He figns of a Gangrene, which inflammation or a Phlegmon hath caused, are pain and pul-fation without manifest cause, the sudden changing of the fiery and red colour into a livid or black, as Hippocrates thews where he fpeaks of the Gangrene of a broken heel. I would fractur. What a pulfihave you here to underfiand the pullifick pain, not onely to be that which is caused by the quicker motion of the Arteries, but that heavy and pricking which the contention of the natural hear doth produce by railing a thick cloud of vapours from these humours which the Gangrene sets upon. The figns of a Gangrene caused by cold, are, if suddenly a sharp pricking and burning pain assailers the part; for penetrabile frigus adurit, (i.) piercing cold doth burn: if a shining reducts, as if you had handled Snow, presently turn into a livid colour; if in stead of the accidental heat which was in the part, prefently cold and numbness shall possess it, as if it were shook with a Quartan Fever. Such cold, if it shall proceed so far as to extinguish the native heat, bringeth a mortification upon the Gangrene; also oft-times Convultions and violent thaking of the whole body, are wondrous troubleforne to the Brain and the Fountains of life. But you shall know Gangrenes caused by too strait bandages, by fracture, luxation, and contusion, by the hardness which the attraction and flowing down of the humours hath caufed, little pimples or blifters forcading or rifing upon the skin by reafon of the great heat, as in a combustion; by the weight of the part occasioned through the detect of the spirits not now sustaining the burden of the member; and lastly from this, the presting of your finger upon the part, it will leave the print thereof as in an adems; and also from this, that the skin

someth from the flesh without any manifest cause. Now you shall know Gangrenes ariting from a bite, puncture, ancurifina, or wound in plethorick and ill bodies, and in a part indued with most exquisite sense, almost by the same signs as that which was caused by items. was caused by inflammation. For by these and the like causes, there is a far greater defluxion and attraction of the humours than is fit, when the perfpiration being intercepted, and the paffages flopts the native heat is oppreffed and fuffocated. But this I would admonish the young Chirurgeon, that when by the fore-mentioned figns he shall find the Gangrene present, that he do not defer the amputation, for that he finds fome fense or small motion reliding in the part. For oft-times the affected parts are in this case moved not by the motion of the whole Muscle, but onely by means,

proceeding from ftrait bandages, or

Signs of a Gangrene

BESTS VILLETTE

that the head of the Mufele is not yet taken with the Gangrene: which moving it felf by its own firength, also moves its proper and continued tendon and tail though dead already; wherefore it is ill to make any delay in fuch cafes.

CHAP. XIV.

Of the Prognosticks in Gangrenes.

Aving given you the figns and causes to know a Gangrene, it is fit we also give you the Prognotlicks. The fierceness and the malignity thereof is to great, that unless it be most speedily withstood, the part it self will die, and also take hold of the neighbouring parts by the contagion of its mortification : which hath been the cause that a Gangrene by many hath been Why a Ganthe contagion of its mortification: which nath been the cause that a Gangrene by many hath been Why a Gandefroys all the neighbouring parts, until it hath ipread over the whole body. For as Hippocrates writes, Lib. de Vulner, capitis; Mortified viventis nulls eli proportio, (i.) there is no proportion between the dead and living. Wherefore it is fit prefently to separate the dead from the living; for unless that patient of the dead. In such as are at the point of death, a cold sweat flows over all their bodies: they are troubled with ravings, and watchings, belchings and bickertings model them, and often swoundings invade them by reason of the vapours abundantly and kettings moleft them, and often fwoundings invade them by reason of the vapours abundantly and continually raifed from the corruption of the humours and flesh, and so carried to the bowels and principal parts by the Veins, Nerves, and Arteries. Wherefore when you have foretold these things to the friends of the Patient, then make hafte to fall to your work.

CHAP. XV.

Of the general Gure of a Gangrene.

He Indications of curing Gangrenes are to be drawn from their differences, for the cure Various Indimust be diversly instituted according to the effence and magnitude. For some Gangrenes cations of cupossess the whole member, others onely some portion thereofy some are deep, other-ries a Ganpossess the whole member, others onely tome portion thereof; some are deep, other-ring a forme superficial onely. Also you must have regard to the temper of the body. For soft and degrees, licate bodies, as of Children, Women, Eunuchs, and idle persons require much milder Medicins than those who by Nature and Custom, or Vocation of life are more firong and hardy, such as Hustinen, Labourers, Mariners, Huntimen, Porters, and men of the like nature who live sparingly bandmen, Labourers, Mariners, Huntfmen, Porters, and men of the line nature who live ipaningly and hardly. Neither must you have respect to the body in general, but also to the parts affected; What parts for the fieldy and musculous parts are different from the folid, as the Nerves and Joints, or more soonest taken hold by a Gast-hold folid, as the Vertebre. Now the hot and moift parts, as the Privities, Mouth, Womb, and Fun-hold by dament, are cafilier and fooner taken hold of by putrefaction, wherefore we must use more speedy means to help them. Wherefore if the Gangrene be chiefly occasioned from an internal cause, he must have a diet prescribed for the decent and fitting use of the fix things not Natural. If the body be plethorick, or full of ill humours, you must purge, or let bloud by the advice of a Phylician. Treacle dissolved in Sorrel or Carduna Water, with a bole of Mithridate, the Conferve of Roses and Bankels and with Ociates made for the present purpose according to Age, this following Archive. Treacle diffolved in Sorrel or Cardinar Water, with a bole of Mithridate, the Conferve of Rofes and Buglofs, and with Opiates made for the prefent purpose according to Art; this following Apoacti self-like is a confidence of the heart. Re Aque Rosar. Φ nomephar. an. 3 iv. A cordial Equation 3.1. mathrid. Φ therisce, an. 3 ii. β. trechiscorum de Caphura 3.1. short cardial in poline redallissim, of the heart with a scarlet cloth or sponge. These are usually such as happen in the Cure of every Gangrene.

CHAP. XVI.

Of the particular Cure of a Gangrene.

He cure of a Gangrene caused by the too plentiful and violent defluxion of humours fuffocating the narive heat, by reafon of great Phlegmons is performed by evacuating and drying up the hamours, which putrefic by delay and collection in the part. For this purThe cure of a pole Scarifications and Incifions, great, indifferent, finall, deep, and fuperficiary, according to the Gangrene condition of the Gangrene, are much commended, that fo the burdened part may enjoy the bene-made by institute of perspiration; and the contained humours of difflation, or evacuation; of their footy excree flammations and pour to most five the made when the affect is great, deep in, and pour to most five the same flammation. ments. Let Incisions be made when the affect is great, deep in, and near to mortification. Bur Scarifications may be used when the part first begins to putrehe, for the greatness of the remedy must answer in proportion to that of the disease. Wherefore if it penetrate to the bones, it will be fit answer in proportion to that of the dilette. Wherefore it it penetrate to the bones, it will be fit to cut the skin and flesh with many and deep incitions, with an Incition-knife made for that purpose; yet take heed of cutting the larger Nerves and Vesses, unless they be wholly putrefied, for fittey be not yet putrefied, you shall make your Incitions in the spaces between them; if the Cangrene be less, we must rest fatistied with onely scarifying it. When the Scarifications and Incitions are reads to provide the state of the conjunction of the state of the conjunctions and Incitions are reads to provide the state of the conjunction and Incitions are reads to the conjunction and Incitions are the state of the conjunction and Incitions are the state of the conjunction and Incitions are the state of the conjunction and Incitions and Incitions are the state of the conjunction and Incitions and Incitions are the state of the conjunction are the state of the conjunction are the state of the conjunction and Incitions are the state of the conjunction Cangrene be lefs, we must rest satisfied with onely tearnying it. When the Scambeations and Incidens are made, we must fusfer much bloud to flow forth, that so the conjunct matter may be evacuated. Then must we apply and put upon it such Medicins as may by heating, drying, resolving, cleaning and consider and correct the pattersaction, and by previous to the botters. cleanling and opening, amend and correct the patrefaction, and by piercing to the bottom may have power to overcome the virulency already impact in the part. For this purpose, Lotions made

The descriptipriscum.

of the Lie of the Ashes of Fig-tree, or Oak, wherein Lupins have been throughly boiled, are good. Or you may with lefs trouble make a Medicin with Salt-water, wherein you may diffolve Aloes and Ægyptiacum, adding in the conclusion a little Aqua vita, for Aqua vita and calcined Vitriol are tinguon of an Agr. lar Medicins for a Gangrene. Or R Acet. opini lb j. mel. rof. 3 iv. fivup, acetofi 3 iij. falis com. 3 v. priscum. buffant fimul, adde aqua vita, lb. f. Let the part be frequently walked with this Medicin, for it hath much force to reprefs Gangrenes. After your Lotion, lay Agyptiscum for a Liniment, and put it into the Incifions, for there is no Medicine more powerful against putrefaction, for by caufing an Efibar, it separates the putrid shell from the found. But we must not in this kind of affect expect that the putrid flesh may of it felt fall from the found; but rather cut off with your Incision-knife, or Sciffers, whatfoever thereof you can, and then put to it Ægyptiaeum as oft as need shall require. The knowledge hereof may be acquired from the colour, smell, and sensibleness of the stell it self. The description of the Ægyptiaeum, whose wondrous effects I have often tried in these causes, is this. Re Floris aris, aluminis roch, melis com, an. 7 iii. aceti acerrimi 3 v. falis com. 3 j. varioli Rom. 3 l. sub-limati pul. 3 ij. bulicant omnia somal ad ignom, stat unquent. If the force of the putresaction in the part be not so great, a weaker Ægyptiaeum may serve. When you have put in the Ægyptiaeum, then presently lay the following Cataplasin thereupon. For it hinders putresaction, resolves, cleanses and dries up the virulent suites, and by the dry subtlety of the parts penetrates into the thember, strengthens it, and assistant as the pain. It Farin, sabar, bordei orobi, lent, supin, an. 1b s. sal. com. melis resolved in cure of a Gangreene. Suppl. quantum sufficit 3 stat Cataplasina melle secondam artem; Somewhat higher than the part affected, apply this following astringent, or desensative, to hinder the slowing down of the homeours into the description of the Ægyptiacum, whose wondrous effects I have often tried in these causes, is this. apply this following aftringent, or defentative, to hinder the flowing down of the homours into the part, and the riling up of the vapours from the patrid part into the whole body. R. Olei refati, & myrtill. an. 3 iv. succi plantog. solani, sempervivi an. 3 ij. album.ovorum v. boli armeni, terra sigillata subtiliter pulverifatorum, an. 33. oxycrati quantum fufficit, mifee ad ufum difium. But these Medicins must be often renewed. If the grief be so stubborn, that it will not yield to the described remedies, we must come to stronger, to wit, Cauteries, after whose application Galen bids to put upon it the juice of a Leck with Salt beaten and diffolved therewith, for that this Medicine hath a piercing and dryipg faculty, and confequently to hinder putrefaction. But if you prevail nothing with Cauteries, then must you come to the last remedy and refuge, that is, the amputation of the part; for according to Hippocrates, to extream diseases exquisitly extreme remedies are best to be applied. Aplear. 6 Sell. 18 Yet first be certain of the mortification of the part, for it is no little or small matter to cut off a member without a cause.

CHAP. XVII.

Therefore I have thought it fit to fet down the figns whereby you may know a perfect and absolute

The figur of a perfect Necrolis, or Mortification.

cerning the uncentibleness of the part.

mortification.

Gal. 2. ad

Glasconem.

Ou shall certainly know, that a Gangrene is turned into a Sphacel, or mortification, and that the part is wholly and throughly dead, if it look of a black colour, and be colder than flone to your touch, the cause of which coldness is not occasioned by the frigidity of the air; if there be a great foftness of the part, so that if you press it with your finger it rites not again, but retains the print of the impression; if the skin come from the sleth lying under it; if so great and (trong a finell exhale (especially in an ulcerated Sphacel) that the standers by cannot indure or fuffer it; if a fanious moisture, viscid, green or blackish, flow from thence; if it be quite defitture of fense and motion, whether it be pulled, beaten, crushed, pricked, burnt, or cut off. Here I must admonish the young Chirurgeon, that he be not deceived concerning the loss or privation of the fense of the part. For I know very many deceived as thus; the Patients pricked on that part, would fay, they felt much pain there. But that feeling is oft deceitful, as that which proceeds rather from the firong apprehension of great pain which formerly reigned in the part, than from any faculty of feeling as yet remaining. A most clear and manifest argument of this false and deceitful sente appears after the amputation of the member; for a long while after they will complain of the part which is

A wondrous symptom.

Verily it is a thing wondrous strange and prodigious, and which will scarce be credited, unless by such as have seen with their eyes and heard with their ears the Patients, who have many months after the cutting away of the Leg, grievously complained that they yet felt exceeding great pain of that Leg fo cut off. Wherefore have a special care lest this hinder your intended amputation; a thing pitiful, yet absolutely necessary for to preserve the life of the Patient and all the rest of his body, by cutting away of that member which hath all the figns of a Sphacel and perfect mortification; for otherwise the neglected fire will in a moment spread over all the body, and take away all hope of re-medy; for thus Hippocrates wisheth, That Sections, Ustions, and Terebrations must be performed as foon as need requires.

Sell. 7. 180.6.

CHAP. XVIII.

Where Amputation must be made.

The controversie decided.

19

T is not fufficient to know that Amputation is necessary, but also you must learn in what place of the dead part it must be done, and herein the wisdom and judgment of the Chirus geon is most apparent. Art bids to take hold of the quick, and to cut off the member in the found shells, but the same Art witherh us, to preserve whole that which is found as much as in us lies.

THE PERSON NAMED IN

The state of the s

I will shew thee by a familiar example how thou mayest carry thy self in these difficulties. Let us suppose, that the foot is mortified even to the ankle; here you must attentively mark in what place you must cut it off. For unless that take hold of the quick flesh in the amputation, or if you leave any putrefaction, you profit nothing by amputation, for it will creep and fpread over the reft of the body. It befits Phylick, ordained for the prefervation of Mankind, to defend from the Iron or Instrument, and all manner of injury, that which injoyeth life and health. Wherefore you shall cut off as little of that which is found as you possibly can't yet so that you rather cut away that which is quick, than leave behind any thing that is perilhed, according to the advice of Celfin. Yet oft- Uh.7. 129-33, times the commodity of the action of the reft of the part, and as it were a certain ornament thereof, changes this counsel. For if you take these two things into your consideration they will induce you, in this propounded case and example, to cut off the Leg some five singers bredth under the Knee. For so the Patient may more fitly use the rest of his leg and with less trouble, that is, he may the better go on a wooden leg; for otherwife, if according to the common Rules of Art, you cut it off close to that which is perilhed, the Patient will be forced with trouble to use three legs in flead

For I so knew Captain Francis Clark, when as his foot was fincken off with an iron bullet, shor An observable forth of a man of War, and afterwards recovered and healed up, he was much troubled and wearied History. with the heavy and unprontable burden of the reft of his leg, wherefore, though whole and found, he caused the rest thereof to be cut off, some five fingers bredth below his Knee; and verily he used it with much more case and facility than before in performance of any motion. We must do other-wise if any such thing happen in the Arm; that is, you must cut off as little of the found part as you can. For the actions of the legs much differ from those of the arms, and chiefly in this that the body refls not, neither is carried upon the arms, as it is upon the feet and legs.

CHAP. XIX.

How the Sellim or Amputation must be performed.

He first care must be of the Patients strength: wherefore let him be nourished with means of good nutriment, easie digettion, and fuch as generate many spirits; as with the yolks of Eggs, and Bread tosted and dipped in Sack or Muskadine. Then let him be placed as is fit, and drawing the Muscles upwards towards the found parts, let them be tied with a firait ligature fit, and drawing the Mufcles upwards towards the found parts, let them be tied with a firait ligature a little above that place of the member which is to be cut off, with a firong and broad fillet, like that which women ufually bind up their hair withall. This ligature hath a threefold ufe; the first is, that The Ligaure is hold the mufcles drawn up together with the skin, so that retiring back presently after the performance of the work, they may cover the ends of the cut bones, and serve them in stead of bolibers or pillows when they are healed up, and so suffer with less pain the compression in sustaining the rest of the body: besides also by this means the Wounds are the sooner healed and cicatrized; sor, by how much more skin or steshis left upon the ends of the bones, by so much they are the sooner healed and cicatrized. The second is, for that it prohibits the flux of bloud by pressing and slutting up the Veins and Arteries. The third is, for that it dulls the series of the part by superging it, the animal spirits by the strait compressing being hindered from passing in by the Nerves. Wherefore when you have made your ligature, cut the stesh even to the bone with a sharp and well-cutting incisions knife, or with a crooked knife, such as is here expressed.

A crosked Knife fit for difmembring, or a difmembring Knife.

The Figure of Such a Sam.

Now you must note, that there usually lies between the bones, a portion of certain muscles which A Causion to you cannot easily cut with a large incition or dismembring knife; wherefore you must carefully diable observed; wide it and separate it wholly from the bone, with an infirument made neatly like a crooked Incition-knife. I thought good to advertise thee hereof; for if thou shouldest leave any thing besides the bone to be divided by the Saw, you would put the Patient to excessive pain in the performance thereof. In things, as field, tendons, and membranes, cannot be easily our with a Saw. of, for foft things, as fielh, tendons, and membranes, cannot be eafily cut with a Saw. Therefore when you shall come to the bared bone, all the other parts being wholly cut afunder and divided, you shall nimbly divide it with a little Saw about some foot and three inches long, and that as near to the found field as you can. And then you must smooth the front of the bone which the Saw hath made rough.

CHAP. XX.

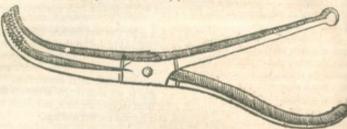

How to stanch the bleeding when the member Caken off.

Hen you have cut off and taken away the member, let it bleed a little, according to the firength of the Patient, that so the rest of the part may afterwards be less obnoxious to inflammation and other symptoms; Then let the Veins and Arteries be bound up as speedily and straitly as you can; that so the course of the slowing bloud may be stopped and wholly staid. Which may be done by taking hold of the Vessels with your Crows-beak, whereof the Figure follows.

The Crows-beak fit for to draw the Veffels forth of the flifts, wherein they lie bid, that so they may be tied or bound fast.

How to draw forth the Veffels and bind them.

The ends of the Veffels lying hid in the fleth, must be taken hold of and drawn with this Instrument forth of the mufeles, whereinto they presently after the amputation withdraw

themselves, as all parts are still used to withdraw themselves towards their originals. In performance of this work, you need take no great care, if you together with the Vessels comprehend some portion of the neighbouring parts, as of the slesh, for hereof will ensue no harm; but the Vessels will so be consolidated, with more case, than if they being bloudless parts should grow together by themselves. To conclude, when you have so drawn them forth, bind them with a strong double thred.

CHAP. XXI.

How, after the bloud is stanebed, you must dress the wounded member.

How the lips of the dismembred part are to be joined toge-

Hen you have the tied Veffels, loofe your Ligature which you made above the place of amputation, then draw together the lips of the Wound with four flitches made acrofs, having taken good hold of the flesh; for thus you shall draw over the bones that part of the skin and cut muscles drawn upwards before the amputation, and cover them as close as you can, that so the air may the less come at them, and that so the Wound may be the more speedily agglutinated. But when we say, draw together the lips of the Wound with four stitches, you must not ounderstand it, as that you must endeavour todraw them so close as to touch each other, for that is impossible; for the stitches would sooner break out, and so the part would lie bare. Wherefore it will be sufficient to draw them indifferent close together, that so you may suffer the skin and stesh thereunder to enjoy its former liberty which it possess, that so you may suffer the skin and stesh thereunder to enjoy its former liberty which it possess the drawing up; and so in time, by Natures as shiftance, the Wound may be the more easily agglutinated.

CHAP. XXII.

How you must stop the bleeding, if any of the bound-up Vessels chance to get looft.

The Hamorrhagy of imall Vellels is not to be regarded.

He business hitherto being performed as we faid, if peradventure it happen that any bandage of any of the Vessels be unloosed, then must you again bind the member with that kind of Ligature which you did before the amputation thereof. Or esse which is better, more easie and less paintul, let your servant take hold of the member with both his hands, pressing his singers strait, stop the passage of the loosed Vessel, for so he may stanch the bleeding. Then let the Workmaster take a needle some four singers long, square, and having sharp edges, drawing after it a three or four doubled strong thred. With this let him bind the Vessel after the following manner. Let him thrust his Needle on the outside into the sleth, some half singers bredth from the loosed Vessel until become to the end thereof, then let him put it about it, and bring it back again, but so that therebe no more than the space of a singers bredth between the going in and coming forth of the Needle. In this space let him put a linnen rag three or four times doubled, and thereupon bind somewhat straight the two ends of the thred together. For so he shall hinder the knot from hurting the sight the two ends of the thred together. For so he shall hinder the knot from hurting the sleth which lies under it in the bindings, and also add strength thereto. For so the bound up orisice of the Vessel will in short space be agglutinated to the adjoyning stells, and that so simply, that there hath never been seen any one drop of bloud to have showed from a Vessel so bound up. But if the bloud which shows forth proceed from any small Vessel, you must not use this strure and ligature, nor make any such great matter thereof, for it will quickly be stanched by the onely application of Astringents, presently to be mentioned.

CHAP. XXIII.

How to perform the refidue of the Cure of the amountated Member.

Ow must we show what Medicins are fitting to be applied after the amputation of a member; which are Emphasticks, as those which exceedingly conduce to green Wounds. As, R. Bol. arm. \(\frac{7}{2}\) iv. farin. vol. \(\frac{7}{2}\) iij. picis, refine, an. \(\frac{7}{2}\) ii pulverisense omnia sabriliss. Or simul An emphastick mixtir stat pulvis; herewith let the Wound be strewed, and lay thereupon dry Lint; but let the sol. Medicin. lowing repercussive or desensative be applied to the member. R. Album overum vj. boli arm.sang.drs.c. Besides, in dressing these wounds the Chirungeon must use disligance to procure the falling away of the ends or seales of the bones which the Saw and the appulse of the ones. Air never before coming hereto, have tainted; which may be done by applying to their ends actual Cauteries, that is, hot irons; in using of which you must have a special care that you touch not the sensible parts with the; neither must the bones themselves be forcibly placked off, but gently moved by little and little, so that you shall think that you and the Patient have exceedingly well performed your parts if they fall away at the thirtieth day after the Amputation. All these things being performed, you shall hinder the growth of proud field with the cathereticks, such these things being performed, you shall hinder the growth of proud fieth with the cathereticks, such Cathereticks as are burnt Vitriol, the Powder of Mercury, and other things, amongit which is Alum burnt and powdered, which is excellent in these kinds of Wounds, whether by it self or mixed with others. You shall use these, and such like, even unto the perfect agglutination and cicatrization of the Wound, and you may of your self devise other things, such as these, as occasion shall offer it self.

An emplaftick

CHAP. XXIV.

What just occasion moved the Author to devise this new form of remedy, to stanch the bloud after the amputation of a member, and to forfake the common way used almost by all Chirurgeons; which is by application of actual Canteries.

Erily I confess, I formerly have used to flanch the bleeding of members, after amputation, Hot Irons not after another manner than that I have a little before mentioned: Whereof I am afhamed, to be used and aggrieved; But what should I do? I had observed my Masters, whose Method I intended to follow, always to do the like; who thought themselves singularly well appointed to flanch a flux of bloud, when they were furnished with various flore of hot irons and cautick Medicins, which they would use to the difmembred part, now one, then another, as they themselves thought meet. Which thing cannot be spoken, or but thought upon without great horrour, much less acted. For this kind of remedy could not but bring great and tormenting pain to the Patient,

Lib. S. Meth.

feeing fuch fresh wounds made in the quick and found flesh, are endued with exquisite sense Neither can any caustick be applied to nervous bodies, but that this horrid impression of the fire will be prefently communicated to the inward parts; whence horrid fymptoms enfue, and oft-times death it felf. And verily of fuch as were burnt, the third part fearce ever recovered, and that with much ado, for that combust Wounds difficultly come to cicatrization; for by this burning are caused cruel pains, whence a Fever, Convultion, and oft-times other accidents worfe than thefe. hereunto that when the efchar fell away, oft-times a new harmorrhage enfued, for franching whereof they were forced to use other cauttick and burning Instruments. Neither did these good men know any other course; so by this repetition, there was great loss and waste made of the flethy and nervous substance of the part: Through which occasion the bones were laid bare, whence many were out of hope of cicatrization, being forced for the remainder of their wretched life, to carry about an ulcer upon that part which was differenbred; which also took away the opportunity of fitting or putting to of an artificial leg or arm, in flead of that which was taken off. Wherefore I must earnefly intreat all Chirurgeons, that leaving this old and too too cruel way of healing, they would embrace this new, which I think was taught me by the special favour of the facred Deity; for I learnt it not of my Masters, nor of any other; neither have I at any time found it used by any: Onely I have read in Galen that there was no speedier remedy for flanching of bloud than to bind the Vessels (through which it slowed) towards their roots; to wit, the Liver and Heart. This precept of Galen, of binding and fowing the Veins and Arteries in the new wounds, when as I thought it might be drawn to these which are made by the amputation of members, I attempted it in many; yet so, that at first in my budding practice thereof, I always had my Cauteries and hot Irons in a readincis, that if any thing happened otherwife than I expected in this my new work, I might fetch fuccour from the ancient practice; until at length confirmed by the happy experience of almost an infinite num-ber of particulars, I bid eternally adieu to all hot Irons and Cauteries which were commonly used in this work. And I think it fit that Chirurgeons do the like. For Antiquity and Custom in such things as are performed by Art, ought not to have any sway, authority or place contrary to reason, as they oft-times have in civil affairs; wherefore let no man fay unto us, that the Ancients have always done thus.

CHAP. XXV.

The practice of the former precepts is declared, together with a memorable History of a certain Souldier whose Arm was taken off at the Elbow.

A Hiflory.

Difmembring. at a soint.

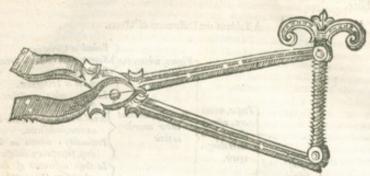

Sell-4. Lib. de

Think it fit to confirm by an example, the prescribed Method of curing a Gangrene and Mortifi-cation. Whilest I was a Chirurgeon to the Marshal of Montejan at Turin, a certain common Souldier received a Wound on his wrift with a Musket-bullet, by which the bones and tendons being much broken, and the nervous bodies cruelly torn, there followed a Gangrene, and at length a Mortification even to the Elbow; befides also an inflammation seized upon the middle part of his Cheff, and there was as it were a certain disposition to a Gangrene; whereby it followed, that he was painfully and dangerously troubled with belchings, hicketings, watchings, unquietness, and frequent swoundings, which occasioned many Chirurgeons to leave him as desperate. But it so fell out, that I (overcome by his Friends intreaty) undertook the cure of this wretched person, destitute of all humane help. Wherefore knowing the mortification by its figns, I cut off the Arm by the Elbow as speedily as I could, making first the ligature, whereof I made mention; I say I took it off not with a Saw, but onely with an Incition-Knife, cutting in funder the ligaments which held the bones together, because the sphacel was not passed the joint of the Elbow. Neither ought this Section to be counted firange, which is made in a joint; for Hippocrates much commends it, and faith that it is eatily healed, and that there is nothing to be feared therein befodes fwounding, by reason of the pain caused by cutting the common tendons and ligaments. But such incision being made, the former ligature could not hinder, but much bloud must flow from thence, by reason of the large Vessels that run that way; Wherefore I let the bloud to flow plentifully, so to disburden the part, and so after wards to free it from the danger and fear of inflammation and a Gangrene; then prefently I tran-ched the blood with an hot Iron, for as yet I knew no other course. Then (gently looling the ligature) I fearthed that part of the brawn of the Arm which was gangrenated, with many and deep incifions, fluorning and not touching the inner part, by the reason of the multitude of the large Veffels and Nerves which run that way; then I prefently applied a Cautery to fome of the Incifions, both to flanch the bleeding, and draw forth the virulent fanies which remained in the part. And then I alfailed and overcame the fpreading putrefaction, by putting and applying the formerly prefcribed Medicins; I used all forts of restrictive Medicins to stay the inflammation of the Chest; I also applying the formerly prescribed medicins. plied Epithemaes to the region of the heart, and gave him cordial potions and boles, neither did I delift from using them until such time as his belching, hicketing, and swoundings had left him. Whileft I more attentively intended thefe things, another mischief affails my Patient; to wit, Convullions, and that not through any fault of him or me, but by the naughtiness of the place wherein he lay, which was in a Barn every where full of chinks, and open on every fide; and then also it was in the midft of Winter, raging with Frost and Snow and all forts of cold; neither had he any fire or other thing necessary for preservation of life, to lessen these injuries of the air and place: Now his joints were contracted, his teeth fet, and his mouth and face were drawn awry, when as I pitying his cafe made him to be carried into the neighbouring Stable, which fmoaked with much Horfe-Earying in hot during; and bringing in fire in two Chafingdithes, I preferrly anointed his neck and all the fpine of horle-during his back, fluoring the parts of the Chett, with liniments formerly described for Convultions; then below Convulfiraitway. I swrapped him in a warm linnen cloth, and buried him even to the neck in hot dung, put-

***** TE TO THE P. LEWIS CO.

ting a little fresh straw about him; when he had staid there some three days, having at length a genthe foouring or flux of his belly, and plentiful fweat, he begun by little and little to open his mouth and teeth, which before were fet and close shut. Having got by this means some opportunity better to do my business, I opened his mouth as much as I pleased, by putting this following Instrument between his teeth.

A Dilator made for to open the Mouth and Teeth by the means of a Screw in the end thereaf.

Now drawing out the Infirument I kept his mouth open by putting in a Willow flick on each fide thereof, that fo I might the more eafily feed him with meats foon made, as with Cows milk and rear Eggs, until he had recovered power to eat, the convultion having left him. He by this means rear Eggs, until he had recovered power to eat, the convultion having left him. He by this means freed from the Convultion, I then again begun the cure of his arm, and, with an actual Cautery feared the end of the bone, to to dry up the perpetual afflux of corrupt matter. It is not altogether unworthy of your knowledge, that he laid, how that he was wondroufly delighted by the application of fuch actual cauteries, a certain tickling running the whole length of the arm by reafon of the gentle diffusion of the heat by the applying the cautick; which fame thing I have observed in many others; especially in such as lay upon the like occasion in the Hospital of Paris. After this cauterizing there fell away many and large scales of the bone, the freer appulse of the air than was fit making much thereto; besides when there was place for fomentation, with the decoction of red Rose leaves, Wormwood, Sage, Bay-leaves, Flowers of Camomil, Meilote, Dill, I so comforted the part, that I allso (at the same time by the same means) drew and took away the virulent sames, which simply adhered to the flesh and bones. Lastly, it came to pass, that by Gods, affiliance these means I used, and hered to the fleth and bones. Lafily, it came to pass, that by Gods, affiliance these means I used, and my careful diligence, he at length recovered. Wherefore I would admonish the young Chirurgeon, Monsters or that he never account any so desperate, as to give him for lost, content to have let him go with prominates in gootiicks; for as an ancient Doctor writes, that as in Nature, so in Diseases there are also Monsters, Diseases.

BOOK XIII.

Of Vlcers, Fistulaes, and Hæmorrhoides.

CHAP. I.

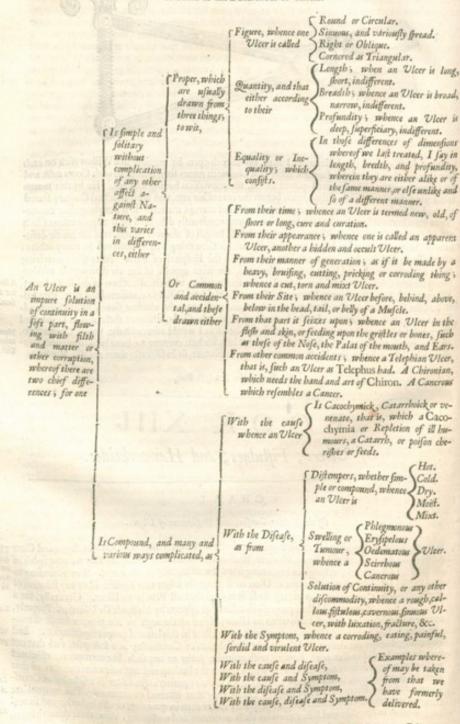

Of the Nature, Causes, and Differences of Vlcers.

Aving already handled and treated of the Nature, Differences, Causes, Signs and Cure The diverted of fresh and bloudy Wounds, Reason and Order seem to require that we now speak of acceptions of ulcers; taking our beginning from the ambiguity of the name. For according to an ulcer, Hipperater, the name of ulcer most generally taken may significe all or any solution of Continuity; in which sense it is read that all Pain is an ulcer. Generally, for a Wound and ulcer properly so called; as appears by his Book De Ulceribm. Properly, Soft. 1, prog. as when he faith it is a sign of death when an ulcer is dried up through an Atrophia, or defect of nourishment. We have here determined to speak of an ulcer in this last and proper signification. And what an ulcer according thereto we define an ulcer to be the solution of Continuity in a soft part, and that not properly is, bloudy, but fordid and unpure, flowing with quitture, savier or any such like corruption, affociated with one or more affects against Nature, which hinder the healing and agglutination thereof; or that we may give it you in sewer words according to Galess opinion; An ulcer is a solution of Continuity, caused by Erosion. The causes of ulcers are either internal or external. The internal are deta caps. The internal causes. through the default of humours peccant in quality rather than in quantity, or else in both, and so mathematically rather than in quantity rather than in quantity.

(tttl://ttp

feizing upon any part, especially more remote from the fountain of heat, whence follows pain, whereunto fucceeds an attraction of humours and spirits into the part, and the corruption of these so drawn
thither by reason of the debility or extinction of the native heat in that part, whence lastly ulceration
proceeds. In this number of external causes may be ranged, a stroke, contusion, the application of
sharp and acrid Medicins, as Causticks, Burns, as also impure contagion, as appears by the virulent
Ulcers acquired by the filthy copulation or too familiar conversation of such as have the French Discase. How many and what the differences of Ulcers are, you may see here described in this following Scheme.

A Table of the Differences of Ulcers.

CHAP.

BEST 10 11 1111

CHAP. II. Of the Signs of Vicers.

Here are various figns of Ukers according to their differences. For it is the fign of a putrid The figns of a Uker, if it exhale a noifom, grievous, flinking and carion-like vapour, together with filthy patrid Uker matter. An eating Uker is known by the eating in, hollowness and weating away of the part wherein it refides, together with the adjoining parts. A fordid Uker may be known by the großness and viscidity of the excrements it fends forth, and by the loose and spongy fortness, or the straining of the problem of the critical straining of the straining of the critical straining of the strainin crufted inequality of the flesh which grows over it. A cavernous Ulcer, by the straintness of the orifice, and largeness and deepness of the windings within. A fiftulous Ulcer, if to the last mentioned figns there accrew a callous hardness of the lips or fides of the Ulcer. A cancrous Ulcer is horrible to behold, with the lips turned black, hard and fwollen; flowing with virulent and flinking corruption, and fornetimes also with bloudy matter, together with the fwelling and lifting up of the adjacent Veins. An untemperate, or as they term it, a differenteed Ulcer, is fuch as is nourished by fome Gal. cap.5. lik. great difference, whether hot or cold, moift or dry, or compounded of these. An ill * natured or 4. Meth. malign Ulcer is known by the difficulty of curing and rebellious conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies appointed **Mem Carette and Repfer Websellious Conturnacy to remedies and remedies and remedies and re according to Art and Reafon. We know a catarrhous Ulcer, if the matter which feeds it flow to it from fome paries thereunto adjoining; or dilated, fwollen and broken Veins, or from fome entrail, or from the whole body being ill affected. An Apostematous Ulcer is perceived by the presence of any tumor against Nature, whose kind may be found out by fight and handling. Telephian Ulkers are fuch as affected Telephus; and Chironian (in whose cure Chiron excelled) are Ellcers which may be known by their magnitude, not much putrid, and confequently not fending forth any ill finell, not eating, not tormenting with pain, but having their lips fwollen and hard, and therefore ill to be heatled. For although they may be fornetimes cicatrized, yet it being but flender may eafily be broken, and the Ulcer renewed. They are almost like an ulcerated Cancer, but that they are accompanied with fwelling in the adjacent parts; they are also worse than these which are termed Cacoethe, that is, ill-natured, or malign; whence it is that Fernelius thought they had a hidden cause of malignity, con. ad apor. befides the common default of the humour, and that fuch as can fearce be driven away; fuch com- 22, fea. 5, monly are felt after the Plague. Wherefore Galen thinks fuch to be malign as will not suppurate or

CHAP. III. Of the Prognofticks of Ulcers.

He bone must necessarily scale, and hollow scars be left by malign Ulcers of a years continuance or longer, and rebellious to Medicins fitly applied. The bone must scale by reason of the continual efflux, and wearing by the acrimony of the humour, which loofes the composure and glue by which the parts thereof are joined together. But the scars must become hollow, for that the bone (whence all the flesh takes its first original) or forme portion thereof, being taken from under the flesh, as the foundation thereof, so much of the bulk of the flesh must necessarily fink down, as the magnitude of the portion of the wasted bone comes unto-

You may know that death is at hand, when the Ellcers that arise in or before discases, are suddenly Hipp grage. III. either livid or dried, or pale and withered. For fuch driness theweth the detect of Nature, which is not able to fend the familiar and accultomed nutriment to the part ulcerated. But the livid or pale 65,943.5. colour is not onely an argument of the over-abundance of choler and melancholy, but also of the extinction of the native heat. In Ulcers where tumors appear, the Patients fuffer no convulsions, neither are franticks, for the tumor being in the habit of the body riofferfied with an Ulcer, argues that ther are frantick; for the tumor being in the habit of the body possessed with an Ulcer, argues that the nervous parts and their original are free from the noxious humours. But these tumors suddenly vanishing and without manifest cause, as without application of a discussing Medicin or bleeding, those who have them on their backs have convulsions and diffensions, for that the spine of the back is almost wholly nervous; but fuch as have them on their fore-parts, become either frantick, or have a sharp pain of their fide, or pleurifie, or else a dysentery if the tumors be reddish: for, the fore-part of the body is repleurified, and are fore-part of the body is repleurified. a sharp pain of their side, or pleurisie, or else a dysentery if the tumors be reddish: for, the fore-part of the body is replenished and over-spread with thany and large Vessels, into whose passages the motivated to those parts which are the seats of such distances. Soft and loose tumors in Ulcers are good, for they show a milders and gentleness of the humours, but crude and hard swellings are naught, for all digestion in some measure resembles elixation. Ulcers which are smooth and thining are ill, for they show that there resides an humour malign by its acrimony, which frest assuader the roots of the hairs, and depraves the natural construction of the pores of the skin; whence it is, that such as are troubled with Quartan Agues, the Loptose, or Lucy Venerus, have their hair fall off. A livid shesh is ill in Ulcers which cause a rottenness or corruption of the bones lying under the stells; for it is an argument of the dying, heat and corrustice. or corruption of the bones lying under the flesh; for it is an argument of the dying heat and corruption of the bone, whence the flesh hath its original and integrity.

Those Ulcers which happen by occasion of any Difease, as a Dropsie, are hard to be cured; as also Big. like de pile. those whereinto a parix or swollen Vessel continually easts in matter, which a present distemper so- sealing lines and such as are circular or round. An Hung life Mainments; which have fwollen, hard and callous lips; and fuch as are circular or round. An Hyper, lib. Mais-4farcofit, or fleshy excrefeence usually happens to Ulkers not diligently mundified; and if they possess the Arms or Legs, they cause a Phlegmon or some other turnor in the groins, chiefly if the body be full of ill humours, as Avien hath noted. For these parts by reason of their rarity and weakness are For what can with she had cicarrived. The first, for want of bloud, in a bloudless body; the second, by reason hard to heal with fleth and cicatrized. The first, for want of bloud, in a bloudless body; the second, by reason hard to heal of

(1111)

of ill humours and the impurity of the bloud; the third, by the unfit application of unconvenient

Medicins; the fourth, by reason of the fordidness of the Ulcer; the fifth, by the putrefaction of the fortiand carion-like flesh encompassing the Ulcer; the fixth, when they take their original from a common cause which every where rages with fury, such as are those which are left by the petitiences the seventh, by reason of the callous hardness of the lips of the Ulcer; the eighth, when the Heavens and Air are of such condition as ministers such to the continuance of the Ulcer, as at Saragosa in Aragow; the ninth, when the bones which lie under it are wasted by rottemess. An Ulcer that easts forth white, fmooth, equal quitture, and little or no flinking, is eafily healed; for it argues the victory of the native heat, and the integrity of the folid parts. We term that fmooth quitture which is absolutely concocted, neither yields any asperity to the touch, whereby we might suspect that as yet any portion of the humour remains crude; we call that equal, wherein you can note no divertity of parts; and white, not that which is perfectly fo, but that which is of an affi colour, as Galen observes But it is ill, if when the cure is indifferently forward, a flux of bloud fuddenly break forth in those Ulcers which beat firoughly by reason of the great inflammation adjoined therewith. For, as Hippe erates observes, an effusion of bloud happening upon a strong pulsation in Ulcers is evil; for the bloud breaking out of an Artery cannot be traid but by force, and also this bloud is so furious by reason of the heat and inflammation the nourithers of this Ulcer, that it breaks its receptacles, and hence cufues the extinction of the native heat, whence the detect of suppuration and a Gangrene ensure-Now for that there flows two forts of excrements from malign Ulcers, the more thin is termed Icher or Sanier, but the more gross is named Sorder, that is virulent and flows from pricked Nerves, and the Periofes when they are evil affected; but the other ufually flows from the Ulcers of the joints, and it is the worfer, if it be black, reddilh, aft-coloured, if muddy or unequal like Wine Lees, if it flink. Sanies is like the Water wherein flesh hath been washed; it argues the preternatural heat of the part; but when it is pale coloured it is faid to shew the extinction of the

What Pas or Matter is fmooth, equal, and white. Ad featest, 32. fell, 2. de feall, Aph.21. fell, 7. Two forts of excrements flow from a malign Ulcer.

CHAP. IV.

Of the general Care of Vlcers.

The curing of a fimple Ulcer confifts in exficcation. Gal. 7. Math 607.12.

Gal, lib.4. de comp. med. seeand-gen-

The things

N Ulcer is either fimple or compound. A fimple Ulcer, as an Ulcer, hath one and that a fimple indication, that is, exficcation; and that more than in a Wound, by how much an Ulcer is moifter than a Wound. There are many indications preposed for the cure of a compound Ulcer, in respect of which Galen would have us to keep this order, that we have the first regard of the most urgent, then of the cause, then of that, which unless it be taken away, the Ulcer cannot be healed. By giving you an example you may easily understand the meaning hereof. Imagine on the inside of the leg, a little above the ancle, an Ulcer very painful, hollow, putrid, affociated with the rottenness of the bone, circular, having hard and swollen lips, and engirt with the inflammation and varieer of the neighbouring parts. If you take this to cure, before you do any thing about the Ulcer, unless you be called upon by that which urges, as by vehemency of pain, you must first use general means by calling and advising with a Phytician. For in Galens openion, if the whole body require a preparation, then must that be done in the first places for in fome Ulcers purgation onely will be fufficient, in fome bloud-letting, others are better by using both means, which is as the cause of the Ulcer proceeds from a repletion or illness of humours-Now by these means having taken away the cause of the Ulcer, you must come to the particular cure thereof, beginning with that which is most urgent. Wherefore you must first asswage the pain by application of things contrary to the cause thereof: as, if it proceeded from a phlegmonous differences, which hath long possess, differenced, and hardned the part, it must be eased by evacuation. tion. First, bathing it with warm water, to mollifie and relax the skin, that so you may the more eafily evacuate the contained humours; then shall you draw away a portion of the matter causing the fwelling and pain by fearification, if the Patient shall be of sufficient courage, or else by application of Horfe-leaches, if he be more faint-hearted; and then you shall temper the heat there of by applying *Unguentum refrigerans Galeni*. To conclude, you shall attempt all things which we have formerly delivered (in our Treatife of Tumors) to take away the swelling thereof. When you have brought this to that pass you defire, you shall come to those which are such, that it can not be taken away or healed without them, which shall be done by orderly helping the detects against Nature which were conjoined with the Ulcer, to wit, the rottenness of the bone, which you shall help by actual cauteries; and in the mean while you shall draw the Ulcer into another form, to wit, cornered, and you shall cut away the callous hardness, and help the rottenness; then must you procure the falling away of the Eschar, and then provide for the scaling of the bone by the means formerly prescribed; lastly, the mundified Ulcer must be filled with flesh. For generating of Seth are the falling of the bone and the must be filled with flesh. rating of fieth two causes must concur, the efficient, and material; the efficient is, the good temperature of the concurrence conducing to rating of fieth two causes must concur, the efficient, and material; the efficient is, the good tenter of the generating per both of the whole body, as also of the ulcerated part. For, this prevailing, there will be an of fieth. attraction, digetion, opposition and affirmulation of the laudable juice to the part affected; verily the landable temper is preferred by like things, but the vicious is amended by contraries. The matter to be spent upon slesh is landable bloud, which offends neither in quality nor quantity. In this reconstruction of the landable bloud, which offends neither in quality nor quantity. this regeneration of the flesh there appear two kinds of excrements, the one more thin and hurring called Spring the there appears two kinds of excrements, the one more thin and hurring called Spring the there are convergent to mid called Sanies, the other more gross termed Sordes. Both of there for that they are contrary to nature, do therefore hinder the regeneration of fleth, and therefore must be taken away by applying their contraries, as by things drying in the first degree, and more firongly or weakly detergeting according to the complexion of the part and the whole body, and the plenty and quality of the excrementitious humour, and the uncleanness of the Ulcer. For the part must be preserved by the

use of the like, but the Ulcer overcome by application of things contrary thereto. After that by Natures endeavour and the Chirurgeons help the Ulcer is replete with field, it must be cicatrized, that is, covered with a callous skin in flead of the true and native skin. It may be cicatrized by Things can firewing of very drying powders having very little or no acrimony. Thus Alum and Vitriol being fing cicatriza, barnt and made into Powder, and thinly firewed upon the part, do quickly cicatrize the former tion. flelly Work. To this purpose also serve the root of Arifteleshia, Aloes, burnt Lead, Pomegranar Pills burnt, Litharge, Tutin, and also plates of Lead befineared with Quick-filver, whose efficacy for this purpose. for this purpole Chirurgeons sometimes find more certain and powerful than any other re-

CHAP. V.

Of a diftempered Vicer.

Efore we speak of a distempered Ulcer, it is meet, lest that the Chirurgeon take one differm- Signs of a diper for another, briefly to relate the figns of each. You may know that an Ulcer is affociated with a dry diffemper by your fight, as if the Ulcer be as it were wrinkled, if it fend Ulcer. forth little or no moisture; also it is known by touch, if it feel rough and hard. You shall correct Remedies for this distemper by humeching Medicins, as fomenting it with warm water according to Galear opil a dry distemption, or else with Hydrelaum (i.) Oil and Water mixt: but always you must first purge, if the body shall abound with ill humours, or use Philebottomy if the body be plets of the wife you shall draw more humours into the part than it can bear. Now you shall so long soment it, untill the sleep hard the part than it can bear. the flesh which is about it begin to look red, wax fort and moiff, and the part it felt be a little fwollen, If you proceed further, you will refolve all the humour which you have drawn thither, and fo your labour is in vain. After the fomentation, apply fuch a remedy to the ulcerated part. It Cremoris bordet

3 ij. fol.malve in aq. coll. 3 j. pingued.parci 3 j. β. mells com. 3 β. mifer in mort. O fiat unquentum.

You shall know a moist distemper affociates the Ulcer by the plenty of the excrementitious has Signs of too mours, which the Ulcer fends forth, by the spongy and singous solutes and growth of the sieth about moist an Ulcer it. You shall amend this by drying remedies, such as those are, which we term Sarcoticks, having allows the state of the state of the party and other indicates. always regard to the plenty of the humour, the proper temper of the part, and other indications formerly mentioned. Amongst other remedies Gales much commends Alum Water, for it dries, cleanfes and corroborates the affected part. Also this enfuing fomentation may be applied to good purpose. R Rojar. rub. absimth. beton. tapsi barbati an. m. j. gallarum, nucum capressi, an. 3 ij. aluminis roche 3 j. stat decollio in vino austero, instituarur fotus. Then let Empl. de cerussa or deminio be applied to the Ulcer. Also I have found by experience that the Powder of burnt Alum lightly strewed upon the Ulcer is very effectual in this case. You shall know that an hot difference affociates the Ulcer Signs of a hot by the reducts or yellowness thereof, by the hear manifest to your touch, and the propriety of your discompered pain. Then must you have recourse to refrigerating things, such as Ung, Refatum Mcf. Refrigerant Ulcer.

Gal. Populon; stoops and cloths dipped in Plantain Water, Nightshade Water, or Oxycrate. Thave oft found by experience that fearification, or Leaches being applied, did more conduce than any other remedy. For so the chased bloud, which by that means is apt to corrupt, is drawn away, and the part it felt is also freed of that burden.

We know a cold difference by the whitish or pale colour, by the touch of the Chirurgeon, and fipecch of the Patient complaining of the coldness of the ulcerated part. You shall correct this by applying and putting bottles filled with Water about the part, or else Swines bladders half niled with the following decocion. Re Origani, pulegii, chamam. melitai, an. m. j. absorb. nationane, faire, rorifinar, an. m., is, fiat decidio in vivo generalo, addendo aque vite quad findles. Also the Ulcer may be conveniently formented with Sponges dipped in the fame decocion, and let there be applied thereto Empl. Ouycroenum, emp. de meliton, de Vigo cam mercaria, and fine mercaria. But it a mixt and compound difference be soined to the Ulcer, the Medicius must in like manner be mixt and composed. pound difference be joined to the Ulcer, the Medicins mult in like manner be mixt and composed. The relidue of the Chirurgeons care and pains must be spent upon the proper and peculiar cure of the Ulcer, as it is an Ulcer; which we faid in the former Chapter was contained in deterfion, regel nerating fleth, and cicatrization thereof.

CHAP. VI. Of an Olcer with pain.

Here oft-times fo great pain accompanieth Ulcers, that it calls thereto the counfel of the Phyfician. Wherefore if it proceed from any difference, it shall be taken away by remodies proper against that difference, such as we mentioned in the former Chapter. But if it do not so cease, we must go on to Narcoticks. Such are cataplasins of the leaves of Mandrakes, Water-The matter of not fo ceafe, we must go on to Narcoticks. Such are cataplains of the leaves of Mandrakes, Water-The matter of lillies, Henbaue, Nightshade, Hemlock, the feeds of Poppy and Oils of the fame; to which also may Narcotick Cabbe added Opium, Populeon, and other things of like faculties. But if a malign acrimony and virulenty of an humour corroding and eating the flesh lying under it and the lips about it, cause and make the pain, you shall neither assware by Anodynes nor Narcoticks; for by application of gentle Medicins it will become worse and worse. Wherefore you must betake you to Cathereticks; for firong Medicins are sittest for strong diseases. Wherefore let a Pledget dipped in strong and more than or dinarily represent the strong diseases. dinarily powerful Ægyptiscam, or in a little Oil of Vitriol, be applied to the Ulcer; for these have assuage pain, power to tame this raging pain, and virulent humours. In the mean scasson let refrigerating things be put about the Ulcer; lett the vehemency of acrid Medicins cause a defluxion.

CHAP

CHAP. VII.

Of Vicers, with over-growing or proudness of flesh.

Things wafling superfluous tiesh,

Lik.z. Math.

For the calloss lips of ULcers.

Leers have oft-times proud or over-growing flesh in them, either by the negligence of the Chirurgeon, or fault of the Patient. Against this, drying and gently eating or confirming Medicins must be applied, such as are Galls, Corux thuris, Aloes, Turia, Antimo-wlix, Vitriol, Lead, all of them burnt and washt if need require. Of these Powders you may allo make Ointments with a little Oil and Wax; but if the proud fleth, as that which is hard and dense, yield not to these remedies, we must come to causticks, or else to iron, so to cut it off. For in Galeus opinion, the taking away of proud shell is no work of Nature, (as the generating, refloring and agglutinating of the flesh is) but it is performed by Medicins which dry vehemently, or elfe by the hand of the Chirurgeon; wherefore amongst the remedies fit for this operation, the Powder of Mercury with fome finall quantity of burnt Alum, or burnt Vitriol alone, feem very effectual to me. Now for the hard and callous lips of the Ulcer, they must be mollified with Medicins which have fuch a faculty, as with Calves, Goofe, Capons, or Ducks greafe, the Oils of Lil-lies, fweet Almonds, Worms, Whelps, Orfipus, the mucilages of Marth-mallows, Linfeed, Fænu-greek-feed, Gum Annoniacum, Galbanum, Edelium, of which being mixed may be made Emplaifiers, Unquents, and Liniments: or you shall use Empl. Dischylon, or de Mucilaginibus, De Vigo cum Mercurio. To conclude, after you have for forne few days used such like remedies, you may apply to the Ulcer a plate of Lead rubbed over with Quickfilver, for this is very effectual to fmooth an Ulcer and deprets the lips: if you thall prevail nothing by this means, you must come to the Causticks, by which if you still prevail nothing, for that the lips of the Ulcer are so callous lous that the caufficks cannot pierce into them, you mult cleave them with a gentle Scarification, or elfe cut them to the quick, fo to make way, or as it were open a Window, for the Medicin to enter in, according to Gales. Neither in the interim must you omit Hippocrates his advice, which is, that by the same operation we reduce the Ulcer, if round, into another figure, to wit, long or triangular.

Lib.4. Math.

CHAP. VIII.

Of an Ulcer putrid and breeding Worms.

The cause of Worms breeding in Ulcers

Orms are divers times bred in Ulcers, whence they are called Wormy Ulcers; the cause hereof is the too great excrementitious humidity prepared to putrese by unnatural and immoderate heat. Which happens, either for that the Ulcer is neglected, or else by reason of the distemper and deprayed humours of all the body, or the affected part; or else for that the excrementitious humour collected in the Ulcer, hath not open and free passage forth; as it happens to the Ulcers of the Ears, Nose, Fundament, Neck of the Wornb, and lassly, to all sinuseus and cuniculous Ulcers. Yet it doth not necessarily follow that all putrid Ulcers must have Worms in them; as you may perceive by the definition of a putrid Ulcer, which we gave you before. For the cure of such Ulcers after general means, the Worms must first be taken forth, then the excrementitious with the ensuing decoction, which is of force to kill them; for if any labour to take forth all that are quick; he will be much deceived; for they oft-times do so tenaciously adhere to the ulcerated part, that you cannot plack them away without much force and pain. Re Absorb. centaur, majoris, marrubii, an. M. j. stat decolio ad the percentage dissipated after a sugment and pain the put into the Ulcer; or else, if the Ulcer be cuniculous or full of windings, make injection therewith which may go into all parts thereof.

well confider, at how many dreffings he shall be able to wath away the gross forder, or filth sticking close to the Ulcer, and dry up the execrementitious farmer. For ott-times these things may be done at one dreffing; but in others who have more quick fenfe or feeling, not fo foon. But when the Ulcer is freed of fuch grofs forder or filth, you must forbear to use more acrid things for sear of palu, defluxion, inflammation and erotion, whereby the Ulker would become more hollow. Wherefore defluxion, inflammation and crotion, whereby the Liner would become more hollow. Wherefore then we shall be content to apply remedies which dry and cleanse without acrimony, that we may so help Natures endeavours in generating sless. Such remedies are, the powdets of Aloes, Massick, Detergent medical powers, and the like, which being strewdicines without applications of the like, you shall cover it with lint, and put over that a plate of Lead, rubbed over with our acrimony, and the like, which being strewdicines without a strength of the like, which being strewdicines with the like, which like, which being strewdicines with the like, which like with the li quick-filver; and you shall put on these detertives and deficcatives more or less strong, as you shall and it requifite and necessary. For the too plentiful use of drying and deterfive things, doth in A caution very time hollow the Uker, whereby it comes to pals that in thort time in like fort, a great quantity of favier observable in flows from the Ulcer, the proper fubflance of the flesh being diffolved by the force or acrimony of gent things. deterfive medicines; as also the proper alimentary humor, which flowed to the part, being in like fort defiled: Which thing beguiles the unskilful Chirurgeon. For by how much he fees the Ulcer flow more plentifully with fanies, he endeavours by fo much the more to exhault and dry up with more acrid medicines these humidities, as if they were excrementitious: But Galen hath long ago A diffination admonished us to take heed hereof, setting forth a History of a certain Emperick who dreffing a to be observed fordid Ulcer with a green, acrid and eating medicine, diffolved the fleth; and to confequently concerning made the Ulcer more hollow, and caused more pain and defluxion; whereby it hapned, that con-the impuri tinually adding more acrid medicines, he continually (by his ignorance and unskilfulncfs) increased the colliquation of the flesh, the largeness of the Ulcer and excrementitious humidity: Wherefore we must take special care whether the fordid Ulcer grows each day worse, by its proper fault, and the impurity of the whole body besides, or else by the colliquation of the sleth, and corruption of the benign and alimentary humor fent thither for the nutrition of the part, by the too frequent of the benign and aumentary numor tent influer for the manifold of the part, by the foreign with-and unskilful use of too acrid a medicine. You may conjecture this, by the increase of the pain with-out reason, and by the heat and redness of the lips of the Ulcer. Therefore you must principally Diligent re-have regard to this, that you give each of your Patients his fit measure; that is, a convenient and gard must be have regard to this, that you give each of your Patients his fit measure; that is, a convenient and gard must be agreeable medicine to each of their firengths, taking indication from the firength, difference and confiftence of the whole body and affected part; for there is a great deal of difference whether you and the affected part; apply a medicine to a Plow-man or labourer, or to an Eunuch and woman; or whether to the leg fedted part. or eyes: For these medicines which to a dense and hard body and part are only detergent and drying, the fame are to delicate and tender bodies and parts catheretick and eating, by colliquation of the flesh, and corruption of the nourishment, making an increase of forder or filth; on the contrary, those things which do laudably and sufficiently cleanse the slesh in a soft body, and dry up the fames, these same things applied to a hard body, increase the forder and famits by suffering them to breed, neither are they of sufficient power to wash away the tenacious impurity of a dense body. Wherefore the skilful Chirurgeon will see when he must betake himself from too strongly cleanling and eating medicines to these which are more mild.

CHAP. X.

Of a virulent, eating and malign Uleer, which is termed Cacoethes, and of a Chironian Uleer.

Irulent and eating Ulcers differ not, unless in magis and minus, for we term it a virulent How virulent Ulcer, which sends forth a virulent fanies, which is properly called Virus. This Virus or and eating Ulcer, and are adjoyed to the Ulcer, and makes an eating Ulcer. Such Ulcers are by Galen called Gal, lib. 4. de Dysconlatica, that is, difficultly to be cicatrized; for, faith he, it happens that the Ulcer is Dysconlatical country made fice. It may corrupt the humor which shows thirther; such an Ulcer is by a particular represented Care. it may corrupt the humor which flows thither; fuch an Ulcer is by a particular name termed Gathe part affected being too moift cannot heal up. He further adds, that a Chironian Eller is far Howa Chiromore malign than the Ellers, which are termed Gassethe. For the cure; by reason that all these man also necessary to have divers medicines ready and at hand, distinct both in their faculties and the before also necessary to have divers medicines ready and at hand, diffines both in their faculties and the before, 627, 22 degrees thereof, so that it is no marvel if they oft fail of their purpose, who with the same medicine described by discontinuous described by Asserting and think they shall heal) all malign Ulcers. This following medicine described by Asserting as much commended by Galen. R. Squamma aris, ariginis rase, an. 3 i. Core lb s. Res. Gal. 1884. See son the Ulcer; 3 i s. Que liquari possion aridis assurant, and make an Emplaister to be laid only upsep. 5.

On the Ulcer; for you must lay a desensative about the Ulcer, for sear of instammation. But Galen such, that the following Epulotick of Primins excels the rest, as that which to desperate Ulcers (which many have taken in hand and left as uncurable,) was of certain and approved use. It Sovers (which many have taken in hand and left as uncurable,) was of certain and approved use. It Sovers Gal. 1884. CHAP. XI.

An Advertisement to the young Chirurgeon, touching the distance of times wherein malign Vicers are to be dreffed.

Gal, lib. 4. de comp. med. See Gen. cap. 5.

O flow the use of Asclepiades his medicines, described in the former Chapter, and convince the error of those Chirurgeons, who think they do well for their Patients, if they twice or thrice on a day drefs malign Ulcers; I have here thought good to digrefs a hit-tle from my purpose, and to interpose Galen's authority. Rightly (faith Galen) hath Assessment added these words to the formerly described medicine: And loose this after three days, and forment the Ulcer, and faften the fame emplater being washed, and apply it again; for unless the medicine adhere long to the skin, it will do no good. Which thing notwithstanding many Physicians have been ignorant of; thinking, if they wiped away the fanies from the Ulcer thrice on a day, they should do better than those who did the same but twice a day. But those who dress it but once a day, are reproved by the Patients, as negligent. But they are much mistaken; for you must remember, as we have delivered in most of our Writings, that the qualities of all neighbouring bodies do mutually actuate and affect each other in fome degree, although the one thereof be much more powerful, for by this reason in space of time they become somewhat alike, though they otherwise differ much: But when the quality of the medicine shall be like the species to the body to be cured, there sollows the better success. Wherefore he wich moved first by these reasons, first appointed to use the emplaster formerly applied, is worthy of commendations; and we ought to follow him much the rather, seeing that which he found out by reason, is approved by experience. Neither did he amadvifedly command, to soment the wound every third day, that is, every dressing; for, seeing it is a powerful medicine, therefore it shands in need of mitigation. Thus much Galen, whose opini-Gales's reason on grounded on reason, he can again confirm with another reason. It is already sufficiently known, that medicines can do nothing in us unless by the force of the native heat, which stirs up the facul-ty of the medicine to operation. But in Ulcers which are absolutely malign, the native heat of the affected part is very languid, being broken and debilitated by the prefence of the preternatural heat; fo that it flands in need of a great space of time to actuate the virtue and faculty of the medicine Wherefore, if in that time, when as the native heat hath much moved and flirred up the faculty of the medicine, the Ulcer be loofed or opened, and that emplatter cast away which was laid upon the part, and a fresh one laid instead thereof; the heat implanted in the part, is either dissipated by the contract of the air, or is weakned and driven in; and that endeavour which was made by the emplaifier was to no purpose, being, as it were, stopped in the midst of the course: But a new emplaifier being laid on, the heat of the part must undergo a new labour, so to stir up the faculty to bring it to act.

Medicines are only fuch in faculty.

further explained.

For all medicines are what they are in faculty. Equal to this is their errour, who by too oft renewing their emplaifters on the fame day, do too powerfully cleanfe; for fo they do not only take away the excrementatious humous, both forder and famies, but also the alimentary juice; to wir, the Rob, Cambinon and Gluten, which are the next matter for procreating of laudable flesh. Wherefore, it is not good to drefs Ulcers fo often in one day, and to loofe them to apply new emplainters, unless some grievous symptom (as pain) force us to do it, which requires to be asswaged and mitigated by the often changing and renewing of Anodyne medicines.

CHAP. XII. How to bind up Vicers.

The begin-ning of your be at the Ul-

Or the binding up of Ulcers, you must always begin your bandage at the Ulcer. Now the rowler must be so large, that it may not only cover and comprehend the Ulcer, but also fome portion of the adjacent parts above and below; and let it press the Ulcer with that moderation, that it may only prefs out the excrementitious humors. For fo the Ulcer will become dry, and confequently more near to healing, as it is observed by Hippocrates. Let this be the measure of your binding, that it be neither too ftrait, for hence would enfue pain and defluxion; nor too lax, for fuch is of no use. You may moisten your boulsters and rollers in Oxycrate, or in red and affringent Wine, especially in Summer; when you have bound it up, the part must be kept quiet: For according to Hippocrates, those who have an Ulcer in the leg, ought neither to stand nor fit, but to lie on a bed. Wherefore, when the legs are ulcerated, the arms must be exercised, by handling, lift-

Revultion into ing up and casting down of divers things. But on the contrary, if the arms be ulcerated, the legs contrary parts, must be exercised with walking, or frictions from above downwards, if the Patient cannot endure to walk. So the humors and spirits which with more violence and greater plenty run down to the part affected, may be drawn back and diverted.

CHAP. XIII. Of the cure of particular Ulcers, and first of those of the Eyes.

4. Merb.

Or that (in Galen's opinion) the divers Indications in curing difeases are drawn from the condition of the part, to wit, the temper, complexion, fite, figure, ufe, dull or quick fenfe;
Therefore having briefly handled the general cure both of fimple and compound, and
implicit Ulcers, I think it fit to treat of them now as they are diffinguished by the parts, beginTHE PERSON NAMED IN

ning with these of the eyes. These according to Gelsus, are sometimes caused by pushules, or a sharp defluxion which frets or eats in funder the coats thereof, or elfe by a ftroke.

Paulus fets down these differences of the Ulcers of the eyes: If (faith he) a small, little and hol- 136.6. cap. 6 low Ulcer be upon the horny-coat, it is by the Greeks termed Berryon; but if it be broader and 116 3. lefs deep, it is termed Geloma; about the circle of the Iris or Rain-bow, it is called Argenou; if it be degrees, Esicrafty and fordid, it is termed Epicatoma. These in general require the same cure as the former, that cases. is, to be mundified, incarnated, dried and cicatrized; but the part affected indicates more gentle medicines. Wherefore having purged the Patient, and taken forme blood both from his arm, as also from his veins and temporal arteries, and bathed him if it be needful, to divert the defluxion, you final to his thoulders apply Cupping-glaffes with Scarifications; or elfe bread newly drawn out of the Oven, and sprinkled with Aqua vite; or some good Wine shall be applied to the original of the spioal marrow. But you shall apply to the forehead and temples an aftringent emplaiter made of em- A colorism to plajirum contra supruram, ung. Comitiffe, and reficeationem rubrum mixed together. But this enfuing deane the al-Colyrium described by Celfus and approved by Hollerius, shall be dropped into the eye. R. Æris 1971, cadmie wie & lote, an. 3 i. ex aqua fingatur cellyrium quod liquore ovi diffolvatur. But in the mean time you must diligently observe whether you put the eye to any great pain. Wherefore now and then by putting anodyne medicines thereto, it will be good to comfort it. Also you may make collyria of the decoction of Plantain, Fenngreek, Wormwood, with a little quantity of Sugar-candy, tutia, gum tragacanth, Myrrh and Vitriol diffelved therein. When the Ulcer is mundified, the following Sarcotick will be of good use. R Sarcocolle in latte muliebri untrite, 3 iij.pul. diaircos simplicis gum. arabici,tra- A sarcocick gaeanth, an. 3 1. Mucilaginis fanugreci quantum sufficis ut inde fiat collyrium. But you must note, that collyrium. for moift Ulcers, Powders are more convenient than Collyria. When the Ulcer is plained or filled with its proper flesh, it may be cicatrized with the following collymon. R Tutie; cadmie at decit pre- An epulotick parate, cerufe, antimonii, clibani, an. 3 p. Myrrhe, farcacelle, fangunit Draconis, alocs, opii, an. 9 p. Collyrian. Com aqua plantaginis fiat collyrium; or the powder only may be conveniently strewed thereon.

Celfire hath noted, that the cicatrizing of the eyes is incident to two dangers; that is, left they be too hollow, or elfe too thick. If too hollow, they must be filled by the following remedy. It Papaveris laceyme, 3 B. Sagapini, opopanacis, an 3 t. arnginis 3 i. Cumini 3 iij. Piperis 5 iij. cadmik late & cerufa, an 3 i p. Cum aqua pluviali fiar collyrium. But if the fears be thick or gross, the following remedy will extenuate them. R. Cinaman, acacia, an. 5 B. Cadmia clota, croci, myerba, papaveris lacryma, gama arabici, an. 3 i. Piperis albi, thuris, an. 3 i \$\beta\$. Æris combusti, 3 ii). Cum aqua pluvialistiat The sears of collyrium. But if the scar be upon the Cornea or horny coat, so that it cover the populsa or sight, the the hornycoat sight will be intercepted by the denseness of the membrane. Here you must also observe, that the are white, and fears that are on the Cornea are white, but these on the Adnata are red, because this is spread over these of the

CHAP. XIV.

Of the Ozwna and Vicers of the Nofe.

He Ozena is a deep and flinking Ulcer in the infide of the nofe, fending forth many crufty Lib. 6. cap. 8. and flinking excrements: Cellie faith, that fisch Ulcers can fearcely be healed. It is caused Gal. lib. 3. de and flinking excrements: Celfin faith that fuch Ulcers can feareely be healed. It is caufed (as Galen faith) by the diffillation of acrid and putrid humors from the head into the nostrils about the mammillary processes. For the cure, the Patient must cat sparingly; and his meat The cure. must neither be sharp nor strong; the humor being prepared, must be purged; the head dried and strengthned, that so it may neither admit the excrementations humors, nor fend them down; then must we come to the part affected with the Ulcer. The Ulcer must be dried with a repelling mediant cine; fuch as is the juice of Potnegramats boiled to the half in a brafs veffel; the powder of Calamint, Creffes, white Hellebore, the juice of Creffes with Alum and other things which you may sead in Celfin. Galen out of Archigenes wishes, to draw up into the notirils the juice of Calamint, or that the Calamint it felf being dried, and made into powder, may be blown with a quill into the nose. Others sufe this following powder. Re Ros. rub, mint, calam, arom, rad, angelice, gentian, macd, Lib, 20, 1918, 5, caryop, an. 3 p. Gamph, ambre, inc. gr. iii). Mosch, gr. v), sat pulves submissioning in this affect. But if the investerate and conturnacious evil do not yield to these remedies, then you must have recourse to Cope to the offa ras, Verdigreece, fal ammoniacum, and Alum with Vinegar. It divers times happens, that the Ull- 21th olders cer fpreading on, comes to take hold of the Offa ethmoidea, or five-like bones; in which case, you must not forcibly pluck them out, but refer the whole business to Nature, and expect when they shall come away of themselves, making in the mean while injections into the nostrik, of Aqua vite, when they come away of themselves, making in the mean while injections into the nostrik, or Aqua vite, wherein Cephalick powders have been fleeped for the greater drying.

CHAP. XV. Of the Ulcers of the Month.

F this Tribe are the Aphaba, Ulcers familiar to little children, according to Hippocrater. Aphaba 16th 3.5. They off-times begin in the gums, and by the palat of the mouth creep into the Uvula, Collar 16th 6. throtle, and over all the mouth, as Celliss faith. Galen makes two kinds of Aphaba's; the one can at 3. 16th, the control of the arrives of the control of the control of the arrives of the control of the control of the arrives of the control of th of case cure, such as that which usually troubles children by reason of the acrimony of the nurses often milk; the other is malign by reason of an afflux of an evil humor (that is, venenate and malign) into the mouth. For the cure, it shall be good to abstain from all acrid things, and if it be a The cure. facking child, it will not be amifs to temper the nurses milk with refrigerating meats, bathing

..........

the whole body, and fomenting the dugs with warm water; for all the members in children are most tender, and as it were mucous, and their mouths are unaccustomed to meats and drinks. For topick medicines, you must make choice of such, which may quickly and readily work the effect; Therefore if the Ulker be malign, it must be lightly touched with Agua fortis, which hath been ofed in feparating metals, and which befides is tempered with fix parts of common water. You may for the fame purpose use the Oyls of Vitriol, Sulphur, Antimony, Mercury-water, and the like. Actins withes you to touch and correct fuch Ulcers with a lock of Wooll dipped in fealding. Oyl, and so fastned to the end of a Probe, until they wax white and become smooth or plain: For so their eating and spreading force will at length be bridled, and laudable slesh grow up in place of that which is eaten. After fuch burning, it will be good to wash the mouth with the following Gagarifm, which allo of it felt alone will ferve to cure Aphtha's, which are not malign. Re Hordei ingantin, which also of it tell asone will lerve to care Aprilla's, which are not mangin. As Fronder metegrip, i. plantag, ceterach, pilofella, agrimmus, an M.i. fiat decolio ad. Ib i. In qua diffolve mellis rofati

§ i. Diamoron, § §. Fint gargarifma. You may also make other gargles, of Pomegranate-Pills, Baluttines, Surnach, Berberies, Red-roses being boiled, and diffolved in the strained liquor Diamoron and Diamorom, with a little Alams: For Galen writes, that simple Ulcers of the mouth are healed with things which dry with moderation; now Diameron and Diameron are fuch. But others fland in need of firong medicines, with fuch like. If the palat be feifed upon, we must use the more diligence and care; for there is danger, left (being the part is hot and moift,) the bone (which lies under which is rare and humid) may be corrupted by the contagion, and fall away; and the voice or speech be spoiled. If the Ulcer be pocky, omitting the common remedies of Ulcers, you must speedily betake your felf to the proper Antidote of that difeafe, to wit, quick-filver. Fiftulous Ulces often take hold on the gums, whence the root of the next tooth becomes rotten; and fo far, that the acrimony of the Sanies oft-times makes its felf a paffage forth on the outfide under the chin; which thing puts many into a false conceit of the Sersphula, or Kings-evil, and consequently of an uncurable difeate. In such a case Actius and Celfus counsel is, to take our the rotten tooth, for so the Fishula will be taken away, the gum preffing and thrufting it felf into the place of the tooth which was taken forth; and so the cause nourithing the putrefaction being taken away, (that is, the tooth) the rest of the cure will he more easie. The Ulcers of the tongue may be cured by the same remedies by which the rest of the mouth; yet those which breed on the fide thereof, endure very long, and you must look whether or no there be not sometharp tooth over against jit, which will not suffer the Ulcer in that place to heal; which if there be, then must you take it away with a file.

A Gargarithn for the Aphthe. Lib. 6. Mith. cap. Lo. Ulcers of the palat must be quickly and carefully deef-

Arties lib. 6. ceffer lib. 6. 119. 23.

CHAP. XVI. Of the Vicers of the Ears.

Their causes,

Leers are bred in the auditory paffage both by an external cause, as a stroke, or fall; as also by an internal, as an abscess there generated. They off-times flow with much matter not there generated, for fuch Ulcers are usually but small, and besides in a spermatick part s but for that the brain doth that way disburthen its felf.

The cure.

For the cure, the chief regard must be had of the antecedent cause, which feeds the Ulcer, and A Mashicatory, it must be diverted by purging medicines, Mashicatories and Errhines. This is the form of a Mashicatory. R. Mafieb. 3 i. staphifagr. & pyreth. an. 3 i. Cinam. & caryoph. an. 3 i. Fiant Masticatoria, attatur mane & vestore. But this is the form of an Erchin. R. Succi betonic, mercurial. & melisse, an. 3 F. Vini albi 3 i. mifee & frequenter naribus attrabatur. For topick medicines, we must thun all fatty and oily things, as Galen fets down in Method. medendi, where he finds fault with a certain follower of Theffalus, who by using Tetrapharmacum, made the Ulcer in the ear grow each day more filthy than other, which Galen healed with the Trochifees of Andronius diffollows in Vinegar, whose compofure is as followeth. over, an Oxes gall diffolved in firong Vinigar, and dropped in warm, amends and dries up the putrefaction wherewith these Ulcers flow. Also the scales of Iron made into powder, boiled in sharp Vincers and June 1988 leave Vinegar, dried and strewed upon them. But if the straitness of the passages should not give leave to the matter contained in the windings of the ears to pass forth, then must it be drawn out with an Instrument thereupon called a Pseuleur, or Matter-drawer, whereof this is the figure.

ARREST MANY

CHAP. XVII.

Of the Ulcers of the Wind-pipe, Weazon, Stomach and Guts.

Hele parts are ulcerated either by an external cause as an acrid medicine, or poyson swal. The causes, slowed down; or by an internal cause, as a malign fretting humor, which may equal the force of poyson generated in the body, and restrained in these parts. If the pain be in-Signs, creased by swallowing or breathing, it is the sign of an Ulcer in the weazon, or wind-pipe joyning thereto. But the pain is most sensibly felt whenas that which is swallowed is either four or acrid, or the air breathed in, is more hot or cold than ordinary: But if the cause of pain lie failned in the same analysis of the strength of the same analysis of the floranch, more grievous fymptoms urge; for fornetimes they fwound, have a naufcous difposition and vomiting, convulsions, gnawings, and pain almost intolerable, and the coldness of the extreme parts; all which when present at once, sew scape unless such as are young, and have very strong bodies. The same affect may be fall the whole stornach, but because both for the bitterness of pain, and greatness of danger, that Ulcer is far more grievous which takes hold of the mouth of the ventricle, honoured by the Ancients with the parts of the Heart, therefore Phospicial of the ventricle, honoured by the Ancients with the name of the Heart; therefore Phylicians do not make so great a reckoning of that which happens in the lower part of the stomach. Now we Got like know that the guts are ulcerated, if Pus, or much purulent matter come forth by itool; if blood de toe. affect: come that the gate decented, if Phis, or finder partition matter come form by noot; it blood de the agree come that way with much griping; for by the Phis flaying, and as it were gathered together in cap. 5. that place, there is, as it were, a certain continual Tenginus, or define to go to flool. Now all fisch Ulkers are cured by meats and drinks, rather than by medicines, according to Galen: Therefore Lib. 4. 6.5. you must make choice of all such meats and drinks as are gentle, and have a lenitive faculty, shunning acrid things; for Tatia, Litharge, Ceruse, Verdigreece and the like, have no place here, as they have in other Ulcers: But when as the Ulcer shall be in the gullet or weazon, you must have a care that such things may have some viscidity or toughness, and be swallowed by little and little, and at that fuch things may have fome viscidity or toughness, and be swallowed by little and little, and at divers times; otherwise they will not much avail, because they cannot make any stay in these common ways of breath and meat; therefore they presently slip down and flow away; wherefore all sich things shall be used in form of an Edogma, to be taken lying on the back, and swallowed medicines for down by little and little, opening the muscless of the throat, less the medicine passing down fuddenly, and in great quantity, cause a Cough, a thing exceeding burtful to these kinds of Ulcers of the denly, and in great quantity, cause a Cough, a thing exceeding burtful to these kinds of Ulcers. When they must be cleanfed, you shall have crude honey, which hash a singular faculty above all other detergent things, in these kinds of Ulcers: But when they can conveniently swallow, you acrid things (as I have formerly advised) must be shunned; as those which may cause pain, instamble a Prisan, and suggested of the decoction of the meat: Therefore let them frequently the decoction of Pranes, Dates, Figs, Raisins, Honey, Cows-milk boiled with the yolks of Eggs, authere, altringent and agglutinative things, which want all acrimony, and ungateful taste, such as the Lentisk-wood, the tops of Vines, of Brambles, Myrtles, made in altringent Wine, unless there Jujubes. Honey mixed with other medicines is a very sitting remedy for Ulcers of the guts and how powerfed telves, they will flick to the stomach's neither will they carry their strength any surther's but hoosely and helps them formed able, if so be that it be made of such their surfaces, here also Affes milk may with men dable, if so be that it be made of such thers themselves. Here also Affes milk may with mendable, if so be that it be made of such theres them to the rest of the body, and helps them formedable, if so be that it be made of such theres and Simples, as by a certain tacit familiarity have that if the greater guts be affected, you may heal them which a Clyster and divers times; otherwife they will not much avail, because they cannot make any stay in these that it the greater guts be affected, you may heal them with a Clyster and Injections, made also marp the correct the putrefaction; fuch as are those which are made of Barley-water, or Wine with £gyp-greater gats.

But if the small guts be ulcerated, they must be rather healed by potions and other things Lib. 5. must taken at the mouth; for that (as Galen faith) these things which are put up into the body by the sundament, do not commonly ascend to the simall or slender guts, but such as are taken at the mouth cannot come unless with the loss of their faculty, so far as the great guts.

CHAP. XVIII.

Of the Vicers of the Kidneys and Bladder.

Leers are caused in the Kidneys and Bladder, either by the use of acrid meats drinks, or me- Causes. Leers are caused in the maneys and baseders, either by the use or acrid means drinks, or me-dicines, as Cantharides; or elfe by the collection of an acrid humor, bred in that place, fent or faln thither; or elfe by the rupture of some vessel, or an absects broken and degene-tated into an Ulcer, as it sometimes comes to pass. They are discerned by their site, for the pain signs. and heaviness of Ulcers of the reins comes to the loins, and the Par or matter is evacuated well and

Neither doth the Pas which flows from the reins flink foill, as that which is cast forth of the bladder; the reason is, for that the bladder being a bloodless, stethless and membranous part, hath not fuch power to refift putrefaction. That Par which flows from the kidneys, never

(1111)

flows without water; and although by long keeping in an urinal, it at length subsides or falls to the bottom, and may be feen feparated; yet when it is first made, you may fee it perfectly mixed with the Urine; but that Pus which flows from the bladder is oft-times made alone without urines and usually it comes to pais that the Pns, or matter which flows from the ulcerated kidneys, hath in it certain caruncles, or as it were hairs according to the rule of Hippocrates. Those who in a thick urine have little caruncles, and, as it were, hairs come forth together therewith, they come from their kidneys; but on the contrary, those who have certain brain-like scales come from them

in a thick urine, their bladder is scabby, or troubled with a scabby ulcer.

For the cure it is expedient that the belly be soluble either by Nature or Art, and the use of mollifying Clyfters. And it is good to vomit formetimes, so to draw back the humors by whose con-flux into the affected part the ulcer might be fed and made more fordid and filthy. You must beware of strong purgations, less the humors being moved and too much agitated, the matter fit to nourish the ulcer may fall down upon the kidneys or bladder. The enfuing potion is very effectual to mundifie those kind of ulcers. Re Hordei integri, M. ij. Let him take one thereof in the morning diffolyed in Barley-water or Goats-milk. Galen bids to mix honey and diuretick things with medicines made for the ulcers of the reins and bladder, for that they gently move urine, and are as vehicles to carry the medicines to the part affected. Ulcers of the bladder are either in the bottom thereof, or at the neck and urinary paffage. If they be in the bottom, the pain is almost continual; if in the neck, the pain then pricks, and is most terrible when they make water and presently after. The ulcer which is in what part of then pricks, and is most terrible when they make water and petering and the urine; but that which is the bladder is the bottom fends forth certain fealy or skinny excrements together with the urine; but that which is observed.

The pricks in the neck, causes almost a continual Tentigo. Those which are in the bottom are for the most part which the ulcer in the bottom are for the most part. incurable, both by reason of the bloodless and nervous nature of the part, as also for that the ulcer is continually chafed and troubled by the acrimony of the urine, so that it can hardly be cicatrized. are uncorable. For even after making of water fome reliques of the urine always remain in the bottom of the bladder, which could not therefore pass forth together with the reft of the urine, for that for the pasfing forth of the urine, the bladder being diffended before, falls and is complicated in its felf. Ulcers of the bladder are healed with the fame medicines as those of the reins are; but these not only taken by mouth, but also injected by the urinary passage. These injections may be made of Gor-donine his Trochisces somerly prescribed, being dissolved in some convenient liquor; but because uldoning his Frochices formerly preterized, being differed in forme convenient nquor; but because incers of the bladder cause greater and more sharp pain than those of the kidneys, therefore the Chirurgeon must be more difigent in using Anodynes. For this purpose, I have often by experience found, that the Cyl of Henbane made by expersion, gives certain help. He shall do the same with Cataplasins and Liniments applied to the parts about the Petien and all the lower belly with Perincum, as also by casting in of Clysters. If that they slink, it will not be amiss to make injection of a little Egyptiscum dissolved in Wine, Plantain or Rose-water. For I have often used this remedy in such a case, with very prosperous success.

CHAP. XIX. Of the Ulcers of the Womb,

The causes.

Lib. 3. fell, 12. tract. 2. cop. 5. Signs.

The cure.

Why firongly drying things are good for Ulcers of the An Injection for an ulcer in the bottom of the womb.

An Injection headring putretaction.

Leers are bred in the womb, either by the conflux of an aerid, or biting humor, fretting the coats thereof, or by a tumor against nature degenerating into an abscess, or by a difficult and hard labour; they are known by pain at the Perincum, and the efflux of Pus and Sanies by the privity. All of them in the opinion of Avicen, are either putrid, when as the Sanier breaking forth is of a flinking finell, and in colour refembles the water wherein flesh hath-been washed; or else fordid, when as they stow with many virulent and crude humours; or else are eating or preading ulcers, when as they cast forth black Sanier, and have pulsation joyned with much pain. Befides they differ amongst themselves in fite, for either they possess the neck and are known by the fight, by putting in a feeulum, or elfe are in the bottom, and are manifelled by the condition of the more liquid and ferous excrements, and the fite of the pain. They are cured with the fame remedies wherewith the ulcers of the mouth, to wit, with Aqua fortis, the Oyl of Vitriol and Antimony, and other things made formewhat more mild, and corrected with that moderation, that the ulcerated parts of the womb may be fafely touched with them; it is requilite that the remedies which are applied to the ulcers of the wornb, do in a moment that which is expected of them, for they cannot long adhere or flick in the womb, as neither to the mouth. Galen faith, that very drying medicines are exceeding fit for ulcers of the womb, that so the putrefaction may be hindred or restrained, whereto this part as being hot and moist is very subject; besides that, the whole body, unto this part, as unto a fink, sends down its excrements. If an ulcer take hold of the bottom of the womb, it shall be cleanfed, and the part also strengthened, by making this following Injection. Re Hordei integri p. ij. Guajaci 3 i. Rad. Ireor. \$ | . Abfinth. plant. centaur. utrinsque, an. Mi. Fint decott, in aqua fabrorum ad 10 ij. in quibus dissolve mellis resait, & sprupi de absinthio, an. 3 iij. Fint injectio. I have often had certain experience of this enfuing remedy. R vini rub. th i. Unguent, egyptisci 3 ij. Buliant, parnon. Thus the putrefaction may be corrected, and the painful malicioutness of the humor abated. Ulcers when they are cleanfed, must prefently be cicatrized, that may be done with Alum-water, the water of Plantain

wherein a little Vitriol or Alum have been disfolved. Lattly, if remedies nothing availing, the ulcer turn into a Cancer, it must be dressed with Anodynes and remedies for a proper Cancer, which you may find fet down in the proper Treatife of Cancers. The cure of ulcers of the fundament was to be joyned to the cure of these of the womb; but I have thought good to refer it to the Treatife of Fiftula's, as I do the cure of these of the urinary passage to the Treatise of the Lucs Venerea,

CHAP. XX.

Of the Varices, and their cure by cutting:

Variet is the dilatation of a vein, some whiles of one, and that a simple branch, other whiles What a Variet of many. Every Varix is either firait or crooked, and as it were infolded into certain windings within its felf. Many parts are subject to Variets; as, the temples, the region of ences thereof. the belly under the navil, the tefficles, womb, fundament, but principally the thighs and legs. The matter of them is ufually melancholy blood, for Varieer often grow in men of a melancholy temper, The matter of them is ufually melancholy blood, for Varieer often grow in men of a melancholy temper, and which ufually feed on groß meats, or fuch as breed groß and melancholy humors: Alfo women with child are commonly troubled with them, by reason of the heaping together of their suppressed mentional evacuation. The precedent causes are a vehement concustion of the botheir suppressed mentitual evacuation. The precedent causes are a vehement concussion of the boarders dy, leaping, running, a painful journey on foot, a fall, the carrying of a heavy burthen, torcure or racking. This kind of disease gives manifest signs thereof by the largeness, thickness, swelling and Signs, colour of the veins. It is best not to meddle with such as are inveterate; for of such being cured there is to be seared a resux of the melancholy blood to the noble parts, whence there may be imminent danger of malign ulcers, a Cancer, Madness or Suffocation. When as many Variets and diversly implicit are in the legs, they often swell with congcaled and dried blood, and cause pain, which is increased by going and compression. Such like Variets are to be opened by dividing the Theodorius vein with a Lancet, and then the blood must be pressed out, and evacuated by pressing it upwards of Variets and downwards; which I have off-times done, and that with happy success to the Patients, whom I have made to rest for some sew days, and have applied convenient medicines. A Variet is often cut I have made to reft for fome few days, and have applied convenient medicines. A Varix is often cut in the infide of the leg a little below the knee, in which place commonly the original thereof is feen He which goes about to intercept a Varix downwards from the first original, and as it were fountain thereof, makes the cure far more difficult. For hence it is divided, as it were, into many rivulets, all which the Chirurgeon is forced to follow.

vulets, all which the Chirurgeon is forced to follow.

A Varize is therefore cut or taken away so, to intercept the passage of the blood and humours For what inmixed together therewith, flowing to an ulcer seated beneath; or else less that by the too great tentions Varize ing from thence. Now this is the manner of cutting it. Let the Patient lye upon his back on a Passage say, 82, the passage of the blood and humours for what ina bench or table, then make a Ligature upon the leg in two places the distance of some four singers. The manner cach from other, wherein the excision may be made, for so the vein will swell up and come more how to carrie in sight; and besides, you may also mark it with ink; then taking the skin up between your singers, cut it long-ways according as you have marked it; then free the bared vein from the adjacent bodies, and put thereunder a blunt-pointed needle (left you prick the vein) thred with a long double thred, and fo bind it faft; and then let it be opened with a Lancet in the middle under the Ligature, just as you open a vein, and draw as much therehence as shall be it: Then streight make a Ligature in the lower part of the forementionevd vein, and then cut away as much of the faid vein as as convenient between the Ligatures, and fo let the ends thereof withdraw themselves into the flesh above and below; let these Ligatures alone until such time as they fall away of themselves. The operation being performed, let an affringent medicine be applied to the wound and the neighbouring pares; neither must you fir the wound any more for the space of three days. Then do all other things as are ht to be done to other such affects.

> CHAP. XXI. Of Fitula's.

Fiftula is a finuous, white, narrow, callous, and not feldom unperceivable Ulcer: It took its What a Fiftulation from the fimilitude of a reeden (Fiftula) that is, a pipe, like whose hollow- lais, ness it is. A Fiftula is bred in fundry parts of the body, and commonly follows upon abfeeffes or ulcers not well cured.

A Callour is a certain fleshy substance, white, folid, or dense and hard, dry and without pain, what a cellour generated by heaping up of dried excrementitious phlegm, or elfe adult melancholy encomis, what a callow paling the circuit of the ulcer, and substituting it felf in the place of the laudable flesh. The Sinus The different or cavity of a Fiffula is fornetimes dry, and other while drops with continual moifture: Sometimes ces of Fiffula is the dropping of the matter fuddenly ceases, and the orifice thereof is that up, that so it may decrive both the Chirurgeon and the Patient with a false thew of an absolute cure; for within a while after it will open again, and run as formerly it did. Some Fiftula's are bred by the corruption of a bone, others of a nerve, others of membranes, and others of other parts of the body. Some run firait in, others, and that the greater part, have turnings and windings a forme have one, others have more oriclies and windings; fome are at the joynts, others penetrate into fome capacity of the body, as into the cheft, belly, guts, womb, bladder; fome are eafily, others diffi-tiety of the and fome wholly uncurable. There are divers figns of Fifula's, according to the va-riety of the ricty of the parts they poffess; for if that which you touch with the end of your Probe make re-

The fign that bare from the the matter which is caft forth. Atting tetr 4. fell. 2. cop. 55.

fistance, and refound, then you may know that it is come to the hone; and then if the end of the Probe flip up and down as on a smooth and polite superficies, it is a sign that the bone is yet found s but if it ftop and ftay in any place as in a rough way, then know the bone is caten, rough and perished; formetimes the bone lies bare, and then you need not use the Probe, Besides also it is a sign that the bone is affected, if there be a purulent efflux of an unctuous or oily matter, not much unlike that marrow wherewith the bone is nourified. For every excrement flews the condition of the nourilhment of the part whence it is fent; in a Fiftula which penetrates to a nerve, the Patient is troubled with a pricking pain, especially when you come to fearch with a Probe, especially if the matter which flows down be more acrid: Oft-times if it be cold, the member is flupified, the motion being weakened; befides also the matter which flows from thence is more subtle, and somewhat like unto that which flows from the bones, yet not oily nor fat, but fanious and vifcous, refembling the condition of the alimentary humour of the nerves. The fame ufually appears and happens in Fiftula's which penetrate to the tendons and those membranes which involve the muscles. If the Fiftula be within the flesh, the matter flowing thence is more thick and plentiful, smooth, white and equal. If it descend into the veins or arteries, the same happens as in those of the nerves but that there is no fuch great pain in fearching with your Probe, nor no offence or impediment in the use of any member: Yet if the matter of the fishulous Uker be so acrid, as that it corrode the veffels, blood will flow forth; and that more thick if it be from a vein, but more fubtle and with forme murmuring if from an artery. Old Fiftula's, and fuch as have run for many years, if fud-denly flut up, cause death, especially in an ancient and weak body.

Old Fiffula's if closed prove mortal.

CHAP. XXII. Of the cure of Fiftula's.

How to find ings and caviries of Fiftu-

Cauffick In-

celfus, lib. 5.

a Fiftula pro-ceeding from a corruptbone.

The cure of what Fiftula's may be at-tempted, and which may A palliarive cure of a Fi. flula,

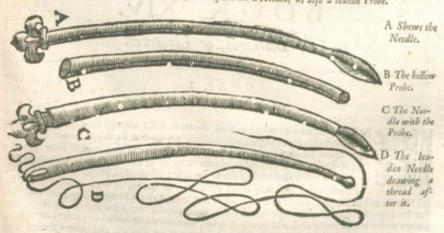

Or the cure; in the first place it will be expedient to search the Fistula; and that either with a wax fize, a Probe of Lead, Gold or filver to find out the depth and windings or corners thereof. But if the Fiftula be hollowed with two or more orifices, and those cunicalous, so that you cannot possibly and certainly fearch or find them all out with your probe; then must you gaft an Injection in fome one of these holes, and so observe the places where it comes forth, for so you may learn how many, and how deep or fuperficiary cavities there be; then by making incitions you must lay open and cut away the callous parts. You must make incisions with an Incision-knife or Razor, or else apply actual or potential cauteries; for nature cannot, unless the callous fubliance be first taken away, restore or generate slesh, or agglutinate the distant bodies; For hard things cannot grow together, unless by the interpolition of glue, such as is laudable blood; but a callous body on all fides possessing the furface of the ulcerated flesh, hinders the flowing of the blood out of the capillary veins, for the refloring of the lost substance, and uniting of the dif-joynted parts If you at any time make cauftick Injections into the Fiftula, you must prefently stop the orises thereof, that fo they may have time to work the effect, for which they are intended. Which thing we may conjecture by the tumor of the part, the digefture of the flowing matter, and its lefter quantity. Then you must hasten the falling away of the Eschar, and then the Ulcer must be dressed like other Ulcers. But oft-times the Callus which possesses the sinuous cavity of a Fistula, overcome by the power of acrid and escarcick medicines, comes whole forth, and falls out like a pipe, and so leaves a pure Ulcer underneath it. Which I observed in a certain Gentleman, when I had washed with firong Egyptiscum divers times a fifulous Ulcer in his thigh, that through with a bullet then prefently by putting in my Balfam formerly described, he grew well in a short time. Fistula's which are near great vessels, nerves or principal intrails, must not be meddled with unless with great Remedies for caution. When a Fiftula proceeds by the fault of a corrupt bone, it is to be confidered whether that fault in your bone be superficiary or deeper in, or whether it is wholly rotten and perished: For if the default be superficiary, it may easily be taken away with a desquammatory Trepan, but if it penetrate even to the marrow, it must be taken forth with cutting mullets, first having made way with a Terebellum. But if the bone be quite rotten and perished, it must be wholly taken away, which may be fitly done, in the joynts of the fingers, the radius of the cubit and leg; but no fuch thing may be attempted in the focket of the huckle-bone, the head of the thigh-bone, or any of the rackbones when they are mortified, neither in those Fistula's, which are of their own nature incurables but you shall think you have discharged your duty and done sufficiently for the Patient, if you leave it with a prognostick. Of this nature are Fishula's which penetrate even to the bowels, which come into the parts orespread with large vessels or nerves, which happen to esseminate and tender persons, who had rather die by much, than to fuffer the pain and torment of the operation. Like caution must be used, when by the cutting of a Fisual there is fear of greater danger, as of convulsion, if the disease be in a nervous part. In these and the like cases, the Chirurgeon shall not set upon the perfect cure of the difease, but shall think it better to prevent, by all means possible, that the difease by fresh supplies become no worse, which may be done, if he prevent the falling down of any new defluxion into the part s if by an artificial diet he have a care that excrementatious humors be not too plentifully generated in the body; or so order it, that being generated, they may be evacuated at certain times, or else diverted from the more noble to the base parts. But in the mean space it shall be reconstructed and the parts. he requilite to waste the faulty slesh, which grows up more than is fitting in the Ulcer, and to cleanle the forder or filth, with medicines which may do it without biting or acrimony and putrefactionTHE REAL PROPERTY.

CHAP. XXIII.

Of the Fiftula's in the Fundament.

Miula's in the Fundament are bred of the fame causes as other kinds of Fifula's are; to wit, The causes, of a wound or abscess not well cured, or of a harmorrhoid which is suppurated. Such as are occult, may be known by dropping down of the fundament purulent humor by the fundament. ment, and the pain of the adjacent parts. But fuch as are manifest, by the helpof your probe you may find whither they go, and how far they reach. For this purpose the Chirurgeon shall put his singer into the fundament of the Patient, and then put a leaden Probe into the orince of the Fishula; which if it come to the finger without interpolition of any medium, it is a fign it penetrates into the capacity of the gut. Befides also, then there flows not only by the fundament, but also by the orince which the malign humour hath opened by its acrimony, much matter, fome whiles famous, and oft-times also breeding Worms. Fiftula's may be judged cuniculous, and running into many turnings and windings, if the Probe do not enter far in, and yet notwithstanding more matter flows there-hence than Reason requires should proceed from so similar Ulcer. You may in the orifices of Symptomia all Fistula's perceive a certain callous wart, which the common Chirurgeons term a Hens-aric. Many fymptoms accompany Fittula's which are in the fundament, as a Tenefinas, firangury and falling down of the fundament. If the Fiftula must be cured by manual operation, let the Patient lye to The art of upon his back, that lifting up his legs, his thighs may prefs his belly; then let the Chirurgeon, ha-ving his nail pared, put his finger, beforeared with fome syntment, into the Patients fundament; la of the fan-then let him thruft in at the orifice of the Fifula, a thick leaden needle, drawing after it a thread con-dament. fifting of thread and horfe-hairs woven together, and then with his finger taking hold thereof, and fornewhat crooking it, draw it forth at the fundament, together with the end of the thread: Then let him knit the two ends of the thread with a draw or look-knot, that so he may straiten them at his pleafure. But before you bind them, you shall draw the thread somewhat roughly towards you, as though you meant to faw the slesh therein contained, that you may by this means cut the Fishula without any fear of a Hzmorrhage, or flux of blood. It fornetimes happens, that fuch Fiftula's penetrate not into the guts fo that the finger by interpolition of fome callous body, cannot meet with the Needle or Probe. Then it is convenient to put in a hollow iron or filver Probe, fo through the cavity thereof to thrust a sharp pointed needle, and that by pricking and cutting may destroy the Callar, which thing you cannot perform with the sormerly described leaden Probe, which hath

The Description of a bollow silver Probe, to be used with a Needle, as also a leaden Probe.

The Callin being wasted, the Fistula shall be bound as we formerly mentioned. That which is superficiary needs no binding, only it must be cut with a crooked featprism, and the Callus being consumed, the rest of the cure must be performed after the manner of other Ulcers. But you must note, that if any parcel of the Callous body remain untouch'd by the medicine or Instrument, the Fiftula reviving again, will cause a relapse.

CHAP. XXIV. Of Hamorrhoides.

Emorrhoides as the word is usually taken, are Tumors at the extremities of the veins en-compassing the fundament, caused by the defluxion of an humor commonly melancho-are-lick, and representing a certain kind of Varieer. Some of these run at an hole being Their diffeopened, which fometimes in space of time contracts a Callus; others only swell, and cast forth no rences. In the commonly cast forth no rences. blood mixed with yellowish scrous moisture, which stimulates the blood to break forth, and by its

Symptomes.

rate flowing of the Hamor rhoides.

For supprest rhoides.

acrimony opens the mouths of the veins. Eut fuch as do not run, are either like blifters, fuch as happen in burns, and by Practicioners are usually called Vescales, and are caused by the defluxion of a phlegmatick and ferous humor; or elfe represent a Grape, whence they are called Uvales, generated by the aiflux of blood, laudable in quality, but over-abundant in quantity; or elfe they exprefs the manner of a difease, whence they are termed Morales, proceeding from the suppression of melancholick blood; or else they represent Warts, whence they are stilled Vermeales, enjoying the same material cause of the generation as the Morales do. This affect is cause of many accidents in men; for the perpetual efflux of blood extinguisheth the vivid and lively colour of the face, calls on a Dropfie, overthrows the firength of the whole body. The flux of Hamorrhoides is common-ly every month, fometimes only four times in a year. Great pain, inflammation, an abfects which may at length end in a Fifula, unless it be relifted by convenient remedies, do oft-times fore-run the evacuation of the Hæmorrhoides. But if the Hæmorrhoides flow in a moderate quantity, if the Seat. 37. felt.6. Patients brook it well, they ought not to be flayed, for that they free the Patients from the fear of eminent evils, as Melancholy, Leprofie, Strangury, and the like. Befides, if they be ftopped without a cause, they by their reflux into the lungs cause their inflammation, or else break the vessels thereof; and by flowing to the liver, cause a Dropsie by the suffocation of the native heat; they cause a Dropsie and universal leanness on the contrary, if they flow immoderately, by refrigerating A remedy for the liver by lots of too much blood; wherefore when as they flow too immoderately, they must be flayed with a pledget of Hares-down dipped in the enfuing medicine. Re Pul. aloes, thuris, balangt. fang, draconis, an. 3 4. Incorporentur fimul cum ovi albumine, fiat medicamentum ad ufum. When they are fretched out and fwoln without bleeding, it is convenient to beat an Onion roafted in the embers with an Oxes gall; and apply this medicine to the fwoln places, and renew it every five hours. This kind of remedy is very prevalent for internal Hæmorrhoides; but such as are manifest, may be opened with Horse-leaches, or a Lancet. The juice or mass of the Herb called commonly Dead-nettle, or Arch-angel, applied to the fwoln Hæmorrhoids, opens them, and makes the congealed blood flow there-hence. The Fungus and Thymus, being difeases about the fundament, are cured by the same remedy. If acrimony, heat and pain, do too cruelly afflict the Patient, you must make him enter into a bath, and presently after apply to the Ulcers (if any such be) this following remedy. Re Olei ros. 3 iiii. Gerusa 3 i. Litharg. 3 S. Ceranova, 3 vj. Opii) i. Fist unguent. secondum artem. Or esse. Thuris, myrrha croci, an. 3 i.Opii) i. BOOK XIV.

Of Bandages, or Ligatures.

CHAP. I.

Of the differences of Bandages.

Andages, wherewith we use to bind, do much differ amongst themselves: But their differences (in Galen's opinion) are chiefly drawn from fix things, to wit, their matter, figure, length, breadth, making, and parts whereof they confilt. Now the mat-ter of Bandages is threefold; membranous or cf skins, which is accommodated peculiarly to the fractured grifles of the note; of woollen, proper to inflamed parts, as those which have need of no affriction; of linnen, as when any thing is to be

What doth best for row. lers.

