purpole; one of which is at the greater corner on the upper part, the other refembling a femicircle at the leffer corner, from whence extending it felf to the middle of the griftle Tarfue, it meets with the former ending there; but they are in part extended over all the eye-lid, whereby it cometh to pass, that it also in some fort becometh moveable. But although in publick diffections, these two muscles are commonly wont to be solemnly shewed, after the manner I have related; yet I think, that those which shew them, know no more of them than I do. I have grounded my opinion from this, that there appears no other mufculous fieth in these places, to those which separate the sleshy pannicle, or broad muscle, than that which is of the pannicle it felf, whether you draw your Incition-knife from the forehead downwards, or from the cheek upwards.

Why you must take heed of making a transverse in-

Befides, when there is occasion to make incision on the eye-brows, we are forbidden to do it transverfe, left this broad muscle falling upon the eye, make the upper eye-lid unmoveable; but, if such a cut be received accidentally, we are commanded prefently to flitch it up; which is a great argutransverse incifion upon ment, that the motion of the upper eye-lid is not performed by its proper muscles, but wholly
the eye-brows. depends, and is performed by the broad muscle, Now if these same proper muscles which we have described should be in the upper eye-lid, it should be meet (because when one of the muscles is in action, the other, which is its opposite or Antagonist, rests or keeps holy-day) that when that which is faid to open the eye is employed, the opposite thereof refting, the upper eye-lid should be drawn towards its original, as we fee it happens in Convultions; because the operation of a muscle is the collection of the part which it moves towards its original.

The action of a muscle.

Therefore feeing fuch a motion or collection appears not any where in the eye-lid, I think it therefore manifest, that all the motion of this upper eye-lid depends upon this broad muscle, and that it alone is the author of the motion thereof.

The original of the broad muscle.

The infertion, why we ex-press so many motions with the face.

The original of this broad mufcle is from the upper part of the Sternon, the clavicles, the shoulderblades, and all the spines of the vertebra's of the neck: But it is inserted into all these parts of the head which want hair, and the whole face, having divers fibers from fo various original, by the benefit of which it performs such manifold motions in the face (for it so spreads it felt over the face, that it covers it like a vizard) by reason of the variety of the original and the production of the divers fibers of this muscle. But I have not in the description of this muscle profecuted those nine conditions, which in the first Book of my Anatomy I required in every part, because I may feem to have fufficiently declared them in the description of the muscles of the Epigastrium, Wherefore hence forward you must expect nothing from me in the description of the Muscles besides their original, infertion, action, composition, and the designation of their vessels.

CHAP. IV.

Of the Eye-lids, and Eye-brows.

What the eyebrows are.

Their ufe.

Econfe we have fallen into mention of the eye-lids, and eye-brows, and because the order of Diffection also requires it, we must tell you what they are, of what they consist, and how, and for what use they were framed by Nature. Therefore the eye-brows are nothing elle, than a rank of hairs fet in a femicircular form upon the upper part of the orb of the eye, from the greater to the leffer corner thereof, to ferve for an ornament of the body, and a defence of the eyes against the acrimony of the sweat falling from the forehead.

What the eyeids are.

fure and ufe.

But the eye-lids on each fide two, one above, and another below, are nothing elfe than as it were certain fluttings appointed and made to close and open the eyes when need requires, and to contain them in their orbs. Their composure is of a musculous skin, a griftle and hairs set like a pale at the fides of them to preferve the eyes when they are open, chiefly against the injuries of small bodies, as motes, dust, and such like. These hairs are always of equal and like bigness, implanted at the edges of the griffly part, that they might always stand strait and stiff out. They

are not thick, for fo they should darken the Eye. The Grisle in which they are fashed is encompassed with the Pericranium stretched fo far before it produce the Conjunctiva. It was placed there, that when any part thereof should be drawn upwards or downwards by the force of the broad Moscle, or of the two proper Muscles, it might follow entirely and wholly by reason of its hardness. or of the two proper Mutcles, it might follow entirely and wholly by reason of its hardness. They call this same Grille, especially the upper, Tarfin. The upper and lower Eye-lid differ in nothing, what the but that the upper hath a more manifest motion, and the lower a more obscure: for otherwise Na-Tarfin is. ture should have in vain encompassed it with a Musculous substance.

CHAP. V.

Of the Eyes.

He Eyes are the Influments of the faculty of Seeing, brought thither by the visive spirit of What the the Optick Nerves, as in an Aque-dull. They are of a foft substance, of a large quantity, Eyes are, being bigger or lesser, according to the bigness of the body. They are feated in the head, Their stee that they might over-look the rest of the body, to perceive and shun such things as might endanger or endamage the body; for the action of the Eyes is most quick, as that which is performed in a moment, which is granted to none of the other senses. Wherefore this is the most excellent sense of them all. For by this we behold the Fabrick and Beauty of the Heavens and Earth, diftinguish the The quickness infinite varieties of colours, we perceive and know the Magnitude, Figure, Number, Proportion, and excellensite, Motion, and reft, of all bodies. The Eyes have a pyramidal Figure whose Basis is without, but action, the Cone or point within at the Optick Nerves. Nature would have them contained in a hollow Figure. circle, that to by the profundity and folidity of the place they might be free from the incurtions of

bruiting and burtful things.

They are composed of fix Muscles, five Coats, three Humours, and a most bright Spirit, (of which Composition, there is a perpetual afflux from the Brain) two Nerves, a double Vein, and one Artery, besides much fat; and lastly, a Glandule seated at the greater angle thereof, upon that large hole which on both fides goes to the Nose, and that, lest that the humours falling from the Brain should slow by the Nose into the Eyes, as we see it fares with those whose Eyes perpetually weep or water by reason of the estimates away of this Glandule, whence that affect is called the Fistula lacrymalis, or weeping Findis.

But there is much fat put between the Muscles of the Eye, partly that the motion of the Eyes Why fat is might be more quick in that flipperiness of the fat, as also that the temper and complexion of the placed about the Eyes, and chiefly of their persons much has proceed and also the process and chiefly of their persons much has proceed and also the process and chiefly of their persons much has proceed and latting which scheme the process and chiefly of their persons are might be processed as a superconduction of the Eyes. Eyes, and chiefly of their nervous parts, might be more conftant and lafting, which otherwife by their continual and perpetual motion would be fubject to excellive driness. For Nature for the fame reason hath placed Glandules slowing with a certain moisture near those parts which have perpetual agitation.

CHAP. VI.

Of the Minfeles, Coats, and humouers of the Eye.

Here are fix Muscles in the Eye, of which four perform the four direct motions of the Eye: The number they arise from the bottom of the Orb, and end in the midft of the Eye, encompassing the fire, and Optick Nerve. When they are all moved with one endeavour, they draw the Eye inwards, action of the Muscles. But if the upper onely use its action, it draws the Eye upwards; if the lower, downwards; if the

right, to the right fide; if the left, to the left fide.

The two other Muscles turn the Eye about; the first of which being the longer and slenderer, arises almost from the same place from which that Muscle arises which draws the Eye to the right fide to the area. fide to the greater corner. But when it comes to the utmost part of the inner angle, where the Glandrila lacrymalis is feated, it ends in a flender Tendon, there piercing through the middle Membrane which is there, as through a Ring; from whence it prefently going back, is spent in a right angle towards the upper part of the Eye, betwixt the insertions of those two Muscles, of the which one draws the Eye upwards, the other directly to the outward corner, as it is observed by Fallopias, or rather, which bremember, I have always observed, they turn between the Muscles which move the Eye upwards, and to the inner comer.

This fifth Muscle when it is drawn in towards its beginning, so draws the eye with its circular

tendon that it carries it to the greater corner.

The fixth Mufcle is contrary to that, for that it hath its original from the lower part of the orb at 2 The fixth Anacle is contary to that, for that it had its original tool the lower part of the orb at a fmall hole, by which a Nerveof the third conjugation paffes forth; and being that it is most flender, whilest it ascends transversly to the outward corner, it involves the eye so also, that it is inserted in it by a small Tendon; so that the Tendons of them both are often-times taken but for one. That thou mayer truly and accurately observe this anatomical description of the Eye, the Eye must not be placket out of its orb, but rather the orb it self must be broken and separated.

For thus thou thalt certainly and plainly fee the fore-mentioned original of the Mufcles. For The five coars the five Coats, the first which is first met with in diffection, comes from the Perioranium, and is ex- of the Eye. the five Coats, the first which is not the twitten and account, coanes from the Terrorannon, and is ex- of the Eye tended over all the white of the Eye even to the Iris or Rainbow. The duty of it is to strengthen, bind, and contain the Eye in its orb, wherefore it had the name Conjunction 3 others call it Adnaia, or Adnata.

Epipophyeas.

The fecond is called the Cornea, because it resembles a Horn in colour and consistence; this

Corner, or the Horny Coat.

coat differs and varies from it felf; for in the fore-part, as far as the Iris goes, it is clear and perfpi-cuous, but thick and obscure in the hind part, by reason of the diverse polithing. On the fore-part it is dense, that it may preserve and contain the Crystalline and waterish humour, but withall trans-parent, so to give the object a free pussage to the Crystalline. It hath its original from the Crass's Meninx, proceeding forth from the inner holes of the orb of the eye, for it compaffes the eye on eve-

seves, or the Grapy Coat,

ry fide.

The third is called Uves or Grapy Coat, because in the exteriour part it represents the colour of black Grape; it arises from the Pia Mater, and encompasses all the Eye, except the Pupilla or Apple of the Eye, for here being personated, it adheres to the horny Coat by the Veins and Arteries which it communicates to it for life and nourithment. But when it arrives at the Iris, then forfaking the Cornea, it descends deep in the Eye, and in some fort is turned about the Crystalline humour, to which also it most firmly adheres, so bounding the waterish humour, and also prohibiting that the Albugineous humour do not overwhelm the Crystalline. This grapy Coat is, as it were, died on the infide with divers colours, as black, brown, blue, or green like a Rainbow, and that for these ensuing benefits.

The first is, if that it had been tinctured with one colour, all objects would have appeared of the py Coat re-fame colour, as it comes to pass when the Sun and Seeing, fembles divers that fo it may collect the spirits diffipated by the Sun and Seeing, fame colour, as it comes to pass when we look through green or red Glass. But it must be coloured,

Thirdly, It was convenient it should be planted with infinite variety of colcurs for the prefervation of the fight. For as the extreme colours corrupt and weaken the fight, fo the middle refresh and preserve it, more or less, as they are nearer or further remote from the extremes. It was fit it should be foft, that so it might not hurt the Crystalline humour upon whose circumference it ends; and perforated in the part objected to it, left by its obscurity it should hinder the passage of the objects to the Crystalline, but rather that it might collect by its blackness, as a contrary, the great, and as it were, diffused variety of colours, no otherwise than we see the heat is strengthened by the opposition of cold; forme call this Coat Charaides, because it is woven with many Veins and Arteries, like the Coat Chorien which involves the infant in the Womb.

Now follows the fourth Coat called Amphible troides or Reti-formis, the Net-like Coat, because proceeding from the Optick Nerve dilated into a Coat, it is woren like a Net with Veins and Amphible troides which it receives from the grapy Coat, both for the life and nourishment both of it self, desor Reti-formity of the Classic Classi also of the Glassie humour which it encompasses on the back-part. The principal commodity of Cost, this Coat is, to perceive when the Crystalline humour shall be changed by objects, and to lead the visive spirit instructed, or furnished with the faculty of Seeing, by the mediation of the Glassie humour even to the Crystalline, being the principal instrument of Seeing. It is softer then any other Coat, lest the touch of it should offend that humour. Wherein thou wilt admire the singular cal Axiom. order of Nature, which as in other things it passes not from one extreme to another, unless by a Medium, so here it hath not sitted the hard horny Coat to the soft humours, but by interpolition of divers media of a middle consistence. For thus, after the harder Coats Adnata and Cornea, it hath placed the grown Coat; by so much offer then these two as the New Sta Coat in soften. it hath placed the grapy Coat; by so much softer than these two, as the Net-like Coat is softer than it, that thus it might pass from extreme to extreme, as it were, by these degrees of hardness and formers,

The fifth and last Coat is called Arachnoides, because it is of the confishence of a Spiders Web. And Arachnoides, we may well resemble this Coat to that skin of an Onion which exceeds the other in clearness, whitefive Aracola, nefs, and thinnefs. This Aranofa or Cobweb-like Coat encompaffes the Crystalline humour on the Cobweb the fore-side, peradventure that so it might defend it, as the chief instrument of Seeing, if the other Coat. humours should at any time be hurt. It hath its original from the excrementitious humidity of the Crystalline humour, hardned into that Coat by the coldness of the adjacent part; absolutely like the

thin skin which encompaffes the white of an Egg.

The first humour of the Eye is called Aqueus, or Waterish, from the similitude of Water; it is The three hufested between the transparent part of the borny Coat, the portion of the Crystalline humour lying mours of the towards the Apple of the Eye, and that reflection of the grapy Coat which comes from the Isis to the circumference of the Crystalline humour, that filling the empty space it may differed the Cornea, and fo hinder the falling thereof upon the Crystalline which would spoil the fight; as also that by its moi-watery.

The first humour of the Crystalline which would spoil the fight; as also that by its moi-watery.

The three humour of the Crystalline which would spoil the fight; as also that by its moi-watery. fo hinder the falling thereof upon the Crystalline which would spoil the fight; as also that by its mosture it might hinder the drying of the Crystalline humour. Peradventure it is made of the whayish humour sweating out of the Vessels of the Coats, having their orifices for the most part in that place where this waterish humour resides. The second humour and middlemost in fituation is called the Crystalline, because it imitates Crystal in the brightness and colour; is fo be, that we may attribute Crystalline, because it imitates Crystal in the brightness and colour; is fo be, that we may attribute Crystalline. The for indeed, it was fit, that none of the three humours should be tinctured with any colour, as those which would be the instruments of Sight, left they might beguile us in seeing, as red and green spectacles do; for, that is true which we have read written by the Philosophic all Axiom.

A Philosophical Axiom, the contraction of any form, should want all impression thereof. Hence sect or matter, appointed for the reception of any form, should want all impression thereof. Hence Nature hath created a formless Matter, the humours of the Eyes without colours, Wax without any Figure, the Mind without any particular knowledge of any thing, that fo they might be able to receive all manner of Forms. The figure of the Crystalline humour is round, yet fomewhat flatted on the fore-fide, but yet more flatted behind, that fo the objects might be the better retained in that, as it were plain figure, and that they might not fly back as from a Globe, or round body, in which they could make but floor flay; left it might be eafily moved from its place by the force of any thing falling or hitting againfit, because that body which is exactly round touches not a plain body, but onely in a point or prick. Half this humour swims in the Glasse humour, that so it may be nowished from it by transposition of matters or rather (seeing it is encompassed on every fide with be nourished from it by transposition of matter; or rather (seeing it is encompassed on every side with the fifth Coat, that the matter cannot eatily be fent from the one into the other) by the benefit of the Veffels produced even unto it as well by the Net-like Coat as by the Grapy; but it is filled with a bright spirit on the fore-part, which lies next to the waterish humour, and the space of the Apple of the Eye.

Of which thing this is an argument, that as long as a man remains alive, we fee the Eye every Galean salive. way full and fwollen, but lank and wrinkled when he is dead; belides also, one of the Eyes being 10.de ma Pert that, the Pupilla of the other is dilated by the spirit compelled to fly thither. And also for the fame cause the horny Coat is wrinkled in very old men, and the Pupilla is straitned by the wrinkles fubliding into themselves, which is the cause that they see little or not at all; for by Age and success of Time the humour is consumed by little and little, the implanted spirit vanishes away, and smaller quantity of spirits flow from the Brain, as from a Fountain which is also exhausted. The

thereof.

horny Coat at his original, that is, in the parts next the Iris, feemeth to be very nigh the Crystalline humour, because all the Coats in that place mutually cohere as touching one another; but as it in what place runs further out to the Pupilla, so it is further distant from the Crystalline. Which you may easily a Catarrhact perceive by Anatomical diffection, and the operation of touching or taking away a Catarrhact: for whereas a Catarrhact is feated between the horny Coat and Crystalline humour, the needle thrust breeds, in, is carried about upwards, downwards, and on every fide through a large and free space, neither touching the horny Coat nor Crystalline humour, by reason these bodies are severed by a good difrance filled with spirit and a thin humour. The use of it is, that it may be like a Looking-glass to the faculty of Seeing carried thither with the visive spirit.

The third and last humour is the Virrem, the Glassie, or rather Albugineous humour; called so, beVireus sea AlLagieras, that line humour, that so it may in some fort break the violence of the spirit showing from the Brain inlike the white to the Crystalline humour, no otherwise than the watery humour is placed on the fore-side of the
of an Egg.

Crystalline to binder the violence of the light and colours accession that we can be compared to the control of the colours and the colours accession that the colours are colours and the colours are colours. Crystalline to hinder the violence of the light and colours entering that way. This Glassie humour is of an Egg. nourished by the Net-like Coat. The Veins of

We have formerly fpoken fufficiently of the Nerves of the Eye: Wherefore it remains that we fpeak of the Veins. Some of these are internal, carried thither with the Coats of the Veisels of the Brain; otherforme external firetched over the external parts of the Eye, as the Mufcles and Coat Adnata; and by these Veins inflammations and redness often happen in the external parts of the Eye: may be open for which the Vena purple must be opened, and Cupping-glasses and Horns must be applied to the nape ed in what in- of the Neck and shoulders: as, in the internal inflammations of the Eye, the Cephalick-Vein must be exceed to avert and evacuate the more likely because the likely because the likely because be opened to avert and evacuate the morbinek humour.

CHAP. VII.

Of the Nofe.

He Nose is called in Greek Rie, because the excrements of the Brain flow forth by this pasfage; thou maift underfland it hath divers fubflances by composition. The quantity, figure and fite are sufficiently known to all. But it is composed of the Skin and Muscles, Bones, The Grifles of Grifles, a Membrane or Coat-nerves, Veins, and Arteries. The Skin and Bones, both contained and containing have formerly been explained, as also the Nerves, Veins, and Arteries. The Grifles of the Nose are fix in number; the first is double, separating both the nostrils in the top of the Nose extended even to the Bone Ethimolder. The second lies under the former. The third and sourth are continued to the two outward Bones of the Nose. The fifth and fixth being very slender, and descending on both sides of the Nose, make the wings or moveable parts thereof. Therefore the use the Nofe. of these Grisles is, that the Nose moveable about the end thereof, should be less obnoxious to external injuries, as fractures, and bruifes; and befides, more fit for drawing the air in, and expelling it forth in breathing. For Nature for this purpose hath bestowed four Muscles upon the Nose, on each fide two, one within and another without.

The External taketh its original from the Cheek, and descending obliquely from thence, and after fome fort annexed to that which opens the upper lip, is terminated into the wing of the Nofe, which

The Internal going on the inner fide from the Jaw-bone, ends at the beginning of the Grifles that make the Wings, that fo it may contract them. The Coat which inwardly invests the Nostrils and their paffages, is produced by the Sive-like Bones from the Craffameninx, as the inner Coat of the Palat, Throttle, Weazon, Gullet, and inner Ventricle; that it is no marvail, if the affects of fuch parts be quickly communicated with the Brain. This fame Coat on each fide receives a portion of a Nerve from the third Conjugation, through the hole which descends to the Nose by the great corner

The Nose in all the parts thereof is of a cold and dry temper. The action and profit thereof is to earry the air, and oft-times finells to the mamillary processes, and from thence to the four Ventricles of the Brain, for the reasons formerly shewed. But because the mammillary processes being the paffages of the Air and Smells are double, and for that one of these may be obstructed without the other, therefore Nature hath also diffinguished the paffage of the Note with a grisly partition put between, that when the one is obstructed, the air by the other may enter into the Brain for the gene-Why the Note ration and preservation of the animal spirit. The two holes of the Note at the first ascend upwards, was parted in and then downwards into the Mouth, by a crooked paffage, left the cold air or dult should be carried into the Lungs. But the Nofe was parted into two passages, as we see, not onely for the forementioned cause, but also for helping the respiration and vindicating the Smell from external injuries. and laftly, for the ornament of the Face.

CHAP. VIII.

Of the Mufeles of the Face.

Ow we must describe the Muscles of the Face pertaining as well to the Lips as to the lower Jaw. These are 18 in number, on each side nine, that is, four of the Lips as to the upper, and as many of the lower. But there belong five to the lower Jaw. The first of the upper Lip being the longer and narrower, arising from the Yoke-bone, descends by the cor-

ner of the mouth to the lower lip, that so itemay bring it to the upper lip, and by that means that the mouth. The other being shorter and broader, passing forth of the hollowness of the cheek, or upper Jaw (by which a portion of the nerves of the third conjugation descends to these two Muscles, and other parts of the face) ends in the upper part of the fame upper lip, which it composes together with the fleshy pannicle and skin, and it opens it by turning up the exterior Fibers towards the Nose, and shuts it by drawing the internal inwards towards the Teeth.

The first of the lower lip being the longer and slenderer, entering out of that region which is between the external perforation of the upper Jaw (through which, on the inner part of the fame, a Nerve paffeth forth to the fame Muscles) and the Muscle Masseter (of which hereaster,) then ascending upwards by the corner of the Mouth, it ends in the upper lip, that fo it may draw it to the

The other broader and shorter, begins at the lower part of the chin, and the hollowness thereof, and ends at the lower lip which it makes, opening it within and without, by its internal and external Fibers, as we also faid of its opposite. And that I may speak in a word, Nature hath framed three forts of Muscles for the motion of the Mouth; of which forne open the Mouth, others thut it; and other fome wreft it and draw it awry: but you must note, that when the Muscles of one kind jointly perform their functions (as the two upper which we described in then it place, on each fide one, which draw the lower lip to the upper, and the Muscles opposite to them) they make a right or streight motion; but when either of them moves severally, it moves obliquely, as when we draw our mouth aside. But these Muscles opposite to the object, as when we draw our mouth aside. mouth aside. But these Muscles are so fastined and fixed to the skin, that they cannot be separated; fo that it is no great matter whether you call it a mufculous skin, or a skinny Mufcle: (Which also takes place in the palms of the hands, and foles of the feet:) but these Mufcles move the lips, the upper Jaw being not moved at all.

CHAP. IX.

Of the Muscles of the lower Jan.

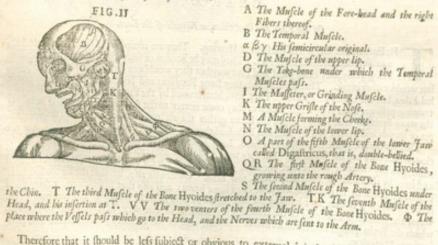

E have faid these Muscles are five in number, that is, four which shut it, and one which Their number opens it, and these are alike on both sides. The first and greater of these four Muscles which shut the Jaw is called Crosophina or Temporal Muscles it arises from the sides of The Temporal Muscles it arises from the sides of The Temporal Muscles it arises from the sides of the Temporal Muscles it arises from whence it inferts it self to the specific of the lower law which the Control of the sides of the lower law which the Control of the sides of the lower law which the Control of the law which th yoke-bone, from whence it inferts it felf to the process of the lower Jaw, which the Greek call Corone,

yoke-bone, from whence it interes at left to the process of the source July, and that it may draw it directly to the upper, fo to that the Mouth.

But you must note that this Muscle is tendinous even to his Belly, and that it fills and makes both why the the Temples. It is more subject to deadly wounds than the rest, by reason of the multitude of wounds of the Nerves dispersed over the substance thereof, which because they are near their original, that is, the Temporal Muscle are Brain, they infer the danger of fudden death by a Convultion, which usually follows the affects of this deadly.

Muscle, but also in like manner it causes a Fever, the Phrensie and Coma.

The Figure of the chief Muscles of the Face.

A The Muscle of the Fore-head and the right Fibers thereof.

B The Temporal Mufcle. a By His semicircular originals

D The Mulcle of the upper lip.
G The Yoke-bone under which the Temporal

Therefore that it should be less subject or obvious to external injuries, Nature hath, as it were, made it a retiring place in the Bone, and fortified it with a Wall of Bone raised somewhat higher The other Muscle almost equal to the former in bigness, being called the Masser, or Grin-The Masser, about it. The other Mutcle aimort equal to the rotation in bigners, being called the Maffett, or Grin-The and ding Mutcle makes the Check; it defeends from the lowelt part of the greatest Bone of the Orb or Grin (which bends it felf, as it were, back, that it may make part of the Yoke-bone) and inferts it felf into Muscle. the lower Jaw, from the corner thereof to the end of the root of the process Covene, that so it may draw this Jaw forward and backward, and move it like a Hand-Mill.

Wherefore Nature hath composed it of two forts of Fibers, of the which fome from the Neck (the Check in that place under the Eyes flanding formewhat out like an Apple arifing from the concourse of the greater Bones of the Orb and upper Jaw) descend obliquely to the corner and

hinder part of the lower Jaw, that it may move it forwards. Othersome arise from the lower part of the same Yoke-bone, and descending obliquely interfect the somer Fibers after the similatede of the letter X, and infert themselves into the same lower Jaw at the roots of the process Corone, that so they might draw it back : Truly by reason of these contrary motions, it is likely this Muscle was called the Mafferer, or Grinder.

The Round

The third which is the round Muscle, arises from all the Gums of the upper Jaw, and is inserted into all the Gums of the lower, investing the sides of all the Mouth with the Coat, with which it is covered on the infide, being otherwise covered on the outfide with more fat then any other Muscle. The action thereof is, not onely to draw the lower Jaw to the upper, but also as with a shovel to bring the meat dispersed over all the Mouth under the Teeth, no otherwise than the Tongue draws

The leffer Muscle of the lower Jaw.

The fourth being shorter and less than the rest arising from all the hollowness of the winged process of the Wedge-bone, is inserted within into the broadest part of the lower Jaw, that so in like manner it may draw the fame to the upper. This is the Muscle through whose occasion we said this lower Jaw is sometimes dislocated.

The Figure of the Muscles of the lower Jaw .

A Abole in the fore-bead bone in the brim of the feat of the Eye, fending a finall Nerve of the third pair to the Muscles of the fore-head and the upper eye-brow.

B The temporal Muscle.

laft Mufcle.

The use of these mentioned Muicles.

The fifth and last Muscle of the lower Jaw is rom the process Styloides of the Stony bone, ascends to the fore-part of the Chin, near to the connexon of the two bones of this Jaw, to draw this Jaw downwards from the upper in opening the Mouth. This Muscle is slender and tendinous in the midst, that so it might be stronger, but it is fleshy at the ends. All these Muscles were made by the fingular Providence of Nature, and engraffed into this part for the performance of many uses and actions, as biting afunder, chawing, grinding and fevering the meat into finall particles, which the tongue by a various and harmless motion puts under the teeth. Thus much I thought good to say of the parts of the Face, as well containing as contained.

CHAP. X.

Of the Ears and Parotides, or Kernels of the Ears.

The nature and composition of the What the Fiby a and Pinna The figure and reason thereof.

He Ears are the Organs of the fenfe of Hearing. They are composed of the skin, a little flesh, a grifle, veins, arteries, and nerves. They may be bended or folded in without harm, because being grifly, they easily yield and give way, but they would not do fo if they should be bony, but would rather break. That hand which they hang Pendants and Jewels, is by the Ancients called Fibra, but the upper part Fima. They have been framed by the Providence of Nature into two twining passages like a Smalls shell, which as they come nearer to the foramen excum or blind hole, are the more straitned, that so they might the better gather the air into them, and conceive the differences of sounds and voices, and by little and little lead them to the Membrane.

This Membrane which is indifferently hard, hath grown up from the Nerves of the fifth conjuga tion, which they call the Auditory. But they were made thus into crooked windings, left the founds rufhing in too violently should hurt the sense of Hearing. Yet for all this, we oft find it troubled and hurt by the noise of Thunder, Guns, and Bells. Otherwise also, less that the air too suddenly entering, should by its qualities, as Gold, cause some harm; and also that little creeping things and other extraneous Bodies, as Fleas and the like, should be staid in these windings and turnings of the ways, the glutinous thickness of the cholerick Excrement, or Ear-wax, hereunto also conducing, which the Brain purges and fends forthinto this part, that is, the auditory paffage framed into these intricate Mæanders.

For what use the Ear-wax ferves.

For what use the membrane fireteled under the Auditory paffage

But that we may understand how the Hearing is made, we must know the structure of the Organ, or Influences thereof. The Membrane which we formerly mentioned to conflit of the Auditory Nerve, is firetched in the infide over the Auditory pulfage, like as the head of a Drum. For it is firetched and extended with the Air, or Auditory Spirit implanted there, and that up in the cavity of the manufactory process and for men cacon, that finitten upon by the touch of the external air entering in, it may receive the chart the in the found.

What found is

It may receive the object, that is, the found, which is nothing elfe than a certain quality arifing from
the Air, beaten or moved by the collision and conflict of one or more bodies.

Such a collision is fpred over the Air, as the Water which by the gliding touch of a Stone produces
many circles and rings, one as it were rifing from another. So in Rivulets running in a narrow Channel, the Water strucken, and as it were, beaten back in its course against broken, craggy and steep

Rocks, wheels about into many turnings: this collifion of the beaten air flying back divers ways from arched and hollow-roofed places, as Dens, Cifterns, Wells, thick Woods, and the like, yields and produces a double found, and this reduplication is called an Echo. Wherefore the Hearing is thus made by the air, as a median : but this air is two-fold, that is, External and Integral.

The Figure of the Ears and Bones of the Auditory paffage.

Tab. 10. Sheweth the Rars and the divers internal parts thereof.

Fig.1. Sheweth the whole external Ear, with a part of the Temple-bone.

Fig. 7-and 8. Shewith the little Bones of the Hearing of a Man and of a Colf, both joined and fiparated.

Fig.9. Sheweth the Mufcle found out by Aquapendens,

For the particular Declaration fee Dr. Grooks Anatomy, pag. 577.

The exteriour is that which encompasses us, but the interiour is that which is shut up in the cavity of the manislary process and for aneas excess, which truly is not pure and sole air, but rempered bones of and mixed with the auditory spirit. Thence proceeds the noise or beating of the Ears when vapors are there mixed with the air in stead of the spirits, whereby their motion is perturbed and confused. But neither do these suites for hearing; for Nature for the more exact distinction of sounds hath also made the little bones, of which one is called the Incas or Anvil, another the Malleslas or hammer, the third the Staper or Stirrop, because the shape thereof resembles a German Stirrop. Also it may be called Delivider, because it is made in the shape of the Greek Letter Δ .

They are placed behind the Membrane; wherefore the Anvil and Hammer moved by the force of Their use, the entrance of the external air, and beating thereof against that Membrane, they more diffinely express the difference of sounds, as strings stretched within under the head of a Drum. As for exam-whence the ples. Their bones being move gently moved represent a low sound to the common sense and faculty difference of Hearing, but being moved more vehemently and violently, they present a quick and great found. To conclude, according to their diverse agitation, they produce divers and different founds.

The Glandules should follow the Ears in the order of Anatomy, as well those which are called the

The Glandules should follow the Ears in the order of Anatomy, as well those which are called the emanctories of the Brain, that is, the Paratides, (which are placed, as it were, at the lower part of the Ears) as these which lie under the lower Jaw, the Muscles of the Bone Hyoides, and the Tongue, in which the Scraphula, and other such cold abscesses breed. It shall here suffice to set down the use of all such like Glandules.

Therefore the Parotides are framed in that place by Nature, to receive the virulent and malign matter first forth by the strength of the Brain, by the Veins and Arteries spred over that place. The rest serve to strengthen the division of the Vessels, to moisten the Ligaments and Membranes of the Jaw, lest they should be dried by their continual motion. Their other conditions and uses are formerly handled in our first Book of Anatomy.

CHAP. XI.

Of the Bone Hyoides, and the Muscles thereof.

He substance of the Bone Hyoider is the same with that of other Bones. The figure thereof imitates the Greek Letter of from whence it took the name, (as also the name of the same of the same) The reason of the name. And from the Letter \(\lambda \) it is in like fort called \(\lambda \ampli \lambda \lambda

Bones joined into one by the interpolition of Grifles. The fite.

This Bone is bigger in Beafis and composed of more Bones, and that not onely by the intercourse of Grifles, but also of Ligaments. It is feated with its basis (being gibbous on the fore-part for conftancy, and arched on the infide that it might receive and contain the root of the Tongue) upon the upper part of that Grifle of the Throttle, which is called Sentiformis, or Shield-like, (for this fecms to prop it up by the firength of two processes rising at the basis thereof) and the root of the Tongue. From this basis it sends forth two homs to the sides of the Tongue on each side one, which in men are tied to the Appendix Styloides by Ligaments fent from it felf. Contrary than it is in Beafts, who have it of many Bones; united, as we faid,, by the intercoufe of Ligaments even to the root of the Styleider. Wherefore this Bone hath connexion with the fore-mentioned parts, and other hereafter to be mentioned. It hath the fame temper as other bones have. The use of it is, to minister Ligaments to certain Muscles of the Tongue, and insertion as well to the two foremost and

The Muscles of the bone Hyoldes.

The temper

and use.

upper Muscles of the Throttle, as to its own, of which we will now treat.

The Muscles of the Bone Hwides, according to the opinion of some, are eight, one each side four; of which there be two, one of which Galen refers to the common Muscles of the Larmax or Throttle; and the other to those which move the Shoulder-blade upwards. Howsoever it be, the first of the four before-mentioned arifes from the Appendix Styloides, and paffing over the nervous substance of the Muscle opening the lower Jaw, is inserted into the horns of the Bone Hyaides. This Muscle is very thin, yet formewhat broad, the which in that refpect may eafly be cut, unlefs you have a care in feparating the Muscle which opens the lower Chap. The second ascends obliquely from the upper part of the Shoulder-blade near the production thereof called Coracoides, to the beginnings of the horns of the faid Bone Hyoider. This is round and nervous in the midft that so it might be the stronger, as that is which we formerly faid opens the lower Jaw; and it is referred by Galen amongst those which move the Shoulder-blade upwards. The third arises from the upper part of the Strong, and is inserted at the root and has of the Bone Hwider, yet Galen referred by the common Sternan, and is inferted at the root and balis of the Bone Hyoider; yet Galen refers it to the common Muscles of the Laring; whose opinion takes place rather in Beasts than in Man, seeing in Man this Muscle cannot be found either to proceed, or be inserted into the Throttle, as it is in Bealts. The action of fourth and last descends within from the Chin to the root of the Bone Hyarder. The first of these

thefe Muscles With its Companion or Partner, moves the Bone Hyades upwards, the second downwards, the third backwards, and the fourth forwards. I would declare whence these Muscles have their Vesfels, had I not abundantly fatisfied that thing, when I treated of the diffribution of the Nerves, Veins and Arteries.

CHAP. XII.

Of the Tongue.

What kind of flesh the Tongue hath.

The quantity. The figure.

Composure. The Nerves.

He Tongue is of a fleshy, rare, loose, and fost subflance; it enjoys flesh of a different kind from the reft of the flesh, as chiefly appears when you cut it from the first original of the Muscles thereof; which thing hath moved some, that they have made a fourth kind of slesh proper to the Tongue and different from the reft, riz. the Fibrous Musculous, and that of the Bowels, The quantity thereof is fuch, that it may be contained in the Mouth, and eafily moved to each part ethercof. The Figure of it is triangular, which it rather expresses in the basis, which is at the root of the Bone Hywider, than in its point, or fore-part, where from a triangle it becomes more dilated. It is composed of a Membrane (which it hath from that which lines all the inside of the Mouth,) Mufcles four, Nerves two on each fide, the one whereof is fent from the third conjugation, into the coat thereof; the other, from the feventh is fent into the mufculous fubflance even to the end thereof for motions fake; fo that those sensifick Nerves from the third conjugation, onely give to judge of Taites, compose the Coat, and touch or enter not the flesh. Belides, it is composed of Veins and Arteries on each fide one, which it receives from the external Jugular and Carotides, running mamifetily to the end thereof on the lower fide, that fo they might be easily opened in the discales of the Mouth and Throttle; they commonly term these the Vone nigre, or black Veins.

The Muscles of the Tongue are absolutely ten, on each fide five. The first narrow at the begin-

The Mufcles of the Tongue, ning, and broader at the end, defcends into the upper fide of the Tongue from the Appendix Styloider, and together with its Co-partner draws it upwards. The fecond hath its original within from the lower Jaw, about the region of the Grinding Teeth, and is inferted into the lower fide of the Tongue, the which with its Partner draws it downward. The third proceeds from the inner part of the Chin, and goes to the root of the Tongue, that when need requires, it may put it forth of the Mouth. The fourth, the greatest and broadest of them all, composed of all forts of Fibers, passets from the basis of the bone Hyeides, and ends at the lower part of the Tongue, which with its Companion plucks it back into the mouth. The fifth and last most usually arises from the upper

part of the homs of the bone Hyoides, and goes to the roots of the Tongue between the two first, that

The state of the s

it may move it to the fides of the Mouth. The temper thereof, as of all other field, is hot and moid. The temper, afting, and made fungous and spongy, that by reason of the rarity of it, it might more easily admit the tastes conjoined with the specific as a vehicle. Another to be an infirument to distinguish the voice by articulate speech, for which it was made moveable into each part of the Mouth. The third is to be a help to charge and finally a the most. For which can be in help to charge and finally a the most. to chaw and (wallow the meat. For which cause it is like a scoop or dish with which we throw back the Corn into the Mill, which hath scaped grinding. And because, when the Tongue is drie, it is left nimble and quick to perform its motions, as appears by those which can scarce speak by reason of thirst, or a burning Fever: therefore Nature hath placed very spongy glandules at the roots thereof, on each side one, which like sponges suck and receive, both from the Brain and other places, a way glandules platerish and spettely humour, with which they humeer and make more glib, not onely the Tongue, but cost of the also the other parts of the Mouth, as the Throat and Jaws; these glandules are called the Tousille, or

CHAP. XIII.

Of the Mouth.

He Mouth is that capacity, which, bounded with the Cheeks and Lips contains within its What it is Precinc's the Teeth, Tongue, and the beginning of the Throttle and Gullet. Therefore the use of the Mouth is to contain the Tongue, and serve it in the fitter performance of its The use, actions; and although many parts hereof have been formerly handled, as the Lips, Teeth, Jaws, Tongue, Almonds, and paffages of the Palat coming from the Nofe, yet it remains that we declare what the Palate, the Gargaress or Uvula, the Pharinx, and fastess or Ghops, are. The Palat (or, as What the Palate) it is commonly called, the Roof of the Mouth) is nothing elfe but the upper part of the Mouth boundaries. ded with the Teeth, Gums, and upper Jaw. In which place the Coat common to the whole Mouth, is made rough with divers wrinkles, that the meats put up and down between the Tongue and the Palat might be broken and chawed more easily by that inequality and roughness. If any would find The Nerves find the Nerves, which descend into the Palate from the fourth Conjugation, let him separate that thereof. Coat, and cast it from the fore to the hind-part of the Mouth; for so he shall find them at the sides and hind-parts of the bones of the Palate, which incompass the Palat, and at the beginning of the inner holes of the Mouth, which defeend from the Nofe, and region of the productions of the Wedg-bone called the Saddle. These holes or pussages are open, that we may breath the better when we sleep, and that when the Nose is not well, the excrements which seek their pussage by it, may be caliber holes of the drawn away by the Mouth. This same Coat is woven with nervous Fibers, that like the Tongue it Palatare open, may judge of Tasses, these Edges competers Coat that hole a middle consistence betwiet fort, and What kind of may judge of Taftes; thefe Fibers compose a Coat that hath a middle confishence betwixt fost and What kin hard. For if it should have been any harder, like a Bone or Grisle, it would have been without sense; but if softer, hard, acid and there would have been any harder, like a Bone or Grisle, it would have been without sense; bath. but if fofter, hard, acid and tharp meats would have hurt it.

CHAP. XIV.

Of the Gargareon, or Uvula.

By the Gargaress we understand a sleshy and spongy body, in shape like a Pine-Apple, hang-what the Garther end of the Palat and basis of the bone Estimates, where garess or Understand body is fituate in this place to break the violence of the air drawn in by breathing and that by delay it rejobt in some fort temperated missions is by the warranges of the Mouth. Believe that by delay it might in force for temper and mitigate it by the warmness of the Mouth. Belides, that thereof, it might be as it were the Pletirum, or quill of the Voice, so to diffuse the fullginous vapour sent forth in breathing, that it may be differfed over all the mouth, that refounding from thence it may be articulate, and by the motion of the Tongue diffinguished and formed into a certain Voice. Which offe is not finall; when we fee by experience, that such as have this particle cut away, or The discomnation of the Tongue distinguished and formed into a certain voice.

Which offe is not finall; when we fee by experience, that such as have this particle cut away, or The discomnation of the collar particle in the particle and deprayed, but speak ill-modities that favouredly, and, as they say, through the Nose; and besides, in process of time they sall into a Con-ense the loss summaries of the collar passing down before it be qualified. This same patricle is also of the Uvula, a means to hinder the dust from slying down through the Weazon into the Lungs. By the Pha-What the vince and Fanter is meant the inner and back-part of the mouth, for or placed before the entrance of Phariax and the Throttle and Gullet's being so called, because that place is narrow and strait, that as it were by Fants are. the Throttle and Gullet; being so called, because that place is narrow and strait; that as it were by Fascu are, these strains, the air drawn in by the mouth might be forced down by the Throttle, and the meat in-

The magnitude, figure, and compofore.

The description of the three Grifles of the Lariny.

Whence the infinite varie-ty of Voices proceed.

The Muscles of the Lariax.

Their number

flory.

yet diverse according to the diversity of bodies. It resembles in shape the head of a German pipe. The composure of it consists of 18 Muscles, on each side nine, which as they are like in quantity, fo also in strength and action; of three Grisles, Veins, Arteries, and Nerves, as we shewed when we fpoke of the distribution of the Vessels; as also of a double Coat, the one external, the other internal, as we shewed when we spoke of the Weazon. These three Grisles are joined together by certain Ligaments and Muscles; the foremost Grisle, which also is the greater, is called by the Greeks Sue 5036, in Latin commonly Sentiformie, that is shield-like, because it resembles a shield. The fecond, being the hinder and middle in magnitude, wants a Name, wherefore it is called the inminata, or nameless Grifle. The last and least, which notwithstanding may be parted into two, so lies upon the edges of the other, that it refembles the mouth of an Oil-pot, or a Pitcher, where-upon the Greeks call it Arysenoides. These Grisles thus fitted amongst themselves utter a distinct Voice, by the benefit of the Epiglottis, or After-tongue, and also of the Muscles opening and shutting, dilating and compressing them, whence proceed infinite varieties of Voices. For thus when they are opened and dilated, they yield a heavy or dull found; when they are thut or drawn together, a quick or tharp found; and to conclude, they make it infinite ways different according to the infinite variety of the dilatation, or confiriction thereof. Therefore, because it was fit these Grifles thould be moveable, especially the Arytensides and Thyroides, Nature hath put to them on each fide nine Muscles, of which three are common, and fix proper. The first of the common lying hid under the third Muscle of them that move the bone Hyoides, arises from the root of the same bone, and by an oblique defcent inferts it felf at the basis of the shield-like Grisle, to dilate it upwards and downwards. The second ascends obliquely from the inner part of the Stermon according to the length of the Weszon (whence it is called Eronchius) to the bottom and sides of the same shield-like Grisle, that it may open and dilate it with its wings. This Muscle is seen from the first original thereof, even a great part of the way straitly to cohere with the third Muscle of the Bone Hyolder's therefore under each of the Muscles there is a glandulous body spred about the fore and upper part of the Weazon, on that place where it applies it self to the Throttle; this body although it resemble A notable Hi- a fleshy substance, yet it is a glandule: which being pluckt away by a certain Emperick taking upon him to cure the Kings-evil, caufed a defect of Voice on one fide, because he pulled away the recusrent Nerve lying upon the glandule as it goes to the Throttle, as Galen reports, Lab. de Locis Affellis. The third and last arises from the parts of the Vertebraes of the Neck lying transversly upon the sides of the Gullet, and ends at the wings and fides at the shield-like Grifle, that it may tie it more straitly to the fecond Grifle. But thefe three are called common Muscles, because they take their original from some other place than the Throttle, that so they may be inserted into some part thereof; for they are called the proper Muscles which arise from the Throttle it self, which we have said to be six on each fide: the first of which arising from the fore-part of the second Grisle, makes a circle under the basis of the shield-like Grisle; whilest ascending obliquely to the basis thereof, it is after-wards inserted in a part of it, so to strengthen and dilate it. The second in like manner arising from the second Grisle, from that place where it adheres to the first, it runs obliquely crotting the first to the inner and forepart of the Grille Thyroides near to the basis thereof, that it may join it to the second. The third from the hind-basis of the second Grisle ascends directly to the basis of the third Grisle Arytegoides, that with the second Muscle it may open and shut it. The fourth ascends from the fides of the second Grisle, near the original of the second Muscle, to the sides of the Arysensides, that with the fecond Muscle it may open and thut it. The fifth arises from the inner middle of the thield-grille, and ends in the fore-part of the Arytemides at the insertion of the fourth Muscle, that so it may press down the faid Gritle.

Whence the Muscles of the Throttle have their Nerves.

The Epiglottis, Tongue,

The fixth and last afcends by the hind-basis of the Arysmoider to the fore-basis of the same, to press it down. But you must note that all such Muscles as arise from below upwards, receive branches from the recurrent, but especially those who open and that the Grisle Aryaevoider. But the fite, temper, connexion, and use of the Throttle may easily be known by that we have said before: Although it be a thing very full of difficulty to fearch out and demonstrate all the conditi-ons of the organical parts, by reason of the diversity of their composition. Wherefore hence-forward concerning the substance, temper, and other circumstances of such parts as we shall omit, you may have recourfe to those things which we have written in the Demonstration of the fimple and fimilar parts, of which these organical are composed; as if any should ask, of what temper the Larinx is, you shall answer, of a cold, dry, hot, and moist, because it consists both of a grifly and fleshy substance. He which reckons up all the parts of the Mouth, must not omit that grifly and membranous body which arifes from the roots of the Tongue, which that it might be more quick for motion, that is, whereby it might be more eafily erected and depreffed (for those things which are more fost do continually flide away, but those which are too hard cannot be bended) it was convenient it should be neither too hard, nor too foft, that it might be erected whileft we breath, but depressed when we swallow. It is a principal instrument of the Voice, for it cannot be well articulated unless the way were strait. Therefore it straitens that way, and the passage of the grifles of the Throttle, but especially the Arytensides; it is always moist by a certain Native and Inbred Humidity; wherefore, if it happen to be dried by a Fever, or any other like accident, the Speech is taken away. It is bound on both fides by the common membrane of the Mouth to the fides of the Arytenoides even to the back-part thereof, that so like a Cover it may open and that the orifice of the Throttle, that none of the meat and drink in fwallowing may fall into the Weazon, in fuch abundance as may hinder the egress and regress of the air. For we must not think that this body doth so closely shut the orince of the Throttle, but that some small quantity of moisture always runs down by the inner sides, as the walls thereof, to moisten the Lungs, otherwise Eelegmaes should be of no use in the diseases of the Chest. And because that this little body is partaker of voluntary motion, therefore according to the opinion of fome

Of potable things formewhat always falls upon the Lungs.

· IFEN III.

there are four Muscles bestowed upon it, two which may open it, and two that that it, on each side one. The opening Muscles descend from the root of the bone Hunder, and in their insertion, grow- The Muscles ing into one, they are terminated in the root of this body, that is, the Epiglettis in the back part of the Epiglet. thereof. The flutting Muscles (in those Creatures where they are found) arise on the inside between the Coat and Grisle thereof. Truly I could never observe and find these four Muscles in a man, though I have diligently and carrefily fought for them, but I have always observed them in Beatis, Therefore some have boldly affirmed that this little body in fwallowing lies not upon the orifice of the Throttle, unless when it is preffed down by the heaviness of such things as are to be swallowed s but that at all other times by reason of the continual breathing it stands upright, the Throttle being but that at all other times by reason of the continual breathing it stands upright, the Throttle being open. There remain as yet to be confidered, two small bosons or cavities, or rather insures which The use of the Nature hath hollowed in the very Throttle under the Epiglottis, on each side one, that if by chance eavities or side any of the meat or drink should fall, or slip aside in the Larinx, it might be there staid and retained, sures of the Beside that, the Air too violently entering, should be in some fort broken by these cliss or chinks, no otherwise then the bloud and spirit entering into the heart through the Anricale, or Ears thereof.

CHAP. XVI.

Of the Neck and the parts thereof.

Virft we will define what the Neck is, then profecute the parts thereof, as well proper as common, efpecially those of which we have not as yet treated. For it were superfluous to speak any more of the Skin, the sleshy Pannicle, the Veins, Arteries, Nerves, Gullet, Weazon and Muscles afcending and descending to the parts into which they are inserted alongst the Neck; wherefore you must not expect, that we should say any thing of the Neck, more than to deferibe the Vertebre or Rack-bones, being the proper parts thereof, and the Ligaments, as well those proper to the Neck, as those which it hath in common with the head; and lattly, the Muscles, as well those it bath in common with the Head and Cheft, as those of its own. Therefore the Neck is nothing else than What the a part of the Head, which is contained between the Nowl-bone and the first Verebra of the back, Neck is. First in the Neck, the Vertebraes must be confidered, and we must shew what they have proper and peculiar, and what common amongst themselves, that we may the more easily shew the original and infertion of the Mufcles growing out of them and ending in them. The Neck confuts of feven infertion of the Mufcles growing out of them and ending in them. The Neck commission reven Vertebre, or Rack-bones; in which you must confider their proper body; and then the holes by which the Spinal-marrow paffes; thirdly, the Apphysics or procedess of the Vertebre; fourthly, the What to be foldes through which the Nerves are differninated into other parts from the Spinal marrow, and becomindered in fides the perforations of the transverse productions by which the Veins and Arteries, which we call the Vertebre of the Neck. Cervicales, afcend alongst the Necks and lastly, the connexion of these same Vertebre, or Rackbones. For the first, By the body of the Vertebra, we understand the fore-part thereof upon which the Gullet lies. For the hole, that is not always the largest in those Vertebre which are nighest the Head; but it is always encompassed with the body of the Vertebra, and besides with three forts of processes, except in the first Rack-bone, that is right, transverse and oblique. By right, we under-which be the part of them, and rife up crested on each side to sustain and receive the basis of the Rack-bone which set of the received the part of them, and rife up crested on each side to sustain and receive the basis of the Rack-bone which set of the received the part of them. part of them, and rife up crefted on each fide to fuffain and receive the basis of the Rack-bone which sets of the Ve is set upon it. By the oblique processes, we understand the bunchings out by which these Rack-bones are mutually knit together by Ginglyma; these are seated between the transverse processes, which the By the transverse, we understand the protuberations next the body, which divide the Vortebra or Which the Rack-bone in a straight line. These processes are perforated, that they may give way to the before Transverse described Veins and Arteries, which entering the Spinal marrow by the holes of the Nerves nourish the Rack-bones and parts belonging to them. Besides, you must note, that the perforations of the Rack-bones of the Neck, by which the Nerves proceed from the Spinal marrow to the outward parts, are under the transverse that is growing or made by the upper and lower Verylors. parts, are under the transverse process, that is growing or made by the upper and lower Vertebra, contrary to all other which are in the rest of the Rack-bones. For the connexion of the Rack-The connexion bone, you must know, that all the Verther of the Spine have fix connexions, two in their own tens of the Verther of the Spine have fix connexions, two in their own tens of the Verther of the Spine have fix connexions, two in their own tens of the Verther of the spine have fix connexions they are fo mutually titize of the articulated in their own bodies, that each are joined with other both above and below. But by the four other by their oblique afcendent and descendent processes on each side two, they are so is received of the descendent processes of the third Rack-bone of the Neck by its oblique ascendent processes, dent processes of the first, by its oblique ascendent processes, dent processes of the first, by its oblique descendents, for always the oblique ascendents are received. is received of the descendent processes of the third Rack-bone, so it receives the oblique ascendent processes of the first, by its oblique descendents, for always the oblique ascendents are received, and the descendents receive. Yet we must except the first Rack-bone of the Neck which is contained with four connexions by his lower oblique processes, and by its upper by which it receives the oblique processes of the Nowl-bone, and of the second Rack-bone. The second Variety as the state of the second Variety as the interest of the second variety and the fifth by its own body, by which it is knit to the body of the shired or Rack-bone, must also be excepted, which is induction, that is to fay, four by its oblique processes, and the fifth by its own body, by which it is knit to the body of the third Vertebra. But we must note, that whereas Nature hath not given a Spine to the first Rack-bone, yet it hath given it a certain bunch or extuberancy in flead thereof; in like manner, feeing it makes yet it hath given it a certain punch or extinuerancy in mean thereor; in tike manner, feeing it makes no common paffage with the fecond Verebra, for the paffing forth of the Nerve, it is perforated at The Process no common pallage with the lecond victors, for the panning form of the incree, it is perforated at The Proced its fides of the body, and it is made very thin on the fore-fide, as if it were without body, that called the perater calls the fore-process raised in the upper body of the fecond Rack-bone, which Hip-Tooth, which the principal Ligament of the Head is fastined, which descends within from the hind over of the Head upper the Application Climites. within from the hind-part of the Head under the Apophyses Climides, or processes of the Wedge-

By what artihead is bended backwards and forwards.

And by this articulation the head is bended forwards and backwards, as it is moved to the fides by the articulation of the first Rack-bone with the second. That process is bound by two ligaments, the first of which being greater and broader is external, comprehending in the compass thereof all the upper articulation, afcending from the Rack-bones to the Head, or rather descending from the Head to them, as any other Ligament going from one bone to another. The other is the ftronger, and also encompasses the articulation mixing it self with the Grisle, which by its interpolition binds together. The other is the stronger, and also all the Rack-bones, the first excepted, as you may see in pulling asunder the Rack-bones of a Swine's and the whole Spine, or Rack-bone is tied together, and composed throughout with such Ligaments.

Table. 20. Figure 1. Sheweth all the Rack-bones of the Back knit together.
Figure 2. Sheweth the fore and upper face of the Neck, &c. See Dr. Crook. p.398.

The Vertina of the Holyopne.

The Holy-bone is composed of four Vertebra (or rather of five or fix, as in the Figure above) befides the Rump-bone, it receives, and holds fall the Offa Ilium, or Hanch-bones, and is as a Balis to all the Rack-bones placed above it, whereby it comes to pass that the Rack-bones from the Head to the Holy-bone grow fill thicker, because that which supports ought to be bigger than that which is supported. There is a certain moisture, tough and fatty, put between the Rack-bones, as also in other joints to make them glib and flippery, that fo they may the better move. Whilefi this motion is made, the Rack-bones part one from another.

The commodities or uses of the Spine are said to be four. The first is, That it is as it were, the The manifold seat and soundation of the composure and construction of the whole body, as the Carcass is in a use of the Ship. The second, That it is a way or passage for the marrow. The third is, Because it contains and preserves the same. The fourth is, That it serves for a Wall or Bulwark to the entrails, which lie and rest upon it on the inside. And, because we have fallen into mention of Ligaments, it will not be a married to the contains and rest upon it on the inside. And, because we have fallen into mention of Ligaments, it will not be amils to infert in this place that which ought to be known of them. First therefore, we will de-clare what a Ligament is, then explain the divers acceptions thereof; and lastly, prosecute their

Therefore a Ligament is nothing elfe than a fimple part of Mans Body, next to a Bone and Grifle What a Ligate the most terrestrial, and which most usually arises from the one or other of them either mediately or ment is. immediately, and in the like manner ends in one of them, or in a Muscle, or in some other part; whereby it comes to pass, that a Ligament is without bloud, dry, hard, cold, and without sense, like without sense to the parts from whence it arifes, although it refemble a Nerve in whiteness and confiftence, but that it is fomewhat harder.

A Ligament is taken either generally, or more particularly; in general, for every part of the What parts body, which ties one part to another, in which fende the skin may be called a Ligament, because it may be called contains all the inner parts in one union. So the Perion comprehending all the natural parts, and binding them to the Back-bone: so the Membrane investing the Ribs, (that is, the Plears) are containing all the Vital parts; thus the Membranes of the Brain, the Nerves, Veins, Arteries, Muches, Membranes, and lastly, all such parts of the Body which hard reachers and contain others. Membranes; and laftly, all fuch parts of the Body which bind together, and contain other, may be called Ligaments, because they bind one part to another; as the Nervesannex the whole Body to the Brain, the Arteries fasten it to the Heart, and the Veins to the Liver. But to conclude, the name of a Ligament more particularly taken, fignifies that part of the Body which we have described a

The differences of Ligaments are many, for fome are membranous and thin; others broad, other- The differenfome thick and round, fome hard, fome foft, fome great, fome little, fome wholly grifly, others ces of Ligaof a middle confistence between a Bone and Grifle, according to the nature of the motion of the parts which they bind together in quickness, vehemency, and flowness. We will show the other difterences of Ligaments, as they shall prefent themselves in diffection.

CHAP, XVII.

Of the Mufcles of the Neck;

He Muscles of the Neck, as well proper as common, are in number twenty, or else twenty. Their number two, that is, ten or eleven on each fide; of which, seven onely move the Head, or the first Vertebra with the Head; the other three or four, the neck it self. Of the seven which move the Head, and with the head the first Verrebra, fome extend and erect it, others bend and decline it, others move it obliquely, but all of them together in a fuccessive motion move it circularly: and the like judgment may be of the Mufcles of the Neck.

But before I can come to the description of their original and insertion, I must admonish thee, that the two Muscles of the Shoulder-blade must sirst be taken away by diffection; that is, the Trapezius or Table-muscle, and the Rhomboides, or Square-muscle; whose original and insertion has me must be letter demonstrate. (or reshort heavilies the reliable to the resistant and insertion) that we may the better demonstrate, (or rather the action by which we feek that original and infertion) they must be pulled up, beginning at their insertion, which is at the Shoulder-blade (as shall be thewed in the proper place, turning them up towards their original, that is, to the Spine. Befides, the lefs Rhomboides, the hinder and upper (called also the Dentatus or toothed-Muscle) must be raised from its original, which is at the three lower Rack-bones of the Neck and the first of the Back, and turned up to its insertion, which is at three spaces of the lower ribs night to the hind and upper angle of the Shoulder-blade, as shall be showed in fit place hereafter. These Muscles thus raised up, the four Muscles which excellent extend the Head, must be taken away, and Mufcles thus raifed up, the four Mufcles which erect and extend the Head, must be taken away, and then those thus rained up, the food marches which feeter and extend the read, man be declines: for thus Anatomical order requires. Yet, if you think good, you may, not hurting the other, first of all cut away that which is called the Majorder, which declines or bends the Head. For these four which lift up and extend the Head, the first from the barres of the Sphere is called the Splering, it assembles away that which is called the Majtoides, which declines or bends the Head. For these four which lift up and extend the Head, the first from the figure of the Spleen is called the Spleenine, it ascends The Spleenine at the back-part of the Head, and the Mamillary process, whence you may raise it towards its original. The second by reason of its composure is called Complexon this patting from the third, The Complexon the head, and the Head, and often from the first of the Neck: ascends discretely to the back-part of the Head, encompatting the lower and side-part of the Neck, you may extensily take it up, if you begin at the spine, and so go forward to the transverse processes and mamillary processes of the Nowl-bone. This Complexon may be divided into two or three Muscles, but that with some difficulty, by reason of its solded texture. The third and fourth, which be two of the the whole side of the second Vertebra. The second form the whole side of the process of the first truly from Vertebra, which it hath in stead of a Spine's they ascend to the back-part of the Head, just against two right the Spine; these two Muscles by the consent of all Anatomists, are called right or direct Muscles, since her consent proving the head, these truly must not be placked from the places of their original, nor insertion. onely moving the head, there truly must not be plucked from the places of their original, nor inferonely moving the head, there may make not be product than the places of their original, nor macrition, but onely bound by a firing put under them, that fo they may be the more eafly thewed. On each fide follow two oblique Mufcles, one whereof onely moves the Head; the other primarily the first Vertebra, but secondarily and by accident the Head it felf. For the first, contrary to the

opinion of fome, it arifes from the transverse process of the first Rack-bone, and then is inferted, above the infertion of the first right Muscle: the which in like manner you must lift up, by something put underneath it, but not separate it. The other entering forth of the Spine of the second Versehra, is inferted at the process of the first, contrary to the original of the precedent, although some think otherwife. It will be convenient in the like manner, onely to lift up this with a firing, and not pluck him from its place, that fo you may fee how all these make a perfect triangle. The action of this Muscle is contrary to the action of the precedent, as the contrariety of its original and infertion shew.

Which may
Wherefore when the first oblique moves the Head obliquely forward, the second pulls it back by
be truly called the first Vertebra; this, with his affociate of the other side, may be truly termed the proper Muscles of the Neck, because they belong to no other part; whereas it is contrary in other Muscles. But we Muscle of the must note, that the Head (according to Galen's opinion) hath two motions, one directly forwards. The two mo- and backwards, as appears in beckning it forwards, and cafting it backwards; the other circular.

The first in Galen's opinion is performed by the first Vertebra moved upon the second; the second by the Head moved upon the first Vertebra; for which he is reproved by the later Anatomists, who teach that the Head cannot be turned round, or circularly upon the first Vertebra, without putting

For the last which bends the Head, it ascends from the upper and fide-part of the Sternon, and the next part of the clavicle, obliquely to the Apophysis Masterders, or mamillary process of the hind part of the Head, whence it is called the Masterders. You may divide this by reason of its manitold original rather into two, than into three Muscles. But it had been better that the Head might have been moved every way, equally backwards and to the right and left fides; but thus it would often have been firained to our great damage and danger of life; neither could there have been fuch facility of motion without a loofness of the joint. Therefore Nature had rather beslow upon the Head an harmless faculty of fewer motions, than one farmished with more variety, but with a great deal more uncertainty and danger. Wherefore it hath made this juncture not lax or loofe, but ftiff and ftrong.

The Malloiditair.

Head.

After the flewing of these Muscles, we must come to three or four of the Neck, of which number, two (which fome reduce to one) extend, another bends, and the last moves fide ways; and all of them with a motion succeeding each other turn it about, as we faid of the Muscles of the Head. The them with a motion increeding each other turn it about, as we laid of the Mulcles of the Head. The first of these which extend, taking its original from the fix transverse processes of the fix upper Rack-bones of the Back or rather from the root of the oblique, ascends directly to the Spine of the Second Vertebra of the Neck, and the oblique process thereof; some some call it the Transverse from the transverse Muscle. This, if you define to take it away, it is best first to separate it from faring the Spine, then to turn it upwards to the transverse processes; unless you had rather draw it a little from its Partner and Companies in that place, where their originals are deliced. Some in the last from its Partner and Companion, in that place where their originals are diffined, feeing it is the last and next to the Bones.

P A part of the transverse Musele of the Abdomen.

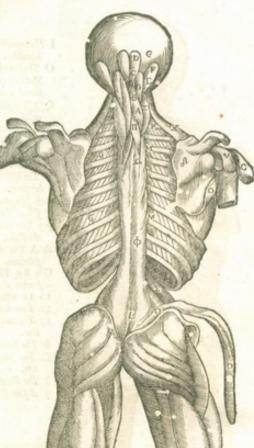

Marvel not if you find not this diffinction of their original to plain and manifest, for it is commonly obscure. For the Muscle Spinstm, as it most commonly comes to pass, arising from the The Spinstmst roots of the feven upper Spinsts of the Back, and the last of the neck, is inserted into other Spinsts of the Neck, so that it might easily be consounded with the former by Galen. The third bends the the Neck, fo that it might eafily be confounded with the former by Osien. The third bends the Neck, and arifing within from the Body of the five upper Veribre of the Back (though with a very obfcure original, fpecially in lean Bodies) it afcends under the Gullet alongfi the Neck, even to the Nowl-bone, into whose inner part it is obscurely inserted. Wherefore it is likely that it helps not onely to bend the Neck but also the Head. This Muscle is made of oblique Fibers proceeding from the body of the Vertebra, all the way it paffes to the transverse processes of the other Vertebra. But it feems with its co-partner which is opposite to it, to make a certain hollow path upon the bo-But it feems with its co-partner which is opposite to it, to make a certain hollow path upon the bodies of the Vertebre, to the Gullet, and it is called the Long Muscle. The fourth and latt, which we The Language faid moves the Neck to one side, is called Scalous from the figure thereof; it ascends from the him. The Scalous der and upper part of the first rib of the Cheft, inserting it self into all the transverse process of the Neck by its Fibers, which as it were for the same purpose, it hath sufficiently long, that it may fasten it self from the furthest and lowest process of the Neck into the first or highest thereof. The passage of the Neck into the first or highest thereof. of the Nerves through this to the Arm makes this Muscle seem double, or divided into two. For

the Veins and Arteries pertaining to the Neck, they have been declared in the proper Chapters of the diffribution of the Veffels; it remains that you note, All these Muscles receive Nerves from the Vertebra, whence they arife.

CHAP. XVIII.

Of the Mufcles of the Cheft and Loins.

E must now speak of the Muscles both of the Chest which serve for respiration, as also of in what the the Loins. But first we must know that the build part of the Cheft, called the Meta Partire of the from the Vertebra of the Neck, confists of twelve Vertebra, the Loins of five, all which differ not Neck and Loins agree are they before he neek, but that they are thicker in their bodies than these of the Neck; neither and diagree, and diagree, and diagree. are they lefter in holes, neither have they their transverse processes maintincte or the Necks neither the Rack-bones of the Neck have. Besides, each of these Rack-bones alone by it self, on each side in the land. in the lower part thereof, makes a hole, through which a Nerve hath paffage from the Spinal-mar-row to the adjacent parts; when on the contrary in the Vertebre of the Neck, such holes or paffages

are not made, but by meeting together of two of them.

Concerning the processes of the Rack-bones of the Cheft, whether transverse, right or oblique they differ nothing from these of the Neck (I mean even to the tenth) but that the transverse see ing they are not perforated, as we faid before, do as it were fullain the Ribs, being flraitly bound to them with flrong Ligaments both proper and common a but after the tenth Forebra of the Back, the two other of the Back, and all thole of the Loins are different, not onely from those of the Neck, but also from the ten first of the Back, by reason of their oblique processes, because from the eleventh Cwhich is received, as well by that which is above it possible trader it, for the fireneth of the whole (which is received, as well by that which is above it, as that under it, for the firength of the whole Back, and the caffer bending thereof without fear of fracture or diffication) the above-mentioned proceffes of the lower Rack-Bones, which were wont to receive, are received; as, on the contrary, they receive, which are wont to be received. They differ befides from all the fore-mentioned, by reason of their Spines, because from the eleventh they by little and little do look upwards, contrary

But if any ask how the tenth Vertebra of the Back may be termed the midft of the Spine, feeing How the tenth But if any ask how the tenth Vertebra of the Back may be tenned the minds of the Spine, seeing now the tenth the whole Spine confiss of twenty four Vertebra? He may know that this may be true, as thus; If Vertebra of the the fix Bones of the Holy-bone, and the fourth of the Rump (being more grilly than bony) be faid to be the control of the Back may be faid to be the seeing the seei numbered amongst the Bones of the Spine; for then from the setting on of the head to the eleventh middle of the Rack-bone of the Back are seventeen in number, and so many from thence downwards.

the Must be set are feventeen in humber, and to many from thence downwards.

Spine.

Spine.

Spine.

Spine.

The Must be set us return to the Muscles of the Cheft ferving for respiration. First you must know that The number and action; and one besides in the midst which they call the Disphragma, or Midrist. Of the Cheft forty four, they can be set as a chiefe beside in the midst which they call the Disphragma, or Midrist. Of the The Muscles forty four, they can be set as a chiefe beside in the midst which they call the Disphragma, or Midrist. forty four, there are twenty two which dilate the Chelt in drawing in the breath; that is, the Sab dilating the

2227311

The Mufcles contracting the Cheft. The Sabela-was is the first ilating the .heft.

elavius, the Dentatus, or Serratus major in the opinion of fome, both the Rhomboides or Serrati postici; the oblique afcendent of the lower Belly, the eleven Intercostales, and the fix Intercartilaginei externi-On the contrary, as many contract the Breft in expiration; to wit, the Sacrolumbus, the oblique defeendent, the Right and Transverse of the lower Belly, the inner Triangular, the fix Intercartilagine, and the eleven inner Interestales. Of these twenty two dilating the cheft, the first from the fite is called The Subclavian, for it defcends obliquely from the inner and fore-part of the Clavicula or Coller-bone, was is the first into the Grifle of the first Rib, even to the Sternon, and dilates it. The second is the Serratus major, the greater Saw-muscle ariting according to the opinion of some from the whole Basis of the Shoulderblade on the infide and it is transverily inserted into the nine upper Ribs producing certain toothed or Suratus major. Saw-like processes, running further to the Bones of the Rib than to the Spaces between them, or Intercoftal Muscles, whereupon it hath the name of the Saw-muscle; yet some have referred this Muscle to them of the Shoulder-blade. The third defcends from the three lower Spines of the Neck, and the first of the Back, by means of a membranous and most thin ligament, into the three or four upper Ribs, running further into their Spaces or Intercofial Mufcles, than into the Ribs themselves,

Serverus poster whereupon it is called Serverus posterior & Superior, that is, the hinder Saw-muscle. The fourth in like

rior and Super-manner ascends by means of a membranous and thin ligament from the three upper Spines of the Loins, and the two laft of the Cheft, or Back, into three or four of the lower, or laft of the Baffard-ribs, fent forth further into them or their Booes, than into the Interconal Muscles possessing the spaces between them, wherefore it is called Serratus posterior & inferior, the hinder and lower Saw-muscle. More-over these two last Muscles have been called by a common name from their figure the Rhomboides, that is, the square Muscles. The fifth which we said was the ascendent of the Epigasirium, hath already been susticiently described in his place. The eleven Interestales externi, or external Intercostal muscles descend obliquely from the back part of the lower side of the upper Rib, into the fore part of the upper fide of the Rib lying, next under, after a quite contrary manner to the fix Intercartilaginei, who having like original and infertion amongst the Grisles, as the Intercostal amongst the Ribs, defeend obliquely from the fore-part backwards. And thus much of the Mufcles dilating the Cheft

Six Intercarrilaginei. But the first of the other Muscles, being as many in number, which contract the Chest in expira-The Sacretan-bus the first of tion, arising from the Holy-bone, and the oblique processes of the Loins, ascends (firmly and confu-those which fodly adhering with the Musculus facer, or Holy-muscle, which we shall describe hereaster) to the roots of the twelve Ribs, imparting in the afcent a small tendon to each of them, by which it draws these Ribs towards the transverse processes; and by reason of its original, it is called Sacrolumbus, that is,

the Holy-loin-Mufcle. The second, third, and fourth, which we said were the oblique descendent, right, and transverse of the Epigatrium, have been formerly described in their place.

But, by the way, you must note that these three Muscles of the Epigastrium, help expiration rather by accident than of themselves, to wit, by driving back the Midriff towards the Lungs by the entrails, which also they force upwards, by drawing the parts into which they are inserted towards the remaining which also they force upwards, by drawing the parts into which they are inserted towards their original. The fifth, which we call the Triangulus, or Triangulus, may be called the Compression of the Grisles, which proceeding from the inner-indees of the Sternon, goes to all the Grisles of the true Ribs. this is more apparent under the Sterman in Beatls than in Men, though it be not very obscure in them For the internal Intercolfal Mulcles, in my judgment, they arife, from the lower fides of the upper Rib, and descending obliquely from the fore-part backwards, are inserted into the upper side of the rib next under it; to that they may follow the production of the Fibers of the external Inter-cartilagine; as the fix Internal Intercartilagine; follow the fite of the external Intercoftal, proceeding from behind forwards; wherefore as well the Intercoftal, as the Intercartilaginei, every where interfect each other, after the fimilitude of the Letter X. I know forne have written that the Internal Mufcles (whether Intercostal or Intercartilaginei) ascend from the upper side of the lower Rib, forwards and backwards.

But if this were true, it would follow, that these Muscles admitted their Nerves in their Tail, and not in the r Head, feeing the Nerve always goes under the Rib, and not above it,

The last Muscle of the Chest, that is, the Diaphragma, or Midriff, is sufficiently described before; wherefore it remains, we describe the Muscles of the Loins. These are fix in number, on each side three, equal in thickness, firength, and fituation; one of these bends, and the other two extend the Loins; it is called by reason of the figure, the Triangulas or Triangular, which bends the Loins; it afcends from a great part of the hind-lide of the haunch-bone into the transverse processes of the loins, and the last of the Cheft, on the in-fide, for which cause it is made of Fibers, short, long, and indifferent, answering to the nearness or distance of the faid processes. The first of the extenders is called Somi-finatus, because even to the middle of its body it takes the original from the Spines of the Holy-bones and Loins, this with its oblique Fibers afcends from all the faid Spines to the transferse processes, as well of the Loins as Chest. The other is called Sacor, the Holy-muscle, because it takes its original from the Holy-bone, or the sides thereof; it ascends with its oblique Fibers to the Spines of the Loins, and of the eleven lower Rack-bones of the Cheft.

CHAP. XIX.

Of the Muscles of the Shoulder-blade.

Ow we must describe the Muscles of the extreme parts, and first of the Arm, taking our beginning from those of the Shoulder-blade. But first, that we may the better understand their description, we must observe the nature and condition of the Shoulder-blade1111 mm 101

Therefore the Blade-bone on that part which lies next unto the Ribs is fornewhat hollowed; where- The deferifore on the other fide it fornewhat bunches out. It hath two Ribs, one above, another below; by ption of the the upper, is meant nothing affection a border or right line, which looking towards the Templer is gove. the upper, is meant nothing elfe than a border or right line, which looking towards the Temples is ex-should tended from the exterior angle thereof under the Collar-bone even to the process Caracoides which blade. this Rib produces in the end thereof: By the lower, the under-fide which lies towards the lower belly and the short Ribs.

Befides, in this Shoulder-blade we observe the Basis, Head, and Spine. By the Basis we understand The Easts of the broader part of the Shoulder-blade, which looks towards the Back-bone. By the Head we under-the Blades, stand the narrower part thereof, in which it receives the head of the Arm in a cavity, indifferently The head of the Shoulder-blade of the Shoulder-blade of the Shoulder-blade of the Shoulder-blade. hollow, which it produces both by it felf, as also by certain Griffes which there failined, encompass that cavity. This kind of cavity is called Glene.

that cavity. This kind of cavity is called Glene.

This receives and contains the Bone of the Arm by a certain strong ligament encomposting and ftrengthening the Joint, which kind of ligament is common to all other Joints: this ligament arises from the bottom of the cavity of the Shoulder-blade, and circularly encompaffes the whole Joint, from the bottom of the cavity of the Shoulder-blade, and circularly encompaties the whole Joint, faffning it felf to the head of the Arm; there are also other ligaments beside this, which encompass and strengthen this articulation. By the Spine is meant a process, which arising by little and little. The Spine of upon the gibbous part of the blade, from the basis thereof where it was low and deprest, becomes the Blade. Higher until it ends in the Acromion or upper part thereof. Nature hath made two productions in this Bone (that is to say, the Acromion from the Spine, and the Coracoides from the upper lide) for the strengthening of the articulation of the Arm and Shoulder-blade, that is, lest the Arm should be easily strained upward or forwards; besides, it is fastined to the clavicle by the process. ned upward or forwards; befides, it is faffned to the clavicle by the process Acronion.

The Mufcles which move the Shoulder-blade are fix in number, of which four are proper, and der-blade, two common. The first of the four proper feated in the fore-part, ascends from the bones of two or fix of the upper Ribs to the Coracoides, which it draws forwards, and is called Serratus minor, i.e. the Serratus minor. leffer Saw-mufcle; which that you may plainly thew, it is fit you pull the pectoral Mufcle from the Collar-bone, almost to the middle of the Stermon. The other first opposite against it is placed on the fore-side, and draws its original from the three lower spines of the Neck, and the three upper of the Cheft, from whence it extends it felf, and ends into all the grifly bafis of the Shoulder-blade, drawing it backwards; It is called the Rhomboides. The third from its Action is called the Levator, or the Hea-Rhomboides. ver, or lifter up, feated in the upper part, it defeends from the transverse processes of the four first Ver-Levator, tebre of the Neck into the upper angle and spine of the Blade. The fourth called Trapezius or the Trapezius. Table-muscle, is seated in the back-part, and is membranous at the original, but presently becomes stelly: it arises from almost all the back part of the head, from all the spines of the Neck, and the eight upper Verebre of the Cheft, and then is inferted by his nervous part, almost into the whole basis of the blade, extending it felt above the Muscle thereof, even to the midst of the Spine, where being stelly it is inferted. it is inferred even to the Aeromion, the upper part of the Clavicle, and in some fort to the upper rib. This Mufele hath a three-fold action, by reason of its triple original. The first is to draw the Shoulder-blade towards its original, that is, to the Nowl and Spine of the Neck; the other is to draw it towards the Eack, because of the contraction of the middle or transverse Fibers, which lead it directly thinker; and the other to draw it downstants. thither; and the other to draw it downwards by reason of the original it hath from the fifth, fixth, feventh, and eighth Spine of the Vertebre of the Cheft.

But we must note that these diversactions are not performed by this Muscle, by the affishance of one onely Nerve, but by more, which come into it by the Spinal marrow, by the holes of the Vertebre as well of the Neck as the Cheft, from whence it takes the original. For the two other which are the common Mufcles of the Blade, and Arm, or Shoulder, we will describe them with the Muscles of the Shoulder, or Arm: for one of these which is called the Latifinnus, that is, the broadest, ascends from Latifinnus,

The other, named the Pellovalis, comes from the Sternon and Collar-bone to the Shoulder-blade Pellovalis. and Arm.

CHAP. XX.

The description of the Hand taken in general.

Ow it befits us to describe in order the Muscles of the Arm; but first we must know what it is that we call the Arm. But feeing that cannot fitly be underflood, unlefs we know what the hand is, feeing that the Arm is a part of the Hand, therefore first we must define what a Hand is, and then divide it into its parts. Therefore the hand is taken two manner of

ways, that is, generally and specially.

The Hand generally taken, fignifies all that which is contained from the joining of the Arm to What is the Shoulder-blade, even to the ends of the fingers. But in particular it fignifies onely that which is comprehended from the furthest bones of the cubit, or the beginning of the wrist, to the very final in general.

Therefore the hand in general is an inftrument of inftruments, made for to take up and hold any thing. It is composed of three great parts, that is, of the Arm, Cubit, and Hand, vulgarly and properly fo called; but the hand taken thus in particular is again divided in three other parts, the Carpus party to called ; but the hand taken time in Polibrachiale, the After-wrift, and the Fingers: all these parts (seeing each of them are not onely organical parts, but also parts of organical parts) are composed to the parts of organical parts. fed of all, or certainly of the moft of the limitar parts; that is, of both the Skins, the fiethy Pannicle, the fat Veins, Arteries, Nerves, Muscles, or Flesh, Coats both common and proper, Bones, Grisles and Ligaments: all which we will describe in their order;

The differences of the hand from the fire thereof.

But first I think good to admonish you of the differences of the hand taken from the fite thereof, and these differences are fix in number, the fore, the hind, the internal, the external, the upper and lower fide, or part thereof.

By the fore, we mean that part which looks directly from the Thumb to the Shoulder; by the hind, we understand the part opposite to it, which from the little singer looks towards the basis of the Shoulder-blade. By the infide, we fignifie that part which lies next to the fides of the body, when the Hand retains it natural fite; by the outfide, the part opposite to it. The upper and lower fide you

may know by the very naming thereof.

The Hand properly fo called, is divided into five Fingers, that fo it may hold and take up bodies; Why the hand is divided inof all figure, as round, triangular, fquare, and the like, and gather up the leaft bodies with the Fingers to fo many ends, as Needles, Pins, and fuch like. Fingers. Why the nails

Nature hath beflowed two Hands upon us, that fo they may help each other, each moving to why the hails are added to each fide. But for the taking up and holding of fmall bodies, it was fit that the Fingers of their the foft flesh own nature foft, should be armed with Nails, that confisting of foft flesh and a hard nail, they might of the Fingers. ferve for all actions; for the nail is a stay to the foft flesh, which otherwise would turn away in meeting with an hard body; the use of the Nails is to scratch, shave, and pull off the skin, to rend, pinch, and pluck, as under small bodies. They have not bony hardness, that so they might not break

Why the nails grow continually.

Yet other Creatures have hard Nails to ferve them in flead of Weapons. Their figure is round, because such a figure is less obnoxious to external injuries; and, by reason they are subject to wearing, they grow continually.

Nature hath placed fleth on the inner and fide part of the Fingers, fo to prefs more firaitly the things they once take hold of; fo, that beholding them close together we can hold Water that it may not run out. The length of the Fingers is unequal, that when they are opened and firetched forth, they make as it were, a circular figure; for fo it comes to pass, that the hand can hold all bodies, but especially round.

It remains that we profecute the distribution of the Veins, Arteries, and Sinews, which run over all the parts of the Hand taken in general and particular, whereby we may more commodiously

hereafter handle all the proper parts thereof.

CHAP. XXI.

The diffribution of the Subclavian Vein, and first of the Cephalica or Humeraria.

Wo large Veins descend from the Subclavian, the one from the lower side, the other from the higher. Yet fometimes, and most usually, both these proceed from the same common orisice, as in men of a low stature in the Arm. The one of these is called the Ascillaris, the other the Humeraria or Cephalick; therefore this Cephalick passing forth of the Subclavian runs superficially along the fore-side, between the Muscle Deltaider, and the tendon of the pectoral Muscle, and descends in the midst between the common Coat of the Muscles and the slethy Pannicle, even to the bending of the cubit, where in lean bodies it is plainly to be feen, whereas in fat bodies it is hardly to be perceived, being as it were buried in abundance of fat. This Vein having in its defeent fent forth fome fmall branches, both to the skin, as also to certain Muscles over which it runs, is divided into two, a little above the outward protuberation of the Arm. One of the branches into which it is divided descending obliquely to the fore-part of the cubit, a little below the bending of the cubit, it meets and is united with the like branch in the fame place, as shall be shewn hereafter.

That which arises from this concourse, is called the Median Vein, because it arises from two branches, and is feated between them. They usually open this Median Vein in the diseases of the Head and Liver, which require Phlebotomy; but if it shall not be sufficiently manifest, when you judge it must be opened, for a general evacuation of the whole body; you may cut one of these branches by whose concourse it is made, which you shall think the fitter, and because each branch draws from the next parts, according to the straightness of the Fibers, rather than from the opposite side; if you would evacuate the Head and Liver equally by opening either of these branches, it is convenient that opening that branch (for example) which comes from the Cephalick, you presently lay your Thumb upon it, until you suppose you have drawn a just quantity of bloud from the Liver by the Basilica or Liver-vein, which done, you may take off your Thumb and suffer the bloud to follow freely, by the open branch of the Cephalick, until you have drawn as much bloud as you shall judge requifite, otherwife you will draw it but from one part, to wit, the Head. So you shall evacuate it onely from the Liver, if you open the branch which comes from the Bafilica, and concurs to the generation of the Median.

Moreover, when there is need to open the Bafiliea, and it shall be no where conspicuous, the Cephalick or Median being easie to be discerned at the same time, you may in stead thereof open the Median, or if it be not to be found, the Cephalick, preffing but the trunk thereof with your Thumb, as we faid before, left the Head should be evacuated in stead of the Liver. You may do the fame in the Bafiliea, if when there shall be necessity to open the Cephalick, it shall not appear.

Most of those which at this day open a Vein, in stead of the Median, open that branch of the Basilica which ascends together with the Cephalick to make the Median. But you must understand
that the Median descends between the two bones of the cubit, even to the end thereof; and then
divided into many branches, it is at length spent on the back of the hand behind the Thumb, the fore and middle Fingers, or the After-wrift. Sometimes it runs back into the following branch;

more or lefs bloud from the Head or Liver.

The Median

How by open-ing the Me-

dian Vein you may draw

The Cephalick Vein.

and then at the Wrift it departs from it, to be bellowed upon the fore-mentioned parts. The other branch of the Cephalick, which we may call the fore and outward Cephalick, defeending directly down to the midit of the Wand, thence wanders overthwart into the hind part of the Arm, where increased with a branch from the Basilies, it is diffributed over all the back of the hand, which with the Median it provides her beauty and part of the fire very through the fore-mentioned parts. the Median it nourisheth. But the branches of these Veins do fo run through the fore-named parts, that by the way they yield them necessary provision.

CHAP. XXII.

The Description of the Axillary Vein.

He Axillary arising at the infertion of the pectoral muscle, or a little higher, after it hath produced the two Theracies, it is divided under the tendon of that Muscle into two fair is divided into the inner deep Axillary, and the skin or outward Axillary. The deep or inner having fill for his Companion in his descent, the Axillary Artery, and the Nerves of the third conjugation, after it hath produced the small external musculous of the Arm, it goes into ward Axillary the bending of the elbow, where running somewhat deep with the Artery and Nerve into the Muscles of the cubit, it is divided into three other branches, of which one descending with the Wand, slides under the ring into the inner side of the hand, and both bestowed two small branches, on the Thumb. under the ring into the inner fide of the hand, and hath bestowed two small branches on the Thumb, two others on the fore, and one upon the middle finger, fo that all of them afcend by the fides of thefe fingers, the other defeending with the Artery, as the former alongst the cubir fends branches to the reft of the fingers, like as the former. The third goes on the fore-fide between the two bones even to the wrift, and the square Muscle.

But you must note that the Veins of which we now treat, do not onely make these divisions mentioned by us, but infinite others besides, as well in the parts which they go to, as also in the inner Mufcles of the hand which they nourifh.

And thus much of the internal and deep axillary Vein. For the external or skin-axillary (which first appears under the skin, especially in lean bodies, a little above the inward production of the arm) it is divided in that place into two branches, the one whereof defeending to the bending of the Arm meets, and is united with the Cephalick branch, fooner or later, that fo it may produce the Median, as

The other branch having fent forth many shoots of a different length and thickness, as well into the skin, as into the other neighbouring parts, defcending alongst the lower fide of the bone of the cubit, properly so called, is at length spent upon the fore and outward Cephalick branch, which we faid descended alongst the Wand; and thus united, they run over all the hand, where in the right hand, between the middle and fore-finger, they make the Salvatella; but in the left, in the fame The Salvatella

place they produce the Splonties.

But always remember, (if in diffection you find any thing otherwise than we have delivered it.) that the distribution of the Vessels is so various, (especially in the hands) that there can no certain rule

and Splenitice;

CHAP. XXIII.

The Distribution of the Axillary Artery.

He Axillary Artery from the first original, which is presently after the the two Threacies defeeding between the Muscle called Biceps, or the two-headed Muscle, and the Brachiens, with the deep Axillary Vein, distributes a large branch amongst the outward Muscles of the Arm, which extend the cubit, and is fpent in the external Mufcles of the fame, which arife without from the productions of the Arm.

And this is called the Ramus Musculus or musculous branch, as also the Vein that accompanies this Artery. Then this Artery when it comes to the bending of the Cubit, thrusting it felf into the Mufcles bending the Fingers, communicates certain branches to the parts pertaining it feat into the Markes bending the Fingers, communicates certain branches to the parts pertaining to the de-articulation of the Cubit with the Shoulder, and other parts there fituate, as it did in the upper parts, by which it defeended hither. Verily it may be a general Rule, that every Veffel fends or beflows certain portions thereof by the way to all the parts by which it paffes. But if you should ask, why I have not cal Axiom.

profecuted these productions? I would answer, I never intended to handle other then large and fair branches of Veffels, by rash incision of which there may be appear danger of death or a difeate. For it protectited these productions? I would antwer, I never intended to mande other then large and fair branches of Vessels, by rash incision of which, there may happen danger of death or a disease. For it would be both an infinite and needless business to handle all the divarications of the Veius, Arteries, and Nerves. Therefore this Artery sank into these Muscles, when it comes almost to the midst of the Cubit's presently, or a little after it is divided into two large branches, the one of which alongst the Wand and the above it is carried into the hand on the inside and a longst the Cubit. Wand, and the other alongst the Cubit, is carried into the hand on the infide under the Ring. For both these branches are distributed and spent upon the hand after the same manner as the branches of the internal axillary Vein, that is, having fent by the way force little shoots into the parts by which they pass, at the length the branch which descends by the Wand of the remainder thereof, bestows two sprigs upon the Thumb, on each side one, and two in like manner on the fore-singer, and one on the middle; the other which runs alongst the Ell, performs the like office to the little and the middle or Ring-finger, as you may fee by diffection.

CHAP. XXIV.

Of the Nerves of the Neck, Back, and Arm.

Nerves of the Neck.

Ow we should handle the finews of the Arm, but because these proceed from the Nerves of the Neck and Back; I think it fit therefore to speak something of them in the first place.

The first pair.

Therefore from the Neck there proceeds feven pair of Nerves, the first of which proceeds from the Nowl-bone, and the first Vertebra of the Neck; as also of the first pair of the Back from the last Vertebra of the Neck, and the first of the Chest. But all these Nerves, divided into two or more branches of the first pair (that is to fay, on each fide) go, the one to the small right Muscle, ascending from the first Rack-bone of the Neck to the Nowl-bone, the other, to the long Musele on the fore-fide of the Neck.

The fecond

The branches of the fecond pair are distributed, some with a portion which they receive from the third pair over all the skin of the head; the two others go as well to the Mufcles, which are from the fecond Vertebra to the back-part of the head; and from the fame to the first Vertebra, as also to the long Mufcle before-mentioned.

The third pair.

One of the third pair of finews is communicated to the Head, as we faid before, but others to the Muscles which extend, or erect the Head and the Neck; there is also one of these distributed into the neighbouring fide-Muscle and part of the long.

The fourth pair. The fifth pair.

The Nerves of the fourth pair go, one to the Muscles as well of the Neck as the Head, and to the broad Muscle, the other, after it hath sent some portion thereof into the long Muscle and the side-Muscles of the Neck; it descends with a portion of the hith and fixth pair to the Midriff. One of the branches of the fifth pair is bestowed on the hind Muscles of the Neck and Head, the other upon the long-Muscle and Midriff; the third is communicated to the Levatores or Heaving-Muscles of the Arm and Shoulder.

The fixth pair.

One of the Nerves of the fixth pair goes to the hind-Muscles of the Neck and Head, another to the Midriff, the third with a portion of the seventh pair of the Neck, and of the first and second of the Cheft go to the Arms, and heaving-Mufeles of the Shoulder-blad

The feventh pair.

One of the branches of the feventh pair runs to the broad-Muscle, and to the neighbouring Muscles both of the Neck and Head; another, increased with a portion of the fifth and fixth pair of the Neck, and a third joined to the fecond and third pair of the Cheft defeending into the Arm, go to the Hand.

But you must note that the Muscles which take their original from many Vertebra, whether from above downwards, or from below upwards, admit Nerves not onely from the Vertebra from whence they take their original, but also from them which they come near in their descent, or ascent.

The 12 pair of Nerves of the cheft. The first pair.

There pass twelve Conjugations of Nerves from the Rack-bones of the Chell. The first entering forth from between the last Rack-bone of the Neck and the first of the Cheft, is divided (that is, on each fide each Nerve from his fide) into two or more portions, as also all the rell. Therefore the branches of this first Conjugation go some of them to the Arms, as we faid before, others to the Mufcles, as well thefe of the Cheft, as others arifing there, or running that way.

The branches of the fecond Conjugation are distributed to the fame parts, that these of the first

The fecond pair. The other pairs.

But the branches of all the other Conjugations even to the twelfth, are communicated, fome to the intercostal Muscles running within under the true ribs even to the Sternon, and under the Bastard-ribs even to the right and long Muscles; and the costal Nerves of the fixth Conjugation are augmented by meeting these intercostal branches by the way as they descend by the roots of the Ribs-Other particles of the said Nerves are communicated to the Muscles as well of the Chest as Spine, as

the fame Mufcles pass forth, or run alongst by the Vertebra, from whence these Nerves have either their original or paffage forth.

The Nervet ried to the Arms.

Having thus therefore shewed the original of the sinews of the Arm, it remains that we shew their hich are car- number and distribution.

Their number is five or fix; proceeding from the fifth, fixth, and feventh Vertebra of the Neck, and the first and second of the Chest. The first of which not mixed with any other from the fifth Vertebra of the Neck, goes to the Muscle Deltaides, and the skin which covers it.

The other four or five when they have mutually embraced each other, not onely from their first original, but even to the thoulder, where they free themselves from this convolution, are distributed after the following manner.

The first and second descending to the Muscle mentioned a little before, and thence sometimes even to the Hand, is by the way communicated to the Mufcle Bierps, and then under the faid Mufcle it meets, and is joined with the third Nerve. Thirdly, It is communicated with the longest Muscle of the cubit, in the bending whereof it is divided into two branches descending alongst the two bones. of the cubit, until at last born up by the sleshy pannicle it is spent upon the skin and inner side of the hand.

The third lower than this, is first united with the second, under the Muscle Bierps, and then straightway feparated from it, it fends a portion thereof to the Arm which lies under it, and to the skin there-

of, laftly, at the bending of the cubit on the fore-fide, it is mingled with the fifth pair.

The fourth the largest of all the rest, coming down below the third branch under the Bierry with the internal Axillary Vein and Artery, is turned towards the outward and back-part of the Arm, there to communicate it felf to the Muscles extending the cubit, and also to the inner skin of

minute in

of the arm, and the exterior of the cubit; the remainder of this branch when in its defcent it hath arrived at the joynt of the cubit, below the bending thereof it is divided into two branches, the one whereof defeending alongft the cubit, is spent on the outside of the wrist; the other affects-

ting the wand, is on the outfide in like manner in two branches, bellowed upon the thumb, and in as many upon the fore-finger, and by a fifth upon the middle finger, though more obscurely.

The fifth branch being also lower than the reft, fliding between the muscles bending and extending the cubit, when it comes behind the inner protuberation of the cubit (in which place we find that the protocolour in the cubit in the protocolour in the cubit (in which place we find that the protocolour in the cubit (in which place we find the cubit (in which faid before the third branch meets with this) it is communicated to the internal muscles of the fame, and then divided into three portions, one of which on the outside alongst the middle of the cubit, goes in two fprigs to the little finger, and fo many to the middle finger, and one to the chart, goes in two trings to the little linger, and to many to the mager, and one to the ring-finger; the other two, the one without, and the other within the ring, go to the hand: where after each of them hath beflowed what was requifite on the mufcles of the hand, they are wafted into other five fmall portions, of which these which are from that portion which descends without the ring, fend two fprigs to the little, two to the fore, and one to the middle finger, but those which come from that which paffes under the ring, by such a distribution communicates it self to other singers, as two springs to the thumb, two to the fore, and one to the middle-singer. The fixth the loweit, and laft, runs between the skin and fleshy pannicle, by the inner protuberation of the arm, and then is fpent upon the skin of the cubit.

CHAP. XXV.

The description of the Bone of the Arm, and the muscles which move it.

Ecause we cannot perfectly demonstrate the original of the muscles of the arm, (especially of the two arm-mufcles) not knowing the description of this bone; first therefore we will describe it, then return to the original of the muscles arising from thence. The bone of the arm is the greatest of all the bones in the body, except the thigh-bone; it is round, The greatness and figure. hollow and filled with marrow, with a great appendix, or head, on the top thereof, having an indifferent neck, to which it is knit by Symphyfis, for appendices are no otherwife united to their of the appendix bones. In the lower part thereof it hath two processes, or protuberations, one on the foreside, the appendix another on the hind, between which swellings there is a cavity like to half the company of a wheel of the arm. another on the hind, between which fwellings there is a cavity like to half the compass of a wheel, of the irm. about which the cubit is moved. The extremity of this cavity ends in two holes, of which one is the more external, the other more internal: These cavities receive the heads of the cubit, that is, the fore, or internal, receives the fore process when the arm is bended inwards; but the external or hinder, the exterior as it is extended.

For the head of the arm, it hath a double connexion, the one with its own neck by Symplogia; that is, a natural union of the bones without any motion; the other with the lightly ingraven cavity of the shoulder-blade, which we call Glose, by that kind of de-articulation which is called Aribrodia: This connexion is made firm and stable by the muscles descending into the arm from the shoulder-blade, as also by the proper ligaments descending from the circle and brow of the cavity of the Acronion and Coracoides to this head of the arm; this same head of the arm is, as it
were, more cleft and open on the inner-side, than on the foreside, that so it may give way to one of the ligaments coming from the shoulder-blade to the muscle Bineps. Forasmuch as belongs to the lower end of the bone of the arm (which we faid hath two procedles;) we may say that it is fastened to the bones of the cubit by two forts of articulation; that is, by Ginglymus, with the Ell of proper bone of the cubit; and by Arthrodia, with the Radius, or Wand, which in a lightly ingraved cavity receives the fore process of the arm, and is turned about it for the motion of the hand. The hinder process is chiefly added for the fafety and preservation of the veins, arteries and nerves.

These things thus shown, it is worth our labour to know the figure of the arm it self, as it lies The figure of how conveniently to reflore it; therefore first we must understand, that this bone is somewhat bended and hollowed on the inside under the eleft of the head thereof, but bunching out on the

Wherefore feeing it must be moveable forwards and backwards, upwards and downwards, Na- The eight ture for the performance of fo many motions hath furnished it with eight mulcles, which are fix mulcles thereproper and two common with the shoulder-blade. Of which number, two move it forwards, two of. proper and two common with the houlder-blade. Of which number, two move it priwards, two backwards, two upwards, two downwards. Which must not be understood so, as that these two muscles should move it directly forwards, inclining neither upwards nor downwards; and the other two should move it so upwards, as it should incline neither sorwards nor backwards; but thus, That it cannot be moved neither to this nor that part, unless by the help and proper action of this, or that muscle. Thus therefore, if the pechoral with his affociate perform their duty s of action, the arm is always moved forwards, as it is lifted up by the action of the Description of the proper action. action, the arm is always moved forwards, as it is lifted up by the action of the Delacides, and his

But to come to the original and infertion of these muscles; the one of these two which move The original But to come to the original and intertion of their matters, the one of their two which move the original, the Pectoral, arising from more than half of the and intertion of the arm forwards called by reason and the fixth, seventh and eighth rile arms and fathers is of the nestern Collar-bone; and almost all the Sternon, and the fixth, feventh and eighth rib, goes up and failers it of the pestoral felt to the Goracoides, by a membrane or a membranous tendon sufficiently strong (for which cause it is muscle; faid to be common to the shoulder and arm) and it goes into the arm between the muscles Deltaider and Beeps with a firong tendon composed of fibers croffing each other, of which forme defected from the Collar-bone, and the upper part of the Sterner, others afcend from the lower original hereof; that is, from the fixth, feventh and eighth sibs; and although the action of this muscle be diverse by

The Eponis, or

wards, whether it be moved upwards, downwards, or to the breatt; the other which is his companion, descends from the whole lip or brow of the timous, or hollow part of the blade, which it fills in the fore-part of the arm near the head thereof. For the two Levatores, or the litters up of the arm, the The Delevides, first named Delevides, descends almost from half the clavicle, the process Accomion, and all the spine of the shoulder-blade into the fore-side of the arm, the breadth of four singers below the joynt. It hath divers actions according to the diverlity of the fibers, as also every muscle hath; yet howfoever it is contracted, whether by the fibers from the clavicle alone, or by the spinal alone, or by both at once, it always lifts and heaves the arm upwards. The other which is his Affociate descends from the gibbous part of the thoulder-blade, contained between the upper rib thereof, and the fpine between the processes Acromion and Corsesides, to the neck of the arm; and this we will call the Eponis or Scapularis; that is, the shoulder-muscle. But the first and larger of the two muscles, which draw the arm backwards, arifes from the greatest part of the utter lip of the gibbous part of the shoulder-blade, which is under the spine thereof, and lying upon the blade it felf, it goes into the hind-part of the arm above the neck thereof. The other which is contiguous to it, and his partner in working, but leffer, paffes from the upper and exterior part of the lower rib of the shoulderblade, and thence, as it were, in fome fort extending it felf upon the gibbous part thereof, near unto that rib, it goes into the arm. This muscle seems to be the same with the former, being stelly without, even above the top of the shoulder. One and the lesser of these two which draw downwards, enters out from the flait line of the lower rib of the blade, and goes into the lower part of the arm about the neck thereof. The other called the Laiffinnia, or broaden, afcends from the spines of the holy-hone of the loins, and often also from the nine lower of the cheft, by the lower corner of the thoulder-blade into which it is inferted by a membranous tendon, as also it is into the inner part of the arm near the neck by another firong tendon; whereupon this mufcle is called a common mufcle of the shoulder and arm. But when this muscle happens to be wounded, the arm cannot easily be firetched forth, or lifted up.

CHAP. XXVI.

The description of the Bones of the Cubit and the Musicles moving them.

Fter these Muscles, follow those which bend and extend the Cubit, but because their infertion cannot be firtly demonstrated, unless the bones of the cubit be first described; therefore first of all, we will delineate the bones themselves. But verily, less this doubtful word Cubit should cause obscurity; first, we must note, that it hath a threefold signification, for oft-times it is used for all that part of the hand which lies between the arm and writh, ofttimes for the lower bone of this part, formetimes for the upper part of this bone, which is turned within the orb, or cavity of the arm (no otherwise than a cord in the wheel of a Pulley) and this is called the Olecranon. Here truly we use this word Cubit in the first fignification. Wherefore, we fay, the cubit is composed of two bones, the one of which we call the Radius, or Wand, or the What is means leffer Facile of the arm; the other we properly call the Cubit, or Ell. These two hones slick to by the cubit. leffer Fecile of the arm; the other we properly call the Cubit, or Ell. These two bones stick to by the cubit, gether at their ends being sirmly bound together by strong ligaments; but the middle-parts of What the olethem are a pretty way diffant from each other, and chiefly towards their lower ends, for the better fituation and paffage of the mufcles and veffels from the inner fide to the exterior, as shall be bones of the other at the lower. The wand hath two Epiphyles, or Appendices, the one at the upper end, the cabir, for proceedings of the bone of the arms bound to the farms by flower linear process of the bone of the arms bound to the farms by flower linear process of the bone of the arms bound to the farms by flower linear entire deforming a small from fore process of the bone of the arm, bound to the same by strong ligaments, descending as well from the process of the bone of the arm, bound to the same by strong ligaments, descending as well from the process of the arm, as the Olecranon into the circumjacent parts of this appendix of the wand. This connexion is made for this use, that we may turn our hand upwards and downwards pendices of by the cubit turned and twinedabout this process. But the lower appendix of this wand is holtoned on the inside, that so it might more commodiously receive the bones of the wrist; but gibbous without, that it might be safer: Now this wand is softer and thicker at the lower end, but and safe of the lesser and harder above, where on the inside it bath a swelling out, whereby to receive the muscle wand. Elefter and harder above, where on the infide it hath a fwelling out, whereby to receive the mufcle wand.

Biespr: Belides, on the out-fide of the middle thereof it is fornewhat gibbous and round, fo to become more fafe from the injuries of external bodies; but it is hollowed or bended on the infide, for the better taking and holding any thing in the head. But they fide which which lies for the better taking and holding any thing in the hand. But that fide which which lies next to the Ell is flatted for the fitter original and feat of the Muscles; lastly, it is feated upon the bone of the Cubit, or Ell, just against the thumb. But the Ell, or bone of the cubit properly and particularly fo called, hath in like manner two appendices, the one above, the other beneath. The upper, which also is the greater, is fitted to the orb of the arm in which it goes to and again for the excess of the bone. which also is the greater, is intent to the color than a rope runs in a pulley, but that it turns not of the cabet tension and bending of the arm, no otherwise than a rope runs in a pulley, but that it turns not of the cabet absolutely and perfectly round, which is caused by the two processes of unequal bigness, the which are therefore flayed in the holes or cavities of the bone of the arm, the greater process which we called Olegranss is letted by the exterior hole, that so the extension of the arm can be no further, but the leffer process by the inner hole, makes the bending thereof the less perfect. The composure of these bones is by Ginglymor, and it is threngthned not only by common ligaments coming from the muscles, which move the bones themselves, but also by proper liga-

ments

11111

The figure of the cubit bone or ell. ments, defeending from the processes of the arm and the lips of the holes and cavities standing about the appendix of the cubit. The other lower and leffer appendix is in fome fort hollow on the infide for the fitter receiving the bones of the wrift, but the outfide is round, and ends in a point, which is called by the Greeks Styloider. But now this Ell (contrary in this to the wand) is thicker towards the arm, but flenderer towards the wrill. And belides, in the thicker part thereof, it is hollowed or bended towards the infide, and in the fame place is gibbous or bunching forth on the outfide: but it is round and firait, unless on that fide which lies next the wand: For the reft, it is hollow and full of marrow like the wand. The fite of the Radius, or wand, is oblique, but that of the cubit or ell, is right, that the arm might be the better and more eafily moved; because the motion by which the arm is extended and bended, is according to a right line, but that by which the infide of the hand is turned upwards and downwards, is performed obliquely and circularly. Wherefore it was expedient, that the wand should be oblique, and the cubit strait; for the cubit-bone is appointed for to extend and bend the arm, but the wand to perform the wheeling and turning about thereof; and this is the caufe that it was fitting, there should be a different connexion of these bones with the arm. These things were fitting to be spoken concerning the nature of these bones, that in the cure of fractures we may work the more fafely and happily, taking indication from that which is agreeable to nature: Wherefore now it remains, that we come to the description of the muscles which are seated in the arm, the cubit-bone or ell. These are four in number, two extending it, and two bending it. The first of the benders is called Bierps, by reason of its two heads, the one whereof descends from the Coracoides, the other from the lip of the cavity of the thoulder-blade by the fiffure or cleft of the head of the bone of the arm. These two heads under the neck of this arm becoming flethy, are firmly united at the belly and midfl of the arm, and thus united, are at the length implanted by a strong tenden to the inner protuberation of the wand. The other is called the Brachieux, by reason of the strait coherence thereof with the bone of the arm; this fastened under the Bierps, defeends obliquely on the back and upper part of the bone of the arm into the top of the wand and the inner isde of the ell. But the first of the extenders is called the Longitt, or long-muscle; this descends from the lower rib of the shoulder, and cleaving to the bone of the arm, goes this ther (faftened, and as it were always firaitly joyned with his fellow-mufcle, specially near the cubit) wherefore you shall prefently hear. The other, termed the Brevis, or short mulcle, being the companion of the long, defcends on the hind-part of the neck of the bone of the arm, as it were growing to, and lying under the former long-mufcle, to that making one common broad tendon outwardly fieldy, inwardly nervous, they are inferted into the Oleconom, to by mutual affiftance to extend the cubit.

C H A P. XXVII.

The Description of the Bones of the Wrift, After-wrift and Fingers.

What the hand properly & called is,

E faid before, that the hard taken more particularly, and properly, is divided into the wrift, after-wrift, and fingers; and that the hand in this lignification is bounded by the ends of the bones of the cubit and fingers. All the parts of the wrift, which it hath common with the after-wrift, have been already also pleutifully explained: This only remains to be noted, that the skin as well of the hands as of the feet, is of a middle nature between pure fleth, and pure skin; no otherwise than that which covers the forehead, but that this which covers the palms of the hands, and foles of the feet, is unmoveable: But it is most thick, especially on the feet, left it should be casily offended by continual going. Belides the common parts, the wrift is compoled of eight finall bones mutually knit together in a certain order, and by Diarthrofir with the two bones of the cubit, but mutually and amongst themselves by Synarthrofir, by interpolition of griffles and ligaments as well common, that is, coming from the mufcles, as proper, defeending always from the upper to the lower. But these same bones are some less than othersomes belides, they are hard, and without marrow, gibbous on the outfide for the fecurity and corneliness of the hand, but hollow on the infide for to give way to the tendons going into the fingers. Thefe bones are disposed in two ranks, the first rank contains only three, but the second five. The three of the first rank are thus arrayed, or placed, that one of them may receive the appendix Styloides, of the cubit; the other the elland the wand together; and the third may be received by the wand. But three of the five bones of the fecond order fuftain the four bones of the after-wrift, and are knit to the fame by Synarthrofis; after which manner of connexion they are joyned to the bones of the first rank, the fourth sustains the first bone of the thumb, to which also it is co-articulate by Synambrofis; the fifth and last is feated on the infide against the ell, chiefly above that home of the first order, which receives the appendix Styleides of the cubit: This is least and weakelt of them by reason of its griftly substance, which makes the ring with certain ligaments running from one the inner fides of the wrift to the other.

What the As-

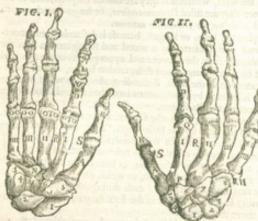

This ring is placed there, as well for the prefervation of the finews, veins and attries palling under it (left when we lean upon our hand and wrift, these parts should be hart by compression) as also for the commodity of the action of the muscles bending the singer, which in the performance of their action and the contracting themselves, might deform the hand by their passing forth of the cavity of the wrist. For what attraction soever is made by strings, if it be free, and not hindred, is according to a strait line.

The bones of Now follow the bones of the fecond part of the hand, or of the after-wrift, These are four in the after-wrift, number, gibbons without, but arched within, or hollow in the middle; for, hence is the palm of

1111/1/10 (II)

the hand, or certainly the greater part thereof; their ends next the fingers are fornewhat remote from each other, that in these clifts the muscles Interoffer might find a place and feat. But these ends have each an appendix, as you may perceive in the Sceleton of a Child. But you must note, that he should be supported to the sould be supported to the support of the supported to the support of t that by the first bone of the wrist, or after-wrist, we mean that which is in the fore-side of the hand, that is to fay, that in the wrist which lies under the thumb, and that in the after-wrist, which is feated under the fore-singer, as those which keep in order the singers; which exceed the rest in neceffity and dignity.

The Figure of the Boxes of the Hand. The first shewesh the inside of the right-hand, and the second shews the back-fide of the same.

wrist, lying under the thumb. I II III The four other bones of the after-writ annexed to the

fingers.

BC The 1100 bones of the thumb. DEF 1 2 The three bones of the fore-finger which are the same in the other fingers.

M 1 2 A little bone sometimes fastned outwardly at the joynt of the eighth bone of the wrist.

N I A process of the eighth bone of the wrift, swelling out into the ball of the hand.

O 1 A process of the fifth bone of the ceeds. P 2 An appendix of the bones of the wrift, by which they are articulated to the after-wrift. Detween the bones of the after-wrift. S 1 2 Two little feed-bones fet on the infide and outside of the first joynt. T 1 Two feed-bones in the first of the four-fingers. V V 1 One feed-bone in the fecond and third is the finger.

After these follow the fifteen bones of the fingers; that is, three in each, which are hollow The bones of and fifulous, full of a thin and liquid marrow, and not of gross and thick, as in the arm and thigh, the fingers.

They are outwardly gibbous, but inwardly hollow and flat for the fitter feat of the tendons afternding alongft the fingers on the infide even to the upper joynt. The which that Nature might the better firengthen and preferve, it hath produced from the lips of the inner cavities of these bones a membranous and firong ligament, which running over-thwart from one fide to the other doth for firaitly close the tendons to their bones, that they cannot go forth of their places, or incline to either fide. They are connexed on the out-fide, that they might be more fit to hold any thing. But for the first bones of the four singers and thumb, four are joyned together with so many bones of the after-wrist by Synarbrofis, for the bones of the after-wrist are moved by no manifest motion; the fifth is knit to the fecond rank of the bones of the wrift, therefore that bone cannot be attributed to the after-wrift, as some have written, seeing it hath manifest motion and is knit by Diarrhrofus, but the bones of the after-wrift are only faitned by Synarthrofus. For the fecond and third rank of bones of the fingers, they are knit the second to the first, and the third to the second by Diambrofir and Arthrodia, because, besides the manifest motion they have, they receive each other by a superficiary cavity; as those of the first rank, the bours of the after-wrist; and those of the fecond rank, them of the first; and those of the third, them of the second. And all the bones of the tingers are larger and thicker at their basis, but smaller towards the ends; and they are bound by ligaments especially proper, which (as we faid formerly) descend from the first to the second; fo that the laft bones, feeing they have not to whom to communicate their nerves, make and produce nails thereof: Wherefore the nails are generated by the fibers of the ligaments, and the ex-Whence the crement of the tendons which are terminated at the bottom of the nails. Now remain the Offa nails are generated by the fibers of the ligaments, and the ex-Whence the crement of the tendons which are terminated at the bottom of the nails. Now remain the Offa nails are generated by the fibers of the ligaments. crement of the tendons which are terminated at the bottom of the naiss. Now temain the Off a mais are geSefamidea, or feed-bones: These are nineteen in number in the inner joynts of each of the hands, nerated,
and as many in each foot, viz. Two in the first joynt of the four fingers, and in the second of the maidea, or
thumb, and one in each of the rest. For the inner side of the joynts, you may for the most part obfeed-bones. ferve one in each of them; yet in the fecond joynt of the thumb there be two above the two ten-

ns, which are tomewhat, granty.

They are made for this ule, that they may firm and firengthen the joynts, fo that the bones of the Their ule. I hey are made for this use, that they may the fingers may not be turned awry, or thrust forth of their places by strong and violent motions, as it formetimes happens in the whirlbone of the knee. They are called Sefamoidea, from the refernblance they have to the feed of Sefamum, which is formewhat long and flat.

Of the Muscles, which seated in the cubit, move the Wand, and with it the hand.

The muscles of the cubit.

The Supina. The Carpites-The Digitum-The Oiliquater The first of the Supinate-The fecond.

The upper of the Carpiten-The lower.

tenferes.

The lefter.

The Obligation or Abdaller extenses,

Ow we must describe the muscles of the formerly described parts; that is, those which are feated in the cubit, which are carried to the infide of the hand, and those which are cal-led the Interoffer. Now the muscles of the cubit are fourteen, seven external, and seven internal; two of the feven external do primarily twine or turn up the Wand; and fecondarily, or by accident, turn the palm of the hand upwards, whereupon they have called them fupinatores, or turnes up of the hand; two extend the wrift, whereupon they are named Carpi-tenfores, or the writt-extenders; two the fingers, whence they are filled Digitum-tenfores, or finger-freechers; to conclude, the feventh and last is termed Abdustor, or Obliquator externus.

The first of the two Supinatores is called the long, or longest, because it descends from the outfide of the arm above the proceffes thereof, and is inferted by a round and firong tendon into the lower appendix. The other defeends obliquely from the outward and upper process of the arm, and is inferted at the third part of the wand by a membranous and flelhy tendon before, and on the infide thereof. The upper of the two extenders of the wrift, defcending above the wand from the external and upper process of the arm, is inferted by two tendons into the first and second bone of the after-wrift, which fuffain the fore and middle-fingers.

The other and lower, descending from the same place as the sormer, above the cubit, is inserted into the fourth bone of the after-wrift which bears up the little-finger. These muscles whilst they move alone, that is, each with his Antagonift, to wit, the wrift-benders, they move obliquely, The greater of upwards or downwards, the whole hand properly so called. The first and greater of the extenders of the fingers, or finger-firetchers, ariling from the Olecranim, or bone of the cubit, defeends fuperficiarily between the two bones of the cubit even to the wrift, in which place it is divided into four tendons, which paffing under the ring feated there, end (each diffinguished by a common ligament above the bone of the after-wrift) in the laft joynts of the four fingers, adhering nevertheless firmly to the bones, which are above thele joynts.

The other, which is the leffer, arifing almost in the middle of the wand, goes obliquely to the thumb, into which it is inferted by two tendons: The one thicker, which is inferted into the root thereof, and draws it from the other fingers; the other flenderer continued even to the upper

joynt thereof, and by its action extending the thumb.

The feventh, which is the Abductor or Obliquator, is feated at the hind-part of the hand; that is, towards the little finger: We have often found this divided into two, yea verily we have found it trifide, or divided into three, this year in three or four bodies; one portion thereof went to the lower fide of the ring-finger with two tendons, the other in like manner to the middle and forefingers, and the third to the thumb.

And for all that it is thus divided, yet some have taken and accounted it for one muscle, because it hath one original and action, which is, to draw the tingers backwards; fome have added to this the extender of the thumb, by reason of their common original; and thus of four muscles they have made one, divided into feven tendons, distributed, as is formerly shewed. But when the Obliquator of the ring-finger is wanting, as it often happens, the extender of the finger fupplies that defect by certain productions of tendinous firings. But fome also have written, that this muscle which we said hath seven tendons, is only a production of the deep fore-muscle, which should be fent through the space between the bones of the cubit; yet I had rather make it a muscle of it felf, by reason of its strait adhesion with the bones of the arm and wand. And let thus much suffice for the external mufcles of the cubit, which you may comprehend in the number of feven, as we have done; or in fix, if you take away one of the four; or in nine, if you had rather refolve it into four with Galen; or in eight, if you divide this muscle only into three. For in very deed the Abduller or Obliquator of the ring-finger is not often found in men.

Now must we come to the inner muscles of the cubit, the first of which compasses the skin of the palm of the hand, whence it is called the Palmaris. The second and third joyned by the com-The muscles of the inner part of the cumanion of their action turn down or prone the wand, and confequently the hand, so that the palm looks towards the feet, whereupon they are called Pronatores.

The fourth and fifth joyned also in affinity of action bend the wrift, wherefore they are named Carpi-flexores, wrift-benders. The fixth and feventh are appointed to bend the first, second, and third joynts of the fingers, wherefore they are termed Digitum-flexores, Finger-benders. For their The Palmaria, original; the Palmaria, the least and uppermost of them all, descends stelly from the hind-procels of the inner arm, and a little after ending in a long flender tendon, it is spent in the skin of the palm of the hand even to the roots of the finger. For it was necessary that the skin should ftraitly cohere with the fubjacent parts, not only for the fitter taking or comprehension of any thing, left that skin in holding should be wrinkled and drawn away from the palm and fingers, and to be an impediment; but belides, that the hand might have a more exact tente to diftinguish of hot, cold, moift, dry, fmooth, equal, rough, foft, hard, great, little, and fuch other qualities. Then follow the two Primatores, of which one called the round, comes obliquely from the inner fide of the hind-process of the arm almost to the middle of the wand, to which it adheres by a membranous and sleshy tendon, even to the place appointed for insertion. The other, square three or four singers broad, yet somewhat slender, seated within under all the muscles which descend on the infide to the writt or fingers, upon the ends of the bones of the cubit, afcends transverse from below the ell, unto the top of the wand, where it ends in a membranous tendon. Both the Carpiflexares, or wrift-benders, arise from the hind, but inner process, and descend obliquely, (the one

The Propate-

The Capiflexwes.

minimum.

· IFEN III . D. SATA

more, or less than the other) the one alongs the ell, but the other alongs the wand; and that which descends alongst the ell, is inserted into the eighth bone of the wrist, which we said made part of the ring; the other which follows the wand is inferted with his greater part into the bone of the wrift, and with the reft into the first bone of the after-wrift which fusiains the fore-finger.

wrift, and with the reft into the first bone of the after-writt which intrains the fore-singer.

Now remain the Digitum-flewers, or finger-benders, which because they lye upon one another, The Digitum-the upper is called the Sublimis, but the lower the Profundus. The Sublimis, or upper, arising from flexers, the inner part of the hind process of the arm, and from the upper part of the ell and wand, defends between the two bones of the cubit, even to the wrift and ring; divided into four tendors it is inserted into the second de-articulation of the four fingers, which it bends by the force of this his proper infertion; as as also the first, as well by the power of the common ligament, as by certain fibers coming from it, which it fends thither by the way in its passage. But these sour tendons near unto this their infertion are divided into two, fo to give paffage and add firength to the ten-dons of the deep mufeles defeending into the third and laft joynt of the tingers.

But this fame Profundur or deep muscle arising from the upper and inner parts of the ell and The Profundation, wand, descends between these two bones under the Sublimir, also undivided even to the wrist, Digital-fixer. where it is divided into five tendons which it brings forth under the common ligament, and the divisions of the tendons of the Sublimir even to the last joynt of the fingers, which they bend, by this their proper insertion, as also of the bones of the first and second joynts of the fingers by the means of the common ligament and fibrous productions which they bellow upon them by the way, Befides these fore-mentioned, there is seen also a certain membranous ligament which engirts the tendons in the compass of the fingers.

Digitam-flexur.

CHAP. XXXIX.

Of the Muscles of the inside of the Hand.

He muscles of the infide of the hand are seven in number; the first is called Thenry, be- The number He mailes of the infide of the hand are feven in number; the first is called Thems, because it makes the greater part of the palm; the second from the fite is called the Hyperof the muscle thenay; the third the external Abdullar of the thumb. The four other are called by of the infide reason of their figure the Lambrici, or wormy-muscles, or the Abdullarer, or drawers of the four of the hand, singers to the thumb. Now the first, called Thenay, thicker than the rest, arises from all the biones. The Thenay, of the after-wrist, taking its beginning from that bone which bears up the ring-singer, whence ascending alongs the vital line even to the end thereof at the first bone of the after-wrist surface. flaining the fore-finger, it is at length inferred into the last joynt of the thumb by the longest inbers, but by the middle and thortest ribers almost into all the inner parts of the first bones of two joynts, and by reason of this, the thumb is drawn to the other singers, and from them again by his

Some dividenthis mufele into three, by reason of his diverse actions, making the first to arise from the root of the bone of the after-writt which bears up the ring-finger; but the other from that middle bone of the after-wrift which fuftains the middle-tinger; but of the third, from the upper end of that bone which under-props the fore-finger; and that the infertion of them all, is, as we formerly mentioned. But the former opinion likes me better, both for thunning confusion, and abbreviating the doctrine of the number of mufcles.

The Hypothesiar arises from the fourth bone of the after-wrift, and that bone of the wrift which The Hypothesia fastains it, and then with its longest fibers, it is inferted into the second joynt of the ring-finger, and by the shortest into the first, through which occasion, as also in respect of its two-fold action, forme have divided it into two, that the one of them might lead it from the reft, and the other might

The third the external Abdullar of thumb, descends from the first bone of the after-wrist, into The external the first and second joynt of the thumb; wherefore some have divided it into two. The Lumbrici, Abdullar of or four external Abdullarer, of the fore-fingers, arise from a membrane, investing and binding to the thumb, gether the tendons of the Digitum-flexurer, or singer-benders, and at length on the sides towards the thumb even by a small tendon, running events the second source of the four-singers.

Now the Interoffer of the after-wrift, remain to be spoken of; these are fix, two in each of the Interoffer. fpaces between the fingers, one internal, the other external, of which the internal defcending with oblique fibers from the fide of the first bone of the after-wrist, goes also into the fides of the fingers, that so it may the more closely bind together the bones of the after-wrist, whose action is manifested, when we thrust our fingers into a firait glove, or when we bend our hand. Some think that it helps also the drawing of the ringers towards the thumb. The external afcends also by oblique fibers from the fides of the fecond bone of the after-wrift, to the first joynts of the fingers, interfecting the internal, which we now described after the manner of the letter X, for to extend the palm

of the hand, and help the drawing away of the fingers of the thumb.

Here concluding the description of the muscles of the whole hand taken in general, you shall note. The number of the muscles of the whole hand taken in general, you shall note. Here concluding the determined or the inflaces of the whole hand taken in general, you shall note The number that they are thirty nine in number, that is, eight appointed to move the arm; four set to move the of the muscles cubit, in general; seven seated on the out-side of the cubit, and as many on the inside in the same taken in generality, moving the wand, and with it the hand; seven on the inside of the hand; And latity, the rall.

Some increase this number, saving, there are nine on the external care of the orbit. fix Interoffer. Some increase this number, faying, there are nine on the external part of the cubit,

CHAP. XXX.

A description of the Leg taken in general.

Fter the hand follows the description of the leg. Wherefore to take away all doubtfulness, we will first define the leg; then divide it into the parts more and less compound; thirdly, we will profecute all things common to all these parts; fourthly, those which are pecu-

The diverse acception of the leg. The thigh. The leg or thank, The foot.

The division of the toor. The toes.

liar to each, and then, God willing, we will give an end to our Anatomy.

Now this word Crus, or Leg, is used two manner of ways, that is, either generally or specially, and specially again after two forts, that is, either absolutely and simply so, or with an adjunct. It is simply taken for all that which is between the knee and soot. But with an adjunct for the greater bone thereof. But the leg taken in general, is the inftrument of going, containing all whatfoever is from the hips, to the very ends of the toes. It is divided into three great parts, that is to fay, the thigh, the leg, or fhank, and the foot. By the thigh, we mean, that which lies between the hip and the knee. By the leg, properly fo called, or fhank, that which is contained between the knee and the foot. By the foot, all from thence to the epds of the toes.

Again, they divide the foot into three parts; that is, the Tarfus or instep, the Pedies or top of the of the foot.

The inften. foot, and the Digiti pedum, or toes. We underfland by the inften, that which is contained in the The top of the first feven bones, which answers in proportion to the wrist of the hand. By the top of the foot, that which is comprehended in the five following bones, which is answerable to the after-wrift.

That which remains, we call the toes. But because all these parts have other common and proer parts, we will only follow the diffribution of the veins, arteries and nerves; feeing we have fufficiently explained the reft, when we described the containing parts of the body in general.

CHAP. XXXI.

A description of the Crural-vein.

The begin-ning of the crucal-vein. The two branches thereof,

He Crural-vein begins then, when the hollow-vein, paffing forth of the Peritoneum, and firetched to the hanch-bone, and the fides of the Pubis in the groin, is first divided into two large branches, the one of which descends on the infide, alongst the bones of the whole leg, together with the artery and nerve; the other runs down outwardly and superficially alongst the leg, between the fat lying under the skin, and the muscles even to the foot, and is spent in the skin thereof. This, because it is always apparent and manifest, is called properly by the Greeks Sapheia, but commonly Saphena.

This vein, but continuity supernst.

This vein, by the way, prefently at its original is divided into two branches, the one internal, the other external; of which the internal is fpent upon the Bubones, and other glandules of that place and the skin, and by this branch come the defluxions called Bubones; the other branch is wasted in the fore and utter skin of the upper part of the thigh; then a little lower, that is, about the breadth of three or four fingers, it is gathered again into one branch made of many little ones, which is fpent in the fore and hind-skin of this thigh. Thirdly, a little below the middle of the thigh, it is again divided into two other branches, of which the one goes into the skin on the fore-tide, and the other on the hind-fide. Fourthly, it is diffributed by two other finall fprigs into the skin, on the four and hind part of the knee; which often-times are not found, especially when the Poplitea, or ham-vein, is fomewhat larger than ordinary. Fifthly, a little below the knee, it produces two other branches, lying upon each other in their paffage out into the fore and hind-skin of that place. You must note, that branch which runs into the skin of the hind-part, is carried by certain other fprigs, which it produces into a branch of the Poplitea paffing forth of the two twin-muscles. Sixthly, in the bigger part of the calf of the leg, it is divided into two other branches, which in like manner are diffributed into the skin, as well in the fore-fide as the back-fide of the leg.

At length, after many divisions, which for brevity fake I omit, when it arrives at the fore and inner fide of the ankle (where it is commonly opened in the difcases of the parts below the midriff which require blood-letting) it is parted into two other branches, the leffer of which descends to the heel; the other in many sprigs is spent upon the skin of all the upper and lower parts of the foot and toes

The fecond branch of this crural-vein, which we faid defeends within together with the artery places, and by and nerve, even into the foot, is divided; first, percent formewhat deep in, it produces four divarications; one internal, defeending below the original of the Sapbia, into the mufcle called Obturator externine, and into certain other external mufcles. The three other run outwardly, the first to-wards the huckle-bone, by which the Ifebias is made, the two other into the four mufcles of the thigh, neither are thefe fprigs far remote from one another. Secondly, all that branch is divided into two other branches, the one above, the other below, an artery always accompanying it; the lower of which is spent upon many of the hinder-muscles of the thigh ending night he ham. The upper, besides, that it beliews many branches upon the fore and inner-mufcles of the thigh; defcending to the ham, it produces the Poplites, or ham-vein, made fornetimes of two branches, the one proceeding from above, and the other from below. This Poplites descending by the bending of the ham, is spent one while upon the skin of the calf of the leg, another while upon the knee; otherwhiles increased with branches of the Saphria, it goes on the out-fide of the ankle to the skin, on the upper-fide of the foot, and forgetimes on the lower.

Thirdly, a little below the original of the ham-vein, and under the bending of the knee, it

Fourthly, under the head of the hinder appendix of the bones of the leg, it produces between these two bones, another vein, which nourithing the fore-truscle of the leg, is consumed upon the

Fifthly and laftly, it brings forth the Ifibiaslica major, or greater Ifchiar, which is divided into Ifchiaslica matwo branches of an unequal bignets; the larger whereof, from his original defeending alongit the image inner part of the leg-bone, infinuates it felf under the mufcles of the calf, between this and the heel, into the fole of the foot, upon which it is washed, divided into ten finall fprigs, two for each toe; the other being the leffer defeending alongit the Perone, or finn-bone, is confirmed between it and the heel, yet formetimes it is produced, not only even to the mufcle the Abdutter of the toes, but also by five furcles, even to the fourth toe, and the fides of the middle tree. but also by five furcles, even to the fourth toe, and the fides of the middle toe.

CHAP. XXXII.

The Distribution of the Crieral Artery.

He Crural Artery arifing from the fame place whence the Crural vein proceeded, and defeending with the internal Crural Vein, is distributed as followeth: First, into the muscle of the thigh, which spreading it self through the muscles thereof arteria major. meets with the utmost bypogasirica, descending with the vein through the common hole of the la-huckle and share-bone, and is joyned with it

Secondly, when it arrives at the ham, between the Condylos, or processes of the leg, it sends two branches into the knee.

Thirdly, a little after it produces another branch, which it fends to the exterior matcles of the leg; and when it arrives at the middle of the leg, it is divided into two branches, between the Twin-mufcles and Solew, the one internal, the other external; the internal, force furcles communicated in the content of the leg in the internal, force furcles communicated in the content of the leg in the internal, force furcles communicated in the leg in the internal internal in the internal nicated by the way to the parts by which it paffes, but specially to the joynt of the ankle, stretches it self over the sole of the foot, between the lower extremity thereof and heel; whither when it arrives, it is divaricated into five furcles, of which it beflows two on the great toe, two on the next, and one on the middle toe. The external defeending in like manner to the fole of the foot, between the Fibula and the heel, befides other fprigs, which it may fpread by the way, it produces the without on the investor of the one without on the joynt of the ankle, another in the mufcle, the Abdullar of the toes; to the wrift and back of the foot. But the remainder is divided into five portions, of which two are fent to the fourth, and two to the little toe, and one to the middle.

CHAP. XXXIII.

Of the Nerves of the Leins, Holy-bone and Thigh.

Here arise five Conjugations of Nerves from the Loins, divided into external and internal branches; the external are differninated into the Rachite, or chin-muscles, the muscles Senior and Saces, and skin lying over them. The internal are first into the oblique the lower and transverse-muscle of the lower belly, into the Pertoneums, into the loin and cheit-muscles arising there, but after a different manner; for fome are absolutely carried thirther, as the nerves of the hirst conjugation of the loins, and oftentimes also of the feecond, but that sometimes they send a small spring to the testicles, when the costal have fent none thicker; but some lower are partly distributed there and partly sent some other ways for the greater portions, but unused amone if where the testicles. they tend a finall fprig to the telucies, when the contain nave tent none thittier; but some lower are partly diffributed there, and partly fent fome other way; for the greater portions, first united amongst themselves, then presently with the portion of those of the holy-bone, go into the thigh, as we shall their nerves. them in the diffribution of the nerves of the holy-bone.

Now from the holy-bone, proceed fix conjugations of nerves, reckoning that for the first which The conjugations from the last Vertebra of the loins, and institute Holy-bone, and that the fixth which proceeds from the lowest part of the holy-bone, and the first of the Rump. These Conjugations of nerves pronerves are divided into external and internal branches.

The lefter external parting forth by the external and hinder holes of the holy-bone, are diffri-holy-bone. butted into the parts properly belonging thereto, to wir, the mufcles and skin thereof; for every between by the Law of Nature, hrit and always yields to the neighbouring parts, that which is need-cal axiom. ful, then prefently to others as much as it can.

Wherefore if thou wouldfi know whence each part hath his veffels at the next hand, that is, the veins, arteries, and nerves, thou must remember the fite of each part, and the course of the vessels, and to confider this, that the veins and arteries, as speedily and conveniently as they can, infinuate themselves into the parts, fornetimes at the head or beginning, fornewhiles by the middle or extremes thereof, as there is occasion.

But a nerve principally enters a muscle at the head thereof, or at least not far from thence, but never by the tail, whereby it may eatily be understood by what branch of each vein, artery, and nerves, each part may have nourishment, life and fenfe. The other internal branches of the forefaid conjugations go, especially the four uppermost united from their original with the three lowermost of the loss, into all the legs, as you shall prefently hear. But the two lower are confused upon the muscles called Levatures Ani, the Sphintler-muscle of the same place; besides,

ceeding through the

cal axiom.

122223

upon the muscles of the yard, and neck of the bladder in men, but in women upon the neck of the womb and bladder.

For these parts admit another in their bottom from the costal nerve, being of the fixth conjugation of the brain: These thus considered, let us come to the nerves of the thigh, which (as we faid) from their first original, as it were compacted and composed of the greater portion of the three inner and lower branches of the loins, and the four upper of the holy-bone, are divided in the thigh into sour branches, of which the first and higher descending from above the Peritonsson, to the little Trechanter, is wasted upon the inward and superficiary muscles of the thigh, and the skin which covers them a little above the thigh.

The fecond, descending with the crural vein and artery by the groin, is divided into two branches like as the vein, the one internal, the other external; of which the internal descending with the vein and artery is sent into the inner and deep muscles of the thigh, ending above the knee. But the external descending superficially with the Sapheia, even into the foot, gives branches by the way to the skin which covers it.

The third feated under these former, passing by the hole common to the share and hanch-bone, fends certain branches to the groins, to the muscles called Observatores, to the Tricipites, and sometimes to the muscles of the yard, and ends at the midst of the thigh.

The fourth, which is the thickeft, folideft, and hardeft of all the nerves in the body, descending wholly from the productions of the holy-bone, and descending outwardly, between the lower part of the same bone, and the Os Ilium, or hanch-bone to the thigh, bestions certain sprigs to the hind-muscles thereof proceeding from the protuberation of the Ischium, or huckle-bone, and in like fort it gives other some to the skin of the buttocks, and also to the skin covering the forementioned mufcles.

A little after, it is parted into two branches descending andivided even to the bending of the knee, they both are communicated by divers furcles of the mufcles of the leg; yet so as the leffer produces another branch from the rest of the portion thereof descending on the fore-part of the legalongs the shin-bone unto the top of the foot, where it is divided into ten sureles scarce apparent to the sight, two running to each of the toes. The other greater, descending in like manner in the remainder of its portion by the hind-part of the leg into the sole of the foot, casts it self with the veins and arteries between the heel and leg bone, where first divided into two branches, each of which prefently parted into five, fend two fprigs to the fides of the toes. And these are the most notable and necessary distributions of the vessels and nerves; we purposely omit others which are infinite, and of which the knowledg is impertinent.

CHAP. XXXIV.

Of the proper parts of the Thigh.

Aving explained the common parts of the leg in general: Now we must come to the proper, beginning at the thigh. The proper parts of the thigh, are muscles, bones and ligaments. But because the demonstration of the muscles is somewhat difficult, if we be ignorant of the description of the bones from whence they arise, and into which they are inserted ; therefore we judg it worth our labour, first to shew the bones, and the dearticulation of these of the thigh; beginning with those bones which are knit with the upper part of the holy-bone. And they are two in number, on each side one, commonly called the Offa llines; each of these is composed of three bones; of which one is the upper, another the lower and anterior, and the third the middle, and after a manner the posterior. The upper by a particular name is called the Os Iliam, the hanch-bone, and it is the largest and biggest, having a gristly Appendix in the compals thereof, even to the connexion it hath with the other neighbouring bones, whose upper part we term the right line thereof; but the basis, which is adjoyned to it by Symphysis, we call the lip, or brow thereof, because it stands both somewhat out and in, after the manner of the brow. But that which lies between the basis and strait line, we name the Rib; this same upper bone hath two hollow superficies, the one internal, the other external. The connexion thereof by Symplosis, is twofold, the one with the upper part of the holly-bone; the other, with that bone we called the middle, and after some fort the posterior; which taking its beginning from the narrower part of the Os Ilinon, makes that cavity in which the head of the thigh is received; this cavity the Greek call Cotyle, the Latins Acetabulum, and it is ended by the fide of the hole common to it, and the share-bone; this middle, and in some fort posterior-bone, is called properly and particularly the Os Ifelia, or huckle-bone, and contains nothing elfe but the fore-mentioned cavity; but, that on the hinder and lower part thereof, it brings forth a process, which adjoyns it felf to the thare bone at the lower part of the common hole, in which place it appears very rough and unequal, and it is called the Tuberolity of the huckle-bone, at whose extremity also it brings forth a little head somewhat resembling the process of the lower jaw called Corone. The third bone named Os pubis, or the share-bone, stretches it self even to the highest part of the Petten, where meeting with the like bone of the other lide, it is united to it by Symphylis, after which manner alfo, all these three bones are united. It is reported, that this bone opens in women in their travel, yet hitherto I can find no certainty thereof.

You may perceive a manifest separation of these three bones in the Sceleton of a child; for in

those who are of more years, the griffles which run between these connexions turn into bones.

Now follows the thigh-bone, the biggest of all the bones of the body; it is round, and so bended, that it is gibbous on the exterior and fore-part thereof, that fo it might be the fafer from

The other Appendix of the thigh, that is, the lower, is the greatest and thickest; rising, as it were, with two heads, which are divided by two cavities, the one superficiary, and on the forefide, whereby it receives the whirl-bone of the lance; the other deep, and on the back-part, by which it receives the griffly, and, as it were, bony-ligaments, proceeding from the eminency, which is feen, between the two cavities of the upper Appendix of the bone of the Leg, which Hippocrates lib. de Frachuris, calls in his tongue Diaphylis.

CHAP. XXV.

Of the Muscles moving the thigh.

He muscles of the thigh are just fourteen in number; that is, two bend it, whereupon Their number. they are called Flexores, or benders; three extend it, whereupon they are called Tenfores, extenders; three move it inwards, driving the knee outwards, and drawing the heel inwards, as when we cross our legs; yet some make these three one, and call it the Triceps, or three-headed muscle. Six spread it abroad, and dilate it, as happens in the act of Venery

Four of these are called Gemini, or Twins, by reason of the similitude of their thickness, original infertion, and action; the two other are called Obturatores, because they stop the hole which is common to the fhare and back-bone.

Now one of the two Fiexeres, being round, defeends on the infide with fibers of an unequal length from all the transverse processes of the loins, above the hind-commissione of the hanch and fhare-bones, and is inferted into the little Trochanter; the other broader and larger from the ori-ginal paffes forth of the whole lip, and inner brow of the hanch-bone, and filling the inner cavity thereof, is inferted above the fore-part of the head of the thigh, into the little Trochanter by a thick tendon, which it with the fellow mafele lately deferibed, produces even from the flefly part there-

of, wherefore you need to take no great pains in drawing, or placking them away.

The three Tenfores, or Extenders, make the buttocks, of which the furfi being the thicker, larger, and external, arising from the rump, the holy-bone, and more than half of the exterior and hinder lip of the hanch-bone, is inferted by oblique fibers, some four fingers breadth from the great

Trechanter at the right-line, which we faid, refembled an Affes back.

The fecond, which is the middle in bignefs and fite, defeends from the reft of the hip, and from the fore and outward rib of the hanch-bone, and, above the midft of the bone, is inferted into the upper part of the great Trechaster, by a triangular infertion above the upper and exterior part

The third being leffer, thorter and thinner, lying hid under these former, proceeds from the mid-dle of the external surface of the hanch-bone; and then is inserted into the greater part of the right line of the great Trochanter.

These three muscles have a great and large original, but a narrow insertion, as it were, by ob-

lique fibers.

Then follow those three muscles which move the thighs inwards, straiten and cross them, so that the knee flands forwards, or outwards, but the heel is drawn inwards, as you may underfland by their infertion, although forne think otherwife. But these three muscles by their original, partly fleshy, and partly membranous, arise from the upper and fore-part of the circumterence of the fluore-bone, and thence are inferted into the hind-line of the huckle-bone, form higher than otherfome; for the leffer and fhorter flays at the roots of the little Trochanter, the middle defeends a little deeper, the third with the longest of his fibers, descends even to the midst of the line.

This, if it be fo, that is, these muscles proceeding from the fore and upper part, to be inserted into the hinder-line of the huckle-bone, whilst they alone perform their action, and draw the thighs together, they will turn them outwards, just so as when we put them a-cross, but they will not draw one heel to another, and put the heel outwards, for fuch like motion is performed by the inner wast muscle of the thigh, moving the leg. Now follow the fix which move the buttocks.

The first and higher of the Quadragemini, or the four Twin-muscles, passes forth of the com-The movers of miffure of the holy-bone, with the bone of the rump, or rather, from the lowest extream of the the buttocks. holy-bone, and thence it is inferted into the cavity of the great Trochanter by a tendon of a fufficient largeness.

The fecond proceeding from the hollow part, or fiffure, which is between the extremity of the huckle-bone, and the tuberofity or fwelling out of the fame, is inferted in like manner into the cavity of the great Trochanter.

The third afcends from the inner part of the fwelling out of the huckle-bone, a little above, between the two Trechanters, into the cavity of the greater of them.

The fourth and laft, the lowest and broadest of them all, proceeds from all the exterior protuberancy of the huckle-bone, and thence is inferted into the great Trockuster, and these four muscles lie hid under the thick and more eminent part of the buttocks; wherefore, that you may the better show them, they must be turned up towards their original.

The two Observatores remain to be spoken of, that is, the internal and external, both which arise from the circuit and circumserence of the hole which they stop, which, as we faid, is common to the fhare and huckle-bone, but the internal afcends to the exterior root of the great Trachanter,

The two Flex-

sere.

Three Istromercetes.

The two Osta-TARREST ES.

by the middle fiffure between the upper part of the protuberancy of the backle-bone, and the fpine which flands up in the hinder basis of the hanch-bone.

But the external proceeds from the exterior cavity, and the middle space between the tuberolity of the huckle-bone, and cavity thereof, and is inferted into the lower part into the cavity of the great Trochaster, together with the Quadrageminic

If you would plainly fee the exterior Obmerator, you must either cut off the beginning of the three-headed mulcle, or handformely pluck it away, and then extend it, and turn it up; the internal is eafily difcerned when the bladder is taken away.

CHAP. XXXVI.

Of the Bones of the Leg or Shanks

Hole which would describe the muscles of the leg, ought first to describe the bones thereof, what the Pa-beginning at the Rotula, or whirl-bone of the knee. This bone is griftly on the out-fide, and round in compass, but on the inner and mid-bone of the die part after some fort gibbons, but somewhat flatted at the sides, that so it may be filler applied to the joynt of the knee, and fitted within the apprior cavity of the way be filler applied to the joynt of the knee, and fitted within the anterior cavity of the two appendices of the thigh, and the upper and fore-most of the leg.

The use thereof is to threngthen the joynt of the knee, and to hold the leg at his due extent, so The use therethat it may not be bended fo far forwards, as it is backwards.

that it may not be bended to far forwards, as it is backwards.

The bones of the leg are two; the one thicker, called by the particular and proper name, the What, and Os Tibie, or leg-bone; the other which is leffer, is termed Penne, or Fibula, but commonly the how many leffer feelle, (and in English it may be termed the shin-bone). The thicker being hollow and markow, is feated in the inner part of the leg, having two processes, the one bigger, the other less. The leg bone. The bigger feated on the upper-part of the bone, and conjoyed to it by Symphysis, makes two superficial and side cavities disjoyned by an indifferent rising; wherefore this bone is connext to the bone of the thigh by Ginglymas. For in the cavities thereof it receives the lower and hinder protuberances of the appendix of the thigh-bone, but the middle eminency thereof, is received by it between the two protuberances thereof. it between the two protuberances thereof.

This joynt is strengthned, not only by the force of the tendons, or muscles ending there, but also of three firong ligaments; of which, one proceeds from all the external; another from all the interthe little state of that connexion; the third, which we out of Hipperster, called Diaphylis, from the di-what Diaphylis flance or space between them. The other process of the leg-bone, which we called the less, seated in fis is, the lower part thereof, makes, as it were, a double cavity, whereby it receives the Afragalus, or pa-stem-bone; but on the inside it makes the ankle, as the Perster makes it without: Between these problems the Afragalus is received and the file. ankles the Astragalus is received on the fides, and turned as the nur in a Crofs-bow, as often as there is need to bend or extend the foot. Befides, this fame leg-bone, being triangular, hath three emiis need to bend or extend the foot. Befides, this fame leg-bone, being triangular, hath three eminencies made in the shape of an Asses back; the shaper descends alongst the fore-part, called by the Greeks Antionomius; the second resides on the inner-part; and the third on the outer: All these must be diligently observed, and chiefly, that on the fore-part; because it is as a guide and rule to a Chirurgeon in the well-setting of a broken leg. The Powe, or thin-bone, is seated, as it were, on The Powet, settle out-side, and as behind the leg-bone; it hath also two appendices hollow on the inside, but bale, or thin-gibbous on the out. This bone by the upper of these is fashed and inserted under the inner, and bone, in some fort the hinder appendix of the leg-bone, so that it is in no fort articulated with the thigh, but serves only instead of a leaning-stock. But by the lower, this same bone is not only received in the lowest part of the leg, or ankle, or pastern-bone, but also receives part thereof, which is joyned on the same side with the heel, especially then when we bend our foot outwards.

This bone is fastned to the fore-mentioned bones by Synarthrosis, but bound by strong ligaments

This bone is failned to the fore-mentioned bones by Synarthrofts, but bound by firong ligaments proceeding from the fame bones, and mutually fent from one to another, or, if you had rather, from the upper into the lower, as we faid in the arm. But this fame fibula, or thin-bone is also triangular, having three lines; of which operands outwards, and another on the forefide, and the third behinds

CHAP. XXXVII.

Of the Muscles of the Legs.

LL the motions of the leg, are performed by eleven mufcles, of which there be fix on the Their num-fore-fide, and five on the hind. But of thefe, fome move the leg only, as those which take ber, their original from the bone of the thigh; others truly move the leg, but with the thigh, as those which arise above the thigh, that is, from the hanch, buckle and share-bones.

The first of these on the fore-fide, called the long, but commonly the Sutorius (or Tailor-muscle, The Longot. by reason of its action) it arises from the lower and fore-extremity of the spine or appendix of the banch-bone, and defeending obliquely above the other mufcles, is inferted by a large and mem-branous tendon, in the fore and inner part of the leg under the knees the action thereof is to crofs the legs, but being first bended by the muscles presently to be treated of, it helps also the threethe legs, but being first bended by the muscles presently to be treated of, it helps also the threethe second of these four muscles is termed the Manbranofus, or membranous, because it is The Manbranofus,
wholly such unless a the existingly where it descends siether from the root and help a legs.

wholly fuch, unless at the original where it defeends fiethy from the root and basis of the abovementioned fpine of the hanch-bone, and that obliquely with its membranous and broad tendon

222777

(mixed with the common coat of the mufcle) into the outward part of the leg, which it moves outwards, as also the thigh with the four twin-muscless for, as we have in another place observed, of two oblique motions concurring in one, is made a right motion; and belides, almost all the motions of the body are thus performed; the mufcles which perform fuch motions are placed and opposed in an

oblique fite, as may be perceived by the motions and fite of the muscles of the hand taken in general,

The third, called the Redner, or Right (because it descends above the Grammer, alongst the right fore-line of the thigh, between the two vait mufcles) comes forth between the extremity of the appendix of the hanch-bone and cavity thereof, with a very firong ligament, and then is inferted into the fore-part of the leg, passing over the midst of the whirl-bone of the knee; it extends the

with the three following, but by accident it may help the bending of the thigh.

The fourth and fifth are called Vafti, vaft or huge muscles, by reason of their largeness, the ene

of these is internal, the other external: They both arise with right fibers, from their original, but with oblique at their infertion, by reason whereof they both seem to have a compound action from a right and oblique motion; the right helping for the extension of the leg, but the oblique to draw one kneel to another, or to disjoyn both the knees; the internal comes by its right fibers from the root of the little Trochanter, but by its oblique from the inner descendent line of the thigh. The external paffes forth by its right fibers from the root of the great Trochamer, but by the oblique from the external descendent line of the same bone. But all these fibers are in certain places so mixed with the Crurent, that they cannot be separated unless you violate the one of them; they go into the leg (each on his fide) above the whirlbone of the knee alongit the fides of the right matcle, with which it makes an unfeparable tendon, as you shall presently hear. The fixth and last of these fore-muscles called Crureus, or thigh-muscle (by reason of the strait and firm adhesion, which it hath with the thigh-bone, which is by some called Crus) from the space between the two Truchasters descends under the right mufcles, and two valt mufcles into the fore-part of the thigh, even to the whirl-bone of the knee. But we must note, that these four last muscles make a common thick and broad tendon, with which they cover the Patella, or whirl-bone, and all the fore dearticulation of the knee, that they cannot be separated without tearing; wherefore we must think, that this tendon serves the knee for a ligament: Now all these muscles performing their action together, extend the leg. The five hind-muscles follow to be spoken of; of which three arise from the subcrossity of the huckle-bone, going into the inner part, the fourth from the middle of the Pubis called Bierps, that is, the twoheaded muscle into the outside of the Leg. Of the internal, one passing from the fore-mentioned tuberofity, descends ligamentous even into the midst of the thigh, and then becoming fleshy, is inferted by its tendon, after the manner we formerly mentioned.

The other being flender, passing forth also from the same place, with its tendon, is inserted with the tendon of the long-muscle, and ends in the inner part of the leg, which with its companion, it draws inwardly, and brings to the other, which fame thing it performs in the thigh, by the help of the three-headed mufcle.

The third being the inner, or hinder, descends from the middle part of the share-bone, with a broad and flender ligament, and is inferted with a round tendon, into the inner part of the leg after the manner of the fore-mentioned.

The fourth called Biesps takes one of the two heads, of which it confifts, from the last mentioned tuberofity, the other from the outer line of the thigh, but is inferted into the external part of the leg, as we formerly faid.

The fifth and last called the Popliteur descends obliquely fleshy from the external condyle or knot of the thigh, into the inner and hinder part of the leg, at the joyning thereof to the thin-bone; the action thereof is, to draw the leg, after a manner inwards.

CHAP. XXXVIII.

Of the Bones of the Foot.

He order of Anatomy requires, that we now profecute the mufcles moving the foot; but because we should in vain deliver their infertion, the disposition and condition of the bones of the foot not being first known, therefore it first behoves us, to set forth their description. Therefore the bones of the foot are fix and twenty in number, diffinguished into three ranks that is, the bones of the Tarfin, or instep, are seven; those of the Pedium, the after-wrist, or back of the foot five; and those of the toes, fourteen. Of the seven bones of the instep, there are four named, and three unnamed. The first of the named immediately following the bones of the legistic called Astragalus, the pastern or ankle bone. This hath three connexions, one, as we faid before, in the upper and broader part, with the bones of the leg, of which it is received; the other in the lower and hind-part, by which it receives the upper and inner process of the bone of the heels the heir use. third on the fore-fide, by which it is received in the cavity of the Os Naviculars, or Scaphoides, that is, the boat-like bone. By the first connexion the foot is extended and bended; by the fecond it is moved with the heel to the fides: The two first connexions are by Diarrhrosis, the last by Synarshrosis. But it is strengthed by strong and broad ligaments, descending and ascending from one bone into another; also they are threngthned by membranes, muscles and tendons, descending to the foot, above and under these joynts. But this bone hath three processes, as three feet, faitned to the bone of the heel; of which the first and least is under the out-ankle; the bigger (which Galen faith, makes a round head, faitned on a long neck) looks towards the fore-part of the foot, over against the great toe, and the next toeto it; the middlemost is at the heel, behind the leg-bone.

I pass over in filence many other things; as, the smoothness and asperity, or roughness of the bone, which I had rather you should learn by ocular Inspection, than by Book. The second bone ly-The defeription of the Calculation of the hind and outer process of the Afragalus; the leffer is received to a little. The great is received in the hind and outer process of the Afragalus; the leffer is received to a little. The great is received in the hind and outer process of the Afragalus; the leffer is received to the inside in the third process of the fame bone, the which we faid had a round head fastined to a long neck. Befides, it is round on the hind-part, and much dif-joyned from the leg-bone, but on the fore and longer part, it is knit by Symarthrofis to the die-bone, whose lower and inner part it feems to receive; the superficies thereof is wholly unequal, and rising up with many swellings. On the inner fide, it makes, as it were, a channel, so to give way, as well to the vessels as tendons going to the fole of the foot and toes. Lastly, we must consider the holes by which the vessels pass into that bone to give it nourishment; by reason of which vessels the fracture of this heel-bone, is very dangerous, because of the pressing and contusion of the vessels; as Happecrates sliews. For the ligaments of this heel, or heel-bone, they are such, as those of the Astragalus, to wit, tendons, members of this heel, or heel-bone, they are such, as those of the Astragalus, to wit, tendons, members of this heel, or heel-bone, they are such as those of the Astragalus, to wit, tendons, members of the such as the su branes and ligaments properly fo called, coming from one bone to another. The third bone of the foot is named Scapboudes, or Boat-like, from the refemblance it bath to a Boat, for on that part which looks towards the Pastern-bone; it is hollow; but on that part which is next the three Innominata, or namelel's bones (which it fullains, and of which it is received, as it in the cavity thereof receives the head of the Aftragalus) it is gibbous like the bottom of a Boat. The connexions thereof are by Symarthrofis, and they are strengthned by the fore-mentioned ligaments: This same bone is arched on the upper part, but somewhat hollowed or flatted below; the inner part ends in a point, like the prow of a ship, but the outer obtase like the stem of a ship. The fourth bone of those which have names, is called Cubvides, from the resemblance of a Die; although that similitude be very obscure. On the fore-part it fultains the toes, which by a certain proportion to the fingers of the hand, may be called the ring and little toes; but it is fultained on the hind-part, with the back-part of the heel; on the inner fide it is joyned with the Boat-like bone, and that nameless bone which fultains the middle toe, on the out-fide it produces a rifing like the back of an Ais, which on the lower part is extended transverily all the length thereof; at the two fides of this eminency, or rifing,

there are two small cavities, in form of a channel. The first and the greater of the Offa innominata, or nameless bones, sustains the great toe; the lesser and second, the next toe thereto; the third and middle in bigness, the middle toe. These three bones are arched on their upper part, but fornewhat hollowed below. They are knit to the three fore-mentioned bones by Synarshrofis, of which they are received; but on the hind-part with the Boat-like bone which they receive. Now we must come to the bones of the fecond rank, that is, of the Pedium, or back of the foot; these are rive in number, bearing up the five bones of the toes. They are somewhat gibbons on the upper part, but hollow below; each of them hath two processes at the end thereof, by the lower and first of which they receive the three numbers and die-bone, but by the upper made into a round head, they are received of the first bones of the toes. Their connexions, whether with the toes, or bones of the inflep, are by Symarthrofis. The ligaments as well proper as common are fuch, as we faid of the former. The bones of the third order now remain to be spoken of, which, we said, makes the toes; and they are fourteen, two of the greater toe; but three of each of the other toes. The first is somewhat longish, but the rest are very short, except that of the great toe, all of them on the upper fide are round and convex ; but on the lower fornewhat hollow, and plain-wife, that the tendons which bend them, may pass more stairly and safely without inclining to either fide, even to their furthest joynts; although such passages are much helped by the membranous and common ligament, which riting from the fides of thefe bones, involves these tendons, as we mentioned in the fingers. To conclude, each of these bones, the last excepted, have a double connexion by Diarrings, they are all unequal in their bigness, that is, thick at their beginning (where they receive the heads of the precedent bones, upon which they move as a door upon the bigness), and so they grow smaller towards the codes, but he there are they move as a door upon the hinges) and to they grow fmaller towards the ends; but by their ends, they are received of the following bones: At their ends they rife into two eminencies on their fides, diffinguished by a cavity between them, through which occasion they are far thicker at their ends, than in their middle. The Ligaments by which their connexions are fattned, are fuch as the former. The Offa fefaminides or feed-bones of the feet, are like in number and fite to those of the hands. But this is to be noted, that those feed-bones which are in the first Articulation are formewhat bigger than the rest, and they are round and longith on the out-fide, but fmooth and hollow on the infide, feated between two cavities, encompatied by three rilings, of which two are on the fides, and the third in the midfl of the extremity of the hift bone of the Pedium, which chiefly bears up the great toe. To conclude, we of the feet, before we come to speak of the Muscles, we must observe, that the foot was made for two commodities. The first is, to stay and bear the whole body, when we stand, for which coule Nature set not the great toe contrary to the other, as it placed the thumb on the hand. The other is for ap prehension, or taking hold of 3 wherefore Nature framed and made the foot, and these moveable and joynted in the toes, as in the fingers of the hand. Befides also, for that we must go upon our feet, Nature hath made them in some places hollow on the lower side, and in other some plain in a triangular figure, that to our feet may carry us over every foil, plain, mountainous, equal and unequal,

CHAP. XXXIX.

Of the Mufcles moving the Foot.

He muscles of the leg moving the foot are absolutely nine, three in the fore-part, and fix Their numbers of the leg moving the foot are absolutely nine, three in the fore-part, and fix Their numbers of the leg moving the foot are absolutely nine. He muscles of the leg moving the foot are ablolutely nine, three in the fore-part, and fix Their number in the hind. Two of three fore-muscles bend the foot, when they joyntly perform their ber. action; but when severally, each draws it to his side; the third chiefly extends the toes, for otherwhiles it seems by its slenderer and longer tendon (which exceeds not that bone of the The first is called Peroneus, because it descends alongst the bone Perone. The other the Tibizen Magalast Persenticus, for that it descends along the Os Tibise, or bone of the leg. The third from its action is called the Digitum-tension, or Toe-stretcher. For their original, the Peroneus which seems to have two heads, descends from the upper appendix of the Perone, or shin-bone by its first head, but by the

heads, defcends from the upper appendix of the Peruse, or thin-bone by its first head, but by the other from the middle of the fame, bone from the fore-fide into the hind, as the superficies thews which paffes between the fore and outward line of the faid bone; but after it arrives at the lower and hinder appendix of the fame bone, behind the outer ankle, it produces two tendons, which by the guidance of the ligaments, as well proper as common, go the thicker under the fole of the foot, ending in the die-bone, and that bone of the Pedium which fustains the great toe; the leffer goes on the out-fide to the die-bone; and the last and least bone of the Pedium which bears up the goes on the out-tade to the die-hone; and the last and least bone or the reason little toe, extend-little toe, formetimes a flender portion thereof is produced even to the fide of the little toe, extend-ing and drawing it from the reft. The Tibieus antieus or fore-leg muscle proceeding from the up-rishest artisper and outer appendix of the leg-bone descends above the surface of the same bone, which is between the four and outer-line to which is adheres, as also to that surface oven to the midst, from which place it produces one tendon, which defcending on the fore and lowest part, ends on the outfide into two of the nameless one tenuon, which is, into the first which is the thicker, and into the middle-most; but besides, by a slender portion thereof, it is extended into the first and greater bone of the Pedium, so to extend the great toe, drawing it inwards to the other foot. And this muscle with the precedent bends the foot, if they both perform their parts at once; but if severally each draws precedent bends the foot, if they both perform their parts at once; but if feverally, each draws the foot towards his fide. The third, which is the Digitum-tenfor, or Toe-firetcher, is twofold; The Toe-firetcher, the one takes its original from the top of the leg, and running, alongst the shin-bone, and passing freecher i the toes, and by a fixth at that bone of the Pedinon which sustains the little toe, whereby (as we formerly said) it helps the bending of the foot. The other descends into the midst of the thin-bone, and some said to the source of the state of the said of bone, and fornewhat faithed thereto, by one tendon paffing under the ring, it goes to the great toe.

But you must note, that all these tendons have nervous, ligamentous, and fielly fibers so separated from each other, that they can equally alone perform their function, as if they were more diffined mufcles. And we muft think the fame of the rest which have distinct tendons presently from their

The fix hind-muscles follow: of which the two first are called the Genelli, or Twins, by reason of The fix the fimilitude of their thickness, original, insertion and action. The third is called the Plantaris, hind muscles because it is spent upon the sole of the foot, as the Palmaris upon the palm of the hand. The fourth is termed the Soleus, or sole-muscle, by reason of the resemblance it hash to the fish of that name. The fifth the Tibieus posticus, or hind-leg muscle, which descends along it the back-part of the legband. Some make but one muscle of this, and the Tibieus posticus, which produces three tendons; hand. Some make but one mulcle of this, and the Tibieus policus, which produces three tendons; others had rather make three, as thus, that one should be the Tibieus, the other the bender of four

Now for the two Genilli, or Twins, the one is internal, the other external; the internal paffes The two General for Twins. forth from the root of the inner Condyle of the thigh, but the external from the external Gon-milli or Twindyle; and from this their original prefently becoming flethy, especially on the out-side, they meet together a little after in their flethy parts, and with the Solens they make the thick and great tendon at the midfl of the leg, which from these is infrared into the holds and great tendon. at the midft of the leg, which from thence is inferted into the back-part of the heels in this very

at the midit of the leg, which from thence is inferted into the back-part of the heels in this very tendon, breed painful kibes. The action thereof is, to help our going by putting forth the foot, whight it draws the heel towards its original.

The Planaris the leaft and flenderest of them all, passes forth slessy from the outward head of the leg-bone, and from thence the space of some four singers breadth it ends in a strong and slender tendon, which it sends between the twin and sole muscles to the sole of the foot, there to produce a membrane which covers the sole of the foot, and a muscle equivalent to the upper bender of the hand.

The Soleur, or fole-muscle, the thickest of them all, and seated under the Twin-muscles, de-feends from the Commissure of the leg, and shin-bones, and about the midst of the leg, after it hath mixed his tendon with that of the twin-muscles, it runs into the foresaid place that it may

tend the foot for the foreign me.

The Tibiens possions descends from the hinder appendix of the leg and shin-bones, and adhering The Tibiens

The Tibiens possions descends from the hinder appendix of the leg and shin-bones, and adhering The Tibiens The Tibieus possess descens from the misser appendix of the leg and thin-bones, and adhering The mis to them almost as far as they go, by a strong tendon, being, as it were, bony at the end thereof possess, it is inserted into the Boat-like bone, and the two first nameless bones; so to help the oblique ex-3

tenanon of the foot.

The last being the Digitum-flexor, or Toe-bender, is two-fold; for one arises from the leg-bone, The Digitum-flexor and inferted into that fame bone, it goes even to the back-flexor twofold: of the inner ankle, and from thence into the joynts of four of the toes. The other draws his original from about the sale of the flexor twofold: original from almost the middle of the shin-bone, and somewhat inferred into it, it goes by the

heel and pastern-bone to the great toe, mixed with the precedent; their action is to bend the first joynt of the toes, rather by the force of the common ligament, than by the small portion of the tendon which ends there. But it is their action to bend the last dearticulation of the toes by their proper infertion.

Ow follow the muscles moving the toes; these are eight in number, one on the upper, and seven on the lower side. The first proceeds from the pastern, heel, and die-bones below the external ankle, or the ligament of these bones with the leg-bones and obliquely firetched to the top of the foot, is parted into five fmall tendons to the fides of the five toes. fo to draw them outwards towards it original, whereupon it is called the Abductor of the toes, and also Pediofus, because it is stretched over the Pedium, or back of the foot.

The first of the seven of the lower side called the Flewer superior, or upper-bender, arises from the heel; and stretched alongst the foot under the strong membrane (which from the heel is straitly fastned to the extremity of the bones of the Pedium, to strengthen the parts contained under it) is inferted by four tendons, at the fecond joynt of the four toes which it bends. Here you mult note, that near the infertion thereof, this mufcle divides it felt, like that mufcle of the hand, which is called Sublimis, that so it may give way to the deep, which (as we faid) descends alongst the singers, to which a certain common membranous ligament adjoyns it felf, which involves and fattens it to

the bone all alongst the lower part of the singers, even to the last dearticulation.

The second equivalent to that muscle of the hand which is called Thenar, seated on the inner side of the foot, arises from the inner and hollow part of the heel and pastern-bones, and ends in the fide, and inner part of the great toe, which it draws from the reil inwards: This may be divided into two or three muscles, as the Thenar of the hand, to draw the great toe to the rest, as much as need requires, just as we said of the hand. The third answerable to that of the hand which is named the Hypotherar, paffes from the outer part of the heel, and afcending by the fides of the foot, it is in like manner inferred into the fide of the little toe, so to draw it from the rest; to which fame action, a certain fleth contained under the fole of the feet may ferve, which is firetched even to thefe toes, that also it may ferve to hollow the foot. The four Lumbrica, or wormy-muscles fol-The four Lam- to these toes; that also it may ferve to bollow the foot. lownext, which from the membrane of the deep toe-bender, are inferted into the inner and fide part of the four toes, so to draw them inwards by a motion contrary to that which is performed by the Pudiofus. The Interoffer or bone-bound mufcles of the Pedium or back of the foot, remain to be spoken of: These are eight in number, four above and as many below, different in their original, infextion and action: For the upper, because they draw the foot outwards with the Pedisfin, arise from the fore and inner part of that bone of the Pedison, which bears up the little toe (and so also the refreach in its order) are inferted into the outward and fore-part of the following bone. The lower, on the contrary, pass from the four and outer part of that bone of the Pedium, which bears up the great toe (and so each of the rest in its order) but are inserted into the inner and upper part of the following bone, fo with the wormy-mufcles to draw it inwards, or to hollow the foot outwards, or to flat the foot, as we faid of the Intensfes of the hand.

CHAP. XLL

An Epitome, or brief recital of the bones of a mans Body.

He whole head which hath the leaft, confifts of fixty bones; but that which hath most, of The bones of fixty three, that is, fourteen of the Cranium or skull, fourteen or seventeen of the face, and the skull fourthirty two teeth: Of the bones of the skull there be eight containing, and fix contained; teen, the containing are, the Os frontis, or forehead-bone, the nowl-bone, the two bones of the Synciput, the two flony-bones, the wedg-bone, and the five-like or fpongy-bone. But the contained are fix,

that up in the cavity of the cars, the anvil, hammer and stirrop. The bones of

For the bones of the face, there are fix within or about the orb of the eye, that is, on each fide three; two bones of the nofe, two leffer jaw-bones, and two bigger, which are always in beatts feen diffinguished by a manifest difference, but it is so rare in men, that I have not found it as yet; therefore these only are distinguished by manifest difference, two which contain all the upper teeth, the two inner of the palate, the two of the lower jaw in children; and last of all the Os Criste, whence the middle grittle or partition of the note arifes.

The two and thirty teeth are equally distributed in the upper and lower jaws; and of these

there be eight shearers, four fangs or dog-teeth, and twenty grinders.

And there is another bone at the root of the tongue called Os Hyodes, always composed of three bones, fometimes of four.

Now follow the bones of the spine, or back-bone, which are just four and thirty, that is, seven of the neck, twelve of the cheft, five of the loins, fix of the holy-bone, and four of the rump. Betwen y four. of the neck, twelve of the cheft, five of the loins, fix of the bones of fides, there are two bones of the throat, or collar-bones.

The ribs are twenty four, that is, fourteen true, and ten battard ribs. The bones of the Surnow, or breatt-bone most frequently three, otherwhiles feven, as fometimes in young bodies.

Hence coming to the arm there are reckoned fixty two, beginning with the thoulder-blade, as

there are two shoulder-blades, two arm-bones, four bones of the cubit, that s, two ell-bones, and two wands, fixteen of the wrift, eight of the after-wrift, and thirty of the fingers; into this number also come the Sesamoidea, or seed-bones, of which some are internal, and these always twelve at the least, although sometimes there may be more sound, a great part of which rather merit the name of gristles, than bones; there are others external, if we believe Sylvius.

The first shewesh the fore-part of the Sceleton of a man, &cc.

The Declaration of these three Figures put into one.

CHAP. XLII.

An Episome of the names and kinds of composure of the Bones.

Ecause it is as necessary for a Chimirgeon to know the manner of setting and repairing broken bones, as to put them in their places when they are diflocated, or out of joynt; but feeing neither of them can be understood when the natural connexion of the bones is not known; I have thought it a work worth my labour, briefly to fet down, by what and how many means the bones are matually knit and faffined rogether. The universal composure and first ture of all the bones in a mans body is called by the Greeks Section. But all the bones are composed after two forts that is, What the Side by Arthrofis, an Articulation or joynt, and by Symphysis a natural uniting or joyning together. Ites is.

There are many other kinds of both these forts. For there are two kinds of Articulation, that is,

Two forts of culation is a composition of the bones with a manifest and visible motion; which differ as thus, De-articulation, and Symphysis, or Co-articulation; which differ as thus, De-articulation.

Two forts of culation is a composition of the bones with a manifest and visible motion; Co-articulation hath a What Distriction of the bones, yet now so received from the bones with a manifest and visible motion; Co-articulation hath a What Distriction of the bones, yet now so received from the bones with a manifest and visible motion; Co-articulation hath a What Distriction of the bones with a manifest and visible motion; Co-articulation had a what Distriction of the bones with a manifest and visible motion; Co-articulation had a what Distriction of the bones with a manifest and visible motion; Co-articulation had a what Distriction of the bones with a manifest and visible motion; Co-articulation had a what Distriction of the bones with a manifest and visible motion; Co-articulation had a what Distriction of the bones with a manifest and visible motion; Co-articulation had a what Distriction of the bones with a manifest and visible motion; Co-articulation had a what Distriction of the bones with a manifest and visible motion; Co-articulation had a what Distriction of the bones with a manifest and visible motion; Co-articulation had a what Distriction of the bones with a manifest and visible motion; Co-articulation had a what Distriction of the bones with a manifest and visible motion; Co-articulation had a what Distriction of the bones with a manifest and visible motion of the bone when the control of the bones with a manifest and visible motion of the bone when the control of the bone when the co motion of the bones, yet not fo manifest, but more obscure. But these two, do again admit a sub-twose and sythorson of the bones, yet not to manner, but more obscure. But more two, do again admit a sub-tirefu and Sydivision into other kinds. For Distribusis, contains under it Estartbusis, Arthrodia, and Ginglymor. Arthrosis are. Now Enstribusis or Inarticulation is a kind of Dearticulation, in which a deep cavity receives a Distribusis. Three sorts of thick and long head, such a composition bath the thigh-bone with the buckle-bone.

What Essar-

thick and long head, factor a composition matrice trings-bone with the mackie-bone.

Aribrodes is when a lightly engraven cavity admits a finall and thort head; fach a connexion is through that of the arm-bone with the thoulder-blade; of the first Vertebra with the fecond. The Greeks what arthrophase diffinguished by proper names these two kinds of cavities and heads; for they call the thick have diffinguished by proper names these two kinds of cavities and heads; for they call the thick and long head Cephale, that is, a head absolutely; but the lesser they term Corone, on Coronen, which what cophale the Latins call Capatalism, a little head. But they call a deep cavity Cosyle, and a superficiary one is.

Glene. The third fort called Gingsums, is when the bones mutually receive, and are received one What cosyle is of another; as when there is a cavity in one bone, which receives the head of the opposite bone, what Glene is, and also she form bone both a head which may be received in the cavity of the opposite bone; what Glene is. or another; as when there is a cavity in one bone, which receives the head of the opposite bone, what Glass is, and also the fame bone hath a head which may be received in the cavity of the opposite bone; such what Glass is, a composure is in the cubit-knee, that is in the connexion of the thigh-bone. And thus much of may. Dearticulation and the three kinds thereof.

Symarthrofus, or Coarticulation, another kind of juncture, hath also three kinds thereof (Gal. lib. Three kinds of Synathropius) to wit, Sutura, Gamphosis and Harmonia.

Suture str. de Offibus) to wit, Sumra, Gamphofis and Harmonia.

What a Satara What Gamphonea is.

Suture is a composition of the bones after the manner of sewing things together, example where of appears in the bones of the skull. Gemphosis is when one bone is fattened in another as a pin is fastened in a hole, after which manner the teeth are sattened in their sockets in both the Jaws. What Harms. Harmony is when the bones are composed by the interposition of a simple line, after which manner many bones of the nose and face are joyned together.

Hitherto we have spoken of the brit construction of the bones by articulation and the kinds

thereof; now it follows we treat of Symphyfis.

Symphysis or growing together, as we formerly faid, is nothing elfe, than natural union of the bones; such union is made two manner of ways, that is, either by interpolition of no other things after which fort, in success of time the bones of the lower jaw grow together, which formerly in chi dren were manifefully diffinguished, or by the mediation of some medium; but that happens, three manner of ways, by interpolition of three feveral Media, as first of a grifile, which kind of union the Greeks call Syncondrofis, after which manner the share-bones grow together, and also some Appendices in young bodies; fecondly, of a ligament, and it is named by the Grecians Symmetrofis, the name of a nerve being taken in the largest senses for sometimes it is used for a tendon otherwhiles for a ligament, otherwhiles for a nerve properly to called and which is the author of fenfe and motion. But this Symphysis, or union, hath place by Symenrosis, or interpolition of a nerve, in certain bones of the Sternon and hanch.

Thirdly, the bones grow into one by interpolition of flelh, called in Greek Synfarcofs; thus the flesh of the gums fastens the teeth, and makes them immoveable. But if some be less pleased with this division, by reason of the obscurities in which it seems to be involved, this following expression comes into my mind, which I was first admonished of by German Cartin Doctor of Phytick, which

if you well observe it, is both blameless and more easie for your understanding.

As I have formerly reckoned up the bones, fo here, I have decreed to recite the mufcles of mans body. Wherefore in the face we first meet with the broad or skin-muscle arising from the flethy pannicle, and covering the whole neck, and almost all the face. Then follow four pertaining to the upper eye-lids. In the orbs of the eyes lie fourteen, that is, feven in each follow four pertaining to the upper two oblique, and one pyramidal. Then succeed four of the nose, two external, on each fide one, and two internal; these draw it together, and the other open it. After these come the ten muscles of the lower jaw, of which two are called the Crotaphite, or temporal; two Massetters or grinders; two round (which feem to me rather to pertain to the lips, than to this jaw s) two little ones hid in the mouth, arifing from the winged process of the wedg-bone; two openers of the mouth being nervous or tendinous in their midit. Then follow the eight mufcles of the lips, that is, four of the upper, and as many of the lower, thutting and opening the mouth. The tongue with his ten mufcles hid, as it were, in the den of the mouth. Wherefore the mufcles of the whole face are nity one. In the four part of the neck are found the mufcles of the bone Hyoider and throttle: Now eight mufcles hold the bone Hyoider as equally ballanced; of which there are two upper ariting from the chin, two on the fides from the process Seyloides, perforated in their midst, through which the two openers of the mouth in that part nervous do pass two arise from the Sternon, and lastly, two from the upper rib of the shoulder-blade to the Coracoides, which also in their midst are nervous, in which place the two Masterder lye upon them-

United mutually by Symphyfis, or union; by which they are so conjugated that there is no dissimilar, nor heterogeneous body, at least which may be discerned, interposed between them. Such union appears in the two bones of the lower jaw at the chin, in the bones of the Sternon, the hanch with the huckle-bones, and the share-bones between themselves; of this union there are no more kinds, for by this it cometh to pass, that the bones which were more and distinct meet together by interposition of one Mcdium, to wit, a griftle, which now indeed, is no griftle, but is turned into a hone.

Enarthrolis, when the head of a hone is wholly received in the cavity of another, and hid therein, as the thigh-hone

is joyned with the buckle-bone.

Arthrodia, when in a lightly engraven and not much depressed cavity the knad of another bone is not robolly hid, but onely received in part thereof; so that, unless Nature had otherwise provided a sufficient receptacle for the head of this bone (as by the ligaments of the neighbouring muscles) it mould otherwise have been in perpetual danger of differential. ger of diflocation. Thus the arm-bone is fatened to the (boulder-blade.

Ginglymos, when the bones mutually receive each Lother ; Juch like composition hath the cubit and arm-bone.

Gomphylis, as when one bone fo receives another as a pin is fastned in the bole made by a piercer; thus the teeth

are failined in the jaws.

Sutura, like a Saw, or teeth of a Comb; as the bones of the skell are matually knit together; or as Scales, or Tiles are laid, after which manner the flony-bones are fait.

ned to those of the Sinciput. Harmonia, which is by interposition of a simple-list, which parts bones abutting one upon another, as the bonts

Either more loofly as by Or Conjoyned Diarthrofis shat is a kind by that which of Articulation not very firait, as by which it they call Axthrodia , or might have opportunity to perform diverse motions: Articulation , 3 as when they Of this Composition or Articulation of bones there are three kinds ; as,

Or more straitly, as by Synarthrofis when the bones are more straitly knit, so that they can perform no motions in the body. Of this Articulation there are also three kinds , that

1 fo concier and are bound together ; that Some Hererogeneous Substance may be noted berring them, but the bones thus composed are knit two manner of ways's that is,

of the rofe rations and the como a row

minicomi

Tan III.

The Throttle composed of three griffles hath eighteen or twenty muscles; of which fix or eight. The eighteen are common, and twelve proper; Of the common there are two above, two below, and two at mufcles of the findes of the first griftle; to which we may add those two which ferve for the opening of the Epiglottis, which are always found in great four-footed Beafts for to prefs down the Epiglottis.

The proper are twelve, which almost all of them come from the fecond griffle, fo to be inferted into the first and third, of which some are before, others behind the Thyrsides. Besides, these are

the Maftoidei which bend the head.

But in the back part of the neck there are twelve mufeles also appointed for to move the head. The head is fo that in all there are fourteen muscles serving for the motion of the head, the two fore Mosformoved by dei, and the twelve hind-muscles, that is to say, the two Splenii, two Complexi, four right, and so muscles. The neck hath eight muscles, of which two are called the long, lying before upon the bodies of The eight the Mostor at the successful the successful the successful to the successful the successf

The neck hath eight muncles, of which are at the fides; the two Spinati, which run alongft the spine; muscles of the Vertebra; the two Sealeni, which are at the fides; the two Spinati, which run alongft the spine; muscles of the cheff.

the Ventors; the two Seaten, which are at the indes; the two Spanti, which run alongst the spine; muscles of the two transverse, which go to the transverse process of the chest.

The chest hath eighty one muscles, of which some are on the fore-part, some on the hind, others The muscles on the sides; they are all combined and coupled together, except the midrist. Now of these there of the chest are the two Sabelanii; the two great saw-muscles which proceed from the basis of the shoulder-blade; eighty one, the four little Rhombeider, or square-muscles, that is, two above, and two below; the two Sacrolambi, the two binders of the grilles within the chest.

Resides, there are two two sacrolambi,

Befides, there are twenty and two external, and as many internal intercofial mufcles, twenty four Intercartilaginei, that is, twelve external, and as many internal; fo that the intercoftal, and Inter-cartilaginei, are fixty eight, which with the twelve before mentioned, make the numbr of eighty mufcles. Add to these the midriff being without an affociate, and you shall have the number for-merly mentioned, to wit, eighty one. But also, if you will add to these the muscles of the lower

belly, I will not much gain-fay it, because by accident they help inspiration and exspiration.

Wherefore of the eight mustles of the Epigatrium, there are four oblique, of which two are defendent, and so many ascendents two right, to which you may add the two affitting or pyramidal muscles of which come from the than-bone, if it please you to separate them from the bead of the right muscles, lower-both.

There are fix or eight Muscles of the Loins, of which two bend the Loins, which are the triangular. The fixer the two Smiths are the triangular.

the two Semispinati; two Sacri; two are in the midst of the back, which for that cause we may call eight of the the Rachite, or Chine-mufcles. Now, that hereafter we may feverally and diffinelly fet down the mufcles of the extreme parts, we will come to the privities.

Where for the use of the testicles, there are two muscles called the Cremasterer, or hanging-muscles. The two creAt the root of the yard, or Peritomenon, there are four others, partly for the commodious passing of masters of the
the urin and feed, and partly for creeking the yard. The Sphintler-muscle is seated at the neck of
testicles.

bladder.

At the end of the right gut are three mufeles, two Levatorer Ani, or lifters up of the fundament, The three of the end of the right gut are three mufeles, two Levatorer Ani, or lifters up of the fundament, the fendaand one Sphinter or flutting muscle. Now let us profecute the muscles of the extremities or limbs. But it will be fufficient to mention only the mufcles of one fide, because seeing these parts of the

body are double, those things which are said of the one may be applied to the other. Wherefore the muscles of the arm, beginning with these of the shoulder-blade, at the least, are The muscles forty two, for there are four of the shoulder-blade: Of the arm properly or particularly so called, of the arm in

feven or eight; and there are three, four or five proper mufeles of the cubit; that is, appointed for general forty the performance of the motions thereof; in the inner part of the cubit are feven, and as many in outer; but those of the hand are reckoned thirteen at least.

The four of the shoulder-blade are the Trapezius, refembling a Monks Cowl, which moves it upwards and downwards, and draws it backwards; the fecond is the Levator, or litter up; the third the great Rhomboides lying under the Trapezius; the fourth, the leffer faw-mufcle, which is inferted into the Caracoides. The arm is moved forwards, backwards, upwards, downwards and circularly.

The pectoral muscle arising from the clavicle, breast-bone, and neighbouring ribs, draw it forwards; the Humilis, or low-muscle, coming from the lower-rib of the shoulder-blade draws it backwards; the Deltoides upwards, and the Latissimus downwards, and somewhat backwards. But the three feated about the shoulder-blade move it about, or circularly.

The Epomis or Seapularis upwards; the Superfeapularis, which may feem two, backwards and downwards; the Subfeapularis which is in the cavity of the thoulder-blade, forwards, so that by a certain viciffitude and succession of action, they move it circularly. Two muscles bend the cubit, the one named Bieeps, or two-headed, and the other Beachieur or the arm-mufcle; but one, two or three mufcles extend it; for, if you have respect to the original, this mufcle hath two or three heads,

In the infide of the cubit are feven mufcles, one Palmaris, two wrift-benders, two Pronatores, one In the inflice of the capit are reven mucies, one ramany, who will be diducted, two rematerers, one fquare, another in forme fort round; two finger-benders, and one Abdullor, or drawer afide. These fourteen internal and external muscles of the cubit, do not indeed move the cubit, but only seated there move the wand, and with it the hand. These are the thirteen masseles of the hand; the Thenar which may not only be divided into two, but into fix, not only by the divers actions it performs, but which may not only be divided by a manifest space between them; the second is called the Hypothesian, which lies under the little finger, as the Thenar doth under the thumb; the third is the Abdullar of the thumb; then follow the four Lumbrici and fix Interoffer, although eight may be observed.

The whole leg hath at the least fifty muscles, for we reckon there are fourteen muscles in the The muscles thigh, there are eleven made for the use of the leg; there are nine seated in the leg, three before, of the leg in and lix behind, which serve for the use of the foot and toes; in the foot are seated in the leg, three peneral fifty, fore of the fourteen muscles serving the thigh to bend it, one called the Lumbaris, the other arising from the cavity of the hanch-bone; but the three which make the buttocks and the Triceps or three

2222237

headed muscles, (which if you please, you may divide into three) extend it. Besides these the four twin-muscles, and two Obsuratores, of which the one is internal, and the other external, turn the thigh about. The leg hath eleven; that is, the long, the membranous, the four Polici, or hind-mulcles (three of which come from the huckle-bone, but the other from the commissure of the sharebone) the right, the two vaft, the Crureus or leg-mufele, and the Poplateus, or ham-mufele. These fear ed in the leg for the use of the foot and toes, are three fore, and ix hind-mufeles: Two of the fore bend the foot, one of which is called the Tilisens anticus, the other Permens, which you may divide into two. The third the bender of the toes, although it also partly bend the foot, to which also the bender of the thumb may be revoked. One of the hind is the toe-bender, others extend the foot; and are in this order: Two twins, one Plantarit, one Soleus, one Tibisus policus, and the great bender of the toes, to which may be revoked the bender of the thumb. Of the fixteen feated in the foot, one is above, feated on the back of the foot, which we call the Abduelor of the toes, another, in the fole of the foot; to wit, the little bender of the toes, which goes to the fecond joynt of the toes along if the inlide of the foot; the other leads his help to the great roe, which you call the Abductor of the thumb, another is feated on the outside for the use of the little roe. To these are added the four Lumbrici, belides the eight Interoffer, or if you had rather ten. And thus much may fuffice for the enumeration of the mufcles.

The Figure of the muscles, when the Skin with its Veins, the Fat, and all the fleshy membranes are taken away; that part of the fleshy Membrane excepted, which takes upon it she nature of amascle, as being

For some Impostumes are said to be reade by defluxions, others by congestion; those are community but, and the other community cold, as it shall more manifoldy appear by the following chapter.

CHAP. II.

Of the general casefes of Tumosers,

Here are two general Caufes of Impollumes, Fluxion, and Congestion: Defluxions are oc- After what Here are two general Caules of Impoltumes, Fluxion, and Congettion: Demuxions are occaffoned, either by the part fending, or receiving; the part fending difcharges it felf of the manner tohumours, because the expulsive faculty resident in that part is provoked to expel them; mours against
moved thereto, either by the troublesomess of their Quantity or Quality. The part receiving,
draws and receives occasion of heat, pain, weakness, (whether natural or accidental) openness of the

The causes of heat, in what part foever it be, are commonly three, as, all immoderate motion The causes of (under which frictions are also contained;) external heat, either, from Fire, or Sun; and the use of Heat.

The causes of Pain are four, the first is a sudden and violent invasion of some intemperate thing. Four causes of by means of the four first qualities; the second is, solution of continuity, by a Wound, Luxation, Fra-Pain. Cure, Contusion, or Diffension; the third, is the exquisit sense of the part, for you feel no pain in cutting a bone, or exposing it to cold or heat; the fourth is, the attention, as it were, of the Animal Faculty; for the mind, diverted from the actual cause of pain, is less troubled, or sensible of it.

Two causes of weakneß,

A part is weak, either by its Nature, or by fome Accident: by its Nature, as the Glandules and the Emunctories of the principal parts; by Accident, as if fome difference, bitter pain, or great defluxion have feized upon it, and wearied it, for fo the firength is weakned, and the paffages dilated.

Two causes of congestion.

And the lowness of site yields opportunity for the falling down of humours.

The causes of congestion are two principally, as the weakness of the concoctive faculty, which refides in the part, (by which the affimilation into the fubfiance of the part of the nouriflment flowing to it, is frustrated) and the weakness of the expulsive faculty; for, whilest the part cannot expel superfluities, their quantity continually increases.

And thus often times cold Impostumes, have their original from a gross and tough humour, and so

are more difficult to cure.

Laftly, All the causes of Impostumes may be reduced to three; that is, the primitive or external; the antecedent or internal; and the conjunct or containing: as we will hereafter treat more at large.

CHAP. III.

The figns of Imposthumes or Tumours in general.

the part.

Efore we undertake the cure of Tumors, it is expedient to know their kinds and differences, figns of tumours are
drawn from their proper figns, the fame way, as in other Difdrawn from
the effence of the part they possess, we must first know the parts, and then consider what their effence and composition are.

We are taught both by Skill in Anatomy, and the observation of the depraved Function, especially when the affected part is one of those which lie hid in the Body; for we know whether or no the external parts are affected with a Tumour against Nature, by comparing that with his Natural, which is contrary. For comparing the found part with the difeased, we shall easily judge whether it be swol-

But because it is not sufficient for a Chirurgeon only to know these general signs (which are known even to the vulgar) he must attentively observe such as are more proper and near. And these are drawn from the difference of the matter and humours, of which the tumours confilt.

For this, Galen teaches, That all differences of Tumours arise from the nature and condition of the matter which flows down and generates the Tumour; also they are known by such accidents as happen to them, as colour, heat, hardness, softness, pain, tension, relistance.

Wherefore pain, heat, rednefs, and tenfion, indicate a fanguine humour; coldnefs, foftnefs, and no reat pain, Phlegm; tenfion, hardness, the livid colour of the part, and a pricking pain by fits, Mencholy; and yellowith and pale colour, biting pain without hardness of the part, Choler.

tick, of a melancholick, of of the humours of which they are generated. Wherefore by the motion and fits it will be no difficult.

The know.

The know the kind of the humour; for as in the Spring, so in the Morning the bloud is in motions. The know.

ledge of tuas in the Summer, so in the midst of the Day, Choler; as in Autumn, so in the Evening, Melancholy;
mors by their as in Winter, so in the Night the exacerbation of Phlegm are most predominant. For Hippocrates and Galen teach, that the Year hath Circuits of Discases, so that the same proportion of the excess and motion of humours, which is in the Four Seafons of the Year, is also in the Four Quarters of each Day.

Lib.2. Epidem. Impostumes which are curable have Four Times; their beginning, increase, state, and declinations and we must alter our Medicins according to the variety of these Times. We know the beginning The begining of an Imby the first swelling of the part; The increase, when the swelling, pain and other accidents do manipositume.

festly increase and enlarge themselves; The state when the foretaid symptoms increase no more, but
The state.

The state when the first symptoms increase no more, but
the state. rumour degenerate, and change it felf into another kind of humour; The Declination, when the fwelling, pain, fever, reftlefsnefs, are leffened. And from hence the Chirurgeon may prefage what the end of the tumour may be; for tumours are commonly terminated four manner of ways, if so be that the motion of the humours caufing them be not intercepted, or they without fome manifest caufe do flow back into the body.

Therefore first they are terminated by insensible transpiration or resolution; secondly, by suppuration when the matter is digefted and ripened; thirdly, by induration, when it degenerates into a Scirrhus, the thinner part of the humour being diffolved; the fourth, which is the worst of all, by a Corruption and Gangrene of the part, which is, when overcome with violence, or the abundance or quality of the humour, or both, it comes to that diffemper, that it lofes its proper action.

It is best to terminate a tumour by resolution, and the worst by corruption; suppuration and inmay prefage that an Impostume may be terminated by refolving, are the remission or slacking of the fwelling, pain, pulfation, tenfion, heat, and all other accidents, and the unaccustomed livelines and itching of the part; and hot Impostumes are commonly thus terminated, because the hot humour is eafily refolved, by reason of its subtiley.

Signs of Supparation are the intention or increase of pain, heat, swelling, pulsation, and thesever; for according to Hippocrates, Pain and the Fever are greater when the matter is suppurating than when it is suppurated.

The Chirurgeon must be very attentive to know and observe when suppuration is made, for the purulent matter oft-times lies hid (as Hippocrates faith) by reason of the thickness of the part lying

Fevers and many other malign Symptoms; as Swoundings and Convulsion, by translation of the matter to the noble parts, follow this flowing back of the humour into the body.

CHAP. IV.

Of the Prognostick in Impostumes,

Umors arising from a melancholy, phlegmatick, groß, tough, or viscous humour, ask a longer time for their cure, than those which are of blood or choler. And they are more diffiger ours. cultly cured which are of humours not natural, than those which are of humours yet contained in the bounds of Nature.

For those humours which are rebellious, offend rather in quality than in quantity, and undergo the Tumors made divers forms of things differting from Nature, which are joined by no smilitude or affinity with of matter nor things Natural, as Suet, Poultis Honey, the dregs of Oil and Wine 5, yea and of folid bodies, as Stone, more difficult-

things Natural, as Suet, Pounts, Honey, the dregs of Oil and wine 3, yea and of iona bodies, as Stone, Sand, Coal, Straws; and fometimes of living things, as Worms, Serpents, and the like Moniters.

The tumours which poffess the inner parts and noble entrails, are more dangerous and deadly, as also those which are in the joints, or near to them. And these tumors which feize upon great Velfels, as Veins, Arteries, and Nerves, for fear of great effution of bloud, wasting of the fpirits and convulfion. So Importumes of a moniferous, bignels are often deadly by reafon of the great refolution of nipo. Aph. 8. and hard to cure, as also those which degenerate into a Scientum, are of long continuance 16th.6.

CHAP. V.

Of the general Cure of Tumors against Nature.

Here be three things to be observed in the cure of Impostumes. The first is the effence what must be Here be three things to be observed in the cure of Importantes. The first is the effecte what man be thereof; the fecond, the quality of the humour causing the Importante; the third, the consistered in greatness or finalness of the Tumor, varies the manner of curing, for the Medicins must be increased the cure of the manner of the Tumor. The foreign taken from the nature of the or diminished according to the greatness of the Tumor. The second, taken from the nature of the humour also changes our couniel, for a *Phlegman* must be otherwise cured than an *Erstipulus* and an Oedema, than a Scirrbas; and a timple Tumor, otherwife than a compound. And allo you must cure after another manner a Tumor coming of an humour not natural, than that which is of a natural humour; and otherwise that which is made by congestion, than that which is made by defluxion. The third Indication is taken from the part in which the Turnor refides; by the nature of What we must be understand by the part we understand its temperature, conformation, fite, faculty, and function.

the part we understand its temperature, conformation, site, faculty, and function.

The temperature indicates that some Medicins are convenient for the stelly parts, as those which are more moist; others for the nervous, as more dry; for you must apply some things to the Eye, and the parts of the stelly some stelly subject to destaxion, another to those parts which by reason of their rarity are easily subject to destaxion, another to those parts which by their density are not obnoxious to it.

Vessels, and if it be fit to pour forth the matter and humour when it is suppurated.

Galea by the name of Faculty understands the use and sense of the part. This hath a manifold what we indication in curing, for some parts are principal, as the Brain, Heart, and Liver; for their vertue is must understands.

indication in curing, for fome parts are principal, as the Brain, Heart, and Liver; for their vertue is must under-fland by the Nerves, Arteries, and Veins.

Others truly are not principal, but yet fo necessary that none can live without them, as the Stomach. Some are endued with a most quick sense, as the Eye, the Membranes, Nerves, and Tendons;
the indication will be confided by these three following intentions: as if we consider the luminary consider in the indication will be perfected by these three following intentions, as if we consider the humour consider in performing the indication will be perfected by these times ionowing intermeds, as it we consider the humour common flowing down, or which is ready to flow; the conjunct matter, that is, the humour impact in the performation of the correction of accidents; yet fo that we always have care of that which is most urgent and the Care. of the cause. Therefore first repercusives must be applied for the antecedent matter, strong or weak, having regard to the Tumour as it is then, onely excepting fix conditions of Tumors; the

What things from using repercuffives.

first is, if the matter of the tumour be venenate: the second, if it be a critical abscess: the third, if the defluxion be near the noble parts: the fourth, if the matter be grofs, tough, and viscid: the fifth, when the matter lies far in, that is, flows by the Veins which lies more deep: the fixth, when it lies in the Glandules. But if the whole body be plethorick, a convenient diet, Purging, and Phlebotomy, must be appointed, frictions and bathes must be used. Ill humours are amended by diet and purging. If the weakness of the part receiving draw on a defluxion, it must be strengthened.

If the part be inferiour in its fire, let the Patient be fo feated, or laid, that the part receiving, as much as may be, may be the higher. If pain be the cause of defluxion, we must asswage it by things mitigating it. If the thinnels, or lightnels of the humour cause a defluxion, it must be inspissate by Meats and Medicins. But for the matter contained in the part, because it is against Nature, it requires to be evacuate by refolving things, as Cataplasms, Ointments, Fomentations, Cupping-glasses; or by evacuation, as by fearifying, or suppurating things, as by ripening and opening the Impostume, Lastly, For the conjunct accidents, as the Fever, Pain, and such like, they must be matigated by asswarded by asswa ging, mollifying and relaxing Medicins, as I shall shew more at large bereafter.

CHAP. VI.

Of the four principal and general Tumours, and of other Impollumes which may be reduced to them.

What tumors may be redu-Phlegmon, Which to an Which to an Ordens.

Which to 4

Scirrbat.

He principal and chief Tumours which the abundance of humours generate, are four; a Phlegmon, Eryfipelas, Oedoma, and Seirrhus: innumerable others may be reduced to thefe, diffinguished by divers names according to the various condition of the efficient cause and parts receiving. Wherefore a Phygethlum, Phyma, Fellon, Carbuncle, Inflammation of the Eyes, Squincy, Buba, and latily, all forts of hot and moist tumours may be reduced to a Phlegmon. The Hereo. miliaris, the eating Herpes, Ring-worms, and Tetters, and all Impostumes brought forth by choler, are contained under an Eryfipelas. Atheromata, Steatomata, Melicerides, the Teftudo or Talpa, Ganglion, Knots, Kings-Evils, Wens, Watery Ruptures, the Afeites and Leucophlegmatia may be reduced to an Oedema, as also all flatulent tumours, which the abundance of corrupt Phlegm produces.

In the kindred of the Scirrbin are reckoned a Cancer, Leprolie, Warts, Corns, a Thymus, a Varix,

Morphew black and white, and other Impostumes arising from a Melancholy humour. Now we will treat of these Turnors in particular, beginning with a Phlegmon.

CHAP. VII.

Of a Phlegmon.

What a true Phlegmon is A Phlegmon one thing, and a phicgmo-nous Tuencer another.

Gal. lib. de The

neribus, &c.

ad Glant. Hippor, Ub, de

Vale. cap. Gal.

Phlegmon is a general name for all Impostumes, which the abundance of inflamed bloud produces. That is called a true Phlegmon, which is made of laudable bloud, offending onely in quantity. But a Baffard Phlegmon, or a phlegmonous Impoffume hath forne other, and proper name; as a Carbuncle, Fellon, Gangrene, Sphacel, and the like malign Puttules. So when there is a conflux of divers humors into one tumor, divers kinds of phlegmonous Impollumes called by divers names, according to the more abundant humour, arife; as if a finall portion of Phlegm thall be mixed with a greater quantity of bloud, it shall be called an Oedenatous Phlegmon, but if, on the contrary, the quantity of phlegm be the greater, it shall be named a phlegmonous Ordona, and so of the reft; always naming the tumour, from that which is predominant in it.

Therefore we must observe that all differences of such tumours arise from that, either because the bloud caufing it offends only in quantity; which if it do, it caufes that tumor which is properly called a Phlegmon; if in quality, it makes a phlegmonous rumour, because the matter thereof is much departed from the goodness of bloud.

But bloud is faid to offend in quantity, either by admixture of fome other matter, as Phlegm, Choler, or Melancholy, from whence proceed Oedematous, Eryfipelous, and Scirrhous Phlegmons; or by corruption of its proper fubfiance, from whence Carbuncles and all kinds of Gangrenes; or by concretion, and when Nature is disappointed of its attempted and hoped for suppuration, either by default of the Air, or Patient, or by the errour of the Phylician; and hence oft-times happen Albert mass, Steatomass, and Melicerides. Although these things be set down by the Ancients, of the simple and similar matter of the true Phlegmon; yet you must know, that in truth there is no Impostume, whose matter exquisitely shews the Nature of one, and that simple humour, without all admixture of any other matter; for all humours are mixed together with the bloud yet from the plenty of bloud

predominating, they are called Sanguine, as if they were of bloud alone.

Wherefore if any turnours refemble the nature of one fimple humour, truly they are not of any natural humour, but from forme humour which is corrupt, vitiated and offending in quality; for form bloud by adultion degenerates into Choler and Melancholy.

Therefore a true Phlegmon is defined by Galon; A tumor against Nature, of laudable bloud, flowing into any part in too great a quantity.

This tumour, though most commonly it be in the flesh, yet formetimes it happens in the Bones, 25 Hippocrates and Gales witness.

A Phlegmon is made and generated thus: when bloud flows into any part, in too great a quanthe de Tange, tity; first the greater Veins and Arteries of the part affected are filled, then the middle, and lastly the smallest and capillary; fo from those thus diffended, the bloud sweats out of the pores and small passages like dew, and with this the void spaces which are between the similar parts are THE PROPERTY OF

first filled, and then with the same bloud all the adjacent parts are filled, but especially the sless, as that which is most fit to receive defluxions, by reason of the spongious rarity of its substance's but then the nerves, tendons, membranes, and ligaments, are likewife fluffed full; whereupon a Turnout mult necessarily follow, by reason of the repletion which exceeds the bounds of Nature; and from hence also are Tension and Resistance a and pain also happens at the same time, both by reason of the renfion and preternatural heat.

And there is a manifest pullation in the part, specially whilest it suppurates, because the Veins, Arteries, and Nerves, are much, being they are not onely heated within by the instance of the service of a beautag pain mour, but pressed without by the adjacent parts. Therefore seeing the pain comes to all the fore-fail parts because they are too immoderately heated and pressed, the Arteries, which are in the perpetual motion of their systele & diastote, whilest they are dilated, strike upon the other instanced parts, whereupon proceeds that beating pain.

Hereupto add: The Arteries, then filled with more consensed but blend have

Hereunto adds. The Arteries, then filled with more copious and hot bloud, have greater need to feek refrigeration by drawing in the encompaffing air; wherefore they must as of necessity, have a conflict with the neighbouring parts which are fwollen and pained. Therefore from hence is that com, ad Apr.

pulfation in a Phlegmon which is defined by Gales, An agitation of the Arteries, painful and fenfible 21. Soll-7. to the Patient himfelf; for otherwife as long as we are in health, we do not perceive the pulfation of

Wherefore these two causes of pulsation, or a pulsifick pain in a Phlegmon, are worthy to be observed, that is, the heat and abundance of bloud contained in the Vessels and Arteries (which more frequently than their wont incite the Arteries to motion, that is, to their (yilole and diaftole) and the comprellion and firaitning of the faid Arteries, by reafon of the repletion and differtion of the adja-cent parts, by whose occasion the parts afflicted and beaten by the trembling and frequent pullation

Hence they commonly fay, that in the part affected with a Phlegmon, they feel, as it were, the fenfe Another kind or ftroke of a Maliet or Hammer imiting upon it. But also, besides this pullation of the Arteries there of Pullation in a Phlegmon.

is, as it were, another pullation with itching from the humours whileft they putterie, and supported a Phlegmon.

by the permittion, motion, and agitation of vapours these upon arising.

The cause of heat in a Phlegmon is bloud, which whileft it flows, more plentifully into the part, is as it were, trodden or thrust down, and causes obstruction, from whence necessarily follows a probi-bition of transpiration and patrefaction of the bload, by reason of the preternatural heat. But the Phlegmon looks red by reason of the bloud contained in it, because the humour predominant in the

CHAP. VIII.

Of the Caufes and Signs of a Phlegmon.

He Causes of a Phlegmon are of three kinds; for some are primitive, some antecedent, and The Primidome conjunct. Primitive are falls, contunions, immoderate labour, factions, application tree causes of a of acrid outments, hornings, long flaving, or labouring in the best of a distinct of a philosophic faction of a crid outments. of acrid ointments, burnings, long flaying, or labouring in the hot Sun, a diet inconsiderate, The Anreceand which breeds much bloud. The antecedent Caufes are, the great abundance of bloud, too plendent and Coninst. tifully flowing in the Veins. The conjunct, the collection or gathering together of bloud impact in junct.

The figns of a Phlegmon are, fwelling, tension, retistance, feverish heat, pain, pullation, (efpecially The figns of a while it suppurates) reducts, and others, by which the abundance of bloud is signified.

And a little Dilement in the support of the support o

And a little Phlegmon is often terminated by resolution, but a great one by suppuration; and fornetimes it ends in a Scirrhus, or a turnour like a Scirrhus; but otherwhiles in a Gangrene, that is, when the faculty and native thrength of the part affected, is over-whelmed by the greatness of the defluxion, as it is reported by Galen. The Chirurgeon ought to confider all these things, that he may Gal. de Toss. apply and vary such Medicins as are convenient for the nature of the Patient, and for the time and

CHAP. IX.

Of the Cure of a true Phlegmen.