Sea.3, de Chir. fast bound; and of linnen cloaths, tome are made of flax, other some of hemp, as Hipportater observes But Bandages do thus differ amongst themselves in structure, for that some thereof confist of that matter which is fufficiently close and strong of it felf, such are the membranous; others are woveras the linnen ones. But that linnen is to be made choice of for this use, and judged the best, not which is new and never formerly used, but that which hath already been worn, and served for other uses that so the Bandages made thereof, may be the more soft and pliable: Yet must they be of such firength, that they may not break with firetching, and that they may firaitly contain and repol the humor ready to flow down, and so hinder it from entring the part. These, besides, must not be hemmed nor flitched, must have no lace nor feam; for hems and feams by their hardness press into, and hurt the fielh that lies under them. Lace, whether in the midft or edges of the rowler, makes the Ligature unequal. For the member where it is touched with the lace, as that which will not yield, is preffed more hard; but with the cloth in the middle more gently, as that which is more lax. Furthermore, these Ligatures must be of clean cloth, that if occasion be, they may be mosistened or steeped in liquor appropriate to the disease, and that they may not corrupt, or make worse that liquor by their most see that they may not corrupt, or make worse that liquor by their mouttening therein. Now the Bandages which are made of of linnen clothes must be cut long-ways, and not athwart, for fo they will keep more firm and firong that which they bind, and betides, they will be always alike, and not broader in one place than in another: But they thus differ in figure, for that form of them are rolled up, to which nothing must be fowed, for that they ought to be of a due length to bind up the member; others are cut or divided, which truly conflit of one piece, but that divided in the end (fuch are usually taken to bind up the breats)

or elfe in the midft; others are fowed together, which conflit of many branches fowed together, and ending in divers heads, and reprefenting divers figures, such are the Bandages appropriated to the head. But they thus differ in length, for that some of them are shorter, others longer: so in like fort for breadth; for fome are breader, others narrower. Yet we cannot certainly define nor fet down, neither the length nor breadth of rowlers, for that they must be various, according to the different length and thickness of the members or parts. Generally they ought both in length and breadth to fit the parts, whereunto they are used. For these parts require a binding different each from other, the head, the neck, shoulders, arms, breasts, groins, testicles, fundament, hips, thighs, legs, fret and toes. For the parts of Bandages, we term one part their body, another their case, legs, fret and toes. For the parts of Bandages, we term one part their body, another their case, ad fill, 22, he age.

CHAP. II.

Shewesh the Indications and general Precepts of fitting Bandages and Ligatures.

Here are, in Hippocrates opinion, two Indications of fitting Bandages or Ligatures; the 10 a felt. life one whereof is taken from the part affected; the other from the affect it felt. From the st frast. part affected: So the leg, if you at any time bind it up, must be bound long-ways, for if you bind it over-thwart, the binding will loofen as foon as the Patient begins to go, and put forth his leg, for then the mufeles take upon them another figure. On the contrary, the arm or elbow muft be bound up, bending in and turned to the breaft; for otherwife at the first bending, if it be bound when it it is firetched forth, the Ligature will be flacked, for that (as we formerly faid) the figure of the muscles is perverted. Now for this Indication, let each one perfuade himself thus much, that the part must be bound up in that figure, wherein we would have it remain.

Now for that Indication which is drawn from the difcafe, if there be a hollow Ulcer, finuous and We must alconiculous, casting forth great store of Sanies; then must you begin the ligature and binding from ways begin the bottom of the figure, and end at the orifice of the Uleer; and this Process must always obthe bottom of the finar, and end at the orifice of the Ulcer; and this Precept must you always obat the bottom of the finar, and end at the orifice of the Ulcer; and this Precept must you always obat the bottom
ferve, whether the finar be fealed in the top, bottom, middle, or fides of the Ulcer: For thus the of a finar,
filth therein contained shall be emptied and east forth, and the lips of the Ulcer too far separated, shall
be joyned together; otherwise the contained filth will eat into all that lies near it, increase the Ulfilth and make it uncorrable, by rotting the hones which lie under it within this action. cer, and make it uncurable, by rotting the bones which lie under it within this acrid Sanies or filth.
But fome Ligatures are remedies of themselves; as those which perform their duties of themselves, and whereto the cure is committed; as are these which reflore to their native unity, those parts which are disjoyned: Others are not used for their own sakes, but only to serve to hold fast such medicines as have a curative faculty. This kind of Ligature is either yet a doing, and is termed by Hip-rop com. 4. porrates, Diligatio operans; or elie done and finished, and is called Diligatio operata: For the first, sold, 2 office, that the Ligature may be well made, it is fit that it be close rowled together; and besides, that the total 2 solfice. Surgeon hold it stiff and strait in his hand, and not carelesly; for so he shall bind up the member the better. Also he must in the binding observe, that the ends of the rowler, and consequently their faffning, may not fall to be on the affected or grieved part; for it is better that they come above or below, or elic on the fide: Befides alfo, he must have a special care, that there be no knot tied up-on the same place, or upon the region of the back, buttocks, sides, joynt, or back-part of the head, on the tame place, or upon the region of the back, buttocks, fides, joynt, or back-part of the head, or to conclude, in any other part upon which the Patient uses to lean, reft or lie. Also on that part Ligaures must be intend to fow or fasten the rowlers, you must double in their ends, that so the fastning not be only the member, yet will they not remain firm, especially if they be of a great breadth. For the second for nearly peakind of Ligature, to wit, that which is already done and finished; the Surgeon, the performer thereof, must consider to what end it was done, and whether he hath performed it well and fitly, as also nearly and elegantly, to the satisfaction both of himself and the beholders. For it is the part of a skilful workman every where handsomely and rightly to perform that which may so be done.

htly, as also neatly and elegantly, to the satisfaction both of number and the penoiders. For it is the part of a skilful workman every where handsomely and rightly to perform that which may so be done. In fractures, and suxations, and all diffications of bones, as also in wounds and contusions, you must begin your Bandage with two or three windings, or wraps about upon the place, and that (if places, and that the humors, if any be already fallen thither, may by this strait compression be pressed for the forms, as also to hinder and prevent the entrance in of any other, which may be ready to fall down.

torth; as also to hinder and prevent the entrance in of any other, which may be ready to fall down.

But in fractures (as those which never happen without contustion) the blood flows, and is prefed forth of its proper vessels; as those which are violently battered and torn, which causes singillation in the violently battered and torn, which causes singillation in the neighbouring flesh, which first looks red, but afterwards black and blue, by reason of the cor-ruption of the blood poured forth under the skin. Wherefore after these first windings, which I formention of the blood pointed that make the same the same that the broken or luxated part; the which does otherwise, will more and more draw the blood and humors into the affected part; the which does otherwise, will more and more draw the blood which flows. the which does otherwise, will more and more diany the blood which flows, goes but one way and cause impossible manifest and cause impossible manifest and other malign accidents. Now the blood which flows, goes but one way Gal. com. and downwards, but that which is pressed, is carried as it were in two paths, to wit, from above down-first 25-field. wards, and from below upwards. Yet you must have a care that you rather drive it back into the Us. de fresh.

body and bowels, then towards the extremities thereof, as being parts which are uncapable of fo trusch matter, and not furnished with sufficient strength to suffer that burthen, which threatens to fall upon it, without danger, and the increase of preternatural accidents. But when this mass and burthen of humors is thrust back into the body, it is then ruled and kept from doing harm by the

firength and benefit of the faculties remaining in the bowels, and the native heat.

CHAP. XXIV.

Of the three kinds of Bandages necessary in Fractures.

Sen. 24. fell. 2. Wo forts of Ligatures are principally necessary for the Surgeon, according to Hipperstet, offic.

by which the bones as well broken as dislocated may be held firm when they are restored to their natural place.

Etypodesnides.

Of these, some are called Hypodesimides, that is, Under-binders; others, Epidesimi, that is, Overbinders. There are sometimes but two Under-binders used, but more commonly three. The first must first of all be cast over the Fracture, and wrapped there some three or four times about, then the Surgeon must mark and observe the figure of the Fracture; for as that shall be, so must be vary the manner of his binding: For the Ligature must be drawn strait upon the fide opposite to that whereto the Luxation or Fracture most inclines; that so the bone which stands forth may be forced into its feat, and so forced, may be the more firmly there contained. Therefore, if the right fide be the more prominent or flanding forth, thence must you begin your ligation, and so draw your Liga-ture to the left side. On the contrary, if the left side be more prominent, beginning there, you shall go towards the opposite side in binding and rowling it. Here therefore would I require a Surgeon to be Ambidexter, (i.e.) having both his hands at command, that so he may the more exquisitely perform such variety of ligations: But lethim in rowling, bend or move this first Ligature upwards, that is, towards the body, for the former reasons. But neither is this manner of ligation peculiar to Fractures, but common to them with luxations: For, into what part foever the luxated bone flew; then when it is reflored, that fide must be bound the more loofly and gently whence it departed, and that on the contrary more hard unto which it went: Therefore the Ligature must be drawn from the fide whereunto the bone went; fo that on this fide it be more loofe and foft, and not firaitly preffed with bouliters or rowlers, that so it may be more inclined to the fide opposite to the luxati on. If the ligation be otherwise performed, it succeeds not well; for the part is relaxed and moved out of its natural feat: Wherefore there will be no finall danger, left the bone be forced out again, and removed from its place, whereintoit was reftored by art and the hand: Which thing Hippo erates fo much feared, that on the contrary he willed that the fet-bone should be drawn somewhat more unto the part contrary to that whereunto it was driven by force, than the natural and proper fite thereof should require. But to return to our former discourse of the three Ligatures: The first Under-binder being put on, we then take the fecond, with which we in like fort begin at the Fra-Cture; but having wrapped it once or twice about there, for that, as we formerly faid, we must not force back, and prefs fo much blood towards the extremities, as we must do towards the body and bowels: Wherefore this Ligature shall be drawn from above downwards, gently straining it to press forth the blood contained in the wounded part: When by rowling you shall come to the end of the part, then you shall carry back again that which remains thereof, to wit, upwards: But otherwise you may take the third Under-binder, wherewith you may begin to rowl, whereas you left with the fecond, and you may carry it thus, rowling it from below upwards. These Under-bindings thus it nished, apply your boulsters, after them your over or Upper-bindings, which are oft-times two, but fornetimes three. The first hath two heads, and is wrapped both from the right hand and the left, for the prefervation of the first Under-binder and the boulsters, and restoring the muscles to their native figure. The two other which remain, confile of one head, and the one of them must be rowled from below upwards, the other from above downwards, after such a manner, that they may be directly contrary to the Under-binders: as if they were rowled from the right hand, then these must be from the left. Now this is the manner of Hippocrates his Ligation, which, for that it is now grown out of use, we must here set down that which is in common use. They do not at this time use any Over-binders, but that which we termed the third Under-binder, serves our Surgeons inflead of the three fore-mentioned Over-binders. Wherefore they carry this third Under-binder, wrapped from below upwards (as we formerly faid) contrary to the first and second Under-binder as if these begun on the right side, this shall be rowled from the left, and shall end whereas the first Under-binder ended. And you must not only draw it indifferently hard, but also make the spires and windings more rare. This third rowler is of this use in this manner of ligation; that is, it reflores the muscles to their native figure, from whence they were somewhat altered by the drawing and rowling of the two former Ligatures. But you must always have regard, that you observe that measure in wrapping your Ligature, which Reason, with the sense of the Patient, and ease in fusfering, prescribes; having regard, that the tumor become not inflamed. Also the habit of the body ought to prescribe a measure in ligation; for tender bodies cannot away with so hard binding as hard. Verily, in Fractures and Luxations, the humors by too strait binding are pressed into the extreme vertex of the head. extreme parts of the body; whence grievous and oft-times enormous Oedema's proceed; for healing whereof the Ligature must be loosed, and then the turnified parts pressed by a new rowling, which must be performed from below upwards, and so, by forcing the matter of the turnor thither, it may be helped; for there is no other hope or way to drive the humor back again. He which doth this, forfakes the proper cure of the difease, so to reful the symptom, which the Surgeon thall never refuse and the symptom of the sy refuse to do, as often as any necessary cause shall require it. For this cause Hippocrates bids, that the Bandages be looked every three days, and then to foment the part with hot water, that fo the humors, which (drawn thither by the venemency of pain) have fettled in the part, may be diffolved and dispersed; and inching and other such like symptoms prevented. The tear of all accidents being past, let the ligation be sooner or later loosed, and more stacked than it formerly was accustomed; that to the blood and laudable matter, whereof a Colles may enfue, may flow more freely to the affect ed part.

When the third Under-1 binder is neceffary.

CHAP. IV.

Of the binding up of Fractures affociated with a Wound.

T fometimes happens that a fracture is affociated by a wound, and yet for all this it is fit to How to bind bind the part with a ligature; otherwise there will be no small danger of swelling, inflammation, and other ill accidents, by reason of the too plentiful afflux of humors from the neightion, and other ill accidents, by reation of the too prentificantial artists of humors from the neighbouring parts. But it is not fit to endeavour to use that kind of binding which is performed with many circumvolutions or wrappings about. For seeing the wound must be dressed every day, the part must each day necessarily be stirred, and the ligature confisting of so many windings, loosed; which thing will cause pain, and consequently hinder the knitting and uniting, which is performed by rest: Therefore this kind of binding may be performed by one only rowling about the wound, and the light would be the more supported by the cause of a twice or their adoubled that made is respectively. and that with a rowler which confifs of a twice or thrice doubled cloth, made in manner of a boulfler, and fewed with as much conveniency as you can, that it may be fo large as to encompals
and cover all the wound, for these reasons which shall be delivered at large in our Treatise of Frachures. But if the wound run long-ways, let the boulsters and splints be applied to the sides of the wound, that so the lips of the wound may be pressed together, and the contained sith pressed forth. But if it be made overthwart, we must abstain from boulsters and splints: For that in Galer's opini- Ad sest. 12: on, they would dilate the wound, and the purulent matter would be pressed out, and cast back into sess, they would dilate the wound, and the purulent matter would be pressed out, and cast back into sess, as the wound.

CHAP. V.

Certain common Precepts of the binding up of Fractures and Luxations.

N every Fracture and Luxation, the depreffed, hollow and extenuated parts, fuch as are near IN every Fracture and Luxation, the depretted, hollow and extenuated parts, fuch as are near unto the joynts, ought to be filled up with bouliters, or clothes put about them, fo to make the part equal, that fo they may be equally and on every fide preffed by the fplints, and the bones more firmly contained in their feats. So when the knee is bound up, you must fill the ham or that cavity which is there, that fo the ligation may be the better and specifier performed. The hypefint, 37, fame must be done under the arm-pits, above the heel, in the arm near the wrift; and to conclude, in \$38, fall, 1, all other parts which have a confpicuous inequality by reason of some manifest cavity. When you have faithed your hinding, then coming of the Patient, whether the members from not to be bound. have finished your binding, then enquire of the Patient, whether the member feem not to be bound too firait. For if he fay that he is unable to endure it fo hard bound, then must the binding be formewhat flackned. For, too firait binding causes pain, heat, defluxion, a gangrene, and latily, a looke binding flate we defire. It is a sign of a just ligation that is neither too former too looke, if the ensuing day the part be swell with an endurate or mortification. day the part be fwoln with an ordematous tumor, caufed by the blood preffed forth of the broken place; but of too firait ligation, if the part be hard fwoln; and of too loofe, if it be no whit fwollen, as that which hath preffed no blood out of the affected part. Now if a hard tumor, caufed by too ftrait binding, trouble the Patient, it must prefently be loosed for sear of more grievous symptoms, and the part must be somented with warm Hydraleum, and another indifferent, yea verily, thore loofe ligature must be made instead thereof, as long as the pain and instammation shall conmore loofe ligature must be made instead thereof, as long as the pain and inflammation shall continue; in which time, and for which cause, you shall lay nothing upon the part which is any thing burthensome. When the Patient begins to recover, for three or four days space, especially if you find him of a more compact habit and a strong man, the ligature must be kept sirm and not sloofed. If on the third day, and so until the seventh, the spires or windings be sound more loofe, and the part affected more slenders, then we must judge it to be for the better. For hence you may gather, that there is an expression and digestion of the humors, causing the tumor made by sorce of the ligation. Verily, broken bones sitly bound up, are better set, and more firmly agglutinated, which is the cause, why in the place of the fracture, the ligation must be made the strater, in other places more cause, why in the place of the fracture, the ligation must be made the straiter, in other places more loosly. If the fractured bone stand forth in any part, it must there be more straitly pressed with boul- why we must flors and fplints. To conclude, the feventh day being paft, we must bind the part more firaitly than before: For that then inflammation, pain, and the like accidents are not to be feared. But these things which we have hitherto spoken, of the three kinds of Ligatures, cannot take place in each fractured part of the body, as in the chaps, collar bones, head, nose, ribs: For, seeing such parts are not round and long, a ligature cannot be wrapped about them, as it may on the arms, thighs and legs, but only be put on their outsides.

CHAP. VI. The uses for which Ligatures serve.

Y that which we have formerly delivered, you may understand that ligatures are of use to The first benereflore those things which are separated and moved forth of their places, and joyn toge- fit of liganues reftore those things which are reparated and those tour of their places, and joyn toge-fit of liganor ther those which gape; as in fractures, wounds, contusions, sinewous ulcers, and other like affects against Nature, in which the solution of continuity stands in need of the help of Bandages, for the reparation thereof. Besides also, by the help of Bandages these things are kept assumed the following the same than the second-fingers and the same than the second the same than the same tha fingers and the hams would mutually grow together; as also the arm-pits to the cheft, the chin to the breath, unless they be hindred by due ligation. Bandages do also conduce to refresh emaciated. The third.

The fourth.

The fifth.

The fixth.

The feventh.

The eighth,

part: Wherefore if the right leg waste for want of nourishment, the left leg, beginning at the foot, may be conveniently rowled up even to the groin. If the right arm confume, bind the left with a strait Ligature, beginning at the hand, and ending at the arm-pit. For thus a great portion of blood from the bound-up part is fent back into the Vena cara, from whence it regurgitates into the almost empty vessels of the emaciated part. But I would have the found part to be so bound, that thereby it become not painful; for a dolorinck ligation causes a greater attractation of blood and spirits, as also exercise: Wherefore I would have it during that time to be at rest, and keep Holy-day. Ligatures also conduce to the stopping of bleedings: Which you may perceive by this, that when you open a vein with your lancer, the blood is prefently flayed, laying on a bouliter, and making a ligature. Also ligatures, are useful for women presently after their delivery for their womb being bound about with ligatures, the blood wherewith their womb was too much moillened, is expelled, the firength of the expulsive faculty being by this means stirred up to the expulsion thereof: And it also hinders the empty womb from being swoln up with wind, which otherwise would presently enter thereinto. This same ligature is a help to such are with child, for the more easie carrying of their burthen; especially those whose child lies so far downwards, that lying, as it were, in the den of the hips, it hangs between the thighs, and so hinders the free going of the mother. Therefore the woman with child is not only cafed by this binding of her womb with this ligature, which is commonly termed, the Navil-ligature; but also, her child being held up higher in her womb, the hath freer and more liberty to walk. Ligatures are in like fort good for revultion and derivation; as also for holding of medicines which are kild to a part, as the neck, breaft or belly. Laftly, there is a triple use of ligatures in amputation of members, as arms the particular and legs. The first to draw and hold upwards the skin and muscles lying under it, that the opera-use of ligatures tion being performed, they may, by their falling down again, cover the ends of the cut-off bones; and so by that means help forwards the agglutination and cicatrization; and when it is healed up, cause the lame member to move more freely, and with less pain; and also to perform the former actions, this, as it were, cushion or bouliter of musculous field lying thereunder. The second is, they hinder the bleeding by prefling together the veins and arteries. The third is, they by firait binding intercept the free passage of the animal spirits, and so deprive the part which lyes thereunder of the fenfe of feeling, by making it, as were, flupid or nam-

CHAP. VII. Of Boulsters or Compresses.

The first use, of Boulfters

Oulsters have a double use, the first is to fill up the cavities and those parts which are not of an equal thickness to their end. We have examples of cavities in the arm-pits, clavicles, hams and groins; and of parts which grow small towards their ends, in the arms towards the wrifts, in the legs towards the feet, in the thighs towards the knees. Therefore you must fill these parts with boulifers and linnen clothes, that so they may be all of one bigness to their ends.

The fecond use of them.

The fecond use of Bouliters, is to defend and preserve the first two or three rowlers or underbinders, the which we faid before must be applied immediately to the fractured part. Boulsters, according to this twofold use, differ amongst themselves, for that when they are used in the first mentioned kind, they must be applied athwart; but when in the latter, long-ways or down-right-

The third use of them.

You may also use Bouliters, left the too firait binding of the ligatures cause pain and trouble to the new-fet bones. A three or four times doubled cloth will ferve for the thickness of your boulfices, but the length and breadth must be more or less, according to the condition of the parts and disease for which they must be applied.

CHAP, VIII.

Of the use of Splints; Junks and Cafes.

The matter of

Aving delivered the uses of ligatures and boulsters, it remains that we say somewhat of the other things, which ferve to hold the bones in their places; as Splints, Junks, Cafes, and fuch other like. Splints are made and composed of past-board, of thin splinters of wood, of leather, fuch as shoot-soals are made with s of the rinds of trees, or plates of lattin, or lead, and fuch other like, which have a gentle and yielding fliffness; yet would I have them made as light as may be, left they by their weight become troubleforme to the affected part. But for their length, breadth and number, let them be fitted, agreeable to the part whereto they multibe used. Let also their figure be firait or crooked according to the condition of the member whereto they must be applied. You must have a special care, that they run not so far as the swellings out, or eminencies of the bones; as the ankles, knees, elbows, and the like, left they hurt them by their preffure: also you must have a care, that they be smaller at their ends, and thicker in their middles, whereas they lye upon the broken bone. The use of Splints is, to hold fail and firm, that they may fir no way the broken and Juxated bones, after they be fet and reflored to their places. That they perform this ufe, it is fit there be no thick bouliters under them, nor over-many rowlers, for fo through fo thick a space, they would not fo straitly press the part. Junks are made of sticks, the bigness of ones, finger, wrapped about with ruftes, and then with linnen cloth: They are principally used in tractures of the thighs and legs. Cases are made of class of lattice or discountry. plates of lattin, or elfe force light wood; their use is, to contain the bones in their due figure, when the Patient is to be carried out of one bed or chamber into another, or elfe hath need to go to ficel: Laftly, if we mail reft formewhat more firongly upon the broken or luxated members,

Their use.

What Junks The matter and use of Cafes.

these cases will hinder the bones from stirring or slying out on the right side or left, above or be their cases will hinder the bones from flirring or flying our on the right lide or left, above or below, we fleeping or waking, being willing or unwilling; and in like fort left being not as yet well
knit, or more loofly bound up for fear of Pain, Inflammation, or a Gangrene, they hang down,
fall, or fly in funder by reafon of the inequalities of the bed. Such Cafes, Junks, and the like,
which ferve for refloring and faft holding of broken and luxated bones, we may, according to
Hippograter his mind, call them in general Goffosomia. All which things, the young Sungeon, which Goffosomian,
is not as yet exercised in the works of Art, can fearce tell what they are. But in the mean time,
whilst that he may come to be exercised therein, or see others perform these operations, I, as plainly
as possibly Leonled. have in words given him their portraiture or shape, as possibly I could, have in words given him their portraiture or shape,

The End of the Fourteenth Book,

BOOK XV.

Of Fractures.

CHAP. I.

What a Frallure is, and robat the differences thereof are.

Fracture, in Galen's opinion, is the folution of continuity in a bone, which by the Lib.6 method, Greeks is called Catagma. There are many forts of hurting or offending the bones; as, the drawing them afunder, luxation, or putting them out of joynt; their unnatural growing together, their cutting or dividing afunder; contuion, abicefs putrefaction, rottennefs, laying bare the *Periodeum*, being violated or loft; and laftly, that whereof we now treat, a Fracture. Again, the varieties of Fractures are al-

most infinite. For one is complete and perfect, another imperfect; one runs long-wife, another transverse, another obliques one while it is broken into great pieces, another while into little and small scales, which have either a blant, or else a flurp end, and prick the adjacent bodies of the what it is for mustes, nerves, veins or arteries. It sometimes happens, that the bone is not broken into spline a bone to be ters, that is, long-ways, but together, and at once into two pieces overthwart, which Fracture is broken supposed.

called Raphandon, that is, after the manner of a Radish.

A Fracture is made Caryedon, or like a nut, when as the bone flies into many small pieces, severed What caryeeach from other, as when a nut is broken with a hammer, or mallet, upon an Anvile: Which fradout, or Alphi-Cture is also termed Alphitidan, by reason of the resemblance it hath to meal or flour; and such is often feen in fractures made by bullets, thor out of Guns and fuch fiery Engines. Contrary to these are those fractures which are called Schidaeidon, as rent into splinters, or after the manner of a board what Schidaeidon. or piece of timber, that is, right-down, and along the bone: And these fractures either are apparent to the eye, or else not apparent, and therefore called Capillary, being so small, as that they cannot be perceived by the eye, tailefs you put ink upon them, and then flave them with your Scrapers. Sometimes the bone is only preffed down with the firoke; fornetimes on the contrary it flies up, as if it were vaulted. They call it Attrition, when the bone is broken into many fmall fragments, and, as it were scales or chips. The fragments of fractured bones are sometimes smooth and polished. otherwhiles unequal, and, as it were tharp and rough with little teeth or pricks. Some fractures touch only the furface of the bone, fetching off only a feale: othersome change not the fite of fractured bones, but only cleaves them length-ways, without the plucking away of any fragment; otherfome penetrate even to their marrow. Furthermore, fome fractures are timple and alone by themfelves; othersome are accompanied with a troop of other affects and symptoms, as a Wound, Hemorrhagy, Inflammation, Gangrene, and the like. Hereunto you may also add the differences drawn from the parts which the fractures poffels; as from the head, ribs, limbs, joynts, and other members of the body. Add also these which are taken from the habit of bodies, aged, young, full of ill humours, well tempered; almost all which have their proper and peculiar indications for curing. Now the The causes of causes of tractures, are the too violent affaults or strokes of all external things, which may cut, bruise, fractures, break or shake: In this number of causes may also be reckoned, falls from high places, and infinite other things, which would be long and tedious to reckon up.

CHAP. II. Of the figns of a Fracture.

E may know by evident figns that a bone is broken: The first whereof and most cer- The first figns tain, is, when by handling the part which we suspect to be broken, we feel pieces of of a broken the bone fevered afunder, and hear a certain crackling of these pieces under our hands, bone. canfed by the attrition of the shattered bones, Another sign is taken from the impotency of the Another part, which chiefly bewrays it self, when both the bones, the leg, and brace-bones, the ell and wand are broken: For if only the brace-bone or wand be broken, the Patient may go on his leg, and stire his his arm; for the brace-bone ferves for the fustaining of the muscles, and not of the body, as the leg-bone doth. The third fign is drawn from the figure of the part changed befides Nature: For A third, it it is there hollow, from whence the bone is flown or gone. but gibbous or bunching out whither it is run. Great pain in the interim torments the Patient by reason of the wronged Periodicum, and that membrane which involves the marrow and the sympathy of the adjacent parts, which are compressed or pricked.

must prefently be made after the bone is broken.

E must prognosticate in fractures whether they are to end in the destruction or welfare of the Patient; or whether their cure shall be long or short, easie, or esse difficult and dangerous; and lafily, what accidents and fymptoms may happen thereupon. He shall eafily attain to the knowledge of all these things, who is not only well seen in the anatomical description of the bones, but also in the temper, composition and complexion of the whole body. Wherefore in the first place, I think good to admonish the Surgeon of this, that in Winter when all is stiff with cold, by a little fall, or some such sleight occasion, the bones may be quickly and readily broken. For then the bones, being dried, by the driness of the air encompassingus, become more brittle; which every one of the vulgar usually observe to happen both in waxen and tallow-candles: But when the Seafon is moift, the bones are also more moift, and therefore more flexible and yielding to the violence of the obvious and offending body. Wherefore also you may gather this to the framing of your Prognosticks, That bones by reason of their natural drinets are not so easily agglutinated and consolidated as shells, though in children, according to Galen, by reason of the abundance of their humidity, the loft fubfiance may be repaired, according (as they term it) to the first intention, that is, by restoring of the same kind of substance or matter. But in others, about the fractures, a certain hard fubliance usually concretes, of that nourithment of the broken bone which abounds, which glues together the fragments thereof, being fitly put together. fubflance is then termed a Calins, and it is so hardned in time, that the bone thereafter in the broken part is feen to be more firm and hard than it is in any other; therefore that ufual faying in Phyfick is not without reafon, That reft is necessary for the uniting of broken bones. For the Callus is eafily disfolved, if they be moved before their perfect and folid agglutination. The matter of a Callus ought to be indifferent and laudable in quantity and quality, even as blood which flows for the regeneration of the loft flesh in wounds. It is fit, that there may be sufficient matter for fuch a Callus, that the parthave a laudable temper, otherwise there either will be no Cal-lus, or certainly it will grow more flowly. Fractures are far more easily repaired in young bodies than in old: For in these there is plenty of the primigenious and radical moulture, that is laudably holding and glutinous, and in the other there is flore of waterith and excrementitious By this you may eafily conjecture, that you cannot certainly fet down a time necessahumours. ry for the generating a Callus: For in fome it happens later, in fome fooner, the cause of which variety is also to be referred to the constitution of the Year and Region, the temper and diet of the Patient, and manner of ligation: For, those Patients whose powers are weak, and blood waterish and thin, in these the generation of a Cashus uses to be more slow: On the contrary, strong powers haften to applutinate the bones, if there be plenty of groß and vifcous matter, where by it comes to pass, that meats of groffer nutriment are to be used, and medicines applied which may help forwards the endeavour of Nature, as we shall declare hereafter. bones are broken near unto the joynts, the motion afterwards uses to be more difficult, especially if the Callus, which is fubfittuted, be fornewhat thick and bunching forth. But if, together with the violence and force of the fracture, the joynts shall be broken and bruifed, the motion will not only be loft, but the life brought in danger, by reason of the greatness of the Inflammation, which usually happens in such affects, and the excess of pain in a tendinous body. These fractures wherein both the bones of the arm or leg are broken, are more difficult to cure, than those which happen but to one of them: For they are handled and kept in their places with more difficulty, because that which remains whole; serves the other for a rest or stay to which it may lean. Moreover, there is longer time required to substitute a Calau to a great bone, than to a little one. Again, these bones which are more rare and spongy, are sooner glaced together by the interposition of a Callus, than those which are dense and solid. A Callus sooner grows in sanguin, than in cholerick bodies: But broken bones cannot be fo happily agglutinated, nor reflored in any body, but that always some asperity or unequal protuberancy may be seen on that part where the Callus is generated: Wherefore the Surgeon ought to make artificial ligations, that the Callus may not fland out too far, nor fink down too low. That fracture is leaft troublefome which is fimple; on the contrary, that is more troublefome which is made into splinters; but that is most troublefome and worst of all, which is in small and sharp fragments, because there is a danger of Convulsion by pricking a nerve, or the Periofeum. Sometimes the fragment of a broken bone keep themselves in their due place: They also oft-times fly forth thereof, so that one of themselves in their due place. above another; which when it happens, you may perceive an inequality by the depretion of the one part, and the bunching forth of the other, as also pain by the pricking: Belides also, the member is made thorter than it was, and than the found member on the opposite fide is, and more fwoln by the contraction of the muscles towards their original. Wheretone when a bone is broken, if you ken, if you perceive any thing to depreffed, prefently putting, your hand on both fides above and below, firetch forth the bone as forcibly as you can; for otherwife, the mufeles and nerves, firetched and contracted, will never of their own accord fuffer the bones to be reflored to their pro-per feat of themselves. This extension must be performed in the first days, for afterwards there will happen inflammation: Which being prefent, it is dangerous to draw the nerves and tendens

too violently; for hence would enfue an Imposthume, Convulsion, Gangrene and Mortification. Therefore Hippocrates forbids you to defer fuch extension until the third or fourth day. Fractures Seed 36. Int. 3 are thought dangerous, whose fragments are great, and fly out, especially in these bones which are de frast, filled with marrow on the infide. When broken or diflocated bones cannot be restored to themfelves and their natural place, the part wastes for want of nourilhment; both for that the natural fite of the veins, arteries and nerves, is perverted, as also because the part it self lies immovable, or fearce moveable: Whereby it cometh to pass, that the spirits do not freely flow thereto, as neither the nutritive juice corneth thither in sufficient plenty. When the diffocated or broken member is troubled with any great inflammation, it is doubtful whether or no a Convulsion will happen, if we attempt to reflore it, or the parts thereof to their seat: Therefore it is better, if it may be done for the parts thereof so long; until the humour which possessing the root be different parts. be done, to defer the reducing thereof fo long, until the humour which possesses the part be dif- be attempted, the turnor abated, and the bitterness of pain mitigated.

CHAP. IV.

The general cure of broken and diflocated Bones.

O cure a broken and diflocated bone, is to reflore it to its former figure and fite: For the Three things performance whereof, the Surgeon must propose three things to himself: The first is, to to be performed reflore the bone to its place: The fecond is, that he contain or flay it being so reflored: ed in curing The third is, that he hinder the increase of malign symptoms and accidents; or else it they do hapdrished the contain or flay it being for reflored. pen, that then he temper and correct their prefent malignity: Such accidents are pain, inflamma-bones, tion, a feaver, abfects, gangrene and sphacel. For the first intention, you may eatily restore a broken or diflocated bone, if prefently, as foon as the mischance is got, or else the same day, you endeavour to restore it : For the bitterness of pain or inflammation, which may trouble the Patient, deavour to reflore it: For the bitterness of pain or inflammation, which may trouble the Fatient, is not as yet very great; neither is the contraction of the mufcles upwards, as yet very much or flubborn: Therefore first of all, the Parient with his whole body, but especially with the broken or How to put diffocated part, as allo the Surgeon, must be in some place which hath good and sufficient light: the boues in Then let trusty and skillful attendants be there, good ligatures, and also, if need fo require, good their places, engines. His friends which are present, let them see and hold their peace, neither say nor do any thing which may hinder the work of the Surgeon: Then putting one hand above, that is, to-wards the center of the body, and the other below, as near as he can to the part affected, let him firetch forth the member: For if you lay your hand any diffance from the part affected, you will hart the found part by too much comprellion, neither will you much avail your felf by firetching hart the found part by too much compression, neither will you much avail your self by stretching it at such a distance: But if you only endeavour below with your hand or ligature, affisting to make extension thereos, it will be dangerous if there be nothing above which may withstand or still, a defrash hold, lest that you draw the whole body to you: This being done according as I have delivered, it is fit the Surgeon make a right or strait extension of the part affected: For when the bone is either broken or out of joynt, there is contraction of the muscles towards their original, and consequently of the bones by them, as it is observed by Galen: Wherefore it is impossible to Ad Sent. self-reflected the bones to their former seat, without the extension of the muscles: But the part being 1 of self-reflected. reflore the bones to their former feat, without the extension of the muscles: But the part being a de fratt. thus extended, the broken bones will fooner and more eafily be reftored to their former feat: Which being reflored, you shall presently with your hand press it down, if there be any thing that bunches being reflored, you main prefently with your hand prefs it down, if there be any thing that bunches or frands out. And hilly, you shall bind it up, by applying boulders and splints as shall be not. But if the bone be diflocated or forth of joynt, then prefently after the extension thereof, it will be requisite to bend it somewhat about, and so to draw it in. The Surgeon is sometimes forced to use engines for this work, especially if the hixation be inveterate, if the broken or lixated bones ments or enable great; and that in strong and rullick bodies, and such as have large joynts; for that then there is need of greater strength than is in the hand of the Surgeon alone. For, by how much the muscles of the Patient are the stronger, by so much will they be contracted more powerfully upwards towards their originals: Yet have a care that you extend them not too violently, left by rending and breaktheir originals: Yet have a care that you extend them not too violently, left by rending and breaking afunder the mufcles and nerves, you cause the forementioned Symptoms, Pain, Convulsion, ing afunder the mufcles and nerves, tyou cause the forementioned Symptoms, Pain, Convulsion, a Pallie and Gangrene: All which sooner happen to firong, and aged bodies, than to Children, What bodies Eunuchs, Women, Youths, and generally all moits bodies, for that they are lefs hurt by violent extension and pulling, by reason of their native and much humidity and fortness. For thus skins hurt by violent of Leather, moistened with any liquor, are easily retched, and drawn out as one pleaseth: But extension, such as are dry and hard, being lefs tractable, will sooner rend and tear, than stretch further out. Therefore the Surgeon shall use a mean in extending and drawing forth of members, as shall be most agreeable to the habits of the bodies. You may know the bone is set, and the setting Signs of a bone performed as is fit, if the pain be affwaged; to wit, the fibres of the muscles, and the other parts well fet. performed as is fit, if the pain be affwaged; to wit, the fibres of the mufcles, and the other parts well fet. places have made, being taken away; if, to your feeling there be nothing, bunching out, nor nugged, but the furface of the membrane remain smooth and equal; and lastly, if the broken or diflocated member compares with its opposite in the composure of the joynts, and knees, as the ankles answer justly and equally in length and thickness. For which purpose it must not fuffice the Surgeon to view it once, but even as often as he shall dress it: For it may happen, that the bone which is well fet, may by fome chance, as by the Patients unconfiderate turning himself in Causes and bis bed, or, as it were, a convultive twitching of the members or joynts whilst he sleeps, the mastles signs of the of their own accord contracting themselves towards their originals, that the member may again fall related of our standards and our standards of the relationship of the standards out; and it will give manifest figns thereof by renewing the pain, by pressing or pricking the adja- set bone. cent bodies: Which pain will not ceafe, before it be reftored to its place: And hereof the Surgeon

(HILLIAM)

the bone it let will all happen in a broken leg, the Patient will halt ever after, to his great grief, and the Surgeons shame: Wherefore the Patient shall take heed, as much as in him lies, that he stir not the broken member, before that the Calus be hardned. Such diligent care needs not be had in Diflocations: For these once set, and artificially bound up, do not afterwards so easily fall forth as broken bones. The second scope is, that the bones which shall be restored may be some ly kept in their fiate and place: That thall be done by Bandages; as Ligatures, Bouffers, and other things, whereof hereafter we shall make particular mention: Hither tend proper and fi medicines, to wir, applying of theyl of Rofes with the whites of Eggs, and the like repelling things, and then refolving medicines, as the prefent necessity shall require. It will be a venient to moisten your rowlers and boulsters in Oxycrate for this purpose, or else in Rose-vin 22t, if the Fracture be simple, or with Red-wine; or the liquor warm (in Galen's opinion) if a wound be joyned to the Fracture; and it will be fit to moisten Fractures often in Summer; for so the part is strengthened, the defluxion being repelled, whereby the inflammation and pain

are hindered. You must defilt from humecting and watering the part which the symptomes are past, lest you retard the generating of a Calas, for which you must labour by these means which

we shall hereafter declare. To this purpose also conduces the rest and lying of the part in its proper figure and site accustomed in health; that so it may the longer remain in the same place unstirred: Besides also, it is expedient then only to dress the part, when it is needful and with those things which are requisite, shunning as much as may be, inflammation and pain. That What the midfigure is thought the best, which is the middle; that is, which contains the muscles in meir fite dle figure is, and why beft.

which is without pain; fo that the Patient may long endure it without labour or trouble. All these things being performed, the Patient must be asked, whether the member be bound up too firait? It he answer, No, (unless peradventure a little upon the fracture or luxation, for there it is fit it should be more straitly bound) then may you know that the binding is moderate: And this fame first ligation is to be kept in fractures without looling for three or four days space, un-

Fit time for loofing of li-gatures in fractures and less peradventure pain urge you to the contrary. In diflocations the fame binding may be kept for seven or eight days, unless by chance some symptom may happen; which may force us to open it before that time; for the Surgeon must with all his art have a care to prohibit the hapning of evil accidents and fymptoms, which, how he may bring to pass, shall be declared in the folfowing Chapter.

CHAP. V.

By what means you may perform the third intention in curing Fractures and Diflocations, which is the bindring and correllion of accidents and symptoms.

Remedies against the

Hipp. fint. 46.

Hat we may attain unto this third scope, it is requifite we handle as gently and without means to himpain, as we may, the broken, or diflocated member; we drive away the defluxion ready to fall down upon the part, by medicines, repelling the humour, and firengthning the part; we, by appointing a good diet, hinder the begetting of excrements in the body, and divert them by purging and phlebotomy: But if these accidents be already present, we must cure them, according to the kind and nature of each of them; for they are various: Amongst which is reckoned itching, which in the beginning forments the Patient: This ariseth from a collection der accidents. and suppression of subacrid vapours, arising from the blood, and other humors under the skin: Whence a light biting, which causeth a simple itch, or else a more grievous and acrid one, from whence (in Galor's opinion) proceeds a painful itching. Wherefore fuch matter, as the caufe, being evacuated, all itching ceafeth: But this cannot eafily and freely be evacuated and breathed out, because the pores of the part are shut up, and, as it were oppressed with the burthen of the emplatfers, boulfiers and ligatures, which are put about the part. Hereunto may be added, that the part it felf doth not fo perfectly perform and enjoy its wonted faculties and actions: By which it cometh to pafs, that the heat thereof is more languid than may fuffice to difcufs the fullginous matter there collected. Wherefore it will be convenient to loofe the ligatures every third day, that as by loofing their ties, their fanious and fuliginous excrements, that up under the skin, may freely pals forth, left in continuance they should fret and ulcerate it; as it happens to most of those who provide not for it by loosing their ligatures. Besides also, the part must be long forment ed with hot water alone, or elfe with a decoction, of Sage, Chamomil, Rofes, and Melilot made in Wine and water: For long fomenting attenuates and evacuates; but shorter fills and mollifies, as it is delivered by Hippocrates. Also gentle frictions, performed with your hand, or a warm linnen cloth upwards, to the right fide and left, and circularly to every fide, are good. But if the skin be already rifen into blifters, they must be cut, left the matter contained thereunder may corrode and ulcerate the skin: Then must the skin be anointed with some cooling and drying medicine; as, Ung. album Camphoratum Rhafis, Deficeativum rubrum, unquentum rofatum fine accio; adding thereto the powder of a rotten post, or prepared Taria, or the like. Other accidents more grievous then these, do often happen, but we will treat of them hereafter: But if the scales of the home and bone underneath, be quite severed from the whole, then must they be presently taken forth, especially if them and for prominent of cially if they prick the mufcles: But if the bone be broken into splinters, and so prominent out of the wounded flesh that it cannot be reflored into its feat, it must be cut off with your Cutting mallets, or Parrats-beak, as occasion shall offer it felt: In the interim you must have a care that the part enjoy perspiration, and by change of place and rising, now and then it may be, as it were ventilated: Also you must see that it be not over-burthened, neither too strait bound, otherwise it

will be apt to inflammation. Thus much concerning fractures and diflocations in general: Now we must descend to particulars, beginning with the fracture of the nose.

CHAP. VI.

Of the Fracture of the Nofe.

He nose is griftly in its lower part, but bony in the upper. Wherefore it suffers no fra- Hipp. Seat. 46. Chure in the griftly part (unless peradventure a Seder) but only a depression, distortion seat. 2, 46 art. or contusion. But a fracture often happens to the bony part, and so great a depression to the inner fide, that unless it be provided for by diligent refloring it, the nose will become flat, or wrested aside, whence there will be difficulty of breathing. That this kind of fracture may How to reduce be reflored, that bone which frands too far out, must be pressed down; but that which is depress, the nose into its natural firmust be lifted up with a spathern, or little stick handsomely fashioned and wrapped about with cotten or alinnen rag, so to avoid pain: Therefore you shall hold the spathern in one hand, and reduce and order it with the other. The bone being restored, directories or tents of a convenient bigness thall be put into the nose; which tents thall be mad of spunge, or flax, or a piece of a beatis or theeps lungs: For these things are sort, and do not only hinder the bones of the nose that, they fall no more, but also lift them up higher: And then the nose shall be in some fort stayed with boulfters on each fide, even until the perfect agglutination of the bones, left the figure and firaitness should be viriated and spoiled. I have oft-times put golden, filver and leaden pipes into fractured nofes, and faitned them with a thred to the Patients night-cap, which, by one and the fame means kept the bones from being again depreft, gave the matter free paffage forth, and nothing hindred the breathing. In the mean time we must fee that we do not prefs the nofe with too firait binding, unless peradventure some other thing perswade; lest they become either too wide, too flat, or crooked. If any wound accompany the tracture, that shall be cured after the same manner as the wounds of the head. The fracture restored, the following medicine, which hath a faculty to repel and reprefs the defluxion, to firengthen and keep the part in its due posture, and to dry up and waste the matter which hath already fallen down, thall be applied to the note, and all the other dry parts. R. Thuris, maftiches, bolt armenie, sanguinis draconis, an. 3 \$. Aluminis roche, refine pini, an. 3 ij. A fit altrin-Pulverisentur subsilissime: Ox else, R. Farine volatilis 3 5. Albuminum obserum quantum sufficit, incor- gent and dry-

Patterspensor June 1, & first medicamentum.

Neither shall you use any other art to cure the cartilaginous part of the nose being fractured: Sent. 47.568.2.

Wherefore Hippocrates terms that solution of continuity that there happens, a fracture, as if it were deart. & Galacter of the solution of the solution of continuity that there happens, a fracture, as if it were deart. in a bone; because he could find no other name more fitly to expressit; for a griffle, next to a in com. bone, is the hardest of all the parts of our body. A Callar ofes to grow in fractured notes, unless fomething hinder, within the space of twelve or fifteen days.

CHAP. VII.

Of the Fracture of the lower Jaw.

He lower jaw runs into two, as it were, horns or tops: The one whereof ends fharp, A description and receives a tendon from the temporal muscle; the other ends blunt and round un- of the lower der the mammillary process, and it is there implanted in a small cavity; it is joyned jaw.

together in the middle of the chin by Symphysis, and is marrowy within: The fracture, which of refloring a broken jaw.

there on the inside and outside, that so the fractured bones put together may be smoothed and united. But the house has come and outside, that so the fractured bones put together may be smoothed and united. But the house has come and outside, that so the fractured bones put together may be smoothed and united. But the house has been unbulled at house the house has come and outside. and united: But if they be broken wholly athwart, fo that the bones lye over each other, extension must be made on both sides on contrary parts, upwards and downwards, where-by the bones may be composed, and joyned more easily to one another: The teeth in the mean while, if they be either flaken or removed out of their fockers, must be reflored to their former places, and tied with a Gold or Silver wyer, or else an ordinary thred, to the next firm teeth, until such time as they shall be fastened, and the bones perfectly knit by a Callus: To which purpose, the ordered fragments of the fractured bone shall be fasted, by The descripes putting a splint on the outside, made of such leather as shoose-foals are made; the midst thereof on of a six is being divided at the chin, and of such leather as shoose-foals are made; the midst thereof on of a six is being divided at the chin, and of such leather as shoose-foals are made; the midst thereof on of a six is being divided at the chin, and of such leather and breadth as may street the jaw; Then you shall savare for the being divided at the chin, and of fuch length and breadth as may ferve the jaw: Then you shall gature for the make ligation with a ligature two fingers broad, and of fuch length as thall be fufficient, divided at both the ends, and cut long-ways in the midit thereof; that fo it may engire the chin on both fides. Then there will be four heads of fuch a ligature fo divided at the ends; the two lower whereof being brought to the crown of the head, shall be there fatined, and sowed to the Patients night-cap. The two upper drawn athwart, shall likewife be fowed as artificially as may be, to the cap in the nape of the neck. It is a most certain sign, that the jaw is restored and well fee, if the teeth fathred therein stand in their due rank and order. The Patient shall not lye down upon his broken jaw, lest the fragments of the bones should again fall out, and cause a greater defluxion. Unless inflammation, or some other grievous symptom shall happen, it is strengthened to what time with a Callier within twenty days; for that it is fpongious, hollow, and full of marrow, effect it may ally in the midit thereof: Yet fometimes it heals more flowly, according as the temper of the Pa- healed. tient is, which takes also place in other fractured bones. The agglutinating and repelling medicine, described in the former Chapter, thall be used, as also others, as occasion shall offer it self.

The Patient must be fed with liquid meats, which stand not in need of chewing, until such time as the Callar shall grow hard, left the scarce or ill-joynted fragments should sly in funder with the labour of chewing. Therefore shall be be nourished with Water-grewel, Ponado's, Cullasses, Barley-creams, Gellies, Broths, Rear-eggs, Reflaurative Liquors, and other things of the like nature.

CHAP. VIII.

Of the Fracture of the Clavicle or Collar-bone.

Hipp, feet, 63. felt. 1. de art.

S the nature and kind of the fractured Clavicle shall be, so must the cure and restoring thereof be performed: But howfoever this bone shall be broken, always the end fastned to the shoulder and shoulder-blade, is lower than that which is joyned to the cheft, for that the arm draws it downwards. The collar-bone, if broken athwart, is more eafily reflored and healed, than if it be cloven long-ways: For, every bone broken athwart doth more eafily return into its former flate or feat, whiles you lift it up on this or that fide with your fingers: But that which is broken schidacidon, or into splinters, or long-ways, is more difficultly joyned and united to the ends and fragments; for those pieces, which were set, will be plucked asunder, even by the least motion of the arms; and that which was knit with the shoulder, will fall down to the lower part of the breaft: The reason of which is, the collar-bone is not moved of its self, but consents in motion How to reflore with the arm. In refloring this or any other fracture, you must have a care that the bones ride not one over another, neither be drawn nor depart too far in funder: Therefore it will be here convenient, that one fervant draw the arm backwards, and another pull the shoulder towards him the contrary way; for so there will be made, as I may so term it, a counter-extension: While which is in doing, the Surgeon with his fingers shall restore the fracture, pressing down that which stood up too high, and lifting up that which is pressed down too low. Some, that they may more easily reftore this kind of fracture, put a clew of yarn under the Patients arm-pit; fo to fill up the cavity thereof: Then they forcibly press the elbow to the ribs, and then force the bone into its former The third way. feat: But if it happen, that the ends of the broken bones shall be so depress, that they cannot be drawn upwards by the fore-mentioned means; then must the Patient be laid with his back, just between the shoulders, upon a pillow hard stuffed, or a tray turned with the bottom upwards, and covered with a rug or forme fuch thing: Then the fervant shall so long press down the Patients shoulders with his hands, until the ends of the bones, lying hid and pressed down, sly out and shew them-selves: Which being done, the Surgeon may easily restore or set the fractured bone. But if the bone be so broken into splinters that it cannot be restored, and any of the splinters prick and wound the flesh, and so cause difficulty of breathing, you then must cut the skin even against them, and with your Instrument lift up all the depressed splinters, and cut off their sharp points; so to prewith your Inftrument lift up all the deprened ipunters, and cut on their many points, to to prevent all deadly accidents, which thereupon may be feared. If there be any fragments, they, after they are fet, thall be covered with a knitting medicine made of Wheat-flour, Frankincenfe, Bole-armeniack, Sanguis drasonis, Refini pini, made into powder, and mixed with the whites of Eggs, putting upon it fplints covered with foft, worn linnen rags; covered over likewife with the fame medicine, and then three bouliters dipped in the fame; two whereof shall be laid upon the fides; but the third and thickest upon the prominent fracture, so to repress it and hold it in : For thus the fragments shall not be able to stir or lift themselves up further than they should, either to the right fide or left. Now these bouliters must be of a convenient thickness and breadth, sufficient to fill up the cavities which are above and below that bone: Then shall you make sit ligation with a rowler, having a double head call crofs-wife, of a hands breadth, and fome two ells and half long, more or lefs, according to the Patients body. Now he shall be so rowled up, as it may draw his arm somewhat backwards, and in the interim his arm-pits shall be filled with boulsters, especially that next the broken bone; for so the Patient may more easily suffer the binding. Also you shall

because it is rare and spongious.

CHAP. IX. Of the Fracture of the Shoulder-blade.

wish the Patient, that he of himself bend his arm backwards, and set his hand upon his hip, as the Country Clowns use to do, when they play at Leap-frog. But how great diligence soever you use in curing this fort of fracture, yet can it scarce be so performed, but that there will some deformity remain in the part: For that a ligature cannot be rowled about the collar-bone, as it may

about a leg or an arm. A Callas oft-times grows on this bone, within the space of twenty days

An anatomical description of the shoulderblade,

He Greeks call that Omoplata, which the Latins term Scapula, or Scapula patella, that is, the shoulder-blade. It is fastned on the back to the ribs, nowl, the Vertebre of the cheft and neck; but not by articulation, but only by the interpolition of mulcles, of which we have fpoken in our Anatomy: But on the forepart it is articulated after the manner of other bones, with the collar-bone, the shoulder, or arm-bone: For with its process, which represents a prick or thorn, and by forne, for that it is more long and prominent, is called Acromism; (that is, as you would fay, the top or (pire of the faid shoulder-blade) it receives the collar-bone. Therefore some Anatomitis, according to Hippocrates, as they suppose, call all this articulation of the collar-bone, with the hollowed process of the shoulder-blade, Acromion. There is another process of the said blade-bone, called Cervix omoplate, or the neck of the shoulder-blade; this truly is very short, but ending in a broad infinuated head, provided for the receiving of the shoulder

or arm-bone. Not far from this process is another, called Cornecides, for that the end thereof is or am-bone. Not far from this process is another, called Coracoact, for that the end thereof is crooked like a Crows-beak. This keeps the fhoulder-bone in its place, and conduces to the firength of that part. The shoulder-blade may be fractured in any part thereof, that is, either on the ridge, which runs like a hill, alongst the midst thereof for its safety, as we see in the Vertibre of the back: Boader-blade whereby the top of the shoulder is knit to it. According to this variety of these fractured parts, the ken.

whereby the top of the shoulder is knif to it. According to this variety of these fractored parts, the ken, happing accidents are more grievous or gentle.

We know the spine or ridge of the shoulder blade to be broken, when a dolorisck inequality is perceived, by touching or feeling it: But you may know, that the broader or thinner part thereof, is depressed, if you seel a cavity, and a pricking pain mosest the part, and if a numness trouble the arm, being stretched forth. The fragments, if they yet slick to their bones and do not prick the slich, The care, must be restored to their state and place, and there kept with agglutinative medicines, and such as generate a Callar, as also with boulsters and rowlers stitled to the place: But if they do not adhere to the bone, or wisk the sless have a generated to the state of the state of the state. to the bone, or prick the fleth lying under them, then must you make incision in the fleth over against them, that so you may take them out with your Crows-beak: But although they sir up and down, yet if they fill adhere to the Periofenon and ligaments, (if fo be that they trouble not the mufeles by pricking them) then must they not be taken forth: For I have oftner than once observed, that by pricking them) then must they not be taken forth: For I have office than once observed, that that they have within fome thort time after grown to the adjacent bones. But if they, being wholly feparated, do not fo much as adhere to the Perintana, then must they necessarily be placked away; otherwise within some short space after, they will be driven forth by the strength of Nature, for that they participate not any more in life with the whole: For that which is quick, saith Hipparrate, uses Lib. de val. to expel that which is dead far from it. The truth whereof was manifested in the Marques of Villary, espirit, who at the Bartel of Down, was wormhold in his strength of Down and when the strength of the Alishov. who at the Battel of Drescx, was wounded in his thoulder with a Pittol-bollet, certain plinters of the A History. broken bone were plucked forth with the pieces of his harnefs, and of the leaden bullet; and with-in fome thort space after, the wound was cicatrized, and fully and perfectly healed: But more than Nature of its feven years after, a defluxion and inflammation arifing in that place by reason of his labour in own according Arms, and the heaviness of his Armour at the Battel of Mont-contour, the wound broke open again: makes it self for that many shivers of the bone, with the residue of the leaden ballet, came forth of themselves, forth strange but if the fracture shall happen in the neck of the shoulder-blade, of dearticulation of the shoulder, bodies and there is scarce any hope of recovery; as I have observed in Anthony of Bourban, King of Navarre; matters.

Francis of Lorrain, Duke of Guise; the Count Khingrave Philiphers, and mrany other in these late. Sure is the Civil Wars: For there are many large vessels about this dearticulation, to wit, the axillary vein and artery, the nerves arising from the Vertebre of the neck, which are thence differenced into the and artery, the nerves ariting from the Veriebra of the neck, which are thence differninated into shoolder is all the muscles of the arm. Befides, also inflammation and putrefaction ariting there, are eatily com-deadly. municated by reason of their neighbourhood to the heart and other principal parts, whence grievous fymptoms, and oft-times death it felf enfues.

CHAP. X.

Of the Frallure and Depression of the Sternon or Breast-bone.

He Sternion is formetimes broken, other whiles only thrust in without a fracture. The in- Signs that the He Sternion is tometimes broken, other whiles only thruit in without a tracture. The in-Signs that the equality perceivable by your feeling, thew's a fracture, as also the going in with a thruit forces is brown in the your finger, and the found or noise of the bones crackling under your fingers. But ken a manifest cavity in the part, a cough, spirting of blood, and difficulty or breathing by compression of the membrane investing the ribs and the lungs, argue the depression thereof. For the re-the care, floring of this bone, whether broken or depress, the Patient must be laid on his back with a cushion stuffed with tow or hay under the Vernion of the back, as we set down in the setting of the collar-bone: Then a servant shall lie strongly with both his hands on his shoulders, as if he would bress them down, whill the Surgeon, in the mean time pressing the ribs on each side, shall restore press them down, whilst the Surgeon, in the mean time pressing the ribs on each side, shall restore and fet the bone with his hand; and then the formerly described medicines shall be applied for to hinder inflammation, and affwage pain; boulflers shall be fitted thereto, and a ligature shall be made crofs-ways above the shoulders; but that not too strait, lest it hinder the Patients breathing-I by thefe means, at the appointment of Anthony of Burbon King of Navar, cured Anthony Benand A History. a Knight of the Order, who had his breast-plate bended and driven in, with an iron bullet shot out of a Field-piece, as also his stermon together therewith, and he fell down as dead with the blow; he did spit blood for three months after I had set the bone, yet for all this he lives at this day in perfect health.

CHAP. XI. Of the Frathere of the Ribs:

He true ribs, for that they are bony, may be broken in any part of them; but the baffard In what place ribs cannot be truly broken, unlefs at the back-bone, because they are only bony in that the shortribs part, but griffly on the foreside toward the breast-bone: Wherefore there they can only may be broken for crooked in. These which are subject to fractures, may be broken inwards and out-ken. wards. But oft-times it comes to pass, that they are not absolutely broken, but cleft into splintered and that sometimes inwards, but not outwards. Thus the fiffure doth oft-times not exceed the middle of the splitting in the splitting of the splitting in the splitting in the splitting of the splitting in the splitting in the splitting of the splitting in the s middle substance of the rib; but sometimes it so breaks through it all, that the fragments and splinters do prick and wound the membrane, which invefts and lines them on the infide, and then there is great danger. But when the fracture is simple without a wound, compression, puncture of the

Any fymptoms ensue upon fractured and contused ribs; but amongst the rest, there are two which are not common, whereof we will treat in this place. The first is, the instance mation, or rising up of the contused stells, which also ensues upon light affects of the stell, but also within a certain phlegmatick, glutinous and viscous humour gathering thereinto-and distemper; which therefore cannot affimiliate the nourishment slowing more plentifully than it was wont, either drawn thither by means of the pain, or fent thither by a blind violence of nature, stirred thereto by a desire of its own preservation. Wherefore this half crude humour remaining there, raiseth much flatuling from its self, or else wrought upon by the weaker heat, it is resolved into cloudy vapours; whence it cometh to pass, that the stell is swoln up in that place, and the skin on the contrary grows soft, as if it were blown up with a quill: Therefore laying your hand thereon, you may hear the noise of the wind going forth thereof, and see a cavity left in the part, as it is usually seen in ordernatous tumors. Unless you remedy this instation, there will ensue an inflammation, seaver, abscess, disficulty of breathing; and lassly, that second kind of affect whereof we have determined to treat in this Chapter; to wit, the putteraction, corruption, or blasting of the ribs. An abscess, and the separation of the sless from the bone is the cause hereof: For hence it cometh to pass, that the bone, despoiled of its natural and slessly cloathing wherewith it was cherished, is easily offended by the touch of the entring air, which it never formerly selt, and so at length it becometh (as it were) blasted: Which when it happens, they spir up hith, and so fall into a Consumption, and at length die. To withstand all these inconveniencies, you must as speedily as you can, restore the fractured bones by the former delivered means: And then this mucous tumor must be resolved by proper heating and discussing

The cure:

The figns.

HARLIN BEIDE

medicines, and kept down by boulfters and rowlers; that fo the fielh may touch the bone, and cover it as it uftally did. But the ligature shall not be anade so strait, as to hinder the ribs from their wonted motion in expiration and inspiration. If the tumor degenerate into an abscess, it shall be specially opened, left the matter, kept in too long, corrupt the bone which lies under it, by the contagion of its putrefaction. The Ulcer being opened, the matter shall be evacuated by potting a Pipe into the Ulcer; the end whereof shall be bound about with a thred, left it fall into the capacity of the cheft, and that it may be drawn forth at your pleafure.

CHAP. XIII.

Of the Fratture of the Vertebrae, or Rack-bower of the Back, and of their Processes.

He Vertebre are fomewhiles broken, otherwhiles bruifed or firained on the infide, where by it cometh to pafs, that the membranes which inveit the fpinal marrow, as also the fpinal marrow it felt; are compressed and straitned, which capte many malign accidents; which, whether they be curable or not, may be certainly foretold by their magnitude. Amongst these symptoms, are the stupidity, or manness and passe of the arms, legs, fundament and bladder, which diminish, or else take away from them the faculty of sense and motion: so that their urine and excrements come from them against their wills and knowledge, or else are wholly supports.

Which when they happen (saith Hipperster) you may forced that death is at hand, by reason sell a party which when they happen (faith Hipperater) you may foretel that death is at hand, by reason self, 2. Prob. that the spinal marrow is hurt. Having made such a Prognostick, you may make an incision, The cure of so take forth the splinters of the broken Vertibre, which driven in, press the spinal marrow, fractured Vertibre, and the nerves thereof. If you cannot do this, at least you shall apply such medicines as may affixed pain, and hinder inflammation; and then the broken bones shall be restored to their places, and contained therein by these mans which we shall previous when the contained the spinal marrow. twage pain, and hinder inflammation; and then the broken bones thall be relioted to their places, and contained therein by those means which we shall mention, when we come to treat of the luxation of the spine. But if that the Processes only of the Variebre be broken, the fragments The cure of shall be put in their places, unless they be quite severed from their Paristicium. But if they be see the processes, vered, you shall open the skin and take them torth, and then dress the wound as is fit. We unsuppose that only the processes of the Variebre are broken, if in the absence of the forementioned are fractured; the processes of proposes and the passes, you laying your suppose the crieved part feel some fymptoms of numnels and the palie, you laying your finger upon the grieved part, feel fomething, as a bony fragment, flaking and moving thereunder, with a certain crackling noife, cavity and depretion; and then, if when the Patient holds down his head, and bends his back, he ty and depression; and then, if when the Patient holds down his head, and bends his back, he feel far more pain, than when he stands up strait on his feet: For in stooping, the skin of the back is somewhat stretched forth and extended, and also forced upon the sharp splinters of the fragments, whenee proceeds a doloristick solution of continuity, and a pricking. In standing strait up, on the contrary, the stretched skin is relaxed, and consequently lest moleticd by the sharp fragments. The fractured processes of the Vertebra easily heal, unless they be affociated with some other more grievous symptom which may hinder; such as is a certain great containon, and the like. For as we formerly said out of Hinterstee, all rate and spongy hours are knit by a Color with. like : For as we formerly faid out of Hippocrates, all rare and spongy boucs are knit by a Calm within a few days.

CHAP. XIV.

Of the Fracture of the Holy-bone.

Lio the Holy-bone in a certain part thereof, which may cafily be healed, may be broken what fracture by the blow of bruifing things, as by a bullet flot out of a musicet, as I have observed in of the boly-many: But if the fracture violate, together with the Vertebra thereof, the spinal marrow and what not end therein then the Patient can scarce scarce death, for the reasons showed in the former contained therein, then the Patient can scarce scape death, for the reasons showed in the former

C H A P. XV. Of the Fracture of the Rump.

He Rump is composed of four bones; the first whereof hath a cavity, wherein it receives the lowest Vertebre of the holy-bone; the other three are joyned together by Symphysis on of the or Coalition; at the end of these hangs a certain small gristle. The fracture of these ramp, bones shall be cured by putting your singer into the Patients sundament, and so thrusting ireven to the fractured place: For, thus you may thrust the fragments forth, and fit and restore it to the rest of the bones by your other hand lying upon the back: But that it may be the sooner healed, it is fit the Patient keep his bed, during all the time of the cure: But if there he a necessity to rise he shall so fit in a personated sear, that there may be nothing which may press the ty to rife, he shall so sit in a personated seat, that there may be nothing which may press the broken parts and fitting remedies for healing fractures thall be applied as occasion thall offer One is up themfoles, wheelever both hance an isosom; Blust in that man medice is public, the word, wherein the cubit or ell-hanc is both to; but that is cause of all, wherein only is wood is broken, for for the instituted part is faithful divide a thome. When both the feet wood is broken, for the making a thought extraface, for that the making are the near the ARD reaches, whenfore refer of them making the whole it work more terrors in buttaking the other, than any rither lightness or lphints, for that it keeps the making making an that place

CHAP. XVI.

Of the Fracture of the Hip, or Os Ilium.

The description of the hip.

He hip confifts of three bones: The first is named Os Ilium, the haunch-bone; the other, Os Isebion, the huckle-hone; the third, Os pubis, the share-bone. These three bones in men of full growth, are so fast knit and joyned together, that they can by no means be separated; but in children they may be separated without much ado. This bone may be broken in any part thereof, either by a firoke, or by a fall from high upon any hard body. You shall know the fracture by the fame kind of figns, as you know others, to wit, pain, pricking, a depreffed cavity, and inequality, and also a numnels of the leg of the fame fide. The splinters of the bones (if quite broke off) must by making incision, be taken away at the first drefling; in performance of which operation, you must have a care that you hurt not with your Instrument the heads of the muscles, nor any veffels, especially which are great; nor laftly, that large nerve which is sent into the mas-cles of the thigh and leg. On the contrary, such fragments as are not broken or severed from their Perioftenm, shall be smoothed and fet in order with your singers, as is sitting. Other things shall be done acording as art and necessity shall perswade and require.

The figns. The cure.

CHAP. XVI.

Of the Fracture of the Shoulder or Arm-bone.

The description of the arm, or shoulder-

The cure,

He arm-bone is round, hollow, full of marrow, rifing up with an indifferent neck, and ending on the upper part into fomewhat a thick head. On the lower part it hath two procedes, the one before, the other behind; between which there is (as it were) an halfcircle, or the cavity of a pully, each end whereof leads into its cavity, of which one is interior, another exterior; that by these (as it were) hollow stops, the bending and extension of the arm might be limited, lest that the bone of the cubit, if the circle should have been perfect, sliding equally this way and that way, might, by its turning, have gone quite round, as a rope runs in a pulley; which thing would much have confused the motion of the cubit: For so the extension or bending it back, would have been equal to the necessary bending it inwards. It is very expedient that a Surgeon know these things, that so he may the better know how to reliore the fractures and hixations of this part. If one of the fragments of this broken bone shall lye much over the other, and the Patient have a good firong body, then the arm shall be much extended, the Patient being so fet upon a low feat, that he may not rife when the fracture shall be a fetting, and so hinder the begun work; and also, that so the Surgeon may there more easily perform his operation upon the Patient feated under him; yet Hippocrates regarding another thing, would have the Patient to fit higher: But you must have a care that the shoulder-bone it self be drawn directly downwards, and the cubit so bended, as when you put it into a feart. For if any one set this bone, lifting the arm up-wards, or otherwise, extending it, then must it be kept in that posture; for otherwise, if the segure be changed, the fetting will quickly be spoiled, when as you come to put the arm in a fearf: Wherefore the Surgeon must diligently and carefully observe, that in setting a broken arm, he put

How the arm

felle 1. de fealt.

mult be placed it in such a posture, that resting on the breast, it look down toward the girdle. when the bone a care in laying the fplints, and rowling your ligatures, that they hart not, nor prefs too hard upis fet.
on the joynts. For, in the opinion of Hippocrates, by the preffure of parts which are nervous, flethseth 3. offic.
lefs, and confequently endued with exquisite tenfe, by the fplints there is danger of most grievous,
pain, inflammation, denudation both of the bone and nerve; but chiefly, if such compression hurt the inner part, towards which the arm is bended; wherefore the splints made for this place must be the fliorter: Therefore after the arm-bone is fet, the arm shall be laid upon the breast in a right angle, and there bound up in a fearf, left that the Patient, when he hath need to flir, spoil and up do the fetting, and figure of the broken bone: But the arm must be kept in quiet, until fuch time as the fragments shall be confirmed with a Callur, which usually is in forty days, fooner or later,

In what time ir will knit.

according to the different conflitutions of bodies.

CHAP. XVIII. Of the Fracture of the Cubit, or the Ell and Wand.

rences

T fometimes happeneth, that the cubit and wand are broken together and at once, and at otherwhiles that but the one of them is fractured. Now they are broken either in their midft or I ends, their ends (I fay) which are either towards the elbow, or elfe towards the wrift. That fracture is worft of all, wherein both the bones are broken, for then the member is made wholly impotent to perform any fort of action, and the cure is also more difficult; for the member cannot so easily be contained in its state: For that bone which remains whole, serves for a ftay to the arm, and hinders the muscles from being drawn back, which usually draw back and flurink up themselves, whensoever both bones are broken: Hence it is, that that tracture is judged the worth whensoever both bones are broken: Hence it is, that that tracture is judged the worth whensoever both bones are broken: the worth, wherein the cubit or ell-bone is broken: But that is easiest of all, wherein only the wand is broken, for fo the fractured part is fuffained by the ell-bone: When both the bones are broken, there must be made a stronger extension, for that the muscles are the more contracted: Therefore, whensoever either of them remains whole, it doth more service in sustaining the other, than any either ligatures or splints, for that it keeps the muscles right in their places

The cure.

Wherefore after the bones shall be set and rowled up with ligatures and splints, the arm must be so carried up in a fearf put about the neck, that the hand may not be much higher than the elbow, left the bloud and other humours may fall down thereinto: But the hand shall be fet in that posture which is between prone and fupine, for fo the Wand shall lie directly under the Ell, as we have read it observed by Hippocrates: The reason is, for that by a supine figure or situation, both the bone and seed a seed of muscles are perverted: for first, for the bone, the Apophysis, Styleides and Olecrasium of the cubit, de Frais. ought to be in an equal plain, and to be feated each against other; which is not so in a supine figure, as wherein the Processus styloides of the cubit is set against the inner process of the arm-bone. But in muscles, for that, like as the infertion and fite of the head of a muscle is, such also is the lite of the belly thereof: and laftly, fuch the infertion of the tail thereof; but by a fupine figure, the muscles ariling from the inner process of the arm-bone, and bending the cubit, shall have the tail placed in an higher and more exteriour site. In the interim, you must not omit, but that the Patients Arm

The Figure of a fractured Arm, with a wound bound up, and may with as little pain as possible you can, be bended and extended Jeated, as is fit:

now and then, left by the too long rest of the tied up part, and the intermission of its proper function, the bones of the joint may be foldered together by the interpolition, and as it were glue of the defluxion which falls abundantly into the joint of the elbow, and neighbouring parts, whence the ftiffness and unmovableness thereof, as if there were a Callus grown there: from whence it may happen

be bended nor extended, which I have observed to have happened to many: Whereof also Galen com. is lib. do makes mention, and calls this kind of viriated conformation Ancyle and Ancylefit. If a Wound Art. also affociate a fracture of the arm, then see that you put about it Plates of Lattin, or Past-board, and make a convenient ligature and that the fragments of the bones be kept in the fame flate wherein they were fet and reftored: Moreover, let him lay his arm upon a foft pillow, or cuthion, as the precedent Figure shews you.

CHAP. XIX.

Of the Fratture of a Hand.

He Bones of the Wrift and After-wrift, may be broken: but, in Hippocrates opinion, chief- Sell.2. de feelt. ly by that kind of Fracture which is called a Seder, now if they finall happen to be broken, feet.9. this shall be the manner of refloring them: Let the Patient lay forth his hand upon some The cure. even and smooth Table; then let your Servant stretch forth the broken bones, and the Work-master reftore them thus extended, and put them in their proper feats. But being reftored, they must be kept in their places by such remedies as are used in other Fractures; to wit, cerates, compresses, kept in their places by tuen remedies as are used in other Fractures; to wit, cerates, comprehes, linnen cloths, and fplints. Now the fractured fingers shall be tied or bound to their neighbours, that so they may the more easily, as bound to a stake, be kept in that state wherein they have been put by the hand of the Workman: But these bones, seeing they are of a rare and spongy nature, are in a short time and easily strengthened, or knit by a Calbur. These things being done, the hollowness or palm of the hand shall be filled with a Tennis-ball, for thus the broken bones shall not onely give of a ball. be more eafily kept in their places, but also the fingers themselves shall be kept in a middle posture, that is, not wholly open, nor quite that. If they be kept in any other figure, the enfuing Callas hand ferves will either deprave or quite abolish that action of the hand, whereby we take hold of any thing. The case stands otherwise with the fractured Toes; for they shall be kept strait and even out, lest they should hinder our going or standing.

CHAP. XX

Of the Fracture of the Thigh.

It is a hard thing to bring the fragments of the broken Thigh together to be fet, by reason of why the bone the large and strong Muscles of that part; which whilest they are drawn back towards their of the Thigh original, by a motion both natural and convulsive, they carry together with them the fragment is more difficult on the bone, whereinto they are inserted: Therefore, when as the Fracture of this bone shall be recally set. shored, the Patient must lie upon his back with his Leg stretched forth, and the Surgeon must strongly and with great force extend the thigh; but if he alone shall not be able sufficiently to extend it, he shall involve two other strong attendants, by whose joint-help the fragments, may be fixed and for shall imploy two other strong attendants, by whose joint-help the fragments may be fitted and set each against other. For this purpose, when as the strength of the hand was not sufficient, the Ancients used an Instrument called a Gloffocombon, whereof this is the Figure.

Srat.67, c. 68.

In flead of this Gloffocommun, you may make use of my Pulley's for Hippocrates, in this bone when it is broken, doth approve of extension fo much, that although by the greatness of the extention the ends of the fragments be fornewhat diliant afunder, an empty space being left between; yet notwithflanding would be have a ligature made: For it is not here as it is in the extensions of other bones, whereas the cafting about of Ligatures keeps the mufeles un-

The Figure of a Gloffocomhum, or Extender.

The natural and internal must be pre-ferved in serting the bone.

The part to be bound up,

movable: but here, in the extended thighs, the deligation is not of fuch force as that it may flay and keep the bones and mufcles in that flate wherein the Surgeon hath placed them: For, feeing that the mufcles of the thigh are large and flrong, they overcome the ligation, and are not kept under by The Surgeon in letting it shall also consider, that the thigh-bone is hollowed on the inner-side, but gibbous on the out-fide, therefore it must be fet in its native figure: Otherwise, if any, unmindful of this confideration, would have it firaight, he shall make his Patient halt all his life after wherefore this inner and native hollowness must be filled up and preserved by putting in a compress or boulder foread over with Unguentum refatum, or the like glutinous thing that it may not fall off: for thus also the ligation thall the more faithfully keep the fragments of the bone in their places. Moreover, Compresses thall be applied to the more slender and less protuberating parts of the thigh, must be made as those which are next the ham and knee, that so the whole ligation may be alike, and confe-Nature of Art. In the factor of pain, as also by weakness: The third is, to that of pains, both by reason of pain, as also by weakness: The third is, to the broken and luxated parts, both by reason of pain, as also by weakness: The third is, to that and hold fast the splints and medicins which are applied. Inflammation is hindered by repreffing and hindering the bloud and other humours, ready to flow down, from entering into the part, and by preffing those humours which are preternaturally contained in the part, into the neighbouring parts above and below: Wherefore there must no fmall care be had of preparing ligatures, to wit, that they be made of choice and well woven cloth, yet not coarse or rough; and let them be of such length and bredth as the Surgeon, perfuaded by an artificial conjecture, shall judge to be fit for the thickness and length of the member and greatness of the fracture: for ligatures ought to be of bredth to involve and cover all the fractured part, and a great part of that which is found: But feeing that in my Book of Bandages, I have feemed chiefly to fet down and approve the manner of binding used by Hippocrates, now I think good here in this place to deferibe that which is in common use amongst our Surgeons. Our Surgeons therefore at this day require three ligatures for Fractures, the first whereof they presently cast upon the hurt part, whether broken or dissocated, or onely strained, making the nust wrappings upon it; fo that they most and straitliest bind it there, but less and more loosly on both fides thereof: Such circumvolutions, or wrappings, are drawn upwards, and there ended. They fides thereof: Such circumvolutions, or wrappings, are drawn upwards, and there ended. They the winof the winof the position of the positi ture; that fo they may prefs the humours the lefs to the extremities of the part, as those which cannot receive and bear, without inflammation and danger of a Gangrene, such abundance of humours, for that they are not fufficiently spacious; as also more remote from the fountain of native heat, which is greater in the center than in the circumference. At the lower end of the hurt part the circumvolutions either end, or elfe are twined thence back again: They east on the third ligature in that lower end of the hurt part, and rowl it smoothly and gently upwards, the windings being made contrary to the windings of the first and second ligatures; that they may so draw back into their natural state the muscles, which peradventure have been drawn aside by the sorce of the former wrappings. These ligations finished, they apply three splints of Past-board, or some such matter; the first below the Fracture, and that truly more broad, and of fusicient length; and then two others, one on each fide, diffant each from other fome fingers bredth, to the end to keep the bone that it do not fiir to this fide or that, being wrapped about with Tow or Corton: Then they think of observe the first being wrapped about with Tow or Corton: think of placing or laying the part, to which purpole they propound to themfelves three fcopes. The first is, that the part may be folts the fecond, imooth and even; the third, forcewhat high. The hurt part ought truly to lie folt, for that hard lying preffes it, and causes pain and inflammation; which whiles the Patient cannot patiently endure, he is forced to change his place, whilest he every way focks case for his pain; and thus he now and then moves the fractured part, which ought to be kept quiet without any motion. It must lie smooth or even, because an unequal or

Why the third ligature must be row first.

The Surgeon ful of three 10 10 EFEE

uneven fite difforts or draws away the part, whileft one portion of the hurt part is born up, and fuflained by that which lies under it; but the other hanging down hath nothing thereunder, whereupon it may reft: Therefore Hippocrates bids us diligently to take heed that the heel do not hang Sed.2. de fr.27.

down, nor the foot remain without a pillow, for hence pain and defluxion of humburs is to be feared. But the part ought to lie formewhat high, that the defluxion may be hindered, which is cafily flirred up by a prone and declining fite: for if the foot fliall be placed in a lower figure, the bloud which flows thither from the leg, will cause inflammation. But on the contrary, if it be higher, nothing can flow down thereinto: Therefore absolutely not onely the foot, but also the thigh and leg are to be placed higher than the rest of the body; yet keeping such a mean, that the part may not be too much distended, as Hipperster admensished us. In the mean time, this hurt leg or side ought to be Smt. 33.05 56. of equal length with the found, and for that purpose it must be staid on both sides with Junks, as we stall year. thall they you hereafter, when we come to fpeak of a broken leg. The bandage being performed, as we have faid, the following night, and the next day the Patient feels the member more firaitly bound, than when it was at first wrapped; yea, verily the Knee is lifted up into a fost tumor by the expression of the humour from the wounded part: but on the contrary, the ensuing day the ligation is flackned and relaxed, some portion of the humour contained in the part being digested. Also the next day all things are perceived more loofe, there being made a larger resolution of the humour: Then therefore the bandages must be loofed, and that not onely, lest that the fragments of when the the bones floudd fall forth of their place, but also that we may gratine the Patient by that alteration first ligation or change of place, and besides that we may avoid itching, which usually happens to parts too long sufficient by that alteration first ligation or change of place, and besides that we may avoid itching, which usually happens to parts too long sufficient bound up, by reason of the supposition of activity and foliations at very contract which all to be eastlessed. bound up, by reason of the suppression of acrid and fuliginous excrements, which use to be gathered in great quantity in a part at reft and bound up, both from the excrementitious humours, wherewith the part is moithned, and the alimentary humours, in a part which is idle and at quiet; by reason the difflation and transpiration are hindered by want of exercise, and the pores of the skin thut up by the abundance of the ligatures: so that by the suppression thereof, many have not onely an itching, but also the skin being broke by the acrimony of these, as well vapours as humours, which are kept thur and pent up, have Ulcers break forth: Therefore when such accidents shall be feared, the part shall so long be somented with warm Water and Oil, as you shall think sit: for, such sometime assumed the line assumed the hinding and amonde the ing affwageth pain, relaxeth that which was too much firaitned by the binding, and amends the refrigeration of the part, caused by the repercussion and expression of the bloud and spirits, the native and internal heat being by this means revived. If, together with the turnour there be a contusion and fugillation, it must be the longer formented, that the excrementitious humour refiding in the part may be digested. But if this quantity of time shall not suffice, then must you use stronger the part may be digerted. But it this quantity of time man not tunice, then man you are thronger digertives: yet have a care you use them not too long; for so you should hinder the generation of a Callus. Therefore that saying of Hippocrates must here be remembred, which faith, That a weak street, see the office of the callus. formentation, and the thort time of using one, doth attract, but not discuss; but a longer and fironger waftes the fielh. Befides also you must have regard to the temper and habit of the Patient; for fomeintations bfed to plethorick bodies, draw superfluous humours to the part. The Ancients bid, that the ligatures be loosed every third day until their seventh day; but after the seventh, on every feventh day: but hereof nothing can be certainly and perpetually decreed: For, according to the accidents the Patients must be dressed fooner or later, more often or feldom; renewing the ligatures, and the reft of the drefting. Therefore, if no fymptom urge, I would have none of these ligatures, and the reft of the drefting. Therefore, if no fymptom urge, I would have none of these things which are done to the Patient at the first drefting, to be moved, unless as slowly and seldom fragments thereof: for, as you see Wood is joined together by Glue, and Pewter with Solders so the the fragments of bones are, by a providence of Nature, glaed and foldred together by a Callas. Wherefore broken bones have very much need of rest, to the generating of a Callas; otherwise, the for the knittenthereof flowing down, quickly flows away, and nothing is done. You may much help forwards the generation of a Callas, which is begun about the thirteenth or fifteenth day, by applying bones. an emplaiter made with the white of an Egg. having the Powder of red Rose-leaves, and Wheatan emplaifier made with the white of an Egg, having the Powder of red Rofe-leaves, and Wheat-flour mixed therewith, and catagonatick Platters, which shall hereafter be described in speaking of

CHAP. XXI.

Of the Fracture of the Thigh night o the Joint, or the upper or lower head of the bone.

Fracture fometimes happens at the joint of the hip in the neck of the thigh-bone, as I once A History, observed in an honest Matron. I being called to her, when I had observed the hurt thigh to be shorter than the whole, with the outward prominency of the Hebitam, which at the In the being the whole, with the outward prominency of the arguman, which at the high light I supposed to proceed from the head of the thigh-bone, I presently persuaded my felf it was a Dislocation and no Fracture; I then therefore extended the bone, and forced (as I thought) the head thereof into its cavity. The equality of both the legs in bigness which followed upon this extension, increased my persuasion that it was a dislocation. The next day I visited her the Then I loofed all her ligatures, and perceived fuch a prominency as I did formerly: Wherethen I loofed all her ligatures, and perceived men a prominency as I did formerly: Where-fore I endeavoured again to force in the head of the bone, as I formerly did; but as I was bufied therein, I heard a little crackling, and also I confidered that there was no cavity nor depression in the integral of the confidered that there was no cavity nor depression in the joint, by which figns I certainly perfuaded my felf that the bone was broken, and not another Fradillocated. Neither onely fuch kind of Fractures, but also the separation of the appendix or head sture of the of this bone from its place, may induce one to think it a diflocation; which thing hath forms Thigh, referrings done from its place, may induce one to think it a diflocation; which thing hath forms Thigh, referrings done from its place. times deceived fome heedless Surgeons, who have not dreamt of the divulsion or separation of the bling a laxa-

appendix from the top of the thigh-bone, but have judged it onely a diflocation. Then therefore

(that I may return to my former narration) I fer the bone, and joined the fragments together, laid thereupon splints with compresses, made ligations with a rowler, having two heads wrapped about the joint, and the body crofs-wife, and I defended her foot with a cafe, that none of the cloths might press it: I fashed a rope to a post, and so let it come down into the midst of the Bed, and tied many knots thereon, for the better taking hold and lifting up her felt; the which thing you must always do in Fractures and Diflocations of the Thigh and Leg, that to your Patients may have fome flay, whereby they may fuccour themselves with their hands as oft as they delire to rife or lift themselves up in their Beds, or go to flool; as also, that they may give perspiration, and as it were ventilation to the loins, buttocks, rump, and other parts, compressed and wearied with long lying, for want whereof they are molefled with heat and pain, whence Ulcers arife, which oft-times torment the Patient with fuch tormenting heat and pain, that he is even confumed by a Fever, watchings, and want Why the Frawhy the Fracture of reft. This opportunity of railing the body out of the Bed, is by so much the more needful in this cure of abone made is place, by how much the Fracture is nearer the joint; for there it is more dangerous than in the more dangerous than in the more dangerous that the part is blood-ross.

It is more dangerous that the part is blood-ross. Tendons, and Ligaments, which are observes. noxious to many malign fymptoms: But the Surgeon must have diligent care in this kind of Fracture, and must look often that the bone which is fet do not fall forth again, which easily happens here by any light flirring of the body, and the like occasion, for that the thigh hath but one onely bone: Therefore as oft as the Bandages shall be loofed, and the Fracture dressed, he shall attentively view the figure of the bone, and the magnitude of the affected part, comparing it with the found; for the fet and composed fragments of the broken bone can scarce fall afunder, but that the one must lie upon the other. But before it be knit the part must be extended and re-flored to its state, that so the Patient may not halt during the residue of his life: For I have read it written in Avien, that scarce any do so well recover a fractured thigh, that they do not halt thereof) therefore the Patient must be careful that he move himfelf or his body as little as he can. Many of the Ancients have fet down the time of the confolidation of this bone to be nifty days: but (as Flore merly (aid) there can be no certain or determinate time hereof. But in what time foever this bone shall be knit the Patient must not stand or go thereon presently upon it, for that there remains a weakness in the part a long time after, so that the Patients are forced to use Crutches to go withall, in that mean space while they recover more firength.

Lib. 3. Sent. 6. In what space the thigh bone may be

CHAP. XXII.

Of the Fracture of the Patella, or Whirl-home of the Knee.

He Whirl-bone of the Knee is oft-times contufed, but not fo frequently broken; yet when The Differenthat happens, it goes into two or three pieces, fometimes long-wife, fometimes athwarts fometimes it is broken in the midft, and fomewhiles fluvered into many fplinters, and all these either with or without a wound. The figns are, impotency in going, a hollowness in that Signs. place, and a fensible separation of the fragments of the hurt part, and the crackling of these parts Cureunder your hand. It is fet after this manner; with the Patient to firetch forth his leg, yea, he must keep it extended all the while until it be knit; and therefore left he should bend it unawares, the hollowness of the ham shall be filled with a boulster; for by bending of the Knee the fee tragments of the Whirl-bone would again fly in funder. This being done, the fragments thall by the hand of the Surgeon be fet as is fitting, and be kept to fet by the application of convenient remedies, making ligatures, and applying junks, as we faid must be done in the fracture of the thigh-bone. And latily, you must observe and do in this as in the fracture of a leg. For the Prognostick, this I affirm, that I have seen none of those who have had this bone fractured who have not halted during the rest of

Why those halt who have their lives, had this bone in of the h ing of the Knee's going, especially on even ground, is more easie to the Patient, but an ascent is far more difficult, and absolutely painful. The Patient must necessarily for this kind of Fracture is or keep his Bed, at the least for forty days. fractured.

CHAP. XXIII.

The cause hereof is, the knitting by the concretion of a Callas hinders the free bend-

Of a broken Leg.

Sent 6 4. fell. 2. His kind of Fracture is cured after the fame manner as that of the arm or cubit. Hippocrates adde Frail, monisheth us, that the Tibia, or leg-hone is more dangerous to be broken, and more difficult and flow to be healed than the Fibula, or shin-bone; because that is the thicker, and as it were the upholder of the whole bulk of the body; but this other is but as it were a certain additament or allifant provided for the flaying or bearing up of the muscles of the leg, by which the foot is moved. The leg-bone being only broken, the figns thereof are perceived only in the inner part of the leg; for that the thin-bone being whole furfers it not to throw or cast forth it self. On the contrary, when the thin-bone pally is book as the furfers it not to throw or cast forth it self. thin-bone only is broken, the figns thereof appear only in the external part of the legs because the leg-bone being opposed thereto, doth not suffer it to cast in it self, and with its tragments to turn it Sign that both wards: But when both the bones are broken, the figns of the Fracture may equally appear both here the bones are broken. But when only one of these bones are broken, the Fracture is far more calle to dress and broken. But which remains whole, is a much more firm stay to that which is hurr than any splints can be. But that I may the better instruct and make ready the Surgeon for the restores.

10 110 E1 E1 E

of this Fracture, I will illustrate the matter by an example from my felf. John Nestov, Doctor of Physick, Richard Hubert, and I, went together to visit a Patient at the place of the Frier Minorites. Wherefore, intending to pass over the Soin within sight of the place, I endeavoured to make my horse take boat, and therefore switched him over the buttocks: The Jade, madded herewith, so struck at me with his heels that he brake both the bones of my left leg, some four impers bredth above my ankle. Then I, scaring some worse mischief, and left the Jade should double his bloom, slew back, and as I shall heals, the horses hours flew in singlet; and breaking should heal heals. John Nefter, Doctor of A History. flew back; and as I fled back, the broken bones flew in funder; and breaking through the fleth, flocking, and boot, shewed themselves, whereby I felt as much pain as it is credible a man was able to endure; wherefore I was prefently carried into the Boat, that fo I might be carried to the other fide of the Water to be dreffed; but the firring of the Boat as they rowed, almost killed me with bitterness of pain, for that the sharp fragments of the bones were rubbed against the sless which lay next them. Being ferried over, as I was conveyed into the next houses, my pain was much increafed, whileft lifted by the hands of divers perfons, one while up another down, formetimes to the left fide, other whiles to the right with my whole body, and all the parts thereof. When at the left fide, other whiles to the right with my whole body, and an one parts disclost. When at the length I was laid upon a bed, I was formewhat freed from the bitterneds of my pain, and had time to wipe off the fiveat which ran down over all my body. Then was I dreffed with fuch a Medicin A foot made as the time and place would afford, we composed it of the White of Egg, Wheat-flour, Soot of a Medicin. Chimney, and melted Butter. For the rest, I entreated Riebard Hubert that he would handle me what to do what to d as if he knew me not, neither that moved for love of me, he should remit any thing of the severity when the Leg of Art, but chiefly, that he would stretch my foot straight out, and if the wound were not suffi- is broken. eiently wide, that he would enlarge it with his Incifion-knife, that fo he might the more eafily fet the broken bones in their due place; that he would with his fingers (whole judgment is far more certain than the best made instruments) search, whether the splinters which were in the wound were quite severed from the bone, and therefore to be taken forth; that he would with his hand prefs forth the bloud, and the clods of bloud which were in a great quantity concrete at the mouth of the wound; that he would bind up and place my leg in that fite and manner as he thought best; which is, that he would have three rowlers in a readiness, the first whereof he should cast discount to the control of the should cast discount to the should be sh rectly upon the wound, so that he should begin his ligation at the wound: also he should put splints about it, forme three, but others two fingers bredth, of the length of half a foot, formewhat deprefied and hollowed, whereby they might be the more easily put about the leg, more firaitly at their ends, and a fingers diffance each from other, which at the laft he fhould bind with fillers, like those wherewith Women use to bind up their hairs yet so that the binding might be more straight upon the wound; and that he would fill the cavity of the ham and of the ankles with boulders made of flax wrapped in linnen cloths: that he would fortise the fides of my leg with Junks made of bents or little sticks, and lined with linnen cloth, stretched from my heel to my groin, and bound over in four places; so that the straight figure of the leg, might forcely be percented by any figure, that in four places; fo that the straight figure of the leg might scarcely be perverted by any sorce: that he would gently and smoothly lift up my leg to an indifferent height: and lastly, that he should The figure of a Leg fractured with a Wound, and bound up.

arm it from the violence of external injuries , by putting it in a Box or Cafe. But you mult note, that the fit placing or laying of the Leg is a matter of fuch moment, that if any errour be here committed, it will cause no less then lameness: For if it be lifted up higher than is fit, the Callar will be hollow on the forefide; if lower, then it will be gibbous or bunching forth. Neither also do they commit a small errour, who do not fill up the cavities at the ancles after the afore-mentioned manner: for,

hereupon the heel will be much afflicted, whileft it is forced to fuffain a tedious and painful compretion, which at length brings a hot diffemper, because the spirits cannot freely flow thereto; which I finding by experience, not knowing the cause, wished them ever now and then to lift up my heel, whereby it might enjoy the benefit of perspiration, and the spirits have free entrance thereinto, and the contained vapours paf-fing forth. To conclude, my hurt leg was laid upon a cushion, after the manner you see here described;

Of some things to be observed in Ligation, when a Fratture is affociated with a Wound.

His taken out of the doctrine of the Ancients, ought to be kept firm and ratified; that liga- That the ligation must be made upon the Wound, otherwise the wounded part will presently lift it self tion must be tion must be made upon the Wound, otherwise the wounded part will presently lift it less most strain up into a great tumor, receiving the humours pressed thicker by the force of the ligation on the wound made on this and that side, above and below, whence ensure many malign symptoms. You may make what symbol is above and below. trial hereof upon a found flefhy part; for if you bind it above and below, not touching that which is toms en in the midft, it will be litted up into a great tumor, and change the flourishing and native colour into want of bind-a livid on blankish here he reason of the flowing and abundance of the humours pressed forth on every ing upon the a livid or blackish hue, by reason of the flowing and abundance of the humours pressed forth on every ing fide from the neighbouring parts. Therefore such things will happen much the rather in a wounded or ulcerated part: But for this cause the Ulcer will remain unsuppurated and weeping, crude and liquid Sanier flowing there-hence, like unto that which ufually flows from inflamed Eyes: Such Sanier, if it fall upon the bones, and make any flay there, it, with the touch thereof, burns and corrupts them, and so much the more, if they be rare and soft. These will be the figure

A STANSON

Signs of the corruption the bones.

of fuch corruption of the bones; if a greater quantity, and that more filthy fanier flow from the Ulcer than was accustomed, or the nature of a simple Ulcer requires; if the lips of the Ulcer be inverted, if the flesh be more fost and flaccid about them, if a forrowful fense of a beating, and also deep pain torment the Patient by fits; if, by fearching with your probe, you perceive the bone to be spoiled of its periodenen; and lastly, if you find it scaly and rough; or also, if your probe be put down somewhat hard, it run into the fubstance of the bone. But we have treated sufficiently hereof in our particular Treatise of the rottenness of the bones; but certainly such rottenness will never happen to the bone, if the hurt part be bound up as is fit, and according to Art. Wherefore I judge it not amiss again to admonish the Chirurgeon of this, that as far as the thing shall suffer, he make his rowlings ted in ligation upon the wound, unless by chance there be such excessive pain and great inflammation, that through occasion of such symptoms and accidents, he be diverted from this proper and legitimate cure of the difease: Therefore then, because nothing more can be done, let him onely do this which may be done without offences that is, let him supply the defect of ligation and rowlers, with a linnen cloth, not too weak, nor too much worn, being twice or thrice doubled, and which may ferve to compais the wound and neighbouring parts once about: let him few the edges thereof at the fides of the wound, left he beforced to flir the fragments of the bones (which once fet ought to be kept unmoved) as often as the wound comes to be dreffed. For, broken bones do not require fuch frequent dreffing as Wounds and Ulcers do. By this it appears, that as want of binding, and too much loofness in abfence of pain and a philegmon, fo alfo too firait ligation when pain is prefent, brings a philegmon and abfeefs to the Wound: Therefore let all things here, according to the forementioned rules and circumstances be indifferent. I have for this purpose thought good to reiterate these things, because you shall as yet find many, who follow the practice of Paulue, and make many circumvolutions here and there, above and below the wound, which prefently they carry crofs-wife. But this crofs or Lattice-like kind of ligation is wholly to be difliked, and that onely to be used which we have described, according to the mind of Hipperater. Now it is time that I return to the former History of my mishap, and declare what was done to me after that first dressing, which I have formerly men-

wounded part must be omit-

binding to be

CHAP. XXV.

What was used to the Authors Leg after the first dressing.

Being brought home to mine own house in Paris in the afternoon, they took from me, out of the Bafilica of the left arm, fome fix ounces of bloud: And then at the fecond dreffing the lips or edges of the wound and places thereabout were anointed with unguentum rosation, which by a joint consent of the Ancients, is much commended in the beginnings of tractures; for it will affaram, wherefwage pain, and hinder inflammation, by repelling the humours far from the wounded part: for ore good in it is cold, aftringent and repelling, as the composition thereof shews; for it is made ex oleo compliacions aqua refacea, pance aceto, & cera alba. Therefore I used this ointment for fix days; I dipped the comprefies and rowlers formewhiles in Oxycrate, otherwhiles in thick and aftringent red Wine, for the threngthening of the part, and reprefling the humours; which two things we must have a care You must have of in Hippocoates opinion, in Fractures especially with a wound : Wherefore it at any time the coma care that the prefes or rowlers feemed to dry, I now and then moistned them with the Oxycrate or Rose Vinegar: for, by their too much drynefs, pain and inflammation happen; and if they bind the part forne-what more firait, they hart it also by their hardness. You shall see many Surgeons, who in this grow not hard kind of affect, from the beginning to the end, use onely affringent and emplastick Medicins, wholly contrary to the method fet down by Hippocrater, and commended by Galen: For, by the continued use of such things, the pores and breathing-places of the skin are thut up; whence the fuliginous excrement being support, the external heat is increased, and itching caused, and at length an Ulcer by the fretting of the acrid and ferous humour long supprest: Whereby you may learn, that aftringent and emplattick Medicins must not be used above fix days: In stead hereof you shall use the emplaisters, which I shall presently describe. In the beginning of my disease I used so spare a diet, that for nine days I ate nothing each day but twelve flewed Prunes, and fix morfels of bread, and drank a Paris pint of fugred Water, of which Water this was the composition. Re Sace, albif. 3 xij. ague funt. for Xij. cinam. 3 iij. buliant finual fecundum artem: Otherwhiles I used Syrup of Maidens-hair with boiled Water: Otherwhiles, the divine drink (as they term it) whereof this is the composition. Re Aque colle Ib vj. face, albif. 3 iv. fuce, lom. 3 j. agitentur & transvasientur fepius in vasis vitriis: I was purged when need required with a bole of Cassia with Rubarb: I used also Suppositories of Cassia Syrup I was purged with a bole of Cassia with Rubarb: I used also Suppositories of Cassia Syrup I was purged when need required with a bole of Cassia with Rubarb: I used also Suppositories of Cassia Syrup I was purged when need required with a bole of Cassia Syrup I was purged when need required with a bole of Cassia Syrup I was purged when the case of t file-Scap to make me go to flool; for, if at any time I wanted due evacuation, a preternatural heat
The causes of prefently seized upon my kidnies: With this, though exquisite manner of diet, I could not prevail, Aboes, enfo-ing upon a an abfects, long flowing with much matter: I think the occasion hereof was some portion of the hubut that a Fever took me upon the eleventh day of my difease, and a defluxion, which turned into mour supprest in the bottom of the wound; as also by too loose binding, by reason that I could not endure just or more firait binding; and lastly, scales or thivers of bones quite broke off, and therefore unapt to be agglutinated: for these therefore putrefying, drew by consent the proper nourishment of the part into putrefaction, and by the putredinous hear thence arising, did plentifully administer the material and efficient cause to the defluxion and inflammation. I was moved to think they were Signs of feales fewered from feales fewered from their bone by the thin and crude famin flowing from the wound, the much fwoln their bones. fides of the wound, and the more loofe and spongy field thereabouts. To these causes this also did accrew, one night amount about a secret of the more loofe. accrew, one night amongst the rest, as I slept, the muscles so contracted themselves by a violent mo-tion, that they drew my whole leg upwards; so that the bones, by the venemency of the convulsion, were displaced, and pressed the sides of the wound; neither could they be perfectly composed or set,

under, and for the heel. most part a continued Fever, delirium,convultion, and (by that fympathy which generally accompanies fuch affects) a hicketing: For the heel and flomach are two very nervous parts, the latter in the whole bodythereof, and by a large portion of the Nerves of the fixt conjugation; but the other by the great tendon pafting under it, the which is produ-ced by the meeting, and as it were growing together of the three mufcles of the calf of

are deadly both by diffipation of the native heat by the feverifly, and that which is preternatural; as also by the infection of the noble parts, whole use the life cannot want, by carrion-lake vapors. When Remedies for as I confidered all these things with my self, and (become more skilful by the example of others) until the preventional self. derification how dangerous they were, I wished them now and then to lift my heel out of the bed; and forefaid underification how dangerous they were, I wished them now and then to lift my heel out of the bed; and forefaid underification, being open in the middle, and itselfed with foft feathers, and laid under my rump and heel, linnen cloths spread over with unguentum to atum, for the affwaging of the pain and I did oft-times apply linnen cloths spread over with unguentum to atum, for the affwaging of the pain and heat: Besides also, I devised

The use of a

devised a Casse of Lattin, wherein the broken Leg being laid, is kept in its place, far more surely and certainly than by any Junks; and moreover also it may all be moved to and again at the Patients This Caffe will also hinder the heel from lying with all its body and weight upon the Bed, putting a foft and thick boulfter under the calf, in that place where the Caffe is hollow: be fides also, it arms and defends it against the falling down and weight of the bed-cloths, having a little arch made over and above of the same matter: All which shall be made manifest unto you by the

precedent figure. Now it remains that I tell you what remedies I applied to the abfects which happened upon my wound. When therefore I perceived an abfects to breed, I composed a suppurative Medicin of the yolks of Eggs, common Oil, Turpentine, and a little Wheat-flour, and I used it till it was opened; then to cleanse it I used this following remedy. Re Symptostation terebinth veneta, ar. 3 ij. pulveris radicis ireas florentiae, aloes, massiches, farina bordei, an. 3 st. incorporentus romnia sinual, & flat A deterfive. mundificationen: but I had a care that the place whereat I conjectured the quite fevered scales of the bones must break forth, should be filled with tents made of sponge or flax, that so by this means I might keep the Ulcer open at my pleasure: But I put into the bottom of the Ulcer catagonatick and Catagmatick Powders have

cephalick Powders, with a little burnt alum, to procure the egrefs of the formerly mentioned feales. Thefe at length east forth, I cicatrized the Uller with burnt alum; For, this having a drying and feales of bones aftringent faculty, confirms and hardens the flesh, which is loofe and spongy, and flowing with liquid Tanies, and helps forward Natures endeavour in cicatrization. For, the fragments of the bones, they

by reason of their natural driness and hardness, cannot be joined and knit together by themselves without a medium: but they need a certain fubstance, which thickning and concreting at their ends, doth at length glue them together, and (as it were) faften them with foder. This substance hath its matter of the proper fubfiance and marrow of the bones; but the former from the native heat, and both efficient

emplattick Medicins, which moderately heat. For on the contrary, these Medicins, which by their of a Callus. too much heat, do discuss and attenuate, do (as it were) melt and dissolve the matter of the Caller, and fo hinder the knitting: Wherefore for this purpose, I would wish you to make use of the following emplasters, of whose efficacy I have had experience; for, hence they are called knitting or Medicins con-confolidating plasters. is fit. It is convenient in the interim to have regard to the temper of the affected bodies; for neither are the bodies of children to be fo much dried as these of old men: otherwise if such drying Medicins should be applied to young bodies as to old, the matter of the Callus would be diffolved, it would

be so far from concreting; wherefore the Surgeon must take great heed in the choice of his Medi-cins: For often-times remedies good of themselves, are by use made not good, because they are used Medicins and applied without judgment; which is the caufe that oft-times pernicious accidents happen, or elfe the Callus becomes more foft, hard, flender, crooked; or laftly, concretes more flowly by the great good of them-felves, not good by event.

errour, and to the great shame of the Surgeon.

CHAP. XXVIII.

By what means we may know the Callus is a breeding.