He Chirurgeon in the cure of a true Phlegmon must propose to himself four intentions, what kind of The first of Diet; This, because a Phlegmon is a hot affect and causes a Fever, must be Diet must be ordained of refrigerative and humesting things, with the convenient use of the fix things prescribed in Not-matural, that is, Air, Meat and Drink, Motion and Rest, Sleep and Waking, Repletion and a Phlegmon. inanition, and laftly, the paffions of the mind. Therefore let him make choice of that air which is pure and clear, not too moift, for fear of defluxion, but formewhat cool; let him command Meats which are moderately cool and moit, thunning fuch as generate blond too plentifully, fuch will be Broths not too fat, feafoned with a little Borage, Lettuce, Sorrel, and Succory: let him be forbidden the use of all Spices, and also of Garlick and Onions, and all things which heat the bloud, as are all fatty and sweet things, as those which easily take fire. Let the Patient drink small Wine, and much allayed with Water of the Decoline of the Patient drink small Wine, and much allayed with Water: or, if the Fever be vehement, the Water of the Decoction of Licoris, Barly, fweet Almonds, or Water and Sugar; always having regard to the firength, age, and cuftom of the

For if he be of that age, or have so led his life that he cannot want the use of Wine, let him use it, but altogether moderately. Rest must be commanded; for all bodies wax hot by motion, but let him chiesly have a care that he do not exercise the part possessed by the Phlegmon for sear of a new defluxion. Let his sleep be moderate; neither, if he have a full body, let him sleep by day, especially presently after meat. Let him have his belly soluble, if not by Nature, then by Art, as by the frequent use of Clysters and Suppositories. Let him avoid all vehement perturbations of mind; as hate, anger, brawling; let him wholly abstain from Venery.

How to divert the defluxion of humours.

This manner of diet thus prescribed, we must come to the second scope, that is, the diversion of the defluxion, which is performed by taking away its cause, that is, the fulness and illness of the humours. Both which we may amend by purging and bloud-letting, if the strength and age of the Patient permit.

The pain must be asswaged.

When we must use re-

percuffives.

But if the part receiving be weak, it must be strengthened with those things which by their aftriction amend the openness of the passages, the violence of the humour being drawn away by Cupping-glasses, Frictions, Ligatures. But if pain trouble the part, which is often the occasion of defluxion, it must be mitigated by Medicins asswaiging pain.

The third fcope is, to overcome the Conjunct Canfe. That we may attain to this, we must enter into the confideration of the tumour, according to its times, that is, the beginning, increase, thate, and declination. For from hence the indications of variety of Medicins must be drawn. For in the beginning we use repercussives to drive away the matter of the Phlegmon flowing down, as the White of an Egg, Oxycrate, the Juices or Waters of Housleek, Plantain, Roses, Cataplasms of Henbane, Pomgranate, Pills, Balausties, Bole Armenick, Terrassigillata, Oyl of Roses, Quinces, Myrtils,

Poppies.

Of these simples variety of compound Medicins arises. This may be the form of a Cataplasin. Re far. bordei 3 ij. fuecisemper-vivi plantag. an. 3 iij. pul. malicorii, balanstiorum & rosar. an. 3 ij. ol. myrtill. & rosar. an. 3 i. siat Cataplasina. Another, Re Plantag. solani, byoseyam. an. an. ii. caquantur persette in oxyerato, pissentur, trajiciantur, addendo pulveris myrtil. nuce. cupress. & rosaub. an. 3 iij. farin. sab. 3 ij. olei rosar. & eydon. an. 3 i s. mix them and make a Cataplasin to the form of a liquid Pultis. And you may use this liminent, by dipping linen clothes in it, and applying to the part; Re ol. nymph. & rosar. an. 3 iij. aq. ros. salami & plantag. an. 3 ij. aceti 3 iij. albumin. overam n. iij. saa linimentum. Also ung. rosatum & ung. album, comphor. Rasis are good to apply to it, as in like matmer, Emp. Diaessleitheas dissolved in Vinegar, and Oyl of Roses and also Populeon may be used. In the increase, you must have care of the humour slowing down, and of that which already impacted in the part, did formerly fall down. Therefore repercustives must be tempered and mixed with discussing Medicins, but so, that they may carry the chief sway, as, se Fol. malve, absorbe, plantag. an.m.iij. coquantur in oxyerato, continudantur, trajessis add. farine sabarum & bordei an. 5 i. pul. rosarub. & Absorber, se farine bord. iii, farine sem. lini & faringsci. an. 3 i. coquantur in aqua communi addendo sub-sime pulanyrill rosaro chamem. an. 3 ii. saris & olei rosar. an. 3 i. misee, fiat Cataplasma.

But in the state, the repercussives and discussives ought to be alike with some anodyns, or mitiga-

But in the flate, the repercultives and discussives ought to be alike with some anodyns, or mitigating Medicins, if it be painful, as, R: Rad. Alther \(\frac{7}{2}\) iv. malve, parietae an mij. cognantur sub cineribus, addendo farin fabar. & tentium an. \(\frac{7}{2}\) ij. pulveris cham. & meliloti an. \(\frac{7}{2}\) b. olei cham. & refar. an. \(\frac{7}{2}\) i. axangie gal. \(\frac{7}{2}\) ij. sias Cataplasma. Another, R: Mice panis triticei aqua calida macerati \(\frac{15}{2}\) b. pulveris refar. rub. & abstinth. ana \(\frac{7}{2}\) vi. olei aneth. & mellis com. an. \(\frac{7}{2}\) ij. Misse connia simul. & fiat Cataplasma ad formam

Pultis fatis liquide; which is of chief use when there is pain.

But when the violence of pain and other fymptoms are affwaged, it is likely that the Phlegmon is come to determination. Wherefore then we must use more powerful and firong discussives, and onely then; beginning with the more gentle, left the subtiler part of the humour being dissolved, the grosser, remaining in the part, should grow hard, as, R. Mal. bismal. an. m. iij. coquantur, addendo farine bordei 3 ij. mellis com. 3 i. ol. chamam. & melilot. an. 3 f. fiat Cataplasma. Or, R. Rad. com Brion. & Cucumer.agrest. an. 3 ij. florum chamam. & melilot. ana m. iij. coquantur in bydromelite addendo farine, som. lini, & farnagrae. an. 3 ij. ol. aneth. avaungia anser. & anat. an. 3 i. siat Cataplasma. And this Plaister sollowing may here find place:

R. Diachyl. mag. 3 ij. Empl. de melilot. 3 i. olei aneth. & chamemel. 3 f. diffolve them all together and make a Medicin for your use. Or, R. Empl. de mucag. & oxyer. an. 3 ij. Empl. Diachyl. Ireat. 3 i. olei liliorum & chamemel. quantum satis est, and make thereos a soft Emplaisser.

The fourth fcope of curing a Phlegmon confifts in correction of the accidents which accompany it; of which, Pain is the principal.

Wherefore the Chirurgeon must be diligent to assume it; for besides, that it weakens the strength, and debilitates and depraves the function, it also causes defluxions by drawing the bloud and spirits to the part affected.

CHAP. V.

The Cure of an ulcerated Phlegmon.

Ut it often happens that the humour is so impact in the part, that it cannot be repressed, and The signs of a fo groß, that it cannot be discussed; which we may know by the greatness of the heat and wherefore laying aside all hope of discussing, we must come to the Suppuratives. For which pure Library define. pole Galen forments the (wollen part with Water or Oyl being Warm, or with both of them; and then 1997.

pose Galen formests the swollen part with Water or Oyl being Warm,or with both of them; and then ^{cap.7}. applies this following Caraplasm.

Re Farine trie vel mice pame 3 W. ol. com. 3 iii. aque comequantum sufficit sita Cataplasma. Or, Re Rad, Supportative lilier. allo & althore, an. 3 iii. sollowed. an. 4 site parietar. & sections, and m.i. communic in hydromelite, possenter bedicins. trajestis adde farin. sem. line 5 ii. axungia sitelle, ol. lilierum, an. 3 β. sita Cataplasma. Or, Re Malve, hismate, violar, an. m.i. caricarum sing. a. a. passell. 3 ii. communic in aq. com. tustis, & trajestis, adde mellis com. 3 ii. sing. hashilicon. & batyoi recent, and 3 i. sita cataplasma. You may profitably use for the same purpose, Empl. Diachylom magnium, or Bassellicon. Or, Re Empl. Diachylomag. 3 ii. sug. hashilicon. 3 i. ol. lilierum 3 β. Or these mixed together make a Medicin for the foresaid use.

When the heat, pain, sever, and other accidents shall remit, when the tumour bath a sharp head, The signs of when by the pressing of your singer you find the humour to slow, as it were, to and fro, then you may Pm., or materi

when by the preffing of your finger, you find the humour to flow, as it were, to and fro, then you may Pm, or matter

Wherefore without any farther delay the tumor must be opened, lest the matter too long that up, corrode the adjacent parts, and the Ulcer become finuous and fiftulous.

For this usually happens, especially then, when the matter is venenate or malign, or when the swelling is near a Joint, or at the Fundament, or such like hot and moist places.

For by the decree of Hipperstes we should anticipate the maturation of such Tumours by Bipelib. de Figula. epening.

They may be opened with an Incision-knife, or Caustick, and that either actual, or potential. For if the Patient shall be heartless and less consident, so that he either cannot, or will not endure any Instrument, you mailt make way, for the matter by a Potential Cautery. You may also do the businefs by another flight; as thus

Thrush the point of a sharp Knife or Lancet through a brass Counter, that it may shand fast in the midst thereof's then cover it diligently with some Emplaister or Cataplasin, that neither the Patient nor standers by perceive the deceit: then laying on the Plaister, as if that you would make a passage for the matter by that means; but when you have sitted the point to the part where it is sit to open the Turner so enide the Counter with your spaces, that you may repfectly make an impression into the Tumor, fo guide the Counter with your fingers, that you may prefently make an impreffion into the Tumor fufficient for excluding the matter. I have here expressed three delineations of such Instruments, that yournay use these, either bigger, lesser, or indisferent, as occasion shall serve.

Counters with the points of Knives or Lancets put through them.

A Shews the Counter or piece of Silver. B Shews the point of the Lancet.

But there are feven things which must be diligently confidered in opening all forts of Impostumes. The first is, That you put your Knife to that part of the Abscess which is the softer, and yields to the impression of your singers, and where it rises into a head or point. The second is, That you make choice of that place for diffection which is the lowest, that so the contained impurity may the more readily flow out, and not stay in the passage. The third is, That it be made according to the wrinkles of the skin, and the right Fibers of the Muscles lying next under the skin. The fourth is, That you turn your Knife from the larger Vessels and Nerves worth speaking of. The fifth is, That the matter contained in them be not evacuated too abundantly at once in great Abscesses, left thereby the strength be dejected, the spirits being much wasted together with the unprofitable humour. The fixth is, That the affected part be handled as gently as you can. The seventh is, That after the opening, when the matter is evacuated, the Abscess be cleansed, filled with fielh, and latily, consolidated and cicatrized. But seeing that commonly after such sections some part of the Tumour reopening, when the matter is evacuated, the Ablects be cleaned, miled with nein, and latily, confolidated and cicatrized. But feeing that commonly after fuch fections forme part of the Tumour reaches mains, all the contained humour being not wholly suppurated, the Chirurgeon may perceive that this is an implicit affect, that is, a Tumour and Ulcer. But the Cure thereof must be fo, that you take the contained humour being not wholly suppurated, the Cure thereof must be fo, that you take away the Turnour before the Ulcer; for the Ulcer cannot be healed before the part be reftored to its nature. Therefore the Suppuratives formerly prescribed must be used, and the Ulcer must be discounted by the College of the Ulcer must be used. dreffed for two or three days with this following Medicin.

But if you would cleanse it more powerfully, you may use Unguentum Apostolorum, or Unguentum Aurena and Agyptiseum mixed according to the score you conceive in your minds; when the Ulcer shall seem surface utly cleansed, it shall be filled with flesh, and cicatrized after the manner we shall declare in the proper treatise of the Cure of Ulcers.

CHAP. XI.

Of Fevers and the Cures of those Fevers which accompany Phlegmons.

The Fever of a Phlegmon. What a Fever

Mongft the Symptoms which most usually accompany Phlegmons, and afflict all the body of the Patient, Fevers are the chief; that is, hot and dry differences kindled in the heart, and thence by the Arteries fent overall the body; yet those which usually follow this kind of Tumours, are Ephemere, that is, Diary, unputrid Symethi; of whose nature and order of Core I will here briefly relate what I have learnt from my Makers, that is, Doctors of Phylick, as I have been conversant with them in the practice of my Art. What an Epo e-

The Ephemera, or Diary [that is, of one day] is a hot and dry different attree kindled in the vital serie, or Diary spirits. It hath that name, because by its own nature it tarries not above the space of one day, or twenty four hours, by reason it is kindled in a subtile easily distipable matter.

The efficient causes of this Fever are weariness, hunger, and drunkenness, anger, fury, forrow, watching, great and piercing cold, Adultion, Bathes, and manner of living inclining more to heat then ordinary; applying, using or drinking of acrid Medicins, as Poifons, or of hot Meats, or drinks to conclude, all the efficient causes common to all Fevers, putrefaction onely excepted, which properly appertains to putrid Fevers.

epiarifis 55-

The crofes

For a Budo alfo, which is a Phlegmon of the Glandules, causes a Diary, as Hippocrates thews. All Fevers proceeding from the Tumours of the Glandules are evil, the Diary excepted. Which Apherism must be understood warily and with that distinction which Galen gives in his Commentary, where he faith; It is not onely to be understood of Tumours rising in the Glandules without occafrom that is, without any evident and manifest cause; for otherwise Fevers that thence take their The Mill of the state of

original, though not Diary, yet are not all evil, as we learn by Buboes in Children, and the venereous Buboes, which happen without inflammation or competion of the Liver; for fuch commonly have no malign Fever accompanying them, which thing is worthy a Chirurgeons observation.

The common figns of a Diary are, a moderate and vaporous heat feeling gentle to the hand, a The figns of a Pulle fwift and frequent, fornetimes great and ftrong, as when the Diary is caused by anger; forne-Diary. times little, if the Fever proceed from forrow, hunger, cold, crudity; for other respects equal and or-

minneoun.

The most certain figns are, if the Fever come upon one not by little and little, but suddenly, and that from external and evident cause; no louthing of Meat, no causses weariness, no deep sleep, yawning, great pain, restlessness, shaking, nor cold going before; and lastly, no other troubleson symptom preceding. We here make no mention of the Urin, because most frequently they refemble the Urins of sound bodies; for in so short a time as Diaries endure, there cannot so great a perturbation be raised in the blood that there may be signs thereof found in the Urine. A Diary is entry the Urin is cled in constitution by the proper nature of this Fever lasts but one day, although sometimes others in health. ded in one fit, which by the proper nature of this Fever lafts but one day, although fornetimes other in health. wife it is extended to three or four days space; and then it easily degenerates into a Putrid, especially any errour of the Patient, Phylician, or those which attend him, concurring therewith, or if the external things be not rightly fitted.

This Fever is terminated either by infenfible transpiration, or by the moisture of the skin, or by a The unputrid sweat natural, gentle, and not ill smelling; to this Diary we may refer the unputrid Symochus gene-5780chus. rated of bloud not putrid, but onely heated beyond measure. For usually there arises a great heat over all the body, by means of the bloud immoderately heated; whence the Veins become more turnid, the Face appears fiery, the Eyes red and burning, the Breath hot, and to conclude, the whole habit of the body more full, by reason of that ebullition of the bloud, and the diffusion of the vapours thence ariting over all the body: Whence it is that this kind of Symothes may be called a vaporous Fever. To this Children are incident; as also all fanguin bodies, which have no ill humours. The cure of this and the Ephemera, or Diary is the fame; because it may scarce seem different from the Ephemera in any other thing, than that it may be prolonged for three or four days. Wherefore what-foever we shall say for the cure of the Ephemera, may be applied to the Symebas, bloud-letting excep-

ted, which in an unputrid Symelow is very necessary.

Now the cure of a Diary-Fever consists in the decent use of things Not natural, contrary to the Diary Fever.

Cause of a disease; wherefore Baths of warm and natural Water are very profitable; so that the Patient be not Plethorick, nor fluffed with excrements, nor obnoxious to Catarrhs and Defluxions, because a Catarrh is easily caused and augmented by the humours diffused and dissolved by the hear of a Bath, therefore in this case we must eschew frictions, and anointing with warm oil, which things notwithstanding, are thought very useful in these kind of Fevers, especially when they have their original from extreme labour, by attriction of the skin, or a Bub. Let this be a general rule, that to every Caufe whence this Fever proceeded, you oppose the contrary for a remedy; as to labour, reft; to watching, fleep; to anger and forrow, grateful fociety of Friends, and all things replenished with

pleafant good will; and to a Bulo, the proper cure thereof.

Wine moderately tempered with Water according to the custom of the sick Patient, is good and The use of profitable in all causes of this Fever, except he be pained in his head, or that the Fever drew its original from anger, or a Bubo; for in this last case especially, the Patient must abstain wholly from Diary. Wine, until the inflammation come to the state, and begins to decline. This kind of Fever often troubles Infants; and then you must prescribe such Medicins to their Nurses, as if they were such that so by this means their Milk may become Medicinable. Also it will be good to put the Infant himself into a Bath of natural and warm Water, and treasured to the research the ride of the himself into a Bath of natural and warm Water, and presently after the Bath to anoint the ridg of the Back and Breft with Oil of Violets. But if a Phlegmon poffes any inward part, or otherwise by its nature be great, or feated near any principal Bowel, so that it may continually fend from it either a putrid matter or exhalation to the heart, and not onely affect it by a quality of preternatural heat by the continuity of the parts, thence will arise the putrid Synachus, if the bloud by contagion putrefying in the greater Vessel, confished one areal mixture of the four humans. This Ferry is thus chiefly in the greater Veffels, confifts of one equal mixture of the four humours. This Fever is thus chiefly How a putrid known: it hath no exacerbations, or remiffions, but much lefs intermiffions; it is extended beyond synchus is the force of the four four force of the the space of twenty four hours, neither doth ir then end in vomit, sweat, moisture, or by little and caused. little infentible transpiration, after the manner of intermitting Fevers or Agues; but remains confiant, until it leaves the Patient for altogether: it commonly happens not, unless to those of a good temper and complexion, which abound with much bloud, and that tempered by an equal mixture of the four humours. It commonly endures not long, because the bloud by some peculiar putrefaction degenerating into Choler or Melancholy, will presently bring forth another kind of Fever, to see a Terran or continued Operary. wit, a Tertian or continued Quartan.

The core of this Fever (as I have heard of most learned Physitians) chiefly consists in bloud-letting. Phlebotomy For by letting of bloud the fulnets is diminished, and therefore the obstruction is taken away, and necessary in a lastly the putteraction. And seeing that in this kind of Fever there is not onely a fault of the mat-putrid System of the blood but a last of the mat-putrid System of the blood but a last of the matter, by the putrefaction of the bloud, but also of the Temper by excess of heat; certainly Phlebotomy helps not onely, as we faid, the putrefaction, but also the hot difference. For the bloud in which all the heat of the creature is contained, whileft it is taken away, the acrid and fuliginous excrements exhale and vanish away with it, which kept in, increase the Feverish hear. Moreover the Veins, to shan emptiness, which Nature abhors, are filled with much cold air in stead of the hot bloud which was drawn away, which follows a cooling of the habit of the whole body, yea, and many by means of Phlebotomy have their Bellies loofed, and fweat, both which are much to be defired in this kind what benefit

This moved the ancient Physicians to write, that we must draw bloud in this disease, even to the by drawing fainting of the Patient.

oud even to Yet fainting.

2022531

Yet because thus, not a few have poured out their lives together with their bloud, it will be better and safer to divide the evacuations, and draw so much bloud at several times, as the greatness of the difease shall require, and the strength of the Patient may bear.

Why we must give a Clyfler prefently after bloud-letting.

When Syrrups profitable in this cafe. Why a flender Diet must be used after letting much bloud.

When drinking of Water is permitted

in a putrid Syrochus.

When you have drawn the bloud, forthwith inject an emollient and refrigerative Clyfler; left that the Veins emptied by Phlebotomy may draw into them the impurity of the Guts; but those Clyfters which cool too much, rather bind the belly than loofe it. The following day the Morbifick fiers which cool too much, rather bind the belly than loole it. The following day the Morbinek matter must be partly evacuated by a gentle Purge, as a bole of Cassia, or Casholicon; then must you appoint Syrups which have not onely a refrigerative quality, but also to resist putrefaction, such as the Syrup of Limmons, Berberies, of the Juice of Citrons, of Pomegranats, Sorrel and Vinegar; let his diet be absolutely cooling and humecting, and also slender; for the native heat much debilitated by drawing of great quantity of bloud cannot equal a full diet. Therefore it shall suffice to feed the Patient with Chicken and Veal Broths made with cooling Herbs; as Sorrel, Lettuce, and Purslan. Let his drink be Barly Water, Syrup of Violets mixed with some pretty quantity of boiled Water, Sulphan and Veal Broths in the better with Chicken and Pursland Water, Syrup of Violets mixed with some pretty quantity of boiled Water, Sulphan and Veal Broths in the Purge of Purgenting of Julepum Alexandrinum, especially if he be troubled with scooring or lask. But the Physician must chiefly have regard to the fourth day; for if then there appear any figns of concoction in the excrethe Crifis must be expected on the seventh day, and that either by a looseness of the belly, or an abundance of Urin, by Vomits, Sweats, or Bleeding Therefore we must then do nothing but commit the whole bufmels to Nature.

But for drinking cold Water, which is fo much commended by Gales in this kind of Fever, it is not to be fuffered before there appear figns of concoction; moreover in the declining of the Difeafe, the use of Wine will not be unprofitable to help forwards Sweats.

CHAP. XII.

Of an Erylipelas, or Inflammation.

Aving declared the cure of a Phlegmon, caused by laudable bloud, we must now treat of thole Tumors which acknowledge Choler the material cause of their generation, by reason of that affinity which intercedes between Choler and Bloud. Therefore the Tumors cau-The definition of an Eryfed by natural Choler, are called Eryfipelata, or Inflammations; these contain a great heat in them, Spilar. which chiefly possesses the skin, as also oftentimes some portion of the slesh lying under it. For they are made by most thin and subtle bloud (which upon any occasion of inflammation easily becomes Cholerick) or by bloud and Choler, hotter then is requifite, and fometimes of choler mixed with an acrid ferous humour.

Galacop. 2.11b. & 2.ad Glasc.

That which is made by fincere and pure choier, is called by Galen, a true and perfect Erylipelas. But there arise three differences of Eryspelaer, by the admixture of choler with the three other kinds of humours. For if it being predominant be mixed with bloud, it shall be termed Eryspelas Phlegmonodes; if with Phlegm, Eryfipelas adomatodes; if with Melancholy, Eryfipelas Scierbodes. So that the former and fubfiantive word thews the humour bearing dominion, but the latter or adjective that which is inferiour in mixture. But if they concur in equal quantity, there will be thereupon made

Two kinds of Eryfiyelats.

Hip. Aphs.79. Still.7.

Aph. 25. Self. 15. Aph. 43. 500.3.

Eryfipelas Phlegmone, Eryfipelas adema, Eryfipelas feiribus.

Galen acknowledges two kinds of Eryfipelaer, one timple and without an ulcer, the other ulcerated.

For choler drawn and tevered from the warmness of the bloud, running by its subtilty and acrimony unto the skin, ulcerates it; but reflrained by the gentle heat of the bloud, as a bridle, it is hindered from piercing to the top of the skin, and makes a tumour without an ulcer. But of unnatural choler are caused many other kinds of cholerick tumors, as the Herpes, Exedens, and Miliaris: and lastly, all forts of tumors which come between the Herpes and Cancer. You may know Erysipelas chiefly by three figns, as by their colour, which is yellowith red; by their quick fliding back into the body at the leaft compretion of the skin, the cause of which is the substery of the humour and the outward site of it under the skin, (whereupon by some Erysipelas is called a Discase of the Skin;) lastly, by the number of the Symptoms, as Heat, Pulsation, Pain. The heat of an Erysipelas is far greater than that of a Philegmon, but the pulsation is much less; for as the heat of the bloud is not so great Gal. 115, 2. ad as that of choler, fo it far exceeds choler in quantity and thickness; which may cause compression and obstruction of the adjacent Muscle.

For Choler eafily diffipable by reason of its subtlery quickly vanishes, neither doth it suffer it selfto be long contained in the empty spaces between the Muscles; neither doth an Eryspelas agree with a Phlegmon in the propriety of the pain. For that of an Eryspelas is pricking and biting without tension or heaviness; yet the primitive, antecedent, and conjunct causes are alike of both the tumors. Although an Expipelas may be incident to all parts, yet principally it affails the Face, by reason of the rarrity of the skin of that place, and the lightness of the cholerick humour flying upwards. It is ill when an Eryfipelas comes upon a wound or ulcer, and although it may come to suppuration, yet it is not good; for it thews that there is obstruction by the admixture of a gross humour, whence there is

forne danger of erofion in the parts next under the skin. It is good when Enfipelar comes from within outwards, but ill when from without it retires inward. But if an Englipeias poffels the Womb it is deadly, and in like manner if it spread too far over

the face, by reason of the sympathy of the membranes of the Brain.

Tax III

CHAP. XIII.

Of the Cure of an Erylipelas.

Or the cure of an Eryfipelar we must procure two things, to wit, Evacuation and Refrigera-Or the cure of an Eryfipeles we must procure two tnings, to wit, Evacuation and Refrigeration. But because here is more need of cooling, than in a Phlegmon, the chief scope must Gal.14. Mrs. be for Refrigeration. Which being done, the contained matter must be taken away and evacuated with moderately resolving Medicines. We must do four things to attain unto these fore- Four things to attain unto these fore- Four things to attain unto these fore- Four things to attain unto these forementioned ends. First of all, we must appoint a convenient manner of Diet, in the use of the fix be performed things not naturally that is, we must incrassate, refrigerate, and moisten, as much as the nature of the incuring an thentioned ends. Fifth of all, we must appoint a convenient manner of Diet, in the use of the fix in caring a things not natural; that is, we must incraffate, refrigerate, and moiften, as much as the nature of the English Difease and Patient will suffer, much more than in a Phlegmon; then we will evacuate the antecedent matter by opening a Vein, and by Medicines purging cholers and that by cutting the Cepha-lick Vein, if there be a portion of the bloud mixed with choles, if the Explipelas pollels the face, and if

But if it flull invade another part, although it flull proceed of pure choler, Phlebotomy will not be In what Etylical invade another part, although it flull proceed of pure choler, Phlebotomy will not be In what Etylical invades another part, although it flull proceed of pure choler, Phlebotomy will not be In what Etylical invades and pulse it is conger, left it become more fierce; yet if the body be plethorick, it will be expedient to let bloud, because this, as Galon teacheth, is oft-times the cause of an Etylipelus. It will be expedient to give a Clyster blood, in what noe, the plants of the p of refrigerating and humeching things before you open a Vein; but it belongs to a learned and prudent Phylitian to preferibe Medicines purging choler.

The third care must be taken for Topick, or local Medicins, which in the beginning and increase what Topick must be cold and moist, without any either driness or astriction, because the more acrid matter by use Medicins are fit to be first of altringent things being driven in, would ulcerate and fret the adjacent particle.

Galor and Avieta much commend this kind of remedy; Take fair Water 3 vj. of the sharpest Vining of an Errnegar 3 i, make an Oxycrate, in which you may wet linnen clothes and apply to the affected part fipular, and the circumjacent places, and renew them often. Or, R Succi foliati, plantag. & fempervivi, an. 3 ij. soil must be affected part fipular.

The force of Medicines fit

CHAP. XV.

Of Fevers, which happen upon Eryfipelous Tumors.

A volgar defeription of an intermitting Tertian Fe ver.

The causes of Tertian Fe-

The figns of ting Tertian.

The Sym-

lute ceffation of the Fever at the end of each fit.

S Fevers formetimes happen upon Inflammations, and Eryfipelaes, which favour of the husmour whereof they proceed, that is, Choler: Therefore feeing it is peculiar to Choler, to move every third day, it is no marvail if great Inflammations bring with them Tertian Fevers, or Agues, which have their Fit every third day; for it is called an Intermitting Tertian which comes every other day.

The primitive causes in general are strong exercises, especially in the hot Sun, the use of heating and drying either Meats or Medicins, great abflinence joined with great labour, care, forrow; the antecedent causes are the plenty of choler in the body, and hot and dry different arture either of the whole Body, or of the Liver onely: the conjunct cause is the putrefaction of the cholerick humour lying in some plenty without the greater Vessels, in the habit of the Body.

The Signs, a shaking or shivering, like as when we have made water in a cold Winter morning, a great pricking, firetching or fliffnels, as if there were pins thruft into us over all our bodies, by reafon of the acrimony of the cholerick humour driven uncertainly and violently over all the body, and the fentible membranous and nervous particles at the beginning of the Fit; then prefently the heat becomes acrid, the Fever kindled like a Fire in dry Straw; the Pulse is great, quick and equal, the Tongue dry, the Urine yellowish, red and thin. The Symptoms are watchings, thirst, talking idly, anger, disquietness and toffing the body at the least noise or whispering. These Fevers are termina-Why Tertians ted by great Sweats. They are incident to cholerick young Men, such as are lean, and in Summer; have an abso- after the Fit oft-times follow cholerick Vomiting and yellowish Stools. After the Fit there follows an absolute intermission retaining no reliques of the Fever, until the approach of the following Fit, because all the cholerick matter by the force of that Fit and Nature, is easily cast out of the body, by reason of its natural levity and facility; whereas in Quotidians there is no such thing, as which after the Fit always leave in the body a fense and feeling of a certain inequality by reason of the stubbornness of the Phlegmatick humour and dulness to motion. The Fit commonly uses to endure 4.5, or 6 hours, although at some time it may be extended to 8 or 10. This Fever is ended at 7 Fits, and ufually is not dangerous, unlefs there be fome errour committed by the Phyfitian, Patient, or fuch as attend him. Tertians in Summer are thorter, in Winter longer.

Wherefore the beginning of the Fit is accompanied with fiiffness, or stretching, the state with sweat, whereupon, if the Nose, Lips, or Mouth, break forth into pimples, or scabs, it is a sign of the end of the Fever, and of the power of nature which is able to drive the conjunct cause of the disease from the center to the habit of the body; yet these pimples appear not in the declining of all Tertians, but onely then, when the cholerick humour causing the Fever shall reside in the Stomach, or is driven thither from some other part of the first region of the Liver. For hence the subtler portion thereof, carried by the continuation of the inner Coat to the Mouth and Nose, by its a crimony easily

The diet of fach as have a Therefore let the Diet be so ordered for the fix things not natural, that it may incline to refrigeration and humecration, as much as the digetive faculty will permit, as Lettuce, Sorrel, Gourds, Cuterian When fuch as cumbers, Mallows, Barly, Creams, Wine much allaid with Water, thin, fmall, and that sparingly, and not before figns of concoction shall appear in the Urine; for at the beginning he may not use Wine, nor in the declining, but with these conditions which we have prescribed.

But for the time of feeding the Patient, on that day the Fit is expected, he muffeat nothing for three hours before the Fit, left the Aguith heat lighting on fuch Meats as yet crude, may corrupt and putrifie them; whence the matter of the Fever may be increased, (because it is as proper to that heat to corrupt all things, as to the native to preserve and vindicate from putrefaction) the Fit lengthened, and Nature called away from the concoction and excretion of the Morbinek humour; yet we may temper the severity of this Law by having regard to the strength of the Patient; for it will be con-venient to feed a weak Patient not onely before the Fit, but also in the Fit it self; but that onely fparingly, left the strength should be too much impaired.

Now for Pharmacy; It must be confidered, whether the strength of the Patient be sufficient, if the humours abound a for then you may preferibe Dispression fomplex, Cassia newly extracted, the decoction of Violets, of Citrin Myrobalanes, Syrups of Violets, Roses, of Pomegranats and Vinegar. But if the powers of the Patient languish, he must not onely not be purged, but also must not draw

have a Tertian may use The time of feeding the Patient.

When to purge the Paminning mi

bloud too plenteously, because Cholerick men soon faint by reason of the facile and easie diffipation of blood too plenteoully, because Cholerick men toon tame, by reason of the facile and case distipation of the fabrile humors and spirits; besides, such as are subject to Tertian Fevers do not commonly abound with blood, unless it be with cholerick blood, which must rather be renewed, or amended by cooling and humoching things, than evacuated. Yea verily, when it is both commodious and recessary to evacuate the body, it may be attempted with far more fasety by such things as work by insentible transpiration, which provoke Sweats, Vomit, or Urin, by reason of the subtlery of the cholerick harmour, than by any other. Also the frequent use of emollient Clysters made with a decoction of mour, than by any other. Also the frequent use of emotinent Clytters made with a decection of Prunes, Jujubes, Violets, Bran and Barley, will profit much. If the Patient fall into a Delirium, or talk idlely by reason of the heat and driness of the head, with a particular excess of the cholerick humor, the head must be cooled by applying to the Temples and Fore-head, and putting into the Nose Oil of Violets, Roses, or Womans Milk. Let the feet and legs be bathed in fair and warm Water, and the foles of the feet be anointed with Oil of Violets, and fuch like.

In the declining, a Bath made of the branches of Vines, the leaves of Willows, Lettuce, and other refrigerating things boiled in fair Water, may be profitably used three hours after meat eaten spa-

But I would have you fo to understand the Declination, or declining, not of one particular Fit, When the But I would have you to to undernand the Decumation, or decuming, not to the skin by the warm-but of the Difeafe in general, that the humours already concocked, allured to the skin by the warm-ufe a Bath. mefs of the Bath, may more eafily and readily breath forth: he which otherwife ordains a Bath at the beginning of the Discase, will cause a constipation in the skin and habit of the body, by drawing this

ther the humours peradventure tough and grofs, no evacuation going before.

Also it will be good after general purgations to cause sweat by drinking White Wine, thin and What kinds of well tempered with Water; but Urin by a decochion of Smallage and Dill. Certainly Sweat is very constant. ry laudable in every putrid Fever, because it evacuates the conjunct matter of the Difease, but chiefly are most fit in in a Tertian, by reason that choicr by its inbred leviry casily takes that way, and by its subtlety is easily resolved into sweat. But that the sweat may be landable it is sit it be upon a critical day, and be fore-shewed by signs of concoction agreeable to the time and manner of the Disease. Sweats Sodorifichs, the control of the disease of the state of the state of the sweat says and sould be stated by signs of concoction agreeable to the time and manner of the Disease. Sweats Sodorifichs, the says are subtless to the state of the when as they flow more flowly are forwarded by things taken inwardly and applied outwardly; by things taken inwardly, as with white Wine, with a decoction of Figs, Raifins flored, Grafs, Roots, and the like opening things; but by things outwardly applied, and Sponges dipped in a decoction of hot Herbs (28 Rofemary, Thyme, Lavender, Marjerom, and the like) applied to the Groins, Ann-

You may for the fame purpose, fill two Swines bladders with the fame decoction, or else Stone-bot-tles, and put them to the feet, tides, and between the thighs. Then let this be the bound of Sweating, when the Patient begins to wax cold, that is, when the Sweat feels no more hot, but cold

But by the confent of all, bloud must not be letten after the third Fit, but prefently at the beginning. When bload of the Feter, according to the opinion and prescription of Galen; for seeing this Fever for the most must be let. part is terminated at feven Fits, if you flay until the third Fit be past, the Fever will now be come to its State; but Hippocrates forbids us to move any thing in the state, lest Nature then busied in concostally.

CHAP. XVL

Of an Oederna, or cold Phlegmatick Tumor.

Itherto we have treated of hot Tumors, now we must speak of cold; Cold Tumors are onely two, an Oedona, and a Scirrbar. And for all that Hipperates and the Ancients used the Gallis de tree,
which succeeded him, it hath been drawn from that large and general signification, to a more strait
and special onely to design a certain secies or kind of Tumor.

Wherefore an Oedema is a foft, lax, and painless Turnor, caused by collection of a Phlegmatick What an Oedema is a foft, lax, and painless Turnor, caused by collection of a Phlegmatick What an Oedema is.

The Ancients made eight differences of Tumors proceeding of Phlegm: The first they termed a The different true and lawful Octoms proceeding from natural Phlegm; from unnatural Phlegm by admixtion of ces of Octoms. another humour they would have three forts of Tumors to arife; as that, by mixture of blond, fhould be made an Oedenia Phlegmander, and fo of the reft.

Befides, when they perceived natural Philegm either puffed up by flatulency, or to flow with a waterish moisture, they called fome Octomer flatulent, others waterishs but also when they faw this fame Philegm often to turn into a certain Philegm-like fishfame, they thought that hence proceeded another binder of the proceeded another while his days are profited one while his days a Friegm often to turn more certain Planter-like Indiance, they thought that hence proceeded another kind of Oedema, which they expressed one while by the name of Alberoma, another while by Steamour, and sometimes by Melietrides, as lastly, they called that kind of Oedema which is caused by puttid and By how many forces that Phleem sometimes is natural and offende ways Phleem. compt Phlegm, Seraphale. For we must observe that Phlegm sometimes is natural, and offends ways Phlegm onely in quantities, whence the true Ocdama proceeds: otherwhiles it is not natural, and it becomes not becomes not compt Phlegm, Serspance. For we man observe that Phlegm followings is natural, and offends onely in quantity; whence the true Oedama proceeds: otherwhiles it is not natural, and it becomes onety in quantity; whence the true organic proceeds: only whence it is not natural, and it pecomes not natural, either by admixtion of a firange fubiliance, as Bloud, Choler, or Melancholy, whence arife the three kinds of Oedomacs noted formerly by the way; or by the putridness and corruptions of its proper fubitance, whence the Strume and Serophule proceed; or by concretion, whence Kernels and all kinds of Weis, Ganglia, and Knots; or by refolution, whence all flatulent and waterish Tumors,

The causes of all Ordonae; are the defluxion of a Phlegmatick, or flatulent humour into any part, The Causes. or the congestion of the same made by little and little in any part, by reason of the imbecillity thereof in concocking the nourishment, and expelling the excrement.

The figns are a colour whitith and like unto the skin, a foft Turnor, rare and lax by reafon of the The Signs. plentiful

The Prognoflicks,

plentiful moisture with which it abounds, and without pain, by reason this humour infers no sense of heat, nor manifest cold; when you press it with your singer the print thereof remains, because of the grossness of the humour and slowness to motion. Oedemass breed rather in Winter than in Summer, because Winter is fitter to heap up Phlegm; they chiefly posses the Nervous and Glandulous parts, because they are bloudless, and so cold and more sit by reason of their loofness to receive a defluxion; for the same cause, bodies full of ill humours, ancient, and not excercised, are chiefly troubled with this kind of Tumor.

How Ordenary are terminated.

An Oedona is terminated fometimes by refolution, but oftner by concretion; feldomer by fuppuration, by reason of the small quantity of heat in that humour.

A Symptomatical Oedoma, as that which follows upon a Dropfie, or Confumption, admits no cure unless the Difease be first taken away.

The intentions of curing Ordenars.

The general cure is placed in two things, that is, in evacuation of the conjunct, and matter prohiring biting the generation of the antecedent. We attain to both, chiefly by four means.

The Dict.

The first truly by ordaining a fit manner of living and prescribing moderation in the use of the fix things not natural. Wherefore we must make choice of such air as is hot, dry, and subtle; we must prescribe Wine of a middle Nature for hisdrink, let the Bread be well baked, let meats be appointed which may generate good bloud, and these rather rosted than boiled. Let all finits be forbidden, as also Broths and Milk-meats; let him eat such Fish as are taken in Stony Rivers; the Patient shall observe mediocrity in feeding, but principally sobriety in drinking, for tear of crudities; after meat let him use digestive Powders, or common Dridge Powder; if his belly be not naturally loose, let it be made so by Art.

What to be observed in the use of Venery.

6. Epid. fell.s.

Let the Patient use exercise before meat, so by little and little to spend this humour, and restore the native heat. Let him sleep little, because much sleep breedeth cold humours; let him avoid grief and sadness. And if he be of a weak body, let him abstain from Venery, less by another weakning by the use of Venery added to his present infirmity, he fall into an incurable coldness, from whence a greater measure of crudity will arise. Otherwise, if the body be strong and lusty, by such exercises, and the moderate use of Venery, it will be the more dried and heated.

For fo that sentence of Hipperates is to be understood; That Venery is a cure for Phlegmatick Difeases, as Galen in his Commentaries tells us. The Physician may perform the second intention by turning his counsel to that part, from whence the Spring of Phlegmatick humour flows. For if the infirmity arise from the Stomach, or from any other part, the part from whence it comes must be strengthened; if from the whole habit of the body, let attenuating, penetrating, and opening Medicins be prescribed. We perform the third intention by evacuating the humour impact in the part with local Medicins varied according to the four times of the Tumor.

Lib. 2. adGlase, cap. 3. A Rowler.

For Galen, in the beginning and increase, prescribeth a formentation of Oxyeratson used with a Sponge. But if so be that the Oedoma be upon the Arm or Leg. a repelling Rowler is very good, that is, such an one as is brought from below upwards. So these Medicins following are very nt for the same purpose, R. Lixivii ex cineribus farmentorum, & canlium, an. 5 iv. Tartari & Altoninis an. 3 iv. acri 3 ij. mix all together and make a decoction, wherein wet Sponges and soment the place. Also you may use the following Cataplasim, R. Farina bordei 3 iv. coquantur in Lixivio communi, addendo pulverit muci supress, cortemn granatorum, balaussi, an 3 i. Myrrba, Alors, alum. an. 3 s. olei Myrtisl. 3 ij. stat Cataplasima. In the state and declination, you must use drying and resolving Medicins, as, Nucum empress, granat. stumach balaussi, an. 3 i. Salvine, origan. calament. Hyspot, melisse, an. mi. abstinity plantag, cande equ. taps. barb. centined. an. m. st. alum. tartar. & salvine com. an. 3 i. coquantur cum lixivio 5 soment it with a Sponge, then presently apply this following Cataplasim. Re Rad. Brionie 3 ij. abstinity plantag, centim. chamaem. melisti peleg. an. m. ss. coquantur un bydromelite, pistentur, trajiciantur, addendo pulveris ros, rub, chamaem. melisti peleg. an. m. ss. l. stat Cataplasim.

What caution to be had in application of Emplainters.

abfails, plantag, centim, chamiem, melitori peleg, an, m. ff. coquanture in bydromelite, prifentur, trajiciantur, addenda pulveris rof, rub, chamiem, melitori peleg, an, m. ff. coquanture in bydromelite, prifentur, trajiciantur, addenda pulveris rof, rub, chamiem, melitori peleg, an, m. ff. coquanture in bydromelite, prifentur, trajiciantur, addenda pulveris rof, rub, chamiem, melitori que felolving Emplaifiers and Ointments, first heating, or chafing the part by friction or formentations, as well most as dry; otherwise Emplaisiers will fearcely do their duty, by reason of the great coldness of the part, being not sufficient of it self-to affimiliate the nourishment, or to expel the superstuous and unprobable humour. Let a somentation be made with white Wine, in which Sage, Rosemary, Thyme, Lavender, Chamomile and Melilot sowers, red Roses, Orris roots, Sanchas, and such like have been boiled, with a little Vinegar added thereunto. Quench hot Bricks in the same decoction, and apply them wrapped in linnen cloths to the affected part, for so vapours will breath forth, which hath an attenuating, piercing, resolving and strengthening taculty. But you may, in stead of the Bricks, fitly apply Hogs or Ox bladders, filled half tull with the forestaid decoction, and that hot. The frictions must be made of hot linnen cloths, for so the native heat together with the bloud and spirits is recalled to the part, and sulginous hamours contained under the skin are resolved, whereby the strength of the part is in some part recovered.

CHAP. XVII.

Of the Cure of flatulent and Waterish Tumours.

In what place Flamiencies may be gathered.

Formerly declared that not onely flatulent and waterish Tumors were comprehended under this word Ocdema, but also such as are bred of congealed Phlegm, as Albertmata, Steatomata, and Melicerides, Flatulent or windy Tumors are caused by vapour and wind kept in or contained sometimes under the skin, screewhiles under the Membranes, as the Periostom and Perioranium, whereupon ensures cruel torment by reason of the difference of those parts which are indued with most exquisite sense, sometimes the Entrails, as the Stomach and Guts are swollen and stretched out with wind, as in a Tympany.

They

The second

They in this differ from a true and legitimate Oedowa, that when you lay your finger upon them In what flatuand take it off again, there remains no fign of the preffure thereof, because they are differ by vapour lent tumours and not by humour, for the vapour being preffed returns speedily again, as you may perceive by balls true Oedowa.

The cause of fuch turnours is the weakness of the native heat, not being able easily to resolve and The causes of waste the Phlegm by which the windy Turnours are raised: for so the morning Sun (which in some flaulent under the cause). fort refembles our native heat) cannot refolve the miss disperfed in the air; which at noon it casily mours. refolves into pure air. Also after the fame manner our weaker heat flirs up vapours from that Phlegm it could not diffolve, which vapours are the matter of inflammations, or fwellings. But oft-times also and the fame of the former than the fame of the former than the fame of the fa though the native heat be fufficiently powerful, yet because the humour lieth deep, or is kept by the thickness of some Membrane, Tendon, or Ligament, the stirred up vapour cannot exhale, whereby it comes to pass, that increased by little and little it causes a Turnour.

it comes to pass, that increated by little and little it causes a 1 umour.

The figns of fuch a Turnour are a certain renatency or relistance, perceived by preffing it with The figns of your finger; and fornetimes a noise, as if you finite upon a Drum, especially if much wind be constained therein, such as are often gathered together in the hollowness of the belly, and in the spaces, between the larger Muscles. The Turnour is neither red, nor hot, but rather cold and white, as in ordered. It often possesses the points, and especially the knees, and it is very difficult to be fornetimes the diffension is so great, that Death ensures by reason of the renting or tearing the Cours. fometimes the diffension is so great, that Death enfires by reason of the renting or tearing the Coats.

CHAP. XVIII.

Of the Cure of a flatulent and waterijk Tunnour.

by the fame diet which we preferibed in an Ocdema; then by firengthening the parts appointed for concoction, as the Stomach and Liver, chiefly by the temperate use of Aromatick things, as Discussions, Discussions, Aromaticum, Carpophyllanon, Aromaticum Rosatom, and the like, to be preferibed according to the good liking of the Physitian which over-fees the Cures conjunct matter by hot, drying, and attenuating Medicins which they be the stomach and attenuating Medicins which they be the conjunct matter by hot, drying, and attenuating Medicins which they be the conjunct matter by hot, drying, and attenuating Medicins which they be the conjunct matter by hot, drying, and attenuating Medicins which they be the conjunct matter by hot, drying, and attenuating Medicins which they be the conjunct matter by hot, drying, and attenuating Medicins which they be the conjunct matter by hot, drying, and attenuating Medicins which they be the conjunct matter by hot, drying, and attenuating Medicins which they be the conjunct matter by hot attenuating Medicins which they be the conjunct matter by hot attenuating Medicins which they be the conjunct matter by hot attenuating Medicins which they be the conjunct matter by hot attenuating Medicins which they be the conjunct matter by hot attenuating Medicins which they be the conjunct matter by hot attenuating Medicins which they be the conjunct matter by hot attenuating Medicins which they be the conjunct matter by hot attenuating Medicins which they be the conjunct matter by hot attenuating Medicins which they be the conjunct matter by hot attenuating Medicins which they be the conjunct matter by hot attenuating Medicins which they be the conjunct matter by hot attenuating Medicins which they be the conjunct matter by hot attenuating Medicins which they be the conjunct matter by hot attenuating Medicins which they be the conjunct matter by hot attenuating matter by hot attenuating the conjunct matter by hot attenuating the conjunct matter by hot attenuation which are the conjunct laftly by taking away of the conjunct matter by hot, drying, and attenuating Medicins which they ter-call Carminative, that so the part being ratified, the humour and flatulency therein may be discussed. call Carminative, that so the part being ratified, the humour and statulency therein may be discussed and distipated. But remedies of this nature must be varied according to the variety of the parts is for some things are sit to be applied to the Stomach, others to the Guts, others to the Joints, and others to the stelly parts: for the Colick you must inject carminative Clysters, let resolving Saccuss or formentations, liniments, chiefly if pain torment, as also Cataplasins and Emplaisters, as Reference chamaem, melist verification, to far. visb. an., p. i. abstation is brillers, an., m. let them be boiled in Lye, adding Galon soments the part with Rose-vinegar and a little Salt put thereto, and would have a Sponge Galon's somendipped therein to lie somewhat long upon the part, Re Olis chamaem, another rat. & listorams, an., 3 to.

CHAP. XIX.

Of an Atheroma, Steatoma, and Meliceris.

In what an Atheroma, Steatome, and Meliceris differ.

Lthough these tumours may be thought to be comprehended under one gones with the other A Oedenatous turnours, yet they differ as thus; that is, their matter is flut up in its bladder, or bag, as it were in a peculiar Cell. But their difference amongst themselves is thus; the matter of the Steatoma, as the name fignifieth, is like onto Tallow for \(\Sigma_{\tau\infty}\) in Greek significant Tallow or Seam] yet it oft-times is found stuffed with other divers hard bodies, stony, bony, or callous, like unto the claws an Hen. For Philoxenus reports that he fometimes faw Flies in a Steatoma at the opening thereof, and fuch other like things wholly diffeenting from the common matter of Turnours. The matter contained in an Atheroma, is like to pap, with which they feed little Children. A Melicaria containes matter refembling Horiey in colour and conflitence; these turnours appear and rise without any inflammation going before them. Thus you shall know these turnours, a Startoma is harder than the other two, neither yields it to the pressure of your singer; but when it once yields, it doth than the other two, neither yields it to the not speedily and easily return to its somer Figure, because the matter is more gross; it is of the same colour as the skin, without pain, and of a longish Figure. The Meliceris yields to the touch, as being a loofe and foft body, and as it is eafily disposed and disfused, so it quickly returns to its former place and tumour. It differs from the Atheroma in figure and fubfilance. For it is more globous and of a fubtiler and more shining matter, besides also it takes up a large space, and is more obsequious to the touch, and, for the rest, without pain. As for the manual operation of the Chirurgeon in their cure, it feems to be of no great confequence of what fort the matter is, whether refembling Tallow, Honey, or Pap, for there is one timple manner of operation, which is, that you pluck away the con-Honey, or Pap, for there is one lample manner or operation, which is, that you pack away the contained humour, as also the receptacle in which it is contained. Yet you must note such tumours, fornetimes as it were hanging in the surface of the skin, are easily to be moved this way, and that way, but othersome again deeper tastned nirmly cohere with the adjacent bodies, and these require an exquisite hand, and also industry, for sear of a great flux of bloud and convulsion by cutting a Vein. There are many other kinds of tumours, as the Testado or Mole, the Nata, the Glandula, Nodus, Estium, Lupia, which as in matter (for they are all of a thick clammy, and viscous Phlegmatick humour) so also in kind they agree with an Atheroma, Steatoma, and Meliceria. But also in these for the most part, when they are opened you may fee bodies of all forts far different from the common matter of tumours, as Stones, Chalk, Sand, Coals, Snails, Straws, or Awns of Corn, Hey, Horn, Hairs, Flesh, both hard and fpongeous, Grifles, Bones, whole Creatures as well living as dead.

The generation of which things (by the corruption and alteration of humours) shall not make us much to admire it, if we consider, that as Nature, of all Seeds and Elements of the whole great World, hath made Man, the Microcosim or little World, that he might be, as it were the lively Image of that greater World; fo in him, it being never idle in us, would have all the kinds of all motions and actions to flew themselves, as long as matter for generation is not wanting. But because there is little, or rather no mention of these tumours amongst the Ancients, we will briefly shew the opi-

nions of the later Writers concerning them.

Now they fay, the Testudo is a tumour contrary to Nature, fost, disfused, vaulted or arched like a Tortois, formetimes it arises in the head in form of a Mole, and then it is called a Mole.

The Nata is a great and flethy tumour, not in fhape unlike a Melon, or rather the fleth of a mans What the Na- Buttocks, whence it may feem to have had the name, unless we had rather fay, It had it, because it

more usually breeds upon the buttocks, than upon any other part of the body.

The Glandula takes it denomination from an Acom, called Glans in Latine, the which it former what refembles in the compafs and form of the tumour; or elfe because it most commonly breeds in the Glandules or Emunctories of Mans body.

The Nodae, or knot, is a round tumour, hard and immoveable, named from a rope tied on a knot. Guido Cauliscensis affirms Knots commonly to grow into nervous bodies; but at this time they more ufually arise on the bones of fuch as havethe French Disease.

CHAP. XX.

Of the Cure of Lupia, that is, Wens, or Ganglions.

What a Garglion is.

Signs

Wen or Ganglion, is a tumour formetimes hard, formetimes fost, yet always round, using to breed in dry, hard, and nervous parts. And seeing that some of the tumours mentioned before in the former Chapter, sick immoveable to the part to which they grow, because they are contained in or one of the tumours mentioned are contained in or one of the tumours mentioned before in the former Chapter, sick immoveable to the part to which they grow, because they are contained in a bag or bladder; it commonly comes to pass that Wens have their bladder wherein to contain the contained in a bag or bladder; it commonly comes to pass that Wens have their bladder wherein to contain them; and therefore we think fit, the rather more freely and particularly to treat of their Cure, because they are more difficultly cured, especially where they are inveterate and of long standing.

The primitive causes of these are dull blows, fallings from high places, strains, and other such like occasions. But the antecedent and conjunct causes are the same with those of an Atherona, Meliceris, The causes. and Steatoma.

The description formerly set down, will furnish you with the signs by which you may know when they are present; certainly from very small beginnings they grow by little and little to a

great bigness, in the space of fix or seven years; some of them yield much to the touch, and almost all

great bigness, in the space of fix or seven years, some of them yield much to the touch, and almost all of them are without pain.

You may hinder such as are beginning and first growing from increase, by somewhat a strong and Their Cure at frequent rubbing with your singers. For so their bag or bladder, together with the skin, wax thin, and the beginning the contained humour grows hot, is attenuated, and resolved. But if so you nothing prevail, you must lie upon them with your whole hand, or a stated piece of Wood, as heavy as you can, until such time as the cift, or bag, be broken by your impression. Then apply and strongly bind unto it a Plate of Lead, Plates of Lead rubbed over with Quicksilver; for I have many times found by experience, that it hath a wonderful rubbed with force to resolve and waste the subject humour. But if the Wen be in such a place in which you can make no strong impression, as in the Face, Chest, Belly, and Throat, let there be applied an Emplaister A resolving which hath a resolving sorce, such as this following hath: Re Gammi animon, bdellingalban, am. § iii. Plaiser. make no firong imprefison, as in the Pace, Chen, Beny, and a linear, he there be applied an Emplainer A resorving which hath a refolving force, fuch as this following hath: R. Gommi animon: bdellingalban, an. 3 iii. Plaister. liquefisms in aceto, & trajiciantur per fetaceum, addendo olei liliorum & lauri, an. 3 l. aque vite parum, pul-waste occupantul conclusion waste occupantul. veris ireas, falis ammon, sulphur, vivis, vitrioli Romani, an. 3 B. Let them be incorporated together, and same the bag.

while a Courtest And often the Echan is removed and the bas refolved, it must be opened with a Knife, or Cautery And after the Eschar is removed, and the bag wasted by Ægyptiscum, Mercary, and the like, the ulcer must be cleansed, replenished with Flesh, and cicatrized.

Sometimes Wens grow to fo great a mass that they cannot be cured by the described remedies, wherefore they must be taken away by the root, by your Hand and Instrument, if so be that there be no danger by reason of their greatness, and so that they adhere not too closely to the adjacent parts, and if they be not too night o the greater Veins and Arteries for it will be better in fuch a cause to let them alone. This shall be your way to cut them off, or take them away. A small Incision must be made, even The mann alone. This in the your way to cut them on, or take them away. A than include made behave, even to the bladder or bag, by which thrust in a Probe of a singers thickness, hollowed in the midst, round to take at the end, and as long as need shall require; then draw it many times about between the skin and Wens. the bag, even to the root of the Wen, that so the skin may be divided long ways, then it will be required to the state of the skin may be divided long ways, then it will be required to the skin and the skin that so the skin the skin that so the skin the skin that so the skin that skin the skin the skin the skin that skin the skin that skin the skin fite to make another Incifion overthwart, fo that they may interfect each other like a Crofs; then presently draw the skin from the bladder, from the corners of the Wen towards the root, and that with your finger covered with a fine linnen cloth, or elfe with a Razor, if need require.

But you must observe, that in a Wen there are always certain Vessels which are small in the beginning, but much increased in process of time, according to the increase of the Wen, whereof they are, as it were, the roots; wherefore if any Hamorrhagie, or flux of bloud happen, let it be flopped by binding the Vessels at their heads and roots, or make a strait ligature at the roots of the Wen, with a piece of Whipcord, or with a many times doubled thred, and let the ends hang forth until it fall away of its own accord. Neither will it be fufficient to have cut away all this Turnor, but also it will be fit to cut away a portion of the skin, wherewith the tumor was covered, and onely to leave fo much as shall suffice to cover the part; then with a Needle and Thred draw together the lips of the incition but in the interim let tents be put into the bottom of the ulcer until it be perfectly cleanfed, and the rest of the Cure be Workman-like performed, even to the cicatrizing thereof.

The Chirurgeon Colle, and I, using this method, in the prefence of Master Dr. Violanius the Kings A History. Physician, took away a Wen from Martial Collard the Major of Burbon, it hanged at his neck, as big as a Mans head, and it weighed eight pounds; which made it to troubleforn and burdenforn to him,

that he was forced to carry it bound up in a Towelas in a Scrip.

Verily, if these kind of Turnors have a stender root and broad top, they must be straitly tied, and so what Wests cut off, But it is very difficult and full of dangerous chance, to take away such Wens as are feated to be cured by in the Neck near unto the Jugular Veins, those under the Arm-holes, in the Groins, and such as are which dangerous chances the Hama, by reason of the deadly force of such some control of the deadly force of such some control of the deadly force of such some control of the deadly such as a reward of the deadly such as under the Ham; by reafon of the deadly force of fach fymproms as may thence arife. We can onely rous rocare. conjecture, not certainly fay, what kind of matter may be contained in them. We can onely know of what fort it is, when by incifion it is prefented to our fight. Yet in fuch as are very hard, and do much relift the Touch, there are often found matters, which in confidence may be referabled to little

I being on a time called to open the body of a great Lady, found in one of her Breits a body which A History, might equal the bigness of an Hens Egg, hard, and compact like a rough Peble; it was held, whileft The matter of the lived, both by the Physicians and the Chiraggeons, to be a Ganer, because this hardness was very formerines ta-

painful to her when it was but gently preffed down.

But alfo force few years agon, I, being called to the Cure of a very honeft Woman, which was troubled with the fame difease, strongly withstood the Phylicians and Chinurgeons, affirming it to be a Another History, the tumor had taken no deep root, the habit of the part was not changed from the native How you may have the Veins about a was not fivelled and other convincing sign of a Cancer. colour, the Veins about it were not fwollen, neither was there any other convincing fign of a Cancer, know a Wen For this fame Woman had her Courfes at their due and ufual time, and was well-liking, and had a from a cases. Specific account in her face and body, was free from all fort of pain, unless when you pressed down the part affected. Besides, thenceforward the Tumor grew not at all, no other evil accident besides, year verily she lives merrily, and well both in body and mind.

CHAP. XXI.

Of a Ganglion more particularly fo called,

Here are also certain small Tumors of the kind of Dupie, or Wens, which grow on divers parts what a Gasdere are also certain innan a union of the hands, and ankles of the feet, being called by a glass property more particular name Ganglia; they appear on the top of the skin, neither do they ever lie to called a class property of a person of the skin, neither do they ever lie to called a property of a person of the skin, neither do they ever lie to called a person of the skin of the ski The cause of them is either the imbecillity of a nerve or tendon, got by wrefting, extention, The cause. a blow, labour, or other fuch like cause. Through which occasion the alimentary juice which

may not be cured with ron Inftru11111111

flowed to these parts, seeing it can neither be concocted, nor assimilated into the proper substance, is converted into an humour of the like nature cold, and grofs, which in continuance of time heaping it felf up by little and little about the Fibers, and the very fubfiance of the tendon concretes into a turnor, What Genglia

It is not fit to use any Iron Instrument to these Ganglia which possess the tendons and joints, but onely apply Ammoniaeum and Galbanum diffolved in Vinegar and Aqua Vite: as, R. Gummi amount of faguspeni in aqua vite diffolutorum, an. 3 is equantur fuper cineres calidos ad formam emplafri, fub finem adde fulphuris vivi fubriliter pulverifati 3 B fiat empl. ad ufion. Also the Emplaister of Vigo with double

Moreony would be good for the same purpose.

The tumor softned by these remedies, must be wrought, rubbed, or pressed, so long, until the bladder or bag be broken under your finger, which I have divers times done; then it will be expedient presently to apply and bind hard thereunto a plate of Lead rubbed with Quickfilver, which may waste and confume the remainder of the tumor.

Sometimes there are Ganglia feen hanging by a small root, as it were a string; wherefore they must be tied with a string at the root, and every day twitched harder and harder, till such time as they fall off. The rest of the cure may be easily performed by the common rules of Art.

CHAP. XXII.

Of the Strumz or Scrophulz, that is, the Kings Evil.

He Serophale are cedematous tumors arising in the glandulous parts, as the Bress, Arm-holes Groins, but chiefly in the glandules of the neck. They appear either one or many, according to the quantity of that matter from whence they proceed, commonly contained in What the Kings Evil is. their proper cift, a bag, as Atheromaes, Swammer, and Melicerides are.

They are made of a gross, cold, viscid, and phlegmatick matter with some admixture of Melancholy. They differ from other glandulous tumors; first in number, for most usually there appear many of them united together, fpringing from fomewhat a deeper root than glandulous tumors do; form of them are moveable, otherform woven with the neighbouring nerves, remaining unre-

Ganglis appear fewer in number, and are without pain; but Scropbiels often-times are painful, especially when they wax hot by putrefaction; so that sometimes they degenerate into cancerous Ulcers, not to be touched by Instruments nor acrid Medicins.

Palegmatick, melancholick, and gluttonous perfons, and fuch as are accustomed to feed on cold and moit nourithments, as 1th and cold water, and lead a federatary and idle life, are subject to the Scrophule. They are cured by a most flender Diet, for so the native heat by want of nourishment turned upon the material cause of such like tumors, wastes its

And they are cuted by purging off the superfluous homours, and also by application of emollient refolving Me- relolving and suppurating Topick Medicins, after this following manner. We Mussgins alth, famogra © ficum pang. an. 3 is. olei lilionum, & chomiem. an. 3 i. pinguedinis insferis & axungie porci 3 l. Terebinth. Ven. 1 . ammoniaci, & galbani in aceto disfolutorum, an. 3 i. cere nove quantum fatis, siat cerotum secundum artem ad modum Diachyli magni.

The Oil tment for the French Difease, and the Emplainer of Pigo with Mercury, are excellent for this purpose, especially, if we continue so long until the Patient come to Salivation, for so nature will disburden it fell of the humour generating the Scropbide, which Phave fometimes tried with happy faccels. A Emplastri disclost, alls. & mag. ceroti afopi deferiptionis Philagrii, an. 11. Terebinth, clare 3 t. oles lillorum parum, sat emplastrum satis mode. But it the Scrophule carried by this means be reforted, but, as it oft-times happens, tend to suppuration, you must use Supporatives, as R Rud, alth. & lillor.

an. 3 ii). coquantur in aqua communi, pifentur, trajetiis adde capitum aliorum fab cineribus cottorum 3 ii).

elet iiliorum, & ping, anferis & anatis, an. 3 i. B. farine feminis lini quantum fatis s formetur cataplafina.

Here we muitadmonish the Chirurgeon that he been not the Scropbula-before that all the contained humour be fully and perfectly turned into pus, or matter, otherwise the relidue of the humour will remain crude, and will fearce in a long time be brought to maturation; which precept must be principally observed in the Scropbule, and also sometimes in other absectes, which come to supportation. For we must not, as soon as any portion of the contained humours appear converted into pas, procure and hasten the apertion. For that portion of the suppurated humour causes the rest sooner to turn into pas, which you may observe in inanimate bodies. For fruits which begin to perish and rot, unless we presently cut away the putrifying part, the residue quickly becomes rotten: there is also another reason, the native heat is the efficient cause of supporation; it therefore (the Sore being opened) diminished and weakned by reason of the diffipation of the spirits, evacuated together with the humour, will cause the remaining portion of the humour not to supporting, or that very hardly, and with much difficulty. Yet if the tumested part be subject, by its own nature, to corruption and putrefaction as the flux. ction, as the Fundament; if the contained matter be malign, or critical, it will be far better to halten the apertion.

There is also another way of curing the Scropbula, which is performed by the hand. For such as The Chirurgical manner of are in the neck, and have no deep xoots, by making Incition through the skin, are pulled and cut away from those parts with which they were intangled. But in the performance of this work, we take especial care that we do not violate or hart with our inftrument the Jugular Veins, the sleepy Arterics, or recurrent Nerves. If at any time there be danger of any great efflux of blond, after they are placked from the skin, they must be tied at their roots, by thrusting through a needle and thred, and then by binding the thred strait on both sides, that so bound they may fall off by themselves by little without any danger. The remainder of the Cure may be performed according to the common rules of Art. CHAP.

· IVAN IIII

CHAP. XXIII.

Of the Fever which happens upon an ædematous Tumoser.

Aving shewed all the differences of ordematous Tumors, it remains, that we briefly treat of How an inter-Aving the wed all the differences of ordematous Turnors, it remains, that we briefly treat of How an interthe Symptomatical Fever, which is fornetimes feen to happen upon them. This therefore mixing Quotithey name intermitting Quotidians. Now the fit of a Quotidian comes every day, and in that repetition continues the fpace of eighteen hours; the refidue of the day it hath manifelt intermiffion.

The primitive causes of this Fever, are the coldness and hamidity of the air encompassing us, the
long use of cold meats and drinks, and of all such things as are easily corrupted, as Summer Fruits,

crude Fishes, and lastly, the omiffion of our accustomed exercise.

The antecedent causes are a great repletion of humans and these specially all the second and the

The antecedent causes are a great repletion of humors and these especially phlegmatick. The conjunct cause is Phlegm purrefying in the habit of the body, and first region thereof without the great Veins.

The signs of this Fever are drawn from three things; as first Natural, for this Fever or Ague The Signs.

chiefly feizes upon those which are of a cold and moist temper, as Old Men, Women, Children, Eunuchs, because they have abundance of Phlegm; and it invades Old Men by its own nature, because their native heat being weak, they cannot convert their meats, then taken in a finall quantity, into land dable bloud, and the lubstance of the parts. But it takes children by accident, not of it felf, and their How children come to be a own nature, for Children are hot and moift; but by reason of their voracity or greediness, and their come to be violent, inordinate, and continual motion after their plentiful feeding, they heap up a great quantity Quotidian Feof crude humours, fit matter for this Fever, whereby it comes to pass, that far children are chiefly vers, troubled with this kind of Fever, because they have the passages of their bodies frait and stopped, or because they are subject to Worms, they are troubled with pain, by corruption of their meat; whence arifeth a hot differnper by putrefaction, and the elevation of putrid vapours, by which the heart being molefied, is eafily taken by this kind of Fever.

From things not Natural, the figns of this Fever are thus drawn. It chiefly takes one in Winter, and the Spring, in a cold and moift region, in a fedentary and idle life, by the use of meats, not onely cold and moift, but also hot and dry, if they be devoured in such plenty, that they overwhelm the na-

For thus Wine, although it be by faculty and Nature hot and dry, yet taken too immoderately, How phlegit accumulates phlegmatick humours, and caufes cold Difeafes. Therefore Drunkennefs, Gluttony, manch humours, Baths, and Exercites prefently after meat, being they draw the meat as yet crude into the to be generated. But by things contrary to Nature, because this Fever usually follows cold Difeases, the Center, dry meats. Circumference and Habit of the Body being refrigerated.

The symptoms of this Fever are, the pain of the mouth of the Stomach, because that phlegm is The Sym commonly heaped up in this place, whence follows a vomiting or caffing up of phlegm; the Face promised Quo-looks pale, and the mouth is without any thirft, often-times in the fit it felt; became the Stomach tidiant. flowing with phlegm, the watery and thinner portion thereof continually flows up into the mouth and tongue, by the continuity of the inner coat of the ventricle common to the gullet and mouth.

It takes one with coldness of the extreme parts, a small and deep pulic, which not withstanding in The manner the vigour of the Fit, becomes more frong, great, full, and quick. Just after the same manner, as the of the pulic heat of this Fever at the suffiction appears mild, gentle, mostly, and vaporous; but at the length it is and heat in a quotidian. first; but at length when the motiture, being overcome, doth no more hinder its action, it burns and

The Patients are freed from their fits with small sweats, which at the first Fits break forth very critical sparingly, but more plentifully when the Crific is at hand; the Urin at the first is pale and thick, and So formetimes thin, that is, when there is obliraction. But when the matter is concoct, as in the flate, it is The Urin. red: if at the beginning of the Fit they cast up any quantity of phlegm by vomit, and that Fit be deter-minated in a plentiful sweat, it shows the Fever will not long last; for it argues the strength of Nature,

the yielding and tenuity of the matter flying up, and the excretion of the conjunct cause of the Fever.

A Quotidian Fever is commonly long, because the Phlegmatick humor being cold and most by Na- why Quotiture, is heavy and many for motion. ture, is heavy and unapt for motion; neither is it without fear of a greater Difease, because off-times diana are offit changes into a barning or Quartan Fever, especially if it be bred of falt Phlegm, for faltness hath astimes long,
finity with bitterness, wherefore by adultion it easily degenerates into it, so that, it need not feem vetimes long,
times lon Gude hamors, whereby it comes respais, that this Fever off-times lafts firsty days. But have a care you How to diffin crude humors, whereby it comes respeats, that this Fever off-times tarts justly days. But have a care you have a Quorible not decrived, and take a double Fertian for a Quorible heart for takes the Patient every day as dain from a a Quotidian doth. Verily it will be very eafie to diffinguish these Fevers by the kind of the humour, double Terand the propriety of the fymptoms and accidents; belides, Quoridian commonly take one in the tian. evening, or the midit of the night, as then when our bodies are refrigerated by the coldness of the air cauled by the absence of the Sans. Wherefore then the cold humours are moved in us, which were bridled a little before by the presence and heat of the Son. But, on the contrary, double Tertians take one about Noon. The shormers and gentleness of the Fit, the plentiful swear breaking forth, the matter being concocted, causes us to think the Quotidian short and falutary.

The Cure is performed by two means; to wit, Diet, and Phatmacy. Let the Diet be flender Diet. and attenuating, let the Patient breathe in a clear air moderately hot and dry, let his means be

11111111

bread well baked, Cock or Chicken broths, in which have been boiled the roots of Partley, Sorrel and

When the use of spiced and falted meats

Neither at fometimes will the use of hot meats, as those which are spiced and salted, be unprofitable, especially to such as have their storach and liver much cooled. Let him eat Chickens, Mutton, Partridge, and small Birds, River-sishes, and such as live in story Waters, fried or boiled, rear Eggs, and such like. These Fruits are also good for him, Raisins, stewed Prunes, Almonds and Dates. Let his drink be small white Wine mixed with boiled Water. Moderate Exercises will be good, as also frictions of the whole Body. Should be such as also frictions of the whole Body. ctions of the whole Body: Sleep taken at a fitting time, and proportioned to waking, fo that the time of Sleep fall not upon the time of the Fit, for then it hurts very much, for calling the heat to the inner parts, it doubles the raging of the feverilh heat inwardly in the Bowels.

When Sleep is hartful.

> For the Paffions of the Mind, the Patient must be merry, and comforted with a hope shortly to recover his health. It feems not amifs to fome, at the coming of the Fit to put the feet and legs into hor Water, in which Chamomil, Dill, Melilot, Marjerom, Sage, and Rosemary have been boiled

Medicins.

The Medicins shall be such Syrups as are called digestive and aperitive, as Syrup of Wormwood, Mints, of the five opening Roots, Oxymel with a decoction of Chamomil, Calamint, Melilot, Dill and the like, or with common decoctions. The Purgatives shall be Disphenicon, Elettrarium, Discaribami, Hierapiera, Agarick, Turbith, of which you shall make Potions with the Waters of Mints, Balm, Hyssop, Sage, Fennel, Endive, or the like; Pilula surea are also good. These Purgatives shall sometimes be given in form of a Bole with Sugar, as the Physitian being prefent shall think most sit and agreeable to the nature of the Patient. agreeable to the nature of the Patient.

Care must be had of the Stomach. Vomins.

About the state of the Disease, you must have a care of the Stomach, and principally of the mouth thereof, as being the chief feat of Phlegm; wherefore it will be good to anoint it every other day with Oil of Chamomil mixed with a little white Wine, as also to unlade it by taking a Vomit of the Juice of Radiffs, and much Oxymel, or with the decoction of the Seeds and Roots of Afarion and Chamomil; and Syrup of Vinegar will be very good, especially at the beginning of the Fit, when Nature and the humours begin to move; for an inveterate Quotidian, though you can cure it by no other remedy, nothing is thought to conduce fo much as one dram of old Treacle taken with Sugar in form of a Bole, or to drink it diffolved in Aqua vite.

The use of Treacle in an invererate

CHAP. XXIV.

Of a Scirrhus, or an hard Tumor proceeding of Melancholy.

What a true and legitimate What an illegitimate Scir. rhus is.

Aving shewed the nature of Tumors caused by Bloud, Choler, and Phlegm, it remains we speak of these, which are bred of a Melancholick humour: of these there are said to be four differences. The first is of a true and legitimate Scirrbue, that is, of an hard Tumor endued with little fense, and so commonly without pain, generated of a natural melancholick humour. The second is, of an illegitimate Scientum, that is of an hard Tumor insensible, and without pain, of a melancholick humour concrete by too much refolving and refrigerating. The third is of a cancrous Scirthus bred by the corruption and adultion of the melancholick humour. The fourth of a phlegmonous, Eryfipelous or Oedematous Scirrhus, caufed by Melancholy mixed with fome other humor. The caufe of all these kinds of Tumors is a gross, tough, and tenacious humor concrete in any part. But the generation of such a humor in the body happens either of an ill and irregular diet, or of the unnatural

The Signs,

affects of the Liver or Spleen, as obstruction; or by suppression of the Hemorrhoids, or Courses.

The signs are hardness, renitency, a blackish colour, and a dilation of the Veins of the affected part with blackilhness, by reason of the abundance of the gross humour. The illegitimate, or bastard Scir-rbus which is wholly without pain and sense, and also the cancerous, admit no cure; and the true legitimate scarce yield to any. Those which are brought to suppuration, easily turn into Cancers and Fiftulaces, these tumors though in the beginning they appear little, yet in process of time they grow to a great bigness.

Prognostick.

CHAP. XXV.

Of the Cure of a Scirrhus.

Dict

He Cure of a Scientian chiefly confifts of three heads. First, The Phylician shall prescribe a convenient Diet, that is, fober and moderate feeding, tending to humidity, and indifferent heat; for his manner of life, let it be quiet and free from all perturbation of anger, grief and fadnets, as also abhorring the use of Venery. The second is placed in the evacuation of the antecedent matter, as by Phlebotomy, if need require, and by purging, by procuring the Hemorrhoids in men, and the Courfes in Women; let Purgations be preferibed of Discarbalicon, Hiera, Discarsa, Polypody, Epithymum, according to the mind of the learned Phylician. The third confiits in the convenient ule of Topick Medicins, that is, emollient at the beginning, and then prefently refolving, or rather frich as are mixed both of refolving and emollient faculties, as Galen teaches; tor by the use of onely emollient things there is danger of putrefaction, and a Cancer; and onely of refolving there is fear of con-

anserie, an. 3 is ceroti assp. descriptione Philagr. 3 is liquescant annia simul, cere quantum sit satis, at indession cerotum satis molle. When you have sufficiently used emollient things, sume the turnour with throng Vinegar and Aqua Vite poured upon a piece of a Militone, Fline, or Brick, heated very hot; for fo the mollined humour will be rarified, attenuated, and refolved 5 their fome while after renew your emollients, and then again apply your refolvers to waite that which remains, which could not be performed together, and at once; for thus Galen healed a Scirrhus in Circlina his Son. Goats dung is very The efficacy of good to diffeuls Scirrhous tumours; but the Emplaifler of Vigo with a double of Mercary is effectual the Empl. of above the reft, as that which mollifies, refolves, and waftes, all turnours of this kind.

CHAP. XXVI,

Of a Cancer already generated.

Cancer is an hard tumour rough and unequal, round, immoveable, of an afth or livid colour, What a cancer horrid by reason of the Veins on every side, swollen with black bloud, and spread abroad to is. the similitude of the stretched-out legs and claws of a Crab. It is a turnour hard to be known at the hirl, as that which scarce equals the bigness of a Chick, or Green after a little time it will come to the greatness of a Hasel-nut, unless peradventure provoked by somewhat too acrid Medicins

The Figure of the Crab, called Cancer in Latine.

it fuddenly increase; being grown bigger, according to the measure of the increase, it torments the Patient with pricking pain, with acrid heat, the gross bloud residing in the Veins growing het, and inferring a fense like the pricking of Needles, from which notwithstanding the Patient hath off-times some rest. But because this kind of tumour by the Veins extended and spread about it like The natire of the pain. times forme feet. But occause this kind of furnour by the veins extended and spread about it like the humour, reprefents, as it were, the toothed claws of the Crab, therefore I thought it not amiss to insert (as before) the Figure of the Crab, that so the reason both of the name and thing might be

CHAP. XXVII.

Of the Caufes, Kinds, and Prognosticks of a Cancer.

Ere we acknowledge two Gauses of a Caneer, the antecedent and conjunct. The antecedent The causes of Exe we acknowledge two Gauses of a Caneer, the antecedent and conjunct. The antecedent accass depends upon the default of irregular diet, generating and heaping up gross and ficurate by the infirmity or weakness of the Spleen in attracting and purging the bloud, by the suppression of the Courses, or Hamorrhoids, or any fach accustomed evacuation. The conjunct cause is that gross and melancholick humour sticking, and shat in the affected part, as in a strait. That melancholick the course mild and less malign, onely increased by a degree of more fervid heat, breeds a not ulcerated Caneer, but the more malign and acrid causes, an ulcerated. For so the humour which ted cases. not ulcerated Caner, but the more mange and acred causes, an increased to the manour which generates the Carbancles, when it hath acquired great heat, acrimony, and malignity, corrodes, and ulcerates the part upon which it alights. A Caner is made more fierce and raging by means inflaming, and appears heat, and Medicine traceral. the bloud, by perturbations of the mind, anger, heat, and Medicins too acrid, oily, and emplatick,

Amongst the forts or kinds of Cancers, there be two chiefly eminent, that is, the ulcerated or The forts and Amongst the forts or kinds or cancers, there is a control of the internal parts, differences manifest Cancers, and the not ulcerated or occult. But of Cancers some possess the internal parts, differences the external, as the Breits; also there is a recent, or late Cancers. as the Guts, Womb, Fundament; others the external, as the Brefts; also there is a recent, or late as the Guts, Womb, Fundament, or late bred Caneer, and also an invectorate one. There is one finall, another great, one raging and malign, bred Cancer, and also an inveterate one. There is one aman, amount great, one raging and malign, another more mild. Every Cancer is held almost incurable, or very difficult to be cured, for it is Activalia. 6a another more mild. Every Cancer is held almost incurable, or very difficult to be cured, for it is Activalia. 6a another more mild, a Cancer is not. The parts easily staid, until it hatti eaten even to the innermost of the part which it possesses. It invades most inbject to cancer.

Women to Cancers.

111111111

Women more frequently than Men, and those parts which are lax, rare, sungous, and glandulous, and therefore opportune to receive a defluxion of a gross humour, such are the Breits, and all the emanctories of the noble parts. When it possesses the Brest it often causes inflammation to the Armholes, and fends the fwelling ever to the glandules thereof, whereupon the Patients do complain that a pricking pain even pierces to their hearts. But this fame pain also runs to the clavicles, and even to the inner fide of the shoulder-blades and blades. When it is increased, and covers the noble parts, it admits no cure but by the hand; but in decayed bodies, whose strength fail, especially if the Cancers be inveterate, we must not attempt the Cure, neither with Instrument, nor with Fire, neither by too acrid Medins, as potential Cauteries; but we must onely feek to keep them from growing more violent, and from spreading further, by gentle Medicins, and a palliative Cure. For thus, many troubled with a Cancer, have attained even to old age. Therefore Hippocrates admonishes us, that it is better not to cure occult or hidden Cancers, for the Patients cured (faith he) do quickly die, but fuch as are not cured live longer.

What Cancers one must not undertake truly to cure.

CHAP. XXVIII.

Of the Cure of a Cancer beginning, and not yet ulcerated.

Cancer beginning, is oft hindered from increasing before it fasten its roots; but when it hath once increased, it admits no cure but by iron, as that which contemns, by reason of the malignity and contumacy, the force of all Medicins. Galen affirms he cured a Cancer not ulcerated. Lib.z. ad Claus. Now that Cure is performed by Medicins, purging Melancholy; by Phlebotomy, when the firength and age of the Patient may well endure it; by fluoring all things which may breed ill and faculent bloud. The diftemper of the Liver must first be corrected, the Spleen, as also the part affected; Diet.

in Men the Hemorrhoides, in Women their Courfes must be procured.

Therefore thick and muddy Wines, Vinegar, brown Bread, cold Herbs, old Cheese, old and salted Flesh, Beef, Venison, Gnat, Hare, Garlick, Onions and Mustard; and lastly, all acrid, acid, and other falt things, which may by any means incraffare the blood, and inflame the humours, must be eschewed. A cooling and humothing diet must be preferabed; Fasting, eschewed, as also Watchings; immoderate Labours, Sorrow, Cares, and Mountings; let him use Prifans, and in his Broths boil Mallows, Spinace, Lettuce, Sorrel, Purslain, Succery, Hops, Violets, Borrage and the four cold feeds. But let him feed on Mutton, Veal, Kid, Capon, Pullet, young Harts, Partridges, Fishes of Stony Rivers, rear Fasts, and of the him has been proposed for the feet of the stony of the

Eggs; and use white Wine but moderately for his drink.

The part affected with the Capter must be gently handled, and not over-burdened by over-hard or heavy things, or by too folid or fat Emplaisters; on the contrary, gentle and mitigating Medicins must be used; applying also at certain times such things as relist venom, or poison, as Treacle and Mithulaton. Mithridate. Affes Milk is exceeding fit to affwage the acrimony of the cancerous humour. Therefore it must not onely be taken inwardly, but also applied outwardly to the cancerous Ulcer, making thereof a fomentation.

CHAP. XXIX.

Of the Cure of an illcerated Cancer.

N Ulcerated Cancer hath many figns common with that which is not ulcerated, as the roundness of the tumour, the inequality, roughness, and pain; to the judgment of the eye the tumour feems foft, but it is hard to the touch; the Ulcer is filthy, with lips, thick, fwollen, hard, knotty, turned out, and fianding up, having a horrid afpect, and cafting forth ichorous, fil-thy, and Carion-like filth, fometimes black, fornetimes mixed with rotten filth, and otherwhiles with much bloud. This kind of Ulcer is malign, rebellious and untractable, as that which contemns mild remedies, and becomes more fierce by acrid and firong; the pain, fever, and all the fymptoms being increased, from whence the powers are dejected, the wasting and consumption of the body follows, and lastly, death. Yet if it be small, and in a part which may suffer amputation, the body where a cases being first purged, and bloud drawn, the strength of the Patient not diffunding, it will be convenient to use the hand, and to take hold of, and cut away whatsoever is corrupt, even to the quick, that no sear of contagion may remain or be left behind. The amputation finished, the bloud must not be prefently flopped, but permitted to flow out in fome measure, yea verily preffed forth all about it, that fo the Veins (wollen with black and melancholy bloud may be disburdened. When you have taken a fufficient quantity of bloud, the place must be seared with an actual cautery. For that will strengthen the part affected, draw forth the venenate quality, and also stay the defluxion. Then must you apply mitigating Medicins, and procure the falling away of the Eschar. To conclude, that which remains must be performed according to the cure of other Ulcers. Now we know and understand, that all the Cancer is cut away, and all the malignity thereof extinct, when the Electrosis fourth landable matters, when they people stells begins to grow by little. extinct, when the Elicer casts forth laudable matter, when that good slesh begins to grow by little and little, like to the grains of a Pomegranate, the pricking pain, and all the fymptoms being iffluaged. Yet the cure of an ulcerated Cancer which shall possess the lips, may be more happily and mildly performed, no caustick Medicin being applied after section, so also that scarce any deformity will be left when it is cicatrized. Which new and never formerly tried, or written of way, as far as I know, I found and performed in a man of fifty years old. Doctor John Altine, a most learned Physitian being called to Counsel, James Guillemean, and Master Englaching the King's Chi-

Chirurgeons, and John le Jeuse the Duke of Guife his most worthy Chirurgeon being present.

Chirurgeons, and John le Jame the Duke of Gnife his most worthy Chirurgeon being present.

The way is this; The Cancer must be thrust through the lips on both fides, above and below with A new and a needle and thred, that so you may rule and govern the Cancer with your left. hand, by the benefit of the thred (left any portion thereof should scape the instrument in cutting) and then with your Sivers in the right hand, you may cut it off all at once 3 yet it must be so done, that some substance of the inner part of the lip which is next to the teeth may remain (if so be that the Cancer be not grown quite through) which may serve, as it were, for a soundation to generate slesh to fill up the hollowness again. Then when it hath bled sufficiently, the sides and brinks of the Wound must be scarried on the right and left sides, within and without, with somewhat a deep scarification, that so (when we would draw together the sides and lips of the Wound, by that manner of stitching which is used in an hare-lip) we may have the side more pliant and tractable to the needle and thred. The residue of the Cure must be performed just after the same manner as we use in hare-lips, of which we shall treat the Cure must be performed just after the same manner as we use in hare-lips, of which we shall treat

CHAP. XXX.

Of the Topick Medicins to be applied to an ulcerated and not ulcerated Cancer.

E at the beginning afe repercutiive Medicins, fach as are the jaices of Nightihade, Plan-Repelling Metain, Henbane, Lettuce, Sorrel, Houfleck, Water, Lentil, or Ducks-meat, Knot-grafs, diens, tain, Henbane, Lettuce, Sorrel, Houlleek, Water, Lentil, or Ducks-meat, Knot-grats, Pomegranates, and the like. Alfo oleom reform Omphacinum, the powders of Sumach, Berberies, Litharge, Cerufe, Burnt-lead, Tutia, Quick-lilver, and the like. Of which you may compole Fomentations, Liniments, Ointments, Cataplafins, Emplafiters. Emplafirum Discaleithers diffolyed with juice of Nightthade, and Oil of Rofes is very in for not ulcerated Cancers. Pompholix, or Tutia washed in juice of Nightthade, or Plantain, is very good for ulcerated Cancers. Besides, this following Medicin is very commendable.

Relativistic of ceruf, an. \$\frac{1}{2}\text{i.terantur in mortario plumb. cum oleo rofar. done reducantur ad confidentiant linimenti vel unquenti\(\text{3}\) and there may be use of a resolving and repercustive Ointment, as, is plumbi ustilloti pamphol, iburic an. \$\frac{1}{2}\); \$\(\text{abssub}\) abssub. pontic. \$\frac{1}{2}\) i. elei rof arom \$\frac{1}{2}\) ii) ceru \$\frac{2}{2}\) vi. succi solani, quantum sufficit ad unquenti crassitudinem. Lib.6. finp. Plates of Lead A Hiftory.

Neither is that remedy for not ulcerated Cancers to be contemned, which confifts of a Plate of Lead befineared with Quick-filver; for Galen himself testifies that Lead is a good Medicin formalign and inveterate Ulcers. But Guido Cauliscenfir is a witness of ancient credit and learning, that such Plates of Lead rubbed over with Quick-filver, to fach malign Ulcers as contemn the force of other Medicins, are, as it were, Antidotes to waste and overcome their malignity and evil nature. This kind of remedy, when it was prescribed by that most excellent Physician Hollering, who commanded me to apply it to the Lady of Montigui, Maid of Honour to the Queen-mother, troubled with a Cancer in her left Breft, which equalled the bignets of a Walnut, did not truly throughly heal it, yet notwithlanding kept it from further growth. Wherefore at length growing wearyof it, when the had committed her felf to a certain Physician, boldly promising her quick help, the tried, with loss of her life, how dangerous and disadvantagious the cure of a Cancer was, which is undertaken according to the manner of healing other ulcers; for this Phyfitian, when he had cast away this our Medicin, and had begun the cure with mollifying, heating and attractive things, the pain, inflammation, and all the other fymptoms increasing, the tumor grew to that bigness, that being the humour drawn thirher could not be contained in the part it self, it thretched the brest forth so much, that it broke it in the middle, just as a Pomgranate cleaves when it comes to its full maturity; whereupon an immoderate flux of bloud followed, for flaying whereof he was forced to firew cauftick powders thereon; but by this means the inflammation and pain becoming more raging, and fwoundings coming upon her, the poor Soul in flead of her promifed health, yielded up her Ghott in the Phylicians bosom.

CHAP. XXXI.

Of the Fever which happeneth in Scierbous Tumors.

Why a Quartan happens upon Scirrhous mors.

Uch a Fever is a Quartan, or certainly coming near unto the nature of a Quartan, by reason of the nature of the Melancholick humour of which it is bred. For this shut up in a certain feat in which it makes the tumour, by communication of putrid vapours heats the heart above measure, and enflames the humours contained therein, whence arises a Fever. Now therefore a Quartan is a Fever coming every fourth day, and having two days intermittion.

The primitive causes thereof are these things which increase Melancholick humours in the body, fuch as the long eating of Pulfe, of coarse and burnt Bread, of falt Flein and Fish, of gross Meats, as Beet, Goat, Venifon, old Hares, old Cheefe, Cabbadge, thick and muddy Wines, and other fuch things of the fame kind.

The antecedent causes are, heaped up plenty of Melancholick humours, abounding over all the body. But the conjunct causes are Melancholick humburs putrefying without the greater Vessels, in the fmall Veins, and habit of the body.

We may gather the figns of a Quartan Fever from things which they call natural, not natural, and against nature. From things natural; for a cold and dry temper, old age, cold and fat, Men, having their Veins small, and lying hid, their Spleen swollen and weak, are usually troubled with Quartan

Why they are frequent in Autumn,

The figns.

Of thingsnotnatural; this Fever or Ague is frequent in Autumn, not onely because, for that it is cold and dry, it is fit to heap up Melancholick humours; but chiefly by reason that the humours by the heat of the preceding Summer are easily converted into adult Melancholy, whence far worser and more dangerous Quartans arise, than of the simple Melancholick humour: to contain the process of the clude through any cold or dry scason in a region cold and dry, men that have the like Temper

mannonia.

eafily fall into Quartains; if to these a painful kind of life full of danger and sorrow doth accrew. Of things contrary to Nature, because the fits take one with painful shaking, inferring, as it were, the lenfe of breaking or thaking the bones; further it taketh one every fourth day with an itching over the whole body, and oft-times with a thin skurf and puffules, efpecially on the legs; the pulfe at the beginning is little, flow, and deep, and the urin also is then white and waterilh,

inclining to fornewhat a dark colour.

In the declination when the matter is concoched, the wrin becomes black, not occasioned by any malign fymptom or preternatural excess of heat (for so it should be deadly) but by excretion of the conjunct matter. The fit of the Quartain continues twenty four hours, and the intermiffion is forty four hours. It often takes its original from an obstruction, pain and Seirrhus of the Spleen, and of the suppressing of the Courses and Hamorrhoides.

Quartains taken in the Summer are for the most part short, but in the Autumn long, especially Prognostick. fuch as continue till Winter. Those which come by faccession of any disease of the Liver, Spleen or any other precedent difease, are worse than such as are bred of themselves, and commonly end in a Droptie. But those which happen without the fault of any bowels, and to such a Patient as From what will be governed by the Physician in his Diet, insert no greater harm, but free him from more grievous and long diseases, as Melancholy, the Falling-lickness, Convulsion, Madness; because grievous and long diseases, as Melancholy, the Falling-lickness, Convulsion, Madness; because frees one. the Melancholy humor, the author of fuch difeafes, is expelled every fourth day by the force of the

fit of the Quartuin.

A Quartain Feaver, if there be no errour committed, commonly exceeds not a year; for otherwife fome Quartains have been found to last to the twelfth year, according to the opinion of Avicen: The Quartain beginning in Autumn is oft-times ended in the following Spring; the Quartain which is caused by adust blood, or choler, or falt-slegm, is more easily and sooner cured, than that which proceeds from adust melancholy humor; because the melancholy humor, terrestrial of its own nature, and harder to be discussed than any other humor, is again made by adustion (the subtiler parts being dissolved and the groffer subsiding) more stubborn, gross, malign, and acrid. The cure is wholly absolved by two means, that is, by Diet and Medicines. The diet ought to Diet, be prescribed contrary to the cause of the Feaver in the use of the stubies not natural, as much as lies in our power. Wherefore the Patient (hall efchew Swines fleib, flatulent, vifeid and glutinous meats, fenny Fowls, falt meats and Venifon, and all things of hard digeftion. The use of white Wine indifferent hot and thin, is convenient to attenuate and incide the groß humor, and to move 'urin and tweat; yea verily at the beginning of the fit, a draught of fuch Wine will cause womitting, which is a thing of to great moment, that by this one remedy many have been cured. Yet How much if we may take occasion and opportunity to provoke vomit, there is no time thought fitter for that vomiting prepurpose than presently after meat; for then it is the sooner provoked, the sibers of the stomach being humected and relaxed, and the fromach is fooner turned to vomiting, whereupon follows a more plentiful, happy, and easie evacuation of the Phlegmatick and Cholcrick humor, and lefs troublesome to Nature: And of all the crudities with which the mouth of the ventricle abounds in a Quartain, by reason of the more copious afflox or the Melancholick humor, which by his qualitics cold and dry diffurbs all the actions and natural faculties. Moreover, exercifes and frictions are good before meat; fuch pathons of the mind are as contrary to the caufe from which this Feaver takes his original, are fit to be cherified by the Patient, as Laughter, Jeffing, Mufick, and all finds like things full of pleafure and mirth. At the beginning the Patient must be gently handled and dealt withal, and we must abitain from all very strong medicines, until such time as the disease hards been of fome continuance. For this humour, contumacious at the beginning, when as yet Nature hath attempted nothing, is again made more stubborn, terrestrial and dry, by the almost siery best of acrid medicines. If the body abound with blood, fome part thereof must be taken away by opening the Median or Bafilick-vein of the left arm, with this caution, that if it appear more grofs and black, we fuffer it to flow more plentifully, if more thin, and tinctured with a laudable and red colour that we presently stay it. The matter of this Feaver must be ripened, concocted and diminished with the Syrups of Epithymum of Scolopendrium, of Maiden-hair, Agrimony, with the waters Medicines of Hops, Buglofs, Borage, and the like. I incerely proteft, next unto God, I have cured very many Quartains by giving a portion of a little Treacle diffolved in about fome two ounces of Aqua vite, allo fometimes by two or three grains of Musk diffolved in Muskadine, given at the beginning of a particular fit towards the general declination of the difeafeafter general purgations, the humor and body being prepared, and the powers firong: And certainly an inveterate Quartain can fearce ever be discussed, unless the body be much heated with meats and medicines. Therefore it is not altogether to be difproved, which many fay, that they have driven away a Quartain by taking a draught of Wine every day affoon as they came forth of their beds, in which fome leaves of Sage had been infused all the night. Also it is good a little before the fit to anoint all the spine of the back with Oyls heating all the nervous parts, fuch as are the Oyl of Rue, Walnuts, of the Peppers, mixby the cating a little Aqua vite; but for this purpose, the Oyl of Castoreum which hath been boiled in an Apple of Coliquintida, the Kernels taken out, upon hot coals, to the consumption of the in an Apple of Coliginatida, the Kernels taken out, upon not coats, to the confumption of the half part, mixing therewith fome little quantity of the Powders of Pepper, Pellitory of Spain, and Emphorbium, is excellent. Certainly, such like Inunctions are good, not only to mitigate the vebenency of the terrible shaking, but also to provoke sweats; for because by their humid hear they discuss this humor being dull and rebellious to the expulsive faculty; for the Melancholy is a second many of the blood. Therefore, if on the content of the Melancholy is, as it were, the drofs and mud of the blood. Therefore, if on the contrary, The Quartain Feaver shall be caused by adult choler, we must hope for and expect a cure by refrigerating and hu-what Quart meetive medicines, fuch as Sorrel, Lettuce, Purilane, broths of the decoctions of Cucumbers, rains must be Gourds, Mellons, and Pompious. For in this cafe, if any use hot medicines, he shall make this humor cared with most obtlinate by the resolving of the subtiler parts. Thus Trallians boats that he hath cased refrigerating things.

What baffard Agues are, and mieft be cured.

these kinds of Quartain Feaver by the only use of refrigerating Epithemaes being often repeated a little before the beginning of the fit. And this is the fum of the cure of true and legitimate intermit-ting Feavers; that is, of those which are caused by one simple humor, whereby the cure of those which they call Bastard intermitting Feavers, may be easily gathered and understood; as which are bred by a humor impure, and not of one kind, but mixt or composed by admixture of some other matter; for example, according to the mixture of divers humors Phlegmatick and Cholerick, the Medicins must also be mixt, as if it were a confused kind of Feaver of a Quotidian and Tertian, it must be cured by a medicine composed of things evacuating slegm and choler.

C H A P. XXXII.

Of an Ancurisma, that is, the dilatation, or springing of an Artery, Vein, or Sinew.

What it is.

In what parts they chiefly

happen,

N Ancurifina is a fost tumor yielding to the touch, made by the blood and spirit poured forth under the flesh and muscles, by the dilatation or relaxation of an Artery. Yet the Author of the definitions, feems to call any dilatation of any veinous veffel by the name of an Aneurisma. Galen calls an Aneurisma, an opening made of the Anatomits of an Artery. Also an Aneurisma is made when an Artery that is wounded closeth too slowly, the substance which is above it being in the mean time agglutinated, filled with flesh and cicatrized, which doth not seldom happen in opening of Arteries unskilfully performed and negligently cured; therefore Ancerifma's are abfolitely made by the Anastomofis, fpringing, breaking, trofios, and wounding of the arteries. These happen in all parts of the body, but more frequently in the throat, especially in women after a painful travail. For when as they more strongly strive to hold their breath, for the more powerful expulsion of the birth, it happens that the artery is dilated and broken, whence follows an effusion of blood and spirits under the skin. The signs are, a swelling one while great, another finall, with a pulfation and a colour not not varying from the native-conflitution of the skin-It is a fost tumor, and so yielding to the impression of the singers, that if it peradventure be small, it wholly vanisheth, the arterious blood and spirits flying back into the body of the artery, but prefently, affoon as you take your fingers away, they return again with like celerity. Some Answifma's do not only when they are preffed, but also of themselves, make a sensible hissing, if you lay your ear near to them, by reason of the motion of the vital spirit rushing with great violence through the straitness of the passage.

Prognofiick,

A Hiftory.

Antwifma's must not rashly be opened,

Wherefore in Aneurisma's in which there is a great rupture of the artery, such a noise is not heard, because the spirit is carried through a larger passage. Great Anturisma's under the arm-pits, in the groins and other parts wherein there are large vessels, admit no cure, because so great an eruption of blood and spirit often follows upon such an Incision, that death prevents both art and cure. tion of blood and Ipirit often follows upon tuch an memon, that death prevents both are and clare. Which I observed a few years ago in a certain Priest of St. Andrews of the Arches, Mr. John Mail-let, dwelling with a chief President Christopher de Thou. Who having an Answifma at the setting on the shoulder about the bigness of a Wall-nut, I charged him, he should not let it be opened, for it had it is smooth being him into manifest, danger of his life, and that it would be more fate for if he did, it would bring him into manifest danger of his life, and that it would be more fafe for him to break the violence thereof with double clothes fleeped in the juice of Night-shade and Housleek, with new and wheyey cheefe mixt therewith: Or with Unguentum de Bolo, or Emplairum contra rupturum, and fuch other refrigerating and aftringent medicines, if he would lay upon it a thin plate of Lead, and would use shorter breeches, that his doublet might serve to hold it too, to which he might fasten his breeches instead of a swathe, and in the mean time he should eschew all things which attenuate and inflame the blood, but especially be should keep himself from all great straining of his voice. Although he had used his diet for a year, yet he could not so handle the matter but that the tumor increased; which he observing goes to a Barber, who supposing the tumor to be of the kind of vulgar Imposshumes, applies to it in the evening a Caustick causing an Eschar so to open it. In the morning fuch an abundance of blood flowed forth from the tumor being opened, that he therewith aftonished, implores all possible aid, and bids that I should be called to stay this great bleeding, and he repented that he had not followed my direction. Wherefore I was called, but when I was fearce over the threshold, he gave up his ghost with his blood. Wherefore I diligently admonish the Chirurgeon that he do not rashly open Ancierisma's, unless they be small, in an ignoble part, and not indued with large veffels, but rather let him perform the cure after this manner: Cut the skin which lies over it until the artery appear, and then feparate it with the cure of the c your knife from the particles about it, then thrust a blunt and crooked needle with a thred in it under it; bind it, then cut it off, and foexpect the falling off of the thread of it felf, whiles Nature covers the Orinces of the cut artery with the new fleth, then the refidue of the cure may be performed after the manner of simple wounds. The Aneurisma's which happen in the internal parts are incurable. Such as frequently happen to those who have often had the unction and sweat for the cure of the French difease, because being so attenuated and heated therewith, that it cannot be contained in the receptacles of the artery, it differeds it to that largeness as to hold a mans fift:

Which I have observed in the dead body of a certain Taylor, who by an Accurifus of the arterious vein suddenly while he dead body of a certain Taylor, who by an Accurifus of the arterious vein suddenly while he dead body of a certain Taylor, who by an Accurifus of the arterious vein suddenly while he dead body of a certain Taylor, who by an Accurifus of the arterious vein suddenly while he dead body of a certain Taylor, who by an Accurifus to the arterious vein suddenly while he dead body of a certain Taylor. ous vein finddenly whilft he was playing at Tennis fell down dead, the veffel being broken; his body being opened, I found a great quantity of blood poured forth into the capacity of the cheft, but the body of the artery was dilated to that largeness I formerly mentioned, and the inner coat thereof was bony. For which cause within a while after I shewed it to the great admiration of the beholders in the Physicians School, whilst I publically diffected a body there; whilst he lived, be felt a beating and a School, whilst I publically diffected a body there; whilst he lived, he faid he felt a beating and a great heat over all his body the force of the pullation of all the Arteries, by the occasion whereof he often swounded. Dr. Sylvius the Kings Professor of Physical at that time torbad him the use of Wine, and wished him to use boiled water for his drink,

Those of the

inward pares incureable.

must be cured.

How they

A Hiftory.

Thamed an

and Curds and new Cheefes for his meat, and to apply them in form of Cataplains upon the grieved and fwoln part. At night be used a Prilan of Barley neal and Poppy-feeds, and was purged now and then with a Clyster of refrigerating and emollient things, or with Castia alone, by which medicines he said he found himself much better. The cause of such a bony constitution of the Arteries by Answissment's, for that the hot and service blood first dilates the coats of an artery, then breaks them, which are in heavy in the persons from the persons healing a first partition. breaks them; which when it happens, it then borrows from the neighbouring bodies, a fit matter to reflore the loofed continuity thereof.

This matter, whilit by little and little it is dried and hardned, it degenerates into a griftly or elfe a bony fubfiance, just by the force of the fame material and efficient causes, by which stones are generated in the reins and bladder. For the more terrestrial portion of the blood is dried and condensed by the power of the unnatural heat contained in the part affected with an Aneurisms where he is that the substantial and broken artery is a substantial and broken artery in whereby it comes to pass, that the substance added to the dilated and broken arrery is turned into a body of a bony confiftence. In which the fingular providence of Nature, the Hand-maid of God, is thewed, as that which, as it were, by making and opposing a new wall or bank, would hinder and break the violence of the raging blood (welling with the abundance of the vital spirits) unless any had rather to refer the cause of that hardness to the continual application of refrigerating and aftringent medicines. Which have power to condenfate and harden, as may not obferrely be Lib. 4. cap. aft. gathered by the writings of Galen. But beware you be not decrived by the fore-mentioned figns; depresses patents for fometimes in large Anesensmans you can perceive no pulsation, neither can you force the blood A Caurion in into the artery by the preffure of your fingers, either because the quantity of such blood is greater the knowing than which can be contained in the antient receptacles of the artery, or because it is condenfate and concrete into clods, whereupon wanting the benefit of ventilation from the heart, it prefently putrefies: Thence enfue great pain, a Gangrene, and mortification of the part, and laitly, the death of the creature.

The end of the Seventh Book,

BOOK VIII.

Of particular Tumors against Nature.

The PREFACE.

Ecause the cure of Diseases must be varied according to the variety of the temper, not only of the body in general, but also of each part thereof; the strength, figure, form, size, and sense thereof being taken into confideration: I think it worth my pains, having already spaces of Tomors in general, if I shall treat of them in particular, which affect each part of the body, beginning with those which affait the bead. Therefore the Tumor either affects the whole head, or else only some particle thereof, as the Eyes, Ears, Nose, Gums, and Let the Hydrocephalos and Physocephalos be examples of those Tumors which possess the

the like.

CHAP. I.

Of an Hydrocephalos or spatry Tumor sphich commonly affects the heads of Infants.

He Greeks call this Discase Hydrocephalos, as it were a Dropsic of the head, by a waterish what it is He Greeky call this Difeafe Hydrocepholos, as it were a Droptic of the head, by a waterish What it is hurror; being a difease almost peculiar to Infants newly born. It hath for an external cause the violent compression of the head by the hand of the Midwise, or otherwise at the birth, or by a fall, contusion, and the like. For hence comes a breaking of a vein, or artery, and an effusion of the blood under the skin. Which by corruption becoming whayish, lastly degenerateth into a certain waterish humor. It hath also an inward cause, which is the abundance of serous and serid blood, which by its tenuity and heat sweats through the pores of the vessels, formtimes between Differences the musculous skin of the head, and the Pericanium; sometimes between the Pericanium and the by reason of skull; and sometimes between the skull and membrane called Diranmator, and otherwhiles in the Ventricke of the brain. ventricles of the brain.

The figns of it, contained in the space between the musculous skin and the Perieranium, are a ma-Signs, nifet turnor without pain, soft, and much yielding to the pressure of the singers. The signs when it remaineth between the Pericranium and the skull, are for the moli part like the fore-named, unless it termaineth between the Percranaum and the skull, are for the than pare like the tore-named, unlets it be that the Tumor is a little harder, and not so yielding to the finger, by reason of the parts between it and the singer: And also there is somewhat more sense of pain. But when it is in the space between the skull and Dura mater, or in the ventricles of the brain, or of the whole subtance thereof, there is a dulness of the sense as of the sight and hearing; the tumor doth not yield to the touch, and the same significant states of the sense in proceedings for them it sinketh somewhat down allowable in the touch, unless you use strong impression, for then it sinketh somewhat down, especially in Infants newly born; who have their skulls almost as soft as wax, and the junctures of their sutures lax, both by nature, as also by accident, by reason of the humor contained therein moistening and relaxing all the adjacent parts; the humor contained here lifts up the skull fomewhat more high, effectially at the cially at the meetings of the futures; which you may thus know, because the tumor being presed, the humor flies back into the fecret pallage of the brain.

A Hiftory.

12112222

To conclude, the pain is more vehement, the whole head more fwollen, the fore-head frands fornewhat further out, the eye is fixt and immoveable, and also weeps by reason of the serous humor fweating out of the brain.

Vefalius writes, that he faw a Girl of two years old, whose head was thicker than any mans head by this kind of Tumor, and the skull not bony, but membranous, as it ufeth to be in Abortive-

births, and that there was nine pound of water ran out of it.

Abuerafis tells, that he faw a Child whose head grew every day bigger by reason of the watery moisture contained therein, till at length the Tumor became so great, that his neck could not bear it neither standing nor sitting, so that he died in a short time. I have observed and had in cure four children troubled with this difeafe, one of which being diffected after it died, had a brain no bigger than a Tennis-Ball. But of a Turnor and humor contained within under the Cranicon, or skull, I have feen none recover, but they are eafily healed of an external Tumor,

Therefore whether the humor lye under the Pericranium, or under the mufculous skin of the head, it must first be affailed with resolving medicines, but if it cannot be thus overcome, you must make an Incision, taking heed of the Temporal Muscle, and thence press out all the humor, whether it refemble the washing of slesh newly killed, or blackish blood, or congealed or knotted blood, as when the tumor hath been caused by contusion; then the wound must be tilled with dry lint, and covered with double boulfters; and laftly, bound with a fitting ligature.

CHAP. II. Of a Polypus, being an eating Difease in the Nose.

The reason of the name,

He Polypur is a tumor of the nofe against Nature, commonly arising from the Os Ethmoides, or fpongy-bone. It is fo called, because it resembles the feet of a Sea-Polypus in figure, and the flesh thereof in consistence. This tumor stops the nose, intercepting and hindring the liberty of fpeaking and blowing the note. Celfus faith, the Polypus is a caruncle of excreteence one while white, another while reddish, which adheres to the bone of the nose, and sometimes fills the nostrils hanging towards the lips, fometimes it descends back through that hole, by which the spirit descends from the nose to the throttle; it grows so that it may be seen behind the Uvula, and often firangles a man by ftopping his breath. There are five kinds thereof; the first is, a fost membrane, long and thin like the relaxed and depressed Vivila, hanging from the middle griftle of the note, being filled with a phlegmatick and viscid humor. This in exspiration hangs out of the nose, but is drawn in and hid by inspiration; it makes one snaffle in their speech, and mort in their sleep. The second hath hard sleth, bred of melancholy blood without adustion, which obstructing the nostrils, intercepts the refpiration made by that part. The third is flesh hanging from the griftle, round and fost, being the off-spring of phlegmatics blood. The fourth is a hard tumor, like flesh, which when it is touched, yields a found like a stone; it is generated of melancholy blood dried, being somewhat of the nature of a Seirrbur confirmed, and without pain. The fifth is, as it were, composed of many

cancrous Ulcers spread over the transverse surface of the grifile. Of all these sorts of Polypi some are not ulcerated, others ulcerated, which send forth a stinking and firong fmelling filth. Such of them as are painful, hard, refitting, and which have a livid, or leaden colour, must not be touched with the hand, because they savour of the nature of a Cancer, as into which they often degenerate; yet by reason of the pain which oppresses more violently, you may use the Anodyne medicines formerly described in a Caneer, such as this following

R. Olei de vitell. oversom 3 ij, Litharg. auri, & Tutbia prap. an. 3 i, fucci plat. folani an. 3 i β, Lapid. hemaiti. & campbore, an. 3 β. Let them be wrought a long time in a leaden Mortar, and fo make a medicine to be put into the nofirils. Those which are fort, loofe, and without pain, are fometimes curable, being plucked away with an Instrument made for that purpose, or else wasted to the found part of the found part of the cound part of the purpose. by actual cauteries put in through a pipe, so that they touch not the found part; or by potential cauteries, as Egyptiscum composed of equal parts of all the simples with Vitriol, which hath a fawhy it must be taken clear away a Polypus by the root; for if any part there remain, it will breed again. But cauteries and acrid medicines must be put into the nostrils with this caution, that in the mean time cold repelling and aftringent medicines be applied to the note and parts about it to affwage the pain, and his-der the inflammation. Such as are Unguentum de bello, and Unguentum nutritum, white of Eggs beaten with Rofe-leaves, and many other things of the like nature.

Which of them admir no manual operation.

Lib.6. cap. 8.

The differen-

ces hereof.

An Anodyne.

CHAP. III.

Of the Parotides, that is, certain finelings about the Ears.

What it its The differences. Their figns and lymptoms.

He Paretir is a tumor against Nature, affecting the glandules and those parts seated be-hind and about the Ears, which are called the Emunctories of the brain; for these because they are loofe and fpongy, are fit to receive the excrements thereof. Of these some are critical, the matter of the disease somewhat digested being sent thither by the force of Nature-Others Symptomatical, the excrements of the brain increased in quantity, or quality, reshing this there of their owners. ther of their own accord. Such abreefies often have great inflammations joyned with them, because the biting humor which flows thirder is more vitiated in quality than in quantity. Befides also, they often caule great pain, by reason of the differation of the parts indued with the most exquisite sense, as also by reason of a nerve of the fifth Conjugation spread over these parts; as also of the neighbouring membranes of the brain, by which means the Patient is troubled with head-ach; and all ummaonn.

his face becomes fwoln. Yet many times this kind of Tumor ufeth to be raifed by a tough, vifcous,

This difeafe doth more grievously afflict young men than old; it commonly brings a Feaver and Prognostick. watching. It is difficult to be cured, especially, when it is caused by a gross, tough, and viscid

humor, fent thither by the Crifir.

hamor, fent thither by the Crifit.

The cure must be performed by diet, which must be contrary to the quality of the hamor in the The cure. temper and consistence of the meats. If the inflammation and redness be great, which indicate abuntable, and consistence of blood, Phlebotomy will be profitable, yea very necessary. But here we must not use the said for temper like judgment, in application of local medicines, as we do in other tumors, as Galen admonstrate thus; that is, we must not use repercussives at the beginning, especially, if the abscels be critical; for so we should infringe or fore-flow the endeavours of Nature toroibly freeing it self from the mortibility is being the matter. But we must much less repel, or drive it back, if the matter which hath slowed this they be venerate, for so the reflow thereof to the noble parts would prove mortal. Wherefive the ther be venerate, for so the reflow thereof to the noble parts would prove mortal. Witcrefore the Chirurgeon thall rather ather Nature in attracting and drawing forth that humor. Yet if the de-Chirurgeon thall rather athir Nature in attracting and drawing forth that humor. Yet if the defluxion thall be so violent, if the pain so fierce, that thence there may be sear of watchings, and a Feaver, which may deject the powers; Galenthinks, it will be expedient with many resolving medicines to mix some repelling. Wherefore at the beginning let such a Cataplassis be applied.

Reference of some season of the following of the sound of the sound of the season of the season

discussing and resolving medicines will be prostable; as,

If the humor doth there concrete and grow hard, you must betake you to the medicines which were prescribed in the Chapter of the Secrebus; but if it tend to suppuration, you shall apply the following medicine.

Re Rad. lilieram & ceperam fub contribut coll. an. 3 iij. Viteli. over. num. ii, aveng. fuills & ungluent. A tipening bafilicen, an. 3 i, fari. fem. lini 3 i β, fiar cataplasma. But if the matter do so require, let the turnor medicine.

CHAP. IV.

Of the Epulis, or over-growing of the flight of the Gunts.

He Epulis is a flethy excrefeence of the gums between the teeth, which is by little and What it is little oft-times increased to the bigness of an Egg, so that it both hinders the speech and eating it casts forth salvious and stinking silth, and not seldom degenerates into a Can- The Sympeer, which you may underliand by the propriety of the colour, pain, and other accidents; for then tomes, you must by no means touch it with your hand. But that which doth not torment the Patient with

pain, may be plack'd away; and let this be the manner thereof.

Let it be tied with a double thred, which must be fraiter twiched until fach time as it fall off; when it shall fall away, the place must be burnt with a cautery, put through a trunk or pipe, or with The Chirus-hore; for it so be that it be not burnt, it usually returns.

I have often by this means taken away fuch large tumors of this kind, that they hung out of the mouth in no small bigness, to the great disfiguring of the face, which when as no Chirargeon durit mouth in no irrial bigness, to the great disniguring of the face, which when as no Univergeon durit touch, because the flesh looked livid, I ventured upon, because they were free from pain's and by taking them away and cauterizing the place, I perfectly healed them: not truly suddenly, and at once is though I burnt the place after diffection, yet nevertheless they sprung up again, because a certain portion of the bone and sockets in which the teeth stand fastned, were become rotten. I have often observed such as they seem to be a sufficient of the soul bank to the seem of th often observed such like slesh by continuance of time to have turned into a grisly and bony sub-stance. Wherefore the cure must be begun as speedily as may be; for being but little, and having must not be fastened no deep roots, it is more easily taken away, being then only filled with a viscid humor, deferred, which in faccels of time is hardened, and makes the taking away thereof more difficult.

CHAP. V. Of the Rangla.

Here is oft-times a tumor under the tongue, which takes away the liberty of promintiation on or speech; wherefore the Greeks call it Batrachinon, the Latins Ramula, because such why it is so as have this discase of the tongue, seem to express their minds by croaking rather than called by speaking.

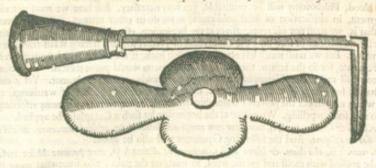

by speaking.

It is caused by the falling down of a cold, moilt, gross, tough, viscid, phlegmatick matter, from The Cause, the brain upon the tongue, which matter in colour and consistence resembles the white of an Egg,

That you may fafely perform the cure, you must open the Tumor rather with a Cautery of The Care. hot Iron, than with a Knite, for otherwife it will return again. The manner of opening it man be thus. You shall get a bended hollow and perforated Iron-plate with a hole in the midst, and making the Parisms to hold onen his mouth, you shall so finite this hole on the midst, and making the Patient to hold open his mouth, you shall so fit it, that the hole may be upon the part

which must be opened. Then there you must open it with an hot Iron, for so you shall hart no part of the mouth which is whole ; but when you are ready to burn it, by thrusting your thumb under the Patients chin, you may fornewhat elevate the Tumor whereby you may open it with more certainty; when it is opened, you must thrust out the matter contained therein, and then wash the Patients mouth with some Barly-water, Honey, and Sugar of Roses; for so the Ulcer will be fasely and quickly healed.

The Delineation of the Iron-plate, and crooked allual Cantery.

CHAP. VI.

Of the swelling of the Glandules, or Almonds of the Throat.

Why the glandules are called Almonds. Their use.

Ature at the jaws near the roots of the tongue, hath placed two glandules opposite to one another; in figure and magnitude like to Almonds, whence also they have their name; their office is to receive the spittle falling down from the brain, both left that the too violent falling down of the humor should hinder the tongue in speaking, as also, that the tongue might always have moifture, as it were, laid up in flore, left by continual speaking, it should grow dry and fail. For thus this spittle being consumed by feaverish heats, the Patients are scarce able to fpeak, unless they first moisten their tongue by much washing their mouth.

The cause of their tumor.

These glandules, because they are feated in a hot and mout place, are very subject to inflammations; for there flows into these oft-times together with the blood, a great quantity of crude, phlegmatick and viscous humors, whence arises a Tumor; which is not feldom occasioned by drinking much, and that vaporous Wine; by too much Gluttony, and staying abroad in the open air.

Swallowing is painful and troublesome to the Patient, and commonly he hat a Feaver. Oft-times the neighbouring mucles of the throttle and neck are so swoln together with these glandules, that (as it usually become in the Society I the respect of the broad size storage).

Symtomes.

that (as it usually happens in the Squinzy) the paffage of the breath and air is stopped, and the Patient firangled.

We refut this imminent danger by purging and blood-letting, by applying Cupping-glaffes to the neck and thoulders, by frictions and ligatures of the extreme parts, and by wathing and gargling the mouth and throat with aftringent Gagarifms. But if they come to Suppuration, you must with your Incition-knife make way for the evacuation of the Pas, or matter; but, if on the contrary, thefe things performed according to art, defluxion be increased, and there is present danger of death by flopping and intercepting the breath, for the flumning fo great and imminent danger, the top or upper part of the Afpens arteris or Weazon must be opened, in that place where it uses to stand most remedies.

Out; and it may be done fo much the fafer, because the jugular veins and arteries are furthest di-flow you must frant from this place, and for that this place hath commonly little fielh upon it. And that the Incision may be the fitlier made, the Patient must be wished to bend his head back, that so the artery may be the more cafily come to by the Inftrument; then you shall make an Incition overthwart way with a crooked knife between two rings (not hurting nor touching the griftly fubfilance) that is to fay, the membrane which ties together the griftly rings, being only cut; you shall then judge that you have made the Incision large enough, when you shall perceive the breath to break out by the wound; the wound must be kept open so long, until the danger of suffocation be past; and then it must be flowed up not touching the griftle: But if the lips of the wound shall be hard and callous; they must be lightly scarrified, that so they may become bloody for their case agglutination and union, as we shall shew more at large in the cure of Hare-lips. I have had many in cure, who have recovered, that have had their weazon together with the griftly rings thereof cut with a great wound, as we shall note when we shall come to treat of the cure of that wounds of that part.

Extreme difeafes must have extreme remedies.

Zon.

CHAP. VII.

Of the Inflammation and Relaxation in the Uvula or Columella.

What the MON-Le is, and what the use there-The cause of the fwelling thereof.

He Vivila is a little body, spongy, and somewhat sharpened to the form of a Pine-apple, hanging even down from the upper and inner part of the palat, fo to break the force of the air drawn in, in breathing, and carried to the lungs; and to be as a quill to form and tune the voice. It often grows above measure by receiving mointure falling down from the brain, becoming tharp by little and little from a broader and more fwoln Bahr. Which thing causes

unanadan

many fymptomes; for by the continual irritation of the diffilling humor the cough is caused, which Symptomes

many symptomes; for by the continual irritation of the diffilling humor the cough is caused, which Symptomes also hinders the fleep, and intercepts the liberty of speech; as also, by hindering respiration, the Patients cannot fleep, unless with open mouth: They are exercised with a rain endeavouring to swallow (having, as it were, a morfel sticking in their jaws) and are in danger of being strangled.

This dilease must be resisted and assailed by purging, bleeding, cupping, taking of elysters, using the Cure, aftringent Gargles, and a convenient dier; but if it cannot thus be overcome, the cure must be tried by a caussick of Agus farits, which I have divers times done with good success. But if it cannot be so done, it will be better to put to your hand, than through idleness to furfer the Patient to Chirurgery, remain in imminent and deadly danger of strangling; yet in this there must very great caution be not be to done, if will be better to put to your natus, than through intends to halfer the Patient to remain in imminent and deadly danger of firangling; yet in this there must very great caution be used; for the Chirurgeon shall not judge the Usula sit to be souched with an instrument, or caustick, which is swoln with much instanced, or black blood, after the manner of a Cancer; but he shall boldly put to his hand, if it be longish, grow small by little and little into a sharp, loose and soft point; if it be neither exceeding red, neither fwoln with too much blood, but whitih and without point; if it be neither exceeding rea, heather twoin with counts about, but which redounds and without pain. Therefore that you may more eafily and fafely cut away that which redounds and is superfluous, defire the Patient to fit in a light place, and hold his mouth open; then take hold of the top ous, defire the Patient to lit in a light piace, and note his income of the thought unprofitable.

Otherwise you shall bind it with the instrument here-under described. The invention of this Infirument is to be aferibed to Honoratus Tastellanus, that diligent and learned man, the Kings Physician ordinary, and the chief Phylician of the Queen-mother. Which also may be used in binding of Polypi, and warts in the neck of the womb.

The Delineation of Constrictory-rings, fit to twitch or bind the Columella, with a switted thread.

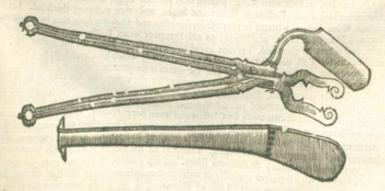

A Shews the ring, whose upper part is somewhat hollow.

B A double waved thread, which is conched in the hollowness of the ring, and hath a running, or loose knot

The state of the s

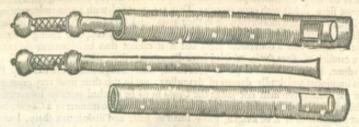

C An Iron rod, into the eye whereof the forementioned double thread is put, and it is to twiteb the Columella, when as museb thereof is taken hold of, as it unprofitable, and fo take it away without any flux of blood. When you would fraiten the thread, draw it again through the Iron-rod, and fo strain it as much as you shall think good, letting the end of the thread hang out of the mouth. But every day it must by the thorness and the part and Patient be reflected to bealth. I have delineated three of these Inframents, that you may use which you will, as occasion shall be offered.

A Figure of the Speculum oris, by which the mouth is held and hops open whilft she Chifurgion is bufsed in the cutting away, or binding the Uvula.

But if an eating Ulcer shall affociate this relaxation of the Viula, together with a flux of blood, then it must be burnt and seared with an hot Iron, so thrust into a Trunk, or Pipe, with an hole in it, that so no found part of the mouth may be offended therewith.

A bollow Trunk with a bole in the fide, with the bot Iron inferred, or put therein.

CHAP. VIII. Of the Angina, or Squinzy.

What it is.

The differen-The first kind,

The Symptoms.

The fecond kind.

The third-

The causes.

Hip. fell. 3. prog. 2. Aphor. 10. fell. 5.

He Squinancy, or Squincy, is a fwelling of the jaws, which hinders the entring of the ambient air into the weazon, and the vapours and the spirit from passage forth, and the meat also from being swallowed. There are three differences thereof. The first torments the Patient with great pain, no fwelling being outwardly apparent, by reason the Morbifick humor lies hid behind the almonds or glandules of the Vertebre of the neck, so that it cannot be perceived, unless you hold down the tongue with a Spatula, or the Speculum oris, for fo you may fee the redness and tumor there lying hid. The Patient cannot draw his breath, por swallow down meat nor drink; his tongue (like a Grey-hounds after a courfe) hangs out of his mouth; and he holds his mouth open, that so he may the more easily draw his breath; to conclude, his voice is, as it were, drown'd in his jaws and note; he cannot lie upon his back, but lying is forced to fit, fo to breathe more freely: And because the passage is stopt, the drink stics out at his moses the eyes are fiery and fweln, and standing out of their orb. Those which are thus affected are often fiddenly furfocated, a foam rifing about their mouths.

The fecond difference is faid to be that, in which the tumor appears inwardly, but little or fearce any thing at all outwardly, the tongue, glandines and javes, appearing outwardly, but little in-The third, being leaft dangerous of them all, causes a great swelling outwardly, but little in-

The causes are either internal or external. The external are a fireak, splinter, or the like thing sticking in the throat, or the excess of extreme cold or heat. The internal causes are a more plentiful defluxion of the humors either from the whole body or the Brain, which participate of the nature, either of blood, choler, or flegm, but feldom of Melancholy. The figos by which the kind and com-mixture may be known, have been declared in the general Treatile of Tumors. The Squincy is more dangerous, by how much the humor is lefs apparent within and without. That is lefs dangerous which shews it self outwardly, because such an one shuts not up the ways of the meat, nor breath. Some die of a Squincy in twelve hours, others in two, four or seven days. Those (faith Hippecrates) which scape the Squincy, the disease passes to the lungs, and they die within seven days abut if they scape these days, they are suppurated, but also often-times this kind of disease is terminated by difappearing, that is, by an obscure reflux of the humoranto some noble part, as into the lungs (whence the Empyema proceeds) and into other principal parts, whose violating brings inevi-

table death; fometimes by refolution, otherwife by suppuration.

The way of resolution is the more to be defired; it happens when the matter is small, and that fubtle; especially, if the Physician shall draw blood by opening a vein, and the Patient use sitting Gargarisms. A critical Squincy divers times proves deadly, by reason of the great falling down of the humor upon the throttle, by which the paffage of the breath is fuddenly that up. Broths must be used made with Capons, and Veal seasoned with Lettuce, Purslain, Sorrel, and the cold Seeds.

If the Patient shall be somewhat weak, let him have potched Eggs, and Barly Creams, the Barly being somewhat boiled with Raisons in Water and Sugar, and other meats of this kind. Let him be forbidden Wine, instead whereof he may use Hydromelina, and Hydrosachara, that is, drinks made of Water and Honey, or Water and Sugar; as also Syrups of dried Roses, of Violets, Sorrel and Limmons, and others of this kind. Let him avoid too much fleep. But in the mean time the Phylician must be careful of all, because this disease is of their kind, which brook no delays. Wherefore let the Basilies be presently opened, on that side the tumor is the greater; then within a short time ter the same day, for evacuation of the conjunct matter, let the vein under the tongue be opened; let Cupping-Glaffes be applied, fometimes with Scarification, fometimes without, to the neck and thoulders, and let frictions and painful ligatures be used to the extreme parts. But let the humor impact in the part be drawn away by Clysters and tharp Suppositories. Whilst the matter is in defluxion, let the mouth without delay be walked with altriagent Gargarifins to hinder the defluxion of the humor, left by its fudden falling down it kill the Patient; as it often happens, all the Physicians care and diligence netwithflanding. Therefore let the mouth be frequently walked with Oxycrate or finely of the control of the c Oxycrate, or fuch a Gargarifm; R. Pomorum fylveft. nu. iiij. fionach, Rofar. rub. an.m. ff.berber. 3 ii. there he all boyled with fufficient quantity of water to the confumption of the half, adding thereunto of the Wine of four Pomgranats, 3 iii), of Diamonn 3 ii, let it be a little more boyled, and make a gargle according to Art. And there may be other Gargarifins made of the waters of Plantain, Night-thade, Veryuyee, Julep of Rofes, and the like. But if the matter of the defluxion shall be Phleomatick Alum Pomerous and a little Vincear may be table a little. be Phlegmatick, Alum, Pomgranat-pill, Cyprefs-nurs, and a little Vinegar may be fafely added. CHAP. IX. Of the Bronchocele, or Rupture of the Threat.

Hat which the French call Goetra, that the Greeks call Brouchocele, the Latins Guttweis Her- The reason of nia, that is, the Rupture of the throat. For it is a round tumor of the throat, the mat-the name. ter whereof coming from within outwards, is contained between the skin and wearon; it proceeds in women from the fame cause as an Anenerisma.

But this general name of Bronchocele undergoes many differences; for fornetimes it retains the The differennature of Melicerides, other-whiles of Steatoma's, Atheroma's or Aneurofina's; in force there is found ces. a flethy fubitance having some small pain; some of these are small, others so great, that they seem almost to cover all the throat ; some have a cift, or bag, others have no such thing; all, how many foever they be, and what end they shall have, may be known by their proper tights; these which shall be curable, may be opened with an actual or potential cautery, or with an Incition-knife.

Hence, if it be possible, let the matter be presently evacuated; but if it cannot be done at once, let The Cure. it be performed at divers times, and discussed by fit remedies; and latily, let the ideer be consoli-

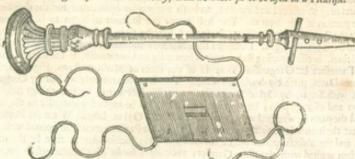

CHAP. X. Of the Plenrifie.

The Pleurific is an inflammation of the membrane, invefling the ribs, caused by subtile and what is cholerick blood, springing upwards with great violence from the hollow vein into the stages, and thence into the intercostal veins, and is at length poured forth into the empty of a Pleurific suppuration, it commonly, infers a pricking pain, a Feaver, and distinctly of breathing. This suppuration, it is purged and evacuated one while by the mouth; the lungs sucking it, and so casting it into the weazon, and so into the mouth; otherwhiles by urin, and sometimes by strong it.

purated blood is purged and evacuated one while by the mouth; the mage meaning it, and to carting it into the weazon, and fo into the mouth; otherwhiles by urin, and fometimes by flool.

Burif nature, being too weak, cannot expectorate the purulent blood poured forth into the capacity of the chelt, the difease is turned into Empyona, wherefore the Chirurgeon must then be called, the difease is turned into Empyona, wherefore the Chirurgeon from below upwards, may make a vent between the third and fourth true. who beginning to reckon from below upwards, may make a vent between the third and fourth true an Engineer and legitimate ribs , and that must be done either with an actual or potential cautery, or with a Of the apert that legitimate ribs , and that bands the back, but not downwards, left the veffels should be vio- on of the lated which are differninated under the rib. This apertion may be fately and eafily performed by this in an Emptactual cautery; it is perforated with four holes, through one whereof there is a pin put higher or lower, according to the depth and manner of your Incision: Then the point thereof is thrust through a plate of Iron perforated also in the midst, into the part designed by the Physician, left the wavering hand might peradventure touch, and so hurt the other parts not to be meddled within. The fame plate must be formewhat hollowed, that fo it might be more easily fitted to the gibbous fide, and bound by the corners on the contrary fide with four strings. Wherefore I have thought good here to express the figures thereof

The Figure of an actual Cautery, with its Plate fit to be used in a Pleurific.

But if the Patient shall have a large body, cheft and ribs, you may divide and perforate the ribs themselves with a Trepan; howsoever the apertion be made, the pws, or matter, must be evacuated by little and little at feveral times; and the capacity of the cheft cleanfed from the purulent matter by a detergent injection of vi. ounces of Barley-water, and 3 ii, Honey of Rofes, and other the like things mentioned at large in our cure of Wounds.

CHAP. XI. Of the Dropfie.

What the Dropfie in.

He Droplie is a Tumor against nature by the abundance of waterish humor, of flatulencies, or Phlegm, gathered one while in all the habit of the body, otherwhiles in fome part and that especially in the capacity of the belly between the Peritanesan and entrails. From this diffinction of places and matters, there arise divers kinds of Dropsies. First, that Dropsie which fills that space of the belly, is either moist or dry. The moist is called the Aseites, by reason of the similar de it hath with a leather-bottle, or Borachio, because the waterish humor is contained in that capacity, as it were in fuch a veffel.

The differences thereof.

The Symp-

The causes.

tomes,

How divers inco Dropfies.

The dry is called the Tympanites, or Tympany, by reason the belly swollen with wind sounds like a Tympanim, that is, a Drum. But when the whole habit of the body is distended with a phlegmatick humor, it is called Anasarea or Lencophlegmatics. In this last kind of Dropsie the lower parts first (well, as which by reason of their fire are most subject to receive defluxious, and more remote from the fountain of the native heat; wherefore if you press them down, the print of your finger will remain fometime after; the Patients face will become pale and puffed up, whereby it may be distinguished from the two other kinds of Dropsie. For in them first the belly, then by a certain consequence the thighs and feet do swell. There are besides also particular Dropsies, contained in the strait bounds of certain places, such are the Hydrocephalus in the head; the Bronebocele in the throat; the Plemocele in the cheft; the Hydrocele in the Scrotum, or cod; and fo of the reft. Yet they all arise from the same cause, that is, the weakness or defect of the altering or concocting faculties, especially of the liver, which hath been caused by a Scirrbus, or any kind of great difference, chiefly cold, whether it happen primarily, or secondarily by reason of some hot difference diftipating the native and inbred heat, such a Dropsie is incurable; or else it comes by consent of some other higher or lower part; for if in the lungs, midriff, or reins, there be any diffemper, or difease bred, it is eafily communicated to the gibbous part of the liver, by the branches of the hollow vein, which run thither. But if the mifchief proceed from the fpleen, flornach, melentery, guts, especially the jejunum and Ileum, it creeps into the hollow fide of the liver by the meseraick veins, and other branches of the Vena porta or gate-vein. For thus fuch as are troubled with the Afthma, Ptifick, Spleen, Jaundife, and also the Phrensie, fall into a Dropsie.

Laftly, All fuch as have the menfitual or hamorrhoidal blood suppressed or too immoderately flowing contrary to their cufforn, either overwhelms, diminisheth or extinguisheth the native hears no otherwise than fire, which is suffocated by too great a quantity of wood; or dieth and is extinguished for want thereof. We must look for the same from the excrements of the belly or bladder, east forth either too sparingly or too immoderately: Or by too large quantity of meats too cold and rashly devoured without any order. To conclude, by every default of external causes through

which occasion, errour may happen in diet or exercife.

The Afeiter is distinguished from the two other kinds of Dropsies, both by the magnitude of the efficient cause, as also by the violence of the Symptoms, as the dejected appetite, thirst, and swelfing of the All and the control of the Symptoms. ling of the Abdomen. And also when the body is moved or turned upon either fide, you may hear a found as of the joggling of water in a veffel half full. Laftly, the humor is diverfly driven upwards or downwards, according to the turning of the body and compression of the Abdomen: It also can feth various Survey and the survey of the body and compression of the Abdomen: caufeth various Symptoms by preffure of the parts to which it floweth. For it caufeth difficulty of breathing and the cough by preffing of the midriff; by fweating through into the capacity of the cheft, it caufeth like Symptoms as the Empyema. Befides also the Patients often feem, as it were, by the ebbing and flowing of the waterill humor, one while to be carried to the skies, and another whiles to be drowned in the water, which I have learn'd not by reading of any author, but by the report of the Patients themselves. But if these waterish humors be fallen down to the lower parts, they suppress the excrements of the guts and bladder by preffing and firaitining the paffages. When the Patient

The figns of an Afrites.

The Symp-

manayan

lies on his back, the tumor feems lefs, because it is spread on both sides. On the contrary, when he frands or fits, it feems greater, for that all the humor is forced or driven into the lower bell he feels a heaviness in the Petter or that at the number is forced or driven into the tower besty, whence he feels a heaviness in the Petter or thate. The upper parts of the body fall away by detect of the blood fit for nourithment in quality and confidence, but the lower parts fwell by the flowing down of the serous and waterish humor to them. The pulse is fittle, quick, and hard with tention.

This difease is of the kind of Chronical or long diseases; wherefore it is scarce, or never cured, Prognosticiss especially in those who have it from their Mothers womb, who have the action of their florasch deprayed; and those who are cachectick, and old; and lastly, all such as have the natural faculty

languishing and faulty.

On the contrary, young and firong men, especially if they have no seaver, and finally all who can endure labour, and those exercises which are no for curing this difease, easily recover; principally if they use a Physician, before the water which is gathered together do putrefie and infect the bowels by its contagion.

CHAP. XII.

Of the cure of the Dropfie.

He beginning of the cure must be with gentle and mild medicines; neither must we come to a Paracentesis, unless we have somethy used and tried these. Therefore, it shall be the part of the Phylician to prescribe a drying diet, and such medicines as carry away water, Hip. lib. 4. de both by ftool and urine, Hippoerates ordains this powder for Hydropick perfons. Re Canther, ablatis interaction, earlies of aliis \$\frac{3}{3} \text{ combinations in furms, \$\phi\$ fiat pulvis; of which administer two grains in white wine; for, nature, helped by this, and the like remedies, hath not feldom been feen to have cured the Dropfie. But that we may haften the cure, it will be available to fiir up the native hear of the part by application of those medicines which have a discussing force; as bags, baths, ointments, and Emplaifiers. Let bags be made of dry and harth Bran, Oats, Salt, Sulphur, being made hot; Bagt, or, for want of them, of Sanders or Ashes often heated.

The more effectual baths are Salt, Nitrous, and Sulphurous waters, whether by nature or art, that Baths, The more effectual baths are Salt, Nitrous, and Sulphurous waters, whether by nature or art, that Baths, is, prepared by the diffoliation of Sal, Nitre, and Sulphur; to which if Rue, Marjoram, the leaves of Fennel, and tops of Dill, of Staches, and the like, be added, the butiness will go better forwards. Let Liniments, bags be made of the oyl of Rue, Dill, Bays, and Squills, in which force Explorition, Pellitory of Spain, emplaifers, or Pepper, have been boiled. Let Plaillers be made of Frankineense, Myrrib, Turpentine, Geiar, Bays, Veficatories, English Galengal Honey, the dune of Oxen, Pigerous Goats, Hories, and the like, which also berries, English Galengal, Honey, the dung of Oxen, Pigeons, Goats, Hories, and the like, which also may be applied by themseves. If the disease continue, we must come to Sinapifous and Phanigms, that is, to rubrifying and vesicatory medicines. When the blisters are raised, they must be anointed again, that so the water may by little and little flow so long until the humor be exhausted, and

Galen writes, the Husbandmen in Afra, when they carried wheat out of the Countrey into the City Gal. 113. de fain Cars, when they would steat away and not be taken, hide fome stone-jugs fill'd with water in the cal. satur. 1. midfi of the Wheat; for that will draw the moifture through the jugs into it felf, and increase both the quantity and weight. When certain pragmatical Phylifians had read this, they thought that Wheat had force to draw out the water, so that if any fick of the Droptic should be buried in a heap

But if the Physician shall profit nothing by these means, he must come to the exquisitly chief re- Divers opinions of Paramedy, that is, to Paraconofis. Of which because the opinions of the ancient Physicians have been one of Para-

diverfe, we will produce and explain them.

Those therefore which disallow Paracentesis, conclude it dangerous for three reasons: The first, the belly, and configurates the pouring out the contained water, together with it, you distingute and resolve the spirits, Reasons, and configurates the manual visual and animal families.

Apostor coinsign is because the lines against it. and confequently the natural, vital, and animal faculties. Another opinion is, because the liver against it. wanting the water by which formerly it was born up, thence-forward hanging down by its weight, depresseth and draweth downwards the midrist and the whole chest, whence a dry cough, and a difficulty of breathing proceed. The third is, because the substance of the Pertuneum, as that which is nervous, cannot be pricked or cut without danger, neither can that which is pricked or cut, be eafily agglutinated and united, by reason of the spermatick and bloodless nature thereof. English as moved by these reasons, condemned Paractaress as deadly: Also, he persuaded that it was unprofitable, for these following reasons; viz. Because the water poured forth, doch not take away with it the cause of the Dropsie, and the distemper and hardness of the liver, and of the other hands whereby it comes to pass that he handless new waters they may easily again fall into the with it the caute of the Drophe, and the diffemper and hardness of the aver, and of the other bowels, whereby it comes to pass that by breeding new waters they may casily again fall into the Drophe. And then the Feaver, the thirst, the hot and dry distemper of the bowels, all which were mitigated by the touch of the included water, are aggravated by the absence thereof, being pour-ed forth; Which thing seemeth to have moved Avices and Gordonius that he faid none, the other said very few, lived after the Paracestefis: But the rejutation of all fuch reasons is very case,

For, for the first, Galen infers that harmful diffipation of spirits, and resolving the faculties happens, when the Paraceteffs is not diligently, and artificially performed. As in which the water is pre-fently poured forth; truly, if that reason have any validity, Phlebotomy must feem to be removed far from the number of wholfome remedies, as whereby the blood is poured forth, which hath far more pure and fubril fpirits, than those which are faid to be diffused and mixed with the Dropsiewaters. But that danger which the fecond reason threatens shall easily be avoided; the Patient being defined to lie upon his back in his bed, for fo the liver will not hang down. But for the third reason, the fear of pricking the Peritongum, is childish: For those evils which follow upon wounds of the nervous parts, happen by reason of the exquisite sense of the part, which in the Peritoneum ill affected and altered by the contained water, is either none or very finall. But reafour

and experience teach, many nervous parts, also the very membranes themselves being far removed from a flethy fubflance, being wounded admit cure; certainly much more the Perinneum, as that which adheres to firaitly to the muscles of the Abdomen, that the diffector cannot separate it from the flesh, but with much labour. But the reason which seems to argue the unprofitableness of Paracentefit is refelled by the authority of Celfus. I, faith he, am not ignorant that Erafifratus did not like Paracentefit; for he thought the Droptie to be a difeafe of the Liver; and so that it must be cured; and that the water was in vain let forth, which, the liver being viriated, might grow again. But first, this is not the fault of this bowel alone, and then although the water had his original from the liver, yet unless the water which stayeth there contrary to Nature be evacuated, it nurteth both the liver, and the reft of the inner parts, whilft it either increafeth their hardness, or at the least keepeth it hard, and yet notwithstanding it is fit the body be cured. And although the once letting forth of the humor profit nothing, yet it makes way for medicines, which while it was there contained, it hindered. But this ferous, falt, and corrupt humor is fo far from being able to mitigate a feaver and thirst, that on the contrary it increaseth them. And also it augmenteth the cold diffemper, whilft by its abundance it overwhelms and extinguisheth the native heat. But the authority of Celius Amerelianus that most noble Physician, though a Methodick, may satisfie Avien and Gordonius. They, faith he, which dare avouch that all fuch as have the water let out by opening their belly have died, do lie; for we have feen many recover by this kind of remedy: Ent if any died, it hapned either by the default of the flow or negligent administration of the Paracentesis. I will add this one thing which may take away all errour or controverse; we unwifely doubt of the remedy when the Patient is brought to that necessity, that we can only help him by that means, Now must we shew how the belly ought to be opened. If the Dropsie happen by fault of the liver, the section must be made on the left side; but if of the spleen, in the right; for if the Parieut The places of the apertion must be divers should lie upon the fide which is opened, the pain of the wound would continually trouble him, and the water running into that part where the fection is would continually drop, whence would follow a diffolution of the faculties. The fection must be made three fingers breadth below the navel, to wit, at the fide of the right mufcle, but not upon that which they call the Lines Alba; neither upon nervous parts of the rest of the muscles of the Epigastrium; that so we may prevent pain and disti-culty of hearing. Therefore we must have a care that the Patient lye upon his right side, if the Incifion be made in the left, or on the left, if in the right. Then the Chirurgion both with his own hand, as also with the hand of his servant affifting him, must take up the skin of the belly, with the fleshy pannicle lying under it, and separate them from the rest; then let him divide them so feparated with a fection even to the flesh lying under them; which being done, let him force as much as he can the divided skin upwards towards the flomach, that when the wound, which must prefently be made in the flesh lying there-under, shall be confolidated, the skin, by its falling therein, may ferve for that purpose; then therefore let him divide the musculous fleth and Peritoneum with a fmall wound, not hurting the kall or guts.

Then put into the wound a trunk, or golden, or filver crooked pipe, of the thickness of a Goofe-quill, and of the length of fome half a finger. Let that part of it which goes into the capacity of the belly have fomething a broad head, and that perforated with two fmall holes, by which a firing being fastened, it may be bound so about the body, that it cannot be moved, unless at the Chirur geons pleafure. Let a fpunge be put into the pipe, which may receive the dropping humon; and let it be taken out when you would evacuate the water; but let it not be poured out all together, but by little and little for fear of diffipation of the spirits, and resolution of the faculties, which I once faw happen to one fick of the Dropfie. He being impatient of the difease and cure thereof, thrust a Bodkin into his belly, and did much rejoyce at the pouring forth of the water, as if he had been freed from the humor and the disease, but died within a few hours, because the force of the water running forth, could by no means be staid, for the Incision was not artificially made. But it will not be suffi-cient to have made way for the humor by the means afore-mentioned, but also the external orifice of taking out the the pipe must bestopped and strengthened by double clothes, and a strong ligature, lest any of the water flow forth against our wills. But we must note, that the pipe is not to be drawn out of the wound, before as much water shall be issued forth as we defire, and the tumor requireths for once drawn forth, it cannot eafily be put in again, and without force and pain be fitted to the lips of the wound, because the skin and flethy pannicle cover it by their falling into the wound of the fleth or mufele. But whillt the water is in evacuation, we mult have a diligent care of feeding the Patient, as also of his strength; for if that fail, and he seem to be debilitated, the effusion of the water must be flayed for fome days, which at the length performed according to our defire, the wound must be

so consolidated that the Chirurgeon beware it degenerate not into a Fistula.

Of the tumor and relaxation of the Navel.

He Examphalas or fwelling of the navel, is caused by the Peritaneum, either relaxed or bros The divers ken; for by this occasion oft-times the guts, and oft-times the kall, fall into the feat of the causes thereof, navel, and fometimes superfluous flesh is there generated; otherwise, this tumor is as an Anurifus by too great a quantity of blood poured forth in that place: Otherwise by a flatulent Atterising by too great a quantity of blood poured forth in that place: Otherwise by a flatulent matter, and sometimes by a waterish humor. If the humor be occasioned by the kall, the part it Signs hereof self will retain his proper colour, that is, the colour of the skin s the tumor will be soft and almost occasioned by without pain, and which will recide without noise, either by the preffire of your singers, or of it self the kall, when the Patient lieth on his back; but tumor cassed by the guts, is more unequal, and when it is. By the guts. forced in by the preffure of your fingers, there is fuch a noise heard, as in the Entercete v but if the tumor proceed of superfluous flesh it will be harder and more stubborn, not easily retiring into the By Flesh. body, although the Patient lie upon his back, and you prefs it with your tingers.

The tumor is fofter which proceeds of wind, but which will not retire into the body, and founds By wind. under your nail like a taber. If the fwelling be caufed by a waterish humor, it hath all things by a waterish commen with the flatuous tumor, except that it is not so visible and without noise. If it be from hamor, effusion of blood, it is of a livid colour; but if the effused blood shall be arterial, then there are blood. the figns of an Aneurifus. Wherefore when the tumor is caused by the guts, kall, wind or a waterish humor, it is cured by Chyrurgery; but not if it proceed from a flethy excrefence or fuffusion of Which may blood. The tumor of the navel proceeding from the kall and guts, the Patient must be upon his Chirurgery, back to be cured; and then the kall and guts, must with your singers be forced into their due which not. place: Then the skin with which the tumor is circumscribed must be taken up with your singers. The cure by and then the kall and guts, must with your singers. and thruft through with a needle, drawing after it a double twined and firong thred; then it must be Chirurgery. fearified about the fides, that fo it may be the eafier agglutinated. Then must it be thrust through with a needle three or four times, according to the manner and condition of the diffention and tumor. And so twitch it strongly with a thred, that the skin which is so bound may at length fall off together with the ligature. But also you may cut off the skin so distended even to the ligature, and then cicatrize it, as shall be fit. A starulent tumor of the navel shall be cured with the same remedies, as we shall hereafter mention in the cure of a windy rupture, but the watery may be poured forth by making a finall incition. And the wound shall be kept open so long, untill all the water be drained forth.

CHAP. XIV.

Of the Tumors of the Groins and Cods called Hernix, that is, Ruptures.

He ancient Phylicians have made many kinds of Ruptures, yet indeed there are only three There are onto be called by that name, that is, the *Intefinalia*, or that of the guts; the *Zirbalia*, or lythree form that of the kall; and, that which is mixed of them both. The other kinds of Ruptures of Ruptures, have come into this order, rather by fimilitude, than any truth of the thing; for in them the gur

or kall do not forfake their places.

The Greeks have given to all these several names, both from the seat of the tumor, as also from The Greeks have given to all their leveral names, both from the leat of the tumor, as allo from their matter. For thus they have called an unperfect rupture which defeends not beyond the groins, Rubmorelle. During all down into the cods, Balboneele: but the complear which penetrates into the cod, if it be by Enterwelle and falling down of the gut, Enterwelle: if from the kall, Epipleele; if from them both together, they Epipleele, name it Enterwelle: but if the tumor proceed from a waterith humor, they term it Hydrocele; Bydrocele, if from wind, Physicele; if from both, Hydro-physicele; if a flethy excrefeence thall grow about the Physicele tellicke, or in the fubliance thereof, it is named Surcevelle. If the veins interwoven, and divariented Surcevelle, divers ways, thell he finds in the cod and reflicles, the tumor obtains the ways of a Codfole. But if Cirifolli. divers ways, shall be swoln in the cod and testicles, the tumor obtains the name of a Cirfofele. But if Cirfocule, the humors shall be swoln in the cod and testicles, the tumor obtains the name of a Carlogate. But if the humors shall be shut up or sent thither, the name is imposed upon the tumor, from the predominant humor, as we have noted in the beginning of our Tractate of Tumors. The causes are many, The causes are many, The causes as, all too violent motions, a firoke, a fall from a high place, vomiting, a cough, leaping, riding upon a trotting horse, the sounding of trumpets, or fackbats, the carrying or lifting up of a heavy borthen, racking, allo the too immoderate use of viscid and statutent means; for all such things may either relax or break the Peritaneous, as that which is a thin and extended membrane. The tigns of a The signs.

Reduced a reand tumor in the groin, which proffed is easily forced in. The tigns of an Essential Bubowcele are a round tumor in the groin, which preffed, is eafily forced in. The figns of an Entero-cele are a hard tumor in the cod, which forced, returneth back and departeth with a certain murmur and pain; but the tumor proceeding of the kall, is lax and feels foft like wool, and which is more difficultly forced in, than that which proceeds from the guts, but yet without murmuring and pain; for the fubfiance of the guts, feeing it is one, and continued to it felf, they do not only mutually fucceed each other, but by a certain confequence do, as in a dance, draw each other, fo to avoid di-flention, which in their membranous body cannot be without pain, by reason of their change of place from that which is natural into that against nature: None of all which can befal the kall decing it is a stupid body, and almost without sense, beavy, dull, and immoveable. The signs that the Peritonsthis a flupid body, and almost without terme, and a flury and cutting pains for when the Periodenters is broken, are the fudden increase of tumor, and a flury and cutting pains for when the Periodenters is only relaxed, the tumor growth by little and little, and to consequently with small pain; yet fuch pain returns fo often, as the tumor is renewed by the falling down of the gut, or kall-which happens not to the *Peritoneron* being broken: for the way being once open, and paffable to the falling body, the tumor is renewed without any differition, and fo without any pain to fpeak of.

The reft of the figure shall be handled in their places. Sometimes it happens that the guts and kall, do firmly adhere to the process of the Peritoneum, that they cannot be driven back into their proper seat. This stubborn adhesion happens by the intervention of the viscid matter, or by means of some exconiation caused by the rude hand of a Chirurgeon, in too violently forcing of the gut, or kall, into their place. But also, too long stuy of the gut in the cod, and the neglect of wearing a Truss, may give occasion to such adhesion. A perfect and inveterate Rupture by the breaking of the process of the Peritoneum in men of full growth, never, or very seldom admits of cure. But you must note, that by great Ruptures of the Peritoneum, the guts may fall into the cod, to the bigness of a mans head, without much pain and danger of life, because the excrements, as they may easily enter, by reason of the largeness of the place and Rupture, so also they may easily entern.

What Ropeure is uncureable,

C H A P. XV. Of the Cure of Ruptures.

To what Ruptures children are subject.

An aftringent Cataplaim.

Ser. 1. 6. 24.

The craft and covetouine is of Gelders,

Another way to cure Ruptures-

The reason of this cure.

Another me-

A notable Hi-

We must never despair in

difeafes, if so be Nature be affociated by Arr.

Ecause children are very subject to Ruptures, but those truly not fleshy or varicous, but watry, windy, and especially of the guts, by reason of continual and painful crying and coughing: Therefore in the first place we will treat of their cure. Wherefore the Chirurgeon, called to reflore the gut which is faln down, shall place the child, either on a table, or in a bed, so that his head shall be low, but his buttocks and thighs higher; then shall be force with his hands by little and little, and gently, the gut into the proper place; and shall foment the groin with the aftringent Fomentation, described in the falling down of the womb. Then let him apply this remedy: Re Preseript. decolionis quantum sufficit, farine bordei & fabarum, an. ξ i, pulver. Aloes, Matinber, Myrill. & Sarcoce. an. ξ β, Boli Armeni ξ ij. Let them be incorporated and made a Cataplasm according to art. For the same purpose he may apply Emplastrum contra. Empiuram: but the chief of the cure confilts in folded Clothes, and Truffes, and Ligatures artificially made, that the reflored gut may be contained in its place, for which purpose he shall keep the child seated in his cradle for thirty or forty days, as we mentioned before; and keep him from crying, thouting, and coughing; Actius bids, freep paper three days in water, and apply it made in a ball to the groin, the gut being first put up; for that remedy by three days adherion will keep it from falling down. But it will be, as I suppose, more effectual, if the paper be steeped not in common, but in the astringent water, described in the falling down of the womb. Truly I have healed many by the help of fuch remedies, and have delivered them from the hands of the Gelders, which are greedy of childrens tefficles, by reason of the great gain they receive from thence. They by a crasty cozenage, per-fwade the Parents, that the falling down of the gut into the cod, is uncurable: Which thing, notwithflanding experience convinceth to be falle, if so be the cure be performed according to the fore-mentioned manner, when the Peritoneum is only relaxed, and not broken: for the process thereof by which the gut doth fall as in a fleep way, in progrefs of time and age is firaitned and knit together, whilst also in the mean time the guts grow thicker. A certain Chirurgeon who deserveth credit, hath told me that he hath cured many children, as

thus, He beats a Loadftone into fine powder, and gives it in pap, and then he anoints with honey the groin, by which the gut came out, and then firewed it over with fine filings of Iron. He administred this kind of remedy for ten or twelve days: The part for other things being bound up of with a Ligature and Truss as was fitting. The efficacy of this remedy feemeth to consist in this is that the Loadftone by a natural defire of drawing the Iron which is firewed upon the groin, joyns to it the fleshy and fatty particles interposed between them, by a certain violent impetuoitry, which on every fide pressing and bending the loosness of the Perinneum, yea verily adjoyning themselves to it, in process of time by a firm adhesion intercept the passage and falling down of the gut or kalls which may feem no more abhorring from reason, than that we behold the Loadstone it self through the thickness of a table, to draw Iron after it any way. The same Chirurgeon affirmed, that he frequently and happily used the following medicine. He burnt into ashes in an oven red Snails, shut up in an earthen pos, and gave the powder of them to little children, in paps but to those which were bigger in broth.

But we must despair of nothing in this discase, for the cure may happily proceed in men of full growth, as of forty year old, who have filled the three dimensions of the body, as this following relation testifies.

There was a certain Priest in the Parish of St. Audrews, called John Mort, whose office was to sing an Epistle with a loud voice as often as the solemnity of the day, and the thing required. Wherefore seeing he was troubled with the Enterocale, he came to me, requiring help, saying, he was troubled with a grievous pain, especially then, when he stretched his voice in the Epistle. When I had seen the bigness of the Enterocale, I perswaded him to get another to serve in his place; so having, gotten leave of M. Curio, Clerk and Deacon of Divinity, he committed himfelf unto me: I handled him according unto art, and commanded him he should never go without a Truss; and he followed my directions. When I met him some five or fix years after, I asked him, How he did? he answered, Very well, for he was wholly freed from the disaste, with which he was sometry troubled; which I could not perswade my self of, before that I had found that he had told me the truth, by the diligent observation of his genitals. But some fix months after, he dying of a Picurisie, I came to Gario's house where he died, and defired leave to open his body, that I might observe whether Nature had done any thing at all in the passage through which the gut fell down: I call God to witness, that I found a certain fatty substance about the process of the Perimaneur about the bigness of a little Egg, and it did stick so hard to that place, that I could scarce pullit away without the rending of the neighbouring parts. And this was the speedy cause of

money m

his cure. But it is most worthy of observation and admiration, that Nature but a little helped by art, healeth difeafes which are thought incurable. The chief of the cure confifts in this, that we firmly flay the gut in its place, after the fame manner as these two Figures show.

The Figure of a man broken on one fide, wearing a Trus's whose Bolster must have three Tuberosities, two on the up per, and one on the looper part; and there must be a hollow-nels between them in the midd, that they may not to strait- Another Figure of a Man having a Rupture on both sides, by press the share-bone, and so cause pain. The manner of sorving by what means, with what hind of and what shoul-stream stress, I found out not long ago, and it seemed bet-ter and safer than the rest for to hinder the falling down of the gut and kall.

A Shewer the shoulder-hand which is tied before and behind A sheweth the shoulder-hand divided in the midst for the preto the girdle of the Trufs.

C The Cavity left in the midft of the Inherofities.

ting through of the head.

B The Trufs, with two Bolfiers, between which is a hole for putting through the yard. The form of both Bolfiers emph to be the Same with the farmer.

In the mean time we must not omit diet. We must forbid the use of all things, which may either relax, dilate, or break the process of the Peritsgenon, of which I have already treated sufficiently. Sometimes, but especially in old men, the guts cannot be reflored into their place, by reason of the quantity of the excrements hardned in them: In this case they must not be too violently forced, but the Patient must be kept in his bed; and, lying with his head low, and his knees higher he following Cataplasms be applied.

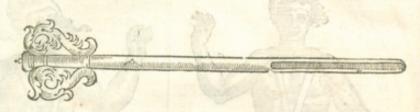

By End with & lift and \$\frac{7}{2}\$ is. Seminis lini & Semon, an. \$\frac{7}{2}\$ followable, the relationship to the patient must be the following Cataplasms be applied.

het the following Cataptains be applied.

Re Rad, alth. & lil. ans 3 ij. Seminis lini & fearge, an. 3 ß, fol. malve, & viol. pariet. an. m. ß. A Cataptain Let them be boiled in fair water, afterwards beaten, and drawn through a fearfe, adding there to folien the too finew Butter without Salt, and Oyl of Lilies as much as shall suffice. Make a Cataptain excrements in the form of a liquid Pultis. Let it be applied bot to the cod, and bottom of the belly; by the help of this remedy when it had been applied all night, the guts have not feldom been feen of themselves, without the hand of a Chirurgeon, to have returned into their proper when. themselves, without the hand of a Chirurgeon, to have returned into their proper place. The windiness being resolved, which hindered the going back of the excrements into another gur, whereby they might be evacuated and expelled. But if the excrements will not go back thus, the flatuleness. flatulencies, yet relating undiscussed, an emollient and carminative clyster is to be admitted, with a little Chymical Oyl of Turpentine, Dill, Juniper, or Fennil. Clysters of Muscadine, Oyl of Chymical oyl. Walnuts, and Aqua vita, and a small quantity of any the aforesaid Oyls, are good for the same

It often happens that the guts cannot yet be reflored, because the process of the Peritoneum is not wide enough. For when the excrements are fallen down with the gut into the cod; they grow hard by little and little, and increase by the access of flatulences caused by resolution, which cause such a tumor as cannot be put up through that hole, by which a little before it fell down: Whereby it happens that by putrefaction of the matter there contained, come inflammations, and a new access of pain; and lastly, a vomiting and evacuation of the excrements by the mouth, being hindered from the other passage of the fundament. They vulgarly call this affect Miscrement. That you may help this symptom, you must rather assay extreme remedies, than suffer the Patient to die by so filthy and loathsom a death. And we must cure it by Chirurgery, after this manner following. We will bind the Patient lying on his back, upon a table or bench; then presently make an Incision in the upper part of the cod, not touching the substance of the gut; then we must have a silver Cane or Pipe, of the thickness of a Goose-quil, round and gibbous in one part thereof, but somewhat hollowed in the other, as is shewed by this following Figure.

The Figure of the Pipe or Cane,

The Chirurgical cure by the Golden tie.

We must put it into the place of the Incision, and put it under the production of the Peritonanum being cut together with the cod, all the length of the production, that so with a sharp knise we
may divide the process of the Peritonaum, according to that cavity separated from the guts there
contained, by the benefit of the Cane in a right line not husting the guts. When you have made
an indifferent Incision, the guts must gently be put up into the belly with your singers, and then
so much of the cut Peritonaum must be sowed up, as shall seem sufficient, that by that passage made
more strait, nothing may fall into the cod after it is cicatrized.

But if there be fuch abundance of excrements hardned, either sby the flay or heat of inflammation, that that Incilion is not fufficient to force the excrements into their place, the Incilion must be made longer, your Cane being thrust up towards the belly: So that it may be fufficient sfor the free regress of the guts into the belly. Then flow it up as is fit, and the way will be fluit up againft the falling down of the gut or kall; the process of the Peritanean being made more strait, by reason of the sutures for the rest, the wound shall be cured according to Art. But before you undertake this work, consider diligently whether the strength of the Patient be sufficient, neither attempt any thing before you have foretold, and declared the danger to the Patients friends.

Of the Golden Ligature, or the Punchus Aureus, as they call it,

F the Rupture will not be cured by all these means, by reason of the great solution of the continuity of the relax'd or broken Periton Luon, and the Patient by the confent of his friends there present, is ready to undergo the danger in hope of recovery; the cure shall be attempted by that which they call the Punctus aureus, or Golden tie.

For which purpose a Chirurgeon which hath a skilful and fure hand, is to be imployed, He shall make an Incision about the share-bone, into which he shall thrust a Probe like to the Cane, a little before described; and thrust it long-ways under the process of the Perinaneum, and by listing it up, separate it from the adjoyning fibrous, and nervous bodies, to which it adheres; then presently draw aside the spermatick vessels, with the Cremaster, or hanging muscle of the testicle; which being done, he shall draw aside the process it self, alone by it self: And he shall take as much therefor as it too lax, with small and gentle mullets, personated in the midst, and shall with a needle, having five or fix threds, thrust it through as near as he can to the spermatick vessels, and Cremaster muscles. But the needle also must be drawn again in to midst of the remnant of the process, taking up with it the lips of the wound; then the thred must be tied on a strait knot, and so much thereof must be left after the Section, as may be sufficient to hang out of the wound. This thred will of it stere shall regenerate and restore shell into the place of the ligature, otherwise all our labour shall be spent in vain.

And laftly, Let the wound be cleanfed, filled with flesh, and cicatrized, whose callous hardness may withstand the falling of the gut or kall.

Another manner thereof,

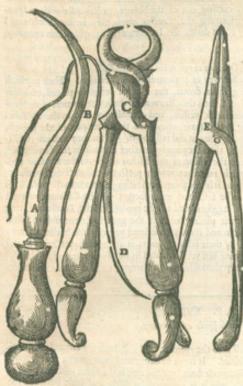

There are fome Chirurgeons who would perform this Golden Ligature after another manner. They cut the skin above the flare-bone where the falling down commonly is, even to the process of the Perioneeus, and they wrap once or twice about it, being uncovered, a finall Golden Wire, and only straiten the passage as much as may suffice to amend the loofness of this process, leaving the spermatick vessels at liberty; then they twist the ends of the wire twice or thrice with small mullets, and cut off the remnant thereof; that which remains after the cutting, they turn in,

mannonni

left with the fharpness they should prick the flesh growing upon it. Then leaving the Golda Wire there, they cure the wound like to other simple wounds, and they keep the Patient some fifteen or twenty days in his bed, with his knees something higher, and his head something lower.

Many are healed by this means ; others have fallen again into the difease by reason of the ill twist-

ing of the wire.

A Shears a crooked needle having an eye not far from the point, through which you may put the Golden Wire.

- B B The Golden Wire put through the eye of of the needle.
- C The Mullets or Pincers, to cut away the waste or superfluence ends of the wire.
- D The firing of the Mullets.
- E The Mullets to twist the ends of the wire together.

There is also another manner of this Golden tie, which I judge more quick and fafe, even for The shird that there is no external body left in that part after the cure. Wherefore they wrap a leaden wire manner there inflead of the golden, which comes but once about the process of the Peritonaum, then twine it as of much as need requires; that is, not too loofly, left it should leave way for the falling down of the body, neither too firaitly, left a Gangrene should come by hindering the passage of the spirits and nourishment. The ends thereof are suffered to hang out; when in the process of time, this contraction of the Peritoneum feems callous, then the wire is untwifted and gently drawn out. And the reft of the cure performed according to Art. But let not the Chirurgeon thrust himself upon A thing to be his work rashly, without the advice of the Physician, for it divers times comes to pass, that the te-noted flicles are not as yet fallen down into the cod by the too 'great fluggifhness of Nature, in some of a pretty growth; but remains long in the groins, caufing a tumor with pain, which thing may make a good Chirurgeon believe that it is an Eutercele. Therefore whilft he labours by repelling medicines and truffes to force back this tumor, he increafeth the pain, and hinders the falling down A History. of the tefficles into the cod. I observed this not long ago in a Boy, which an unskilful Chirurgion had long, and grievously troubled, as if he had a rupture: For when I had observed that there was but one stone in the cod, and knew the Boy was never gelt; I bid them cast away the Plaisters and Trusses, and wish'd his Parents that they should fusfer him to run and leap, that so the idling flone might be drawn into the cod, which thing by little and little, and without pain, had the event as I foretold.

That the reason of this affect may be understood, we must know that man disters from a woman, only in efficacy of heat; but it is the nature of firong heat to drive forth, as of cold to keep in. Hence it is that the flones in men hang forth in the cod, but in women they lie hid in the lower belly. Therefore it happens that in some males more cold by Nature, the testicles are shut up forme certain time, until at length they are forc'd down into the cod by youthful heat. But that we may return to our former Treatife of the Cod, although that way of curing Ruptures wants not pain and danger, yet is fafer than that which is performed by gelding, which by the cruelty there-of exposes the Patient to manifest danger of death. For the Gelders while they tear left when the cure is finished, the relaxation may remain, pull with violence the process of the Peritoneum from the parts to which it adheres, and together with it a nerve of the fixth conjugation which runs to the flones; they offer the fame violence to the spermatick vessels; by which things ensue great pain, convultion, efflux of blood, inflammation, putrefaction, and latily death, as I have observed in many whom I have diffected, having died a few days after their gelding. Although some escape these dangers, yet they are deprived of the faculty of generation for all their lite after ;

Lib. de arte medica.

Lib. de fem.

for performance whereof, Nature hath beliowed the reflicles, as pasts principally necessary for the conservation of mankind. Through which occasion Galon hath not teared to prefer them before the heart, because the heart is the beginning of life, but the testicles of a better life; for it is far more noble to live well, than simply and absolutely to live; therefore Eunuchs degenerate into a womanish nature; for they remain without beards, their voice is weak, their courage tails them, and they turn cowards; and seeing they are unsit for all human actions, their life cannot but be miserately. Wherefore I will never subscribe to the cutting out of the Stones, unless a Sarcoccie or Gangrene invade them, But that the way of performing the Puncius aureus may be better known, I have thought good (in the foregoing page) to set down the Instruments, by which this operation is performed, before your view.

Lib 3. cap.33.

Another more casse and safe way to restore the Gue and Kall.

Hodorick and Guido have invented another way of performing this operation. They put back into their places the gut and kall being sallen down, the Patient being so placed, that his thighs are high and his head is somewhat low; then they draw associate lower portion of the production of the Perinmeum, and also the spermatick vessels, and creinaster-masse to the Isomom; then by applying a causick sitted to the age and disease, they burn the other part of the process, directly perpendicular to the share-bone, where the gut did fall down. Then they pull off the Eschar thus made with a knife even to the quick, then they apply another causick in the same place, which may go even to the bone, then procure the falling of this Eschar made on the foresaid process. And atterwards they heal the Ulcer which remains; which presently contracting somewhat a thick Gallus, so keeps up the guts and kall, that it binds them from falling down into the cod. This way of restoring the gut and kall, though it be safer and more facile; yet the Chirurgeon must not attempt it, if the guts or kall stick so fast, agglutinated to the process of the Peritomeum, that they cannot be severed, nor put back into their places (for from the guts so barnt and violated, greater mischief would ensue) if by the broken and too much dilated process, the bodies thereby restrained, make an exceeding great tumor by their falling down; if the testicle yet lying in the groin as in a Bubuscele, a kind of Entercele being not yet descended in the Scotum, or cod, if the Patients be not come to such diage, as they can keep themselves from stirrings or hold their excrements while the operation is performed.

Of the cure of other kinds of Ruptures.

What a Hy-

The figns.

The Cure.

A medicine to draw forththe contained maner. Piplocele is the falling down of the kall into the groin or cod; it hath the fame causes as an Enterocele. The signs have been explained. It is not so dangerous, nor infers a consequence of so many evil symptoms, as the Enterocele doth, yet the cure is the same with the other. Hydrocele is a waterish tumor in the cod; which is gathered by little and little between the membranes encompassing the testicles, especially the Daries and Erysbroider; it may be called a particular Dropsie, for it proceeds from the same causes, but chiefly from the defect of native heat. The signs are a tumor encreasing slowly without much pain, heavy, and almost of a glassic clearness, which you may perceive by holding a candle on the other side; by pressing the cod above, the water shows down, and by pressing it below, it rises upwards, unless peradventure in too great a quantity it fills up the whole capacity of the cod, yet it can never be forced or put up into the belly as the kall or guts may, for oft-times it is contained in a cist or bag; it is distinguished from a Sarcacele, by the smoothness and equality thereof. The cure must first be tried with resolving, drying and discussing medicines, repeated often before, and in the Chapter of the Dropsie; this which follows I have often tried and with good faccess.

Re Ung. cominifie, & deficeate rube, an \$\frac{3}{2}\$ ij, malaxentur fimul, and make a medicine for your eafe. The water by this kind of remedy is digetted and refolved, or rather dried up, especially if it be yield to those remedies, there is need of Chirurgery; the cod and membranes wherein the water is contained, must be thrust through with a Seton, that is, with a large three-square pointed Needle, thred with a skean of Silk; you must thrust your Needle presently through the holes of must be left there, or removed twice or thrice a day, that the humor may drop down, and be evacuated by little and little. But if the pain be more vehement by reason of the Seton, and instammation come upon it, it must be taken away, and neglecting the proper cure of the disease, we must

Some Practitioners use not a Seton, but with a Razor, or Incision-knife, they open the lower part of the cod, making an Incition some half singers breadth long, penetrating even to the contained water; always leaving untouched the substance of the testicles and vessels, and they keep the wound open, until all the water seems evacuated; truly by this only way the cure of a watery suprure whose matter is contained in a cist, is safe, and to be expected; as we have said in our Treatise of Tumors in general.

The Presonatocele, is a flatulent tumor in the cod, generated by the imbecillity of heat residing

what a Para- The Para

The Cure.

It is known by the roundness, levity, renitency and shining. It is cured by prescribing a convenient diet, by the application of medicines which resolve and discuss statulencies, as the seeds of Annis, Fennel, Fennegreek, Agnus Castur, Rue, Origanum, and other things set down by Avien in his Treatise of Ruptures. I have often used, with good success for this purpose, Emplastram Viga-

manna m

uis cum Mercurio; and Emplastrum Discalcitheer, diffolved in some good Wine, as Muscadine with Oyl of Bays.

A Sarcocele is a Tumor against Nature, which is generated about the stones by a scirrhous sless. What a Sarcocome and assume that to it selfs whence this over-abundance of sless proceeds like as Warts do. Varices, or swoln The Signs. Veins often affociate this tumor; and it increases with pain. It is known by the hardness, asperity, inequality and roughness. It cannot be cured but by amputation, or cutting it away; but you must dilagently observe, that the sless be not grown too high, and have already seized upon the groin; for so nothing can be attempted without the danger of life.

But if any man think, that he in fuch a case may fornewhat ease the Patient by the cutting away of some portion of the same soft slick, he is deceived. For a Fangus will grow, if the least portion therefore but left, being an evil far worse than the sormer; but if the tumor be either small or indifferent, the Chirurgeon taking the whole tumor, that is, the testicle tumified through the whole substance, with the process incompassing it, and adhering thereto on every side, and make an incision in the cod, even to the tumor; then separate all the tumid body, that is, the testicle from the cod: Then let him thrust a needle with a strong thred in it, through the midst of the process, above the region of the swoln testicle; and then presently let him thrust it the second time through the same part of the process; then shall both the ends of the thred be tied on a knot, the other midstle portion of the Parioneum being comprehended in the same knot. This being done, he must cut away the whole part of the process with the testicle comprehended therein. But the ends of the thred, with which the upper part of the process was bound, must be suffered to hang some length out of the wound, or incition of the cod. Then a repercussive medicine shall be applied to the wound and the neighbouring parts with a convenient ligature. And the cure must be performed as we have formerly mentioned.

The Cirfocele is a tumor of veins dilated, and weven with a various and muroal implication about What a cirfothe tefficle and cod, and fwelling with a gross and melancholy blood. The causes are the same cute is.

To heal this tumor, you must make an Incision in the cod, the bredth of two singers to the Varia. Then put under the varicous vein, a needle having a double thred in it, as high as you can, that you may bind the roots thereof: Then let the needle be again put after the same manner about the lower part of the same vein, leaving the space of two singers between the ligatures. But before you bind the thred of this lowest ligature, the Varia must be opened in the midst, almost after the same manner as you open a vein in the arm to let blood: That so this gross blood causing a tumor shall be cured by the rules of Art after the manner of other wounds; leaving the threds in it, which part thereof, where the vein was bound, it must be cicatrized; for so afterwards blood cannot be strained or run that way.

Hernis Humaralis is a tumor generated by the confused mixture of many humors in the cod, or Humis Humabetween the tunicles which involve the testicles, often also in the proper substance of the testicles, ralis. It hath like causes, figns and cures as other tumors. While the cure is in hand, Rest, Trusses, and fit Rowlers to sustain and bear up the testicles, are to be used.

Of the falling down of the Fundament.

Hen the muscle called the Sphindler which ingirts the fundament is relaxed, then it The cases, comes to pass that it cannot sustain the right gut. This disease is very frequent to chilmassic muscle mollished and relaxethit, or president it down by an unaccustomed weight, so that the muscles called Levatores Ani, or the listers up of the fundament, are not sufficient to bear up any ments, the Hemorrhoids, which suppressed do over-load the right gut, but slowing relax it: Gold, sain those which go without breeches in Winter, or sit a long time upon a cold stone, a stroke or up of the sundament; the weight of nerves which go from the Holy-bone to the muscles the listers up of the sundament: the weight of the stone being in the bladder.

up of the fundament: the weight of the flone being in the bladder.

That this difeafe may be healed, we must forbid the Patient too much drinking, too often eating of Broth, and from feeding on cold Fruits. For local medicines the part must be fomented with
an aftringent decochion made of the rinds of Pomegranats, Galls, Myrtles, Knotgrafs, Shepherdspurfe, Cyprefs Nuts, Alam, and common Salt boiled in Smiths-water, or Red-wine. After the
Fomentation, let the gut be anointed with Oyl of Rofes or Myrtles, and then let it be gently put by
little and little into its place, charging the child, if he can understand your meaning, to hold his
breath. When the gut shall be restored, the part must be diligently wiped, left the gut fall down again
by reason of the slipperiness of the unction. Then let the powder prescribed for the falling down
of the Womb be put into the fundament as far as you can: Then you must straitly bind the loins
with a swathe, to the midst whereof behind let another be fastned which may be tied at the Pater
soming along the Perismenum, so to hold up the sundament the better to contain it in its place, a
span ged put in the attringent decoction. The Patient, if he be of sufficient age to have care of himassigned, left by his straining he thrust forth the gut together with the excrement; but if he can do

Benefit shall be wished when he goes to flool, that he sit upon two pieces of wood being set some inch
it standing, he shall never by straining thrust forth the gut.

But if the gut cannot by the prefcribed means be reflored to its place, Hippocrates bids that Rippocrates his the cure,

the Patient hanging by the heels be flaken; for fo the gut by that flaking will return to his place: But the fame Hippocrates wisheth to anoint the fundament, because that remedy having a drying faculty, hath allo power to resolve the flatulent humors without any acrimony, by reason of which the gut was the lefs able to be contained in his place.

CHAP. XIX. Of the Parenychia.

What the Pavanychie is-

Lin. cap. 4.

track.

He Paranychia or Panaria is a tumor in the ends of the fingers, with great inflammation, coming of a malign and venemous humor, which from the bones by the Perioftean is comcoming of a malign and venemous numer, which from the bones by the Periodicion is communicated to the tendons and nerves of that part which it affecteth, whereof cruel fymptoms do follow, as pullifick pain, a Feaver, refilefinels, so that the affected through impatiency of the pain are variously agitated like those termented with Carbuneles: For which cause Guido and Johannes de Vigo judge this disease to be mortal; wherefore you must provide a skilful Phylician for the cure of this disease, which may appoint convenient diet, purging and blood-letting. In the mean time the Chirurgeon shall make way for the virulent and venenate matter, by making incidion in the inner part of the singer, even to the bone alongst the first joynt thereof; for Vigo sith, there is not a presenter remedy, if so be that it be quickly done, and before the convenient of the source. faith, there is not a prelenter remedy, if so be that it be quickly done, and before the mutaration of the matter; for it vindicates the finger from the corruption of the bone and nerves, and affwages pain, which I have often and happily tried immediately at the beginning, before the perfect impreffion of the virulency.

But the wound being made, you must fuffer it to bleed well, then prefently let him dip his finger in firong and warm Vinegar, in which some Treacle being dissolved may draw forth the virulency. But to appeale the pain, the same remedies must be applied to the affected part as are used in Carbuncles, as the leaves of Sorrel, Henbane, Hemlock, Mandrake roasted under the Embers, and beating the same of ten in a Mortar with new Unguentum Populeon, or Oyl of Roses, or new Butter without Salt: For fuch like medicines also help forward suppuration; whilst by their coldness, they repress the extra-neous heat affecting the part; and so strengthen the native heat, being the author of suppuration: Which reason moved the ancient Physicians to use such medicines in a Carbuncle; but it by reason of the fearfulness of the Patient, or unskillulness of the Chirurgeon, no incision be made, a Gangrene and Sphacel shall possess the part, it remains that you cut off with your cutting Mullets as much of the part as shall be corrupt, and perform the rest of the cure according to Art. Yet it doth not seldom happen, that there may be no need to cut off such a singer, because it being corrupted together with the bone by little and little, dissolves into a purulent, or rather sanious or much slinking filth. But in this affect there is often caufed an Elchar by the adultion of putredinous heat, and superfluous fielh indued with most exquisite sense groweth underneath it, which must in like manner be cut off with the Mullets, that the part may receive comfort, the pain being affwaged by the copious effulion of blood.

CHAP. XX. Of the fivelling of the Kneer.

Gel. com. ad fent. 1. fer. 4. Liv. 6. Epid. fest, 67. foll.2. prog.

The Cure.

Fter long and dangerous difeafes there oftentimes arife tumors in the knees, and also in Plethorick bodies, and fuch as have evil juyce after labours and exercise. This kind of disease is frequent, because the humor easily falls into the part which hath been heated by labour. But if such tumor follow long diseases, they are dangerous and difficult to cure, and therefore not to be neglected; for bitter pain accompanieth them, because the humor falling thither, diffends the membranes, which being many, involve the part; besides that, this humor participateth of a certain virulent and malign quality, whether it be cold or hot, when it hath fettled into those parts, being such as we find in the pains of the joynts, and in the bitings of venemous Creatures.

For the cure, if the tumor be caused by blood, let a stender and refrigerating dier be appoint-

ed, and Phlebotomy for the revullion of the antecedent cause; divers local medicines shall be used, according to the variety of the four times. But for to affwage the pain, Anadynes, or mitigating medicines shall be appointed: Of all which we have sufficiently treated in the Chapter of the cure of

a Phlegmon.

And because these parts are of exact sense, if there be necessity to open the tumor, yet must we had because these parts are of exact sense, if there is necessary to open the tumor, yet must we

not do it rashly, or unconsiderately, for fear of pain and evil accidents. This kind of tumor is oft-times raifed by wind contained there; in which cafe the Chirurgeon must be very provident, that he be not deceived with the shew of flowing of the humor, which he feems to perceive by the preffures of his fingers, as if there were matter and humor contained therein, and so be brought to open the tumor. For the wind breaking forth instead of the humor, causeth evil symptoms by reason of the Section rashly made in a part so sensible.

But if waterish humors shall tumefie the part, the body shall first be purged with medicines purging slegm: And then inciding, attenuating, rarifying, discussing, and very drying local medicines shall be used.

Of which we have abundantly spoken in the Chapter of the Oedona. Yet this humor divers times lies deep between the whirl-bone and the joynt, which caufeth it that it cannot be discussed and resolved by reason of the weakness of the part, and detect of heat, so that the adventitious harmor often moves and excludes the bones from their seat. As I have observed it to have happened

In which case, Irrigations of red Wine, falling fomething high whereby the force of the Medi-cine may enter and more easily penetrate, are much commended.

CHAP. XXI. Of the Dracunculus.

Cannot chase but explain in this place those things which may be spoken of that kind of tutris not as yet
mor against Nature, which by the Ancients is called *Draeunculus*. The matter and reason of these
stath been variously handled by divers Authors, so that hitherto we have nothing written of
them, to which we may by right and with good reason adhere as a sirm soundation of their effence.

For the Secretary opinion, Like the Lee affelt can 2. The generation sixth has contained.

For first, for Galea's opinion, Lib. 6. de Loc. affell. cap. 3. The generation, faith he, of those hairs which are evacuated by the urin is worthy no less admiration than the Dracuncusti, which, as they which are certain place of Arabia breed in the legs of men, being of a nervous nature, and like Worms in colour and thickness.

Therefore feeing I have heard many who have faid they have feen them, but I my felf never faw Lib. 4. esp. siz.

Therefore feeing I have heard many who have faid they have feen them, but I my felf never faw Lib. 4. esp. siz.

Paulus Ægineta writes, that the Draeuweuli are bred in India, and the higher parts of Egypt, like

Worms in the mufculous parts of mans body, that is, the arms, thighs and legs, and also creep by the intercottal mufcles in children with a manifest motion.

But whether they be creatures indeed, or only have the shape of creatures, they must be cured The cure out with a hot fementation, by which the Dracunculus raised to a just tumor, may put forth it felf, and of Agina. be pluck'd away piece-meal with the fingers: Alfo suppurating Cataplasins may be applied, composed of Water, Honey, Wheat and Barley-meal.

Avien being various, having no certainty whereon to reft, inclineth one while to this, and another while to that opinion: For now he speaketh of the Dracunculi, as of creatures, then present ly of a matter and humor thut up in a certain place; for the reft, he rightly delivers the cure and effence of this disease, as we shall afterwards shew.

effence of this difeafe, as we shall atterwards show.

Action faith, the Dracunculi are like Worms, and that they are found sometimes great, sometimes csp. 11, 116, 4, finall, and that their generation is not unlike to that of flat Worms, which are bred in the guts, for some integer for the skin, without any trouble, but in process of time, the place becomes suppurate about the end of the Dracunculus. The skin openeth, and the head thereof is thrust forth.

But if the Dracunculus be pulled, it causes greet; especially, if it be broken by too violent pulling. For that which is left causest most vehement pain. Wherefore that the creature may not run back, the arm must be bound with a strong thred, and this must be done every day, that the Dracunculus going forward by little and little, may be intercepted by this binding, but not that the Draeuwculus going forward by little and little, may be intercepted by this binding, but not

The place must be bathed with Aqua mulfa, and oyl in which Wormwood or Southernwood hath The cure our been boyled, or some other of those medicines which are prescribed for the Worms of the belly.

But if the Dracuneulus going forward of its one accord, may be callly drawn forth, we must do nothing elfe: But if it be turned to suppuration, we must not leave off the Caraplasms, the Aqua musts, and anointing with oyl: It was usual with him after the taking away of the Caraplasms, to apply Emplafrum è Baccis Lauri: But when it is come to suppuration, the skin must be opened longways, and the Dracunculus so laid open must be taken away, but the skin must be filled with lint, and the rest of the suppurative cure used, so that the creature being suppurated and drawn forth,

Rhafis writeth, that when the part is lifted up into a bliffer, and the vein halineth its egrefs, it is wallet 7.6.34 good for the Patient to drink the first day half a dram of Aloes, the next day a whole dram, the The cure of third day two drams; and in like manner the place affected must be fomented with Aloes, for fo of Rossis, that which lies hid will break forth: That which shall come forth must be rolled in a pipe of Lead, which may equal the weight of a dram, fo that it may hang down, for the vein drawn by the weight will come more forth; and when that which shall come forth is grown much and long, it must be cut off, but not by the root, but fo that a portion thereof may remain and hang forth, to which the leaden Pipe may be faftened, for otherwise it would withdraw its felf into its skin and its larking.

Therefore we much construct with this life of the large by little and little.

Therefore we must gently meet with this difease, and the vein must be drawn by little and little out of the Body, until it be all come forth, that no worse thing happen: But if by chance it shall happen that as much of the vein as shall be come forth shall be cut off by the roots, then the Ulcer must be opened long-ways with an incision-knife, and that so that whatsoever remains thereof may be wholly taken away. Then for some days the part must be anointed with butter until whatsoever of such a substance adheres, being consumed with putrefaction shall show away. Then the Ulcer must be cured with farcotick things.

therefore Rhafis thus in the fame Text expresses as if he means to divers names, and armed Hisopinion of with Iron and Lead, he comes to the cure thereof, as if he meant to encounter with forne fierce there

Soramus the Physician, who lived in the times of Galen, was of a quite contrary opinion, as Paulus' Saramas his Eginesa in the place being before cited, relates of him; as who denies the Dractaneulus to be a opinion. living-creature, but only a condensation of a certain small nerve, which seems both to the Physici-

Wherefore Soranus feems to have come nearer the truth than the reft, but yet not fo, as throughly to understand, and know the Essence of this Disease, as we shall demonstrate here-

Manardus writes, that the Draeuneuli are generated of evil and unlaudable blood, grofs, hot, #91/2. 2. Lib. 7. and melancholick; or of adult phlegm very much dried.

Gorress a most learned Physician of our time, Lib. de Definitionib. medic. denies any of our Phyficians to be able to fay any thing of the Draemeuli, because it is a disease so unfrequent in these our Regions, that it is scarce ever met withal in practice.

The Author of the Introduction, and Medicinal Definitions, defines the Dracunculus to be a difcase very like the Varices; then causing great pain, when increasing by little and little, it begins to be moved: Therefore to be cured after the fame manner, and by the fame method of Section and Incition, as the Varices are. Which thing feems chiefly to have moved Guido to refer this kind of difease to the Variees in his Tractate of Imposshumes, because it hath the same cause, and is heal-

ed with the fame remedy as the Varices.

But feeing that divers names have been imposed upon this difease by several Writers, yet they have all expressed it by the name of a Vein, for it is called by Avien and Guido, Vena Meden, because it is a discase frequent in the City Medina: by Albuerasis, Vena Civilis. Haliabas hath called it Vena Famofa; others have called it Vena Cruris, or the Leg-vein. Truly, the contrariety of formany epinions repugnant not only amongst themselves, but also with themselves, easily argueth how little certainty they had of the effence of this difeafe, who have written of it unto us: To which also this may be added, that none of the later Phylicians have written any thing thereof. For although Jacobas Da Iechampiass, a man most conversant in every part of Physick, hath written much of this matter in his Book of the French Surgery which he fet forth some years ago: Yet he hath left us no ampler testimony of his industry, than that he was very diligent in collecting the writings of the Ancients concerning

this thing, interpoling no judgment of his own, the better to affure us of a thing so controverted.

But my modelly cannot so contain me, but that I shall chuse rather to undergo the censure of being thought too daring, than (as much as in me lieth) to fuffer this question of the Dracunculi, to remain longer ambiguous and undecided. Therefore for the prefent, I will thus order it, that refuting the opinions of the Ancients, I may strengthen by certain reasons, my opinion of the effence

and cure of this difeafe.

Attias opinion Traff.3. ferm.4. 117-40

4 Matemalog.

Natural Me-Iancholick humors is most

unapt to pu-trefie.

trefaction.

Stink, an unfeparable companion to pu-

For first, that Dracunculi are no living things, nor like unto Worms, nor of like generation as the flat Worms of the belly, which was the opinion of Actius, is easie to disprove both by his Writings, as also by Reason it felf. For he writes, that the broad Worm which he calls Tania, is, as it were, a certain Metamorphofix, or Transmutation, of the inner tunicle of the small guts into a quick living and moveable body.

But no man ever faid, neither will he confels that the Draemenli hath the material causes of their beginning from the tunicle of the vein, in which they are closed, or from the fibers of a nervous body, to which often they are adjoyned; but much less from the skin under which they lie, may

they draw the material causes of their original.

Moreover, neither can there be any generation of Worms, nor of any other living Creatures whatfoever, who have their original from putrefaction, unless by the corruption of some matter, of whose better and more benign part, Nature by the force of the vital heat, produceth some animate body, as Arifolde teacheth. Wherefore to produce this effect, it is fit the matter should have fuch a disposition to putrefaction as is required for the generation of such a creature as they would make the Draeuweilus to be: It is fit the helping causes should concur as affishant to the principals in the action. And it is meet the place should be opportune or fit.

But there may be many causes found which may give life to the Descurrent; for by the common confent of all those who have written of them, their generation proceeds from an humor melan-cholick, terrefirial and gross, which by its qualities both by the first coldness and driness, as also by the second, that is Acidity, is not only thought most unfit of all others for putrefaction, but also is is judged to reful putrefaction, as that which is caused by heat and superfluous humidity. Besides, if the material cause of this disease should be from a humor putrefying and turning by putrefaction into some living creature, it was fit there should be stench also, as being an unseparable accident of putrefaction; for thus, the excrements in the guts of which the Worms are generated, do

fmell or ftink.

Therefore that which exhales from their bodies who are troubled with the Dracunculi, should be ftinking, as it happens to those fick of the Pthiriafis or Lowfie-cvil. But none of those who have delivered the accidents or fymptoms of the Draeunculi are found to have made mention hereof; but of the efficient cause whereby so great heat may be raised in the places next under the skin, by the efficacy whereof fuch a creature may be formed of a matter melancholick and most unapt to putrefie, as they make the Draeuneulus to be, who feign our bodies to be fruitful Montiers; especially feeing the furface of the body is continually ventilated by the fmall arteries forcad under the skin, as also by the benefit of infentible Transpiration, and breathed with the coolness of the air incompassing us. But now the material and efficient causes being defective, or certainly very weak, for the generation of fo laborious an effect; what coadjutory caufe can yield affifiance? Can the humidity of meats; for those bodies which are fed with warm and moiting meats, as Milk, Cheefe, Summer-fruits, ufually breed Worms, as we are taught by experience in

What things usually breed worms.

But on the contrary Aviers in the place before cited writeth, that meats of a hot and dry temper chiefly breed this kind of difeafe, and that it is not fo frequent to moift bodies, and fuch as are accufromed to the Bath, moift meats and Wine moderately taken. But whether may the condition of the air of the Bath, moift meats and Wine moderately taken. the air of thole Regions in which it is, as it were, an Endemial difeate, confer any thing to the generation of such creatures? Certainly, for this purpose in a cloudy, warm and thick air, such as useful to be at the beginning of the Spring when all the places resound with Frogs, Toads, and the maniovam.

But on the contrary, Jacobus Daleebampius by the opinion of all the Physicians that have written cap. 83. Chir. of the Dracunculi, writes, that this difease breeds in the dry and Sun-burnt Regions of India and Gallie.

Arabia; but if at the least that part of our body which is next under the skin should have any opportunity to ingender and nourish such creatures, they may be judged to have written that the on in that place, nor capacity for the neurithment of such like creatures as in the guts, if that Region of the body be breathed upon with no warmness and smothering heat, if it be defiled with none of those gross excrements, as the guts usually are, but only by the subtiller exhalation, which have an ease and insensible transpiration by the pores of the skin, which may seem to be a just cause of monitrons and prodigious an effect: But we shall little profit with these engines of reason unless we cast down at once all the Bulwarks, with which this old opinion of the Dracunguli may standard and be defended.

For first they say, Why have the ancients expressed this kind of disease by the name of a living thing, that is, of a Dracmenta or little Serpent? I answer, because in Phytick, names are often imposed upon diseases rather by similated than from the truth of the thing; for the confirmation whereof, the examples of three difeafes may fuffice, that of the Caneer, Polypus, and Elephus. For whereof, the examples of three difeates may futhce, that of the Caneer, Polypus, and Elephan. For these have those names, not because any Crab, Polypus, or living Elephant may breed in the body by such like Diseases, but because this by its propagation into the adjacent parts represents the feet and claws of a Crab; the other represents the slesh of the Sea-Polypus in its substance; and the third, because such as have the Leproise, have their skin wrinkled, rough, and horrid with scales and knots, as the skin of a living Elephant. So truly, this disease of which we now enquire seems by why they are good right to have deserved the name Dracusculus, because in its whole conformation, colour, quadilled Dracusculus, and production into length and thickness it expresses the image of a Serpent. But, whence, sakealis. lity and production into length and thickness it expresses the image of a Serpent. But, whence, sateals. will they fay, (if it be without life) is that manifest motion in the matter? We reply, that the humor, the cause of this disease is subtil and hot, and so runs with violence into the part whence it may feem to move. But when the Draenneuli are separated, why do they put their heads, as it were, out of their holes? We answer, In this the Ancients have been very much deceived; because after the Suppuration, the Ulcerbeing opened, fome nervous body being laid bare, thrust forth and subjected it felf to the fight, which by the convultive and shaking motion, might express the crooked creeping of a Scrpent. But they will fay, pain happens not unless to things indued with sense and life, but this *Draemensus* when he is drawn too violently, especially if he be broken, thereby will cause extreme pain: We do answer, that the conclusion doth not follow, and is of no consequence; for these pains happen not, unless when the unprovident Surgion draws or pulls instead of the Dra-cusculus some nervous or membranous body (woln and repleat with adult humor, whence there cannot but be great pain, that part being pull'd which is the author of fense. But it is childish, to fay that the Dracmoulus feels, for that it caufeth sharp pains to the living body in which it is.

Therefore that at last we may determine fornething of the nature, effence, and generation of these Pracunculi, I dare boldly affirm, it is nothing elfe but a tumor and abfeefs bred from the heat of the blood in a venenate kind. Such blood driven by the expulsive faculty through the veins to the external parts, especially the limits, that is, the arms and legs, canfeth a tumor round and long often firetched from the joynt of the flouider even to the wrift, or from the groin even to one of the ankles with tension, hear, renitency, pricking pain, and a seaver. But this tumor is some while stretchforth strait, otherwhites into oblique and crooked tumors, which bath been the cause that many,
taken with this kind of disease, and having their limbs so insolded as with the twinings of a Servery. There she would be some the course the servery that the street she with the twinings of a Servery. pent, would fay, they had a Serpent. I have thus much to fay of the Dracunculi, especially of those

For the cure, it is not unlike to the cure of a Phlegmon arising from a Defluxion; for here also in The Cure: like manner the remedies must be varied according to the four times of the disease, and the same rule of diet, Phlebotomy and purging must be observed, which is before prescribed in the cure of

The mention of the Drseusenli calls to my memory another kind of Abscels, altogether as rate. So the Malan and pricks their back like thorns. They toss up and down being not able to take any reft. This displaying fease ariseth from small hairs which are fearer of a pins length, but those thick and strong. It is the cured with a sometiment of water more than warm, after which you must presently apply an oyntment made of hony and wheaten flower; for so these hairs lying under the skin are allured and drawn forth; and being thus drawn, they must be plucked out with small mullets. I imagine this kind of disease was not known to the ancient Physicians.

The end of the Eighth Book.

BOOK IX.

Of Wounds in general.

CHAP. I.

What a Wound is, what the kinds and differences thereof are, and from whence they may be drawn or

What a wound properly is.

Divers appel-lations of wounds ac cording to the the parts.

Wound is a folittion of Continuity, caufed by a firoke, fall, or bite, newly done, bloody, and with putrefaction and filth. They also call it a new simple Ulcer; for the solution of Continuity happens to all parts of the body; but according to the diversity of parts, it hath divers names amongst the Greeks. For in the sleth it is called Heless, in the bone Gatagma, in the nerve Spafma, in the ligament Thalafma, in the wellels Apopaima, in the mufcles Regma, and that folution of Continua-

ty, which happens in the veffels, their mouths being open, is termed Anglomofis; that which happens by erotion, Aneurofis; that which is generated by fweating out and transcolation, Diapeteless. That these may be the more easily understood, I have thought good to describe them in the following Table.

A Table of the differences of Wounds.

Either foft, as & Glandules, Flift, Fat, Mar-Or bard , as \ A Bone A Griftle. Eisber fimi-lar, and shefe Of a middle Membranes , Liconfistence, as gaments, Fibers, the Veffels, Nerves, Veins, Arseries.

(Brain, Hears, From the nature of the parts in which they are made or happen. Liver, to which some add the But these parts are Womb and Te-(Hicles. Or Organi-The Weafon, Or ferving cal, and thefe Lungs, Gullet, Stomach, Guts, the principal Leither Bladder. (The Ears, Nofe, Or neither, as Feet, Hands, and other of the Same The Differences of Wounds are drawn When there is no complication of any other disease or symptom, be-sider. or taken, Simple wounds From their proper effence, from When there is a complication of whence they are called, Some one or more diseases, which Sunless they be taken away, we must not hope for to cure the wound. From their quantity according Screet, Indifferent, Little, to which they are called, Short, Narrow, Superficiary. From their Figure, according to Soblique, which they are named, Cornered.

CHAP, IL. Of the causes of Wounds.

Divers denominations? from their canfes.

LL things which may outwardly affail the body with force and violence, may be counted

the causes of wounds; which are called green, and properly bloody. These things are either animate, or inanimate, as the bitings and prickings of Beass. The inanimate, as the firoke of an Arrow, Sword, Club, Gun, Stone, a Dagger, and all such like things.

From the variety of such like causes, they have divers names: For those which are made by sharp and pricking things are called Punctures: Those caused by cutting things, are called Wounds or Gashes; and those which are made by heavy and obtuse things are named Gontusions, or wounds with contusions. with contulions.

CHAP.

PERSONAL PROPERTY.

CHAP. III.

Of the Signs of Wounds.

Ounds are first known by fight, and by the figns drawn from thence. The Chirurgeon A caution for ought first and chiefly to confider, what wounds are curable, and what not, what wounds making reports of will fearce admit of cure, and what may be eafily cured; for it is not the part of a prudent Wounds. Chirurgeon, to promife cure in a deadly or dangerous and difficult wound; left he may feern to have Chirurgeon, to promile cure in a deady of daugerous and dancent wound; lett ne may recr killed him, whom not the unfufficiency of the Art, but the greatness of the wound hath flain.

But when the Wound is dangerous, but yet without delipair of recovery, it belongs to him to admonifie the Patients friends which are by, of the prefent danger, and doubtful flate of the Wound, that if Art thall be overcome by the greatness thereof, he shall not be thought ignorant of the Art,

But as this is the part and duty of a good and prodent Chirurgeon, fo it is the trick of a cheating. A jugling the as this is the part and duty of a good and prodent Chirurgeon, fo it is the trick of a cheating. A jugling the state of the part of and jugling Knave, to enlarge finall wounds, that fo he may feem to have done a great cure, when it rangeson.

But it is agreeable to reason, that the Chirurgeon professing the Disease easie to be cured, will think himself in credit bound by such promises and his duty, and therefore seek all means for the quick recovery of the Patient; left that which was of its own nature small, may by his negligence become

the restriction of the faith) is three ways to be known; The first is by the magnitude and principality Lib4. Mark. of the part affected; for thus the wounds of the Brain, Heart, and of the greater Veffels, though imall cape.

of themselves, yet are thought great. Then from the greatness of the solution of cootinuity.

Wounds are for which cause Wounds may be judged great, in which much of the substance of the part is lost in our of three every dimension, though the part be one of those which are accounted service. Then from the marrespects. lignity; through which occasion the Wounds of the joints are accounted great, because for the most

CHAP. IV.

Of Prognosticks to be made in Wounds.

Hole Wounds are thought dangerous, wherein any large Nerve, Vein, or Artery are hurr. What wounds or arterious bloud, whence the powers are debilitated; also these are judged evil, which are upon the Arm-pits, Groins, Legs, Joints, and between the Fingers; and likewife those which hurt upon the Arm-pits, Groins, Legs, Joints, and between the Fingers; and incovare under which start, the head or tail of a Mufcle. They are leaft dangerous of all other which wound onely the flethy flub-thance. But they are deadly which are inflicted upon the Bladder, Brain, Heart, Liver, Lungs, Stornach, dangerous, Local Course, Brain, Grove Bosse, Crifle, Normal or portion of the Cheek, or Prepace, thall be cut. and fmall Guts. But if any Bone, Grifle, Nerve, or portion of the Cheek, or Prepuce, thalf be cut What away, they cannot be reftored. Contuied wounds are more difficult to cure than those which are Line. from a fimple foliation of continuity; for before you must think to heal them up, you must suppurate Why round and cleanse them, which cannot be done in a short time. Wounds which are round and circular are so Wounds are difficult to much the worfe, for there can be no unity unlefs by an angle, that is, a meeting together of two lines, which can have no place in round Wounds, because a circular figure confirs of one oblique line. Be-fides, Wounds are by so much thought the greater, by how much their extreams and lips are the fur-ther disjoined, which happens to round Wounds. Contrary to these are cornered Wounds, or such

Wounds may be more easily healed in young men than in old, because in them Nature is more vigorous, and there is a greater plenty of fruitful, or good bloud, by which the loss of the flesh may be smaller in quantity and more readily restored, which is slowlier done in old bodies, by reason their bloud is smaller in quantity and more about the strength of parties more benefit.

finaller in quantity and more dry, and the firength of nature more languid.

Wounds received in the Spring, are not altogether fo difficult to heal as those taken in Winter or Hipp. lib. de not altogether. For all excess of heat and cold is hartful to them, it is ill for a Convultion to happen upon car. Hipp. eph. a Wound, for it is a light that some Nervous body is hurt; the Brain suffering together therewith, as 66-dib. 5.

the force of nature is able to expel that which is hartful, and to ease the wounded part. The organical parts wholly curoff, cannot again be united: because a vital part once severed and plucked the force of nature is able to expel that which is harmful, and to cafe the wounded part. The organical parts wholly cut off, cannot again be united: because a vital part once severed and plucked from the trunk of the body, cannot any more receive influence from the heart as from a root without which there can be no life. The loofed continuity of the Nerves, Veins, Arteries, and also the Bones, is sometimes restored, not truly, and, as they say, according to the first intention, but by the second, that is, by reposition of the like, but not of the same substance. The first intention takes place in the the second, in the spermatick in which the lost substance may be repaired by interposition of some heterogeneous body, which Nature, diligent for its own preservation, substitutes in place of that which is lost; for thus the body, which restores and agglutinates, is no Bone but a Callur, whose original is terogeneous body, which reftores and agglutinates, is no Bone but a Calliar, whose original it proceeds matter is from an humour formewhat groffer than that, from whence the Bones have their original

This humour, when it shall come to the place of the fracture, agglutinateth the ends of the Bones This humour, when it man could never be forknit by reason of their hardness. The Bones of Children are more early and speedily united by reason of the pliantness of their fost and tender find-contemptible france. Laftly, We must here admonish the Chirurgeon that finall Wounds, and such as no Arti-wounds often fan will judge deadly, do divers times kill by reason of a certain occult and ill disposition of the prove moral.