When the Callot is bree-ding the Ulcer must be seldom dreft.

a Calles.

on of a Sparadrapan, or Cerecloth,

Means fit for generating a

Hen I knew that my Leg begun to knit, when as less matter than was usual came from the Ullcer, when the pain flackned, and laftly, when as the convultive twitchings ceafed; which caused me to judge it fit to dress it seldomer than I was used to do: For, by the frequent detertion in dreffing an Ulcer, whileft a Callus is breeding, the matters whereof it is to be made, are drawn away and spent, which are (as they term them) Ros, Cambinen, and Gluten, which are the proper and genuine nourithments both of the bony, as also of the flethy substance. I by other signs also conjectured the breeding of the Callus, to wit, by the sweating of a certain dewy bloud out of the edges and pores of the wounds, which gently died and bedewed the bouliters and ligatures, proceed-Hippfest 43. ing from the efflux of the fubtler and gentler portion of that matter, which plenteously nowed feel. 1. de frail. for the breeding of a Callus. As also by a tickling and pleasing sense of a certain vapour continually for the breeding of a Callus. As also by a tickling and pleasing sense to the place of the wound. Wherefore thenceforwards I fornewhat loofened the ligation, left by keeping it too ftrait, I should him der from entering to the fragments of the bones, the matter of the Callus, which is a portion of the bloud, temperate in quality, and moderate in quantity. Then therefore I thought good to use non-rithments ht togenerate more gross, thick, and tenacious bloud, and sufficient for generating a Calini-such as are the extremities, tendinous, and grifly parts of Beafts, as the heads, seet, legs, and cars of Hogs, Oxen, Sheep, Kids; all which I boiled with Rice, French Barley, and the like, using some whiles one, somewhiles another, to please my stomach and palate. I also sometimes sed upon Fra-mits. The Miles of the state of the s

mity, or Wheat fodden in Capon broth with the yolks of Eggs; I drank red, thick and aftringent Wine, indifferently tempered with Water. For my fecond course, I are Chesnuts and Medlars. Neither do I without some reason, thus particularize my diet; for that gross nourithments, especially if they be friable and fragil, as Beef is, are alike hurtful (for as much as pertains to the generating of a Callus) as light meats are; for that makes the Callus too dry, these too tender. Wherefore Galen Lib 6. Math. 4.5. pronounces those meats onely fit for generating a Callus, which are neither fragil nor friable, neither ferous and thin, nor too dry's but indifferent gross, and also viscid, fat and tough. These meats digefted by the florasch into chylar, are fent into the Guts, and from hence, by the mefaraick veins into the gate vein, and the hollow part of the Liver, thence into the hollow-vein, and so into the veins dispersed over all the body and parts thereof. There are also some of these veins which carry bload into the bones, but in the large cavities of the bones is marrow contained, as in the small, a certain marrowy fubfiance, proportionable thereto, being their proper nourithment. The generation of marrow is from the groffer portion of the bloud, which flows into the greater cavities of the bones by larger Veins and Arteries, but into the less by leffer, which end in their pores and finall paffages: For in large bones you may observe large and apparent passages, by which the Veins and Arteries enter for the fore-mentioned use. By the same ways the Nerves also infinuate themselves, from Why the marwhence proceeds a membrane which involves the marrow of the bones, the which by that means is to have fenfe indued with most exquisite sense, as experience teacheth; which is the cause that makes many be- of teeling. lieve that the marrow hath fense of feeling, because the membranes thereof being hurt cause most bitter pain. Therefore out of the marrow and the proper substance of the bone, there sweats a certain gross and terrestrial juice, whereof by the power of the assimilating faculty, which serves in stead of the formative, a Callus grows and knits. Simple fractures of the leg are ufually knit in tifty days, in what force but through the occasion of the Wound, and the scales quite broke off, and other accidents which be-fel me, it was three whole Moneths before the fragments of the bones were perfectly knit, and it was ally knit. also another Moneth before I could go upon my Leg without the help of a Crutch. Going was painful to me for forme few days, because the Callus had taken up some place of the muscles: for before my former freedom of motion could return again to the broken and knit part, it was necessary that the tendons and membranes should separate themselves by little and little from the scar. In the performance of all thefe things, I had the diligent and faithful affithance amongst the Surgeons, to omit Phylicians, of Ambony Portal the Kings Surgeon.

CHAP. XXIX.

Of those things which may hinder the generation of a Callus, and how to correct the faults thereof, if it be ill-formed.

Aving already fpoken of the figns of a Callus beginning to concrete, of its generation and the manner thereof: it now remains that we treat of those things which hinder the generation thereof; and what on the contrary help forwards the conformation and concretion thereof. Now these things which either wholly hinder, or else retard the generation of a Cal- Discussing and In, have a firong and powerful diffusive and attenuating faculty; or elfe they are unchoos, oily, and unchoos Memoit;: For by fuch, the juice, whereof the Callus ought to be, is either melted and confumed, or dicins hinder elfe grows fort, and is relaxed. But on the contrary, those things which help forwards a Callus, of a Callus must be drying, incraffating, thickning, hardning, and emplatick; moderately hot and attringent: what helps But for moit and relaxing Medicins, they ought to have no place here, unless when it happens that forward the the Callus is ill formed, that is, too thick or created and confusion much be warded to the contrary. the Callar is ill formed, that is, too thick, or crooked, or otherwife ill shapen, whereby it may be wageneration
shed and broken, so to be restored again after a better manner. Yet notwithstanding, such things are
not to be attempted, unless when the Callar is yet green, and so deprayed that the fault thereof doth
very much pervert the native conformation of the part, and exceedingly offer the alternoon. Then
therefore in such cost the data which a describing and a Stepneshed and outs, wheretherefore in fuch case the place must be formented with a decoction of a Sheeps-head and guts, wherein thall be boiled the roots of Marth-mallows, of Briony, the feeds of Line, Færnagreek, Pigeons-dung, Bay-berries, and the like. You shall also use this following Ointment and Platter. Re Unguesti de Alibea 3 iv. elei lilierum, & exemple anscris, an. 3 j. aque vite parum, liquestast smul, siat linimonum, quo linatur part. Then apply this following Emplastier. Re Emplast. de Vigo com Mercario, cirati assipati, descriptione Phylagrii, at. 3 ii, elei anethini & lilierum, an. 3 j. liquestast amul, siat emplastrum; let it be spread upon leather for the aforesid use. When by this means the Callus shall seem to be sufficiently mollisted, it shall be broken, and the bourse restored to their natural state, and the cure of the Fracture to be followed as at the beginning. If the Callus be become too hard through age, it is better not to break it, but to let it alone, left some worfe accident befall the Patient: For it must not be to break it, but to let it alone, left some worfe accident befall the Patient: For it must not be to be a broken, may fo fail out, that by your labouring to break it, the bone may break in fone other part, before it broken, break in that which is knit by the Callus; therefore the different Patient had rather live lame, than flort, or other-foreschewing it, to undergo the hazard of his life. If the Callus be too gross, it shall be diminished wise ill-con(if it be as yet fresh) with emollient, resolving, and powerfully aftringent Medicins, which have force formed, to diffolve, dry and exhauft. It will also be good strongly to rub the Callus with Oil of Bays, wherein Salt-petre, or some other kind of Salt hath been dissolved, then wrap it about with a rowler to band it very thraitly, patting a leaden plate thereon, whereby the flowing down of the nourithing huthour into the part, may be forbidden, that thus by little and little the Callus may decay and dimi-If on the contrary it any ways happen that the Callus be more thin and flender, and grows The causes of thore flowly, for that it is too firaitly bound, or because the idle part is longer kept in quiet than is too flender a ht, without exercising of its proper function, (which cause is to be reckoned amongst the chief causes of the longer kept of the longer kept in quiet than is called. of the leanness, even for this reason, for that exercise stirs up the native heat of the part, the worker of digeition and nutrition) or elle for that they feed upon fuch mouriflyments as offend in quality or

ennis, men

Remedies therefore

quantity, or both; or for that the ligature used to the part is too often loofed, or because the part it self is too hastily, and before the time put to undergo solid offices and motions. According to the variety of causes medicins shall be applied; for if the ligature of the part be too strait, it shall be loofed, yea, verily the fractured place, the ligature being taken away, thall be quite freed from ligation, and a new kind of ligature must be made, which must be rowled down from the root of the Vessels, that is, from the arm-pits, if the arm; or from the groin, if the leg be broken, to the fracture; yet for as that you may leave it untouched or taken in, for thus the bloud is preffed from the fountain and fpring and forced into the affected part, by a way quite contrary to that whereby we have formerly taught, in fear of inflammation, to hinder it from entrance into the affected part : Also gentle frictions and fomentations with warm water may be profitably made, from which you must then defilt, when the part shall begin to grow hot and swell. If any too long continue these frictions and fomentations, he shall resolve that which he bath drawn thither: For this we have oftentimes observed, that frictions and fomentations have contrary effects, according to the shortness and continuance of time. Pications will also conduce to this purpose, and other things which customarily are used to members troubled with an atrophia, or want of nourishment.

When we must defist ting and fri-

CHAP. XXX.

Of fomentations which be used to broken boner.

Warm Water. thereof.

Ivers fomentations are used to broken bones for several causes. When we use warm water for a fomentation, we mean that which is just between hot and cold, that is, which feels Jukewarm to the hand of the Physician and Patient. A formentation of fuch water used for fome thore space, doth moderately heat, attenuate, and prepare for resolution, the humour which is in the surface of the body, it draws bloud and an alimentary humour to the part labouring of an arrophis it affwages pain, relaxes that which is too much extended, and moderately heats the member refrige-rated through occasion of too firait binding, or by any other means: On the contrary, too hot to-menting cools by accident, digeffing, and discussing the hot humour which was contained in the Notes of short, member. We mean a short time is spent in formenting, when the part begins to grow red and swell; a just space, when the part is manifestly red and swollen: but we conjecture, that much or too much time is spent thereon, if the redness which formerly appeared go away, and the tumor which listed up the part, subside. Also in somenting, you must have regard to the body whereto it is used; For if it be plethorick, an indifferent fomentation will distend the part with plenty of superfluous humours; but if it be lean and spare, it will make the part more fleshy and succulent. Now it remains that we say somewhat of the fracture of the bones of the Feet.

long forment-Fomentations bure plethorick bodies,

CHAP. XXXI.

Of the Fracture of the bones of the Feet.

Why the fire ctured bones of the fdot must be kept in a ftrait po-

He bones of the inftep, back and toes of the Feet, may be fractured as the bones of the hands may: Wherefore these shall be cured like them, but that the bones of the toes must not be kept in a crooked posture, as the bones of the fingers must, left their action should perish or be deprayed; for as we use our legs to walk, so we use our feet to stand; besides also the Patient thall keep his bed until they be knit.

The End of the Fifteenth Book.

BOOK XVI. Of DISLOCATIONS or LUXATIONS.

CHAP. I.

Of the Kinds and Manners of Diffocations.

What a Luxu tion properly to called is. What a Luxa tion not properly to called

Diflocation is the departure or falling out of the head of a bone from its proper cavity into an accustomed place belides nature, hindring voluntary motion. There is another kind of Luxation, which is caufed by a violent differtion, and as it were a certain divarication, and dilatation, or extension into length and bredth of the ligaments, and all the nervous bodies, which contain; firengthen, and bind together the joints. Thus those who have been tormented and racked, have that thick ligament which is in the inner cavity of the buckle bone too

violently extended. Those who have suffered the Strappado, have the ligaments encompassing the articulation of the arm-bone, with the shoulder blade, forcibly and violently diffended. Such also is their affect, whose foor is strained by slipping. There is a third kind of Luxation, when as those bones which are joined contiguous, and one (as it were) bound to the sides of another, gape or sly afunder; 25 in the arm, when the Ell parts from the Wand; in the leg', when the one Focile slies

The third kind of diflo

from the other: yet this may be referred to the focond fort of Diflocations, because it happens not without dilatation, or elfe the breaking of the ligaments. There is also a fourth added to these, as The fourth when the Epiphyles and heads of bones are plucked from the bone whereon they were placed or fatined; which unproperly called kind of Luxation, hath place chiefly in the bones of young people, and it is known by the impotency of the part, and by the noise and grating together of the crackling bones when they are handled. Now the bones of young folks are also incident to another calculates for as the bones of old people are broken by violence, by reason of their driness and hardness, thus the bones of children are bended or crooked in by reason of their natural softness and humidity.

GHAP. H. Of the Differences of Diffocations.

Ome Diflocations are fimple, others compound: We term them fimple which have no other What Luxatipreternatural affect joined with them; and fuch compound, as are complicated with one or one are fimmore preternatural affects; as when a diffectation is affectated with a wound, fracture, great ple, pain, inflammation, and an abfects: For, through occasion of these we are often compelled so long to pound, let alone the luxation until these be remitted of themselves, or by our Art. Some diffectations are What a compound. compleat and perfect, as when the bone wholly falls out of its cavity; other fome are unperfect, as pleat Lixations or firains. Differences of Luxations are also drawn from the place; for fometimes the bone is wrested forwards, otherwhiles backwards, upwards, downwards; formewhiles it may be wrested according to all these differences of site, and otherwhiles onely according to some of them. Differences are also taken from the condition of the diflocated Joint in greatness and littleness, from the superhciary or deep excavation of the finus or hollowness; and laftly, from the time, as if it he lately done, or of fome long continuance. I have judged it fit to fet down all these, for that there are several Indications of curing, according to the variety of each of these, as we shall teach hereafter.

CHAP. III. Of the Caufes of Diffocations.

Here are three general causes of Luxations, internal, external, and hereditary: The internal, What a sub-are excrementitious humours and flatulencies, which setling into the joints with great force and plenty, do so make slippery, soften and relax the ligaments which bind together the that they easily fall out of their cavities, or else they so fill and distend these ligaments, and set of distoca-tions for the being some solutions. make them fo thort, that being contracted, they also contract the appendises of the bones from whence tions, they arife, and so pluck them from the bone whereon they are placed, or else draw the heads of the they arie, and to paick them from the bone whereon they are placed, or the draw the means of the bones out of their cavities, chiefly if the violence of a noxious humour doth also concur, which posterling and filling up the cavities of the joints, puts them from their seats, as it off-times happens to the joint of the hip by Sciaticaes, and to the Vertebre of the spine, by whose Luxation people become gibbous, or otherwise crooked. But external causes of Diflocations are falls from high, bruising and External causes the Rack Supposed of Significant and all stables the stables of the s gibbous, or otherwise crooked. But external causes of Diffocations are falls from high, bruiting and External causes heavy blows, the Rack, Strappado, flipping in going, and all fuch like things, which may force the fest heads of the bones to fly out of their feats or cavities, which also happens sometimes to Instants in their birth, when as they are too carefully and violently drawn forth by the Midwise, so that either their arms or legs are put out of joint. Hereditary causes are such as the Parents transsuse into their Hereditary off-spring: hence it is, that crooked not necessarily, but often-times are generated by crooked, and causes, lame by lame. The truth whereof is evident by daily experience: Besides also Hipperates himself Stall 3-stall 48.82, avers, that Instants in the very Womb may have their joints dissocated by a fall, blow, and compress. avers, that Infants in the very Womb may have their joints diffocated by a fall, blow, and compression, and by the too much humidity and loofness of the joints: whence also we see many crook-likely or, legged and footed from their nativity, so that none need marvel or make any doubt hereof. We children may have read it observed by Galen, In Libro de Artic, that children may have impositionness in their Mohave Imposition of their own accord, and be citatived by the onely benefit of Nature. It also have read to their own accord, and be citatived by the onely benefit of Nature. thers Wombs, which may cast forth quitture, the Ulcers being opened of their own accord, and be citatrized by the onely benefit of Nature. It also happens to many from their first conformation, that Wombs, the cavities of their joints are less depressed than they should be, and that their verges are more dilated than they ought to be; whereby it happens that the heads of the bones can the less enter into them. It falls out that othersome have the ligaments appointed by Nature for fashing together the bones of the joint, whether inferted or placed about, so weak, that from their first original they are not of sufficient strength, or else abound with much phlegm, either bred together with them, or thowing from some other place; so that by their too much slipperiness they less faithfully contain the knittings or articulations of the bones. In all these, as the bones are easily dislocated, so they may presently be easily restored, without the affishance of a Surgeon, as I have off-times observed. may prefently be eafily reflored, without the affiftance of a Surgeon, as I have off-times observed

CHAP. IV.

The figns of Diflocations,

Ome of the figns whereby we come to the knowledge of a luxated bone, are common to all The common diffocations; others are proper onely to feveral Luxations. It is a common fign that there fign of all different common figures are common figures. is always a tumor in that part whereto the bone runs, and a hollowness on that fide from locations. whence it is flown. Now the proper figns shall be shewed, when as we come to treat of the par-

ticular kinds of Luxations. We know a perfect Diflocation by the loft action of the part, that is, to fay, the loft motion; pain also breeds a suspition of a diflocation; for the head of the bone, which (thoved out of its place) is forced into another, preffes the fleth, and diffends the nerves also moved out of their place. Hereto also conduces the comparing of the found joint with that which is burt, in which collation it is fit the found part, which is compared with the burt, be no ways, neither by Nature or any accident, wronged, nor deformed, nor withered or decayed, nor (wollen above measure, otherwise it may cozen and deceive you, if you be less wary. Labour and difficulty of action in moving, is a fign of an uncomplear Luxation, or firain. Now we thus know that the imperfect dif-ligaments ferving to the connexion of the articulations, are extended and relaxed, if the head of location. the bone, preffed with your fingers, be eafily driven to the contrary part, and fuddenly fly thence back again; if thrusting your finger into the Joint, it easily enter, nothing relisting it, as though all were empty within; if the motion be difficult, or none at all.

Signs of an

plucking of an appendix from a bone is uncurable.

Hipp, fent. 88. feld. 3. de art.

endeavour to fet an inflamed joint.

LI Joints may be perverted and luxated, but all of them cannot in like manner be reftord; For the head may be diflocated, but thereupon prefent death enfues, by reason of the compreffion of the whole spinal marrow prefently at the original thereof; such also is the dislocation of a vertebra of the spine, and of the Jaw-bone, which, slipped forth on both sides, hath caused inflammation, and a great tumor before it be set. The bones of other Joints, as they are more or less are hardly dif-located, are much they are the lefs moved out of their feats, fo may they be more eafily or difficultly reflored: For, by how much they are the lefs moved out of their places, by fo much they are the more quickly, and by how located, are much they are the lefs moved out of their places, by to much they are the moved out of their places, by to much they are the much they are the further by fo much they are the move flowly and difficultly fet. Also an indication hard to be fet. much they are the further by fo much they are the moved flow of the edge or hard refloring of the difficult. taken from the figure of the luxated bone, gives a fign of the easie or hard refloring of the diflocation; as in the arm, by how much the bones be the more easily diflocated, by fo much once laxated they are the more eafily reftored. Bones do not eafily fall out of joint in fleshy bodies; but when they chance to be put out, they are not eafily got in again: For in fuch, the articulation is firaitly on every fide held in by the thickness of the muscles and the plenty of the fat lying thereabouts. On the contrary, such as are lean, especially those who formerly have been more fat, have their joints more lax, whereby it comes to pass, that their bones may eafily be put forth of joint: besides also, through the default of the digeftive faculty, they have their joints replete with mineous humours; whence it is, that the heads of the bones, as flanding in a flippery place, are the lefs flable, as it is recorded by Hippocrates: But flender bodies, which are naturally dry, compact and denfe, have their mufcles and
ligaments more firoug and dry; wherefore their bones are the more difficultly displaced; and displaced, the more difficultly fet. Some bones, joined amongst themselves, do formetimes fly assumed to the flore form the collapsement the december and in the Arms the Fliften as when the shoulder-blade flies from the collar-bone at the Acronium, and in the Arm, the Ell from the Wand; and in the Leg, the one focile from the other, and the Heel-bone from the Ancles Bones thus feparated will never be joined together again, will never recover their former comely figure, never their firength of action: For then it most usually happens that the ligaments are eighted backers for the control of the land of the ligaments. ther broke afunder, or elfe refolved and become lax. Those whose bones are dislocated by an external caufe, they, after they be fet, may eafily fall out again, for that the ligaments, most need and bedewed with an excrementitious humour, cannot firmly hold them: off-times the ligaments are not wholly broken, but onely in fome portion thereof; and hence the action of the part either portifies, or is debilitated: Also that diflocation is uncurable, when as the ligaments, sleeped and fwollen up with an excrementitious humidity, are fo much shortned and contracted in their length, as they have acquired in their breadth: and thus they draw away and pluck off the appendices of the bones from whence they arife, and by reason the bone and the appendix do enter and receive each other by many cavities and prominencies, therefore they cannot, by how skilful hand foever they be handled, be again fitly placed and put together. Old and inveterate diffocations, wherein a tough humour poffetting the cavity is concrete in flead of the head of the bone, are not to be reffored; as neither when the heads of the luxated bones have by continual attrition made themselves a new cavity in the neighbouring bone: neither if they be reflored, is the reflitution firm and of continuance, because the natural cavity is possessed by another matter, and the new made near thereto cannot well and faithfully contain the received head of the bone. Those who have their shoulder diflocated, may use their hand for many actions, as well as the opposite found hand, for the weight of the body is not furtained by the hands as it is by the legs: and by how much the hand is the more exercifed, by fo much the arm becomes the more corpulent. Contrarily, if the thigh bone be diflocated, especially if it be wrested inwards, the whole leg quickly decays by an atrophus, because the part doth absolutely lose all motion: for by the opinion of Hippocrates, the performance of the proper action increases strength, and makes the part in better plight; but idleness debilitates and makes it less. and makes it lean. If a great wound and fracture be joined with a luxation, there is danger, left while we use extention for refloring the part, we draw the nerves too violently, and so break the nerves, veins, and arteries, whence would enfue fear of inflammation, convultion, and other ma-Seat. 10. fell. 5. lign fymptoms. Wherefore Hippocrates judges it better in fuch a concourse and complication of lib. 6. qid. 6 preternatural affects, absolutely not to meddle at all with the setting of the diflocated bone: for, by attempting the resistation, certain death; but by omitting it, onely lameness is to be feared. Every you must not dissociated must be restored before inflammation come; but if it be already present, you must predeayout to fensly be careful to take it among for other than Parignt rest, less if the affect be irritated, fently be careful to take it away: For other things, let the Patient reft, left if the affect be irritated, the increase and access of pain cause a convulsion, gangrene, and latily death, as I remember I have fornetimes observed. Therefore when inflammation, and other malign symptoms shall be mitigated

and corrected, then may you endeavour to reliore the luxation, especially if the habit of the body and member affected may admit it. For if the body be flender, delicate and tender, then the restinguishment which the restinguishment is a second of the se tution will be more speedy and facile. But on the contrary, more difficult if it be gross and compact. And let thus much fuffice for Prognofticks in Luxations.

CHAP. VI.

Of the general cure of Diflocations.

Or all that I have heretofore delivered the general method of curing Fractures and Diflocations, yet it shall not be unprofitable to repeat here in this place those things which may be accommodated to this Treatise of curing Luxations. Now he that will cure Diflocations, pire inventional that the first is, of holdons in curing the first is the fourth of placing in course in the first in the fourth of placing in the first in the fourth of placing in the first in the fourth of placing in the first ing; the fecond, of drawing or extending; the third, of forcing in; the fourth, of placing in conve- Diffocation

The first feore, which we faid was of holding, is meant either of the whole body, or elfe of fome. The benefit part thereof onely.

The whole body must be holden by the strong embracement of your Servant member in or Attendant, when as the shoulder, the vertebre, or the thigh-bones are dislocated. But in the member in dislocation of the Collar-bone, Elbow, Hand, Knee, or Foot and Leg, it is sufficient onely to hold the part fraitly in your hands. There is necessity of holding either the body, or elfe some part thereof, left while the dislocated bone is extended, the whole body follow by continuance of parts, if there be nothing which may hinder: for if the body should follow him that draws or extends, all the Workmafters labour and endeavour to reflore it is to no purpose. The use of the second scope, that is, of The use of exdrawing or extending, is, that there may be a free space and distance between the luxated bones, by tension. which distance the diffocated bone may the more freely be forced into its cavity. But the manner of drawing or extending is different in quantity and manner, according to the various strength of the mufcles and ligaments, and diflocation of the bones to this or that part. Therefore this work is almost always performed by the hands, which when they cannot suffice, we must have the assistance almost always performed by the hands, which when they cannot tuince, we must have the anurance of Instruments and Engines, whose figures you shall see hereaster delineated: But that you may not do amiss, you may so far use extension, until the head of the bone be brought just against its cavity. When the Surgeon hath brought it to this pass, then must be hasten to the third intention, which is, The manner to put the head of the bone first moved and gently bended, into its cavity: For he must have a special of serving it not care that he force it no other way than into its proper cavity; for it would be dangerous, left he its place. should turn it from one extreme into another, and the bone, for example fake, of the thigh, which was diflocated into the fore-part by too violent forcing, by exceeding the middle cavity, may be driven and diflocated into the hinder part. To thun this, the bone thall be put back the fame way that it fell out, which may eafily be done in fresh and late happening diflocations. We understand bone is fer, that the bone is fer by the noife, or as it were a pop, or found like that, which folid and founding bone is fer. bodies, being fully and forcibly thrust into their cavities, do make; by the similitude and confent in figure, magnitude, and all conformation of the affected part with the found; and laftly, by the mitiagainst and an conformation of the affected part with the found; and fairly, by the matigation of the pain. The fourth fcope, which is of the convenient fite of the part, must be to fulfilled. The benefit of that the bone after it is fet may be kept in its cavity, and not fly forth again: Wherefore if the arm be different be different belief by the first basis of the state of the last of be fitly laid in a bed ; but in the interim the Surgeon, prefently after he bath fet them, thall have that the affected joint be wrapped about with tours and cloths, or compresses steeped in Rose Vine-gar, and spred with convenient Medicins; then let it be bound with an artificial deligation, rowling the ligatures unto the part contrary to that whereto the diflocated bone flew. For the which purpose The manner thicker benefit are that the part contrary to that whereto the diflocated bone flew. thicker bouliters shall be there applied whence the bone came out, otherwise there will be formed anger of binding the fer joint. the feet joint, left it flould be again displaced: when these things are done, he shall for four or five days space meddle with nothing about the dislocation, unless pain, or some such like symptom happen. For then the fifth scope will call us from that cessation and rest, which is, to correct the symptoms and complicate affections, as pain, inflammation, a wound, fracture, and others, whereof we have spoken abundantly in our Treatise of Fractures. Before we attempt to set inveterate Dislocations, we must rendeavour to humest the ligaments, tendons, and muscles, by somentations, cataplasms, complasters, inveterate liniments, and other remedues, that so these parts may be more obedient to the Surgeons hand; then luxations, liniments, and other remedies, that so these parts may be more obedient to the Surgeons hand; then laxations, thusi the differented bones be moved with a gentle motion up and down, to and again, that by this theans the excrementitious humour, which by continuance of time hath flowed down, may wax hot, be attenuated; refolved or made flippery, and also the fibres of the muscles, ligaments, and nervous bodies, placed about the joint for the defence thereof, may be loosed, that so they may presently be more freely extended: But if a great swelling, pain, and inflammation urge, we must first think of also and curing them; then of the restoring the Dislocation.

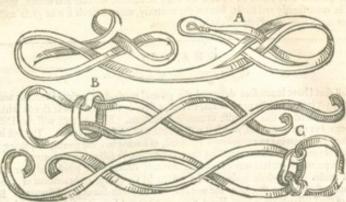

CHAP. VII.

The description of certain Engines serving for the restoring of Dislocations.

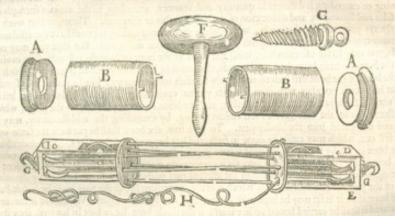

Efore I come to the particular kinds of Diflocations, I think it not amifs to describe three These ligaforts of Bandages, and give you their Figures, as those which are most fit to hold and extra trend diffections. The first ligature, designed by this letter A, is made for holding the for deligation limit. The second, marked with the letter B, is fit for drawing or extension, and consists of one but extension limit. The third, whereto the letter C is put, consisting of two knots, is to hold or bind more

THE PERSON NAMED IN

The delineation of the three Ligarners.

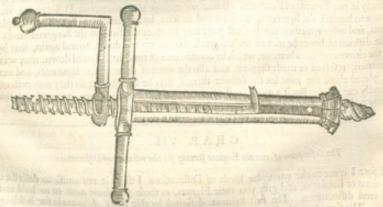

I have thought good also to delineate the following Engine, made for to draw and extend more powerfully, when the hand will not serve. It is made like a Pulley, marked with these Letters D.D. Within this there lie hid three Wheels, through whose furrows runs the rope which is to be drawn, marked with this Letter H. At the ends of the Pulley are hooks fassend, the one of which is to saften the Pulley to a Post, the other is to draw the ligature saftned to the part. The Boxes or Cases wherein the Pulley is kept, is marked with B.B. Their Covers are marked with A.A.

A Screw-pin which may be twined, and so fattned to a Post, that so one of the ends of the Pulley may be hooked thereto, is signed with C. A Gimlet (marked by F) to make a hole in a Post, so to let in the Screw-pin. You may see all these things exprest in this Figure.

Some Practitions in stead of this Pulley, make use of this described Instrument, which they term Massibrium versatile, or a Hand-vice. The end thereof is sastioned like a Gimblet, and is to be twined into a Post. Within that handle lies a Screw with a hooked end, whereto the string or ligature must be fastined. Now the Screw-rod or Male-screw runs into the Female by twining about of

Manubrium versatile, or a Hand-vice.

the handles and thus the ligature is drawn as much as will fuffice, for the fetting the diflocated bone. Having delivered their things thus in general, now I come to treat of the Luxations of each part, from the Jaw-bone even to the Toes of the Feet.

CHAP.

OF THE REAL PROPERTY.

CHAP. VIII. Of the Differation of a Jaw-bone.

He Jaw bone is diflocated by many occasions, and not feldom by yawning, and other more The Causes. firong openings of the mouth. It is more frequently luxated into the fore, than into the Differences, hinder part, by reason of the mamillary additaments, which hinder it from falling back-The dislocation is sometimes but on one side, otherwhiles on both. If the one side onely Signs that only be luxated, it (together with the chin) is drawn away funto the contrary fide, which is not difloca- one part is ted; the place is hollow from whence it is flown, but (wollen whither it is gone; the Patient can-different not that his mouth, but is forced to gape, fo that he cannot eat; the Jaw, together with the teeth therein, hangs formewhat forwards; neither do the teeth answer fiely to one another, but the dog teeth are under the shearers. But if both sides be dislocated, all the Jaw and Chin hang forwards Signs that and towards the Breft; beides also, the temporal muscles appear differeded, spirtle runs out of the both fides are Patients mouth against his will, the lower teeth stand further forth than the upper, which is the occasion that the mouth cannot be thut, neither the tongue have free volubility to speak, the Patient flammering in his speech. When it is dislocated on both sides, it is more difficultly restored, Prognosticks. and all the fymptoms are more vehement; wherefore it must be fee with all speed, otherwise the Why death Patient will presently have grievous pain about his throat, inflammation, a fever, whereupon off- quickly enforced the state of the st times death enfues within ten days, by reason of the five branches of nerves, which arising from location of which too violently extended, brings the fore-mentioned symptoms. Practitioners affirm, that the Jaw. the Jaw twelve days after it is fet, is free from the danger of relapfe. If it have been diflocated forne few days before you go about to reftore it, you must use foftning and relaxing Medicins to it; but when it is put in the joint, apply a Medicin made of the Whites of Eggs and Oil of Rofes to affwage the pain, and apply cloths dipped in oxycrate. At the fecond drelling you shall apply fuch things as have power to agglutinate and firengthen the ligaments and other relaxed parts, and also to keep it being refored in its place. This shall be the form of such a Medicin: Re Pulv. bost An astringent armoni, Jang, draconis, farine volat, mastich, piets, refine, an. 3 15. albuminis overom c. 5: san medicamentum; afterwards you may use Emplost. Discalcibbos, disloved in Oil of Roses and Vinegar, and other things, as recognition shall be.

CHAP. IX.

How to fet the Jaw diflocated forwards on both fider.

Nift of all the Patient must be placed upon the ground or some low seat, with his face upwards, The first manand his head must be firmly held by your Servant, that so it may be the more immovable: then the Surgeon shall put both his thumbs, wrapped in cloths (left he hurt them by rubbing them the Surgeon man put both his thumbs, whapped in cools (left he has the hards) though them upon the Patients teeth, as also to keep them from slipping) into the Patients mouth, and press with them the larger teeth of the luxated jaw, but put his other fingers without under his chin, and fo lift up the whole jaw with them. But if the operation cannot be thus done, for that the Another, mouth on the infide is fo shut and closed, that the thumbs cannot be put thereinto, then must you had in mouther made of forth wood as basic or to be had one for the ingers. thrust in wooden wedges made of fost wood, as hazle or fir, being cut square, and of some singers thickness. These shall be wedged in on each side above the grinders; then east a ligature under his chin, whose ends your servant shall hold in his hands, and setting his knees upon the Patients shoulders, shall pull them upwards; then at the same time the Surgeon shall press downwards the wooden wedges. The Jaw bones thus reftored, shall be kept to by convenient ligation, and drested with medicins, as it is fitting; and in the mean space you must forbid the Patient to speak, or needlessly to open his mouth. Wherefore he must abitain from hard meats, and such as require much chew-Diecing, until his pain be quite passed, and use onely spoon-meats, as Barley Creams, Panadoes, Jellies, Cullaffes, Broths, and the like.

CHAP. X. Of restoring the Jaw dislocated forwards but on one side.

He Patient must be placed on a low feat, so that he may be under the Surgeon; then your what the Sur-Servant, flanding at his back, shall hold his head firm and steddy, that it may not follow the good Surgeon, drawing, extending, and doing other things necessary, for refloring it. Then the Surgeon putting his thumb between the grinders, shall press down the Jaw, and gently drawing it aside, force it into its cavity; in the mean while also the Patient, as much as in him lies, shall help What the Patient, as much as in him lies, shall help what the Patient, as much as in him lies, shall help what the Patient, as much as in him lies, shall help what the Patient is a shall help white the Patient is a shall help what the Patient is a shall help what the Patient is a shall help what the Patient is a shall help white the Patient is a sh of a side, force it into its cavity, in the local white another a little as he can, left the mufcles thould tient ought to be extended; and he shall onely gape so wide as to admit the Surgeons thumb, for so the tembe extended; and he shall onely gape to wide as to admit the Surgeons thumb, for so the temporal implicies shall be reflored to their place and favour the restitution. If he open his mouth as wide as he can, they will be extended after a convulfive manner; if on the contrary he shut his teeth too close, there will be no passage for the Surgeons thumb unto his grinding teeth. Some there be which assume that the Jaw bone may sometimes be dissocated towards the hind part, and that then the Jaw is dissocated towards the hind part, and that then the Jaw is dissocated towards the story of the care of backtonia surther in, and nearer the throat than the upper. Now for restoring it, the Patients head wards, then the story of the surgeon, the mean while pursing both his thought. The Cure. trust be firaightly holden behind, whilest the Surgeon, the mean while putting both his thumbs The Cure. Into the Patients mouth, holding his other fingers without under the Patients chin, he shall by

shaking it, draw it to him, or forwards, and so restore it to its place. For my own part, I confess I never faw this kind of Luxation, and I cafily perfuade my felf that it can scarce ever happen, for the reason I gave in the sormer Chapter. But nevertheless, if it by any means chance to happen, yet can it not be a perfect luxation, but an imperfect one; the jaw being onely but a little thruit back to the throat to those mamillary additaments; and then it may easily be retlored by lifting or drawing forth the jaw, and fuddenly forcing it from below upwards.

CHAP. XI.

Of the Inxation of the Collar-bone.

Differences of

The Cure.

Sthe Collar-bones may be broken, wrefied, and crooked, fo also they may be diflocated. Now they are diflocated, either against the steemen, or against the shoulder blade, or sero min thereof: yet both these kinds of dislocations are very rare, by reason of the trrait and firm connexion which the collar-bone hath with the forefaid parts; but chiefly where it is joined to the flermon it can scarcely be deprest, for that it is as it were underpropt with the first rib: But it may be diflocated inwardly, outwardly, and fide-wife, and according to this variety there must be divers ways to reflore it; yet generally the Collar-bone is put into its place by moving or extending the arm: But if need require, the Patient shall be laid upon the ground with his face upwards, a Tray with the bottom upwards, a hard stuffed cushion, or the like thing being put under his shoulders is for thus it will so come to pass, that the shoulder and cheft will stand so forth, that presently by listing up, by prefling down, or drawing forth the arm forwards or backwards, as the bone thall be flown out to this or that part, you may reflore it; for thus the prominency may be forced into its eavity. But it will be requifite to bind it up and lay bouliters thereon, and to give it reft, as if it were fractured. Galen writes, that when he was five and thirty years old, whilest he exercised him-Com. ad fent.62. felf in the place of exercise, his Collar bone was so far separated from the Aeromion, that there was the fpace of three fingers between them. And that this luxation was reflered in forty days space, by so firait and firong a ligation, that he perceived the motion of the beating arteries under the bone. But you shall find very few who will suffer such strait ligation so long, though it be never so necessary. Verily, this kind of luxation is hard to be known, but far more difficult to be healed. I have known many Surgeons deceived, who have taken the luxation of the Collar-bone for the diflocation of the top of the shoulder: for then the Epomis, or top of the shoulder swells, and the place from whence the collar bone is flown, is depressed with a manifest cavity, with vehement pain, inflammation and impotency of lifting up, or otherwise moving the arm, or performing other actions which are done by the help of the shoulder. Certainly if this bone when it is diffocated, be not fer, the Patient shall be lame during his life, so that he shall not be able, neither to put his hand to his head nor mouth.

CHAP. XII.

Of the Inscation of the Spine, or Back-bone.

He Back bone confifts of many bony Vertebre, like rowls or wheels mutually jointed or knit

An anatomical description of the Spine,

together, by their importances and circular form confpiring to an aptness of moving or bending forwards. For if it should confift of one bone, we thould frand continually with the trunk of our bodies immovable, as thrust through with a stake. The Vertebre have a hole paf-fing through the midst of them, whereby the marrow passing this way out from the brain as by a pipe, may serve for the generation of the sensitive and motive nerves, and their distribution into all parts beneath the head. For which purpose it is perforated with many holes on the fides, through each whereof certain conjugations of the nerves pass forth into the rest of the body, and veins and arteries pals in for the propagation of nourifliment and life. The whole exteriour face of the spine is rough, and as it were armed with four forts of apphyla or processes, whereof some stand up, others down; some direct, others transverse: Wherefore from these thorny and sharp processes, the whole hath acquired the name of the Spina. The Vertebra the further from the neck they are, the greater they grow, fo that those which are the lowest, are the largest; for it is agreeable to reason, that that which bears should be greater than that which is born. Hence we see, that the holy bone is placed under the rest as a soundation. The side processes of the Rack bones of the cheft, besides the benefit of defending the spinal marrow that up therein from external injuries, have also another, which is, they firm and faften the bones of the ribs by a ftrong tie. There lies a grifle, and a tough, and (as it were) albuminous humour between the Vertebre, which makes them, as also all the other joints of the body flippery and fit for motion: the fpine is flexible with notable agility forwards onely, but not backwards, for that fo there would be continual danger of breaking the hollow afcendent vein, and the great defeending artery running thereunder: Therefore the dearticulations of the Vertebra, mutually itrengthened with firong ligaments, do look more backwards. I have thought good to premife these things of the nature of the spine, before I come to dislocations happening thereto. Lib. 13. de afa I willingly omit divers other things which are most copiously delivered by Gallin, content onely to add thus much that there is nothing to be found in the whole structure of mans bones, which more clearly many to a dark the spine and the

clearly manifests the industry of Gods great workmanship, than this composure of the Spine and the

The variety of the proces-Spine.

CHAP. XIII.

Of the Diffocation of the Head.

He Head flands upon the Neck knit by dearticulation to the first Vertebra thereof, by the in- The comexitempolition of two processes which arise from the basis thereof, near the hole through which on of the head which the marrow of the brain passes down into the back-bone; and they are received by fit Rack-bone of cavities, hollowed in this first Vertebra. These processes sometimes fall out of their cavities, and the Neck. cause a dislocation behind, whereby the spinal marrow is too violently and hard compressed, bruised Prognosticks. and extended, the chin is fafined to the breft, and the Patient can neither drink nor fpeak: wherefore death speedily follows upon this kind of luxation, not through any fault of the Surgeon, but by the greatness of the disease, refusing all cure.

CHAP. XIV.

Of the Diflocation of the Vertebra, or Rack-bones of the Neck.

He other Vertebra of the Neck may be both diflocated and firained. Diflocation verily, unlefs it be freedily helped, brings fudden death: for, by this means the foinal marrow is prelefs it be fpeedily helped, brings fudden death: for, by this means the fpinal marrow is prefently oppreffed at the very original thereof, and the nerves therehence arising, fuffer also
together therewith, and principally those which serve for respiration; whereby it cometh to pass,
that the animal spirit cannot come and disperse it self into the rest of the body lying thereunder;
hence proceed sudden inflammation, the squinsie, and a difficulty, or rather a defect of breathing.

But a strain or incompleat luxation brings not the like calamity: by this the Vertebra, a little moyed out of their seas, are turned a little to the hind or fore-part; then the Neck is wrested aside, the
frace looks black, and there is difficulty of speaking and breathing. Such, whicher Diffocation or
strain, is thus restored. The Patient must be fet upon a low seat, and then one must hean and lie with
his whole weight upon his shoulders; and the mean while the Surgeon must take the Patients head,
about his ears, betwixt his hands, and so shake and move it to every part, until the Vertebra be restored
to its place. We may know it is fet by the sudden ceasing of the pain, which before grievously afflicted the Patient, and by the free turning and moving his head and neck every way. After the restoring it, the Head must be inclined to the part opposite to the Luxation, and the Neck must be
bound up about the dearticulation of the Shoulder; but yet so, that the ligature be not too strait, left
by pressing the Weazon and Gullet, it straiten the passages of breathing and swallowing. by prefling the Weazon and Gullet, it firaiten the passages of breathing and swallowing.

CHAP. XV.

Of the Diflocated Vertebrae of the Back.

He Rack-bones of the Back may be diflocated inwards, outwards, to the right fide, and to Differences the left. We know they are diflocated inwards, when as they leave a depreffed cavity in and figure. the spine; outwardly, when they make a bunch on the back; and we know they are luxated to the right or left fide, when as they obliquely bunch forth to this or that fide. The Vertebre Causes, are differented by a cause either internal or external, as is common to all other Luxations; the internal is either the defluxion of humours from the whole body, or any part to them and their ligaments; or else a congession proceeding from the proper and native weakness of these parts; or an attraction arising from pain and heat. The external is a fall from high upon some hard body, a attraction arifing from pain and heat. The external is a fall from high upon fome hard body, a heavy and bruifing blow, much and often flooping, as in Dreffers and Lookers to Vineyards, and Paviers, decrepit Old Men; and also such as through an incurable diflocation of the thigh-bone are forced in walking to stoop down and hold their hand upon their thigh. But a Vortora cannot be The danger of forced or the other parts of the danger of the dan forced or thrust inwards, unless by a great deal of violence, and if it at any time happen, it is not located in-but with the breaking of the ties and ligaments, for they will break rather than fuffer fo great exten-wards. fion. Such a Diflocation is deadly, for that the fpinal marrow is exceedingly violated by too firalt compreffion, whence proceeds dalnets, and lofs of fenfe in the members lying thereunder. Neither is reflictation to be hoped for, because we cannot through the belly force if into its place: the hips feat, st. Urine is then support, as also the excrements of the belly; sometimes on the contrary, both of them & Gal, is compressed for the patients mind, the knees and logs grow cold, their sense and motion being the patients mind, the knees and logs grow cold, their sense and motion being the patients mind, the knees and logs grow cold, their sense and motion being the patients mind, the knees and logs grow cold, their sense and motion being the patients mind, the knees and logs grow cold, their sense and motion being the patients mind, the knees and logs grow cold, their sense and motion being the patients. loft. Such things happen more frequently when the figure is luxated inwards than when it is diffor-cated outwards, for that the Nervesthence arifing, run and are carried more inwardly into the body. Befides the preffed fpinal marrow becomes inflamed, and that being inflamed, the parts of the fame kind, and fuch as are joined thereto, are also inflamed by confent, whence it happened that the bladder cannot cast forth the Urine. Now where the sinews are presed, they can no more receive the irradiation of the animal faculty. Hence follows the deprivation of the sense and motion in the Parts whereto they are carried, therefore the contained excrements do no more provoke to expulfrom by their troubleform fense, neither are preffed to keep them in: thence proceeds their suppression, and hence their breaking, forth against their wills. But the spine outwardly diflocated, scarce caules any compression of the marrow or nerves.

CHAP. XVI.

How to restore the Spine outwardly dislocated.

The Cure.

He Vertebre outwardly diflocated, when as they fland bunching forth, then it is fit to lay and firetch forth the Patient upon a Table with his face downwards, and firaitly to bind himabout with Towels under the arm-pits, and about the flanks and thighs; and Another man- then to draw and extend, as much as we can, upwards and downwards, yet without violence: for unless fuch extension be made, restitution is not to be hoped for, by reason of the processes and hollowed cavities of the Vertebre, whereby, for the faster knitting, they mutually receive each

other. Then muft you lie with your hands upon the extuberancies, & force in the prominent vertebra. But if it cannot be thus reftored, then will it be convenient to wrap two pieces of wood, of four fingers long, and one thick, more or lefs, in linnen cloths, and fo to apply one on each fide of the diflocated Vertebra. and fo with your

In the mean while have a care that you touch not the processes which stand up in the ridge of the Spine, for they are easily broken. You may know that the Vertebra are restored by the equal smoothness of the whole Spine. It is fit, after you have restored it, to bind up the part, and lay splints or plates of Lead nearly made for that purpose upon it; but so, that they may not press the crists or middle processes of the Vertebra, which I sometry mentioned, but onely the sides: then the Parises shall be taken the best and the foliage long terms on held the New Action to Partient shall be laid upon his back in his bed, and the splints long kept on, lest the Vertebre should fall out again.

How to keep the restored Vertebra in their places,

CHAP. XVII.

A more particular enquiry of the diffocation of the Vertebræ, proceeding from an internal casese.

He Vertebre are in like fort luxated by the antecedent cause, as we have formerly faid, which is caused by the natural imbecillity of the parts, principally of the nervous ligament, by which all the Verrebre are bound each to other; this ligament comes not to the fpinal marrow, but onely binds together the Vertebre on their out-fides: For, befides the the ipinal marrow, but onely binds together the Vertebre on their out-lines: For, beinges the two membranes proceeding from the two Meninges of the Brain, wherewith the marrow is covered, there is a third firong and nervous coat put upon it, left while the fpine is diverfly bended, the bended marrow flould be broken. This third coat arises from the Pericanium, as soon as it arrives at the furth Vertebra of the neck. Now that ligament, wherewith we faid the Joints of the Vertebre were mutually knit and fafined, is encompaffed with a tough and glutinous humour for the freer motion of the Vertebre. Sometimes another cold, crude, grofs and vifeid humour, confined and mixed herewith by great defluxions and catarrhs, begets a tumour, which doth not onely differed the Nerves proceeding forth of the holes of the Vertebra, but also differed the ligaments wherewith they are bound together: which fo diffended, and (as it were) drawn afide, do draw together with them the Vertebre, one while towards the right fide, another while to the left, fomewhiles inwards, otherwhiles outwards, and thus move them out of their feats, and diflocate them. A diflocated Vertebra, flanding forth and making a bunch is termed leats, and diflocate them. A diflocated Vertebra, flanding forth and making a bunch is termed in Greek Cypbofis, (Those thus affected we may call Bunch-backe:) But when it is depressed, it is named Lordofis, (Such we may term Saddle-backe:) But when the same is luxated to the right or lest side, it maketh a Scoliosis (or Crookednesse) which wresting the spine, draws it into the similatude of this letter S. Galen adds a fourth default of the Vertebra, which is, when their joints are moved by reason of the loosiness of their ligaments, the Vertebra vet remaining in their places, and he calls it a Scisse, or shaking. They also note another detect peculiar to the spinal marrow, which is, when as it (the Vertebra being not moved whereto it is placed and severed from them: this distase is occasioned by a fall from on high, by a great stroak, and by all occasions which may much shake, and consequently depress the spinal marrow, or by any other means remove, or put it forth of its place. Scarce any recovers of this disease, which

Cypholis. Lordofis. Scaliolis. Com. ad Sent. 2. fill.3.1.de art. The separation of the spinul marrow from the en-Venetire.

The state of the s

which any exercifed in the Art, may eafily think upon: But let us return to the internal cause of Luxations. Fluid and foft bodies, fuch as Childrens, ufually are very fubject to generate this internal cause of defluxion. If external occasions shall concur with these internal causes, the Vertebre will fooner be diflocated: Thus Nurfes, whileft they too firstilly lace the brefts and fides of The error of bre will fooner be diflocated: Thus Numes, whilet they too intally late the brens and lates of the errour of Girls, fo to make them flender, cause the brest-bone to cast it felf in forwards or backwards, or Nurses is bigs else the one shoulder to be bigger or fuller, the other more spare and lean. The same errour is ding and facilities the one shoulder to be bigger frequently and long upon their fides, than upon their backs, cing of Chilcommitted if they lay children more frequently and long upon their fides, than upon their backs; cing or if, taking them up when they wake, they take them onely by the feet or legs, and never put their other hand under their backs, never fo much as thinking that children grow most towards their heads.

CHAP. XVIII.

Prognosticks of the diflocated Vertebræ of the Back-

F in Infancy it happen that the Vertebre of the back shall be diflocated, the ribs will grow little or nothing in bredth, but run outwards before; therefore the Chest loseth its natural latitude, or nothing in bredth, but run outwards before; therefore the Cheft lofeth its natural latitude, and flands out with a flarp point. Hence they become affinatick, the lungs and mufcles Hipp.feet. 6. which ferve for breathing, being preffed together and firaitned; and that they may the eaflier fifth, and breathe, they are forced to hold up their heads, whence also they feem to have great throats. Now because the Weazon being thus preffed, the breath is carried through a firait passage, therefore they wheaze as they breathe, and fnort in their fleep, for that their lungs, which receive and fend forth the breath or air, be of less bigness: besides also they are subject to great distillations upon their lungs, whereby it cometh to pass that they are shorter lived. But such as are bunch-backed below the midriff, are incident to diseases of the Kidneys and Bladder, and have smaller and stenderer thighs and legs, and they more slowly and sparingly cast forth, bair, and have smaller and secondary. thighs and legs, and they more flowly and fparingly cast forth hair and have Beards: to conclude, they are less fruitful, and more subject to barrenness, than such as have their crookedness above their midriff. The bunches which proceed from external causes are oft-times curable; but such as have their original from an inward cause, are absolutely uncurable, unless they be withstood at the first with great care and industry. Wherefore such as have it by kind, never are helped. Such as whilst they are yet children, before their bodies be come to perfect growth, have their fpine crooked and huxared, the bunching out, their bodies ufe not to grow at the fpine, but their legs and arms come to their pars belong-perfect and full growth; yet the parts belonging to their breft and back, become more flender; ing to the Neither is it any wonder, for feeing the Veins, Arteries, and Nerves are not in their places, the fpi-cheft are nourits do neither freely, nor the alimentary juices plenteously flow by these straitned passages, whence grow the less learners must needs enfac: but the limbs shall thence have no wrong, for that not the whole body, but the neighbouring parts onely are infected with the contagion of this evil. When divers Vertebra, following each other in order, are together and at one time diflocated, the diflocation is less discovered than if one alone were diverted. For when contagin Parther is different in dangerous, than if one alone were luxated: For, when one onely Vertebra is diflocated, it carries why the laxamore firmitly preffed, it must necessarily be either broken or hart, which is absolutely deadly, for that Vertebra is not discovered by the laxamore firmitly preffed, it must necessarily be either broken or hart, which is absolutely deadly, for that Vertebra is the beauty of the laxamore firmitly preffed, it must necessarily be either broken or hart, which is absolutely deadly, for that Vertebra is it is the brains substitute. But when divers Vertebre are dislocated at once, it must of necessity be more danger to the brains substitute an obtain an obtain of reaching the properties by which converting the first constraints. forced onely into an obtufe angle, or rather a femicircle; by which compression it certainly suffers, many.

Hereto may seem to belong that which is pronounced by Hippocrates; a circular moving of the Vertebra out of their places is less dangerous sent \$1.50.3; than an angular.

CHAP. XIX. Of the diflocation of the Exempt

He Rump oft-times is after a fort diflocated inwards by a violent fall upon the buttocks, or The Signa a great blow; in this affect the Patient cannot bring his heel to his buttocks, neither unless with much force, bend his Knee; Going to flool is painful to him, neither can be fit unless in a hollow chair; That this (as it were) diflocation may be reflored, you must thrult your The Care, you frought raife up the bone, and with your other hand at the fame time join it rightly on the outfod throughy rate up the bone, and with your other hand at the fame thise join a rightly of the out-fide with the neighbouring parts: Laftly it must be firengthened with the formerly mentioned reme-dies, and kept in its place. Now it will be recovered about the twentieth day after it is fet. During all which time the Patient must not go to stool, unless fitting upon a hollow seat, lest the bone, as yet seatce well recovered, should fall again out of its place.

CHAP. XX. . Of the Luxation of the Ribs.

He Ribs may by a great and bruifing firoak be diflocated, and fall from the Vertebra whereto Caused they are articulated, and they may be driven inwards, or fide-ways. Of which kind of they are articulated, and or luxation, though there be no particular merition made by the Ancients, yet they confels that all the bones may fall, or be removed from their feats or cavities, wherein they are received and articulated. The fign of a rib different days for the bone that all the bones may fall, or be removed from their feats or cavities, wherein they are received and articulated. The fign of a rib different days for the bone that it is a figure th here makes a hollowness, and there a bunching forth; but it is a fign that it is driven in, when as

(minim

Chrel.

there is onely a depressed cavity where it is knit and fashned to the Vertebra. Such dislocations cause divers symptoms, as difficulty of breathing, the hurt rib hindering the free moving of the chest a painfulness in bowing down or lifting up the body, occasioned by a pain, counterfeiting a pleuristic the riling or puffing up of the mulculous flesh about the rib, by a mucous and flatulent humour there generated: the reasons whereof we formerly mentioned in our Treatise of Fractures. To with-stand all these, the dislocation must be forthwith restored, then the pushing up of the sless must be belped. Wherefore, if the dislocated rib shall fall upon the upper side of the Vorebra, the Patient shall be set upright, hanging by his arms upon the top of some high door or window: then the head of the rib, where it frands forth, shall be pressed down until it be put into its cavity. Again, if the rib shall fall out upon the lower side of the Vertebra, it will be requisite that the Patient bend his face downwards, fetting his hands upon his knees; then the diflocation may be reflored by preffing or Galleon, ad fer. thrufting in the knot or bunch which flands forth. But if the luxated rib fall inwards, it can no more 3.fell. 1. de art. he reftored or drawn forth by the hand of the Surgeon, than a Vertebra which is diflocated towards the infide, for the reasons formerly delivered:

> CHAP. XXI. Of a diflocated shoulder.

He shoulder is easily dislocated, beause the ligaments of its dearticulation are soft and loose; as also for that the cavity of the shoulder-blade is not very deep; and besides it is every where smooth and polite, no otherwise than that of the shoulder-bone, for that it is herein Why there is received. Add hercunto, that there is no internal ligament from bone to bone, which may firengthen no internal li-that dearticulation, as is in the leg and knee. Wherein not withflanding, we must not think Nature the arm-bone one ly for extension and leading a little arm-bone one ly for extension and leading the arm-bone one ly for extension and leading to the arm-bone one large t onely for extension and bending, as that of the elbow, but besides, for a round or circular motion, as that which carries the arm round about, now up then down, according to each difference of fite. The shoulder-bone, which Hippoerates calls the arm-bone, may be dislocated four manner of ways, Differences of upwards, downwards, or into the arm-pit, forwards and outwards, but never backwards, or to the hinder part: For, feeing that there the cavity of the blade-bone, which receives the head of the arm-bone, which Hipperness calls a joint, lies and flands against it; who is it that can but imagine any such diflocation? In like fort it is never diflocated inwardly, for on this part it hath the fleth of a firong mufcle, termed Deltoider, lying over it, befides also the back and acromion of the blade; and laftly, the Anchor-like, or beak-like process, all which four hinder this joint from flipping inwards. Now Hippocrates faith, that he hath onely feen one kind of diflocation of this bone, to wit, that which is downwards or to the arm-pit; and certainly it is the most usual and frequent; wherefore we intend to handle it in the first place. When the shoulder is diflocated downwards into the armweintend to handle it in the first place. When the shoulder is dislocated downwards into the ampit, a depressed cavity may be perceived in the upper part of the joint; the across of the blade shows more sharp and standing forth than ordinary, for that the head of the shoulder-bone is slipt down more sharp and standing forth than ordinary, for that place; the clow also casts it self (as it and hid under the arm-pit, causing a swelling forth in that place; the elbow also casts it self (as it were) outwards, and flands further off from the ribs, and though you force it, yet can you not make it to touch them; the Patient cannot lift up his hand to his ear on that fide, neither to his mouth nor shoulder. Which fign is not peculiar to the luxated shoulder, but common to it, affected with a contusion, fracture, inflammation, wound, abfects, febirrie, or any defluxion upon the Nerves, arifing out of the Vertebre of the neck, and fent into the arm; also this arm is longer than the other-Latily, (which also is common to each difference of a luxated shoulder) the Patient can move his arm by no kind of motion without fenfe of pain, by reafon of the extended and preffed mufcles, forme also of their fibres being broken. There are fix ways to reflore the shoulder luxated down-wards into the arm-pit: The first is, when it is performed with ones fift, or a towel; the second wards into the arm-pit: The first is, when it is performed ward only a clower, the feether with a clew of yarn, which put under the arm-pit, shall be thrust up with ones heel; the third, with ones shoulder put under the arm-hole; which manner, together with the first, is most fit for new and easily to be reflored luxations, as in those who have loose slesh, and efferninate persons, as children, cunuchs, and women; the fourth, with a ball put under the ampit, and then the arm cast and the state of the state over a piece of wood held upon two mens shoulders, or two standing posts; the fifth, with a Ladder the fixth, with an infirument called an Ambi. We will describe these fix ways, and present them

The ways to reffore it.

to your view.

CHAP. XXII.

Of the first manner of setting a Shoulder, which is with ones First.

Virit, let one of fufficient strength, placed on the opposite fide, firmly hold the Patient upon the joint of the thoulder, left he move up and down with his whole body, at the necessary extension, working and putting it in: then let another, taking hold of his arm above the elbow, so draw and extend it downwards, that the head thereof may be set just against its cavity, bollowed in the letter of the head of bollowed in the blade-bone: Then at last let the Surgeon list and force up with his sist the head of the bone into its cavity. Here this is chiefly to be observed, that in fresh luxations, especially in a body soft, esfeminate, moist, and not over corpulent, that it sometimes comes to pass, that by the onely means of just extension, the head of the bone freed from the muscles and other particles wherewith it was, as it were, entangled, will betake it self into its proper cavity; the muscles being by this means restored their place and figure, and drawing the bone with them, as they draw themselves towards their heads, as it were with a sudden gird or twitch: wherefore in many, whilest we thought

Gal. com, 40 fent. 23. fell. 1. *******

An Expression of the first manner of putting a Shoulder into joint.

thought no fuch thing, it fufficed for relitation onto have extended the arm. But A perfect fer-if the luxation be ting the luxa-inveterate, and ted shoulder the hand cannot by extension onely. ferve, then must the Patients shoulder be failned to a post with the forementioned liga-ture, or elfe committed to ones charge, who may flaud at his back and hold him fait : Then the Then the arm thall prefently be tied about, a lit-

tle above the clbow with a fillet, whereto a cord shall be fastned; which being put or fastned to the polley, shall be drawn or firesched forth as much as need shall require. Latily, the Surgeon, with a towel, or such like ligature, fastired about his need shall require. Latily, the Surgeon, with a towel, or such like ligature, fastired about his need and hanging down, and so put under the Patients arm-pit, near to the luxation, shall, raising himself upon his seet with the whole through of his need, lift up the shoulder, and also at the same time bringing his arm to the Patients brest, shall set the head of the shoulder-bone, forced with both his hands into its cavity, as you may see by the precedent Figure. Then must you cover all the adjacent parts with a Medicin made ex forms volatily, belower and mixed with the white of an Execution and the surgest should be supported with the white of an Execution and since refer the surgest surgest should be surgested with the white of an Execution and surgest su menio, myrtilis, piec, refins & alumine, beaten into Powder, and mixed with the white of an Egg.
Then must the hollowness under the arm be filled with a clew of woollen or cotten yarn, or a line then cloth fired over with a little Oil of Rofes or Myrtles, a little Vinegar, and unguestum refaunt, or refrigerant Galeni, left it slick to the hairs, if there be any there. The part must afterwards be bound up with a ligature, consisting of two heads, of some five fingers bredth, and two ells long; more or lefts, according as the body shall require. The midst thereof shall be put immediately under the arm-pit, and then crossed over the lame shoulder, and so crossing it as much as shall be fit, it shall be wrapped under the crossed over the lame shoulder. it shall be wrapped under the opposite arm. And lastly, the arm shall be laid upon the brest, and put in a fearf, in a middle figure almost to right angles, so that by lifting up, the hand he may almost touch his found shoulder, left the bone newly set, may fall out again: neither shall the first dressing be flirred, untill four or five days be paft, unless the greatness of some happening symptom divert us from this our purpole.

CHAP. XXIII.

Of the second manner of restoring a Shoulder, that is, with the beel, when as the Patient by reason of pain, can neither sit nor stand.

He Patient must be laid with his back on the ground upon a coverlid, or mat, and a clew hipp. for. 12.

of yam, or leathern ball, stuffed with Tow or Cotton, of such bigness as may ferve to sed. 1. de art, fill up the cavity, must be put under his arm-pit, that so the bone may straight-ways the thore easily be forced by the heel into its cavity. Then let the Surgeon sit belief him, even over

against the luxa-ted shoulder; and if his right shoulder be luxated, be shall put his right heel to the ball, which filled up the ann-pit; but if the left, then the left heel; then let him forth-with draw towards him the Patients arm, taking hold thereof with both his hands, and at the fame instant of time strongly press the arm-pit with his heel. Whileft this is in doing,

one shall stand at the Patients back, who shall lift up his shoulder with a towel, or some such thing sitted for that purpose, and also with his heel press down the top of the shoulder blade: another also shall sit on the other side of the Patient, who holding him, shall hinder him from stirring this way or that way at the necessary extension in setting it, as you may see it expressed by the precedent figure.

CHAP. XXXIV.

The third manner of restoring a Shoulder.

Some one who is of a competent height and firength, shall put the sharp part of the top of his shoulder under the Patients ann-pit, and also at the same time, shall sown brest, so that the Patients whole body may (as it were) hang thereby. In the mean time another, for the greater impression, shall lay his weight on the luxated shoulder, shaking it with his whole body. Thus the shoulder, drawn downwards by the one which stands under the arm-hole, and moved and shaken by the other, who hangs upon it, may be restored into its seat, by the help of the Surgeon concurring therewith, and with his hand governing these violent motions, as this Figure shews.

The Figure of the third manner of putting a Shoulder into joint.

CHAP. XXV.

Of the fourth manner of restoring a dislocated shoulder.

The Figure of the fourth manner of restoring the shoulders

Ou must take a Perch, or piece of wood (fornewhat refembling that which the Water-bearers of Paris use to put on their shoulders) some two inches broad, and fome fix foot long; in the midft hereof let there be fastned a clew of Yam, or ball of fufficient bigness to fill up the cavity of the arm-hole : Let there be two pins put in, one on each fide of the ball, each alike diffant therefrom, with which, as with flays, the shoulder may be kept in, and upon the ball, that it flip not away from it: Let two firong men, taller than the Patient, either by Nature or Art, put this Perch upon their shoulders; then let the Patient put his arm-pit upon that place where the ball stands up; the Surgeon must be ready to pull his hanging arm downwards. Thus the Patient fhall (as it were) hang on the Perch with his fhoulder, and fo the head of the bone shall be forced into its cavity, as this figure declares; wherein you may fee the Perch or Yoak, with the two wooden Pins and Ball fafined in the midst, delineated by it felf.

CHAP. XXVI.

Of the fifth manner of putting the foulder into joint, which is performed by a Ladder.

The delineation of the fifth manner of voftering a shoulder.

Ou may also restore a shoulder dislocated into the arm-pit, by the help of a Ladder, after this manner. Let fome round body, as a Ball or Clew of Yarn, which (as we formerly faid) may ferve to fill the arm-pit, be faithed upon one of the upper fleps of a Ladder; at the foot of the Ladder let a low flool, whereupon let the Patient mount; then bind both his legs, and alfo his found arm behind his back, left, when you are about your operation, he hinder and fpoil all you do, by laying his hand, or fetting his foot up-on the Ladder: Then Jet his arm be prefently put over the ftep of the Ladder, and his arm-pit put upon the there failned ball, the Patient in the mean while being wished to come with his whole body as near unto the steps of the Ladder as he is able; for otherwise, besides that there is no other hope of reftoring the luxation, there would be no fmall danger of breaking the (boulder-bone : Alfo let him take heed that he put not his head between the fleps. Then his arm, bound above the Elbow with hilleting, or forne other ligature fit for that purpole, shall be drawn down by the hand of some that affilt you, and at the same time let the stool be placked from under his feet, so that he may hang upon the Ladder. Thus by this means the head of the thoulder will be rettored by it felf, the endeavour of the Surgeon affitting, and prefling down the thoulder-blade, and moving it to and again. The bone being fet, the flool, which a little

before was plucked from under the Patients feet, fhall be put there again, that he may with the more eate and less pain, pull back his arm from the ftep of the Ladder; for if he thould lift it high up to draw it over, there would be danger, left being newly fet, and not well fiaid, the head of the bone might fallout again. I have thought good to have all these things here expressed, that you may learn this operation, as if you see it done before you. I have

Another Figure expressing the fourth manner of restoring a dislocated shoulder.

Another Figure to the same purpose.

not thought fit in this place to omit the industry of Nicholas Picart, the Duke of Guise his Surgeon, who being called to a certain Country man to fet his shoulder being out of joint, and finding none in the place belides the Patient and his wife, who might affift him in this work, he put the Patient, bound after the aforementioned manner, to a Ladder; then immediately he tied a fiaff at the lower end of the ligature, which was faftned about the Patients arm above his elbow; then put it fo tied under one of the steps of the Ladder, as low as he could, and got aftride thereupon, and fate thereon with his whole weight, and at the same instant made his Wife to pluck the stool from under his feet: which being done, the bone prefently came into its place, as you may fee by the foregoing figure.

If you have never a Ladder, you may use a piece of Wood laid across upon two Posts. Also you may use a Door, as the other Figure thews, wherein you must observe a stat piece of Wood or statula,

with strings thereat, whose use shall be shewn in the following Chapter.

CHAP. XXVII.

The fixth manner of restoring a shoulder luxated into the arm-pit.

art.fest.19.

med Anii.

Sell. s. de art. feet.21.

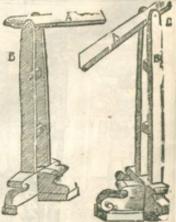

Ippocrates writes, that this is the best way of all to restore a dislocated shoulder. You must Sell, 1.116.1.de take a woodden spatula of some four or five singers breadth, and some two singers thick-The descriptierive part of the head of the houlder. This upper part of the flatula must be wrapped about with
on of the Glofa linner or woollen rag, or forme fuch foft thing, that it may be the fofter and hurt the less and
fecenium, terterm is creatly be for them upder the corner than the control of the flatula must be the fofter and hurt the less, and then it must be so thrust under the arm-pit, that it may throughly penetrate into the inner part between the ribs, and the head of the shoulder-bone. There must, besides in this standa, be two holes in three feveral places, each alike diftant from other, through which let foft ftrings be put, whereby it may be tied to the arm, firetched all the length thereof even to the fingers, in one place a little below the head of the shoulder-bone, in another a little above the elbow, and the third at the wrist, that so they may hold it firm: Therefore let the distances of the holes be fitted to this purpole; but principally you must have a care of this, that the upper part of the pataila, reaching beyond the head of the arm, enter even to the innermost cavity of the arm-pit; then a cross pin or piece of wood must be made fast through two Polis or a Frame, and well fastned thereto, and thereupon the Arm with the standard must be so put over, that the pin may be under the arm-pit, the body weighing one way, and the arm another: which being done, the arm must be drawn down one way, and the body another about the pin. Now this crofs pin must be put on such a height that the Patient may frand on tip-toes Now this is the very best way of restoring a shoulder. In stead of two Posts or a Frame, you may make shift with a Ladder, Door, Bed-posts, and such like things as shall be there present. I have heard Henry Arver, a very good Surgeon of Orleans say, that he never attempted this manner of putting into joint a shoulder dislocated into the arm-pit without good success, unless by chance (which also is noted by Hipporrates) that the sleep will sit be some attempted to the cavity, and the head of the bone hath made it self another cavity in the place whereinto it is fallow. place whereinto it is fallen, for in this case the bone will either not be restored, or else not re-

main in its place, but fall back notwithstanding into the new hollowed cavity, which serves it in stead of its natural socket or cavity. But I must here admonish young Surgeons, that if the bone be not reflored at the first endeavour and on-set, that they do not despair and presently delift from their intended operation, but they must winde about, and gently move the joint : for fo at the length it will be more eafily moved, and enter into the natural cavity: When it is in, it must be bound up with comprelles and rowlers after the fore-mentioned

manner.

To the former Figures I have thought good to add this, which expresseth the manner of restoring a shoulder luxated into the arm-pit, with a fatula after the manner of Hippocrates. This ffatula fatined with an iron pin to the flanding Frame, may be turned, lifted up, and preffed down at your pleafure. A Shews the wooden flatuda. B The frame or flanding pofis.

Hippocrates bis Gloffocomium towed Ambi,

Hipp. feet. 64. 4- de artic.

How to make nie of the Ambi.

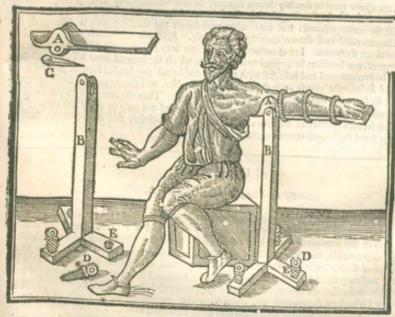

For the more certain use of this Instrument the Patient must fit upon a feat which must be some what lower than the standing Frame, that so the standa which is thrust into the arm-pit may be the more forcibly deprest, so to force in the head of the shoulder-bone; the Patients seet must also be tied, that he may not raise himself up whilest the Surgeon endeavours to restore it. Now he shall tied, that he may not raife him felf up whileft the Surgeon endeavours to reflore it. then endeavour to reflore it when he shall have bound the stretched forth arm of the diflocated shoulder unto the arm of the diflocated shoulder unto the arm of the shoulder the der unto the francis, and thrust the one end thereof under the slipped forth head of the shoulder-bone, as we have formerly thewed, for then by preffing down the other end of the flatula which goes to the hand, the bone is forced into its cavity. You must diligently observe the wooden flatula, which therefore I have caused to be expressed by it self, which Hippornus calleth Ambi, whose head is a little hollowed, where it is noted with this letter B. The whole flatula is marked with this letter A. with

three firings hanging thereat, provided for the binding of the arm, that it may be kept fleddy, as you may perceive by the annexed figure.

There are other additions to this Ambi, whose figure I now exhibited to your view, by the invention of Niebolas Picare the Duke of Lorrain's Surgeon, the use and knowledge whereof, bestowed upon me by the inventor himself, I would not envy the studious Reader.

Another Figure of an Ambi with the Additaments.

AA Shews the two ears. as it were stops made to hold and keep in the top of the shoulder, left it should flip out when it is put into the frame or Supporter.

BB The frame or siepporter whereon the Ambi rofts.

CC The pin or axeltree which fustens the Am-bi to the supporter.

DD Screw-pins to fasten the foot of the supporter that it stir not in the operation.

EE The holes in the foot of the Supporter, whereby you may fasten the Screw-pins to the floor.

CHAP. XXVIII. How to restore a Shoulder dislocated forwards.

T is feldom that the floulder is laxated towards the forefide; yet there is nothing to flable and firm in our bodies which may not be violated by a violent affault; to that those bones do also fall out of joynt, whose articulations are firengthned for the firmer connexion with fleshy, nervous, griftly and bony stays, or bars: This you may perceive by this kind of diflocated, hould be a six were, with a strong wall on every hand, to wit the shoulder, strengthned, as it were, with a strong wall on every hand; to wit, the Aeronium and the end of the collar-bone, seeming to hinder it, as also the great and strong muscles, Eponis, and Eceptification, the strong muscles, Eponis, and Eceptification, which was a first strong by Galen: I profess I have seen is but once and should be and should be supported by the strong by Galen: I profess I have seen is but once and should be supported by the strong str which was observed five times by Galen: I profess I have seen it but once, and that was in a certain Nun, which weary of the Nunnery, cast het self down out of a window, and bore the fall and Gomad first, 22 weight of her body upon her elbow, so that her shoulder was dislocated forwards. This kind of de articulus dislocation is because the decrease of the confirmation or forms of the confirmation of the confirmation or forms of the confirmation of the confirmation or forms of the confirmation of the conf diffocation is known by the depravation of the conformation or figure of the member, by the head Signs of

Curc.

of the shoulder wrested out towards the breast, as also the Patient cannot bend his elbow: It is restored by the same means as other luxations of other parts, to wit, by strait holding, extend-ing and forcing in: Therefore the Patient must be placed upon the ground with his sace upwards, and then you must extend the shoulder otherwise than you do when it is luxated into the arm-pit; for when it falleth into the arm-hole, it is first drawn forwards, then forced upwards, until it be brought just against the cavity whereinto it must enter: But in this kind of luxation, because the top of the shoulder is in the foreparts of the dearticulation shut up with muscles, opened both to the outer, as also the inner part, you must work to the contrary; to wit, to the hind part : But first of all you must place a servant at the back of the Patient, who may draw back a strong and broad Bandage cast about the arm-pit (such as is the Carebestus, which consists of two contrary and continued ftrings) left that when the arm shall be extended, the shoulder follow: Also you must Sut. 23. full.1. put a clew of yarn to fill up the arm-pit; then must you extend the arm, cashing another ligature a little above the elbow, and in the interim have a care that the head thereof fall not into the armpit, which may be done both by putting the fore-mentioned clew under the arm, and drawing the head another way; then mult you perm it, by flacking your extension, the joynt from the encomparfing-mufcles, to be drawn and forced into its cavity by the mufcles forcible recoiling as with an unanimous confent, into themselves and their originals, for thus it will easily be restored, and such extenfion only is fufficient thereto.

The cure.

What to be done to hold

He diflocation also of the thoulder to the outward parts seldom happens; but yet, if it may at any time happen, the extension of the arm will be very difficult, but yet more difficult towards the outward part than towards the inward: There is a depressed cavity erceived towards the cheft; but externally a bunching forth, to wit, in that part from whence the head of the shoulder-bone is fled : For the restoring hereof, the Patient must be laid flat on his belly, and the elbow must be forcibly drawn contrary to that whereto it is fled, to wit, inwardly to the breaft; and also the flanding-forth head of the arm-bone must be forced into its cavity, for thus it shall be easily restored: But into what part soever the shoulder-bone is dislocated, the arm must be extended and drawn directly downwards. After the restitution sitting medicines shall be put about the joynt. Let there be somewhat put into the arm-pit which may fill it up, in the fhoulder and let compresses or boulders be applied to that part to which the luxated bone fell; then all these after it is reflored.

The flored arm-pit, and so brought across upon the joynt of the shoulder, and thence carried unto the opposite arm-pit by so many windings as shall be judged requisite: Then the arm must be put and catried in a scarf to right angles, which figure must be observed not only in every luxation of the same arm must be put and catried in a scarf to right angles, which figure must be observed not only in every luxation of the same arm must be put and catried in reach fracture of the arm also, for that it is less painful, and consequently, such as the arm may fland the longest therein without moving.

CHAP. XXX.

Of the Shoulder diflocated upwards.

Signs

Cure.

He head of the shoulder also may sometimes be luxated into the upper part; Which when it happens, it shews it felf by bunching forth at the end of the collar-bone, the hollowness of the arm-pit is found larger than usual, the elbow flies further from the ribs than when it fell downwards, now the arm is wholly unable to perform the usual actions. It is fit for the reflitution of fuch a luxation, that the Surgeon floop down, and put his fhoulder under the Patients arm, and then fland up as high as he can upon his feet, and therewithal prefs down the head of the shoulder-bone into the cavity, or elfe make some other to do it. Otherwise it is fit to lay the Patient upon his back on the ground, and whilst some one extends the affected arm by drawing it downwards, the Surgeon with his own hand may force down the head of the bone into its cavity-The operation performed, the fame things shall be done as in other luxations, compresses being applied to that part whereto the bone flew, and it being also bound up with ligatures. Now you may understand in these four fore-mentioned kinds of diflocations, that the bone which was luxated is reflored, by the found which shall be heard as you force it in, by the restitution of the accustomed actions, which are perceived by the bending, extending and lifting it up, by the mitigation of the ain, and lastly, by the collation and comparing of the affected arm with the found, and by its firmlitude and equality therewith.

CHAP. XXXI.

Of the Differation of the Ethore.

He elbow may also be four manner of ways diflocated; to wit, inwardly, outwardly, up- The Author wards and downwards. By the part which is inwards, I mean that which looks towards feems not to the center of the body, when as the arm is placed in a natural fite, to wit, in a middle the state after between prone and fupine; I make the outward part, that which is contrary thereto. By fell 3, feat, and figure between prone and lupine; I make the outward part, that which is contrary thereto. By fett.3, fealt, and the upper part I mean that which is towards the heaven, and by the lower that which is next to cells in the the earth: And by how much the joynt of the elbow confifts of more heads and cavities than that fetting down of the shoulder, by so much when it is luxated it is the more difficultly set, and is also more fablished and to grow hard therminon, as Hippocrates faith. Now the joynt of the clow ject to inflammation, and to grow hard thereupon, as Hippocrates faith. Now the joynt of the elbow bow.

Is more difficultly diffocated than that of the shoulder, and more hardly set, for that the bones of * The Author the cubit and arm do receive and enter each other by that manner of articulation which is termed doth not agree Ginglymus, as we have formerly more at large treated in our Anatomy, and a little before in our with Hipport.

Treatife of Fractures. The elbow is therefore diffecated, for that the proceeds the roof are treatment and culpit, in Treatife of Fractures. The elbow is therefore diflocated, for that the proceiles thereof are not turn-feeting down ed about the shoulder-bone in a full orb, and by an absolute turning. Wherefore if at any time the notes of the cubit be bended more firaitly and closely than that the inner process can retain its place and these diffecent flation in the bottom of its finus, the hind-process falleth out and is dislocated backwards: But ones when as the fore-process is extended more violently, and forced against the bottom of its cavity, it are here attrified than the former: Add hereunto, that the utter extremity of the cubit, which is calculated to an outward and led Observation is the higher, but the other input is the lowest when as it is the size of the cubit, which is calculated to an outward and led Observation is the higher. But the other input is the lowest when a let is the size of the cubit, which is calculated to an outward and led Observation is the higher. led Olecranum, is the higher, but the other inner is the lower; whence it is that every one can better and more eafily bend than extend their cubits: Therefore fuch a diffocation is caused by a more violent force, than that which is made to the inner side. * The sign of this luxation is, the arm yen to an element of the control of the control of this luxation is the arm yen to an element of the control of the control of the control of this luxation is the arm yen to an element of the control of t remains extended, neither can it be bended, for the inner process stays in the external cavity bow discoated which is hollowed in the bottom of the shoulder-bone, which formerly was possessed by the inner towards the part of the Oleganium; which thing makes the restitution difficult, for that this process is less. part of the Oleranum; which thing makes the restitution distinctly was posterior by the line, fore and our-as it were, imprisoned there: But when it falleth out diffocated to the fore-part, the arm is crook-which are as it were, impriloned there: But when it fancth out dislocated to the fore-part, the arm is cross-which are ed, neither is it extended, and it is also shorter than the other. But if the elbow be fallen out here attributed its place according to the other manner of diflocations, to wit, upwards or downwards, the ted to the elbow, diflocations in the control of the arm is stretched forth, but little notwithstanding bendered and the control of the arm is stretched forth, but little notwithstanding bendered upwards to the control of the arm is stretched forth, but little notwithstanding bendered upwards to the control of the arm is stretched forth, but little notwithstanding bendered upwards to the control of the arm is stretched forth, but little notwithstanding bendered upwards to the control of the arm is stretched forth, but little notwithstanding bendered upwards to the control of the arm is stretched forth, but little notwithstanding bendered upwards to the control of the arm is stretched forth, but little notwithstanding bendered upwards to the control of the arm is stretched forth, but little notwithstanding bendered upwards to the control of the arm is stretched forth, but little notwithstanding bendered upwards to the control of the arm is stretched forth. natural figure thereof is perverted, for the arm is firetened torth, but little notwithlanding bended towards that part from whence the bone went, that is, figured after a middle manner between and downbending and extending thereof. What kind foever of diflocation fliall befal it, the action of wards; those there is a fwelling in the part whereinto it is flown, and a cavity there from whence it is fled, which also happens in the diflocations of all other parts. Furthermore, one diflocation of the elbow is complete and perfect, another imperfect. The later as it cashly happens, and through a linides. Inflammation fmall occasion, fo it is easily restored; but on the contrary a perfect, as it hardly happens, and not Inflammation unless with great violence, so it is not so easily restored again, especially if that you do not prevent hinders reposition. inflammation, for being inflamed it makes the reflitution either difficult, or wholly impossible,

CHAP. XXXII.

How to referre the Elbow, diflocated outwardly.

Ou may know that the elbow is diflocated outwardly, if at any time you shall observe the Signarm to be distended, and not able to be bended. Wherefore you must forthwith undertake the restitution thereof, for fear of defluxion and instammation which the bitterness of pain usually causeth, upon what part soever the luxation happens. There is one manner of Cure. refloring it, which is, you must cause one to hold hard and steddy the Patients arm a little under the joynt of the shoulder, and in the mean while let the Surgeon draw the arm, taking hold thereof with his band, and all the control of the ship and and the steam of the arm. with his hand, and also force the shoulder-bone outwards, and the eminence of the cubit inwards, but let him by little and little draw and extend the arm, wretting it gently this way and that way, that he may bring back the bone which fell out into its cavity. I have thus expressly delivered this, A Caution that the young Surgeon may understand, that the arm must not be bended for the restoring of this bind of layering the state of the restoring of this little of differentials. kind of diflocation; for relitution cannot fo be hoped for, because by this kind of luxation the inner process of the cubit possesses the place of the exterior process in the cavity of the shoulder-bone. Wherefore whilst the arm is bended or crooked, the cubit is only lifted up, and not drawn into its feat. But if we cannot attain to the reflicution thereof with our hands alone, you must cause the difference arm, lightly bended, to embrace a poll, then must the end of cubit called Olera-new be tied or bound about with a strong ligature or line, and then rested into its cavity by putting a battoon or staff into the ligature, as is demonstrated by this ensuing figure.

tunner.

A Figure which shews the way how to refere the Elbow by putting it about a post, with a batton.

A Figure which shews how to restore the Elbow by only casting a line about it.

Thereis also another more exquisite way of re floring it, which is expressed by the latter figur wherein a line of fome inch breadth is cast abou the Olecranism of the arm, embracing a post of pillar, and it is drawn to long, until the difloca-

ted bone be brought into its feat. Now we know that the bone is returned into its place, and re-flored, when the pain ceafeth, and the figure and whole natural conformation is reflored to the arm, and the bending and extending thereof is easie, and not painful.

C H A P. XXXIII.

Of the Diflocation of the Elbow to the infide, and of a complete and uncomplete Luxation.

The care.

F the elbow be diflocated to the inner part, the arm must be strongly and powerfully exten-ded, then bended quickly, and with sudden violence, so that his hand may finite upon his shoulder. Some put some round thing into the bout of the elbow, and upon that do suddenly force the elbow to the shoulder, as we have formerly faid. If the cubit-bone be only lightly moved out of its place into the upper or lower place, it is easily reflored by drawing and forcing it into its cavity, after this following manner. Let two extend the arm, taking hold thereof at the thoulder and wrift, and each draw towards himfelf: And also the Surgeon (who shall there be prefent) shall force the bone which is diflocated from that part whereunto it is bended, unto the contrary: After he shall thus have restored it, he shall lay the arm in a strait angle, and so bind it up, and apply fit medicines formerly mentioned, and fo let him carry it in a feart put about his neek as we faid in the diflocation of the flioulder. Hippocrates bids, that the Patient, after it is let, shall often endeavour to bend his hand upwards and downwards, and also extend and bend his arm, yea, and also to attempt to lift up some heavy thing with his hand; for so it will come to pass, that the ligaments of this joynt may become more fort, ready and able to perform their accuriomed functions, and also the bones of the cubit and shoulder shall be freed from the affect termed Analogue whereto they are incident by the luxations of this part. Now Ancylofis is a certain preternatural agglutination, coagmentation, and, as it were, union of fundry and feveral bones in the fame joynt, which afterwards hinders the bending and extention thereof. Now a Callist is generated in the elbow fooner than in any other articulation, whether it remaineth out, or be put into joynt, by rea-fon that by reft and ceffation from the accustomed actions, a viscid humor which is placed naturally in the joynts, as also another which is preternatural drawn thither by pain, floweth down, and is hardned, and gleweth the bones together, as I have observed in many, by reason of the idleness and too long rest of this part: Wherefore that we may withfiand this affect, the whole ligation that he had a sent the part is D. i. must be loosed sooner and oftner than otherwise, that is to say, every third day, and then the Patients arm must be gently moved every way. Within the space of twenty, or twenty five days, these restored Bones recover their a. reflored Bones recover their firength, foother or later, according to the happing accidents. It is necessary also that the Surgeon know that the Radim, or wand, sometimes falleth out, when the cubit or ell is wholly diflocated; wherefore he must be mindful in fetting the cubit, that he also restore

Why the elfabicat to ds90 TO ESTA

Was III)

the wand to its place; in the upper part it hath a round process lightly hollowed, wherein it receive the shoulder-bone: it hath also an eminency which admitteth the two headed muscle.

CHAP. XXXIV.

Of the Differentian of the Styliformis, or bodkin-like process of the Cubit or Ell.

He process of the Ell called Stylaides, being articulated to the wrist by Diarrhrofis, by which it Differences is received in a small cavity, is dislocated, and falleth out fornetimes inwards, somewhiles out- and causes. wards: The cause usually is the falling of the body from high upon the hands: It is reflored, if that you force it into its feat, diligently bind it, and apply thereto very aftringent and drying medicines: But yet, though you shall diligently perform all things which may be done in diflocati- Cure. ons, yet you shall never so bring it to pass that this bone shall be periodly restored, and absolutely put into the place where-hence it went: Which thing we have read, observed by Hippocrater's When Sea. 1. Sell. 2. (faith he) the greater bone, to wit, the Ell, is removed from the other, that is, the Wand, it is not & fast. sit. fell. eafily reflored to its own nature again; for that, feeing that neither any other common connexion of 3. de frait. two bones, which they call Symphyfis or union, when it is drawn afunder and deliroyed, may be reduced into its former nature, by reason these ligaments wherewith they were formerly contained, and as it were continued, are too violently diffended and relaxed, whence it happens, that I have in these cases often observed, that the diligence and care of the Surgeon hath nothing availed.

CHAP. XXXV. Of the Diffocation of the Wright

E understand by the wrist, a certain bony body, consisting of a compositive of eight bones. Here, as before knit to the whole cubit by Diarthrosis: For the wrist considered wholly in its felf, is knit coast, \$1. the and articulated with the ell and wand: With that, against the little singer; with this, Authordissense thumbs. For thus, as it were, be two connexions the joint is made more sirms, yet may it and things. against the thumb: For thus, as it were, by two connexions the joynt is made more firm; yet may it and Hipperat-be diflocated inwardly, outwardly, and towards the fides. We fay it is luxated inwardly when the in expressing hand flands upwards, but outwardly, when it is crook'd in and cannot be extended: But if it chance the sames and to be diflocated fide-ways, it flands away either towards the little finger, or elfe towards the thumb, figns of the as the luxation befals to this or that fide. The caufe hereof may feem to depend upon the different diflocations. dearticulation of the ell and wand with the hand or wrift: For the wand, which is articulated on the lower part with the wrift at the thumb, by its upper part, whilft it receives the outward (welling or condyle of the ell in its cavity, performs the circular motions of the hands: But the cubit or ell, which in like fort is connected on the lower part by Disrebrofis at the little finger with the writi, being articulated on the upper part with the shoulder-bone, bends and extends, or stretches forth the hand. There is one way to reflore the formerly mentioned diflocations: The arm on one fide and the hand on another must be extended upon a hard resisting and smooth place, so that it may lie flat; and you must have a care that the part whence the dislocated bone fell, be the lower in its fite and place, and the part whither it is gone, the higher: Then to conclude, the prominencies of the bones must be presided down by the hand of the Surgeon, until by the force of compression and fite the laxated bones be thrust and forced into their places and cavities.

CHAP. XXXVI.

Of the diflocated bones of the Wrift.

He wrift confifts of eight bones, which cannot, unless by extraordinary violence, be put or fall out of their places. Yet if they shall at anytime fall out, they will shew it by the turnor of the Sign. part whereto they are gone, and by the depretion of that wherefrom they are fled: They Cure, may be reflored, if the difeafed hand be extended upon a table; and if the bones thall be diflocated inwards, the hand thall be placed with a second upon a table; and if the bones thall be diflocated inwards, the hand shall be placed with the palm upwards, then the Surgeon shall, with the palm of his hand, prefs down the eminencies of the bones, and force each bone into its place: But if the luxation be outwards, he shall lay the palm next to the table, and prefs it after the same manner. To conclude, if the luxation shall be toward either side, the luxated bones shall be thrust towards the palm next to the table, and prefs it after the same manner. the contrary, and the restored bones shall be presently contained in their places with fit remedies, binding, rowling, and carrying the hand in a scars?

CHAP. XXXVII. Of the diflocated bones of the After-wrift.

Here are four bones in the palm or after-wrift, the two middlemoft whereof cannot be diflo- color like. cated fide-ways, because they are hindred and kept from falling afide by the opposition of ear. 18. the parts, as it were relifting them. Neither can that which answereth to the little ringer, nor that whereon the fore-inngers reit, be diflocated towards that fide which is next the middle bones, whereof we now spake, but only on the other fide, freed for the neighbour-hood of the bones. the bones: But all of them may be diflocated inwardly and outwardly. They may be reflored as those of the wrist,

BOOK XVI.

tminne.

C H. A P. XXXVIII.

Of the diflocated Finger.

Why the diflocated fingers may be easily reftored.

A Lio the bones of the fingers may be four feveral ways diflocated, inwardly, ontwardly, and at each fide. To reflore them, they must be laid strait upon a table, and so put into joynt again. For thus they may be easily reflored, by reason their sockets are not deep, and their joints are shorter, and ligaments less strong. In twelve days space they will recover their strength, as also these districtions that happen to the wrist and after weilt. also those dislocations that happen to the wrist and after-wrist.

CHAP. XXXIX. Of a diflocated Thigh or Hip.

Hipp. fest. 68. fell. 3. de art.

Gal. com. ad feet.47 fell- 4. de art.

A fubluxation internal caufe.

He thigh or hip may be diflocated, and fall forth towards all the four parts, but most frequently inwards, next to that outwards, but very feldom either forwards or backwards. A fubluxation cannot happen in this joynt, as neither in the shoulder, especially from an external cause, contrary to which it usually happens in the elbow, hand, knee, and The cause hereof is, for that the heads of thigh and shoulder-bone are exactly round, and the fockets which receive them have certain borders and edges encompatting them: Hereunto may be added, that firong muscles encompass each dearticulation, so that it cannot come to pals that part of the heads of fuch bones may be contained in the cavity, and other parts fland or fall forth, but that they will quickly be reflored to their places by the motion and wheeling about of the joynt, and the firength of the encompaffing mufcles. But a fubluxation may feem to happen in these parts from an internal cause. For then the ligaments and ties being softned and relaxed, cannot draw and carry back the head of the bone franding forth fo far as the edges may beful the of the focket. If the hip be diflocated towards the inner part, that leg becomes longer and larger than the other, but the knee appears formewhat lower, and looks outwardly with the whole foot, neither can the Patient fland upon his leg. To conclude, the head of the thigh-bone bewrays it felf lying in the groin, with a fwelling manifest both to the eye and-hand; now the leg is longer than that which is found, for that the head of the thigh is out of its focket or cavity, and fituated lowered, to wit, in the groin, therefore the leg is made by fo much the larger. Now the knee stands forth, because necessarily the lower head of the thigh-hone stands contrary to the socket. For this is common to all dislocated bones, that when as the dislocation happens to the one side, the other end of the bone flies out to the contrary. Whence it is, that if the upper-head of the thighbone shall fall inwards, then the other head, which is at the knee, must necessarily look outwards. The like happens in other diflocations. The leg cannot be bended towards the groin, for that the diflocated bone holds the extending muscles of the same part so titifly stretched out, that they cannot sidd on a state of the same part so titifly stretched out, that they cannot sidd on a state of the same part so titifly stretched out, that they cannot sidd on a state of the same part so titifly stretched out, that they cannot be same part so the same not yield, or apply themselves to the benders. For flexion or bending ought to precede extension, and extention, flexion.

CHAP. XL. Prognosticks belonging to a diflocated Hip.

Why the thigh bone difficulta reflored, cafily falls out

The breaking on of the internal ligament.

Gal. com. ad feat-42-felf-4. de art.

Here is this danger in the diflocation of the hip, that either the bone cannot be put into the place again, at leaft unless with very much trouble, or elle being put in, that it may prefently fall out again. For if the tendons of the mufcles, the ligaments, and other nervous parts of the member be hard and firong, they, by reason of their contumacy and ftiffness will hardly suffer the bone to return to its place. If that they be soft, loose, effeminate and weak, they will not contain the restored bone in its place. Neither will it be any better contained, if that fhort, but yet firong and round ligament, which faftens the head of the thigh-bone on the infide in the focket or cavity of the huckle-bone, be broken or relaxed. Now it may be broken by fome violent thock or accident, it may be relaxed by the congestion and long stay of fome excrementitious, tough and viscous humour lying about the joynt, through which means it waxeth foft. But if it be broken, how often foever the bone be reflored, it will prefently fall out again. If it be relaxed, there is only this hope to contain the relicred bone, that is, To conforme and draw away the heaped up humidity by application of Medicines and Cauteries of both kinds, for which purpose those are more effectual which do actually burn, for that they dry and strengthen more powerfully. Leanness of the body, and the want of Aponeuroses, that is, of broad tendons, and external ligaments, whereof many encompass the knee, increases the difficulty of containing it in the place. But the parts adjoyning to the dislocated and not-fet bone fall away by little and little, and confume with an Atrophia or want of nourishment; both because the part it felf is forced to delist from the accustomed actions and functions, as also for that the veins, arrests and requires and requi teries and nerves being more firaitned and put out of their places, hinder the spirits and nourithment frow flowing to freely as they ought, to the part: Whence it comes to pais, that the part it felf is made more weak, the native heat being debilitated through idleness, it can neither attract the alimentary juice, neither can it digett and attimilate that little thereof which flows and alleth thereto. Verily the thigh-bone, as long as it is forth of the cavity, grows no more after the manner as the other bones of the body do, and therefore in some space of time you may perceive it to be shorter than the sound bone. Notwithstanding the bones of the leg and foot are not hindred of their growth,

1-110 E 17 F

growth, for they are not out of their proper places. Now for that the whole leg appears more flender, you must think that happens only by the extenuation and leanness of the proper muscles The fame thing happens to the whole hand, in the largest acception, when as the thoulder is out of joynt, unless that the calamity and loss hereof is the less. For the shoulder being forth of joynt you may do fomething with your hand, whereby it will come to pass that no small portion of nourishment may flow down into these parts. But the thigh-bone being dislocated, especially inwards in a child unborn, or an infant, much less alimentary nourishment Bows to that part, because it can much less use the foot and leg by reason of the diflocation of the hip, than it can do the hand by a luxation of the shoulder. But now we must thus understand that which is faid by Hippocrates, That diflocated bones, and not reflored, do decrease or are hindred Hippocrates exfrom their just growth, to be only in those who have not yet attained to their full and natu-rally appointed growth in every dimension. For in men of full growth, the bones which are not reflored, become more flender, but yet no shorter, as appears by that which he hath delivered of the shoulder.

CHAP. XLL

Of the figns of the Hip diflocated outwardly or inwardly.

He thigh-bone or hip when it is diflocated outwardly, and not reflored, after fome time the pain is affwaged, and flesh grows about it, the head of the bone wears it self a new cavity in the adjoyning hip, whereinto it betakes it felf, fo that at the length the Pabents may go without a staff, neither so deformed a leanness will waste their leg. But if the luxation happen inwards, a greater leanness will befal whem, by reason that the vessels naturally run more inwardly as Galen observes in the diflocation of the Verabre to the inside; therefore it comes to pass that they are more grievously oppressed: Besides, the thigh-bone cannot wag or once ffir against the share-bone; wherefore if the bone thus diflocated be not restored to its joynt again, then they must cast their leg about as they walk, just as we see Oxen do. Wherefore the found leg Al fast 51, whilst they go, takes much less space than the lame, because this, whilst it stirreth or moveth, must sell 3, de art, Patients frand upon their lame leg to put forwards the found, they are forced to frand crooked, whereupon they are forced to flay themselves with a flaff that they fall not.

Furthermore those who have this bone difformed either backwards or outwards, fo that it can-Signs of the

not be reflored, have the part it felf grow fliff and hard; which is the cause why the ham may be bended without great pain, and they may fland, and go upon the tops of their toes; befries also, when they defire to go fafter, they are forced to floop, and firengthen themselves by laying their hand on their lame thigh at every flep, both for that their lame leg is the thorter, as also because the whole weight of the body should not lie wholly or perpendicularly upon the joynt or head of the thigh-bone. Yet in continuance of time, when they are used to it, they may go without any staff in their hands. Yet in the interim, the found leg becomes more deformed in the composure and figure, because, whilst it succours the opposite and lame leg by the firm standing on the ground, it bears the weight of the whole body, in performance whereof the ham must necessarily now and then bend. But on the contrary, when as the head of the thigh being diflocated inwards is not put into the joynt, if the Patient be arrived at his full growth, after that the head of the bone hath made it felf a cavity in the neighbouring bone wherein it may reft, he may be able to walk without a staff, because the dislocated leg cannot easily be bended toward the groin or ham, and he will sooner rest upon his heel than upon his toes. This kind of dislocation it it be inveterate, can never be reflored. And thefe things happen, when as the thigh-bone is diflocated inwards, or when the interhal ligament which faffens the dearticulation shall be broken or relaxed. But the contrary shall plainly appear if the diflocation thall happen to be outwards; for then the lame leg becomes the thorter, because the head of the thigh flies into a place higher than its cavity, and the muscles of that part are contracted towards their original, and convolvively draw the bone upwards together with them. The whole leg, together with the knee and foot looketh inwards, they cannot go upon their heels, but upon the fetting on of the toes. The leg may be bended, which it cannot be in a diffication of the thigh inwards, as Paulus thews. Therefore we must diligently observe that the fetting on the fetting on the toes. The refore we must diligently observe that the distribution of the thigh inwards, as Paulus thews. Therefore we must diligently observe that the fetting of the toes, as the fetting of the fetting of the fetting of the second of the toes. The second of the fetting of the fet Oc. quin & crus ipfum, Oc. But now the lame leg will better fuftain the weight of the body in an external, than in an internal diflocation, for then the head of the thigh is more perpendicularly fubject to the whole weight of the body. Therefore when in the fluccess of time it thall by wearing have made it felf a cavity in the neighbouring bone, which in time will be confirmed, fo that there will remain no hope of refforing the diflocation, nevertheless the Patient shall be able to go without a shalf, for that then no sense of pain will trouble him; whence it follows, that the whole leg also will become lefs lean, for that going is lefs painful, neither are the veffels fo much preffed as in that diflocation which is made inwardly.

6.8-Hip (ret.91.

(minima)

CHAP. XLII.

Of the Thigh-bone diflocated forwards.

T feldom hapneth that the thigh is diflocated forwards; yet when as it shall happen, it is by these figns. The head of the thigh lieth towards the share; whence the groins swell up, and the buttock on the contrary is wrinkled and extenuated by reason of the contraction of the muscles; the Patient cannot extend his leg without pain, no verily, not so much as bend it to-wards the groin, for for the fore-muscle which ariseth from the hanch bone is so pressed by the head of the thigh, that it cannot be diffended; neither can the ham be bended without very much painting on of the toes; therefore when he is forced to go, he toucheth the ground with his heel only, scapping of urine, by this accident, is supprest; because the head of the thigh oppresses the greater nerves and diffocation profiles is rained and instanced by consent. Now, when inflammation that the same are the Sainteen and diffocation profiles is rained and instanced by consent. Now when inflammation that the sainteen are the Sainteen and the sainteen are the Sainteen and the sainteen are the Sainteen are the Sainteen and the sainteen are the Sainte nal diffocation prefion is pained and inflamed by confent: Now when inflammation thall feize upon the Spingmuscle, the urine can scarcely flow out, for that it is hindred by the swelling.

CHAP. XLIII.

Of the Thigh-bone diffocated backwards.

Signs.

Eldom also is the thigh-bone diflocated backwards, because the hind-part of the cavity of the huckle-bone is deeper and more depreffed than the force; whence it is that the diflocation of the thigh to the inner part is more frequent than the reft. The Patient can neither extend nor bend his leg by reason of the much compression and tention of the muscles which encompass the head of the thigh by this kind of luxation. But the pain is increased when he would bend his ham, for that then the muscles are more strongly extended. The lame leg is shorter than the found: When the buttocks are pressed, the need of the thigh is perceived his amongst the muscles of that part, but the opposite groin is lax, foft, and deprest with a manifest cavity. The heel touches not the ground, for that the head of the thigh is plucked back again by the muscles of the buttocks, amongst which it liesth hid: But principally by that which is the larger, and which is faid to make, as it were the pillow or cushion of the buttocks; for this is much more present in this kind of diflocation than the rest: Whence it is, that the Patient cannot bend his knee, because the extention of the nervous production or large tendon which covers the knee is so great. But if the Patient will stand upon the foot of his luxated leg without a staff, he shall fall down backwards, for that the body is inclined to that part, the head of the thigh being not directly underneath for the propping or bearing up of the body; wherefore he is forced to fultain himself upon a crutch on his lame fide. Having promifed these things of the differences, signs, symptoms and prognosticks, it now remaineth, that we briefly describe the difference ways of restoring them, according to the difference of the parts whither it is fallen. First, you must place the Patient upon a bench or table, groweling, or with his face upwards, or upon one fide, laving some fore total or a bench or table, groveling, or with his face upwards, or upon one fide, laying some foft quilt or coverlid under him, that he may lie the easier. Now you must place him to, that the part unto thick the boxes is flower to the him to the him to. which the bone is flown, may be higher, but from whence it is fled, the lower. For if the thighbone be diflocated outwards or backwards, then must the Patient be laid groveling; if inwardly, up on his back; if forwards, then upon his fide. Then must extension and impulsion be made towards the cavity, that so it may be forced thereinto: But if the diflocation be tresh, and in a fost body, as a woman, child, and fuch like, whose joynts are more lax, it shall not be any ways needful to make great extension with strong ligatures for the restoring it; the Surgeons hand shall suffice, or a list or towel cast about it. In the interim the bone shall be kept fast with compresses applied about the joynt: Then the Surgeon shall extend the thigh, taking hold thereof above the knee, in a strong light and so that the presents the strong that the strong th firait line, and fo fet it directly against the cavity, and then presently thrust it thereinto. For thus thall he reftore it, if so be that in thrusting it he lift up the head thereof fornewhat higher, left the lips of the cavity force it back, and hinder it from entring. Now because unless there be just extension, there can be no reflitution hoped for, it is far better in that part, that is, to extend in Self. 2. 116. de formewhat more than is necessary, yet so, that you do not endanger the breaking of any muscles tendon or other nervous body. For that as Hipperrates writes, when as the mufcles are strong and large, you may fafely extend them, if so be that you displace nothing by the force of the extension If your hand will not fuffice to make just extension, you must use the help of an Engine, fuch as is our Pulley, fatined to two posts, so much of the rope being let forth and drawn up again as shall suffice for the business in hand; in the performance whereof, it is fit that the Patients friends absent themselves from this sad spectacle, and that the Surgeon be resolute, and not deterred from his business to the last the same of the terred from his butiness by the lamentation, neither of the Patient nor his friends. But for that we write thefe things chiefly for the benefit of young Practicioners, it feemeth meet, that having delivered these things in general, of restoring the thigh-bone, that we run over these generalities in each particular, beginning with that diflocation which is made inwardly.