Aphr.1.Sell.1. wounded, and encompassing bodies; for which cause we read it observed by Hippocrates, that it is not sufficient for the Physician to perform his duty, but also external things must be rightly prepared and fitted.

CHAP. V.

Of the Cure of Wounds in general:

The general Indication of Wounds.

Five things

necessary for

weining Weards,

He Chirurgeon ought for the right cure of Wounds to propose unto himself the common and general indication: that is, the uniting of the divided parts, which indication in such a case is thought upon and known even by the vulgar: for that which is disjoined desires to be united, because Union is contrary to Division. But by what means such Union may be procured, is onely known to the skilful Artisan. Therefore we attain unto this chief and principal Indication by the benefit of Nature as it were the chief Agent, and the work of the Chirurgeon as the servent of Nature. And unless Nature shall be firong, the Chirurgeon shall never attain to his conceived and wished for end: therefore that he may attain hereto, he must personn five things; the first is, that if there be any strange body, as pieces of Wood, Iron, Bones, bruised Flesh, congealed Bloud, or the like, whether they have come from without, or from within the Body, and shall be by accident fastned or stuck in the Wound, he must take them away, for otherwise there is no Union to be expected.

Another is, that he join together the lips of the Wound, for they cannot otherwise be agglutinated and united. The third is, that he keep close together the joined lips. The fourth, that he preserve the temper of the wounded parts for the distemper remaining, it is impossible to referre it to its unity. The fifth is, that he correct the accidents, if any shall happen, because these urging, the Physician is often forced to change the order of the Cure.

All firange and external Bodies must be taken away, as speedily as is possible, because they hinder the action of Nature intending Unity, especially if they press or prick any Nervous Body or Tendon, whence pain or an abscess may breed in any principal part, or other serving the principal.

whence pain or an abfeefs may breed in any principal part, or other ferving the principal.

Yet if by the quick and too hafty taking forth of fuch like Bodies there be fear of cruel pain or great effusion of bloud, it will be far better to commit the whole work to Nature than to exasperate the Wound by too violent hastening.

For Nature by little and little will exclude, as contrary to it, or elfe together with the Pas, what firange Body foever shall be contained in the wounded part. But if there shall be danger in delay, it will be fit the Chirurgeon fall to work quickly, safely, and as mildly as the thing will suffer: for effusion of bloud, Swooning, Convulsion, and other horrid symptoms, follow upon the too rough and boistrous handling of Wounds, whereby the Patient shall be brought into greater danger than by the Wound it self.

Therefore he may pull out the firange Bodies, either with his fingers or with infiruments fit for that purpole: but they are fornetimes more easily and fornetimes more hardly pulled forth, according as the Body infixed is either hard or easile to be found or pulled out. Which thing happens according to the variety of the figure of fuch like Bodies, according to the condition of the part it felf, fort, hard, or deep, in which these bodies are fastned more straitly or more loosly; and then for fear of inferring any worse harm, as the breaking of some Vessel: but how we may perform this first intention, and also the expression of the instruments necessary for this purpose, shall be shewn in the particular Treatise of Wounds made by Gun-shot, Arrows, and the like.

But the Chirurgeon shall attain to the second and third scope of curing. Wounds by two and the same means, that is, by Ligatures and Sutures: which notwithstanding before he use he must well observe whether there be any great flux of Bloud present, for he shall stop it if it be too violent, but provoke it if too slow, (unless by chance it shall be poured out into any capacity or belly) that so the part freed from the superfluous quantity of Bloud may be less subject to inflammation. Therefore the lips of the Wound shall be put together, and shall be kept so joined by Suture and Ligatures: Not truly of all, but onely of those which both by their nature and magnitude, as also by the condition of the parts in which they are, are worthy and capable of both the remedies. For a simple and small solution of continuity, stands onely in need of the Ligature which we call Incamative, especially if it be in the Arms or Legs, but that which divides the Muscles transversly, stands in need of both Suture and Ligature; that so the lips which are somewhat far distant from each other, and as it were, drawn towards their beginning and ends may be conjoined.

If any portion of a fielhy fubitance by reason of some great Cut, shall hang down, it must necessarily be adjoined and kept in the place by Suture. The more notable and large Wounds of all the parts, stand in need of Suture, which do not easily admit a Ligature, by reason of the figure and site of the part in which they are, as the Ears, Nose, Hairy-scalp, Eye-lids, Lips, Belly, and Throat.

There are three forts of Ligatures, by the joint confent of all the Ancients. They commonly call the first a Glutinative or Incarnative, the second Expulsive, the third Retentive. The Glutinative or Incarnative is fit for simple, green and yet bloudy Wounds. This confists of two ends, and must so be drawn, that beginning on the contrary part of the Wound, we may so go upwards, partly crossing it, and going downwards again, we may closely join together the Lips of the Wound. But let the Ligature be neither too strait, lest it may cause instammation or pain; nor too loofe, lest it be of no use, and may not well contain it.

The expulsive Ligature is fit for fanious and fiftulous Ulcers, to prefs out the filth contained in them. This is performed with one Rowler, having one timple head, the beginning of binding must be taken from the bottom of the Sinus, or bofom thereof, and there it must be bound more firaitly, and fo by little and little going higher, you must remit formething of that rigour even to the mouth of the Ulcer, that fo (as we have faid) the fanious matter may be pressed forth.

The

Ligatures and Sutures for to conjoin and hold together the lips of Wounds.

Three forts of Ligatures. What an Incarnative Ligature is,

What an Ex-

Phillips of the

The Mark The State of the State

The Retentive Ligature is fit for fuch parts as cannot fuffer firait binding; fuch are the Throat, Belly, as also all parts oppressed with pain, for the part vexed with pain, abhorreth binding. The ense thereof, is to hold to local Medicins. It is performed with a Rowler, which confifts formewhiles of one, formewhiles of more heads. All these Rowlers ought to be of Linnen, and such as is neither too be made of. new, nor too old, neither too coarse nor too fine. Their bredth must be proportionable to the parts to which they thall be applied; the indication of their largeness being taken from their Magnitude, Figure, and Sire. As we shall show more at large in our Tractates of Fractures and Dislocation

What the re-

The Chirurgeon shall perform the first scope of curing. Wounds, which is of preserving the tem- why and how per of the wounded part, by appointing a good order of Diet by the prefeript of a Phylician, by using the temper of universal and local Medicins. A flender, cold and moilt Diet must be observed, until that time be passed, wherein the Patient may be safe and free from accidents which are usually search and the control of the wounded part and the control of the cont passed, wherein the Patient may be safe and free from accidents which are usually seared. Therefore preserved let him be fed sparingly, especially if he be plethorick; he shall abstain from Salt and spiced Flesh, and also from Wine: if he shall be of a cholerick or sanguine nature, in stead of Wine he shall use the Decoction of Barley or Liquorite, or Water and Sugar. He stall keep himself quiet, for Rest is (in Celfise's opinion) the very best Medicin. He shall avoid Venery, Contentions, Brawls, Anger, and other perturbations of the mind. When he shall seem to be past danger, it will be time to fall by little and little to his accustomed manner and diet of life. Univerfal remedies are Phlebotothies and Purging, which have force to divert and hinder the defluxion, whereby the temper of the part might be in

Hanger of change.

For Phlebotomy it is not always necessary, as in small Wounds and Bodies, which are neither trou- In what For Phlebotomy it is not always necessary, as in small Wounds and Bodies, which are neither trou- In what wounds in great Wounds, where there is fear wounds in the property of t bled with ill humburs, or Plethorick: But it is onely required in great Wounds, where there is fear wounds bloe of Defluxion, Pain, Delirium, Raving and unquietness; and lastly, in a Body that is Plethorick, and letting is not when the Joints. Toudous or Neuroscan wounded Control of Control of the Politics of Neuroscan wounded Control of the Politics of the Politics of Neuroscan wounded Control of the Politics of when the Joints, Tendons, or Nerves are wounded. Gentle purgations must be appointed, because the humours are moved and enraged by fironger; whence there is danger of defluxion and inflammation: wherefore nothing is to be attempted in this case without the advice of a Physician.

neceffary.

The Topick and particular Medicins are Agglutinative, which ought to be endued with a drying What Mediand altrictive quality, whereby they may hold together the lips of the Wound and drive away deflucing are to be judged aggle xion, having always a regard to the nature of the part, and the greatness of the disease. The Simple tinative. Medicins are Olibanum, Aloes, Sarceolla, Bole Armenick, Terrassigillata, Sanguis Draconis, Common and Venice Turpentine, Gum, Elemai, Plantane, Horsetail, the greater Country, Parma Volatilis, and many

judged aggle-

other things of this kind, which we shall speak of hereafter in our Anidetary.

The fifth scope of healing Wounds, is the correction of those Symptoms or Accidents which are accuflomed to follow Wounds, which thing verily makes the Chirurgeon have much to do; for as he is often forced to omit the proper cure of the Difcase, so to relift the accidents and symptoms as Bleeding, Pain, Inflammation, a Fever, Convultion, Paliie, Talking idly, or Diffraction, and the like. Of which we shall treat briefly and particularly, after we have first spoken of Sutures as much as we shall the first spoken of Sutures as much as we shall

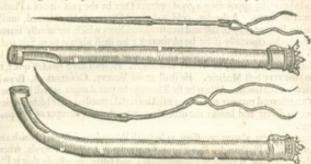

CHAP. VI. Of Sutures.

Hen Wounds are made alongst the Thights, Legs, and Arms, they may eafily want Su. What wounds tures, because the Solution of continuity is easily reflored by Ligatures, but when they fland in are made overthwart, they require a Suture, because the flesh and all such like parts being ture. cut are drawn towards the found parts; whereby it comes to pass that they part the further each from other: wherefore that they may be joined and so kept, they must be sewed, and if the Wound be deep, you must take up much field with your Needle; for it you onely take hold of the upper part, the Wound is onely superficially healed: but the matter that up, and gathered together in the bottom of the Wound will cause absorbed hollow Hillers: Wherefore now we must treat of making tom of the Wound, will cause abscesses and hollow Ulcers: Wherefore now we must treat of making

The first called Interpunctus, leaves the distance of a fingers bredth, and therefore is fit for the green The first man-Wounds of the flefby parts, which cannot be cured with a Ligature, and in which no heteroge-ner of Saure, neous or firange body remains. It is performed after this manner. You must have a fmooth The form of Needle, your Needle. Needle with a Thred in it, having a three-figure point, that fo it may the better enter the Skin, your Needle, with the head of it formewhat hollowed, that the Thred may lie therein; for fo the Needle will the better go through. You must also have a little Pipe with a hole or window in the end, which you The form of must hold and thrust against the lip of the Wound, that it he not moved to the one that we have a little pipe with a hole or window in the end, which you The form of must hold and thrust against the lip of the Wound, that it he not moved to the one that we have the must hold and thrust against the lip of the Wound, that it be not moved to the one side or other, the ripe with whilest you thrust through the Needle: And that we may see through that window when the a window in it Whilett you thank through, and also draw it together with the thred, and withall hold the fip of the Wound in more family, that it follow not at the drawing forth of the Needle and Thred. Having thus pierced the lips of the Wound, tie a knot, near to which cut off the Thred, left that if Having thus pierced the lips of the wound, the anot, beauto which cut off the Thred, left that it any of it be left below the knot, it may fo flick to the Emplaifiers that it cannot be plucked and feparated from them without pain, when they are taken off. But you must note the first flitch must be thrust through the midst of the Wound, and then the second must be in that space which is between the second must be in that space which is between the midft and one of the ends; but when you have made your flitches, the lips of the Wound must not be too closely joined, but a little space must be left open between them, that the matter may have free paffage forth, and inflammation and pain may be avoided: otherwife, if they shall be closely joined together without any diffance between, a tumor after arising when the mattershall come to the Three will be formuch diffended that they may easily be broken by the stiffness of the Thred. But you must neither take hold of too much nor too little shesh with your Needle;

for too little will not hold, and too much caufeth pain and inflammation. And befides, leaves an illfavoured fear. Yet in deep Wounds fuch as are those which are made in the thicker Muscles, the Needle must be thrust home, that so it may comprehend more of the stelly substance, left the Thred drawn away by the weight of the sless not taken hold of, may be broken. But oft-times Wounds are seen made in such places, as it would be needful the Chirurgeon should have a crooked Needle and Pipe, otherwise the Suture will not succeed according to his desire. Wherefore I have thought good to fet forth both their figures, that you may use either as occasion shall serve.

The Figures of Pipes with Feneftels in them, and Needles fit for Sutures.

The fecond means of Suture,

The third Suture.

The fourth kind of Suture termed Gaffre-The fifth kind Suture.

The fecond Suture is made just after the fame manner as the Skinner fows their Fells or Furs-And the Guts must be fowed with this kind of Suture (if they shall be at any time wounded) that the Excrements come not forth by the Wound.

The third Suture is made by one or more Needles having Thred in them, thrust through the Wound, the Thred being wrapped to and again at the head and the point of the Needle, as Boys use to fasten their Needle, for fear of loting it, in their Caps or Cloths. This kind of Suture is fit in the curing and healing of Hare-lips, as we shall shew you hereafter expressed by a Figure.

The fourth kind of Suture is termed Gastroraphia, invented for the refloring and uniting the great Muscles of the Epigastrium, or lower Belly, cut with a great wound together with the Peritoneum lying under them. The manner whereof we thall thew in due place.

The fifth kind is called the dry Suture, which we use onely in the Wounds of the face, which also called the Dry we will describe in its proper place.

CHAP. VIL

Of the Flux of Blond, which ufually happens in Wounds.

The figns of bloud flowing from an Arte-

Ft-times great bleeding follows upon Wounds; by reason of some Vessel cut, broken, or torn, which there is need to heal and help diligently, because the bloud is the treasure of Nature, without which life cannot confist. The Bloud which sloweth from an Artery, is thus known. It is more fubtile, it runs forth as it were leaping, by reafon of the vital spirit contained together with it in the Arteries. On the contrary, that which floweth from a Vein is more gross, black, and flow. Now there are many ways of stanching bloud.

The first way of flaying bleeding.

The first and most usual is that, by which the lips of the Wound are closed, and, unless it be somewhat deep, are contained by Medicins which have an aftringent, cooling, drying, and glutinous faculty: As Terra figill. Boli Armeni, and \$ | . Thuris, Mafticia, Myrrha, Albes, and 3 ij. Farina volat. molend. 3 i. Fin pulvis qui albumine ori excipiatur. Or, ix Thuris & Aloes, and partes equales. Let them be mixt with the White of an Egg, and the Down of a Hare, and let the pledgets be dipped in these Medicins, as well those which are put unto the Wound, as those which are applied about it. Then let the Wound be bound up with a double cloth and fit ligature, and the part be so seated as may seem the leaft troubleform and most free from pain.

The amanner of franching is

But if the Bloud cannot be staid by this means, when you have taken off all that covereth it, you shall prefe the Wound and the orifice of the Vessel with your Thumb, so long until the bloud shall be merete about it, into fo thick a clot as may flop the paffage.

The 3 way by But if it cannot be thus flaid, then the Suture (trany be) must be opened, and the building of the fel towards the original or root, must be taken hold of, and bound with your Needle and Thred, with vellels.

For thus I have flaid great. bleedings, even in the amputation of members, as I shall shew in ht place. To perform this Work we are often forced to divide the skin which covereth the wounded Veffel. For if the Jugular Veinor Artery be cut, it will contract and draw it felf upwards and downwards. Then the Skin it felf must belaid open under which it lieth, and thrufting a Needle and Thred under it, it must be bound as I have often done. But before you loofe the knot, it is no the flesh should be grown up, that it may nop the mouth of the Veffel, left it should then bleed.

Am admonition.

But if the condition of the part shall be such as may forbid this comprehension, and binding of the Veffels we must come to Escharaides, such as are the powder of burnt Varial, the powder or Mercury, with a small quantity of burnt Allani; and Cautticks which cause an Escar. The talling away of which must be left to Nature, and not procured by Art, left it should fall away before that the orince.

The saway by of the Vessel shall be stopt with the slesh or clotted blood.

The 4. way by Eschatoricks

Vellels,

But sometimes it happens that the Charurgeon is forced wholly to cut off the Veffel it self,

£3217101V-1131

that thus the ends of the cut Veffel withdrawing themselves, and shrinking upwards and downwards, being hidden by the quantity of the adjacent and incompating parts, the flux of the bloud, which was before not to be flaid, may be flopped with lefs labour. Yet this is an extreme remedy and not to be used, unless you have in vain attempted the former.

CHAP. VIII.

Of the pain which happens upon Wounds.

He pains which follow upon Wounds ought to be quickly affwaged, because nothing so quick- Pain weakens ly dejects the powers and it always causes a defluxion, of how good soever a habit and termper the body be of; for Nature ready to yield affittance to the wounded part, always fends coases defla-xions. more humours to it than are needful for the nourithment thereof, whereby it comes to pass that the defluxion is eafily increased, either by the quantity, or quality, or by both.

Therefore to take away this pain, the author of defluxion, let fuch medicins be applied to the part as Divers Anohave a repelling and mitigating faculty; as R Olei Myrili, & Rofanon, and \$ ij. Cene all. \$ i. Farine dynes on medicins to afhave a repelling and integrating factory, as it over payment, or agarnam, and 3 in our ato. 3 is Farine bordet, 3 is Bolt arment, & terre figillar, and 3 vi. Melt the Wax in the Oils, then incorporate all the 3 iv. Ole. Rofar. & aceti, and 3 is liquefiant final, and let a Medicin be made for the fore-mentioned use. Irrigations of Oil of Roses and Myrtils, with the white of an Egg, or a whole Egg added that the part is the part of the fore-mentioned than the part of the part of the fore-mentioned than the part of the thereto, may serve for lenitives, if there be no great inflammation; Rowlers and double cloths moiflened in Oxycrate, will be also convenient for the fame purpose. But the force of such Medicins must be often renewed, for when they are dried, they augment the pain. But if the pain yield not to thefe, we must come to narcotick Medicins, such as are the Oil of Poppy, of Mandrake, a Cataplasmos Henbane and Sorrel, adding thereto Mallows and Marth-mallows, of which we fpoke formerly in

Laftly, We must give heed to the cause of the pain, to the kind and nature of the humour that flows down, and to the way which nature affects: for according to the variety of these things, the Medicins must be varied, as if heat cause pain, it will be affwaged by application of cooling things and the like reason observed in the contrary: If Nature intend suppuration, you must help forwards its indeavours with suppurating Medicins.

CHAP. IX.

Of Convulsion by reason of a Wound.

Convulsion is an unvoluntary contraction of the Muscles (as of parts moveable at our plea- What a Confure) towards their original, that is, the Brain and Spinal Marrow, for by this the convulled vultion is member or the whole body (if the Convulsion be universal) cannot be moved at our plea-Yet motion is not lost in a Convultion as it is in a Palife, but it is onely deprayed: and because sometimes the Convulsion possesses the whole body, otherwhiles forme part thereof, you must note that there are three kinds of Convulsions in general.

The first is called by the Greeks Tetanos, when as the whole body grows stiff like a stake that it cannot be moved any way The fecond is called Ophyilhotown, which is when the whole body is drawn backwards.

The third is termed Emprofibetones, which is when the whole body is bended or crooked forwards. Three cases A particular Convulsion is, when as the muscle of the Eye, Tongue, and the like parts which is fur- of a Convulnihed with a Nerve, is taken with a Convultion, Repletion, or Inantition, Sympathy or confent of fion.

Abundance of humours cause Repletion, dulling the body by immoderate Causes of Repletion. cating and drinking, and omiffion of Exercise, or any accustomed evacuation, as suppression of the pletion. Hemorrhoids and Courfes: for hence are fuch like excrementitious humours drawn into the Nerves, with which they being repleat and filled are dilated more than is fit, whence necessarily becoming more floor, they fuffer Convolsion. Examples whereof appear in Leather, and Lute or Viol strings, which fwollen with moiflure in a wer feafon are broken by repletion.

Immoderate Vomitings, Fluxes, or Bleedings, caufe Inantition or Emptines; wherefore a Convulsion Caufes of Inational Power of Ination of Wound, is deadly: as also by burning, Fevers. For by these and the like causes, the inbred mition, and primogenious humidity of the Nerves is waited, fo that they are contracted like Leather which is thrunk up, by being held too near the fire, or as Fiddle-strings which dried with Summers heat, are broken with violence; such a Convulsion is incurable: For it is better a Fever follow a Convulsion, than a Convulsion a Fever; as we are taught by Hippocrates, so that such a Fever be proportional to than a Convultion a Fever; as we are taught by Hippocrates, for that fuch a Fever be proportional to Aph. 26.fet. 2.

the firength of the convultifick caufe, and the Convultion proceed from Repletion; for the abundant and gross humour cauting the Convultion is digetted and wasted by the feverish heat.

and grofs humour cauling the Convultion is digetted and wanted by the reveran near.

The causes of a convultion by reason of pain, are either the punchare of a Nerve, whether it be Causes of Conby a thing animal, as by the biting of a venemous Beast; or by a thing inanimate, as by the prick of valson by consal Needle, Thom, or Pen-knife; or great and piercing cold, which is hurtful to the Wounds, principles of pain.

The causes of a convultion by reason of pain are either the punchare of a Nerve, whether it be Causes of Consal and Co pally of the nervous parts; whereby it comes to pals, that by cauting great and bitter pain in the Nerves they are contracted towards their original, that is, the Brain, as if they would crave the Nerves they are continued towards the Belides also, an ill vapour carried to the Brain from force purrefaction to vellicateth it, that contracting it felf, it also contracteth together with it all the Nerves and Mufcles; as we fee it happenerth in those which have the Falling-Sickness. By which it appears that not onely the Brain it self suffereth together with the Nerves but also the Nerves with the Brain. The figns of a Convulsion are, difficult, painful, and depraved Signs of a convulsion.

motions, velfion.

motions, either of fome part or of the whole body, turning afide of the Eyes and whole Face, a contra-ction of the Lips, a drawing in of the Cheeks as if one laughed, and an univerfal Sweat.

CHAP. X.

The cure of a Convulsion.

The cause of a Convulsion by Repletion,

He Cure of a Convulfion, is to be varied according to the variety of the convulfive Caufe, for that which proceeds from Repletion must be otherwise cured, than that which is caused by an inanition; and that which proceeds of Pain, otherwife than either of them. For that which is caused by Repletion is cured by discussing and evacuating Medicins; as by Diet conveniently appointed, by purging, bleeding, digettive local Medicins, Exercise, Frictions, Sulphureous Baths and other things appointed by the preferription of some learned Physician which shall overfee the cure, which may confume the superfluous and excrementious humors that possess the substance of the Nerves and habit of the Body. The local remedies are Oils, Unguents, and Liniments, with which the Neck, Back-bone, and all the contracted parts shall be anointed. The Oils are, the Oil of Foxes, Bays, Cammomil, Worms, Turpentine, of Coftus, of Castoreum: The Ointments are, Unguentum Aragon, Agrippe, de Althea, Mariatum. This may be the form of a Liniment; R Olei chamem. & Laurin, and § ij. Olei Vulp. § i. Unquenti de Althea & Marti. an. § B. Axungia Vulpis, § i. Aqua vita § i. S. Cera quantum fufficit. Of the Cure of a Convulsion by sympathy and pain.

The Cure of a Convultion by a puncture or bire.

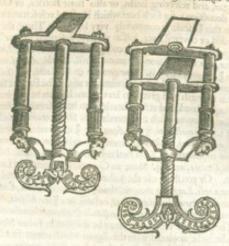

A worthy Alser Antidote.

You must himder the locking of the

Convulsion which is caused both by confent of pain and communication of the affect, is cured by remedies which are contrary to the dolorifick cause. For thus if it proceed from a puncture or venemous bite, the wound must be dilated and enlarged by cutting the skin, that so the venenate matter may flow forth more freely, for which purpose also Medicins which are of a thin and liquid confiftence, but of a drying and digeflive faculty shall be poured in, to call forth and diffove the virulency, as Treacle and Mithridate diffolved in Aqua vite, with a little of some Mercurial Powder; for this is a noble antidote. Also Cupping-glasses and scarifications will be good. Latily, the condition of all doloritick causes, shall be oppugned by the opposition of contrary remedies; as if pain by reason of a pricked nerve or tendon, shall cause a Convulsion, it must prefently be relifted by proper remedies, as Oil of Turpentine, of Euphorbium, mixt with Aqu. vita, and also with other remedies appropriated to punctures of the nerves. If the pain proceed from excels of cold, because cold is hurtful to the brain, the spinal marrow, and nerves; the Patient shall be placed in a hot air, fuch as that of a Hot-house or Stove; all the spine of his back and convulsed parts must be aneinted with the hot liniments above mentioned: for that is much better than fuddenly to export him from the conceived convulfifick cause to a most shot are or warm bath. In the mean time the Chirurgeon must take diligent heed, that as soon as the sign of the Convulsion to come, or already prefent, or at hand, do shew themselves, that he put a slick between the Patients teeth, lest they be taft locked up by the pertinacious contraction of the Jaws, for many in such a case have bit off their Tongues, for which purpose he shall be provided of an instrument called Speculum Oris, which may be dilated and contracted according to your mind by the means of a ferew, as the following figures demonstrate; the one presenting it open and somewhat twined up, and the other as it is thut.

Time on

The Figure of a Speculum Oris, to open the Teeth when they are locked or held full together.

CHAP. XII.

Of the Palfie.

He Palfie is the refolving or mollification of the nerves, with privation of fense and motion, what a Palfie fuch is properly named the Palfie: for otherwise and less properly the resolution of some one member is also called the Palfie: for when the whole body is resolved, it is an Apoplexy. There ces thereof, the Palfie fometimes takes half the body, otherwhiles the upper parts, which are between the Navel and the Head, otherwhiles the lower which are from the Navel to the Feet; sometimes the It differs from a Convultion in its whole nature. For in a convultion, there is a contention and How it differs contraction of the part, but in this a resolving and relaxation thereof: besides, it commonly happerson a Convention of the part, but in this a resolving and relaxation thereof: besides, it commonly happerson a Con-

contraction of the part, but in this a refolving and relaxation thereof: belides, it commonly hap- from a Conenerth that the fenfe is either abolifhed or very dull, which usually remains perfect in a Convultion.

There are some which have a pricking, and as it were great pain in the part.

The causes are internal or external; the internal are humours obstructing one of the Ventricles The Causes. of the Brain, or one fide of the fpinal marrow, fo that the animal faculty, the worker of Senfe and Motion, cannot by the nerves come to the part to perform its action. The external caufes are a fall, blow, and the like injuries, by which oft-times the joints are diflocated, the fpinal marrow wrested cannot come to the Organs in its whole substance. But it is easie by skill in Anatomy perfectly to understand by the resolved part the feat of the morbifick cause, for when there is a Palite properly to the late it is the late of the morbifick cause, for when there is a Palite properly to the late is the properly to the resolved part the feat of the morbifick cause, for when there is a Palite properly fo called, that is, when the right or left fide is wholly feized upon, then you may know that the obfruction is in the brain, or fpinal marrow; but if the parts of the head be untoucht, either of the fides being wholly refolved, the fault remains in the original of the spinal marrow; if the arms be taken with this Discase, we may certainly think that the matter of the Discase hid in the fifth, fixth, and feventh Vertebra of the neck. But if the lower members languish, we must judge the Paralytick cause to be contained in the Vertebra of the Loins and Holy-bone. the Chirurgeon must diligently observe that he may always have recourse to the original of the Difeafe. The Palfie which proceeds from a nerve cut, or exceedingly bruifed, is incurable, because the way to the part by that means is thut against the animal spirit. Old men scarce or never recover of the Palse, because their native heat is languid, and they are oppossed with possess that the part is possessed in accordance of excrementations humours; neither doth an inveterate Palsie which hath long possess that which succeeds an accordance wish as any better hope of cure. The abundance of excrementitious humours; neither doth an inveterate Pallie which hard long possess possess, posses

CHAP. XIII. Of the Cure of the Palfie.

A diffilled Water, good to wash them and to drink inwardly.

Exercises and Chymical Oil.

You must also appoint Exercises of the affected parts, and frequent and hard frictions, with hot linen cloths, that the native heat may be recalled, and the excrements contained in the parts digethed : you may also use the Chymical Oyls of Rosemary, Thyme, Lavender, Cloves, Nutmegs; and lastly, of all Spices, the manner of extracting whereof, we shall hereafter declare in a peculiar Treatife.

CHAP. XIV.

will be heated, and much phlegm contained therein as the fewel of this dileafe, will be confumed.

Of Swooning.

What Swooning is. Three causes of Swooning.

Wooning is a fedden and pertinacious defect of all the powers, but especially the vital; in this, the Patients lie without motion or fense, so that the Ancients thought that it differed from Death onely in continuance of time. The cause of Swooning, which happens to those that are Wounded, is Bleeding, which caufeth a diffipation of the spirits: or Fear, which caufeth a fudden and joint retirement of the spirits to the heart. Whence follows an intermission of the proper duty, as also of of the reft of the faculties, whileft they being thus troubled, are at a fland. Also Swooning happens by a putrid and venenate vapour, carried to the Heart by the Arteries, and to the Brain by the Nervesby which you may gather, that all Swooning happens by three causes. The first is, by diffipation of the fpirits and native heat, as in great bleeding. And then by the oppression of these spirits by ob-firmation, or compression, as in Fear, or Tumult; for thus the spirits sty back hastily from the surface and habit of the body, unto the Heart and Center. Lafily, By Corruption, as in bodies filled with humours, and in poisonous Wounds. The figns of Swooning are paleness, a dewy and sudden sweat arifing, the failing of the pulse, a sudden falling of the body upon the ground without sense and motion, a coldness possessing the whole body, so that the Patient may seem rather dead than alive. For

The cure of Swooning caused by dis-fipation of fpirits. The cure of Swooning caused by a venenate air. The cure of preffion and direction.

many of these who sall into a Swoon die, unless they have present help.

Therefore you shall help them, if when they are ready to sall, you sprinkle much cold water in their face, if that the swooning happen by diffipation of the spirits; or if they shall be set with their faces upwards upon a bed, or on the ground, as gently as may be; and it you give them bread dipt in Wine to hold and chew in their mouths. But if it be caused by a putrid vapour and poisonous air, you shall give them a little Mithridate or Treacle in Aqua vira with a Spoon, as Infinally do to those which have the Plague, or any part affected with a Gangrene, or Spacel. But if the Patients cannot be raifed out of their Swoons, by reason of the pertinacious oppression and compression of the spirits about the Heart, you must give them all such things as have power to distuse, call forth, and resuscitate the spirits, such as are, strong Wines to drink, sweet Persumes to smell: You must call them by their own name loud in their ear, and you must pluck them fornewhat hard by the hairs of the Temples and Neck. Also rub the Temples, Nostrils, Wrists, and Palms of the Hands with Aqua Acc.

wherein Cloves, Nutmegs, and Ginger have been fleeped.

the second

CHAP, XV. Of Delirium (i.e.) Raving, Talking idly, or Daving.

Oting or Talking idly, here is used for a symptom which commonly happeneth in Fevers what a symcaused by a wound, and inflammation; and it is a perturbation of the fantie and function promatical proof the mind, not long induring. Wherefore such a doting happens upon Wounds by reason
where it is a perturbation of the fantie and function promatical proof vehement pain, and a sever, when as the nervous parts, as the joints, stemach, and midrift, shall be
thereof.

For the Ancients did therefore call the Midriff Phrena, because when this was hurt, as if the mind Why the it felf were hurt, a certain phrenzie enface; that is, a perturbation of the animal faculty, which is imit fell were hurt, a certain phrenzic entace; that is, a perturbation before annual racurry, which is imployed in ratiocination, by reason of the community which the Displayer hath with the Brain, by rift. Therefore Doting the Nerves sent from the fixth conjugation, which are carried to the stomach. Therefore Doting happens by too much bleeding, which caufeth a diffipation of the sparies, whereby it happens that the motions and thoughts of the mind err, as we see it happens to those who have bled much in the amputation of a member. And it happens by the puncture of a venemous Beatt, or from Seed retained putation of a member. And it happens by the puncture of a venemous Bealt, or from Seed retained or corrupted in the Womb, or from a Gangrene or Sphacel, from a venemate and putridair carried up to the Brain, or from a fudden turnult and fear. Laftly, What things foever with any difference, effectially hot, do hurt and debilitate the mind. These may cause Doting by the afflux of humours, specially cholerick, by diffination, oppression or corruption of the spirits. Therefore if it shall proceed the Carel letting by the prescription of a Physician, and Meninger or Membranes thereof; after Purging and Bloud-letting by the prescription of a Physician, the hair being shaved or cut off, the head shall be formented with Rose Vinegar, and then an Emplaister of Discalcibeer, dissolved in Oil and Vinegar of Roses, shall be laid thereupon. Sleep shall be procured with Barly creams, wherein the feeds of white Poppy with Role Vinegar, and then an Emplaitier of Discalcibers, diffolved in Oil and Vinegar of Roles, fhall be laid thereupon. Sleep shall be procured with Barly creams, wherein the feeds of white Poppy have been boiled, with Broths made of the decoction of the cold feeds of Lettuce, Purllain, Sorrel, and such like. Cold things shall be applied to his Nottrils, as the feeds of Poppy gently beaten with Rose-water and a little Vinegar. Let him have merry and pleasant Companions that may diver his mind from all cogitations of forrowful things, and may ease and free him of cares, and with their sweet intreaties may bring him to himself again. But if it happen by default of the spirits, you multifeek remedy from those things which have been set down in the Chapter of Swooning.

The End of the Nineth Book.

BOOK X.

Of the Green and Bloudy Wounds of each Part.

C. H. A. P. L. Smith on A what to make to de

Of the kind or differences of a broken Skull.

Ow that we have briefly treated of Wounds in general, that is, of their differences, figns, causes, prognosticks and cure, and also shewed the reason, of the accidents and tymptoms which usually follow and accompany them, it remains that we treat of them as they are incident to each part, because the cure of Wounds must be diversly performed according to the diversity of the parts. Now we will begin with the The different Wounds of the Head. Therefore the head hath the hairy scalp lightly brussed without ces of a broad with the controlled and ken head. any wound, otherwhiles it is wounded without a Contusion, and sometimes it is both contused and ken head, wounded: but a fracture made in the skall, is sometimes superficiary, sometimes it descends even to the Diples, sometimes it penetrate atthrough the two Tables, and the Meninges, into the very substance of the Brain; belides the Brain is off-times moved and shaken with breaking of the internal Veins, and divers symptoms happen when there appears no Wound at all in the head: of all and every of which we will speak in order, and add their ture, especially according to the opinion of the divine Hipportates. He in his Book Of the Wounds of the Head, seems to have inade 400.5 kinds of fractures of the Skull. The first is called a Fiffure or Fracture, the second a Contusion or Collision, the third is fermed Effractures, the fourth is named Sedes, or a feat; the sitth (if you please to add it), you may call a broken skull contrary side, to that which received the stroke. There are many differences of these sixed out of Hipportary side, to that which received the stroke. There are many differences of these sixed out of the broken Skull. For some fractures are great, some similar, and others indifferent: some run out to a greater length or bredth, others are more contracted a some reside onely in the superficies, others deany wound, otherwhiles it is wounded without a Contufion, and fometimes it is both contufed and ken head broken Skull. For tome tractures are great, tome timan, and others indifferent: fome run out to a from their greater length or bredth, others are more contracted a former refide onely in the fuperficies, others degrantity. It is an oblique and circular, fome are complicated amongst themselves, as a Fiftere is necessarily and always accompanied with a Collision or Contation, and others are affociated with divers accidents, as from their pain, hear, fwelling, bleeding, and the like. Sometimes the Skull is fo broken, that the Membrane lying complication full off any pain, hear, fwelling, bleeding, and the like. Sometimes the Skull is fo broken, that the Membrane lying complication full off any parties of the Bone, as with pricking Needless Somewhiles none of the bones fall off. All which, differences are diligently to be observed, because they force us to vary cure, and therefore All which, differences are diligently to be observed, because they force us to vary cure, and therefore for the help of memory, I have thought good to defcribe them in the following Table.

CHAP. II.

Of the causes and signs of a broken Skull.

He causes of a broken Skull are external, as a fall, a blow, or stroak with any kind of Weapon, The external sharp, obtuse, heavy, hard, the bitings of Beasts, and many other things of the like kind.

But the signs by which we come to know that the Skull is broken, are of two kinds; for fome of them are found out by the reasoning and discourse of the mind, other by the sense, as those

which lay open the Wound to the Eye and Hand. The Rational figns shew by these things which have happened upon the thing it self, whether it Bational caube, and of what fort it is. For you may know the Skull is broken, if the Patient shall fall down with the ftroak, or if he shall fall headlong from a high place upon some hard thing. If for some time after the stroak he shall lie without speaking, sight, and hearing; if he shall have felt and feel much pain, so that he is often forced to put his hand to the Wound. But also the Weapon is to be considered, that is, whether if it be heavy, obtufe, pricking, or tharp. Also we must consider with what and how great firength the firoak was given, and with how great anger, and from what diffance the Weapon fell. Also we must consider whether the Patient received the blow with his Head unarmed and naked; whether he fell into a Swoon presently after the blow; whether when he came to himself, he was in his right fenfes; whether his eyes were blinded; whether he were troubled with a giddiness or dizi-

nefs, and whether he bled at the nofe, mouth, ears, or eyes; and laftly, whether he vomited. For Appearance writes, that those who have their Brain cut, must necessarily have a Fever and vomiting of feld.6. Choler to enfue thereupon, which Galen confirming in his Commentary, faith that the fame happens also when the Wound comes to the Membranes of the Brain.

Alfo a dull found as from a broken Veffel coming from the Skull, (the Hairy scalp and Perieranium Lib.8.ca) 4. being taken off) and it being lightly finitten upon with an iron Probe, is faid to be a fign of a fracture thereof, as it is recorded by Paulus Aginets. Truly all thefe figns make a great conjecture, or rather affurednefs that the Skull is wounded, and the Brain hurt, as which cannot happen unlefs the bone be broken, as Gelfius hath written. Yet many have had their Skulls broken, who had no fuch fign immediately after the blow, but this is very feldom. But I do not think fit amongft fo many figns, here to omit that which is fet down by Guidedt any (faith he) will know in what place the Skull Bips is broken, but the Patient hold for herevery, his fore-teach one, and of a Luce figure or thread and the 19th. is broke, let the Patient hold faft between his fore-teeth one end of a Lute firing or thred, and the and Gaido's Chirurgeon hold the other in his hand, then let him lightly touch or play upon the firing with his conjectural form of a lightly touch or play upon the firing with his figns of a fingers; for in the very inflant of the found or ftroke, the Patient will be certainly admonifised, or broken skull-perfectly perceive the part of the Skull that is broken, and as overcome and forced by this fenfe of pain, will by lifting up of his hand make demonstration thereof. As yet I have not been able to find the truth hereof by experience, although I have made trial of it in many. Wherefore I cannot fay any thing certainly of this fign, as neither of that which is mentioned by Hippocrates in Cosis

Pref. In fuch as you doubt whether the bones of the Skull be broken or not, you must judge by giving them the stalk of the Asphodil to chaw on both sides of their jaws, but so that you bid them withall observe, whether they perceive any bone to crackle or make a notic in their heads; for those which are broken seem to make a notic.

But passing over these things, now let us come to those figns which may be obvious to our fenfes.

CHAP. III.

Of the figns of a broken Skydl, which are manifest to our fense.

Hose signs are here faid to be manifest to sense, which when the bone is bared, manifest the sensible signs Wound to our Eyes, Fingers, and Probe. But if the hairs stand upon one end in the of a broken Wound, you may know the bone is broke, because the hair which yields to the violence of skull before the dividing cannot be for our the bone which resists the strong being not violated as it is chessed by the blow, cannot be fo cut, the bone which refifts the fireak being not violated, as it is observed by of the skin Hippocrates; wherefore we may by the fight of this one thing, before any inspection of the Wound Lib. at Value. it felf, suspect by a probable conjecture, that the Skull is broken, and persuade the beholders or stan- cap.

ders by fo much.

Moreover we may, before we have cut the skin acrofs, or laid bare the bone, give a guess by our feeling, whether the Skull be broken or no, if we by prefling down our fingers near the Wound shall perceive the bone either to stand up, or be pressed down otherwise than it should naturally be.

The skin being cut crofs-wise, and the bone laid bare, if the fracture be not obvious to the eye, you what probe
must trie with your Probe, which must neither be too thin nor too sharp, left by falling into some namust be used in the problem.

The skin being cut crofs-wise, and the bone laid bare, if the fracture be not obvious to the eye, you what problems is tried with your Probe, which must neither be too thin nor too sharp, left by falling into some namust be used in the problems. tural cranics, it may cause us to suspect without any cause that the bone is broken a neither let it be for a fracturer too thick, less the little clists may deceive you. If when your Probe comes to the bone it meets with nothing but that which is fmooth and flippery, it is a fign that it is whole,

But on the contrary, if you find it any thing rough, specially where there is no future, it shews the bone is broken. But let the Chirurgeon consider, that the fractures are not seldom upon the futures; and that the futures have not always one and their natural fite, as also it often comes to pass that the broken clift, or cut bone, can neither be perceived by your fight nor infirument: wherefore if you think there is any fuch thing, by the rational figns above mentioned; anoint the place with Writing Ink and Oil, and fo you shall find the crack or clift, by the means we shall shew you here-

When you are certain of the fracture, then you must diligently consider the greatness of the Difease, and apply Medicins speedily. Verily when a fracture chances to light upon any fature,

fatures-

Lib 5. Epid. is the difease is hard to be known, unless the fracture be very great, because the futures by their cliffs
Automotion When the state of and roughness resemble fractures; wherefore Hippocrates faith, that he was deceived by them. Now omilion, Hifts having briefly delivered the differences and figns of a broken Skull, it is time to come to the feveral ceived by the kinds thereof, with a Fiffure,

CHAP. IV.

Of a Fiffiere, being the first kind of a broken Skull.

must be cur.

Hippocrates.

Cellus.

F the Chirurgeon by the fore-mentioned figns shall know that the Skull is broken, or crackt, and if the Wound made in the musculous skin shall not be thought sufficient for ordering the Fiffure, then must be shave off the hair, and cut with a Razor or Incision-knife, the musculous Skin with the Ferieranium lying under it in a triangular or quadrangular figure to a proportionable bigness, always shunning as much as in him lies, the futures and temples; neither must be fear any harm to ensue hereof; for it is far better to bare the Bone by cutting the Skin, than to suffer the kind and nature of the Fracture to remain unknown by a too religious prefervation of the skin; for the skin is cured without any great ado, though pluckt off to no purpofe.

For it is much more expedient (in Hippoerates opinion) to cure Difeales fafely and securely, though not speedily, than to do it in a shorter time with fear of relapse and greater inconveniencies. Let this diffection be made with a Razor or sharp Knife, and if there be any Wound made in the skin by the Weapon, let one of your Incisions be made agreeable thereto.

A Razor, or Incifion-Knife.

ken Skull.

Now therefore the mufculous skin together with the Pericranism must be divided, and cut with a how to pull the sharp Razor pressed and guided with a strong and steddy hand; then it must be so pluckt from the bone or skull lying under it, that none thereof remain upon the bone; for if it should be rent or torm with the Trepan, it would cause vehement pain with inflammations. You must begin to pull it back at the corners of the lines croffing each other with right angles, with this Chiffel whole figure you fee here expressed.

A Chiffel or Infrument to pull back or separate the Pericranium from the Shell.

Then you must fill all the Wound with Bolsters of fine soft lint, that so the lips may be kept further alunder. But you shall apply upon it Medicins fit to stanch bloud. But if it so come to pass that the bloud flows forth to violently, that it can be flaid by no means, the Veffel it felf must be bound, after this manner.

The manner to bind aVeG fel in case of too much bleeding. A Hiftory.

First thrust through the musculous skin on the outside with a needle and thred, then thrust the needle back again, then tie the thred on a knot on the out-side, but first put some lint rolled up to the bignels of a Goole-quill between the thred and the hairy fealp on both fides thereof, left the firait twitching of the thred which may ferve to flay the bleeding, may cut and tear the skin, or cause pain: then must you raise his head somewhat higher.

Thave lately tried, and performed this upon a certain Coach-man, who, thrown from the Coach upon his head on a pavement of Free-stone, exceedingly bruised the hinder part of the Bregma, for which cause it was not to open the musculous skin, with a cross Incision, both that the congealed bloud might be pressed out, as also that the fracture (if there were any) might be observed. But an Artery being cut in performance hereof, when as the Chirurgeon, who was there prefent, could not flay the bloud leaping out with violence; and the Coachman already had loft to great a quantity thereof, that his firength was so much decayed that he could not stir himself in his Bed, or scarce speak: I being called, thewed them by experience, that whereas aftringent Medicins were used before to no purpose, it was better to stay the bleeding by binding the Vessel, than to let the Patient die for a childith fear of pricking him.

A way to find a fracture in the Skull, when it pro fents not it felf to the view at the firft. A fign that both the Tables are bro-

But that we may return to our former matter, the Chirurgeon shall the next day consider, with what kind of fracture the bone is hurt; and if no figns of hurt appear to the eyes, nor be perceived with your fingers and probe, yet fome of the rational figns may cause one to have a conjecture that there is no figure with Western Felt. there is a fracture: Then you must anoint, as we told you before, the bared bone with Writing Ink. and a little Oil of Roles, that the cleft or crack may be died or coloured therewith, if that there be any there. Then the next dreffing you must dry the bone with a linnen cloth, and ferape off the Ink and Oil with feraping Infiruments made for the purpose, if any part thereof shall be such into the bone, for if there be any crack, it will be black: Wherefore you must continue scraping until no sign of the Fishure remain, or else until you come even to the Dwas Mater. But that he may be more certain whether the Fishure pierce through both the Tables of the skull, he must bid the Patient, that Maniero mini

flopping his Nose and Mouth he strive to breath with a great indeavour. For then bloudy matter, or fanies, will sweat through the Fiffure: For the breath driven forth of the Cheft, and prohibited paffage forth, fwells and lifts up the fubflance of the Brain, and the Meninger, whereupon that frothy ken. humidity and fanies fweats forth. Therefore then the bone must be cut, even to the Dura Mater, with humidity and fanier sweats forth. Therefore then the bone must be cut, even to the Dura Mater, with a Radala, and other scraping Instruments fit for that purpose, yet so as you hart not the Membrane; but if the Fissure shall be somewhat long, it will not be convenient to follow it all the extent thereof, for Nature will repair and restore the remnant of the Fissure by generating a Callus; besides also, the Chirurgeon according to Celsus opinion, must take away as little of the bone as he can, because there is nothing so fit to cover the Brain as the Skull. Therefore it shall suffice to make a passage, whereby the bloud and sanies may pass and be drawn forth, left that matter being suppress, may corrupt the bone, and canse as instantantion in the Brain. But the broken Bone must be taken forth withthe bone, and cause an inflammation in the Brain. But the broken Bone must be taken forth with- You may use for three days, if it be possible, especially in Summer, for fear of inflamniation. Yet I have often taken the Trepan forth with a Trepan, and with Scrapers the bones of the Skull, after the seventeenth day, both in Wins after the tenth ter and Summer, and that with happy success. Which I have the rather noted, left any should at day, any time suffer the wounded to be left destitute of remedy, for it is better to try a doubtful remedy than now. Yet the Budgarders (4.1) he almost that a state of the days of the state of than none. Yet the By-flanders shall be admonished and told of the danger, for many more die,

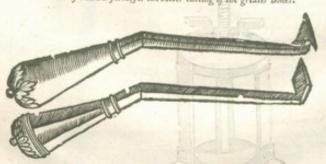

who have not the broken bones of the Skull taken out, than those that have.

But the Instruments with which the wounded or cleft bones may be cut out, are called Scalpri, or Radule, of which I have caused divers sorts to be here decyphered, that every one might take his choice according to his mind, and as shall be best for his purpose. But all of them may be served into one handle, the rigure whereof I have exhibited.

Radulæ or Scalpri, (i.) Shavers or Scrapers.

Radulæ of another form, for the better cutting of the greater Bones.

To conclude, When the Skull shall be wounded or broken with a simple Fissare, the Chirurgeon It is sufficient must think he hath done sufficient to the Patient, and in his Art, if he shall divide the bone, and distinct since the Fissare, or clift, with the described Instruments, though he have used no Trepan, although fore to dilate the Fissare through both the Tables. But if it doth not exceed the first Table, you must stay your scrapers as soon as you come to the second, according to the opinion of Pauliu: but if the bone shall be broken and shivered into many pieces, they shall be taken forth with fit Instruments, using also a Trepan, if need shall require, after the same manner as we shall shew you hereafter.

CHAP. V.

Of a Consussion, which is the second fort of Fratture.

What an #c-

How a Contufion of the Skull must be cured,

Different cures of a deprefied Skull, N Ecchymofit, that is, effusion of bloud, presently concreting under the musculous Skim, without any Wound, is oft caused by a violent contusion. This Contusion if it shall be great, fo that the Skin be divided from the Skull, it is expedient that you may make an Incision, whereby the bloud may be evacuated and emptied. For in this case you must wholly desist from suppurative Medicins (which otherwise would be of good use in a stelly part) by reason that all the most things are hurtful to the Bones, as shall be shown hereafter.

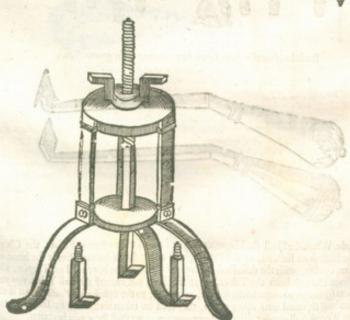

Such like Contusions more frequently happen in Children, being easily perceived by the softness and inundation of the contused part: forth of which oft-times when I have opened them with my Incision-Knife, scrous clotted and blackish bloud hath issued. The residue of the Cure is perfected by moderate compression of the part, and drying Medicins. Moreover the Skull of a Child may be pressed down by a great Contusion, even as we see it happens in thin Vessels of Brass, Lead, or Pewter, for oft-times by the pressure of your singer, they are so dented in, that the print thereof remains; yet sometimes they sly back of themselves, and again acquire their former plainness and equability, which also happens in the bones of Children, Women, and such as are fost, humid, and phlegmatick. But if the Bones do not spring back of themselves, you must apply a Cupping-glass with a great stame; withall command the Patient to sorce his breath up as powerfully as he can, keeping his mouth and nose close that; for thus there will be hope to restore the depressed Bone to its place, by the spirits forced upwards to the Brain and Skull, by the powerful

attraction of the Cupping-glafs. But if fo be that the Bone cannot by this means be seftored, then you must make an Incision in the skin, and fasten such a Trepan as you see here delineated, into the departs or fetled part of the Bone, and so pull it directly upwards; just as we see Coopers raise the staves of their Cask when they are sunk too much in.

But if the Bone shall be too strong, thick, and dense, so that this In-

But if the Bone shall be too strong, thick, and dense, so that this Infrument will not serve to pluck it forth; then you must perforate the Skull in the very center of the depression, and with this threefold Infrument or Levatory, put into the hole, lift up and reftore the Bone to its natural site; for this same Instrument is of strength sufficient for that purpose. It is made with three seet, that so it may be applied to any part of the head which is round; but divers heads may be stitled to the end thereof, according as the business shall require, as the Figure here placed doth shew.

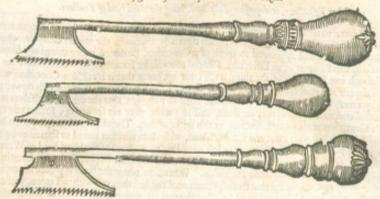

A three-footed Levatory.

But if at any time it comes to pass that the Bone is not totally broken or depress, but onely on one fide; it will be fit so to lift it up, as also to make a vent for the issuing out of the filth, to divide the Skull with little Saws like these which you see here expressed; for thus so much of the bone as shall be thought needful, may be cut off without compression, neither will there be any danger of hurting the Bra inor Membrane with the broken bone.

The second services

The figures of Saws fit to divide the Shull.

But if by fuch figns as are prefent, and thall appear, we perceive or judge that the contulion goes but to the fecond Table, or fearce to far, the baring or taking away of the bone must go no farther than the contusion reaches, for that will be fufficient to efchew and divert inflammations and divers other fymptoms. And this shall be done with a scaling or Desquamatory Trepan (as they term it) with which you may easily take up as much of the bone as you shall think expedient: And I have here given you the figure thereof.

A Desquamatory, or Scaling Trepan.

A Delineation of other Levatorier.

- AA. Shows the point or tongue of the Levisory, which must be somewhat dull that so it may be the more gently and easily put between the Dura Mater and the Skyll, and this part thereof may be listed up so much by the head or handle taken in your hand, as the necessity of the present operation shall require.
- B Intimates the body of the Levatory, which must be four square, lest the point or tongue put thereon should not stand fast, but the end of this body must rest upon the sound bone, as on a sure foundation.
- The use thereof is thus, Put the point or tongue under the broken or depressed bone, then lift the handle up with your hand, that so the depressed bone may be elevated.
- C Shows the first Arm of the other Levatory, whose crooked end must be gently put under the depressed bone.
- D Shows the other Arm, which must rest on the found hone, that by the sirri standing thereof, it may lift up the depressed hone;

What a Contufion is. What an Ef-

fracture is,

The cause of Effractures.

The Cure.

CHAP. VI.

Of an Effracture, or depression of the Bone, being the third kind of Fracture.

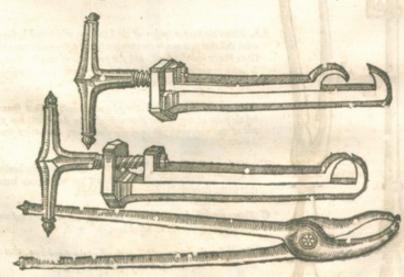

Before I come to speak of an Effracture, I think it not amiss to crave pardon of the courteous, and understanding Reader, for this reason especially, that as in the some Chapter, when I had determined and appointed to speak of a Contusion, I inserted many things of a Depression; so also in this Chapter of an Effracture, I intend to intermix something of a Contusion; we do not this through any ignorance of the thing it self; for we know that it is called a Contusion when the bone is depreit and crusht, but falls not down. But an Effracture is when the bone falls down, and is broken by a most violent blow. But it can searce come to pass, but that the things themselves must be consounded and mixt, both as they are done, and also when they are spoken of; so that you shall scarce see a Contusion without an Effracture, or this without that. Therefore the bones are often broken off and driven down with great and storible blows, with clubs whether round or square, or by falling from a high place directly down, more or less according to the force of the blow, kind of Weapon and condition of the Part receiving the same: Wherefore you must be provided with diversity of remedies and infiruments to encounter therewith. Wherefore admit the bone is pressed down, and shivered into many pieces, now for that these splinters need not be taken out with a Trepan, you may do the business with Levatories made and neatly fashioned for that purpose; such as these, which here are express.

· A Levatory.

But we must have special care, lest that in pulling and taking out of these scales and splinters we hurt the membranes. These scales are sometimes very rough and prickly, so that they cannot touch the Meninger without offence; but somewhiles the business is so intricate, that they cannot be taken out, unless by enlarging the tracture. Wherefore in this case, if there be a space so large, as that the ends of these mustlets may enter, you may easily shear off so much of the bone as shall be necessary and requisite for the taking away of these scales without any affistance of the Trepan, which I have done very often, and with good success; for the operation performed by these Mullets is far more speedy and safe than that with the Trepan; and in the performance of every operation, the chief commendation is given to faseness and celerity.

Cutting Mullets, commonly called Roftra Pfittaci, or Parrots Beaks.

Moreover I have thought good here to give you the Figures of Chifels, Scrapers, Pincers, together with a leaden Mallet, because such Instruments are not onely very necessary to take forth the scales of bones which are broken, but also to plain and smooth those which remain whole.

The second second

The Figures of Serapers, Pincers, a lenden Mallet, &cc.

But here you must note, that a Trepan or Levatory, must ever be applied to a bone quite broken, lest the membranes lying under it be hurt by the compression thereof. Therefore you must apply them to a found bone, but as near as you fore you must apply them to a found bone, but as near as you can to the Fracture, so that you take away as little of the Skull as is possible, left the Brain despoiled of its bony cover, take some harm thereby. Neither Effractures, nor yet Fisfures, if they be of some length, must be followed to their ends; but think your self well, if you have made a passage for the issuing forth of the sames or filth, and have drawn forth that bone which pricked the membranes. For Nature is accustomed by generating a Callus to soulder, or unite the bones of the Skull, as it also doth those of the other parts; as we have read it written by Hippocrates and Galen; for which we have read it written by Hippocrates and Galen; for which Hipp, Lio, de purpose, it hath by singular providence replenished both the vals, cap, tables of the Skull, with a certain alimentary and bloudy matter, that with this as with marrow it might repair the loss and defect of the bone.

The truth hereof was lately manifelled in the fervant of Mafter Grole, who had an Effracture on A History. the coronal bone by a grievous blow given him with the foot of a Mule; which when I underflood, I divided the mufculous skin with a three-cornered fection in that place, with an intent to apply I divided the mufculous skin with a three-cornered fection in that place, with an intent to apply a Trepan there; wherefore the day following, the bone being bored, and when I thought to draw it forth, yea verily endeavoured to plack it forth, being already divided with the Trepan, I perceived a fearful production of an Effracture, by the moveableness of the bone thaking under my hand, for it reached from the midft of the Fore-head to the leffer corner of the Eye. Wherefore omitting both my determination, and endeavour to pull it forth, I thought I thought do fufficiently for the Patient if I thould onely raite up the bone which was depret, for fo it did not trouble the Craffa Mexica by preffing it and the matter and filth were let forth by a paffage made with a Saw. So that in conclution, he recovered perfectly, but that he loft one of his Eyes which was adjoining to the

CHAP. VII.

Of a Seat, being the fourth kind of a broken Skull.

Ippocrates calls a Seat that kind of Fracture of the Skull, when the Weapon to falls upon the What a Seat is Skull, that the Fracture retaining the print thereof, is neither firetched forth any further, nor contracted to any less space.

And feeing there be many forms hereof, they all (whether they shall be superficiary, or shall pierce The Cure.) even to the Diploe, or else pass through both the Tables, whether it be with any loss of the bony fubttance, whether it run long ways, or elfe be but fhort, or otherwife are dilated to fome bredth or elfe be but narrow; whether they shall be done with a cut; or with a prick with a Dagger, Styletto, Lance, or other kind of Weapon, whether they shall have this or that accident joined with them, I fay all of them, how many and various foever they be) ought and must be cured by fome of the formerly described Instruments and means. Yet this must be noted which as yet we have not refocus off that it is clean fevered from the rest of the Skull, and hang onely by the Perieranium and the musculous skin; yet you must not pluck it from the Perieranium, and cast it away as unprofitable, but reftore it to its proper feat and place, fo by the force of Nature, to be glewed by a Callan, as Celfin Lib. 8.c.p.4.

hath observed.

Thave tried the truth of this experiment in Captain Hydron, not very long ago. He had the A History-middle part of the Os Coronale, of the bredth and length of three singers, so cut with a sharp Sword that it sluck not to the rest of the bone; but scarce adhering to the Pericennium and musculous skin lay turned down over his face, so that the Dura Mater was plainly seen; wherefore I prepared to pluck it from the skin, and cast it away, but that I remembred Hippocrates Precept, where he bids, that the Brain should not be robbed of its cover and lest bare. Wherefore shift of all I wiped away the bloud which was fallen upon the Dura Mater, whose motion you might plainly see, then I restored the portion of the bone to its place, and fastned it on the upper side with a Suture consisting of three stitches; and that the residue of the matter might have passage forth, I filled the places between each stitch with lint: by this means, he by the mercy of God recovered, though at the same time he received many other large wounds in his body; which is a certain experiment, that we must cast away no part of the Skull nor of the Periceanium, no not of the musculous skin, unless necessity urge, therefore much less to leave the Brain naked and despoiled of its coverings. fity urge, therefore much less to leave the Brain naked and despoiled of its coverings.

CHAP. VIII.

Of a Resonitus, or Counter-Fissure, being the fifth kind of Fracture.

1.16.6.cap.90.

What a Referi- Ometimes the Fracture is made in the part opposite to that which received the blow; as if the right fide be flruck, the left is cloven; this kind of Fracture is very dangerous, because we cannot find it out by any certain fign, as it is written by Hippocrates, Lib. de Vuln. Capitis. Wherefore if at any time the Patient die of fuch a Fracture, the Chirurgeon must be pardoned.

And although Paulus Æginera laugh at this kind of Fracture, and thinks that it cannot happen to a mans head, as that which is hard and full, as it happens in empty Glass Bottles, yet I have forne-

times feen and observed it.

In whom this fracture may take place in divers bones of the skull.

Neither is their reason of any validity, who think Nature therefore to have framed the Head of many bones knit together by sutures; left the fracture of the one side, should be stretched to the other. For peradventure this may take place in such as have express sutures, seated and framed according to Nature. But it takes no place in fuch as either want them, or have them not feated according to Nature, or have them very close and so defaced that it may feem one Bone grown together of many; This thall be made manifett by recital of the following Hiftory.

A Hiftery.

A servant of Massis the Post-master, had a grievous blow with a stone upon the right Bergma, which made but a fmall wound, yet a great Contufion and Turnor. Wherefore that it might more plainly appear, whether the Bone had received any harm, and also that the congealed blood might be prefied forth, the wound was dilated, the skin being open by Theodore Hereus the Chirurgeon, who as he was a skilful workman, and an honefi man, omitted nothing which Art might do for his cure. When he had divided the skin, the bone was found whole, although it was much to be feared that it was broken, because he fell presently to the ground with the blow, vomited, and shewed other signs of a fractured skull; so it happened that he died on the one and twentieth day of his fickness. But I being called to learn, and fearch how he came by his death, dividing the skull with a Saw, found in the part opposite to the blow, a great quantity of fasies, or bloudy matter, and an Abscels in the Craffa Mening, and also in the substance of the very Brain, but no futures but the two fealy ones. Therefore that is certain which is now confirmed by the authority of Hippocrates, as alfo by reason and experience, that a blow may be received on the one side, and the bone may be fractured on the opposite, especially in such as have either no futures, or elfe so firmly united and closed, that they are scarce apparent.

The Refinitus the skull.

A Riffory.

Neither is it abfurd, that the part opposite to that which received the stroak, of the same bone and may be in the not of divers bones may be cloven, and in those men who have their skulls well made, and naturally same bone of diffinguished and composed with surgress, and this both was and is the true meaning of History at diffinguished and composed with sutures; and this both was, and is the true meaning of Hippocrate.

That this may be the better understood, we must note that the opposite part of the same bone may be understood two manner of ways. First, When the fracture is in the same surface of the smitten bone. as if that part of one of the bones of the Brogma, which is next to the Lambdal future be fmitten, and the other part next to the Coronal future be cloven. Secondly, When as not the fame superfacilities and table which receives the blow, but that which lies under it is cleft, which kind of fracture I observed in a certain Gentleman, a Horseman of Captain Stempana Troop; He in defending the breach of the Wall of the Castle of Hisdim, was struck with a Musquet bullet upon the Brigma, but had his Helmet on his head, the bullet dented in the Helmet but did not break it, no nor the musculous skin, nor skull, for as much as could be differmed, yet notwithflanding he died apoplectick upon the fixth day after.

But I being very definous to know what might be the true cause of his death, dividing his skull, observed that the second Table was broken, and east off scales and splinters, wherewith as with Necdles the substance of the Brain was continually pricked, the first and upper table being whole for all this: I afterwards shewed the like example to Capellanus and Castellanus, the King and Queens chief

Physicians, in the expedition of Roan.

Why Hippocra-tes let down no way to cure a Referei-

fractured by

a Relaxitur.

But Hippocrates preferibes no method of curing this fifth kind of fracture, by reason he thinks it cannot be found our by any circumfrance, whence it happens that it is for the most part deadly: Yet must we endeavour to have some knowledge and conjecture of such a fracture, if it shall at any time Wherefore having first diligently shaven away the hair, we must apply an Emplaister of Pitch, Tar, Wax, Turpentine, the Powder of Iris, or Flower-de-luce roots and Mastich; now if any to know when place of the head shall appear more moist, fost, and swollen, it is somewhat likely that the bone is cleft in that place, fo that the Patient, though thinking of no fuch thing, is now and then forced to put his hand to that part of the skull. Confirmed with these and other signs formerly mentioned, let him call a Council of learned Phylicians; and fore-tell the danger to the Patients friends which are there prefent, that there may no occasion of calumny remain, then let him boldly perforate the skull, for that is far better than forfake the Patient ready to yield to the greatness of the hidden dif-case, and so consequently to die within a short while after. There are sour forts or conditions of fractures, by which the Chirurgeon may be fo deceived, that when the skull is broken indeed, yet he may think there is no fracture. The first is when the bone is so depressed, that it presently rises up into its true place and native equability. The second is when the Fissure is onely capillary. The third is when the bone is shaken on the infide, the utter furface nevertheless remaining whole, forafmuch as can be differred. The fourth is, when the bone is firicken on the one fide, and eleft on the other.

turner mer

CHAP. IX.

Of the moving, or concussion of the Brain.

Efides the mentioned kinds of Fractures by which the Brain also fuffers, there is another kind Gal. lib, 2. de of affect belides Nature, which also affails it by the violent incursion of a cause in like man-comp. ner external; they call it the commotion or flaking of the Brain, whence Symptoms like csp. 6. & com. those of a broken skull ensue. Falling from aloft upon a folid and hard body, dull and heavy blows, and Aph. 50 fell. as with Stones, Clubs, Staves, the report of a piece of Ordnance, or crack of Thunder, and also a blow 7.

Thus as Hippocrates tells, that beautiful Damofel the daughter of Nerius, when the was twenty years Lib.5. Epidem. old, was finitten by a Woman, a friend of hers playing with her, with her flat hand upon the fore-part of the head, and then she was taken with a giddiness, and lay without breathing, and when she came home, she fell presently into a great Fever, her head aked, and her face grew red. The seventh day after, there came forth tome two or three ounces of flinking and bloudy matter about her right Ear, and the feemed formewhat better, and to be at formewhat more eafe. The Fever increased again, and the fell into a heavy fleepines, and loft her speech, and the right side of her face was drawn up, and the breathed with difficulty, she had also a convulsion and trembling, both her tongue failed her, and her eyes grew dull, on the nineth day she died. But you must note, that though the head be armed with a Helmet, yet by the violence of a blow the Veins and Arteries may be broken, not the veiles of could these which rafe through the fatther than the last through the last through the last through the fatther than the last through th onely these which pass through the futures, but also those which are dispersed between the two Ta- the brain brobles in the Diplot, both that they might bind the Graffa Menine to the skull, that fo the Brain might ken by the move more freely, as also that they might carry the alimentary juice to the Brain wanting Marrow, thereof. that is, bloud to nourish it, as we have formerly shewed in our Anatomy.

But from hence proceeds the ciflux of bloud running between the skull and membranes, or elfe be- Signs. tween the membranes and brain; the bloud congealing there, canfeth vehement pain, and the eyes caffar, become blind, Vomiting is caused, the mouth of the stomach suffering together with the Brain, by reafon of the Nerves of the fixth conjugation, which run from the Brain thither, and from thence are fon of the Nerves of the lixth conjugation, which from the main tuning, and trouble of the offence, it contracts for felf, and is prefently, as it were, overturned; whence first those things that are contained therein. The cause of are expelled, and then such as may flow, or come thicker from the neighbouring and common parts, when the cause of the contract of the as the Liver and Gall; from all which choler, by reason of its natural levity and velocity is first ex-pelled, and that in greatest plenty, and this is the true reason of that vomiting, which is caused and ded. ufually follows upon fractures of the Skull and concustions of the Brain.

Within a short while after, inflammation seizes upon the membranes and brain it self, which is caused by corrupt and putrid bloud proceeding from the vessels broken by the violence of the blow, and so spread over the substance of the Brain. Such inflammation communicated to the Heart, and whole body by the continuation of the parts, causes a Fever. But a Fever by altering the Brain, causes Designed to which is a substantial process. causes Doting; to which if stupidity succeed, the Patient is in very ill case, according to that of Hippecrater; Stupidity and doting, are ill in a wound, or blow upon the Head. But it to these evils, a Aph. 14-stal. 9.

Sphacel, and corruption of the Brain ensue, together with a great difficulty of breathing, by reason of the disturbance of the animal faculty, which from the Brain imparts the power of moving to the Muscles of the Chest, the Instruments of Respiration; then death must necessarily follow.

A great part of these accidents appeared in King Hony of happy memory, a little before he died. A History-He having let in order the affairs of France, and entered into amity with the neighbouring Princes defirous to honour the marriages of his Daughter and Sifter with the famous and noble exercise of Tilting, and he himself running in the Tilt-yard, with a blunt lance received so great a stroak upon his breft, that with the violence of the blow, the vizour of his Helmet flew up, and the trunchion of the broken Lance hit him above the left Eye-brow, and the mufculous skin of the Fore-head was tom even to the leffer corner of the left Eye, many splinters of the same Trunchion being struck into the substance of the sore-mentioned Eye, the Bones being not touched or broken, but the Brain was so moved and shaken, that he died the eleventh day after the hort. His Skull being opened after his necessary death, there was a great deal of bloud found between the Dura and Pia Mater, poured forth in the cause of the part opposite to the blow, at the middle of the future of the hind-part of the head; and there ap-death of King peared figns, by the native colour turned yellow, that the fubliance of the Brain was corrupted, as Hisry the femuch as one might cover with ones Thumb. Which things caused the death of the most Christian cond, of

King, and not onely the wounding of the Eye, as many have falily thought. For we have feen ma-France, ny others, who have not died of far more grievous wounds in the Eye.

The History of the Lord Saint-Johns is of late memory: He in the Tilt-yard made for that time be-A History for the Duke of Guifer house, was wounded with a splinter of a broken Lance, of a singers length and thickness, through the vizour of his helmet, it entering into the Orb under the eye, and piercing some three singers bredth deep into the head; by my help and Gods savour, he recovered, Valeranue and Durentus the Kings Physicians, and James the Kings Chirurgeon affiling me. fome three fingers breden deep into the nead; by my neip and Gods favour, ne recovered, Valeranus and Durerus the Kings Physicians, and James the Kings Chirurgeon affitting me.

What shall I say of that great and very memorable wound of Francis of Lorain the Duke of Guife? A History.

What shall I say of the City of Bologue had his head so thrust through with a Lance, that the point entering under his right Eye by his Nose, came out at his Neck between his Ear and the Vertebra, the Head or Iron being broken and left in by the violence of the firoak, which fluck there io firmly, that it could not be drawn or plucked forth, without a pair of Smiths Pincers. But although the firength and violence of the blow was fo great, that it could not be without a fracture of the Bones, a tearing and breaking of the Nerves, Veins, and Arteries, and other parts; yet the generous Prince by the favour of God recovered.

By which you may learn, that many die of small wounds, and other recover of great, yea, very

wounds, and others recover of great.

The cause of which events is chiefly and primarily to be attributed to Why some die large and desperate ones. God, the Authour and Preserver of Mankind; but secondarily to the variety and condition of Temperaments. And thus much of the commotion or concussion of the Brain; whereby it happens, that although all the Bone remains perfectly whole, yet fome Veins broken within by the stroak, may cast forth some bloud upon the membranes of the Brain, which being there concrete, may cause great pain, by reason whereof it blinds the Eyes; if so be that the place can be found against which the pain is, and when the Skin is opened, the bone look pale, it must prefently be cut out, as Celfar hath written. Now it remains that we tell you how to make your Prognosticks, in all the forementioned Fractures of the skull.

CHAP. X.

Of Prognosticks to be made in Fractures of the Shull.

7 E must not neglect any Wounds in the Head, no not those which cut or bruise but onely Hip de val. cap. the hairy fealp, but certainly much lefs, those which are accompanied by a fracture in the Skull, for oft-times all horrid fymptoms follow upon them, and confequently death it felf, especially in bodies full of ill humours, or of an ill-habit, such as are these which are affected with the Lucs Venerea, Leprofic, Dropfic, Pthyfick, Confumption: for in thefe, fimple wounds are hardly or never cured; for union is the cure of wounds, but this is not performed unless by the firength of Nature, and fufficient store of laudable bloud: but those which are sick of hectick Fevers and Consumptions want flore of bloud, and those bedies which are replete with ill humours, and of an ill habit, have no afflux or plenty of laudable bloud: but all of them want the firength of Nature; the reason is almost the same in those also which are lately recovered of some Disease.

Whether the wounds of children, or old people are

Those Wounds which are bruised are more difficult to cure, than those which are cut. When the Skull is broken, then the continuity of the flesh lying over it must necessarily be hurt and broken, unless it be in a Reference. The bones of children are more fost, thin, and replenished with a fanold people are guin humidity than those of old men, and therefore more subject to putrefaction; Wherefore the Wounds which happen to the bones of children, though of themselves and their own Nature they may be more eafily healed, (because they are more soft, whereby it comes to pass, that they may be more eafily agglutinated, neither is there fit matter wanting for their agglutination by reason of the plenty of bloud laudable both in confiftence and quality) than in old men, whose bones are drier and harder, and fo refift union, which comes by mixture, and their bloud is ferous, and confequently a more unfit boild of unity and agglutination; yet off-times through occasion of the fymptoms which follow upon them, that is, putrefaction and corruption, which fooner arise in a hot and moist body, and are more speedily increased in a fost and tender, they usually are more suspected, and diffi-

The Patient lives longer of a deadly fracture in the Skull in Winter than in Summer, for that the native heat is more vigorous in that time than in this; befides also, the humours putrefie fooner in Summer, because then unnatural heat is easily inflamed, and more predominant, as many have obser-

A)6.47 Sell. 20

red out of Hippocrates.

The Wounds of the Brain and of the Maninges or Membranes thereof are most commonly deadly, because the action of the Muscles of the Chest, and others serving for respiration, is divers times discussed the action of the Muscles of the Chest, and others serving upon a Wound of the head flurbed and intercepted, whence death enfues. If a fwelling happening upon a Wound of the head presently vanish away, it is an ill sign, unless there be some good reason therefore, as Bloud-letting, Purging, or the use of resolving local Medicins, as may be gathered by Hippocrates in his Aphorisms. If a Fever enfue prefently after the beginning of a wound of the head, that is, upon the fourth or feventh day, which usually happens, you must juge it to be occasioned by by the generating of Pus or Matter, as it is recited by Hipperstee. Neither is such a Fever so much to be seared, as that which happens after the feventh day, in which time it ought to be terminated so but if it happen upon the tenth or fourteenth day with cold or shaking, it is dangerous, because it makes us conjecture that there is putrefaction in the Brain, the Meninger or Skull, through which occasion it may arife, chiefly if other figns shall also concur, which may thew any putrefaction, as if the wound shall be pallid and of a faint yellowith colour, as flesh looks after it is walhed.

rough, livid, and black, are

Wounds For as it is in Hippocrates Aphorif. 2. Sell. 7. It is an ill fign if the flesh look livid, when the bone which are dry, is affected; for that colour portends the extinction of the heat, through which occasion the lively or rough, livid, indifferently red colour of the part, faints and dies, and the flesh that the first and the flesh that the first and the flesh that the indifferently red colour of the part, faints and dies, and the flesh thereabout is diffolved into a viscid Pas or filth.

Commonly another worse affect follows hereon, wherein the wound becoming withered and dry, looks like falted flesh, fends forth no matter, is livid and black, whence you may conjecture, that the bone is corrupted, especially if it become rough, whereas it was formerly smooth and plain, for it is made rough when Carnes or corruption invades it; but as the Caries increases, it becomes livid and black, fanious matter withall fweating out of the Diplot, as I have observed in many: all which are figns that the native heat is decayed, and therefore death at hand, but if fuch a Fever be occasioned from an Eryfipelas, which is either present or at hand, it is usually less terrible. But you shall know by these figure that the present of the by these figns that the Fever is caused by an Enginelis and conflux of cholerick matter; if it keep the form of a Tertian, if the fit take them with coldness and end in a sweat, if it be not terminated before the desirant of the lips of the wound be fore the cholerick matter is either converted into Pas, or elfe refolved; if the lips of the wound be formewhat fwollen, as also all the face; if the eyes be red and fiery; if the neck and chaps be so this, that he can searce bend the one, or open the other; if there be great excess of biting and pricking pain and heat, and that far greater than in a Phlegmen. For such an Eryspelous disposition generated of this and both local distances. affail) the face ted of thim and hot blood, chiefly affails the face, and that for two causes.

The figns of a by an Eryspi-

the property of the same

The first is, by reason of the natural levity of the cholerick humour, the other because of the rarity of the skin of these parts.

The cure of fuch an affect must be performed by two means, that is, evacuation, and cooling with The cure of an humectation. If choler alone cause this turnor, we must easily be induced to let bloud, but we must ensure the purge him with Medicins evacuating choler. If it be an Expipelas Phlegmander, you must draw the face, bloud from the Cephalick Vein of that side which is most affected, always using advice of a Physician. Having used these general means, you must apply refrigerating and humeching things, such as are the Juice of Nightshade, Housleek, Purshane, Lettrace, Navel-wort, Water-Leutil, or Ducks-meat, Gourds, a Liniment made of two handfulls of Sorrel boiled in fair Water, then better or drawn through a fearce, with ointment of Rofes or fore anguent. Populan added thereto will be very commodious. Such and the like remedies must be often and so long renewed until the unnatural heat be extinguished. and the like remedies must be often and to long renewer until the unitatural near be extinguished.

But we must be careful to abstain from all unctions and oily things, because they may easily be inflawhy oily
med, and so increase the Disease. Next we must come to resolving Medicins; but it is good when any things must
thing comes from within, to without; but on the contrary, it is ill when it runs from without innot be used in
wards, as experience and the authority of Hippocrates restline: If, when the bone shall become purulent, pushules shall break out on the tongue by the dropping down of the acrid filth or matter by the
Heavy of the foregree, which lies under a new when this symptom appears, sew escape. holes of the palat upon the tongue, which lies under; now when this fymptom appears, few efcape.

Alfo it is deadly when one becomes dumb and flupid, that is, ApopleCtick by a firoak or wound on the Deadly figure that not onely the Bone, but also the Brain it felf is hurt. But off-times the hurt in wounds of the property of the palating that the bounds of the brain it is the bounds. of the Brain proceeds to far, that from corruption it turns to a Sphacel, in which case they all have not the head onely pushales on their tongues, but some of them die shapid and mute, othersome with a Convulsion of the opposite part; neither as yet I have observed any which have died with either of these symptoms, by reason of a wound in the Head, who have not had the substance of their Brain tainted with a Sphatel, as it hath appeared when their Skulls have been opened after their death.

CHAP. XI.

Why, when the Brain is hurt by a Wound of the Head, there may follow a Consulsion of the opposite part.

Any have to this day enquired, but as yet as far as I know it hath not been sufficiently ex- A Convultion plained, Why a Convultion in wounds of the Head feizes on the part opposite to the blow, is caused by plained, Why a Convultion in wounds of the Head feizes on the part oppoint to the blow. In caused by Therefore I have thought good to end that Controversie in this place. My reason is this, drynesis, that kind of fymptom happens in the found part by reason of emptiness and dryness; but there is a A two-fold twofold cause, and that wholly in the wounded part, of this emptiness and dryness of the found or op-cause of Conposite part, to wit, pain, and the concourse of the spirits and humours thither by the occasion of the published dryness, and happens of the Pairs dryning and Natures violently fending help to the affected part.

Wound, and by reason of the Pains drawing, and Natures violently tenanting their to the action of the Pains drawing, and Natures violently tenanting their to the action of the Pains drawing, and Nature sand humours, easily falls into a Convulsion. For thus Galen writes; God the Creator of Nature hath so knit together the triple spinish. tuous fubstance of our bodies, with that tie and league of concord, by the production of the passages, to wit, of Nerves, Veins, and Arthries, that if one of these forsake any part, the rest presently neglect it, whereby it languisheth, and by little and little dies through defect of nourithment. But if any object that Nature hath made the body double for this purpose, that when one part is hurt, the other remaining safe and sound, might suffice for life and necessity: but I say this Axiom hath no truth in the vessels and passages of the body. For it hath not every where doubled the vessels, for there is but one onely Vein appointed for the nourithment of the Brain, and the Membranes thereof, which is that they call the Taylor has which when the left true is promoted in representations. call the Torentar, by which when the left part is wounded, it may exhauft the nounthment of the right and found part, and through that occasion cause it to have a Convulsion by too much dryness. Verily it is true, that when in the opposite parts the Muscles of one kind are equal in magnitude, firength, and number, the resolution of one part makes the convulsion of the other by accident, but it is not foin the Brain.

For the two parts of the Brain, the right and left, each by it felf performs that which belongs therethe two parts of the Brain, the right and lett, each by it tell periodis that which belongs thereto, without the confent, confpiration, or commerce of the opposite part; for otherwise it should follow that the Palsie properly so called, that is, of half the body, which happens by resolution, caused either by mollistication, or obstruction, residing in either part of the Brain, should infer together with it a Convulsion of the opposite part. Which notwithstanding, daily experience convinceth as false. Wherefore we must certainly think, that in Wounds of the Head wherein the Brain is hurt, that Inanition and want of pourishment are the cause that the structure of the structure of

and want of nourillament are the causes that the found and apposite part suffers a Convulsion.

Francis Dalechampias in his Francis Chirurgery renders another reason of this question. That (faith Opinion of he) the truth of this proposition may stand firm and ratified, we must suppose that the Convulsion of Dalechampias the opposite part mentioned by Hippocrates, doth then onely happen, when by reason of the greatness of the inflammation in the hurt part of the Brain, which hath already interred corruption, and a Gangrene to the Brain and Membranes thereof, and within a short time is ready to cause a Sphacel in the Stan Gastar the Disease must be terminated by death; for in this defined state of the Disease the Skull, fo that the Difeafe must be terminated by death; for in this defined state of the Difease, and these conditions, the sense and motion must necessarily perish in the affected part, as we see it happens in other Gangrenes, through the extinction of the native heat. Befides, the paffages of the animal fpirit must necessarily be so obtinicted by the greatness of such an instammation or phlegmon, that it cannot flow from thence to the parts of the same side lying thereunder, and to the neighborn, that it cannot flow from these same sides with the same side lying the same side in the same side lying the same side lyin anon, that it cannot flow from thence to the pairs of the faile had sying thereunder, and to the neighbouring parts of the Brain; and if it should flow thither, it will be unprofitable to carry the strength and faculty of sense and motion, as that which is infected and changed by admixture of putrid and Gangrenous vapours. Whereby it cometh to pass, that the wounded part defittute of sense, is not stirred up to expel that which would be troublesom to it, if it had sense; wherefore neither are the Nerves there a refer to the pass of the first support of the pass of Nerves thence arifing feized upon, or contracted by a Convultion.

It furthermore comes to pass, that because these same Nerves are deprived of the presence and comfort of the animal spirit, and in like manner the parts of the same side, drawing from thence their fense and motion, are possessed with a Palsie; for a Palsie is caused either by the cutting or oblimction of a Nerve, or the madefaction, or mollification thereof, by a thin and watery humour, or so affected by fome vehement diftemper, that it cannot receive the animal spirit.

But for the opposite part and the Convulsion thereof, it is known and granted by all, that a Convullion is caufed either by Repletion, which shorten the Nerves by distending them into bredth; or by Inanition, when as the native and primitive heat of the Nerves being wasted, their proper substance becoming dry, is wrinkled up and contracted; or else it proceeds from the vellication and acrimony of some vapour, or fanious and biting humour, or from vehemency of pain. So we have known the Falling-tickness caused by a venerate exhalation carried from the Foot to the Brain. Also we know that a Convultion is caused in the puncture of the Nerve, when as any acrid and fanious humour is that up therein, the oritice thereof being closed; but in Wounds of the Nerves, when any Nerve is half cut, there happens a Convultion by the bitternels of the pain.

But verily in the opposite part, there are manifefuly two of these causes of a Convulsion; that is to fay, a putrid and carion-like vapour, exhaling from the hurt and gangrenate part of the Brain; and also a virulent, acrid, and biting finites or filth sweating into the opposite found part, from the affected and gangrenous; the malignity of which fanies, Hippocrates desirous to decipher, in reckoning up the deadly signs of a wounded head, bath expressed it by the word Iebox; and in his Book of Fractures he hath called this humour Dacryodes & non Pyon, [that is, Weeping and not digefted.] Therefore it is no marvail, if the opposite and found part endued with exquisite and perfect sense, and offended by the flowing thereto of both the vaporous and fanious matter, using its own force, contend and labour as much as it can, for the expulsion of that which is troublesom thereto. This labouring or concustion is followed (as we see in the Falling-lickness) by a Convulsion, as that which is undertaken in vain, Death being now at hand, and Nature over-ruled by the Discase. Thus (faith Daleebampiss)

must we in my judgment determine of that proposition of Hippocrates and Aviers.

But he adds further, In Wounds of the Head which are not deadly, Practitioners observe that sometimes the hurt part is taken with the Pallie, and the found with a Convulsion; otherwhiles on the contrary, the wounded part is feized by a Convulsion, and the found by a Pallie; otherwhiles both of them by a Convultion or Palfie, and fornewhiles the one of them by a Convultion or Palfie, the other being free from both affects; the causes of all which belong not to this place to explain. Thus much Daleebampine.

CHAP. XII.

A Conclusion of the deadly signs in the Wounds of the Head.

Ow that we may return to our former Difcourfe, you may certainly fore-tell the Patient will die, when his reason and judgment being perverted, he shall talk idly, when his me-The figns of a deadly wound from the demory fails him, when he cannot govern his tongue, when his fight grows dark and dim, his ears deaf, when he would caft himfelf headlong from his Bed, or elfe lies therein without any motions when he hath a continual Fever with a Delirium, when the Tongue breaks out in Pultules, From the ha- when it is chopt and become black by reason of too much driness, when the Wound grows dry and casts forth little or no matter; when as the colour of the Wound which was formerly fresh, is now become like falted fleth yellow and pale; when the Urin and other excrements are supprest; when the Pallie, Convulsion, Apoplexy; and lastly, often swooning, with a small and unequal pulse invade From the time that fuch him. All fuch figns fometimes appear prefently after the wound, otherwhiles fome few days afters

therefore when as the Brain is hurt and wounded by the violence of the Incition or Fiffure, of the Contusion, Compression, Puncture, Concession, or any other Fracture, the fore-mentioned signs appear prefently in the first days; but when they do not appear till many days after the blow, you may know that they rife and appear, by reason of an inflammation and phlegmon in the Brain, occasioned by the putrefaction of the bloud poured forth upon it.

But we must observe this by the way, which also belongs to the Prognosticks, that flesh is easily regenerated and restored in all parts of the Head, except in that part of the Forehead which is a little

above that which lies between the Eye-brows, fo that it will be ulcerated ever after, and must be covered with a Platter. I believe that in that place there is an internal cavity in the Bone, full of air, which goes to the fieve-like bones of the that the bone is very denfe or compact in that place, fo that there can scarce sufficient Juice sweat forth, which may fuffice for the regeneration of fleth; add hereunto a great conflux of excrements flowing to this older, which should otherwise be evacuated by the Eyes and Nose, which hinder by

that means the drinefs of the Ulcer, and confequently the healing thereof.

Hence certainly it comes to pass, that if you defire the Patient thus affected to breath, shutting his mouth and note, the air or breath will come forth of the Ulcer with fuch force, as it will eafily blow forth a lighted Candle of an indifferent bigness held thereto. Which thing, I protest, I observed in a certain man, whom I was forced to trepan in that place, by reason the bone of the fore-head was broken and depreffed.

praved faculties of the mind.

figns appear.

Calfon Lib. 8.

the morning.

CHAP. XIII.

Of Salutary Signs in Wounds of the Head.

Ut on the contrary, these are falutary signs; when the Patient hath no Fever, is in his right mind, is well at the application or taking of any thing; sleeps well, hath his Belly soluble, the Wound looks with a fresh and lively colour, casts forth digested and laudable matter, the

Yet we must note, which also is observed by the Ancients, and confirmed by experience, that we when the Pamilt think none past danger, and free from all chance, until the hundredth day be past. Wherefore tiens are out think none past danger, and free from all chance, until the hundredth day be past. the Phylician cought fo long to have a care of his Patient, that is, to confider how he behaves and gowerns himfelf in meat, drink, fleep, venery, and other things.

But let the Patient diligently avoid and flum cold, for many when they have been cured of Wounds The Patient

in the head, by careless taking cold have been brought into danger of their lives. Also you must must be know that the Callus, whereby the bones of the Skull are knit together, requires almost the space of forty or fifty days to its perfect coagmentation and concretion. Though in very deed one cannot fer down a certain number of days, by reason of the variety of bodies or tempers: for it is sooner finished in young men, and more flowly in old: and thus much may serve for prognosticks. Now will we treat as briefly and personnel was an of the warner beach in great and contribute where the prognostics is the state of the superfect treat as briefly and perspicuously as we can of the cure both in general and particular; wherefore be-ginning with the general, we will first prescribe a convenient Diet, by the moderate use of the six

CHAP. XIV.

Of the general cure of a broken Skull, and of the Symptoms ufually happening thereupon.

He first cure must be to keep the Patient in a temperate air; and if so be that it be not such How the air of it self and its own proper nature, it must be corrected by Art. As in Winter he must ought to be, have a clear fire made in his chamber, lest the smook cause sneezing and other accidents; and the windows and doors must be kept shut to hinder the approach of the cold air and wind. All the time the wound is kept open to be dress, some body standing by shall hold a Chasingdish full of Coals, or a heated Iron bar over the wound, at such a distance, that a moderate heat may pass thence to the Wound; and the frigidity of the encompaffing air may be corrected by the breathing of the diffused heat. For cold, according to the opinion of Hipperrates, is an Enemy to the Brain, Bones, Nerves, and spinal Marrow; it is also hurtful to Ulcers, by suppressing their excrements, which support the brain is also hurtful to Ulcers, by suppressing their excrements, which support the brain is also hurtful to Ulcers, by suppressing their excrements, which support the brain is also hurtful to Ulcers, by suppressing their excrements, which support the brain is also hurtful to Ulcers, by suppressing their excrements, which support the brain is also hurtful to Ulcers, by suppressing their excrements, which support the brain is also hard the support to the support to the brain is also h prest do not onely hinder suppuration, but also by corrosion makes them sinuous. Therefore Galen rightly admonisheth us, to keep cold from the Brain, not onely in the time of trepaning, but also afterwards. For there can be no greater, nor more certain harm befal the fractured skull, than by admitting the air by fuch as are unskilful. For if the air flould be hotter than the Brain, then it could not Like, draft thence be refrigerated; but if the Brain should be laid open to the air in the midst of Summer, when participal. it is at the hottest, yet would it be refrigerated; and unless it were relieved with hot things, take The Air harm. This is the opinion of Galen, whereby you may understand that many who have their Skulls sammer is broken, die more through default of skill in the curing, than by the greatness of the fracture.

But when the Wound is bound up (with the Pledgets, Cloths, and Rowlers, as is fit) if the air chance the Brain.

to be more hot than the Patient can well indure, let it be amended by fprinkling, and firewing the chamber with cold Water, Oxycrate, the branches of Willows and Vine. Neither is it fufficient to thun the too cold air, unless also you take heed of the over light, chiefly until such time as the most feared and malign fymptoms are past.

For a too great light diffipates the fpirits, increases pain, firengthens the Fever and Symptoms. The discomHippocrates wholly forbids Wine, therefore the Patient in stead thereof must drink Barley Water, fair modities of
Water boiled and tempered with Julep of Roses, Syrup of Violets, Vinegar, and the like, Water wherein Bread crums have been steeped, Water and Sugar with a little juice of Limmons or Pomecitron adwhat his
ded thereto, and such like as the ability and researched by Patient thall require. The him continues first drink must be ded thereto, and fuch like, as the ability and talte of the Patient shall require. Let him continue such drink must be

drinks until he be free from malign fyruptoms, which ufually happen within fourteen days.

His meat thall be Pap, Ptifan, thunning Almond-milks; (for Almonds are faid to fill the Head with Almonds invapours and caufe pain) flewed Darnask Prunes, Raifins, and Currants feafoned with Sugar, and reafe the a little Cinamon, (which hath a wonderful power to comfort the Stomach, and revive and exhilarate the fpirits) Chickens, Pigeons, Veal, Kid, Leverets, Birds of the Fields, Pheafons, Black-birds, Turtles, Partridges, Thrufhes, Larks, and fuch like meats of good digettion, boiled with Lettuce, Purflane, Sorrel Borace, Buglofs, Succory, Endive, and the like, are thought very convenient in this cafe. If he Sorrel, Borage, Buglos, Succory, Endive, and the like, are thought very convenient in this case. If he Sorrel, Borage, Buglots, Succory, Endive, and the like, are thought very convenient in this cate. If he defire at any time to feed on meats roafted, he may; onely dipping them in Verjuice, in the acid juices of Oranges, Citrons, Limmons, or Pomegranates, fornetimes in one, and fornetimes in another, according to his tafte and ability. If any have a defire to eat fifth, he must make choice of Trouts, what fifth he Gudgeons, Pikes, and like, which live in running and clear Waters, and not in muddy; he thall may eat. Glidgeons, Pikes, and like, which live in routing and creat traces, and not in muddy; he thall efchew all cold Sallets and Pulle, because they sly up and trouble the head: it will be convenient after meat to use common Dridge Powder, or Annifeed, Fennel-seed, or Coriander-comits; also Conserve of Rofes, or Marmalate of Quinces to that up the orifice of the Ventricle, left the head thould be offended with vapours arifing from thence.

Children must ear often, but sparingly, for Children cannot fast so long as those which are elder, Aphr. 13. 6 because their natural heat is more throng, wherefore they stand in need of more nourishment: so al- 14 stat. fo in Winter all forts of People require more plentiful nourithment, for that then their fromachs are more hot than in Summer,

The use of Frictions.

A Hiffory.

When the fourteenth day is paft, if neither a Fever, nor any thing elfe forbids, he may drink Wine moderately, and by little and little increase his diet, but that respectively to each ones nature, strength, and custom. He shall shun, as much as in him lies, sleep on the day time, unless it happen that a Phlegman seize upon the Brain or the Meninger. For in this case it will be expedient to sleep on the day time; especially from morning till moon, for in this season of the day, as also in the Spring, bloud is predominant in the body, according to the opinion of Hipperater. For it is so vulgarly known, that it need not be spoken, that the bloud when we are awake is carried into the habit and surface of the body; but on the contrary, by sleep it is called into the noble parts, the Heart and Liver, wherefore if that the bloud by the force of the Sun cassing his beams upon the Earth at his rising is carried into the habit of the body, it should again be more and more dissured by the strength and motion of watching, the inflammation in the Brain and Moninger would be much increased. Wherefore it will be better, especially then to stay by sleep the violence of the bloud running into the habit of the body, when it shall seem to rage and more violently to affect that way. Watching must in like manner be moderate, for too much depraves the temper of the Brain and of the habit of the whole body; it causes crudities, pains, and heaviness of the head, and makes the wounds dry and malign.

But if the Patient cannot fleep by reason of the vehemency of the inflammation of the Brain and Meninger, Galen wishes to wash, besinear and anoint the head, nose, temples, and ears with refrigerating and humecting things, for these stupesie and make drowsie the Brain and Membranes thereof, being more but than they ought to be. Wherefore for this purpose let the temples be anointed with Unguentum populeon, or Unguentum Rosatum with a little Rose-Vinegar or Oxycrate; let a Sponge moistned in the decoction of white or black Poppy-seed, of the rinds of the roots of Mandrages, of the Seeds of Henbane, Lettuce, Purslane, Plantain, Night-shade, and the like. He may also have a Broath, or Barley-cream, into which you may put an emultion made of the Seeds of white Poppy, or let him have a potion made with \(\frac{3}{2}\) i. \(\frac{1}{2}\). \(\frac{1}{2}\) of the Syrup of Poppy, with \(\frac{3}{2}\) ii. \(\frac{1}{2}\) of Lettuce water; Let the Patient use these things sour hours after meat, to procure sleep. For sleep doth much help concoction, it repairs the efflux of the triple substance caused by Watching, asswept pain, refresheth the weary, mitigates anger and forrow, restores the depraved reason, so that for these respects it is absolutely necessary that the Patient take his natural rest.

If the Patient shall be Plethorick, let the plenitude be leffened by bloud-letting, purging and a flender diet, according to the discretion of the Physician who shall over-see the Cure. But we must take heed of strong purgations in these kinds of Wounds, especially at the beginning, left the Fever, Instammation, Pain, and other such like symptoms be increased by stirring up the humours.

Phlebotomy, according to Galeus opinion, must not onely be made respectively to the plenty of bloud, but also agreeable to the greatness of the present disease, or that which is to come, to divert and draw back that humour which flows down, by a way contrary to that which is impact in the part; and which must be there evacuated, or drawn to the next. Wherefore for example, if the right tide of the head be wounded, the Cephalick-vein of the right arm shall be opened, unless a great Ple-*bors or plenitude cause us to open the Basilies, or Median; yet if neither of them can be sitly opened, the Basilies may be opened, although the body be not plethorick. The like course must be observed in wounds of the left fide of the head; for that is far better by reason of the straitness of the fibers, than to draw bloud on the opposite fide; in performance whereof you must have diligent care of the firength of the Patient, fill feeling his pulfe, unlefs the Phylician be prefent, to whose judgment you must then commit all that business. For the pulfe is, in Galens opinion, the certainest shewer of the strength. Wherefore we must consider the changes and inequalities thereof, for as soon as we find it to become leffer and more flow, when the fore-head begins to fweat a little, when he feels a pain at his heart, when he is taken with a defire to vomit or to go to flool, or with yawning, and when he shall change his colour and his lips look pale, then you must stop the bloud as speedily as you can, otherwise there will be danger by he pour forth his life together with his bloud. Then he must be otherwise there will be danger by he pour forth his life together with his bloud. Then he must be refreshed with bread steeped in Wine, and put into his mouth, and by rubbing his temples and noftrils with throng Vinegar, and by lying upon his back. But the part thall be cafed and freed from fome portion of the impact and conjunct humour by gently fearifying the lips of the wound, or applying of Leeches. But it shall be diverted by opening those Veins which are nighest to the wounded part, as the Vena Pappis, or that in the midst of the fore-head, or of the temples, or those which are under the tongue; besides also Cupping-glasses shall be applyed to the shoulder, sometimes with scarification, sometimes without; neither must strong and long frictions with coarse cloths of all the body, the head excepted, be omitted during the whole time of the Cure, for these will be available, though but for this; that is, to draw back and diffipate by infenfible transpiration the vapours which otherwise would ascend into the head; which matters certainly in a body that lies still and wants both the use and benefit of accustomed exercise, are much increased.

But it shall be made manifest by this following and notable example, how powerful Bloud-letting is, to lessen and mitigate the inflammation of the Brain, or the membranes thereof, in wounds of the head. I was lately called into the Suburbs of Saint German, there to visit a young man twenty eight years old, who lodged there in the house of John Marrial at the Sign of St. Michael. This young man was one of the houshold-servants of Mr. Dowcador, the Steward of the Ludy Admiral of Brian. He sell down head-long upon the less Brogma, upon a marble pavement, whence he received a contusted wound, without any fracture of the Skull, and being he was of a sanguin temperature, by occasion of this wound, a Fever took him on the seventh day with a continual Delirium and inflammation of phlegmonous turnour of the wounded Pericranium. This same turnor possessing his whole head and neck by continuation and sympathy of the parts, was grown to such a bigness, that his visage was so much altered, that his striends knew him not, neither could he speak, heat, or swallow any thing but what was very liquid. Which I observing, although I knew that the day past, which was the eighth day of his Disease, he had four Sawcers of bloud taken from him by Germain Agase Barber-surgeon of

the residence of

the fame Suburbs; yet confidering the integrity and confiancy of the firength of the Patient; I thought good to bleed him again, wherefore I drew from him fourteen Saweers at that one times when I came to him the day after, and faw that neither the Fever nor any of the fore-mentioned fymptoms were any whit remitted, or affwaged, I forthwith took from him four Saucersmore, which in all made two and twenty; the day following when I had observed that the symptoms were no whit lessened, I durst not presume, by my own onely advice, to let him the fourth time bloud, as I desired. Wherefore I brought unto him that most famous Physician Doctor Visions, who as soon as he selt his pulse, knowing by the vehemency thereof, the strength of the Patient, and moreover confidering the greatness of the inflammation and tumor which offered it felt to his fight, he bid me prefently take out my Lancet and open a Vein. But I lingered on fer purpose, and told him that he had already twenty two Saucers of bloud taken from him; then said he, grant it be so, and though more have been drawn, yet must we not therefore delift from our enterprise, especially seeing the two chief Indications of bloud-letting yet remain, that is, the greatness of the Difease, and the constant. The two chief firength of the Patient. I being glad of this, took three Saucers more of bloud, he flanding by, and Indications in was ready to take more, but that he wilhed me to defer until the afternoon; wherefore returning after bloud letting. dinner I filled two Saucers more, fo that in all, this young man to his great benefit, loft twenty feven Saucers of bloud at five times, within the space of 4 days. Now the ensuing night was very pleasing to him, the Fever left him about noon, the tumor grew much lefs, the heat of the inflammation at liward and longer than the left of the control of the same left of the same le ged in all parts, except in his eye-lids, and the laps of his ears, which being ulcerated call forth a great quantity of Pas or matter. I have recited this history purposely to take away the childish fear which many have to draw bloud in the constant strength of the Patient, and that it might appear how speedy and certain a remedy it is, in inflammations of the head and brain.

wounds of the head, as Venery; not only at that time the difease is present, but also long after the cure modity of Vethereos. For great plenty of spirits are contained in a small quantity of seed, and the greatest part, nery in thereof. For great plenty of fpirits are contained in a finall quantity of feed, and the greatest part, wound thereof flows from the Brain; hence therefore all the faculties, but chiefly the Animal, are refolved; head. whence I have divers times observed death to ensue in small wounds of the head, yea when they have been agglutinated and united. All pussions of the mind must in like fort be avoided, because they by How hurtful to rease is not contraction and diffipation of the fpirits cause great trouble in the body and mind. Let a place be chosenoise is to the fen for the Patient as far from noise as can be, as from the ringing of Bells, beatings and knockings of the skull. Smiths, Coopers, and Carpenters, and from High-ways through which they use to drive Coaches s for notife increases pain, causes a Fever, and brings many other symptoms.