The general

cure

CHAP. XLIV.

Of refloring the Thigh-bone diflocated inwards,

T is fit to place the Patient after the forefaid manner, upon a table or bench, in the middt whereof shall stand fastined a wooden pin of a foots length, and as thick as the handle of a spade useth to be; but it must be wrapped about with some fost cloth, lest the hardness hurt the buttocks, betwirt which it must stand, as we read that Hippearates did in the extension of a broken The wooden pin bath this use, to hold the body that it may not follow him that draweth sell, a lib. de or extendeth it; and that the extension being made as much as is requisite, it may go between frait, the Peritonaum and the head of the dislocated thigh. For thus there is no great need of counterextension towards the upward parts; and belides it helpeth to force back the bone into its cavity, the help of the Surgeon concurring, who twining formewhiles to this, and otherwhiles to that fide, doth direct the whole work. But when the extension hath need of counter-extension, then How to make it is needful you have such ligatures at hand, as we have mentioned in the reftoring of a dislocated shoulder, to be drawn above the shoulder. One of these shall be fatined above the joynt
conner-exconstends and extended by a strong man; another shall be cast above the knee by another with
the like trees. But if you cannot have a more beginned another shall be the like force. But if you cannot have a wooden pin, another firong and like ligature thall be dure. put upon the joynt directly at the hip, and held fiff by the hands of a firong man, yet fo that it may not touch the head of the thigh by prefling it, for fo it would hinder the refloring thereof. This manner of extension is common to four kinds of luxation of the thigh-bone. But the manner of fire he had a local transfer of the of forcing the bone into its cavity must be varied in each, according to the different condition of the parts whereunto the head inclineth; to wir, it must be forced outwards if it be fallen inwards, and contrary in the rest, as the kind of the diffocation shall be. Some too clownish and ignorant knotknitters faffen the lower ligature below the ankle, and thus the joynts of the foot and knee are more extended than that of hip or buckle-bone, for they are nearer to the ligature, and confequently to the active force: But they ought to do otherwise; therefore in a diflocated shoulder you shall not faster the ligatures to the hand or wrift, but above the clbow. But if the hands shall not be suffici- Ligatures ent for this work, then must you make use of engines. Wherefore then the Patient being placed as is made for exfit, and the affected part firmly held, forme round thing shall be put into the groin, and the Patients tension must knee, together with his whole leg, shall be drawn violently inwards, towards the other leg. And in the mean while the head of the thigh shall be strongly forced towards the cavity of the hackle-bone, and fo at length reflored, as the following figure shews:

A Figure which manifesteth the way of restoring the Thigh-home dislocated inwards.

When the head of the thigh by just extension is freed from the muscles wherewith it was infolded, and the muscles also extended that they may give way and yield themselves more pliant, then cept.

The professional facked, and then you must also desit from tending, otherwise the resitution cannot be performed, for that the stronger extension of the engine will relift the hand of the Surgeon, thrusting and forcing it into the cavity. This precept must be observed in the restoring of this and other dislocations. You shall know that the thigh is restored by the equality of the legs, by the free and painless extension and inflection of the lame leg. Laftly, by the application of agglutinative medicines (whereof we have formerly spoken) the restored bone shall be confirmed in its place; to which purpose ligation shall be made, the ligature being first cast upon the place whereinto the head of the thigh fell, and thence brought to the opposite or found side by the belly and logns. In the mean while the cavity of the groin must be filled with fornewhat a thick boulder, which may keep the head of the bone in the cavity. Neither must you omit junks stretched down even to she ankles, as we have observed in the fracture of the thigh. Then must both the thighs be bound together, whereby the diflocated member may be unmoveable, and more and more firengthned. Neither that this drelling be loofed until four or five days be paffed, unless peradventure the fudden hap-

(tilling)

ning of fome other more grievous fymptom shall perswade otherwise. To conclude, the Patient must be kept in his bed for the space of a month, that the relaxed muscles, nerves and ligaments may have fpace to recover their former firength, otherwise there is danger left the bone may again fall out by the too forward and speedy walking upon it. For the fite of the thigh it must be placed and kept in a middle figure, yet this middle figure confists in the extension, not in the flexion, as it is demonstrated. ftrated by Hippocrates, for that fuch a tigure is accustomable to the leg.

Stlt. 2. lib. de fratt.

CHAP, XLV.

Of refloring the Thigh diflocated outwardly.

He Patient must be placed groveling upon a table in this kind of diflocation also, and ligatures as before, cast upon the hip and lower part of the thigh, then extension must be made downwards, and counter-extension upwards; then presently the head of the bone must be forced by the hand of the Surgeon into its place. If the hand be not sufficient for this purpose, our Pulley must be used, as the following figure sheweth.

A Figure which expresses the manner of restoring the Thigh luxated outwards.

When it is ring the diflocated thigh.

This kind of diflocation is the cafiliest restored of all those which happen in the thigh or hip, for that I have divers times observed the head of the thigh to have been drawn by the only regress of the extended muscles into themselves towards their originals, somewhiles to the restless towards their originals, somewhiles restless to the control of the control with a noife or pop, otherwhiles without; which being done, laying a comprets upon the joynt, you shall perform all other circumstances as before, in an internal diflocation.

CHAP. XLVI.

Of restoring the Thigh dislocated forwards.

Hen the thigh is luxated forwards, the Patient must be laid upon his found side, and tied as we have formerly delivered. Then the Surgeon shall lay a boulster upon the prominent head of the bone, and have a care that his servant firmly hold it: Then immediately just extension being made, he shall with his hand force the bone into the cavity; but if his hand will not serve, he shall ustempt it with his knee. Then to conclude, he shall use the rest of the things formerly mentioned to contain the reftored bone.

CHAP. XEVII. Of restoring the Thigh dislocated backpourds.

He Patient shall be placed groveling upon a table or bench, and the member extended, as in the rest, one ligature stretched from the groin, another from the knee; then the Surgeon shall endeavour to force back with his hand that which stands up, and also to draw away the knee from the found leg. The bone thus placed and reftored, the cure requires nothing elfe than to be bound up and kept long in bed, left that the thigh, if it should be moved, the nerves being yet moved be for that the ing yet more loofe, might again fall out: For the thigh is in great danger of relapfe, for that the cavity of the huckle-bone is only depreft, as far as it goes in, and the burthen of the hanging or adjoyning thigh is heavy.

C H A P. XLVIII.

Of the diflocation of the Whirl-bone of the Knee.

He Whirl-bone of the knee may fall forth into the inner, outer, upper and lower part; but never to the hind-part, because the bones which it covers do not suffer it. To restore it, the Patient must stand with his foot firmly upon some even place, and then the Surgeon must force and reduce it with his hands from the part into which it is preternaturally flidden. When it shall be restored, the cavity of the ham shall be tilled up with boulders so that he may not bend his leg, for if it be bended, there is no finall danger of the falling back of the whirl-bone. Then a cale or box shall be put about it, on the side especially whereto it fell, being made somewhat star and round, resembling the whirl-bone it fell, and it shall be bound on with ligatures and needicines to faft, that it may not flir a jot. After the part shall seem to have had sufficient rest, it is fit that the Patient try and accustom by little and little to bend his knee, until at length he shall find that he may eafily and fafely move that joynt.

CHAP. XLIX.

Of the differented Knee.

He knee also may be diflocated three manner of ways, that is, into the inner, outer and hind-part, but very seldom towards the fore-side, and that not without some grievous and forcipart, but very feldom towards the fore-fide, and that not without fome grievous and forcible violence; for the whirl-bone lying upon it, hinders it from flipping out, and holds it in.

The other ways are easie, because the cavity of the leg-bone is superficiary and very smooth, but the cavity of the lower end of the thigh-bone is made in the manner of a spout or gutter, and besides, the head thereof is very smooth and superfix, but the whole joynt is much more lax than the joynt of the elbow: So that as it may be the more easily diflocated, fo may it the better be reflored; and as it may be the more easily, so may it be the more fasely diflocated, for that inflammation is less to be feared here, as it is observed by Hippometer. Falls from high, leaping, and too violent running Ad form fell.; are the causes of this diflocation. The sign thereof is the disability of bending or lifting up the leg de frail, to the thigh, so that the Patient cannot touch his buttock with his heel. The diflocation of the knee which is inwardly and outwardly, is restored with indifferent extension and forcing of the bones into their feats from those parts whereunto they have fallen. But to restore a diflocation made back-How to restore which is inwardly and only and only and on which is inwardly and only a line of their feats from those parts whereunto they have fallen. But to reflore a diffocation made back. How to reflore wards, the Patient fhall be placed upon a bench of an indifferent height, so that the Surgeon may a knee diffocated him, who may bend with both his hands and bring to his buttocks the Patients leg put because his large parts of the patients leg put because the fallent patients leg p tween his legs. But if the refittution do not thus fucceed, you must make a clew of yarn, and fasten it upon the midft of a flaff, let one put this into the cavity of the ham, upon the place whereas the bone flands out, and so force it forwards; then let another cast a ligature of some three singers breadth upon his knee, and draw it upward with his hands, then presently and at once they shall so bend and crook the lame leg, that the beel thereof may touch his buttocks.

CHAP. L. Of a Knee differented forwards.

Ut if the knee be diflocated forwards (which feldom happens) the Patient shall be placed upon a table, and a convenient ligation made above, and another close beneath the knee. Then the The eure.

Surgeon shall so long press down with both his hands the bone which is out of joynt, until it shall return to its place gain. To which purpose if the strength of the hand will not serve to make just extension each way, you may make use of our engine, as you may perceive by this following figure.

(mittin)

You shall know that the bone is restored by the free and painless extension of the leg; then will there be place for medicines, boulsters and strengthening ligatures. In the mean space the Patient shall forbear going so long as the part shall seem to require.

CHAP. LL.

Of the Separation of the greater and leffer Focile.

The Joyning of the leg and fhin-bones. He Fibula or leffer Focile is fafined and adheres to the Tibia, leg-bone, or greater Focile without any cavity, above at the knee, and below at the ankle. But it may be pluck'd or drawn afide three manner of ways, that is, forwards, and to each fide: This chance happens when in going we take no fure footing, fo that we flip with our feet this and that way as in a flippery place, and fo wreft it inwards or outwards; for then the weight of our body lying open upon it, draws the leg, as it were, in funder, fo that the one Focile is diflocated or feparated from the other. The fame may happen by a fall from an high place, or form grievous and bruiling blow: Befides alfo, their appendices are fometimes feparated from them. For the refloring of all thefe into their proper places, it is fit they be drawn and forced by the hand of the Surgeon into their feats: Then shall they be straitly bound up, putting compresses to that part unto which the Fibula flew; beginning also your ligation at the very luxation, for the fore-mentioned reasons. The Patient shall rest forty days, to wit, as long as shall be sufficient for the strengthening of the ligaments.

The cure,

CHAP. LIL

Of the Leg-bone or greater Focile diflocated and divided from the Pastern-bone.

Differences and figns, Lfo the Leg-bone is fornetimes diflocated and divided from the Pastern-bone, as well inwardly, as outwardly; which may be known by the swelling out of the bone to this or that part; if it be only a subluxation or strain, it may be easily restored by gently forcing it into the place again. After the bone shall be restored, it shall be kept so by compresses and it deligation, by cross and contrary binding to the side opposite to that towards which the bone fell, that so also in some measure it may be more and more forced into its place. In the mean time you must have a care that you do not too straitly press the great and large tendon which is at the heel. This kind of dislocation is restored in forty days, unless some accident happen which may hinder it.

CHAP. LIII.

Of the diflocation of the Heel.

Canfes and differences. Hofoever leaping from an high place have fallen very heavy upon their heel, have their heel diflocated and divided from the Paftern-bone. This diflocation happens more frequently inwardly than outwardly, because the prominency of the leffer Focile embraces the Paftern-bone; whence it is that there it is more straitly and firmly knit. It is reflored by extension and forcing it in, which will be no very difficult matter, unless some great defluxion or inflammation hinder it. For the binding up it must be straited in the part affected, that so the blood may be pressed from thence into the neighbouring parts; yet using such a moderation, that it may not be painful, nor press more straitly than is fit, the nerves and gross tendons which runs to the heel. This dislocation is not confirmed before the fortieth day, though nothing happen which may hinder it. Yet usually it happeneth that many symptoms ensue by the vehemency of the contusion. Wherefore it will not be amiss to handle them in a particular Chapter.

The cure,

CHAP. LIV.

Of the Symptoms which follow upon the contustion of the Heel.

Why bloodletting neceffary in the fracture of a heel. Hip. fell-3, de frallaris. It happenth by the vehemency of this contusion, that the veins and arteries do, as it were, vomit up the blood both through the secret passages of their coats, as also by their ends or orifices, whence an Ecchymosis or blackness over all the heel, pain, swelling, and other the like ensure, which implore remedies and the Surgeons help, to wit, convenient diet, and drawing of blood by opening a vein, (of which though Hipperster makes no mention, yet it is here requisite by reason of the seaver and inflammation) and if need require, purgation; principally such as may divert the matter by causing vomit; and lastly, the application of local medicines, chiefly such as may soften and rarise the skin under the heel, otherwise usually hard and thick such as are somentations of warm water and oyl) so that divers times we are forced to scarifie it with a lancet, thunning the quick stellar. For so at length the blood poured forth into the part, and there heaped up, is more cally attenuated, and at length resolved. But these things must all be performed before the inflammation series upon the part, otherwise there will be danger of a convultion. For the blood, when it falls out of the vessels, readily putrises, by reason the density of this part hinders it from ventilation and dispersing to the adjacent parts. Hereto may be added, that the large and great tendon which covers the heel, is endued with exquisite sense, and also the part it self is on every side spread over

Why the heel is subject to inflammation. The Man and the second second

with many nerves. Befides also there is further danger of inflammation by lying upon the back and heel, as we before admonished you in the fracture of a leg. Therefore I would have the Surgeon to be here most attentive and diligent to perform these things which we have mentioned less by inflammation. tion a Gangrene and Mortincation (for here the fanious flesh presently falls upon the bone) happen together with a continued and tharp Feaver, with trembling, hicketting and raving. For the corruption of this part first by contagion assails the next, and there, a Feaver assails the heart by the arteries pressed and growing hot by the putrid heat, and by the nerves and that great and notable tendon file 2. its, dr made by the concourse of the three muscles of the call of the leg, the muscles, brain and stomach are field evilly affected and drawn into confent, and fo cause convultions, raving and a deadly hicketting.

CHAP. LV.

Of the diflocated Pattern, or Ancie-bone.

He Airagalus or pastern bone may be dislocated and fall out of its place to every fide. Signi Wherefore when it falls out towards the inner part, the foal of the foot is turned outwards, when it flies out to the contrary, the fign is also contrary; if it be diflocated to to the forefide; on the hind fide the broad tendon coming under the heel is hardned and diffended; but if it be luxated backwards, the whole heel is, as it were, hid in the foot: neither doth this kind of diflocation happen without much violence. It is reflored by extending it with the hands, and forcing it into the contrary part to that from whence it tell. Being reltored, it is kept to by application of medicines and fit ligation. The Patient must keep his bed long in this case, lest that bone Cure, which fuftains and bears up the whole body, may again fink under the burthen, and break out, the finews being not well knit and strengthned.

CHAP. LVI.

Of the diffecation of the In-step and back of the Foot.

He bones also of the In-step and back of the foot may be luxated, and that either upwards or downwards, or to one fide, though feldom fide-wife, for the reason formerly rendred, speaking of the dislocation of the like bones of the hand. If that they stand upwards, Care. then must the Patient tread hard upon forme plain or even place, and then the Surgeon by pressing them must the ration that appear to the plant of even place, and their the suggestion them with his hand shall force them into their places; on the contrary, if they shand out of the foal of the foot, then must you press them thence upwards, and restore each bone to its place. They may be restored after the same manner if they be slown out to either side. But you must note, that although the ligatures confift but of one head in other diflocations, yet here Hippocrates would have fuch used Start. 14, fell: 2. as have two heads, for that the diflocation happens more from below upwards, or from above down. Ub. defratt,

CHAP. LVII.

Of the diflocation of the Toes.

Ow the toes may be four ways diflocated, even as the fingers of the hand; and they may The differenbe reflored just after the fame manner, that is, extend them directly forth, and then force cea-each joynt into its place, and lastly, bind them up as is fitting. The restitution of all them is case, for that they cannot far transgress their bounds. To conclude, the bones of the teet are dislo-cure. cated and reflored by the fame means as those of the hands, but that when as any thing is diflocated in the foot, the Patient must keep his bed; but when any thing is amiss in the hand, he must carry it in a scarf. The Patient must rest twenty days, that is, until he can firmly stand upon his seet.

CHAP. LVIII.

Of the symptoms and other accidents which may beful a broken or dislocated member.

Any things may befal broken or differented members by the means of the fracture or differented Any things may befal broken or diflocated members by the means of the fracture or diflocation is such as are bruifes, great pain, inflammation, a Feaver, Impostume, Gangrene, Mortification, Ulcer, Fifiala and Atrophia, all which require a skilful and diligent Surgeon for their cure. A contusion happens by the fall of some heavy thing upon the part, or by a fall Remedies for from high, whence follows the estudion of blood poured out under the skin: Which is it be poured a contusion, forth in great plenty, must be speedily evacuated by scarification, and the part cased of that burthen, left it should thence gangrenate. And by how much the blood shall appear more thick, and the skin more dense, by so much the scarification shall be made more deep. You may also for the same purpose apply Leeches. purpose apply Leeches.

concerning pain we formerly faid, that it usually happens by reason that the bones are moved out what may of their places, whence it hapneth that they become troubleforn to the mofeles and nerves, by prick-happen by ing and preffing them. Hence enfue inflammations, as also impostumation and a feaver, oft-times a pain gangrene, and in conclusion a mortification, corrupting and rotting the bones; otherwhiles a tinuous ulcer or fiftula. But an Atrophia and leanness ariseth by the floth and idleness of the member decaying all the firength thereof, and by too firait ligation interespting the paffages of the blood, other-

BOOK XVII. Of divers preternatural Affects,

Remedies for the leannels or Arraphia of any member.

fomenting.

Now the leanness which is occasioned by too thait ligation receives cure by the flackning of the ligatures wherewith the member was bound. That which proceeds from idlenefs, is helped by moderate exercise, by extending, bending, lifting up, and depressing the member, if so be that he can away with exercise. Otherwise he shall use frictions and somentations with warm water. The fri-What measure Ctions must be moderate in hardness and gentleness, in length and shortness. The same moderation to be used in shall be observed in the warmness of the water, and in the time of somenting. For too long somenting refolves the blood that is drawn. But that which is too little or flort a space draws little or no-thing at all: After the fomentation, hot and emplattick medicines made of Pitch, Turpentine, Essphorbinon, Pellitory of Spain, Sulphur, and the like, shall be applied. They shall be renewed every day more often or feldom, as the thing it felf shall feem to require.

found part op-polite to the emaciated.

A dropax. These medicines are termed Dropaces, whose form is thus: R Picis nigra, ammoniaci, bdelii gummi elemi in aqua vita dissolutorum an. 3 ii. Olci laurini 3 i pulveris piperis, zinziberis, granorum paradisi, bacac-Binding of the riom lauri & juniperi, n. 3 ii. Fiat emplastrum secundum artem, extendatur super alutam. It is also good to found part op-bind about the population of the proposition of the pro for want of nourithment, the left shall be bound, beginning your ligation at the hand, and continu-ing it up to the arm-pit. If this mischance shall seize upon the right leg, then the left shall be swathed up from the fole of the foot to the grein. For thus a great portion of the blood is forced back into the with the veffels almost empty; befide also it is convenient to keep the found part in rest, that so it may draw the less nourishment, and by that means there will be more store to refresh the weak part.

How to bind up the emaci-ated part.

Some with also to bind up the decaying member with moderate ligation; for thus, say they, the blood is drawn thither: for when as we intend to let blood by opening a vein with a lancet, we bind the arm. Also it is good to dip it into water fornewhat more than warm, and hold it there until it grow red, and swell; for thus blood is drawn into the veins, as they find, which use to draw blood of the Saphena and Salvatella. Now, if when as these things and the like be done, the lame part grows hot, red and swoln, then know that health is to be hoped for; but if the contrary happen, the case is desperate: Wherefore you need attempt nothing further.

Signs that an

Furthermore, there is sometimes hardness left in the joynts, after fractures and diflocations are reflored. It is fit to foften this, by refolving the contained humor, by Fomentations, Liniments, Cataplatins, emplatters made of the roots of Marth-mallows, Briony, Lilies, Line-feed, Fenugreekfeed, and the like, and also of Gums dissolved in strong Vinegar; as, Anemoniacum, bdelium, opopanase, labdanism, sagapenism, styrax liquida, and adeps anserinus, gallinaceus, bumanus, oleum liliorium, and the like. Also you must wish the Patient to move the part ever now and then, every day; yet so, that it be not painful to him, that fo the pent up humor may grow hot, be attenuated, and at length difcuiffed, and laftly the part it felf reflored as far as Art can perform it ; for oft-times it cannot be helped any thing at all. For if the member be weak and lame, by reason that the fracture hapned near the joynt, for the residue of his life the motion thereof used to be painful and difficult, and oft-times none at all, especially if the callus, which grows there, be somewhat thick and great; and lassly, if the joynt it felt thall be contufed and broken by the stroke, as it oft-times happens in wounds made by Gunihor.

BOOK XVII.

Of divers other Preternatural Affects, whose cure is commonly performed by Surgery.

CHAP. I.

Of an Alopecia, or the falling away of the bairs of the head.

Gal. c.2. L.1, de comp. med. fe-The cause.

Alopecia is the falling away of the hair of the head, and sometimes also of the eye-brows, chin and other parts; the French commonly call it the Pelade: Phyticians term it the Alopecia, for old Foxes (fubject, by reason of their age to have the scab) are troubled off-times with this disease. This affect is caused either through defect of nourithment fit to nourith the hairs, as in old age through want of the radical humidity, or by the corruption of the alimentary matter of the fame, as after long Feavers, in the Lucs veneres, Leprofie, the cor-

ruption of the whole body and all the humors, whence follows a corruption of the vapors and fuliginous excrements; or elfe by the vicious conflitution of pores in the skin in rarity, and confiriction or denlity, as by too much use of hot ointments made for colouring the hair, or such as are used to take off hair, therefore called Depilatoria, or by the burning of the skin, or loss thereof, having a fear what Alspecia by old Age, a Confumption, Burn-baldnefs, Leprotic, a Scald head, is incurable: That which adward of cure, the cause being taken away, is helped. Wherefore if it proceed from the corruption of humors, let a Phylician be called, who, as he shall think fit, shall appoint diet, purging and phlebotomy. Then the Surgeon shall shave off the hair which is remaining, and shall first use resolving. Fomentations, apply Letches and Horns to digest the vicious humour which is under the skip.

skin, then shall he wash the head to take way the filth with a Lee wherein the roots of Orris and Aloes have been boiled. Lafily, he shall use both attractive fomentations and medicines for to draw forth the humor which is become laudable in the whole body by the benefit of diet fitly appointed. But if the Alapecia shall happen through defect of nourishment, the part shall be rubbed so long with a coarfe linnen cloth, or fig-leaf, or onions until it wax red shefides also the skin shall be pricked in many places with a needle, and then ointments applied made of Labdanum, Pigeons dung, Stavesacre, Oyl of Bays, Turpentine and Wax, to draw the blood and matter of the hairs. If the hair be lost
by the Lucr venera, the Patient shall be anointed with Quick-silver to sufficient salivation. To conclude, as the caufes of this difeafe shall be, so must the remedies be sitted which are used.

CHAP. II. Of the Tinca, or Scald-bead.

He Tines (let me so term it in Latine, whil'st a fitter word may be found) or a Scald-head, is a difease possessing the museulous skin of the head or the hairy scalp, and eating there- List. de comp. into like a Moth. There are three differences thereofythe first is called by Galen, Scaly or bran- med. feel. leastlike, for that whilst it is scratched it easts many bran-like scales: Some Practicioner's term it, A dry feall, because of the great adultion of the humor causing it. Another is called, Ficosa, a fig-like feall, because when it is despoiled of the crust or feab which is yellow, there appear grains of quick and red flesh, like to the inner feeds or grains of figs, and casting out a bloody matter. Galen names the third Achor, and it is also vulgarly termed, the Correfive, or Vicerous Scall, for that the many ulcers wherewith it abounds are open with many finall holes flowing with liquid fautes like the washing of flesh, stinking, corrupt and Carrion-like, somewhiles livid, somewhiles yellowith. These holes, if they be formewhat larger, make another difference, which is called Gerisn or Favofa, (that can 8.1th. citat. is, like a honey-comb) because as Galen thinks, the matter which floweth from these, resembleth honey in colour and confidence. They all proceed of an humor which is more or lefs vicious, for a lefs corrupt humor canfeth a fealy, a more corrupt the fig-like, but the most corrupt produceth the ulcerous. If it shall happen to an Infant by reason of the fault and contagion of the Nurse, or else prefently after it is born, it fearce admits of cure; neither must we attempt that, before the child come that to age that he may be able to endure the cure and medicines. But you may in the mean while apply the leaves of Colworts or Beets befineared with fresh butter, or other gentle medicine having a faculty to mollific and open the passage for the shut-up matter. Those who are of sufficient age to away with medicine, may bleed, purge, bathe, according to art by the advice of a Phylician. For local medicines in a fealy feall, foftning and difcuffing fomentations thall be appointed, made of the For a fealy roots of Marth-mallows, Lilies, Docks, Sorrel boiled in Lee with a little Vineger added thereto. The feall, head shall be twice in a day fomented with such a decoction, and on the fixth day, the hair being shaven off, it shall be fearified, and then Leeches and Horns put to it so fearified. Then it shall be fearified with Only of Samuel and Joseph Samuel Residual Ports for a horth to draw and ropes of the forthwith anointed with Oyl of Staves-acre mixed with black-fope, both to draw and reprefs the malignity of the humor impact in the part. You may also use the following medicine even to the perfect cure of the disease, as that which is much commended in this kind of disease by Vigo Gordonius and Guido; it is thus made. it Elleb. albi & algri, atrament, auripigmenti, lithorgyri auri, caleis vive, vi- An oint triol. alum. galla, fulg. ciner. facis vini ufti, an, 3 | . Argenti vini extintit, 3 ii). aruginis aris 3 ii. Fist for a scalled pulvis qui incorporetur cum succo boraginis scabiosa sumaria acceptapathi aceti an quartà. Olei antiqui liba bulhant usque ad consumpt. Succorum in fine decoltionis cineres ponantur, addendo preis liquide & 1. Cere quantum sufficit, fiat unquentum: These Authors testitie that this will heal any kind of scall. Certainly none can difallow of it, who well considereth the ingredients and composure thereof.

A crusty also or fig-like scall may be so long formented with the prescribed formentation, until the The cure for a crults or scabs fall off, yet there is nothing so good and effectual as Creffes beaten or fried with Hogs crufty scall, fuer, For it will make it fall off in the space of four and twenty hours, besides if it be continued, it A pouleis of will heal them throughly, as I have known by experience, and reason also stands therewith; for according to Galen, Cresses are not and dry. When the crusts shall be fallen away, the parts affected Lib.7. simp. shall be another with the formula of the crusts shall be appropriately with the formula of the crusts of the crusts shall be appropriately with the formula of the crusts of the crusts of the crusts shall be appropriately with the formula of the crusts of shall be anointed with the formerly prescribed ointment. I have cured many with a little Oyl of Vitriol, and fometimes also with Egyptiscom made fomewhat more firong than ordinary. But if the root of the hairs appear rotten, they shall be plucked out one by one; yet if such patrefaction shall possess the whole hairs speak them out the more the whole hairy fealp, and trouble all the roots of the hair, that you may plack them out the more the whose hairy tealp, and trouble all the roots of the hair, that you may plack them out the more readily, and with lefs pain, you may befinear a cotten-cloth on the rougher fide with this following medicine. Re Pieir nigre \(\frac{1}{2}\) vis. I Pieir ref. \(\frac{1}{2}\) ii. Pulaviridis aris, \(\frac{1}{2}\) visited. Kom. an. \(\frac{1}{2}\) i. Pielphur. A plaster to viv. \(\frac{1}{2}\) is copusatur omnia simul in aceti acerimi quantitase sufficiente, sia medicimentum ad nsum: Let it plack away be applied to the head and remain on for two days, then let it be quickly and forcibly placked away the hair at against the hair, that so the hairs sticking to the plaster may by that means be placked away therewith: You shall use this medicine so long as need thall seem to require.

For the third kind of feall which is termed a Corrofive or Ulcerous, the first indication is to cleanse The cure of an the ulcers with this following ointment. Re Unquenti enulati cum mercurio duplicato, agyptiati,an. 3 iij, ulcerous fealls. varied, albi in pulveren redalti 6 is incorporentur finad, fiat augmentum ad ufam; also you may use the for-tnerly described oyutment. But if any other pain or accident fall out, you must withfiand it by the affishance and direction of fome good Phylicians verily these following medicines against all kinds of scalls have been found out by reason, and approved by use. A contumaci-ous feall muft be cared as we care the Luca content.

troubled in like fort with crusty ulcers, I would wish that his head might be anointed with an ointment made of Axungia, argenium vivum, and a little Sulphur, and then fit fome emplastrum Vigoris com mercurio into the fathion of a cap; also some plainers of the same may be applied to the shoulders, thighs and legs, and so let him be kept in a very warm chamber, and all things done as if he had the Lucs veneres. This kind of cure was first (that I know of) attempted by Simus Blanch the King's Surgeon, upon a certain young man, when as he in vain had diligently tried all other usual medicines. A scalled head oft-times appeareth very loathsom to the eye, cashing forth virulent and shinking finites; at the first it is hardly cured, but being old, far more difficultly. For divers times it breaketh out afresh, when you think it kill'd, by reason of the impression of the malign putrefaction remaining in the part, which wholly corrupts the temper thereof. Moreover, oft-times being healed, it hath left an Alopecia behind it, a great shame to the Surgeons. Which is the reason that most of them judg it belt to leave the cure thereof to Empericks and Women.

CHAP. III. Of the Vertigo, or Giddiness.

What the Vertigo is, and the

The figns,

Z.ib. 6.

A critical Vertige.

He Vertigo is a fudden darkning of the eyes and fight by a vaporous and hot spirit, which afcendeth to the head by the fleepy arteries, and fills the brain, diffurbing the humors and fpirits which are contained there, and toffing them unequally, as if one run round, or had drunk too much Wine. This hot spirit oft-times rifeth from the heart upwards by the internal fleepy arteries to the Rete mirabile, or wonderful net; otherwhiles it is generated in the brain it felf, being more hot than is fitting; also it oft-times ariseth from the stomach, spleen, liver, and other entrails being too hot. The fign of this difease is the sudden darkning of the fight, and the clofing up, as it were, of the eyes, the body being lightly turned about, or by looking upon wheels running round, or whirl-pits in waters, or by looking down any deep or freep places. If the original of the difease proceed from the brain, the Patients are troubled with the head-ach, heaviness of the head, and noise in the ears, and oft-times they lose their smell. Panlus Ægineta for the cure bids us to open the arteries of the temples. But if the matter of the difease arise from some other place, as from fome of the lower entrails, fuch opening of an artery little availeth. Wherefore then forme skilful Physician must be confulted with, who may give directions for Phlebotomy, if the original of the difease proceed from the heat of the entrails; by purging, if occasioned by the founcis of the flomach, But if such a Vertigo be a critical symptom of some acute disease affecting the Crifis by vomit or bleeding, then the whole business of freeing the Patient thereof must be committed to nature.

CHAP. IV. Of the Hemicrania, or Megrins.

He Megrim is properly a difease affecting the one fide of the head, right or left. It sometimes paffeth no higher than the temporal mufcles, otherwhiles it reacheth to the top of the crown. The cause of such pain proceedeth either from the veins and external arteries, or from the Mexinges, or from the very substance of the brain, or from the Perieranium, or the hairy scalp covering the Pericranium, or lastly, from putrid vapours arising to the head from the ventricle, womb, or other inferior member. Yet an external cause may bring this affect, to wit, the too hot or cold conflitution of the encompaling air, drunkenness, gluttony, the use of hot and vaporous meats, some noisom vapour or simoak, as of Antimony, Quick-silver, or the like, drawn up by the nose, which is the reason that Gold-smiths, and such as gild Metals are commonly troubled with this difease. But whence foever the cause of the evil proceedeth, it is either a simple diffemper, or with matter: With matter, I say, which again is either simple or compound. Now, this affect is either alone or accompanied with other affects, as inflammation and tention. The heaviness of head argues plenty of humor; pricking beating and tention thews that there is a plenty of vapours mixed with the humors, and that up in the nervous, arterious, or membranous body of the head. If the pain proceed from the inflamed Meninger, a Feaver followeth thereon, especially, if the humor causing pain do putrebe-If the pain be superneiary, it is seated in the Perieranium. If prosound, deep and piercing to the bottom of the eyes, it is an argument that the Meninger are affected, and a Feaver enfues, if there be inflammation, and the matter putrche; and then oft-times the tormenting pain is fo great and grievous, that the Patient is afraid to have his head touched, if it be but with your finger, neither can be way with any noise, or small murmuring, nor light, nor smells however sweet, no nor the sume of Wine. The pain is fometimes continual otherwhiles by fits. If the cause of the pain proceed from hot, of Magin the thin and vaporous blood, which will yield to no medicines, a very necessary profitable and speedy reopening of an medy may be had by opening an artery in the temples, whether the disease profitable and speedy reopening of an medy may be had by opening an artery in the temples, whether the disease from the interArtery is good, nal or external vessels. For, hence always ensueth an evacution of the conjunct matter, blood and spirits. I have experimented this in many, but especially in the Prince de la Roche-fur-yo ficians when he was troubled with this grievous Megrim, were Chaplain, the Kings, and Gaftellane the Queens chief Phylicians, and Lewes Dioret, who notwithstanding could help him nothing by bloodletting, cupping, bathes, frictions, diet or any other kind of remedy either taken inwardly or applied outwardly. I being called, faid, that there was only hope one way to recover his health, which was to open the artery of the temple in the fame fide that the pain was; for I thought it probable, that the cause of his pain was not contained in the veins, but in the arteries, in which case by the testimony of the Aucients, there was nothing better than the opening or bleeding of an

The diffe-

In what kind A Hiftory.

The III

artery, whereof I have made trial upon my felf to my great good. When as the Phylicians had approved of this my advice, I prefently betake my felf to the work, and choice out the artery in the pained temple, which was both the more fwoln and beat more vehemently than the reft. I open this, as we use to do in the bleeding of a vein, with one incition, and take more than two fawcers of blood as we the to do in the naceding of a vein, whit one include, and take more thankwo taweers of blood flying out with great violence and leaping; the pain prefently ceafed, neither did it ever moleft him again. Yet this opening of an artery is fulpected by many, for that it is troublefome to fray the guthing forth blood, and cicatrize the place, by reason of the density, hardness, and continual pullation of the artery; and laftly, for that when it is cicatrized, there may be danger of an Anterifma. Where-fore they think it better first to divide the skin, then to separate the artery from all the adjacent particles, and then to bind it in two places; and lastly, divide it, as we have formerly told you must be done in Variets. But this is the opinion of men who fear all things where there is no cause; for No danger in I have learn'd by frequent experience, that the apertion of an artesy, which is performed with a opening an ar-Lancet, as we do in opening a vein, is not at all dangerous; and the confolidation or healing is fornewhat flower than in a vein, but yet will be done at length, but that no flux of blood will happen, if to be that the ligation be fitly performed, and remain to for four days with fitting pledgets.

CHAP. V.

Of certain affells of the Eyes, and first of staying up the upper Eye-lid volum it is too lax.

F the difeafes which befal the eyes, fome possess the whole substance thereof, as the Ophthalmis, a Phlegmen thereof: Others are proper and peculiar to fome parts thereof, as that Differences, which is termed Gutta ferena to the optick nerve. Whence Galen made a threefold difference of the diseases of the eyes, as that some happened to the eye by hurting or offending the chief organ thereof; that is, the crystalline humor; others by hindring the animal faculty, the chief causes organ thereof; that is, the crystalline humor; others by hindring the animal faculty, the chief cauter of fight, from entring into them; and lastly, other some by offending the parts subservient to the prime organ or instrument. Now of all these diseases, the eye hath some of them common with the other parts of the body, such as are an ulcer, wound, Phlegman, contusion, and the like: Other some are peculiar and proper to the eye, such as are the Egilops, Cataralla, Glancoma, and divers others Paul. Agin. Is of this kind. Some have their upper eye-lid fall down, by reason that the upper skin thereof is re-8. sap. 6. laxed more than is sufficient to cover the eye, the grittle in the mean while not relaxing it self together therewith. Hence proceeds a double trouble; the first, for that the eye cannot be easily opened; the other, because the hairs of the relaxed eye-lid run in towards the eye, and become trouble-some thereto by pricking it. The cause of such relaxation is either a particular pulse of that part. The cause, fome thereto by pricking it. The cause of such relaxation is either a particular palsie of that part, The cause, which is frequent in old people, or the defluxion or falling down of a waterith humor, and not acrid or biting; which appears by this, that those who are thus affected have a rank of hairs growing under the natural rank, by reason of abundance of heaped-up humor, as it is most probable. For thus a wet and marish ground hath the greatest plenty of grass. Now if this same humor were acrid, it would cause an itching, and consequently become troublesome to the Patient, and it would also fret in funder and destroy the roots of the other hairs, so far it is from yielding matter for the preternatural generation of new. It is fit before you do any thing for the cure, that you mark with ink the The cure. portion thereof which is superfluous, and therefore to be cut away, lest if you should cut off more than is requisite, the eye-lid should remain turned up, and so cause another kind of affect, which the Ancients have called Editorion. Then the eye being covered, take and lift up with your fingers the middle part of the skin of the eye-lid, not taking hold of the griftle beneath it, and then cut it athwart, taking away just fo much as shall be necessary to make it, as it were, natural; lastly, joyn the lips of the wound together with a simple suture of three or four stitches, that so it may be cicatrized; for the cicatrization reftrains the eye-lid from falling down to loofly, at least fome part thereof being taken away. There ought to be fome measure and heed taken in the amputation, otherwife you must necessarily run into the one or other inconvenience, as if too much be cut away, then the eye will not be covered; if too little, then you have done nothing, and the Patient is troubled to no purpofe. If there shall be many hairs grown preternaturally, you shall pluck them away with an Instrument made for same purpose; then their roots shall be burned with a gentle cautery, the eye being left untouch'd, for a fear prefently arifing will hinder them from growing again.

CHAP. VI. Of Lagophthalmus, or the Hare-eye.

Uch as have their eye-lids too short, sleep with their eyes open, for that they cannot be covered by the too short skin of the eye-lids: The Greeks term this affect, Λαγορίαλμω. The parise Agia. cause is either internal or external: Internal, as by a Carbunele, Imposiume or Ulcer; ex-1.6.12, 10. ternal, as by a wound made by a fword, burn, fall, and the like. If this mithap proceed by reason of a cicatrization, it is curable, if so that the short eye-lid be of an indifferent thickness. But if it have been from the first conformation, or by some other means, whereby much of the substance is lost as that which happens by burning, and a carbuncle, then it is uncurable. For the cure, you shall use The cure. relaxing and emollient fomentations, then the skin final be divided above the whole fear, in figure of an Half-moon, with the horns looking downwards. Then the edges of the incition thall be opened, and lint put into the middle thereof, that fo it may hinder the lips from joyning together again. Then thall you apply a plaster upon the lint, and so bind up the part with a fitting ligature, that may somewhat press upon the whole eye, lest it should lift it self somewhat upwards again. wards again, and fo return into its ancient, but not natural figure. But in cutting the skin, you

(minute)

must take care that your incision harm not the gristle; for if it be cut, the eye-lid falls down, neither can it be afterwards lifted up. But now for the lower eye-lid; it is subject to fundry diseases, amongst which there is one which answereth in proportion to that, which we late mentioned, which is, when as it is lifted upwards little or nothing, but hangs and gapes, and cannot be joyned with the upper, and therefore it doth not cover the eye, which affect is samiliar to old people; it is called Ettropion, and it may be helped by means formerly delivered.

Eliropies, or the turning up, or out of the eye-lid.

378

CHAP. VII.

Of the Chalazion, or Hail-stone, and the Hordcolum, or Barly-corn of the Eye-lids.

Paul. cap. 6.

The cure,

He Chalazian is a round and clear pimple, which grows upon the upper eye-lid; it is also moveable, and may be stirred this way and that way with your singers. The Latins call it Grando, for that it resembles a hail-stone. Another pimple not much like this grows sometimes upon the verges of the eye-lids above the place of the hairs. It is termed Hardeolum, by reason of the similitude it hath with a barly-corn. The matter of these is contained in its proper cist or skin, and therefore is hardly brought to suppuration. At the first beginning it may be resolved and discussed: But when as it is once grown and concrete into a platter or stone-like hardness, it is scarce curable. Wherefore it is best to perform the cure by opening them, that so the contained matter may flow or be pressed forth. If the pimple or swelling be small, then thrust it through with a needle and thread, and leave the thread therein of such length, that you may fasten the ends thereof with a little of the emplaster called Grasia Dei, like glue to the forchead, if it be on the upper eye-lid; or to the checks, if on the lower. You must draw through a fresh one every second day, as is usually done in chirurgical secons: For thus at length the swelling will be destroyed, and made plain.

CHAP. VIII.

Of the Hydatis, or fatness of the Eye-lids.

What Hydatis

com. ad aphor. 55-fell. 7. The cure. He Hydatis is a certain fatty substance, like a piece of fat, seated and lying under the skin of the upper eye-lid. It is a disease incident to children, who are of a more humid nature: Wherefore it is a soft and loose tumor, making the whole eye-lid, which it possesses, that it hath, as it were, a bladder distended with a wheyish humor, which kind of fault is observed by Galen in the liver, Those who are thus affected, have their eyes look red, and flow with tears, neither can they behold the Sun, or endure the light. The cure is performed by cutting off the superfluous substance, not hurting the neighbouring parts; and then presently put some salt into the place whence it was taken out (unless the vehemency of pain hinder) that so the place may be dried and strengthned, and the rest of the matter (if any such be) may be consumed, and hindred from growing again. Lastly, you shall cover the whole eye with the white of an egg dissolved in Rose-water, or some other repercusive.

CHAP. IX.

Of the Eye-lids fastened or glued together.

Peulus cap. 15. Ub. 6.

The cause.

The cure.

Ometimes it cometh to pass that the upper-eye-lid is glued or fastened to the under, so that the eye cannot be opened, or so that the one of them may stick or be fastened to the white coat of the eye, or to the horny. This fault is sometimes drawn from the first original, that is, by the default of the forming faculty in the womb (for thus many Infants are born with their sugers fastened together, with their sundaments, privities and ears unperforated) the eye in all other respects being well composed. The cause of this affect sometimes proceeds from a wound, otherwhiles from a burn, scald, or impossumation, as the breaking of the Small-pox. It is cured by putting in a fit instrument, and so opening them; but with such moderation, that you touch not the horny coat, for otherwise it would fall out. Therefore you must put the end or point of your probe under the eye-lids, and so lifting them up (that you hurt not the substance of the eye) divide them with a crooked Incision-knife.

The incifion made, let the white of an egg beaten with fome Rofe-water be put into the eye, let the eye-lids be kept open; yea, let the Patient himfelf be careful that he often turn it upwards, and lift it up with his fingers, not only that the medicine may be applied to the ulcer, but also that they may not grow together again. In the night, time let a little pledget dipped in water, and that either fimple, or wherein fome vitriol hath been diffolved, be laid thereon. For thus you shall hinder the eye-lids from joyning together again. Then on the third day the parts or edges of the eye-lids shall be touched with waters drying without biting or acrimony, that so they may be cicatrized. But if the eye-lid adhere to the homy-coat at the papilla or apple of the eye, the Batient will either be quite bland, or very ill of fight. For the scar which ensues will hinder the shapes of things from entring to the crystalline humor, and the visive spirits from passing forth to the objects. For prognosticks you may learn out of Celsin, that this cure is subject to a relapse, so that it may be shunned neither by diligence nor industry, but that the eye-lid will always adhere and cleave to the eye.

A difeafe fabjeft to relapfe.

CHAP.

CHAP. X.

Of the itching of the Eye-lids.

Any have their eye-lids irch vehemently by reason of sale phlegm, which oftentime excoriating and ulcerating the parts themselves, yields a fanier, which joyns together the eye-lids in the night time, as if they were glued together, and makes them watry and. This affect doth to torment the Patients, that it oft-times makes them require the Physical results of the patients of the patients. bleared. This affect doth to torment the rations, that it obtains makes them require the Phylicians help. Wherefore general medicines being premited, the ulcers thall be walled with the following Collyrium: it days mellis in balneo meric detillate 5 iij. Sacchari candi 5 is. Aloes lete 6. A detergent in polinum redatte 3 ii. Aloes lete 6. A detergent in polinum redatte 3 ii. Differe in aque plantaginis quantitate sufficienti. Let the ulcerated eye-lids be touched with a fost linnen rag dipped therein, but with care that none thereof fall upon the eye. But when the Patient goes to bed, let him cause them to be anointed with the following ointment, very effectual in this cale: We desungie percie butyer recentiv, an. 3 \(\beta \). The propert 3 \(\beta \). Antimum in agua emphrafic properties, \(\beta \) ii. Comphere graiv. Mifee, \(\beta \) in martario plumbee ducantur per tres keres, conflatum inde unguentum, servetur in syxide plumbes. Let the liquor be kept in a glass well stopped for the foresaid use. affect we mult not fear the use of actid medicines, for I once saw a woman of fifty years of age, who sear to use a for the forelaid use.

CHAP. XI. Of Lippitudo, or Blear-eyes.

Here are many whose eyes are never dry, but always flow with a thin, acrid, and hot humor which caufeth roughness, and upon small occasions, inflammations, blear or blood-shot eyes and at length also Strabifinus or squinting. Lippitude is nothing else but a certain white what Lippite filth flowing from the eyes, which oft-times agglutinates or joyns together the eye-lids. This difease do is. often troubles all the life time, and is to be cured by no remedy; in some it is curable. Such as have this discase from their infancy, are not to be cured, for it remains with them till their dying day. For large heads, and fuch as are repleat with acrid or much excrementitions phlegm, fearce yield to There is much difference whether the phlegm flown down by the internal veffels under the skull; or by the external, which are between the skull and the skin, or by both. For if the internal veins cast forth this matter, it will be difficultly cured, if it be cured at all. But if the external veffels cast forth, that cure is not unprofitable, which having used medicines respecting the whole body, applies aftringent medicines to the shaved crown, as, Empl. contra rupturum, which may straiten the veins, and, as it were, suspend the phlegm, useth cupping, and commands frictions to be made towards the hind-part of the head, and latily, maketh a seton in the neck. There are some who cauterize the top of the crown with an hot iron, even to the bone, so that it may cast a scale, thus A castrian of to divert and fray the defluxion. For local medicines, a Collyrium made with a good quantity of vitriol to flay Rose-water, with a little vitriol dissolved therein may serve for all.

the defluxions of the eyes.

CHAP. XII.

Of the Ophthalmia; or inflammation of the Eyes.

N Ophthalmia is an inflammation of the coat Adnata, and confequently of the whole eye, be- what Ophthalmia ing troublesome by the heat, redness, beating, renitency, and lastly pain. It hath its ori- mia is, and the ginal either by some primitive cause or occasion, as a fall, stroke, dust, or small fand slying causes thereof. into the eyes. For the eye is a finooth part, fo that it is eafily offended by rough things, as faith Hipportates, lib. de Carnibus. Or by an antecedent cause, as a defluxion falling upon the eyes. The Signs figns follow the nature of the material cause, for from blood especially cholerick and thin, it is full of heat, reduced and pain; from the material cause of the disease allayed with phlegm all of the disease are more remiss. But if a heaviness possess the whole head, the original of the disease proceeds there from. But if a hot pain trouble the forehead, the difease may be thought to proceed from some hor distemper of the Diera mater, or the Perioranam; but if in the very time of the raging of the difease the Patient vomit, the matter of the disease proceeds from the fromach. But from whencesoever it cometh,

An anodyne Cataplatin.

The efficacy of Bathes in pains of the Ad Aphor, fell. Detergent Collyria.

there is scarce that pain of any part of the body, which may be compared to the pain of the inflamed eyes. Verily the greatness of the inflammation hath forced the eyes out of their orb, and broken them afunder in divers. Therefore there is no part of Physick more blazed abroad than for fore eyes. For the cure, the Surgeon shall consider and intend three things, diet, the evacuation of the antecedent and conjunct cause, and the overcoming it by topick remedies. The diet shall be moderate, eschewing all things that may fill the head with vapours; and those things used that by afriction may strengthen the orifice of the ventricle, and prohibit the vapour from stying up to the head; the Patient thall be forbidden the ufe of Wines, unless peradventure the difease may proceed from a gross and viscid humor, as Galen delivers it. The evacuation of the matter flowing into the eye shall be performed by purging medicines, phlebotomy in the arm, cupping the shoulders and neck with scarification, and without: And lassly, by frictions, as the Physician that bath undertaken the cure thall think fit. Galen after universal remedies for old inflammations of the eyes, commends the opening of the veins and arteries in the forehead and temples, because for the most part the veilels thereabouts diffended with acrid, hot, and vaporous blood, cause great and vehement pains in the eye.

For the impugning of the conjunct cause, divers topick medicines shall be applied according to the four fundry times or feafons that every phlegmon ufually hath. For in the beginning when as the four fundry times or feafons that every pniegmon unually nath. For in the beginning when as the acrid matter flows down with much violence, repercuffives do much conduce; and tempered with refolving medicines, are good also in the increase. R. Of the Proptolis, that is, the falling or flarting forth of the eye, and of the Phthilis and Chemolis of

He Greeks call that affect Proposis, the Latines Procedentia, or Exitus oculi when as the eye

The capie.

The cure.

fiands, and is cast out of the orb, by the occasion of a matter filling and lifting up the eye into a great bigness and largeness of substance. The cause of this disease is sometimes. external, as by too violent straining to vomit, by hard labour in child-birth, by excessive and wondrous violent shouting, or crying out. It sometimes happeneth that a great and cruel pain of the head, or the too strait binding of the forehead and temples for the easing thereof, or the palsie of the muscles of the eye, give beginning to this disease. Certainly sometimes the eye is so much diftended by the defluxion of humors, that it breaks in funder, and the humors thereof are shed, and blindness enfues thereof, as I remember befel the sister of Lewis de Billy Merchant, dwelling at Paris near St. Michael's Bridge. The cure shall be divertisted according to the causes. Therefore univer-fal medicines being premised, Cupping-glasses shall be applied to the original of the spinal marrow, and the shoulders; as also Cauteries or Setons: The eye shall be pressed or held down with clothes doubled and fleeped in an aftringent decoction made of the juice of Acacia, Red-rofes, the leaves of Poppy, Henbane, Rofes and Pomegranate-pills; of which things poultiffes may be made by adon of Barly-meal, and the like.

The Atrophia of the eye, The Phebifis Lib. 3. cap. 12.

There is formetimes to be feen in the eye an affect contrary to this, and it is termed Arrophia. By this the whole substance of the eye grows lank and decays, and the apple it self becomes much lefs. But if the confumption and emaciation take hold of the pupil only, the Greeks, by a peculiar name and different from the general, term it a *Phibifis*, as *Paulus* teacheth. Contrary causes shall be opposed to each affect; hot and attractive fomentations shall be applied, frictions shall be used in the neighbouring parts, and lastly, all things shall be applied which may without danger be used to attract the blood and spirits into the parts.

The chemofis. Paulus l.g.c.2.

There is another affect of the eye, of affinity to the Proptofis, which by the Greeks is termed Chemofis. Now this is nothing elfe then when both the eye-lids are turned up by a great inflammation, the proptofis are turned up by a great inflammation. fo that they can fearce cover theeyes, and the white of the eye is lifted much higher up than the black. Sometimes the Adnata changing his wont, looketh red; belides also, this affect may take its original from external causes, as a wound, contustion, and the like. But according to the variety of the causes, and the condition of the present affect fixed and remaining in the parts, divers remed ies shallbe appointed.

CHAP. XIV.

Of the Ungula, or Web.

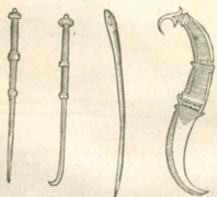

He Ungula, Pterygion or Web is the growth of a certain fibrous and membranous fleih up-on the upper coat of the eye called Adnata, ariting more frequently in the bigger, but fometimes in the leffer corner towards the temples. When it is neglected, it covers not only the Adnata, but also some portion of the Cornea, and coming to the pupil it self hurts the fight therefore. Such a web fornetimes adheres not at all to the Adnata, but is only stretched over it from the corners of the eye, so that you may thrust a Probe between it and the Adnata: It is of feveral colours, formewhiles red, formewhile yellow, formewhiles duskith, and otherwhiles white.

It hath its original either from external causes, as a blow, fall, and the likes or from internal, as the defluxion of humors into the eyes. The Ungula which is inveterate, and that hath acquired the defluxion of humors and besides doth difficultly adhere to the Adnata, is difficultly taken what incurations. away; neither may it be helped by medicines whereby scars in the eyes are extenuated. But that ble, which covereth the whole pupil must not be touched by the Surgeon, for being cut away, the scar which is left by its denfity hindreth the entrance of objects to the crystalline humour, and the egrefs of the animal spirit to them. But oftentimes it is accompanied with an inflammation of the eyes of the animal lpirit to them. But oftentimes it is accompanied with an inflammation of the eyes, aburning, itching, weeping defluxion, and fwelling of the eye-lids. That the cure may rightly and The cure happily proceed, he must first use a spare diet, purging medicines shall be given, and blood taken away by opening a vein, especially if there be great inflammation. For peculiar remedies, this excrescence shall be eaten away, or at least kept from growth, by dropping into the eye Collynium of Vitriol described in wounds of the eyes. But if that we proit nothing by this means, it remaineth, that we take it away with the hand after the following manner;

You shall fet the Patient upon a form or stool, and make him lean much back, and be held to the web. firmly, that he may not fall nor flir, then must you open his force eye, putting therein a specular ceuli formerly described in treating of the wounds of this part, and then must you lift up the web it self with a sharp little hook, with the point turned a little in, and put under the midst of the web; when you have lifted it a little up, thrust a needle threaded with a smooth thread between it and the Adnasa, then taking hold of the hook, and the two ends of the thread drawn through with the needle and lifting up the web by them, you shall gently begin to separate it from the sublance of the treader, beginning at the original throat with a crossled Legisley, beginning at the original throat with a crossled Legisley, beginning at the original throat with a crossled Legisley, beginning at the original throat with a crossled Legisley, beginning at the original throat with a crossled Legisley, beginning at the original throat with a crossled Legisley, beginning at the original throat with a crossled Legisley, beginning at the original throat with a crossled Legisley legisle and so the content of the co eye lying thereunder, beginning at the original thereof with a crooked Incision-knife, and so pro-secute it even to the end, yet so as you hart no part of the Adnasa nor Carnes.

The Figure of little Hooks, a Needle, and crocked Incision-knife.

Little Hocks. A Needle. A crooked Incifion-knife;

Then must it be cut off with a pair of sciffers, and the white of an Egg beaten with some Rosewater laid thereon, and often renewed. Afterwards the eye must every day be opened, left coming to cicatrization, the eye-lids shall be glued together in that part whereas the web is taken away, which also shall be hindred by putting of common Salt, Sage and Cummin-feed into the eye, being first champed and chawed in the mouth. There are forme who instead of the crooked Knife feathers the mouth from the Advances with a Horses hair others do it, with a Conferently made reads for parate the web from the Adnata with a Horses hair, others do it with a Goose-quill made ready for the same purpose, taking heed that they hurt not the caruncle at the corner by the nose, for it will follow if that you draw the web away too violently; and if it be cut, there will remain a hole, through which during the reft of the life a weeping humor will continually flow; a difease by the Greeks termed Rbyss. If after the cutting there be fear of inflammation, linnen rags mouthed in repelling medicines, formerly prescribed in wounds of the eye, shall be laid thereupon,

(milion)

CHAP. XV.

Of the Ægilops, Fiftula lacrymofa, or meeping of the Fiftula of the Eye.

The use of the glandule at the greater corner of the eye. The differerences.

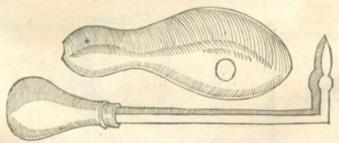

Periodical and typical fiftulars,

The cure.

The efficacy of an actual Cautery.

T the greater corner of the eye there is a glandule, made for the receiving, and containing the moilture which ferveth for the lubricating and humecting the eye, left it thoulddry by continual motion. This glandule foractimes by a fanguine or pituitous defluxion falling violently from the brain, fwells, imposiumates, and ulcerates with an ulcer, not feldom degenerating into a fiftula, fo that in fuccess of time it rotteth the bone that lieth under it. Of fuch fiftula's, forme are open outwardly, and these usually have their original from a phlegmon; othersome are inwardly, and those are such as at first swelled by the defluxion or congestion of a phlegmatick mat-ter, so that there appeareth no hole outwardly, but only a tumor of the bigness of a pease, this tumor being preffed, floweth with a fanious, ferous and red, or otherwife with a white and vifeid matter, and that either by the corner of the eye, or by the infide of the nofe. Some have this matter flowing continually, others have it only monthly, which is proper also to some fishula's. Such weeping fitula's if they become old, cause an Atrophia of the eye, and sometimes blindness and a stink-ing breath. Therefore we must diligently and speedily by physical and chirurgical means resist the breeding difeafe. Wherefore, having used general medicines, we must come to particulars. Therefore if the ulcer be not sufficiently wide, it shall be enlarged by putting tents of spunge therein. The flesh of the glandule increasing more than is fit, shall be corrected by putting therein the catheretick powders of Mercury, calcined Vitriol, or forme Aqua foria, or oyl of Vitriol; and lattly, by a potential cautery. If you cannot prevail by these means, and that the bone begins to rot, and the Patient be shout hearted, then use an actual cautery whose use is far more effectual, ready, certain and excellent, than a potential cantery, as I have tried in many with happy faccefs. In my opinion it makes no matter, whether the cautery of Gold, Silver or Iron's for the efficacy it hath proceedeth not from the matter, but from the fire. Yet if we must religiously observe and make choice of metals, I had rather have it of Iron, as that which hath a far more drying and affringent faculty than Gold, for that the Element of Earth beareth the chief fway therein, as appeareth by the waters which flow through Iron mines. Wherefore you shall cause to be made a triangular Iron, sharp at the end, that it may the more speedily penetrate. And then the sound eye and adjacent parts being well coyered and defended, and the Patients head firmly holden in ones hand, left the Patient being affrighted, fiir himfelf in the very inftant of the operation. But a plate of Iron formewhat depreffed in the midft, for the cavity of the greater corner shall be applied and fitted to the pained eye. This plate thall be perforated that the hot Iron may pass thereby to the fitula lying thereunder and so may only touch that which is to be cauterized.

The Figure of a Cautery, and a Plate with a hole therein.

After the bone is burnt with the Cautery, a Collyrium made of the whites of Eggs beaten in Planthings to be done after the parts; but the Patient thall be laid in bed with his head formewhat high, and the Collyrium shall be renewed as often and as soon as you shall perceive it to grow dry. Then the fall of the Escharshall be procured by anointing it with fresh Butter; when it is fallen away, the ulcer shall be cleaned, filled with flesh, and lastly cicatrized.

C H A P. XVI. Of the Staphyloma, or Grape-like fivelling.

What a Staphylona, is and the causes thereof.

Taphyloma is the fwelling of the horny and Grape-like Coat, bred through the occasion of an humor slowing down upon the eye, or by an ulcer, the horny coat, being relaxed, or thrust forth by the violence of the pushule generated beneath. It in shape resembleth a Grape, whence howny coat be ulcerated and fretted in sunder, so that the grapy coat shew it self and fall through the ulcer, then the Staphyloma will look black like a ripe Grape, for the utterpart of the Uvea is blackish. But if the Gernea be only relaxed and not broken, then the swelling appears of a whitish colour like an unripe Grape. The Ancients have made many kinds or differences thereof. For if it be but a small hole of the broken Gernea by which the Uvea sheweth or thrustest forth it self, then they termed it Mye aplaton, that is, like the head of a Flie. But if the hole were large, and also callous, they called it

Paulus and edition

Classes, or a nail; if it were yet larger, then they termed it Acious, or a Grape. But in what shape Every Staphstor figure soever this disease shall happen, it bringest two discommodities, the one of blindness, the curable blind-other of deformity. Wherefore here is no place for Surgery to restore the fight, which is already lost, ness. but only to amend the deformity of the eye; which is by cutting off that which is prominent. But you must take heed that you cut away no more than is fit, for so there would be danger of pouring out the humors of the eye.

CHAP. XVII.

Of the Hypopyon, that is, the Suppurate or patrified eye.

US or Quitture is fometimes gathered between the horny and grapy coat from an internal or external cause: From an internal, as by a great defluxion, and oft-times after an inflammation; but externally by a stroke, through which occasion, a vein being opened hath poured forth blood thither, which may prefently be turned into Quitture. For the cure, univerfal remedies being premifed, Cupping-glaffes shall be applied, with Scarifications and Frictions used. Anodine and digestive Colyma shall be poured from above downwards. Galen writes that he hath formedine and digestive Colyma shall be poured from above downwards. times evacuated this matter, the Cornes being opened at the Iris, in which all the coats meet, concur esp. ult. and are terminated. I have done the like, and that with good fuccess, James Gridlemeau the King's Surgeon being present, the Quitture being expressed and evacuated after the apertion. The ulcer shall be cleansed with Hydromed, or some other such like medicine.

CHAP. XVIII.

Of the Mydrialis, or dilatation of the Pupil of the Eye.

Idrisfix is the dilatation of the pupil of the eye, and this hapneth either by nature or chance! The cause. The former proceedeth from the default of the first conformation, neither is it curable; but the other is of forts, for it is either from an internal cause, the off-spring of an huflowing down from the brain, wherefore physical means must be used for the cure thereof. Now that which cometh by any external occasion, as a blow, fall or contusion upon the eye, must be The cure, cured by prefently applying repercusive and anodyne medicines, the defluxion must be hindred by diet skilfully appointed, phlebotomy, cupping, fearification, frictions, and other remedies which may feem convenient. Then must you come to refolving medicines, as the blood of a Turtle-dove, Pigeon or Chicken, recking-hot out of the vein, being poured upon the eye and the neighbouring parts. Then this following Cataplaim shall be applied thereto, R. Farine fabor. & bordei an \$\frac{1}{3}\tille{1}\tille{1}\tilde{0}\t Vini auteri ib B. Aq. rofar. & plantag. an. 3 iii. Make a decoction of them all for a Fomentation to he used with a sponge.

CHAP. XIX. Of a Catarall.

Cataract is called also by the Greeks Hypochima, by the Latines Suffings. Howforver you a Carract. term it, it is nothing elfe but the concretion of an humor into a certain thin skin under the horny coat, just against the apple or pupil, and as, it were swimming upon the watery humor; and whereas the place ought to be empty, opposing it self to the internal faculty of section of the place ought to be empty, opposing it self to the internal faculty of section of the place ought to be empty. ing, whereby it differeth from fpots and fears growing upon the horny coat and Adnata. It formes times covereth the whole pupil, otherwhiles but the one half thereof, and fomewhiles but a small rentes. portion thereof. According to this variety the fight is either quite loft, weak, or somewhat deprayed, because the animal visive spirit cannot in its entire substance pass through the density thereof. The Causes, defluxion of the humor whence it proceeds, is either caused by an external occasion, as a stroke, full or by the hard conditions. deflixion of the humor whence it proceeds, is either caused by an external occasion, as a stroke, fall, or by the heat or coldness of the encompassing air, troublesome both to the head and eyes; or elle it is by an internal means, as the multitude, or else the acrid hot and thin quality of the homors. This disease also formetimes taketh its original from gross and fumid humors sent from a crude stormach, or from vaporous meats or drinks, up to the brain, and so it falleth into the eyes, where, by the coldness, straitness, and tarrying in the place, they turn into moisture, and at length into that concretion or film which we see: The signs may be easily drawn from that we have already delivered. For when the Cataract is formed and ripe, it resemblesh a certain thin membrane spred over the pupil, and appeareth of a different colour, according to the variety of the humor whereoff it consistents, one while white, another while black, blue, ash-coloured, livid, citting errors. It of it conditieth, one while white, another while black, blue, ash-coloured, livid, citrine green. It fornetimes resembleth Quick-filver, which is very trembling and fugitive, more than the rest. At the first when it beginneth to breed, they seem to see many things, as Flies slying up and down, Hares, Nets, and the like, as if they were carelefly toffed up and down before their eyes: Sometimes every thing appeareth two, and fome whiles lefs than they are, because the visive spirit is hindred from patting, to the objects by the dentity of the skin, like as a cloud fladowing the light of the Sun-Whence it is that the Patients are duller fighted about noon, and furer and quicker lighted in the morning and evening, for that the little vitive fpirit diffused through the air, is dispersed by the greater. greater light, bot contracted by the less. Now it this film cover half the pupil, then all things thew but by halis; but if the midit thereof be exered, and, as it were, the centre of the crystalline

tunnar.

humor, then they feem as if they had holes or windows: But if it cover it all, then can be fee nothing at all, but only the shadows of visible bodies, and of the Sun, Moon, Stars, lighted candles, and the like luminous things, and that but contufedly, and as by conjecture.

CHAP. XX.

Of the physical cure of a beginning Cataralt.

Diet for fuch as are troubled with a Cataract.

Bread feafoned with Fennel-feeds.

How bright fligging things may diffipate a beginning Gasaract.

A collyrium diffipating a beginning Cavaract.

A Cataract must not be couched, unless it be ripe.

Beginning Cataract is hindred from growing and concretion by diet conveniently and artificially prescribed, by the abstinence from Wine, especially more strong and vaporous, and forbearing the use of meats, which yield a phlegmatick juice and vaporous; as, Pease, Beans, Turneps, chefnuts, and laftly, all fuch things as have the faculty of ftirring up the humors, and caufing defluxion in the body, fuch as are all falt, and spiced meats, as also garlike, onions, muflard. The immoderate use of venery hurts more than all the reft, for that it more violently exagitates the whole body, weakens the brain and head, and begets crude humors. Let his bread be feafoned with some Fennel-seeds, for it is thought to have a faculty of helping the fight, and clearing the eyes, and diffipating the mifty vapours in the flomach before they can afcend to the brain. Wherefore by the fame reason it is good to use Marmelade of Quinces, Conserve of Roses, and common Dridge-powder, or any fuch like composed of things good to break wind, or corroborate the ven-Phlebotomy and purging, if they be requifite, thall be fitly appointed: Ventofes thall be applied to the shoulders and neck; and phlegmatick matter shall be diverted and evacuated by the mouth with using masticatories in the morning. There be some which believe, that a beginning Cataract may be diffipated and discussed by often subbing the eye-lids with his singers, and in like fort by the often and earnest beholding of the Stars and the Moon when it is at the full, Lookingglaffes, Diamonds, and all other fuch like bright thining things. I believe, that by beams pleotifully and fuddenly brought and diffused over the eye, directly opposite against some bright shining thing, it may ferm to have a penetrating, dividing, dissolving, as also a consuming and drying faculty. Befides, also the hot breath of him who holdeth in his mouth, and chaweth Fennel-feeds, Annis-feeds, Coriander-feeds, Nutmeg, Cinnamon, Cloves, and the like, hath a great faculty, the eyes being first gently rubbed with the finger, it being breathed in near at hand, and often received, to heat, artenuate, refolve, digett and diffute the humor which is ready to concrete. Moreover, this Colyrium of John Vigo is thought very powerful to clear the eyes, firengthen the fight, hinder fuffutions, and discuss them, if at any time they concrete, and begin to gather. Be Hepatis bircini sani & recentis to ij calami aromatici & mellis an. 3 1. Succi ruta, 3 iij. Aqua chelidonia, faniculi, verbena, emphrafia an. 3 iij. Piperis longi, mucis moschatæ, earyophyllorum an. 5 ij. Croci 🤿 i. slovis rorismarini aliquantum contriti, m. l'. Sarcecolle, aloes bepatice, an. 3 ii). Fellis rate, leporis & perdicis, an. 3 i. terantur comia, tritifo udde facebari albi 3 ij. mellis rofati 3 vi. conjeciantur in alembreum vitremm, & detillentur in balneo edarie: Let this diffilled liquor be often dropped into the eyes. But if you prevail nothing by all thefe medicines, and that the cloudy and heaped-up humor doth daily increase and thicken, then must you abstain from remedies, and expect until it be no more heaped up, but thickned, yea until it feem to be grown semewhat hard: For so it may be couched with a needle; otherwise if this same skin shall not be ripe, but more tender than is fitting, when you shall come to the operation, it will be broken and thrust through with the needle, and not couched. On the contrary, if it be too hard hard, it will refift the needle, neither will it fuffer it felf to be eafily couched. Wherefore it is requifite that the Surgeon know when it is ripe, and he must diligently observe the figns whereby he may difeern a ripe Cataract from an unripe; and that which is curable, from that which is uncurable. For that only which is ripe and curable, is to be couched; that which is unripe, that is fuch an one as is more tender, and as it were crude, and that which is more hard and dense, and lastly, that which is uncurable must not be attempted at all.

CHAP. XXI.

By what signs ripe and curable Cataratis may be discerned from unripe and uncurable ones.

Uncurable Cataracts

F the found eye being that, the pupil of the fore or fuffafed eye, after it shall be rubbed with your thumb, be prefently dilated and diffused, and with the like celerity return into the place, ngure, colour and state, it is thought by some to thew a ripe and confirmed Cataract. But an unripe, and not to be couched, if the pupil-remain dilated and fuffufed for a long while after. Eur it is a common fign of a ripe, as also more dense, and consequently uncurable sustation, to be able to see nor diffinguish no visible thing beside light and brightness; for to discern other objects sheweth that it is not yet ripe: Therefore the found eye being that and prefled, the pupil of the other rubbed with your thumb, is dilated, enlarged, fwelleth, and is more diffused; the vitive spirits by this compression being, as it were, forced from the found into the fore-eye. But thefe following Cataracts are judged uncurable, that is, fuch as are great, fuch as when the eye-lid is rubbed are nothing dilated or diffused, whose papil becometh no broader by this rubbing: For hence you may gather, that the flopping or obfruction is in the optick nerve, to that how cunningly and well foever the Cataract be couched, yet will the Patient continue blind ; you shall do no more good in couching a Cataract, which is in an analysis of the incurable, which is which is in an eye confumed and waited with a Philiffir. Also that Cataract is incurable, which is occasioned by a most grievous difease, to wit, by most bitter and cruel pains of the head, or by a violent blow. Such as are of a plaffer-like green, black, livid, citrine and quick-lilver-like colour, are usually uncurable. On the contrary, such as are of a Chesnut colour, or of a sky or lea-water colour, with fome little whiteness, yield great hope of a happy and fuccessful cure.

- 63

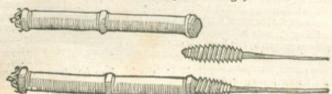

Curable Cata-

CHAP. XXII.

Of the couching a Casarall.

Fter you shall know by the fore-mentioned signs that the Cataract is curable, it remains that when to you attempt the couching thereof, but fo, that there be nothing which may hinder. For if couch a Causthe pain of the head, cough, naufcoufness or vomiting at that time trouble the Patient, ract. the pain of the head, cough, naufeoufness or vomiting at that time trouble the Patient, raft. you shall then bestow your labour in vain: wherefore you must expect till these symptoms are gone. Then make choice of a season fitting for that purpose, that is, in the decrease of the Moon, when the Air is not troubled with Thunder nor Lightning, and when as the Sun is not in Aries, because that sign hath dominion over the head. Then let the Surgeon consult a Physician whether purging or bloud-letting, be convenient for the Patient, so to resist plethorick symptoms, otherwise ready to yield matter for relapse. Two days after you must make choice of a place similard with in- The place different or competent light, and the Patient being fasting shall be placed in a straight Chair, so that the light may not fall with the beams directly upon him, but side-wise. The eye which shall be cured, must be made more fieldly by laying and binding Wool upon the other. Then the Surgeon shall seat and place himself directly against the Patient upon a feat somewhat higher, and bidding the Patient put his hands down to his girdle, he shall hold the Patients legs between his knees. One shall stand at the Patients back, who shall hold his head, and keep it from stirring; for knees. One shall fland at the Patients back, who shall hold his head, and keep it from stirring; for by a little stirring he may lose his sight for ever. Then must you prepare and make ready your Nee-The Needle. dle, and thrust it often into force strong thick cloth, that it may be as it were smooth by this motion, and for the performance of the work in hand with the less pain somewhat warmed. It must be made of iron, or ficel, and not of gold or filver, it must be also flatted on the fides, and sharp-pointed, that fo it may the better pierce into the eye, and wholly couch the Cataract once taken hold of; and left it should slip in the Surgeons hand, and be less steddy, it shall be put into a handle, as you may fee by this Figure.

A Needle inserted in a handle for the conching of Cataratts.

All things being thus in a readiness, you must bid the Patient to turn the fight of his eye towards his note, and the Needle must be boldly thrust (for it is received in a place that is void, and onely filled with spirits) directly by the coat Adnata, in the middle space between the leffer corner and the horny coat, just against the midst of the Cataract, yet so as that you hart no vein of the Adnata, and Galdib. 10. de then by flirring it as it were diverfly until it come to the midft of the pupil and fuffusion. When als parties 65. It is come thither, the Needle must be inclined from above downwards to the susfusion, and there to custom-7. be firred gently until by little and little it couch or bring down the Cataract as whole as may be be-neath the compais of the pupils let him full follow it though couched with his Needle, and formewhat violently deprefs and keep it down for fome short space, that so it may rest and stay in that lower place whither it is depressed. The Surgeon shall try whether it firmly remain there or no, The sign of a bidding the Patient presently to move his eye; for if it remain constantly so, and do not return Cararact well again, the Cure is perfect. Then must the Needle be listed up by little and little, neither must it pre-coached. fently be taken forth, that if the Cataract should bear up, or rile again, that it might again, and so often (whilest the work is yet hot, and all things in a readiness) be couched towards the lefter corner, until it be fully and surely hid. Then must you draw back the Needle gently, and after the same manner as you put it in; left if you use not moderation, you bring back the Cataract from whence you couched it. Or create the same manner as you put it in; left if you use not moderation, you bring back the Cataract from whence you couched it, or grievously offend the chrystalline humour, the prime instrument of sight, or the pupil with danger of dilating thereof. Some as soon as the work is done, give the Patient something in his hand to look upon: but Panlas approves not thereof, for he fears left his endeavoring or firiving Lib.6, eq. 11. to fee, may draw back the Cataract. Wherefore it is more wifdom, and better prefently after the What to be to fee, may draw back the Cataract. Wherefore it is more wisdom, and better presently after the What to be drawing forth of the Needle, to put on a fost rag the white of an Egg beaten in Rose-water with a done after the little choice Alumand so apply it to the eye and neighbouring parts for to bind and hinder the inflammation; then also you must together therewith bind up the sound eye, left by stirring to see, it might together therewith draw and move the fore eye, by reason of the sympathy and consent they mutually have by the optick nerves. After all things are thus performed, the Patient shall be laid in a soft bed, and so placed, that his head may lie somewhat high; let him be laid far from noise, let him not speak nor eat any hard thing that may trouble his jaws, wherefore let him seed upon legislamants. feed, and to placed, that his head that may trouble his jaws, wherefore let him feed upon liquid meats, a Peak, nor cat any hard thingers, gellies, rear-eggs, and other meats of the like nature. At the end of eight days the ligature that binds up the eyes thall be loofed, and his eyes washed with Rose-water, and putting on Spectacles, or some Taffaty, the Patient shall by little and little accustom himself to the light, left he should be offended by the sudden meeting with light. But if the suffusion, after fome thort while after lift it felt up again, it must be couched again, but through a new liole, for the eye is pained and tender in the former place. It fometimes happens by the touch of the Needle that the Cataract is not couched whole, but is broken into many pieces; then therefore each of them must be followed, and couched severally: if there be any very small particle which scapes them

ELLIPTING.

Of a Cataract which is broken to pieces,

the needle, it must be let alone, for there is no doubt but that in process of time it may be dissolved by the force of the native heat. There are also some Cataracts which at the first touch of the needle are dissufted and turn into a substance like to Milk or troubled Water, for that they are not throughly ripe, yet these put us in good hope of recovery, if it be but for this, that they can never afterwards concrete into one body as before. Wherefore at the length they are also discussed by the firength of the native heat, and then the eye recovers its former splendor. If that any other symptoms come unlooked for, they shall be helped by new counsels and remedies.

CHAP. XXIII.

Of the stopping of the passage of the Ears, and the falling of things thereinto.

The Cause.

It fometimes happeneth that children are born without any holes in their ears, a certain flefhly or membranous fubitance growing in their bottom or first entrance. The fame may also happen afterwards by accident, they being ulcerated by some impossume or wound, and the ear that up by some fleshly excrescence or scar. When as the stopping is in the bottom of the cavity, the cure is more difficult than if it were in the first entrance. But there is a double way of cure; for this substance, whatsoever it be, must either be cut out, or else eaten away and consumed by acrid and catheretick Medicins; in personnance of which there is need of great moderation of the mind and hand. For it is a part endued with most exquisite sense and near the brain, wherefore by handling it too roughly, there is sear of distension of the nerves, and consequently of death.

The Cure.

Sometimes also the preternatural falling of some strange bodies into this passage maketh a stopping of the ears, such as are fragments of Stone, Gold, Silver, Iron, and the like Metals, Pearls, Cherrystones, or Kernels, Pease and other such like Pulse. Now solid and bony bodies still retain the same magnitude; but Pease Seeds and Kernels, by drawing the moisture there implanted into them, swell up, and cause vehement pain by the distension of the neighbouring parts, wherefore the sooner they are drawn forth, the better it is for the Patient. This shall be done with small pincers and instruments made in the shape of Ear-picks. But if you profit nothing thus, then must you use such pincers are made for the drawing forth of bullets shot deep into the body. Little stones and bodies of the like stony hardness, shall be torced forth by the brain, provoked to concustion by sneezing, and by dropping some Oil of Almonds sirst into the passage of the Ear, that the way may be the more slippery; for it will come to pass by this sneezing, or violence of the internal air forcibly sceking passage out, that at length they may be cast forth, the mouth and nothis being shopped with the hand. But if we cannot thus prevail, it remains, that we cut open the passage with an incison knife, so much as shall be sufficient for the putting in and using of an Instrument to extract them. If any creeping things of little creatures, as Fleas, Ticks, Pismires, Gnats, and the like, which sometimes happeneth, shall gut therein, you may kill them by dropping in a little Oil and Vinegar. There is a certain little creeping thing, which for piercing and getting into the Ears, the French call Persecute (we an Earwige) this if it chance to get into the Ear, may be killed by the fore-faid means; you may also catch it, or draw it forth by laying half an apple to your Ear, as a bait for it.

The conculfive force of facezing,

CHAP. XXIV.

Of getting of little bones and such like things out of the Jaws and Throat.

The Cure different according to the places where they flick.

Ometimes little bones and fuch like things in eating greedily use to flick, or as it were falten themselves in the Jaws or Throat. Such bodies if you can come to the fight of them, shall be taken out with long, slender and crooked Mallets made like a Cranes beak. If they do not appear, nor there be no means to take them forth, they shall be east forth by causing vomit, or with swallowing a crust of bread, or a dry sig gently chawed, and so swallowed; or else they shall be thrust down into the stomach, or plucked back with a leek, or some other such long and stiff crooked body anointed with Oil and thrust down the throat. If any such like thing shall get into the Weazon, you must cause coughing, by taking sharp things, or else sweezing; so to cast forth whatsoever is there troublesom.

CHAP. XXV.

Of the Tooth-ach.

The Toothach a most cruel pain.

The cause thereof. The figus of this or that defluxion, Fall pain, there is none which more cruelly tormenteth the Patients than the Tooth-ach. For we fee them often-times after the manner of other bones to fuffer inflammation, which will quickly supportate, and they become rotten, and at length fall away piece-meal; for we fee them by daily experience to be eaten and hollowed, and to breed Worms, some portion of them patrefying. The cause of such pain is either internal, or external and primitive. The internal is a hot or cold defluxion of humours upon them, filling their fockets, and thence consequently driving out the teeth; which is the reason that they stand sometimes so far forth, that the Patient neither dares, nor can make use of them to chaw for sear of pain; for that they are loose in their sockets by the relaxation of the Gums, caused by the falling down of the defluxion. When as they are rotten and perforated even to the roots, if any portion of the liquor in drinking fall into them, they are pained as if you thrust in a pin or bodkin, the bitterness of the pain is such. The signs of a hot defluxion are tharp and pricking pain, as if needles were thrust into them, a great pulsation in the root of the pained Tooth and the Temples, and some ease by

The Miles

by the use of cold things. Now the figns of a cold defluxion are a great heaviness of the head, much and frequent spitting, some mitigation by the use of hot remedies. In the bitterness of pain by the use of cold things we must not presently run to Tooth-drawers, or cause them presently to go in hand to pluck them out. First confult a Physician, who may prescribe remedies according to the variety of the causes. Now here are three intentions of Guring. The first is concerning Diet, the other for the Three scopes causes. Now here are three intentions of Curing. The first is concerning Diet, the other for the Three sopes evacuation of the defluxion or antecedent cause, the third for the application of proper remedies of curing. for the assumption of pain. The two former scopes, to wit, of Diet, and diverting the defluxion by Purging, Phlebotomy, application of Cupping-glasses to the Neck and Shoulders, and Scarification, do absolutely belong to the Physician. Now, for proper and topick Medicins they shall be chosen contrary to the cause. Wherefore in a hot cause it is good washing the mouth with A cold and rethe interest of Porporanaes. Plantain, Water, a little Vincear, wherein Roses, Balantine and Samuel percentive lothe juice of Pomgranates, Plantain Water, a little Vinegar, wherein Rofes, Balangiae and Sumach percussive keeping and Sumach percussive keeping and Sumach tion for the have been boiled. But such things as shall be applied for the mitigating of the pain of the Teeth, mouth, ought to be things of very subtle parts, for that the Teeth are parts of dense consistence. Therefore the Ancients have always mixed Vinegar in such kind of remedies. R. Rosar, rub. sumselv. bordei, an. m. | feminis byofeyami conquaffati, 3 ij. fantalorum an. 3 j. latines finnmitatum rubi, folani, plantaginis, an. m. | buliant omnia in aque to iv. & panco aceto ad bordei crepaturam. Wash the mouth with fuch a decection being warm. You may also make Trochifices for the fame purpose after this a hot destu-manner. R. Sem. hypogyami, fundaracha, cerisandri, opii, an. 3. p. terantire & cum aceto incorporative, for-menturque trochifei apponendi dentibus dolentibus. Or esc, R. Sem. portulaca, hypogyami, cerisandri, sentimon, corticis, fantali carini, rofar, rub. presbri, campbore, an. 3 %. let them all be beaten together with throng Vinegar, and made into Trochitees, with which being diffolved in Rose-water, let the Gums and whole mouth be washed when need requireth. But if the pain be not assward with these, you shall come to narcoticks which may stupe the nerve; as, ik. Sembyoseyami albi, opii campbore, papavalbi, an quantum stam supplied the nerve; as, ik. Sembyoseyami albi, opii campbore, papavalbi, an quantum stam supplied the nerve; as, ik. Sembyoseyami albi, opii campbore, papavalbi, an quantum stam supplied the car of the pained side. Ropii & castorei, an. Di misceanum stam sleerosato: It hath sometimes availed in swollen and diffended Gums, being first lightly scarified, to have applied Leeches, for the construction of the control matter, as also to have appeared the Vaine under the Topque, or these the evacuation of the conjunct matter, as also to have opened the Veins under the Tongue, or these which are behind the ears. For I remember that I, by these three kinds of remedies, asswaged great pains of the Teeth. Yet there besome who in this affect open not these veins which are behind the cars, but those which are conspicuous in the hole of the car, in the upper part thereof.

Pain of the Teeth arising from a cold cause and defluxion, may be helped by these remedies; boil Rosemary, Sage, and Pellitory of Spain in Wine and Vinegar, and add thereto a little agua vite; in this liquor distolve a little treacle, and wash your Teeth therewith. Others mingle Gum annowaise distolved in agua vite with a little sandarache and myrrh, and lay it to the pained Tooth after Vige's countries. fel. Mefine thinks that beaten Garlick carried in the right or left hand, affwages the pain, as the Teeth ake upon the right or left fide. But I being once troubled with grievous pain in this kind, followed the counfel of a certain old Woman, and laid Garlick roafted under the embers to my pained tooth, and the pain fortwith ceafed. The fame remedy used to others troubled with the like affect, had like forces. Moreover, fome think it available if it be put into the auditory passage. Others drop into the cars Oil of Castorium, or of Cloves, or some such other Chymical Oil. It is good also to walk the Teeth with the following decoction. R. Rad. pyribri 3 \(\beta\). menthe \(\chi\) rate, an.p., business in ageto, and with this decoction being warm, wash the Teeth. Some like sumes better, and they make them Hot Fames. of the Seeds of Colognization and multiard, and other like; they take the fmoak by holding their mouths over a Funnel. Other fome boil Pellitory of Spain, Ginger, Ginnamon, Alum, common Sale, Nutmegs, Cyprefs-nuts, Anife and Muftard Seeds, and Emphorbinon in Oxycrate, and in the end of the decoction add a little agus tite, and receive the vapour thereof through a Funnel; as also they wish their Teeth with the decoction, and put Cotton dipped therein into the ear, first dropping in a little thereof. Some there are which affirm, that to wall the Teeth with a decoction of Spurge is a very good and anodyne Medicin in the Tooth-ach. I have oft-times affwaged intolerable pains of the Teeth, by applying velicatories under the ear, to wit, in that cavity whereas the lower jaw is articulated with the upper; for the vein, artery, and finew that are distributed to the roots of the Teeth, lie thereunder. Wherefore the blifters being opened, a thin liquor runs out, which doth not only cause, but also nourish or feed the difeafe. But if the tooth be hollowed, and that the Patient will not have it pulled out, there is no speedier remedy than to put in caustick medicins, as oil of vitriol, dues fortis, and also an hot iron; for thus the nerve is burnt in funder, and lofeth its fenfe. Yet form affirm that the milky juice that flows from Spurge made into a pathe with olibanum and amylum, and put into the hollow tooth, will make it prefently to fall away in pieces. When the guns and checks are fwollen with a manifest tumor, then the Patient begins to be formewhat better and more at ease. For so by the strength of Nature the tumor causing the pain is carried from within outwards. But of what nature soever the matter which caused the pain is carried from within outwards. But of what nature soever the matter which caused the pain is carried from within outwards. feth the pain be, it is convenient to intercept the course thereof with Empl. contra rupturant made with Pitch and Mastich, and applied to the temple on that side where the tooth aketh.

CHAP. XXVI. Of other Affects of the Teeth.

He Teeth are also troubled with other preternatural affects. For fometimes they shake by relaxation of the Gums, or elfe become corrupt and rotten, or have Worms in them, Causes of loofor elfe are fet on edge. For the first, the Gums are relaxed either by an external or pris new of the mitive cause, as a Fall or Blow: or else by an internal or antecedent, as by the defluxion of Teeth. or waterilh humours from the brain, or through want of nourithment in old bodies. If the Teeth grow loofe by the means of the decaying Gums, the difease is then uncurable: but

doing any harm.

THE PART OF THE PA

(militin)

A Hiftory.

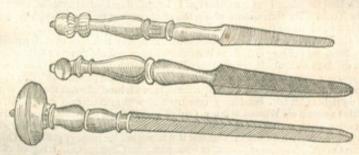

you may withfland the other causes by the use of such things as fasten the teeth, shunning on the contrary fuch as may loofen them. Therefore the Patient must not speak too earnestly, neither chew hard things. If they become loofe by a fall or blow, they must not be taken forth, but restored and fastned to the uext that remain firm, for in time they will be confirmed in their fockets, as I tried in Antony de la Rue a Tailor, who had his Jaw broken with the Pommel of a Dagger, and three of his teeth were loofened, and almost shaken out of their sockets; the Jaw being restored the teeth were also put in their places, and bound to the rest with a double waxed thred, for the rest, I sed the Patient with Broths, Gellies, and the like, and I made astringent Gargarisms of Cypressnuts, Myrtle-berries, and a little Alum boiled in Oxycrate, and I withed him to hold it a good while in his mouth: by these means I brought it so to pass that he within a while after could chew as ca-ly upon those teeth as upon the other. I heard it reported by a credible person, that he saw a Lady of the prime Nobility, who in flead of a rotten tooth she drew, made a found tooth, drawn from one of her waiting, Maids at the fame time, to be fublituted and inferted, which tooth in process of time. as it were taking root, grew to him, that the could chew upon it as well as upon any of the reft. But as I formerly faid, I have this but by hear-fay.

The causes of hollow teeth.

Now the teeth are corroded or eaten in by an aerid and thin humour penetrating by a plenteous and frequent defluxion even to their roots, and being there contained, it putrefies, and becoming more acrid, it doth not onely draw the teeth into the contagion of its putrefaction, but also perforates and corrodes them.

The Cure. The putrefaction may be corrected, if after general Medicins you put Oil of Vitriol or aqua fortis into the hole of the eaten tooth: or elfe, if you burn the tooth it felf to the root with a small iron Wier being red hot: you shall thrust this hot iron thorow a Pipe or Cane made for the same purpose, lest it should harm any found part by the touch thereof, and thus the putrefaction, the case of the arrosion may be staid. But if the hole be on the one side between two teeth, then shall you sile away so much of the found tooth, as that you may have sufficient liberty to thrust in your Wier without

The forms of Files made for filing the Teeth.

Worms breeding by putrefaction in the roots of the teeth, shall be killed by the use of causticks? Causes of Worms in the by gargles or lotions made of Vinegar, wherein either Pellitory of Spain hath been steeped, or treacle diffolved; also aloes and garlick are good to be used for this purpose. teeth.

on edge.

Setting the teeth on edge happens to them by the immoderate eating of acrid or tart things, or by ting the teeth the continual afcent of vapours endued with the fame quality, from the orifice of the ventricle to the mouth, or by a cold defluxion, especially of acrid phlegm, falling from the brain upon the teeth, or else by the too excellive use of cold or stupesying liquors. This affect is taken away, if after general Medicins and shunning those things that cherish the disease, the teeth be often washed with agus tine, or good Wine wherein Sage, Rolemary, Cloves, Nutmegs, and other things of the like nature have been boiled.

CHAP. XXVII. Of drawing of Teeth.

Eeth are drawn, either for that they cause intolerable pains, which will not yield to Medicins, or else for that they are rotten and hollowed, so that they cause the breath to smell; or else for that they infect the found and whole teeth, and draw them into the like corruption, or because they stand out of order. Besides, when they are too deep and strongly rooted, so that they cannot be plucked out, they must oft-times be broken of necessity, that so you may drop some cauflick thing into their roots, which may take away the fenfe, and confequently the pain. must be used with much moderation in the drawing out of a tooth; for the jaw is sometimes diflocated by the too violent drawing out of the lower teeth. But the temples, eyes, and brain are shaken with great danger by the too rude drawing of the upper teeth-Wherefore they must first be cut about, that the Gums may be loosed from them, then shake them with your fingers, and do this until they begin to be loofe; for a tooth which is fast in, and plucked out with one poll, off-times breaks the jaw, and brings forth the piece together therewith, whence follows a Fever and a great flux of bloud not eafily to be fiaid (for bloud or pw flowing out in great plenty is, in Celfin's opinion, the fign of a broken bone) and many other malign and deadly lymptoms. Some have had their mouths drawn fo awry, during the reft of their lives, that they could fearce gape. Beindes, if the tooth be much eaten, the hole thereof must be filled either with Lint, or a Cork, or a piece of Lead well fitted thereto, left it be broken under your forceps, when

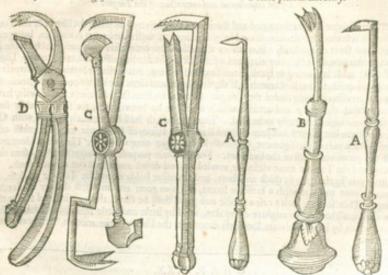

A cayeat in drawing of reeth.

L/b.7.cap.8.

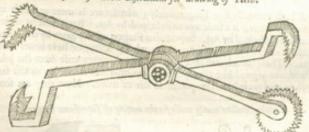

it is twitched more straightly to be plucked out, and the root remain, ready in a short time to cause more grievous pain. But judgment must be used, and you must take special care, left you take a found those griceous pain. But judgment must be used, and you must take special care, lest you take a found tooth for a pained one; for oft-times the Patient cannot tell, for that the bitterness of pain by neighbourhood is equally diffused over all the Jaw. Therefore for the better plucking out a tooth, ob- The manner ferving these things which I have mentioned, the Patient shall be placed in a low seat, bending back of drawing his head between the Tooth-drawers legs; then the Tooth-drawer shall deeply scaring about the Teeth, tooth, separating the gums therefrom with the infirmments marked with this letter A, and then if spoiled as it was of the well of the course it grow bosses, it must be shaken and then if spoiled as it were of the wall of the gums, it grow loofe, it must be shaken and thrust out, by forcing it with the three-pointed Levatory noted with this Letter B, but if it slick in too fast, and will not fir at all, then must the tooth be taken hold of with fome of these toothed foreign marked with these letters CCD; now one, then another, as the greatness, figure and site thall seem to require. I would have a Tooth-drawer expert and diligent in the use of such toothed Mullets; for unless one know readily and cunningly how to use them, he can scarce so carry himself, but that he will some cout three teeth at once, oft-times leaving that untoucht which caused the pain.

The Effigies of Forcipes, or Mullets for the drawing of Teeth,

Instruments for scraping the Teeth and a three-pointed Levatory.

The form of another Instrument for drawing of Teeth.

After the Tooth is drawn, let the blood flow freely, that so the part may be freed from pain, and the matter of the tumor discharged. Then let the Tooth-drawer press the field of the gums on both dides with his fingers whereas he took out the Tooth, that so the focket that was too much dilated, and oft-times torn by the violence of the pluck, may be closed again. Lastly, The mouth shall be pucket out. open air, lest it cause a new defluxion upon his Teeth-

CHAP. XIV. Of cleanfing the Teeth.

Icces of meat in eating fometimes flick between the teeth, and becoming corrupt by long Caufes of food flaying there, do also hurt the teeth themselves, and spoil the sweetness of the breath. He or rusty that would eschew this, ought presently after meat, to wash his mouth with Wine mixed Teeth. with Water, or Oxycrate, and well to cleanfe his teeth, that no flimy matter adhere to them. Many folks teeth by their own default gather an earthy filth of a yellowish colour, which eats into them by little and little, as rult cats into iron. This rulty filthiness, or as it were mouldiness of the teeth, doth also oft-times grow by the omitting of their proper duty, that is of chawing. Whence-

(militure)

The Care,

A caution in the use of acrid things. foever this flimy filth proceeds, we must get Descriptions to fetch it off withall, and then the reeth must be prefently rubbed with ages forth and ages with mixed together, that if there be any thing that hath scaped the Description, it may be all setched off; yet such acrid washings are hurtful to the found teeth, for that they by little and little consume and waste the field of the gums.

Description that he made of the root of Marth-mallows boiled in white Wine and Allom, and, as when the teeth are loofe, we must abitain from such things as are hard, to be easen and chawed, but much more from breaking of such things as are of a bony consistence, so also here we must than all things that by their toughness slick to the teeth. Many for the cleaning of the teeth commend a Powder made of Scutie-bones, Purple-shells, Pumice-stone, burnt Allum, and Harts horn, and a little Cinnamon, which is a singular remedy for the teeth howsfoever affected. Many other are content with bread onely tosted and beatens but this following Water is very effectual to whiten the teeth. It Sal. animon, or general, an. 3 j. alumnoch. 3 [5. ague 10], quad sufficit, difficienter. And let the teeth be cleansed with this diffilled liquor.

A Water to whiten the teeth.

CHAP. XXIX.

Of the impediment and contraction of the Tongue.

The cause of being Tonguetied.

The Cure.

He Tongue is formetimes tied and fhort from the nativity; as when the liberty of the Tongue is reftrained by the fubject and neighbouring, as well membranes as mufeles, being either too fhort or too hard. Sometimes this difeafe happens after they are born by forme accident or preternatural affect, as by too hard a fear left by the healing of an Ulcer under the Tongue. The Patient at his beginning to fpeak, is too flow in fpeaking, but prefertly leaving his flowness, he becomes too quick, so that he stammers. If the disease proceed from the affriction and shortness of the ligamental membrane lying under the Tongue, then the incision shall be made broad-wise, having great care that the veins and arteries which are there, be not violated, for fear left they should cause an Hemorrhagie, not easily to be staid. Then the mouth shall be presently washed with Oxycrate, and forme lint dipped in Syrup of dried Roses, or Honey of Roses put into the midst of the incision, left the part of the ligament, especially in the night time when the Tongue is ident and at rest, should grow to the rest of the ligament. For the same purpose the singer shall be often thrust this way, and the Tongue more violently rowled up and down and thrust out of the mouth. Yet formetimes this ligament is so thick and short, and therefore holds down the Tongue so dose, that you cannot come to cut it with a knife or lancet, without great and manifest danger of death by bleeding. Therefore in such a case a needle and thred shall be thrust through it, and so the thred shall be teed straighter and straighter every day, until by little and little this ligamental tie of the Tongue, which by its immoderate shortness intercepts the liberty of the motion, shall be consumed and broken.

Another way

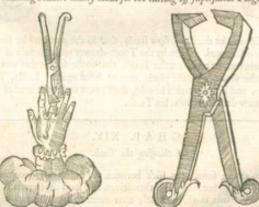

CHAP. XXX.

Of Superfluores Fingers, and Such as Stick together.

The differen-

Ach hand hath naturally five Fingers onely; whatfoever is more or lefs is against Nature: and if there be fewer, it a fault not to be helped by Art. But if there be more, that for the most part maybe helped by Art. Superfluous Fingers usually grow by the Thumb or the little Finger, but seldom otherwise. These are either wholly stelly, or have bones of their kind and nails upon them. Those which are of a bony nature, do either arise from the joints of the natural Fingers, and are jointed like them, and so are oft-times movable; or else from some middle space of a joint, and these have not power to stir or move. Now they are sometimes equal

Cutting Mullets neatly made for the cutting off Superfluous Fingers.

in magnitude to the natural Fingers to which they grow, yet more frequently they are fhorter. Those which are onely fleshy, are easily ampurated and made even with a razor; but such as are also bony cannot be cut off, unless with the cutting Mullets here described, and this is a disease of the Fingers in number. There is also another disease in Fingers, for they sometimes stick toge-

gether, and otherwhiles they are very little feparated. This fault happens either from the first original, by the errour of the formative faculty, or elfe it happens atterwards by accident, as by a Wound, or Burn ill cured. For neighbouring Fingers being ulcerated do easily grow together, unless they be kept afunder by a linnen rag. And if they by chance shall grow together by a little and thin skin and stells, they shall forthwith be divided with a sharp Razor 5 but if they be joined by the interpolition of a more gross and dense substance, to wit, the nerves, tendons, and vessels being knit together on each side, it will be best not to meddle at all with the dividing them.

rogether on each fide, it will be best not to meddle at all with the dividing them.

Neither must we omit, that many have their nails run with such bony sharpness into the flesh The cure of of their singers lying under them, that they cause most cruel pains neither commonly do you avail an anistrunning any thing by paring them; for growing up within a while after, they press downwards again with of the more violence. Therefore the Surgeon is often forced to cut away all the slesh whereinto the sharpness of the nail runs. Which I have done in many with happy success. Many have Corns growing upon their Fingers in divers fastisons: They are taken off by paring away by little and little, the callous hardness, and then laying a head of Garlick beaten thereon. Yet the Cure is more off the forms of the singers. quick and certain, which is performed by caufticks, as aqua fartie, or Oil of Vitriol.

CHAP. XXXI.

Of the too floors a Prepace, and of fuch as have been circumcifed.

7 Hen as the Prepuce of fore-skin is too flore, it cannot cover the Glant. This happens ci. The Caufe. ther by Nature, to wit, by the first conformation, or afterwards by some accident, as to those whom Religion and the custom of their Nation bids to be circumcifed. The Cure The Cure The Prepuce is turned up, and then the inner membrane thereof is cut round, and great care is had, that the Vein and Artery which are there between the two membranes of the Prepuce, be not cut in funder. Hence it is drawn downward by extension, until it cover the Glant, a deficeative emplaister being first put between it and the Glass, left they should grow together. Then a Pipe being first put into the urinary passage, the Prepuce shall be there bound until the incision be cicatrized. This cure is used to the fews, when having abjured their Religion full of superstitions, for handformels fake, they would cover the Nut of their Yard with a Prepuce, and so recover their cut-off-

CHAP. XXXII.

Of Phimotis and Paraphimotis, that is, so great a constriction of the Prepace about the Glans or Nut,
that it cannot be bared or uncovered at pleasure.

He Prepuce is firaightned about the Glass two ways; for it either covers the whole Nut, and fo firaightly encompaffes the end thereof, that it cannot be drawn upwards, and confequently the Nut cannot be uncovered; or elfe it leaves the Glass bare under it, being fallned fo firifly to the roots thereof, that it cannot be turned up, nor drawn down, or over the Glans. The first manner of construction is termed Phinosis, the latter Paraphonosis. The Phinosis happens the cither by fault of the first conformation, or else by a sear, through which occasion the Prepuce hath grown lesser, as by the growing of Warts. Now Paraphinosis is often occasioned by the instammation of the Yard, by impure copulations, for become Ulberts breed between the Prepuce and Glans, with tion of the Yard, by impure copulation; for hence Ulcers breed between the Prepuce and Glass, with fwelling and fo great inflammation, that the Prepuce cannot be turned back. Whence it is that they The Care, cannot be handled and cured as you would, and a Gangrene of the part may follow, which may by the contagion bring death to all the body, unless it be hindred by amputation: but if a fear be the cause of the confriction of the prepuce, the Patient being placed in a convenient fite, let the Prepuce be drawn forth and extended, and as much as may be stretched and enlarged, then let the fear be gently cut in three or four places on the inner fide with a crooked Knife, but so, that the gashes come not to the outside, and let them be an equal distance each from other. But if a slessly excrescence or a Wayt shall be the confirmal but the same of a confirmal but the same of t or a Wart shall be the occasion of this firaitness and constriction, it shall be consumed by the same remedies, by which the Warts of the Womb and Yard are confamed or taken off. But when as the Prepace doth closely adhere to the Glans on every fide, the Cure is not to be hoped for, much less to be attempted.

CHAP. XXXIII.

Of those whose Glass is not rightly perforated, and of the too short or strait ligament, bridle, or cord of the Yard.

Ome at their birth, by evil conformation, have not their Glans perforated in the middle, but The Caufes have onely a small hole underscath, toward the bridle and ligament of the Yard, called the Cord. Which is the cause that they do not make water in a strait line, unless they turn up their Yard toward their belly, neither by the same reason can they beget children, because through this fault of conformation, the feed is hindred from being cast directly into the Womb.

The Cure is altogether Chirurgical, and is thus performed. The Prepace is taken hold of and extended with the left hand, but with the right hand, the extremity thereof, with the end of the Glass, is cut even to that hole which is underneath. But fuch as have the bridle or ligament of the Yard too thort, fo that the Yard cannot stand straight, but crooked, and as it were turned downwards; in these also the generation of children is hindred, because the seed cannot be cast directly and plen-

tuning.

Therefore this ligament must be cut with much dexterity, and the wound tifully into the Womb. cured after the manner of other wounds, having regard to the part.

Sach as are a hole in their Fundament are not long-lived.

Children also are sometimes born into the World with their fundaments unperforated, for a skin preternaturally covering the part, hinders the passage forth of the excrement; those must have a paffage made by Art with an Inftrument, for fo at length the excrements will come forth: yet I have found by experience, that fuch Children are not naturally long-lived, neither to live many days after fuch fection.

CHAP. XXXIV.

Of the Caufes of the Stone.

Why children are fubject to the Stone in the Bladder,

The Caufe:

He Stones which are in the bladder have for the most part had their first original in the reins or kidnies, to wit, falling down from thence by the Ureters into the Bladder. of these is two-fold, that is, material and efficient. Gross, tough, and viscid humours, which crudities produce by the diffempers of the bowels and immoderate exercises, chiefly and immediately after meat, yield matter for the Stone; whence it is that children are more subject to this difease than those of other Ages: But the efficient cause is either the immoderate heat of the kidnies, by means whereof the fubtiler part of the humours is refolved, but the groffer and more earthly fubfides, and is hardned as we fee Bricks hardned by the Sun and Fires or the more remifs heat of the bladder, sufficient to bake into a stone the feees or dregs of the Urine gathered in great plenty in the capacity of the Bladder. The straightness of the Ureters and urinary passage may be accounted as an affiftant cause: For by this means the thinner portion of the Urine floweth forth, but that which is more feculent and muddy being flaid behind, groweth as by scale upon scale, by addition and collection of new matter into a flony mass. And as a wick often times dipped by the Chandler into melted Tallow, by the copious adhesion of the tallowy substance presently becomes a large Candle; fo the more groß and viscid feees of the Urine stay as it were at the barrs of the gathered gravel, and by their continual appulse are at length wrought and fashioned into a true stone.

CHAP. XXXV.

Of the Signs of the Stone in the Kidnics and Bladder.

fame fide, by reason of the compression caused by the stone, of the nerves descending out of the Ver-

tebre of the loins of the thigh. But when the flone is in the Bladder, the fundament and whole peri-

He figns of the Stone in the Reins, are the fubfiding of red or yellow Sand in the Urine, a

certain obscure itching at the Kidnies, and the sense of a weight or heaviness at the loins, a sharp and pricking pain in moving or bending the body, a numbress of the thigh of the

Why the thigh Stone of the Signs of the Eladder.

Why fuch as Fundament,

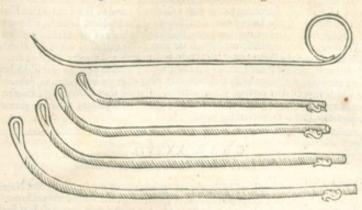

in the Bladder with a Carberer.

neum is pressed as it were with a heavy weight, especially if the stone be of any bigness, a troublesom and pricking pain runs to the very end of the Yard, and there is a continual itching of that part, with a defire to feratch it: hence also by the pain and heat there is a tension of the Yard, and a frequent and needless defire to make water, and sometimes their urine cometh from them drop by drop. A most grievous pain torments the Patient in making water, which he is forced to thew by flamping with why nen as green and the grating of his feet, bending of his whole body, and the grating of his teetth. He is oft-times fo tormented with the gladder excess of pain, that the Sphintler being relaxed, the right gut falleth down, accompanied with the fallowith the fallowing heat and pain of the Homorrhold veins of that place. The cause of such torment is the free free with the fallowing heat and pain of the Homorrhold veins of that place. quent firiving of the bladder to expel the flone wholly contrary to the nature thereof, whereto by fympathy the expulsive faculty of the guts and all the parts of the belly come as it were for supply, lediment of the Urine is groß and viscid, and off-times like the whites of Eggs, which argueth the weakness of the native heat not attenuating the juices. The Patient looketh of a pale and yellowish complexion and hollow-eyed, by reason of the almost continual watching which is caused by the bitternels of pain; yet may it more certainly be known by putting in or fearthing with a Catheter How to fearch Which to do, the Patient shall be wished to stand with his body somewhat stooping, leaning against formewhat with his back, and holding his knees forme foot afunder. Then the Catheter being bigger or leffer, as the body shall require, and anointed with oil or butter, shall be thrust with a skilful hand into the paffages of the Urine, and fo into the capacity of the bladder. But if the Carberr cannot come to that capacity, the Patient shall be placed in such a posture; then shall he be laid upon his back on a bench, or the feet of a bed, with his knees bended, and his heels drawn to his buttocks, after which manner he must almost lie when he is to be cut for the stone, as shall be shewn hereafter. For thus the Carbeter is more eafily thrulf into the Bladder, and fliews there is a frone by the meeting and obfcure found of the obvious, hard and relitting body. You must have fundry Carbeters, that they may serve for every body bigger and leffer, and these must be crooked, smooth and hollow. When being thrust into the urinary puffage (which before unawares I omitted) they come to the neck of the bladder, they must not be thrust straight into the bladder; but taking hold of the Yard with the left hand, they must be gently thrust with the right directly into the bladder; especially in men, by reason of the length and crookedness of the way, which tends in the form of this letter S. It is not so in women by reason of the thortness and firaitness of the neck of the bladder. It is fit your Cabeters be the neck of then by realon of the thortness and firattness of the neck of the pladder is hollow or infulous in manner of a pipe, that they may receive a filver Wiar or String, that may himder the groß and viscid humour, clotted bloud, or the like, from itopping the further end of the Catheter, through which the suppressed Urine ought to pass and be made. But now as soon as we perceive that the Catheter is come into the capacity of the bladder, the Wiar must be drawn forth; that so the Urine may the freelier flow out by the hollowness of the Catheter. You may perceive the

thates of these instruments by this following Figure.

The Figure of Catheters, and of a filver String or Wiar.

CHAP. XXXVI.

Prognosticks in the Stone.

Hen the Stone is cast forth of the Kidney (whereas it bred by little and little) and is so How death driven into one of the Ureters, that it wholly flop it, yet thereupon there followeth no may ensue by fupprefion of the Urine; for feeing Nature hath made divers parts of our body double, the suppreficuent into the other Urine; For feeing Nature hath made divers parts of our body double, fing of Urine. all the Urine floweth into the other Ureter: But if they shall be both stopped with sones, there is no doubt but the Urine will be wholly suppress, and death ensue by the suffocation and extinction of the native heat, by the Urine flowing, back by the rivelets of the Veins over all the whole body. Such as have a small stone cast forth of their Reins into the cavity of the Ureters, until this stone be fallen into the Bladder, have cruel pain with gripings, with often defire to go to flool and make water, but oft-times do neither; For fuch oft-times have their bellies diffended with flatulencies: an argument hereof is their continual belching or breaking of wind: But by fneezing and coughing, or any other concession of the whole body, a pricking pain is forthwith felt, whereas the stone stops, especially if it be either rough, or have sharp points like homs. This pain is communicated to the hip and thigh by fympathy, and forme have the frones drawn up as it were with great violence. To these may be added the Colick, cholerick vomiting, and almost a general swear. The stone in the Kidnies is most commonly bred in such as are ancient, by reason of the weakness of the expulsive faculty: But the fione in the Bladder happeneth to fuch as are more young, because the native heat is more vigorous in such, and strong and inordinate motions increase the strength of the expulsive faculty. When the stone is in the bladder, and the Urine appeareth bloudy, it is the sign of a small, as also a prickly and rough stone, for thus it more easily entereth into the neck of the bladder, and exulcerateth it being flethy, whence the blond cometh away with the Urine, and most cruel pain, as why some of of needles thruit into the fieth, especially after labour and much exercise: on the contrary, a large the Ridnies and more smooth stone will not cause such tormenting pain, and it causeth a milky water. fhapes of flones in the kidnies are various, according to the variety of the strainers through which they pass whilest they are bred. Verily I have seen stones which represented the sigure of Gray-hounds, Hogs, and other Creatures, and things wholly contrary to mans nature, by the production of their prickles, and as it were branches. Some are four-square, others longish and like a singer, others longish and like a singer longish and their prickles, and as it were branches. Some are four-fquare, others longish and like a singer, otherfome of a round figure with many protuberancies like a Pine-apple kernel; neither is the variety less
in magnitude, number, and colour; for some are yellowish, others whitish, red, ash-coloured, or
fome other like, according to the various temper of the affected bodies. The stones of cholerick and
lean men usually concrete by preternatural heat and driness; but those of phlegmatick or fat bodies,
of a certain congelation as it were, and obstruction of the passages. A stone talling sometimes from the
bottom of the bladder into the passages of the Urine quite stops it up, and thence followest a total suppressing of the Urine. Therefore then the Patient shall be placed upon his back and his legs being lifted
up on high, he shall be shaken and tossed up and down just as one would shake up a sack to fill its for thus
it is forced back into the Bladder from whence it came, from the passage of the Urine whereinto it was
got, yet it may also be forced back by thrusting in a Canbeter. The pain which afflictes shake have the stone is somewhiles continual, yet more trequently it cometh by fits and returns. Sometimes got, yet it may also be lifect or the state of the state more thort and broad, as also more firaight; wherefore the matter of the Stone by reason of the more subject thorrest and broad, as accurated in gravel, before it can be gathered and grow into a flone of a to the flose flortness of the passage is evacuated in some Women, and those equally as big as in Men, and therefore then Women.

When the those some and the like remedies. When the those some and therefore they are to be cured by fection and the like remedies. When the tione exceedeth the bigness of an Egg, it can fearce be taken away without tearing of the Bladder; whence happeneth an unvoluntary thedding of the Water, curable by no Art, because the bladder, seeing it is nervous and without

CHILLIAN I

What flones cannot be ta-ken out of the

bloud, being once torn admitteth no confolidation: add hereto that inflammation and a gangrene often following the rending of the Bladder, brings inevitable death. The Patient runs the fame hacannot be taken out of the zard, if a long from the pulled out fidewife with your Infrument, or if it be inclosed in a membrane
Bladder with (which kind of from can fearce be found with a Catheter) and fo be fashed to the Bladder, or out killing the otherwise if the stone it self be fastned into the substance of the Bladder; or lastly, if by any chance the Surgeon being about to pluck out the flone, fluil hurt the body of the Bladder with his Infiru-ments. Yet flones of a more indifferent bigness are more fafely extracted out of the Bladder then those which are less, and the Patient more frequently and happily recovereths. For they do not scape from the Instrument, and the Patient being used a long while to endure pain, as that which hath been a long time a growing, doth more eafily and confiantly away with the inflammation, pain and other fymptoms which happen after cutting, yea in cutting. Having thus fpoken of the Caufes, Signs, Places, Symptoms, and Prognoficks, we must come to the Cure, beginning with that part which is termed Prophylactice, that is the preventing part.

CHAP. XXXVII.

What Cure is to be used when we fear the Stone.

What Diet fuch must use as fear the Stone.

let must first be appointed, which by the convenient use of the fix things Not Natural (as they term them) may heap up finall flore of grofs, tough and vifeid humours in our bodies Therefore cold and cloudy air is to be flunned. They must abstain from Fish, Beef, Pork, Water-fowl, Pulfe, Cheefe, Milk-meats, fried and hard Egs, Rice, Cakes and all Paftry, unleavened Bread, and laftly, all manner of obtiructing meats. Also Garlick, Onions, Leeks, Mustard, Spices, and lastly, all things which over-heat the bloud and humours must be shunned, especially if you fear that the flone is concrete by the heat of the reins. Standing and muddy Waters, thick, and troubled Wines, Ecer, and fuch kind of Liquors must be eschewed. Satiety in meats and drinks is to be flunned, as that which breeds crudities. Also long watching and continual labour because they inflame the bloud, cause crudities and preternatural heat, must carefully be eschewed, as also more vehement paffions of the mind. If the body be plethorick, then it must be evacuated by Phlebotomy, Purging, and Vomiting, which is accounted for a fingular remedy for the prevention of this difeafe. For the performance of all which things a Physician shall be consulted with. But because Phylicians are not in every place and always at hand, I have thought good to let down thele follow-Lib. 13. Method. ing Medicins; yet we must first remember this Counsel of Galen; the use of Diureticks and strong purging Medicins is hurtful, as often as there is inflammation in the reins and bladder, for fo the conflux of the humours to the affected parts is the greater, whence the inflammation and pain are

CHAP. XXXVIII.

What is to be done when the stone falleth out of the Kidnies into the Vreter.

Ft-times it falleth out that the reins using their expulsive faculty, force down the stone Signs of the (whose concretion and generation the Physicians by the formerly prescribed means could not hinder) from themselves into the Ureters; but it stayeth there either by reason of the ftraightness of the place, or the debility of the expulsive faculty. Therefore then cruel pain torment-eth the Patient in that place whereas the stone sticketh, which also by confent may be communicated to the Hip, Bladder, Tetticles, and Yard, with a continual defire to make Water and go to Stool. this case it behoveth the Physician that he supply the defect of Nature, and assist the weak en-

of stairs, until he be weary, and even sweat agains for the stone by this exercise is oft-times shaken sticking in the into the Bladder; then preferitly shall be given or taken by the mouth such things as have a lenitive ureter. and relaxing faculty, as Oil of Sweet Almonds newly drawn, and that without hre, and mixed with the Water of Pellitory of the Wall and White Wine. Let frictions of the whole body be made from above downwards with hot cloths; let Ventoses with a great flame be applied one while to the loins, and another while to the bottom of the belly, a little below the grieved place; and unless the Patient vomit of his own accord, or by the bitterness of his pain, let vomiting be procured with a draught of Water and Oil lake-warm; for vomiting bath much force to drive down the stone by reason of the compression of the parts, which is caused by such an endeavour. Lastly, if the stone descend not by the power of these remedies, then the Patient must be put into a Semicopium, that is, a Half-bath, made of the following decoction. Re Matva, bifinal, cum toto an. m.ij. beton. nafturt. faxifrag, berul. parietar. A Decoction violar, an. m.iij. femonelonum, milii folic, alkekengi an. 3 vy. escer. rub. Ib j. rud. apii. gram. faxiculi, & cringii, an. 3 vv. in fufficienti quantitate aqua pro inceffic, coquantur ilta omnia inclusa face: herein let the Patient lit up to the Navel, neither is it fit that the Patient tarry longer in fuch a both than is requisite, for the spirits are dislipated, and the powers resolved by too long stay therein. But on the contrary, if the Patient remain as long as is sufficient in these rightly made, the pain is mitigated, the extended parts relaxed, and the passages of the Urine opened and dilated, and thus the stope descended into the bladder. But if it be not moved by this means any thing at all out of the place, and that the fame total suppression of Urin does as yet remain, neither before the Patient entered into the bath the putting of a Catheter into the bladder did any thing avail, yet notwithstanding he shall try the fame again after the Patient is come out of the bath, that he may be throughly fatished whether peradventure there may be any other thing in these first passages of the yard and neck of the bladder, which may with-hold the Urine; for the Catheter will enter far more eafily, the parts being re-laxed by the warmness of the bath: then inject some Oil of Sweet Almonds with a Syringe into the **Urethra* or passage of the yard; whileft all these things are in doing, let not the Patient come into the cold air. But I have thought good to describe a Ghair for a Bath, wherein the Patient may fitly

fit, as you may fee in the following Figure. There may also be another decoction made for the bath, as thus: Re Rad. raph. alth. an. so ij. rad, ruse, petrosel. & asparage, an. th j. cumin, fanicul, ameos an. 3 iv. semdini, fanug. an. 3 vj. fol.marrub Parietar, florum chamem, melil, anethi, an, m. ij, bulliant omnia focundum artem in aque fufficienti, & vini albi odorfer exigus quantitate ad confimptionen tertie partis pro Semicopio. Also the fame decoction may be used for Clysters, adding thereto two yelks of Egs, and four ownees of Oil of Lillies, with 3 j. of Oil of Juniper, which hath a certain force to affivage the pain of the Stone and Collick. But a far less quantity of the decoction in a Clyster must be used in these diseases, than usually is appointed in other difeases; otherwise there will be danger left the guts being distended, should more press upon the kidnies and preters, troubled in fome fort with inflammation, and fo increase the pain and other fymtoms. This following Cataplain thall be profitably applied to the grieved place, to wit, the loins, or flanks, and bottom of the belly, for it is very powerful to affwage pain, and help forwards the talling down of the stone. Re Rad. alth. & raphani, an. 5 iv. pariet. fanic. senectonis, nature, bernel, an. m., An anodyne bernarie m. CHAP. XXXIX.

What must be done to the Stone being fallen into the neck of the Bladder, or passage of the Yard.

Fter the flone is fallen out of the capacity of the Bladder, and flops in the neck thereof, or paffage of the Yard, the Surgeon shall have a special care that he do not force or thrust back the stone from whence it came, but rather that he press it gently with his singers to the cond of the Yard, the passage being first made slippery by injecting some Oil of Sweet Almonds. But if it stop in the end of the Glans, it must be plucked out with some crooked instrument; to which the condition of the Glans, it must be plucked out with some crooked instrument; to which the condition of the Glans, it must be plucked out with some crooked instrument; to which the condition of the Glans, it must be plucked out with some crooked instrument; to which if it will not yield a Gimblet with a Pipe or case thereto, shall be put into the passage of the Yard, and so it shall be gotten out, or else broken to pieces by the turning or twining about of the Gimblet, which I remember I have divers times attempted and done; for such Gimblets are made with sharp Scrues, like ordinary Gimblets.

> The delineation of a Gimblet made to break the stones in the passage of the Yard, together with its Pipe, or Cafe.

The effigies of another leffer Gimblet.

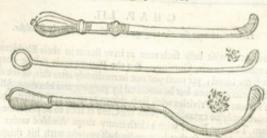

Verily what Gimblets foever are made for this bufiness, their body or point must be no thicker than a small Probe; lest whilest they are forced or thrust into the Verthra, or urinary passage, they might hart the bodies next unto them by their violent entrance.

CHAP. XL.

What course must be taken, if the stone sticking in the Urethra, or nrinary passage, cannot be gotten out by the fore-mentioned Arts.

Ut if the stone be more thick, hard, rough and remote from the end of the Yard, than that it The fronce be more thick, hard, rough and remote from the end of the Yard, than that it may be gotten out by the means formerly mentioned in the precedent Chapter, and if that the urin be wholly supprest therewith; then must you cut the Yard upon the side with a fraight wound: for you must not make incision on the upper part, for fear of a flux of bloud, for a sidely cut. For that it is a bloudless part, and besides, the continual and acrid falling of the urine would hinder the agglutination: wherefore the incision must be made on the fide, on that part whereas the stone most resists and swells out. For that part is the more fields and swells out. most relists and swells out. For that part is the more fleshy; yet first the end of the skin of the prepuce must be much drawn up to to cover the Glass, which being done, the Uresbra shall be tied with thred a little above the stone, that so the stone may be staid there, and may not fall back again. Therefore then, incition being made, the ftone must be taken forth, and the skin which was drawn more violently to cover the Glans, is to be let go back again; for so it will come to pass that a whole part of the skin may cover the cut Yard, and so it may be the more speedily united, and the urin may naturally flow out. I have by this means oft-times taken forth the flone with the influments

Inflruments fit to take the stone forth of the opened Usethra, or urinary passage of the Tard.

Then for the agglutination, if need require, it will be requifit to few up the lips of the wound, and an agglutinative Medicin following. R. Tereb, vener. 3 iv. gam. elemi, 3 j. fang. dracm. & ma-tive medicin. file. an. 3 fi. fint medicamentum at ditium of : then the whole Yard must be covered over with a reperculfive Medicin made of the whites of Eggs, with the Powder of Bole Armenick, Aloes, faring volatilis, and Oil of Robert Legisland Covering a Way-coulds or Leaden friest anointed with How to haften Venice Turpentine shall be thrust into the Verthers, to hasten the agglutination, and retain the natural smoothness and straightness of the urinary passage, left peradventure a caruncle grow therein.

CHAP. XLL

What manner of Section is to be made when a stone is in a Boys Bladder.

Itherto we have shewed, by what means it is convenient to draw small stones out of the Ureter, Bladder, and paffage of the urin; now will we briefly flew the manner of taking of greater flones out of the bladder, which is performed by meifion and iron infiruments, and I will deliver the practice thereof first in children, then in men, and lattly in women. First and I will deliver the practice thereof not in condition, then in then, and iaitiy in women. First therefore let the Surgeon take the Boy (upon whom it is determined the work shall be performed) Why the Boy under the arm-holes, and so give him five or six shakes, that so the shore may descend the more must be shadownwards to the neck of the bladder. Then must you cause a strong man, fitting upon an high ken before starting the bladder. Then must you cause a strong man, fitting upon his kneed, then you have a large feat, to lay the child upon his back with his face from him-ward, having his hips lying upon his knees. How to place The child must lie formewhat high, that he may breath the freelier, and let not the nervous part be the child too much firetched, but let all parts be loofe and free for the drawing forth of the flone. Further fore diffedit more, it is fit that this firong man, the childs legs being bended back, with the child, that putting on his legs to his hams, that he draw them up as much as he can, and let the other be fure he keep them fo; for this fite of the child much conduceth to well performing of the work. Then let the Surgeon thrust two of the singers of his left hand as far into the childs Fundament as he is able; but

THE PERSON

let him with his other hand press the lower belly, first wrapping a cloth about his hand, that so the compression may be the less troublesom, and lest inflammation thould happen rather by this means than by the incition. Now the compression hath this use, to cause the stone to descend out of the bottom of the Bladder into the neck thereof under the os pubis, whither after it is arrived, it must be there kept, and as it were governed by the command of your hand, left it should flide from that place whereto you have brought it. These things thus done, nothing now remaineth, but that the Surgeon, with a wound some two singers bredth distant from the Fundament, cut through all the flesh even to the stone on the left side of the Perincium. But in the interim, let him beware that he hurt not the intestinum reclium, for it may, and usually doth happen, that whilest the stone is brought out of the bottom of the bladder to the neck thereof, this gut is doubled in: now if it be cut with your incifion-knife, it cometh to pass that the excrements may sometimes come out at the wound, and the urin by the fundament, which thing hath in many hindred the agglutination and confoli-dation of the wound; yet in some others it hath done little harm, because in this tender age many things happen which may feem to exceed Nature: the incition being made, the fione must be placked forth with the inftrument here expressed.

Nature very powerful in children.

vide the pari-READ.

The stone being drawn out, a small pipe shall be put into the wound, and there kept for some General Bules wound will the fooner close and be agglutinated. The refidue of the Cure shall be performed by must be reducing the general Cure of Wounds to the particular temper of the childs age, and the peculiar nadius ture of the child in cure.

duced to par-ticular bodies.

CHAP. LIL

How to cut men for the taking out of the Stone in the Bladder.

Eeing we cannot otherwife help fuch men as have ftones in their Bladders, we must come to

What to be done before

How to lay she Parient.

the extreme remedy, to wit, Cutting. But the Patient mult first be purged, and if the case require, draw some bloud, yet must you not immediately after this, or the day following hasten to the work: for the Patient cannot but be weakned by purging and bleeding. Also it is expedient for forme days before to forment the Privities with fuch things as relax and foften, that by their yielding the flone may the more easily be extracted. Now the Cure is thus to be performed. The Patient shall be placed upon a firm Table or Bench with a cloth many times doubled under his buttocks, and a Pillow under his loins and back, so that he may lie half upright with his thighs lifted up, and his legs and heels drawn back to his buttocks. Then shall his feet be bound with a ligature of three fingers bredth cast about his ankles, and with the heads thereof being drawn upwards to his neck, and cast about it, and so brought downwards, both his hands shall be bound to his knees, as the sol-

lowing figure theweth.

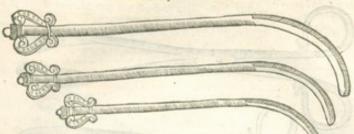

The Figure of a man lying ready to be cut of the Stone.

The Patient thus bound, it is fit you have four strong men at hand; that is, two to hold is arms, and other two who may fo firmly and ftraightly hold the knee with one hand and the foot with the other, that he may nei-ther move his limbs, nor fiir his buttocks, but be forced to keep in the fame posture with his whole body. Then the Surgeon shall thrust Probe must be into the urinary passage even to the bladder a filter or iron and hollow Probe amointed with Oil, and opened or flit on the outfide, that the point of the knife may enter thereinto, and that it may guide the hand of the Workman, and keep the knife from piercing any further into the bodies lying there-under. The Figure of this Probe is here express.

Why the

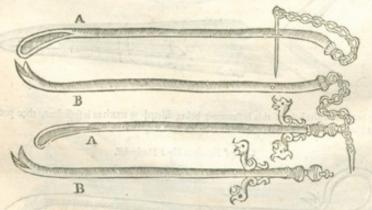

Probes with flits in their ends.

He shall gently wrest the Probe, being so thrust in, towards the left side, and also he who standeth why the seam on the Patients right hand, shall with his left hand gently lift up his cods, that so in the free and open of the Princeton support the Surgeon may have the more liberty to make the incision assessmust not upon the Probe, which is thrust in and turned that way. But in making this incision, the Surgeon be cut, it will not be easily consolidated, for that it is callous and bloudless, therefore the urin would continually drop forth this way. But if the wound be made too near the Fundament, there is danger it will not be eafily confolidated, for that it is callous and bloudlefs, therefore the urin would continually drop forth this way. But if the wound be made too near the Fundament, there is danger left by forcible plucking forth of the flone he may break fome of the hamorrhoid veins, whence a bleeding may enfue, which is fearce to be flopped by any means, or that he may rend the fiphincter markele, or body of the bladder, fo that it never can be repaired. Therefore it must be made the fipace of two fingers from the fundament, according to the firsightness of the fibres, that fo it may be the more eafily reflored afterwards. Neither must the incision thus made, exceed the bigness of forth the ones thumb, for that it is afterwards enlarged by putting in the Grows-beak and the Dilater, but the more by the flone as it is plucked forth. But that which is cut, is neither fo fpeedily nor easily healed. That which is up as that which is torn. Then prefently put into the wound fome one of these filver instruments to the delineated here below, and called by the name of Guiders, for that they serve as guides to the other that that instruments which are to be put into the bladder; these are made with a round and prominent cut.

Then presently into the described cavity of the Probe, and they are noted by these letters A A, then there are others marked with the letters B B, and called by the like name, and are to be put under the former, being made forked at the end, that so it may, as it were, embrace the end be put under the former, being made forked at the end, that fo it may, as it were, embrace the end

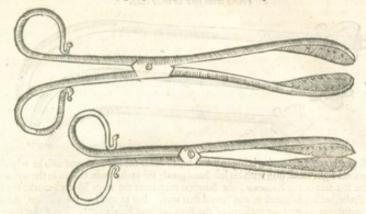

The Figures of Guiders of two forts.

Now the Probe is to be drawn forth, and the Guiders to be thrust and turned up and down in the bladder, and at length to be staid there by putting in the pin; yet such Guiders as want a Pin are fitter for the hand, and are by some called stable. Then must they be held betwirt the Surgeons singers. It will be also necessary for the Surgeon to put another instrument called the Ducks-bill between the two guiders into the capacity of the bladder; he must thrust it in somewhat violently, and the stable is with both his bands surging it every way to endure the and dilate it fo thrust in with both his hands, turning it every way to enlarge the wound as much as shall be sufficient for the admitting the other instruments which are to be put into the bladder; yet it is far better for the Patient, if that the wound may with this one inframent be fufficiently dislated, and the flone pulled forth with the fame without the help of any other.

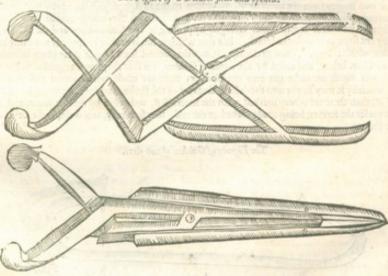

tunning.

The effigies of an Instrument called a Ducks-bill.

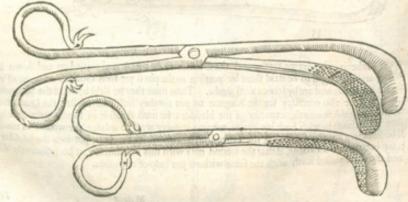

Which if you have not in readiness, and the largeness of the stone require more dilatation, then must you put in this dilater; for being put into the bladder, and the handle pressed together, it will dilate the incision as much as you detire.

The Figure of a Dilater shut and opened.

The wound by the help of this Instrument being dilated as much as is sufficient, then put in the straight Ducks-bill before described, or the crooked here express.

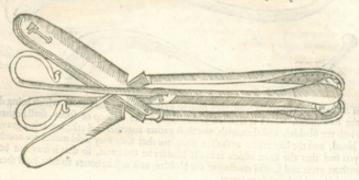

Crooked Forcipes like a Ducke-bill.

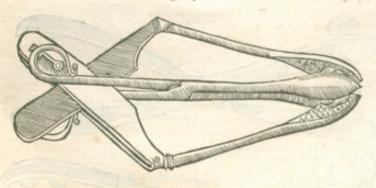

The frone may be fought and taken hold of with these Instruments, and being taken hold on the branches of the Instrument shall be tied together, lest they should suffer that to slide away which

which they have once taken hold of. Neither shall the stone be suddenly placked out, but easily shaken to and again, and at length gently drawn forth. Yet you must beware that you do not press it too straitly in the forcept, lest you should break it in pieces: Some, lest it should ship away, when they shave once taken hold thereof, put their two singers into the Fundament, and put them about the straction of the stone. There are others who strengthen this comprehension by putting in on each side above and below these winged instruments, so that the stone can slip forth on no side.

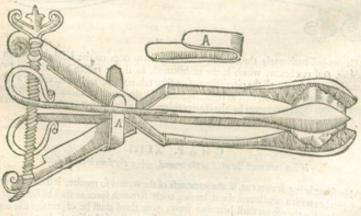

Winged Instruments to hold the stone with the Ducks-beak

The Figure of another.

thin in the

A Cleanser or Scoop subereby you may search whether there be any more stones behind, as also cleanse or purge the bladder from gravel, clots of bloud, and other such bodies as use to remain behind after the drawing forth of the stone,

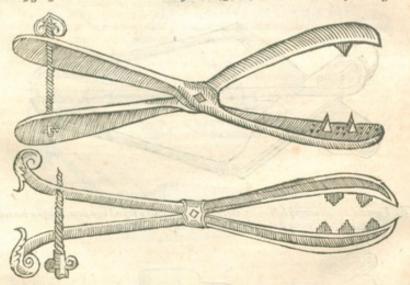

How to clenie

For if other flones remain behind, they shall be drawn forth as the former, which being done, the end of the Instrument, which is crooked and hollowed like a scoop or spoon, shall be thrust by the clotted bloud, and the like refuse as shall be there, for that they may yield matter for another stone.

How to break But if you find that the stone which is in the bladder be too great, so that it may not be plucked a stone that forth without great and searful rending of the bladder, as it will be better to take hold thereof with this Crows bill, and so break it to pieces.

and at once.

The effigies of a toothed Crows-bill made neatly to break greater stones, with a Screw to force it together.

This Crows-bill hath onely three teeth, and those sharp ones on the inside, of which two are placed above, and one below, which is the middlemost, fo that it falleth between the two upper. When the stone is broken, all the pieces thereof must be taken forth, and we must have a special care, lest any piece thereof lie hid, for that in time, increased by the access of a tough and viscous matters. or conjoined with other fragments by the interpolition of the like matter as glew, may rife to a ftone of a large bignels.

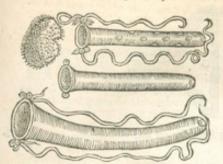

CHAP. XLIII.

What cure must be used to the wound, when the stone is taken forth.

Of sewing the wound when the stone is taken forth-

He flone being drawn out, if the greatness of the wound so require, it shall have one or two stitches with a needle and thred, leaving onely so much space as shall be sufficient to put in a pipe for the use we shall hereafter shew; your thred must be of crimson silk waxed, and let it not be too small, lest it by binding should cut as under the slessly lips of the wound, or rot in a short time, either by the moisture of the Urin, or matter slowing from the Ulcer. Therefore you shall take up much seth with the chief in forming it is to the line. take up much flesh with the skin in sewing it, lest the lips of the wound being torn, your labour prove in vain, and so you are forced to trouble the Patient with making a new one. Things being thus performed, a filver pipe shall be put through the wound into the bladder, whereof I have here given you divers forms, that you may take your choice, and so fit them to the wounds, and not the wounds to them, which oft-times in want of influences the Surgeons are forced to do, to the great harm of to them, which oft-times in want of inftruments the Surgeons are forced to do, to the great harm of the Patient.

Silver Pipes to be put in the Bladder when the stone is drawn out.

These must have no holes in their sides (as those here expressed) but onely in their ends, that all the matter of the wound, and the filth gathered and concrete in the bladder may flow and be carried forth this way. When clear Urine shall begin to flow out of the wound, there shall be no more need of a Pipe; therefore if you continue it and keep it longer in the wound, there is fome danger left Nature accultomed to that way, may afterwards neglect to fend the Water through the Vretbra, or urinary paffage. Neither must you forget to defend the parts near to the wound with the following repercutiive Medicin, to hinder the de-

fluxion and inflammation, which are incident by reason of the pain. Re Album, overum, nu. iij. pul. A repercussive boli armeni, sanguinis dracon. an. 3 iij. elei ros. 3 j. pilorum leperimum quantum sufficis: make a Medicin of Medicin. the confiftence of honey.

CHAP. XLIV.

How to lay the Patient after the Stone is taken away.

Ll things which we have recited, being faithfully and diligently performed, the Patient shall be placed in his bed, laying under him as it were a pillow filled with Bran, or Oat Chaff, to drink up the Urin which floweth from him. You must have divers of these pillows, that drink up the Urin which floweth from him. You must have divers of these pillows, that they may be changed as need shall require. Sometimes after drawing forth of the stone, the bloud in Remedies for great quantity falleth into the Cod, which unless you be careful to provide against, with discussing, the Cod, lest drying and consuming Medicins, it is to be feared that it may gangrenate. Wherefore if any accident happen in curing these kind of Wounds, you must diligently withstand them. After some few days a warm injection shall be cast into the Bladder by the wound, consisting of the Waters of Plantain, Night-shade, and Roses, with a little Syrup of dried Roses. It will help to temper the heat of the Bladder caused both by the wound and contustion, as also by the violent thrusting in of the Instruments. Also it sometimes happens, that after the drawing forth of the stone, clots of bloud and other impurity may fall into the urinary passage, and so show the Urin that it cannot show forth. Therefore you must in like fort put a hollow Probe for some days into the Ureshra, that keeping the passage open, all the grosser filth may flow out together with the Urin. open, all the groffer filth may flow out together with the Urin.

CHAP. XLV.

How to cure the Wound made by Incifion.

Ou must cure this wound after the manner of other bloudy wounds, to wit, by aggluting- What things of that care this wound after the manner of other bloudy wounds, to wit, by agglutina- What thing gent Medicins. The Patient shall hasten the agglutination if he lie cross-legged, and keep union a stender diet until the seventh or nineth day be past. He must wholly abstain from Wine, unless it be very weak; in stead thereof let him use a decoction of Barley and Licorish, or Mead, or Water and Sugar, or boiled Water mixed with Syrups of dried Roses, Maiden-hair, and the like. Let his Meat be Panado, Raisins, stewed Prunes, Chickens boiled with the cold Seeds, Purslain, Sorrel, Borage, Spinage, and the like. If he be bound in his belly, a Physician shall be called, who may help it, rage, Spinage, and the like. If he be bound in his belly, a Physician shall be called, who may help it, by appointing either Cassa, a Clyster, or some other kind of Medicins as he shall think good.

CHAP. XLVI.

What cure is to be sifed to Ulcers, when as the Urine flows through them, long after the stone is drawn out.

Any after the stone is drawn out, cannot have the Ulcer confolidated, therefore the Urin flows out this way continually by little and little, and against the Patients will during the rest of his life, unless the Surgeon help it. Therefore the callous lips of the wound must how to make be amoutated, fo to make a green wound of an old ulcer; then must they be tied and bound with a fresh wound the instrument we term a Retinateslass or stay; this must be perforated with three holes, answering of an old ulcer, to three other on the other side; Needles shall be thrust through these holes, taking hold of much slich, and shall be knit about it, then glutinative Medicins shall be applied, such as are Venice Turpenting. tine, Gum Elemi, Sanguis descens, Bole Armenick, and the like; after five or fix days the Needles shall be taken out and also the stay taken away. For then you shall find the Wound almost glewed, and there will nothing remain but onely to cicatrize it.

tunner

The Figure of a Retinaculum, or Stay.

A Shews the greater. B The leffer, that you may know that you must use divers according to the different bigness of the Wound.

what to do in If a Retinaculum or Stay be wanting, you may conjoin the lips of the Wound, after this following want of a flay. manner. Put two Quills formewhat longer than the Wound, on each fide one, and then prefently thruft them through with Needles having Thread in them, taking hold of the flesh between, as often as need shall require, then tying the thread upon them. For thus the Wound shall be agglutinated, and the flethy lips of the wound kept from being torn, which would be in danger if the needle and thred were onely used.

CHAP. XLVII.

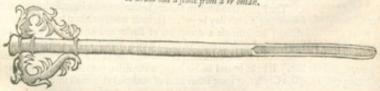

How to take stones out of Womens bladders.

E know by the fame figns that the flone is in a womans bladder as we do in a mans, yet it is far more eafily fearched by a Catheter, for that the neck of the bladder is the fhorter, broader, and the more firaight. Wherefore it may not onely be found by a Catheter pot in Women. into the bladder, but also by the fingers thrust into the neck of the Womb, turning them up towards the inner fide of the Os pubis, and placing the fick woman in the fame posture as we mentioned in the cure of men. Yet you must observe that maids younger than seven years old, that are troubled with the stone, cannot be searched by the neck of the womb, without great violence. Therefore the stone must be drawn from them by the same means as from Boys, to wit, by thrusting the singers into the Fundament; for thus the stone being found out, and the lower belly also pressed with the other hand it must be brought to the neck of the bladder, and then drawn forth by the forementioned means Yet if the riper years of the Patient permit it to be done without violence, the whole work thallbe more eafily and happily performed, by putting the fingers into the neck of the Wornb, for that the bladder is nearer the neck of the womb than it is to the right gut. Wherefore the fingers that thrust in, a Catheter shall be prefently put into the neck of the bladder: This Catheter must be hol-

ceive by the following Figure.

A Cathetex, upon which, being put into the bladder, the neck thereof may be cut to draw out a ftone from a Woman.

low, or flit on the outfide like those before described but not crooked, but straight, as you may per-

Ulpon this Instrument the neck of the bladder may be cut, and then with the Dilater made for the fame purpole, the incifion shall be dilated as much as need requires; yet with this caution, that fee-ing the neck of a womans bladder is the shorter, it admits not so great dilation as a mans, for otherwife there is danger that it may come to the body of the bladder, whence an involuntary fledding of the water may enfue and continue thereafter. The incilion being dilated, the Surgeon putting one or two of his fingers into the neck of the womb, shall press the bottom of the bladder, and then thrust his crooked Instruments or foreiges in by the wound, and with these he shall easily plack out the stone, which he shall keep with his singers from slipping back again. Yet Laurence Gold the Kings Surgeon, and both his fons (than whom I do not know whether ever there were better cutters for the itone) do otherwise perform this operation; for they do not thrust their fingers into the Fundament or neck of the womb, but contenting themselves with putting in onely the Guiders (whereof we formerly made mention) into the paffage of the Urine, they prefently thereupon make ftraight incition directly at the mouth of the neck of the bladder, and not on the fade as is ufually done in mentioned they gently by the fame way thrust the foreigner hollowed on the outside formerly delineated, and so dilate the wound by tearing it as much as shall be sufficient for the drawing of the stone forth of the bladder. The residue of the cure is the same with that somerly mentioned in men: yet this is to be added, that if an along a remain the same with that somerly mentioned in men: yet this is to be added, that if an older grow in the neck of the bladder by reason of the rending it, you may by putting in the feemlum manages, dilate the neck of the womb, that fitting remedies may be app with the more eafe.

CHAP. XLVIII.

Of the suppression of the Urin by internal causes.

Belides the fore-mentioned causes of suppressed Urin, or difficulty of making water there are in suppression many other, lest any may think that the Urin is stopt onely by the Stone or Gravel, as Sur- of the urin we external and internal causes. The internal causes are clotted bloud, tough phlegm, warts, carnineles Diureticks. bred in the paffages of the Urin, flones and gravel; the Urin is formetimes fupprefit, because the matter thereof, to wit, the scrous or whayish part of the bloud, is either consumed by the severish heat, or carried other ways by fweats or a fcouring; fometimes also the flatulency there contained, or inflammation ariting in the parts made for the Urin and the neighbouring members, supporties the Urin. For the right gut, if it be inflamed, intercepts the paffage of the Urin, either by a tumor whereby it preffeth upon the bladder, or by the communication of the inflammation. Thus by the default of an ill-affected Liver, the Urin is oft-times suppress in such as have the droptic; or else by dulness or decay of the attractive or separative faculty of the reins by some great differences, or by the default of the animal faculty, as in fuch as are in a Phrenfie, Lethargy, Convultion, Apoplexy, Ecfides also a tough and viscid humour falling from the whole body into the passages of the Urin, obtinicts and thurs up the passage. Also too long holding the water sometimes exactly this affect, why the too For when the bladder is differed above measure, the passage thereof is drawn together and made long holding more straight: hereto may be added that the too areas differed on of the bladder is a bindrance that the urin capmore firaight: hereto may be added, that the too great diffension of the bladder is a hinderance that the urin causic cannot use the expulsive faculty, and firaighten it self about the Hrin to the expulsive thereof. it cannot use the expulsive faculty, and straighten it self about the Urin to the exclusion thereof; herepression thereof to also pain succeeds which presently dejects all the faculties of the part which is seized upon. Thus of. of late a certain young man riding on horfe-back before his Mittrefs, and therefore not daring to An history, make water, when he had great need fo to do, had his Urin fo suppress, that returning from his journy home into the City, he could by no means possible make water. In the mean time he had grievous pain in the bottom of his belly and the *Perinenon*, with gripings and a fweat all over his body,
fo that he almost fwooned. I being called, when I had procured him to make water by putting in
a hollow Catheter, and pressing the bottom of his belly, whereof he forthwith made two parts. I
told then that it was not occasioned by the store, which provisitionding the standards by imagined told them that it was not occasioned by the flone, which notwithstanding the standers by imagined to be the occasion of that suppression of Utrin. For thence forward there appeared no signs of the flone in the Youth, neither was he afterwards troubled with the flopping of his Urin.

CHAP. XLIX.

A digression concerning the purging of Such things as are unprofitable in the subole Body by the Urin.

Think it not amifs to teflifie by the following Hiflories, the providence of Nature in expelling by Urin fach things as are unprofitable in the whole body. Mangeur Sarres the Kings Secretary was wounded in the right arm with a Pittol bullet; many and malign fymptoms happened thereupon, but principally great inflammations, flowing with much fanier and pass or quitture: it in inflammation; whereof while we folicitously inquired the cause, we found both his stools and water commixed with much purulent filth, and this through the whole course of the disease, whereof that without any reason, this purulent and fanious efflux of matter was staid water commixed with much purulent filth, and this through the whole course of the disease, whereof notwithflanding by Gods affirtance he recovered, and remains whole and found: we observed that as long as his arm flowed with this filthy matter, fo long were his excrements of the belly and blidder free from the fanious and purulent matter; to long were his excrements of the deny were dry, to long were the excrements of the guts and bladder fanious and purulent. The fame ac- An Hiffory cident hetel a Centleman called Monfour de la Croix, who received a deadly wound with a fword on the life and the fame acthe left arm, though German Chewal and Mafter Raß most expert Surgeons, and others, who together with me had him in cure, though it was not fo for this reason, because the pay cannot run fo long a way in the body, neither if it were fo, could that be done without the infection and corruption of the whole mass of bloud, whilest it slows through the Veins; therefore to be more probable that this whole mass of bloud, whilest it flows through the Veins; therefore to be more probable that this quantity of filth, mixed with excrements and urine, flowed out by the default of the liver, or of some other bowel, rather than from the wounded arm. I was of a contrary opinion for these following reasons: First for that which was apparently seen in the Patient; for as long as the excrement and How the put urin were free from this purulent matter, so long, his arm plentifully flowed therewith; this on the may flow from contrary being dry, much purulent matter was voided both by flool and urin. Another was, that as the wounded our whole body is perspirable, so it is also (if I may so term it) constable. The third was an examble taken from the Glasses which the French term Monte vine, (that is, Mount-wines) for if a Glass ments, out of the lower vessel to the upper through the midst of the Water, and so the Water descends through the midst of the Wine, yet so, that they do not mix themselves, but the one take and possible. through the midit of the Wine, yet fo, that they do not mix themselves, but the one take and posfels the place of the other. If this may be done by Art, by things onely natural, and to be different by our eyes, what may be done in our bodies, in which by reason of the presence of a more noble soul, by our eyes, what may be done in our coars, it which is it which we may despair to be done in the likecase? For doth not the laudable bloud flow to the guts, kidnies, spleen, bladder of the gall, by the impulse of Nature together with the excrements, which prefendly the parts themselves separate from their nutriment? Doth not milk from the breits flow formerimes forth of the wombs of women lately delivered? Yet that cannot be carried down thither, unlefs by the paffages of the mamillary veins and arteries, which meet with the mouths of the veffels of the wornb in the middle of the

CHARLES THE

Lib de loc-affec firaight muscles of the Epigafrium. Therefore no marvel, if according to Galen, the pas unmixt 6. cap.4. with the bloud flowing from the whole body by the veins and arteries into the kidnies and bladder, be cast forth together with the urin. These and the like things are done by Nature, not taught by any Counfel or Reason, but onely affished by the firength of the legregating and expulsive faculty; and certainly we presently diffecting the dead body, observed that it all, as also all the bowels thereof, were free from inflammation and ulceration, neither was there any fign of impression of any purulent matter in any part thereof.

CHAP. L.

By what external causes the urin is supprest, and prognosticks concerning the suppression thereof.

Vertibra of the loins may preffion of Why the fuppreffion of the thereupon. ur in becomes A Fever fol-lowing there-on helps the

Here are also many external causes, through whose occasion the urin may be supprest; such are bathing and swimming in cold water; the too long continued application of Narcotick Medicins upon the Reins, Perineum, and Share; the use of cold meats and drinks, and such Why the dif-other like. Moreover, the diflocation of fome Vertebra of the loins to the infide, for that it preffeth the nerves differninated thence into the bladder; therefore it caufeth a flupidity or numbrels of the bladder. Whence it is, that it cannot perceive it felf to be vellicated by the acrimony of the urin, and confequently it is not filired up to the expulsion thereof. But from whatfoever cause the oppreffion of the urin proceeds, if it perfevere for fome days, death is to be feared, unless either a Fever which may confume the matter of the urin, or a Scouring or Flux, which may divert it, thall happen thereupon. For thus by fray it acquireth an acrid and venenate quality, which flowing by the veins readily infecteth the mass of bloud, and carried to the brain, much moles it by reason of that similitude and fympathy of condition which the Bladder bath with the Meninger. But Nature, if pre-valent, eafily freeth it felf from this danger by a manifest evacuation by shool, otherwise it must neceffarily call as it were to its aid, a feverish heat, which may fend the abounding matter of this ferous fuppression of humidity out through the skin, either by a fensible evacuation as by sweat; because sweat and urin have one common matter: or elfe disperse and breath it out by transpiration, which is an insensible excretion.

CHAP. LI. Of blondy Urin.

The differen-Canles

Ome pifs pure blood, others mixt, and that either with urin, and then that which is expelled refembles the washing of flesh newly killed; or else with pas or matter, and that either alone or mixed with the urin. There may be divers causes of this symptom, as the too great quantity of bloud gathered in the body, which by the suppression of the accustomed and periodical evacuation, by the Courses or Hemorrhoids, now turns its course to the reins and bladder: the freeting afunder of some vessel by an acrid humour, or the breaking thereof by carrying or lifting of some heavy burden, by leaping, falling from high, a great blow, the falling of fome weight upon the loins, riding post too violently, the too immoderate use of venery, and lastly, from any kind of painful and more violent exercise, by a rough and sharp stone in the kidnies, by the weakness of the retentive faculty of the kidnies, by a wound of fome of the parts belonging to the urin, by the too frequent use of diuretick and hot meats and medicins, or else of things in their whole nature contrary to the urinary parts; for by these and the like causes, the reins are oft-times so inflamed, that they necessarily impoliumate, and at length the impoliume being broken it turns into an ulcer, casting forth quitture by the urin. In fo great variety of the causes of bloudy urin, we may gather whence the causes of this fymptom may arife; by the depraved action of this, or that part, by the condition of the flowing bloud, to wit, pure or mixt, and that either with the urin alone, or with Par. For example, if this Signs of what bloudy matter flow from the lungs, liver, kidnies, diflocated Verthre, the straight gut, or other the like part: you may differn it by the seat of the pain and symptoms, as a Fever: and the propriety of the pain, and other things which have preceded, or are yet prefent. And we may gather the fame by the plenty and quality; for if, for example, the pur flow from an ulcer of the arm, the purulent matter will flow by turns, one while by the urin, fo that little is call forth by the ulcer; then prefently on the contrary the urin becomes more clear. That purulent matter which flows from the lungs by reason of an Empyems, or from the liver, or any other bowel placed above the midriff, the pas which is cast forth with the urin, is both in greater plenty and more exactly mixed with the urin than that which flows from the kidnies and bladder. It neither belongs to our purpose, or a Surgeons office either to undertake, or deliver the cure of this affect. It thall fuffice onely to note that the cure of this symptom is not to be hoped for so long as the cause remains. And it this bloud flow by the opening of a veffel, it shall be staid by astringent medicins; if broken, by agglutinative; if corroded or fretted afunder, by farcotick.

causes they proceed.

Cure.

CHAP. LII.

Of the Signs of the ulcerated Kidnies.

Had not determined to follow or particularly handle the causes of bloudy urins, yet because that which is oceasioned by the ulcerated reins or bladder more frequently happens, therefore I have thought good briefly to speak thereof in this place. The figns of an ulcer of the reins are, pun in the loins, matter howloever maxt with the urin, never evacuated by it felt, but always flowing

from the blad-

der.

forth with the Urin, and refiding in the bottom of the Chamber-pot, with a fanious and red fediment, flefly and as it were bloudy fibres fwimming up and down in the Urin, the finell of the filth for which is not fo great as that which flows from the ulcerated bladder, for that the kidnies, feeing they are of the kidnies is a fleshy substance, do far better ripen and digest the purulent matter than the bladder which is ner-less stinking which flow

CHAP, LIII.

Of the Signs of the ulcerated Bladder.

Leers are in the bottom of the Bladder, and the neck thereof. The figns of an ulcer in the Differences.

Bladder are, a deep pain at the thare-bones; the great ftench of the matter flowing therefrom, white and thin skins fwimming up and down in the water. But when the Ulcer pofferfieth the neck of the bladder, the pain is more gentle, neither doth it trouble before the Patient come to make water, but in the very making thereof, and a little while after.

But it is common both to the open and the control of the water and the control of the patient come to make water, but in the very making thereof, and a little while after.

But it is common both to the one and the other, that the Yard is extended in making water, to wit, by reason of the pain caused by the Urin fretting of the ulcerated part in the passage by: neither is the matter seen mixed with the Urin, as is usual in an ulcer of the upper parts, because it is poured forth not together with the Urin, but after it.

CHAP. LIV.

Prognosticks of the ulcerated Reins and Bladder.

Leers of the kidnies are more eafily and readily healed than those of the bladder; for fleshy Why useers of parts more speedily heal and knit than bloudless and nervous parts. Ulcers which are in the bladder the bottom of the bladder, are incurable, or certainly most difficult to heal; for belides with more the contained Ulrin for all the contained Urin, for all the Urin is never evacuated: now that which remains after making water, becomes more acrid by the distemper and heat of the part, for that the bladder is always gathered about it, and dilated and firatined according to the quantity of the contained Urin: therefore in the *Ifebraia*, that is, the suppression or difficulty of making water, you may formetimes see a quart of water made at once. Those which have their legs fall away, having an ulcer in their bladder, are near their deaths. Ulcers arising in these parts, unless they be consolidated in a short time, remain

CHAP. LV.

What Cure must be used in the suppression of the Urin.

N curing the suppression of the Urin, the indication must be taken from the nature of the dif- scopes of cueafe, and cause thereof, if it be yet present or not. But the diversity of the parts by which being ring hurt, the Ischwis happens, intimates the variety of Medicins, neither mult we prefently run to diureticks, and things breaking the flone, which many Empericks do. For hence grievous and malign To what support supports often arise, especially if this suppression proceed from an aerid humour, or bloud pressed arise diagrams and also are the about the suppression of the suppression of the support to the support of the suppression out by a bruife, immoderate venery, and also more vehement exercise, a hot and acrid potion, as of ricks must not Canthurides, by too long abftaining from making water, by a Phlegman, or ulcer of the urinary parts. So afed,
For thus the pain and inflammation are increased, whence follows a gangrene, and at length death.
Wherefore attempt nothing in this case without the advice of a Phylician, no not when you must come to Surgery. For diureticks can scarce have place in another case, then when the urinary passes are obstructed by gravel, or a gross and viscid humour, or else in some cold Country, or in the when to be application of Narcoticks to the long, although we must not here use these before we have first made used. application of Narcoticks to the loins, although we must not here use these before we have first made used. use of general Medicins: now Diureticks may be administred fundry ways, as hereafter shall ap-

Trochifces to heal the ulcers of the Kidnics.

Drink in flead of Wine.

CHAP. LVI.

gar, and two drams of choice Cinamon added thereto, and fo let it be kept for usual drink.

Of the Diabete, or inability to bold the Urin.

What Dissitt The Caufes,

Why the Urins are we-terifh,

The Cure.

Narcotick things to be applied to the

He Disbete is a Difease, wherein presently after one hath drunk, the Urin is presently made in great plenty, by the diffolution of the retentive faculty of the reins, and the depravation or immoderation of the attractive faculty. The external causes are the unseasonable and immoderate use of hot and diurctick things, and all more violent and vehement exercises. The internal causes are the inflammation of the Liver, Lungs, Spleen, but especially of the kidnies and bladder. This affect must be diligently distinguished from the excretion of the morbifick causes by Ulrin. The loins in this disease are molested with a pricking and biting pain, and there is a continual and unquenchable thirst: and although this disease proceed from a hot distemper, yet the Urin is not coloured, red, troubled, or thick, but thin, and white or waterish, by reason the matter thereof makes very small stay in the Stomach, Liver, and hollow Vein, being presently drawn away by the heat of the Kidnies or Bladder. If the affect long endure, the Patient for want of nourishment falleth away, whence certain death ensues. For the cure of fo great a disease, the matter must be represed which course of sease the instrument of the season and conference the leader of the left. be purged, which causes or feeds the inflammation or phlegman, and consequently bloud must be let-We must abitain from the four cold feeds, for although they may profit by their first quality, yet will they hart by their diaretick faculty. Refrigerating and aftringent nourithments must be used, and fuch as generate groß humours; as Rice, thick and aftringent wine mixed with much water. Exceeding cold, yea narcotick things shall be applied to the loins, for otherwise by reason of the thick nefs of the mufcles of those parts, the force, unless of exceeding refrigerating things, will not be able to arrive at the reins; of this kind are Oil of white Poppy, Henbane, Opinm, Purllain, and Lettuce feed, Mandrage, Vinegar, and the like: of which Cataplasms, Plasters, and Ointments, may be made fit t corroborate the parts, and correct and heat.

CHAP. LVII.

Of the Strangury.

What the Strangury is. The Caufes.

He Strangury is an affect having some affinity with the Diabete, as that wherein the water is involuntarily made, but not rogether at once; but by drops, continually and with path. The external causes of a Strangury are, the too abundant drinking of cold water, and all too long fiay in a cold place. The internal causes are, the defluxion of cold humours into the Urinary parts; for hence they are refolved by a certain palfie, and the @bintler of the bladder is relaxed, fo that he cannot hold his water according to his defire : inflammation also and all diffemper causeth this affect, and whatfoever in fome fort obstructs the passage of the Urin; as clotted bloud, thick phlegm, gravel, and the like. And because, according to Galers opinion, all forts of difference may cause this disease, divers Medicins shall be appointed according to the difference of the difference. Therefore against a cold difference fomentations shall be provided of a decoction of Mallows, Rotes, Origanion, Calamint, and the like, and fo applied to the Privities: then prefently after, let them be anounted with Oil of Bays, and of Castareum, and the like. Strong and pure Wine shall be preferibed for his drink, and that not onely in this cause, but also when the Strangury happens by the occafrom of obliruction, caused by a gross and cold humour, if so be that the body be not plethorick. But it inflammation, together with a Plethora or fulness, hath caused this affect, we may, according to solve and when he will be taken away according to solve and with the solve he will be taken away. Galens advice, heal it by bloud-letting. But if obstruction be in fault, that shall be taken away Diureticks either hot or cold, according to the condition of the matter obfiructing. We here omit to focak of the Dyfuria, or difficulty of making water, because the remedies are in general the same with those which are used in the Isebania, or suppression of Urin.

CHAP.

CHAP. LVIII.

Of the Colicks

Henfoever the guts being obfirmeted, or otherwife affected, the excrements are hindred from passing forth, and if the fault be in the small guts, the affect is termed Volvulus, Ifrom paffing forth, and if the father of in the managers, the ances is certified populars, as less, and Misserer mei; but if it be in the greater guts, it is called the Colick, from the What Iless, or part affected, which is the Colon, that is, the continuity of the greater guts; but especially named Colon, or the Colick cours. What Colick ally that portion of the greater guts, which is properly and especially named Colon, or the Colick-gut. Therefore Avien rightly defines the Colick, A pain of the guts, wherein the excrements are difficultly Colick is.

evacuated by the fundament. Panins Eginesa reducethall the causes of the Colick, how various for Lib. 3. ever, to four heads: To wit, to the groffness or toughness of the humors impact in the coats of the Lib. 3. c. 43. guts: Flatulencies hindred from paffage forth; the inflammation of the guts; and laftly, the collection of aerid and biting humors. Now we will treat of each of thefe in particular. Almost the fame causes produce the groffness of humors and flatulencies in the guts, to wit, the use of flatulent and phlegmatick, tough and viscid meats, yea also of such as are of good nourithment, if fundry thereof, and of sundry kinds be eaten at the same meal, and in greater quantity then is fit. For hence crudity and obstruction, and at length the collection of flatulencies, whereon a tensive pain ensues. This kind of Colick is also caused by the use of crude fruits, and too cold drink, drunken especially when any is too hot by exercise, or any other way: For thus the stomach and the guts continued thereto, are refrigerated, and the humors and excrements therein contained are congealed, and, as it were, bound up. The Golick which is caused by the inflammation of the kidneys, happens by the sympathy of the reins pained or troubled with the tione or gravel contained in them or the ureters. Therefore then also pain troubles the Patient at his hips and loins, because the nerves, which arifing from the vertebre of the loins, are oppreffed by the weight of the stones and gravel, about the joynt of the hip are differninated into the mufcles of the loins and thigh. Also the ureter are pained (for they feem nothing else but certain hollow nerves) and also the cremaster muscles, fo that the Patients tefficles may feem to be drawn upwards with much violence. Hence great phlegmatick, and cholerick vorniting, and fweat of the whole body, all which do not forcease before that the flone or gravel shall be forced down into the bladder. Now vomiting happens in this affect, for that the ventricle by reason of its continuity and neighbourhood which it hath with the guts, suffers by consent or sympathy. For the stomach is of the same kind or matter as the guts are, so that the guts feem nothing else but a certain production of the stomach. Therefore if at any time Nature endeavour to expel any thing that is troublesome in the kidneys, uneters, coats of the guts, mefentery, paneress, and hypocondries, it causeth a Colick with pain and vomiting. An hot and dry flow a hot disdifferenter also causeth the Colick, prducing a pricking and biring pain, by drying the excrements seth the colick; thur up in the guts, as also by wasting, as it were, the radical humors of that place provided for the lubricating of the guts. Acrid, vilcid and tough phlegm caufeth the fame. There is also another the cause of the Colick which is not so common; to wit, the twining of the guts, that is, when they the guts the are so twined, folded, and doubled, that the excrements, as it were, bound in their knots, cannot cause of the colick. be expelled, as it manifestly happens in the rupture called Enterocele, by the falling of the guts into the cod: Likewife also Worms generated in the Colick-gut, whilst that they mutually fold or twine themselves up, do also twine the Colon it self, and fold it with them. Also the too long stay of the excrements in the guts, whether it shall happen by the peculiar default of the too hot and dry body of the Patient, or by his diet, that is, the use of too dry meats, or exercises and pains taken in the heat of the Sun, or by the greatness of business, the mind being carried away, causeth the Colick, with Head-ach, and plenty of vapors flying upwards.

I remember I once diffected the body of a Boy of fome twelve years old, who had his guts fold. An History. ed with many, as it were, ties or knots of the restrained, too hard and dry excrements, the which he cast out by his mouth a little before his death, which brought him to his end, being not helped in time by fitting medicines. Now these are the causes of the Colick, according to the opnion of the Ancient and Modern Phylicians, of whole figns I judge it not amils here to treat in Signs whereby particular. You shall know the Patient is troubled with the Stone-colick, by the pain which is we know that fixed, and, as it were, kent in one place, to wir, of the kidness, by his former quanter of life, the colick fixed, and, as it were, kept in one place, to wit, of the kidneys; by his former manner of life; the coas if the Patient hath formerly voided flones or gravel together with his urine; by the pain of this can the hips and tefficles for the formerly mentioned causes; and lastly, by that the Patient catheth cause. forth by stone or urine, for that the great and laborious endeavour of Nature to cast forth the stone which is in the Kidneys, is propagated by a certain fympathy and like fludy of the neighbouring parts, flirring up the expulsive faculties each to his work. The figns of a flatulent colick are, a tenfairs, thring up the expanse factors each to instead to get the guitary factor with a noise or rumbling in the belly. The force of the shur-up wind is sometimes so great, that it rendeth or teareth the guts in sunder, no otherwise than a Swines bladder too hard blown up: Which when it happens, the Patient dies with much vomiting, because the stomach oppress with wind, can contain nor imbrace no meat. The Colick which is occasioned by the too long keeping in of the excrements, is accompanied with the weight and pain of the belly, the tension of the guts, head-arch, apparent hardness. hardness of the belly, and the complaint of the Patient that he hath not gone to flool in a long fation. That which proceeds from a cholerick inflammation, yields a fense of great hear and pulfaction in the midft of the belly, by reason of the veins and arteries which are in the paneress and coats of the guts, and there are the other figns of a Phlegmon, although also this, as it were, inflammation may arise also from falt, acrid and viscous phlegm, which Nature can neither expel upwards by some by vomit, nor downwards by stool; this fundry times is affociated with a difficulty of making wa-

BOOK XVII Of divers preternatural Affects, 410 ter, for that when as the right gut is inflamed, the bladder is preffed by reason of their society or neighbourhood. The Colick which proceeds from the conulion of the guts, shews it self by the excessive cruelty of the pain arising, for that the guts are not in their due site and place, and because the excrements by their too long detention acquire a preternatural heat; and this is the cause of the death of many such as have ruptures, for that the gut falling down from the natural place into the cod, being a preternatural place, is redoubled, and kept there, as it were, bound, whereby the excrements being baked, becoming more actidly hot, cause inflammation, and by raising up flatulencies, increase the diffension through all the guts, until at length a deadly Ileos or colick arising, they come forth at the mouth. For prognosticks, it is better to have the pain in the colick to wander up and down, than to be fixed: It is good also that the excrements are not wholly supprest. But Avien. lib.3. Hip. aphor. 10. the evil figns that are here, pronounce the affect either difficult or deadly. Now these shew that it is devdly, intolerable tormenting pain, continual vomiting, cold fweat, coldness of the extreme parts, hicketing by reason of the sympathy the stomach hath with the guts, a phrensie by the confent of the brain with the ftomach, and oft-times a convulsion, by drawing the matter into the nerves. But such as have griping and pain about their navil and loins, which can neither be helped by medicine nor otherwise, it ends in a Dropfie. The cure must be diversified according to the variety The cure. of the causes, for the Stone-colick is cured by medicines proper to the stone; that which is caused by an Enterseele, is cured by the only relioning the gut to its place; that which is occasioned by Worms, requires medicines ht to kill and cast forth the Worms. But that which proceeds from the weakness and refrigeration of the guts and stomach, is cured by heating and strengthning medicines as well applied outwardly, as taken inwardly by the mouth, or otherways. The beginning of the cure of that which is occasioned by tough phlegm and flatulencies, is by the mitigation of the pain, seeing there is nothing which more dejects the powers than pain. To this purpose shall you provide Baths, Semicapia, fornentations of Mallows, Marih-mallows, Violet leaves, Peny-royal, Fennel, Origanum, the feeds of Thyme and Fenugreek, flowers of Camomil, Melilote, and other fuch Earlis and alike, which have power to heat, dry, attenuate and rarifie the skin, so to diffipate the wind. But all An ointment, must be actually hot. Also the belly may be anointed with this following oyutment. R. Olei chament. aneth. butyr. recent. an. 3 i. sem. apii, petros. & galang. an. 3 s. Aq. vite, ol. salvie ant Thymi chimici extrail. q.s. The following liniment is much commended by Hollerius. ... Olei.rut. & nardi an. 3 vi. Galbani cum aq. vit. diffoluti 3 ii. Liquefaciis fimul adde zibeta gr. iii). Croci, gr. vi. Fiat linimentum. Alfo little bags made with Millet, Oats, and Salt fried with a little White-wine in a frying-pan, shall be applied hot upon the belly and flanks, and renewed before they grow cold. You may, inflead of these bags, use Ox-bladders half filled with a decoction of resolving things; as Salt, Rosemary, Thyme, Lavender, Bay-berries, and the like: Then inject a Clyffer being thus made. R. Quature entitle an. m.i. orig. puleg.calamenth. an. m. p. anifi, carni an. m. p. Flor. aneth. an. p.i. bulliant in hydromele ad 15 is in qua dissolve bened. laxat. meliu anthosati, sacc. rub. an. 3 i. Olei aneth. & chamam. an. 3 i . Leta clyster Why clyfters be made to be injected at twice; for the guts being firetched out cannot contain the accufromed defit must be given of a clyfter; Allo this following clyfter is much approved. Re Vini malvat & olei nucum an. 3 iij. Aqin less quantivite, 3 i. Olei juniperi & rut. per quintum effent actract. an. 3 iij. Let this be injected as hot as the Patient can endure. I have oft-times, as by miracle, helped intolerable pain caused by the Windcolick and Phlegm with this clyfler. Avien prescribes a carminative clyfler made of Hyffop, Ori-gamm acorns, Anis-feeds, and English Galengal. Let the Patient feed upon meats of good juice and easie digestion, as Broths made with the yolks of Eggs, Saffron, hot Herbs, and a Nutmeg, let him drink good Wine, as Muscadine, or Hypocrass made with good Wine, so to heat the stomach and guts. For in Galen's opinion, all windiness is generated by a remiss heat. But if the pain shall continue, a large Cupping-glass thall be applied to the navel, todraw and diffipate the windiness; the belly shall be bound with strong and broad ligatures, to strengthen the guts, and discuss the matter of statulencies. The Patients taught by Nature to use this remedy, whilst none admonishing Specifick methem, they prefs the belly with their hands in the bitterness of pain. But if the pain cannot be thus appealed, we must come to such medicines as work by an occult property, as the dried gut of a Wolf, The cure of a for a dram thereof made into powder is given in Wine with good fuccefs. That Colick which is caused by a cholerick inflammation requires contrary medicines, to wit, blood-letting, and a refricholerick cogerating diet; potions made of Discatholism and Cassia dissolved in Barley-water, also cooling cly-flers. Avien prescribes narcoticks for that being cold, they are contrary to the morbifick cause which is hot and dry; such are pills of Philonium. Also pills of Hiera piera in the quantity of Div. with Opium and Saffron, of each one grain, may be used. Also Baths are appointed, made of water wherein Mallows, Marth-mallows, Violet leaves, flowers of white Lilies, Lettuce, Purflan have been boiled, to correct the acrimony of the cholerick and hot humors, whence the difease and symptom That Colick which is like to this, and proceeds from falt, acrid, thick and tough phlegm, is cured, the humor being first attenuated, and diffused, and at length evacuated by medicines ta-ken by the mouth and otherwise, according to the prescription of the learned Physician. But sen cures that which is occasioned by the suppression of the hardned excrements, and twining of them by meats which have an emollient faculty, fach as humecting broths, as that which is made of an old Cock tired with running, and threshed to death, and so boiled with Dill, Polypody, and a live of little Salt, until the flesh fall from the bones; also he useth detergent clysters, such as this which solows. R. Bete, m.i. Furfaris, p. i. ficus, nu. x. alth. m.i. First decotio ad the i. In qua dissolve niri of murie an. 3 ii. Sacc. 3 i. Ol. sesanni, 3 ij. and the Worms are killed which gave occasion to this affect. John of S. Germans, that most worthy Apothecary, hath told me that he saw a Gentleman, who when as he could not be freed from the pain of the colick by any means preferibed by learned Phylicians, at length by the coun-fel of a certain German his Friend, drank three ounces of oyl of Sweet-almonds drawn without fire, and mixed with fome White-wine and Pellitory-water, and fwallowed a leaden Bullet befineared with Quick-filver, and that Bullet coming prefently out by his fundament, he was wholly freed from his colick.

CHAP. LIX. Of Phlebotomy, or Blood-letting.

Hlebotomy is the opening of a vein, evacuating the blood with the reft of the humors; What Phlebothus Arteritomy, is the opening of an artery. The first scope of Phlebotomy is the evacua- tomy is. tion of the blood offending in quantity, although oft-times the Phylicians intention is to The use, draw forth the blood which offends in quality, or either way by opening a vein. Repletion, Repletion, which is caused by the quantity, is two-fold; the one advires, that is, to the strength, the veins two-fold. being otherwise not very much swelled: This makes men infirm and weak, Nature not able to bear his humor, of what kind soever it be. The other is termed ad vasa, that is, to the vessels, the which is to called comparatively to the plenty of blood, although the firength may very well away therewith. The veffels are oft-times broke by this kind of repletion, fo that the Patient calls and fpits up blood, or elfe evacuates it by the nofe, womb, hemorrhoids, or variets. The repletion The figns, which is ad varet, is known by the heaviness and wearisonmess of the whole body; but that which is ad vafa, is perceived by their diffension and fulness, both of them fland in need of evacuation.

But blood is only to be let by opening a vein, for five respects: The first is to lessen the abundance of blood, as in plethorick bodies, and those who are troubled with inflammation without any plenting blood.

The second is for diversion or revulsion, as when a vein of the right is opened to flay the blooding of the less works. The chief the second is the less when a vein of the less when the color of the less when the color of the less when the color of the less when a vein of the less when the color of th bleeding of the left nostril. The third is to allure or draw down; as when the Saplana is opened in the ankle, to draw down the courses in women. The fourth is for alteration or introduction of another quality 5 as when in sharp feavers we open a vein to breathe our that blood which is heated in the veffels, and cooling the relidue which remains behind. The rifth is to prevent imminent difeafes; as when in the Spring and Autumn we draw blood by opening a vein in fach as are subject to spitting of blood, the Squinancy, Plarifie, Falling-tickness, Apoplexy, Madness, Gout, or in fuch as are wounded, for to prevent the inflammation which is to be feared. Before blood-letting, if there be any old excrements in the guts, they shall be evacuated by a gentle Clyster or suppo fitory, left the mefaraick veins should thence draw unto them any impurity. Blood must not be From whence drawn from ancient people, unless fome present necessity require it, less the native heat, which is we must not but languid in them, should be brought to extreme debility, and their substance decay; neither draw blood. must any in like fort be taken from children, for fear of retolving their powers by reason of the tenderness of their substance, and rareness of their habit. The quantity of blood which is to be let, must be considered by the strength of the Patient and greatness of the disease: Therefore if the Patient be weak, and the disease require large evacuation, it will be convenient to part the letting of blood, yea by the interpolition of some days. The vein of the forehead being opened what it is new what it is neletting of blood, yea by the interpolition of fome days. The vein of the forenead being opened is good for the pain of the hind-part of the head, yet first we foment the part with warm water, that so the skin may be softer, and the blood drawn into the veins in greater plenty. In the Squinancy, the veins which are under the tongue must be opened atlant, without patting any ligagatures about the neck, for fear of strangling. Phlebotomy is necessary in all diseases which stop or hinder the breathing, or take away the voice or speech; as likewise in all contusions by a heavy stroke, or fell from high in an Apopleyy. Squinancy, and Burning-scaver, though the strength be not or fall from high, in an Apoplexy, Squinancy, and Burning-feaver, though the firength be not great, nor the blood faulty in quantity or quality, blood must not be let in the height of a Feaver. Most judge it fit to draw blood from the veins most remote from the affected and inflamed part, for that thus the course of the humors may be diverted, the next veins on the contrary being opened, the humors may be the more drawn into the affected part, and so increase the burthen and pain. But this opinion of theirs is very erroneous, for an opened vein always evacuates and burthens the next part. For I have findry times opened the veins and arteries of the affected part, as of the hands and feet in the Gout of their parts; of the temples in the Megrim; whereupon the pain always was formewhat affwaged, for that together with the evacuated blood; the malignity of the Gout, and the hot spirits (the causes of the Head-ach or Megrim) were evacuated. For thus Galon witheth to 13. Math. cap. open the arteries of the temples in a great and contumacious defluxion falling upon the eyes, or in alt. the Megrim or Head-ach.

CHAP. LX.

How to open a vein, or draw blood from thence.

How to place the Patient.

Rubbing the arm. Binding it before we open the vein.

He first thing is, to seat or place the Patient in as good a posture as you can, to wit, in his bed, if he be weak; but in a chair, if strong, yet so, that the light may fall directly upon the vein which you intend to open. Then the Surgeon shall rub the arm with his hand, or a warm linnen cloth, that the blood may flow the more plentifully into the vein: Then he shall bind the vein with a ligature a little above the place appointed to be opened, and he shall draw back the blood upwards towards the ligature from the lower part; and if it be the right arm, he shall take hold thereof with his left hand; but if the left, then with his right hand, pressing the vein in the mean time with his thumb a little below the place were you mean to open it, lest it should slip away; and that it may be the more swoln by forcing up the blood: Then with with his nail he shall mark or design the place to be opened, and shall anoint it, being so marked, with butter or oyl, whereby the skin may be relaxed, and the lancet enter more easily, and therefore the section may be the less painful. He shall hold his lancet between his thumb and fore-singer, neither too near, nor too far from the point; he shall rest his other three singers upon the Patients arm, that so his hand may be the more steddy, and less trembling. Then shall he open the vein with an Incision agreeable to the magnitude of the vessel, and the indisferent thickness of the contained blood, somewhat aslant, diligently avoiding the artery which lies under the Basilica, and the nerve or tendon of the two-headed muscle, which lies under the Median vein. But for the Cephalick, it may be opened without danger. As much blood as is sufficient being drawn, according to the mind of the Physician, he shall loose the ligature, and laying a little boulster under, he shall with a ligature bind up the wounded part to stay the bleeding, the ligature shall be neither too firait nor loose, but so that the Patient may freely bend and extend his arm; wherefore whilst that is in doing, he m

Of Capping-glaffes or Ventofes.

The use of Cuppingglasses,

Upping glaffes are applied especially when the matter conjunct and impact in any part is to be evacuated, and then chiefly there is place for scarification after the Cupping glaffes: yet they are also applied for revellion and diversions for when an humor continually flows down into the eyes, they may be applied to the shoulders with a great stame, for so they draw more firongly and essectionally. They are also applied under womens breasts, for to shop the courses slowing too immoderately, but to their thighs, for to provoke them. They are also applied to such as are bit by venemous beasis, as also to parts possessed by a pestiferous basho or Carbuncle, so to draw the poyson from within outwards. For (as Celsia saith) a Cupping glass where it is fastned on, if the skin be first scarified, draws forth blood; but if it be whole, then it draws spirit. Also they are applied to the belly, when any gross or thick windiness that up in the guts, or membranes of the Epigastriam, or lower belly causing the colick, is to be discussed. Also they are fastned to the Hypecondries, when as statulency in the liver, or specen, swells up the entrail lying thereunder, or in too great a bleeding at the nose. Also they are set against the reins in the bottom of the belly, whereas the unevers run down to draw down the stone into the bladder, when as it stops in the middle or entrance of the unever. You shall make choice of greater and lesser cupping glasses, according to the condition of the part, and the contained matter. But to those parts whereto these cannot by reason of their greatness be applied, you may sit homs for the same purpose.

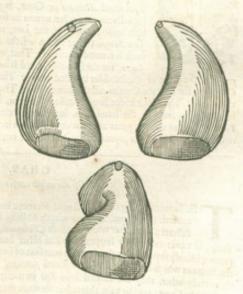

The Figures of Cupping-glasses of different bigness, with little boles in their bottoms, which shall be stapped with wax, when you apply them to the parts; but opened when you would take them off, that so the air may enter in with the more ease.

Of Leeches, and their ufe.

The use of Leeches.

How to apply them.

How to cause them to fall off,

N those parts of the body whereto Cupping-glasses and horns cannot be applied, to those Leeches may for the most part be put, as to the fundament, to open the coat of the Hemor-thoid veins, to the mouth of the womb, the gums, lips, nose, fingers. After the Leeches be-ing filled with blood, shall fall off, if the disease require a large evacuation of blood, and the Ing filed with blood, that fall off, if the difference require a large evacuation of blood, and the part affected may endure it, Cupping-glaffes, or Horns, or other Leeches shall be fublituted. If the Leeches be handled with the bare hand, they are angred, and become fo fromachful, as that they will not bite; wherefore you shall hold them in a white and clean linner cloth, and apply them to the skin, being first lightly scarified, or bestreamed with the blood of some other creature; for thus they will take hold of the sless, together with the skin more greedily and fully. To cause them fall off, you shall put some powder of Aloes, Salt or Ashes upon their heads. If any defire to know how much blood they have drawn, let him sprinkle them with Salt made into powder, as soon as they are come off; for thus they will vomit up what blood foever they have fucked. If you defire they thould fock more blood than they are able to contain, cut off their tails as they fuck, for thus they will make no end of fucking, for that it runs out as they fuck it. The Leeches by fucking, draw the blood not only from the affected part whereto they are applied, but also from the adjacent and diffant parts. Also fometimes the part bleeds a good while after the Leeches be fallen away, which happens not by scarification after the application of Cupping-glasses or Horns. If you cannot stop the bleeding after the falling away of the Leeches, then press the half of a Bean upon the wound, until it stick of it self, for thus it will stay; also a burnt rag may be fitly applied with a boul-

Of the Gout.

CHAP. I.

The description of the Gout.

What it is.

Particular

fter and fit ligature.

He Cout is a difease occupying and harming the substance of the joynts by the falling down and collection of a virulent matter accompanied by four humors. This word Arthritis or Gout, is general for every joint to affected; yet it enjoys divers particular names in fundry joynts of the body; as that which falleth upon the joint of the Jaw, is termed Siagonagra, for the Greeks call the Jaw Siagon; that which affects the neck is termed Traebelagra, for that the neck is termed Trachelos: That which troubles the back-bone is called Rhate lagra, for the spine is termed Rhacis: That which molests the shoulders Ones

gra, for the joynt of the shoulder is called Omor: That which affects the joynt of the collar-bones Cleifagra, for that the Orecks call this bone Cleir: That in the elbow Pechyagra, for Pechya fignisheth the elbow: The Gout in the hand is called Chinagra, in the hip Ischias, in the knee Gonagra, in the feet Podagra, for that the hand, hip, knee and foot are in Greek termed, Cheir, Ifchion, Gonia and Pour. When as there is great abundance of humors in a body, and the Patient leads a federatry life, not some one, but all the joynts of the body are at once troubled with the Gout.

CHAP. II. Of the occult causes of the Gout.

He humor caufing the Gouti snot of a more known, or eafily express nature than that which caufeth the plague, Lues venrea, or Falling fickness. For it is of a kind and nature clean different from that which causeth a Phlegmon, Ocdema, Eryspelas, or Scirrbus; for as Action - faith, it never cometh to suppuration like other humors, not for that, as I think, because it hap-Lib.12.cap.12. pens in bloodless parts, but through the occasion of some occult malignity. Hereto may be added, that the humors which cause the fore-mentioned tumors, when as they fall down upon any part, not then truly when they are turned into Par or matter, do they cause so that which caufeth the Gout, for the pain thereof is far more tharp, than of that humor which caufeth an ulcerated Cancer. Befides these humors, when they fall upon the joynts through any other occasions never turn into knots, only that which caufeth the Gout in the joynts, after it hath fallen thither, is at length hardned into a certain knotty, and, as it were, plafter-like substance to be amended by 100 remedies. But seeing it offends not the parts by which it flows down (no more than the matter which creeping upwards from the lower parts to the brain, caufeth the Epilepie) as foon as it fal-eth into spaces of the joynts, it causeth cruel pain, one while with heat, another while with cold-

The refem-Gout or the Epileptie,

For you may fee fome troubled with the Gout, who complain that their pained joynts are burnt; there are others to whom they feem colder than any ice, so that they cannot be sufficiently heated to their hearts defire; verily you may fonetimes fee in the fame body troubled with the Gout, that the joynts of the right fide will, as it were, burn with heat, but on the left fide will be fliff with cold; or which is more, the knee in the fame fide to be tormented with a hot diftemper, and the ankle troubled with a cold. Laftly, there fometimes happens a fuccetion of pain in a fuccetii. The firance on of days, as the fame joynts will be this day troubled with a hot, to morrow with a cold different variety of per, fo that we need not marvel to fee Phylicians prefcribe one while hot, another while cold medi-cines against the fame difease of the fame part and body. Also it sometimes happens that the malignity of this humor doth not only not yield to medicines, but it is rather made worfe, so that the Patients affirm that they are far better when they have none, than when they have any remedies applied. For all things being rightly done, and according to reason, yet the discase will come again at certain feafons by fits; and hereupon it is faid by Horace:

> Qui cupit, aut metuit, juvat illum sic domus aut res, Ut lippum pille tabule, fomenta podagram. Riches the covetous, and fearful fo do pleafe, As Pictures fore eyes, Bathes the Gout do eafe-

Certainly fuch as have this difease hereditarily, can no more be helped and throughly freed therefrom, than those in whom the matter of the difease is become knotty, whereof Ovid thus fpeaketh:

> Tollere hodosam nescit medicina podagram. Physick the knotty Gout it cannot heal.

These reasons have induced many to believe, that the effence of this disease is unknown, for there is a certain occult and inexplicable virulency, the author of fo great malignity and contuma-cy; which Aries feems to acknowledge, when he writes that there is a certain kind of Gout whose Lib. 3. sett. 21. matter is so acute and malign, that if it at any time be augmented by the sorce of anger, it may suffer traft, 2-top, sice to kill the party by sudden death. Therefore Gales himself writes that Treade must be used in all Lib. do there and Archaelical and acute affects. Arthritical and gouty affects, and as I think for no other reason, than for that it dries, wastes, and Pijosem. c. 15. weakens the malignity thereof. Gordanius is of the fame opinion, but addeth withal, that the body must be prepared and purged before we use Treacle. Therefore the matter of the Gout is a The matter of the Gout parthin and virulent humor, yet not contagious, offending in quality rather than quantity, caufing the Gout particle than quantity, caufing the Gout particle than quantity that the contagion of the contagions of t extreme pains, and therefore infligating the humors together with the caliginous and flatulent (pi-cult malignirits prepared or ready for defluxion upon the affected parts. Therefore as the bitings of Afps, and ty. flingings of Wafps cause cruel pain with sudden swelling and bliftering, which is by the heat of the humors which the poyfon hath tainted, and not by the timple folution of continuity, feeing that we daily fee Shoo-makers and Taylors pricking their fleth with auls and needles, without having any fuch fymptom: So the virulency of the Gout caufeth intokrable tormenting pain, not by the abundance, because it happens to many who have the Gout, no fign of defluxion appearing in the joynts, but only by a malignant and inexplicable quality, by reason whereof these pains do not cease unless abated by the help of medicines, or nature, or both. The recital of the following Historian and the following the Gout. ries will give much light to that inexplicable and virulent malignity of the matter cauting the Gout. An History. Whilit King Charles the ninth of happy memory, was at Burdeaux, there was brought to Chappellain and Castellan the Kings Phylicians, and Taje a Phylician of Burdeaux, Nicolas Lambert and my felf, Surgeons, a certain Gentlewoman fome forty years old, exceedingly troubled for many years, by reason of a tumor scarce equalling the bigness of a Pease, on the outside of the joynt of the left hip: One of her tormenting his took her in my presence; the presently began to cry and roar, A terrible size of the property of the left hip: and rathly and violently to throw her body this way and that way, with motions and geffures above a womans, yea a mans nature; for the thrust her head between her legs, laid her feet upon her shoulders; you would have faid the had been possessed of the Devil. This is held her forme quarter of an hour; during all which time I heedfully observed whether the grieved part swelled any bigger than it was accustomed, whether there happed any new inflammation; but there was no alteration as far as I could gather by fight or feeling, but only that the cried out more loudly when as I touched it. The nt passed, a great heat took her, all her body ran down with fiveat, with so great weariness and weakness of all her members, that the could not so much as fiir her little finger. There could be no forfpicion of an Epileptick, for this woman all the time of her How an Epi-agony did perfectly make use of all her senses, did speak, discourse, and had no convultion. Nei-leptick fit dif-did the spare any cost or diligence, whereby the might be curred of her discase by the help of Physi-cians or famous Surgeons; the consulted also with Witches, Wizzards, and Charmers, so that the had left nothing unattempted, but all art was exceeded by the greatness of the discase. When I had thewed all thefe things at our confultation, we all with one confent were of this opinion, to apply a potential Cautery to the grieved part, or the tumor. I my felf applied it; after the fall of the Eschar very black and virulent sames slowed out, which freed the woman of her pain and difeafe for ever after. Whence you may gather, that the cause of fo great evil was a certain venedifeate for ever after. Whence you may gather, that the cause of 10 great evil was a certain vene-nate malignity, hurting rather by an inexplicable quality than quantity; which being overcome and evacuated by the Cautery, all pain absolutely ceased. Upon the like occasion, but on the right arm, the wife of the Queens Coach-man at Ambaife, confulted Chappellain, Castellan and me, exu-estly craving ease of her pain, for the was so grievously tormented by its, that through impatien-cy, being careless of the first the endeavoyed to call her felt headless. cy, being careless of her felf, the endeavoured to catt her felf headlong out of her chamber window,

CHILD THE PARTY OF

for fear whereof she had a guard put upon her. We judged that the like Monster, was to be affaulted with the like weapon, neither were we deceived, for using a potential Cautery, this had like success as the former. Wherefore the bitterness of the pain of the Gout is not occasioned by the only weakness of the joynts, for thus the pain should be continual, and always like it self; neither is it from the difference of a simple humor, for no such thing happens in other tumors of what kind soever they be; but it proceeds from a venenate, malign, occult and inexplicable quality of the matter: Wherefore this disease stands in need of a diligent Physician, and a painful Surgeon.

CHAP. III.

Of the manifest causes of the Gout.

The first primitive cause of the Gout)

Lib.de aere, loc. & aqua. Lib.1.cap.19.

Lib. 3. fee. 22. traff. 2. cap. Another primitive cause of the Gout.

Alph.19.fell.9.

The antecedent cause of the Gour.

The conjunct

Five causes of the pain of the Gour. What and how the matter of the Gout comes down from the brain.

Lthough these things may be true which we have delivered of the occult cause of the Gout, yet there be and are vulgarly assigned others, of which a probable reason may be rendred, wherein this malignity, whereof we have spoke, lies hid and is seated. Therefore as of many other difeases, so also of the Gout, there are assigned three causes; that is, the primitive, antecedent, and conjunct: The primitive is twofold, one drawn from their first original and their mothers womb, which happens to fuch as are generated of gouty Parents, chiefly if whilli they were conceived, this gouty matter did actually abound and fall upon the joynts. For the feed falls from all the parts of the body, as faith Hippocrates, and Ariftotle affirms lib. de gen. animal. Yet this causes not an inevitable necessity of having the Gout, for as many begot of found and healthful Parents are taken by the Gout by their proper and primary default; for many live free from this discase, whose fathers notwithstanding were troubled therewith. It is probable that they have this benefit and priviledge by the goodness of their Mothers seed, and the laudable temper of the womb; whereof the one by the mixture, and the other by the gentle hear, may amend and correct the faults of the paterna! feed; for otherwife the difease would become hereditary, and gouty persons would necessarily generate gouty; for the seed followeth the temper and complexion of the arty generating, as it is shewed by Avicen. Another primitive cause is from inordinate diet, espeparty generating, as it's inewed by Assem. Another printide cause is from mordinate diet, especially in the use of meat, drink, exercise and venery. Lastly, by unprostrable humors which are generated and heaped up in the body, which in process of time acquire a virulent malignity; for these full the head with vapors raised up from them, when the membranes, nerves and tendons, and consequently the joynts become more lax and weak. They offend in feeding who cat much meat, and of fundry kinds at the fame meal, who drink ftrong Winewithout any mixture, who fleep prefently after meat, and which use not moderate exercises; for hence a plentitude, an obtinuction of the veffels, crudities, the increase of excrements, especiallyserous: Which if they flow down unto the joynts, without doubt they cause this difease; for the joynts are weak either by nature or accident, in comparison of the other parts of the body: By nature, as if they be loose and fost from their first original; by accident, as by a blow, fall, hard travel-ling, running in the Sun by day, in the cold by night, racking, too frequent venery, especially fuddenly after meat; for thus the heat is diffolved by reason of the diffipation of the spirits caused in the effusion of feed, whence many crude humors, which by an unleasonable motion are fent into the snews and joynts. Through this occasion old men, because their native heat is the more weak, are commonly troubled with the Gout. Belides also the suppression of excrements accuflomed to be avoided at certain times, as the courses, hemorrhoids, vomit, scouring, causeth this disease. Hence it is, that in the opinion of Hippogrates, a woman is not troubled with the Gout, unless her courses sail her. They are in the same case who have old and running uncers suddenly healed, or variees cut and healed, unless by a first course of diet they they hinder the generation and increase of accustomed excrements. Also those which recover of great and long diseases, un-less they be fully and perfectly purged, either by nature or art; these humors falling into the joynts, which are the reliques of the difeafe, make them to become gouty: And thus much for the The internal or antecedent cause is the abundance of humors, the largeness of the veffels and paffages which run to the joynts, the firength of the amandating bowels, the loofnefs, fortness, and imbecillity of the reviving joynts. The conjunct cause is the humor, it felf repact and thur up in the capacities and cavities of the joynts. Now the unprofitable humor, on every fide fent down by the firength of the expulsive faculty, fooner lingers about the joynts, for that of they are of a cold nature and denfe, fo that once impact in that place, it cannot be easily digefled and refolved. This humor then caufeth pain by reason of diffention or solution of continuity, diftemper; and befides the virulency and malignity which it requires. But it favours of the nature fornetimes of one fornetimes of more humors; whence the Gout is either phlegmonous, erylipelatous, oedematous, or mixt. The concourse of statulencies, together with the slowing down humors, and as it were turnult by the hinderance of transpiration, increaseth the dolorinck diffention in the membranes, tendons, ligaments and other bodies wherein the joynt confifts.

CHAP. IV.

Out of what part the matter of the Gout may flow down upon the joynts.

He matter of the Gout comes for the most part from the liver, or brain; that which defeends from the brain is phlegmatick, serous, thin and clear, such as usually drops out of the nose, endued with a malign and venenate quality. Now it passets out by the nussculous skin and Pericranium, as also through that large hole by which the spinal marrow, the brains substitute, is propagated into the spine, by the coats and rendons of the nerves into the spaces

of the joynts, and it is commonly cold. That which proceeds from the liver is diffused by the great vein and arteries filled and puffed up, and participates of the nature of the four humors, of which the mais of the blood confifts, more frequently accompanied with an hot diffemper, together with a gouty malignity. Besides this manner of the Gout, which is caused by defluxion, Gout by conthere is another which is by congestion; as, when the too weak digestive faculty of the joynts gestioncannot affimilate the juices fent to them.

CHAP. V.

The figns of the Arthritick butmer flowing from the Brain.

Hen the defluxion is at hand, there is an heaviness of the head, a defire to rest, and a dulness with the pain of the outer parts, then chiefly perceptible, when the hairs are turned up, or backwards; moreover, the mulculous skin of the head is puffed up, as fwoln with a certain ordematous tumor; the Patients feem to be much different from themfelves by reason of the functions of the mind hurt by the malignity of the humor, from whence the natural faculties are not free; as the crudities of the flomach, and the frequent and acrid belchings may tellifie.

CHAP. VI.

The fight of a gouty Humor, proceeding from the Liver.

He right Hypocondry is hot in fuch gouty perfons, yea the inner parts are much heated by the When the bowels, blood and choler carry the fway, the veins are large and fwoln, a defluxion fudden-proceeds ly falls down, efpecially if there be a greater quantity of choler than of other humors in the frees the despectation and a wheelift humors at these will be a greater quantity of choler than of other humors in the frees the despectation and a wheelift humors, then will be phlegm and a wheyith humor; then will it come to pass, that the Gout also, which proceeds from ver, affimilates phologin and a wheylin humor; then will it come to pals, that the Goat allo, which proceeds from ver, attentiate the liver, may be pituitous or phlegmatick, and participate of the nature of an actions, like that the nature of which proceeds from the brain. As if the fame mals of blood decline towards melancholy, the Goat which thence articth, refembles the nature of a feirrbus; yet that can fearce happen, that melancholy by reason of the thickness and showness to motion may fall upon the joyuts. Yet notwith-why the standing, because we speak of that which may be of these, it will not be unprotribable briefly to differences of Course to be always design these. flinguish the figns of each humor, and the differences of Gours to be deduced from thence.

snelancholy,

CHAP. VIL.

By what fight we may understand this or that humor to accompany the goury malignity.

On may give a guess hereat by the Patients age, temper, season of the year, condion of the Country where he lives, his diet and condition of life, the increase of the pain in the morning, noon, evening or night, by the propriety of the beating, pricking, tharp or dull pain; by numers, as in a melanchely Gout or Itching; as in that which is caused by tough phlegmatick by the sensible appearance of the part in shape and colour (as for example sake) in a phlegmatick Gout, the colour of the affected part is very little changed from its felf, and the neighbouring well parts, in a fanguine Gout it looks red, in a cholerick it is fiery or pale, in a melanchely livid or blackilh, by the heat and bignefs which is greater in a fanguine and phlegmatick than in the reft, by the change; and latily, by things helping and hurting. And there be fome, who for the knowledge of these differences, wish us to view the Patients urine, and feel their pulse, and consider these excrements, which in each particular nature, are accustomed to abound or flow, and are now fuddenly and unaccuttomarily suppress. For hence may be taken the signs of the dominion of this or that humor. But more ample knowledge of these things may be drawn from the humors predominant in each person, and the figns of tumors formerly delivered. Only this is to be noted by the way, that the Gout which is cansed by melancholy, is rare to be found.

CHAP. VIII. Prognafticks in the Goat.

Y the Writings of Phylicians the pains of the Goat are accounted amongst the most grievous and acute; fo that through vehemency of pain many are almost mad, and with themfelves dead. They have certain periods and fits, according to the matter and condition of the humor wherein this malign and inexplicable gouty virulency relides. Yet they more freof the humor wherein this manigh and an expirence good, in the former it was born with them, and implement and implement in the therefrom, as neither fuch as have it knotty: For in the former it was born with them, and implanspring and ted, and, as it were, fixed in the original of life; but in the other, the matter is become plafterfull.

That which proceeds from a cold and pituitous matter is the control of tuitous matter, caufeth not fuch cruel tormenting pain, as that which is of an hot, fanguine or cholerick caufe, neither is it fo fpeedily healed, for that the hot and thin matter is more readily diffolyed; therefore commonly it ceafeth not until forty days be pail : Befides also, by how much the Substance of the affected part is more deale, and the expulsive faculty more weak, by so match the pain is more tedions. Hence it is, that those Gonty pains which moles the knee, heel

tummus ...

Gal. ad aphor. 49. feet. 5.

tica caufeth lameneß.

and huckle-bone, are more contumacious. The Gout which proceeds of an hot matter, relis not before the fourteenth or twentieth day. That which is occasioned by acrid choler, by the bitternels of the inflammation of the pain caufeth a difficulty of breathing, raving, and fundry times a Gangrene of the affected part, and laftly death; and healed, it often leaves a palic behind it.
Whythe Scia- Amongst all the gouty pains, the Sciatica challengeth the prime place, by the greatness of the pain and multitude of symptoms; it brings unquietness and watching, a Feaver, Dislocation, perpetual lameness, and the decay of the whole leg, yea and oftentimes of the whole body. Now lameness and leannels, or decay of the part are thus occasioned, for that the decurrent humor forceth the head of the thigh-hone out of the cavity of the huckle-hone; this being forceth out prefed the mufcles, veins, arteries, and that notable and large nerve which runs along the thigh, even to the further joynts of the toes, and by the way is diverfly disperfed over the muscles of the whole leg: Therefore because the head of the thigh is put out of its place, the Patient is forced to halt's because the vessels and nerves are oppressed, the nourishment and spirits do not freely flow into the parts there-under, whence proceeds their decay. Yet it sundry times happens, that the head of the thigh being not displaced, many halt because the viscid humor, which is naturally implanted in that place, and continually flows thither, both for the nutrition of these parts, and the subrication of the joynt for quicker motion, is hardned by heat and idleness, and the other unprofitable humors which flow down to their concrete, and so intercept the liberty of motion. A gross and viscid humor in what joynt foever it falleth and flayeth, doth the fame. For by concretion it turns into a plaster-like nature at or near the joynt, possessing the cavities thereof, and it deprayeth the figure of the part, making it crooked and knotted, which formerly was firait and fmooth. Furtherdiffemperature caused by the defluxion of humors, if it thall lye long upon any part, deprayes all the actions, and oft-times wholly abolitheth them ; fo that there may be three causes of the leanness or decay of the joynt by the Gout, the obstruction or compression of the vessels, idlenefs, and an hec'tick diffemper: But two of lamenefs, diflocation and the concretion of an adventitious humor impact in the joynt. If contrary to custom and reason the pains of the Gout do not go away, or return at their accustomed periods, most grievous and dangerous diseases there-The causes of the lameness or decay of on follows for the matter accustomed to flow down into the joynts, if it seize upon the subtrance of the liver, causes a slegmon; if it stay in the larger veins, a continual Feaver; if it slow in the membrane investing the ribs, a Plurific; if it betake it felf to the guts, and adhere to their coats, How the Gout the Colick, or Iliaca passio: And to conclude, it produceth divers other symptoms, according to turns into the the diversity of the parts whereto it flows and abides. For thus fundry that have been treatbled with the Gout, become paralytick, because the matter, which formerly flowed down into the joynts, stays in the substance and pores of the nerves, and so hinders the spirit that it cannot freely in its whole substance pass through them: Hence therefore comes the resolution of the part, whereinto the nerve is inferted. Old men can never be quite or abfolutely cured of the Gout, for that the mass of their blood is so departed from its primary and native goodness, that it can no more be reftored, than dead or fowred Wine. The Gout, which proceeds from a cold cause, in-wadeth flowly, and by little and little, and is helped by the use of hot things; that which is from an hot matter quickly thews it felf, and is helped by the use of cold things. Now, although the Why the Gout Gout more frequently returns in the Spring and Fall, yet it comes in the midft of Winter, the nerves being weakned by the excess of cold, and the humors preffed out, otherwhiles in the Winter, and the midft of midft of Summer, the fame being diffused and dislipated. Lastly, it comes at any time or fea-fon of the year, if those who are subject to this disease freed plenteously, and do all things ac-cording to their own minds and defire. Those who are troubled with the Gout, feel and perceive change of weather, florins, rains, fnows, winds, and fuch like, before they come. A Southerly conflitution of the air, for example, fills the body with humidities, and flirs up the humors that lye quiet in the body; and therefore cause defluxions upon the weaker parts, such as the joynts, both by nature, as being without blood and flesh, as also by accident, for that they a long time have been accustomed to be so tormented; therefore their pains are increased in a wet feafon. Many of these that are troubled with the Gout, defire venery in the bitterness of their pain, because the internal heat wherewith they then are inflamed, doth not diffipate into fpirits and air, as the feaverish heat doth, but diffolves, and, as it were, melts down the feminal upon them, do humor, which diffolved, flows to the genitals, filleth and diltends them. The fame thing befals carriage and running horses, for in these by labour, much heat sends statulencies to the bottom of the belly. Yet venery is very hurtful to fuch as are troubled with Gout, because it diffipates the ful in the Gout. Spirits and native heat, and increaseth the unnatural heat; whereby it cometh to pass, that the nervous parts are weakned, and the pain exasperated. Rich men, that is, such as feed riotoutly on variety of dainties, and in the mean space live idly and lazily are more frequently and cruelly termented with the Gout than poor people, who live sparingly and hardly: Wherefore there have been seen not a few of such rich and riotous persons, who having spent their estates, therewith changed their health, together with their fortune and diet, and so have been wholly freed

CHAP. IX.

The general method of preventing and curing the Gout.

Aph.30-918.6.

Hofe who defire to prevent the Gout, must not glut themselves with meat, must be quick to labour, and abitain from Wine and Venery, or certainly must not use them unless for their healths sake, must vomit and purge at certain times. Hipportates writes, that bodies are not troubled with the Gout-before the use of Venery. Yet at this day many Eunuchs are seen

to have the Gout, but especially those who abound with idleness and pleasures, yet these we have heretofore mentioned are very effectual, not only for the prevention, but also for the cure of the prefent difease. Yet we must diligently distinguish the causes, what they be, and whence they may proceed, and oppose thereto remedies contrary in quantity and quality. There are absolutely three diffinct causes of Gout: A tainture from the Parents, a corruption of the humors by diet and air; a native, or adventitious weakness of the joynts. Against these there is a twofold indica- Two general tion: The first is the evacuation and alteration of the peccane humors, the other the strengthning foots of cu-for the weak joynts. These two shall be performed by diet conveniently appointed, purging bloodletting, provocation of the homorrhoids, courles, vomit, fweat, urine, and fit application of local medicines. Therefore, when the time shall come, wherein the Gout accustometh to return by course, the Patient shall have a care of himself by a diligent manner of diet, he shall lessen the matter of the difease by Phlebotomy (if that the Goet shall arise from the blood) from the opposite Whence blood part, that by the same means revultion and evacuation may be made y as if the upper parts be inflamed, blood shall be drawn from the lower; if on the contrary the lower, out of the upper, al. the Gow. ways observing the straitness of the fibres. Thus the right arm being troulbed with a goury inflamm ation, the Saphona of the right leg shall be opened, and so on the contrary; but if this general blood-letting being premifed, the pain shall not cease, it will be requisite to open the vein next

to the pain, which I have often performed with happy fuccefs. Yet Phlebotomy hath not the like effect in all, for it is not available to fuch as are continually what go and uncertainly troubled with gouty pains, or whole bodies are weak and cold, wherein phlegin perions find only is predominant. We may fay the fame of purging, for though it be oft-times necessary, yet too frequently re-iterated, it proves hurtful; furthermore, neither of these remedies is usually very profitable to fuch as observe no order in meat and drink, which use venery too intemperately, who abound with crude and contumacious humors, whose joynts by long vexation of the difease, have contracted an hectick diffemper and weakness, so that they are departed from their natural conflitution, and fuffer a great change of their proper fubflance. Wherefore as often as thefe greater In what Gour remedies shall be used, a Physician shall be called, who according to his judgment may determine diet proves more effectual theoretic flit in the called the more available than medicines. Therefore the Patient (if the than medicines) the Court has both shall either dieth as Wine at all the difference of the Court has both shall either dieth as Wine at all the difference of the Court has both shall either dieth as Wine at all the difference of the Court has been shall be added to the court of the Court has both shall either dieth as Wine at all the difference of the Court has both shall either dieth as well as a little of the court of the Court has been shall be added to the court of the Court has been shall be added to the court of the cour matter of the Gout be hot) shall either drink no Wine at all, or else very much allayed, that is, as eines. much as his cuftom and the conflitution of his flomach can endure. A fit time for purging and bleeding is the Spring and Autumn, because, according to the opinion of Hippocrates, Gouts reign chiefly Aph: 55-fell 6, in these seasons, in Autumn, for that the heat of the precedent Summer debilitateth the digestive faculty, the native heat being diffipated: As also the eating of Summer-fruits hath heaped up plenty of crude humors in the body, which eafily flow down into the paffages of the joynts opened and dilated by the Summers heat: Add hereunto, that the inequality or variableness of Autumn weakneth all nervous parts, and confequently the joynts. But in the Spring, for that the humors forced inward, by the coldness of the Winter, are drawn forth from the centre to the circumference of the body, and being attenuated, fall into the joynts upon a very small occasion, therefore there is great both necessity and opportunity for evacuation, which if it shall not avert the accustomed ht, yet it will make it more gentle and easie.