I remember when I was at Hifdin at the time that it was belieged by the forces of Charles the fifth, A Hiffory, that when the Wall was beaten with the Canon, the noise of the Ordnance caused grievous torment to all those which were fick, but especially those that were wounded on their heads, so that they would fay, that they thought at the discharging of every Cannon that they were cruelly strucken with flaves on that part which was wounded, and verily their wounds were fo angered herewith, that they bled much, and by their pain and Fevers increased, were forced with much fighing to breathe their Thus much may serve to be spoken of the cure in general: now we will out of the monuments of Ancients, treat of the particular.

CHAP. XV.

Of the particular cure of wounds of the head, and of the nusfeulous Skin.

Et us begin with a fimple wound, for whose cure the Chirurgeon must propose one onely of a simple scope, to wit, Union; for unless the wound pierce to the skull, it is cured like other wounds wound of the of the slehy parts of our bodies. But if it be compound, as many ways as it is complicate, so skin, many Indications shew themselves. In these, the chiefest care must be had of the more urgent order

Therefore if the wound shall be simple and superficiary, then the hair must first be shaven away, then a Plaister applied made of the white of an Egg, Bole Armenic, and Aloes. The following day you must apply Emplastrum de Janua, or else de gratia Dti, until the wound be perfectly healed. But if it be deeper and penetrate even to the Perieranium, the Chirurgeon shall not do amis, if at the second dressing he apply a digettive Medicin (as they call it) which may be made of Venice Turpentine, the A digettive yolks of Eggs, Oil of Roses, and a little Sassion, and that shall be used so long, until the wound come Medicin, to maturation; for then you must add Honey of Roses and Barley sour to the digettive. Hence must we pass to these Medicins, into whose composition no oily or unchuous body enters, such as this; R. Terebinth, veneta 3 is fyrapi rosa, 3 pal. Aloes, Myrrha & Mastich, an. 3 s. Let them all be incorporated and made into an unguent, which shall be perfectly regenerated, then it must be cicatrized with this following Powder. Re Aluminis combustic, corriers granaturem combust. an. 3 s. Misceantar simul. An Epulocick. Stat pulvis: but if the Wound be so large that it require a suture, it shall have so many stitches with a Needle as need shall seem to require. Therefore if the wound shall be simple and superficiary, then the hair must first be shaven away, then

a Needle as need shall feem to require. Whileft I was at Hifdin, a certain Souldier, by falling of the Earth whileft he undermined, had the A Hiftory. Hairy Scalp fo preffed down even to the Perieranium, and fo wholly separated from the beginning of the hind-part of his head, even to his fore-head, that it hung over his face. I went about the cure in this manner; I first walked all the Wound with Wine a little warmed, that so I might walk away the congcaled bloud mixed with the Earth, then I dried it with a fott linnen cloth, and laid upon it Venice Turpentine mixed with a little AquaVita, wherein I had diffolved fome Sangnis Desce sii, Manich and Aloes; then I reflored the hanging skin to its former place, and there fixed it with we must obforme stitches, being neither too strait, nor too close together, for fear of pain and instammation, serve in fewfive two chiefly happen whilest the Wound comes to suppuration) but onely as much as should ing.

ferve to flay it on every fide, and to keep forth the air, which by its entrance doth much harm to Wounds: the lower fides of the Wound I filled with somewhat long and broad tents, that the matter might have paffage forth. Then I applied this following Cataplain to all the head. R. Farine bords & fabarum an. 3 vi. olei rofati 3 iij. aceti quantum susticit, siat estaplasma ad formam pultir; this hath a faculty to dry, cool, repel, mitigate pain and inflammation, and fray bleeding,

When we mult not let bloud in wounds. A Hiftory.

I did not let him bloud, because he had bled much, especially at certain Arteries which were broken near his Temples; he being dressed after this manner grew well in a short time. But if the wound be made by the biting of a wild Beast, it must be handled after another manner, as shall appear by this following History. As many people on a time flood looking upon the Kings Lions, who were kept in the Tilt-yard at Paris for the delight of King Hisry the Second, and at his charges, it happened that one of the fercest of them broke the things wherein he was tied, and leaping amongst the Company, he with his paws threw to the ground a Girl of fome twelve years old, and taking her head in his mouth, with his teeth wounded the mufculous skin in many places, yet hurt not the skull. She fearce at length delivered by the Matter of the Lions from the jaws of Death and the Lion, was committed to the cure of Rawland Clarer Chirurgeon, who was there prefent by chance at the fame time: fome few days after I was called to visit her; she was in a Fever, her head, thoulders, brest, and all the places where the Lion had fet his teeth or nails, were fwollen, all the edges of the wound were livid, and did flow with a wateriffs, acrid, virulent, cadaverous, dark, green and flinking matter, fo that I could scarce indure the smell thereof: the was also oppress with pricking, biting, and very great pain, which I observing, that old saying came into my mind, which is, That all Wounds made by the bitings of Beasts, or of Men also, do somewhat participate of poison. Wherefore there must principally great care he had of the venenate impression left in the Wounds by the nails and teeth, and therefore fuch things must be applied, as have power to overcome poison. Wherefore I scarified the lips of the Wounds in divers places, and applied Leeches to fack out the venenate bloud, and eafe the inflammation of the parts; then I made a Lotion of Ægyptisciem Treacle and Mithridate, atter the following manner.

pick Medicins.

nemane.

The bitings of Man and Beafts are ve-

> W. Mitbrid. 3 i. therise. 3 ij. egyptise. 3 B. diffolvantur omnia eum aqua Vita, & Cardui ben. Let the Wounds be formented and washed with it warm; besides also Treacle and Mithridate were put in all the Medicins which were either applied, or put into the Wound; and also of the same with the Conferves of Rofes and Buglofs diffolved in the Water of Sorrel and Cardum benedictus, potions were made to itrengthen the heart, and vindicate it from malign vapours.

A Cordial Epithema, For which purpose also this following Epithema was applied to the region of her heart. Re Aque rosar. O nemphar, an. 3 iv. aceti scillitici 3 i. corallorum, santalorum alborum o rubrorum, rosar, rub pulveris, spodii. an. 3 ii. Mitbridatii, Theriace, an. 3 ii. slo. cordial. pulverisarorum p. ii. croci 3 i. dissolve them all together, make an Epitheme and apply it to the heart with a scarlet cloth or sponge, and let it be often renued. Verily, the dreft after this manner, and the former remedies but once used, pain, inflammation, and all the malign fymptoms were much leffened; to conclude, the recovered, but lingred, and was lean formet two years after, yet at length fhe was perfectly reftored to her health and formet nature. By which you may underfland, that fimple Wounds must be handled after another manner

The cure of when it is con tufed. A repelling

A discussing

Fomentation.

than thefe which have any touch of poilon. But now that we may profecute the other affects of the hairy fealp; fay that it is contuled with a the hairy fealp blow without a wound, that which must be first and always done, (that so the affect may better appear, and the remedies which are applied may take more effect) the hair must be shaven away, and at the first dresling a repelling Medicin applied, such as this following Oxyrbadirum. R. Ol. of. 3 iij. album oversom nu. ij. pulveris nucuom cypresse, balanti. alumin, roche, rosar, rub, an 3 i. Let them be all incorporated, and make a medicin for the former use; or in stead thereof you may apply the cataplasin
prescribed before, consisting of Farina bordei, fabarum, aceto & oleo rosace. But such Medicins must be often renued. When the pain and defluxion are appeared, we must use discussing Medicins for distipation of that humour which remains impacted in the part; Re Emplastri de mucilagin. 3 ij. oxicrocci, & emp. de meliloto, an. 3 i. olei chamem. & anethi, an. 3 B. malaxentur fimul, & fiat emplafram at a firm dellim. Such a fomentation will also be good. Be Vini rub, lib. iv. lixivii, com. lib. i). nuces enterficientific contust. nu. x. pul. myrillorum 3 i. refar. rub, absorbt. fel. falvie, majorane, stachados, storane chamem. melil. an. M. B. alaminis rocke, radies eyperi, calami aromatici an. 3 B. bulliant omnia somel, and make a decoction to foment the grieved part. After somewhat a long somenting it, whereby it may the better discuss, dry and exhaust the concrete humour, the head must be dried and more discussing constant de 2011. things applied, fuch as the Cerate described by Vigo, called De Minio; which hath an emollient and digestive faculty in this form. R. Olei chamaem. lilion. an. 3 x. olei mastich. 3 ij. pinguedinis vervecis lib. i. litharg, auri 3 viij, minii 3 ij, vini boni eyathum unum, bulliant omnia fimul baculo agitando, primum quidem lents igne, more vero luculentiore, donce tota massa colorem nigrum vel subnigrum contrabat, adde in fine colture Terebimb, lib. f. palveris medich. 3 is, gum. elemi. 3 is cere quantum fufficit, bulliam rarfus uses ebulliance of first empl. melle. But if the humour be not thus difcuffed, but onely grow foft, then the tumor must be quickly opened, for when the flesh is inflamed and patrefied through occasion of the contained humour, the bone under it putrefies also by the contagion of the inflammation and the acrimony of the matter falling upon the bone. When you have opened it, wash away the filth of the Ulcer with this following detertive Medicin. Re Sympirof. & abstitute and j. rerebinth. 3 [8, pat. irros, aloes, mastichis, myrrhe, farine bordei, an. 3 [8]. In stead hereof, if there be great putretaction, Agyptia, either by it self, or mixt with an equal quantity of Unguestum Apostolorum may be put into the Ulcer. When the Ulcer is cleanfed, it will be time to use farcotick and cicatrizing Medicins.

Deterfive or cleanfing McChine Chine

CHAP. XVI.

Of the particular cure of a Fracture or broken Skull.

F the Skull be broken, fo that it be needful to trepan it, or to elevate and lift it up, or scrape it Why the Prilaway, the mufculous skin being cut, as we formerly noted, the Pericranium shall be plucked from crasium buth the skull, as we faid before; which because it can hardly be done without great pain, by reason such the skull, as we faid before; which because it can hardly be done without great pain, by reason sense. of its exquifite fenfe and connexion with the Membranes of the Brain, we must labour to mitigate the pain for fear of inflammation and other accidents. Therefore the first drefling ended, and the corners of the Wound drawn each from other; at the fecond dreffing put to the Wound a Digefiive (as they term it) made of the Yolk of an Egg and Oil of Rofes, but you must apply no humid thing to the bone, because we defire to keep it found and whole. For Galens opinion is, that bared bones Gal. 6. meb. must not be touched with unctuous things; but rather on the contrary, all dry things must be applied. The bones are to them, which may confume the superfluous humidity. Therefore we must lay some lint and the applications to them, which may consume the superfluous humidity. cephalick powders which we shall hereafter describe, upon the bone we intend to preserve, and must on of humid have diligent care that it be not offended either by the air, or touch of humid Medicins. You must things. in Trepaning have a special care of the Crassa Meninx. For I have often observed a great quantity of bloud to have flowed from some broken Vessel which adhered to the second Table: neither must we prefently and forthwith stay such bleeding, but fuffer it to slow according to the plenitude and ftrength of the Patient; for thus the Fever, and together therewith the rest of the symptoms are diminished. For the opinion of Hippocrates, in every green Wound it is good to cause often bleeding, Lib. de ulcer: except in the Bellies; for thus the vehemency of pain, inflammation and other accidents will be lefs troubleform; also it is not amiss too for old Ulcers to bleed much, for so they are freed from the burden of the impact humours. When you think it hath bled fufficiently, it may be tranched with this following Medicin described by Galen.

Re Pulveris Aloes 3 is, thuris Malitches, an. 3 i f. albumina oversom nu.i). agitentur found cum pilis lepo-Gal.6 mete.

rinis minution incifis, fiat medicamentum. When the bleeding is flaid, you shall, for the affwaging of
pain, drop upon the Meninx forne Pigeons blood, yet warm by opening a Vein under the Wing, then it shall be strewed over with this following Powder: W Alves, Thuris, Myrtha, Sanguinis draconir an. 3 i. Misce, fiat pulvis subtilis. Also you may make an irrigation with Rose Vinegar, or some repelling Medicin such as is a Cataplasim ex farinis, & oleorofaces. Which may be applied until the sourch

day to affwage and mitigate pain.

Vigo's Gerate will be of good use in this case, as that which in my opinion is most fit for fractures Vigo's Corate of the skull, because it draws powerfully, resolves and dries moderately, and by reason of the smell good for a refreshes the animal spirits, and strengthens the Brain and Membranes thereof, as you may easily now, broken skull. refreshes the animal spirits, and strengthens the Brain and Membranes thereof, as you may easily perceive by things which enter into the composition thereof. R. Olei rof. Omph. refine pini, gummi Elemi, an. 3 ij. Mastiches 3 i β. pinguedinis vervecis castrati 3 ij. β. soliorum beton. caprifol. anthos, an. M. i. autonomiaci 3 B. granorum tinctorum 3 x, liquata pinguedine ; terenda terantur, & ammoniacum fimul cum aceto scillitico, eliquetur; deinde bulliant, omnia fimul in lib.ij, vini boni, lento igue usque ad consiumptionem vini, deinde exprimantur; eum expressone addantur terebinib. Ven. 3 iv. cere albe quantum sufficit, siat cere-tum molle ad usum predictium. Also let the neck, and all the Spine of the Back be anointed with a lini-ment, which hath force of mollisying the Nerves, lest they should suffer Convulsion; such is this.

Be Rutz, marrubii, rorifmar, ebulor, falviz, berb. paralyf.an.M.f. rad. Iren, cyperi, baccarum lauri, an. 3 i. A linimen florum chamentelil, hyperici, an. Mă. pițentur & macerentur omnia în vino albo per nollem, deinde coquantur în good against vafe duplici cum oleo lumbricorum, liliorum, de terebinthina, axungie anferis & hum. an. 3 iș. ufque ad con-Convultions. Sumptimem vini, postes colentur, & in colatura adde terebinth, venet, 3, iii, aque vit.e. 3 p. ecra quantum sinf-

ficit. Fiat linimentum secundum artem. But when the pain is affwaged, we must abstain from all such unctuous things, lest they make Gal. 4. mil. the Wound become fordid and malign, and putrefie the adjacent parts, and confequently the Crassa Mening and Skull; for the integrity of all parts may be preserved by their like, and such are dry things in a fracture of the skull. Wherefore all humid and oily things must be shunned in the cure thereof, unless peradventure there shall be some need to mitigate pain, and bring the humour to sup-

For, according to Galen, we are oft forced for a time to admit the proper cure of the disease, so to result the symptoms; furthermore Hippocrates would have us not to forment the Skull, no not How far hus with Wines but if we do, to let it be but with very little. Vidias interprets that little to be, when mid things are there is four of the last with very little. with Wine; but if we do, to let it be but with very little. Vidias interprets that little to be, when mid things are there is fear of inflammation; for Wine if it be red, tart, and aftringent, hath a reprefling, refrigerating and drying faculty: for otherwife all Wine, although it heats and dries by its faculty, yet it actually humeels and cools, both which are very hurtful in Wounds of the head, or a fractured skull, especially when the bone is bare; for from too much cooling of the Brain there is fear of a Convellion, or some other evil fymptom. Wherefore let this be ratified, that is, we must not use humid and unctuous Medicins in Wounds of the head, except for caring of inflammation, or the mitigation of pain caused thereby. Therefore let the bared skull be strewed with catagmatick and Why Cephacephalick Powders, (being so called by the Ancients, for that they are convenient and good in frallick or Catagoriums of the Skull and the reit of the Bones;) for by their driness they consume the superfluous matick Powders of the Skull and the reit of the Bones;) for by their driness they consume the superfluous matick Powders of the Skull and the reit of the Bones; for that they are convenient and good in frallick or Catagorium, and by that means help Nature in the separating of the broken bones, and the regenerating of steff. Such Powders usually consist of such things as these ensuing; Thus, Radix Irisos florest, faring bordes, & Ervi, pulvis Aloes Hepatice, Sanguis Draconis, Mastiche, Myrrba, rad, Aristoschuse. Gentiane; and generally all fuch Simples as have a drying and an abstergent faculty without biting; but you must not use these things before the pain, inflammation, and apostumation be past; that is, then, when the Membranes must be cleansed, the bones scaled, and the sless generated. For the when to be skull, by how much it is the drier, by fo much it requires and more eafily endures more powerful used.

How to be mixed when they are to be applied to the Meninger.

and drier Medicins than the Dura Mater or Pericranium, as that which in quickness of sense comes far thort of thefe two. Wherefore when you would apply the fore-mentioned cephalick Powders to the Meninger, they must be affociated and mixed with Honey, Syrup of Roses, or of Wormwood, and such other like, that so their too violently drying faculty may be allayed and tempered.

CHAP. XVII.

Why we use Trepaning in the Fractures of the Skull.

Here are four causes of this remedy: The first is to raise up the deprest Bones, and take forth their fragments which preis upon the Meninges, or also upon the substance of the Brain. The fecond is, that the families or matter may be evacuated, cleanfed, wasted, and dried up, which by the breaking of any vessel is poured forth upon the Membranes, whereby they, and not they onely, but the Brain also is in a great danger of corruption. The third is, for the fitter application of Medicins, convenient for the wound and fracture. The fourth is, that so we may Why a repel-Why a repel spansation of metalins, the function of a repelling Ligature, and fuch a one as may cannot be used hinder defluxions; for fuch a Ligature cannot take place here as it may in the other parts of the in fractures of body, by reason of the spherical or round figure of the head, which doth not easily admit binding a and then the dentity and hardness of the interpoled Skull is a means that the veilels lying under it (by which usually the defluxion comes) cannot easily be bound with a rowler sufficiently to repel the running bloud. And the external Veffels (to whom the force of the Ligature may come) cannot be bound without great pain, and danger of inflammation. For by such a compression the pulfation of the Arteries would be intercepted, and the efflux of the fullginous excrements which useth to pass through the sutures of the Skull, would be supprest, by reason of the constriction of these

How the Pa-tient must be placed when ou Trepan

What to be done before the application of the Tre-

A Shews the bandle.

and fitted into the bandle,

pan.

Befides also, the bloud would thus be forced from the wounded part without, to within into the Membranes and Brain; when pain, inflammation, a Fever, Abfects, Convultion, Palite, Apoplexy, and laftly Death it felf would enfue.

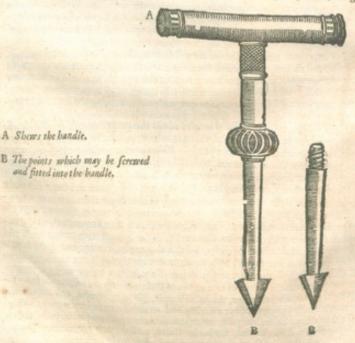

And these are the chief causes that Trepaning is necessary in fractures of the Skull, and not so in the fractures of other Bones.

But before you apply or put to your Trepan, the Patient must be fitly placed or seated, and a double cloth must be many times wrapped about his head, and then his head must be so laid, or pressed upon a Cushion or Pillow, that when you come to your operation, it may not link down any further, but remain firm and fleddy. Then you must stop the Patients Ears with Cotton-wool, that so he may not hear the noise made by the Trepan, or any other Instrument.

Eut before you put to your Trepan, the bone must be pierced with an Instrument, having a three-figuare point, that so it may be the more speedily and certainly personated. The point thereof must be no bigger than the pin of a Trepan, that so the Trepan which is forthwith to be applied may stand the more firm, and not to play to and again in too wide a hole.

The shape of this Instrument is not much different from a Gimblet, but that the point is threefquare, and not twined like a fcrew, as you may perceive by this following figure.

A Gimblet or Piercer to perforate the Skull before the setting of the Trepate.

CHAP. XVIII.

A Description of Trepans.

Repans are round Saws which cut the bone circularly, more or less according to their greatness; they must have a pin standing in the middle a little further out than their teeth, so to stay and hold fast the Trepan that it stir neither to this side nor that, until it be entered, and you have cut through the first table at the least: then you must take forth the pin, lest going quite through the bone, it may prick or hurt the Crassa Menius. Wherefore when you have taken forth the pin, you may fafely turn it about until you have cut through both the tables; Your Trepans must also have a cap, or somewhat to engirt or encompass them, lest no way hindred they cut more of the bone than we would, and in conclusion run into the Menine. They must also be anointed with oil, that to they may cut more readily and gently; for thus Carpenters ale to greate their Saws. But you must, during the time of the operation, often dip them in cold water, left the bone. The harm the by attrition become too hot: for all hard folid bodies by quick and often turning about become hot; bone receives but the bone made more hot and dry, is altered and changeth its nature, fo that after it is cut more ed with the one made more hot and dry, is altered and changeth its nature, fo that after it is cut more ed with the off, its fcales and falls away. Now you must know that the bone which is touched with the Tre-Trepan. Pan or the Air, always calls off fcales: for the speedier helping forwards whereof, you must firew what things upon it powders made of Rocket, Briony, wild Cucumber, and Arightechis-roots. When the bone baften the featist following recorder he not promit which backs featily to cover the bone ling of the is sufficiently scaled, let this following powder be put upon it, which hath a faculty to cover the bone ling of with flesh, and to harden it with driness convenient to its kind. Re Pulver. Irees Illyrice, Aloes Manne theris, Myrebe Aristolochie, an. 3 i. Flesh being by this means generated, let it be cicatrized by strewing upon it the rinds of Pomegranates and Alum burnt.

Neither shall the Chirurgeon forcibly take away these scales, but commit that whole work to Na- The bone ture, which useth not to cast them off before that it hath generated shell under them. For otherwise must not be liftle do not thing rights, he brings now corruption to the bones as we shall more at large declare. if he do any thing rashly, he brings new corruption to the bone; as we shall more at large declare, led.

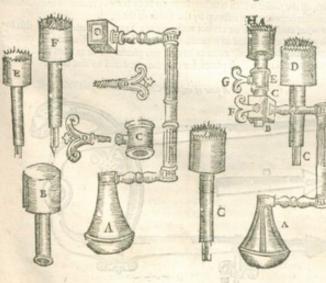

when we come to treat of Caries, or rottennels of Bones. He which useth the Trepan, must consider this, that the head is of a round figure, and also the Tre- A caution in pan cuts circularly, and therefore it is impossible to cut the bone so equally on every side, as if it were Trepaning. performed upon a plain body. Furthermore the thickness of the skull is not alike in all places, wherefore you must look and mark whether the Trepan go not more deep on one fide than on the other,

which you may do by measuring it now and then with a Pin or Needle, and if you find that it is cut deeper on one fide than on the other, you must press down the Trepan more powerfully upon the op-

But feeing there are many forts of Trepans invented and expressed by many men, yet if you weigh A fase and
But feeing there are many forts of Trepans invented and expressed by many men, yet if you weigh A fase and
Convenient and rightly confider them all, you shall find none more safe, than that I invented and have here de-lineated. For it cannot pierce one jot further into the skull, than he pleases that uses it, and therefore it cannot hurt either the Meninger or the Brain. An iron head or cover, flays it as a bar, that it can penetrate no further than you shall think it requisite. This head or cover is to be drawn up and down, and fet higher and lower, as he which uses it shall think good, and so it will stay the Trepan that it shall not go a hairs bredth beyond your intended depth. So that henceforwards there shall be no Chirurgeon, howfoever ignorant in the performance of his Art, which by the benefit of fuch a Trepan may not perform this operation without any danger, or fear of danger, of touching the Durs Mater, the hurting whereof, puts the life in jeopardy.

The figure of our Trepan opened and taken in pieces.

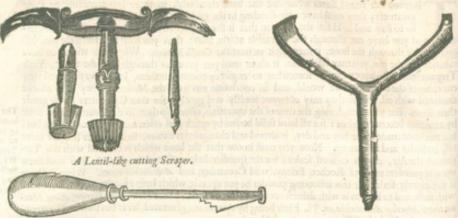

The figure of the Same Tropan fitted and put together.

- A Shews the sobole bandle or Brace of
- B The Cover or Cap of the Trepan.
- C Theferule.
- D D The Screw-pins which hold and fray the ferule and Trepan. E The Trepan without his pin.
- The Trepan furnished with its pin.
- A Shews the Brace and Trepan fitted
- in every point.
- B The place into which the Trepan is put and fitted.
 CCC The upper end of the Trepan
- which is to be fitted and put into the Brain.
- D. The Trepan with its cover or cap sepon it. The ferule.
- A screw-pin by the twining whereof the Trepan is fastned in the Brace.
- G Another screw-pin which fastens the ferule closer to the Trepan.
- H The three-square point.

In flead of the other Trepan fet forth by the Author, I have thought fit to give you the figure of that Trepan that is here most in use, and the fittest therefore, as it is set forth by Dr. Grook.

A Terebellum or Gimbles confishing of three branches.

All these particulars of the Trepan taken asunder, you may see united and fitted together in the other figure. But when you cannot bring out the bone which you have cut off with your Trepan, then you may take it forth with the Terebellium or Gimblet here express, that is, screwing the point thereof into the hole made by the three-fquare pin; the handle of this infirument may also ferve in flead of a Levatory. When with the Gimblet you have drawn or taken forth that part of the Skull which was cut away by the Trepan; if there thall be any tharp splinters in the second Table which may hart and prick the Mening when it is heaved up by the motion of the brain, they must be shaved away and planted with this Lentil-sashioned scrapers, being so called, because it hash the head thereof fashioned and smooth like a Lentil, left being sharp it should hurt and prick the membrane in the fmoothing thereof.

The afe of a Leaden Mul-

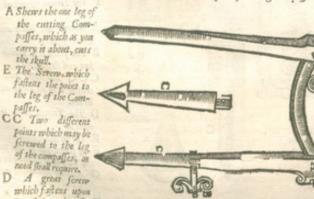

But if by reason of the thickness the Skull cannot be cut with the Lentil-like Scraper, you may use the cutting Scrapers and a Mallet. The Mallet must be of Lead, that so it may shake the Brain as little as may be. But you must diligently with your Mullets take forth the sharp splinters, and pieces of the Bone. But if the fractured part of the Skull be fuch, that it will not admit that Section which is requifite for the bared bone, as when the fracture is upon the temporal mufcle, or at the futures; then in Why a Tre-pan must not be flead of one Trepan, two or three must be applied, if the necessity of the present case so require, be applied to and that within a very small compass; but they imal not be applied to the fractured part, but night the saures.

The flead of one Trepan, two or three must be applied to the fractured part, but night the saures.

The flead of one Trepan, two or three must be applied to the fractured part, but night thereto, as we shall shew more at large in the following Chapter. But the Trepans shall be applied so Why two Tre- near to each other, that the ring of the fecond may be joined with the ring of the first and third. But pans are to be if a fracture shall happen to light upon a future, then you must not apply a Trepan to it, but use two wied to a fracture on each side; he that shall do otherwise shall tear in sunder the nervous and membraous sides and the state of some contents of the state of some contents. ctured future, thereto on each inde, he that man do otherwise man tear is fastned to the Skull, and yields matter to the Pericranium. He which shall apply one Trepan, that is, but upon one side of the suture, he shall not be able to get forth all the sanies which is fallen down on both sides by reason of the partition of the Craffa Meninx, which lies between and rifes up by the future of the skull

To conclude, when for what cause soever we cannot make use of a Trepan, we may imploy this Infirement, if to be as much of the bone be bared as is needful. It is made in form of a pair of Compatfes, and by means of a Screw may be opened, more or lefs, as you pleafe. You as need shall require may change the points, and put other into their places, for they may be fitted to one fide of the Compass with a Screw.

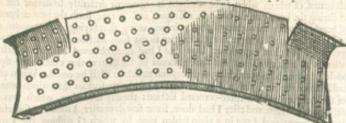

A pair of cutting Compasses to cut forth the Skull.

an Ironstring, along it which the one of the legs of the Compass running may be widered and straitned as you

the mark mark

A crooked Iron place fit to fultain and hold feeddy one leg of the Compass upon the head.

Another pair of Compasses of the like nature and use, which may be widened and strainned by a Screw.

Moreover it is fit that the one leg of fach cutting Compaffes should stand firm and steddy, whilest the other is drawn circularly to cut. Wherefore it is fit you have an iron plate made full of little holes, wherein you may firmly flay that leg of the Compafs, left it waver against your will; it is requisite that this plate be crooked, (because the head is round) that so it may be fitted to any part thereof.

CHAP. XIX.

Of the places of the Skull subcreto you may not apply a Trepan.

Virit of all, you shall not apply a Trepan to a Bone that is so broken, that it is wholly, or in the Abone almost greater part thereof, divided from the skull by the violence of the strong, less by your weight several must be skull by the violence of the strong, less by your weight several must be strong to the strong the strong than the skull by the violence of the strong that it is wholly, or in the Abone almost greater part thereof, divided from the skull by the violence of the strong that it is wholly, or in the Abone almost greater part thereof, divided from the skull by the violence of the strong that it is wholly, or in the Abone almost greater part thereof, divided from the skull by the violence of the strong that it is wholly, or in the Abone almost greater part thereof. and prefting of the Trepan, you force it down upon the membrane. Secondly, you must not the skull must apply one to the fractured futures, for the reasons mentioned in the former Chapter. Thirdly, nor to ed. that part of the forchead which is a little above the eye-brows, for those reasons we gave you before in the twelfth Chapter. For there is in that place under the first Table of the Skull it felf, a large ca- A notable caviv in the with a certain white and tough humour, as also with a certain spirituous and airy fore-head fulfillance, placed there by Nature, to prepare the air which ascends to the Brain by the Notirils: unbess the Chirurgeon observe and be mindful hereof, he may be deceived, supposing this cavity to be an Effracture of the Bone, and a depression thereof. Fourthly, neither in the lowest parts of the Skull, less the reassessive substance of the Brain, by reasons of the Manne. left the marrowy substance of the Brain, by reason of its weight, should slide through the hole made by the Trepan. Fifthly, neither to the Bregma-bones of children, as those which as yet have not acby the I repan. Fifthly, neither to the Bregma-bones of children, as those which as yet have not acquired just folidity, to endure the impression of a Trepan. Sixthly, nor to the temples by reason of Lib. de Val. the temporal muscle, the centing whereof, in the opinion of Hippernies, causes convulsion of the opposite part. For being cut athwart it loses its proper action, that is, to move and lift up the lower Jaw; but then the opposite temporal muscle being whole and perfect, using its strength, (his Antagonist suffering it, and not resisting or labouring any thing at all to the contrary) it draws the same Jaw to it, whereupon the mouth and all the parts of the face are drawn awry, and suffer a convulsion towards the found part, the other being resolved according to Hippernies his rule. For as often as the Muscles of one kind are equal in number, magnitude, and strength on each side, the resolution of Hippernies have a file from the outer of the temporal muscle her also sent to the other.

Neither doth this danger alone arife from the cutting of the temporal mufcle, but also another, what discom-which is, that this mufcle when we car and speak, is in perpetual motion, whereby it comes to pass, modifies arise that being once cut, it is scarce ever united again, beside also the commissioner or joyning together of from coming the stony bones, lie under it. But by the second caution we are forbid to trepan upon the sutures; models. moreover also many Veins, Arteries, and Nerves are spread over the substance thereof, so that by cutting of them, there is danger of many and malign fymptoms, as pain, inflammation, a Fever, a Convulsion not onely of the part it felf, but also of the whole body, whence lastly death ensues. Wherefore let no Chirurgeon be fo fool-hardy, as to attempt the cutting of this masses, so to trepan the bond which lies under it; rather let him apply his trepan above it, or on the fide thereof, or as near to the affected part as I can, as I did in a Gentleman called Monfiner de la Bretefebe. He in the triumphant en- A History. trance of King Henry the fecond into the City of Paris, was fo hurt with a flone, that the Os Petrofien, or fealy bone, was broken with the violence of the blow, and the temporal mufele was vehemently contailed, yet without any wound. I being called the next day (viewing the manner of the hurt, and

the condition of the wounded part) thought good to bring some Physicians and Chinargeons with me to confult hereof, of whom when some thought it expedient presents and divide the temporal muscle, that baring the bone we might apply a Trepan, and so take forth the broken bones: I, on the contrary, begun carrefily to withstand that opinion, citing that saying of Hippocrates, ex libro de subscribus Capitis, wherein Chirurgeons are forbidden to cut such muscles, for sear of the fore-mentioned fymptoms; also I cited experience, how that I had often observed all those which had this muscle cut died with a Convulsion; but that it should be far bettere that near above the fracture the bone should be trepaned, not touching the temporal muscle at all, if he could, when all of them at the last had inclined to my opinion, I presently divided the musculous skin which was over the upper part of the fracture with a three-comered section: the day following, which was the third of his Disease, I trepaned him, and after I had done, some few days after, I took out some four splinters of the broken bone; and I put in a plain leaden pipe, by which (I withing the Patient ever when I dreft him to hold down his head, to ftop his mouth and his nofe, and then ftrive as much as in him lay to put forth his breath) much fanious matter came forth, which was gathered between the Skull and Craffa Meninx. Other filth which fluck more fast, I washed out with a detergent decoction, injected with fuch a Syringe as is here exprest; and I did fo much, God bleffing my endeayours, that at length he recovered.

A plain leaden pipe for to carry forth the Sanics gathered under the Skull.

A little Syringe fit to make injections withall,

A Hillory.

The like chance and fortune befel Monsieur de Pienne at the fiege of Metz. For he, as he fought at the breach of the Wall, had the bone of his temples broken with a flone flruck out of the adjacent Wall by a piece of Ordnance (hot from the Emperours camp, he prefently fell down with the blow, and east bloud out of his mouth, note, and ears, with much vomiting, and remaining dumb, and as it were, fensless almost fourteen days, so that he knew none of the by-standers. He had often palpitations, and convultive twitchings, and his face was fwollen. His fore-head bone was trepaned at the fide of the temporal muscle by the hand of Peter Aubert the Kings Chirurgeon: and although on the 25, day soft stell endued with exquisite sense grew out of the hole made with the Trepan, whose growth could not be hindered by Catheretick Powders, yet at the length he recovered. The Ancients called this kind of growing flesh, a Fungus [i.a Mushrome] for that it is foft, and grows with a small root and broad top like a Mushrome: but it increases and decreases, according to the plenty of the flowing matter, and industry of the Chirurgeon hindering by art the growth thereof. This flesh sinks exceedingly, they commonly call it Fieus saniti Fiaerii [i.the Fig of S. Fiaerys.] This disease commonly that it is original after this manner. Even as in the bodies of trees from the excrements of nourishment, a certain half putrid, gross and viscous humour sweats through the bark, and gathered together by little and little against Moshroy. So blend methods both both ther by little and little grows into a Mushrom; so bloud melancholy both in temper and confishence, fprings from the broken veffels of the skull and Graffa Meninx, which also is sent sometimes by Nature for the necessary repairing the flesh in these parts, whereupon a certain Fungue breeds, which in Galeur opinion favours or partakes of the nature and condition of the parts to which it grows, though in general it be of the nature of malign Warts or Excrefcences. But for to take away fuch Fangi, you must apply medicins which have a specifick faculty to waste superfluous sleth; such are those which strongly dry, and gently waste and eat, such as this which follows. R. Sabine 3 is ceres 3 is pulverisenter sound, astergatur caro excrescent. Or else R. Hermodastylorum combustorum 3 B, make a powder for the fame use. But if so be that this fungous flesh come to such growth, (as it often hap-pens) as to equal the bigness of an Egg, it must be tied and strait twitched close to the root with a tilken thred; and when it shall fall away by reason of this binding, the place must be strewed with the fore-mentioned Powders, for so it will be more certainly cured than with more acrid Cathæreticks.

CHAP. XX.

Of the corruption and Caries, or rottenness of the Bones of the Head.

Why when the Skull is broken, the foul or rotten.

Corrupt bones

Here fometimes follows a corruption and Sphacel of the fractured bones of the Skull upon wounds of the Head; which happens, either because they are touched by the air, which they are not sensible of, or for that the fanies putrefying and detained under them, hath infected them with like putrefaction; or by the cure unskilfully handled, they by the rath application of fuppurating and oily Medicins becoming more moift, and to undergoing an unnatural change of their foul or rotten.

Proper complexion and native temper, as we shall show more at large when we shall treat of the reation of the Carier in the Lucr venera. We shall know this unnatural change and corruption, partly foulness of the by sight, that is, when from white they become to be yellowish, livid, and black; partly also by putting down a Probe, when as it meets with nothing smooth and slippery, but feels rough in many places, and besides also when it enters and easily penetrates with a small thrusting down into their substance, as if it were suppose. Yet this loss of the proper states with a small thrusting down into their substance, as if it were suppose. flance, as if it were fungous. Yet this laft fign may often deceive you, for I have divers times observed rotten bones, which being bare had long suffered the injury of the air, to become so hard, that a Trepan would scarce pierce them; for it is putrid humidity which makes the bones soft and sungous, timen mi

but the air by drying them exhaufts this humidity, and lattly dries it, whence follows fuch contuma-cious hardness. This fign will be far more certain, if the flesh which is grown upon the bone be more foft than is fit, loofe, and have little or no fenfe of feeling. You may correct and amend this corruption of the bone with cauteries as well actual as potential, or with powders of Alors, Gentian, Ariruption of the bone with cauteries as well actual as potential, or with powders of Aloes, Gentian, Arifiologies, Centaury, Cortex pini: as is Radie, Ireos, Flor. Arithologies an. 3 is conjunt. 3 i with no flesh growing over it, would be corrupted by the appulse or touch of the air. Yet you that he held growing over it, would be contained by the appeals of touch of the air. Yet you shall by little and little gently move and shake rotten bones with your Probe, that so they may more easily scale, and with less trouble to Nature. But note by the way, that the scaling of the bone which hath environed the Trepan, is commonly performed in the frace of forty or nity days. So long also will that caused by the unusual appulse or torich of the air, or application of a cautery, or the afpertion of the Cephalick Powders; befides also, in the fatne number of days broken bones may be united and joined together by a Callus, which is to them as a fear, yet fometimes fooner, fornewhiles later, according to the variety of the ages, tempers, and habits of diversmen. But if the Garies or rottenness can neither by these fore-mentioned remedies be overcome and amended, neither the loofed continuity applicanated or united, you must give the Patient a vulnerary Potion; The benefit of for hence I have found happy facces irrinany. But fornetimes not onely a certain portion of the botte a value is taken with a Caries, but also the whole is often seized upon with a sphacel, and all falls out. For, potton. in Hippocrates opinion, Lib. de Vulneribus Capitii, the bone of the Skull being broken, falls from the found more or lefs, according to the violence of the blow; which also is confirmed by experience. For which purpose I think good in this place to recite a History, whereof I was an eye-witness, whilest I ferved as a Chirurgeon in Pientont under the Marthal de Montejan (who was the Kings Lieutenant there.) It happened that a Lacquey of Monsteur de Coulains came to me to be cured a he half the Brig. A History. ma bone of the left fide broken with a Sword, neither yet didighe fracture come to the fecond Table; a few days after his recovery, the bone being agalutinated and united, it came to pass that a company of Gascoign Souldiers (his Country-men) came to Thrib, with whom one morning he eat plentifully Tripe fried with Onions and Spices, and drank a great quantity of firong Wine. Whereupon he prefently fell into a continual Fever and lost his Speech and understanding a his head (welled, his eyes looked red and fiery, and as though they would have started out of his head. Which things being considered, I let him bloud, having first (by the Physicians advice) given him a Clyster, and applied to his head fuch things as were he; and also I laboured with Frictions and Ligartness of the extreme parts, to draw the humours downwards, yet for all this the part of the head which was formerly affected begun to apostumate; which being opened, there came forth a great quantity of matter, and at the length the mufculous skin and Pericranium linking down, both the Tables of the Skull became putrefied and rotten, as you might know by their blackness and flench. Now to take away this corruption, I applied at certain times actual cauteries, both to amend the corruption and feparate that which was altered: but mark, after fome moneths space, a great number of Worms came forth by the holes of the rotten bones from underneath the putrefied Skull; which moved me to haften the feparation and falling away of the putrid bones. Which being done, upon the very Craffo Modax, A great falling which is more firange, in that place which Nature had covered with fleth, I observed three cavities away of a cot of the largeness of ones thamb filled with Worms about the bigness of a points tag, with black heads, rape bone. diverfly wrapped att.ong themselves. The bone which Nature separated was of the bigness of the Palm of ones hand, so that it was strange that so large a portion of the skull should be can off by Nature, and yet the Patient not die thereof; for he recovered yet beyond all mens expectation, but after the agglutination of the wound the fear remained very hollow according to the decree of Hippo- Api 45 fell.6. crater. For fieth doth not eafily grow upon a Callies, because it is a thing strange and suppositions by Nature: befides, as a fear is a thing more denfe than the skin, to is a Callus than the bone, fo that through the more compact fubfiance thereof, the bloud can neither freely nor plentifully fiwest through for matter to regenerate fielh. Hence it is that wherefoever any portion of the skull is wanting, you may there by putting to of your hand perceive and feel the beating of the brain, wherefore the Skull must needs be much weaker in that place. Now to help this infirmity, I wished this
Lacquey to wear a Cap made of thick Leather, so more easily to withstand external injuries; and
weight thereby be grown much better. Lacquey to wear a Cap made of thick Leather, so more easily to withstand external injuries; and verily thereby he grew much better. Now I think good in this place to lay open the deceit and craft of some Impostors fally stiling themselves Chirurgeons, who when they are called to care Wounds of craft of Imput a plate of Gold in the place of the skull is lost, perfuade the Patient and his Friends that they must postors. Presence of the Patient, and turn it divers ways and apply it to the part, the better to fit it; but presently after they shilly convey it into their purses, and so leave the Patient thus courened. Others brag that they are able to put the dried rind of a Gourd in the place of a lost bone, and saften ir on to defend the part; and thus they grossy abuse which are ignorant in the Art. For this is so far from being done, that Nature will not suffer nor endure so much as an hair, or any other small. far from being done, that Nature will not fuffer nor endure fo much as an hair, or any other finall body to be that up in a Wound when it is cicatrized; neither is the reason alike of a leaden buller, which shot into the body lies there for many years without any harm to the Patient; for although lead have a certain familiarity with Mans Body, yet is at length (unlefs the dentity of the oppoint fieth, ligament, tendon, or fome other fixeh like substance hinder) thrust forth by Nature, impatient of all firange bodies. And thus much of the rottennels and corruption of fractured bones; now must we speak of the discommodities which befall the Meninger by Wounds whereby the Skull is

CHAP. XXI.

Of the discommodities which happen to the Crassa Meninx by frattures of the Skyell.

Any discommodities chiefly happen to the Craff's Meninx by a fracture of the skull, and ralh trepaning thereof; for it fometimes chances to be cut and torn. Agglutination is a remedy for this difease, which Hippocrates wishes to be procured with the juice of Nepeta, [that is, of that Calamint, which finells like Penny-royal] mixed with Barley-flour. In flead where-

Remedies for the lacerated Mening.

of this following Powder having the like faculty, may take place.

Re Colopbon 3 iii. Myrrhe, Aloes, Mafiches, Sanguinis Dracon. an. 3 ii. croci, farcocolle, an. 3 ß. mifce & flat pulvis fubrilis. But to purge the bloud and matter which is gathered and lies between the Craffa Meninx and skull, you shall put in a Tent made of a rag twint up four four or five double, and fleeped in Syrup of Roles or Wormwood, and a little Agua Vite; for thus you shall press down both the Craffa Mening, left lifted up by the accustomed and native pulfation of the Brain, it should be hurt by the edges of the Skull, yet rough by reason of the sharp splinters of the bone lately trepaned, and give freer paffage forth for the matter there contained. But as oft as you shall dress the Patient, you shall renew the fore-mentioned Tent, untill all the matter be purged forth. And so often also you shall press down with this following Instrument the Dura Mater, and bid the Patient to strive to put forth his breath, ftopping his mouth and nofe, that fo the mafter may more cafily be evacuated. This Instrument wherewith you shall hold down the Dura Mater, must have the end round, polisht, and fmooth, as it is here exprest.

A fit Instrument to press and hold down the Dura Mater, so to make way for the passage forth of the Sanies or Matter.

stachad utrinsque an. M. iij. G. rad. eyperi, calam. aromat. ireos, caryophyllate, angelice, an. 3. 15. bulliant omnia secundum artem cum aqua fabrorum & vino rubro, fiat decociio ad usion dicium. An in stead hereof you may use Claret with a little Aqua Vita, that so the contained matter may be evacuated and dried

up. A Sponge is fitter for this purpole to draw than a linnen rag, or any other thing, both because it is good of it felf to draw forth the humidity, as also for that by its foftness it yields to the pulsation of the Brain. Then apply to the Wound and all the adjoining parts, an Emplaifier of Discalcibous diffolved with Vinegar or Wine, or Oil of Rofes, that so the Plaifier may be the more gold and soft-

For, in Hippocrates opinion, nothing which is any thing heavy or hard multi be applied to the wounds of the head, neither most it be bound with too strait or hard a ligature, for fear of pain and inslam-

And let there be laid upon the Dura Mater strewed over with the forenerly fore-mentioned Powder, sponge moistned and wrung forth of a drying decoction made of aromatick and cephalick things, fuch as this which follows. we must use.

How the Patient must lie in his bed.

For Galen tells (as he had it from Mantias) that a certain man had lost his eyes by inflammation and impostumation, ariting for that an Apothecary had used too strait a ligature to his head and face; for this strait ligature so pressed the sutures, that the fuliginous vapours, which used to pass through them and the pores of the skull, were tropped from patting that way; befides, the beating of the Arding of the head, his eyes were rent and broke in funder and fell forth of their orb. Wherefore Hippocrates rightly comwhat cloaths mends an indifferent ligature: also he fitly wishest us to let the Emplaisfiers be fost which are applied to the head, as also the cloaths wherewith it is bound up to be of fort and thin Linnen, or of Cotton or Wool. When the Patient is in dreffing, if there come much matter out of the Wound, you shall wish him if he can, to lie upon the wound, and now and then by fits to strive to breathe, stopping his mouth and nose, that so the brain lifted and swollen upwards, the matter may be the more readily cast forth; otherwise suffer him to lie so in his bed, as he shall best like of, and shall be least troublesom to him. You may with good success put upon the Crassa Menice. Oil of Turpentine with a small quantity of Aqua Vine and a little Aloes and Sasfron finely powdered, to cleanse or draw forth the Santes or Matter, Or else, R. Mellis rosar. 3 ij. farine bord. pulver. aloes, mastieb. & Ircos storent. an. 3 [. Agua Vit.e. p. arum ; let them be incorporated together and make a deterfive Medicin for the aforefaid ufc.

Paulus lib. 6. cup. 90.

Sometimes also the Craffa Meninx is inflamed after Trepaning, and fwollen by a Phlegman, that, impatient of its place, it rifes out of the hole made by the Trepan, and lifts it felf much higher than the kull, whence grievous fymptoms follow. Wherefore to prevent death, of which then we ought to be afraid, we must enlarge the former hole with our cutting Mullets, that the matter contained under the Skull, by reason of whose quantity the membrane swells, may the more freely breathe and pass forth, and then we must go about by the prefeript of the Physician to lethim bleed again, to purge and diet him. The inflammation shall be resisted by the application of contrary remedies, as this following formentation. Its Sem.lini, althe. fan. psillii, referab. an. 3 i. folani, plantag. an. Anodyne and repelling Medicins shall be dropped into his ears, when it is exceedingly swollen, that the tumor may subside, you shall cast upon it the meal or flour open the crass that is in a dwithall you conjecture that there is Pas or Matter contained therein, then you must open the Dura Mater with your incition-knife, holding the point upwards and outwards, for so the matter will be poured forth and the substance of the Brain not hurt nor touched. Many other Chirurgeons, and I my self-shave done this in many Patients with various success. For it is better in desperate cases to

the second

to trya doubtful remedy than none at all; also it oft-times happens, whether by the violence of the contusion and blow, or concretion, or clotting of the bloud which is shed, or the appulse of the cold air, or the rash application of Medicins agreeing neither in temper nor complexion with the Crass a Moning, or also by the putrefaction of the proper substance, that the Dura Mater it self becomes black. The causes

Of which fymptom the Chirurgeon must have a great and special care.

Therefore that thou mayest take away the blackness, caused by the vehemency of the contusion, of the blackness, you shall put upon it oil of Eggs with a little Agena Vita, and a small quantity of Saffron and Orris roots in fine powder, you shall also make a somentation of discussing and aromatick things boiled in Remedies for Water and Wine; and Vigo's Cerat formerly described shall be applied. But if the harm come from consiston.

Water and Wine; and Vigo's Cerat formerly described shall be applied. But if the harm come from consiston.

For connected. congealed bloud, you thall withfland it with this following remedy. Re Aqua vita 3 ij. graner, tin-For co dorum in tenuem pulverem tritorum 3 ij. B. croci, 3 i. Meliu refat. 3 ij f. farcecol. 3 iij. Levier & famul buliant omnia, & de colatura infundatur, quousque nigrities fuerit obliterata. If this affect come by the touch of the air, it shall be helped with this following remedy. R. Tereb. ven. 3 iij. Melis 10f. 3 ii. For the hure Vitellum ov. unum, farin. bordei 3 iij. croci 3 i. farcocol. 3 ij. aq. vitæ 3 ij. incorporentur fimul, & buliant This remedy shall be used until the blackness be taken away, and the Membrane recover paululum.

its priftin colour.

But if this affect proceed from the rash use of Medicins, it must be helped by application of things contrary. For thus the offence caused by the too long use of moist and oily Medicins may be amended by using catagonatick and cephalick powders; but the heat and biting of acrid Medicins shall be miti-gated by the contrary use of gentle things; for both humid and acrid things somewhat long used, make the part look black; that truly, by generating and heaping up fifth; but this by the burning and hardning heat. But when fuch blackness proceeds from putrelaction, John de Vigo commends the following remedy. We Agua Vine 3 ij. melit roslat. 3 β. But if the affect be grown so continued. cious that it will not yield to this gentle remedy, then this following will be convenient. Re Agus the Maries. Vite 3 ii), mellis rof. 3 i, pulver. Mercur. 3 ii, senies ebullitione bulliant fimul ad ufum dictron. Or, R. Aq. vit. 3 i f. fyrup, abfinth. & mellis rofat, an. 3 ij. nuguenti Ægyptisti 5 i. p. farcocol, myrrha, aloes, an. 5 i. vini albi boni & odoriferi, 3 i. bulliant leviter omnia fimul, colentur ad nfum dellum. But if the force of the putrefaction be so flubborn that it will not yield to these remedies, it will be helped with Agyptiscum (made with Plantain Water in flead of Vinegar) used alone by it self, or with the powder of Mercury alone by it felf, or mixt with the powder of Alum. Neither must we be afraid to use such remedies especially in this extreme disease of the Dura Mater, for in Galens opinion the Crassa Meninx, after why the crast-the skull is trepaned, delights in Medicins that are acted, that is, strong, and very drying, especially if sames estiit have no Phlogmen: and this for two reasons; the first is, for that hard and dry bodies, such as membranous bodies are, he not eafily affected, unless by strong Medicins; the other is, which must crid Medicins be the chief and prime care of the Phylician, to preserve and restore the native temper of the part by things of like temper to it. But if the auditory paffage not onely reaching to the hard membranes of the Brain, but also touching the Nerve which descends into it from the Brain, suffer most vehement Medicins, though it be placed so near; certainly the Crass Mening will endure them far more easily and without harm. But if by these means the putrefaction be not restrained, and the tumor be increafed fo much, that the Dura Mater riting far above the skull, remains unmovable, black and dry, Signs of death and the Patients eyes look nery, fiand forth of his head and rowl up and down with unquietness and at hand. a phrensie, and there so many ill accidents be not fugitive, but constant; then know that death is at hand, both by reason of the corruption of the gangrene of a noble part, as also by extinction of the

CHAP. XXII.

Of the Cure of the Brain, being shaken, or moved.

E have formerly declared the causes, signs, and symptoms of the concussion, or shaking of What the contine Brain, without any wound of the musculous skin, or fracture of the bone; wherefore certion of the first three continues of the Constant three continues of the continu for the present I will treat of the Cure. Therefore in this case, for that there is fear that fome Veffel is broken under the skull, it is fit prefently to open the cephalick Vein, and let bloud be plentifully taken according to the firength of the Patient, as also respectively to the disease both which is prefent and like to enfue, taking the advice of a Phylician. Then when you have flaved away the hair, you shall apply to the whole head and often renue the fore-mentioned Cataplain, Ex farinis, eleo refaceo, osymmelite, and other like cold and moist repelling Medicins. But you must eschew dry, and too aftringent Medicins must be shanned, such as are Unquentum de belo and the like; for they obstruct too vehemently, and hinder the passage forth of the vapours both by the sutures and the hidden pores of the skull. Wherefore they do not onely not hinder the instanmation, but fetch it when it is absent, or increase it when present. The belly shall be loosed with a Clyster, and the acrid vapours drawn from the head; for which purpose also it will be good, to make frictions from above downwards, to make firaight ligatures on the extreme parts, to faften large cuppingglasses with much flame to the shoulders and the original of the spinal marrow, that so the revulsion of the bloud running violently upwards to the brain, and ready to cause a Phlegmon, may be the greater. The following day it will be convenient to open the Vens Puppis, which is feated upon The opening the Lambdal future, by reason of the community it hath with the Veins of the brain, and shutting of the Vesa the mouth and nofe to firite powerfully to breathe. For thus the membranes swell up, and the Paper. blood gathered between them and the skull, is thrust forth, but not that which is shut up in the brain and membranes, of which if there be any great quantity, the case is almost desperate, unless Nature affifted with fironger force, cast it forth turned into Pur. But also after a few days the Vena frontie or fore-hand Vein may be opened, as also the Temporal Arteries, and Veins under the Tongue, that

the conjunct matter may be drawn forth by so many open passages. In the mean space the Patient must keep a spare diet, and abstain from Wine, especially until the 14. day, for that until that time the fearful symptoms commonly reign. But repelling Medicins must be used until the 14. day be pass, when we must come to discussing Medicins, beginning with the more mild, such as is this following decoction. R. Rad. Alth. 3 vj. reos, cypari, calamarom. an. 3 ij. fol.falvia, majoran. betonic, flor. chamam-melil. rofirah. flachad. an.M. B. falis com. 3 iij. bulliant omnis famul fecundum artem enon vino rub. & aqua fabrorum, fiat decoclio. Let the head be walhed therewith twice a day with a Sponge. But yet when you do this, fee that the head be not too much heated by fuch a fomentation, or any fuch like thing, for fear of pain and inflammation. Then you shall apply the Cerate of Vigo which hath power to discuss indifferently, to dry, and draw forth the humours which are under the skull, and by its Aromatick force and power to confirm and firengthen the Brain; it's thus described. Re Furfurir bene triturati 3 iij. farin. lentium 3 ij. rof. myrtillor. foliorum & granorum ejus, an. 3 i. calam: aromat. 3 i. S. chamemel. melil. M. Vigo faith that one of the Duke of Urbins Gentlemen found the Urine hereof to his great goods He fell from his Horfe with his head downwards upon hard Marble, he lay as if he had been dead, the bloud gusht out of his nose, mouth, and ears, and all his face was swollen, and of a livid colour a he remained dumb twenty days, taking no meat but diffolved Gellies, and Chicken and Capon broths with Sugars, yet he recovered, but loft his memory, and faltered in his fpeech all his life after. To which purpole is that Aphorifin in Hippocrates; Those that have their Brain shaken by what cause soewer, must of necessity become dumb; yea, also as Galen observes in his Commentary, lose both their sense and motion. That Cerate is not of small efficacy, but of marvellous and admirable force, which would hinder the necessity of an also seem which was incident to the Brain the research of the sense of which could hinder the generating of an abfeefs, which was incident to the Brain by reason of the fall. Yet there be many men to far from yielding to reason, that they stifly deny that any impostumation can be in the Brain; and augmenting this errour with another, they deny that any who have a portion of the Brain cut off can recover, or rife again; but the authority of ancient Writers and Experience, do abundantly refel the vanity of the reasons whereon they rely. Now for the first, in the opinion of Hippocrater; If those which have great pain in their heads have either pas, water or blood flowing from their note, mouth, or ears, it helps their difease.

But Galen, Rhafis, and Avicen, affirm that Janies generated in the Brain, disburdens it self by the

nole, mouth, or ears; and I my felf have observed many who had the like happen to them.

I was told by Prothais Coulen, Chirurgeon to Monfieur de Langey, that he faw a certain young man in the Town of Mans, who often used to ring a great Bell, he once hanging in sport upon the rope, was fnatcht up therewith, and fell with his head full upon the pavement; he lay mute, was deprived of his senses and understanding, and was besides hard bound in his Belly. Wherefore presently a Fever and Delirium, with other horrid fymptoms affailed him, for he was not trepanned because there appeared no fign of fracture in the skull: on the feventh day he fell into a great fweat with often fricezing, by violence whereof a great quantity of matter and Pau flowed forth of his ears, mouth, and node; then he was eafed of all his fymptoms, and recovered his health.

Now for the second, Galen affirms that he saw a Boy in Smyrna of Ionia, that recovered of a great wound of the Brain, but fuch an one as did not penetrate to any of the ventricles. But Guido of Cau-liac faith, he faw one which lived and recovered after a great portion of the Brain fell out by reason. of a wound received on the hind part of his head. In the Year of our Lord 1538, while I was Chirurgeon to the Marshal of Montejan at Turin, I had one of his Pages in cure, who playing at Quoits received a wound with a stone upon the right Bregms with a fracture, and so great an effracture of the bone, that the quantity of half a hasel Nut of the Brain came forth thereat. Which I observing, prefently pronounced the wound to be deadly; a Physician which was prefent, contradicted my opi-nion, affirming that substance was no portion of the Brain, but a certain fatty body. But I with reafon and experience in the presence of a great company of Gentlemen, convinced the pertinacy of the Man with reason; for that fat cannot be generated under the skull, for although the parts there contained be cold, yet because they are heated by the abundance of the most hot and subtle animal spirits, and the heat of vapours riting thither from all the body, they do not fuffer fat to concrete about them. But with experience, for that in diffecting of dead bodies, there was never any fat observed there; belides also fat will fwim on the top of water, but this substance as marrowy, cast into the water prefently funk to the bottom.

Lastly, Fat put to the fire becomes liquid and melts; but this substance being laid upon a hot iron became dry, shrunk up and contracted it self like a piece of leather, but dissolved not at all. Where-fore all those which were present cried out, that my judgment was right of that substance that came forth of the skull. Yet though it was cut away, the Page recovered perfectly, but that he continued deaf all his life after.

CHAP. XXIII.

Of the Wounds of the Face.

Why we treat in particular of wounds of

Aving treated of the Wounds of the Head by their causes, figns, and cure, it follows that we now speak of the wounds of the Face, if but for this, that when they are carelesly handled, they leave deformed fears in the most specious and beautiful part of the body. The causes are the same which are incident to the skull, that is, external. But this may be added to the kinds nd differences of the wounds, that the life may be out of danger though any one whole part of the aFac (as the car, eye, nofe, lip,) may be cut away by a wound, but not fo in the Head or Skull. tumerous.

Wherefore beginning at the Wounds of the eye-brows, we will profecute in order the Wounds of

the other parts of the face. This is chiefly to be observed in wounds of the Eyebrows, that they are off-times cut so overthwart, that the mufcles, and fleshy pannicle which move and lift them up, are wholly rent and tom. In which case the eye-lids cannot be opened, and the eyes remain covered, and, as it were, that A thing to be up in the cases of their lide; fo that even after the agglutination of the Wound, if the Patient would observed in Wounds of the look upon any thing, he is forced to hold up the eye-lids with his hand; with which infirmity I have for many troubled, yet oft-times not fo much by the violence of the Wound, as the unskilfulness of the Chirurgeon who cured them, that is, by the negligent application of the boulflers, an unfit ligature, and more unfit future. In this cafe the skilful Chirurgeon, which is called to the Patient, shall cut off as much of the skin and flefhy pannicle as shall serve the eye-lids, that so they may by their own firength hold and keep open, without the help of the hand: then he shall sew the Wound as is stt, with such a stitch as the Furriers and Glovers as and then he shall pour thereon some of the Balfom of my description, and thall lay such a Medicin to the neighbouring parts. Re Olei rofar. 3 (5) album over, nu. ij. boli armen. fanguin. Drac. Majtieb. an. 3 j. agitentur funul, fiat medic. Then let the part be bound with a fitting ligature. Afterwards you shall use Emplayt. de gratia Dei, Empl. de Betasica, Diacalenboss, or some other like, until the Wound be cicatrized. But such like, and all other Wounds of the Face may be eafily healed, unless they either be affociated with some malign symptoms,

or the Patients body be repleat with ill humours. There fometimes happen a quite contrary accident in Wounds of the Eye-brows, that is, when Lagophthalmia the eye-lids fland fo up that the Patient is forced to fleep with eyes open; wherefore those which are is a gaite contrary accifor affected, are called by the Greeky Lagophibalmi. The cause of this affect is often internal, as a cardent to the
buncle, or other kind of abscess, as a blow or stroak. It shall be cured by a crooked or semicircular saling down incition made above the eye-lids, but fo, that the extremes of the femicircle bend downwards, that of the Eyethey may be preffed down and joined as much as is needful to amend the ftiffnels of the eye-lid. But lids. you must not violate the grisle with your Instrument, for so they could no more be lifted up; the re-

Eye-brows.

CHAP. XXIV.

fidue of the cure must be performed as is fit.

Of the Wounds of the Eyes.

Ounds of the Eyes are made by the violence of things pricking, cutting, bruifing, or otherwise looling the continuity. But the cure must always be varied according to the variety of the causes and differences. The first head of cure is, that if any firange and beterogeneous body shall be fallen into the eyes, let it be taken forth as soon as you can, lifting and ruming up the eye-lid with the end of a Spatula. But if you cannot difcern this mote or little body, then put three or four feeds of Clary, or oculus Chrifti into the pained eye. For these seeds are thought to have a faculty to cleanfe the eyes and take out the motes, which are not fafined deep in, nor do too stubbornly adhere to the membranes. For in this case you shall use this following Infirmment, for herewith we open the eye-lids the further, putting it between them and the Eye, and also keeping the Eye steddy by gently pressing it, that so with our mullets we may pull out the extraneous body; this is the figure of fuch an Instrument.

The delineation of a Speculum Oculi, fit to dilate and bold aftender the Eye-lids, and keep the Eye fieldy: it is so made, that it may be dilated and contrasted according to the greatness of the Eyes.

All firange bodies taken out, let this medicin be put into the Eye. Take the firains A repercuffive of a dozen Eggs, let to be put into them be beaten in a the Eye. leaden Mortar, with a little Rofe-water, and fo put into the Eye;

but let this repercuffive be laid upon the

Eye and the neighbouring parts. R. Albumin, over, me, iv. pulver, aluminis roche combusti 3 ij. sanguinis Divers reper-custives to be praconis 3 j. aque refer de plantag an. 3 ii. agitentur sumul, make a repercussive, which you may frequent-applied to the ly use. Or else apply Cheefe-curds well wrung, mixed with Rose-water, the white of an Egg, and as Eye. I much acacia as shall suffice. This which followeth doth more powerfully stay the stowing humour.

much acacis as that turner. This which followeth doth more powerfully tay the flowing humour. For rofar. concinnetur collyrium, of which you may drop fome both within and about the Eyes.

But note, that all fuch remedies must be applied warm, both that they may the better penetrate by Things actual-their moderate heat, as also for that all actual cold things are hurtful to the eyes and fight, because ly cold are they dull the fight by incrustating the visivespirits. For I have known many who have become dull of light by the frequent using of Medicins actually cold to the eyes. I have on the contrary feen not a few, who have recovered with the fit use of such like Medicins, who have had any part of their eyes (foir ways not the sure) of the eye) so pricked with a Needle or Bodkin, they must be fully the results of the eyes. (foir were not the pupills or apple of the eye) so pricked with a Needle or Bodkin, that much of the waterish humour ran forth thereat-

The milk of a Woman which fuckles a Girl (for that is reputed the cooler) mitigates pain and Anodyne Mecleanles, if it be milked out of the Dug into the eye; to which purpose also the bloud of Turtles, dicins for the Pigeons, Eyes.

Narcoticks.

A farcotick Medicin for the eyes.

Pigeons or Chickens much conduces, being dropt into the eye by opening a Vein under their Wings. Also this following. Cataplasm asswageth pain and inflammation, and hinders defluxion, being applied to the eye and the adjacent parts. R. Carnis pomorum fub cinere ealido decoctorum 3 v. vinel. overnos num.ii). caffie fifule recenter extraîte 3 \(\beta \). mucaginis pfillii, althee, \(\beta \) cyden. an. \(\beta \). Is farin, bordei params incorporantur omnia fimul, fiat eataplasma. Also Sheeps Lungs boiled in Milk and applied warm, and changed as they grow cold, are good to asswape pain. But if the too violent heat and pain shall not yield to fuch Medicins, but require more vehement, then Foliorum Hyofeyami, m. j. fub. concribus coquatur, asque in mortario cum mucagine séminis psillis, & cydonior, extrall, in aquis solani & plantag, pistetur : then let this Medicin be wrapped in a linnen cloth and applied to the Eyes and Temples. The mucilages of Pfillium or Flea-wort, and Quince-feed extracted in a decoction of Poppy-heads, and mixed with a little Opium and Role-water, are used for the same purpose. But when there is need of detergent and farcotick Medicins, then R Symp. rofar. ficeat. 3 j. aggente. & rate, an. 3 ij, aloes lote, olibani, an. 3 p.

and Fennil Water, are fit for cleanling such Wounds: as also this following Collyrium. Re Ague bardei 3 j. melie despumati, 3 iij. Aloes ter lote in aqua plantaginis & facchari cand, an. 3 j. siat colyrium. Also this ensuing Medicin is very farcotick. R. Mucagin, gammi olibani arabici, tragacamb. & farcocolin aq. berdei extrati. an. 3 iii. aloes ter lote in aq. rosar. 3 i. cerus. whe & lote, tutie prepar, an. 3 is first collyrium. But here you must note, that the coat Adnata often swells so much by reason of a wound, or fome other injury, and stands so forth by the falling down of humours, access and mixture of statulencies, that it hides the whole Pupilla, and hangs forth of the eye-lids like as if it were an unnatural fleshy excrescence, and it loses, the native colour, and looks very red, so that the Eye can neither

A drying Fo-

A Medicin to confume a fleshy excreout biting.

A Seton, # good remedy grainst inveerate defluxions into the cyes.

A History.

Wherewith a young Chirurgeon being deceived, determined to cut away this protuberancy of the Adnata, as though it had been fome superfluous flesh, and then to waste it with catheretick Powders, had I not forbidden him, telling him of the certain danger of blindness which would tick Powders, had I not forbidden him, telling him of the certain danger of blindness which would thereupon befall the Patient. Wherefore I prescribed a Fomentation of Chamonil, Melilote, Rose-leaves, Wormwood, Rue, Fennil and Annifeeds, boiled in Milk with the roots of Oris and Marigolds. Then I presently added this following Fomentation, being more powerful and drying. K Nucis express, palar, balant, an. 3 j. plantagin. abstant, hippures, flor.cham.em. rofar, rub. an. M is. bulliant stimul, cum aqua fabrorum, & stat decision pro san cum spogis. Besides also you may apply a Cataplasin made of Barley and Bean-flour, the Powders of Mastick, Myrrhe, and Aloes, and some of the last described Decoction. The Tumour beginning to declibe, I dropt the flowing Liouer into the Eye, which bath a very astringent, drying and strengthening tathe flowing Liquor into the Eye, which hath a very aftringent, drying and firengthening faculty. Roaft a new laid Egg in Embers until it be hard, then pill off the shell, take forth the Yolk, and in place thereof put a scruple of Roman Vitriol in sine Powder, then put it in a linnen cloth and wring it hard forth into some clean thing, and drop thereof for some days into the Eye, with a little Smiths Water wherein Sumach and Rose-leaves have been boiled. I have found by experience the certain force of this remedy; but if notwithstanding there be a true flethy excreteence upon the coat Adnasa, it may be taken away by this following Powder. In Of-fix fepie, & refle exercise calcinate an. 3 j. fiat pulvis. Calcined Vitriol, burnt Alum, and the like may be commodically used to this purpose. Yet you must warily make use of all such things, and always lay repercuffives about the eye, that no harm enfue thereof. For divers times acrid humours fall down into the Eye with fuch violence, that they break the horny coat, whereupon the humours of the Eye are poured out. Remember also, that in difeases of the Eyes the Patient lie with his head fornewhat high, and that he keep that not onely the pained, but also the found Eye, because refris always necessary for the grieved part. But one Eye cannot be moved without some motion of the other, by reason of the connexion they have by their optick and moving nerves, both the Meninges and the Pericranium, Veins and Arteries; which is the cause that when the one suffers, the other in fome fort partakes therewith.

But if we cannot prevail by all these formerly prescribed Medicins fit to stay the defluxion, then it remains that we apply a Seton to the Neck, for it is a fingular remedy against inveterate deflu-xions into the Eyes. For we know by daily experience, that many who have had their fight dulled by a long and great defluxion, so that they were almost blind, have by little and little reco-wered their former splendour and sharpness of fight, when matter once began to be evacuated by

The truth bereof appeared in Paul the Italian Goldsmith, who dwelt near the Austin-Friars. For he having used many Medicins of divers Physicians and Chirurgeons in vain, when he was almost blind, he applying a Seton by mine advice, began by little and little to see better according to the quantity of the matter which was evacuated, until at length he perfectly recovered his fight at last growing weary of the Seton which he had worn for a Year (although matter came daily forth thereof) yet he would have it taken forth and healed up; but this way of evacuation being thut up, and the humour beginning to flow into his eyes, fo that he was in danger to become blind, he called me and made me again to apply the Seton in his Neck. Whereby recovering his former foundness and perfection of fight, he yet wears the Seton.

A Seton good against the Falling-fick-I also once freed by this kind of remedy, by appointment of the most learned Phylician Hellerius, a certain young man of 20 years old, from the Falling-sickness, who before had many fits thereof; the Ichorova had a contain young man of 20 years old, from the Falling-sickness, who before had many fits thereof; the Ichorous humours, the feeders of this Difease, being by this means, as it is most probable, drawn

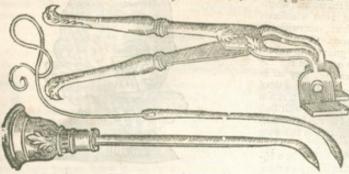

Wherefore feeing a Seton is of this use, I have thought good in this place to set down in Writing and by Figure, the manner of making thereof, for the behoof of young Practitioners: With the Patient to int on a low Stool, and to bend down his head, that so the skin and flelly pannicle may be relaxed; then must you with your fingers pluck up and sever the skin from the musteles

The manner of making a Seron.

ncfi.

time viini

A Figure of the Pincers, actual Cautery, and Needle, used in making a Seton.

and take hold of as much hereof as you can with your Pincers, not touching the Mufcles of the neck for fear of a Convulsion and other fymptoms; you shall then twitch the skin which is held in the Pincers most hard, when you shall thrust the hor I-ron through the

ron through the holes made in the midft of them; that also the nerves being so twitched, the doloristick sense may the less come to the part. The wound must be made or burnt in long-ways, and not thwarting that so the matters may be the better evacuated by the strait fibers. But the Cautery or hot Iron must have a three or else a four-square point, and that sharp that so it may the more easily and speedily enter. Then keeping the Pincers immoveable, let him draw through the passage made by the Cautery a needle and thred with a three or four-doubled thred of Cotton [or rather a skean of Silk] moissined in the white of an Egg and Oil of Roses; then after you have applied pledgets dipped in the same Medicin, bind up the part with a convenient ligature. The day sollowing the neck must be anointed with Oil of Roses, and the pledgets dipped in the former Medicin applied for some days after. But it will be convenient to moisten the Seton with a digestive made of the yolk of an Egg and oil of Roses until the Ulcer cashs forth much matter; then you shall anoint the Cotton thred with this following remedy. R. Terebintheren. § iv. syrapi rosat. & abstration and § p. pure. Iros, diacrydia, agarici trockist. Rosi, an. § p. incorporation contains somal & star medic. Which you shall use so long as you intend to keep open the Ulcer. For it hath a faculty to draw the humors from the face, and cleanse without biting.

I have found not long fince by experience, that the apertion made with a long thick Triangular needle of a good length like to a large Pack-needle, is lefs painful than that which is performed with the actual cautery which I formerly mentioned.

Wherefore I would advise the young Chirurgeon, that he no more use the aforesaid actual cautery.

I have here given you the Figure of the Needle.

The Figure of a Triangular Needle.

CHAP, XXV.

Of Wounds of the Checks

Ecing a Wound in the Check feems to require a Suture, it must have a dry suture (as they term The use of a it) less that the scar should become deformed. For that deformity is very grievous to many, dry sure; as to Women who are highly pleased with their beauties. Therefore you shall spread two pieces of new cloth of an indifferent sineness, and proportionable bigness with this ensuing Medicin. Re Pulveris Mastichini, Sanguinis Draconis, Thuris, farine volatilis, tragacanthe counts, gryss, pifus, surce-cloth spread with this, on each side of the Wound one, fome singers bredth as under, and let it alone till it be hard dried to the skin. Then you shall so draw them together with your Needle and thred, that the sless hy their sicking may also follow, and be mutually adjoined, as you may see it here express. Ligatures. But all the Ligatures and stays which shall be used for that purpose, must be fassined to the Patients night-lap.

But when the Wound is great and deep, and the lips thereof are much diffant the one from the A future fit other, there can be no use of such a dry suture. Wherefore you must use a three or four-square Nee- for hare-lips. dle (that so it may the more readily and easily enter into the slesh) being thred with a waxed three, The manner and with this you must thrust through the lips of the Wound, and leave the Needle sticking in the Wound, and then wrap the three to and again over the ends thereof eight or ten times, just after that manner which Women use to saften a Needle with thred in it upon their sleeves, or Tailors to their hats or caps, that they may not lose them.

The Needle thus failned shall be there until the perfect agglutination of the Wound; this kind of future is used in the wounds of the lips, as also in hare-lips, for so we commonly call lips which are what hare-lift from the first conformation in the Womb by the errour of the forming faculty. But such a su-lips are.

Z 2

ture will help nothing to agglutination, if there lie or remain any skin between the lips of the wound; where-fore you shall cut away whatsoever thereof shall be there, otherwise you must expect no union. Other kind of futures are of no great use in wounds of these parts, for out of the necessity of eating and fpeaking, they are in perpetual motion, wherefore a thred would cut the flesh; for which reason you shall take up much flesh with such Needles mentioned in this last described kind of future, as this following

A History.

A decoction

good to wash

away putrefa-ction.

Figure thews.

To this purpose I will recite a History, to the end, that if any such thing happen to come to your hands; you may do the like. A certain Gascoign in the battel of Saint Laurence, had his upper jaw cut overthwart even to his mouth, to the great disfiguring of his face. The wound had many worms in it, and fiank exceedingly, because he could get no Chirurgeon until three days after he was hurt. Wherefore I washed it with a decoction of Wormwood, Aloes, and a little Ægyptiscum

The Figure of the future fit for cloven or hare-lips, as alfo the delineation of the Nee-dle about whose ends the thred is wrapped over and under, to and again.

both to kill the Worms, and to fetch away all the putrid matter; I discussed the tumor with a dissolving fomentation and cataplasm, I joined together the lips of the Wound with the last described suture. But I applied this following Medicin to the whole part. R. Terebinth, veneta § vi. gummi elemi § ij. pulv. boli armeni, san. drac. Mastiebes, Myrrba, Aloes, an. 3 B. incorporentur simul, siat medicamentum. The wound was agglutinated within a few days, but that there remained a certain little hole at the joining of the lower Jaw with the upper, wherein you could fcarce put the head of a pin s out whereof nevertheless much ferous and thin moisture flowed, especially when he either eat or fpake; which I have also observed in many others. But for staying of this waterish humidity I dropped Aqua fortis into the bottom of the ulcer, and divers times put therein a little of the powder of burnt Vitriol. Thus by Gods grace he recovered and became whole,

A fmall hole remaining af-

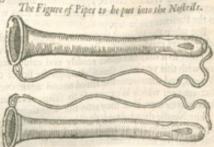

CHAP. XXVI. Of the Wounds of the Nofe.

He Note many ways fuffers folution of continuity; as by a Wound, Fracture, and Contu-fion, and it is fometimes battered and broken on the upper part; which when it happens, ways the note may be hurt. you shall restore the deprest bones to their native seat and figure, with the end of a Spanda, The cure of a or fit flick wrapped about with Tow, Cotton, or a linnen rag. Then with pledgets dipped in an aftrinbroken Note. gent Medicin composed ex albumine ovi, Mastieb. bol. armen. sanguin. drae. & alumine wite, and applied to the fide of the Nofe, he shall labour to strengthen the reliored Bones, and then bind them with a convenient ligature, which may not prefs them too much, left the Nofe should become flat, as it happens to many through the unskilfulness of Chirurgeons

The uses of Pipes in bro-ken Noses.

How many

Then must you put little Pipes into the Nofirils, and these not exactly round, but somewhat flat and deprett, tied to the night-cap on each fide with a thred, left they should fall out. By the help of these Pipes the Bones of the Nose will be kept in their place, and there will be possage forth for the matter, and for inspiration and exspiration. But if all the Nose, or fome portion thereof thall be wholly cut off, we must not hope to restore it. But if the Nose be so cut, that as yet it adheres to much of the adjacent fielh, from whence it may receive life and

10001-

timen mi

nourithment, then few it up. For the lower part of the Nofe, it may be shaken, deprest and wretted afide, feeing it is grifly; but it cannot be broken, as the other which is of a bony Na-

CHAP. XXVII. Of the Wounds of the Tongue.

The Tongue may be fo wounded, that either it may be wholly cut off and deprived of forme How many portion of the fubfiance, or onely flit long-ways, or athwart. The lofs of the fubfiance ways the concannot be repaired, because every part separated and pluckt from the living body, from the living body is concerned. The whole it is call the long-ways or fide-ways, it is easily restored by future if non of regression. But when it is cut or slit long-ways or side-ways, it is easily restored by future, if so be that the cloven part yet adhere to the living body from whence it may draw both matter and Therefore a careful fervant shall straitly hold with a foft and clean linnen cloth the The care of a form of life. Therefore a careful fervant shall straigly hold with a lott and clean innen cloth the The care of a body of the Tongue, lest it should slip away by reason of its slipperiness, whilest the Chirurgeon cloven tongue. Slitch it above and below; when he thinks he hath sufficiently sewed it, let him cut off the thred as near to the knot as he can, lest being lest too long it unight be tangled with the teeth as he eats, and so cause a hurtful laceration or rending of the sewed parts. In the mean time let the Patient eat Barley-Creams, Almond-Milks, Gellies, Cullisses, and Broths, and the yolks of Eggs, and let him the bold in his mouth Sugar, of Roses, and Sepure of Opiness; for such things believe their notes. often hold in his mouth Sugar of Rofes and Syrup of Quinces; for fuch things belides their nourithing faculty, perform the part of an agglutinating and detergent Medicin. I have learned these things I have here fet down, neither from my Mafters whom I have heard with attention, nor by reading of Books, but they have been fuch as I have tried with happy faccefs in many; as in the fon of Monficur de Marigny Prefident of the Inquifition, in John Piet a Carpenter dwelling in the Suburbs of Saint German.

But most apparently in a child of three years old, the son of the great Lawyer Monsieur Covet, who A History.] fell with his chin upon a stone, and so cut off a large piece of the end of his tongue, which chanced to be between his teeth; it hung but at a very small ober of slesh, so that I had very little or no hope to be between his teeth; it hung but at a very Imall nber of fleth, to that I had very little or no hope to agglutinate and unite it, which thing almost made me to pluck it quite away; yet I changed that determination by confidering the loss of the most noble action of speaking, which would thereupon ensue, and weighing the providence of Nature often working wonders, and such things as exceed Nature oft the expectation of the Physician in curing Diseases; I also thought thus with my self, the fleth of the doth strange Tongue is soft, loose, sungous and spongy, neither is altogether spongy, neither is altogether obvious to the external injuries of the air; wherefore after that I had once or twice thrust through the Neesless and downwards, and for the rest ordered the Child to be used and distret dle and Thred upwards and downwards, and for the reft ordered the Child to be used and dieted after the manner I lately mentioned, he grew well within a short time, and yet remains so, speaking

CHAP. XXVIII. Of the Wounds of the Ears.

He Ears are fometimes wholly cut off, fometimes but in part, otherwhiles they are onely How many flit, so that the rent portion as yet adhering to the rest, is joined with it in communion of life. In this last case it is fit to use a future, but yet so that you touch not the Grisle be wiold with your Needle, for thence there would be danger of a Gangrene, which happens to many by foolish curing; therefore you shall take up and comprehend with your Needle onely the Skin, How to sew a and that little slesh which encompasses the Grisle. You shall perform the rest of the cure with wounded Ear, Pledgets and Ligatures artificially fitted, and shall result inflammation and other symptoms with fit Medicins. But you must take special care that no superstuous shesh grow in the auditory pasfage, which may hinder the hearing; wherefore you thall keep that paffage free by flopping it with a piece of fponge. But you shall procure agglutination and confolidation of the grifly part (and therefore next to a bone most dry) with dry Medicins. But those who have their Ears quite cut off, can do nothing but hide the deformity of their mishap with a cap, stuffed with Cotton on that side.

CHAP. XXIX. Of the Wounds of the Neck and Throat,

He Wounds of the Neck and Throat are formewhiles simple, as those which onely use the The differen-continuity of the Muscles; otherwhiles compound, such as those which have conjoined ces of wounds with them a fracture of the Bones, as of the Vertebre, or hurt of the internal and external of the Neck Jugular Veins or fleepy Arteries; fornetimes the Traches Arteria, or Weazon, and the Octobra- and Throne. gas or Gullet are wounded; fornetimes wholly cut off, whence prefent death enfues. Wherefore gw or Gullet are wounded; ionictines whosp car on, trighter present death entires. Wherefore let not the Chirurgeon meddle with fuch Wounds, unlefs he first forestel the danger of death, or the loss of fome motion to those that are present. For it often happens that some notable nerve or triples of fome motion to those that are present. tendon is violated by a wound in the neck, whence a Palfie enfues, and that abfolutely incurable, if The Palfie folthe wound shall penetrate to the spinal marrow, also hart therewith. Wounds of the Gullet and lows upon Weazon are difficultly cured, because they are in perpetual motion; and chiefly of the latter, by the Neck. reason it is grifly and without bloud. The wounds of the Gullet are known, by spitting of bloud,

wounded.

The Wounds of the jugular Veins and fleepy Arteries are deadly by accident. By hurring

The cure of Weazon and A Gargariim,

The manifold use thereof

A History.

Signs that the by the breaking forth of meat and drink by the wound; but if the Gullet be quite cut afunder, the Patient cannot swallow at all: for the cut parts are both contracted in themselves, the one upwards and the other downwards. But we know the Weazon is hurt by cafting up bloud at the mouth with a continual cough, and by the coming forth of the breath or wind by the wound. the jugular Veins and fleepy Arteries, if they be great are ufually deadly, because they cannot be firaitly bound up, for you cannot bind the throat hard without danger of choaking or firangling the Patient. But for defect of a ftrait ligature in this cafe the flux of bloud proves deadly. If the recurrent Nerve of either fide be cut, it makes the voice hoarfe; if cut on both fides, it takes away the use of fpeech, by hurting those instruments which impart motion to the Mutcles of the Larinx. For the cure, the recurrent if the Wound be small, and not affociated with the hurt of any notable vessel, nor of the Wearon and Nerve, the Gullet, it is speedily and easily cured; and if there shall be need, you shall use a future, then you shall voice is hurt, put therein a sufficient quantity of Venice Turpentine mixed with Bole-Armenick, or else some of my The description of the Austhors Ballom, of which this the Receipt. Re Terebush, venetae it off gam, eloni \(\frac{\circ}{\circ}\) is the life and the Austhors Ballom.

The facely of pulsers irres florent, alors, multicles, myrrhe an. \(\frac{\circ}{\circ}\) I have done wonders with this Ballom.

The facely of put it in, lay upon it a plaifter of Diacalcibes diffolved in Oil of Roses and Vinegar, as that thereof Diacalcibros. hath power to repress the flowing down of humours, and hinder inflammation, or in flead thereof you may apply Emp. de Gratia Dei, or Emp. de Janua. But if the Jugular Veins and fleepy Arteries be cut, let the bleeding be flaid, as we have shewed in a Chapter treating thereof. When the Weathe wounded zon or Gullet are wounded, the Chirurgeon shall few them up as neatly as he can; and the Patient finall not endeavour to (wallow any hard thing, but be content to be fed with Gellies and Broths-When a Gargarifin is needful, this following is very good. Re Herdei M. j. florum rofar, p. j. pafful-mund, jujubarum an. § (s. glycyribiz. § j. bulliant omnia funul, addendo melii rof. Julep. rof. an. § 1), fiat Gargarifma, ut artis eft.

With which being warm, the Patient shall moissen his mouth and throat, for it will mitigate the hardness of the part, asswage pain, cleanse and agglutinate, and make him breathe more freely. But that the Chirurgeon may not defpair of, or leave any thing unattempted in fuch like wounds, I have thought good to demonstrate by some examples how wonderful the Works of Nature are, if they be affifted by Art.

A certain servant of Monsieur de Champaigne a Gentleman of Anjou, was wounded in the throat with a Sword, whereby one of the Jugular Veins was cut, together with his Weazon. He bled much and could not fpeak; and thele fymptoms remained until fuch time as the Wound was fewed up and covered with Medicins. But if Medicins at any time were more liquid, he, as it were, fucked them by the wound and spaces between the stitches, and presently put forthat his mouth that which he had sucked or drawn in. Wherefore more exactly considering with my felf, the greatness of the Wound, the Spermatick, and therefore dry and bloudless nature unapt to agglutination of the affected part, but chiefly of the Weazon and Jugular Vein; as also for that the rough Artery is obnoxious to those motions which the Gullet performs in swallowing, by reason of the inner coat, which is continued to the coat of the Gullet, by which means these parts mutually serve each other with a reciprocal motion, even as the ropes which run to the wheel of a pulley; furthermore, weighing that the Artery was necessary for the breathing, and tempering the heat of the heart, as the Jugular Veins served for the nourithment of the upper parts; and laftly, weighing with my felf the great quantity of bloud he had loft, which is, as it were, the Treasure of Nature, I told those which were present, that death was near and certainly at hand. And yet beyond expectation, rather by Divine Favour than our Art, he recovered his health.

Equally admirable is this History following. Two Englishmen walked out of the City of Paris for their Recreation to the Wood of Vincenne, but one of them lying in wait to rob the other of his money, and a maffy chain of Gold which he wore, fet upon him at unawares, cut his throat and robbed him, and so left him amongst the Vines which were in the way supposing he had killed him, having with his Dagger cut the Weazon and Gullet. This Murderer came back to the City; the other half dead, crawled with much ado to a certain Peafants house, and being dreffed with such Medicins as were prefent, and at hand, he was brought to the City, and by his acquaintance committed to my care to be cured. I at the first, as diligently as I could, sewed up the Weazon which was quite cut asunder, and put the lips of the Wound as close together as I could; I could not get hold of the Gullet, because it was fallen down into the Stomach, then I bound up the Wound with Medicins, Pledgets, and fit Ligatures. After he was thus dreft, he begun to fpeak, and tell the name of the Villain the author of this fact, fo that he was taken and fastned to the Wheel, and having his limbs broken, loft his wretched life, for the life of the innocent wounded man, who died the fourth day after he was hurt.

The like hurt befel a certain German who lay at the house of one Persts, in the street of Nats, he being frantick in the night cut his throat with a Sword; I being called in the Morning by his friends who went to fee him, dreft him just after the fame manner as I dreffed the English man. Wherefore he prefently recovered his speech, which before could not utter one syllable, freed from suspicion of the crime and prison the servant, who lying in the same Chamber with him, wrs upon suspicion committed to Prifon, and confelling the thing as it was done, lived four days after the Wound, being nourished with Broths put into his Fundament like Clysters, and with the grateful vapour of comforta-ble things, as Bread newly drawn out of the Oven and foaked in strong Wine; I having thus by Art of Chirurgery made the dumb speak for the space of four days.

Another Hiflory.

CHAP. XXX.

Of the Wounds of the Cheft.

Ome Wounds of the Cheft are on the fore-fide, fome behind, fome penetrate more deep, The differenothers enter not into the capacity thereof, otherforne pierce even to the parts contained there- ces of w in, as the Medisfinum, Lungs, Heart, Midriff, hollow Vein, and afcendent Artery. Otherforce of the Cheft, pass quite through the body, whereby it happens that some are deadly, some not.

You shall thus know that the wound penetrates into the capacity of the Chell, if that, when the Pa- The figure, tients mouth and note be thut, the breath or wind break through the wound with a notic, to that it may diffipate, or blow out a lighted Candle being held near it. If the Patient can fearee either draw, or put forth his breath, this also is a fign that there is some bloud fallen down upon the Diaphragma.

By these figns you may know that the heart is wounded: If a great quantity of bloud gush out, if Signs that the a trembling possess all the members of the body, if the pulse be little and faint, if the colour become heart is wounded, if a cold sweat and frequent swooning assall him, and the extreme parts become cold, then death ded.

Yet when I was at Turin, I faw a certain Gentleman, who fighting a Duel with another, received A Hiftory. a wound under his left breft which pierced into the fubftance of his heart, yet for all that he firuck fome blows afterward, and followed his flying enemy fome two hundred paces until he fell down dead upon the ground; having opened his body I found a wound in the fubfiance of the heart, so large as

would contain ones finger; there was onely much bloud poured forth upon the Midriff.

These are the signs that the Lungs are wounded, if the bloud comes fearny or frothy out of the Signs that the wounds, the Patient is troubled with a cough, he is also troubled with a great difficulty of breathing Lu and a pain in his fide, which he formerly had not; he lies most at ease when he lies upon the wound, and fometimes it comes to to pass, that lying so, he speaks more freely and easily, but turned on the

Contrary fide, he prefently cannot fpeak.

When the Diaphragma or Midriff is wounded, the party affected is troubled with a weight or hea-Signs that the vines in that place, he is taken with a Delirium, or Raving, by reason of the sympathy of the Nerves of the fixth conjugation which are spread over the Midriss; difficulty of breathing, a cough and tharp pain troubles the Patient, the Guts are drawn upwards; so that it sometimes happens by the vehemency of breathing, that the Stomach and Guts are drawn through the wound into the capacity of the Cheft, which thing I observed in two.

The one of these was a Mason, who was thrust through the midst of the Midriff, where it is neryous, and died the third day following. I opening his lower belly, and not finding his flomach, A History. thought it a monstrous thing; but at length searching diligently, I found it was drawn into the Chest through the wound which was scarce an inch broad. But the stomach was full of wind, but little humidity in it.

The other was called Captain Francis d' Alona Native of Xantoign, who before Rochel was that Another Hiswith a Musket Bullet, entring by the breft bone near to the fword-like Grifle, and paffing through flory. the fleshy part of the Midriff, went out at the space between the fifth and fixth bastard ribs. The wound was healed up on the outlide, yet for all that there remained a weakness of the Stomach, whereupon a pain of the Guts like to the Colick took him, especially in the Evening, and on the Night, for which cause he durst not sup but very sparingly. But on the eighth moneth after, the pain raging more violently in his belly than it was accustomed, he died; though for the mitigating thereof Simon Malmedy and Anthony du Val, both learned Phyfitians, omitted no kind of remedy.

The body of the deceased was opened by the skilful Chirurgeon James Guillemean, who found a great portion of the Colick-gut (welled with much wind gotten into the Cheft through the wound of the Disploragma, for all it was fo fmall that you could fearce put your little finger in thereat. But now let us return from whence we digreffed.

We understand that there is bloud poured forth into the capacity of the Chest by the disficulty Signs that We understand that there is bloud poured forth into the capacity of the Cheft by the difficulty Signs—that of breathing, the vehemency of the increasing Fever, the stinking of the breath, the casting up of the bloud at the mouth, and other symptoms which usually happen to those who have puttered and clotted bloud poured out of the Vessels into the Belly, insecting with the filthy vapour of the corrupt substance, the parts to which it shall come. But also, understone the cannot lie upon his back, he is troubled with a defire to vomit, and covers now and then to rife, whence he often falls into a fwound; the vital faculty which suffains the body being broken and debilitated both by reafon of the wound, and concrete or clotted bloud; for so putting on the quality of poison, it greatly diffipates and dissolves the strength of the heart.

diffipates and diffolves the firength of the heart.

It is a fign the fpinal marrow is hurt, when a Convoltion or Paltie, that is, a fudden lofs of fenfe and Signs that the motion in the parts thereunder, an unvoluntary exerction of the Urine and other exercments, or a spin total suppression of them, seizes upon the Patient. When the hollow Vein and great Artery are wounded, the Patient will die in a short time, by reason of the shoden and abundant effusion of the bloud and spirits, which intercepts the motion of the Lungs and Heart, whence the party dies suffocated.

CHAP. XXXI.

Of the Cure of the Wounds of the Cheft.

E have read in John de Vigo, that it is disputed amongst Chirurgeons concerning the confo- vigo, trast is lidation of wounds of the Cheft. For fome think that fuch wounds must be closed up, and Palatherar. cicatrized with all pollible speed, left the cold air come to the heart, and the vital spirits cap. 10. fly away and be diffipated. Others on the contrary, think that fuch. Wounds ought to be long kept

open; and also if they be not sufficiently large of themselves that then they must be enlarged by Chirurgery, that so the bloud poured forth into the capacity of the Chest may have passage forth, which otherwise by delay would putrefie, whence would ensue an increase of the Fever, a fiftulous Ulcer, and other pernicious accidents. The first opinion is grounded upon Reason and Truth, if so be that there is little or no bloud poured forth into the capacity of the Chest. But the latter takes place where there is much more bloud contained in the empty spaces of the Chest. Which lest I may seem rafhly to determin, I think it not amifs to ratific each opinion with a Hiflory thereto agreeable.

A Hiftory.

Whileft I was at Turin, Chirurgeon to the Marshal of Montejan, the King of France his General, I had in cure a Souldier of Paris, whose name was Levefque, he served under Captain Removart. He had three wounds, but one more grievous than the rest, went under the right brest, somewhat deep into the capacity of the Cheft, whence much bloud was poured forth upon the Midriff, which caufed fuch difficulty of breathing, that it even took away the liberty of his speech; besides through this occasion he had a vehement Fever, coughed up bloud, and a sharp pain on the wounded side. The Chiturgeon which first dressed him, had so bound up the wound with a strait and thick suture, that nothing could flow out thereat. But I being called the day after, and weighing the prefent symptoms which threatned speedy death, judged that the sowing of the Wound must straight be loosed, which being done, there inflantly appeared a clot of bloud at the orifice thereof, which made me to cause the Patient to lie half out of his bed, with his head downwards, and to flay his hands on a Settle which was lower than the Bed, and keeping himfelf in this pofture, to that his mouth and nofe that to his Lungs thould fwell, the Midriff be stretched forth, and the intercoftal Muscles and those of the Abdomen should be compressed, that the bloud poured into the Chest might be evacuated by the wound; but also that this excretion might fucceed more happily, I thrust my finger formewhat deep into the Wound, that fo I might open the orifice thereof being flopped up with the congealed bloud; and certainly I drew out fome feven or eight ounces of putrefied and flinking bloud by this means. When he was laid in his Bed, I caufed frequent injections to be made into the Wound of a decoction of Barley, with Honey of Roses and red Sugar; which being injected, I wisht him to turn first on the one, and then on the other, and then again to lie out of his bed as before: for thus he evacuated small, but very many clots of blood, together with the liquor lately injected; which being done, the fymptoms were mitigated, and left him by little and little. The next day I made another more detergent injection, adding thereto Wormwood, Centaury, and Aloes; but fuch a bitterness did rife up to his mouth, together with a defire to cast, that he could no longer endure it. Then it came into my mind that formerly I had observed the like effect of the like remedy in the Hospital of Paris, in one who had a fiftulous ulcer in his Cheft. Therefore when I had confidered with my felf that fuch bitter things may eafily pass into the Lungs, and so may from thence rise into the Weazon and Mouth, I determined that thenceforwards I would never use such bitter things to my Patients, for the use of them is much more troublesome than any way good and advantagious. But at the length this Patient by this and the like means recovered his health beyond my expectation.

Read the Hiflory of Ma-ryllus in Galen, lib.7. de Ana-

Why bitter things muft not be caft in

to the Cheft.

long use of most be used in wounds of the Cheft.

But on the contrary, I was called on a time to a certain German Gentleman who was run with a Sword into the capacity of his Cheft; the neighbouring Chirurgeon had put a great tent into the Wound at the first drefting, which I made to be taken forth, for that I certainly understood there was no bloud poured forth into the capacity of the Cheft because the Patient had no Fever, no ten.adminifra. weight upon the Disphragma, nor spitted forth any bloud. Wherefore I cured him in few days by onely dropping in some of my balsom and laying a Plaister of Discalcibeos upon the Wound. The like Cure I have happily performed in many others. To conclude, this I dare boldly affirm, that enfues the too Wounds of the Cheft by the too long use of tents degenerate into Fiftulaes. Wherefore if you at any time shall undertake the cure of Wounds which penetrate into the capacity of the Chest, you shall not presently shut them up at the first dressing, but keep them open for two or three days, but when you shall find that the Patient is troubled with none or very little pain, and that the Midriff is presfed down with no weight, and that he breathes freely, then let the tent be taken forth, and the Wound healed up as speedily as you can by covering it onely with lint dipped in some balsom which hath a glutinative faculty, and laid fornewhat broader then the Wound; never apply liniments to Wounds of this kind, left the Patient by breathing draw them into the capacity of the Cheft. Where-fore also you must have a care that the tent put into those kinds of Wounds may be fastned to the Pledgets, and also have somewhat a large head, left they should be drawn (as we said) into the capacity of the Cheft; for if they fall in, they will cause putrefaction and death. Let Emplast. Discaler there, or forme such like, be applied to the Wound. But if on the contrary, you know by proper and certain figns, that there is much bloud fallen into the spaces of the Cheft, then let the orifice of the Wound be kept open with larger tents, until all the fanier or bloudy matter, whereinto the bloud hath degenerated, shall be exhausted. But if it happen at any time, as assuredly it sometimes doth, that notwithstanding the art and care of the Phylician, the Wound degenerates into a Fiftula, then the former evil is become much worse. For Fiftulaes of the Chest are scarce cured at any time, and that fay degene-rate into a Fi. for divers causes. The first is, for that the muscles of the Chest are in perpetual motion. Another is, because they on the contrary inside are covered onely with the membrane investing the ribs, which is without bloud. The third is, for that the Wound hath no stay, by means whereof it may be compressed from the contrary at least he are preffed, fewed, and bound, whereby the lips being joined together, the Wound may at length be replenished with slesh and cicatrized.

Why there flows fuch plenty of marter out of ounds of the

the Cheft ea-

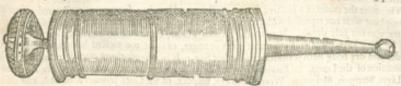

But the reason why Wounds of the Chest do every day heap up and pour forth so great a quantity of matter, feems to be their vicinity to the heart, which being the fountain of bloud, there is a perpetual efflux thereof from thence to the part affected. For this is Natures care in preferving the affected parts, that continually and abundantly without measure or mean it fends all its supplies, that is, bloud and, spirits to their aid. Add hereto that the affected parts by pain, heat, and continual motion of the Lungs and Midriff, draw and allure much bloud to themselves. Such like

Married House

bloud defiled by the malignity and filth of the wound, is speedily corrupted: whence it is that from the perpetual afflux of bloud, there is a continual efflux of matter or filth, which at the last brings a man to a confurration; because the ulcerated part like a ravenous Wolf confurnes more bloud by the pain, heat, and motion than can be ministred thereto by the heart. Yet if there be any hope to cure and heal the Fifula, it shall be performed (after the use of diet and phlebotomy, according to the prescript of the Physician) by a vulnerary potion, which you shall find described when we treat of the Carita or rottenness of the bones. Wherefore you shall make frequent injections therewith into the The cure of a Fiftula, adding and mixing with it Syrup. de rofis ficeis and mel rofarum. Neither do I, if the putrefa- Fiftula in the ction be great, fear to mix therewith Egyptiseum. But you must have a care to remember and obferve the quantity of the injected liquor, that you may know whether it all come forth again after it
hath performed its detergent office. For if any thereof remain behind in the corners and crooked into the injections.

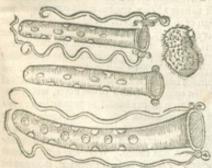

Cheft. Whe
must be put
liquor, that you may know whether it all come forth again after it
must be put
liquor. For if any thereof remain behind in the corners and crooked into the injections.

The form of a Syringe fit to make injection, when a great quantity of liquor is to be injected into any part.

After the injected liquor is come forth, a Pipe of Gold, Silver, or Lead, shall be put into the fifulous ulcer, and it must have many holes in it, that so the filth may pass forth at them; it must be fast tied with firings, that it may not fall into the capacity of the Chelt. A great Sponge freeped in Agus Vose and wrong forth again, shall be laid hot to the end or orifice thereot, both to hinder the entrance of the Air into the fiftulous ulcer, as also to draw forth the fifth there by its gentle heat; the which thing the Patient shall much further, if often-times both day and night he hold his breath, stopping his mouth and note, and lying upon the difeafed fide, that fo the Sanies may be the more forcibly evacuated; neither must we leave the putting in the pspe, before that this fiftulous ulcer shall be almost dry, that is, whole; as when it yields little, or no matter at all, then it must be cicatrized. But it the critice of this fiftulous ulcer being in the upper part hinder the healing thereof, then by a chirurgical Section, a pussage shall be made in the bottom, as we said before in an Empyonia.