CHAP. X. Of Vomiting.

Omiting is by all the Antients exceedingly commended, not only for the prevention, but To what Goat also for the cure, especially when as the matter floweth from the brain and flomach; for vomiting is to the phlegmatick, serous and cholcrick humors, which usually flow from the joynes, are beused. excluded and diverted by vomit, and also there is attenuation of that phlegm, which being more thick and viscid, adhereth to the roots of the stomach: yet you must consider and see, that the Patient be not of too weak a florach and brain, for in this case vomiting is to be suspected. For the What time time, fuch as have excrementitious humors flowing down to the fromach through any occasion, as by exercise and motion, must vomit before they cat; on the contrary, such as are over-charged with therefore, an old congestion of humors, must vomit after they have eaten something. Certainly, it is fafer Vomiting after meat, than it is before. For the dry flomach cannot, unless with great contention and ffraining, free it felf from the viscid humors impact in the coats thereof; and hence there is no finall danger of breaking a vein or artery in the cheft or longs, especially if the Patient be straittheRed, and long-necked, the feafon cold, and he unaccustomed to such evacuation. I remember that An History, with this kind of remedy I cured a certain Gentleman of General, grievously molested with a cruel pain in his shoulder, and thereby impotent to use his left arm; the Phylicians and Surgeons of Lions feemed to omit nothing else for his cure. For they had used purging, phiebotomy, hunger, a diet-drink of Gnaiseum and China (although his difease was not occasioned by the Lines veerrea) and divers other topick medicines, nether yet did they any thing avail. Now learning by him that he was not apt to vomit, but that it was difficult to him. I wished him to feed more plen- How to make tifully, and that of many and fundry meats; as, fat meats, onions, leeks; with fundry drinks, as one vomit Bear, Ptifan, fweet and tharp Wine, and that he fhould, as it were, over-charge his fromach at eafily. his meal, and prefently after get him to his bed; for fo it would happen, that Nature not enduring to great confusion and perturbation of meats and drinks, whereof fome were corrupted already. dy in the fromach, and other-fome fearce altered at all, Nature not enduring this confusion and perturbation, would eafily, and of its own accord provoke the ftomach to vomit; which that it might the better fueceed, he should help forward Natures endeavour, by thrusting his singer or a teather into his throat, that fo the thick and tenacious phlegm might by the fame means be evacuated a

And not content to do thus once, I wished him to do the like the second and third day following Lik derst. vi- for fo it verifieth that faying of Hippocrates, The fecond and third day exclude the reliques of the first dis.

Afterwards, that he should vomit twice a month, chaw Mastick fasting, rub his neck and the pained part with Aqua vita, strengthned by infusing therein Lavander, Rosemary, and Gloves grossly beaten, confirm his arm by indifferent exercise: He performed all this, and so became free from his pain, and recovered the use of his arm. Those who do not like such plentiful feeding, shall drink a great quantity of warm water, wherein Radish roots have been boiled, and they shall have a care lest by using their stomachs to this excretion by vomit, they weaken the digestive and retentive faculty thereof. Wherefore fuch as can naturally, shall think it sufficient to vomit twice a month.

tery.

Pills:

Cephalick A Mafticatory.

He defluxion of ferous humors is very fitly diverted from the joynts by the urine, by the use of diuretick medicines. Therefore the roots of Sorrel, Parily, Ruseus, asturagus, and Grass, and the like, shall be boiled in Broth, and given to such as have the Gout: For when the urine floweth much and thick, the pain is lessened. Many have found benefit by iffues; for the Arthritick malignity flows forth of these, as by rivulets; experience shews it in such as are troubled with the Lucs venerea, for in those that you cannot overcome the malignity by the proper antidote, that is, Quick-filver, they feel no greater ease of the pain, then by application of Gausticks, and making of iffues. They shall be made in fundry places, according the difference of the pained joynts, to wit, in the beginning of the neck, if the defluxion proceed from the brain, and fall into the joynts of the collar-bones or shoulder; if into the elbow or hand, under the muscle Eponis; if into the hip, knees and feet, fome three fingers breadth under the knee, on the infide: For thus there will follow more plentiful evacuation, by reason that the Sapheia runneth down that way. Yet if the Patient be troubled with much bulinels, and must travel much on horse-back, then shall they be made on the out-fide of the leg, between the two bones thereof, that fo they may trouble him An adual cau- the less in riding. If any had rather use an actual Cautery, let him take such an one as is triangular and tharp, that to he may with more speed and less pain, perform that which he intends, and let him thrust it through a plate of iron which hath an hole therein, and let the plate be marked, left he should err; the ulcer shall be kept open, by putting in a pill of gold, silver, lint, or the root of Orris, Hermodactiles, Gentian, Wax, wherewith fome powder of Vitriol, Mercury or Alum shall be incorporated, left it should fill up with flesh sooner than the Physician shall think fit. In the mean space, the head, oft-times the original of the evil, shall be evacuated by taking in the Winter the pills Cochia, and de Affajoreth; but in Sunner fine quibus, or Imperiales, before the full of the Moon-Re Pul. hiera fimp. 3 i. agar. recent. troch. & rhei an. 3 ij. myrobal. chebul. 3 ft. Let it be put into linnen bags, with which, being warmed at the fire in a frying-pan, and kept with firring, the head shall be rubbed. Let the following medicine be chawed, and kept in the mouth in the form of a Masticatory, in the time of the falling down of the defluxion. By Cubebarum, nucle mofebas, glycyrebiz, and, and it is a likely and for the defluxion. By Cubebarum, nucle mofebas, glycyrebiz, and, and to mixed together. 3 ij. Mastieb. rad, stapbisarg, eryngii, an. 3 ij. Let them all be made into powder, and mixed together, and tied up in a little taffary to the bigness of a hafel-nut, and let them be rowled up and down the mouth with the tongue to cause spitting or falivation. Working with the hands, and frictions of the arms, especially in the morning after the evacuation of the excrements, are good for such as are troubled with the Gout in the feet, for fo, it not only caufeth revulsion from the feet, but also the refolution of that which is unprofitable.

CHAP. XII.

What diet is convenient for such as have the Gout.

Fter the body is once fed, they must not return to meat before that the concoction be perfeeted in the flornach, left the liver be forced to draw by the mefaraick veins that which is yet crude and ill digefted, and as it were forced thence. Whence the depravation of the Let them make choice of meat of good juice and easie digettion, rotted for fuch as are phlegmatick, but boiled for fuch as are cholerick: As they shall shun much variety one meal, so must amended in they efchew the afe of pulses, milk-meats, fallads, and tharp things; as verifice, vinegar, the juice of oranges, and citrons. They shall not eat unless they be hungry, and shall defit therefrom before they be fully satisfied, if it be but for this, that whilest the native heat is busied in the digestion of meat plenteously eaten, it is diverted from the concection of the noxious hungry. mors. The flesh of great fowl, as fwans, cranes, peacocks are not of laudable juice, and are with more difficulty digetted in the stomach. Some of the ancients have disallowed of the eating of capons, Capons subject and such like birds, because they are subject to be troubled with the Gout in the feet. Fishes are to the Gout. to be flunned, for that they heap up excrementitious humors, and are eafily corrupted in the flormach, yea and relax it by continual ufc. Of the fleth of beafts, yeal is most to be commended, for that it breeds temperate blood, and laudable juice, and is eafily digested. Neither in the mean time is matten to be found fault withall. But the like hunger or abilinence must not be appointed to all men troubled with the Gout, for fuch as are of a fanguine and cholerick complexion, because they Cholerick perare endued with much, and much wafting heat, are to be refreshed with more plentiful nourishment; for hunger sharpens choler, and so augments their pains; neither in the interim must they fasting. be fed with too much moift meats, for too much moifture, befides that it is the author of the putrefaction, will cause defluxions, and draw down the matter to the joint. Therefore the cholerick humor must be incraffated and refrigerated by taking things inwardly, and applying things cutwardly left by its tenuity it should fall down into the grieved parts. To this purpose conduce broths altered with lettuce, purssain, forrel, and the like herbs, and barly creams made with a decoction of the four cold feeds. Phlegmatick bodies, by reason that they have not so vigorous heat, do as it were carry their provant about them, wherefore they must not be fed, neither with many, nor with moist All that are troubled with the Gout, must thun those things that are hard of digestion, and which are foon corrupted, for they all have a certain remifs feaver, which diminishesh the native hear, and makes the meats ape to putrifie. Too plentiful drinking not only of wine, but also of any other liquor is to be avoided. For by too great a quantity of moithure the meat float in the fromuch and the native heat is in fome fort extinguished, whence proceed crudities. Some Phylicians commend the use of white wine, for that it provokes urine, which is not altogether to be disallowed, if so be that the body be free from excrements, otherwise by this, as it were a vehicle, especially if the temperature of the body be fornewhat more hot, they thall be carried down into the joints. Therefore in fuch a case I should rather advise them to use claret, which is somewhat weak and airringent, for that it doth not fo much offend the head nor joints, and it thuts and firengthens the ori-faces of the veffels, yet it will be more convenient wholly to abstain therefrom, and initead thereof to drink an Hydromel made after this manner: ik aque ib iv. melis opt. q. j. bulismt ad confumptionem th j. bene despumando, adde ad sinem salvie p. j. imo si ager su pitutosiu, cunanimi aut caryophylerum mo-mentum. For cholerick persons make a sugred water thus: R aque sontis th iv. sacchari . D. colerther per manicam fine ebullinione, addendo in fine cinnamomi jij. For thus the flormach thall also be fireng-charam, thened; also he may drink prifan, wherein at the end of the decoction thall be boiled forme dried rofes, or elfe forme fyrup of pomegranates added thereto, left it should offend the fromach; as focu as it comes from off the fire, let it stand and fettle, and then strain it through an hypocras bag, or clean linnen cloth.

bodies in faft-ing feed upon

CHAP. XIII. How to strengthen the Joints.

T is a matter of much consequence for the prevention of this evil, to strengthen the joints, whereby they may be able to resist the humors preternaturally falling down upon them. Wherefore it is good morning and evening to rub them withdeam ompharium, that is, oil made of olives
not come to their perfect maturity; or with oil of roles mixed with common falt finely powdered. not come to their perfect maturity; or with one to toles mixed with common taken mely powdered. It may also be mixed with common oil, adding thereto the powder of Harts-horn, as that which hath an aftringent and drying, faculty. Also it is good to bathe them in this following lee: Re core, granat, nucuou cupress, galarum, sumach corrie, querni, an. 1; falis com. alumin, roch, an. 3]. Assume the fattie, rorifman, lavendul, lauri, inc arthritic, an. m. j. rofar, rub, m. B. bulliant omnia in vi. It viii crassi to throughton of afringentia, of lixivio parato ex aqua chalibrata, of concrequence. Then foment the part with the joines. spanges or cotten cloths; after, this fomentation shall be carefully wiped and dried with hot linner cloths, taking heed of cold. The juice of unripe haws tempered with oxycrate is a fingular thing for The juice of this purpose. But if you defire to strengthen the joints weakned by a cold cause, then, it falvae, raris- have with o mar. thymi, lavendul.laur.abfinth.an. (th.). cary-phyl.zanzib.piperis.comman[atorum an. 3]. infundantur in aqua xycrate, with this liquor forment the joints. morning and evening. Some think it good to ftrengthen the joints, to tread grapes in vintage-time, which if they be not able to do, then let them wash their feet in the must or new pressed wine

obstruction and putrefaction, may prefently cause a scaver, and that intermitting, if it be small, and obstruct only the leffer veins, and these of the habit of the body. Wherefore then it is not sufficient that the Physician employ himself in the cure of the Gout, but it behoves him much to attend the cure of the feaver, which if it be continual, it discredits the Physician, and endangers the patient; if it be intermitting, it eafily becomes continual, unlefs it be withflood with fit remedies, that is, un-

lefs you let blood, the belly being first gently purged, and nature be prefently freed by a stronger purge of the troublesome burden of humors. Now it is convenient, the purge be somewhat stronger than ordinary.

than ordinary; for if it should be too weak, it will flir up the humors, but not carry them away, and

they thus agitated will fall into the pained and weak joints, and cause the Gout to encrease. By this

ir appears how decentful that conjecture is, which relies and is grounded on one fign, as often as we

CHITTING TO PE

Why ftrong purges mult be given to fuch as have the Gost, That judg-ment most certain which must pronounce judgment of morbifick caufes. Wherefore to conclude, we must think that opinion refis upon multiplicity of most certain concerning the matter of the disease, which is firengthned with multiplicity of figns, as those which are drawn from the colour of the part, the heat or coldness manifest to the touch,

less you let blood,

those things that help and hurt, the patients familiar and usual diet, temper, age, region, season of the year, propriety of pain, the exacerbation or excess thereof, in what days, and in what hours of the day, the length of these fits, the urine and other excrements coming from the patients body. But of the day, the length of thele his, the urine and other excelences coming nor the patients body but for that not a few are in that herefie, that they think that we must neither purge nor let blood in the Why we must Gout, we must here convince that opinion; For feeing that phylick is the addition of that which use parging wants, and the taking off those things that are superfluous, and the Gout is a discase which hath its estimate the convention of them by representation of them. fence from the plenty of abounding humors, certainly, without the evacuation of them by purging and bleeding, we cannot hope to cure, either it, or the pain which accompanies it. Metrius, in his Lib. de affell a-Treatife of the Gout writes, that it must be cured by purging, used not only in the declination, but bide Aribrit dealso in the height of the disease, which we have found true by experience; and it is consonant to guitar.

this saying of hipperater; In pains we must purge by the stool. Besides also, Galen prosesses and aphasa, sets, in great inflammations, severs and pains, he knew no greater nor surer remedy than to let blood, Lib. de car, per even to the fainting of the Patient. If those which are in this case shall not become better by pur- lag. missioner ging and phlebotomy conveniently prefcribed, then it happens by the means of drunkenness, gluttony, and the like distemper. For hence abundance of crude humors are heaped up, which by their contumacy yield themselves less obedient to medicines. Therefore such gouty persons as are intermediated. perate and given to gluttony and venery; may hope for no health by use of medicines.

CHAP. XV.

Of local medicines which may be ufed to a cold Gout,

Ittle do topick medicines avail, unless the body of the gouty patient shall be purged from excrementatious humors a besides also there is danger lest by the use of repelling meditis not see to cines, the virulency of the humor may be driven into the entrails, which thing hath use repercustives in the cause of sudden death to many. Now in the first place we will speak of local medicines good before which are thought meet for a phlegmatick juice, because this is more frequent, than that which purgingwhich are thought meet for a phlegmatick juice, because this is more frequent, than that which purging is from a hot cause. At the beginning in every Gout, the Sciatica excepted, we must use altringent things which have a faculty to bind or strengthen the joints, and to dry and waste the excrementitious humor. As, R fol. fabine m. (i. neuron capress 3 jii. aluminis roch. 3 j. gum. tragacanthe 3 iv. An aftringent mucilaginis pfilis & cyden, quantum sufficit, stat cataplasma. Or, R strength recents the meeting of cataplasm.

Cataplasma. Or else, R eleivosa. & myrilli an. 3 ji. buliant simul parum, fiat cataplasma. Or else, R eleivosa. & myrilli an. 3 ji. pulveris myribe & aloes an. 3 j. acacie. 3 ji. (s. incorporentur cum aqua gallarum collarum, & fiat unquantum. Some boil sage, camonile and melilote slowers, wormwood and danewort, of each A discussing a handful lin a sufficient quantity of vincear, then they not the grieved part into this decoction sometime. a handful in a fufficient quantity of vinegar, then they put the grieved part into this decoction fomentation being warm; and by frequent using this medicine, it hath been found to repel and consume the noxious humor, not only cold, but also cholerick; and also to strengthen the part. The fresh fecer of Olives laid to the part, affwage pain: dried Oranges boiled in vinegar, beaten and applied, do the fame. Or, Re medii corrieir ulmi fb β. canda equin. fixebad. confolid. majorir, an. m. β. One, parely aaluminis roch theris an. 3 iii. farin. bordei 3y. lexivii com. quantum fusficit, fiat estaplasine ad formam stringent and
pultis fatis liquids. Commonly then when as the part swelleth up, the pain is lessend, for that parely discutthe expulsive faculty driveth the humor from the center into the circumference of the part, that is,
img. from within outward; for in like fort, fuch as have the tooth-ach have lefs pain when their cheeks begin to fwell.

After repercuffives, we must come to those which evacuate the contained humor by evacuating or refolving it. For every defluxion of humors remaining in any part requires evacuation. Neither must we marvel thereat, if the digested humor doth not vanish at the first time; for we must have regard to the cold phlegm which is thick and viscid, as also of the part which is ligamentous, membranous and nervous, and confequently more dense than fielily parts. R rad. bry. Why the gotom. figili beat. Marie an. 31v. bulliant in lixivio, postes terantur, & colentur per setaceum, addendo fanot presently

changed in the fore, and now availeth, will in a short time become hurtful.

gainst the o

conjunct mar-

But if the the contumacy and excess of the pain be fo great, that it will not yield to the described medicines; then it is fit, because the disease is extreme, to use (according to Hippocrates coun-A great discus. sel.) extreme, such are are those which follow. Be axungia gallina, olei laurini mattie. & emplorite an. 3]. pulv. eupborb. & pyreth. an. 3]. first linus; herewith let the part be rubbed every day, for it is a very effectual medicine. For Eupborbium and Pellitory by their heat attenuate and refolve, the apons greafe and oil of bays relax, the oil of maffich firengtheneth the part and hindreth a new An Anodyne, defluxion. Also there is made a very anodyne ointment of oil of Foxes, wherein earth-worms, the roots of elecampane and bryony have been boiled, with a little torpentine and wax; this foftens, attenuates and refolves the cold humor impact in the joints. Or elfc, Re feminis finapi pulvisirati, & aceto acerrimo dissoluti, \(\frac{2}{3}\)ii. mellis anacerdani \(\frac{2}{3}\)ii. aque vite \(\frac{2}{3}\)i. \(\frac{2}{3}\)ii. com. \(\frac{2}{3}\)ii. let them be all mixed together, and applied to the pained part. Or, Re pieis nigre, \(\frac{2}{3}\)iii. terebinth, venete \(\frac{2}{3}\)i. slipbaris vivi subtiliter pulverssati \(\frac{2}{3}\)iii. olei quantum sufficit, siquessati fonul, siat emplastrum; let it be spread upon leather, and laid upon the part for two or three days space, if the patient perceive any ease thereby; if otherwise, let it be changed as we said before. Some for the same cover any ease thereby; if otherwise, let it be changed as we said before. purpose apply nettles thereto, and presently after wash the part in the sea or falt water. Others foment the part with vinegar wherein pigeons have been boiled. A veficatory made of very fower leaven, cantharides, and a little agus vite is very powerful to evacuate the conjunct matter. For thus the malign and virulent ferson, or whayith humor is let out, whence follows fome case of the pain. Now there are forme gouty pains, which cannot be leffened or affwaged unless by remedies more powerful than the difference, therefore vesicatories ought not to be rejected, seeing that the Ancients in this affect have also made use of actual cauteries, as we shall show hereafter. Christopher Andrew in his book termed Occentarie [that is, domestick physick] much commends Oxdung wrapped in cabbage or vine-leaves, and roufied in the embers, and to applied hot to the grieved part.

CHAP. XVI.

Of local medicines to be applied to a lot or funguin Gost.

What reperhere required.

Ere must we in the beginning make use of repercustives, such as are cold and dry, that they may contend with the morbifick matter by both their qualities; also let them be aftri-Ctive, fo to add firength to the part. But I would have you always to understand that you must first premise general medicines. Re albuminum overum nu. iv. succi lactuce & folani an. 3j. aq. rofar. 311. incorporentus funul, & fiat linimentum sepius renovandum. Others take the meal of barly, lentils, acatia, oil of roles, myrtles, and with a little vinegar they make a cataplain; Or, Refor mach, myrtillorum, boli arm, an. 3 5. acacia, corticum granat. balauft.an. 31j. aq. plantag. & rofar. an. 31ij.al. rofati 315. aceti 31j. farina bordei & lentium quantum fatis erit, fiat cataplasma. This is very excellent and effectual to flay or hinder phlegmonous and erylipelatous tumors. Alfo you may make a cataplasm ex mucagine Cidoniorum in aqua rosarum extració, cassia sistula, oleo rosato, & aceto : Ot, Re pampinorum vitis viridium, 11. ij. terantur & bulliant in oxycrato ex aqua fabrorum, cui adde sumach. conquassat. 3j.solei rosat. 3ij. farina hordei quantum sussieit, siat cataplasma. and preffed out again and applied thereto dott the fame. Or elfe, K. fol. caulium rub. m. ii. cognantur in oxycrato & terantur, adde ovorum vitellor tres, olei rofati žiii. farine b. rdei quantum fufficia, fingantur estaplasma. Also you may take the crude juice of cole-worts, dane-weed, and roses beaten and pressed out, and of these incorporated with oil of roses and barly-meal make a cataplasm. In winter-time, when as these things cannot be had green, you may use unquent. infrigidans Galeni & populem. Or elfe, R. cere albe 3i. croci 3i opii 3iv. olei rofati quantum fufficit, macerentur A cerate with opium & crocus in aceto, deinde terantur & incorporentur cum cera & oleo, fiat ceratum; fpread it upon opium. a eloth, and lay it upon the part, and all about it, and let it be often renewed. Some cut frogs open and apply them to the grieved part. It is confirmed by fundry mens experience, that pain of the Sciences, when it would yield to no other remedy, to have been affwaged by anointing the affected part with the mucous water or gelly of Snails, being used for the space of seven or eight days. The water that whereof was affured me by the worthy Gentleman the Lord of Longenium, a man of great honefly and credit, who himfelf was troubled for fix months space with the Sciation. This water is thus made, Take fifty or fixty red Snails, put them in a copper-pot or kettle, and fprinkle them over with common falt, and keep them fo for the space of a day, then prefs them in a coarse or hair cloth: in the expressed liquor dip linnen rags and apply them so dipped to the part affected, and renew them often. But if there be great inflammation, the Snails thall be boiled in Vinegar and Rofe-water They fay that Citrons or Oranges boiled in Vinegar, and beaten in a mortar, and incorporated with a little barly or bean flower, are good against these pains. Or elle, it, po-morum collorum in latte it, i. butyri 31, vitelios everum, no. ii. aceti 31, siat cataplasma. There are some who take cheef-curd newly made, and mix it in a mortar with oil of Rofes and barly-meal, and to apply it; it represent inflammation and asswageth pain. Others mix easie newly extracted forth of the cane, with the juice of Gourds or Melons. Others apply to the part the leaves of Coleworts, and Dane-weed or Smallage, or all three mixed together and beaten with a little Vinegar. Others macerate or freep an ounce of linfeed in Wort and make the mucilage extracted therefrom into a Cataplain with forne oil of Roles and barly-meal. Some put oil of poppies to the pulp of Citrulls or Gourds being beaten, and so incorporate them together, and apply it.

This following medicine hath its credit from a certain Gascoin of Basas that was throughly cu- An history: red therewith, when as he had been vexed long and much with gouty pains, above the common custom of she has are troubled with that disease. Thus it is, Take a great ridg-tile thick and strong. A particular and heat it red hot in the fire, then put it into such another tile of the same bigness, but cold, left show.

The water of

it should burn the bed cloths, then forthwith fill the hot one with fo many Dane-wort-leaves, that the patient may fafely lay the affected part therein without any danger of burning it. Then let the patient endure the heat that comes therefrom, and by fiveat receive the fruit thereof, for the space of an hour, substituting fresh Dane-wort-leaves, if the former become too dry; a salfo another hot rile, if the former shall grow too cold before the hour be ended. This being done, let the part be dried with warm and dry linnen cloths. Use this particular stove for the space of sit-

the part be dried with warmand or the part be dried with the morning fafting; afterward anoint the part with this following of the dried days, and that in the morning fafting; afterward anoint the part with this following of thement. R. fince ebull it i. B. olei com. This miferantur finual, and let them be put into a firaight An officement mouthed glass, and well luted up; then let it boil in balance Marie, being first mixed with some of the race of wine, until the half thereof be confumed, for the space of ten or twelve hours, then let it cool, Dane-wort,

003

timming.

and so keep it for use, adding thereto in the time of anointing, some few drops of squazzine. It may be anointed twice or thrice in a day, long after meat. Moreover; the roots and leaves of Dane-wort boiled in water, beaten and applyed affwage pain; the oyl thereof chymically extracted performs the fame.

When to use marcoeicks.

A cataplasim with opian.

But if the contumacious pain cannot be mitigated by the described remedies, and becoming intolerably hot and raging, make the patient almost to swoun; then must we slie to Narcoticks; For although the temper of the part may be weakned by thefe, the native heat diminished or rather extinguished; yet this is a far less inconvenience than to let the whole be wasted by pain. These things have a powerful refrigerating and drying faculty, taking away the sense of the pain, and furthermore, incraffate, thin acrid and biting humours, fuch as cholerick humors are. Wherefore if the matter which caufeth the pain be thick, we must abstain from Narcoticks, or certainly use them with great caution. R. mice pans scalin param colli in late, in vitelos overim, nu. ii. opi 3i. succerm solani, hyosyami, mandragore, pormiace, sempereno, an. 3i. let them be mixed together and applied, and often changed. Or esse, hyosyami cicine, accros, an. ii. buliant in experato & contundantin, comque vitelas overim cridosom nu. ii. & olei vojat. 3ii. farin. bordei quod fatis fit, incorporentur, fiat cataplasma; with the use thereof I am accustomed to asswage great pains. Or else, R. opii. 3iii. campbor. 38, olei nemph. 3i. taliir 3ii. noguent. ros. Ga-Ioni 31v. incorporentur famul in mortario, applicatur. Moreover, cold water applied and dropped upon the part drop by drop, is narcotick and flupefactive, as Hippocrates affirmeth, Apher. 29. Sell. 5. for a moderate numnels mitigateth pain. There is also another reason why it may be profitably used in all pains of the Gout, for that by repelling the humors, it hindereth their defluxion into the part. Mandrag-apples boiled in milk, and beaten, do the same things also the leaves of henbane, hemlock, lettuce, pursain, being so boiled do the same. If any defire to use these more cold, he must apply them crude, and not boiled.

But the excels of pain being mitigated, we must desist from the use of such narcoticks, and they most rather be strengthned with hot and digerating things; otherwise there will be danger less it be too much weakned, the temper thereof being defroyed, and so afterwards it may be show to mend subject to every kind of defluxion. Wherefore it shall be strengthned with the formerly discussion. the harm done fing fomentations, and these ensuing remedies. As, R. gum, ammoriaci & bdeliu an. 3i. disfolvan-by Narcotteks.

The harm done fing fomentations, and these ensuing remedies. As, R. gum, ammoriaci & bdeliu an. 3i. disfolvan-tur in aceto, & passentin per set acetom, addendo styracis liquid. & farin. sanuer. an. 3). pulv. ireos. 3iv. olei chamem. 3ii. pulveris pyrethri 3ii. cum cera, siat emplastrum mole. Yet you must use moderation in discussing, left the subtler part of the impact humor being discussed, the groffer part may turn into a frony consistence, which also is to be feared in using re-

percuffives.

Eaths affwage the pain of the

A mean to be

used in discus-

fing

How means of groß juice are profitable.

I also omitted, that according to the opinion of the Ancients, baths of fresh-water, wherein cooling herbs have been boiled, used three hours after meat, conduce much to the affwaging of pains for fo used, they are more convenient in cholerick natures, and spare bodies, for that they humeet the more, and quickly digeft the thin and cholcrick, and confequently acrid vapors, the pores being opened, and the humors diffipated by the gentle warmness of the bath. After the bath the body must be anointed with hydrelium, or oil and water tempered together, left the native heat exhale and the body become more weak. Meats of more groß juice are more convenient, as beef, theeps-feet, and the like, if so be that the patient can digest them, for these inspissate the cholerick blood, and make it more unfit for defluxion.

CHAP. XVIII.

What remedies must be used in pains of the joints proceeding of a distemper only, without matter.

An history.

Hip. ap. 10.60. Divers reme-dies for pain arifing from a cold diftemmamer.

Ains also happen in the joints by diffemper without any matter, which though rare, yet because I happined once to feel them, I have thought good to shew what remedies I used against them. I once earnestly busied in study, and therefore not sensible of such external injuries as might befal me; a little wind coming fecretly in by the crannics of my fludy, fell upon my left Hip; at length wearied with fludy, as foon as I rose up to go my way, I could not flund upon my feet, I felt fuch bitter pain without any fwelling or humor which might be different. Therefore I was forced to go to bed, and calling to mind, that cold, which was absolutely hurtful to the nerves, had bred me that pain, I attempted to drive it away by the frequent application of very hot cloths, which though they scorched and bliftered the found parts adjoining thereto, yet did they fearce make any impression upon the part where the pain was fetled, the distenper was so great, and so firmly fixed therein. And I laid thereto bags filled with fried cats and miller, and dipped in hot red wine; as also ox-bladders half filled with a decection of hot herbs.

And lastly, a wooden dish almost filled with hot ashes, covered over with sage, referrance, forth a lightly braifed, and fo covered with a cloth, which, fprinkled over with agus one, fent forth a vapor which affwaged the pain. Also brown bread newly drawn out of the oven, and sprinkled over with rose-water, and applied, did very much good. And that I might more fully expel this hurtful cold, I put flone bottles filled with hot water to the foals of my feet, that the brain might be heated by the straitness and continuity of the nerves. At length, by the help of these remedies, I was very well freed from this contumacious difference, when it had held me for the space of four A fuliginous - and twenty hours.

vapour fonie-There is another kind of Gouty pain formetimes canfed by a certain excrementitious matter, but for thin and fubtle that it cannot be differred by the eyes. It is a certain fuliginous or footy vapor, times the cause of the Gour.

like to that which paffeth from burning candles or lamps, which adheres and concretes to any thing that is opposed thereto; which being infected by the mixture of a virulent serous humor whitherioever it runneth, caufeth extreme pain, fome whiles in thefe, and otherwhiles in other joints, unless you make a way therefore, when as it feeketh paffage forth, which must be done by homs cupping glaffes, vehicatories, cauteries, or other the like art.

CHAP. XIX.

What is fit to be done after the fit of the Goar is over.

T is convenient when the pain is affwaged, that you firengthen the joints. Now, to firengthen How to firengthen them is not only to bind and dry, but wholly to amend the weakness left in the part by the then the joint difease, that is to difcuss the humor, if any superfluity thereof remain; but to humoer the part; if the moisture be exhausted and dryed up. But such as are troubled with the Gout, after they Remedies for are freed from their pain, have notwithflanding fuch impotency of their joints that they cannot the weaknets go of a long time after; for that the nerves and tendons which are in great number in the feet, joint after the go or a long time after 3 for that the fields and tenaous different in great number in the rect, being moithred with much Phlegm, are fo relaxed, that they can no more fulfain or bear them-felves upon their feet, than paper when it is wet can be made fland. Wherefore, that they may recover the use of their feet, the impacted humor must by all means be discussed, and spent with formentations, cataplasms, drying and aftringent emplasters. You may use the formerly described fomentation, encreasing the quantity of alam and falt, and adding thereto a like quantity of fur-fomentation, encreasing the quantity of alam and falt, and adding thereto a like quantity of fur-plus vision: then the following emplatter shall be applyed thereto. R. mass. omplate contrarappapour vienne. Acti the concoving emplater man be appayed thereto. W. may emplay, contra rupturam iv. tereb. 3ii. pulv. rof. rub. nucum eupreff. gallarum, gran. myrid. & fol. ejufdem, thuris, nuclich & caryophyl. an. 3i malexentur omnia finud, mambus injunditi oleo myrimo & matichino, fias emplastrum. Let it be spread upon leather to a just bigness, and applied to the top and foal of the foot. Draw over the plaffer, and the whole leg a focking made of a tanned-dogs-skin; this emplafter firengthneth the nerves, draweth forth the humor impact therein, and intercepts the defluxion. But the Dog-skin- a dog-skin a dog-skin below to the defluxion of the defluxion of the defluxion of the defluxion of the dog-skin and og-skin a flocking preferveth the native heat of the pare, and for that it bindeth, hindreth the defluxion into flocking.

pain is gone.

CHAP, XX.

Of the Tophi, or knows which grow as the joints of fuch as are troubled with the Gout.

Ome that are troubled with the Gout, have knotty buriches growing in their joints, which by the ancients were called Topbs. These are generated by the congestion of gross, viscid and Whence the crude Phlegm, with a little admixtion of an acrid and cholerick humor. These matters remain feeled in the part, for that it being too speak cannoe digeft and depress them; wherefore rated, being there impact, they eafily concrete into a certain platier-like or chalk-like fubflance, whileft by the adventitious and burning heat caused by pain, and the gouty malignity, their more subtle part is dispersed, but the grotter subsides. Yet fornetimes the unit application of repercusive The unit application. or discussive medicines is a cause of the generation of these Tophi. For by the former, the impact plication of matter is incraffated and gathered together it but by the latter, the labele part being difcussed, the remnant that subsides, concretes into Topbi. Those medicines which are made to molline, ought to have a moderately hearing, and humselting faculty, that they may diffuse, and as it were diffuse reposifolve the impact matter; fuch is warm water, the decoction of emollient herbs, the decoction of Mollifying calves or fleeps entrails, heads and feet a after these or the like fomentations, you shall use the medicine following medicine. CHAP. XXI.

Of Flatulencies contained in the joints, and counterfeiting true Gouts, and of the remedies to be used thereto

In what joints flatulencies are chiefly generated. Signs of flam-Iencies.

Ft-times there is finall quantity of humor, which moves the pain of the Gout but much flatulency mixed therewith, especially in great joints, as in the huckle or hip-bone, and the knees; they fometimes cause so great differition, that they drive the heads of the bones forth of their places. You may partly understand it is so, if a tensive pain afflict the patient with any fense of heaviness; if when you press the tumor with your fingers, the place retain no mark or impression thereof, as happens in an adoma; but on the contrary, a statulent spirit lifts it up as it were by renitency, as if one flould throft a pair of bellows, which are filled with wind; hence the part cannot perform its duty, for that the spaces of the joints are possessed with about dance of statulencies, so that the liberty of motion is intercepted, and the member is kept as it.

How flatulen, were bound up. Many no very skilful Surgeons, putting their singers to these kind of tumors, so cies may make that lifting up the one, they press down the other, when as they perceive the statulency, as it were you believe that lifting up the one, they press down the other, when as they perceive the flatulency, as it were there is pas, or matter already generated and thing they are so the statulency, as it were so the statulency. The statulency is the statulency as it were so that lifting up the one, they press down the other, when as they perceive the statulency, as it were so that lifting up the one, they press down the other, when as they perceive the statulency, as it were so that lifting up the one, they press down the other, when as they perceive the statulency, as it were there is pas, or matter already generated and the motion of pass, or matter already generated and the motion of pass, or matter already generated and the motion of pass, or matter already generated and the motion of pass, or matter already generated and the motion of pass, or matter already generated and the motion of pass, or matter already generated and the motion of pass, or matter already generated and the motion of pass, or matter already generated and the motion of pass, or matter already generated and the motion of pass, or matter already generated and the motion of pass, or matter already generated and the motion of pass, or matter already generated and the motion of pass, or matter already generated and the motion of pass, or matter already generated and the motion of pass, or matter already generated and the motion of pass, or matter already generated and the motion of pass, or matter already generated and the motion of thing flowed forth, it appeared how much they were deceived, yet in the interim, by this their raffiness they have caused many dangerous symptoms : as increase of pain, defluxion of humors, by force whereof the bones have been diflocated, and brought to the patient an incurable lamemels. But these flatulent Gouts are seldom without some plagmatick matter; which is neither too why hard to crude nor viscid. Such like flatulencies are not easily discussed, nor at the first endeavour, by reafon of a cold difference which they bring to the part, and the dentity of the membranes and liga-ments, by which the articulation is knit and fathed, fo that fearee any part of that which is there that up, can breath forth of fuch firait passages. Therefore the cure must be undertaken with refolving, difcuffing, and drying fomentations; as for example, with a decoction of fennel, anti-feeds, rue, canomil, melilote, fage, rofemary, origanum, calamints, hore-hound, and the like, boiled in wine with a little lee, rofe-vinegar, and common falt. This following ointment thall be le olei chamam, aneth, rut, lauri, an. 313, cum cerà alba, fiat linimentum. used after the fomentation. addendo aq. vies parum. After you have anointed it, apply thereto this following Caraplafin. CHAP. XXII. Of the Ischias, Hip-gont, or Sciatica.

momil, melilote, rue, common falt, adding thereto forne aqua vite. Then the part thall be bound up as firaight as the patient can endure it a in conclusion that the native firength may by little and little be rettored to the part it shall be formented with see made of the albest of oak-wood and the cuttings of vines, wherein shall be boiled falt, sulphur, choice alum; and wetting linnen clothes, or stoups therein, and applying them, it shall be firaitly swathed up. Yet if great pain shall more cruelly vex the part, then neglecting for a time the proper cure of the disease, you shall withstand the symptom by rubbing the part, and anointing it with fome difentling oil laying thereon fome moilt wool,

Why it hath the most griewous fympand other anodyne things.

The cause of the large spreading of the pain.

Or that the hip-gout in the greatness of other causes, bitternessof pain, and vehemency of other symptoms, easily exceeds the other kinds of Gout, therefore I have thought good to treat thereof in particular. The pain of the Sciatica is therefore the most bitter, and the fymptoms most violent for that the dearticulation of the buckle bone, with the head of the thigh-bone, is more deep than the reft; because also the phlegmatick humor which canfeth is commonly more plenteous, cold, grofs, and vifeid, that flows down into this joint : and lafily, because the Sciatica commonly succeeds forme other chronical difease, by reason of the translation and falling down thither of the matter, become malign and corrupt by the long continuance of the former discase. But the pain not only troubles the hip, but entring deep, is extended to the mufcles of the buttocks, the groins, knees, and very ends of the toes, yea often times it vexeth the patient with a fenfe of pain in the very vertebra of the loins, fo that it makes the patients and all the patients, and also oft-times the very Phylicians and Surgeons to think it the wind or ftone-The cause of such wandring and dispersed pain is to be referred to the manifold distribution of the perves which come to that joint from the joins and bily-bore, for they are fent into the mufcles of the buttocks, and fo disperfed over the whole leg to the very ends of the tees, as it is the wed in our Area. fhewed in our Anatomy. Therefore the pain is largely extended, that is, to what part foever a nerve runs which comes from the affected hip. Oftentimes there is no fwelling, no redness, nor diffemper manifelt to the eye, by reason that the veins are very few which rife into the surface and

skin of this part, and the humor lies, as it were, funk in; which is the cause that divers times the excrementitious humors mixed with flatulency, run fo violently into the cavity of this joint, that relaxing the ligaments, as well proper as common, the head of the thigh-bone is catily driven out from hence, so that it may never be restored again, if it remain so for any space of time, for The thigh that in this time the humor falling down into this cavity, by delay concretes as it were into a flo-ny body, and the head of the thigh-bone wears it felf another cavity in the neighbouring bone; but the lips of the true cavity, which are griffly, become more flraight and depreft; and lafily, all the ligamentous bodies moiftened with this excrementitious humor become more loofe and weak, whence fucceed many and most grievous symptoms; as lameness, and the decay not only of the thigh and leg, but at length of the wholebody; and laftly, a flow and heetick feaver, which in continuance of time will confume the Patient for the causes formerly mentioned. Therefore let Phylicians and Surgeons have a care that they refift it at the first, and, with such powerful remedies as are mentioned in the following Chapter, hinder the springing up and growth of the formerly mentioned symptoms.

CHAP. XXIII.

The care of the Sciatica.

Hough the Sciation be commonly occasioned by tough phlegm, yet if the patient be Why we must firong, and abound with blood, and all things elfe content, it thall be good to draw blood open a vein in the Sciatica, by opening a vein; for phlebotomy equally evacuates all humors: therefore the falling down of the humors into the part affected, is thereby hindred or retarded. Verily, I have known no speedier remedy to asswage the pain of inflammation, than blood-letting, being first made on the Basilies of the grieved fide for revulsions sake; and then for evacuation of the conjunct matter on the vona Ischiadica, which is at the out-side of the ankle, if the pain of the Sciatica be more when the von the out-side; or else on the Sapheia, which is on the inside of the ankle, if the inner parts be not likely in the pain of the satisfactory of the out-side. The quantity of blood which is to be drawn, must be left to the judgment of the physician, without whose advice I would attempt nothing in this case. Also acrid clysters are distributed by the satisfactory of the parts of the parts of the satisfactory of the parts of the parts of the satisfactory good, if there be nothing which may hinder; as ulcers of the guts, or hemorrhoids. Re rad. acov. tica. \$\frac{3}{2}\]i. centaur, rut. falv. rorifin. calam. origan. puleg. an. m. \$\frac{1}{2}\]inclind. arabic. flo.cham.melil. aneth.an.p.f.cm. anif. & funic. an. \$\frac{3}{2}\]i. fiat decotio ad Ib.j. in colatura diffolve hiera & diaphen, an. \$\frac{1}{2}\]i. melis anthof. facch. rub. an. 31. olei liliorum 31i), fiat elyiter. Strong purgations are also here useful, as of pillul, fatid, arthristica purgation. Affajoreth de Hermodallylis, and others used in phlegmatick causes. Eleitusrium Discarthami trons in the purgeth choler and phlegm. Often vomitings do not only evacuate the humors, but also make revulhon, as we have formerly delivered, Baths and fweats profit no otherwise than a decoction of Guaiscum or Sarfaparilla. If heat moleft the part, then foment it with oil of rofes and vinegar, ef-pecially if the pain be deep in, for vinegar by its tenuity pierceth to the bottom, and makes way for the oil, which of its own nature is anodyne. After the use of general medicines, you shall apply attractive and resolving things: emplaters of pitch and sulphur, or of automaticaem, emplorface or skin. As in like fort also the chymical oil of fage, rosemary, Pelistory of Spain, and other fuch like do the fame, which by reason of the tenuity of their substance, and their separa-tion from earthy impurity, have far more powerful and expedite faculties to penetrate and discuss. Yet must you use none of all these without very good judgment and deliberation, otherwise there will be danger of inflammation.

There may also be made fomentations of discussing and resolving herbs, as the roots and leaves of dane-weeds, orris, bay and juniper-berries, the feeds of fenugreek, anis, fennel, the leaves of fage, rosemary, chamomil, melilote, elder, and the like, boiled in wine and oil; the following fage, rolemary, chamomil, melilote, elder, and the like, boiled in wine and oil; the following platter is much commended by the ancients to digeft, or refolve and affwage the pain, with this which draws forth thoms, fplinters, and rotten bones. THE PERSON NAMED IN

The inner rind of Travellers-joy

Hip. alt. felt 6.

may be raifed by applying the inner rind of Travellers-joy to the weight of fome two drams, a little beneath the grieved part: you must have a care that the ulcers that remain after the skin of the blifters is taken off do run, and be kept open for fome time after, and fo more of the humor contained in the part may be drawn away. But if we cannot avail by these means, we must according to Hippocrates his counsel, come to the last and extremest remedy. Such (faith he) as are troubled with a long Lib. 4. cap. 22. pain of the Sciatica, have their hip fall out of joint, their leg consumes, and they become lame, unless they be Lib. 4. cap. 22. hurnt. We have also read the same approved by Celsus. It is the last (saith he) and most effectual medicine in longer diseases, to cauterize with hot irons, the skin of the hip in three or sour places; and then not beal up these ulcers or southerless of soon at may be, but to keep them open, by putting thereinto bullets of gold, or silver, or pills of gentian, or wax melted and wronght up with the powder of viriol, mercury, and the like eathersticky, until the affelt against which we use this remedy, be belped, for by this means many have been helped. Therefore three or sour actual canteries, or hot irons shall be thrust in, about the joint of the hip, that they may enter into the flesh some fingers breadth, yet so that you shun the nerves. Cauteries here do good, for that by heating the part, they heat and dissolve the cold humors, they cut, attenuate, and draw forth the gross, and viscid, so that they slow out by the ulcers, together with the quitture. Over and besides, the ligaments are firengthened by their cicatrization, and their loofeness helped, and by this means the whole part is notably corroborated.

The use of the Sciatica.

CHAP. XXIV.

Of the flatulent convulfion, or convulfive controllion, which is commonly called by the French, Gout Cramp, and by the English, The Cramp.

What the Cramp is.

The cause thereof.

Who fubject thereto.

The oure.

Hat which the French call Gont Cramp, we here intend to treat of, induced thereto rather by the affinity of the name, than of the thing; for if one fpeak truly, it is a certain kind of convulsion generated by a flatulent matter, by the violence of whose running down or motion, oft-times the neck, arms, and legs are either extended, or contracted into themselves with great pain, but that for a short time. The cause thereof is a gross and tough vapor, infinuating it self into the branches of the nerves, and the membranes of the muscles. It takes one on the night, rather than on the day, for that then the heat and spirits usually retire themselves into the entrails and centre of the body; whence it is that flatulencies may be generated, which will fill up, diffend and pull the part whereinto they run, just as we see lute-strings are extended. This affect often takes fuch as fwim in cold water, and caufeth many to be drowned, though excellent fwimmers, their members by this means being fo straightly contracted, that they cannot by any means be ex-tended: For the skin, by the coldness of the water is contracted and condensed, and the pores thereof that, so that the engendred flatulencies have no paffage forth. Such as give themselves to drunkenness and gluttony, or sloth and idleness, are usually more frequently troubled with this disease, by reason of their heaping up of crudities. Therefore it is cured by moderate diet, and order ing of the body, and exercise of each part thereof; for thus they gather stength, and the generation of the statulent matter is hindred. In the very time when it takes one, the patient shall be cured by long rubbing with warm cloths, and agua vite, wherein the leaves of fage, rofemary, thyme, favory, lavendar, cloves, ginger, and the like difcuffing and refolving things have been infufed. The extension and flexion of the members or joints, and walking, are also good.

The end of the Eighteenth Book

BOOK XIX.

Of the LUES VENEREA, and those Symptoms which happen by means thereof.

CHAP. I.

What the Lars #

He French call the Lucs Venerea the Neapolitan difease; the Italians and Germans (as alfo the English) term it the French difease; the Latines call it Pudendagra: others name it otherwife. But it makes no great matter how it be called, if the thing it felf be underotherwife. But it makes no great matter how it be called, if the thing it felf be underfitted:

fitted: Therefore the Lues Venera is a difease gotten or taken by touch, but chiefly that which is in unclean copulation; and it partakes of an occult quality, commonly taking its original from ulcers of the privy parts, and then further manifelling it self by puttles of the head, and other external parts; and lastly, insecting the entrails and inner parts, with cruel and nocturnal tormentation to the land, shoulders, joints, and other parts, it causes hard supplies and lastly, corrupts and fouls the bones, diffoliving them, the flesh about them being condition of each of them, the diffemper and evil habit of the affected bodies, and the inveteration or continuance of the morbisisch cause. For some lose one of their eyes, others both: Some

lose a great portion of their eye-lids, other tome took very gattry, and take the polar of their become squint-eyed. Some lose their hearing, others have their noses fall stat, the palat of their mouths perforated with the loss of the bone Ethmoides, so that instead of free and perfect utterance, they faulter and sumble in their speech. Some have their mouths drawn away, others their yards cut off, and women a great part of their privities tainted with corruption. There be some, who lose a great portion of their eye-lids, other some look very gastly, and not like themselves, and some cut off, and women a great part of their privities tainted with corruption. There be forne, who have the **Urethra* or paffage of the yard obstructed by budding caruncles, or inflamed putiles, so that they cannot make water without the help of a Catheter, ready to die within a fhort time, either by the suppression of the urine, or by a gangrene arising in these parts, unless you succor them by the amputation of their yards. Others become lame of their arms, and other some of their legs, a third fort grow stiff by the contraction of all their members; so that they have nothing left them found but their voice, which ferveth for no other purpose but to bewail their miseries, for which it is scant-ly sufficient. Wherefore should I trouble you with mention of those that can scantly draw their breath by reason of an Asibma: or those whose bodies waste with an heerick seaver, and slow confumption? it fares far worse with these, who have all their bodies deformed by a leprosie arising The Leprosie there-hence, and have all their throttles and throats even with putrid and cancrous ulcers; their fometimes the there-hence, and have all their throttles and throats even with putric and cancrous uncers; their hards and feet eleft with tetters and fealy chinks: neither is off fpring of their falling off from their heads, their hands and feet eleft with tetters and fealy chinks: neither is off fpring of the Law Penttheir case much better, who, having their brains tainted with this disease, have their whole bodies ret. flaken by fits of falling-fickness; who troubled with a filthy and curfed flux of the belly, do contimually calt forth flinking and bloody filth. Laftly, there are no kinds of difeases, no forts of symptoms, wherewith this disease is not complicate, never to be taken away, unless the virulency of this marrain be wholly taken away, and impugned by its proper antidote, that is, argentum vivum.

CHAP. II. Of the causes of the Lues Venerea.

Hele are two efficient causes of the Laus venerea; the first is, a certain occult and specifick quality which cannot be demonstrated; yet it may be referred to God, as by whose rea the securge and lafeivious lufts of unpure whoremongers. The other is an impure touch or contagion, and prin-morgers. cipally, that which happeneth in copulation, whether the man or woman have their privities troubled with virulent ulcers, or be moletted with a virulent firangury (which difeafe crafty Whores colour by the name of the whites) the malignity catcheth hold of the other; thus a woman taketh this difease by a man, casting it into her hot, open and moist womb; but a man taketh it from a wo-man, which for, example sake, hath some small while before received the virulent seed of a whoremafter polluted with this difease, the mucous fanies whereof remaining in the wrinckles of the womans womb, may be drawn in by the pores of the fianding and open yard, whence fucceed malign ulcers, and a virulent strangury. This virulency, like a torch or candle fet on fire, will by little and little be propagated and fent by the veins, arteries and nerves to the noble parts; whose malignity a firong liver not enduring, by the firength of the natural expulsive faculty, will fend it into the groins, whereon follow abfeeffes, therefore called Venereal Bubbes. These if they return in a-Venereal bugain, and cast not forth matter by being opened, will by their falling back into the veins and arte-boes returning ries, infect the mass of the blood by the like tainture, and thence will ensue the Lues Venerea: Yet from the Lass this difease may be got by a more occult manner of touch, as by breathing only. For it is not altogether belide reason and experience, that a woman long troubled with this disease, may by impor- The Last work he are tunate and often kiffing, transfuse malignity into a child; for the tender and foft substance of a reamay be goe little child may be altered, infected, and by little and little corrupted by receiving of filthy, and in communication whole kind malign vapors. For it is known, and now vulgarly believed, that mid-wives, on of vapor. by receiving the child of a woman infected with this difease, have got this affect, the malignity being taken and drawn into their bodies through the pores of their hands by the passage of the veins and arteries. Neither doth it spare any condition, fex, nor age of men : for not only who foever use copulation, but such as only lie with them, may be taken with this virulency; yea verily, if they only lie in the sheets or coverings which retain his sweat, or the virulency cast forth by an user. The fame danger may affail those who shall drink in the same vessel after such as are troubled with The larger may affail those who shall drink in the tame vestel after such as are troubled with this difease: For by the impure touch of their lips, they leave a virulent fanier and spittle upon the edges of the cup, which is no less contagious in its kind, than the virulency of leprous persons, or the forme of mad dogs. Wherefore it is no marvel if children nursed by an infected nurse, How nurses draw in the seeds of this disease together with the milk, which is only blood whitened in the maj infect breasts; or insected sucking children by their hot and ulcerated mouths, may transfuse this malignity into the body of the nurse, by the rare, loose and porous substance of the dugs which it frequently suckets. fucketh.

This following history is very memorable to this purpose. A certain very good Citizen of this an history. City of Paris granted to his wife, being a very chalte woman, that conditionally the should nurse her own child, of which she was lately delivered, she should have a sturse in the house to ease her of some part of the labour : by ill hap, the nurse they took was troubled with this difeafe; wherefore the prefently infected the child, the child the mother, the mother her husband, and he two of his children, who frequently accompanied him at bed and board, being ignorant of that malignity wherewith he was inwardly tainted. In the mean while the mother when the observed that her nurse-child came not forward, but cried almost perpetually, she asked my counsel to tell her the cause of the disease; which was not hard to be done, for the whole body thereof was replenished with venereal feabs and pustles, the hired nurses and the mothers nipples were eaten in with virulent ulcers; also the fathers, and the two other childrens bodies, whereof

tunning,

the one was three, the other four years old, were troubled with the like puttles and feabs. I told them, that they had all the Lucs Veneres, which took its original and first off-spring by malign contagion from the hired nurse. I had them in cure, and by Gods help healed them all, except the sucking child, which died in the cure. But the hired nurse was foundly lathed in the prison, and should have been whipped through all the fireets of the City, but that the Magistrate had a care to preserve the credit of the unfortunate family.

CHAP. III.

In what bumor the malignity of the Lucs Venerca refides.

Hough in the opinion of many the antecedent cause of this difease be the mass of blood containing the four humors, yet I had rather place the matter, and primary and chief feat thereof in groß and vifeid phlegm infected with the malign quality of the venereous venom, and from this beginning and foundation, I think by a certain contagious growth, it fooner or later infects the other humors, as each of them is disposed or apt to fuffer: Of which my opinion there are many arguments, but this chiefly, That by the evacuation of a phlegmatick humor, whether by the mouth and falivation, or by flool, urine, or fweat in men of what temper fo-ver, whether cholerick, fanguine or melancholick, the difease is helped or cured. Secondly, for Why the pain that the excels of pain is more by night than by day, because then the phlegm bearing sway, severs the periodeson from the bone, or else offends it and the rest of membranous and nervous bodies by the acrimony of its malignity. Thirdly, because the patients are hurt by the use of cold things, but usually find benefit by hot medicines, whether they be ointments, plaifters, furnigations, or whatfoever elfe, inwardly taken, or outwardly applied. Fourthly, for that in venereous puttles there is found a certain hardness at the root, though outwardly they make thew of choler or blood: For being opened, you thall find them stuffed with a certain plaister-like and tophous matter, or elfe with rough phlegm, or viscous pas , whence arise these hard tophi , or bony excrefcences upon the bones, if not from phlegmatick humors there heaped up and concrete. Fifthly, for that the spermatick and cold parts do primarily and principally feel the harm of this difease. Sixthly, for that the ulcers which over-spread the body, by reason of this disease, admit of no cure, unless you cause sweats. Therefore if the matter of the disease, and such ulcers as accompany it, were hot and dry, it would grow worfe, and be rather increased by a decoction of Guaisesom, the roots of China, or Sarfaparilla. Seventhly, because oft-times this disease, the feed thereof being ta-ken or drawn into the body, so lieth hid for the space of a year, that it shews no light thereof, which happens not in difeafes proceeding from a hot matter, which caufeth quick and violent motions. By this it appeareth that the Bufit and foundation of the Lucs Veneres is placed or feated in a phlegmatick humor: yet may not deny, but that other humors confused therewith may be also in fault, and defiled with the like contagion. For there are fearer any tumors which proceed from a fimple humor, and that of one kind, but as in tumors, fohere the denomination is to be taken from that humor which carrieth the chief fway.

is worfe upon the night, than on the day.

The difease fometimes lies long hid in the body before it thews it felf.

CHAP. IV. Of the figns of the Lues Venerea.

Hen the Lues Veneres is lately taken, malign ulcers appear in the privities, fwellings in the groins, a virulent strangury runneth oft-times with filthy fanies, which proceeds either from the proflate, or the ulcers of the urethra; the patient is troubled with pains in his joints, head, and shoulders, and as it were breakings of his arms, legs and all his members, they are weary without a cause, so that neither the foot nor hand can easily perform his duty their mouths are inflamed, a fwelling troubles their throats, which takes away their freedom of fpeaking and swallowing, yea of their very spittle; pustles rife over all their bodies, but chiefly certain garlands of them engire their temples and heads; the thedding or loss of the hair, difgra-ceth the head and chin; and leanness deformeth the relt of the body; yet all of these use not to The most cer- appear in all dodies, but some of them in some. But the most certain signs of this difease are, 2 callous ulcer in the privities, hard and ill conditioned, and this fame is judged to have the fame force in a prognoflick, if after it be cicatrized, it retain the fame callous hardness; the Buboes or swellings in the groins to return back into the body without coming to suppuration or other manifest cause, these two tigns, if they concur in the same patient, you may judge or foretel that the Luca veneres is either prefent, or at hand; yet this disease happeneth to many without the concourse of these two signs, which also bewraieth it self by other manifest signs, as ulcers and pustles in the rest of the body, rebellious against medicines though powerful, and discreetly applyed, unless the whole body be anointed with Argentum visum. But when as the difease becometh inveterate many become impotent to venery, and the malignity and number of the symptoms increase, their pains remain fixed and stables very hard and knotted tophi grow upon the bones, and off-times they become rotten and for become rotten and foul, as also the hands and feet by the corruption of falt phlegmare troubled with chops or clefts, and their heads are feized upon by an ophiafis and alopecia; whitish tumors with roots deep fastned in, arise in fundry parts of the body, filled with a matter like the meat of a chesnut, or like a tendon; if they be opened they degenerate into divers ulcers, as putrid, eating and other such, according to the nature and condition of the affected bodies. But why the pains are more gricyous on the night so feet and along the transfer of the pains are more grievous on the night scason, this may be added to the true reason we rendred in the precedent Chapter, first, for that the veneroous virulency lying as it were asleep is stirred up and enraged

rain figns of

the Lucs vers-

Two other causes of the excess of pain in the night.

by the warmnels of the hed and coverings thereof; fecondly, by reason of the Patients thoughts which on the night featon are wholly turned and fixed upon the onely object of pain.

CHAP. V. Of Prognofticks.

F the Discase be lately taken, affociated by a few symptoms, as with some small number of pusiles, The signs of a and little and wandring pains, and the body belides be young and in good cafe, and the conflictuable tution of the feafon be good and favourable, as the Spring, then the Cure is easie, and may be Ventue. happily performed. But on the contrary, that which is inveterate and enraged by the fellowship of anany and malign fymptoms, as a fixed pain of the head, knots and rottenness of the bones, ill-natured eleers in a body very much fallen away and weak, and whereof the cure hath been already fundry times undertaken by Empericks, but in vain; or elfe by learned Phylicians, but to whole remedies, approved by reason and experience, the malignity of the disease and the rebellions virulency hath refused to yield, is to be thought incurable, especially if to these so many evils this be added, that The signs of the Patient be almost wasted with a consumption and hectick leanness, by reason of the decay of the an incurable one. native moissure. Wherefore you must onely attempt such by a pulliative cure; yet be wary here in making your Prognotticks: for many have been accounted in a desperate case, who have recovered a for by the benefit of God and Nature, wenders oft-times happen in diseases. Young men who are of a rare or lax habit of body, are more subject to this disease, than such as are of a contrary habit and complexion. For as not all who are convertent with such as have the Plague, or live in a pefilient Air, are alike affected; fo neither all who lie or accompany with fuch who have the Lues Veneres, are alike infected or tainted. The pains of fuch as have this difficale, are far different from the pains of flow, thefe alike infected or tainted. the Gout. For those of the Gout return and torment by certain periods and first but the other are from those of continual and almost always like themselves, Gouty pains possess the joints, and in these condense a the Gout, w plaster-like matter into knots; but those of the Pox are rather fashned in the midst of the bones and at length diffolve them by rottenness and purrefaction. Venereous ulcers which are upon the Yard, are hard to cure, but if being healed, they shall remain hard and callous, they are figns of the difease lying hid in the body.

Generally, the Lucs Veneres which now reigneth is far more mild and easie to be cured then that The Luss Vewhich was in former times, when as it first began amongst us : besides, each day it seemeth to be more sente milder than other. Aftrologers think the cause hereof to be this, for that the celestial influences which than formerly first brought in this disease, in success of time by the contrary revolutions of the Stars, lose their power it was and become weak, so that it may feem somewhat likely, that at length after some few years it may wholly cease; no otherwise than the discase termed Mentagra, which was very like this in many Symptoms, and troubled many of the Romans in the reign of Tiberius; and the Lieben, which in the time of Claudius (who fucceeded Tiberius) vexed not onely Italy, but all Europe betides: Yet Phylicians had rather take to themselves the glory of this less raging disease, and to refer it to the many and wholfom means which have been invented, used and opposed thereto by the most happy labours

of noble Wits.

CHAP. VI.

How many, and what means there are to oppugn this Difease.

Any forts of remedies have been found out by many to oppugn and overcome this Difeafe. Why the desertion of Yet at this day there are onely four which are principally ufed. The first is by a deco-coction of Guaiseams, the fecond by Unction, the third by Emplatters, and the fourth by Functional is most fufficiently firm by Hydragyrum, the first excepted. Yet that is not fufficiently firming and to impount the first excepted. powerful; for experience hath taught, that the decocrion of Guatiscum hath not fashcient firength to difease, extinguish the venom of the venerous virulency, but onely to give it eafe for a time, for because it heats, attenuates, provokes Sweat and Urin, wastes the excrementitious humours by drying them; it feemeth to cure the difease, for that thereupon for some time the pain and all other symptoms feem more remiss: but these endeavours are weak and deceitful, as whereby that onely which is more subtle in the humours in fault, is exhausted and dispersed by sweat. But Hydrargyram is a certain higher Hydrargyram is a certain power, contains therein all the power of Guanamin, yet make the Sweat and Ulrin, and belides it ex- overcome the fides that it heats, attenuates, cuts, refolves and dries, it provokes Sweat and Ulrin, and belides it ex- overcome the fides that it heats, attenuates, cuts, refolves and dries, and Stool. By which evacuations diffeate. pels noxious humours upwards and downwards, by the Mouth and Stool. By which evacuations not onely the more fubtle, but also the more gross and feculeut excrements, wherein the feat of this difease is properly fixed, are dispersed and evacuated; by which the Physician may be bold to affire himself of certain victory over the disease. But after the use of the decoction of Guaiseum, fresh pains and knots arife by the reliques of the more grofs and vifcous humours left in the cavities of the entrails; but Hydrargyrum leaves no reliques behind it.

CHAP. VII.

How to make eboice of the Wood Guaiacum.

Hat is preferred before the rest which is of a great log, of a dusky colour, new, gummy, with a fresh strong smell, an acrid, and somewhat biting taste, the bark cleaving very close to the Wood. It hath a faculty to heat, rarise, attenuate, attract, to cause Sweat, and move The faculty.

timinum.

The parts.

The hot and fiery faculty of the bark.

Urin, and befides by a specifick property to weaken the virulency of the Lares Venerea. There are three fubliances taken notice of in this wood, the first is the bark, the other is a whitish wood which is next to the bark, the third is the heart of the wood, that is, the inner, blackish, and more dusky part The bark is more dry, wherefore you shall use it when as you would dry more powerfully; the middle fubflance is more moift, because it is more fucculent and fat; that which lieth between both, is of a mild temper: wherefore the two last are more convenient for delicate Natures and rare Bodies, which require lefs drying. Furthermore, the bark must be given to dense and strong Na-tures, that by the more stery force thereof, the humours may be made more shuid, and the passages of the body more paffable. But I would here be understood to mean such bark as is not putrid and rotten with age, to which fault it is very subject, for that long before it be shipped by our people, the wood lieth in heaps upon the shore in the open air, until they can find Chapmen for it; which when it is brought aboard, it is showed in the hold or bottom of the ship, where beneath by the Sea through the chinks of the boards, and above by the Mariners, it usually gathereth much dirt. When it is brought hither to us, it is bought and fold by weight, wherefore that it may keep the weight, the Druggifts lay it up in Vaults and Cellers under ground, where the furface thereof bedewed with much moisture, can scarce escape mouldiness and rottenness. Wherefore, I do not like to give the decoction either of the bark or wood which is next thereto, to fick people.

CHAP. VIII.

Of the preparation of the decollion of Guaiacum.

Gualarum to the Water. heat,

ges to a decoacam.

Hip, aph. nlt.

must be taken

How to dry the (wear of the body.

Mrst you must have your Guaiscum shaved into small pieces, and to every pound sof the shavings, add of fair water eight, ten, or twelve pints, more or lefs, as the nature of the party, and condition of the difeafe shall feem to require, according to the rule of the formerly mentioned Indications. Let the Water be hot or warm, especially if it be in Winter, that Stion ought to fo it may the more easily and throughly enter into the body of the wood, and draw into it felf the be performed faculties thereof in the space of twenty four hours, wherein it is macerated, then boil it in balnes, to avoid Empyreuma, or tathe of fire, which it will contract by boiling it over a hot fire. Yet fome nothing regard this, but think the Patient fufficiently served, if they make a decoction in an earthen pot well glazed over a gentle fire, fo that no part of the liquor may run over the mouth of the veffel, for that thus formuch of the strength of the decoction might vanish away. Howseever it be made, let it be boiled to the confumption of half, a third, or fourth part, as the nature of the Patient and Difease thall seem to require. There be some who mix divers Simples therewith, which have an occult and proper sympathy with that part of the body which is principally hurt by the Difease, which at the least may serve in stead of a vehicle to carry the faculties of the Whether it be decoction thither where the difease most reigneth. Others add thereto purging Medicins, whose judgment I cannot approve of, for that I think it is not for the Patients good to attempt two evacuations at once; that is, to expel the humours by Sweat by the habit of the body, and by purging by the belly; for that as much Urin, so also much Sweat shews little evacuation by Stool. For these two motions are contrary, which Nature cannot brook at once: For Purging draws from the Circumterence to the Center, but Sweat runs a quite contrary course, and this is the opinion of many and great Phylicians. This first decoction being boiled out and strained, the like quantity of Water shall be put to the stuff, or mass, that so being boiled again without any fur-ther intusion, and strained, with the addition of a little Cinamon for the strengthening of the Stomach, the Patient may use it at his meals, and between his meals (if he be dry) for his ordinary what quantity and it shall be drunk warm, that so it may be the sooner brought into action, and less the actual this decoction coldness should offend the storagh, and the storagh and the sto coldness should offend the stomach; and then the Patient being well covered, shall keep himself in bed, and there expect sweat, which is it come slowly on, it shall be helped forwards with stonebottles filled full of Water, and put to the foals of the feet. If any parts in the interim shall be much pained, they shall be comforted by applying of Swines bladders half filled with the same de-coction heated. Neither will it be unprobable before the decoction be drunk, to rub over all the body with warm linnen cloths, that by this means the humours may be attenuated, and the pores of the skin opened. When he shall have sweat some two hours, the parts opposite to the grieved places thall first be wiped, then presently, but more gently, the grieved parts themselves, lest a greater conflux of humours flow thereto. These things being done, he shall keep himself in bed, thunning the cold air until he be cooked and come to himself again, some two hours after he shall so dine, as the discase and his former custom shall seem to require; six hours after, betaking himfelf to his bed, he shall drink the like quantity of the decoction, and order himself as before. But if he be either weak, or weary of his bed, it shall be sufficient to keep the house without lying down; for although he shall not sweat, yet there will be a great diffipation of the vapours and venenate spirits, by insensible transpiration; for the Lucs Veneres by the onely communication of thele, often times catcheth hold, and propagates it felf in lying with a bedfellow tainted therewith. But it is requisite to have let bloud, and purge the body by the advice of a Physician, before the taking of the decection of Gusiacum; fo whileft he doth take it, it much conduceth to keep the helly foliable continues. the belly foluble (which is much bound by the heat and drinefs of fuch a drink) and to preferve the How long this purity of the first Veins by a Clyster, or laxative Medicin taken every fifth or fixth day. How long this decoction use of it, we must warily observe, taking indication, not onely from the malignity and contumacy use of the disease, but also from the particular nature of the Patient; for such as have their body was feed by heat and learness, and their skin dry and fealy (whence you may gather a great adultion of the humours, and as it were, a certain incineration of the habit of the body) must more sparingly

WINDSON,

make use of these things, but rather temper the body by humsetting things taken inwardly, and applied outwardly, as Baths, Ointments without Quick-filver, and other fuch like things: And then a very weak decoction of Guaiacum thall be used for a few days before your unction with Quickfilver. A more plentiful diet, as it draws forth the difease, which of its own nature is long, so a more sparing The manner and flender diet makes the ulcers more rebellious and contumacious, by a heelick drinefs,

Therefore a middle course must be kept, and meats made choice of, which are fit and naturally engender good and laudable juice in the body. For it is not onely great ignorance, but much more emel-ty to go about to contain all Patients without any difference, within the straight allowance of four ounces of Ship-bisket, and twelve damask Prunes: for I judge it far better to diet the Patient with Lamb, Veal, Kid, Pullets, fat Larks, and Black-birds, as those which have a greater familiarity with our bodies, than Prunes and the like Junkets. Let his bread be made of white wheat well leavened, neither too new, or tough, neither too old or hard. Let his drink be made of the mass or firainings To whom, and of the first decoction of Guaisenss boiled with more water, as was formerly mentioned; yet if there what manner arife any great weak sels of the faculties, you may permit the use of some little Wine, drinking espe- be allowed. cially before each, a cup of the last mentioned decoction. Let him avoid sleep presently after meat, for so the head is filled with gross vapors. Passions or perturbations of the mind must also be avoided, for that by these the spirits are inflamed and diffipated; all the delights of honest pleasure are to be defired, but venery wholly avoided, as that which weakens all the nervous parts. Many in flead of The deferipti-a decoction of Giusiacum, use a decoction of China. Now this China is the root of a certain Rush, on of China. knotty, rare, and heavy when it is fresh, but light when it is waxed old; it is also without smell, whence many judge it void of any effectual quality, it is brought into use out of India, it is thus prepared, it is cut into thin round flices, boiled in Fountain or River Water, and is given to Patients to drink morning and evening after this manner. R. Rad. chin. in taleol. fell. § ij. aque font. Ib xij. infundanter per bor. xij. & coquantur ad confumption, tertin partie. Let him take 3 vj. in the morning, and to much at night; let him expect a fweat in his bed: a fecond decoction may be made of the mass remaining of the first, but with a less quantity of water put thereto, which also by longer boiling may draw forth the firength remaining in the mals, and be used at meals for ordinary drink. There are fome who make a third decoction thereof, but that is wholly unprotitable and unufeful. Sarfaparilla Of Sarfaparilla is prepared also just after the same manner.

CHAP. IX.

Of the second manner of curing the Lucs Venerca, which is performed by Friction or Unition.

He Cure of the Luce Veneres which is performed by Unction and Friction is more certain, yet not in every kind, condition, and feafon thereof. For if the difeafe be inveterate from an humour, tough, gross, viscous, and more tenaciously nixed in the folid parts, as you may gather by the knotty tumours of the bones; for then we are fo far from doing any good with a Fri- when the bogather by the knotty tumours of the bones; for then we are to far from doing any good with a rate. When the be-ction used at the first, that on the contrary, we bring the Patient in danger of his life, unless we shall dy must be have first prepared the tumor to expulsion, by emollient and digesting things first used. But if it be prepared with lately taken with moveable pains, pussless, and useers in the jaws, throat, and privy parts, then may it have the preparatives. especially if the number be sufficiently obedient, and as unless before be easily cured without such preparatives, especially if the numour be sufficiently obedient, and as unction. it were prepared of it felf, and its own nature. Therefore hrit uting general medicins, you may afterwards come to use the Unction with Hydrarg yrum.

CHAP. X.

Of the choice preparation and mixing of Hydrargyrum.

Tdrargyrum which is clear, thin, white, and fluid, is the best: on the contrary, that which is livid, and not so fluid, is thought to be adulterated, by the admixture of some Lead. That it may be the purer, firain it through fome sheeps-leather, for by prelling it when it is bound up, it paffeth through by its fubtilty, and leaves the nith and leaden drofs behind it on the infide: Then it may be boiled in Vinegar, with Sage, Rofemary, Thyme, Camomil, Melilot, and strained again, that so many ways cleansed, it may enter into Ointments and Platters. To kill it more sure-How to kill en ly, it shall be long wrought, and as it were ground in a Mortar, that it may be broken so a special into most small particles, that by this means it may not be able to gather it self into the former body: to which purpose you may also add some substitution or substitution, as we shall show hereafter. It is most usually mixed with Hogs-grease, adding thereto some Oil of Turpentine, Nutmegs, Cloves, Sage, what to mix to be the substitution of t ly, it shall be long wrought, and as it were ground in a Mortar, that it may be broken and separated gentum visuan. and Galens Treacle. If a Leucophlegmatia together with the Lucs Venerea affect the body, then hot, therewith attenuating, cutting and drying things shall be added to the Medicin, which shall be provided for Unction; the fame shall be done when as we would have it to enter into the substance of the bones. But if the Patient be of a cholerick temper, and his bloud eatie to be inflamed, you shall make choice of lefs hot attractive and difeufling things; as when the body thall be replenished with knotty and feirthous tumours, or fqualid by excessive driness, then shall emollient and humeching things mixed Reirrhous tumours, or fqualid by excentive diffiels, their manifelionient and numering things mixed therewith: But that fuch Ointments may have a better confidence, I use to add to each pound thereof, four, five, or fix yolks, of hard Egs. Therefore this shall be the form of the Ointment called Vigoes. Re Axang, porci, sh j. olei chamam, anoth mastiches laurini an. 3 jejyrac.liquid. 5x. radenule cam. expertis, It j. vitellas ovorum fub cineribus collorum, nu. iij. olei terebinth. & laurini, an. 3 ij. theriac. vet. & expertie, it j. vitellar oversian fub cineribus colloram, nu. iij. olei terebinth. & Laurini, an. 3 ij. theriae. vet. & mithridat. 3 ij. fiat linimentum ut artis oft. You shall compose it thus, first the fublimatum and fulphur shall be finely powdered, then some part of the Argentum vivum and Hogs-grease put to them, then presently after, some of the hard yolks of Eggs, continually and diligently sirring and mixing them all together. All these being well incorporate, add some more Argentum vivum, Hogs-grease, and yolks of Eggs, and incorporate them with the former; at last add the Oils, then Treache and Mithridate, and so let them be all beaten together for a whole days space, and thus you shall make an ointment of a good consistence, which I have often used with good success. Yet the Hogs-grease shall be first boiled with the hot herbs good for the sinews, as Sage, Rosemary, Thyme, Maryerom, Lavender, and others which the Season affords. For so the axing a sequires a more attenuating faculty, and confodating of those parts which the Lues Veneres afflicts. Besides, when unguents are made for this purpose, that such virulency may be drawn from within outwards, by sweats and transpiration, through pose, that such virulency may be drawn from within outwards, by sweats and transpiration through the pores of the skin, no man need doubt but that they ought to be furnished with relaxing and rarifying and attractive faculties. But axungia, belides that it is very fit to kill the Argentum vivum, it also relaxeth and mollifieth. Now Oleum Laurinum, de flica, rataceum, rarifie, digest, and asswage pain, Turpentine also extinguisheth and bridleth the Argentum vivum, moderately heats, resolves, and firengthens the nervous parts. But Argentum vivum is the proper antidote of the Lues Venerea, as that which cures it howfoever used, drying by the subtilty of the parts, and provoking sweat. Verily Treacle and Mithridate fornewhat conduce to retund the virulency of this difease, but unless Argentum virum affift as a ferret to hunt, and an Alexiterium to impugn the difeafe, they can do no great matter.

CHAP. XI.

How to use the Unition.

He body and humours apt to cause or nourish a pletbors or inflammation, being prepared by digeffive fyrups, and evacuated by purging and bleeding as is fitting, according to the direction of fome Phylician, the Patient shall be shut up in a Parlour or Chamber, hot either both for that it hurts the nervous parts, already ill-affected by reason of the disease, as also for that it lesses the efficacy of Medicins. Wherefore many do ill in this, who, whether in Winter or Sumbursul to fisch mer anoint their Patients in a large room, exposed on every side to the winds. They deal former are troubled with the anoint ed by the Fire side, so to keep away the cold air from him. Yet it is the safest to set, and anoint the Patient either in a little Room, or else in some corner of a large Room, separated from the rest of the Room, by some handings and building a store or making some fire therein for some trees. reft of the Room by fome hangings, and building a flove, or making fome fire therein, for fo he may fland or fit as he beft likes, the longer, and with the lefs offence, and be equally heated on every fides whereas fuch as are anointed in a Chimney by a fires-fide cannot but be heated unequally, being ready to burn on the one fide, whileff the other is cold, which motions are contrary hurtful to that we require: befides, if the Patient shall be weak he cannot stand and endure the heat of the fire. Or if he be shame-faced, he will be unwilling to shew all his body at once naked to the Surgeon, but he may without any harm, and with modesty, lying on a Bed in a little Room wherein a store is made, have all his limbs anointed about the joints, and prefently bound up, either with floups, or carded cotten, or brown paper.

CHAP. XII.

What cautions to be observed in rubbing or anointing the Patient.

The Patient, if ing.

In what pla-ces the body must be a-pointed,

and diffiribution of the meat being perfected, which functions otherwise would not be well performed, the powers of Nature being diffracted into several operations: Yet if done, must be the Patient shall be weak, you may some hour before the unction give him some Gelly, the yolk anointed fall of an Egg, or fome Broth made of Meat boiled to pieces, but very fparingly, left Nature intent upon the concoction of folid Meats, or in great quantity, should be drawn away from that which we intend. At first let onely the joints of the limbs be anointed, as about the Wrists, Elbows, Knees, Ankles, Shoulders. But afterward, if the Patient shall be more strong, and a greater commotion of the humours and body feem necessary; the emunctories of the principal parts may also be anointed, and the whole spine of the back; yet having much care, and always shunning the principal and noble parts, left we should do as those batcherly Empericks do, who equally, and in like manner daub and rub over all the body, from the foles of the feet to the crown of the head : moreover, diligent regard must be had of those parts which are seized upon by the symptoms of this difease, that they may be more anointed, and that it may be more throughly rubbed in. Yet you may always begin your anointing or rubbing at those parts which are less offended, lest the humours thould be drawn in greater measure to the grieved part. And as gentle frictions do not sufficiently open the pores of the skin, so more strong and hard ones that them up, cause pain, and more placed in and more plentifully attract the morbinek matter. Wherefore it will be more convenient to use moderate frictions, taking indication from the firength of the Patient, as that whereto we must fill have the chief regard. There is also another thing whereto the Physician and Surgeon must discountly attend to the physician and surgeon must be a surgeon of the surgeon of th diligently attend, as that, which if it be not carefully prevented, will either haften the death of the Patient, or make him subject to a relapse; that is, the quantity of the remedies and unctions, and the

gin the Uncti-

number of the frictions. Which confideration, together with that which is of the degrees of the What it is that temperaments of the whole body, and each part thereof, much troubles the minds of good Phy-maker thereof, and each part thereof, much troubles the minds of good Phy-maker thereof. ficians, and maketh the Art conjectural. It is far from being attained to by Empericks; yet we must endeavour by Method and Reafon, that by the Rule of Indications to frequently mentioned, we may attain to the knowledge thereof, as near as may be: for to have perfect knowledge hereof, and to fay that those need onely four, others five, and othersome fix, more or fewer frictions at the beginning, which Empericks, commonly do, is a thing both impossible and vain. All these must be changed and ordered according to the malignity and continuance of the disease, and the condition of the affected bodies. Verily we must so long use frictions and unchions, until the virulent humours be perfected bodies. feetly evacuated by Spitting and Salivation, by Stool, Urin, Sweat, or infentible transpiration. Which you may underfland by the falling away and drying up of the Putiles and Ulcers, and the ceafing of the pains and other fymptoms proper to this difeafe. In many, by reafon of the more denfe and compact habit of the body Nature is more flow in excretion. Yet I have learnt by long experience, who must be that it is best to anoint and chase such twice in a day, to wit Morning and Evening, six hours after rubbed over meat. For fo you shall profit more in one day, then by the single friction of three days. But on the once, who contrary, I have often, and with good fuccefs, rubbed over but each other day more rare and delicate twice in a day bodies, giving them one or two days reft to recollect their strength, which by the too much disfolution of their spirits becoming too weak, were not sufficient to expel the reliques of the morbinek day. matter. And certainly about the end of the appointed friction, especially when as the Patient begins to flux at the mouth, the bodies, together with the noxious humours are made fo fluid by the means of the precedent friction, that one friction is then more efficacious then two were at the beginning. Therefore as Galen bids, when as the difease is great, and the firength of the Patient infirm, that Lib. de vest, we should part our bloud-lettings, and draw a little and a little at once; so also here, when as we shall sea, observe Nature stirred up, and ready bent to any kind of evacuation by the Mouth, Stool, or other like; you ought not to use any Unction or Friction oftner than once in a day; yea, certainly it will be better to intermit for some few days. For thus Maffa reports, that there was a certain man who almost wasted with a Consumption, being continually afflicted with the most grievous pains of this difease, and reputed in a desperate case by other Physicians, was notwithstanding at length recovered by him, when as he had anointed him thirty feven times, putting fome time between for the recovery of his firength. I my felf have observed others, who thus, by the interposition of one or two days, being rubbed over for hitten or seventeen times, have perfectly recovered. Where you two days, being rubbed over for litteen or leventeen times, have perfectly recovered. Where you must take this course in resolved and weak bodies, yet in the interim must you have a care that the frictions be not too weak, and so sew, that the morbinek cause may not be touched to the quick: for able to expel in this kind of disease Nature doth not of it self endeavour any crifus, or exerctions it requires the the virulen auxiliary forces of Medicins, by whose affifance it may expell all the malignity. These are figns of matter. fuch a crifit, either at hand or already prefent, if the Patient be fo reitlefs, fo loath all things, that he Signs that the cannot remain in one place either flanding or lying; becan neither eat nor drink, if he be oppressed criss is nigh, with a continual weariness, almost ready to swound, yet have a good and equal pulse, and gripings in his belly afflict him, with bloudy and vifcous dejections, until at length Nature after one or two days portion of the morbifick matter being fpent, be formewhat freed, and all pains and fymptoms to much abated, as the excretions have proceeded. But whereas Medicins are not fufficient in number or strength, there follows an imperfect enfir, which leaves behind it some reliques of the morbifick matter, which like leven do fo by little and little infect the whole mass of the humours, that ofttimes after ten years space the disease riseth as out of an ambush, or lurking-hole, and becomes far worse than before. But we must in like manner have a care left these Medicins, that are either given Inconvenien inwardly, or applied outwardly, be not too firong: for by cauting fuch colliquation of the radical ees following moifture and folid parts, many have been brought into an incurable confumption. In others for derate unfit did and putrid ulcers have thence arisen in the mouth, which having eaten a great part of the Pa-ons. late and Tongue, have degenerated into a deadly Cancer. In others hereupon the tongue hath fo fwelled up, that it hathfilled the whole capacity of the mouth, fo that it could not be bended to any part of the mouth for chawing, whereupon they have by little and little, been familhed. In other fome there hath been caused so great colliquation of humours, that for a whole moneth after tough and filthy flaver hath continually flowed out of their mouths. Other fome have the mufeles of their jaws relaxed, others troubled with a Convulsion, so that during the relt of their lives they can fearce gape. Others by loting a portion of their jaw, have lost fome of their teeth. But you must not always so long anoine and chase the body, until a flux of the mouth or belly appear: For you may find fundry perfors, who if you should anoint or rub them to death, you cannot bring them to flux at the mouth; yet these will recover notwithflunding, exerction being made either by insensible transpiration, or evacuation of Urin, or some gentle flux of the belly, either pro- For what perby Intentione transplantation, of it felf. In which case I have observed that many have received much sons a purging good by a purging decoction of Gnaiseum, administred according to the quantity of the peccant huder decoction of mour, and given for some days in the morning, adding thereto white Wine, if the body abounded mour, and given for some days in the morning, adding thereto white Wine, if the body abounded good.

With tough and viscid humours. Dysenteries, or bloudy Fluxes caused by Unctions, may be helped. CHAP. XIII.

Of the third manner of Cure, which is performed by Cerates and Employeers, as fabilituates of Unilions.

The cure by Emplasters more flow.

In what case

plaffer.

Or that fundry by reason of the name, abbor the use of friction, which is performed by the fore-mentioned Ointments, therefore there is found out another manner of cure by Cerates and Emplasters, as substitutes of Frictions, but that usually is somewhat slower; for which purpose it is not needful onely to use the things which are described by Vigo, but you may also devise other, which are more or lefs anodyne, emollient, attenuating, difcuffing, or drying, according to the condition of the prefent disease, symptoms, humours, and Patient, never omitting Hydrarg yram, the onely antidote of this disease. Such Emplatiers mitigate pains, and knots, and resolve all hardnefs, and are abfolutely very effectual; for continually flicking to the body, they continually operate: Wherefore they are of prime use in relapses of this disease, or when the humours are thick and viscous, they are chief- or otherwife lie deep in the body, and very difficult to root out. But for that they work more flowly ly uleful. oft-times, fuch as use them are forced at length to use some frictions to stimulate Nature, and cause the speedier excretion. Yet in some, whose bodies and humours have been fluid, either by Nature or Art, the applied Emplasters have in three days space procured evacuation sufficient for the disease, so that if they had not been taken away, they would have caused a colliquation, like that which we lately mentioned in too violent friction: Wherefore you shall use the like discretion in taking of The descripti- these, as you use in your unctions and friction. In sicad of Emp. de Vigo, this following may be titly on of an Em- used. W Mossa Emp. melil. & oxyer. an. th & argenti vivi extin. 3 v). oleo laserino, & de spica reducantin ad formam emplastri. These Plaisters must be equally spread upon leather, and laid upon the same places of the joints, as were formerly mentioned in the cure by trictions. Yet some there be who cover with the plainer all the arm, from the hand even to the shoulder, and all the leg from the top of the knee, even to the ends of the toes, which thing I do not difallow of, if so be that the places or the joints be covered over with a thicker Plaister. They must be left sticking thereon so long, until Nature be filrred up and provoked to cause excretion of the virulent humours. Yet if in the interim, great itching (hall arife in the parts, you may take them off fo long until the parts (hall be fomented with a decoction of the flowers of Camomil, Melilot, red Roles, and the like, made in Wine, to discuss that which caused the itching, and then you may lay them on again. Some to hinder the riting of any itch, lay not the bare Plaifter to the part, but cover it over with Sarcenet, so to keep it from flicking, and thus intercept the transpiration of the part, the cause of itching. They shall be stronger or weaker, and lie to the part a long or shorter space, as long as the indications so often formerly mentioned, shall seem to require. The effects of Emplasters are the same as of srictions: for they cause excretion, one while by infentible transpiration, otherwhiles by a Distribus, or flux of the belly forectimes by Urins, but most frequently (which Griffs is also most certain) by falivation. Sordid and virulent ulcers often breed in the Mosth, Tongue, Pallat, and Gums by falivation, by reason of what exercit, the actimony of the virulent humours adhering to the side of the mouth: to hinder the growth of on best in this these, many inject Clysters made of emollient things, especially at the beginning of the falivation, so disease.

disease.

it felf may endure them.

There are also some, who to the same end give a purging Medicin at the very time when as the humours are ready to move upwards, the which I think is not a safe course. The cure of sach ul-To avoid the cers is far different from the cure of others; for they ought by no means to be repercuffed or repelled, nicers of the mouth.

how inflamed foever they be, but onely to be mitigated by gargarifins, fo onely to leften the heat, and that by this frequent washing of the mouth, you may hinder the sticking or furring of viscid.

To care them. humours to fuch like ulcers. A decoction of Barley, Cows milk warm, held and gargled in the mouth, the mucilages of the feeds of Mallows, Marth-mallows, Pfilium, Lettuce, Line extracted in the Water of Barley, Mallows, and Pellitory of the Wall, are good for this purpole; for thus the ulcers become more mild, and the tenacity of the adherent humours is loofed. You must at the first beware become more mild, and the tenacity of the adherent humours is loofed. of firong detergent Medicins, for almost all fuch have acrimony joined with them, which will increase the pain, but chiefly in the state of the disease: for so, the ulcers gently cleansed by frequent gargling, would become worse by the use of acrid things. Therefore it shall be sufficient to make use of the fore-mentioned Medicins, so to hinder the increase of the filth, and inflammation of the ulcers, if so be that such ulcers be not too exceeding malign and burning. For if it shall happen either by the powerful efficacy of the applied Plasters, or by the violence of Nature in its motion of the ill humotus upward, that fuch flore of vifcous and grofs humours are carried to the mouth, that it wants little, but that the part it felf is over-ruled by the morbinek matter, so that by the violence and continuance of the flux, the Mouth and Jaws become fo fwelled, that a gangrene is to be feared, by hindring the entrance of the spirits, and extinguishing of the native heat of these parts. In this case we are torced to leave the proper cure for to withstand the accidents, and for this purpose we use refirictive and repelling things, fech as are Barley Water, Plantain, Night-shade, Knot-grass, Shepherdspurie, and the like; with fyrup of Rofes, Violets, Quinces, Berberies, Pomgranats, and the like; also fuch are the mucilages and decochions of the feeds of Lettuce, Pfilium, Quinces, Plantain, Night-shades, Water-lillies, Wood-bind, &c. Also it is convenient to procure sweats by Stoves, or the application of any hot and dry things, for thus the humours which run forth of the vessels into all the surface of the body, are directed. of the body, are diverted. But when as the course of the humours running to the mouth, is beginning to ftop, and the tumours of ulcers begin to leffen, then nothing hinders, but that we may ufe gently detergent things, as Syrnp, reforming ficear, mel refat. Diameron, Diameron, and the like. But when it is time to dry the ulcers, they may be lightly touched with Alum-water, or with Aqua fertis, fuch as Goldsmiths have used for the separation of Metals. They may also frequently use drying

to draw downwards the humours forcibly flying up in greater quantity than is fit, although the part

Restrictive repelling Gargarifus.

To dry the ulcers of the - TITLE TO

Gargarifins made with altriction of the water of Roles, Plantain, Night-shade, Shepherds-purfe Knot-grafs, and Dogs-tengue, boiling therein balanting rub, myrtil, fumach, alum, acaeta, berber gallar, malicor, and the like. During the time of fluxing or fallvation, you must diet and feed the Patient with liquid meats, and those of good juice and case digestion, for that then he can neither chaw, swallow, nor digeft hard things: For Nature wholly intent upon the excretion of the noxious and peccane humours, as also weakned by the bitterness of pain, watchings and unquietness, and consequently a great resolution of the spirits, cannot insist powerfully upon the work of concoction. Therefore he manner of that be sed with rear new-laid Egs, Caudles of the same, Barley-creams, Cullesses made of a decoction diet when the of Knuckles of Veal, and a Capon, and Gellies; and with these in small quantity, but frequently admost independent of the same ministred, always gargling his mouth before he cat. For his drink he shall use a decoction of Guaiscame aromatized with a little Cinamon; but if any defire that the drink shall become nourishment; for that the Patients cannot feed on more folid meats, you may give them old Wine, Claret and thin, mixed with force Barley-water. Some there are who fleep force crums of pure Mancher in the force faid Wine, and then prefs it out, but yet fo, that there may force part of the bread remain therein, which may make it more nourifhing, and lefs tharp or acrid. Others fleep bread hot out of the Oven in Wine for the space of a night, then they distil it all over in balmo Marie; the liquor which comes over is more strong and hot, but that which flows out afterwards, more mild, and such as the Patient may use to mix with his Wine without any danger, for his better nourithment, and the recovery of his ftrength.

For to refresh the spirits in sear of fainting, Muscadine, Hippocras, Rose Vinegar, and the like, put to the nose to finell to, will be sufficient, unless peradventure the Patient should naturally abhor such things, for fo they would rather deject the powers and spirits. In the interim you must have care of the belly, that you keep it open by gentle and emollient Clyffers.

To make their drink nourith.

CHAP. XIV.

Of the fourth manner of Curing the Lues Venerea.

Ome have devised a fourth manner of curing the Luces Venerea, which is by Suffices, or Fumigations. I do not much approve hereof, by reason of fundry malign symptoms which thence arife, for they infect and corrupt by their venemous contagion, the Brain and Lungs, by whom they are primarily and fully received, whence the Patients during the relidue of their lives, have flinking breaths. Yea many while they have been thus handled have been taken hold of by a containing their Heads, Hands, and Legs, with a Deafrets, Apoplexy, and lattly, mistellows upon ferable death, by reason of the malign vapours of Sulphur and Quarkfilver, whereof Contabaris conformations, fifts, drawn in by their mouth, and a send of the hold. Wherefore Lean power approach fifts, drawn in by their mouth, nofe, and all the reft of the body. Wherefore I can never approve the ufe of fuch furnigations which are to be received in fumes by the mouth and notirils for to work upon the whole body; yet I do not diflike of that which is undertaken for forme one part onely, as to dry up ill-conditioned ulcers, which to affect it, they cannot be overcome by any other means, or for to differ for digeft knots, or to refolve fixed pains, otherwise unmoveable. These Furnigations by reason of the admixture of recenture times, have an attenuating, outline, resolving, and col. from good. tor to disperte or digert knots, or to reloave fixed pains, otherwise unanoveance. There is using a what tuning tions, by reason of the admixture of argentum vivum, have an attenuating, cutting, resolving, and coltions good. In the patient under a Tent or Canopy made close on every side, left any thing should expire, and they put in unto him a Vessel filled with hot coals, whereupon they plenting them. fully throw Cinnabaris, that so they may on every side enjoy the rising sume, just after the same manner as Farriers use to smooth. The principal matter or basis of such Furnigations, as we have already noted, is Cinnabaris confilling of Sulphur and argentum victor mixed together: there is added allo, Radix ireas flor, thus, elibanem myrba, juncus ederatus, affa oderata, majtiche terebinabina & theriaca, all which have a faculty to refolve and tirengthen the Spirits and Nature, and correct the french and them. evil quality of the argentum vivum. There are also other Furnigations made after another manner, them. but that also when as the argentum vivum is extinct, and as it were fixt after this manner, let some Lead be melted, and let there be poured or put thereto fome argentum vivum, then let it all be powdered, adding thereto Antimony, Aloes, Mattich, Coperas, Orpiment, and Benjamin made into Powder, and framed into Trochifees with fome Turpentine. Or elfe R. Cinnabaris 3 j. figracis liq. & cander, and framed into Trochifees with fome Turpentine. Lamitæ, nucis moschat. an. 3 iij. benzoini 3 [s. excipe terebinib. fiant trochisci ponderit 5 i). for the atorefaid use. The terebinthina is added to incorporate the dry things, and the gums are added to yield matter to the sum. But virulent users of the Lues Venorea shall not be sumigated before they be clean-sumigations. sed; also this following Furnigation is good. R. Cinnab. 3 j. benzoini, myrrha, styracis, dibani, opepanacis, an. 3 fs. maftiches, macis, thuris, an. 3 ij. exceptantur terebinth. er fiat fuffumigium.

CHAP. XV.

The Cure of the Symptoms, or Symptomatick affells of the Lucs Venerea: and first, of the Vicers of the Yard.

Allows and malign ulcers in this difease may grow all over the Yard; but these are far more The Ulcers of malign which arise upon the Prepuce, than those that grow on the Glass or Nut of the Yard, the prepuce more malign Now they are rebellious to the common Medicins of Ellicers which happen otherways, and than abose of they are also subject to rurn into a Gangrene, so that fundry who have not in time provided for thern- the Gless, felves by the use of argonium virum, are forced for their negligence, to suffer the loss of their Glans, and oft times of their whole Yard. Yet I am of opinion, that I think we must begin the cure of

* This which by our Author

timinus.

Ulcers of the Yard with the general remedies of Ulcers. For all Ulcers arifing in these parts by reason of cogulation, are not virulent. But when as we shall find that we do no good by this means, and that the disease notwithstanding grows worse and worse, then must we come to make use of fuch things as receive argentum vivum, that by these we may result the virulency which is ready to disperfe it felf over all the body; yet it is absolutely necessary that all these things be endued with such faculties as may return the malign acrimony of this venom, such an one is this following collyrium of Lasfranks Cal-Lanfrank. R. Vini albi, lb j. aq.rof. & plantag. an. quart 1. auripig. 3 ij. viridis eris, 5 j. aloes, myrrhe, an. hyriam. Alfo thefe ulcers may be profitably touched with Mercury water, or aqua fortis which the Goldsmiths have used, or else Mercury in Powder, or our Ægyptiacum: but the falling away of the Eschar shall be procured with basilicon, or fresh butter. Yet I think it not fit to use these acrid things without very great caution, for sear of a Gangrene, which easily happens to this part: but if such 'Ulcers are so stubborn, that they will not yield to these remedies, then must we come to the friction or unction of the groins, perineum, and alcers, with the Ointments formerly preferibed for the general friction. Also Furnigations may be made, as we mentioned in the former Chapter: For thus at length the malignity of the virulent humour will be overcome, and the callous hardness mollified; and laftly, the Ulcers themselves cleansed, and being cleansed, consolidated. Sometimes after the perfect cure of fuch Ulcers, there will appear manifest tigns of the Lucs Veneres in many, which thewed not themselves before, for that the virulency flowed forth of the running Ulcers, and now this vent being stopt, it flows back into the body, and thews signs thereof in other parts; and these men have need of a general Unction,

CHAP. XVI.

How a Gonorrhoea differeth from a *Virulent Strangury.

Ven to this day very many have thought that the virulent Strangury hath fome affinity with the Gonorbaa of the Ancients, but you shall understand by that which follows, that they are ciralenta, and much different. For a Gosorrhan is an unvoluntary effusion of feed running from the whole body to the genitals, by reason of the resolution and pallie of the retentive faculty of these parts, as it is delivered by Galen, lib. de loc. affect. This difease befalleth others by the collection of the bloud and feminal matter by the Veffels of the whole body, which not turning into fat and good fleth, takes its courfe to the genitals; but on the contrary, a virulent Strangury is a running, or rather dropping **hear virulesta, concocted, oftentimes fretting and exulcerating the paffage with the acrimony, and cauting a paingarly in Eaglift, The Rusning of rather dropping
or rather drop The cause hereof is a gross and flatulent spirit, filling and distending by its plenty, the whole channel or hollow nerve, yea verily, the whole porous substance of the Yard. If to these symptoms this be lent Strangury added, that the urinary passage be exulcerated, a grievous pain afflicts the Patient whilest he makes water, for that the Ulcers are irritated by the sharp Urin passing that way. Such a virulent Strangury, or Running of the Reins oft-times continueth for two or three years space: but the Gonorrhaus, or Running of the Seed cannot endure fo long, but that it will bring the body to an extreme and deadly leanness, for that the matter of the Seed is of the more benign and laudable portion of the bloud, as you may perceive by those who have too immoderately used copulation but the space of one night: For such have their Faces more lean and lank, and the rest of their bodies enervated, languisheth and becometh dull. By this we have delivered, it may be perceived that the running of What kind of virulent Strangury, is not the running of a feminal humour, fit for generation of iffue, but rather of a vifcous and acrid filth, which hath acquired a venenate malignity by the corruption of the whole eth forth in a fubftance.

CHAP. XVII.

Of the Caufes and Differences of the Scalding or Sharpness of the Urin.

The cause of a particular repletion of the privy parts.

He heat or scalding of the Water, which is one kind of the virulent Strangury, arifeth from fome one of these three Causes; to wit, Repletion, Inanition, and Contagion. That which proceeds from Repletion, proceeds either from too great abundance of bloud, or by a painful and tedious Journey in the hot Sun, or by feeding upon hot, acrid, diuretick, and flatulent Meats caufing tention and heat in the urinary parts, whence proceeds the inflammation of them and the genital parts; whence it happens that not onely a feminal, but also much other moisture may flow unto those parts, but principally to the Profate, which are Glandules situate at the roots, or beginning of the neck of the bladder, in which place the spermatick vessels end; also abstinence from Venery causeth this plenitude in some who have usually had to do with Women, especially the expulfive faculty of the feminal and urinary parts being weak, fo that they are not of themselves able to free themselves from this burden: For then the suppressed matter is corrupted, and by its acrimony contracted, by an adventitious and putredinous heat, it caufeth heat and pain in the paffage fostly. The Profitate Iwelling with fuch inflamed matter, in process of time become ulcerated, the ablects being broken. The purulent fanier dropping and flowing hence alongit the urinary passage causes the Ulcers by actimony which also con-Ulcers by acrimony, which the Urin falling upon, exafperates; whence that pain, which also continueth for some flort time after making of water, and together therewith by reason of the inflammation, the pains attraction, and the vaporous spirits diffension, the Yard stands, and is contracted.

THE REAL PROPERTY.

with pain, as we noted in the former Chapter. But that which happens through inantition, is actually a superior of the immoderate and unfit use of Venery, for hereby the oily and radical moisture of the of the inantion fore-mentioned Ghandules is exhausted, which wasted, and spent, the Urin cannot but be troubleforme and sharp by the way to the whole **Urethra**. From which sense of sharp pain, the scalding of the genital parts, the standard of the standard person, or with a woman, which some shy contagion, is caused by impure copulation with an unclean person, or with a woman, which some short while before hath received the tainted seed of a virulent person, or else hath the Whites, or her Privities troubled with hidden and secret unless or carrieth a virulent spirit shut up or hidden there, which heated and resuscitated by cores. ulcers, or carrieth a virulent fpirit flut up or hidden there, which heated and refuscitated by copulation, presently infects the whole body with the like contagion, no otherwise then the sting of a lation, prefently infects the whole body with the late contagion, no otherwise then the ring of a Scorpion or Phalangium, by cafting a little poison into the skin, prefently infects the whole body, the force of the poison spreading farther than one would believe, so that the party falls down dead in a short while after. Thus therefore the seminal humour contained in the proflate, is corrupted by the tainture of the ill, drawn thence by the Yard, and the contagion infects the part it self; whence following for the triplency by the urinary passage, causeth a virulent strangury. lows an abfects, which cashing forth the virulency by the urinary passage, causeth a virulent strangury, and the malign vapour carried up with fome portion of the humour unto the entrails and principal parts, cause the Lues Venerea.

CHAP. XVIII.

Prognosticks in a virulent Strangury.

E ought not to be negligent or careless in curing this affect, for of it proceed pernicious A virolent accidents, as we have formerly told you, and neglected, it becomes uncurable, fo that forme have it run out of their urinary paffage during their lives; off-times to their former mifery is added a fuppreliion of the Urin, the profitate and neck of the bladder being inflamed and unmeasurably fwelled. Copulation, and the use of acrid or flatusent means increase this inflammation. tion, and also together therewith cause an Ischaria or stoppage of the urin; they are worse at the change of the Moon: certain death follows upon such a stoppage; as I observed in a certain man, An Historya who troubled for ten years space with a virulent Strangury, at length died by the stoppage of his water. He used to be taken with a stopping of his urin as often as he used any violent exercise, and then he helped himself by putting up a silver Catheter, which for that purpose he still carried about him; it happened on a certain time that he could not thrust it up into his bladder, wherefore he sent for me, that I might help him to make water, for which purpote when I had ufed all myskill, it proved in vain: when he was dead and his body opened, his bladder was found full, and very much diftended with urin, but the profiate preternaturally swelled, ulcerated, and full of matter resembling that From what which formerly used to run out of his Yard, whereby you may gather that this virulency flows from part the matthe proflate, which runs forth of the Yard in a virulent Strangury, and not from the Reins, as many ter of a virulent Strangury, and not from the Reins, as many ter of a virulent Strangury have imagined. Certainly a virulent Strangury, if it be of any long continuance, is to be judged a flows. certain peculiar Lucs Veneres, fo that it cannot be cured unless by frictions with Hydrargyrum. But the ulcers which possess the neck of the bladder are easily discerned from these which are in the body or capacity thereof. For in the latter the filth comes away as the Patient makes water, and is found mixed with the Urin, with certain ftrings or membranous bodies coming forth in theurin: to these may be added, the far greater stench of this filth, which issue the out of the capacity of the bladder. Now must we treat of the Cure of both these Diseases, that is, the Gonoribus and virulent Strangury; but first of the former.

CHAP. XIX.

The chief beads of curing a Gonomhora.

Et a Physician be called, who may give direction for purging, bleeding, and diet, if the affect proceed from a fulness and abundance of bloud and seminal matter; all things shall be shun- Dies. ned which breed more bloud in the body, which increase seed, and stir to venery. Where-fore he must abstain from Wine, unless it be weak and astringent, and he must not onely eschew famifore he must abstain from Wine, unless it be weak and altringent, and he must not onesy eachew tarm-liarity with women, but their very pictures, and all things which may call them to his remembrance, especially if he love them dearly; strong exercises do good, as the carrying of heavy burdens even For a Strangi-until they sweat, swimming in cold water, little sleep, refrigerations of the loins and genital parts, ry occasioned by anointing them with anguestum refrigerans Galeni & matritum, putting thereupon a double by repletion. cloth steeped in oxycrate, and often renewed. But if the resolution or weakness of the retentive fa-sulting of shade parts be the cause of this disease, contracted by too much use of venery before they arive of the cause culty of these parts be the cause of this disease, contracted by too much use of venery before they arive of the retenat an age fit to perform such exercise; in this case strengthening and astringent things must both be tive faculty.

taken inwardly, and applied outwardly. But now I hasten to treat of the virulent Strangury, which is more proper to my purpofe.

CHAP. XX.

The general Cure buth of the scalding of the Water, and the virulent Strangury.

E must diversly order the Cure of this Disease, according to the variety of the Causes and Diet. Accidents thereof. First, care must be had of the diet, and all such things shunned as instame the bloud, or cause windiness; of which nature are all diuretick and flatulent things, as also strong and virulent exercises. Purging and bleeding are convenient, especially if sul-

timining.

nels cause the affect. Womens companies must be shunned and thoughts of venereous matters; the Patient ought not to lie upon a foft bed, but upon a quilt or mattrice, and never, if he can help it, upon his back: boiled meats are better than rofted, especially boiled with Sorrel, Lettuce, Purslain, cleanfed barley, and the four cold feeds beaten: for fauce, let him ufe none, unlefs the juice of an Orange, Pomgranate, or Verjuice: let him thun Wine, and in flead thereof afe a decoction of Barley and Licorice, an hydromel, or hydrofaccarum, with a little Cinamon, or that which is termed Patus divinus. In the morning let him fup of a Barley Cream, wherein hath been boiled a nodulas of the four cold Seeds beaten together with the feeds of white Pappy; for thus it refrigerateth, mitigateth, and cleanfeth; also the syrups of Marsh-mallows and Maiden-hair are good. Also purging the belly with half an ounce of Cassia, fornetimes alone, otherwhiles with a dram, or half a dram of Rhubarb in powder put thereto, is good. And these following Pills are also convenient. Re Masse pilul. fine quibus) i. rbei elelli 3 6. camplure gr.iv. com terebinthina formentur pilule; let them be taken after the first sleep. Venice Turpentine alone, or adding thereto some Rhubarb in powder, with Oil of sweet Almonds newly drawn without fire, or fome fyrup of Maiden-hair; is a fingular Medicin in this cafe, for it hath an excellent lenitive and cleaning faculty, as also to help forwards the expulsive faculty to cast forth the virulent matter contained in the Profite. You may by the bitterness perceive how it resists putrefaction, and you may gather how it performs its office in the Reins and Urinary parts, by the finell it leaves in the Urin after the use thereof. But if there be any who cannot take it in form of a Bole, you may eafily make it potable, by diffolving it in a Mortar with the Yolk of an Egg, and some made potable, white Wine, as I learned of a certain Apothecary, who kept it as a great fecret. If the dilease come by inanition or emptiness, it shall be helped by fatty injections, oily and emollient potions, and inwardly taking and applying these things which have the like faculty, and shunning these things which caused the disease. How to cure that which happens by contagion, or unpure copulation, it thall be abundantly thewed in the entuing Chapter.

How to be

CHAP. XXI.

The proper Cure of a virulent Strangury.

An injection to flay inflam

The faculties Strangury.

How the cleanfed ulcers may be dried,

Virit, we must begin with the mitigation of pain, and staying the inflammation, which shall be performed by making injection into the Urethra with this following decoction warms R Sem. pfilii, lačinez, papav. albi, plantag. cydon. lini, byofcyami albi an. 3 ij. detrabantur mucores in aquis folani & rofar. ad quansitatem fufficientem, adde trochife. alborum Rhafis camphoratorum in polinem redallorum, 7 j. mifce finul, & fiat injellin frequent: For this because it hath a refrigerating faculty, will help the inflammation, mitigate pain, and by the mucilaginous faculty lenine the roughness of the **Urethra, and defend it by covering it with the flimy substance, against the acrimony of the Urin and virulent humours. In stead hereof you may use Cows milk newly milked, or warmed at the fire. Milk doth not onely conduce hereto, being thus injected, but also drunk, for it hath a refrigeof Milk against rating and cleanfing faculty, and by the subtilty of the parts it quickly arrives at the urinary passa-Furthermore, it will be good to anoint with Cerat, refriger, Galeni, addita campbora, or with Ceratum centalinum, ung. comitiffe, or nutritum, upon the region of the kidnies, loins, and perineum, as also to anoint the Cods and Yard. But before you use the aforesaid Ointments, or the like, let them be melted over the fire, but have a care that you make them not too hot, left they should lofe their refrigerating quality, which is the thing we chiefly defire in them. Having used the aforefaid ointment, it will be convenient to apply thereupon fome linnen cloths moifined in oxycrate, composed ex aquis plantagines, folani, femperorio, rofarum, and the like. If the Patient be tormented with intolerable pain in making water, and also some small time after, as it commonly cometh to pass, I would How to make with him that he should make water, putting his Yard into a Chamber-pot filled with milk or water water without pain.

The pain by this means being asswaged, we must come to the cleansing of the ulcers by this or the like injection: Re Hydromelistis sport, or de ross facility, de de abstinate. and \$\frac{1}{2}\$ is fat injections.

But if there be need of more powerful detersion, you may safely add, as I have frequently tried, ications.

I have also found this following decoction to be very good for this purposea little Ægypriaeum. I have also found this following decochion to be very good for this purpose. Pe Vini albi odoriferi, It B. aquar. plantag. & rof. an. 3 ij. auripigmenti, 3 [. viridis eris, 3 j. aloes opt. 3 f. pulverifentur pulverifanda, & bulliant fimul. Keep the decoction for to make injection withall. You may increase or diminish the quantity and force of the ingredients entering into this composition, as the Patient and Difease shall seem to require. The Ulcers being thus cleansed, we must hasten to dry them, fo that we may at length cicatrize them. This may be done by drying up the fuperfluous moifiure, and firengthening the parts that are moifined and relaxed by the continual defluxion, for which purpose this following decoction is very profitable. Re Aq. fabrorum, the pfollowing balangter nucuum capres, conquass around an 3 j. I fornin. sumach. & berber, an, 3 j. Syrup, rofar, & de abstitute an. 3 j. sind decocitio. You may keep it for an injection to be often injected into the Vretbra with a syrup. ringe, follong as that there shall no matter or filth flow over thereat, for then there is certain hope of the cure.

CHAP. XXII.

Of Caruncles or fleshy Excrescences which sometimes happen to grow in the Urethra, by the heat or scalding of the Urin.

Sharp humour which flows from the Glandules termed Profesta, and continually runs alongst How carancles the urinary paffage, in fome places by the way it frets, and exulcerates by the acrimony the come to grow Uretbra in men, but the neck of the womb in women. In these, as also is usual in other upon the ululcers, there fornetimes grows up a superstuous sless, which oft-times hinders the cashing or coming cers of the geforth of the Seed and Urin by their appropriate and common passage, whence many mischiefs arises forth of the Seed and Urin by their appropriate and common puffage, whence many mischiefs arise; whence it is that fuch ulcers as have caruncles growing upon them must be diligently cured. But first we must know whether they be new or old. For the later are more difficultly to be cured than Callous carunthe former, because the caruncles that grow upon them become callous and hard, being off-times ci-cles hard to catrized. We know that there are caruncles, if the Catheter cannot freely pass alongst the passage care. of the Urin, but finds so many stops in the way, as it meets with caruncles that then the rustiage, if Signs. of the Urin, but finds fo many flops in the way, as it meets with caruncles that flop the paffage; if the Patient can hardly make water, or if his water run in a very fmall fiream, or two freams, or crookedly, or onely by dropand drop, with fuch tormenting pain, that he is ready to let go his excrements, yea and oft-times doth lo, after the fame manner as fuch as are troubled with the fione in the bladder. After making water, as also after copulation, some portion of the urin and feed stays at the rough places of the caruncles, fo that the Patient is forced to prefs his Yard, to prefs forth fach reliques. Sometimes the urin is wholly flopped, whence proceeds fuch diffention of the bladder, that it caufeth inflammation, and the urin flowing back into the body, haftens the death of the Patient. Yet fornetimes the urin thus supprest, sweats forth preternaturally in fundry places, as at urin comes the Fundament, Perinamon, Cod, Yard, Groins. As soon as we, by any of the fore-mentioned signs, forth whereas shall suspect that there is a caruncle about to grow, it is expedient forthwith to use means for the it can get vent cure thereof; for a caruncle from a very little beginning, doth in a short time grow so big, that at the length it becomes incurable: verily, you may eafily guefs at the difficulty of the cure, by that we have formerly delivered of the effence hereof; betides, Medicins can very bardly arrive thereat. The fittest season for the undertaking hereof is the Spring, and the next thereto is Wilster; yet if it The fittest be very troublesom, you must delay no time. Whilest the cure is in hand, the Patient ought wholly time for the to abflain from Venery, for by the use thereof, the Ridnies, Spermatick Vessels, Frostate, and the cure whole Yard, swell up and wax hot, and consequently draw to them from the neighbouring and upmoult be esperarts, whence abundance of excrements in the affected parts, much hinder the cure. You must chewed: beware of acrid and corroding things in the use of detergent injections, for that thus the **Detabra* being indued with most exquisit sense, may be easily offended, whence might ensue many ill accidents. Neither must we be frighted, if at sometimes we see bloud flow forth of secret or hidden caruncles. Neither must we be frighted, if at sometimes we see bloud flow forth or secret or hidden caruncles. For this helps to shorten the cure, because the disease is hindered from growth, by taking away portion of the conjunct matter, the part also it self is eased from the opprating burden, for the material cause of caruncles is superstuous blood. Wherefore unless such blooding happen of it self, it is not amiss to procure it by thrusting in a Catheter somewhat hard, yet with good advice. If the caruncles The particular be inveterate, and callous, then must they be mollified by Fomentations, Ointments, Cataplassins, care. Platters, and Funnigations; you may thus make a Fomeotation. Re Rad. also, & lilius, als. an. § v. A Fomentatad bryonie, & fanic, an. § j. fol. malvar. violarum parietar. & mercur. an. m. st. sem. livis samper. an. tion. § scaricas ping, nu. xij. storum chammem. & melil. an. p. j. contandantur contandenda, incidenda incidantur, buliant omnia in aqua communi: make a Fomentation, and apply it with soft Sponges. Of the mass of the strained-out things you may make a cataplasm after this manner. Re Pradicta materialia, A Cataplasm. terantur, & trajiciantur, adde axungia parci, unguenti basiliconis, an. § ij. stat cataplasma: let it be apmais of the strained-out things you may make a cataplasm after this manner. R. Pradilla materialia, A Cataplasm terantur, & trajiciantur, adde axungia parci, unguenti bassiliconis, an. 3 ij. stat cataplasma: let it be applied presently after the someontation. You may use this following Liniment whilest the Cataplasm is providing. R. Unguenti altib. & agrippe, an. 3 j. st. asspis bunide, & axung, bunian, an. 3 j. busyri A Liniment. recensis, olei lilim. & chamem. an. 3 vj. liquistant smul, addendo aque vite 3 j. stat linimentum. Let it be applied outwardly upon the part wherein the caruncles are. For the same purpose Platters shall be applied, which may be diversished and sitted as you shall think good; yet Emplastrum de Vigo truly Vigo's Emplasmade, exceedeth all the rest in a mollifying faculty, and in washing such callous hardness. The toll-stre effectual lowing Furnigation is also good for the same purpose; take some pieces of a Mill-stone (for this we to soften a use in stead of the Pyrites mentioned by the Ancients) or else some Bricks of large size, after they are leasted hot in the sire, let them be put into a Pan and set under a Close-stool, then cause the Patient to sit thereon as if he were going to Stool, then pour upon the hot stones equal parts of very sharp Vi- Assimilation. heated hot in the are, act them be put into a Pan and let under a Ciole-itooi, then cause the Patient to fit thereon as if he were going to Stool, then pour upon the hot flones equal parts of very flarp Vi-Assignizing, negar, and very good aque vite, and cashing cloths about him, that nothing may exhale in vain: let him receive the ascending vapour at his Fundament, Perinenon, Servison, and Verbra. Moreover that this Medicin may work the better effect, you may put the Patient naked into the Barrel noted with this letter A, so that he may sit upon a feat or board perforated on that part, whereas his genitals are the latter board perforated on that part, whereas his genitals are the patient patients and the part of parts of the part of parts of parts of the parts of pa are, then place the Pan holding the hot ftones between his legs, then prefently fprinkle the ftones with the fore-mentioned liquor, by the door marked with the letter B. Thus the Patient shall easily receive the fume that exhales therefrom, and none thereof be soit, he covering and vailing himby receive the fume that exhals under in Galen's opinion, hath a faculty to penetrate, cut, refolve, di Glass felf on every fide. Such a fumigation in Galen's opinion, hath a faculty to penetrate, cut, refolve, 2. cap. 5. foften and digeft scirrhous hardnesses.

CHAP. XXIV.

Of venereal Buboes, or fivellings in the Groins.

He virulency of the Lucs Veneres is fornetimes communicated to the Liver, which if it The efficient have a powerful expulsive faculty, it expels it into the groins, as the proper emunctories and material thereof, whence proceed venereal Buboes. The matter of these, for the most part, is abuncanse of cold, tough, and viscous humours, as you may gather by the hardness and whiteness of nereous Baboes. the tumor, the pravity of the pain, and contumacy of curing; which also is another reason, be-fides these that we formerly mentioned, why the virulency of this disease may be thought com-monly to saften it self in a phlegmatick humour. Yet sometimes venereal Buboes proceed from a hot, acrid, and cholerick humour, affociated with great pain and heat, and which thereupon of-ten degenerate into virulent and corroding ulcers. Some venereous Buboes are fuch conjoined ac-what Buboes cidents of the Lues Veneres, that they foretell it; fuch are these which for a small while show a fore-tell the manifest tumor, and suddenly, without any manifest occasion hide themselves again, and return Lucs Visiones back to the noble parts. Others are diffined from the Lucs Visiones though they have a similitude of effence and tratter therewith, and which therefore may be healed, the Lucy Venera yet remaining uncured. Such are these which are usually seen, and which therefore compared with the former, may be termed simple and not implicit. For the cure, you must not use discussing Medicins, left refolving the more fubtil part, the groffer dregs become impact and concrete there; but much

(minimize.

Cupping.

A potential Centery,

less must we use repercussives, for that the matter is virulent. Wherefore onely attractive and suppurating Medicins are here to be used, agreeable to the humour predominant and causing the tumor, as more hot things in cedematous and scirrhous tumors, than in those which refemble the nature of a phlegmon, or enfipelse: the indication taken from the rarity and denfity of bodies infinuates the same variety. The applying of Cupping-glasses is very effectual to draw it forth: But when as it is drawn forth, you shall forthwith apply an emplastick Medicin, and then you shall come to suppuratives. When the tumor is ripe it shall be opened with a potential cautery, if it proceed from a cold cause; for by the inducing of heat the residue of the crude matter is more easily concocted; besides, when as an ulcer of this kind is opened, the matter will be more easily evacuated, neither shall it be fit to use any tent, but only to apply pledgets. The residue of the cure shall be performed by detergent Medicins, and then, if need require, the Patient shall be let bloud, and the humours evacuated by a purging Medicin, but not before the perfect maturity thereof.

CHAP. XXV.

Of the Exoficies, bunches or knots growing upon the bones by reason of the Lucs Venerea.

The matter of rulent Tophi.

An emplaster against the inching out of the bones."

And tumors, Exostofes and knots, have their matter from thick and tough phlegm, which cannot be diffolved unless by hot Medicins, which have a mollifying and diffolving faculty. For which purpose, belides those Medicins which usually are applied to scirrhous humours, you must also make use of Argenium virum commonly after this manner. R Emplast, silis Zach & Ceronei, an. 3 ii), eaphorb. 3 [s. emplast. de Vigo, 3 ii, cerat. estp. descript. Philagr. 3], argent. vivu extinst. 3 vi. statemplastrum. Spread it upon Leather for your use. In the mean space let the Patient observe a sparing diet; for thus he shall be helped, if so be that the substance of the bones be yet unperiffied: For if it be putrefied and rotten, then described Medicins are of no use, but you must of necellity lay bare the bone, either by incision, or else by an actual or potential cautery; but I had rather do it with an actual, for that it extracts the virulency impact in the bones, as also it haftens the abfeels, or falling away of the corrupted bone. It shall be of a convenient figure to cauterize the bone, as round, fquare, or long. I usually before the application of such a Caustick, first divide the stell that lies over it with an incifion-knife, that so the pain may be the less, because the flesh cannot burn through but in a long time, by which the lire may come to the bone. But it will not be amis before we treat of this Art, first to consider the nature of the rottenness of the bones.

CHAP. XXVI.

Why the bones become rotten, and by what figns it may be perceived.

Gal marb. 6.

cause of the rottenness of

cour, not.

Signs of the rottennels,

Hat foliation of continuity which is in the bones, is called by Galen, Catagma. This usually is the cause of rottenness; for bones that are grated, bruised, rent, perferated, bro-ken, luxated, inflamed and despoiled of the flesh and skin, are easily corrupted; for despoiled of their covering, they are altered by the appulse of the air, which they formerly never felt; The frequent whence also their bloud and proper nourithment is dried up and exhausted. Besides also, the fanies running down by reason of wounds and old ulcers, in process of time fastens it self into their fubiliance, and putrefies by little and little: this putrefaction is increased and caused by the too much use of oily and fatty Medicins, as moist and suppurate things; for hence the Ulcer becometh more filthy and malign, the flesh of the neighbouring parts groweth hot, is turned into pur, which His, tib, dt alc. prefently falling upon the bone lying under it, inflames it. Laftly, the bones are fubject to the fame difeafes as the flesh that lieth under them is a believe also, according to Galen, the beginning of in-Gallibide tam, flammation off-times proceeds from the bones, but they heat not, because according to the opinion of the Ancients, pulfation is a dolorifick motion of the Arteries, but the bones want fenfe. Which verily I cannot deny, but also we must confess that the membrane that encompasseth them, and the arteries that enter into their body, are endued with most exquisite sense. Wherefore the arteries compressed and waxing hot by reason of the inflamed bone, cause a sense of pain in the perinferent, fo that the Patients complain of a dull and deep pain, as it were funk into the fubfiance of the bones. The rottenness or corruption is oft-times manifest to the eye, as when the bone is laid bare, for then it varieth from the natural colour, and becomes livid, yellowish, or black. Otherwise you may perceive it by touch, as by fearching it with a probe, as when you meet with any inequality or roughness, or when but gently touching it your Probe runs into the substance of the bone Mardness is no as into rotten wood; for a bone is naturally hard, but being rotten, becomes foft. Yet hardness is infallible fign. of found bones not an infallible fign of a found bone: for I have feen rotten and bared bones to have fornetimes grown fo hard, by the appulfe of the air, that a Trepan could not, without a ftrong endeavour, enter Also the rottenuels of the bone is known by the condition of the filth which flows forth of the ulcer, for it is not onely more thin and liquid, but also more flinking. Furthermore, fuch ulcers have a foft, loofe, and watery flesh, besides also they are untoward and rebellious to farcotick and control of the control of th and epolotick Medicins; to which if they chance to yield and be cicatrized, yet within a fhort while after, the fear will relent of its own accord, for that Nature deflitute of the firm and found found the firm of the firm and found found the firm and found th foundation of the bones, cannot build up a laudable and conflant fielh. Neither is it sufficient that the Surgeon know certainly that the bone is rotten and corrupt; it is furthermore fit he know, whether the corruption be superficiary, or pierce deep into the substance of the bone, that he may

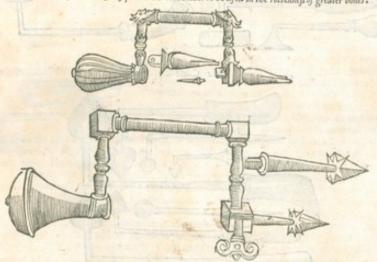

The cure of a know how much of the bone must be scaled: for scaling is the onely cure of that which is corruptrotten bone.

ed; now it is scaled by that which dries exceedingly, and draws forth all the humidity, as well the

THE REPORT

excrementitious, the author of the rottennels, as the alimentary: For thus it remains without bloud and nourithment, and confequently life also; whence it must of necessity scale or fall off, being deand nourithment, and confequently life allo; whence it must of necessity scale or fall off, being deflitute of the glue or moisture which joined it to the found parts in vicinity and communion of life, like as leaves which fall away from the trees, the humidity being exhausted, by which, as by glue, they adhered to the boughs. For this purpose Cataginatick powders are prepared to amend the corruption which is onely superficiary. Re Pul. aloes, cretæ combagitæ, pompholygos, an. 5 ij. ireas flor. arifioloch, rot. myrib. cerus[æ, an. 3 i, pul. often. combagitæ, pompholygos, an. 5 ij. ireas flor. arifioloch, rot. myrib. cerus[æ, an. 3 i, pul. often. combagitæ, pompholygos, an. 5 ij. ireas flor. arifioloch rot. myrib. cerus[æ, an. 3 i, pul. often. combagitæ, arifical cither alone by it self, or else with Honey and a little Aqua vitæ. Also the following Emplaster being applied (firs up Nature to the exclusion of the broken bones, and cleansieth, the ulters from the being applied, ftirs up Nature to the exclusion of the broken bones, and cleanfeth the ulcers from the being appared, this up Nature to the exclusion of the broken bones, and cleanteth the ulcers from the more grofs and vifeid fanies. Europorbium, according to Diofeorides, takes off the scales of bones in one day. Hereto also conduceth Emp. de betonica. Or, R olei caryophyl. 3 [s. eamplo. 3 ij. miseantum funul in mortario, & utere. But if that part of the bone which is cornerpt cannot thus be taken away, then must you use the scaling Trepans and Scrapers described formerly in wounds of the head; especially if any more great or folid bone be foul. Furthermore the here-described Trepan will be good to profess more great or folid bone be foul. Furthermore the here-deferibed Trepan will be good to perforate the rotten bone in many places where it is corrupted, until as it were a certain bloudy moisture iffue forth at the holes; for thus it more freely enjoys the air, and also the force of the medicins additional to the force of the medicins and the force of the medicins additional to the force of the medicins and the force of the medicine the force of the medicine the force of the force of the force of the medicine the force of t mitted by these holes work more powerfully.

A Trepan with two triangular bits and a pin no hold them in the stock: as also another Trepan having four-square and six-square bits convenient to be used in the rottenness of greater bones.

But if the rottenness be more deep, and the bone more hard, either by Nature or Accident, as by the occasion of the too long admission of the air, then the rotten scales shall be cut off by the instruments described in wounds of the head, driving them into the bone with leaden mallets, left the part thould be too much offended or shaken with the blow. The scales and fragments shall be taken forth signs that the with mullets; the figns that all the rottenness is taken away, are the folidness of the bone thereunder, and the bloudy moisture fweating out thereat.

taken away,

CHAP. XXVII.

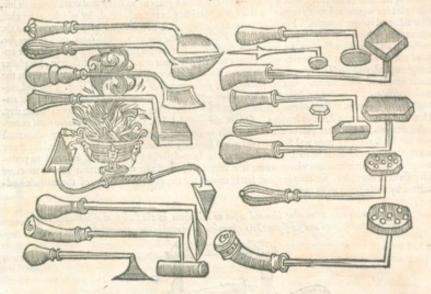

Of actual and potential Cauteries.

Ut if the described remedies cannot take place, by reason of the malignity or magnitude of the rottenness, then must we come to actual and potential Cauteries. But I should rather Actual Cauteries. approve of actual, because by strengthening the part they confume the excrementations hurries to be pre-thours wherewith it is overcharged, to wit, the matter of the Caries; which is not fo effectually ferred before performed by potential cauteries. Yet are we oft-times forced to use these, to please the Patients Potential. which are terrified at, and afraid of hot irons. Potential Cauteries are Aqua fortis, Aqua virrioli, scal- Potential Cauding Oil, melted Sulphur and boiling, and the like; in pouring on of which I would have the Surteries.

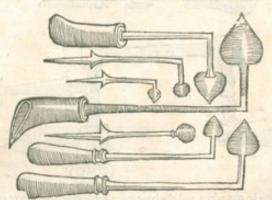

geon to be prudent and industrious, let he should rashly violate the neighbouring sound parts by the burning touch of these things, which his temerity would cause vehement pains, instammations, and other horrid symptoms. For actual Cauteries, their variety in figure is so great, that it cannot be defined, much lefs fet down in writing; for they must be varied according to the largeness of the rottennels, and the figure and conformation of the fouled bones. Such as are more usual I have thought good to delineate unto you, content onely to admonish you thus much, that some of these work by pricking, fome by cutting, fome flatwife, and other fome with their points made to the form of an Olive-leaf.

THE OWNER OF THE OWNER,

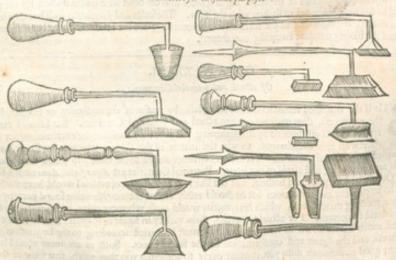

Sundry forms of allual Canteries fit in all necessary cases of all parts.

Other Conteries.

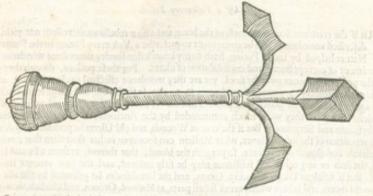

Other Canteries for thefame purpofe.

The following figure of a Cautery is fit for virulent knots that arife in the foull, when you defire to take away the field that covers the bones for this purpofeit is made hollow and flarp in a triangular and quadrangular form, divided as it were into three branches, that you may fo make use of which you please.

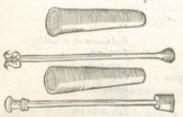

The

The Figure of an hollow and cutting Cautery.

The Cauteries whose forms are hereafter exprest, take place in rotten bones that lie deep in, wherein you cannot make use of the formerly described, without touching of the neighbouring found

parts. To avoid which danger, you shall put your cautery even to the bone through an iron pipe, which may keep the neighbouring and flethy parts from burning.

Allual Cauteries with their Pipers

Great discommodities ensue upon too rash, that is, too frequently applied Cauteries, or too long adhering to the bone; for by this immoderate and fiery heat not onely the excrementitious humidity of the rotten bone is con-fumed, but also the radical and substantial moissure of the part is exhausted, wherein alone Nature endeavouring to cast off the corrupt scales, and sever the found from the rotten bone, and to substitute flesh, stands and consists. Wherefore, the measure of applying of cauteries ought to Manner of ap-

be taken from the greatness of the rottenness, and the excrementitious, or after a manner, forning plying of Gashumidity sweating through the pores of the bone. But before you press your cautery into the rotteness ten bone which lies very deep in, as that which happens in the thigh-bone, and upon other very fleshy parts, you must diligently defend the neighbouring found and fleshy part, as it were with a covering, for that the humour diffused by the touch of the fire, burns the other places whereunto it diffuseth it felf like scalding oil. After the cauterization, you must help forwards the falling away of the feales by fometimes dropping in our Oil of Whelps, being made Oil of Whelps fealding hot. This Oil, though very fit for this purpose, yet do I not judge it fit to use it too often, helps for it may fuffice to have dropped it in some twice or thrice; for at length it may violate the found made it may fiffee to have dropped it in some twice or thrice; for at length it may violate the found fing off of bone that lies under the rotten, by the oily, fabtil and moift fubfiance. Furthermore, a bone is the fealer. most dry part of the body, therefore unctuous and most Medicins are contrary to its temper and confiftence. But it conduceth often and gently to move the scales already beginning to separate themselves, and it hastens the slackness of Nature in casting them off. Yet may you not use sorce, unless peradventure when as they hang by a flender threadsotherwise if the unwary Surgeon forcibly A carrion in pluck away the feales before that Nature hath put a cover upon the found bone, he shall give way to moving the a new alteration and foulness, by the appulse of the air. Furthermore, after the corrupt scale is fal- scales of burne ling off, by the force of Nature expelling it, you must have a diligent heed that you put not eating or bones. corroding Medicins upon the bone that is under it; for thus thou thalt confirme or waite the field which Nature hath generated thereupon, which composed of newly concreted bloud, is like in fostness to newly curdled milk, which otherwise in time would grow into a more folid and hard confi-fience. This under-growing flesh by little and little thruss the rotten bone above it, out of its place, and is the cause of the scaling thereof; it is at the first gathered together like the grains of a pomgranate, with a red, fmooth and equal fasies, and not tlinking, and at length it catts forth a white matter. Therefore then we must rather strew thereon Cephalick powder composed of such things Cephalick as have a faculty to dry without biting, such as are Orris-root, washed Aloes, Mastich, Myrrh, Barly-Powders of flower, and the like. Laftly, it must be cicatrized, it is better that scales of bones fall away of them, what comp felves, by the onely force of Nature, than to be plucked away by the force of Medicins or Infiruments, fed. because such as are too violently and forcibly plucked away, leave corners like to tiffulous ulcers. Neither ought the corrupted membranes when they are turned into pas, to be plucked away too violently, or to be touched by too acrid Medicins; for pain hereupon arising, hath divers times caused inflammation, convulsion, and other pernicious symptoms. Therefore, it is better to commit this business to Nature, which in success of time, by making use of the expulsive faculty, will easily free it felf from this rotten fubfrance; for that which is quick as far as it is able, will fill put away that Which is dead from it.

CHILITATION

CHAP. XXVIII.

Of a Vulnerary Potion.

The use of Vulnerary Porions. But if the contumacious rottermess of the bone, and also a rebellious ulcer shall not yield to the described remedies, it will be convenient to prescribe a Vulnerary Potion to the Patient. For Nature helped by such a Potion, hath to my knowledge fundry times done wondrous things in amendment of corrupt bones, and consolidation of ulcers. For these potions, though they do not purge the noxious humours away by shool, yet are they wondrous effectual to cleanse ulcers, and free them from the excess of excrementitious humours, to cleanse the bloud, and purge it from all impurity, to agglutinate broken bones, and knit the sinews. I have here thought good to speak of them, and chiefly, for that they were much commended by the Ancients, but neglected by the modern Physicians and Surgeons. But if the cure of Wounds and old Ulcers be performed by detersion, and the reposition of the lost substance, what Medicin can sooner or rather do it than that, which by its admirable and almost divine force, so purgeth the bloud, that thereof, as from a fit and laudable matter, the slesh or any other lost substance may be fitly rettored, and the part recover its former union? But if situlous Ulcers, Cancers, Gouts, and the like diseases to offended by the use of salt, spiced, acrid meats, and others which are of substil parts, as Mustard, Onions, and Garlick, or any other excess in meat or drink; why may they not become mild and gentle by medicated and contrary meats and drinks, or at least be reduced to a more equal temper? Therefore that Surgeons may know of what things such compositions may arise, I have here thought good to reckon them up, that you may learn what they are.

Scabious,	Centaury,	Gentian,
Saniele.	Adders-songue.	Herniaria.
Eugle.	Betony.	Red Colewort, or Cabbage.
Mouf-ear.	Cardrus benedictus.	Scordium.
Burnet.	The Cordial Flowers.	Cats-mint.
Madder.	Aristolochia, or Birth-worts.	Cinque-foil.
Taxfic.	Speed-well.	River-Crabs.
Tops of Hemp.	Agrimony.	Mace.
Tops of Brambles.	The Capillaries.	Bole-armenick
Sow-bread.	Herb-Kabert,	Perum, or Tobacco.
Comfrey the greater and leffer.	Doves-foot.	Mead-sweet.
Vervain.	Dogs-songue Avens.	Colts-foot.
Beiort.	Primella.	Dandelion.
Mug-wort.	Ofmund,	Plantain.
Perinvincle.	Clary.	St. Johns-wort.

Of all these the Surgeon shall make choice according to the mind and judgment of the Physician, such as he shall think it and proper to every Ulcer or Wound, or to each wounded and ulcerated part, according to the condition of the time, the temper of the Patient, and kind or nature of the disease. You may make drinks not onely of the decoctions of these, but also of their juices in white Wine, or anomal, which are good not onely to puritie the mass of the bloud, to cleanse sanious, virulent, hithy, and dysenterious ulcers, but also to drive away purresiction, scale-bones, dissolve clotted bloud in bruises, to draw, pluck out and exterminate all strange bodies, as I have often observed to my great admiration. They are composed usually after this manner. Re Savie. bugul. scabios. buton. fixed, nepet. an. m. s. never. mund. sem. byper. & eard. bon. an. 3 j. trium flor. cord. an. p. ii. coquanture complete in aqu. communi: posts in fine adde vini alb. mel. ros. & cinnum, quod fussici, fiat decosine, caletur per manicam. Let him drink 3 iii. in the morning three hours before dinner. You may also with good success make injections with the same liquor into tissuous and sinuous ulcers, as also to wash the fordid ulcers therewith. You may also boil the same Simples, as herbs, slowers, and feeds, in the Patients broths, that so they may acquire a medicinable and nourishing faculty. For the time of the affect, wherein you may with good success make use of these, we have read in Gnido, that he used not to prescribe these potions to his Patients when as they were newly wounded, for that they commonly are composed of things hot and opening, which heat and attenuate the bloud, whence there would be danger of a defluxion upon the affected part. Wherefore when the matter is come to suppuration, when as there is nothing remains, but to cleanse the ulcer, and all it with fielh, no inflammation as now remaining in the part, I judge these potions may then be used with good success.

The form of a Vulnerary Potion.

In what time of the difease they are chiefly to be used.

CHAP. XXIX.

Of Tetters, Ring-worms, or Chops occasioned by the Lues Venerea.

Pon the cure of the Luce Venerea, usually Tetters and Chops happen thereupon, which makes furrows in the palms of the hands and soals of the feet. They acquire their matter from falt phlegm, or aduat choler, or the reliques of the venereous virulency sent thinker. The cure, especially when as the disease is grown old, is difficult; by reason that the humour hath long accustomed to flow that way, and for that it hath corrupted the habit of the part by the continual.

nual defluxion s but the cure is more easie, if the difease be newly bred. Now you may know it is Signs of the newly bred by the redness, accommanied by a great itching, and not onely a drings of the skin, but new bred difnewly bred by the redness, accompanied by a great itching, and not onely a driness of the skin, but new also a thickness and densiness thereof. That which is old, besides these fore-recited signs, hath sea-case. ly and bran-like hardnesses conjoined therewith, which by scratching and rubbing catteth off scales. For general Medicins, the distemper of the Liver, and habit of the Body tout be corrected, which by the occasion of the former disease and remedies, apt to inflame the bloud, cannot but much swerve from their native temper. This may be done by diet conveniently appointed, by purging and al. The cure of tering Medicins, bleeding, Bathing, applying of Cupping-glaffes and horns. For topick, or particular newly co Medicins, wath fuch as are newly or lately bred with the following water which dries, and is of fubtil parts. R Aq. rof. & pariet. an. § j. aq. alum. § ij. calc. § ij. alum. § iij. pnd. fiebl.) iv. fiat lenis, & A Water dryminim. ebul. in baln. mar. This water shall be made more or less forcible, according to the condition ing virulent of the difease. Or, is Ol. tart. § i), sip. com. § iv. mise, first unguent, ad usum. If the Physician shall Teners, thing good, let the Patient use a decection of Guaiscam, but that very weak. But old Tetters and old Tetters, old Tetters, are unit be softened with condition, attempting, and inciding decections, as also with Linguistics. Chops must be formed with emollient, attenuating, and inciding decoctions, as also with Liniments, Ointments, and Plasters having the same effect. Then let the residue of the cure be performed by Fumigations, such as this which follows: R. Pul. cinab. 3 ij. lad. aff. odor. flyrac. cal. an. 3 \$. olib. A Fumigatimaftic. an. 3 iii. elei tart. & theriae. q. f. fiant trochifei; use at each time some 5 !. of them, and let on onely the affected parts receive the smoak. Some commend the rubbing of the hands with the following Medicin. Take the after of Wine-lees, make thereof a lee, and ftrain it through an hypocras-bag, then put thereto fome rennet; let them be well mixed together in a mortar, and herewith let the hands be rubbed or washed. Or, it unguent end. § iii. fugit. § ii. Or else, it Res. pint. § i. A Linimente cerus. an. § v. argent. viv. § iii. fueci citri & lapath. acut. an. § . Let them be incorporated, and make a Liniment to be used to the part. If to this you add fublimate so washed and prepared, as women use for their Faces, you shall make it more effectual. Others take burnt alum made into Powder, and incorporated with the yolk of an Egg, the jusce of Citrons, and a little Aloes dissolved in

CHAP. XXX.

Of caving the Lues Venerea in Infants, and little children.

Nfants oft-times conceive the feeds of this difease in the wombs of their mothers, and are born infected therewithall, puttles prefently arifing over all the bodies, infecting with the like difeafe as many Nurses as give them suck; they scarce ever recover thereof, for that they contracted the difease from their first conformation. But such as are somewhat bigger, if they chance to catch the difease after they are born, by sucking some insected Nurse, or by any other occasion or kind of contagion, oftentimes receive cure. For first, you shall cause the Nurse to use the Aqua theriacalis The Cures here-tunder described, for the space of twenty or more days, that so the may the better arm her feli against the contagion of this disease, and yield Milk which may have the faculty of meat and medicin; the thall be careful, as often as the gives the child fuck, to wath and dry her teat or pap, left the virulency that the child breaths out at his mouth, be impact in the little holes of the teat through which the milk flows out. Now the puttles of little children thall be anointed with forme ointment that receives Argentum vivuon in fome small quantity, as Unquentum enulatum com mercome, or the like. Then shall it be swathed or bound up in swaths and cloths aired with the formerly described Furnigations. For the rest, it shall be kept as warm as you can in some warm place. These and the like must be done, not in one continued course, but at several seasons, otherwise it is to be seared that it would cause ulcers to arise in the mouth, or else fallwation. It any Ulcers arise in the mouth, and spread therein, they shall be touched with the formerly described waters, but made fomewhat weaker, having regard to the tender age of the Patient; if the Infant shall get this difease of its Nurse, let the Nurse be presently changed, for it being otherwise nounified with tainted and virulent bloud, can never be healed. Many have by these means recovered; but fuch as have perished, have not perished by the default of Medicins, but by the malignity and vehemency of the disease.

A description of the Aqua Theriacalis, or Treacle-water somerly mentioned.

Re Rasor, interior, ligni sandri gummosi, the ij. polypod, querni, \(\bar{z}\) iv. vini albi dulcedinis expertis the ij. A Treacle-aqua sontan parriss. It viii, aquar, cichor. The End of the Nincteenth Book,

BOOK XX.

Of the SMALL POX and MEAZLES:

As also of WORMS, and the LEPROSIE.

CHAP. I.

Of the earlies of the Small Pex and Meazles.

Or that the Small Pox and Meazles are diseases which usually are fore-runners and foretellers of the Plague, not onely by the corruption of humours, but oft-times by default of the air. Moreover, for that Worms are oft-times generated in the Plague, I have thought good to write of these things, to the end, that by this Treatise the young Surgeon may be more amply and perfectly infiructed in that peffilent difeafe. Alfo I have thought good to treat of the Leprofie, as being the off-fpring of the highest cor-

What the Their manter,

ruption of humours in the body. Now the small Pox are pusiles, and the Meazles spots which arise in the top of the skin by reason of the impurity of the corrupt bloud sent thither by the force of Nature. Most of the Ancients have delivered that this impurity is the reliques of the mentimous Small Pox and bloud remaining in the body of the Infant, being of that matter from whence it drew nourithment in Meszles are. the womb, which lying full or quiet for fone frace of time, but firred up, at the full opportunity the womb, which lying still or quiet for some space of time, but stirred up at the first opportunity of a hotter Summer, or a foutherly or rainy feafon, or a hidden malignity in the air, and boiling up, or working with the whole mass of the bloud, spread or slaew themselves upon the whole surface of the body. An argument hereof is, there are few or none who have not been troubled with this difeafe, at least once in their lives, which when it begins to show it felf, not content to fet upon some one, it commonly feizeth upon more: now commonly there is as much difference between the finall Pox and Meazles, as there is between a Carbuncle and a petillent Bubo: for the Small Pox arises of a more groß and vifcous matter; to wit of a Phlegmatick humour: but the Meazles of a more fubtil and hot; that is, a cholerick matter, therefore this yields no marks, but certain fmall fpots with-out any tumour, and these either red, purple, or black. But the Small Pox are extuberating pustles, white in the midth, but red in the circumference, an argument of bloud mixed with choler, yet they are scarce known at the beginning, that is, on the first or second day they appears but on the third and fourth day they bunch out and rise up into a tumour, becoming white before they turn into a feab; but the Meazles remain fill the fame. Furthermore, the fmall Pox prick like needles by reafon of a certain acrimony, and cause an itching; the Meazles do neither, either because the matter is not fo acrid and biting, or elfe for that it is more fubtil, it eafily exhales, neither is it kept that up under the skin. The Patients often ineeze when as these matters seek passage out, by reason of the putrid vapours afcending from the lower parts upwards to the brain. They are held with a continual Fever, with pains in their backs, itching of their nofe, head-ach, and a vertiginous heaviness, and with a kind of fwounding or fainting, a naufeous disposition, and vomiting, a hearfness, difficult and frequent breathing, an inclination to fleep, a heaviness of all the members, their eyes are fiery and fwollen, their urin red and troubled. For Prognotticks we may truly fay thus much, That the matter whence this affect takes its original, partakes of fo malign, petillent and contagious a quality, that not content to mangle and spoil the fleshy part, it also cats and corrupts the bones like the Lucs Venerea, as I observed not onely in Anno Dom. 1568. but also in divers other years, whereof I think it not amiss to set down this notable example.

The daughter of Claude Pique a Book-feller, dwelling, in St. James his street in Paris, being some four or two years old, having been sick of the Small Pox for the space of a Moneth, and Nature could not overcome the malignity of the discase, there rose abscesses upon the storms, and the joints of the thoulders, whose eating and virulent matter, corroded the bones of the flernon, and divided them in funder; also it consumed a great part of the top of the thoulder-bone, and the head of the blade-bone; of this things the state of the Kings. of this thing I had witnedles with me, Marcar Myron Phylician of Parir, and at this prefent the Kings chief Phylician, John Dorean Surgeon to the Conte de Eryane, the body being diffected in their pre-fence. Also you may observe in many killed by the malignity of this disease and diffected, that it causeth such impression of corruption in the principal parts, as brings the Dropsie, Ptisick, Hoarfiness, Althma, Bloudy-flux ulcerating the Gues, and at length bringeth death, as the puttles have raged or rejenced over these or those corrects.

reigned over these or those entrails, as you see them do over the surface of the body; for they do not onely moleft the external parts, by leaving the impretions and fears of the puttles and olers,

An Hiftory.

Why the

What gricvous and pertouss may

with the same

rooting themselves deep in the flesh, but also oft-times then take away the faculty of motion, eating afunder, and weakning the joints of the Elbow, Writt, Knee, and Ankle. Moreover fundry have been deprived of their fight by them, as the Lord Gaymonay, others have loft their hearing, and othersome the finelling, a fleshy excrescence growing in the passages of the note and ears. But it any relique of the disease remain, and that the whole matter thereof be expelled by the strength of Nature, then fymptoms afterwards arife, which favour of themalignity of the humour, yea and equal the harm of the fymptoms of the Lucs Ventres.

CHAP. II.

Of the Cure of the Small Pox and Meazles.

He Cure of this Difease wieth to be diverse, according to the condition of the humour free The Cure. from, or partaker of the venenate quality: For if it partake of malignity, and the child be a fucking child, fuch things shall be given to the Nurse as may infringe and overcome the firength of the malignity, as we shall shew more at large when we come to treat of the Cure of children which are fick of the Plague 5 howfoever it be, the child must be kept in a warm room free from wind, and must be wrapped and covered with scarlet cloths, until the Pox come forth. There shall be provided for the Nurse medicated Broths, with Purslain, Lettuce, Sorrel Succory, Borage, and French-Barley bound up in a cloth. She shall thun all falt, spiced and baked Meats, and in stead of Wine, drink a decoction of Licorice, Raisins, and Sorrel-roots. She shall also take purging Medieins, as if the were fick of the fame difease, that so her milk may become medicinable. Latily, She shall observe the same diet as is assually prescribed to such as have the Plague. You shall give the The Child child no Pap, or if you give it any, let it be very little. But if the child be weaned, let him abitain must have no from flesh until the Fever have left him, and the Pox be fully come forth: in flead of fleih let him Pap. feed on Barley and Almond Creams, Chicken Broths, wherein the fore-named Herbs have been boiled, Panadoes, Gellies, Cullaffes, Prunes, and Raifins. Let his drink be a Ptifan made of French-Barley, Orafs and Sorrel-roots or with a Nodula containing the four Cold Seeds, the pulp of Prones and Raifins, with the flavings of Ivory and Harts-horn; between meals the fame decoction may be mixed with some Syrup of Violets, but not of Roses or any other astringent Syrup, leit we hinder the course and inclination of the humour outwards. Let his sleep be moderate, for too found sleep How found draws back the matter to the center, and increaseth the Fever, you must acither purge, nor draw harm in this bloud, the difease increasing or being at the height, unless peradventure there be a great plenitude, disease, or else the disease complicate with other, as with a Pleurisie, inflammation of the eyes, or a squanarcy of purging, which require it, lest the motion of Nature should be dissured; but you shall think it sufficient to bleeding, and sufficient to be designed in the control of the eyes. Joofe the belly with a gentle Clyfler: but when the height of the difease is over, and in the declen- sadorificks. fion thereof, you may with Caffia or forme fronger Medicin evacuate part of the humours, and the reliques of the difease. But in the state and increase, it is better to use Sudorificks, which by attenuating the humours and relaxing the pores of the skin may drive the caufe of the difcase from the center to the circumserence, which otherwise residing in the body might be a cause of death as I and Riebard Hubert observed in two Maids, whereof one was four, and the other seventeen years old. An History. for we diffecting them both being dead, found their cutrails covered with feabby or crufted puttles, like those that break forth upon the skin. We must not think that a bleeding at nose at the beginning of the difeafe, or in the first four or five days, should carry away the matter and original of the difease, for nevertheless the Pox will come forth; but for that this is a true and natural Crific of this difease, as that which is carried to the surface and circumstrence of the body, such bleeding must not be stopped, unless you fear it will cause swounding. The matter shall be drawn forth with a decoction of Figs, husked Lentils, Citron-feeds, the Seeds of Fennel, Parfly, Smallage, roots of Grafs, Raifins, and Dates. For such a decoction, certainly if it have power to cause Sweat, bath also a faculty to fend forth unto the skin the morbifick humour; the Seeds of Fennel, and the like opening things relax and open the pores of the skin's Figs lenifie the acrimony of the matter, and gently cleanfe, the Lentils keep the jaws and threat, and all the inward parts from publics, and hinders flux by reason of their moderate attriction, but having their husks on, they would bind more then is required in the difease; Dates are thought to comfort the stomach, and Citron Seeds to defend the heart from malignity; Licorice to finooth the throat, and hinder hoarfness and cause Sweat. But when it is these things shall be given long after meat, for it is not fit to sweat patiently after meat, some there best to proceed these things shall be given long after meat, for it is not fit to swear patiently after meat; tome there best top be who would have the child wrapped in linner cloths steeped in this decoction being hot, and as Swear, terwards hard wrung forth. Yet I had rather to use bladders or sponges, or hot bricks for the same purpose, certainly a decoction of millet. Figs and Raisins, with some Sugar, cansett swear powerfully. Neither is it amiss whilest the Patient is covered in all other parts of the body, and sweats, to fan his face, for thus the native heat is kept in, and so strengthered, and fainting hindered, and a greater excretion of exercmentitious humours caused. To which purpose you may also put now and then to the Patients note a Nosalas made with a little Vinegar and Water of Rotes, Camphire, the Powder of Sanders, and other odoriferous things which have a cooling faculty; this also will keep the note from puffics.

prevalent to waite and smooth the Pock-arrs.

He eyes, note, throat, lungs, and inward parts ought to be kept freer from the eruption of puffles than the other parts, for that their nature and confiftence is more obnoxious to the malignity of this virulency, and they are eafilier corrupted and blemished. Therefore left the eyes should be hurt, you must defend them when you first begin to suspect the disease, with the eye-lids, also moithing them with Rose-water, Verjuice or Vinegar, and a little Camphire. There are some also who for this purpose make a decoction of Sumach, Berbery-seeds, Pomgranat-pills. Aloes, and a little Saffron, the juice of fower Pomgranats, and the water of the Whites of Eggs dropped in with Rofe-water are good for the same purpose, also Womens milk mixed with Rofe-water and often renewed, and laftly all fuch things as have a repercuffive quality. Yet if the eyes be much fwollen and red, you shall not use repercustives alone, but mix therewith discussers and cleansers, fuch as are fit by a familiarity of Nature to firengthen the fight; and let these be tempered with some Fennel or Eye-bright water. Then the Patient shall not look upon the light, or red things, for fear of pain and inflammation; wherefore in the flate of the difease, when the pain and inflammation of the eyes are at their height, gently drying and discussive things properly conducing to the eyes, are most convenient, as washed Aloes, Tutty, and Antimony, in the Water of Fennel, Eye-bright, and Roses. The formerly mentioned Nodular will preserve the nose, and linnen cloths dipped in the fore-said aftringent decoction, put in the nottrils, and outwardly applied. We shall defend the jaws, throat, and throtle, and preferve the integrity of the voice by a gargle of oxycrate, or the juice of fower Porn-granats, holding also the grains of them in their mouths, and often rouling them up and down therein, as also by Nodulaes of the feeds of Pfilium, Quinces, and the like cold and aftringent things. We must provide for the lungs and respiration by syrups of Jujubes, Violets, Roses, white Poppies, Porngranats, Water-Lillies, and the like. Now when as the Pox are throughly come forth, then may you permit the Patient to use somewhat a freer diet, and you must wholly busic your felf in ripening and evacuating the matter, drying and scaling them. But for the Meazles, they are cured by resolution onely, and not by suppuration; the Pox may be ripened by anointing them with a decoction of the Roots of Mallows, Lillies, Figs, Line-seeds, and the like. After they are ripe, they shall have their heads clipped off with a pair of Sciffers, or elfe be opened with a golden or filver needle, left the matter contained in them should corrode the flesh that lies thereunder, and after the cure, leave the prints or pock-holes behind it, which would cause some deformity; the pur or matter being evacuated, they shall be dried up with unguent. refut, adding thereto Cerus, Litharge, Aloes, and a little Saffron in Powder; for these have not onely a faculty to dry, but also to regenerate fieth; for the same purpose the flower of Barley and Lupines are diffolved and mixed with Rose-water, and the affected parts anointed therewith with a fine linnen rag; some anoint them with the sward of Bacon boiled in Water and Wine, then presently strew upon them the flower of Barly or Lupines, or both of them. Others mix crude Hony newly taken from the Comb, with Barly-flower, and therewithal anoint the puftles so to dry them; being dried up like a fourf or feab, they anoint them with Oil of Rofes, Violets, Almonds, or elfe with fome Cream, that they may the fooner fall away, the pufiles being broken; tedious itching folicits the Patient to

Remedies for fcratch, whence happens excoriation and filthy ulcers, for fcratching is the occasion of greater atexcoriation. Wherefore you shall bind the fick childs hands, and foment the itching parts with a decoction of Marih-mallows, Barly and Lupines, with the addition of some falt. But if it be already excoriated, then shall you heal it with unguestum album campborat, adding thereto a little Powder of Aloes or Cinnabaris, or a little deficeationm rubrum. But if notwithflanding all your application of repelling medicins, pufiles nevertheless break forth at the Eyes, then must they be diligently cured with all manner of Collyria, having a care that the inflammation of that part grow not to that bignels as to break the Eyes, and that which fometimes happens to drive them forth of their proper orbs. If any crusty ulcers arise in the nothrils, they may be dried and caused to fall away by putting up of Ointments. Such as arife in the Mouth, Palate, and throat, with hoarfnefs and difficulty of fwallowing, may be helped by Gargarifins made with Barly-water, the Waters of Plantain and Chervil, with fome fyrup of Roles, or Diamaron diffolved therein; the Patient shall hold in his mouth Sugar of Roses, or the Tablets of Elect. diatragaeanth. frigid. The Pock-arrs left in the Face, if they bunch out undecently, shall be clipped away with a pair of Sciffers, and then anointed with fresh Unguent, citrin. or else with this liniment. R Amyli triticis & amygdalar, excerticatarum an. 31 15. gum. tragacanth. 3 (. feminis melonum, fabarum ficcarum excorticat. farine bordei, an. 3 iv. Let them all be made into fine Powder, and then incorporated with Rofe-water, and fo make a Liniment, wherewith anoint the face with a feather; let it be wiped away in the morning, walking the face with fome water and wheat-bran; hereto also conduceth lae virginale; Goose, Ducks, and Capons greafe are good to smooth the roughness of the skin, as also of Oil of Lillies; Hares bloud of one newly killed and hot, is good to fill and plain, as also whiten the Pock-holes, if they be often rubbed therewith. In flead hereof many use the sward of Bacon rubbed warm thereon; also the dittilled Waters of Bean-flowers, Lilly-roots, Red-roots, Egg-shells, and Oil of Eggs are thought very

A Discourse of certain monstrous Creatures which breed against Nature in the box dies of Men, Women, and little Children, which may ferve as an Induction to the ensuing Discourse of WORMS.

S in the Macrocofiner or bigger World, foin the Microcofiner or leffer World there are Winds, A comparison Thunders, Earthquakes, Showrs, Inundations of Waters, Sterilities, Fertilities, Stones, Moun-between the tains, and fundry forts of Fruits and Creatures thence arife. For who can deny but that there is bigger and Wind a subject to the control of Wind contained and flut up in Batulent abfectfes, and in the guts of those that are troubled with the lefter World. Colicle? Flatulencies make to great a noife in divers women's bellies, if to be you fland near them, tion of wind that you would think you heard a great number of Frogs croaking in the night time. That Water in mans body is contained in watery abfeeffes, and the belly of fuch as have the droptie, is manifested by that cure Of water. which is performed by the letting forth of the water. In its of Agues the whole body is no otherwife thaken and trembles, than the Earth when it is heard to bellow, and felt to thake under our feet. He which shall see the Stones which are taken out of the bladder, and come from the kidnies of Stones. and divers other parts of the body, cannot deny burthar Stones are generated in our bodies. Fur-thermore we fee both Men and Women, who in their Face or fome other parts flew the impression of the first conimprinted figure of a Cherry, Plumb, Service, Fig., Mulberry, and the like Fruit; the cause bereof formation, is thought to be the power of the Imagination concurring with the formative faculty, and the tendemess of the yielding and wax-like Embryon, easie to be brought into any form or figure, by reason of the proper and native humidity. For you shall find that all their Mothers whilest they went with them have earnestly defired or longed for such things, which, whilest they have too carnestly agitated in their minds, they have transferred the shape unto the child, whilest that they could not enjoy the things themselves. Now who can deny but that the Bunches of the Back and large Wens refemble Mountains? Who can gain-fay, but that the fqualid Sterility may be affimilate to the heetick driness of waited and confumed perfores? and Fertility deciphered by the body diffended with much flesh and fat, so that the legs can scarce stand under the burden of the belly? But that divers Creatures are generated in one Creature, that is in Man, and that in fundry parts of him, the following Histories thall make it evident.

Holerius tells that a certain Italian by frequent finelling to the Herb Bafil, had a Scorpion bred in Lib. 4t mobiles Brain, which caused long and vehement pain, and at length death; therefore I have here express into cap.1. the figure of that Scorpion, found when as his Brain was opened.

The Figure of a Scorpion.

It makes Hollerins conjecture of the cause and original of this Scorpion probable, for that Chrysquas Displance, and Pliny write, that of Bafil beaten between two stones, and laid in the Sun, there will

Fernelius writes that in a certain Souldier who was flat noted, upon the too long refiraint or flop- Like depart. Page of a certain filthy matter that flowed out of the nofe, that there were generated two hairy worms movie, cop. 70 of the bignets of ones finger, which at length made him mad; he had no manifest Fever, and he died about the twentieth day. This was their shape, by as much as we can gather by Fernelius his words.

The Effigies of Worms mentioned by Fernelius.

The floape of a Millepes cast forth by Vrin.

Lues Dures, a man of great learning and credit, told me that he had An Historya come forth with his Urin, after a long and difficult difease, a quick Creature, of colour red, but otherwife in shape like a Millepes, that is, a Cheflop, or Hog-loufe.

Count Charles of Mansfields last Summer troubled with a grievous and continual Fever, in the An History. Duke of Guifes place cast forth a filthy matter at his Yard, in the shape of a live thing almost just in

timminus ...

The shape of a thing cast forth by Urin.

Mitolaus Flor. Monstrous Creatures also of fundry forms are also generated in the wombs of women; somewhiles God. 116-7, e.18- alone, otherwhiles with a Mola, and sometimes with a Child naturally and well made; as Frogs, Toads, Scrpents, Lizzards: which therefore the Ancients have termed the Lombards brethren, for that it was usual with their Women, that together with their natural and perfect iffue, they brought into the World Worms, Serpents, and monifrous Greatures of that kind generated in their wombs, for that they always more respected the decking of their bodies than they did their diet. For it happened whileft they fed on Fruits, Weeds and Trash, and such things as were of ill juice, they ge nerated a putrid matter, or certainly very fubject to putrefaction and corruption, and confequently Libertor, popul. opportune to generate such unperfect creatures. Joubartas telleth that there were two Italian women that in one moneth brought forth each of them a monstrous birth; the one that married a Tai-Jor, brought forth a thing fo little, that it refembled a Rat without a tail; but the other a Gentlewoman, brought forth a larger, for it was of the bigness of a Cat; both of them were black, and as foon as they came out of the Womb, they ran up high on the wall, and held fast thereon with their nails. Lycoftbenes writes that in Anno Dom. 1494. a woman in Cracovia, in the fireet which taketh name from the Holy Ghoft, was delivered of a dead child who had a Serpent faftned upon his back, which fed upon this dead child, as you may perceive by this following Figure.

The Figure of a Scrpent fastned to a Child.

Lib. de occult. nat.mir. cap. 8.

Letinus Lemnius tells a very firange History to this purpose. Some few years agone (faith he)a certain woman of the Isle in Flanders, which being with child by a Sailor, her belly swelled up to fpeedily, that it feemed the would not be able to carry her burden to the term preferibed by Nature; her nineth moneth being ended, the calls a Midwife, and prefently after throng throws and pains, the first brought forth a deformed lump of slesh, having as it were two handles on the sides, stretched forth to the length and manner of arms, and it moved and panted with a certain vital motion, after the manner of Sponges and Sea-nettles; but afterwards there came forth of her womb a monfler with a crooked note, a long and round neck, terrible eyes, a tharp tail, and wonderful quick of the feet: it was shaped much after this manner.

The shape of a Monster that came forth of a Womans Womb.

As foon as it came into the light, it filled the wholer som with a noise and hiffing, running to every fide to find out a larking hole wherein to hide its head, but the Women which were prefent, with a joint confent fell upon it, and imothered it with cuthions at length the poor woman wearied with long travel, was delivered of a Boy, but fo evilly entreated and handled by this Monster, that it died as foot as it was christened.

Cornelius Comma, a Physician of Lovain, telleth that there were many very monitrous and strange Lib. de divin things cast cast forth, both upwards and downwards out of the belly of a certain Maid of Lovain, of the satar con selfage of fifteen years. Amongst the rest, she cast forth at her fundament, together with her excrements, a living creature fome foot and half long, thicker then ones thumb, very like an Ecl, but that it had a very hairy tail. I have here given you the figure of the Monfler, as it was expressed by him.

The Figure of a Monster that came forth of a Maids Belly.

Master Peter Barque and Claude le Grand, Surgeons of Verdun, lately affirmed to me, that they cured An History. the wife of a certain Citizen of Verdan, which out of an Abscess broken in the belly, cast forth a great number of Worms, together with the quitture; and these were of the thickness of ones singer, with fharp heads, which fo gnawed her guts, that the excrements for a long time came forth at the ulcer, but now the is perfectly recovered.

Anthony Benenius a Phylician of Florence, telleth that one John Menuficeus, a man of forty years of An History, age, troubled with continual pains at his flomach, was often at the point of death, neither found he any help by the counfels of many Phylicians which he used. At length coming to have his advice, he gave him a vomit, by means whereof he cast up a great quantity of corrupt and petrid matter, yet was he not thereby cafed of his pain: Therefore he gave him another vomit, by force whereof he caft up much matter like to the former, and together therewith a Worm of four fingers, long, having a red round head, of the bigness of a great Peale, covered over the body with a fort downiness, with a forked tail in manner of a half Moon, going upon four feet, two before, and two behind.

The Figure of a Worm cast forth by Vomit.

Why should I mention the prodigious bodies which are found in Abscesses, as Stones, Chalk, The efficient Sand, Coals, Snail-shells, Straws, Hay, Horns, Hairs, and many kinds of living and dead creatures? For and material tion) which may make us admire, or hold us in suspence, especially if we shall consider that Nature, the fruitful Parent of all things, hath put divers portions and particles of the universal matter where-soft the greater World is composed into this Microsoftman, or little World, Man; whereby he might the tather seem to be made to the resemblance and torm of the greater. Wherefore it so disports it self. rather feem to be made to the refemblance and form of the greater. Wherefore it fo disports it self-here, that it may counterfeit and refemble all the actions and motions which it useth to perform in the Scene of the greater World in this little one, if so be that matter be not wanting.

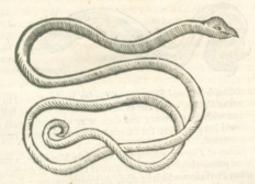

CHAP. IV.

Of the Worms which use to breed in the Guts.

Gross visid and crude humour is the material cause of Worms, which having got the be- How Worms ginning of corruption in the Stomach, is quickly carried into the Guts, and there it pus are generated, trefies, having not acquired the form of laudable Chylus in the first concoction. This, for that it is viscid, tenaciously adheres to the Guts, neither is it easily evacuated with the other excrements; therefore by delay it further putrefies, and by the efficacy of heat, it turns into the matter and nourithment for Worms. This alimentary humour being confurned, unless some fresh supply The reason the want thereof, which may ease their hunger, they move themselves in the Guts with great vio-that they some lence, they can'te grievous and great pains, yea, and oft-times they creep up to the Stomach, and times come for come forth by the Mouth, and fometimes they afcend into the holes of the Palat, and come forth at the found to the forth by the Mouth. forth at the Note. Worms are of three forts, for fome are round and long, others broad and long, others floor and flender. The first are called by the Ancients Tereter, that is round, for that they The differential long and round. The fecond are named Tenie, for that their bodies are long and broad, like ces of Worms. a Rowler or Swathe. The third are termed Afearides, for that they commonly wrap themselves up tound. Other differences of Worms are taken from their colours, as red, white, black, afh-coloured. ted, yellowith. Some also are hairy, with a great head like the little Fifth which the French call Chabet, we a Millers Thumb; in some diseases many worms are generated and east forth by the Fundathen, as finall as hairs, and usually of colour white, and there are they which are called Afcarider. The diversity of colours in Worms proceedeth not from the like diffined diversity of humours whereof they are generated. For the melancholick and cholerick humour by their qualities are wholly under the generated. unfit to generated. For the metanenones and colour, is by reason of the different corru-ption of the chylus or plalegmatick humour whereof they are bred. The long and broad Worms are often-time of the chylus or plalegmatick humour whereof they are bred. The long and broad Worms are often-times firetehed alongst all the Guts, being like to a mucous or albuminous substance; and

458 verily I faw one voided by a Woman which was like to a Serpent, and some fix foot long, which ought not to feem firange, feeing it is noted by the Ancients, that they have feen Worms fo long as the length of the whole Guts, that is feven times the length of ones body. Wieras writes, that he faw a Country-man who voided a Worm eight foot and one inch long, in head and mouth refern-An Hiftory. > Why worms of divers codangerous,

Valeriela affirmeth, that he saw a Worm above nine foot long Now as Worms differ in shape, fo are their places of generation also different. For the round and long Worms are commonly gene-In what places rated in the smaller guts, the rest in the greater, but especially the Assertion in the Stoof the belly mach, as that which is the place of the first concodion. There tooks the rest in the Stoworms are ge- these Worms, gets the first rudiment of corruption, but comes to perfection onely in the guts; they breed in fome Infants in their mothers bellies, by the pravity and corrupt nature of the humour flowing from the Mother for the nourithment of the Child, which for that then they do not expel it by fiege, it by delay putrefieth the more, and yields fit matter for the breeding of Worms, as fome that have observed out of Hippocrates. Laftly, Worms breed in people of any age that are Belly-gods and given to gluttony, as allo in fuch as feed upon meats of ill juice, and apt to corrupt, as crude Summer-fruits, Cheefe, and Milk-meats. But to know in what part of the guts the Worms do lurk, you must Worms in the note that when they are in the fmall guts, the Patients complain of a pain in their Stomach, with a dog-like appetite, whereby they require many and feveral things without reason, a great part of the nourishment being consumed by the Worms lying there; they are also subject to often fainting, by reason of the sympathy which the stomach, being a part of most exquisit sense, hath with the heart, the nofe itches, the breath flinks, by reason of the exhalations sent up from the meat corrupting in the stomach; through which occasion they are also given to sleep, but are now and then waked therefrom by fudden flaxtings and fears; they are held with a continued and flow fever, a dry cough a winking with their eye-lids, and often changing of the colour of their faces. But long and broad Worms, being the innates of the greater guts, thew themselves by stools replenished with many sloughs, here and there refembling the feeds of a Musk-melon or Cucumer. Afearides are known by the itching worms in the great gurs. they cause in the Fundament, causing a sense as if it were Ants running up and down; causing also signs of Asea a tensimus, and falling down of the Fundament. This is the cause of all these symptoms; their sleep is turbulent and often clamorous, when as hot, acrid and fubtil vapours, raifed by the Worms from the like humour and their food, are fent up to the head; but found fleep by the contrary, as when a mifty vapour is fent up from a grofs and cold matter. They dream they eat in their fleep, for that while the Worms do more greedily confume the chylous matter in the guts, they fir up the fense of the like action in the phantalie. They grate or gnash their teeth by reason of a certain convulsion. fick repletion, the mufcles of the temples and jaws being diffended by plenty of vapours. A dry cough comes by the confent of the vital parts ferving for respiration, which the natural, to wit, the Diaphragma, or Midriff, finit upon by acrid vapours, and irritated as though there were fome humour to be expelled by coughing. These same acrid sumes affailing the orifice of the ventricle, cause either an hicketting, or else a fainting, according to the condition of their consistence, gross or thin; these carried up to the parts of the Face cause an itching of the Nose, a darkness of the Sight, and a sudden changing of the colour in the cheeks. Great Worms are worse than little ones, red than white lines there is the colour of th white, living than dead, many than few, variegated than those of one colour, as those which are figns of a greater corruption. Such as are cast torth bloudy and sprinkled with bloud, are deadly, for they thew that the fubilance of the guts is eaten afunder; for oft-times they corrode and perforate lours are more the body of the gut wherein they are contained, and thence penetrate into divers parts of the belly; fo that they have come forth fometimes at the navel, having eaten themselves a passage forth, as Hollerius affirmeth. When as children troubled with the Worms draw their breath with difficulty, and wax moift over all their bodies, it is a fign that death is at hand. If at the beginning of that Fevers, round worms come for the bodies at the second country of the beginning of the provided to the beginning of the beginning of the beginning to the beginning to the beginning of the beginning to the beg round worms come forth alive, it is fign of a peftilent Fever, the malignity of whose matter they could not endure, but were forced to come forth. But if they be cast forth dead, they are figure of greater corruption in the humours, and of a more venenate malignity.

tunnunger

CHAP. V.

What Cure to be used for the Worms.

'N this difease there is but one Indication, that is, the exclusion or casting out of the Worms The general ture; all things must be shunned which are apt to heap up putrefaction in the body by their curing the corruption, such as are crude Fruits, Cheese, Milk-meats, Fishes; and lastly such things as are of a Worms, difficult and hard digestion, but prone to corruption. Pap is fit for children, for that they require moift things; but these ought to answer in a certain similitude to the consistence and thickness of Milk, that so they may be the more easily concocted and assimilated, and such onely is that pap which is made with Wheat-flower, not crude, but baked in an Oven, that the Pap made therewith may not be too vifeid nor thick, if it should onely be boiled in a Pan as much as the Milk would require; or elfe the Milk would be too terrestrial or too waterish, all the fatty portion thereof being resolved, the cheefie and whayilh portion remaining, if it should boil so much as were necessary for the full boiling cheefie and whayilh portion remaining, if it should boil so much as were necessary for the stull boiling of the crude meat; they which use meal otherwise in pap, yield matter for the generating of gross and visid humours in the stomach, whence happens obstruction in the first veins and substance of the liver; by obstruction worms breed in the guts, and the stone in the kidnies and bladder. The Patient must be fed often, and with meats of good juice, lett the worms through want of nourishment should gnaw the substance of the guts. Now when as such things breed of a patrid matter, the Patient shall be purged, and the putrefaction represt by Medicins mentioned in our Treatise of the Plague. For the quick killing and casting of them forth, Syrup of Succory or of Limmons with Rubarb, a little Treacle or Mithridate, is a singular Medicin, if there be no Fever. You may also and wherefore, for the same purpose use this following. Medicin. Re Geometery, pul, rasher, there is an 3 i. St. for the with such as for the fame purpose use this following Medicin. R. Corna cervi, pul. vasiar. eberis, an. 3 j. β. sem. to— with sich as for one of the fame purpose use this following Medicin. R. Corna cervi, pul. vasiar. eberis, an. 3 j. β. sem. to— with sich as firmelide abstration. 3 j. sin decoll. proparva dosi, in colar. infunde risci optimi, 3 j. cinam. 3 j. disolve have the firmelide abstration. 3 j. disolve have the color can't be purposed. Oil of Wotons, mass olives drunk, kills Worms, as also Water of Knotgrass drunk with Milk; and in like manner all be purged, hitter things. Yet Legald first with them to give a Cheller and a Milk. However, which we have the Yet I could first with them to give a Clyster made of Milk, Honey, and Sugar, without Oils and bitter things, left flunning thereof they leave the lower guts and come upwards; for this is natural to Worms to flun bitter things, and follow fweet things. Whence you may learn, that to the bitter things which you give by the mouth, you must always mix sweet things, that allured by the sweetness, they may devour them more greedily, that so they may kill them. Therefore I would with Mile and Spear mix the foods of Contrary Pare Women and the like. Harre-horn with Milk and Sugar mix the feeds of Centaury, Rue, Womwood, Aloes, and the like: Harts-horn Harts-horn is very effectual against Worms, wherefore you may infuse the thavings thereof in the Water or good against Drink that the Patient drinks, as also to boil forme thereof in his broths. So also Treacle drunk or the Worms. taken in broth, killeth the Worms; Purflain boiled in broths, and diffilled and drunk, is also good against the Worms; as also Succory and Mints; also a decoction of the lester Housleck and Sebestens given with Sugar before meat; it is no lefs effectual to put Worm-feeds in their Pap, and in roafted Apples, and fo to give them it. Alfo you may make suppositories after this manner, and put them Suppository upinto the Fundament. R Corali subalbi, rasura eboria, corn cerv. usti, ireos, an. 3 ij. melie albi 3 ij. 15. aguinst the ague centinodie of ad omnia concorporanda, frant Glandes: let one be put up every day, of the weight of dearides. 3 ij. for children; these suppositories are chiefly to be used for Ascarides, as those which adhere to the right gut. To such children as can take nothing by the mouth, you shall apply Cataplasms to their navels made of the Powder of Cummin-feeds, the flower of Lupines, Wormwood, Southernwood, Tanfie, the leaves of Artichokes, Rue, the Powder of Colognizatida, Citron-feeds, Aloes, Arfefmart, Horse-mint, Peach-leaves, Costus amarus, Zedoaria, Sope, and Ox-gall. Such Cataplasms are oft-times spread over all the belly, mixing therewith astringent things for the strengthening of the Part, as Oil of Myrtils, Quinces and Maitich; you may also apply a great Onion hollowed in the the midft, and filled with Aloes and Treacle, and fo roafted in the Embers, then beaten with bitter Almonds, and an Ox gall. Alfo you may make Emplafters of bitter things, as this which follows: R. Felle bubuli, fucer abfurth, an. § i), celosyn. § j. terantur & mifceautur funal, incorporatur cum farina luJingments and Ointments may be also made for the force of the apoint the belle, you may

Liniments and Ointments may be also made for the fame purpose, to anoint the belly; you may also make Plasters for the navel of Pilule Rust, anointing in the mean time the Fundament with Honey A Plaster and Sugar, that they may be chasted from above with bitter things, and allured downwards with guinst the sweet things. Or else take Worms that have been east forth, dry them in an iron pan over the fire, Worms, then powder them, and give them with Wine or some other liquor to be drunk, for so they are thought such that they have the surface of Circums drunk might be surfaced by the work of the surface of Circums drunk might. quickly to kill the relt of the Worms. Hereto also conduceth the juice of Citrons drunk with the Oil of bitter Almonds or Sallet-oil. Also some make Baths against this affect, of Wormwood, Galls,

Peach-leaves boiled in Water, and then bathe the child therein. But in curing the Worms, you must observe that this disease is oft-times entangled with another more grievous difease, as an acute and burning Fever, a flux or scouring, and the like; in which (as for example fake) a Fever being prefent and conjoined therewith, if you shall give Worm-feeds, old Treacle, Myrrh, Aloes, you shall increase the Fever and Flux, for that bitter things are very contrary to the contrary in a Flux whereby the Worms are excluded, you shall give to these affects. But if on the contrary, in a Flux whereby the Worms are excluded, you shall give Corral, and the Flower of Lentils, you shall augment the Fever, making the matter more contumations by dry and aftringent things. Therefore the Phylician shall be careful in considering whether the Fever be a symptom of the Worms, or on the contrary it be effential, and not symptomatick; that this being he as a symptom of the worms, or on the unit of such Medicins as result both affects. this being known, he may principally infift in the use of such Medicins as result both affects, as Pursometime and bitterish in a Fever and Worms, but bitter and somewhat aftrictive things in the Worms disease.

timining of the

CHAP. VI

A first description of the Elephantialis or Leprofie, and of the Causes thereof.

His difease is termed Elephantiasis, because the skin of such as are troubled therewith is rough, feabious, wrinkled, and unequal, like the skin of an Elephant. Yet this name may feem to be imposed thereon, by reason of the greatness of the disease. Some from the opinion of the Arabians, have termed it Lepra, or Leprofic (but unproperly, for the Lepra is a kind of feab and difease of the skin, which is vulgarly called Malum santiti manis) which word for the present we will use, as that which prevails by custom and antiquity. Now the Leprosie (according to Paulus) is a Cancer of the whole Body, the which (as Avien adds) corrupts the complexion, form and figure of the members. Galen thinks the cause ariseth from the error of the fanguisying faculty, through whose default the affimilation in the flesh and habit of the body is depraved, and much changed from it felt, and the rule of Nature. But ad Glauconem, he defines this difease, An effusion of troubled or gross bloud into the veins and habit of the whole body. This Difease is judged great, for that it partakes of a certain venerate virulency, depraying the mem-There is a cer- bers and comelinels of the whole body. Now it appears that the Leprofic partakes of a certain tain hidden venenate virulency by this, that fuch as are melancholick in the whole habit of their bodies, are not leprous. Now this difease is composed of three differences of Difeases: First, it confists of a difference against Nature, as that which at the beginning is hot and dry, and at length the ebullition of the humours ceafing, and the heat dispersed, it becomes cold and dry, which is the conjunct cause of this symptom. Also it consists of an evil composition or conformation, for that it deprayes the figure and beauty of the parts. Also it confilts of a solution of continuity, when The Leprofie hath for the most as the flesh and skin are cleft in divers parts with ulcers and chops: The primitive part three general causes, that is, the Primitive, Antecedent, and Conjunctive: The Primitive cause is either from the first conformation, or comes to them after they are born. It is thought to be in him from the first conformation, who was conceived of depraved and mentionous bloud, and fuch as are inclined to melancholy, who was begot of the leprous feed of one or both his Parents, for leprous persons generate leprous, because the principal parts being tainted and corrupted with a melancholick and venenate juice, it must necessarily follow, that the whole mass of bloud and seed that falls from it, and the whole body should also be vitiated. This cause happens to those that are already born, by long flaying, and inhabiting in Maritime Countries, whereas the grofs and mifty air, in fuccefs of time, induceth the like fault into the humours of the body; for that, according to Hippocrates, fuch as the air is, such is the spirit, and such the humours. Also long abiding in very hot places, because the bloud is torrified by heat, but in cold places, for that they incraffate, and congealing the spirits, do after a manner stupiste, may be thought the primitive causes of Thus in some places of Germany there are divers leprous persons; but they are more frequent in Spain, and over all Africa, than in all the World befide, and in Languedoc, Proven and Guyenne, are more than in whole France befides. Familiarity, copulation, and cohabitation with leprous persons may be reckoned amongst the causes thereof, because they transfer this disease to their Familiars by their breath, fweat, and spirtle, left on the edges of the Pots or Cups. eafe is also caused by the too frequent use of falt, spiced, acrid and gross meats, as the stell of Swinc, Asses, Bears, Pulse, Milk-meats, so also gross and strong Wines, Drunkenness, Gluttony, a laborious life, full of forrow and cares, for that they incraffate, and as it were burn the bloud. But the retention of melancholick excrements, as the suppression of the Hemorrhoids, Courses, Small Pox, and Meazles, as also a Quartan Fever accustomed to come at set times; the drying up of old ulcers, for that they defile the mass of the bloud with a melancholick drofs and filth. Now you must underfland, that the cause of the Leprosie by the retention of the superfluities, happens, because the corrupt bloud is not evacuated, but regurgitates over the whole body, and corrupts the bloud that should nourish all the members; wherefore the affimilative faculty cannot well affimilate by reason of the corruption and default of the juice; and thus in conclusion the Leprolie is caused. The Antecedent causes are the humours disposed to adustion and corruption into melancholy, by the torrid heat; for in bodies pofferfed with fuch heat, the humours by adultion eafily turn into melancholy, which in time acquiring the malignity and corruption of a virulent and venenate quality, yields a beginning The Conjunct and effence to the Leprotic. The Conjunct cautes are the melancholick humours, which are now partakers of a venenate and malign quality, and spread over the whole habit of the body, corrupting and defiroying it first by an hot and dry distemper, and then by a cold and dry, contrary to the beginnings of life. For hence inevitable death must ensure, because our life consists in the moderation of heat and moifiure.

cause.

How it comes to be deadly.

CHAP. VII.

The figns of a Leprofie, breeding, prefent, and already confirmed.

He disposition of the body and humours to a Leprosie, is shewed by the change of the native and fresh colour of the Face, by that affect of the Face, which is commonly called Gutta refaces, red and blackish furfusions and puttles, the falling away of the hairs, and utili, and a dringle of the second stress in a great thirth, and a driness of the mouth both by night and day, a stinking breath, little ulcers in the mouth, the change of the voice to hoarinefs, a defire of venery above nature and cultom. Now there are four times of this disease, the beginning, increase, state, and declension. The beginning is, when as the malignity hath not gone further than the inner parts and bowels, whereapon the

The beginning of a Le-

firength must needs be more languid. The increase is, when as the virulency comes forth, and the The increases figns and symptoms are every day increased in number and strength. The state is, when as the mem- The state, bers are exulcerated. The declension is, when as the aspect of the Face is horrid, the extreme parts The declension fall away by the profundity and malignity of the ulcers, fo that none, no not of the common fort for. of People, can doubt of this difeafe. According to the doctrin of the Ancients, we must in fearching out of the figns of this difease being present, have chief regard to the head. For the figns of difeases more properly and truly shew themselves in the Face by reason of the softness and rarity of the fubiliance thereof, and the tenuity of the skin that covers it; wherefore a black and adult humour diffused thereunder, easily shows it felt, and that not onely by the mutation of the colour, but also of the character, and bulk, and oft-times by manifest hurting it. Wherefore you must observe in the head, whether it have scales, and whether in the place of those hairs that are fallen away, others more tender, short and rare grow up, which is likely to happen through defect of fit nourishment to preferve and generate hairs through corruption of the hairy fealp that should be stored with such nourishment, and of the habit it sell, and through the unstitues thereof to contain hairs: lastly, by the actimony of the vapours fent up from the adult humours and entrails, fretting afunder the roots of the hairs. But if not onely the hair, but also some portion of the skin and flesh about the roots of the Lepro of the hair, come away by pulling, it is an argument of perfect corruption: let this therefore be fie.

the first fign of a Leprosic. A second and very certain fign, is a numerous and manifest circumseription of round and hard puffies or puttles under the eye-brows, and behind the ears, and in feveral places of the Face, refembling round and hard kernels, occasioned by the default of the attimil. ting faculty. The cause of this default is the grossness of the flowing nourishment, by which means it being impact, and flopping in the thraitness of the way, it grows round, as it were compassed about in the place whereas it flicks, and by the means of the crudity, for that it is not affimilated, and by delay, it is further hardned. The third fign is, the more contract and exact roundness of the cars, their großness, and as it were grainy spiffitude or densness; the cause of their roundness is the confumption of the flaps and flelly part through want of nourithment, and excels of heat; but the occasion of their grainy spissitude is the grossness of the earthy nourishment flowing thither. The fourth fign is a Lion-like wrinkling of the fore-head, which is the reason that some term this difeafe Morbus Leoninus; the cause hereof is the great driness of the habit of the body, which also Why it is calis the reason that the bark of an old. Oak is rough and wrighted. The fill is the reason that the bark of an old. Oak is rough and wrighted. is the reason that the bark of an old Oak is rough and wrinkled. The fifth is, the exact roundness Leasing. of the eyes, and their fixt and immoveable fleddiness; verily the eyes are naturally almost round, yet they appear obtuse, and somewhat broad on the foreside, but end in a Const on the hind part, by reason of the concourse and figure of the muscles and fat investing them. Therefore these being confumed either through defect of laudable nourithment, or elfe by the acrimony of the flowing humour, they are reflored to their proper figure and roundness. Now the muscles which moved the eyes being confumed, and the fat which facilitated their motion wasted, it comes to pass that they fland fliff and unmovable, being deflitute of the parts yielding motion, and the facility thereof. The fixth fign is, the Nothrils flat outwardly, but inwardly straight and contracted, that is, an earthy and grofs humour forced from within outwards, which fwells the fides or edges of the Notirils; whence it is, that the paffages of the Nofe appear as it were obtiructed by the thickness of this humour, but they are depressed and slatted by reason of the rest of the Face and all the neighbouring parts (wollen more than their wont; add hereto that the partition is confiamed by the acrimony of the corroding and ulcerating humour. The feventh is, the lifting up, thickness and swelling of the lips, the filthiness, stench and corrosion of the gums by acrid vapours rising to the mouth, but the lips of leprous perfons are more fwollen by the internal heat burning and incraffating the humours, as the outward heat of the Sun doth in the Moors. The eighth fign is, the fwelling and blackness of the Tongue, and as it were varicous veins lying under it; because the Tongue being by nature spongeous and rare, is easily stored with excrementitious humours, fent from the inner parts unto the habit of the body: which fame is the cause why the glandules placed about the Tongue above and below, are swollen hard and round, no otherwise then scrophulous or meazled Swine. Laftly, All their Face rifeth in red bunches or puthes, and is over-spread with a dusky and obscure reducts; the eyes are nery, herce and fixed, by a melancholick cachecrick disposition of the whole body, manifeft figns whereof appear in the Face, by reason of the fore-mentioned causes, yet fome leprous persons have their Faces tinctured with a yellowish, others with a whitish colour, according to the condition of the humour, which ferves for a basis to the leprous malignity. For hence Physicians affirm that there are three forts of Leproties, one of a reddish black colour, conachie Physicians animi that there are three forts of Leprones, one of a readin black colour, confiding in a melancholick humour; another of a yellowish green, in a cholerick humour; another in a whitish yellow, grounded upon adult phlegm. The ninth fign is a flinking of the breath, as also of all the excrements proceeding from leprous bodies, by reason of the malignity conceived in the humours. The tenth is, a hoarfness, a shaking, harsh and obscure voice, as it were coming out of the Nose, by reason of the Lungs, recurrent Nerves and Muscles of the Throttle taining out of the Nose, by reason of the Lungs, recurrent Nerves and Muscles of the Throttle taining out of the Nose, by reason of the Lungs, recurrent Nerves and Muscles of the Throttle taining out of the Nose, by reason of the Lungs, recurrent Nerves and Muscles of the Throttle taining out of the Nose, by reason of the Lungs, recurrent Nerves and Muscles of the Throttle taining out of the Nose, by reason of the Lungs, recurrent Nerves and Muscles of the Throttle taining out of the Nose, and the Nose of the Nose o ted with the großness of a virulent and adult humour; the fore-mentioned constriction and obstruction of the inner passage of the Nose; and lastly, the asperity and inequality of the Weazon by inmoderate drinefs, as it happens to fuch as have drunk plentifully of firong Wines without any mixture. This immoderate driness of the Muscles serving for respiration makes them to be troubled with a difficulty of breathing. The eleventh fign is very observable, which is a Morphew or defedation of all the skin, with a dry roughness and grainy inequality, such as appears in the skins of placked Geefe, with many tetters on every side, a hithy scab, and ulcers not casting off onely a bran-like scurff, but also scales and crusts. The cause of this dry scab is the heat of the burning bowels. wrinkled by the heat of the Sun or Fire. The cause of the filthy scab and septimous ulcers, is the sational by the heat of the Sun or Fire. cating and correding condition of the melancholick humour, and the venenate corruption, it also

thele fore-mentioned figns.

CHAP. VIII.

is unctuous or greatie, fo that water poured thereon, will not in any place adhere thereto: I con-

ceive it is by the internal heat disfolving the fat that lies under the skin, which therefore always

looks as if it were greafed or anointed therewith in leprous perfons. Now of these fore-mentioned figns, some are univocal, that is, which truly and necessarily shew the Leprose: other some are equivocal or common, that is, which conduce as well to the knowledge of other diseases as this. To conclude, that affuredly is a Leprose which is accompanied with all, or certainly the most part of

THILITETTE

Of Prognoflicks in the Leprofie; and how to provide for fuch as stand in fear thereof.

Why the Le-x profic is incurable.

He Leprofie is a discase which passet to the issue, as contagious almost as the Plague, scarce curable at the beginning, incurable when as it is confirmed, because it is a Cancer of the whole body; now if some one Cancer of some one part shall take deep root therein, it is judged incurable. Furthermore, the remedies which to this day have been sound out against this Discase are judged inscribur and unequal in strength thereto. Besides, the signs of this discase do not outwardly shew themselves before that the bowels be seized upon, possessed and corrupted by the malignity of the humour, especially in such as have the white Leprofie, fundry of which you may see about Boundaries, and in Little-Bestale, who notwithstanding inwardly burn with so great heat, that it will suddenly wrinkle and wither an Apple held a short time in their hand, as if it had laid for many days

THE RESIDENCE

days in the Sun. There is another thing that increaseth the difficulty of this disease, which is an equal pravity of the three principal faculties whereby life is preferved. The deceitful and terrible equal pravity of the three principal faculties whereby the is preferved. The decentual and terrible visions in the fleep, and numbries in feeling, argue the depravation of the animal faculty; now the weakness of the vital faculty is shewed by the weakness of the pulse, the obscurity of the hoarse and jarring voice, the difficulty of breathing, and sinking breath; the decay of the natural is manifested by the depravation of the work of the Liver in fanguistication, whence the first and principal cause of the liver in the decay of the natural security of the depravation of the work of the Liver in fanguistication, whence the first and principal cause of the liver in the decay of the natural security of the depravation of the work of the Liver in fanguistication. this harm articth. Now because we cannot promise cure to such as have a confirmed Leprose, and that The Cure. we dare not do it to fuch as have been troubled therewith but for a fhort space, it remains that we briefly show how to sree such as are ready to fall into so fearful a difease. Such therefore must first of all thing all things in diet and course of life, whereby the bloud and humours may be too vehement-ly heated, whereof we have formerly made some mention. Let them make choice of meats of good The Diet. or indifferent jaice, such as we shall describe in treating of the diet of such as are sick of the Plage Purging, Eleeding, Bathing, Cupping, to evacuate the impurity of the bloud, and mitigate the heat Purging, Electing, Bathing, Cupping, to evacuate the impurity of the bloud, and mitigate the heat of the Liver, shall be prescribed by some learned Physician. Valesius de Tarenta much commends Gelding good gelding in this case, neither do I think it can be disliked; for men subject to this disease may be estagainst the Leterman of their testicles, and so degenerate into a womanish nature, and the profice. heat of the Liver boiling the bloud, being extinguished, they become cold and moist, which temper is directly contrary to the hot and dry distemper of leprous persons; besides the leprous being thus deprived of the faculty of generation, that contagion of this disease is taken away which spreadeth, and is dissufted amongst manking, by the propagation of their issue. and is diffused amongst mankind, by the propagation of their iffue.

The End of the Twentieth Book,

BOOK XXI.

Of Poysons, and of the BITING of a MAD Dog;

And the Bitings and Stingings of other venomous Creatures.

CHAP. I.

The cause of writing this Treatise of Poysons.

Ive Reasons have principally moved me to undertake to write this Treatise of Poyfons, according to the opinion of the Ancients. The first is, that I might instruct the Surgeon what remedies must prefently be used to such as are burt by poisons, in the interim whilest greater means may be expected from a Physician. The second is, that he may know by certain figns and notes fuch as are poisoned or hurt

by poylonous meats, and so make report thereof to the Judges, or to such as it may The third is, that those Gentlemen and others who live in the Country, and far from Cities, and fiore of greater means, may learn fomething by my labour, by which they may help their friends bitten by an Adder, mad Dog, or other poylonous creatures, in fo dangerous, findden and unufual a cafe. The fourth is, that every one may beware of poylons, and know their fymptoms when prefent, that being known, they may speedily seek for a remedy. The fifth is, that by this my labour all men may know what my good will is, and how well-minded I am towards the Common-wealth in general, and each man in particular, to the glory of God. I do not here so much attended to make the man in particular, to the glory of God. I do not here so much attended to make the man in particular, as Surgeons, to provide to help and defend each mans. arm malicious and wicked perfons to hurt, as Surgeons to provide to help and defend each mans life against poyfon; which they did not understand, or at least seemed not so to do, which taking

The against poyton; which they did not understand, or at least termed not so to do, which taking this my labour in evil part, have maliciously interpreted my meaning.

But now at length, that we may come to the matter, I will begin at the general division of Poyfons, and then handle each sector thereof severally; but first let us give this Rule. That poyson is what is to be that which either outwardly applied or struck in, or inwardly taken into the body, both power to accounted kill it, no otherwise than meat well dreft is apt to nourish it. For Conciliator writes that the pro-Poyson. perties of Poylon are contrary to nourithments in their whole fubitance s for as nourithment is turned into bloud, and in each part of the body whereto it is applied to nourilh, by perfect affimilation fublitated in the place of that portion which flies away each moment. Thus on the contrary Poyfon turns our bodies into a nature like it felf and venenate, for as every agent imprints the force and qualities thereof in the fubject patient, thus Poylon by the immoderation of faculties in their whole nature contrary to us, changeth our fubfiance into its nature, no otherwise then fire turneth chaff in a moment into its own nature, and fo confumes it. Therefore it is truly delivered by the Ancients, who have diligently pried into the faculties of Natural things, that it is poyfon that may hill men by defiroying and corrupting their temper, and the composite and conformation of the body. Now all poylons are faid to proceed either from the corrupt Air, or from living Creatures, Plants and Minerals, or by any artificial malignity in diffilling, fublining, and diverily mixing of Poylonous and furning things. Hence arise fundry differences of Poylons, neither do they all work. The different after the fame manner; for some corrupt our nature by the unmeasurableness of the manifest and ces of Poylon, elements of the manifest and ces of Poylon, elementary qualites whereof they confait, others from a specifick and occult property. Hence it is

tumming

All poyions have not a pe culiar antipathy with the heart.

cap. 5. 110.6. de loc. affeit.

The true reafon of the wondrous ef-

fects of poy-

that fome kill fooner than other fome; neither is it true that all of them prefently affail the heart, but others are naturally at deadly firife with other parts of the body; as Cantharides with the bladder, the Sea-Hare with the Lungs, the Topedo with the hands, which it stupesieth, though the Fishers rod be betwirt them. Thus of Medicins, there are some which are apt presently to comfort and strengthen the heart, others the brain, as starchar; others the Stomach, as Cinamon. Also there are some poyfons which work both ways, that is, by manifest and occult qualities, as Emphorbium; for that both by the exceptive heat and the whole substance, or the discord of the whole substance with ours, corrupts our nature. An argument hereof is, that Treacle, which by its quality is manifestly hot, in-fringeth the force thereof, as also of all others of an occult property. Poysons which work by an occult and specifick property, do not therefore do it, because they are too immoderately hot, cold, dry, moiftsbut for that they are absolutely such, and have that effence from the Stars and celestial instance, which is apt to dissolve and destroy the strength of mans body, because being taken but even in a small quantity, yet are they of so pernicious a quality that they kill almost in a moment. Now Poyfons do not only kill being taken into the body, but fome being put or applied outwardly; neither do venomous creatures onely harm by their flinging and biting, but also by their excrements, as Spittle, Bloud, the Touch and Breath.

CHAP. II.

How Poyfons being small in quantity, may by their onely touch eaufe so great alterations.

T feemeth strange to many how it may come to pass, that poyson taken or admitted in small quantity, may almost in a moment produce so pernicious effects over all the body, and all the parts, faculties, and actions; so that being admitted but in a little quantity, it swells up the body into a great bigness. Neither ought it to seem less strange, how Antidotes and Counter-poyfons, which are opposed to poyfon, can so suddenly break and weaken the great and permicious effects there is not a set of 13 do not consider the property of the post of the thereof, being it is not fo likely that fo fmall a particle of poyfon or antidote can divide it felf into fo many, and fo far fevered particles of our body. There are fome (faith Galen) who think that fome things by touch onely, by the power of their quality, may alter those things which are next to them; and that this appears plainly in the Fish Torpedo, as that which hath so powerful a quality, that it can send it along the Fishers rod to the hand, and so make it become torpid or numb. But on the contrary, Philosophers teach that accidents, fuch as qualities are, cannot without their sub-jects remove and diffuse themselves into other subjects. Therefore Galen's other answer is more agreeable to reason, that so many and great affects of poysons, and remedies arise either from a certain fpirit or fubtil humidity; not truly, for that this fpirit and fubtil humidity may be dispersed over the whole body and all the parts thereof which it affects, but that little which is entered the body, as cast in by the stroak of a Spider, or the sting of a Scorpion, infects and corrupts all the next parts by contagion with the like quality, these other that are next to them, until from an exceeding small portion of the bloud, if the ftreak shall light into the veins, it shall spread over the whole mass of bloud; or of phlegm, if the poyson shall chance to come to the Stomach, and so the force thereof shall be proposed to the stomach. be propagated and diffused over all the humours and bowels. The doubt of Antidotes is less, for these being taken in greater quantity, when they shall come into the stomach, warmed by the heat of the place they become hot, and fend forth vapours, which fuddenly diffused over the body by the fubtilty of their fubflance, do by their contrary forces dull and weaken the malignity of the poylon. Wherefore you may often fee, when as Autidotes are given in lefs quantity than is fit, that they are less prevalent, neither do they answer to our expectation in overcoming the malignity of the poylon so that it must necessarily follow that these must not onely in qualities, but also in quantity be superiour to Poylons.

CHAP. III.

Whether there be any fuch Poyfons as will kill at a fet time?

No poyfors kill in a fer

How poyfors come to kill fooner or la-

O the propounded Question: Whether there may be Poyfons which within a certain and definite time (put case a Moneth or Year) may kill men? Theophrastar thus answers; of Poyfons fome more fpeedily perform their parts, others more flowly; yet may you find no fuch as will kill in fet limits of time, according to the will and defire of men: For that fome kill fooner or later than others, they do not this of their own or proper nature, as Phylicians rightly judge, but because the subject upon which they light, doth more or less result or yield to their efficacy. perience sheweth the truth thereof; for the same fort of poyson in the same weight and measure, given to fundry men of different tempers and complexions, will kill one in an hour, another in fix hours, or in a day, and on the contrary, will not fo much as hurt fome third man. You may also hours, or in a day, and on the contrary, will not fo much as hurt fome third man. You may also observe the same in purging Medicins. For the same Purge given to diverse men in the same proportion, will purge forme fooner, forme later, forme more sparingly, others more plentifully, and other-forme not at all; also with some it will work gently, with othersome with pain and gripings. Of which diverfity, there can be no other cause assigned, than mens different natures in complexion and temper, which no man can fo exactly know and comprehend, as to have certain knowledge thereof, how much and how long the native heat can relift and labour against the strength of poylon, or how pervious or open the paffages of the body may be, whereby the poylon may arrive at the heart and principal parts. For in fuch (for examples fake) as have the paffages of their arteries more large, the poylon may more readily and speedily enter into the heart, together with the air that is continually drawn into the body. CHAP. THE REAL PROPERTY.

CHAP. IV.

Whether fuch Creatures as feed upon psylonous things, he also psylonous? and whether they may be eaten fafely and without harm.

Ucks, Storks, Herons, Peacocks, Turkies, and other Birds, feed upon Toads, Vipers, Afps, Such things as Snakes, Scorpions, Spiders, Caterpillers, and other venemous things: Wherefore it is feed upon worthy the questioning, whether fuch like Creatures nourished with such food, can kill poylon may be or poyfon fuch perfons as thall afterward eat them? Marthiolas writes, that all late Authors, who eaten without have treated of Poyfons, to be abfolutely of this opinion, That men may fafely and without any danger feed upon fuch Creatures, for that they convert the Beafts into their nature after they have eaten them, and on the contrary are not changed by them. This reason though very probable, yet doth it not make these Beasts to be wholly harmless, especially if they be often earen or fed upon. Disferrides and Galen feem to maintain this opinion, whereas they write that the milk, which is nothing elfe then the relented bloud of fuch beatls as feed upon Scammony, Hellebore, and Spurge, purgeth violently. Therefore Phylicians defirous to purge a fucking child, give Purges to the Nurses, whence the milk becoming purging, becomes both Meat and Medicin to the Child. The fleth of Thrulhes which feed upon Juniper-berries, favours of Juniper. Birds that are fed with Wormwood or Garlick, either tafte bitter, or have the ftrong feent of Garlick. Whitings taken with Garlick, so small thereof, that they will not forego that smell or taste by any falting, srying, or boiling; for which fole reason, many who hate Garlick, are forced to abitain from these Fishes. The fleth of Rabbits that seed upon Penny-royal and Juniper, savour of them; Physicians with that Goats, Cows, and Asses whose Milk they would use for Consumptions, or other diseases, should be fed fome space before, and every day with these or these herbs which they deem sit for the curing this or that difease: For Galen affirms that he doubts not, but that in success of time the flesh Lib. de first. of Creatures will be changed by the meats whereon they feed, and at length favour thereof. Jacab. Therefore I do not allow that the flesh of fuch things as feed upon venemous things, should be eaten for food, unless it be some long space after they have disused such repail, and that all the venom be digested and overcome by the efficacy of their proper heat, so that nothing thereof may remain in talle, smell, or substance, but be all vanished away. For many die suddenly, the The occasion canfe of whose deaths are unknown, which peradventure was from nothing else but the sympa- of sudden thy and antipathy of bodies, for that these things cause death and discase to some, that nourith death in manner. othersome (according to our vulgar English Proverb, That which is one mans meat, is another mans mypoyfon.)

CHAP. V.

The general figns of fuch as are poyloned.

E will first declare what the general figns of poylon are, and then we will descend to Common particulars, whereby we may pronounce that one is poyloned with this or that poy- figns of fach fon. We certainly know that a man is poyloned, when as he complains of a great as are poyloned, when as he complains of a great as are poyloned, when as force have and least from ned. heaviness of his whole body, so that he is weary of himself, when as some horrid and loathsom take (weats out from the orince of the fromach to the mouth and tongue, wholly different from that tafte that meat, howfoever corrupted, can fend up: when as the colour of the Face changeth fuddenly, formewhiles to black, formetimes to yellow, or any other colour, much differing from the common cultom of man; when naufcoufnefs with frequent, vomitting troubleth the Patient, and that he is molested with fo great unquietness, that all things may feem to be turned uptide down. We know that the poyfon works by the proper, and from the whole fubfiance, when as without any manifelt fende of great heat or coldnels the Patient favourds often with cold faveats, for ufually fuch poyfors have no certain and diffinct part wherewith they are at enmity, as Cambarides have with the bladder. But as they work by their whole fubflance, and an occult propriety of form, to do they prefently and directly affail the heart, our effence and life, and the fortrets and beginning of the vital faculty. Now will we flow the figns whereby poylons that work by manifeth and elementary qualities may be known. Those who exceed in heat, burn or make an impref- Signs of hot flow of heat in the tongue, the mouth, through, gues, and all the inner parts, with great poylons. thirft, unquietrocis, and perpetual iweats. But if to their excels of heat they be accompanied with a corroding and putrefying quality, as Arfenick, Sublimate, Rofe-ager, or Rats-bane, Verdegreafe, Orpiment, and the like, they then cause in the stomach and guts intolerable pricking pains, rumblings in the belly, and continual and intolerable thirst. These are succeeded by vornatings, with fweats fornewhiles hot, fornewhiles cold, with fweunings, whence fudden death enfues. Poylons Signs of cold that kill by too great coldness, induce a dull or heavy fleep, or drownings, from which you can-poylons not eafily rowze or waken them; fometimes they to trouble the brain that the Patients perform many undecent gettures and antick tricks with their mouths, eyes, arms, and logs, like as fuch as are frantick; they are troubled with cold fweats, their Faces become blackith or yellowith, always ghafily, all their bodies are benumbed, and they die in a fliort time, unless they be helped; poyfons of this kind are Hemlock, Poppy, Night-shade, Henbane, Mandrag. Dry poyfons are usually ac-Signs of dry companied by heat with moutture, for although Sulphur be hot and dry, yet hath it moutture to hold Porfoos. the parts together, as all things which have a conflitence have; yet they are called dry, by reason that driness is predominant in them: such things make the tongue and throat dry and rough, with unquenchable thirit; the belly is for bound; that 40 much as the urin cannot have tree pallage forths

CHILITIA

An History.

all the members grow fqualid by drinefs, the Patients cannot fleep: poyfons of this kind are Li-Signs of moift tharge, Cerufs, Lime, Scales of Brafs, Filings of Lead, prepared Antimony. On the contrary, moift poisons induce a perpetual fleep, a flux or scouring, the resolution of all the nerves and joints so that not so much as the eyes may be faithfully contained in their orbs but will hang as ready to fall out; the extreme parts, at the Hands, Feet, Nofe, and Ears corrupt and putrifie, at which time they are also troubled with thirst by reason of their strong heat, always the companion of putrefaction and off-times the author thereof: now when this cometh to pass death is at hand. Very many deny that there can be any moist poyfons found, that is, such as may kill by the efficacy of their humidity, because there are no such things to be found as may come to the fourth degree of moisture. Yet there is an example that averrs the contrary, which was of one, who fleeping on the night, was bitten by a Serpent, as Gilbertus Anglieus affirmeth; for dying thereof, when as his fervant, defirous to awaken his Master out of his sleep, took him by the arm, all the slesh being putrefied, fell off, and presently the bones also fell asunder, being deprived of their slesh, which could not happen unless by excess of the venemous humidity which lay hid in the teeth and spittle of the Serpent. Also we have found it noted by Hippocrates, that in a rainy, humid, and foutherly conflitution of the Year, it happened by the malign violence of the venenate and putrefying humidity, that the flesh of the arms and Sell. 3. lib.3. legs becoming rotten, fell away by piece-meal, and the bones remained bare; yea also and the bones themselves in some, putressed and fell away: neither certainly doth the Lues Venerea kill by any other means than by a fretting and putresying sorce of humidity, by whose efficacy the solidity of the bones is diffolved, then much more the flesh may be tainted and consumed by putre-

The Lats Venerea kills by excess of moiflure.

in their diet.