The delineation of the Pipes with their Strings and Spo

The Reader must note that the Pipes which are sit for this use, need not have so many holes as these here exprest; but enely two or three in their ends; for the flesh growing and getting into the rest, makes them that

they cannot be plucked forth without much pain,

A Wound made in the Lungs admits cure, un- What wounds less it be very large, if it be without inflammations of the Lunga if it be on the skirts of the Lungs, and not on their are or able. upper parts; if the Patient contain himfelf from coughing much, and contentious fpeaking, and great breathing: for the wound is enlarged by coughing, and thence also arises inflammations the Par and Sames whereof, whilli the lungs again. The harm that condeavour to expel by coughing, by which means enface upon they are onely able to expel that which is hurtful coughing, in Wounds of

and troubleforn to them, the ulcer is dilated, the inflammation augmented, the Patient wages aways the Lungs. and the Difease becomes inourable.

There have been many Eelegmeer described by Physicians for to cleanse the ulcers, which when How Eelegmeet the Patient useth, he shall lie on his back to keep them long in his mouth, so to relax the muscles of must be swalted the Larines, for thus the Medicin will fall by little and little alongst the coats of the Weston, for if it lowed. should fall down in great quantity, it would be in danger to cause coughing. Cows, Asses, or Goatstrails with a little Honey, left they should corrupt in the stomach, are very fit remedies for this purpose; but Womans milk exceeds the rest.

But Sugar of Rofes is to be preferred before all other Medicins, in the opinion of Aviens, for that it The utility of But Sugar of Rootes to be preterred before all other Medicins, in the opinion of Parent, for that it hath a detergent, and also an africtive and strengthening faculty, than which nothing is more to be defired in curing of Ulcers. When you shall think it time to agglutinate the cleanfed ulcer, you must command the Patient to use emplathick, austere, and afteringent Medicins, such as are Terra singularia, below armens, hyperysis, Plantan, Knu-graft, Sunsach, Acaia, and the like, which the Patient shall use in his Broths and Eclegomer, mixing therewith Honey of Roofes, which ferving for a vehicle to the contract of the impacted of the which hinders are lutination. The second of the sunsach of the second of the to the reft, may carry away the impacted filth which hinders agglutination. But feeing an hective fever eafily follows upon these kinds of Wounds, and also upon the affects of the Cheft and Lungs, it will not be amifs to fet down formewhat concerning the Cure thereof, that so the Chirurgeon may know to administer some help to his Patient, whilest a Physician is sent for, to overcome this difeafe with more powerful and certain remedies.

CHAP. XXXII.

Of the differences, causes, signs, and cure of an Hellive Fever.

The reason of the name.

Hective Fever is fo called, either for that it is stubborn and hard to cure and loose, as things which have contracted a habit, for Hexis in Greek signifies a habit; or else for that it seites upon the solid parts of our bodies called by the Greeks Hexis; both which the Latin word ras doth fignific.

The differences thereof.

There are three kinds, or rather degrees of this Fever. The first is when the bectick heat confumes the humidity of the folid parts. The fecond is, when it feeds upon the flelhy fubfiance. The third and uncurable is, when it deftroys the folid parts themselves. For thus the flame of a Lamp first wastes the Oil, then the proper moissure of the Wick. Which being done, there is no hope of lighting it again, what store of Oil foever you pour upon it. This Fever very seldom breeds of it self, but commonly follows after forne other.

The Causes.

Wherefore the causes of a Hective Fever, are sharp and burning. Fevers not well cured, especially if their heat were not repressed with cooling Epithems applied to the heart and Hypochondria. If cold Water was not fitly drunk. It may also succeed a Diary Fever which hath been caused and begun by some long great and vehement grief or anger, or some too violent labour, which any of a slender and dry body hath personned in the hot Sun. It is also oft-times caused by an uleer or inflammation of the Langs, an Empensa of the Chest, by any great and long continuing Phlegmon of the Liver, Stomach, Meientery, Womb, Kidneys, Bladder, of the Guts Jejmann and Colon, and also of the other Guts, if the Phlegmon succeed some long Diarrham, Lienteria, or Bloudy-slux, whence a Confumption of the whole body, and at last a Heckick Fever, the heat becoming more acrid, the moisture of the body being consumed.

of the body being confumed.

This kind of Fever, as it is most easily to be known, so is it most difficult to cure; the pulse in this Fever is hard, by reason of the driness of the Artery which is a folid part; and it is weak by reason of The Signs, the debility of the vital faculty, the fubfiance of the heart being affaulted. But it is little and frequent because of the distemper and hear of the heart, which for that it cannot by reason of its weakness

cause a great pulse to cool it self, it labours by the oftenness to supply that detect.

Why in he-clicks the hear after meat.

But for the pulse, it is a proper fign of this Fever, that one or two hours after meat the pulse feels oneer than usual; and then also there is a more acrid heat over all the Patients body. The heat ftronger than usual; and then also there is a more acrid heat over all the Patients body. is more acrid of this flame lasts until the nourithment be distributed over all the Patients body; in which time the driness of the heart in some fort tempered and recreated by the appulse of moist nourishment, the heat increases no otherwise than Lime which a little before feemed cold to the touch, but sprinkled and moistned with water grows so hot, as it smoaks and boils up. At other times there is a perperual equality of heat and pulfe in fmalnefs, faintnefs, obfcurity, frequency, and hardnefs, without any exacerbation, fo that the Patient cannot think himfelf to have a Fever, yea, he cannot complain of any thing, he feels no pain, which is another proper fign of an hectick Fever. The cause that the heat doth not shew it felf is, it doth not possess the furface of the body, that is, the spirits and humours, but lies as buried in the earthy grossess of the folid parts. Yet if you hold your hand somewhat long, you shall at last perceive the heat more acrid and biting, the way being opened thereto by the skin, partised by the average of the parts. The figns of a rarified by the gentle touch of the warm and temperate hand. Wherefore if at any time in these kind hedick joined of Fevers the Patient feel any pain, and perceive himfelf troubled with an inequality and excefs of with a putrid heat, it is a fign that the hectick Fever is not fimple, but conjoined with a putrid Fever, which caufeth fuch inequality, as the heat doth more or lefs feize upon matter subject to putrefaction; for a heetick Fever of it felf is void of all equality, unless it proceed from forne external cause, as from meat. Certainly if an Hippocratick face may be found in any disease, it may in this, by reason of the colliquation or wasting away the triple substance. In the cure of this Disease, you must diligently observe with what affects it is entangled, and whence it was caused. Wherefore first you must know whether this Fever be a Difease, or else a Symptom. For if it be symptomatical, it cannot be cured as long as the Difease, the cause thereof, remains uncured; as if an ulcer of the Guts occasioned by a Bloudy-flix thall have caused it, or else a fitulous ulcer in the Cheft, caused by some wound reby a blocary-tax that have caused it, or else a fitulous useer in the Circli, caused by foline wound re-ceived on that part, it will never admit of cure, unless first the fitulous or dysenterick useer shall be cured; because the Disease seeds the Symptoms, as the Cause the Effect. But if it be a simple and ef-fential hectick Fever, for that it hath its effence confishing in an hot and dry distemper, which is not fixed in the humours, but in the folid parts, all the counfel of the Phylician must be to renew the

Fever.

An effential beffick.

taken inwardly and applied outwardly. Things to be The things which may with good fuccess be taken inwardly into the body for this purpose, are Medicinal nourithments. For hence we shall find more certain and manifest good, than from alter-

taken inward-The benefit of

nourithments.

ing Medicins, that is, wholly refrigerating and humecting without any manner of nourithment.

For by reason of that portion ht for nutriment which is therewith mixed, they are drawn and carried we have the company to make it company to make it. ried more powerfully to the parts, and also converted into their subtlance: whereby it comes to pais that they do not humec't and cool them lightly and superficially, like the Medicius which have onely power to alter and change the body, but they carry their qualities more throughly even into the in-nermoti fubfiance. Of these things some are Herbs, as Violets, Purslain, Buglos, Endive, Ducks-meat, or Water-lentil, Mallows, especially when the belly shall be bound. Some are Fruits, as Gourds, Cucu-mers, Apples, Prupes, Baifurg Sweet, Alexander of Prupes, Apples, Prupes, Baifurg Sweet, Alexander of Prupes, Prupes, Prupes, Baifurg Sweet, Alexander of Prupes, Prupe mers, Apples, Prunes, Raifins, Sweet Almonds, and fresh or new Pine-Apple kernels; in the number of Seeds are the four greater and leffer cold Seeds, and these new, for their native humidity, the Seeds of Poppies, Berberies, Quinces. The Flowers of Buglos, Violets, Water-lillies, are also convenient; of all these things let Broth be made with a Chicken, to be taken in the morning for eight or nine days, after the first Concoction.

body, but not to purge it; for onely the humours require purging, and not the defaults of the folid parts. Therefore the folid parts mult be refrigerated and humected, which we may do by Medicins Maniew mark

For Meats; in the beginning of the Difeafe, when the faculties are not too much debilitated, he The choice of shall use such as nourish much and long, though of hard digestion; such as the extreme parts of Beafts, as the feet of Calves, Hogs-feet not falted, the fleth of a Tortois which hath lived to long in a Garden, as may fuffice to digett the excrementitious humidity; the fleth of white Snails, and fuch as have been gathered in a Vineyard, of Frogs, River-Crabs, Eels taken in clear Water, and well cooked, hard Eggs eaten with the juice of Sorrel without Spices, Whitings and Stock-fifth. For all fuch things, because they have a tough and glutinous juice, are easily put and glutinated to the parts of our body, neither are they fo cafely diffipated by the Feverish heat. But when the Patient languisheth of a long heclick, he must feed upon meats of easie digestion, and these boiled rather then roasted; for boiled meats humect more, and roafied more eafily turn into choler. Wherefore he may use to cat Veal, Kid, Capon, Pullet, boiled with refrigerating and humecting herbs; he may also use Barlycreams, Almond-milks, as also Bread crummed and moistned with Rose-water, and boiled in a decoction of the four cold Seeds with Sugar of Roses; for such a Panada cools the Liver, and the habit of the whole body, and nourisheth withall. The Testicles, Wings, and Livers of young Cocks, as also Figs and Raisins. But if the Patient at length begin to loath and grow weary of boiled meats, then let him use routs, but so that he cut away the burnt and dried part thereof, and feed onely on the inner part thereof, and that moistned in Rose-water, the juice of Citrons, Oranges, or Pomegranates. Let him abitain from Salt and dry Fishes, and chuse such Fishes as live in stony Waters, for the exercise they are forced to undergo in flumning the Rocks beaten upon by the Waves. Affes milk newly milked and feafoned with a little Salt, Sugar, Honey or Fennel, that it may not compt nor grow fowre in the flomach; or Womans milk sucked from the Dug by the Patient, to the quantity of half click.

a pint, is much commended; verily Womans milk is the more wholforn, as that which is more fweet. Womans milk and familiar to our fubflance, if fo be that the Nurfe be of a good temper and habit of body. For fo it more whole is very good against the gnawings of the Stomach, and ulcers of the Lungs, from whence a Confumption oft proceeds. Let your Milch Ass be fed with Barly, Oats, Oak-leaves; but if the Patient chance to be troubled with the Flux of the Belly, you shall make the milk somewhat aftringent by gently boiling it, and quenching therein Pebble-stones heated red hot. But for that all Natures cannot away with Affes milk, fuch thall abitain from it, as it makes to have acrid belchings, difficulty of breathing, a heat and rumbling in the Hypochondria and pain of the Head. Let the Patient temper his Wine with a little of the Waters of Lettuce, Purllain, and Water-Lillies, but with much Buglofs-Water, both for that it moiftens very much, as also for that it hath a specifick power to recreate the Heart, whose folid fubiliance in this kind of Disease is grievously afflicted. And thus much of things to be taken inwardly.

These things which are to be outwardly applied, are inunctuous Baths, Epithems, Clysters. In- Things to be unctions are divers, according to the various Indications of the parts whereto they are applied. For Galen anoints all the spine with cooling and moderate astringent things, as which may suffice to plied. firengthen the parts and hinder their wasting, and not let the transpiration; for if it should be letted, the heat would become more acrid by fuppreffing the vapours. Oil of Roses, Water-Lillies, Quin-ces, the mucilages of Gum-tragacanth and Arabick extracted into Water of Night-shade, with some small quantity of Camphire, and a little Wax if need require: but on the contrary, the parts of the Brest must be anointed with refrigerating and relaxing things; by refrigerating, I mean things which moderately cool, for cold is hurtful to the Breft. But aftringent things would hinder the motions of the Muscles of the Cheft, and cause a difficulty of breathing. Such inunctions may be made of Oil of Violets, Willows, of the Seeds of Lettuce, Poppies, Water-Lillies, mixing with them the Oil of Sweet Almonds to temper the affriction which they may have by their coldness. But you must the choice of have great care that the Apothecary for covetoufness in fread of these Oils newly made give you not Oils. old, rancid and falted Oils, for fo in flead of refrigerating, you shall hear the part; Wine, Honey, and Oil, acquire more hear by Age; in defect of convenient Oils, we may use Butter well washed in Violet and Night-shade Water. The use of such inunctions, is to cool, humeet, and comfort the parts

whereto they are used; they must be used Evening and Morning, chiefly after a Bath. Now for Baths, we prescribe them either only to moiften, and then plain warm Water wherein the The differen-Flowers of Violets and Water-lillies, Willow-leaves and Barly have been boiled, will be fufficient; or ces of Baths. elle not onely to moifien, but also to acquire them a fairer and fuller habit, and then you may add to your Bath the decoction of a Sheeps-head and Gather, with fome Butter. But the Patient thall not Why the Patient of the Patient that the Patient shall not enter into the Bath faiting, but after the first concoction of the Stomach, that so the nourishment tiens must not may be drawn by the warmness of the Bath into the whole habit of the Body. For otherwise he fasting. which is fick of a Confumption, and shall enter the Bath with his Stomach empty, shall fuffer a grea-Which is like to a Contamption, and mail enter the Bath with his fireight is well able to endure, ter diffipation of the triple fubblance, by the heat of the Bath, than his fireight is well able to endure. Wherefore it is fit thus to prepare the body before you put it into the Bath. The day before in the How to prepare the immediate Clyster, to evacuate the excrements baked in the guts by the hepare the bod Click drines; then let him cat to his dinner force folid meats about nine of the Clock, and let him for the Bath, also a Clock eat forcewhat forcingly, meats of case discellion to his force. about four of the Clock eat fomewhat sparingly, meats of easie digestion to his supper. A little after midnight let him sup off some Chicken-broth, or Barly-cream, or else two rear Eggs tempered with forme Rofe-water and Sugar of Rofes in stead of Salt. Some four or five hours after, let him enter into the Bath, those things which I have set down being observed. When he comes out of the Bath, let him be dried and gently rubbed with foft linnen cloths, and anointed, as I formerly prefcribed, then let him fleep, if he can, for two or three hours in his bed: when he wakes, let him take fome Prifan or forne fuch like thing, and then repeat his Bath after the aforefaid manner. He thall use this Buth thrice in ten days. But if the Patient be subject to crudities of the stornach, so that he cannot sit Things stream in the Bath without fear of fwooning, and fuch fymptoms, his flornach must be firengthened with Oil themag the of Quinces, Wormwood and Maftich, or elfe with a cruft of Bread to afted and fleeped in Muskadine, and firewed over with the Powders of Rofes, Sanders, and so laid to the stomach, or behind near to

enter the Bath

Epithems.

the 13. vertebra of the back, under which place Anatomy teaches that the mouth of the flomach lies. Epithems shall be applied to the Liver and Heart, to temper the too acrid heat of these parts, and correct the immoderate drines by their moderate humidity. Now they shall be made of refrigerating and humeching things, but chiefly humeching; for too great coldness would hinder the penetration of the humidity into the part lying within. The Waters of Buglos and Violets, of each a quartern with a little white Wine, is convenient for this purpose. But that which is made of French Barly, the seeds of Gourds, Pompions, or Cucumers, of each three drains in the decoction, and mixed with much tempering with Oil of Violets, or of fweet Almonds, is most excellent of all other. Let cloths be dipped and fleeped in fuch Epithems, and laid upon the part and renewed as oft as they become hot by the heat of the part. And because in hectick bodies, by reason of the weakness of the digestive faculty, many excrements are usually heaped up, and dried in the guts, it will be convenient all the time of the Disease to use frequently Clysters made of the decoction of cooling and humecting Herbs, Flowers and Seeds, wherein you shall dissolve Cassa, with Sugar and Oil of Violets or Water-Lillies. But because there often happens very dangerous fluxes in a confirmed hectick Fever, which shew the decay of all the faculties of the body, and waiting of the corporeal substance, you shall relist them with refrigerating and affifting Medicins, and Meats of groffer nourithment, as Rice, and Cicers; and application of affringent and ftrengthening remedies, and using the decochion of Oats or parched Barly for drink. Let the Patient be kept quiet and fleeping as much as may be, especially if he be a child. For this Fever frequently invades children by anger, great and long fear, or the too hot milk of the Nurse, over-heating in the Sun, the use of Wine, and other such like causes; they shall be kept in a hot and moift air, have another Nurfe, and be anointed with Oil of Violets; to conclude, you shall apply Medicins which are contrary to the morbifick cause.

wher a flux happening in a hectick Fever indicates.

CHAP. XXXIII.

Of the Wounds of the Epigastrium and of the lower Belly.

How children !" be cured.

Their differences.

Signs of a wounded li-

Signs that the Stomach and fmaller Gun are wounded.

Signs to know when the greater Guts ere wounded, hart.

wounded. wounded.

Prognofficks. Lib.S.tap.88.

He Wounds of the lower Belly are fometimes before, fometimes behind, fome onely touch the furface thereof, others enter in , fome pass quite through the Body, so that they often leave the Weapon therein; some happen without hurting the contained parts, others grievously offend these parts, the Liver, Spleen, Stomach, Guts, Kidneys, Womb, Eladder, Ureters, and great Vessels, so that oft-times a great portion of the Kall falls forth. We know the Liver is wounded, when a great quantity of bloud comes forth of the Wound, when a pricking pain reaches even to the Sword-like grifle, to which the Liver adheres. Oft-times more choler is caft up by Vomit, and the Patient lies on his Belly with more ease and content.

When the Stomach or any of the fmall Guts are wounded, the meat and drink break out at the Wound, the Ilis or flanks fwell and become hard, the Hicker troubles the Patient, and oft-times he casts up more choler, and grievous pain wrings his Belly, and he is taken with cold fweats, and his extreme parts wax cold.

If any of the greater Guts shall be hurt, the excrements come forth at the Wound: When the Spleen is wounded there flows out thick and black bloud, the Patient is oppressed with thirst, and there are also the other figns which we faid use to accompany the wounded Liver. A difficulty of making water troubles the Patient whose reins are wounded, bloud is piffed forth with the Urin, and he hath Signs that the a pain firetched to his groins and the regions of the Bladder and Tefficles.

The Bladder or Ureters being wounded, the flanks are pained, and there is a Tention of the Petter, Signs that the or Share; Bloud is made in ftead of Urin, or elfe the Urin is very bloudy, which also divers times comes forth at the Wound. When the Womb is wounded, the bloud breaks forth by the Privitics,

Signs that the and the symptoms are like those of the Bladder. The Wounds of the Liver are deadly, for this part is the Work-house of the Bloud, wherefore neceffary for life; belides by Wounds of the Liver the branches of the Gate or hollow Veins are cutwhence enfues a great flux of bloud not onely inwardly, but also outwardly, and consequently a diffipation of the spirits and strength.

But the bloud which is fleed inwardly amongst the Bowels putrefies and corrupts, whence follows Pain, a Fever, Inflammation, and lastly Death. Yet Paulus Argineta writes that the lobe of the Liver may be cut away without necessary consequence of death. Also the Wounds of the Ventricle and of the small Guts, but chiefly of the Jejumon, are deadly; for many Vessels run to the Jejumon or empty Gut, and it is of a very nervous and slender substance, and besides it receives the cholerick humour from the bladder of the Gall. So also the Wounds of the Spleen, Kidneys, Ureters, Bladder, Womb, and Gall, are commonly deadly, but always ill, for that the actions of such parts are necessary for lifes belides divers of these are without bloud and nervous, others of them receive the moist excrements of the whole body, and lie in the innermost part of the body, so that they do not easily admit of Medicins. Furthermore, all Wounds which penetrate into the capacity of the Belly, are judged very dangerous, though they do not touch the contained Bowels: for the encompating, and new air en-

tering in amongst the Bowels, greatly hurts them, as never used to the feeling thereof; add hereto the distipation of the spritts which much weakens the strength. Neither can the sith of such Wounds be wasted away according to the mind of the Chirurgeon, whereby it happens they divers times turn into Fishulaes, as we said of Wounds of the Cheft, and so at length by collection of matter cause death. Yet I have dressed many, who by Gods assistance and favour have recovered of Wounds passing quite through their healts. palling quite through their bodies. I can bring as a witness the Steward of the Portugal Embassadour, whom I cured at Melun of a Wound made with a Sword to running through the body, that a great quantity of excrements came forth of the wounded Guts as he was a dreffing, yet he recovered.

A Hiftory

Manusconni)

Not long ago Giles le Maistre, a Gentleman of Paris was run quite through the body with a Ra-Another Hi-pier, fo that he voided much blood at his month, and fundament divers days together, whereby flory, you know the guts were wounded; and yet he was healed in twenty days. In like fort the wounds of the greater veffels are mortal, by reason of the great effusion of blood and spirits which ensues thereupon.

CHAP. XXXIV.

The cure of Wounds of the lower Belly.

He first cogitation in curing of these wounds ought to be. Whether they pierce into the capacity of the belly; for those which pass no further then the Peritoneum shall be cured like timple wounds which only require union. But those which enter into the capacity must

be cured after another manner. For oft-times the kall, or guts, or both, fall forth at them.

A gut which is wounded must be fowed up with fuch a fearn as Furriers or Glovers use, as we The cure of a formerly told you; and then you must put upon it a powder made of Mustich, Myrrh, Aloes and wounded gar. Bole. Being fowed up, it must not be put up boisterously together and at once into its place; but by little and little, the Patient lying on the side opposite to the wound. As for example, the right fide of the guts being wounded and falling out by the wound, the Patient shall lye on his left fide, for the more easie reftoring of the faln-down gut, and so on the contrary. If the lower part of the guts being wounded flide through the wound, then the Patient shall lye with his head low down, and his buttocks raifed up by putting a pillow under them: If the upper part be hurt, then most he lye quite contrary, that the guts falling downwards, by fuch a fite, may give way to those which are taln out through the wound. But often in this case, the guts having taken cold by the encompassing air, swell up and are differed with wind, the which you must discuss before you put them into their place, with a Fomentation of the decoction of Camomil, Melilot, Anifeeds, and Fennel, applied with a fpunge, or contained in a bladder; or elfe with Chickens, or Whelps cutalive in the midft and laid upon the fwelling; for thus, they do not only difcufs the flatulency, but also comfort the afflicted part. But if the inflation cannot thus be difcuffed, the wound shall be dilated, that

for the afflicted part. But if the innation cannot thus be uncauted, the wonarchian be unact, the for the guts may return the more freely to their place.

If the kall thall fall out, it must be speedily restored to its place, for it is very subject to putrefie; The care for the fat, whereof for the most part it consists, being exposed to the air, easily loses its native when the heat, which is small and weak, whence a mortification ensues. Hence is that of Hippocrater; If the falls out. heat, which is necessarily putrefies. The Chirurgeon shall know whether it putrihes, or not, by the Hip. Aph. 52. blackness and the coldness you may perceive by touching it; neither must you when it putrefies, pre-side. 6. fently restore it to its place, for so the contagion of the putrefaction would spread to the rest of the parts: But whatsoever thereof is putrefied shall be twitched and bound hard with a string, and so cut off, and the reft reftored to his proper place; but its good after cutting of it away, to leave the firing fill hanging thereat, that fo you may pluck and draw forth whatfoever thereof may by being too firait bound, fall away into the capacity of the belly. Some think it better to let the kall thus bound to hang forth until that portion thereof which is putrefied fall away of it felf, and not to cut it off. But they are much deceived; for it hanging thus would not cover the guts, which is the proper place. The guts and kall being put up, if the wound be great and worth fpeaking of, it must be fowed with that future which is termed Gastroraphia; but this kind of furnishing the state of the property of the state there is thus made. The needle at the first putting in must only take hold of the Peritoneum, and then on the opposite side only of the sless, letting the Peritoneum alone, and so go along putting the needle from without inwards, and from within outwards, but fo that you only take the mutenlous flesh and skin over it, and then only the Peritonenon, until you have sowed up all the wound. He which doth otherwise shall undergo this danger, that whereas the coat Peritonenon is of it selfwithout blood, it being divided, or wounded, cannot of it felf be united to it felf, therefore it requires an intercourse of slesh: Otherwise unless it be thus united by the benefit of the slesh intermixed therewith, there would remain an incurable tumor after the wound is cicatrized on the outfide. But that which we faid before, according to Galen's mind, that all the wounds must be fowed, it 116. 6. Math. fide. But that which we faid before, according to Galea's mind, that all the wounds must be fowed, it Lib. 6. Mathe is not for to be taken, as if that the wound must be fowed up to the very end for in the lower part of cap. 4. the wound there must be left a certain finall vent by which the quitture may pass forth, which being wholly cleansed and exhausted, the wound must be quite healed up. But the wounds which shall penetrate into the substance of the liver, spleen, ventricles, and other-bowels, the Chiungeon shall not suffer them to be without medicines, as if they were desperate, but he shall spare neither labour nor care to dress them diligently. For doubtful shope is better than certain despair. The bladder, womb and sight gut being wounded, detergent and agglutinative injections shall be put up by their proper passages. I have read nothing as yet in any Author of the wounds of the fat, for all of them refer the cure thereof to the wounds of the muscles. Yet I will say this by the way, that The cure of ting in of any tent, but only dropping in some of my Balsam, and then laying upon it plainter of fur. Granta Dei, or some such like; for so they will heal in a short time;

CHAP. XXXV.

Of the Wounds of the Groins, Yard, and Testicles.

Hen the groins and neighbouring parts are wounded, we must first consider whether they pierce to within: And if they do penetrate, to what inward parts they come, whether to the bladder, the womb, or right gut; for these parts are such near neighbours that oft-times they are all wounded with one blow. But for the wounds of the tefficles and genital parts, because they are necessary infiruments for the preserving the Species by generation of a fuc-cession of Individuals, and to keep all things quiet at home, therefore the Chirurgeon ought to be very diligent and careful for their preservation. Wherefore if they should chance at any time to be wounded, they shall be dressed, as we have formerly delivered, the medicines being varied according to the flate of the wound, and the appearing and happening fymptoms; for it would be a thing of immenfe labour to handle all things in particular.

CHAP. XXXVI. Of the Wounds of the Thighs and Legs.

Why wounds of the infide o the thigh are oft-times deadly.

Ounds which have been received on the infide of the thighs, have often caufed fudden death, if they have come to the vein Suppens, or the great artery, or the nerves, the affociates of these vessels. But when they are simple, there is nothing which may after the usual manner of cure. Yet the Patient must be careful to lye in his bed; for the vulgar Italian Proverb is true, La mane al pette, la gamba al lette; that is. The hand on the breast, and the leg on the bed. But when they penetrate more deeply into the substance of the part, they bring horrid and fearful fymptoms, as an inflammation, an abfeefs, from whence oft-times fuch abundance of matter isflues forth, that the Patient falls into an Atrophia and Confumption. Wherefore fuch wounds and alcers require a careful and induffrious Chirurgeon, who may fitly make Incilious necessary for the corrupt parts, and callofity of the fiftulous ulcer. Some Chirurgeons have been to bold as to the corrupt parts, and callofity of the fiftulous ulcer. Some Chirurgeons have been to bold as to fow together the end of the tendous of the ham, and of other joynes, when they have been quite cut afunder. But I durft never attempt it for fear of pain, convultions, and the like horrid fymptoms. For the wounds of that large tendon which is composed in the calf of the leg by the concourse of three muscles, and goes to the heel, I have observed that when it hath been cut with a Sword, that the wounds have been long and hard to cure; and besides, when at the last they have been healed as foon as the Patient bath and the calf of the last they have been healed. as from as the Patient hath got out of his bed, and endeavoured to go, they have grown ill and broke open again. Wherefore in fuch like wounds let the Patient have a care, that he begin not to go, or too boldly to use his hurt leg before it be perfectly cicatrized, and the scar grown hard. Therefore that the Patient may be in more fafety, I judge it altogether necessary, that he use to go with Crutches for a good while after the wound is perfectly healed up.

C H A P. XXXVII.

Of the Wounds of the Nerves and nervous parts.

Differences drawn from things wound-

Their fymp-

Why a pun-

He continuity of the nervous parts is divers ways loofed by the violent incursion of external things; as by things which contufe, batter, and grind in funder, as by the blow of a fione, cudgel, hammer, lance, bullet out of a Gun or Crofs-bow; by the biting of greater teeth; or the pricking of fome tharp thing, as a needle, bodkin, pen-knife, arrow, iplinter; or the puncture of fome venemous thing, as of a Sea-dragon; or the edge of fome cutting thing, as a fword or rapier; or of firetching things which violently tear afunder the nervous bodies. Hence therefore it is, that of fuch wounds forme are fimple, others compound; and the compound, forme more compound than other. For of thefe forme are superficiary and short, others deep and long; fome run alongs the nervous body, others run broad-ways; some cut the part quite afunder, others only a portion thereof. The symptoms which follow upon such wounds are, vehement pain, and defluxion, inflammation, ableefs, feaver, delirium, fwooning, convullion, gangrene, fiphacel; whence often death enfues by reafon of that fympathy which all the nervous parts have with the brain. Amongst all the wounds of the nervous parts, there is none more to be feared than a punchare, or prick, nor any which causest more cruel and dangerous fymptoms. For by reafon of the direction of the dire ness of the wound, medicines can neither be put in, nor the fanious matter pass forth; now the fanious matter pass forth; nerve is deadas when the Pericranium is half cut, or when it is cut to apply a Trepan. For the cutting thereof in-fers far greater pain, than when it is cut quite afunder. Wherefore it is fafer to have the nervous body quite cut off, for fo it hath no community, nor consent with the upper parts, neither doth it labour, or strive, to resist the contraction of its self; now this contractity, and as it were right, is the cause of pain's yet there arises another misery from such a wound, for the part whereinto the nerve which is thus cut infunder paffes, thence forwards lof th its action.

CHAP. XXXVIII.

Of the cure of Wounds of the nervous parts.

T is the ancient Doctrine of the ancient Phylicians, that the wounds of the nervous parts should A wound of not presently be agglutinated (which notwithstanding the general and first indication, usually the nervous taken from the folution of continuity, requires) but rather, chiefly if they be too ftrait, that the parts indicapunctures should be dilated, by cutting the parts which are above them, and let them be kept long to the general open that the fifth may pass freely forth, and the medicine enter well in. Yet I in many cures have cure of not followed this counfel, but rather that which the common indication requires.

That cure is in fresh memory which I performed upon Monsieur le Cocq, a Proctor of the Spiritu- A History. al Court, who dwelt in our Ladier-freet; he gathering and binding up fome loofe Papers; run a Pen-knife which was hid amongst them, through his hand. Also one of his neighbours who went to spit a piece of Beef, thrust the spit through the midst of his hand : But I presently agglutinated both their wounds, without any danger, dropping presently in at the first dresting a little of my Bastom warm, and putting about it a repelling and allringent medicine, and by this means they were both of them healed in a fhort time, no fymptom thereupon happening. Yet I would not have the young Chirurgeon to run this hazard: For hirli, he must be well practifed and accustomed to know the tempers and habit of men; for this manner of curing will not do well in a plethorick body, or in a body replete with ill humors, or indued with exquifite fenfe. Therefore in fach a cafe it will be fafer to follow the course here set down. For wounds of the nerves do not only differ from other wounds, but also among themselves in manner of curing. For although all medicines which draw from far, and waste fanious humors, may be reputed good for the wounds of the nerves; yet those which must be applied to punctures, and to those nerves which are not wholly laid open, ought to be far more powerful, flurp and drying; yet fo that they be not without biting, that so penetrating more deep, they may draw forth the matter, or else consume and discuss that which either lies about the nerves, or moiffcus their fubfiance. On the contrary, when the finews are bared from fleft and Medicines fit adjoyning particles, the fland in need but of medicines, which may only dry. Here you may furnish for wounds of the nerves. your felves with sufficient flore of medicines good for the nerves howsoever pricked. As R. Terebinth, vin. & olei veteris an. 3 i. Aqua vite parum. Or R. elei Terebinth, 3 i. Aqua vite 3 i. Euphor. 5 ß. Or, R. radices Dracontia, Brionia, Valeriana & Gentiana exssecution, & in pulverem reductas, misce cum develo centauri, and oleogant assungia peteri; drop hereof warm into the wound as much as shall suffice. Orelic put fome Hogs, Goofe, Capons, or Bears Greafe, old Oyl, Oyl of Lilies, or the like, to Gallsaum, pure put fome Hogs, Goofe, Capons, or Bears Oreafe, old Oyl, Oyl of Lilies, or the like, to Galbanam, pure Rozin, oppanax diffolved in Aqua vita and firong Vinegar. Or, Re elei hypericonix fambuci, & de enpharbio an. § i. Sulphuris vivi fubriliter pulverifati § β, gammi ammoni. belefin an. § ii. Aceti bani § ij. fuffice be dropped into the wound; then apply this following Gerate, which draws very powerfulin aceto diffoliatorum, an. § ii. Terebinth. venet. § β, diachylonis albi cam gammi, § x. ammoniae, belefit faits molle. We must use force whiles one, fome whiles another of their medicines in punctures of the ments and habits of the wounded bodies. But if the pain yield not to fuch remedies, but rather inverses, with the inflammation of the affected part, a fwelling of the lips of the wound, and fweating forth of a ferous, thin and virulent matter or hith, then you thall pour into it fealding Oyl, and thall forth of a ferous, thin and virulent matter or filth, then you shall pour into it fealding Oyl, and shall must be burne, touch three or four times not only the surface of the wound, but the bottom thereof with a rag dipped therein and tied to the end of Spatulae. For this will take away the sense from the nerve, tendon, A certain or membrane, like as if they were burne with a source, and feat a way the sense from the nerve, tendon. or membrane, like as if they were burnt with a cautery, and fo the pain will be eafed. So in the most Anodyne in grievous pains of rotten teeth, the thrufting of an hot iron into their roots, or flopping them with pain of the cotton dipped in Oyl of Vitriol, or Aqua vite, gives most certain ease; for by burning the nerve which is inferted into their roots, the sense, and so consequently, the pain is taken away. So also in roots must rain cease by arrelating and spreading ulcers, which are always associated with much pain; the beautiful to the roots of Alum or Mercury, or Acuticous mode some forceding ulcers. pain ceases by applying an Escharotick, the powder of Alum or Mercury, or Agystiscom made some-spreading ul-

what more firong than ufual. That the young Chirurgeon may be more ready for this practice and cers. the ufe of the former medicines, I have thought good to infert the following History, both for the lateness of the thing, and pleasing memory of the most laudable Prince.

Charles the ninth, the French King, being sick of a Feaver, Monsteur Chapellan and Castellan his A simous History, being sick of a Feaver, Monsteur Chapellan and Castellan his A simous History, and the simous for that business, but when as he by chance had pricked a nerve instead of a vein, the King cried out, that he felt a mighty pain in that place. Then I hid that Chirurgeon wondrous farmous for that bulinefs; but when as he by enance had pricked a nerve inflead of a vein, the King cried-out, that he felt a mighty pain in that place. Then I bid, that the ligature fhould fireight-ways be loofed, otherwise the arm would prefently be much fwelled. But he going flowly about it, behold the arm began to fwell with fuch contraction, that he could not bend it, nor put it forth, and cruel pain moletted not only the pricked particle; but all the whole member befides. I forthwith I aid upon the wound a plainer of Bafiliem, to hinder the same particle is the same particle of the same particle in the same particle is but all the same particle is the same particle in the same particle in the same particle is the same particle in the same particle in the same particle is the same particle in the same particle in the same particle is the same particle in the same particle in the same particle is the same particle in the same particle in the same particle is the same particle in the same particle in the same particle is the same particle in the same particle in the same particle is the same particle in the same particle in the same particle is the same particle in the same particle in the same particle is but all the same particle in the same particle is but all the same particle in the same particle is but all the same particle in the same particle is but all the same particle in the same particle is but all the same particle in the same particle is but all the same particle in the same particle is but all the same particle in the same particle is but all the same particle in the same particle is but all the same particle is but all the same particle in the same particle is but all the same particle in the same particle is but all the same particle in the same particle is but all the sam agglutination thereof, and then I wrapped all the arm in a double linnen cloth dipped in Oxycrate, putting upon it an expulsive ligature, which beginning at the wrift and ending at the top of the thoulder, might keep the blood and spirits from sear of destuxion and inflammation. This being thus performed, we went afide to confult what was necessary to be done, both to affwage the pain, as also to divert the other symptoms, which usually happen upon punctures of the nerves. I being defired, thus delivered my opinion, that in my mind, there were nothing better, then prefently to drop into the wound fome Oyl of Turpentine warmed and mixed with a little Aqua vira. And then all the arm shouldbe be covered with a plainter of Discalcibear dissolved in Vinegar and

Oyl of Roses, bound over and besides with the expulsive ligature, which we formerly mentioned. For the Oyl and Aqua vite have a faculty to penetrate into the bottom of the wound, and to exhaust and dry up the serous and virulent humos, which sweats from the substance of the pricked nerve; and also to mitigate the pain by its actual heat. Furthermore, emplaister Discalcingos hath a faculty to dissolve the humor which hath already fallen down into the arm, and to hinder the entrance and destuxion of any new matter. And the ligature is such as by its moderate affirction would serve to strengthen the muscles, and to press out and repel the humors, which were fallen down into the upper part, and to prohibit that which is ready to fall down. Mine advice being approved of the Phylicians both in word and deed, the pain was mitigated. But the humor staid in the part, for the dissolving and drying whereof, this following remedy was used. Re far. bordei & grabi an. 3 ij. flor. chansem. & melilot. an. p. ij. butyr. recents fine sale 3 is. Lixivii burbitonsoris quod sufficit, stat cataplasms and formam pultis. By these remedies the King at last, after three months space was perfectly healed, so that there remained no sign of the depraved action in the part. But if at any time there shall be so great contumacy, that it will not yield to these means, but that there is imminent danger of a Convulsion; it will be better to cut it in funder, whether nerve, tendon, or membrane, than to expose the Patient to the danger of a deadly Convulsion; for thus indeed the peculiar action of that part will be lost, but the whole body preserved thereby; for so we had determined by common consent, that if the pain which afflicted the King would not yield to the prescribed remedies, either to pour in sealing Oyl, or else to cut the sinew quite assunder.

For the late and sad memory of M¹¹⁰ Courtin dwelling in the Street of Holy-Crose, was in our

A Hiftory.

A discussing and drying cataplasm.

An Anodyne and Sarcotick Balfom.

A general rule for all wounds of all nervous parts.

minds, who of a vein not well opened in her arm fell into a Gangrene and total mortification of that whole part, of which the died, because the was not dreffed with the formerly mentioned medicines. Yet we must abstain from these two powerful remedies, when the pricked nerve shall lye bare, for elfe the pain would be increased, and more grievous symptoms follow. Wherefore as I formerly wished, more mild medicines must be applied, which may dry up the serous humor without biting acrimony; as R. Terebinth, venet. in aq. rof. lota 3 ij. Boli armeni fubtiliter pulverifati, 3 ij. Incorporentuer fimul. Our Balforn also is excellent in this case, and this of Vigo's which follows. & Olei rofare omphacini § 1 [5]. Olei de terebinth. 3 iij, succi plantag. § [5]. Semin, hypericonis aliquantulum conversion, p.
Tutia prapar. 3 iij. Calcis decies lota cum aqua plantagin. 3 ij. antimonis 3 i. sevi hercini, & vitulini,
an. § v. vermium terrestrium cum vino lotorum § i [6]. Bulliant omnia simul dempta tutia in cyatho decolisonis bordei, ad consumpaionem aqua. & vini, colentur rursumq, igni admoveantur, addendo tutiam, & siat Linimentum com cera alba, & 3 \$. Croci. This liniment affwages pains, and covers the bared nerves with flesh. This cure of punctured nerves, may with choice and judgment, and observing the proportion of the parts, be transferred to the pricked tendons and membranes. But take this as a general and common rule, that all nervous bodies howfoever hurt, are to be comforted by anointing them with hot Oyls, fuch as the Oyl of Bays, Lilies, of Worms, Sage, or fome other fuch like remedy being applied to their originals and more notable passages; as to the original of the spinal mar-row, the arm-pits and groins. Neither do I think sit in this place to omit an effect which sometimes happens to the large tendon of the heel, of which we formerly made mention. For it ofe-times is rent or torn by a fmall occasion without any fign of injury or folution of continuity apparent on the outfide, as by a little jump, the flipping afide of the foot, the too nimble getting on horfe-back, or the flipping of the foot out of the flirrop in mounting into the faddle. When this chance happens, it will give a crack like a Coach-mans whip; above the heel, where the tendon is broken, the depressed cavity may be selt with your singer, there is a great pain in the part, and the party is not able to go. This mischance may be amended by long lying and retiing in bed, and repelling medicines applied to the part affected in the beginning of the disease, for sear of more grievous fymptoms, and then applying the Black-plaifter, or Discalcibees, or fome other fuch, as need shall require; neither must we hereupon promise to our selves, or the Patient, certain or absolute health. But on the contrary, at the beginning of the difease we must foretel that it will never be so cured, but that some reliques may remain, as the depretsion of the part affected, and depravation of the action and going; for the ends of this broken or relaxed tendon by reason of its thickness and contumacy, cannot easily be adjoyned, nor being adjoyned, united.

G H A P. XXXIX. Of the Wounds of the Joynts.

Why wounds of the joynts are malignant,

Because the wounds of the Joynts have something proper and peculiar to themselves, besides the common nature of wounds of the nerves, therefore I intend to treat of them in particular. Indeed they are always very dangerous, and for the most part deadly, by reason of the nervous productions and membranous tendons wherewith they are bound and ingirt, and into which the nerves are inserted: Whereby it comes to pass, that the exquisite sense of such like parts will eafily bring malign symptoms, especially if the wound possess an internal, or, as they term it, a domestick part of them; as for example, the arm-pits, the bending of the arm, the inner part of the wrist, and ham, by reason of the notable veins, arteries, and nerves of these parts, the loosed continuity of all which brings a great flux of blood, sharp pain, and other malignant symptoms; all which we must resist according to their nature and condition, as a flux of blood with things staying bleeding, pain with anodynes. If the wound be large and wide, the severed parts shall be joyned with a future, leaving an orifice in the lower part, by which the quitture may pass forth. This following powder of Vigo's description must be strewed upon the suture. R. Thuris, sang. draconis, ball arms. term sight. an. 3 ij. Alors, massich. an. 3 i. Fias pulvis substitis. And then the joyne must be wrapped about with a representative medicine composed of the whites of Eggs, a little oyl of Roses, Bole, Massich, and Barley flower. If it be needful to use a Tent, let it be short, and according to the wound

The cure.

tanien nui

thick, left it cause pain, and moreover let it be anointed with the yolk of an Egg, oyl of Roses, washed Turpentine and a little Saffron. But if the wound be more thort and narrow, it shall be dilated, if there be occasion, that so the humor may pass away more freely. You must rest the part, and beif there be occasion, that so the humor may pass away more freely. You must rest the part, and beware of using cold, relaxing, mollifying, humeching, and unchuous medicines, unless peradventure the sharpness of the pain must be mitigated. For on the contrary, aftringent and deficeant medicines are good, as this following Cataplasin. Re fuestir, macri, farin, bordei, & fabarum an. 3 iii, Flo. An aftringent rum chame. & melil, an. m. B terebinth. 3 iii, melis community 3 ii. ol. myri. 3 i. Oxymelinis, vel lixiviii and drying com, quantum sufficit; stat estaplasins ad forman pultit. Or you may compose one of the Lees of Wine, Wheat-bran, the powder of Oaken-bark, Cypreis-nuts, Galls and Turpentine, and such like, that have an afteiness. that have an aftringent, firengthning and drying quality, and thereby affwaging pain, and hindering the defluxion of humors. This following medicine is aftringent and agglutinative. R. terebinth, venet. 3 ij. aq. vite parum, pulveris maftich. aloes, myrrhe, boli armen. an. 3 ij. And also our Balsam will be good in this case, if so be that you add hereto so much powder which dries without Acrimony, as occasion shall serve: I admonished you before to take heed of cold, and now agains for it is hurtful to all wounds and ulcers, but especially to these of the nervous parts: Hence it is that many die of finall wounds in the Winter, who might recover of the fame wounds though greater in the Summer. For cold, according to Hippocrates, is nipping to Ulcers, hardens the skin, and hinders them Aphor. 20, fices. from suppuration, extinguisheth natural heat, causes blackness, cold aguish fits, convulsions and diflentions. Now divers excrements are cast forth of wounds of the joynts, but chiefly albugineous, that What matter is, refembling the white of an Egg, and mucous, and fornetimes a very thin water, all which favour usually flows of the nature of that humor which nourisheth these parts. For to every part there is appropriate for forom wounds his nourishment and conservation, a peculiar Balfam, which by the wound flows out of the same part; as out of the branches of the Vine, when they are pruned, their radical moitture or juyce flows, whence also a Callus proceeds in broken bones. Now this fame mucous, and albugineous humor, flow, and as it were frozen, flowing from the wounded joynts, shews the cold diffemper of the parts which cause pain, not to be orecome by medicines only potentially hot. Wherefore to correct why things that, we must apply things actually hot, as Beasts and Swines bladder half full of a discussing must be asso decoction, or hot bricks quenched in Wines. Such actual heat helps Nature to concoct and difculs ed to the the fuperfluous humor impact in the joynts, and flrengthens them; both which are very necessary, because the natural heat of the joynts is so infirm that it can scarce actuate the medicine, unless it joynts, be helped with medicines actually hot. Neither must the Chirurgeon have the least care of the figure. Of the fire and and posture of the part, for a vicious posture increases ill symptoms, uses to bring to the very part posture of though the wound be cured, diffortion, numnels, incurable contraction; which fault left he should run into, let him observe what I shall now say : If the fore-part of the shoulder be wounded, a great boulifer must be under the arm-pit, and you must carry your arm in a fearf, so that it may bear up the lower part of the arm, that so the top of the shoulder may be elevated somewhat higher, and that fo it may be thereby more speedily and happily agglutinated and consolidated. If the lower part be wounded, when slesh begins to be generated, and the lips of the wound to meet, you must bid the Patient to move and flir his arms divers ways ever and anon; for if that be omitted or negligently done, when it is cicatrized, then it will be more stiff and less pliable to every motion; and yet there is a further danger left the arm should totally lose its motion. If the wound be upon the joynt of the elbow, the arm shall be placed and swathed in a middle posture, that is, which neither too straitly bows it, nor holds it too stiffly out; for otherwise, when it is cicatrized, there will be an impediment either in the contraction or extention. When the wound is in the wrift or joynts of the fingets either externally or internally, the hand must be kept half shut, continually moving a ball therein. For if the fingers be held firait firetched forth, after it is cicatrized, they will be unapt to take up or hold any thing, which is their proper faculty. But if after it be healed, it remain half thut, to great inconveniency will follow thereon: For fo he may use his hand divers ways to his Sword, Pike, Bridle, and in any thing elfe. If the joynts of the hip be wounded, you must fo place the Pa-tient that the thigh-bone may be kept in the cavity of the buckle-bone, and may not part a hairs breadth there-from, which shall be done with linner boulsters and ligatures applied as is fitting, and lying full upon his back. When the wound shall begin to cicatrize, the Patient shall use to move his thigh every way, left the head of the thigh-bone flick in the cavity of the huckle-bone without motion. In a wound of the knee, the leg must be placed firait out, if the Patient delire not to be lame.
When the joynts of the feet and toes are wounded, these parts shall neither be bended in nor out, for otherwife he will not be able to go. To conclude, the fite of the foot and leg, is quite contrary to that of the arm and hand.

CHAP. XL. Of the Wounds of the Ligaments.

He wounds of the Ligaments, befides the common manner of curing those of the Nerves, Ligaments have nothine peculiar, but that they require more powerful medicines, for their agglutination, deficcation and confolidating; both because the ligamental parts are harder and
their, and also for that they are void of sense. Therefore the foresaid cure of nerves and joynts may
be used for these wounds: For the medicines in both are of the same kind; but here they ought to
be strong and cure of all the symptomes related to be fironger and more powerfully drying. The Theory and cure of all the fymptomes which shall happen thereupon, have been expressed in the Chapter of curing the wounds of the nervous parts, so that here we shall need to speak nothing of them, for there you may find as much as you will. Wherefore here let us make an end of wounds, and give thanks to God the Author and giver of all good, for the happy process of our labours: And let us pray that that which remains may be brought to a happy end, and secure for the health and safety of good people.

The end of the Tenth Back.

BOOK XI.

Of Wounds made by Gunshot, other fiery Engines, and all forts of Weapons.

The PREFACE.

Have thought good here to premife my opinion of the original, increase, and hurt of fiery Engines, for that I hope it will be an ornament and grace to this my whole Treatise: As also to intice my Reader, as it were with thise junkets, to our following Banquet so much savaring of Gunpowder. For thus it shall be known to all whence Guns had their original, and how many habits and stapes they have acquired from poor and observe beginnings; and lastly, how hurtful to mankind the use of them is.

Lib. v. de in. TABLE PERSON.

Polydore Virgil writes, that a German of obscure birth and condition was the Inventor of this new Engin which we term a Gun; being induced thereto by

this occasion. He kept a Mortar covered with a sile or flate, for some other certain uses, a sounder (which fince that time for its chief and new known faculty, is named Sunposeder.) Now it chanced as he struck fire with a steel and flint, a spark thereof, by accident fell into the Mortar, whereupon the powder suddenly catching sire, cash the stone or tile which covered the Mortar up on high; he stood amazed at the novelty and strange effect of the thing, and withat observed the formerly unknown faculty of the powder's So that he thought good to make experiment thereof in a small from Trunk framed for that purpose according to the intention of his mind. When all things were correspondent to his expellation, he first shewed the use of his Engine to the Venetians, when they warred with the Genoveses about Fossa Clodia, in the year of our Lord, 1380. Tet in the opinion of Peter Messias, this Invention must have been of greater antiquity of our Lord, 1380. Tet in the opinion of Peter Messias, this Invention must have been of greater antiquity of it is read in the Chronicles of Alphonsus XI. King of Castile, who subdued the Isles Argerires, that when he hesieged the chief Town, in the year of our Lord, 1343. the hesieged Moors shot, as it were, thunder against the Assault, out of Iron Mortars. But we have read in the Chronicles mritten by Peter Bishop of Leons of that Alphonsus who conquered Toledo, that in a certain Sea-fight fought by the King of Tunis, against the Moorish King of Sivil, whose part King Alphonsus favoured, the Tunetans cast lightning out of certain hollow Engine or Trucks with much noise. Which could be no other, than our Guns, though not attained to that persettion of Art and Execution which now they have.

I think the Deviser of this deadly Engin hath this for his recompence, that his name should be hidden by the darksels of persecual jenowance, as not meritine for this his most pernitious. Invention, any meaning form

Who the Invencer of Gums. The reason of

the name.

Cap. 8. prim. par. var.lell.

> I think the Develor of this deadly Engin hath that for his recompact, that his his noth permitting, any mention from Posteriy. Tet Andrew Thevet in his Cosmography, published some few years agane, when he comes to treat of the Suevi, the Inhabitants of Germany, brings, upon the authority and credit of a certain old Manuscript, that the German the Inventor of this Warlike Engine was by Profession a Monk and Philosopher, or Alchymist, born at Friburg, and nam'd Constantine Anche the Greeky and Latins according to the found, call Postphys; they is the Colleging over time and any mobile the Gereky and Latins according to the found, call Postphys; they is the Colleging over time and and many mobile added much ing to the found call Bombus; then in the following ages, time, art and mans maliciousness, added much to this rude and unpolish d invention. For first for the matter; Brass and Copper, Metals far more tradable, fusible, and less subject to rust, came as supplies to Iron. Then for the form; that rude and undigested Barrel. or Mortar-like mass, bath undergone many forms and sastions, even so far as it is gotten upon wheels, that so it might run not only from the higher ground, but also with more rapid violence to the runs wheels, that so it might run not only from the higher ground, but also with more rapid violence to the runs of mankind; when as the first and rude Mortars seemed not to be so nimbly traversed, nor sufficiently crued for our destruction by the only casting forth of Iron and fire. Hence strong these borrible Monsters of Canons, double Canons, Bastards, Musquets, Field-pieces; hence these ernel and furious Beasts, Culturius, Serpentines, Bastisques, Sakgers, Falcons, Falcanets, and divers other names not only drawn from their signer and making, but also from the effects of their cruelty. Wherefore certainly cannot sufficiently admire the wisdom of our Ancestors, who have so rightly accommodated them with names agreeable to their natures; as those who have not only taken them from the swifted Birds of prey, as Falcons, but also from things most harmful and hateful to mankind, such as Serpents, Snakes, and Basissques. That so we might clearly discress that these Environs were made for no other turpose, nor wish other intent, but the we might clearly discren, that these Engines were made for no other purpose, nor with other intent, but only to be imployed for the speedy and cruel stangenter of men; and that by only hearing them named we might detest and abbor them, as pernicious enemies of our lives. I let pass other Engines of this Off-spring, being for their quantity small, but so much the more pernicious and harmful, for that they never assail our lives. for their quantity small, but so much the more pernicious and barmful, for that they nearer assail our lives, nay trayterously, and forthwith seife upon us not thinking nor searing any such thing; so that we can searce have any means of escape; such as Pistols and other small Hand-guas, which for shortness you may earry in your pocket, and so privily and fuddenly taking them sorth oppress the careless and secure. Four-ling-pieces which men usually carry upon their shoulders, are of the middle rank of these Engines, as also Muckets and Calceveres, which you cannot well discharge unless lying upon a Reli, which therefore may be called Breast-guas, for that they are not laid to the check, but against the breast, by reason of their weight and shortness: All which have been invented for the commoding of Footmen, and Light-borsem. This middle fort of Engine they call in Latin by a general name Schopus, in initiation of the sound, and the Italians, who term it Schopeters is the French call it Harquebuse, a mord likewise borrowed from the Italians, by reason of the touch-hole by which you give fire to the Piece, for the Italians call a hale Euric. It is termed Arcus (i.) a Fow, for that at this present it holds the same place in Martial assains, as the Rom did of old in and

The danger of Piftols.

A21310 W 11117 C.

and as the Archers formerly, so at this day the Musicitiers are placed in front. From the same wretched Shop, and Magazine of Cruelty, are all sorts of Mines, Countermines, Ports of five, Trains, Fiery Arcons, Lances, Cross-bows, Barrels, Balls of Five, burning Fagats, Granats, and all such firey Engines and Inventions, which closely stuffed with fuel and master for fire, and cast by the Defendants upon the Bodies and Investof the Ashilants, cassly take fire by the violence of their motion. Certainly a most miserable and pernicious
kind of Invention, whereby we often see a thousand of beedless men blown up with a Mine by the sorce of Gunpender's otherwhiles in the very heat of the Conflict you may fee the flowest Soulderes, feised upon with some of Cun-of these Fiery Engines, to hurn in their harness, no water being sufficiently powerful to restrain and queuels the raging and wasting violence of such fire cruelly spreading over the body and howels. So it was not distinct to have Arms, Iron, and Fire to mans destruction, unless also that the stroke might be more speedy, we had some to the proceeding of the super such that the stroke might be more speedy, we had furnished them, as it were with wings, so to fly more hashily to our own perdition, furnishing Sithe-bearing Death with wings so more speedily to opposes man, for whose preservation, all things contained in the World were created by God. Verily when I consider with my self-all the forts of war-like Engines, which A comparison the Ancients used, whether in the field in set Battels, as Bows, Darts, Cross-bows, Slings, or in the affault of the ancient of Cities, and shaking or overturning their Walls, as Rams, Horses, Wooden-towers, Slings, and such like, with the moof Cities, and shaking or overturning their Walls, as Rams, stories, we continued and just super, with the mo-they seem to me certain childs shorts and games made only in imitation of the former. For these modern In-ventions are such as easily exceed all the hest appointed and cruel Engines which can be mentioned or thought upon, in the shape, cruelty and appearance of their operations. For what in the World's thought more borried or fearful than Thunder or Lightning 2 and yet the hartfulness of Thunder is along the nothing to the cruelty of easy, 19. these insternal Engines; which may easily appear by comparing together both their effects. Man alone of all Creatures is not always killed by being touched with Thunder; but it immediately killeth all other things which are subject to be touched therewith. Nature bestowing this honouse upon him, seeing so many Creatures in the control of the control tures exceed him in strength: For all things lye contrary to man; and man, unless be be overthrown with it, doth not die thereof. But these fire-fritting Engines do no more foure man, than they do other Great Pile, 115, 21 sures, and kill without difference from whence soever they come, whither soever they are carried, and howfoever they touch. There are many, but more are faid to be the remedies against Thunder's for hefule the charms whereby the ancient Romans did suppose they might be driven sway, they never penetrate deeper into the ground than five foot, therefore such a most seasful thought the deeper Caves the most safe. Of some in this those which came out of the earth, they do not touch the Emerger and the court the confidence in this. and the ground than five foot, therefore such as not seasonal thought the deeper Caves the most sare. Of son those things which grow out of the earth, they do not touch the Bay-tree, and that was the earle that it via ras counted a sign of Victory both in ancient and modern times. Wherefore Tiberius Casas, otherwise a contempor of God and Religion, as he who indued with the Mathematical Sciences, thought all things governed by Fate, yet because he exceedingly feared Thunder, he always carried a Laurel Wreath about his report that he made him Tents of Seals shan, because it touchesh not this kind of Creature of all thinge things that live in the Sea, as neither the Eagle among it Birds, which for that is feigned to be Jone's Sourier. But on the contrary, Charms, the victorious Bay, the Sea, or Sea-east, the Eagle, or any sich thing, but it But on the contrary, Charms, the willowing Bay, the Seal, or Sea-calf, the Eagle, or any fact thing, profits The wondrown has as the contrary, Coarms, the interiors Bay, the Seal, or Sea-easy, the Eagle, or any fucutions, prosts The wondrown nothing against the violence of these fiery engines: No not a wall of ten foot thick will advantage. Lastly, force of great this argues the immense violence of brasen Canons above Thunder, for that Thunder may be dispersed and driv. Ordnance, also by the shooting of such great Ordnance; to wit, the clouds, by whose collision and sight the Thunder's easifed, being dispersed by this violent agitation of the air, or else driven further to more remote parts of the skies. But their survence troubled is hand be no ordered by a proved. thies. But their fury once provoked, is stayed by no opposition, appealed by no remedy. As there are certain feasions of the year, so also there are certain Regions of the earth, wherein Thunder is seldom to never beard. Thunders are rare in Winter and Summer, and that for contrary causes s for that in Winter and Summer, and that for contrary causes s for that in Winter the days of the earth of the contrary causes of the contrary causes of the contrary causes. denfe air is thickned with a thicker coat of clouds, and the fresty and cold exchalation of the earth extinguished what stery vapours soever it receives; which thing keeps Scythia and the cold Country about is free much live to the control of the gnisheth what stery vapours sover it receives; which thing keeps Scythia and the cold Countrys about it free from Thunder. And on the contrary, too much heat preserves. Egypt. For hot and day exchalations of the pith, this, it earth are condensed into very thin, subtile, and weak clouds. But as the Invention, so also the harm and tend-cap, 50.

Post of great Ordnance, like a contagious Postilence, is spread and reges over all the earth, and the shies at all times sound again with their report. The Thunder and Lightning commonly gives but one blow or stroke, and that commonly strikes but one man of a multitude: But one great Canon at one show or stroke, a hundred men. Thunder, as a thing natural, falls by chance, one while upon a high O.d., another while upon the top of a Mountain, and somewhiles on some lossy story, but seldom upon Man. But this belish Engine, tempered by the malice and anidance of man. assails man only, and takes him for his only mark, Engine, tempered by the malice and guidance of man, affails man only, and takes him for his only merk, and directs his bullets against him. The Thunder by its noise, as a Messuger sent before, forestes the storm at hand; hus, which is the chief mischief, this infernal Engine roars as it strikes, and strikes as it rears, which is the chief mischief, this infernal Engine roars as it strikes, and strikes as it rears, wherefore we all of us rightfully curse the Author of so permissions an Engine; on the contrary, proise to the takes, who endeavour by words and pous exhortations to debore Kings from their use, or else labour hy writing and operation to apply sit medicines to wounde made by these Engines. Which hath moved me those to the signs, who endeavour by words and pious exhortations to debort Kings from toeir use, or else labour by writing and operation to apply sit medicines to wounds made by these Engines. Which hath moved me thus I have written hereof almost with the first of the French. But hefore I shall do this, it seems host amiss, of for facilitate the wast to the Treatise I intend to write of wounds made by Gunshot) to premise two Discourses, by which I may consiste and take away certain erroneous opinious which have possessed the minds of divers; for that, unless these be taken away, the effence and nature of the whole disease cannot be understood, when which is ignorant of the disease. nor a fitting remedy applied by him which is ignorant of the difease.

The first Discourse which is dedicated to the Reader, refels and condemns, by reasons and examples, the The Argumentod of entring prescribed by John de Vigo, whereby he cauterizeth the wounds made by Guashot, sup-ments of the pastern of the contest the order of entring policy. poling them venerate; and on the contrary proves the order of carring subject is performed by support, suppring them venerate; and on the contrary proves to be for faller, and the performed by supplieratives, to be for salutary and gentle, as that prescribed by Vigo is full of crease and cruelty. The second dedicated to the King, teaches that the same meands are of themselves would of all poylon, and therefore that all their males. malignity depends upon the fault of the air, and ill humors predominant in the bodies of the Patients.

The first Discourse wherein Wounds made by Gunshot, are freed from being burnt, or cauterized, according to Vigo's method.

N the year of our Lord, 1536. Francis the French King, for his acts in War and Peace Miled the Great, fent a puiffant Army beyond the Alps, under the Government and Leading of Annas of Monomorancy High Constable of France, both that he might relieve Turin with Victuals, Souldiers, and all things needful, as also to recover the Cities of that Province taken by the Marquis of Gnast General of the Emperors Forces. I was in the Kings Army the Chirurgeon of Montieur of Mantejan General of the Foot. The Imperalists had taken the Straits of Suze, the Cafile of Villant, and all the other paffages; fo that the Kings Army was not able to drive them from their Fortifications but by fight. In this conflict there were many wounded on both fides with all forts of weapons, but chiefly with bullets. I will tell the truth, I was not very expert at that time in matters of Chirurgery; neither was I used to dress wounds made by Gunshot. Now I had Lib. 1. de tollett. read in John de Vigo, that wounds made by Gunshot were venenate or poisoned, and that by reason of the Gunpowder; wherefore for their cure, it was expedient to burn or cauterize them with oyl of Elders scalding hot, with a little Treaclemixed therewith. But, for that I gave no great credit neither to the Author, nor remedy, because I knew that causticks could not be poured into wounds, without exceflive pain; I, before I would run a hazard, determined to fee whether the Chirurgeons, who went with me in the Army, used any other manner of dressing to these wounds. I observed and saw that all of them used that method of dressing which Vigo prescribes; and that they silled, as full as they could, the wounds made by Gunshot with Tents and Pledgets dipped in this scalding Oyl, at the first dreffing, which encouraged me to do the like to those who came to be dreffed of me. It chanced on a time, that by reason of the multitude that were hurt, I wanted this

Oil. Now because there were some sew left to be dressed, I was forced, that I might seem to want nothing, and that I might not leave them undress, to apply a digestive made of the yolk of an egg. Oil of Roses, and Turpentine. I could not sleep all that night, for I was troubled in mind, and the dressing of the precedent day (which I judged unit) troubled my thoughts; and I seared that the next day I should find them dead, or at the point of death by the posson of the wounds, whom I

had not dreffed with the scalding Oyl. Therefore I rose early in the morning, I visited my Patients, and beyond expectation, I found fuch as I had dreffed with a digeftive only, free from vehemency of pain to have had good reft, and that their wounds were not inflamed nor tumefied; but on the contrary, the others that were burnt with the scalding Oyl were seaverish, tormented with much pain, and the parts about their wounds were swoln. When I had many times tried

this in divers others, I thought thus much, that neither I nor any other should ever cauterize any, wounded with Gunshot. When we first came to Turin, there was a Chirurgeon far more famous than all the reft in artificially and happily curing wounds made by Gunfhot; wherefore I labour-ed with all diligence for two years time to gain his favour and love, that fo at the length I might learn of him, what kind of medicine that was, which he honoured with the glorious title of Balfam, which was fo highly efteemed by him, and fo happy and fuccefsful to his Patients; yet could I not obtain it. It fell out a finall while after that the Marihal of Montejan the Kings Lieutenant General there in Piedmont died; wherefore I went unto my Chirurgeon, and told him that I could take no

pleafure in living there, the favourer and Macenus of my studies being taken away tended forthwith to return to Paris, and that it would neither hinder, nor difcredit him to teach his remedy to me, who should be so far remote from him. When he heard this, he made no delay, but presently wished me to provide two Whelps, one pound of Earth-worms, two pounds of Oyl of

Lilies, fix ounces of Venice Turpentine, and one ounce of Aquavite. In my prefence he boiled the Whelps put alive into that Oyl, until the flesh came from the bones; then prefently he put in the Worms, which he had first killed in White-wine, that they might so be cleanfed from the earthy drofs wherewith they are ufually repleat, and then he boiled them in the fame Oyl fo long, till they became dry, and had spent all their juyce therein: Then he strained it through a towel without much prelling; and added the Turpentine to it, and lastly Aqua vita. Calling God to witness, that he had no other Balfam, wherewith to cure wounds made with Gunshot, and bring

them to suppuration. Thus he fent me away as rewarded with a most preciods gift, requesting me to keep it as a great fecret, and not to reveal it to any. When I came to Paris, I went to visit Silvius the Kings Professor of Physick, well known by name to all Scholars for his great Learning

he kept me long that so I might dine with him, and diligently enquires of me, it I had observed any new method of curing wounds made by Gunshot, and Combustions, occasioned by Gunpowder. Then I affirmed to him that Gunpower did not participate any thing of poylon, for that none of those things whereof it is compounded are poylonous; which reason ought to free the whole composition from suspicion of poylon. And that experience confirmed this reason; for I had seen

many Souldiers, who would drink a great quantity of this powder with Wine, because they were perfwaded, that this drink would free them from malign fymptoms when they were wounded; yet give no credit to this perfwasion; and lastly, for that many without any harm, strewed this powder upon rebellious Ulcers. For the Bullets, I affirm, that they cannot conceive fuch heat as to become

cauffick. For if you shoot them out of a Gun against a hard stone, yet you may presently take them up without any harm in your hands, though by striking upon the stone, they should become more hot. For the Combustions caused by Gunpowder, I observed no special nor peculiar remedy, which might make their cure different from other combustions. To which purpose I related this insure History. infuing History.

One of the Marshal of Montejan his Kitchin-boys, fell by chance into a Caldron of Oyl, being

cap. 8.

What chance may do in finding out of remedies.

The description of Oyl of Whelps.

Gunpowder not poylonous.

Bullets fhot out of a Gun do not burn.

Manusconni,

even almost boiling hot; I being called to dress him, went to the next Apothecaries to fetch refrigerating medicines commonly used in this case: There was present by chance a certain old Countrey woman, who hearing that I desired medicines for a Burn, perswaded me at the first dressing out hindering that I should lay two raw Onions beaten with a little Salt; for so I should hinder the breaking out hindering that I should lay two raw Onions beaten with a little Salt; for so I should hinder the breaking out bifacting in of blifters or puffules, as the had found by certain and frequent experience. Wherefore I thought Borns or good to try the force of her medicine upon this greafie Scullion. I the next day found those places Scalds. of his body whereto the Onions lay, to be free from blifters, but the other parts which they had not touched, to be all bliftered.

It fell out a while after, that a German of Montejan his Guard had his Flafque full of Gunpowder A History, fet on fire, whereby his hands and face were grievously burnt: I being called, laid the Onions beaten, as I formerly told you, to the middle of his face, and to the rest I laid medicines usually applied to Burns. At the second dressing I observed the part dressed with Onions quite free from blisters and excertation, the other being troubled with both; whereby I gave credit to the medicine. Before also also that the redd him this that that the reddish was to do not be the fides also, I lastly told him this, that I had observed, that was the readiest way to draw forth Bullets that into the body, which fets the Patient in the fame posture and fite, as he was when he reccived his hurt. Which things when I had told him, together with many other handled at large in this Work, the good old man requested me to publish in print my opinions concerning these things, that so the erroneous and hurtful opinion of Vigo might be taken out of mens minds. To whose earnest intreaty when I had affented, I first of all caused to be drawn and carved many Instruments Work in the year of our Lord, 1545, which when I found to be well liked and approved by many, I thought good to fet it forth the fecond time formewhat amended in the year, 1552, and the third time augmented in many particulars in the year, 1564. For I having followed many Wars, and detained as Chirocean in believed Cities as Managed 16 to 1 tained as Chirurgeon in belieged Cities, as Metr and Hefden, had observed many things under five Kings, whom I served with diligence and content. I had learn'd many things from most expert Chirurgeons, but more from all learned Phylicians, whose familiarity and savour for that purpose I always laboured to acquire with all diligence and honest arts; that so I might become more learned and skilful by their familiarity and discourse, if there was any thing, especially in this matter and kind of wounds, which was hid from me, or whereof I was not well affured. Of which num- Wounds made ber I have known very few, who have feen any thing in this kind of operation, either by fludy, or by Gunfhot on the caperience in Wars, have not thought that wounds made by Gunfhot ought to be dreffed at the first with fuppurative medicines, and not with fealding and canstick Oyl. For this I affirm, which then also I tertified to this good man, that I have found very many wounds made in the fleshy parts by Gunfhot, as easily cured as other wounds, which be made by contusing things. Eat in the parts of the body where the Bullet meets with bones and nervous particles, both because it tears and rends into finall pieces those things which refult, not only where it touches, but further also, through rends into small pieces those things which relist, not only where it touches, but further also, through the violence of the blow, therefore it caufeth many and grievous fymptoms which are flubborn and difficult, and off-times impossible to cure, especially in bodies replete with ill humors, in an ill conflitution of the Heaven and Air, fuch as is hot, moitt and foggy weather, which therefore is fulject to putrefaction, and in like manner a freezing and cold feafon, which ufes to mortifie the wounded parts not only of those that are hurt with Bollets, but in like fort with any other weapons not only in bony and nervous particles, but also in musculous. Whereby you may understand, that the difficulty of curing proceeds not from the venenate quality of the wounds a nor the combustion made by the Gunpowder, but the foulness of the Patients bodies, and the unfeatonableness of the air. For proof whereof, I will fet down, that which I, not long agone, observed in a South Noble- A History. man the Earl of Gordon, Lord of Achindon, whom I cured at the appointment of the Queen-Mother. He was that through both his thighs with a Pittol, the bone being not hurt nor touched; and yet the two and thirtieth day after the wound he was perfectly healed, to that he had seitlier Feaver

nor any other symptom which came upon the wound. Whereof there are worthy winteffes, the Archbishop of Glasce, the Senish Ambassador, Francis Erigare, and John Altine, Doctors of Physick, as also James Guillemeau, the Kings Chirurgeon, and Giles Buzet a Senish Chirurgeon, who all of them wondred that this Gentleman was so toon healed, no acrid medicine being applied. This I what makes have thought good to recite and senious that the Readers was understand, that I say shirty years Chirurgeons

have thought good to recite and fet down, that the Readers may understand, that I for thirty years for thought good to recite and fet down, that the Readers may understand, that I for thirty years ago had found the way to cure wounds made by Gumshot, without fealding, Oyl, or any other, more acrid medicine; unless by accident the illness of the Patients bodies, and of the air, caused any made by Gunshot shall be more amply treated of in the following Discourse. Another Discourse of these things, which King Charles the Ninth, returning from the Expedition and Taking of Rouen, inquired of me concerning Wounds made by Gunshot.

Or that it pleafed your Majeffy one day, together with the Queen-Mother, the Prince of The occasion the Rock upon You, and many other Noblemen and Gentlemen, to inquire of me, What was of writing this the cause that the far greater part of the Gentlemen and common Souldiers which were wounded with Guns, and other warlike Eugines, all remedies used in vain, either died, or scarce, and that with much difficulty recovered of their hurts, though in appearance they were not very great, and though the Chirurgeons diligently performed all things requisite in their Art: I have made bold to premise this Discourse to that Tractate which I determine to publish concerning

The argument ourie.

Wounds made by Gunshot; both to fatisfie the defires of the Princes and of many Gentlemen, as also the expectation they have of me, as being the Kings chief Chirurgeon (which place being given me by Henry II. Charles IX. a Son most worthy of fuch a Father, had confirmed:) Neither make I any queltion, but that many who too much infilt upon their own judgment, and not throughly confider the things themselves, will marvel, and think it far from reason; that I departing from the steps of my Ancestors, and differting wholly from the formerly received opinions, am far from their Tenents, who lay the cause of the malignity of wounds made by Gunshot, upon the poyson brought into the body by the Gunpowder, or mixed with the Bullets whilft they are tempered or east. Yet for all this, if they will courteoully and patiently weigh my Reafons, they shall either think as I do, or at least shall judge this my endeavour and pains, taken for publick good, not to be condemned nor contemmed. For I shall make it evident by most strong reasons drawn out of the writings of the Ancients both Philosophers and Physicians, and also by certain experiments of my own, and other Chirurgeons, that the malignity and contumacy which we frequently meet withal in curing wounds made by Gunthot, is not to be attributed either to the poylon carried into the body by the Gun-Gunpowder is powder or Bullet, nor to burning imprinted in the wounded part by Gunpowder. Wherefore to come not poylonous. to our purpose, that opinion must first be consuted, which accuseth wounds made by Gunshot of poyfon, and we must teach, that there is neither any venenate substance, nor quality in Gunpowder: Neither, if there should be any, could it empoys on the bodies of such as are wounded. Which that we may the more eafily perform, we must examine the composition of such powder, and make a particular inquiry of each of the simples, whereof this composition consists, what effence they have, what ffrength and faculties, and laftly, what effects they may produce. For thus by knowing the simples, the whole nature of the compolition confilling of them will be apparently manifelt,

The Simples which enter the composition of Gunpowder are only three, Charcoals of Sallow or

Of what it is

Lib. 5. cap. 73. tap. 36.

Bullets cannot be poyioned.

As Gales notes ad fent. 20. & 21. felt. 8. lib. 3. Epid.

by Gunshot

concerning their combustion. First, it can scarce be understood how bullets which are commonly made of Lead, can attain to fuch heat, but that they must be melted; and yet they are fo far from melting, that being shot out are not burnt. of a Musket they will pierce through Armour and the whole body befides, and yet remain whole, or but a little diminish d. Besides also, if you shoot them against a stone wall, you may presently take them up in yourhand without any harm, and also without any manifelt fense of heat; though their heat by the firiking upon the flone flould be rather increased, if they had any. Furthermore, a bullet flut into a barrel of Gunpowder, would prefently set it all on fire, if the bullet should acquire such heat by the shooting, but it is not so. For if any time the powder be fired

held wounds made by Gunshot for poyfonous: Let us now come to overthrow that which is held

Willow, or of Hemp-stalks, Brimstone, and Salt-peter, and fornetimes a little Aqua vine. You shall find each of thefe, if confidered in particular, void of all poyfon and venenate quality. For first in the Charcoal you shall observe nothing but driness, and a certain subtlety of substance, by means whereof it fires fo fuddenly even as Tinder. Sulphur or Brimftone is hot and dry, but not in the higheft degree; it is often an oily and viscid substance, yet so that it doth not so speedily catch fire as the coal, though it retain it longer being once kindled, neither may it be so speedily extinguished. Salt-peter is fuch, that many use it for Salt, whereby it is evidently apparent, that the nature of fuch Simples is abfolutely free from all poyfon, but chiefly the Brimstone (which notwithstanding is more suspected than the rest.) For Disserides gives Brimstone to be drunk, or supped out of rear Egg, to fuch are Afthmatick, troubled with the cough, fpit up purulent matter, and are troubled with the yellow Jaundife. But Galen applies it outwardly to fuch as are bitten by venemous Beafls, to Scabs, Tetters and Leprolies. For the Aqua vita, it is of fo tenuious a fubstance, that it prefently vanisheth into the air, and also very many drink it, and it is without any harm used in trictions of the exterior parts of the body. Whence you may gather, that this powder is free from all man-ner of poylon, feeing those things whereof it consists and is composed, want all suspicion thereof. Therefore the German Horfe-men, when they are wounded with fhot, fear not to drink off cheerfully half an ounce of Gunpowder diffolved in Wine; hence perforading themselves freed from fach malign symptoms as usually happen upon such wounds; wherein whether they do right or wrong, I do not here determine. The same thing many French Souldiers forced by no necessity, but only to shew themselves more couragious, also do without any harm; but divers with good fuccels afe toffrew it upon Ulcers, fo to dry them. Now to come to those, who think that the venenate quality of wounds made by Gunshot, springs not from the powder, but from the bullet wherewith fome poylon hath been commixt or joyned, or which hath been tempered or fleeped in fome poyfonous liquor: This may fufficiently ferve for a reply, that the fire is abundantly powerful to diffipate all the firength of the poyton, if any should be poured upon or added to the bullet. This much confirms my opinion which every one knows, the bullets which the Kings Souldiers used to shoot against the Towns-men in the siege of Rosen, were free from all poyton; and yet for all that, they of the Town thought they were all poyloned, when they found the wounds made by them, to be uncurable and deadly. Now on the other fide, the Towns-men were falfly suspected guilty of the fame crime by the Kings Army, when as they perceived all the Chirurgeons la-bour in curing wounds made by the bullets shot from Romen, to be frustrated by their continuacy and malign nature; each fide judging of the magnitude and malignity of the caufe, from the unhappy fuccels of the effect in curing. Even as among Phylicians, according to Hippocrater, all difeales are termed peftilent, which ariling from whatfoever common caufe, kill many people; fo also wounds made by Gunshot, may in some respect be called pestilent, for that they are more refractory and difficult to cure than others, and not because they partake of any poyfonous quality, but by default of fome common cause, as the ill complexions of the Patients, the infections of the air, and the corruption of meats and drinks. For by these causes wounds acquire an evil nature, and become lefs yielding to medicines. Now we have by these reasons convinced of errour that opinion which

tanica mai

by fuch an accident, we must not imagine that it is done by the bullet bringing fire with it, but by the firiking and collision thereof against some iron or tione that opposes or meets therewith, whence sparks of fire proceeding as from a flint, the powder is fired in a moment. The like opinion we have of thatched houses, for they are not fired by the bullet which is shot, but rather by some other thing, as linner rags, brown paper, and the like, which rogues and wicked persons fation to their bullets. There is another thing which more contains me in this opinion, which is, take a bullet of Wax, and keep it from the fire, for otherwise it would mele, and thoot it against an inch board, and it will go through it; whereby you may understand that bullets cannot become so hot by shooting, to burn like a cautery. But the orifices (may fome fay) of fuch wounds are always black. The reason This indeed is true, but it is not from the effect of heat brought thither by the bullet, but the force why wounds of the contration. Now the contration is exceeding great, both because the buller is round, and enters the body with incredible violence. Of which those that are wounded will give you sufficient testimony, for there is none of them, which thinks not prefently upon the blow, that as it were fome pott, or thing of the like weight, falls upon the affected member, whence great pain and flupidity possess the part, whereby the native heat and spirits are so much dislipated, that a Gangrene may follow. But for the Efchar which they affirm is made by the blow, and falls away afterwards, they are much millaken. For certain particles of the membranes are field contufed and torn by the violence of the bullet beguiles them; which prefently patretying, and fevered from the found parts by the power of nature and the feparating heat, which thing usually happens in all great Contufions. But for all that there so many and weighty reasons may free the powder from all suspicion of poylon, and the bullet from all thought of burning, yet there are many who infilting upon Philo-tophical Arguments raife new firs. For (fay they) the difeharging a piece of Ordnance is abfolutely like Thunder and Lightning, which the rent and torn clouds east from the middle region upon the earth; wherefore the iron bullet which is shot out of the Canon must needs have a venenate and burning faculty. I am not ignorant that Lightning generated of a groß and viscous exhalation, The regions of breaking the cloud wherewith it is incompassed, never falls upon the earth, but brings fire with it, our adversaone while more fubtile, another while more grofs, according to the various condition of the mat-ries refelled, ter whence the exhalation hath arisen. For Some writes that there are three several kinds of Lightning differing in harming, condition and plenty. One of them penetrates, or rather perforates by the tenuity of the matter of the object which it touches. The other with a violent impetuoity breaks in funder, and diffipates the objects, by reason it hath a more dense; compact and forcible matter, like as Whirlwhols have. The third, for that it consists of a more terrestrial matter, burns what it touches, leaving behind it the impression of the burning. Also I know that Lightning is of The stinking a peftilent and flinking nature, occationed by the großness and viscidity of the matter whereof it is; which matter taking bre, fends forth to leathfem and edious a finell, that the very wild Beafis uing. cannot indure it, but leave their dens, if they chance to be touched with fuch a Lightning. Belides also we have read in the Northern History of Olaus Magnus, that in some places after a Lightning, you shall find a whole Plain spread over with Brimstone, which Brimstone notwithstanding is extinguished, improfitable, and of no efficacy. But grant thefe things to be thus, yet must we not therefore conclude, that the bullets of the great Ordnance carry poylon and fire with them into the wounds. For though there be many things alike in Lightning and discharging great Ordnance, yet they have no fimilitude either in matter or fubfiance, but only in effects, whereby they hake, break in funder, and disperse the bodies which withfland them: For Lightning, and Thunder do it by means of fire, and oft-times of a flone generated in them, which is therefore termed, a Thunderbelt; but Ordnance by the bullet carried by the force of the air, more violently driving and forcing it forwards. Neither if any thould by more powerful Arguments force me to yield that the matter of Lightning and flooting of Ordnance are alike, yet will I not therefore be forced to confels that wounds made by Gunthot are combust. Frr, according to Pliny, there are force Lightnings Lib. 2, esp. 49. which confilling of a most dry matter, do sharter in funder all that withstand them, but do not the words. burn at all; others which are of forewhat a more humid nature, burn no more than the former, fal nature of but only black fuch things as they touch; laftly, otheriome of a more fubtile and tentious matter, whole nature (as Seneca faith) we must not doubt to be divine, if but for this reason, that they will ning. melt gold and filver, not harming the purfe; a fword, not harting the feabbard; the head of a fance, not burning the wood, and fled wine, not breaking the veffel. According to which decree I can grant, that thefe Lightnings which break in funder, melt, and diffipate, and perform other effects to full of admiration, are like in fublitance to the flot of great Ordnance; but not those which carry with them fire and flame.

In proof whereof there comes into my mind a Hiftory of a certain Souldier, out of whose thigh A History. I remember I drew forth a buller wrapped in the tartety of his breeches, which had not any fign of tearing or burning. Befides, I have feer many who not wounded, nor fo much as touched, yet notwithflanding have with the very report and wind of a Canon bullet, fliding close by their ears, falls down for dead, fo that their members becoming livid and black, they have died by a Garagene enfuing thereupen. These and such effects are like the effects of Lightning which we lately mentioned, and yet they bear no lign nor mark of poylon. From whence I dare now boldly con-clude, that wounds made by Gunfhot are neither poyloned, nor bornt. But feeing the danger of fach wounds in thefe last Civil-wars hath been so great, univerfal, and deadly to so many worthy perwounds in these last Civil-was that then may have been the cause thereof, it is were neither cumbustion, for the venerate quality of the wound? This must be therefore now infilt upon and somewhat hardily explain. Those who have spent all their time in the learning and searching out the mysteches transfound in the property of the work of the property of the course of the property of the work of the property of the work of the property of the p ries of narroral Philosophy, would have all men think and believe, that the four Elements have such tation of the matural fympathy, that they may be changed each into other; to that they not only undergo the alterations of the nrii qualities which are heat, coldness, driness and moisture, but also the mutati-

eds made by Gunthor fome few years

on of their proper fubstances by rarefaction and condensation. For thus the fire is frequently changed into air, the air into water, the water into air, and the water into earth; and on the contrary, the earth into water, the water into air, the air into fire; because these four first bodies have in their common matter enjoyed the contrary and fighting, yet first and principal, qualities of all.

* These Bellows here mentioned by the Author, are Balls made of Brafs in with a very fmall hole in their leffer ends: when you would fill them with water you must heat them veexceedingly rarified,

Whereof we have an example in the * Ball-bellows brought out of Germany, which are made of brafs, hollow and round , and have a very small hole in them, whereby the water is put in, and so put to the fire; the water by the action thereof is rarified into air, and fo they fend forth wind with a great noise, and blow firongly affoon as they grow throughly hot. You may try the fame with Chefinuts; which, caft whole and undivided into the fire, prefently fly afunder with a great crack; form of a Pear, because the watry and innate humidity turned into wind by the force of the fire, forcibly breaks his paffage forth. For the air or wind raifed from the water by rarefaction, requires a large place, neither, can it now be contained in the narrow films, or skins of the Chefnut, wherein it was formerly kept. Just after the same manner Guopowder being fired, turns into a far greater proportion of air according to the truth of that Philosophical Proposition, which faith, Of one part of earth, there are made ten of water; of one of water, ten of air; and of one of air, are made ten of fire. Now this fire, not possible to be pent in the narrow space of the Piece, wherein the powder was formerly heat them very hot, and fo contained, endeavours to force its paffage with violence, and fo calls forth the bullet lying in the the air which way, yet fo that it prefently vanishes into air, and doth not accompany the ballet to the mark; is contained in or object, which it batters, spoils and breaks afunder. Yet the bullet may drive the obvious air with fuch violence, that men are often fooner touched therewith than with the bullet, and die by having their bones shattered and broken without any hurt on the slesh which covers them; which, as we rathica, which by put- formerly noted, it hath commen with Lightning. We find the like in Mines, when the powder is ting them pre- once fired, it removes and shakes even Mountains of earth.

ter will be condenfate as much,& fo will draw in the water to supply the place, or detar vacuum. Then put them into fire, and it again rarifying the water into air will make them yield a strong continued and forcible blast. The cause of the report and blow of a Canon.

A Hiftory.

queke.

The cause of

In the year of our Lord, 1562, a quantity of this powder which was not very great, taking fire by accident in the Arcenal of Paris, caused such a tempest that the whole City shook therewith, but it quite overturned divers of the neighbouring houses, and shook off the tiles and broke the windows of those which were further off; and to conclude, like a florm of Lightning, it laid many here and there for dead, fome lost their fight, others their hearing, and otherfome had their limbs toma funder, as if they had been rent with wildHorfes; and all this was done by the only agitation of the air into which the fired Gunpowder was turned. Just after the same manner as winds pent up in hollow places of the earth which want vents: For in feeking paffage forth, they vehemently thake the fides of the earth, and raging with a great noise about the cavities, they make all the furface thereof to tremble; fo that, by the various agitation one while up, another down, it over-turns or carries it to another place. For thus we have read that Megara and Agina, anciently most famous Cities of Greee, were fivallowed up and quite over-turned by an Earthquake. I omit the great blufterings of the winds fiving in the cavities of the earth, which represent to such as hear them at some distance, the sierce assailing of Cities, the bellowing of bullets, the horrid roarings of Lions, neither are they much unlike to the roaring reports of Canons. These things being thus premifed, let us come to the thing we have in hand. Amongst things necessary for life, there is none causes greater changes in us than the air; which is continually drawn into the bowels appointed by nature, and whether we fleep, wake, or what elfe foever we do, we continual draw in and breath it out. Through which occasion, Hippocrates calls it Divine, for that breathing through this mandane Orb, it embraces, nourithes, defends and keeps in quiet peace all things contained therein, friendly confpiring with the Stars from whom a Divine vertue is infused therein. in. For the air diverfly changed and affected by the Stars, doth in like manner produce various changes in these lower mundane bodies. And hence it is that Philosophers and Physicians do fo feriously with us to behold and consider the culture and habit of places, and constitution of the air, when they treat of preferving of health, or curing difeases. For in these the great power and dominion of the air is very apparent, as you may gather by the sour Seasons of the year; for in Summer the air being hot and dry, heats and dries our bodies; but in Winter it produceth in us the effects of Winters qualities, that is, of cold and moisture; yet by such order and providence of nature, that although according to the varieties of Scasons our bodies may be varioufly altered, yet shall they receive no detriment thereby, if so be that the Seasons retain their feafonableness: From whence if they happen to digress, they raise and stir up great perturbations both in our bodies and minds; whose malice we can scarce shun, because they encompass us on every hand, and by the Law of Nature enter together with the air into the feeret Cabinets of our Bodies both by occult and manifest passages. For who is he, that doth not by experience find both for the commodity and discommodity of his health, the various effects of winds, (wherewith the air is commixt) according as they blow from this or that Region, or quarter of the World. Wherefore feeing that the South-wind is hot and moift; the North-wind cold and dry; the Eaft-wind clear and fresh; the West-wind cloudy, it is no doubt but that the air which the dry in the inferior of that winds. we draw in by infpiration carries together therewith into the bowels the qualities of that wind which is then prevalent. Whence we read in *Hippocrates*, that changes of times, whether they happen by different winds, or vicilitude of Seafons, chiefly bring difeates; for northerly winds do condenfe, and firenghten our bodies, and make them active, well coloured and during, by refulcitating and vigorating the native heat. But fouthern winds refulve and moilten our bodies, make its heavy-headed, dull the hearing, cause giddiness, and make the eyes and body less agile; as the Inhabitants of Narbon find to their great harm, who are otherwise ranked among the most active people of France. But if we would make a comparison of the Seafons, and Constitutions of the year

How the air

Aphor. 17. Sect. 3MINICH HOUSE

by Hippocrates Decree, Draughts are more wholefome and lefs deadly than rains; I judge, for that too much humidity is the mother of putrefaction, as you may learn by those Countries which are blown upon by a wind from Sea. For in these flesh which is kept for food, putrefies in the Flesh guickly space of an hour; and such Ulcers as in other places are easily and quickly healed, do there by the conflux and collection of matter become inveterate and contumacions. Therefore as when the feafons of the year facceffively fall out agreeable to their nature, and when each feafon is feafonable, then either we are not fick at all, or affuredly with lefs danger. So on the contrary, the perfect conflictution and health of our bodies becomes worse and decays, when the seasons of the year are depraved and perverted in time and temper. Now feeing that these many years, the four scasons of the year are depraved and perverted in time and temper. Now seeing that these many years, the sour scasons of the year have wanted their scasonableness, the Summer wanting his usual heat, and the Winter its cold, and all things by moisture and the dominion of the southern winds have been humid and languid, I think there is none to ignorant in natural Philosophy and Aftrology, who will not think but that the caufes of the malignity and contumacy of those diseases which have so long afflicted all France, are to be attributed to the Air and Heavens. For otherwise, whence have so many pestilent and contagious difeases tyrannized over so many people of every age, sex and condition? Whence have so many Catarrhs, Coughs, and heavinesses of the head? So many Pleurisies, Tumors, Smallpoxes, Meafles and Itches, not admitting of digelion and remedies preferibed by Art? Whence have we had fo many venemous Creatures, as Toads, Grafhoppers, Caterpillers, Spiders, Wafps, Hornets, Beetles, Snails, Vipers, Snakes, Lizards, Scorpions, and Efts or Neuts, unlefs from exceffive putrefaction which the humidity of the air, our native heat being liquid and dull, hath caused in us, and the whole Kingdom of France? Hence also proceeds the infirmity of our native heat, and the corruption of the blood and humors whereof we confift, which the rainy Southwind hath caufed with its fultry heat. Wherefore in these last years I have drawn little blood, which hath not prefently thewed the corruption of its fubflance by the black or greenish colour, as I have diligently observed in all such as I have bled by the direction of the Physicians, either for prevention of suture, or cure of prefent difeafes. Whence it comes to pass that the fleshy substance of our bodies could not but be faulty both in temper and consistence; seeing that the blood whence it is generated had drawn the seeds of corruption from the defiled air. Whence it fell out, that the wounds in what bodies which happed with loss of substance could be scarce head or united, be the depraved Ulcers and nature of the blood. For, fo the wounds and ulcers of those which are troubled with the Dropfie, whose blood is more cold or wholly waterish; so of leprous persons, whose blood is corrupt; and laftly, of all fuch as have their bodies replete with ill juyce, or elfe are Cachectick, will not eafily admit of cure. Yea afforedly, if but the very part which is but fiverve from its native temper, the wound will not eafily be cured. Therefore feeing all these things, both the putresaction of the air, and depraved humors of the body, and also the distemper of the affected parts conspired together to the destruction of the wounded; what marvel was it, if in these late Civil Wars, the wounds which were for their quantity small, for the condition of the wounded part but little, have caused formany and grievous accidents, and laftly death it felf? Especially, seeing that the air which encompaffeth us, tainted with putrefaction, corrupts and deales the wounds by inspiration and exspiration, the body and humors being already disposed, or inclined to putrefaction. Now there came fuch a flink, which is a most affured sign of putrefaction, from these wounds, when they were dressed, that such as stood by could scarce endure it: Neither could this slink be attributed to the want of dreffing, or fault of the Chirurgeon; for the wounds of the Princes and Nobility flunk as ill as those of the common Souldiers. And the corruption was such, that if any chanced to be un- An argument dreft for one day, which fometimes hapned amongst such a multitude of wounded persons, the next of great put day the wound would be full of Worms. Befides also, which furthermore argues a great putrefacti- the humors. on of humors, many had abfeeffes in parts opposite to their wounds, as in their left knee, when as the right shoulder was wounded; in the left arm, when as the right leg was hurt. Which I remember berel the King of Navarre, the Duke of Nevers, the Lord Rendam, and divers others. For all men had Nature fo over-charged with abundance of vicious humors, that if it expelled not part thereof by Imposshumes to the habit of the body, it certainly otherwise disposed of it amongst the inner parts of the body, for in dissecting dead bodies, we observed that the Spleen, Liver, Lungs, and other Bowels were purulent, ; and hence it was that the Patients by reason of vapours sent from them to the heart, were troubled with continual Feavers. But the liver and all the veinous parts being polluted, and so the generation of the laudable blood hindred, they languished for want of fitting nouriflement. But when the brain by vapours was drawn in to sympathize with the rest, they were molefted with Ravenings and Convultions. Wherefore if any thing fueceeded unprosperously in so great malignancy of wounds, the Chirurgeon was not to be blamed, for that it were a crime to fight against God and the Air, wherein the hidden scourges of the divine Justice lye hid. Therefore if according to the mind of great Hippocrates, who commands to bring all contufed wounds to suppura- All contused tion, that so they may be healed, we endeavoured to cure with such medicines wounds made with wounds must Gunshot, and therefore contused; who can rightly be angry with us, if we performed it not so well, be brought to by reason of those Putrefactions, Gangrenes and Mortifications which proceeded from the corrupt suppuration. Air: For all that, we used not only suppuratives, but were oft-times forced to use other medicines; fo long turning, afide from the cure of the difease, until we had orecome the symptoms which much indanger the Patient, and customarily happen upon such wounds, as also upon those which are made with a Sword, or any other kind of Weapons as shall plainly appear in the following Treatife, to which it now feems high time that we betake our felves.

not eafily cu-

CHAP. L

A division of Wounds drawn from the variety of the wounded parts, and the Bullets which wound.

A division of wounds from the variety of the wounded parts,

From the difference of bullets. Wounds made by Gunthot are usually round.

A LL wounds which are made in mans body by Gunthot, whether fimple or compound, are accompanied with contufion, dilaceration, differencer and fwelling. If ay, all these possess of either the noble parts, or ignoble, the sleshy, nervous, or bony; some whiles with rending and tearing assumes the larger vessels, fornetimes without harming them. Now these wounds are only superficiary, or else pierce deep and pass quite through the Body. But there is also another division of these wounds taken from the variety of the bullets wherewith they are made. For some bullets are bigger, some less, some between both; they are usually made of Lead, yet sometimes of Steel, Iron, Brass, Tin, scarce any of Silver, much less of Gold. There arises no difference from their figure; for almost all kinds of wounds of this nature are round. From these differences, the Chirurgeon must take his Indications what to do, and what medicines to apply. The first care must be, that he think not these horrid and malign symptoms, which usually happen upon these kinds of wounds, to arise from combustion, or poyson carried with the bullet into the wounded part, and that for those reasons we have formerly handled at large. But rather let him judge they proceed from the vehemency of the contusion, dilaceration and tracture, caused by the bullets, too violent entry into the nervous and bony bodies. For, if at any time the bullet shall only light upon the sleshy parts, the wounds will be as easily cured, as any other wound usually is, which is made with a contusing and round kind of weapon, as I have often found by frequent experience, whill I have followed the Wars, and performed the part of a Chirurgeon to many Noblemen and common Souldiers, according to the counsel of such Physicians as were there overfeers of the cure.

CHAP. II.

Of the figns of Wounds made by Gunsbot.

Signs of wounds from wounds from their figure. From their colour. From the feeling of the blow. From the bleeding. From the beat of the wound. Whence these wounds are fo much contusted.

Ounds made by Gunshot are known by their figure, which is usually round; by their colour, as when the native colour of the part decays, and instead thereof a livid, greenifh, violet, or other colour fucceeds; by the feeling or fenfe of the firoke, when in the very inftant of the receiving thereof, he feels a heavy fense, as if some great stone, or piece of timber, or force fuch other weighty thing had fall upon it; by the finall quantity of blood which iffues out thereat, for when the parts are contufed, within fome fmall while after the stroke they swell ap, fo that they will scarce admit a Tent, whence it is that the blood is stopped, which otherwise would slow forth of the orifice of the wound; by heat, which happens either by the violentness of the motion, or the vehement impulsion of the air, or the attrition of the contused parts as the sless and nerves. Also you may conjecture that the wounds have been made by Gunihot, if the bones shall be broken, and the iplinters thereof by pricking the neighbouring bodies cause defluxion and inflammation. But the cause that the bullet makes so great a contusion is, for that it enters the body without any points or corners, but with its round and fpherical body, which cannot penetrate but with mighty force; whence it cometh to pass that the wound looks black, and the adjacent parts livid: Hence also proceed fo many grievous fymptoms, as Pain, Defluxion, Inflammation, Apottumation, Convultion Phrentie, Palfie, Gangrene, and Mortification, whence laftly Death enfues. Now the wounds do often call forth virulent and very much flinking filth, by reason of the great contuition, and the rending and tearing of the neighouring particles. A great abundance of humors flow from the whole body, and fall down upon the affected parts, which the native heat thereof being diminished, forfakes, and prefently an unnatural heat feifes upon it. Hitherto also tend an universal or particular repletion of ill humors, chiefly if the wounds poffers the nervous parts, as the joynts. Verily neither a Stag with his horn, nor a flint out of a fling can give fo great a blow, or make fo large a wound, as a leaden or iron bullet that out of a Gun; as that which going with mighty violence, pierces the body like a Thunderbolt.

CHAP. III.

How thefe Wounds must be ordered, at the first dreffing.

Strange bodies must first be pulled forth.

The manner how to draw them forth. He wound must forthwith be inlarged, unless the condition of the part resist, that so there may be free passage forth, both for the Sanier or matter, also for such things as are farced, or otherwise, contained therein; such as are pieces of their Cloaths, Boenbast, Linnen, Paper, pieces of Mail or Armour, Ballets, Hail-shot, splinters of Bones, bruised Flesh, and the like, all which must be plucked forth with as much celerity and gentleness as may be. For presently after the receiving of the wound the pain and inflammation are not so great, as they will be within a short time after. This is the principal thing in performance of this work, that you place the Patient just in such a possure as he was in, at the receiving of the wound; for otherwise the various motion and toming of the muscles will either hinder or straiten the passage forth of the contained bodies. You shall, if it be possible, search for these bodies with your singer, that so you may the more certainly and exactly perceive them. Yet if the builtet be entred somewhat deep in, then you shall search for it with a round and blum probe, lest you put the Patient to pain; yet often-rimes you shall scarce by this means find the Bullet. As it happened to the Marshal of Brissa the Siege of Perpignan, who was wounded in his right shoulder with a bullet, which the Chirur-courts.

The crocked Cranes-bill, with teeth like a Saw.

geons thought to have entered into the capacity of his body. But I, withing the Parient to fiand just in the farme manner as he did when he received the wound, found at length the place where the Bullet lay, by gently preffing with my fingers, the parts near the wounds, and the reft which I farfpected; as also by the fwelling, hardnefs, pain and blacknefs of the part, which was the lower part of the fhoulder near unto the eighth or ninth spondil of the back. Wherefore the bullet being taken forth by making incission in the place, the wound was quickly healed, and the Gentleman recovered. You shall also be this and extend by he believe the invent of worst for any first and parks believe the invent of worst for the parts. vered. You thall observe this, and rather believe the judgment of your fingers, than of your Probe.

CHAP. IV.

A Description of fit Instruments to draw forth Bullets and other strange Bodies.

Oth the magnitude and figure of Instruments fit for drawing forth of bullets and other firange bodies, are various according to the diversity of the incident occasions. For some are toothed, others smooth, others of another figure and bigness; of all which sorts the Chinargeon must have divers in a readiness, that he may fit them to the bodies and wounds, and not the proposed and bodies to his Institute. not the wounds and bodies to his Instruments.

The Delineation of fuch like Inftruments.

The strait Cranes bill being also tootbed sit for draw-ing forth hail-stones pieces of armour splinter of bones and fuch things as the deep within.

much flift.

This Ducks-bill hath a large, round and toothed carvity in the end, for fo is more eafily taketh bold of the Bullet when it lies among ft

A toothed Crows-bill.

Another Instrument fit for drawing forth of Bullets, which may be termed a Catch-buller.

A Shews the Trunk. B Shews the rod, or string, which opens and shuts the joynt.

Bb 2 Anaber nose, made for drawing out of Bullets, which are somewhat flatted, by striking upon a bone.

ing forth pieces of mail thrust into the flesh, or bones; and this is the figure thereof.

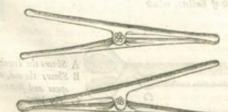

Another Catch-bulles called a Lizards- The Parrots-beak, is made for draw- The Swans-bill opens with a ferew you may with this dilate the wounds, and fo put in a strait Cranes-bil, as pincers to pluck forth strange bodies. The signer of both are bese exprest.

But if these strange bodies, especially Bullets and Hail-shot, be not too deep in the wound, they may be taken forth with your Levatory, or else by the help of these Gimblets. These Gimblets are screwed into their pipes, or canes, and enter with their screwed points into the Bullets, if that they be of Lead or Tin, and of no harder metal; and so being fastined in them, being them out with

The figure of the Gimblet, with his Pipe or Cane. Befides the Swans-bill which we lately mentioned, there are also other Instruments fit to dilate and open the wounds, therefore called Dilaters, by whose help the wound may be held open, that so the hidden bodies may be seen; for when you press together the two ends of this Instrument, the other two open and dilate themselves. You may also use them in dilating divers other para of the body, as the Nostrils, Fundament, and fuch like.

Dilaters.

The Infiruments which follow are called Scton-needles, or Probes; whose use is, to draw through a Flamula, so to keep the wound open, that you may the better take forth any strange body. Besides also we use the same Needles to fearch, or as it were to found the deepness of the wounds,

and to find out the bullets. For they cannot put one to much pain because they have smooth and round ends. So also all Probes wherewith we fearch for bullets, must have somewhat large,

Probes for to put flamula's through a Wound with al.

Marie Company

fmooth and round ends. For feeing that the verges of the Wound meet together prefently after the hurt, if the Probes be too small or slender, they will flick in the inequality of the flesh, neither will they be able to come to the Bullet. But if they be sharp and pointed, they will cause and renew the pain by pricking the fleth they meet withal, and so hinder your intention of finding the Bullet: Now you must be furnished with these Infiruments of a different length, according to the various thickness of the parts; for you cannot put any through the thigh but fuch as are of a good length.

CHAP. IX.

What dreffing must first be used, after the strange bodies are plucked or drawn out of the Wound.

7 Hen the firange bodies are drawn or pluck'd out of the wound, by those means we have formerly recited, the chief of the cure must be to heal the contusion, and amend V the differencer of the air if it be hot and moift, that is, fisbject to putrefaction. This shall be done by medicines taken inwardly, applied outwardly, and put into the wound. Things to be inwardly used in diet and Pharmacy I leave to the judgment of learned Physicians; for the par- A caurion in ticular and topick medicines, (unless from the present constitution of the air, the condition of the the use of supwounded part, or from fome other cause, there being a danger of a Gangrene) you must use suppuratives paratives. as you ufually do in contufions; fuch as are oyls of Whelps, and that which we call a Digettive; you must chiefly forbear suppuratives, when as the wounded part is of a nervous nature. For all neryous parts require drier medicines then fleshy, as we have formerly delivered speaking of wounds ticks must be of the joynts; wherefore in wounds of the joynts and nervous parts you shall use more Venice Tureiche wed in pentine than oyl. Laurentius Jolerus the Kings Phylician and Chancellor of the University of their Atompelier, in a Treatife which he writ of wounds made with Gunfhot, forbids the use of Escharople. ticks both actual and potential, in these wounds, if simple; for that they induce pain, inflammation, a feaver, gangrene, and other deadly symptoms. Befides also, an Eschar will hinder suppuration, which sow an Esc is to be defined in this kind of wounds, that fo the contufed fielh may be fevered from the found, that may be left it be drawn to patrefaction by contagion. Which eatily happens when an Efchar is drawn, as a bar over it, for then the excrementitious humor remains longer in the part, and the putredinous. The descriptivapours, hindred from pating forth, are increased, and carried from the lefter vesses to the bigs on of an ger, and so over all the Eody. Wherefore, when you suspect putresaftion, letting alone support of the putresaftion, putratives, use in the first place such things as resist putresaftion, as this following Cyntment. Research to the putresaftion of th Pulver, alumin, rocha, viridis aris, vitrioli Romani, mellis rofat, an. 3 ij. aceti boni quantum fufficis, buliant omnia finual fecundum artem, & fiat medicamentum ad forman mellir. This by reason of the heat and fubtlety of the fubfiance, bath a faculty to induce and attenuate the humors, as also to call forth the native heat drawn in and diffipated by the violent and forcible entrance of the bullet into the body; furthermore also it corrects the venemous contagion of the virulent humor. Now into the body; furthermore also it corrects the venemous contagion of the virulent humor. Now this medicine shall be used, dissolved in Vinegar or Aqua vive, and be put into the wound with tents or pledgets. The tents which shall be used at the first dressing must be somewhat long and thick, that by dilating the wound, they may make way for application of other remedies; otherwise you may make injection with a Syringe, that so it may penetrate the more powerfully. But this described Ægyptianum shall be tempered according to the condition of the affected parts, for the nervous parts will be offended with it as being too acrid; but it may be qualified by admixture of oyl of Turpentine and Saint Johns-wort. Also we may well be without this Ægypti-nown when there is no such pestilent constitution of the air, as was seen in the late Civil Wars. maxing of oyl of Tale and petitlent conflictation of the air, as was feen in the late Civil Wars. repelling medicine.

The binding up. How oft the md muft be dreft in a

ding to the rule of Hippocrates, which wishes every contused wound to be presently brought to suppuration, for so it will be less subject to a Phlegmon; and besides, all the rent and bruised stella must putrefie, disfolve and turn to quitture, that new and good slesh may be generated instead thereof. Laurentius Isubertus much commends this following medicine, of whose efficacy, as yet I have made no trial R Pulver. mercur. bis calcinati, 3 i. Adipis porci recentis, vel butyri recentis, 3 viij. Campbore in aqua vite diffolute, 3 ij. Misce omnia simul, addendo tantilium olci liliorum, and lini. Experience taught him, and Reason also shews, that this kind of remedy is very commendable; for the powder of Mercury, if mixed with a gross and humecting matter, doth in a short space turn the bruifed flesh into Pus, without causing any great pain. For the Camphire, whether it be hot or cold, in temper, it much conduces to that purpose, by reason of the subtlety of the parts whereof it consists. For by means of this quality the medicines enter with more facility into the affected bodies, and perform their parts; befides also, Camphire resists Putresaction. Some drop into the wound Aqua vita, wherein they have dissolved some calcined vitriol. Which kind of remedy is not suppurative, but yet much relifts putrefaction, so that we may use it with good fuccess, when the weather is hot, moift and foggy. But when the wound is made very near at hand, it cannot but be burnt by the flame of the powder; in which, remedies used for burns, will be useful, not omitting such as are fit for contulions. But for those parts which lye next the wound, you shall not, unless at the first dreffing, apply refrigerating and astringent things, but rather emollient and suppurative. For those things which have a refrigerating faculty, weaken the part, and hinder suppuration. For astringents constipate the skin, which is the cause, that, the putrid vapours shuts up and hindred from transpiration and paffage forth, a Gangrene and Mortification easily seife upon the part. But if the contusion be great, and diffuse it self more largely over the slesh, the part must be much scari-fied; that so the contused and concrete blood, and therefore subject to putrefaction, may be evacuated. But for those parts, which somewhat farther distant from the wound, encompass the contufed flesh, they require refrigerating and strengthening medicines, so to hinder the falling down An Aftringent and fettling of the humor in that part, which is this enfuing medicine. Repulboli armen. fanguin. Dracon. Myrrba, an. 3 i. succi solan. sempervivi, portulac. an. 3 i s. album iiij ovorum. oxyrbodin. quantum sufficit; stat linimentum, ut decet. You may use this and the like until the suspected symptom be pass fear. Neither must you have less care, of binding up and rolling the part, than of your me-dicines; for it doth not a little conduce to the cure, to bind it so fitly up as it may be without pains The wound at the beginning of the cure, must be dressed but once in four and twenty hours, that is, until the wound be come to suppuration; but when the quitture begins to flow from it, and confequently the pain and Feaver are increased, it shall be drest twice a day, that is, every twelve hours. And when the quitture flows more abundantly than usual, so that the collection thereof is very troublefome to the Patient, it will be requilite to drefs it every eight hours; that is, thrice a day. Now when as this abundant efflux is fomewhat flaked, and begins to decrease, it will fusfice to dress it twice a day. But when the Ulcer is filled with flesh, and consequently easis forth but little matter, it will ferve to drefs it once a day, as you did at the first.

CHAP. VI.

Hore you shall order it at the second dressing.

Why wounds made by Gun-fhot are fo long before they come to fuppuration.

Why Turpe tine must be washed. Gal. 13. Mith.

A detergent medicine.

Why Tents must be neinor thick,

T the fecond and following dreffings, unless you suspect putrefaction, and a Gangrene, you shall only put into the wound some of the Oyls formerly described, adding to them the yelks of fome eggs and a little Saffron; and use this medicine, until the wound come to perfect suppuration. Here you must note this, that these kinds of wounds are longer before they come to suppuration, than other wounds made by any other fort of Weapon; both for that the bullet, as also the air which it violently carries before it, by much bruifing the fleth, on every fide, diffipates the native heat, and exhausts the spirits of the part. Which things hinder digestion, and often cause the matter to stink, as also many other pernicious symptoms. Yet most usually Pas or quitture appears within three or four days, sooner and later according to the various complexion and temperament of the Patients bodies, and the condition of the ambient air in heat and cold. Then by little and little you must come to detersives, adding to the former medicine fome Turpentine washed in Rose, Barley, or some other such like water, which may wash away the biting thereof. If the incompassing air be very cold, you may, to good purpose, add some Aqua vite; for by Galen's prescript, we must not use hot medicines in Winter, and less hot in Summer. Then in the next place use deterfives; as, & Aque decollionis bordei quantum sufficit, succiplantaginis, apii, agrimon. centaurei minoris, an. 3 i. Bulliant omnia simul; in fine decollionis adde terebinthine venere 3 iii. Mellis rosat. 3 ii. farin. bordei 3 iii. Croci 3 i. Let them all be well mixed together and make a Mundificative of an indifferent confiftence. Or, R Succi clymeni, plantag, abfinthapti, an. 3 ij. Tereb. venet. 3 iiij. Syrup. abfinth. & mellis rof. an. 3 iij. Buliant omnia fecundum artem postea colentur in colatura, adde pulver. aloes, mastiches, Iros Florent. sar, bord. an 3 i. Fiat Mundisseativum ad users distance. ad usum diction. Or, Re Terebinth, venet, lote in agros 3 v. Olei ros 3 i. Mellis ros aij myrrhe, aleos, mastich, arijtoloch, rotunde, an. 3 i S. Far. bord. 3 iij. Misee. Make a Mundificative, which you may put into the wound with Tents, but fuch as are neither too long, nor thick, left they hinder the evacuation of the quitture and vapours, whence the wounded part will be troubled with erofion, pain, defluxion, inflammation, abfeefs, putrefaction; all which feverally of themfelves, as also by infecting the noble parts, are troublestome both to the part affected, as also to the whole body befides. Wherefore you shall put into the wound no Tents, unless small ones, and of an indifferent confisence; lest (as I faid) you hinder the passing forth of the matter, or by their hard prefing of the part, cause pain, and so draw on malign symptoms. But seeing Tents are used between BEFFER OF THEFE

keep open a wound to long, until all the firange bodies be taken forth, as also to carry the medicines, wherewithal they are anointed, even to the bottom of the wound: Now it the wound be finuous and deep, that fo the medicine cannot by that means arrive at the bottom and all the parts thereof, you must do your business by injections made of the following decoction. Rt ag, bord, lib.iiij. agrimon. centaur. minor. pimpinelle, absorbe plantag. M. S. Rad. aristoloch. round. 3 S. First decollio ad lib.j. in colatura express a disjolve alors bepatica 3 iij. Melis ros. 3 ij. Enlishes modicum. Inject some of this decoction three or sour times into the wound, as often as you dress the Patient; and if this shall now be sufficient to classife the fish, and waste the spone icus, putrid and dead stelly you shall shall not be sufficient to cleanse the filth, and waste the spongious, putrid and dead slesh, you shall diffolve therein as much Egyptiseum as you shall think fit for the present necessity, but commonly you The quantity shall dissolve an ounce of Egyptiseum in a pint of the decection. Verily Egyptiseum doth powerfully can to be used consume the proud shesh which lies in the capacity of the wound; besides also, it only works upon such kind of stess. For this purpose, I have also made trial of the powder of Mercury and burnt Alum equally mixed together, and found them very powerful, even as fublimate, or Arfenick (but that thefe cause not such pain in their operation.) I certainly much wonder at the largeness of the Eschar which arises by the aspersion of these powders. Many Practitioners would have a great why none of quantity of the injection to be left in the cavities of finuous Ulcers, or wounds; which thing I could never allow of. For this contained humor caufeth an unnatural tension in these parts, and taints them with superfluous mosslure, whereby the regeneration of slesh is hindered; for that every Ulceras it is an Ulcer, requires to be dryed, in Hippocrates opinion. Many also offend in Hollow Tenes the too frequent use of Tents; for as they change them every hour, they touch the sides of the or Pipes. wound, cause pain, and renew other malign symptoms; wherefore such Ulcers as cast forth more abundance of matter, I could wish rather to be dreffed with hollow Tents, like those I formerly deferibed to be put into wounds of the Chest. You shall also press a linner boulster to the bottom of the wound, that so the parts themselves may be mutually condensed by that pressure and the quitture thrust forth; neither will it be amiss to let this boulster, have a large hole fitted to the orifice of the wound and end of the hollow Tent and Pipe, that fo you may apply a fpunge for to receive the quitture, for so the matter will be more speedily evacuated and spent, especially if it be bound up with an expulsive ligature, beginning at the bottom of the Ulcer, and so wrapping it up to the top. All the the boulsters and rowlers, which shall be applied to these kinds of wounds, thall be dipped in Oxycrate or Red-Wine, so to strengthen the part, and hinder defluxion. But you must have a special care, that you do not bind the wound too hard, from hence will arise pain, hindering the passage forth of the putredinous vapours and excrements, which the contrided stellar forth, and also tear of an dropping, or want of pourishment, the alignment was the passage to the last so the passage of the pas also fear of an Atrophia, or want of nourishment, the alimentary juyces being hindred from coming

An injection.

CHAP. VII.

By what means strange Bodies, left in at the first dressing, may be drawn forth.

T divers times happens, that certain fplinters of bones, broken and shattered afunder by the Two causes violence of the firoke, cannot be pulled forth at the first dreffing, for that they either do not that make yield or fall away, or else cannot be found by the formerly described Instruments. For which purhard to be to pose this is an approved medicine to draw forth that which is lest behind. Re Radie, Ires Floren, panae, ken forth. & capper, an. 3 ii. Arijioloch, rotund, manne, thuris, an. 3 ii. In polinem redalla, incorporentur cum melle rosar & terebinth, venet, an. 3 ii. Or Re Resin, pini sece 3 iii. Pumicis combusti & extintli in vino albo, radic. Ireos, aristolochie, an. 3 b. Thuris 3 i. Squame eris, 3 ii. in pollinem redigantur, incorporentur cum melle rofato, fiat medicamentum.

CHAP. VIII.

Of Indications to be observed in this kind of Wounds:

He Ulcer being cleanfed and purged, and all firange bodies taken forth; Natures endea-yours to regenerate flesh, and cicatrize it, must be helped forwards with convenient remedies, both taken inwardly, and applied outwardly. To which things we maybe callly and fafely carried by indications drawn, first from the effence of the disease, then from the cause; if as yet present it nourish the disease. For that which Galen says, Lib. 3. Meth. that no Indication may be taken from the primitive cause and times must be understood of the time past, and the cause which is absent. And then from the principal times of the disease, the beginning, increase, state, and declination; for each of these four require their remedies. Others are taken from the temperament of the Patient, so that no Chirurgeon need doubt, that some medicines are fit for cholcrick, otherfome for phlegmatick bodies. Hither refer the indication taken from the age of the Patient; also it is drawn from his diet, for no man must prescribe any slender diet to one who is always feeding, as to him who is accultomed to eat but once or twice a day. Hence it is that a diet contifting only of Panada's is more fitter for Italians than for French men; for we must give fomewhat to cultom, which is as it were another nature. Vocations and daily exercises, are re-ferred to diet: For other things beht Husbandmen and Labourers, whose flesh is dense, and skin on which is hardned by much labour, than idle and delicate persons. But of all other, have diligent regard of the frenesh of the Parient; for we much labour, the different of the Parient; for we much labour, the different of the Parient; for we much labour, the different of the frenesh of the Parient. of that indication which is drawn from the firength of the Patient; for we must prefently, (all the frength of elie being neglected) fuccour the fainting, or decaying ftrength; wherefore if it be needful to cut the Patient is off a member that is putrefied, the operation must be deferred if the strength of the Patient be so all other. dejected, that he cannot have it performed without manifest danger of his life. Also indication

Why wounds of the head as Parls, and of the legs at Avignan are hard to be cured.

An indication to be drawn from the quick and dull fenfe of the wounded part.

Gallib.7.Meth.

Gald. 7. Merb.

How and when we must take indication of curing from a fympcome.

may be drawn from the incompatting air, under which also is comprehended that, which is taken from the feafon of the year, region, the flate of the air and foil, and the particular condition of the present and lately by-past time. Hence it is we read in Guido, that wounds of the head are cured with far more difficulty at Paris, than at Avignon; where, notwithstanding on the contrary, the wounds of the legs are cuted with more trouble, than at Paris; the cause is, the air is cold and moist at Paris; which conflitution feeing it is hurtful to the brain and head, it cannot but must be offen-five to the wounds of these parts. But the heat of the ambient air at Avignon, attenuates and diffolves the humors, and makes them flow from above downwards. But if any object that experience contradicts this opinion of Gmido, and fay, that wounds of the head are more frequently deadly in hot Countreys; let him understand that this must not be attributed to the manifest and natural heat of the air, but to a certain malign and venenate humor, or vapour differred through the air, and raifed out of the Seas; as you may eafily observe in those places of France and Italy which border upon the Mediterranean Sea. An indication may also be drawn from the peculiar temper of the wounded parts, for the mufculous parts must be dressed after one, and the bony parts after another manner. The different fense of the parts, indicates and requires the like variety of remedies, for you shall not apply so acrid medicines to the nerves and tendons, as to the ligaments which are de-stitute of sense. The like reason also for the dignity and function of the parts needful for the prefervation of life; for oft-times wounds of the brain, or fome other of the natural and vital parts, for this very reason that they are defixed in these parts, divert the whole manner of the cure, which is ufually and generally performed in wounds. Neither that without good caufe, for oft-times from the condition of the parts, we may certainly pronounce the whole fuccefs of the difease's for wounds which penetrate into the ventricles of the brain, into the heart, the large vessels, the chest, the nervous parts of the midriff, the liver, ventricles, small guts, bladder, if somewhat large are deadly; as also those which light upon a joynt in a body repleat with ill humors, as we have formerly noted. Neither must you neglect that indication which is drawn from the fituation of the part, and the commerce it hath with the adjacent parts, or from the figure thereof; feeing that Galen himfelf would not have it neglected. But we must confider in taking these forementioned Indications, whether there be a composition, or complication of the diseases; for as there is one and that a simple indication, of one and that a simple disease, so must the indication be various of a compound and complicate difease. But there is observed to be a triple composition or complication of affects belides nature: For either a difeafe is compounded with a difeafe, as a wound, or a phlegmon with a fracture of a bone; or a difease with a cause, as an ulcer with a defluxion; or a difease with a fymptom, as wound with pain or bleeding. It fornetimes comes to pass, that these three, the difease, cause and symptome, concur in one case or affect. In artificially handling of which, we must follow Galen's counsel, who wishes in complicated and compounded affects, that we retiit the more urgent; then let us withfrand the cause of the disease; and lastly that affect, without which the rest cannot cannot be cured. Which counsel must well be observed; for in this composure of asfects, which diffracts the Emperick; on the contrary, the rational Physician hath a way prescribed in a few and these excellent words, which if he follow in his order of cure, he can scarce miss to heal the Patient. Symptoms truly as they are fymptoms, yield no indication of curing, neither change the order of the cure; for when the discase is healed, the symptom vanishes as that which follows the difease, as a shadow follows the body. But symptoms do oftentimes so urge and press that perverting the whole order of the cure, we are forced to refit them in the first place, as those which would otherwife increase the difease. Now all the formerly mentioned indications may be drawn to two heads; the first is, to restore the parts to its native temper; the other is, that the blood offend not either in quantity or quality; for when those two are present, there is nothing which may hinder the repletion or union of wounds nor ulcers.

CHAP. IX.

What remains for the Chirurgeon to do in this kind of Wounds.

He Chirurgeon must first of all be skilful, and labour to assume pain, hinder defluxions, prescribe a diet in those fix things we call not-natural, forbidding the use of hot and acrid things as also of Wine; for such attenuate humors, and make them more aptfor defluxion. Therefore at the first let his diet be stender, that so the course of the humors may be diverted from the affected part; for the stoquach being empty, and not well filled, draws from the parts about it, whereby it consequently follows, that the utmost and remotest parts are at the length evacuated; which is the cause, that such as are wounded, must keep so spare a diet for the next days following. Venery is very pernicious for that it instants the sprits and humors far beyond other motions; whereby it happens that the humors waxing hot, are too plentifully carried to the wounded and over-heated part. The bleeding must not be stanched presently upon receiving of the wound, for by the more plentiful efflux thereof, the part is freed from danger of instantation and sulness. Wherefore if the wound bleed not sufficiently at the sixt, you shall the next day open a vein, and take blood according to the strength and plenitude of the Patient: for these usually, slows no great store of blood from wounds of this nature; for that by the greatness of the contusion and vehemency of the moved air, the spirits are forced in, as also I have observed in those who have one of their limbs taken away with a Cannon bullet. For in the time when the wound is received, there shows no great quantity of blood, although there be large veins and arteries toru in funder thereby. But on the tourth, sith, or some more days after, the blood slows in greater abundance, and with more violence, the native heat and spirits returning into the same. The belly must be so qualified, that he may have at the least one stool a day, either by Na-

Why we must open a vein in such as are wounded by Gunshot.

Why fach as

mult keep a flender diet.

THE PERSON NAMED IN

ture, or Art; and if by Art, then rather with a Clyffer than purging medicines taken by the mouth, for that the agitation of humors, chiefly in the first days of the disease, is to be suspected, lest we increase the defluxion falling down upon the wounded part. Yet Galen writes that both the evacuations are here needful, that is, blood-letting and purging; though the Patient be neither ple-thorick; nor repleat with ill humors. But the care hereof must be committed to the judgment of the learned Physician; pain, if joyned with inflammation shall be mitigated, by anointing the parts near unto the wound with unquent. nutritum, composed with the juice of Plantain. Housleek, Nightshade, and the like. Unquentum Discoleithers described by Galen dissolved with vinegar, oyl of Poppies and Roses, is of no less efficacy; nor anguents, de balo, nor diversother things of the same faculty, though cand. Gen. c. 6. properly no Anodynes, as those which are not hot and most in the first degree, but rather cold, but yet not so as to have any narcotick faculty. Now these forementioned things asswage pain, for that they correct the hot difference, and fray the acrid and cholerick defluxions, whose violence is more than cold. After the use of repercussives, it will be good to apply this following Cataplasin. Re Mice An Anodyne panis infins in latte vaccino the is. Bulliant parson, addendo olei violacci, & rosar, an. 3 ii. Vivell, over and ripcaing ruom na. iii. pulver. rosar, rub. flor. chamem. & meliloti, an. 3 ii. Farin. fabar. & bordei, an. 3 i. miser. Cataplasin. flat cataplasina secundum artem. Also in this case you may easily make a medicine, of bread-crums boiled in Oxycrate and oyl of Roses. The cure of Tumors, if any affociate the wound, may be found in their proper place. Natures motion, whether to suppuration, or any such thing, must full be observed, and helped by the Physician and Chirurgeon, as the ministers and servants thereof.

Gal. Ub. 4.

CHAP. X.

Of Bullets which remain in the body, for a long time after the Wound is healed up.

Eaden Bullets lye in fome parts of the body fome whiles feven, eight, or more years, fo that Why Leaden they neither hinder the agglutination of the wound, neither doth any other symptom happen thereupon, as I have divers times observed; until at length by the strength of Nature forcing the body so many years them, and their proper weightiness bearing them downwards, they show themselves in some lower without doing part, by their fwelling or bunching forth, and so must be taken forth by the hand of the Chirurge- any harm. on. For they fay Lead hath a certain fympathy and familiarity with mans body, chiefly the fleshy parts thereof. Wherefore it neither purrenes it felf, nor causeth the flesh to putrenes besides it hath an excellent faculty in cicatrizing old ulcers. But bullets of ftone, iron, and of any other metal, are of another nature, for they cannot remain any long time in the body without hurt; for Iron will ow rufty, and so corrode the neighbouring bodies, and bring other malign symptoms. Yet a Leaden allet cannot remain any long time in nervous or noble parts without danger.

CHAP. XI.

How to correll the conflictation of the Air, so that the noble parts may be strengthened, and the sobole body

Ut because, as we have formerly told you, there are some times wherein even small wounds Cordials to made by Gunfhot prove deadly, not by their own fault, but the fault of the air therefore frengthen deaffor the Chirurgeon must have this care, that he correct the air with all diligence, and remoble parts. duce it to a certain quality and moderation of fubriance, and strengthen the noble parts and whole body belides; which may be performed by the following medicines, which are to be taken inwardly and applied outwardly. In the morning, three hours before meat, let the Patient take fome certain quantity, as the Phylician shall think lit, of the Electuary Diarrhodon Abbatis, or Aromaticum reforum, triafantalon, biomoschum, latisseans Galeni, or some such other like. And you shall reshall apply some such Epitheme as is here described to the Heart and Liver. R. Make hereos persunes in what sashion you please. For the rottenness and corruption of bones, we will treat thereof hereaster in due place.

CHAP. XII.

Certain memorable Histories

Ere I think good for the benefit of young practitioners, to illustrate by examples the formerly prescribed method of curing Wounds made by Gunshot. The famous and most valiant Count of Manifelt, Governor of the Dutchy of Lacenberry, Knight of the Order of Burgundy, coming to the aid of the French King, was at the Battel of Moccontair; where in the conflict he received to great a wound at the joynt of the left arm with a Pittol-bullet, that the bones were shivered and broken in so many pieces, as if they had been laid upon an Anvil and struck with an hammer: Hence proceeded many malign fymptoms, as cruel and tormenting pain, inflam-mation, a feaver, an ordematous and flatulent tumor of the whole arm even to the ingers ends, and a certain inclination to a Gangrene: Which to refit, Nicolas Lambert, and Richard Hubert, the Kings Chirurgeons, had made many and deep fearifications. But when I came to vifit and drefs him, by the Kings appointment, and had observed the great stench and putrefaction, I withed that they would use lotions of Agyptiacon made somewhat stronger than ordinary, and dissolved in Vinegar, and Aquavita, and do other things more largely spoken of in the Chapter of a Gangrene. For the Patient had also a Diarrhora, or Flux, whereby he evacuated the purulent and slinking, filth which flowed from his wound. Which how it might come to pass we will thew at large, when we come to treat of the suppression of the Urine. For this seemed very absurd to many, because that if this purulent humor flowed out of the arm into the belly, it must needs flow back flow from the into the veins, be mixed with the blood, and by its pernicious and contagious paffage through wounded limbs into the heart and liver, cause exceeding ill symptoms, and lastly death. Indeed he often swounded by the ascent of the filthy vapours raised from the Ulcerto the noble parts, which to resist, I withen A brief recital thin to take a fpoonful of Aqua vite with fome Treacle diffolved therein. I endeavoured to repress of the manner of the cure. The codematous and flatulent Tumor possessing all the arm with stoups dipped in Oxycrate, to which was put a little Salt and Aqua vite; these stoups I stayed and held to the part with double cloaths, sowed as strait as I could. Such a compression held the broken bones in their places, pressed their Sanier from the Ulcers, and forced back the humors flowing to the part into the center of the body. If at any time I omitted this compression, the Tumor was so increased, that I was in a great deal of sear, lest the native heat of the part should be suffocated. Neither could I otherwife bind up the arm by reason of the excessive pain which molested the Patient upon the least stirring of the arm. There were also many Abscesses about his elbow and over all his arm besides. For the letting forth of whose matter I was forced to make new Incisions; which he endured very floutly. At length Leured him with using a vulnerary potion, and by cleanling the Ulkers, and correcting the putrefaction with Ægyptiacum diffolved in Wine and honey of Roles, and so poured into the Ulcers, and repreffing the growth of proud flesh, with the powder of burnt Alum, drying it after the detertion with liniments. Now this I can truly affirm and profess, that, during the time of the cure, I took out above threefcore splinters of bones, and those necessarily, amongst which there was one of the length of ones finger; yet by Gods affifiance at length he became found in all

things, but that he could not put forth, or draw in his arm.

Not long after by the Kings command I went to fee Charles Philip of Croy, Lord of Auret, the Duke of Arfebets Brother, not far from Mounts a City of Hensit. He kept his bed feven months by reason of a wound made by a bullet the space of three singers above his knee. When I came to him, he was afflicted with these symptoms, intolerable pain, a continual seaver, cold sweats, watchings, excoriation of the hips by reason of his long lying upon them, his appetite dejected with much thirft. He oft funk down as if he had the Falling-lickness, had a defire to vomit, and a continual trembling or shaking, so that he could not put one hand to his mouth without the assifrance of the other: He fwounded frequently by reason of the vapours ascending to the noble parts. For the thigh-bone was broken long-ways, and fide-ways with many iplinters of bones, whereof fome were plucked out; and others remained flicking fast in. He belides also had an ulcer in his groin which reached to the midft of his thigh, and many other finnous ulcers about his knee. All the mufeles of his thigh and leg were fwoln with a flegmatick, cold and flatulent humor, fo that although all the president of the considered. I had thost all the native hear of those parts seemed extinct. All which things being considered, I had fearce any hope to recover him, so that I repented my coming thither. Yet at length putting fome considence in his firength, and prime of youth, I began to have better hopes. Therefore with his good liking, first of all, I made two Incisions, so to let forth the matter, which lying about the bone did humeet the substance of the muscles. This had happy success, and drew out a great quantity of matters, then I with a Syringe injected much Agyptiseum dissolved in Wine, and a little Agus vite into these Incisions, so to restain and amend the putrefaction, repress the spongy, loose, and soft fieth, resolve the ordernational flatulent Tumor, assume the pain, and the putrefaction of the parties had a little and the putrefaction of the parties had been always to the parties had a little and the parties and the parties had a little and the parties and the parties and the parties are always and the parties and the parties are always and the parties are always a little and the parties are always a little and the parties are always are always and the parties are always are always are always and a little are always are al flir up and firengthen the native heat almost opprest by the abundance of excrementitious ha-

mors, so that it could scarcely affimilate any nourithment and adjoyn it to the parts. Then I soment-wherefore f ed the affected part with Sage, Rosemary, Thyme, Lavender, Chamomile and Melilot-flowers, and wied Foment-Red-rofe leaves boiled in White-white, and Lye made of Oak-ashes, adding thereto as much Salt and Vinegar as I judged requifite. This Fomentation did attenuate and draw forth the morbinek humor. Now we used them long and often, so to waste the humor more by drying up and breathing through the paffages of the skin, more thereof than fell into the part. For this fame purpose, we or- Mixed or dained that he should use frictions with hot linnen clothes, and that these should be made from round tricking above downwards, from below upward, and so on every side, and somewhat long withal: For a one, as they term them. showe downwards, from nelow upward, and to the car refolve: I wished that each other day they term them. Should lay bricks heated hot in the fire about his leg, thigh, and foal of his foot; but they were to be formerwhat quenched, and sprinkled with Wine and Vinegar, with a small quantity of Aqua rate. Much waterish most turn by this most heat, did sweat out of these parts, the tumor was lessented. ed, and the native heat by little and little reflored. Then floups dipped in Lye made of Oak affect, wherein Sage, Rofemary, Lavender, Salt and Cloves, were boiled, fome Aqua vita added, were applied thereto; but the rowlers were fo gently and artificially wrapped about, that he did eafily endure them without any pain, and that with fuch happy fuccess, that if they were omitted but one day, the tumor became very great. But thick linnen boulders were laid upon the lower cavities of the Illegal that for the Saries, or filth, might be more self-a were laid upon the lower cavities of day, the tumor became very great. But thick finner bounters were fail upon the lower cavities of the Ulcer; that fo the Sanies, or filth, might be more eafily preffed forth. But I had always a fpecial care that the oritices of the Ulcers flould be kept open with hollow tents or pipes put therein: And fornerimes this following Cataplasm was applied to resolve the tumor. Re Far, bord, sabar, orobi, an. 3 vy. Mellis com, & tereb, an. 3 ij. slo. chamem, melli, & ros, rub, an. 3 | Pulv.rad, Ireos, Flor.cyper.Mass. an. 5 iii. Oxymel. simp.quantum sufficit; slat cataplasma ad formum pultis fails liquide. An employers de Vigo without Mercury was applied thereto, whereby the pain was much affwaged, and the tumor leffened: Yet were they not applied before the parts were throughly heated by the Fomentation, Frictions and Evaporations; for otherways this Emplaifler could never have been activated, by reason of the executive coldness of the affected parts. Neither did we omit cataginatick powders, it for the taking, and drawing forth of broken bones. He used a vulnerary potion for fifpowders, ht for the taking, and drawing forth of broken bones. He used a vulnerary potion for inteen days, Also belides the particular frictions of the affected parts, I appointed other general frictions of the whole body, which was become very lean; for by thefe, blood together with the fpirit was drawn to the parts, and the acrid, and fuliginous vapours were breathed forth. To conclude, his Feaver and pains being affwaged, his appetite reflored, by feeding plentifully upon good meats according to his firength, he in a thort time became more lufty; and laftly, by the fingular mercy of God, recovered his health periodily, but that he could not very well bend his knee. I thought good to reflect the feetings, not to clory or brag of the happy fueces of these Parients, which have proposes cite these things, not to glory or brag of the happy success of those Patients, which have recovered by means, and the savour of God; but that thus I may more fully and perfectly, by familiar examples, instruct young practicioners, in the operations of Chirurgery.

CHAP. XIII. An Apology concerning Wounds made by Gunshot.

Here lately came to my hands a Book written by a certain Phylician, whereby he endea- The occasion vours to disprove and overthrow, that which I have hitherto writ, of the cure of wounds of writing this made by Gunthot. Affuredly, if there were no other harm, but the lofs of my credit enthereon, I would willingly hold my peace, and frop his mouth by modelf filence. But feeing the fafety of to many men lyes upon the judgment of this point, I have thought good to with fland this errour, left it, to the great destruction of mankind, spread and diffuse it self any further. The The chief thand this errour, left it, to the great definition of mankind, spread and diffuse it self any further. The the use (saith he) of suppurative medicines, have killed many who have been but lightly wounded with Gunshot; but acrid medicines, as \(\tilde{x}\)gyptiacion, have killed more. Neither is the counsel of the adversaries to be observed in curing this fort of wounds, who bids that every contusted wound be brought to suppuration. For seeing this is a new kind of wound, it requires new, and not anciently used, medicines. Now the temper of the air, changed from the natural constitution, ought not to indicate change of medicines; but much less must Thunder and Lightning be compared to the shooting of great Ordinance. These are the chief heads of this his Benks, which because they the shooting of great Ordnance. These are the chief heads of this his Book; which, became they diffent from the truth, and those things I have formerly delivered, I have thought good here to consiste. First, seeing leaden Bullets which are usually shot out of Guns are round, obtain and All wounds weighty, they cannot would the body without contusion and attrition: Now no contustion can made by Gunsare without supportant to the control of Hisparcases, but also of Galan they are con-nor tyranny can pervert. Wherefore neither those who with great praise are Phylicians to Kings and Princes, I mean Jawhert and Petallus, think it lawful for them to depart from the rules of Hipparater. And this they not only do and follow in curing and doing the works of Art, but much and highly commend, confirm, and propound to be diligently observed by all in their Books, which they have published concerning the cure of these kinds of wounds. And yet these Physicians are such as daily conversant in Armies and Kings-houses, have healed and daily cure as many wounded by the cure of these published conversant in Armies and Kings-houses, have healed and daily cure as many wounded by the cure of ed by Gunsbot as this Phylician our Antagonist hath feen in all his life. Neither only do these whom I have named thus cure these wounds, but almost all that dress such kind of wounds do the like of that, if there be nothing which may hinder, or indicate to the contray, they prefently apply suppuratives. And I wonder that he hath not observed how his neighbour Doubles

Apology.

A suppurative tried efficacy.

the Emperick, eures desperate wounds of this nature, with no other than a suppurative medicine, composed of Lard, the yolk of an Egg, Turpentine, and a little Sassron. In the year, 1538, there was at Turin whilst I was Chirurgeon there to the Marshal of Montejan the Kings Lieutenant General in Piedmant, a certain Chirurgeon wondrous famous for curing these wounds, and yet he used nothing else but the Oyl of Whelps, (the Description whereof I at length obtained of him with much intreaty and expence s) and he used it not fealding hot, as some have imagined, but poured it fcarce warm into their wounds, and fo did mitigate their pain, and happily bring them to suppuration. Which afterwards almost all Chirurgeons, after they had got the Description hereof, when I first published this Work, have used, and daily do use with happy fuccels.

The force of Agoptiacum against putrefection.

But in contemning and condemning Ægyptiseum, I think he hath no partaker; feeing there as yet hath been found no medicine more speedy and powerful to hinder putrefaction, if beginning or correct it, if present. Now these wounds often degenerate into virulent, eating, spreading and malign Ulcers, which cast forth a stinking and Carion-like filth, whence the part gangrenates, unlefs you withfrand them with Agyptiacum, and other acrid medicines, being greatly approved by the formerly named Phylicians, and all Chirurgeons. But (faith he) this Unquent is poyfonous, and therefore hath been the death of many who have been wounded by Gunshot. Verily if any diligently enquire into the Composition of this Oyntment, and confider the nature of all and every the ingredients thereof, he shall understand that this kind of Unguent is far from poylon; that on the contrary, it directly opposes and refists all poyson and putrefaction which may happen to a fleshy part, through occasion of any wound.

It is most false and diffonant from the doctrine of Hippocrates to affirm, that the Seasons of the year fwerving from the Law of Nature, and the air, (not truly the simple and elementary) but that which is defiled and polluted by the various mixture of putrid and peffilent vapours, (either raifed from the earth, or fent from above) make not wounds more malign and hard to cure at fome times than they are at other fome. For the air either very hot, or cold, drawn into the body by infpiration or transpiration, generates a condition in us like its qualities. Therefore why may it not, when defiled with the putredinous vapours of bodies lying unburied after great Battels, and Shipwracks of

the air in breeding and dileales.

The force of

A Hiftory.

In our fecond Discourse.

Hip. Apb. 1.

the air and our bodies.

great Armadoes, infect with the like quality our bodies and wounds?

In the year, 1562, when the Civil Wars concerning Religion first begun in France, at Pose, a Cafile lying upon the River Lot, many slain bodies were east into a Well, some hundred cubits deep: fo flinking and peffilent a vapour arole from hence fome two months after, that many thousands of people died all over the Province of Agencis, as if the Plague had been amongst them, the permicious Contagion being spread twenty miles in compass. Which none ought to think strange, especially feeing the putrid exhalations by the force of the winds may be driven and carried into divers and most remote Regions, dispersed like the seeds of the Pestilence, whence proceeds a deadly corruption of the spirits, humors and wounds, not to be attributed to the proper malignity or perverse cure of wounds, but to be the fault of the air. Therefore Francis Daleschampe, in his French Chirurgery, in reckoning up those things which hinder the healing of Ulcers, hath not omitted that common cause which proceeds from the air defiled or tainted with the seeds of Pestilence. For he had learn'd from his Master Hippocrates, that the mutations of times chiefly bring discases, and he had read in Guido, that this was the chief occasion, that wounds of the head at Paris, and of the legs at Avignion, were more difficultly healed. Laftly, even Barbers, and fuch as have leaft skill in Chirurgery know, that wounds eafily turn into a Gangrene in hot and moift conflitutions of the air. Wherefore when the wind is foutherly, the Butchers will kill no more flesh than to serve them for one day. I have formerly declared the malignity of the wounds occasioned by the air in the fiege of Rouen, which spared none, no not the Princes of the Blood, who had all things which were requisite for their health. Which caused me, made at length more skilful by experience, to use Unguentum Agyptiaeam, and medicines of the like faculty, inflead of Suppuratives, to wounds during all that featon, that fo I might withfland the putrefaction and Gangrene which fo commonly affailed them. But if the various motion of the Stars, can by their reflux fend a Plague into the air, why then may it not by depravation of their qualities infect, and as by poyfoning corrupt both wounds and wounded bodies obnoxious to their changes, and that of the air? We learn'd long fince by experience, that all pains, but principally of wounds, grow worfe in a rainy and moit feafon, specially because in that foutherly constitution the air replete with thick and foggy vapours, causes the humors to abound in the body, which forthwith eatily fall upon the affected parts, and cause increase of pan-But, saith our Adversary, in the Battel at Drine, and at S' Denis which were fought in Winter, there has died a great number of men who were wounded by Gunshot: This I confess is true; but this I deny, that it was occasioned by applying suppuratives or corrolives, but rather the vehemency and largeness of their wounds, and the spoil the bullet made in their members; but above all, by reason Apier, 40. felt. of the cold. For cold is most hurtful to wounds and ulcers, (as Hipperrates testifies) it hardens the skin, and canfes a Gangrene. If this my Gentleman had been with me in the fiege of Metz, he might have feen the legs of many Souldiers to have rotted, and prefently taken with a Gangrene to have faln away, by the only extremity of cold: If he will not believe me, let him make trial himself, and go Winter to the Chappel at Mount Senis, oneof the Alpine hills, where the bodies of such as were frozen to death in passing that way are buried, and he shall learn and feel how true I speak. In the mean time I think it for a confirm to he had been and feel how true I speak. mean time I think it fit to confute the last point of his Reprehension-

He cavils for that I compared Thunder and Lightning with discharging of Pieces of Ordnance. First, he cannot deny, but that they are alike in effects. For it is certain that the flame arising from Gunpowder set on fire, resembles Lightning; in this also, that you may see it before you hear the crack or report. I judge, for that the eye almost in a moment perceives its objects; but the ear cannot but in some certain space of time, and by distinct gradations. But the rumbling noise is like in

The fimilitude Thunder and great Ordin both, and certainly the Report of great Ordnance may be heard fornetimes at forty miles distance, whilest they make any great battery in the besieging of Cities. Besides also, Iron Bullets cart forth with incredible celerity by the fired Gun-powder, throw down all things with a horrid force, and that more speedily and violently by how much they result the more powerfully by their hardness. They report that Lightning meles the Money not have the Pursel Now many by the onely violence of the rich of the property of the prope lence of the sir agitated and vehemently moved by shooting a piece of Ordnance, as touched with Lightning, have died in a moment; their bones being shivered and broken, no sign of hort appearing in the skin. The smell of Gun-powder when it is street, is hursful, siery and sulphurous, just like that which exhales or comes from bodies killed with Lightning. For men do not onely than the Imell, but also wild Beatls leave their Dens if touched with Lightnings. Now the cruelty of great Ordnance makes no lefs fpoil amongst Buildings, nor flaughter amongst Men and Beatls, than Lightnings do, as we have formerly shewn by examples, not onely horrid to fee, but even to hear reported, as of Mines, the Arcenal of Paris, the City of Malines. These may seem sufficient to teach, that Thunder and Lightning have a great fimilitude with the shooting of great Ordnance, which notwithstanding I would not have alike in all things. For they neither agree in substance nor matter, but onely in the manner of violent breaking afunder the objects.

Now let us fee and examine what manner of cure of Wounds made by Oun-fhot our Adverfary Our Adverfar fubilitutes for ours. For he would have suppuratives used and applied, yet such as should not be ries method, hot and most in quality, or of an Emplastick consistence, but hot and dry things. For (faith he) and manner of cure reproture is not the same reason as in Abscesses, where the Physician intends nothing but suppuration. ved. But here because a contusion is present with the wound, this requires to be ripened with suppura-

tives, but the Wound to be dried.

ERRENCE VIOLETTE.

Now to answer this objection, I will refer him to Galen, who will teach him the nature of suppu- Gal. U.S. 9. Gupt. ratives; from whom also he may learn that great regard is to be had of the Canfe, and more urgent to Mithol. order in the Care of Compound Difeases; then would I willingly learn of him whether he can heal a wound made by Gun-shot, not first bringing that which is contusted to perfect maturity. If he af-firm he can, I will be judged by whatfoever Practitioners he will, to judge how obscure these things Whereby you may the better understand there is nothing more commodious than our Bafilican and Oil of Whelps to ripen wounds made by Gun-thot, if to be that putrefaction, corruption, a Gangrene, or fome other thing do not hinder. Then would be have Oxyerare poured into these wounds to stay their bleeding, which if it cannot so be staid, he would have a Medicin applied consisting of the white of an Egg, Bole Armenick, Oil of Roses and Salt. But I leave it to other mens judgment, whether the Medicins have power to flay bleeding if put into the wound a certainly they will make it bleed the more. For Vinegar feeing it is of a tenuious fubflance and biting, it is no doubt but that vinegar put it will cause pain, defluxion and inflammation. To which purpose, I remember I put to flanch into a wound and the pain, defluxion and inflammation. bleeding, for want of another remedy, a Medicin wherein was forme Vinegar, into a Wound received by a Moor, an attendant of the Earl of Roiffy, hurt with a Lance run through his arm before Bologne by an English Horseman. But he comes again to me a little after, complaining and crying out that all A History. his arm burnt like fire; wherefore I was glad to drefs him again, and put another Medicin into his Wound, and laid an aftringent Medicin upon the Wound, but poured it not therein. And then above all-other remedies he extols his Ballam composed of Oil of Wax and Myrrh beaten together with the white of an Egg, which he faith is equal in operation to the natural Balfam of Pow. For he affirms, that this bath a faculty to confume the excrementitions humidity of Wounds, and fo firengthens the part that no fymptom afterwards troubles them. Yet he faith, this doth not fo well heal and agglutinate these wounds, as it doth others which are cut. Verily it is ridiculous to think that contusted Wounds can be healed after the same manner, as simple wounds may, which onely require to heal simple wounds may. the uniting of the loofed continuity.

Therefore neither can these Ballams be fit remedies to heal Wounds made by Gun-shot, seeing by reation of their driness they hinder suppuration, which unless it be procured, the Patient cannot be healed. Wherefore such things ought not to be put into Wounds of this nature, before they be ripened, washed and cleaned from their filth. Yet can I scarce conceive where we shall be able to find out to many Chymifts which may furnish us with thefe things fufficiently to drefs fo many wounded Souldiers as usually are in an Army, or whence the Souldiers have sufficient means to bear the charge thereof. Also that which he faith is absurd, that the Balfams must be put into the Wounds without Tents; and prefently forgetting himfelf, he faith it will not be amifs if there be a little and flender Tent put into the Wound, which may onely ferve to hinder the agglutination thereof. But how can these Balfams come to the bottoms of Wounds without Tents, when as it is their chief property to carry Medicins even to the innermost parts of the Wounds, and always keep open a tree passage for the evacuation of the quitture? But it is not worthy, that after he hash rejected \$\mathcal{U}_n\$—greation \$Aggriacom\$, he nevertheless bids to apply it, from the beginning until the contusion come to perfect maturation, dissolving it it in a decoction of the tops of Wormwood, \$S. Johns Wort, the lesser Centery and Plantain, and so injecting it into the Wound. Besides also a little after he gives *Aggriacom* another way of using it, which is, to boil a quantity of Honey of Roses in Plantain Water, carefully howsever. lefter Centory and Plantain, and To injecting it into the Wound. Benues also a little after he gives *Emiliar another way of uling it, which is, to boil a quantity of Honey of Rofes in Plantain Water, carefully howloever skimming it, until it be boiled to the confidence of Honey, and then to add as much *Egyptiacnes* made, is a thereto, and fo to make an Ointment most fit to bring these Wounds to suppuration. But I leave it suppurative, and to to make an Ointment most fit to bring these Wounds to suppuratives. Or whether the suppurative. thereto, and to to make an Ontdiage, whether fuch Medicins can be supportation. But I leave it for any skilful in Chirurgery to judge, whether such Medicins can be supportatives, or whether they be not rather deterfives. Laft of all, he writes, that thefe Wounds must be dreft but every fourth day. And if there be a fracture of the bone joined with the Wound, then to move nothing after the first drelling until the eighth day after; then prefently in another place he faith, it will be good and expedient to drop ten or twelve drops of the formerly described Balfam every day into the Wound. Verily fuch, doctrin which neither agrees with it felf, nor the truth, cannot but much pulle a Novice and young practitioner in Chirurgery, who is not yet verfed in the Art, or the operations thereof.

fed Wounds,

cleanfer, not a

CHAP. XIV.

Another Apology against those who have laboured with new Reasons to prove that Wounds made by Gun-shot are poisoned.

The occasion of this Apolo gy.

that the Bullets may be poisoned, fer down and con-

Ome few Moneths ago, I vilited a Patient together with fome learned Phylicians and skillful Chirurgeons. Now they, as it oft-times happens, in way of discourse, begun to argue of the condition and quality of Wounds made by Gun-thot, and endeavoured to prove that they might be poiloned, by five reasons. Not truly through the occasion of the Gun-powder, for they all confessed that it was free from poison, whether you have regard to its essence, or to its composition our Adversary that Lead seeing it is of a rare and spongious nature, which the cost of the cost of the second of the secon that Lead feeing it is of a rare and fpongious nature, which the cafinels of melting and foftnels argues, is very fit to drink and foak in what liquors foever you pleafe. But methinks this conclusion is very weak; for in all mixtures made by Art, such as this is whereof we speak, there are two things to be confidered; that is to fay, the Matter of the things which enter into the mixture, and the Form-For the Matter, fuch bodies must be either liquid, or foft, or friable; and lastly, such as may be broken and divided into fmall particles, that fo they may eafily in all parts concur and be conjoined and united. But for their Form, there ought to be a certain affinity, confent, and fympathy. You may perceive this by Water and Oil; for each of them, though of a liquid fubflance, and fuch may eafily be mixed with divers other things, yet cannot they be mixed the one with the other, by reason of their antipathy of Forms. For thus Gold and Silver are so agreeing with Lead, that as oft as they are molten, Lead is mixed with them. But Brafs shuns Lead, as much as Gold and Silver sty Tin and white Lead. If therefore Brafs and Lead being melted cannot be mixed together, though contained under the same Genus, and common nature of Metals; how then can it be commixt with another thing diffinct in the whole kind, much more in Species and Form, to wit, poifon? Their fecond reafon is this; Iron (fay they) which is more dense, folid, and less porous, may receive forne venerate fubfiance and quality, as the Arrows of the Ancients which were dipped in poison, tellifie; therefore must Lead much more be capable thereof. I answer, that the furface of Iron may be poisoned, but not the inner part or substance by mixture therewith. But here the question is of union, but not of anointing or inunction. The third reason is thus framed; though (say they) Lead casts off and purges it self from the dross and unpure parts, yet that is no argument that it will not commix, or soak it self in some strange liquor or body; for thus Steel, being the most folid Iron, receives the temper which hardens it, by the artificial pouring upon it, or quenching it in liquors contrary thereto in their whole kind. I answer, that Steel admits into it by that quenching and tempering, none of the juices or liquors wherewith it is watered or quenched. For if that were necessary, it might be better and more easily performed, when the Metal is first easily, than when it is beaten into Plates or Bars; which answer shall serve to consiste their fourth reason; wherein they say, that Bullets may be made to poisonous by the commixture of the juices of Monks-hood, Oleander, Crow-foot, and other fuch like things which in their whole fubiliance are contrary to ours, that the Wound which is made with them cannot but be poisoned. But I on the contrary affirm, that mixture is onely of those things, which may not onely be put, but also slick thereto, and be mutually united; but how can Water, or any other liquid juice fo much as onely flick to Lead, as that which is a folid and firm body, it is fo far from being united therewith? You may give more certain judgment hereof by experience, than by reason; wherefore let melted Lead be put into the foresaid juices, or the like, then when the Lead is cold, weigh each of them severally and you shall find, that both of them retain the same weight they formerly had. Which is a most certain argument, that neither the Lead hath mixed or united it felf with the juices, nor the juices loft any part of their fubfiance. Their fifth reason is thus; A Bullet shot out of a Gun against some hard stone, grows not so hot, but that you may prefently without any harm take it up in your hand. Therefore it is false, that the poison commixt and united with the Bullet can be diffipated by the fire and flash of Cun-powder. The answer to this objection is easie. For when we say, that although the Bullet may be insected by poifon perfectly commixt with the Lead, yet all the force of the poifon would be diffipated by the firewe would have you thus to understand us, that we do not mean this of that fire which is made by the powder at the discharging of the Piece, but of that by force whereof the molten Lead is mixed and conjoined with the venerate juice, so to make one of many. For this fire exercising its force upon the venenate juices hindered by the intercourse of no Medium, and that for some space of time, and not for an inftant, it may, if not confume, yet much weaken their firength. If there be any, who will not be fatisfied by these reasons, let him consult, and read Mathiolus. There are (faith he) some in these In Prafet. 1. 6. later times wholly ignorant of things, who (if we may fay the truth) have been fo madly foolish, that they faid it was fit and requilite to put Treacle and Mithridate, and fuch like Antidotes among Gold and Silver that was melted to make Cups, that fo receiving the faculties of the Antidote they might refift poilon. But how abfurd and ridiculous their opinion is, let them judge, (for it needs no clearer reproof) who have but a little knowledge in natural things, but chiefly in Metals. These are my Reasons, these the Authorities of men excelling in Learning and Judgment, that confirm me in the ancient and former consists, that Wounds made by Gundhor do not partake of any venenate tny ancient and former opinion, that Wounds made by Gun-thot do not partake of any venenate

Of the difference of the wounded parts.

He wounded parts are either fleshy or bony; fome are near the joints, others feated upon the very joints; fome are principal, others ferve them; fome are external, others internal. Now in wounds where deadly figns appear, it is fit you give an abfolute judgment to that effect: left you make the Art to be feandalized by the ignorant. But it is an inhumane part, and much digreffing from Art, to leave the Iron in the Wound; it is fornetimes difficult to take it out, leave the weather a charitable and artificial Work. For it is much better to try a doubtful remedy than none pon in the Wound.

CHAP XVIII.

Of drawing forth Arrows.

Ou must in drawing forth Arrows shan Incisions and Dilacerations of Veins and Arte-The manner ries, Nerves and Tendons. For it is a shameful and bungling part to do more harm of drawing with your hand than the Iron hath done. Now Arrows are drawn forth two ways, forth Arrows that is, either by extraction, or impulsion. Now you must prefently at the first drefling pull and such weafforth all strange bodies: which that you may more easily and happily perform, you shall set the pour.

Patient in the same posture as he stood when he received his wound; and he must have also his Infrare, ents in the fame politice as he hood which he fectived his wound, and nemant have also his infrare, ents in a readiness, chiefly that which hath a slit pipe and toothed without, into which there is put a sharp iron stile, like the Gimblets we formerly mentioned for the taking forth of that for that it hath no screw at the end, but is larger and thicker, so to widen the Pipe, that so widened it was the hold of the Arrows head whereints the shall receive and so bring. that so widened it may fill up the hole of the Arrows head whereinto the shaft was put, and so bring

FERTILITY.

it forth with it, both out of the fleshy as also out of the bony parts, if so be that the end of the shaft be not broken, and left in the hole of the head. That also is a fit Instrument for this purpose, which opens the other end toothed on the out-side; by preffing together of the handle. You shall find the Iron or head that lies hid by these figns: there will be a certain roughness and inequality on that part, if you feel it up and down with your hand; the fiesh there will be bruised, livid, or black; and there is a heaviness and pain felt by the Patient both there and in the Wound.

A delineation of Instruments sit to draw forth the heads of Arrows and Darts which are lest in the Wounds without grafts.

A booked Instrument six for to draw forth strange bodies, as pieces of Male, and such other things as it can catch hold of, which may also be sufed in Wounds made by Gue-fret.

But if by chance either Arrows, Darts or Lances, or any winged head of any other weapon, be run through and left flicking in any part of the Body, as the Thigh, with a portion of the fhair, or fiaff flivered in pieces, or broken offs then it is fit the Chirurgeon with his cutting Mullets fhould cut off the end of the fhaff or fhair, and then with his other Mullets pluck forth the head, as you may fee by this Figure.

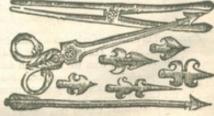

CHAP. XIX.

How Arrows broken in a Wound may be drawn forth.

But if it chance that the weapon is fo broken in the wound that it cannot be taken hold on by the formerly mentioned Mullets, then must you draw, or pluck it out with your Grane, or Crows-bill, and other formerly described Instruments. But if the shaft be broken near draw forth the the head, so that you cannot take hold thereof with your Cranes-bill, then you shall draw it forth weapon on the with your Gimblet, which we described before to draw forth Bullets; for if such a Gimblet can contrary side, be fashed in Bullets, it may far better take hold of Wood. But if the head be barbed, as usual-

ly the English Arrows are, then if it may be conveniently done, it will be very fitting to thrust them through the parts. For if they should be drawn out the same way they went in, there would be no small danger of breaking or tearing the Vessels and Nerves by these hooked barbs. Wherefore it is better to make a section on the other side whither the head tended, and so give it passage forth if it may be easily done; for so the Wound will be the more easily cleansed and consolidated. But on the contrary, if the point tend to any bone, or have many masses or thick slesh

A Delater bollowed on the infide with a Cranesbill to take hold on the barbed head.

When by the fame way it went in.

against the head thereof, as it happens fornetimes in the Thighs, Legs, and Arms, then you must not thrust the head through, but rather draw it out the same way it came in, dilating the Wound with fit Instruments, and by skill in Anatomy shunning the larger Nerves and Vessels. Therefore for this

CHARLES WHEN

purpose put a hollow Dilater into the Wound, and therewith take hold of both the barbs or wings of the head; and then take fast hold of the head with your Cranes-bill, and so draw them forth all three

CHAP. XX.

What to be done when an Arrow is left fastned or sticking in a Bone.

Ut if the Weapon be so depact and fastned in a Bone that you cannot drive it forth on the other fide, neither get it forth by any other way than that it entered in by; you must first gently move it up and down, if it slick very fast in; but have a special care that you do not A Causion. break it, and foleave fome fragment thereof in the bone; then take it forth with your Crows-bill, or fome other fit Instrument formerly described. Then press forth the blood, and fuffer it to bleed fomewhat largely, yet according to the strength of the Patient and nature of the wounded part. For thus the part shall be eased of the fulness and illness of humours, and less molested with inflammation, putrefaction, and other symptoms which are customarily feared. When the Weapon is drawn forth, and the wound once dreffed, handle it, if fimple, as you do fimple wounds; if compound, then according to the condition and manner of the complication of the effects; Certainly the Oil of Whelps, formerly described is very good to affwage pain. To conclude, you shall cure the rest of the symptoms according to the Method prescribed in our Treatise of Wounds in general, and to that we have formerly delivered concerning Wounds made by Gunthot.

CHAP. XXI.

Of poisoned Wounds.

F these Wounds at any time prove poisoned, they have it from their primitive cause, to wit, the 'The signs of impossioned Arrows or Darts of their Enemies. You may find it out both by the property of the wounds. impossored Arrows or Darts of their Enemies. You may find it out both by the property of the pain, if that it be great and pricking, as if continually flung with Bees, for such pain usually confuses in Wounds possored with hot possor, as Arrows usually are: Also you shall know it by the condition of the wounded slesh; for it will become pale and grow livid, with some signs of mortification. To conclude, there happen many and malign symptoms upon Wounds which are impossioned, being such as happen not in the common nature of usual Wounds. Therefore presently after you have pluckt Remedies in forth the strange bodies, encompass the Wound with many and deep scarifications, apply ventoses and possored wounds. with much flame, that so the poisson may be more powerfully drawn forth; to which purpose the fucking of the Wound, performed by one whose mouth hath no foreness therein, but is filled with Oil, that so the poilon which he sucks may not stick nor adhere to the part, will much conduce. Laftly, it must be drawn forth by rubefying, vesicatory, and caustick Medicins, and affailed by Ointments, Cataplasms, Emplaisters, and all forts of local Medicins.

BOOK XII. Of CONTUSIONS and GANGRENES.

The End of the Eleventh Book,

CHAP. I.

Of Contufions.

Contusion, according to Galen, is a folution of continuity in the Flesh or Bone, caused Gal. 116, de abby the stroke of some heavy and obtase thing, or a fall from on high. The symptom the employed of this Disease is by Hipperrates called Pellosis, and Melasina, that is to say, blackness and blueness, the Latins term it Singillation. There are divers forts of these Sugillations or blacknesses, according as the bloud is poured forth into the more inward or outside the body. The bloud is reversed forth into the more inward or outside the body. The bloud is reversed forth into the more inward or outside the body. The bloud is reversed forth into the more inward or outside the body.

ward part of the body. The bloud is poured forth into the body, when any (for example) falls Sugillations, from an high, or hath any heavy weight falls upon him, as it often happens to fuch as work in Mines, or are extremely wracked or tortured; and fornetimes by too loud and foreible exclamations. Befoldes alfo, by a Bullet flot through the body, bloud is poured forth into the belly, and fo often evacuated by the paffages of the Guts and Bladder. The fame may happen by the more violent and obtained by the paffages of the Guts and Bladder. custed by the pallages of the Guis and blackers. The blowd obtained by the pallages of the Guis and obtained blows of a hard Trunchton, Club, Stone, and all things which may bruife and prefs the bloud out of the Veffels either by extending or breaking them. For which causes also the exteriour parts are contusted, or bruised sometimes with a Wound, sometimes without, to that the Skin being whole, and as far as one can differn, untoucht, the bloud pours it felf forth into the empty spaces of the Muscles, and between the Skin and Muscles; which affect the Ancients have termed Ecolymosis; Hipperater calls it by a peculiar name Naufofis, for that in this affect the fwollen Veins feem as it were self. 2. 150. de to vornit, and verily do vornit or calt forth the superfluous bloud which is contained in them. From frast. these differences of Contusions are drawn the Indications of curing, as shall appear by the ensuing

CHAP. II.

Of the general Cure of great and enormous Contufuers.

Ad fentent. 62. feelig, lib. de Articulia.

A Potion to diffolve and hot Sheeps skin.

A discusting Ointment.

A Sudorińck Potion to diffolve congea-led bloud. Syrups hin-dering purre-faction and congealing of A drink for

the fame. The diffilled water of green Walnuts.

Lib.3. de Vill. de morb.

He bloud poured forth into the body, must be evacuated by visible and not visible evacua-The visible evacuation may be performed by Bloud-letting, Cupping-glasses, Horns, Scarification, Horfleeches, and fit purgative Medicins; if so be the Patient have not a strong and continual Fever. The not visible evacuation is performed by refolving and sudorifick potions, baths, and a flender diet. Concerning Bloud-letting, Galeus opinion is plain, where he bids, in a fall from an high place, and generally for bruiles upon what part foever they be, to open a Vein, though the parties affected are not of a full conflictation; for that, unlefs you draw bloud by opening a Vein, there may inflammations arise from the concrete bloud, from whence without doubt evil accidents may enfue. After you have drawn blood give him four ounces of Oxycrate to drink; for that by the tenuity of its substance hinders the coagulation of the blood in the Belly, or in stead thereof you may use this following Potion. Re Rad. Gentiane 3 iii. bulliant in Oxycrato; in colature dissolver bet diffolve and evacuate clot. eletis 5 j. fiat potis. These Medicins diffolve, and cast forth by spitting and vomit the congealed ted bloud, A bloud, if any thereof be contained in the Ventricle or Lungs, it will be expedient to wrap the Patient prefently in a Sheeps skin, being hot and newly taken from the Sheep, and sprinkled over with a little Myrrhe, Creffes and Salt, and so to put him presently in his Bed, and then cover him so that he may sweat plentifully. The next day take away the Sheeps skin, and anoint the body with the following Anodyne and refolving Unquent. R. Unguent, de althea 3 vj. elei Lumbric, chamem, anethi, an. 3 ij, terebinth, venete, 3 iv. farine frangre, rofar, rub, pulverifat, pul, myrtillorum, an. 3 j. fiat litus ut dictum est. Then give this potion which is fudorifick, and disfolves the congealed bloud. R. Ligni guajaci, 3 viij, radicis enulæ camp, confolid, majoris, iros Florent, polypod, querni, seminis coriandri, anis, an. 3 s. glycyrrhiz, 3 ij, nepete, centauree, caryophyl, cardai benedictiverbine, an. m. s. aque fontant bib. xij. Let them be all beaten and insused for the space of twelve hours, then let them boil over a gentle fire until the one half be confumed; let the Patient drink fome half a pint of this drink in the morning, and then sweat some hours upon it in his bed, and do this for feven or eight days. If any poor man light upon fuch a mifchance, who for want of means cannot be at fuch coft, it will be good, having wrapped him in theet, to bury him up to the chin in Dung mixed with some hay or firaw, and there to keep him, untill he have sweat sufficientthe fame pur- ly. I have done thus to many with very good fuccefs. You shall also give the Patient Potions made with syrups which have power to hinder the coagulation and putretaction of the blond; such as fyrup of Vinegar, or Lemmons, of the juice of Citrons and fuch others to the quantity of an ounce diffolved in Scabious, or Cardnus Water. You may also presently after the fall give this drink, which hath power to hinder the coagulation of the bloud, and strengthen the bowels. Re Rhei elect. in pul. redail 9 j. aque rubie majoris, & plantagin. an. 3 j. theriace 3 is fyrupi de rofis ficcis, 3 js. fiat potus.

Let him take it in the morning for four or days. In flead hereof you may make a potion of one dram of Sperma cest diffolved in Buglofs or forme other of the Waters formerly mentioned and half an ounce of fyrup of Maiden-hairs if the difcase yield not at all to these formerly prescribed Medicins, it will be good to give the Patient for nine days, three or four hours before meat, fome of the following Powder. Re Rhei terrefalli, rad. rub. majoris, contaurei, gentiane, arijfulo. ratunde, an. 5 Bigive 3 J. hereof with fyrup of Vinegar and Carduns Water. They say that the Water of Green Walnuts distilled by an Alembick, is good to dissolve congealed and knotted bloud. Also you may A Powder for lowing Powder. use baths made of the decoction of the roots of Orris, Elecampane, Sorrel, Fennel, Marth-mallows, Water-fern, or Osmand the Water-man, the greater Comfrey, the feeds of Fænngreck, the leaves of Sage, Marjerom; the flowers of Camomile, Melilote, and the like. For a Warm Bath hath power to rarifie the skin, to diffolve the clotted bloud, by cutting the tough, and mitigating the acrid humours, by calling them forth into the furface of the body, and relaxing the paffages thereof; fo that the rebellious qualities being overcome, there enfues an eafie evacuation of the matter by Vornit or Expectoration, if it flote in the Stomach, or be contained in the Cheft; but by Stool and Urin, if it lie in the lower parts; by fweats and transpiration, if it lie next under the Skin-Wherefore Baths are good for those who have a Peripresonants or inflammation of their Lungs, or a Pleurific, according to the mind of Hippocrates, if so be that they be used, when the Fever begins to be affwaged; for so they mitigate pain, help forwards suppuration, and hasten the spitting up of the purulent matter. But we would not have the Patient enter into the Bath, unless he have first used general remedies, as Bloud-letting and Purging; for otherwise there will be no small danger, left the humours diffused by the heat of the Bath, cause a new defluxion into the parts affected: Wherefore do not thou by any means attempt, to use this or the like remedy, having not first had the advice of a Phylician.

CHAP. III.

How we must bandle Contusions when they are joined with a Wound.

Sell. lib frall.

Very great Contusion forthwith requires Blood-letting, or purging, or both; and these either for Evacuation or Revultion. For thus Hippocrates in a contusion of the heel, gives a Vomitory Porion, the Contustion of the heel, gives a Vomitory Porion, the Contustion of the heel, gives a Vomitory Porion, the Contustion of the heel, gives a Vomitory Porion, the Contustion of the heel, gives a Vomitory Porion, the Contustion of the heel, gives a Vomitory Porion, the Contustion of the heel, gives a Vomitory Porion, the Contustion of the heel, gives a Vomitory Porion tory Potion, the fame day, or elie the next day after the heel is broken. And then if the Contution have a Wound affociating it, the defluxion must be staid at the beginning with an Ointment made of Bole-Armenick, the White of Eggs and Oil of Roses, and Myrtles, with the Powders of Red Roses, Alum, and Mattich. At the second dressing apply a digestive made of the Yolk of an Egg. Oil of Violets and Turpentine. This following Cataplasm shall be applied to the near parts to help THE OWNER OF THE PARTY OF

forwards suppuration. Re Rad. although & lilin, an. 3 iv. fol. malv. violar. Senecionis, an. M. B. coquamtur A suppurative complete, & passentur per setaceum, addendo butyri recentis & olei viol. an. 3 iii. farine volatilis quant. Cataplasm. sinstitut par setaceum, addendo butyri recentis & olei viol. an. 3 iii. farine volatilis quant. Cataplasm. sinstitut par setaceum, addendo butyri recentis & olei viol. an. 3 iii. farine volatilis quant. Cataplasm. one too much exceed, for too frequent and immoderate use of them makes wounds phlegmonous, be observed. sordid, and putrid. Wherefore the Wound, after it is come to suppuration, routh be cleanted, filled with stella and cicatrized; unless happily the contusted stellar shall be very much torn, so that the native heat forsike it for them transfer out away. But if there be any hope to another that the stellar shall be cut away. But if there be any hope to another that the stellar shall be cut away. heat forfake it, for then it must be cut away. But if there be any hope to agglutinate it, let it be fewed, How consider and other things performed according to Art; but the flitches must not be made to close together, as well when the Wound is simple, and without contribute for such wounds are easily inflamed and swell up, which would occasion either the breaking of the thred or flesh, or tearing of the skin.

CHAP. IV.

Of those Contusions which are without a Wound.

F the Skin being whole and not hurt, as far as can be differmed, the flesh which lies under it be contused, and the bloud poured forth under the Skin make an Ecchymofic, then the Patient must be governed according to Art, until the malign fymptoms, which commonly happen, be no more to be feared. Wherefore in the beginning draw bloud on the opposite fide, both for evacuation and revultion. The contusted part shall be scarrifed with equal fearifications; then shall you apply Cupping-glasses, or Horns, both for evacuation of the bloud, which causes the tumour and tension in the fear part; as alfo to ventilate and refrigerate the heat of the part, left it turn into an Abfects. Neither part; as alfo to ventilate and refrigerate the heat of the Belly. The first Topick Medicins ought to Africtives be africtives, which must be form while upon the part, that so the Vens and Arteries may be, as it were, strained and closed up, and so the deduxion hindered, as also that the part it self may be firengthened. This may be the form of such a remedy, Re Albumina overnous nuity, ole imprini & rof. After aftrian. \$\frac{1}{2}\$ j. boli armeni, \$\phi\$ san, \$\frac{3}{2}\$ j. nucum cupres, gallar, pul. alum. sqti, an. \$\frac{3}{2}\$ j. incorporentur omnia fives must addendo acesi parum, fint medicamentum. Then you shall resolve it with a somentation, cataplasm, and follow discut discuttions. Explaintage. discutting Emplaisters.

Cupping-glaf-

CHAP. V.

By what means the contused part may be freed from the fear and imminent danger of a Gangrene.

Reat Contusions are dangerous even for this cause, for that a Gangrene and mortification sell.a. 110. de fometimes follow them; which Hippoerates teacheth to happen, when as the affected part is feet.

grown very hard and liquid. Wherefore when the part grows livid and black, and the na: The cause of the part the tool back, and the na: The cause of tive colour thereof, by reason of the efflux of the concrete bloud is almost extinct; chiefly to case the a Gangrene. part of that burden, Cupping-glaffes and Homs shall be applied to the part it self being instifted with a Lancet, or else the following Instrument termed a Scarification, which hath 18 little wheels sharp the we of a Instrument is to be commended for that it performs the operation quickly and gently, for it makes 18 makes 18 meters in the space that you make one with a Lancet, or Knife. Incifions in the space that you make one with a Lancet, or Knile.

Incifions in the space that you make one with a Lancet, or Knife.

Then shall you foment the part with strong Vinegar wherein the Roots of Radish, or of Dragons, A someonation Cuckow-pint, Solomoni Scal, Antipigmentom, and the like, have been boiled; for such acrid things do to discuss and powerfully heat, resolve, and draw the concrete bloud from the inner part of the body unto the Skin, which by its setling in the part affected, prohibits the entrance of the vital spirits, the preservers of its integrity, yea also extinguisheth the native hear of the same part. Now we must not use these things but with great discretion, left so we draw not onely that bloud which is poured forth of the Vessels, but also the other which is contained in the Vessels. Moreover also we must not use them, unless when the defluxion is staid. For small Contusions (which Galon judgeth by the softmess of the controlled part) it will be sufficient to apply to discuss them, Virgins-wax dissolved and mixed with Countriols and significant to apply to discuss them, Virgins-wax dissolved and mixed with Countriols and significant to apply to discuss them, Virgins-wax dissolved and mixed with Countriols and significant to apply to discuss them, Virgins-wax dissolved and mixed with Countriols and significant to apply to discuss them, Virgins-wax dissolved and mixed with Countriols and significant to apply to discuss them, Virgins-wax dissolved and mixed with Countriols and significant to apply to discuss them, Virgins-wax dissolved and mixed with Countriols and significant to apply to discuss them, Virgins-wax dissolved and mixed with Countriols and significant to apply to discuss them, Virgins-wax dissolved and mixed with Countriols and significant to apply to discuss them.

tufed part) it will be fufficient to apply to discuss turns, min-feeds, Cloves, the Root of the black Briony, (which hath a wonderful faculty to discuss an one nefs and fugillation:) for the fame purpose, you may also apply Wormwood bruised, and so warned in a dish and sprinkled over with a little white Wine.

Also try Wormwood with Oil of Camonil, Bran, the Powder of Cloves and Nor.

CHAP. VI.

Of that strange kind of Symptom which happens upon Contusions of the Ribs.

Mip. felt.z.lik. de art. fent.58.

He flesh contused sometimes by great violence, becomes mucous and swoln, or puffed up like Veal which the Butchers blow up, the Skin remaining whole. This is seen and hap-pens chiefly in that slesh which is about the ribs; for this being bruised either by a blow or fall, or renitency, or any other fuch like cause; if you press it with your hand, a certain windiness goeth out thereof with a small whizzing, which may be heard, and the print of your singers will remain, as in adamser. Unless you quickly make fit provision against this symptom, there is gathered in that space, which the flesh departing from the bones leaves empty, a certain purulent fanies, which divers times fouls and corrupts the ribs. It will be cured, if the mucous tumor be prefently prefed, and ftraitly bound with ligatures, yet fo, that you hinder not the breathing, when as the affect happens upon the Ribs and parts of the Cheft. Then apply to the part a Plaifier of Oxycroceum, or Discloylon Ireatum with the Emplaifier de meliloto; also discussing fomentations shall be used. The cause of such a tumour is a certain mucous flegm, seeing that Nature is so weak that it cannot well digest the nourishment, and affimilate it to the part, but leaves fomething, as it were half concocred. No otherwise than the conjunctive coat of the eye is fometime fo lifted up, and fwoln by a ftroak, that it ftarts, as it were, out of the orb of the eye, leaving fuch filth, or matter, as we fee those which are blear-eyed to be troubled withall; because the force and natural strength of the eyes is become more weak, either by the fault of the proper differmperature, or the abundance of moifture which flows thither, as it happens in those tumours which are against Nature. For flatulencies are easily raised from a waterish and phlegmatick humour wrought upon by weak heat, which mixed with the rest of the humour, the tumour becomes higher.

Remedies for a mucous and flatulent humour of the The cause.

CHAP. VII.

A Discourse of Muthia, or Microny,

quent and utual Medicin in Contufions. The reason Medicins.

The opinion of the Ara-

Another opinion of Mummy.

Another.

Eradventure it may feem flrange what may be the cause why in this Treatise of curing Contufions or Bruifes, I have made no mention of giving Mummy either in Bole or Potion to fuch as have fallen from high places, or have been otherwise bruised; especially seeing it is so common and ufual, yea the very first and last Medicin of almost all our practitioners at this day in such a cafe. But feeing I understood, and had learnst from learned Physicians, that in using remedies, the Inther makes no dication must always be taken from that which is contrary to the Difease, How could I? or how can mention there any other give Mummy in this kind of Difeafe, feeing we cannot as yet know what Mummy is, or Medicins. what is the nature and effence thereof? So that it cannot certainly be judged, whether it have a certainly be judged. tain property contrary to the nature and effects of Contusions. This, how it may have, I have thought good to relate formewhat at large; neither do the Phylicians who preferibe Mummy, nor the Authors that have written of it, nor the Apothecaries that fell it, know any certainty thereof. For if you read the more ancient Serapio and Aviern, or the Modern Matthiolas and Thever, you shall find quite diffebizes concern- rent opinions. Ask the Merchants who bring it to us, ask the Apothecaries who buy it of them to fell it to us, and you shall hear them speak diversly hereof, that in such variety of opinions, there is nothing certain and manifest. Serapio and Avices have judged Mummy to be nothing else but Piffafphalthum; now Piffaffhalthum is a certain froth or foam rifing from the Sea, or Sea-waters; this fame foam as long as it swims upon the Water is soft, and in some fort liquid; but being driven upon the shore by force of tempest and working of the Sea, and sticking in the cavities of the Rocks, it concretes into somewhat a harder substance than dried Pitch, as Disserted saith. Bellowing faith, that Mummy is onely known to Egypt and Greece. Other write that it is mans flesh, taken from the Carcales of fuch as are dead and covered over in the Sands in the Defarts of Arabia; in which Countrey they fay the Sands are fometimes carried and raifed up with fuch force and violence of the Winds, that they overthrow and furfocate fuch paffengers as they meet withall; the fieth of thefe, dried by the Sand and Wind, they affirm to be Mummy. Matthiolar following the more usual and common opinion, writes that Murrary is nothing elfe than a liquor flowing from the Aromatick Embalments of dead Bodies, which becomes dry and hard. For underfranding whereof you must know from all manner of antiquity, that the Ægyptians have been most studious in burying and embalming their dead; not for that end, that they should become Medicins for such as live, for they did not fo much as suspect or imagine so horrid a wickedness; but either for that they held an opinion of the general Refurrection, or that in these Monuments they might have something whereby they might keep their dead friends in perpetual remembrance. There not much differiting from his own opinion, writes that the true Mummy is taken from the Monuments and flony Tombs of the anciently dead in Egypt, the chinks of which Tombs were closed and cemented with such diligence, the enclosed bodies embalmed with pretious Spices, with such Art, for eternity; that the linnen votures which were wrapt about them presently after their death, may be seen whole even to this day;
but the bodies themselves, are so fresh, that you would judge them scarce to have been three days
buried. And yet in those Sepulchres and Vaults from whence these Bodies are taken, there have
been some Corus of two those and Vaults from whence these Bodies are taken, there have been fome Corps of two thousand years old. The same, or their broken members are brought to Venice from Syria and Egypt, and thence dispersed over all Christendom. But according to the different condition of men, the matter of their embalments were divers; for the bodies of the Nobility or Gentry were embalmed with Myrrh, Aloes, Saffron, and other pretious Spices, and Drugs; but the bodies of the common fort, whose poverty and want of means could not undergo such cost, were embalmed with Affibaltum or Piffafibaltum.

CHEST OF PERSON

Now Mathielus faith, that all the Mummy which is brought into these parts, is of this last kind and What our condition. For the Noble-men and chief of the Province, to religiously addicted to the Monuments Munnay utualof their Anceltors, would never fuffer the bodies of their friends and kindred to be transported hither for filthy gain, and fuch detefted use, as we shall shew more at large at the end of this Work. Which thing fornetimes moved certain of our French Apothecaries, men wondrous and acious and covetous, to feal by night the bodies of fuch as were hanged, and embalming, them with Salt and Drugs, they dried them in an Oven, fo to fell them thus adulterated in flead of true Mannny. Wherefore we are thus compelled both foolifhly and cruelly to devour the mangled and putrid particles of the carkaffes of the basest people of Ægypt, or of such as are hanged, as though there were no other way to help or recover one bruised with a fall from a high place, than to bury Man by an horrid insertion in their, that is, in Mans Guts. Now if this Drug were any way powerful for that they require, they might perhaps have fome pretence for this their more than barbarous inhumanity. But the cafe flands thus, Mummy is no that this wicked kind of Drug, doth nothing help the difeased, in that case, wherefore and wherein it is administred, as I have tried a hundred times; and as Theor witnesses, he tried in himself, when as he took some thereof by the advice of a certain Jewish Physician in Egypt, from whence it is brought; but it also infers many troublesom symptoms, as the pain of the heart, or stomach, womiting

way good for

and flink of the mouth.

I, perfuaded by these reasons, do not onely my self not prescribe any hereof to my Patients, but Bur hureful, also in consultations, endeavour what I may, that it be not prescribed by others. It is far better, ac- and how. cording to Galen's opinion, in Method. med. to drink fome Oxycrate, which by its frigidity refitains. The effects of the flowing bloud, and by its tenuity of fubftance diffolves and difcuffes the congealed clots thereof. Oxycrate Many reatons of learned Phyticians (from whom I have learned this Hiftory of Mummy) drawn Continues. from Philosophy, whereby they make it apparent, that there can be no use of this or that Mursiny in contusions, or against flowing or congcaled bloud, I willingly omit; for that I think it not much beneficial to Chirurgeons to infert them here. Wherefore I judge it better to begin to treat of Combuftions or Burns.

CHAP. VIII.

Of Combustions and their Differences.

LI Combustions whether occasioned by Gun-powder, or by scalding Oil, Water, some Metal, The reason or what things soeverelle, differ onely in magnitude. These first cause pain in the part, and symptom and imprint in it an unnatural heat. Which savouring of the fire, leaves that impression, of Combustion, of Combustion, or the same of the sa which the Greeks call Empyreuma. There are more or lefs figns of this impreffion, according to the efficacy of the thing burning, the condition of the part burned, and flay upon the fame. If the combustion be superficiary, the skin rifes into pushules and blifters, unless it be speedily prevented. If it be low or deep in, it is covered with an Eschar or Crust, the burnt slesh by the force of the fire turning into that crufty hardness. The burning force of the fire, upon whatfoever part it falls, leaves a The crufe of hot diftemper therein, condenfates, contracts, and thickens the skin, whence pain proceeds; from pain there comes an attraction of humours from the adjacent and remote parts. These humours Euros. presently turn into waterish or serous moisture, whilest they seek to pass forth, and are hindred thereof by the skin condenfated by the action of the fire, they lift it up higher, and raife the blifters which we fee. Hence divers Indications are drawn, whence proceeds the variety of Medicins for burns. For some take away the Empyreuma, that is, the heat of the fire, (as we term it) and affwage the pain; other hinder the riling of blifters, otherfome are fit to cure the ulcer, first to procure the falling away of the Eschar, then to cleanse, generate slesh, and cicatrize it. Remedies sit to asswage pain, and take away the fiery heat, are of two kinds; for fome do it by a cooling faculty, by which they extake away the
tinguish the preternatural heat, and repress or keep back the bloud and humours, which flow into heat and atthe parts by reason of heat and pain. Others endued with contrary faculties, are hot and attractive; swage the pain as which by relaxing the skin, and opening the pores, refolve and diffipate the ferous humours, which yield both begining and matter to the pullules, and fo by accident affwage the pain and heat. Refrigerating things are cold Water, the Water of Plantain, Nightihade, Henbane, Hemlocks the juices of cooling Herbe as Pardage Leave Plantain, Nightihade, Henbane, Hemlocks the juices of cooling Herbe as Pardage Leave Plantain, Nightihade, Henbane, Hemlocks the juices of cooling Herbe as Pardage Leave Plantain, Nightihade, Henbane, Hemlocks the juices of cooling Herbe as Pardage Leave Plantain, Nightihade, Hembane, Hemlocks the juices of cooling Herbe as Pardage Leave Plantain, Nightihade, Hembane, Hemlocks the juices of cooling Herbe as Pardage Leave Plantain, Nightihade, Hembane, Hemlocks the juices of cooling Herbe as Pardage Plantain, Nightihade, Hembane, Hemlocks the juices of cooling Herbe as Pardage Plantain, Nightihade, Hembane, Hemlocks the juices of cooling Herbe as Pardage Plantain, Nightihade, Hembane, Hemlocks the juices of cooling Herbe as Pardage Plantain, Nightihade, Hembane, Hemlocks the juices of cooling Herbe as Pardage Plantain, Nightihade, Hembane, Hemlocks the juices of cooling Herbe as Pardage Plantain, Nightihade, Hembane, Hemlocks the juices of cooling Herbe as Pardage Plantain, Nightihade, Hembane, Hemlocks the juices of cooling Herbe as Pardage Plantain, Nightihade, Hembane, Hemlocks the juices of cooling Herbe as Pardage Plantain, Nightihade, Hembane, Hemlocks the juices of cooling Herbe as Pardage Plantain, Nightihade, Hembane, Hemlocks the juices of cooling Herbe Plantain, Nightihade, Hembane, Hemlocks the juices of cooling Herbe Plantain, Nightihade, Hembane, Nightihade, Hembane, Hemlocks the juices of cooling Herbe Plantain, Nightihade, Hembane, Nightihade, Nigh cooling Herbs, as Purllane, Lettuce, Plantain, Houlleck, Poppy, Mandrake, and the like. Of these forme may be compounded, as some of the fore-named juices beaten with the white of an Egg, Clay heaten and dissolved in strong Vincous Park. forme may be compounded, as forme of the fore-named juices beaten with the white of an Egg, Clay beaten and disfolved in strong Vinegar, Roch-Alum disfolved in Water, with the Whites of Eggs beaten therein, Writing-Ink mixed with Vinegar, and a little Camphire, **Unguentum natrition**, and also Populain newly made. These and the like shall be now and then renewed, chiefly at the first, until the heat and pain be gone. But these fame remedies must be applied warm, for if they should be laid, or put to cold, they would cause pain, and consequently defluxion; besides also, their strength could not pass, or enter into the part, or be brought into action; but so applied they assume pain, line to industry and the rising of blisters.

the blifters rifing upon

CHAP. IX.

Of bot and attractive Medicins to be applied to Burns.

Mongst the hot and attractive things which by rarifying, drawing out, and diffolving, af- How fire may Iwage the pain and heat of combultions, the fire challenges the first place, especially when pain of burgtwage the pain and heat of combonators, the burning is but finall. For the very common people know and find by daily experience, ingthe heat of the lightly burnt part vanishes away, and the pain affwaged, if they hold the part which was burnt fome pretty while to the heat of a lighted Candle or burning Coals, for the firmi-

Medicins' for un Efchar.

the Hospital of

Why deep ful than fuperficiary.

litude caufeth attraction. Thus the external fire, whileft it draws forth the fire which is internal and inust into the part, is a remedy against the disease it caused and bred. It is also an easily made and approved remedy, if they prefently after the Burn, apply to the grieved part raw. Onions beaten with forme Salt. Now you must note that this Medicin takes no place, if it be once gone into an ulcer, for it would increase the pain and inflammation; but if it be applied when the skin is yet whole and not exceriated, it doth no fuch thing, but hinders the riling of puffules and bliffers. Hipportster for this cause also uses this kind of remedy in procuring the fall of the Eschar. If any endeavour to gain-fay the use of this remedy by that principle in Phylick, which says, that Contraries are cured by Contraries, and therefore affirm that Onions, according to the authority of Gales, being hot in the fourth degree, are not good for combustions; let him know that. Onions are indeed potentially hot, and actually moift, therefore they rarifie by their hot quality, and foften the skin by their actual moifture, whereby it comes to pass that they attract, draw forth, and distipate the imprinted heat, and so hinder the breaking forth of Pusiules. To conclude, the fire, as we formerly noted, is a remedy against the fire. But neither are difeases always healed by their contraries (faith Galen) but fornetimes by their like; although all healing proceed from the contrary; this word contrary, being more largely and flrictly taken: for fo also a Phlegmon is often cured by resolving Medicins, which healeth it by diffipating the matter thereof. Therefore Onions are very probable for the burnt parts, which are not yet exulcerated or excoriated. But there are also many other Medicins good to hinder the rifing of bliffers, fuch as new Horfe-dung fried in Oil of Wal-nuts or Rofes, and ap-In like manner the leaves of Elder or Danc-wort boiled in Oil of Nuts, and beaplied to the parts. ten with a little Salt. Also quenched Lime powdered and mixed with Unguentum Rofatum. Or else the leaves of Cuckow-pint and Sage, beaten together with a little Salt. Alfo Carpenters Glue diffolved in Water and anointed upon the part with a feather, is good for the same purpose. Also thick Vernith which Polishers or Sword-Cutlers use. But if the pain be more vehement, these Medicins must be renewed three or four times in a day and a night, fo to mitigate the bitterness of this pain. But if if fo be we cannot by theferemedies hinder the rifing of blifters, then we must prefently our them as foon as they rife, for that the humour contained in them, not having paffage forth, acquires fuch acrimony that it eats the fleth which lieth under it, and to caufeth hollow ulcers: So by the multitude of causes and increase of matter the inflammation groweth greater, not onely for nine days (as the common people prattle) but for far longer time; also somewhiles for less time, if the body be neither replete with ill humours, nor plethorick, and you have speedily refisted the pain and heat by fit remedies. When the combattion thall be to great as to cause an Efeber, the falling away must be procured by the use of emollient and humective Medicine, as of Greases, Oils, Butter with a little Basilicon, or the following Ointment. ix Mucagin. pfillis & cyden. an. 3 iv. gummi trag. 3 is extrabating cum agua parietaria, olei liliurum 3 is. [5]. cere nove of first unguentum molle. For ulcers and excornations were first array for the companion of the companio you shall apply fit remedies, which are those that are without acrimony, such as Unguentum alb amphoratum, deficeativum rubrum, unquentum rofatum, made without Vinegar, or nutritum, composed A description after this manner. R Lishargyei auri 3 iv. ol. rosat. 3 iii. ol. de papaver. 3 ij. \(\beta\). ung. populeon. 3 iv. camplore 3 j. star unguentum in mortario plumbes secundum artem. Or Oil of Eggs tempered in a Leadert Mortar. Also unquenched Lime many times washed and mixed with unguentum rosatum, or fresh Butter without Salt, and fome yolks of Eggs hard roafied. Misceantur omnia simul, siat linimentum ut decet. Ot else, Re cort. sambue, viridu, & olei rosat. an. lib. j. bulliant somul lento igne, postea colentur, & adde olei ovorum z iv. pulæcrus. & tuibiæ prapar. an. 3 j. cere albe quantum sufficit. siat unquentum mole secundum artem. But the quantity of drying Medicins may always be increased or diminished, according as the condition of the Ulcer shall seem to re-The following remedies are fit to affwage pain, as the mucilages of Lin-feeds, of the feeds of Pfilliams, or Flea-wort, and Quinces extracted in Rose-water, or fair water, with the addition of a little Camphire's and left that it dry too speedily, add thereto some Oil of Roses. Also sive or six yolks of Eggs mixed with the mucilages of Lin-feed, the feed of Pfillium, and Quinces often renewed, are very powerful to affwage pain. The Women which attend upon the people in the Hofpital in A remedy for Paris, do happily use this Medicin against Burns. R. Landsonfeill libram unam; let it be disfolved in Burns combane, or fome other of that kind, then let it be incorporated with eight yolks of new laid Egs, and fo make an Ointment. If the finart be great, as usually it is in these kinds of Wounds, the Ulcer or Sores shall be covered over with a piece of Tiffany, lest you hurt them by wiping them with some what a coarse cloth, and so also the matter may easily come forth, and the Medicins easily enter in Alfo you must have a care when the eye-lids, lips, sides of the singers, neck, the arm-pits, hams, and bending of the elbow are burnt, that you fuffer not the parts to touch one the other, without the interpolition of some thing; otherwise in continuance of time they would grow and stick together Therefore you shall provide for this, by fit placing the parts, and putting fort linnen rags between them. But you must note that deep combustions, and such as cause a thicker Estar, are less painful than such as are but onely superficiary. The truth hereof you may perceive by the example of such as have their limbs cut of as have their limbs cut off, and feared and cauterized with an hot Iron: for prefently after the cauterizing is performed they feel little pain. For this great combustion takes away the fenfe; the vehemency of the fearers of their fenfe; as hemency of the fenfory or thing affecting the fenfe, depriving the fenfitive parts of their fenfe: as we have formerly mark the fenfer of the fenfer again. we have formerly noted when we treated of Wounds and Pains of the Nerves. The falling away of such Efebarr shall be procured by somewhat a deep scarification which may pierce even to the enick, that so the human which have been somewhat a deep scarification with an and modified the human which it is the same and modified the human which it is the same and modified the human which is the same and modified the human which it is the same and modified the same a quick, that fo the humours which lie under it may enjoy free perfpiration, and emollient Medicins may the freelier enter in, so to foak, moissen and fosten the Eschor, that it may at length fall away-

The rest of the Cure shall be performed by detergent and farcotick Medicins, adding to the former Ointments Metalline Powders, when the prefent necessity shall feem so to require. But we cannot DESCRIPTION OF THE PARTY.

justly say in what proportion and quantity each of these may be mixed, by reason of that variety which is in the temper and consistence of bodies, and the stubbornness and gentleness of Diseases. After a Burn the Scar which remaineth is commonly rough, unequal, and ill-favoured: therefore we will tell you in our Treatife of the Plague, how it must be smoothed and made even.

I must not here omit to tell you, that Gun-powder set on fire doth often so penetrate into the flesh, Marks or sport not ulcerating or taking off the skin, and so infinuate and throughly saften it self into the slesh by its made in the tenuity, that it cannot be taken or drawn out thence by any remedies, no not by Phenigmes, nor Veficatories, nor Scarification, nor Ventoses, nor Horns, so that the Prints thereof always remain, no otherwise than the marks which the Barbarians burn in their Slaves, which cannot afterwards be taken away. ken away or destroyed by any Art.

CHAP. X.

Of a Gangrene and Mortification.

Ertainly the malign fymptoms which happen upon Wounds, and the folutions of Continuity, are many, caused either by the ignorance or negligence of the Chirargeon; or by the Patient, or fuch as are about him; or by the malignity and violence of the Difeafe: but there can happen no greater than a Gangrene, as that which may cause mortification and death of the Gangrene, first giving you the definition, then shewing you the causes, signs, prognosticks, and lastly, the manner of the Cure. Now a Gangrene is a certain disposition, and way to the mortification of the Gal. 2. ad Gleapart, which it feizeth upon, dying by little and little. For when there is a perfect mortification, it cause. is called by the Greeks Sphacelos, by the Latins Syderatio, our Countrey-men term it the Fire of S. Anthony, or S. Marcellus.

CHAP. XI.

Of the general and particular causes of a Gangrene.

He most general cause of a Gangrene is, when by the dissolution of the harmony and joint The general temper of the four first qualities, the part is made unapt to receive the Faculties, the Natus cause of a deprived by any chance of these, as of the light, languislies, and presently dies. Now the particular The particular causes are many: and these either primitive or antecedent. The primitive or external are combutants. tions caused by things either actually or potentially burning; actually, as by Fire, scalding Oil, or Water, Gun-powder fired, and the like. But potentially by acrid Medicins, as Sublimate, Vitriol, potential Cauteries, and other things of the same nature: for all these cause a great inflammation in the part. But the ambient air may cause great refrigerations, and also a Gangrene, which caused Hippserates lib. de Aer. to call great refrigerations of the Brain Sphaeelism. Therefore the unadvised Cold and narcotick things, a fracture, luxation, and great contusion, too Gangrene. Gangrene, the biting of Beasts, especially of such as are venemous, a puncture of the Nerves and Tendons, the wounds of the nervous parts and joints, especially in bodies which are plethorick and replete with ill humours, great wounds whereby the Vessels which carry life are much cut, whence an Associate, and lastly, many other causes, which persurb that harmony of the four prime qualities. an Aneserifina, and laftly, many other causes, which perturb that harmony of the four prime qualities which we formerly mentioned, and so infer a Gangrene.

CHAP. XII.

Of the Antecedent Caufes of a Gangrene.

Ow the Antecedent or Internal and Corporeal causes of a Gangrene, are plentiful and How defluxiabundant defluxions of humours, hot, or cold, falling into any part. For feeing the faculty one cause a pass that the native heat of the part is surple and unable to sufficient and govern such plenty of humours, it comes to Gaugrene.

The pass that the native heat of the part is sufficient and extinct for want of transpiration. For the Arteries are hereby so that or penturing a Straightful pass are hereby so that or penturing a Straightful pass are hereby so that or penturing a Straightful pass are hereby so that or penturing a Straightful pass are hereby so that or penturing a Straightful pass are hereby so that or penturing a Straightful pass are hereby so that or penturing a Straightful pass are hereby so that or penturing a Straightful pass are hereby so that or penturing a Straightful pass are hereby so that the part is sufficient pass and pass are passed as a constant pass and pass are passed as a constant pass and passed as a constant pass are passed as a constant passed as pais that the native heat of the part is suffocated and extinct for want of transpiration. For the Pateries are hereby so shut or pent up in a Strait, that they cannot perform their motions of contraction and dilatation, by which their native heat is preserved and tempered. But then the Gangrene is An uncurable chiefly uncurable when the influx of humours first takes hold of the Bones, and inflammation hath Gangrene. Its beginning from them. For in the opinion of Galen, all these kinds of affects which may befall Lib. de tamer, the flesh, are also incident to the bones. Neither onely a Phlegmon or Inflammation, but also a rot- protest material tempers and corruption doth oft-times first invade and begin at the bones; for thus you may see materials and corruption doth oft-times first invade and begin at the bones; for thus you may see materials and corruption doth oft-times first invade and begin at the bones; for thus you may see materials and corruption doth oft-times first invade and begin at the bones; for thus you may see materials and corruption doth oft-times first invade and begin at the bones; for thus you may see materials. by who are troubled with the Leprose and French disease, to have their skin and slesh whole and fair to look on, whose bones notwithstanding are corrupt and rotten, and oft-times are much decayed in their proper substance. This mischief is caused by a venemous matter, whose occult quality we can scarce express by any other name than poison inwardly generated. Oft-times also there is a certain acrid and flinking filth generated in fleth with a malign and old ulcer, with which if the bones chance to be mosifined they become foul, and at length mortified: of which this faying of the fears hollow. Whither also belongs this saying of the same party; An Eryspelas is ill in the lay. A Gangrene ing bare of a bone. But this flowing venenate and gangrenous matter is somewhiles hot, as in petition Carboneles, which in the space of four and twenty hours by causing an Escher, bring the part to mortification. mortification: otherwhiles cold, as we see it divers times happens in parts which are possess with a

Gangrene, no pain, tumor, blackness, nor any other precedent fign of a Gangrene going before. For John de Vigo faith, that happened to a certain Gentlewoman of Genea under his cure.

A notable Hiflory.

I remember the fame happened to a certain man in Parit, who fupping merrily, and without any fense of pain, went to bed, and suddenly in the night time a Gangrene seized on both his legs, caused a mortification without tumour, without Inflammation; onely his legs were in fome places fored over with livid, black, and green fpots, the reft of the fubliance retaining his native colour: yet the fense of these parts was quite dead, they selt cold to the touch; and if you did thrust your Lancet into the skin no bloud came forth. A Council of Physicians being called, they thought good to cut the skin and flesh lying under it, with many deep fearifications; which when I had done, there came forth a little black, thick, and as it were, congealed bloud; wherefore this remedy, as also divers other, proved to no purpose; for in conclusion, a blackith colour coming into his face and the rest of his body, he died frantick. I leave it to the Readers judgment, whether fo speedy and suddenly cruel a mischief could proceed from any other than a venenate matter; yet the hurt of this venenate matter is not peculiar, or by its self. For oft-times the force of cold, whether of the encompassing air, or the too immoderate use of Narcotick Medicins is so great, that in few hours it takes away life from some of the members, and divers times from the whole body, as we may learn by their example who travel in great Snows, and over Mountains congealed, and hoared with Frost and Ice. Hence also is the extinction of the native heat, and the spirits residing in the part, and the shutting forth of that which is sent by Nature to aid or defend it. For when as the part is bound with rigid cold, and as it were frozen, they cannot get nor enter therein. Neither if they should enter into the part. can they flay long there, because they can there find no fit habitation, the whole frame and government of Nature being spoiled, and the harmony of the four prime qualities defiroyed by the offensive dominion of predominant Cold their Enemy; whereby it cometh to pals, that flying back from whence they first came, they leave the part destitute and deprived of the benefit of nourishment, life,

fenfe, and motion. A certain Briton an Hoftler in Paris, having drunk foundly after Supper, east himfelf upon a Bed; the cold air coming in at a Window left open, so took hold upon one of his legs, that when he waked forth of his fleep, he could neither fland nor go. Wherefore thinking onely that his leg was numb, they made him fland to the fire; but putting it very nigh, he burnt the fole of his foot without any fense of pain, some singers thickness; for a mortification had already possessed more than half his leg. Wherefore after he was carried to the Hospital, the Chirurgeon who belonged thereto, endeavoured by cutting away of the mortified leg to deliver the reft of the body from imminent death; but it proved in vain, for the mortification taking hold upon the upper parts, he died within three days, with troubleforn belching and hicketing, raving, cold fweat, and often fwounding. Verily all that fame Winter the Cold was fo vehement that many in the Holpital of Paris, loft the wings or fides of their notivils, feized upon by a mortification without any putrefaction. But you must note that the Gangrene which is caused by cold, doth first and principally seize upon the parts most difrant from the heart, the fountain of heat, to wit, the feet and legs; as also such as are cold by nature, as grifly parts, fuch as the Nofe and Ears.

Simple cold may cause a Gangrene,