Why fleep is

Why and how

be procured.

To these and such poysons which work by a manifest and elementary faculty, when as they shall be received into the body after what manner foever, you shall forthwith oppose their contraries; and if by chance it be not manifest what, and of what distinct kind of poison that is, you must know that fuch poisons as work by occult properties, it is not by Reason as yet found out how they will affect the body, but onely by Experience. Therefore to these you must oppose their like Antidotes, which may by their whole substance strengthen the heart and vital faculty, and withstand the strength of the poison. But to this our distinction of poisons, working by a manifest and elementary quality, their opinion is contrary, who affirm that the venom of all poisonous Beatls are therefore cold, for that fuch as are bitten or flung with them, are forthwith felt to be colder than a ftone. And that Serpents for fear of cold, when as Winter is at hand keep themfelves in holes and dens under ground, or elfe as Vipers use to do, lie under stones, under which you may often find them stiff and numb, and so unapt for motion, that you may easily take them up in your hand. But the coldness that is perceived or felt in such as are bitten or stung, is not occasioned by the coldness of the poison, but by the absence of the natural heat, withdrawing it self in the very in-flant of the siroak, from the surface into the center of the body, both for the defence of the heart, as the principal part, as also for that there is nothing which so much dislipates, or so much oppugns the vital heat as poilon (of what kind foever it be) doth.

CHAP. VI.

How, or by what means to shun or eschew Poysons.

T is a matter of much difficulty to avoid poilons, because such as at this time temper them, are fo throughly prepared for deceit and mischief, that they will deceive even the most wary and quick-lighted; for they to qualifie their ingrate tafte and finell, by the admixture of fweet and well finelling things, that they cannot eafily be perceived even by the skilfulwhat fach as Therefore fuch as fear poifoning, ought to take heed of meats cooked with much Art, very
fear poifoning fweet, falt, fowre, or notably endued with any other tafte. And when they are opprefit with
mult observe hunger or thirst, they must not eat nor drink too greedily, but have a diligent regard to the tafte of fuch things as they eat or drink; befides, before meat let them take fuch things as may weaken the strength of the poylons, such as is the fat broth of good nourishing steth means; in the morning let them ann themselves with Treacle or Mithridate, and conserve of Roses, or the leaves of Rue, a Walnut, and dry Figs; befides, let him prefently drink a little draught of Muskedine, or fome other good Wine; when one suspects he hath taken any poison in meat or drink, let him forbear fleeping. For befides that the force of poilon is off-times fo rapid, that it confumes our life in a flort space, as Fire doth Stubble, as also for that it is drawn more inwardly into the secret passages of the body by sleep. Wherefore in such a case it is better to procure Vomit by drinking Hydraleum warm, or Butter diffolved in warm Oil, or a decoction of Line, or Fenugreck feeds, or far Broth, for thus the received poison is also cast forth therewith, or elfe the acrimony thereof retunded, and the belly loofed.

You may fee this by dayly experience, for Caulticks, Velicatories, and the like acrid things being applied to the anointed part, will not blifter nor exulcerate the part. Neither doth the Vornit conduce onely in this, that it excludeth the poison, but it shows either by the Taste, Smell, or Colour, the kind of the taken poifon; to that then by using the proper Antidote, it may be the more easily and speedily relified, yet notwithstanding it you conceive that the poison have descended deeper into the Guts, you may with a Clyster draw away the rest thereof which adheres to the Guts of the Guts of the Patient cannot yount, then shall thereof which adheres to the Coats of the Guts. But if the Patient cannot vomit, then shall fome purging Medicin be given him forthwith, and such as are thought more particularly to resist poilon; such as are Agarick, Aloes, the lesser Centaury, Rubarb, and other things, according to the direction of the learned Physician. Then shall you administer Clysters made

When and wherewich they shall be purged.

THE REPORT OF

with Casta, fatty decoctions, Sheeps Suet, or Butter, or Cows Milk, with the mucilages of Line feed, Philium feeds, Quince feeds, and other fuch things as are usually given in a Dyfentery, or bloudy flux, that fuch things may hinder the adhesion of the poylon to the coats of the guts, and by their unctuousness retund the acrimony of the poyson, and mitigate it any thing shall already be ulcerated, and absolutely defend the found parts from the malign effects of the poyson. But let this be a perpetual rule, that the poyfon be speedily drawn back by the same way it entered into the body; The care of as if it entered by finelling, in at the Nothrils, let it be drawn back by fneezing; if by the mouth into poyfones the ftomach, let it be excluded by vomit; if by the fundament into the belly then by clytter; if by the Privities into the Womb, then by metrenchites or injections made thereinto; if by a bite, fling, or wound, let revultion be made by fuch things as have a powerful attractive faculty: for thus we make divertions, that by these we may not onely hinder the poyson from affailing the heart, but also that by this means we may draw it from within outwards. Wherefore strong ligatures cast about the arms, thighs and legs, are good in this cafe. Also large Cupping-glasses applied with stame to fundry parts of the body are good. Also baths of warm water, with a decoction of such things as result Poyson, Southern-wood, Calamint, Rue, Betony, Horebound, Penny-royal, Bays, Scordium, Smallage, Scabious, Mints, Valerian, and the like, are good in this case. Also Sweats are good, being provoked so much as the strength of the Patient can endure. But if he be very wealthy, whom we suspect poysoned, it will be fafer to put him into the belly of an Ox, Horse, or Mule, and then prefently into another as foon as the former is cold, that fo the poyfon may be drawn forth by the gentle and vaporous heat of the new killed Beaft; yet do none of these things without the advice of a Phylician, if it may conveniently be had,

CHAP. VII.

How the corrupt or venemous Air may kill a man.

He Air is infected and corrupted by the admixture of malign vapours, either arifing from By how many, the unburied bodies of fuch as are flain in great conflicts, or exhaling out of the earth after means the air. Earthquakes, for the air, long pent up in the cavities and bowels of the earth, and deprived may be infeof the freedom and commerce of the open air, is corrupted, and acquires a malign quality, which it &ed.

prefently transferreth unto fuch as meet therewith. Also there is a certain malignity of the air, which How Thunders and accompanies Thunders and Lightnings, which favours of a fulphureous virulency, so that whatsoever Lightnings wild Beasts shall devour the Creature killed therewith, they become mad, and die immediately is for may infect the fire of Lightning bath a far more rapid, febtil, and greater force than other fires, fo that it may the Air.

rightly be termed a Fire of Fires.

An argument hereof is, that it melteth the head of a Spear, not harming the Wood, and Silver and Gold, not hurting the Purse wherein it is contained. Also the air is infected by funnigations which prefently admitted into the body and bowels by the mouth and nofe in respiration, by the skin and arteries in perspiration, doth easily kill the spirits and humours being trit intected, and then within a short space after the folid substance of the principal parts, and chiefly of the heart being turned into their nature, unless the man be first provided for by Sneezing, Vomiting, Sweating, purging by the belly, or fome other excretion. For that poyfon which is carried into the body Whether the by fmell, is the most rapid and effectual, by fo much as a vapour or exhalation is of more subtil risets from a and quicklier-piercing effence than an humour. Yet notwithlianding, wilt thou fay, it is not cre-burnt thing dible, that any be killed by any vapour raised by the force of fire, as of a Torch or Warming-pan, may poyfor for that the venenate quality of the thing that is burnt, is diffipated and confumed by the force of one, the fire, purging and cleanling all things. This reason is fally seigned to the destruction of the lives of eareless people; for sulphureous brands kindled at a clear tire, do not withit anding east forth a sulphurous vapour. Whether do not Ligaum aloes and Juniper, when they are burnt in a flame, fmell less (weetly?

Pope Clement, the seventh of that name, the Uncle of our Kings Mother, was poyloned by the sume An History. of a poylonous Torch that was carried lighted before him, and died thereof. Matthiolas telleth, that there were two Mountebanks in the Market-place of Sionsa, the one of which but finelling to a poy-

foned Gilly-flower given him by the other, fell down dead prefently.

A certain man not long ago, when he had put to his nofe, and finelled a little unto a pomander, which was fecretly poytoned, was prefently taken with a Vertigo, and all his face fwelled, and unless that he had gotten speedy help by Stemutatories and other means, he had died shortly after of the same kind of death that Pope Clement did.

The fafeft prefervative against such poyfons is, not to finell to them: moreover some affirm, that there are prepared some Poyfons of such sorce, that being anointed but on the Saddle, they will kill the Rider; and others, that if you but anoint the Stirrups therewith, they will send so deadly poyfonous a quality into the Rider through his Boots, that he shall die thereof within a short time after: which things, though they be scarce credible, because such poysons touch not the naked skin, we have the same after when the same such as the same s Yet have they an example in Nature, whereby they may defend themselves; for the Torpedo sends a narcotick, and certainly deadly force into the arm, and so into the body of the Fisher, the cords of the Net being between them.

tunning,

CHAP. VIII.

That every kind of Poyson hath its proper and peculiar Signs and Effects.

S Poyfons are diffinct in flecies, so each flecies differs in their Signs and Effects; neither is it possible to find any one kind of poyton which may be accompanied with, or produce all the igns and effects of all poylons, otherwife Phylicians should in vain have written of the figns and effects of each of them, as also of their proper remedies and antidotes. For what kind of poyfon thall that be which thall cause a burning hear in the Stomach, Belly, Liver, Bladder, and Kidnies, which shall cause a hicketting, which shall cause the whole body to tremble and shake, which shall take away the voice and speech, which shall cause convulsions, shall weaken the pullifiek faculty, which shall intercept the freedom of breathing, which shall stupishe and cast into a dead sleep, which finall together and at once cause a Verrigo in the head, dimness in the fight, a strangling or stoppage of the breath, thirft, bleeding, fever, ftoppage of the urin, perpetual vomiting, rednefs, lividnefs, and palenefs of the face, refolutions of the powers, and many other things, all which are canfed by all forts of poyfon. Laftly, No body will deny but that hot poyfons may kill more fpeedily than cold, for that they are more speedily actuated by the native heat.

than cold.

CHAP. IX.

The Effects of Payfons from particular venemous things, and what Prognofticks may thence be made.

Lib. 2. cap. 27.

man virulent

Controlled wounds har-der to heal than fuch as are cur.

T is the opinion of Cornelius Celfus, and almost of all the Ancients, that the bite of every Beast The bites of all wild Beafts inflicted by Venemous Beafts, Afps, Vipers, Water-Snakes, and all kinds of Screents, Barevirulent, filisks, Dragons, Toads, mad Dogs, Scorpions, Spiders, Bees, Wafps, and the like. They are lefs malign, which are of Creatures wanting Venom, as of Horfes, Apes, Cats, Dogs not mad, and many other things, which though of their own nature they are without poilon, yet in their bites there is something more dolorinck and ill-natured than in common wounds inflicted by other occafions: I believe, that in their flaver or fanies, there is fomething, I know not how to term it, contrary to our nature, which imprints a malign quality in the ulcer, which also you may observe in the tearings or scratchings of such Creatures as have tharp claws, as Lions and Cats. Moreover ma-The bites of a ny affirm, that they have found by experience, that the bites of Men are not altogether without virulency, especially of such as are red haired and freekled, chiefly when as they are angred; it is probable that the bites of other persons want this malignity, seeing that their spittle will cure finall ulcerations. Wherefore if there shall happen difficulty of cure in a wound, caused by a mans biting, which is neither red haired, nor freekled, neither angry, this happens not by means of the spittle, nor by any malign quality, but by reason of the contusion, caused by the bluntness of the teeth, not cutting, but bruifing the part; for being not sharp they cannot so easily enter the stella unless by bruifing and tearing, after the manner of heavy and blunt firoaks and weapons, wounds being occasioned by fuch, are more hard to be cured than fuch as are made by cutting and sharp Weapons. But of the fore-faid bitings of Venemous Creatures, there are few which do not kill in a flort space, and almost in a moment, but principally if the poyson be fent into the body by a live Creature, for in such poyson there is much heat,; also there is therein a greater tensity, which ferves as vehicles thereto, into what place or part foever of the body they tend, the which the poy-fens taken from the dead Creatures are defective of. Wherefore fome of these kill a man in the space of an hour, as the poylon of Aips, Bafilisks, and Toads; others not unless in two or three days space, as of Water-Snakes; a Spider and Scorpion require more time to kill, yet all of them admitted but in the least quantity, do in a short space cause great and deadly mutations in the body, as if they had breathed in a pefliferous air, and with the like violence taint and change into their own na ture all the members and bowels, by which these same members do in the time of perfect health change laudable meats into their nature and fubflance. The place whereas these poisonous Creatures live, and the time, conduce to the pemicioufness of the poyfon; for fuch as live in dry mountains and Sun-burnt places, kill more speedily than such as be in moift and marish grounds; also they are more hurtful in Winter than in Summer; and the poyfon is more deadly which proceeds from hungry, angry, and falling Creatures, than that which comes from fuch as are full and quiets as also that which proceeds from young things, chiefly when as they are stimulated to Venery, 19 more powerful than that which comes from old and decrepit; from Females worse than from Males 5 from fuch as have fed upon other venemous things, rather than from fuch as have abstained from them, as from Snakes which have devoured Toads, Vipers which have fed upon Scorpions, Spiders and Caterpillers. Yet the reason of the efficacy of poysons depends from their proper, that is, their subtil or gross consistence, and the greater or less aptness of the affected body to suffer. For hot men that have larger and more open veins and arteries, yield the poyton freer paffage to the heart: Therefore they which have more cold and firait veffels, are longer ere they die of the like poifon; fuch as are full, are not fo foon harmed as those that are fasting: for meats, belides that by filling the veffels, they give not the poylon fo free paffage, they also firengthen the heart by the multiplication of fpirits, fo that it more powerfully refifs pernicious venom. If the poyfon work by an occult and specifick property, it causeth the Cure and Prognostick to be difficult, and then must be have recourse to Antidotes, as these which have their whole subtance resist poyfons; but principally to Treacle, because there enter into the Composition thereof Medicins which are hot, cold, mosts, and dry: whence it is, that it retunds and withstands all poysons, chiefly such

Why Treacle force of all fimple poy-

as confift of a fimple nature: fuch as these which come from venemous Creatures, Plants, and Minerals, and which are not prepared by the detertable Art of empoifoners.

CHAP. X.

What Cure must be used to the bitings and stingings of venemous Beasts.

Ure must speedily be used without any delay to the bites and slingings of venemous Beasts which may by all means disperse the poison, and keep it from entering into the body; for when the principal parts are pofferfed, it boots nothing to use Medicins afterwards. Therefore the Ancients have propounded a double Indication to lead us to the finding out of Medicins in such a case, to wit, the evacuation of the virulent and venenate humour, and the change or alteration of the fame and the affected body. But feeing evacuation is of two forts, to wit, Univer-fal, which is by the inner parts; and Particular, which is by the outward parts: We must begin our of veneat the particular, by fuch to pick Medicins as are fit to draw out and retund the venom; for we mult mous bites. not always begin a Cure with general things, as fome think, efpecially in external difeases, as Wounds, Fractures, Diflocations, Venemous Bites and Punctures. Wherefore hereto as speedily as you may, you thall apply remedies fit for the Bites and Punctures of venemous Beafts; as for example, the Wounds shall be presently washed with Urin, with Sea-water, Aqua Vine, or Wine, or Vinegar wherein old Treacle or Mustard shall be dissolved. Let such washing be performed very hot, and Lossons fit for ffrongly chafed in, and then leave upon the Wound and round about it, linnen rags, or lint fleeped in venemous the fame liquor. There be forme who think it not fit to lay Treacle thereto, because as they say, it bites. drives the poison in. But the authority of Galen convinceth that opinion, for he writeth that if Lib, de Thoriac the Treacle be applied to this kind of wounds before that the venom thall arrive at the noble parts, it much conduceth. Also reason consures it, for Vipers fieth enters the composition of Treacle which attracts the venom by the fimilitude of fubfrance, as the Load-flono draweth Iron, or Amberfiraws. Moreover, The other fimple Medicins which enter this composition, resolve and consume the virulency and venom, and being inwardly taken, it defendeth the heart and other noble parts, the virulency and venom, and being inwardly taken; it defendeth the heart and other noise parts, and corroborateth the fpirits. Experience teacheth that Mithridate fitly given in the flead of Treacle worketh the like effect. The Medicins that are taken inwardly and applied outwardly for evacuation, man be of fibbil parts, that they may quickly infinuate themselves into every part to red wardly applitude the malignity of the poilon; wherefore Garlick, Onions, Leeks, are very good in this case, wirdly taken for that they are vaporous; also Scardinin, Rice, Dillamnin, the lefter Centaury, Hore-hound, Rocket, good against the milks inite of units fire and the like are good; there is a hind of wild Rocket, good against venezues. the milky juice of unripe figs, and the like, are good; there is a kind of wild Buglofs amongst all venomous other Plants, which hath a fingular force against venemous bites, whence it is termed Echium and bites. Viperium, and that for two caufes; the first is, because in the purple flowers that grow amongst The force of the leaves, there is a refemblance to the head of a Viper or Adder. Another reason is, because it heals the biting of a Viper, not onely applied outwardly, but also helpeth such as are bitten being drunk in Wine, year and will not suffer these about the first and the suffer these are being drunk in Wine. drunk in Wine, yea and will not fuffer those that have lately drunk thereof to be bitten at all. Wild Tyme hath the like effect, though their oft-times agree with the pointon in quality as in heat, yet do they help in discussing and resolving it; yet, as much as we may, we must labour to have evacuation and alteration together. It is most convenient, if the part affected will permit, to apply large Cupping-glaffes with much flame and homs; also facking is good, the mouth being hrib wathed in Wine wherein some Treacle is dissolved, and with Oil, left any thing thould adhere thereto, for it will hinder it, if so be the mouth be no where ulcerated. It is good also to apply Horseleeches, forme with to apply to the wound the fundaments of Hens or Turkies that lay Eggs, for that fach are opener behind, first parting fast upon them that they may gape the wider, thatting their beaks and opening them now and then, lest they should be stiffed, and ever and anon to substitute others in flead of fuch as die or are fuffocated, for thus it is thought the poison is drawn forth, and palleth into the Bird by the fundament. There be others which had rather apply to the wound live Birds cut afunder in the midth, and so laid to the wound hot, for that they guess these resist poifon by a natural diffcord. But certainly it is by their heat, whereby they do not onely digett Toads, Aips, Vipers, Scorpious, and other venemous things, but also wear afunder and fotten Sand, Stones, and most dry and stony seeds in their gizzards; wherefore we must think them very good to draw out the poison and diffipate it. But nothing is so forcible to disperse and retund the The efficacy venom, as the impereison of Cauteries, especially actual; for a hot iron works more effectually and spec- of Cauteries dily, and causeth an ulcer which will remain open a longer time. Wherefore to cause the special regainst vene-falling away of the Eschar, you shall scarine it to the quick, and then plettifully anoint the place, mous bites. For this tie poisson will the sconer pass forth. But this must be done before the poisson replace into the poisson will the sconer pass forth. into the body, for otherwise Cauteries will not onely do no good, but further torment the Patient, and weaken him to no purpole. Let drawing platters be laid to the wound and neighbouring parts, The force of made of Galbanum, Turpentine, black Pitch, and other gummy and refinous things. After the falling Precipitate assumed to the property of the precipitate of the precipitat away of the Eschar Bufisem shall be applied quickned with a little Precipitate, for it is very effectual in thefe cases, for that it draweth forth the virulent fanier out of the bottom of the wound, neither doth it fuffer the wound to be closed speedily. To which purpose they put in a piece of sponge, or a root of Gentian or Hermodactyl, or some acrid Medicin, as Ægyptiscum or Precipiase mixed with the purpose of Gentian or Hermodactyl, or some acrid Medicin, as Ægyptiscum or Precipiase mixed with the powder of Alum, or a cautick beaten to powder. But you must always observe this, that with when het the powder of Alum, or a cautick beaten to powder. But you must always observe this, that with when het the like, which have power to attract and disperse the poison, and cleanse the ulcer; yet if to vector venioned to be possible to bring a Capazzan by the like; which have power to attract and disperse the poison of capazzan by the like. hermont hear thall cause such pain as is likely to bring a Gangrene by the diffipation of the spirits, wounds. en neglecting the cure of the proper difease for a time, we must labour to correct the symptom. But in this case you must observe this rule, that you let no bloud, give no purging Medicin nor S f Clyster,

BOOK XXI.

Commission

Clyfter, nor Vomit, nor use no Bath, nor other thing that may procure sweat, until three days be past after the bite or sling. In the mean space let the Patient shan all manner of labour, but chiefly Venery, lest by causing an agitation of the humours, the posson get sooner to the heart. Therefore then it is time to use universal evacuations, when as you shall suspect that the poison is diffused over the veins and whole inner part of the body belides. Before you shall give nothing, unless Medicins of Treacle and Mithridate, and the like things, which have a faculty to refift poison, and strengthen the whole body by their benign and vital vapour, although their substance go no further than the flomach. Thus Pills when they are fwallowed, though they go no further than the flomach, yet do they draw matter out of the joints and head; and firong Clytters, though they pass no further than the guts, yet by their quality diffused further with the vapour, they draw from the most distant Anxidores parts; yet you must give an Antidote, not onely more powerful than the poison in quality, but also must be given greater in quantity, that so it may the more easily overcome and expel the poison. Wherefore you in great quantity give it twice in a day, and continue it so long until you shall know that the strength of the titles. poison is weakned and overcome by the remission and decay of the malign symptoms. Yet in the mean while you must not neglect the distemper caused in the part by the poison, but must rather correct it by the application of the remedies contrary to the difference, as by cold things if great heat afflict the affected part and whole body; by hot things on the contrary, if it feem as cold as a flone, which oft-times happens. And let thus much fuffice for the general cure of Poifons: now will we come to their particular Cure.

CHAP. XI.

Why Dogs former become mad than other Creatures, and what he the figns thereof.

Dogs natural-ly subject to madness.

Dogs become mad, not onely in the heat of also in the

Ogs become mad fooner than any other Creatures, because naturally they enjoy that tem-per and condition of humours which hath an easie inclination to that kind of disease, and as it were a certain disposition, because they feed upon Carrion, and corrupt, putrid and flinking things, and lap Water of the like condition; befides the trouble and vexation of loting their Matters, makes them to man every way, painfully fearthing and fmelling to every thing and neglecting their meat. An heating of the bloud enfuse upon this pain, and by this heat it is turned into a melanthele and an example of the bloud enfuse upon this pain, and by this heat it is turned into a melanthele and an example of the bloud enfuse upon this pain, and by this heat it is turned into a melanthele and the pain and choly, whence they become mad. But yet Dogs do not always become mad by means of heat, but also by occasion of cold, that is, by contrary causes; for they fall into this disease not onely in the Dog-days, but also in the depth of Winter: For Dogs abound with melancholick humours, to wit, cold and dry. But such humours as in the Summer through excess of heat, so in the depth of Winters by configuration and the supportion of full interest through excess of heat. ter by conflipation and the suppression of fuligimous excrements, they easily turn into melancholy-Hence tollows a very burning and continual Fever, which causeth or bringeth with it a madness. Add hereto, that in the depth of Winter the heat which is contained within is redoubled, and in like manner as the foorching heat in Summer, it breeds and turns the humours into melancholy. Also Dogs become mad by contagion, as such as are bitten by another mad Dog. A mad Dog hath spark-ling and siery eyes, with a fixed look, cruel and asquint, he carries his head heavily, hanging down towards the ground, and somewhat on one side, he gapes and thrusts forth his tongue, which is livid and blackish, and being short breathed, casts forth much filth at his nose, and much soaming matter at his mouth; in his gate, as if he suspected and feared all things, he keepeth no one or certain path, but runs one while to this fide, another while to that, and flumbling like one that is drunk, he oft-times falleth down on the ground; he violently affails whatfoever he meets withall, whether it be Man, Tree, Wall, Dog, or any thing elfe; other Dogs than and prefently feat him afar off. But if another unawares chance to fall foul upon him, he yields himfelf to his mercy, fawns upon him, and privily labours to get from him, though he be the fironger and greater. He is unmindful of eating and drinking, he barks not, yet bites he all he meets, without any difference, not sparing his Mafter, as who at this time he knows not from a stranger or enemy. For it is the property of Melancholy to disturb the understanding, so that such persons as are melancholick, do not onely rage against, and afe violence to their Friends and Parents, but also upon themselves. But when as he sees Water, he trembles and shakes, and his hairs stand up on end.

Why melancholick perfons hurt themselves.

CHAP. XII.

By what figns we may know a man is hitten by a mad Dog.

The bite of a mad Dog nor very painful at the fielt.

> Signs of the ce of a mad Dog.

T is not fo easie at the first to know that a man is bitten with a mad Dog, and principally for this reason, because the wound made by his teeth causeth no more pain than other wounds usually do; contrary to the wounds made by the sting or bite of other poisonous Creatures, as those which presently after they are inflicted, cause tharp pain, great heat, swelling, and abundance of other malign accidents according to the nature of the poilon; but the malignity of the bite of a mad Dog appears you before that the control of the poilon; but the malignity of the bite of a mad Dog appears not before that the venom thall invade the noble parts. Yet when you are fuspicious of such a wound, you may acquire a certain knowledge and experience thereof by putting a piece of bread into the quitture that comes from the wound. For it a hungry Dog neglect, year more fly from it, and dare not fo much as finell thereto, it is thought to be a certain fign that the wound was inflicted by a mad Dog. Others add, That if any give this piece of bread to hers, that they will die the first they will die they will that they will die the fame day they have eaten it; yet this latter I making experiment thereof. failed; for devouring this virulent bread, they became not a jot the worfe. Wherefore I think the former fign to be the more certain, for Dogs have a wonderful and fire fmelling faculty, whereby they eafily feent and perceive the malignity of the like Creature. But when as

the raging virulency hath invaded the noble parts, then the Patients, becoming filent and for-Signs by rowful, think of many things, and at the beginning make a noise with their teeth; they make no which you answer to the purpose, they are more telly than ordinary, and in their sleeps they are troubled with may gather that the noble dreams and firange phantafies, and fearful visions; and laftly, they become afraid of the water, parts are tained after that the poisson hath fixed it self into the substance of the noble parts, then all their faced.

In a disturbed, all the light of their memory, senses, reason, and judgment is extinguished. Wherefore becoming flark mad, they know not fuch as fland by them, nor their friends, no nor themselves, falling upon such as they meet withall, and themselves with their teeth and nails and feet. Often twitchings like Convultions do fuddenly rife in their limbs; I judge them occasioned by extraordinary driness, which hath as it were wholly drunk up all the humidity of the nervous parts; there is a great driness of the mouth with intolerable thirst, yet without any desire of drink, because the mind being troubled, they become unmindful and negligent of such things as concern them, and are needful for them; the eyes look fiery and red, and all the face is of the fame colour; they still think of Dogs, and feem to fee them, yea and defire to bank and bite just after the manner of Dogs. I conjecture that the virulent humour hath changed all the humours and the wholebody of the beautiful the like nature, for that they think themselves also Dogs; whence their voice becomes hoarse coming mad, by much endeavouring to bark, having forgot all decency, like impudent Dogs, to the great hor-bark like dogs. rour of the beholders. For their voice grows hoarfe by reason of the great driness of the aftern arteria; they flush the light, as that which is enemy to melancholy, wherewith the whole subfrance Why they of the Brain is replenished; on the contrary they desire darkness, as that which is like and friendly shun the light. to them. But they are afraid of the water (though good to mitigate their great difference of heat Why they are and driness) and they fly from Looking-glasses, because they imagine they see Dogs in them, where- afraid of the of they are much afraid, by reason whereof they shan the Water and all polite and clear bodies which Wherefore thinking that he fees him in the Water, he trembles for fear, and therefore thuns the Water. Others write that the body by madness becometh wondrous dry, wherefore they hate the Water, as that which is contrary thereto, being absolutely the moisself element; and so they say that this is the reason of their searing the Water. Russias writes that madness is a kind of melancholy, and that fear is the proper fymptom thereof, according to Hippocrates; wherefore this or Approx.25,60.6 that kind of melancholy begets a fear of these or these things, but chiefly of bright things, such as Looking-glaffes and Water, by reafon that melancholy perfons feek darkness and folirariness, by reafon of the black corruption of the humour wherewith they abound. They fall into cold fweats, a formy, flinking, and greenish matter flows from the ulcer, by reason of the heat of the antecedent cause and ulcerated part. The urin most commonly appears waterish, by reason that the strainers, as it were of the Kidnies, are strained by the heat and driness of the venom. Yet sometimes also it appears more thick and black, as when Nature powerfully using the expulsive faculty, times allost appears more thick and black, as when Poature powerfully using the expulsive faculty, attempts to drive forth by urin the melancholy humour, the feat of the venors. Also forestimes it is wholly suppress, being either incrassated by hot driness, or else the mind being carried other. The bits of a ways and forgetful, of its own duty, until at length the Patients, vexed by the cruelty of so mad dog tamany symptoms, and overcome by the bitterness of pain, die frantick, by reason that Medicins sine, is for the have not been specially and fitly applied. For few of those who have used remedies in time, have most part our rable.

CHAP. XIII.

Prognosticks.

Ecannot fo eafily thun the danger we are incident to by mad Dogs, as that of other Beafts, by reason he is a domestick creature, and housed under the same roof with The virulency that refides in his foam or flaver is hot and dry, malign venenate The venom of and contagious, fo that it causeth a differnper like it felf, in the body whereto it shall apply it a mad dog apand contagious, to that it caudeth a difference like it telt, in the body whereto it man apply it a mind nog ap-felf and fpread it felf over the whole body by the arteries; for it doth not onely hurr when as plied out-it is taken in by a bire or puncture, but even applied to the skin, unless it be forthwith walhed wardly onely, away with falt water or urin. Neither doth this venom hurt equally or at all times alike, for it madness, harms more or lefs, according to the inclination of the air to heat or cold, the depth of the wound, the strength of the Patients Body, and the ill humours thereof, and their disposition to patrefa-Gion, the freedom and largeness of the passages. Now malign symptoms happen somer or later, as in some about the fortieth day, in others about fix moneths, and in others a year after. There whether the forme who thereupon are troubled with the falling tickness, and at length grow mad; such as fall Hydropichia. into a fear of the Water, never recover. Yet Ancen thinks their cafe is not desperate, if as yet or fear of wathey can know their face in a Glass; for hence you may gather, that all the animal faculties are not yet overthrown, but that they fland in need of ftrong purgations, as we shall shew hereafter. Action An History. tells that there was a certain Philosopher, who taken with this difease, and a fear of Water, when as he defeended with a great courage unto the Bath, and in the Water beholding the mape of the Dog that bit him, he made a fland, but afhamed thereof, he forthwith cried out, Quid Cani cam Balmo ? i. c. What hath a Dog to do with a Bath? which words being uttered, he threw himself forcibly into the Bath, and tearlefly drank of the Water thereof, and so was freed from his difease together with his erroneous opinion. It is a deadly fign to tumble themselves on the ground to have an hoarfe voice, for that is an argument that the wearon is become rough, by reason of too excellive

BOOK XXI.

drinefs. Finally, The principal parts being pofferfied, there is no recovery or life to be hoped for. Men may well fall mad, though they be not bit by a mad dog. For as the humours are often inflamed of themselves, and cause a Cancer or Leprosie, so do they also Madness in melancholick per-The bites of Vipers and other venemous creatures cause not like symptoms to these that come by the biting of a mad Dog, because they die before such can come forth or shew themselves. Great wounds made by mad Dogs are not equally so dangerous as little, for from the former great plenty of venemous matter flows out, but in the latter it is almost all kept in.

CHAP. XIV.

What cure must be used to such as are bitten by a mad Dog.

An Hiftory.

The force of Sorrel-

An Hiftory.

tain remedy against Mad

His case also requires speedy remedies; for such things are in vain which come long after the hurt. The Lawyer Baldas experienced this to his great harm, for being by chance lightly bit in the lip by a little Dog wherewith he was delighted, not knowing that he was mad, and neglecting the wound by reason of the smalness thereof, after some four moneths space he died mad, having then in vain assayed all manner of Medicins. Wherefore observing these things both for evacuation, as also for alteration, which we have formerly mentioned in the general Cure of Wounds inflicted by the bite or fting of venemous Creatures, and by all the means there specified, we must draw forth the venom, and if the wound be large, then suffer it to bleed long and much, for so some part of the poisson will be exhausted ; if it be not great it shall be enlarged by fearification, or an occult cautery, neither shall it be healed or closed up at the so-nest till forty days be passed. Sorrel beaten and applied to the wound, and the decoction there-of taken inwardly, is very effectual in this case, as Aeims affirms. To the same purpose you may with good success make a lotion and friction with Mustard dissolved in Urin or Vinegar, leaving upon the wound a double cloth moifined in the fame decoction: laftly, all acrid, biting, and very attractive Medicins are convenient in this case. Wherefore some apply Rocket boiled and beaten with Butter and Salt, others take the flower of Orobus, and temper it with Honey, Salt, and Vinegar, and apply it hot. Horse-dung boiled in tharp Vinegar, or Brimstone beaten to powder, and tempered with ones spittle, is good. Also black pitch melted with some salt, and a little Euphorbinon mixed therewith, and so applied, is good. Some write that the hairs of the Dog whose bite caused the madness, applied by themselves, by their sympathy or similitude of substance, draw the venom from within outwards; for so a Scorpion beaten and applied to the place whereas it flung, by drawing out the poison that it sent in, restores the Patient to health, both these by often experience are affirmed to have certain event. Others chew unground Wheat, and lay it upthe wound, other roast Beans under hot Embers, then husk them and cleave them, and so apply The force of them. Also the wound may be wholfomly washed and formented with a decoction of Docks, and then the herb beaten may be applied thereto; also the Patient may drink the decoction; and by this one remody Actins affirms that he hath recovered divers; for thus it moves Urin plentifully, which is thought much to conduce to the cure of this difease. There be some who apply the leaves of Betony and Nettles beaten with common Salt; others make a Medicin to the fame purpose, after the fame manner, of an Onion, the leaves of Rue, and Salt. Yet the reft are exceeded by Treacle diffolved in Agua Vine or strong Wine, and rubbed hard upon the part, so that bloud may follow, laying upon the wound when you have wiped it, cloths dipped in the same Medicin; then presently apply Garlick or Onions beaten with common Salt and Turpentine. By this onely remedy I freed one of the daughters of Madameifella de Gron from the symptoms of midness, and healed the wound, when as a mad Dog had bit her grievoully in the call of the right leg. Alfoit is good prefently to eat Garlick with bread, and then to drink after it a draught of good Wine, for Garlick by its fpirituous heat will defend the noble parts from poifon. There be fome who with to eat the roafied liver of the Dog that hurt them, or elfe the liver of a Goat, of which remedies, as yet I have had no experience. Others preferibe a dram of the feeds of Agram eafter to be drunk with Wine and Butter. Others the powder of River-Crabs burnt and drunk in Wine. Or, it Rad gent. 3 ij. aftacorum fluviat, in fumo combuft, & in pollinem redali, 3 iij. terra figill, 3 β, mifce. Give 3 j. of this fame Powder in the decoction of River-Crabs, and let them drink thereof oft, at fundry times. Many have cast themselves into the Sea, neither have they thence had any help against Madnels, as the Sea no cer- Ferrand Pozet the Cardinal tettifieth in his Book of Poifons; wherefore you must not rely upon that remedy, but rather you must have recourse to such things as are set in the Books of Physicians, and approved by certain and manifold experience. But feeing that no poifon can kill, unless it be taken or admitted into the body, we must not fear any harm by sprinkling our bodies with the fanies of a mad Dog, Viper, Toad, or any other fuch like venemous Greature, it so be that it be prefently wiped or washed clean away.

CHAP. XV.

What Cure migh be used to such as fear the Water, but yet are able to know themselves in a Glass.

The force of Antimony a-gainst mad-

Uch as have not their animal faculty as yet overcome by the malignity of the raging venoms must have strong purgations given them. Wherefore if in any case Antimony be useful, then is it in this, as that which causeth sweats, looseth the belly, and procures vomiting: For it is a feet terms and danger on the feet terms and danger on the feet terms. part of extreme and dangerous madness to hope to overcome the cruel malignity of this poiton al-ready admitted into the bowels, by gentle purging Medicins. Affuredly, Such and so great dan-ger is never overcome without danger. Baths also conduce, which may disperse and draw forth the

poifon by caufing fweats. Also many and frequent Treacle-potions are good to retund the venom, and ftrengthen the bowels; also it will be fitting to give them Water and all other liquid things, which they so much abhor, in a cup with a cover. Always let such as are possoned, or stung, or bitten by a mad Dog or other venemous Beaft, keep themselves in some warm and light place, that the poison which by coldness is sorced in, may be the readilier drawn out by the means of heat, and the spirits be recreated by the brightness of the air and therefore move from the center to the circumference of the body, and let the room be perfiamed with fweet things. To ear very hot and falt things prefently at the beginning, as Onious, Leeks, all fpiced meats, and firong Wine not allayed, feem not to be besides reason; because such things by their spirituous heat hinder the disfusion of the poifor over the body, and firengthen the filled entrails. There be forme also that would have them to feed upon gross and viscous meats, which by obstructing the vessels, may hinder the passage of the poison to the heart and other parts; and by the same reason it will be better to fill themselves with meat to fatiety than otherwife, because the malignity of humours is increased by hunger, than which nothing can be more harmful to venemous wounds. Yet within a short while after, as within five or fix days they must return to a mediocrity, and use all things temperate, boiled meats rather than roafied, and that in a decoction of opening things, fo to move urin. Laftly, They must keep fuch a diet as melancholick persons ought to do; neither shall they let bloud, lest so the poison should be further drawn into the veins; but it is good that the Patients body be soluble from the very first. Let their drink be Wine indifferently allayed with Water, Oxymel fimplex, or the Syrup of the juice of Citron with boiled Water; or elle this following Julip: R. Sueci limmum, & malorum citri, an 3 [5. fue, gran, acid. 3 ij. aque acetofe, min. & rof. an. 3 j. aq. font. coq. quantum fufficit, fiat Julep. nt artis eft.

Sleep is to be avoided until the force of the poison be abated, for by fleep the humours flow back into Why fleep is the bowels. All things that refitt poifon must be given any way whatfoever, as Limons, Oranges, harful to fach Angelica-roots, Gentian, Tormentil, Burnet, Vervain, Cardinas Benedilius, Borage, Buglots, and the as are abiten like. Let all things that are afterwards fet before the Patient, be meats of good juice, fuch as are and all fach as Veal, Kid, Mutton, Partridge, Pullets, Capons, and the like.

CHAP. XVI.

Of the biting of a Viper or Adder, and the symptoms and cure thereof.

He remedies that were formerly mentioned against the bitings of mad Dogs, the same may be used against all venemous bites and stings, yet nevertheless each poison hath his peculiar antidote. Vipers or Adders (as we vulgarly term them) have in their; gums, or the spaces The bites of between their teeth, little bladders filled with a virulent fanies, which is pressed out into the part vipers how that they bite with their teeth. There forthwith ariseth a pricking pain, the part at the first is much virulent. (wollen, and then the whole body, unless it be hindred: gross and bloudy filth sweats out of the The symptom wound, little blitters arife round about it, as if it were burnt, the wound gnaws, and as it were feeds upon the flesh, great inflammation possesset the Liver and the Guts, and the whole body becomes very dry, becoming of a pale or yellowith colour, with thirst unquenchable; the belly is griped by fits, a cholerick vomiting molefleth them, the Stomach is troubled with a hicketing, the Patients are taken with often fwounings, with cold fweat, the fore-runner of death, unlefs you provide by fit Medicins for the noble parts, before the poifon shall invade them. Matthebus tells, that he saw a Coun-An History-try man, who as he was mowing a Meadow, by chance cut an Adder in two with his Sithe, which when he thought it was dead, he took the one half, whereon the head remained, without any fear in his hand, but the enraged creature turning about her head, cruelly bit him by one of his fingers, which finger, as men usually do (especially when as they think of no such thing) he put into his mouth, and fucked out the bloud and poison, and presently fell down dead.

When as Charles the ninth was at Montpelier, I went into the thop of one Farges an Apothecary, An History, who then made a folernn differniation of Treacle, where not fatistying my felt with the looking upon the Vipers that were there in a glafs, ready for the composition, I thought to take one of them in my hands, but whileft that I too curiously and fecurely handled her teeth which were in her upper jaw, covered with a skin, 'as it were a case to keep the poilon in, the beast catched hold of the very end of my fore-finger, and bit me in the space between the nail and the fleth; whence prefertly there arose great pain, both by reason of the part endued with most exquisit sense, as also by the malighity of the possion: forthwith I exceeding straightly bound my singer above the wound, that so I might prefs forth the bloud and possion, left they should diffuse themselves further over the body. I dissolved old Treacle in Aqua vita, wherein I dipped and most straightly bound my singer above the wound, and within a few days I thorowsly recovered by this onely Medicin. You-may use in the bire of a solve of the straight and solve one of the straight have reason of their boars. the wound, and within a few days I thorowly recovered by this onely medicin. Tool thay ute in the bar flead of Treacle, Mithridate and fundry other things, which by reafon of their heat are powerful Viper. drawers, as a Quill roafted in hot Embers, Garlick and Leeks beaten and applied, Barley-flour tempered with Vinegar, Honey, and Goats-dung, and fo applied like a pultis. Some think it fufficient forthwith to wath and forment the wound with Vinegar, Salt, and a little Honey. Galen writes, that Lib. de Torrise, the poison inflicted by the bite of a Viper, may be drawn forth by the applying to the wound the head of a Viper, but other-form apply the whole Viper beaten to math.

timinione.

CHAP. XVII.

Of the Serpent called Hæmorrhous.

The Henririous why fo called.

Wonderful bleedings. He Serpent Hemorrhous is so called, because by biting he causeth bloud to drop out of all the passages of the wounded body; he is of a small body, of the bigness of a Viper, with eyes burning with a certain fiery brightness, and a most beautiful skin. The back of him (as Aviert writes) is spotted with many black spots, his neck little, and his tail very small: the part which he bites forthwith grows black sin, by reason of the extinction of the native heat, which is extinguished by such poisson which is contrary thereto in its whole substance. Then follows a pain of the stomach and heart, these parts being touched with the pessiferous quality of the poisson. These pains are seconded by vomiting, the orises of the ventricle being relaxed by a Diarrhea, the retentive faculty of all the parts of the belly being weakned, and the veins which are spread through the guts, not being able to retain the bloud contained in them. For the bloud is seen to flow out, as in streams, from the Nose, Mouth, Ears, Fundament, Privities, corners of the Eyes, roots of the Nails, and Gums, which putresse, the Teeth falling out of them. Moreover there happens a difficulty of breathing, and stoppage of the urin, with a deadly convulsion.

The Cure is forthwith to scarific and burn the bitten part, or else to cut it quite off, if that it may be done without danger of life, and then to use powerfully drawing Antidotes.

The Figure of the Serpent Hamorrhous.

CHAP. XVIII.

Of the Seepent called Seps.

The reason of the name, and description of the Seps.

The (ym-

He Serpent Sept is fo called, because it causeth the part which it bites, forthwith to putrefie by reason of the cruel malignity of its poison. It is not much unlike the Hemorrhous,
but that it curls or twines up the tail in divers circles. Pausanias writes that this Serpent
is of an alla-colour, abroad head, small neck, big belly, writhen tail, and as he goes he runs aside like
a Crab; but his skinis variegated and spotted with several colours, like to Tapistry. By the cruelty
of his caustick and putrefying venom he burns the part which he hath bit, with most bitter pain; he
causeth the shedding of the hairs, and as Aetius addeth, the wound at the first cateth forth manifest
bloud, but within a little while after, sinking filth. The putrefied affected parts wax white, and
the body all over becomes of the colour of that scurff which is termed Alphas, so that by the wickedness of this putrefactive poison, not onely the spirits are resolved, but also the whole body consumed,
as by fire, a pestilent carbuncle, and other putrid tumors, arising from an hot and humid or suffocating constitution of the air. Now for the remedies, they must be such as are formerly prescribed
against the bitings of a Viper.

The Figure of the Serpent Seps.

CHAP. XIX.

Of the Bafilisk or Cockatrice.

The efficacy of the poison of the Basilisk He Bafilisk far exceeds all kinds of Serpents in the curftness of its poison. Therefore it is affirmed by Nicander, that into what place soever he comes, other venemous creatures do forthwith slie thence, for that none of them can so much as endure his hissing, for he is thought to kill all things even with this, and not with his biting and touch onely; belides, if any of them

them haften to get any meat or drink, and perceive that the Bafilisk is not far from thence, he flies back, and neglects the getting of nourithment necessary for life. Galen writes, that the Basilisk is a Lib. de Tenise, yellowish Serpent, with a sharp head, and three risings distinguished with white spots, and rising up yellowish Serpent, with a sharp head, and three rabings dutinguished with white ipots, and ruing up in form of a Crown, by reason whereof he is stilled the King of Serpents. Certainly the violence of Why the Basinis poisson in killing men is so great, that he is therefore thought to kill men and other creatures by sik is thought his sight only. Solings affirms, that the body of a Basilisk hath wondrous faculties: Wherefore the to kill by his onely sight. Inhabitants of Pergamum, in ancient times gave a mighty price for one to hang upon the Joilts of the Temple of Apollo, fo to drive away the Spiders and Birds, left they should weave their webs, or the other build their nefts in that facred place. Verily no ravenous creature will touch their carkafs; but if confirmined by hunger, they do touch it, then they forthwith fall down dead in the fame place: and this happens not onely by eating their body, but also by devouring of the bodies of such Beasis as are killed by their bitings. They kill the Trees and Shrubs by which they pass, not onely by their Plia.lib.8.6.21 touch, but even with their breath. Among the Western Æthiopians is the Fountain Nigris, near which there is a Scrpent called Catablepas, small in body, and slow, having a great head, which it The catable-fearce can carry, but that it lies always upon the ground, otherwise it would kill abundance of people, page for it forthwith kills all that fees the eyes thereof, the Bafilisk hath the fame force; he is bred in the Province of Cyrene, of the length of forne twelve fingers, with a white spot in his head, resembling a Crown; he chafeth away all forts of Serpents with his hifs. Weafels are the definiction of fach monfters: thus it pleafed Nature that nothing should be without its equal; they affail them in their Nothing in dens, being eafly known by the barrenness or consumption of the foil. These kill them also by their own its equal, they affail them in their Nature without and they die, and the tight of Nature is ended. Thus Nature to the magnanimous Lion, left them should be replied to the magnanimous Lion, left them the foothers. there should be nothing which he might fear, hath opposed the weak creature the Cock, by whose crowing onely he is terrified and put to flight. Erofitratus writes, that a golden yellowness affects Symptoms, the bitten part of fuch as are hurt by a Basilisk, but a blackness and tumour possession the rest of the body, all the fleth of the muscles within a while after falling away by piece-meal. An Antidote against Cure. this must be made of a dram of Casterners, dissolved in wine and drunken, or in the juice of poppy. But Actins thinks it superfluous to write remedies against the Basilisk, when as the sight and hearing bnely kills fuch as either fee or hear her.

The Figure of a Bafilisk,

CHAP. XX.

Of the Salamander.

He Salamander kills not onely fuch as it bites, by making a venemous impression, but it also the Fruits and Herbs over which it creeps, with a spirite or gross moissure which of a Salaman-fewests out of all the body, to the great danger of the health and life of such as eat these der, things at unawares: wherefore it need not feem strange, which is received by some late Writers, that some Families have all died by drinking Water out of the Pits whereinto a Salamander by accident was fallen. For if it shall creep upon a Tree, it infects all the Fruit with the qualities of cold and moist poison, wherein it yields not to Aconite.

The temper of her,

and moift poifon, wherein it yields not to Aconite.

Actins writes, that fuch as are infected with the poifon of a Salamander, certain parts of their of her, body grow livid, fo that they fall away often, being potrefied. At the first there appear white spots, over the body, then red, afterwards black with putrefaction; and the falling away of the hairs. The Cure is to procure worms, to loose the belly with a Clyster, and to give them Treacle and Mithridate The Care. In potions. Anien prescribes the same things against this kind of poison as against Opinon, by reason of the cold nature of them both; the proper Antidote is Turpentine, Styrax, Nettle-seeds, and Cypress-leaves. Dioscrides writes, that the Salamander is a kind of Lizard, dull, variegated, and which is fally reputed, not to be burnt by fire. But Pliny faith she is so cold, that the extinction and Cyprefs-leaves. Disferrides writes, that the Salamander is a kind of Lizard, dull, variegated, and which is falfly reputed, not to be burnt by fire. But Ploty faith the is fo cold, that the extinguishest the fire by her touch onely, being laid upon hot Coals. On the contrary, Matthiolus faith, that cast into a great flame they are quickly confumed. It is easie out of Actius to reconcile these disfagreeing opinions. This creature saith he, passet through a burning flame and is not hurt, the flame dividing it fels, and giving her way, but if the continue any time in the fire, the cold humour being confused in her the salary. Now the Salamander is black, variegated with nellows Goes in the fire. being confumed in her, the is burnt. Now the Salamander is black, variegated with yellow fpots in the fire.

CHILITITIES

Of the Torpedo:

The craft of the Torpedo hath his name from the effect, by reason that by his touch and power the members become torpid and numb. In muddy shores it lives upon fish, which she catcheth by craft. For lying in the mud, she so stupeness those that are nigh her, that she easily preys upon them. She hath the same power over men, for the sends a numbers not onely into the arm of force.

The Torpedo hath his name from the effect, by reason that by his touch and power the members in the catcheth by craft. For lying in the mud, she so shupeness those that are nigh her, that she easily preys the Fisher-man, but also over all his body, although his Fishers Pole be between them.

C H A P. XXII. Of the bitings of Asps.

Symptoms.

Curing.

An Hiftory.

By what means Alps may be made left bureful.

Gel.lib.de Ther.

ad Pillman

Against the bites of what Serpens Treacie doth no good. A certain remedy against the biting of Afps.

He wound which is made by an Afp is very finall, as if a needle were thrust into the part, and without any swelling. These symptoms follow upon her bite, sudden darkness clouds their eyes, much agitation in all their bodies, but gentle notwithstanding; a moderate pain of the flomach troubles them, their fore-heads are continually troubled with convulfive twitchmgs, their cheeks tremble, and their eye-lids fall gently to reft and fleep; the bloud which flows from the wound is little, but black; death no longer deferred then the third part of a day, will take them away by convulsions, unless you make resistance with fitting remedies. The male Asp makes two wounds, the semale four, as it also happens in the bitings of Vipers. Now for that the poston of Asps congeals the bloud in the veins and arteries, therefore you must use against it such things as are hot and subtil of parts, as Mithridate or Treacle dissolved in Agris Vita, and the same poured into the wound; the Patient must be warmed by baths, frictions, walking and the like. When as the hurt part becometh purple, black, or green, it is a fign that the native heat is extinct and fut-focated by the malignity of the venom. Therefore then it is best to amputate the member, if the Patient be able to endure it, and there be nothing which may hinder. Vigo writes that he faw a Mountebank at Florence, who that he might fell the more of his Antidotes, and at the better rate, let an Afp to bite him by the finger, but he died thereof fome four hours after. To the fame purpole you may read Matthiolus, whereas he writes that those Impostors or Mountebanks to cozen the better, and deceive the people use to hunt and take Vipers and Asps long after the Spring, that is, then when as they have cast forth their most deadly poison; then they feed them meats formerly unufual to them, to that by long keeping and care, and at length they bring it to pass, that they put off a great part of their venemous Nature; neither being thus fatished, they make them oftentimes to bite upon pieces of flesh, that so they may cast forth into them their venom which is contained in the membrane between their teeth and gums. Laftly, they force them to bite, lick, and fwallow down an aftringent medicin, which they compose and carry about for the same purpose the control of the contro pole, that so they may obstruct the paffages by which the venom used to flow out, for thus at length their bites will be harmless, or without great danger. This therefore is their Art, that so they may fell their counterfeit Treacle to the people at a high rate, as that which is a most safe remedy against all poisonous bites. Christopher Andrew in his Book called Oicoistria, writes, that the Islands of Spain are every where fell and the little of the same of the are every where full and thered with Serpents, Afps, and all forts of venemous Beatls, againft whole bites they never observed or found any benefit in Treacle. But the efficacy of the following Antidote is so certain and excellent, and approved by so manifold experience, that in the conhecue thereof, they will not be afroid to let themselves be bitten by an Asp. Now this Medicin is compofed of the leaves of Mullet, Avens, and red Stock-gillyflowers in like quantity, which they boil in

sharp Vinegar and the Urin of a found man, and therewith soment the wounded part. Yet if he have not taken nor used any thing of a good while after the wound, it will be better and more certain, if the Patient drink three ounces of this decoction fasting two hours before meat,

CHAP. XXIII. Of the biting of a Snake.

Have thought good in a true History to deliver the virulent malignity of the bite of a Snake, and An Wistory, the remedies thereof. When as King Charles the nineth was at Mostlins, Mousieur le Festre the Kings Phylician and I were called to cure the Cook of the Lady of Costelphers, who gathering Hops in a hedge to make a Sallet, was bit on the hand by a Snake that there lay hid, he putting his hand to his mouth, fucked the wound to eafe the pain by facking forth the venorn; but his Tongue forthwith fwelled fo big, that he could not fpeak his mind: befides, his whole arm, even to his thoulder, was in like fort much fwelled, his pain was fo vehement, that it hath made him fwoun twice in my prefence, his face was wan and livid like to a dead body; and though I despaired of his recovery, yet not fuffering him to be quite forfaken, I washed his mouth with Treacle dissolved in white Wine, and gave him fome thereof to drink, adding thereto fome Aqua Vita. I opened his fwollen arm with many and deep fearifications, especially in the place where he was hurt I suffered the bloud which was wholly scrous and fanious, to flow more plentifully, I washed the wounds with The Cure. Treacle and Mithridate diffolved in Aqua Vine, and then I put him exceeding warm in bed, procuring fweat, and making him to lie awake, left fleep should draw the poison inwards to the entrails. I by these means so far prevailed, that on the day after he was freed from all his malign symptoms, Therefore I judged it enely remained for a perfect cure, that the wound should be long kept open and washed with Treacle; neither was I deceived, for within a few days he was perfectly recovered.

CHAP. XXIV. Of the bitings of Toads.

Hough Toads want teeth, yet with their hard and rough gums they fo straitly press or pinch The bites of the part which they shall take hold on, that they will force their poison thereinto, and so Toads over the whole body by the pores of the preffed part. Moreover they can forth their ve- harmful, nom by urin, spittle, and vomit upon herbs, but chiefly upon Straw-berries, the which they are reported greatly to affect. Hence many fuddenly and ignorantly catch their deaths.

I heard from a man of very good credit, that there were two Merchants not far from the City An History. Theloufe, who whileft dinner was providing, walked into the Garden that belonged to the Inn, where they gathered fome Sage leaves, and unwashed as they were, put them in their Wine. They had The symnot as yet dired, when being taken with a fudden Vertigo, the whole Inn feemed to run round, then proms occasion leaves their fight, they fell into a fwound intermixed now and then with convulsions. But they frame ned by the loging their fight, they fell into a fwoun, intermixed now and then with convultions. But they frammered with their lips and tongues becoming black; a froward and horrid look, with continual Toads, vomiting and a cold fweat, the fore-runner of death, which prefently feized upon them, their bodies becoming exceedingly much fwollen. But the Juitices of the place suspecting that they were possened made the Inn-keeper and the Guetis to be apprehended; being examined they all conflantly and with one voice, answered, That the dead parties are of the same meat and drink which the reft did, but onely they put Sage into their Wine. A Phylician was asked the queftion whether Sage might be poiloned? he answered it might: but to come to the purpose, it must appear whether any venemous Creature hath poisoned the Plant with her spittle or venemous fanies. which was lightly pronounced, and onely by conjecture, was by the eye found to be true. For at the root thereof there was found a hole in the ground full of Toads, who got out by putting in of warm Water, made it credible that the Plant was poisoned by their spittle and urin, where-by you may understand how unwisely they do, who devour herbs and fruits newly gathered without washing. Also we must take heed left falling affeep in the fields, we lie not near the holes which Toads or other venemous beafts of the fame nature, have made their habitation. For thence a venemous or deadly air may be drawn into the Lungs. For the fame cause we must abitain from eating of Frogs in the Moneth of May, because then they engender with Toads. Oxen in feeding May-Frogs, fornetimes lick up small Toads together with the Grafs, which presently will breed their great barm, for thereupon the Oxen swell so big, they often burst withiall. Neither is the venom of Tonds deadly onely being taken inwardly, but even sprinkled upon the skin, unless they forthwith Wipe the place, and wash it with urin, water and falt. Such as are postened by a Toad turn yellow, swell over all their bodies, are taken with an Althmatick difficulty of breathing, a Verigo, Convulsion, Swouning, and lastly by death it felt. These so herrid symptoms are judged inherent in the poilon of Toads, not onely by reason of the elementary qualities thereof, coldness and moiflure, which are chiefly predominant therein; but much rather by the occult property which is ape to putrefie the humours of that body whereto it shall happen. Therefore it will be convenient The Cure. to procure vomit, especially if the posson be taken by the mouth, to give Clysters, and to weaken the firength of the posson by hot and attenuating Antidotes, as Treacle and Mithridate diffolved in good Wine; but in conclusion to digett it by Baths, Stoves, and much and great exercise. Randelerius in his Book De Pifcibus, affirms the fame things of the curfed venom of Toads, as we have formerly delivered: yet that they feldom bite, but that they cast forth either their urin, the which they gather in a great quantity in a large Bladder, or elfe their venemous spittle or breath, against fuch as they meet withall or assail: bendes the herbs which are tainted by their poisonous

(manager

Antidores 4gainst the poiton of Toads. breath, but much more such as are sprinkled with their spittle or urin, are sufficient to kill such as eat them. The Antidotes are juice of Betony, Plantain, Mugwort, as also the bloud of Tortoises made with flour into Pills, and forthwith dissolved in Wine, and drunken. Pliny writes, that the hearts and spleens of Toads resist poison. The vulgar opinion is salse, who think that the Toad-stone is sound in their heads, which is good against poison.

CHAP. XXV.

Of the stinging of a Scorpion.

The description of a q Scorpion. His Tail.

Winged Scor-

AND LET

Symptoms,

Lib.2.cop.44.

Zib.3.cap.1.

Scorpion is a finall creature with a round body, in form of an Egg, with many feet, and a long tail confifting of many joints, the last whereof is thicker, and a little longer than the reft, at the very end thereof is a fling it cafts, in fome two, hollow and replete with cold poilon, the which by the fling, it cafts into the obvious body; it hath five legs on each fide forked with firong Claws not unlike to a Crab or Lobfier, but the two foremost are bigger then the reft; they are of a blackith or footy colour, they go afide, afide; and oft-times faften themfelves with their mouths and feet fo faft to them, that they can fearce be plucked there-hence. There be form who have wings like the wings of Locusts, wasting the Corn and all green things with their biting and burning. Such are unknown in France. These sty in divers Countries, like winged Ants. This is likely to be true by that which Matthiolus writes, That the Husband-men in Capille in Spain, in digging the Earth oft-times find a fwarm of Scorpions, which betake themselves thi-ther against Winter. Pliny writes, that Scorpions laid waste a certain part of Esbiopia, by cha-fing away the Inhabitants. The Ancients made divers kinds of Scorpions, according to their varicty or difference of colours, fome being yellow, others brown, reddift, ash-coloured, green, whitish, black, dusky; fome have wings, and fome are without. They are more or less deadly, according to the Countries they inhabit. In Tuseany and Scythia they are absolutely deadly, but at Trent, and in the Island Pharas their stinging is harmless. The place stung by a Scorpion presently begins to be inflamed, it waxeth red, grows hard, and fwells, and the Patient is again pained; he is one while hot, another while cold; labour prefently wearies him, and his pain is fome whiles more and fome whiles lefs; he fweats and shakes as if he had an Ague, his hair stands upright, palenefs discolours his members, and he feels a pain, as if he were pricked with Needles over all his skin, wind flieth out backwards; he firives to vomit and go to flool, but doth nothing; he is molefled with a continual Fever and fwouning, which at length proves deadly, unless it be remedied. Dioscorides writes, that a Scorpion beaten and laid to the place where he is flung, is a remedy thereto; as also eaten roasted to the same purpose. It is an usual, but certain remedy to anoint the slung place with the oil of Scorpions. There be some who drop into the wound the milky juice of Figs, others apply Calamint beaten, other some use Barly-meal mixed with a decoction of Rme. Snails beaten together with their shells, and laid thereon, presently asswage pain. Sulphur vivum mixed with Turpentine, and applied Platter-wife is good, as also the leaves of Rue beaten, and laid thereto. In like fort also the herb Sempirides, which thence took its name, is convenient, as also a Briony-root boiled and mixed with a little Sulphur and old Oil. Diofeorides affirms, Agarick in Powder, or taken in Wine, to be an Antidote against possons; verily it is exceeding good against the stingings or bitings of Serpents. Yet the continual use of a Bath stands in stead of all these, as also sweat, and drinking Wine formewhat allaid. Now Scorpions may be chaled away by a furnigation of Sulphur and Galbanum; also oil of Scorpions dropped into their holes, hinders their coming forth. Juice of Raddish doth the same. For they will never touch one that is besmeared with the juice of Raddish or Garlick, yea verily, they will not dare to come near him.

CHAP. XXVI.

Of the stingings of Bees, Wasts, &c.

Bes, Wasps, Hornets, and such like, cause great pain in the skin wounded by their stingings by reason of the cursiness of the venom which they send into the body by the wound, yet are they seldom deadly, but yet if they set upon a man by multitudes, they may come to kill him. For thus they have sometimes been the death of Horses: Wherefore because such same stung by these, by reason of the cruelty of pain, may think they are wounded by a more virulent and deadly Creature, I think it not amiss to set down what signs sollow upon their stingings. Great pain presently ariseth, which continueth, until the sting left in the part is taken forth, the part becomes red and swollen, and there riseth a push or little blister. The Cure is, forthwith to suck the wound very hard, and thereby to draw forth the stings, which if they cannot thus be gotten out, the place, if nothing hinder, is to be cut, or else temper Ashes with Leven or Oil, and so apply them: the part also may be very conveniently put into hot Water, and there somened for an hours space, and at length washed in Sea water. Cresses beaten and applied, asswer the pain and discuss the humour causing the tumor. Ox dung macerated in Oil and Vinegar, and applied hot, doth the fame. There are some who apply to the part she same Creatures beaten, as we formerly said of Scorpions; Beans chawed and laid to the part asswer pain. Vinegar, Honey, and Salt, applied exceeding hot, are good, if besides, you dip a cloth therein, and lay it upon the place; Sulphur Vinum tempered with spittle hath the same effect. The milky juice of unripe Figs incorporated with Honey, is judged very effectual, but it is much the better, mixed with Treacle. Wasps will not sting not bite such as anoint their bodies with the juice of Mallows mixed with Oil. They may be quickly chased away with the fume of Brimstone and such like things. A Wasp is faid, if the

Symptoms, The Cure. The III

find a Viper dead, to dip her fling in the others poifon, and thence men learned to empoifon the heads of their arrows. The rough and hairy Worms, which are commonly called Bear-worms, especially The bites of Bear-worms. those which breed about a Pine-tree, cause great itching, redness and swelling in the part which they bite, touch, or grate upon very hard. A remedy hereof is Onions beaten with Vinegar, and the rest of the things formerly mentioned.

CHAP. XXVII. Of the bite of a Spider.

Piders weave Webs with various art, yet in these they always make a lurking hole to lie in wait Differences of to catch the intrapped Flies, and so to prey upon them. There are many forts of Spiders, spiders, one is termed Rhagiana, round and like a Black-berry, whence it taketh the name; it hath a very small mouth under the midst of the belly, and most short feet, as if they were imperfect, her bite is as painful as the sting of a Scorpion. Another is called Lupus, or the Wolf-Spider, because the doth not onely lie in wait to catch Flies, but also Bees and Wasps, and all such things as may see into her Web. The third is named Myrmecian, it is larger then an Ant, but headed like one, the body thereof is black and bath white from the remaining the body. thereof is black, and hath white fpots or fireaks running towards the back. The fourth kind may be called Vetharium, in other things refembling a Wasp, but that it wants the wings; of a reddish colour and living onely on herbs. The Ancients have thought their bitings to be venemous. Now their poison is therefore thought to be cold, because the symptoms thence arising are, wind in the belance of the symptoms thereof the symptoms t ly, refrigerations of the extreme parts of the body, numnels in the bitten part, with fende of cold and flaking. The wound must forthwith be washed with very hot Vinegar, then must you lay thereto Onions, and fuch like things beaten, then procure fweat by art, as by Baths and Stoves; yet nothing is more effectual than Treacle and Mithridate.

CHAP. XXVIII.

Of Cantharides and Buprelies.

Antharider shine as it were with a golden colour, acceptable to the eye, by reason of the comThe descriare hot and dry in the fourth degree, and so caustick, corrosive and venemous, not onely by tharider. reason of their caustick quality, but because of a secret antipathy which they naturally have against Enemies to the urinary parts; which effects they produce not onely if they be taken by the mouth into the body, but even applied outwardly to raife bliffers. Such as have taken them inwardly, have the taffe of Pitch, or foreething like Cedria, or Rofin of Cedars in their mouths; it is likely that this tafte proceeds from the humours diffolved by the putredinous heat in the flornach, guts, and liver, and the vapours that there-hence arife; for taken inwardly they gnaw, exulcerate and burn all parts from the mouth even to the belly, whence enfueth a bloudy flux, excrements flowing out, which refemble the washings of new killed flesh. Then follows a burning Fever, Verigo, Madnels, Resilessness, the Brain being disturbed by the plenty of vapors listed up from the corroded and burnt parts and humours, which therefore when as they appear, you may know the affect is uncurable. In the parts appointed for the receiving and conveyance of theurin they cause a burning inflammation, exconation throng and continual erection of the Yard, whence enflies a bloudy and painful strangury, in stead of which there oft-times happens or fucceeds an Ifebury, or floppage of the water, whence a gangrene and mortifica-tion of the part, and so in conclusion of the whole body besides. When as Canthariates are taken in-wardly, the remedy is vomiting, drinking of Cows-milk to correct the heat and driness, good also to mitigate the ulcers, and stay the dysentery; it is good also to inject it into the guts by Clyster. In flead thereof Sallet-oil or oil of fweet Almonds is convenient to retund the acrimony of the poylon faffined to the fides of the flomach. The reft and whole cure of this poilon you may learn by the following History. A certain Whore, the better to enjoy the company of a young Abbot who loved An History, her, entertained him with a banquet, and fprinkled divers of their Cakes with the powder of Cantharides, to incite him the more to Venery. The next day, when as the Abbot call forth pure bloud at his Fundament and Yard which food very fifif, he called fome Phylicians, who prefently by the fore-mentioned furnations which were all restricted and closed that he had Cantharides. fore-mentioned fymptoms, which were all very apparent in him, underflood that hehad Cantharider given him: wherefore they purged him upwards with Vomits, and downwards by Clyfters made The Cure, with French-barley, Rice, a decoction of Mallows, feeds of Line and Foenugreek, Oil of Lillies, Goats fuet: then prefently after they gave him a little Treacle with a good quantity of Conferve of Violets, which might draw the poilon outwards, they gave him Milk to drink, and caufed him to use injections into the urinary passage and guts made of refrigerating things, as the juice of Lettuce, Purllain, Cucumers, Gourds, Melons, 3 of tough and vifcid things: that fo they might flick the thore eafily and longer to the ulcerated parts, as the mucilages of Philium, Mallows, Quince-feeds, Syrup of Water-lillies, Poppies, and Violets, fresh Butter, and Oil of fweet Almonds; and they made syrup of Water-lillies, Poppies, and Violets, frein Butter, and Oli of tweet Almonds; and they made him drink onely Barley-water, or the common Ptifan; they let him feed on Veal, Rid, and Pork boiled with Lettuce, Purflain, Barley and Violet leaves, the which by their humidity might relax the belly, and by their toughness lenine the roughness of asperity; they applied also retrigerating things to the Loins, Share, and Perincum to assume the hear of the urin. At length they pur him into a warm Bath, and to conclude, they left nothing unattempted to draw forth or weaken the position. But all their endeavours were in vain, for the Abbot died, not being definite of remedies conveniently prescribed, but overcome by the contumerious malignity of the position. The Physicians rough had far better success in a certain Gentlewomen against the kind of affects. The Phylicians pains had far better success in a certain Gentlewoman against this kind of affect a An History.

tummino.

her whole face was deformed with red, hery and filthy puffles, fo that all flunned her company as if the had been troubled with a Leprotie, and were ready to forbid her the fociety of men; the came to Paris, and calling for Hollerius and Grealmus Phylicians, my felf and Caballus being Surgeons, the made a grievous complaint, and befought us earneftly for fome remedy against fo great a deformity of her face; having diligently confidered her case, we pronounced her free from a Leprotie, but we judged it fit to apply to her whole sace a vesicatory of Cantharides, three or four hours after the application it fit to apply to her whole face a veficatory of Cantharider, three or rour nours after the applied to the whereof, the Medicin being come to work its effect, her bladder began to burn exceedingly, and the head, ileerate the bladder.

neck of her womb to fwell with gripings, continual vomitings, making of water and feouring, a troublefome agitation of the body and members, a burning and abfolutely fiery Fever. I forthwith called the Phylicians, it was decreed that the should drink Wine plentifully, and that it should be injected by the fundament into the guts, and by the urinary passage into the bladder and the neck of the womb, and that the thould keep her felf, until the pain were mitigated, in a warm Bath made of the decoction of Line-feeds, the roots and leaves of Mallows, Marth-mallows, Violets, Henbane, Purssain, and Lettuce; and her loins and genitals should be anointed with unquentum refatum and po when stirred and incorporated with experate. By these means all the symptoms were mitigated. gainfile prous Her face in the interim rofe all in a blifter, and much purulent matter came out thereof, and so the de-putiles. formity where with the was formerly troubled, vanished away for ever, so that within a while after the was married, and had many children, and is yet living in perfect health.

the name.

Buprefees also are of the kind of Cantharides, being like unto them in shape and faculty. If an Ox or Sheep or any other Creature shall in feeding devour one of them, he shall prefently swell up like a The reason of Tun; whence also they take their name: if a Man take them inwardly, he shall endure the like symptoms as in taking Canthorides; and over and befides, both his flomach and his whole belly shall be wonderfully puffed up, as if he had a Dropfie. It is probable that this inflation like a Tympany happeneth by humours diffused and resolved into vapours by the nery acrimony of the venom. They are to be cured after the fame manner as fuch as have drunk Cantharides. Laftly, As in all other poilons which are taken into the body, fo also here, if the poison taken by the mouth be thought as yet to be in the flomach, you must then procure vomit. If it be gotten into the guts, then must it be drawn away by Clysters. If disfused over all the body, then must you make use of such things as may drive the poilon forth from the center to the circumference, fuch as are Baths and Stoves.

CHAP. XXIX.

Of Horfe-Leeches.

What Horic leeches most virulent.

Divers remeing to the diparts,

Orfe-Leeches are also venemous, especially such as live in muddy stinking ditches, for these are less burtful which refide in clear and pure waters. Wherefore, before they are to be used in cases of Physick, they must be kept for some days space in clean water, that so they may purge themselves; otherwise they may chance to leave ulcers hard to cure in the places whereto they thalf be applied, and the rather, if they be violently plucked off, because they by that means leave their teeth fallned in the part. Now he which by chance hath (wallowed a Horfe-leech, must be asked in what part he feeleth her, that is, the fenfe of her fucking: For if the ttick in the top of the throat or gullet, or in the midft thereof, the part shall be often washed with mustard dissolved in vinegar. If the benear the orifice of the ventricle, it is fit that the Patient by little and little swalverfity of the low down Oil with a little Vinegar. But if the fasten to the stomach, or the bottom of the ventricle, the Patient, by the plucking off the part, shall perceive a certain sense of sucking, the Patient will spit bloud, and will for scar become Melancholick. To sorce her thence, he shall drink warm Water with Oil; but if she cannot so be loosed, then shall you mix aloes therewith, or something endued with the like bitterness, for the will by that means leave her hold and so be cast forth by vomit-You may perceive this by such as are applied to the skin, on the external parts; for by the afper-fion of bitter things, whether they be full or empty, they will forfake their hold. Then shall the Patient take astringent things which may stop the bloud flowing forth of the bitten part, such is Conserve of Roses, with Terra sigillata, Bole-Armenick, and other more astringent things, it need so require. For if they shall adhere to some greater branch of some Vein or Artery, it will be more difficult to ftop the flowing bloud.

But for that not the Earth onely, but the Sea also produceth venemous Creatures, we will in like fort treat of them, as we have already done of the other, beginning with the Lampron.

CHAP. XXX. Of the Lampron.

The description of the Lampron.

and Viper,

He Lampson, called in Latin Murena, is a Sea-fifh, formething in shape refembling a Lamprey, but the is bigger and thicker, and hath a larger mouth, with teeth long, tharp, and bending inwards, the is of a dusky colour, diffinguished with whitish spots, and fome two cubits The Ancients had them in great effect, because they yield good nourishment, and may be kept long alive in Pools or Ponds, and fo taken as the owners pleafe, to ferve their Table, as it is furficiently known by the Hitlory of the Roman Graffie. She by her biting induceth the fame fymptoms as the Viper, and it may be helped by the fame means. Verily the Lampron hath fuch familiarity with the Viper and freketh out the Viper. with the Viper, that leaving her natural element the Sea, the leapeth alhore, and feeketh out the Viper friendship of in her den to join with her in copulation, as it is written by Ælian and Nicander. the Lampron CHAP

CHAP. XXXI.

Of the Draco marinus, or fea-Dragon.

He sca-Dragon, called by the French viva, for his vivacity (and by the English a Viver, or as some (ay, a Qua-viver) because being taken in fishing, and drawn out of the sea, the is said long to survive. Her pricks are possonous, but chiefly those that are at the edges of Which is the reason that Gooks cut off their heads before they serve them up to the table; her gills. and at Rosen the fiftermen lay them not upon their fialls to fell before they have cut off their head. The wounded part of such as are hurt, pains them much with inflammation, a feaver, swouning, Symptoms, gaugene and deadly mortification, unless it be quickly withstood. Not very long ago the wife of An history. Mountieur Fromages, Secretary of the requests, was wounded with a prick of this fish in her middle singer, there followed a swelling and reduces of the part; without much pain; but perceiving the smalless of the part; without much pain; but perceiving the finger, there followed a fwelling and rednefs of the part; without much pain; but perceiving the fwelling to increase, being made more wary by the mischance of her neighbour the wise of Mounssiene Eurgeloanse, Lieutenant particular in the Chastelet of Paris, who died not long before by the like accident being neglected, sent for me; I understanding the cause of her disease, laid to her pained finger and her whole hand, besides a pultis made of a great Onion rosted under the coals, leaven, and a little treacle. The next day I wished her to dip her whole hand into warm water, so to draw forth the poyson, then I divided the skin about it with much scarification but only superficiarily; to the galkes I applied Leeches, which by sucking drawing a sufficient quantity of blood, I put thereto treacle dissolved in aqua vita. The next day the swelling was assumed and the pain cased, and the was periectly well. Dissolved writes, that this sish divided in the midst, and applied to the wound, will cure it.

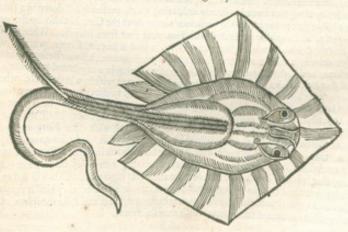

CHAP. XXXII.

Of the Pastinaca marina, or Sting-Ray, which some call the Fierce-claw.

Uch as are flung by a Sting-Ray (as Actius hath written) the place of the wound doth mani- The fympfelly appear; there enfues thereon lasting pain and the numnels of the whole body. And tom feeing that it hath a tharp and firm fling, whereby the nerves by the deepness of the ftroke may be wounded, it fo happpens that fome die forthwith, their whole bodies fuffering convultions.

Moreover, it will kill even the very trees into whose roots it is fastined. Yet Pliny affirms, that it is 21% 9. cap. 48. good against the pain of the teeth, if the gums be fearisted therewith, yea, and it being made into powder with white Hellebore, or of it self, will cause teeth to fall out without any pain, or any violence offered to them. This sish is good meat, the head and tail excepted; some of them have two strings, other-some but one; these strings are sharp like a faw with the teeth turning towards their lines. Obvious writes that their strings are sharp like a faw with the teeth turning towards their flings, other-tome but one; these strings are sharp like a saw with the teeth turning towards their heads. Oppianus writes, that their strings are more poysonous than the Persians arrows, for the force of the poyson remaineth, the nish being dead; which will kill not only living creatures, but plants of her string. also, Fishermen, when they eatch this fish, presently spoil him of his string, lest they should be hurt therewith. But if by chance they be hurt therewith, then take they forth his liver, and lay it to the wound; turthermore, the fish being burnt and made into powder, is the true Antidote of his wound. The Silver has lives in middly places near the flore, upon the fishes that he hunterth and catcheth The Sting-Ray lives in muddy places near the thore, upon the fishes that he hunteth and catcheth with his fting, having the teeth thereof turned towards his head for the fame purpose. He is not unlike a Ray, and I have here given you his figure.

The figure of a Sting-Ray.

THE OWNER OF THE OWNER, THE OWNER,

CHAP. XXXIII.

Of the Lepus Marinus, or Sea-hare.

The description of the Sexhare.

Pliny calls the Sea-hare, a mass or deformed piece of flesh. Galen faith it is like a Snail taken forth of the shell. It is exceedingly poylonous in the judgment of the Ancients, wherefore it is not amifs to fet down the description of it, lest we might eat it at unawares, too earneftly view it, or finell thereto, as also that we may use it against the poyson thereof; it is an inhabitant not only of the fear but also of lakes of sea-water, especially such as are muddy; it is of the fame colour as the hair of the land-hare is, it hath a whole in the head, out of which he putteth a certain piece of fielh, and plucks it back again when as he is feen, Paulus, Actius, Plusy, Galon and Nicander are of one opinion, and agree in this, that if a woman big with child do too carnefly look The earnest beholding of a upon one, the will vomit, and prefently after abort. They which have drunk this poyfon, faith Dissorder, are troubled with pain in the belly, and their urine is ftopped. If they do make water, then is it bloody, they run down with flinking fweat, which finells of fifth; a cholerick vomiting cause abortion. fometimes mixed with blood enfues thereon.

The fymp-

Sea-hare will

Actius writes, that all their bodies turn yellow, their faces fwell, and their feet, but chiefly their genital member, which is the cause they cannot make water freely. Galen writes that it is the pro-The Antidote, perty of the Sea-hare to exulcerate the lungs. Their Antidote is Affes-milk, muskadine, or honized wine continually drunken, or a decection of the roots and leaves of Mallows. It is good for the falling away of the hair. I have here given you the figure thereof out of Rondeletius his book of Fithes.

The figure of a Sca-bare.

CHAP. XXXIV. Of the Poyfon of Cats.

A Cars hair most subject to choak.

hurtful to the kings.

An history.

A wonderful antipathy between a man and a Cat.

The Antidoce against the brains of a Car. Cats dange-rous for children.

Ot only the brain of a Cat, being eaten, is poylonous and deadly to man, but also their hair, their breath, yea and their very prefence to fome prove deadly. For although any hair devoured unawares, may be enough to choak one, by flopping the influences of refpiration; yet the hairs of a Cat by a certain occult property, are judged most dangerous in this case;
besides also, their breath is infected with a certain hurtful malignity. For Matthielus faith, that he
knew some, who being so delighted with Cats, that they would never go to bed without them,
have by so often drawing in the air with their breath. following a consumption of the lungs. The breath of have by fo often drawing in the air with their breath, fallen into a confumption of the lungs, which occasioned their death. Moreover, it is manifest that the very sight of their eyes is hurtful, which appears by this, that some but seeing or hearing them, presently fall down in a swound; yet I would not judge that to happen by the malicious virulency of the Cat, but also by the peculiar nature of the party, and a quality generated with him, and sent from heaven. When as, faith Mathistan a certain Generalia with respect to the party. three of the party, and a quality generated with him, and fent from heaven. When as, faith Mathiolas, a certain German in winter-time, came with us into a flove to supper, whereas were divers of our acquaintance, a certain woman, knowing this mans nature, less that he should see her kitling which she kept, and so should go away in chase, she shut her up in a cup-board in the same chamber: But for all that he did not see her, neither heard her cry, yet within a little space, when he had drawn in the air, insected with the breath of the Cat, that quality of temperament, contrary, or cremy to Cats, being provoked, he began to sweat, to look pale, and to cry out (all of us admiring it.) Here lies a Cat in some corner or others, neither could be be quiet till the Cat was taken away. But such as have eaten the brains of a Cat, are taken with often Vertiges, and now and But fuch as have eaten the brains of a Cat, are taken with often Vertigoes, and now and then become foolish and mad: they are helped by procuring vomit, and taking the Antidote against then become foolish and mad: they are helped by procuring vomit, and taking the Antidote against this poylon, that is, half a feruple of Musk, dislowed and drunk in wine. There be forme who preferibe the confection Diamsfam to be taken every morning four hours before meat. By this you may gather, that it is not so fabulous that the common fort report, that Cats will kill or harm children; for lying to their mouths with the weight of their whole bodies, they hinder the passage forth of the suliginous vapors, and the motion of the cheft, and infect and stifle the spirits of tender infants by the pessiferous air and exhalation which they ford forth fants by the peftiferous air aad exhalation which they fend forth.

CHAP. XXXV.

Of certain Peyfonous Plants.

Aving described the poylons that come from living creatures, I come to speak of such as are from Plants, beginning with the Sardonian herb, which is also also called Apunn rifus: this Apinn visus is a kind of Rannaculus, or Crow-foot: (and, as it is thought, the round leaved water Crow-foot, called Marth-Crow-foot, or Spear-wort) it taketh away the understanding of such as have eaten thereof, and by a certain diffention of the nerves, contracts the cheek, fo that it makes have eaten thereof, and by a certain uncertaint or the that proverbial speech of the Sardonian language, them look as if they laughed; from this affect came that proverbial speech of the Sardonian language.

His Antidote

The juice, fruit, and fubiliance of Napelius taken inwardly, killeth a man the fame day, or at the Napelius, or farthest in three days: yea and such as escape the deadly force thereof by the speedy and convenient Monks-hood use of Antidotes, fall into an hectick seaver, or consumption, and become subject to the fallingfickness, as Avien affirmeth. And hence it is, that barbarous People poyson their arrows therewith: For the lips are forthwith inflamed, and the tongue so swells, that by reason thereof, it cannot be contained in the mouth, but hangs out with great horror; their eys are inflamed, and fland forth of their head, and they are troubled with a Vertigo and fwounding; they become fo weak that they cannot flir their legs, they are fwoln and puffed in their bodies, the violence of poyfon is fo great. The Antidote thereof is a certain little creature like a * Moufe, which is bred, and lives * Our Author on the root of Napellor, being dried and drunk in powder, to the weight of two drams. In want deceived by hereof you may use the feed of Raddish or Turnips to drink, and anoint the body also with oil of the drablane, who six may

the Greek word page and inflead thereof read page for a Flie, a Moufe: for there is no Moufe to be found, but whole iventus of Flies, which feed thereon, you may find the description of an Antidote made with them in Labels Stirp, advers, Fag. 303.

Dericinum and Solanum Manicum, or deadly Night-shade, are not much different in their mortal Devicinum and fymptoms or effects. Darieman being drunk, refembleth milk in tafte, it canfeth continual hicket- Salanum Maniting, it troubleth the tongue with the weight of the humor, it caufeth blood to be cast forth of the Night-shade. mouth, and certain mucous matter out of the belly, like that which cometh away in the bloudy flux. A remedy hereto are all shell-fishes, as well crude as rosted, also Sea-Lobsters and Crabs, as the broth or liquor wherein they are boyled, being drunk. Now the root of Solanum Manicum drunk in the The symp-weight of one drain in wine, causeth vain and not unpleasing imaginations, but double this quantity causes a distraction or alienation of the mind for three days, but four times so much kills. The remedies are the fame as these prescribed against Doricinum.

Hen-bane drunken, or otherwife taken inwarly by the mouth, caufeth an alienation of the mind Hen-bane. of like drunkenness; this also is accompanied with an agitation of the body, and exsolution of the spirits like swounding. But amongst others, this is a notable symptom, that the patients so dote, that they think themselves to be whipped: whence their voice becomes so various, that sometimes they bray like an Ass or Mule, neigh like an Horse, as Avien writes. The Antidote is Pistick The Antidote, nuts eaten in great plenty, treacle also and mithridate dissolved in fack, also wormwood, rne and

Of mushroms, force are deadly and hortful of their own kind and nature, as those, which broken Mushroms. prefently become of divers colous, and putrefie : (fuch, as Avicen faith, those are which be found of a grayith or blewish colour) others though not huntful in quality, yet eaten in greater measure than is fitting, become deadly; for seeing by nature they are very cold and moitt, and consequently abound with no finall viscosity, as the excrementitious phlegm of the earth or trees whereon they grow, they suffocate and extinguish the heat of the body, as overcome by their quantity, and strangle as if one were hanged, and lastly kill. Verily I cannot chuse, but pitty Gourmondizers, who though they know that Mulhroms are the feminary and gate of death, yet do they with a great deal of do, most greedily devour them; I say, pittying them, I will shew them, and teach them the art, how they may feed upon this so much defired dish, without the endangering of their health. Know therefore that Mushroms may be eaten without danger, if that they be first boyled with wild pears: Their Antibut if you have no wild pears, you may supply that defect with others which are the most harle, either newly gathered, or dried in the Sun. The leaves, as also the bark of the fame tree, are good, sfreedills of the wild; for pears are, their Antibutes, as also the bark of the sun or the sun of the sun o especially of the wild; for pears are their Antidote; yet Conciliator gives another, to wit, garlick eaten crude; whereunto in like fort vinegar may be fitly added, so to cut and attenuate the tough, viscous and gross humors, heaped up, and in danger to strangle one by the too plentiful eating of Mushroms, as it is delivered by Galen.

Ephemeraus, which forme call Colebiasm or Bulbus filvestris, that is, medow saffron, being taken colebiasm, or inwardly, causeth an itching over all the body, no otherwise than those that are nettled, or rubbed Medow-saffwith the juice of a Squill. Inwardly they seel gnawings, their stomach is troubled with a great from. heaviness, and in the disease increasing, there are strakes of blood mixed with the excrements. The Antidote thereof is womans milk, Asses or Cows-milk drunken warm, and in a large quantity.

Mandrag taken in great quantity, either the root or fruit caufeth great fleepiness, sadness, reso-Mandrag. lution and languishing of the body, fo that after many feritches and gripings, the patient falls affeep in the fame posture that he was in, just as if he was in a Lethargy. Wherefore in times pass they gave Mandrag to such as were to be distremented. The apples, when as they are ripe, and their feeds taken forth, may be fafely eaten, for being green and with their feeds in them, they are deadly. For their arifeth an intolerable hear, which burns the whole furface of the body, the tongue and though wax dry, by reason whereof they gape continually, so take in the cold air; and in which Ttz

In 5. Epidemi

case unless they be presently helped, they die with convulsions. But they may easily be helped, if they shall prefently drink such things as are convenient therefore. Amongst which, in Conciliators opinion, excel raddiffseeds eaten with falt and bread for the space of three days. Sneeling shall be procured, if the former remedy do not quickly refresh them, and a decoction of Coriander or Penny-royal in fair water shall be given them to drink warm.

tititititities.

The ungrateful tafte of the juice of black poppy, which is termed *Opinon*, as also of Mandrag, ea-why not used filly hinders them from being put into meat or drink, but that they may be discerned, and chiefly in poysonings. for that neither of them can kill, unless they be taken in a good quantity. But because there is dan-ger, less they be given in greater quantity than is fitting by the ignorance of Physicians, or Apothecaries, you may by these tigns find the error.

There enfues heavy fleep, with a vehement itching, fo that the patient oft-times is forced there-by to cast off his dull sleep wherein he lay, yet he keeps his eye-lids shut being unable to open them. By this agitation there flows out fweat, which finells of opinm, the body waxeth pale, the lips burn, the jawbone is relaxed, they breath little and feldom. When as their eyes wax livid, unless they be drawn afide, and that they are depressed from their orb, we must know that death is at hand. The remedy against this is two drams of the powder of Castoreum given in wine.

Hemlock drunken, caufeth Verigees, troubleth the mind, so that the patients may be taken for mad men; it darkneth the fight, caufeth hickerting, and benums the extreme parts, and laftly firangles with convultions, by suppreffing or stopping the breath of the Artery. Whereof at the first, as in other poylons, you must endeavour to expel it by vomit; then inject clysters, to expel that which is got The Antidote. things the Bezoar or Antidote thereof, to be a potion of two drams of Treacle, with a decection of Dictaments or Gentian in wine. He which further defires to inform himfelf of the effects of Hemlock,

In lib. 6. Diofe. let him read Marthiolus his commentary upon Diofeorides, where he treats of the fame fubject. Acontion called of Acons a town of the Periendines, whereas it plentifully grows. According to Matthiolus, it kills Wolves, Foxes, Dogs, Cats, Swine, Panthers, Leopards, and all wild beatls, mixed with flesh, and so devoured by them, but it kills mice by only smelling thereto. Scorpions, if touch ed by the root of Aconite, grow numb and torpid, and fo die thereof; arrows or darts dipped therein, make incurable wounds. Those who have drunk Aconite, their tongue forthwith waxeth fweet with a certain aftriction, which within a while turneth to bitterness; it causeth a Vertigo, and shedding of tears, and a heaviness or firaitness of the chest and parts about the heart; it makes them break wind downwards, and makes all the body to tremble. Pliny attributes fo great celerity and violence to this poylon, that if the genitals of female creatures be touched therewith, it will kill the fame day; there is no prefenter remedy than speedy vomiting after the poyson is taken. But Gan-eiliator thinks Aristolochia to be the Antidote thereof. Yet some have made it useful for man by experimenting it against the stinging of Scorpions, being given warm in wine; for it is of such a na-ture that it killeth the party unless it find something in him to kill, for then it strives therewith as if it had found an adverfary: But this fight is only when as it finds poyfon in the body; and this is marvelous that both the poyfons being of their own nature deadly, should die together, that man may by that means live. There are divers forts thereof, one whereof hath a flower like an helmet, as if it were armed to mans defruction; but the other here defineated hath leaves like to fows-bread

> and Walnut tree may witness; Cattel if they feed on the leaves of Yew, are killed therewith. * But men, if they fleep under it, or fit under the fhadow thereof are hurt therewith, and oft-times die thereof. But if they eat it, they are taken with a bloudy flux, and a coldness over all their bodies, and a kind of firangling or floppage of their breath. All which things the Yew canfeth, not fo much by an elementary and cold quality, as by a certain occult malignity, whereby it corrupteth the humors and thaveth the guts. The fame things are good against this, as we have fet

down against Hemlock; Nicander affirms, that good wine being drunken, is a remedy thereto. There is also a malignity in a Walnut-tree, which Grevinus affirms that he found by experience, whilst he unawares fate under one, and slept there in the midft of Summer; For waking, he had a fense of cold over all his body, a heaviness of his head, and pain that lafted fix days.

medies are the same as against the Yew.

or a cucumber, and a root like the tail of a Scorpion. The figure of a certain kind of Aconite. Trees also are not without poylon, as the Yew

CHAP. XXXVI.

Of Bezoar, and Bezoartick medicines.

Or that we have made mention of Bezoar, in treating of the remedies of poylons, I judge I what poylon shall not do amis, if I shall explain, what the word means, and the reason thereof. Poylon is absolutely taken is that which kills by a certain specifick antipathy contrary to our nature. So an Antidote or Counter-poyfon is by the Arabians in their mother tongue, termed Bedezabar, as the prefervers of life. This word is unknown to the Greeks and Latines, and in use only with the Arabians and Perfians, because the thing it self first came from them as it is plainly showed by Garclas ab horto, Physician to the Vice-roy of the Indies, in his history of the Spices and Simples of the East-Indies. In Persia (faith he) and a certain part of India is a certain kind of Goat called Pazain (wherefore in proper speaking, the stone should be termed Pazar of the word Pazain, that signifies a Goat, but we corruptly term it Bezar or Bezar) the colour of this beaft is commonly reddiff, the height thereof indifferent, in whose stomach concretes the stone called Bezar; it grows by little and little about a firaw or fome fuch like fubftance in feales like to the feales of an onion, fo that when as the first scale is taken off, the next appears more smooth and shining as you still take them away, the which amongst others, is the fign of good Bezon and not adulterate. This stone is found in sun- A fign of true dry shapes, but commonly it resembles an Acom or Date-stone; it is sometimes of a sanguin colour, Bezoar. and otherwhiles of a hony-like or yellowish colour, but most frequently of a blackish or dark green, refembling the colour of mad apples, or else of a Civet-Cat. This stone hath no heart or kernel in the midit, but powder in the cavity thereof, which is also of the same faculty. Now this stone is light and not very hard, but so that it may easily be scraped or rasped like Alablaster, so that it will diffolve, being long macerated in water; at first it was common amongst us, and of no very great price, because our people who trafficked in Persia, bought it at an easie rate. But after that the fa- The use of Beculties thereof were found out, it began to be more rare and dear, and it was prohibited by an Edict zoar. from the King of the Country, that no body should fell a Goat to the stranger-Merchants, unless he first killed him and took forth the stone, and brought it to the King. Of the notes by which the flone is tried, (for there are many counterfeits brought hither) the first is already declared; the other is, it may be blown up by the breath, like an Oxes hide; for if the wind break through, and do not flay in the dentity thereof, it is accounted counterfeit. They use it induced thereto by our example, not only against poyfons, but also against the bites of venemous beasts. The richer fort of the Countrey purge twice a year, to wit, in March and September 3 and then, five days together they take the powder of this stone macerated in Rose-water, the weight of ten grains at a time : for by this remedy they think their youth is preferved, as also the strength of their members. There be some who take the weight of thirty Grains ; yet the more wary exceed not twelve grains. The same Author addeth that he useth it with very good success in inveterate melancholick difeafes, as the itch, feab, tetters and leprofie; therefore by the fame reason it may well be given against a quartane seaver. Besides he affirmeth for certain that the powder contained in the given against a quartane seaver. Besides he anisthest for certain that the powder contained in the midst of the stone, put upon the bites of venemous beafts, presently freeth the patient from the danger of the poylon, as also applied to the pestilent Carbuncles, when they are opened, it draws forth the venom. But because the small pox and meazles are familiar in the Indies, and oft-times dangerous, it is there given with good success, two grains each day in Rose-water. Matthialar subscribeth to this opinion of Garcis, witnessing that he hath found it by frequent experience cap. 73. that this stone by much exceeds not onely other simple medicines of this kind, but also such as are termed theriscalia, and what other Antidotes foever, hereto also consents Abdanalaraeb; We (faith he) have seen the stone which they call Bezabar, with the sons of Almarima the observer of the Law of the God; with which stone he bought a stately and almost princely house at

Some years ago, a certain Gentleman who had one of these stones which he brought out of An history. Spain, bragged before King Charles then being at Clermont in Avern, of the most certain efficacy of this flone against all manner of poysons. Then the King asked of me; whether there were any Antidote which was equally and in like manner prevalent against all poysons? I anfwered, that nature could not admit it s for neither have all poylons the like effects, neither do they No one thing arife from one cause; for some work from an occult and specifick property of their whole nature, can be an Anothers from some elementary quality which is predominant. Wherefore each must be withstood all poytons,
with its proper and contrary. Antidote; as to the bot, that which is cold, and to that which affails
by an occult propriety of form, another which by the same force may oppugn it, and that it was
an easie matter to make trial hereof on such as were condemned to be hanged. The motion pleafed the King, there was a Cook brought by the Jaylor who was to have been hanged withpleated the King, there was a cook or dithes out of his mafters house. Yet the King defired in a while after for ficaling two filver dithes out of his mafters house. Yet the King defired first to know of him, whether he would take the poyson on this condition, that if the Antidote which was predicated to have fingular power against all manner of poysons, which should be presently given himaster the Poyson, should free him from death, that then he should have his life faved. The Cook answered chearfully, that he was willing to undergo the hazard, yea, and greater matters, not only to fave his life, but to thun the infamy of the death he was like to be adjudged to: Therefore he then had poylon given him by the Apothecary that then waited, and prefently after the poylon, forme of the Bedezahar brought from Spain, which being tahen down, within a while after he began to vomit, and to avoid much by flool with grievous torments, and to cry out that his inward parts were burnt with fire. Wherefore being thirfly, and defiring water, they gave it him; an hour after, with the good leave of the Jaylor, I was admitted to him; I find him on the

(dillining)

The conflick force of fablimatt.

ground going like a beaft upon hands and feet, with his tongue thrust forth of his mouth, his eyes hery, vomiting, with flore of cold fweats, and laftly, the blood flowing forth by his ears, nofe, mouth, fundament and yard. I gave him eight ounces of oil to drink, but it did him no good, for it came too late. Wherefore at length he died in great torment and exclamation, the feventh hour from the time that he took the poyfon being scarcely passed. I opened his body in the presence of the Jaylor and sour others, and I sound the bottom of his stomach black and dry, as if it had been burnt with a cautery; whereby I understood he had fublimate given him; whose force the Spanish Bedezahar could not reprefs, wherefore the King commanded to burn it.

C H A P. XXXVII. Of Mineral Poyfons.

Inerals or metals are either to taken forth of the bowels of the earth, or elfe from fornaces. Of these many are poysonous, as arsenick, sublimate, plaster, ceruss, litharge, verdegreafe, orpiment, filings of Iron, brafs, the load-flone, lime and the like. Such as have taken sieblimate, the tongue and jaws become straitned and rough, as if they had drunk the juice of unripe fervices: you cannot amend this afperity with lenitive gargarifms but with labour and time; for as foon as it defcends into the flomach, it flicketh to it. Therefore prefently after it frets and exulcerates; it causeth unquenchable thirst, and unexplicable torments; the tongue is swoln, the heart faints, the urine is supprest, the cheft can scarce perform the office of breathing, the belly is griped, and fo great pains happen to other extreme parts, that unless they be helped, patient will die ; for prefently will grow upon them, unless it be speedily hindred, the devouring and nery fury of the poylon, renting or eating into the guts and ftomach, as if they were feared with an hot iron, and blood floweth out of the ears, nofe, mouth, urinary paffage and fundament, and then their case is desperate. These and who else soever shall take any corroding poyson, shall be cured with the fame remedies, as those that have taken Cantharides.

Verdegrease so stops the instruments of respiration that it strangles such as have taken it. The cure is performed by the same remedies as help those that have taken Arsenick.

Litharge caufeth a heaviness in the stomach, suppresseth urine, makes the body swelled and livid. We remedy this, by giving a vomit prefently, then after it pigeons-dung mixed in firong wine and fo drunken. Peter Aponensis witheth, to give oil of sweet almonds and tigs. Also it is good to give relaxing and homecting clyfters, and to anoint the belly with fresh butter or oil of lillies

The scales of Brass drunk, by troubling the stomach, cause a casting and scouring. The remedy is, if the patient forthwith vomit, if he enter into a bath made of the decoction of Snails, if he anoint his belly and breaft with butter or oil of lillies, and inject laxative and humecting clyfters.

The loadftone makes them mad that take it inwardly. The Antidote thereof is the powder of

gold, and an emerald drunk in firong wine, and clyfters of milk and oil of fweet almonds. The filings of Lead, and the scales or refuse of Iron, cause great torment to such as take them The which we help with much milk and fresh butter dissolved therein, or with oil of sweet almonds drawn without fire, with relaxing and humecting clyfters used until the pain be perfectly affwaged.

Rifagallum, Role-aker or Rats-bane, because it is of a most hot and dry nature, induces thirst and aker or Rass- heat over all the body, and so great colliquation of all the humors, that although the patients by medicines speedily given escape death, yet can they not during the residue of their lives, use their members as they formerly did, being deftitute of their strength, by reason of the great driness and contraction of the joints. The Antdiote thereof is oil of Pine-kernels speedily given, and that to the quantity of half a pint; then procure vomit, then give much milk to drink, and clyfters of the fame, and let them sup up fat broths.

Unquencht Lime and Auripigmentum, or Orpiment drunk, gnaw the flomach and guts with great tormenting pain, and cause unquenchable thirst, an asperity of the jaws and throat, difficulty of breathing, stopping of the urine, and a bloody flux, They may be helped by oil, fat, humeching, and relaxing things which retund the acrimony by lenitive potions, and fuch as lubricate the belly; as also by creams, and the mucilages of some seeds, as with a decoction of the seeds of Line, mallows, marsh-mallows and other things set down at large in the cure of Cantharides.

Those exceeding acrid and strong waters wherewith Goldsmiths and Chymists separate Gold from filver, being taken into the body, are hard to cure, because they are forthwith diffused over all the body, first burning the throat and stomach. Yet it may be helped by the means prescribed against unquenched Lime and Orpiment.

Cerufs caufeth hicketting and a cough, makes the tongue dry, and the extreme parts of the body numb with cold, the eyes heavy to fleep. The patients very often in the midft of the day fee fome vain phantalie or apparition, which indeed is nothing; they make a black and oftentimes bloody water. water, they die frangled unless they be helped. The Antidote in the opinion of Actions and Avicen, is Scanmony drunk in new wine, or hony and wine, and other diaretick things, and fuch things as

procure vomit, and purge by ftool. Plater, because it concreteth and becometh front in the fromach, causeth frangulation, by firairning and stopping the infiruments that ferve for breathing. The patients receive cure by the fame remedies as those who have eaten mashroom, or drunk Cerus: you must add Geole-greafe in Clytiers, and anoint the belly with oil of lillies and butter-

CHAP. XXXVIII.

Of Quick Silver.

Uick-filver is so called because it resembleth filver in the colour, and is in perpetual motion, The restor Uick-filver is so called because it resemble that the colour, and is in perpetual motion, The reason as if it had a spirit or living soul, there is a great controversic amongst authors concerning why it is so it, for most of them affirm it hot, among whom is Galen, Halyaba, Rhafir, Aritotle, called. Complantine, Ifase, Platearens, Niebolas Massa: they maintain their opinion by an argument drawn prassic. Lib.4, septia 2, from things helping and hurting; besides from this, that it is of such subtle parts, that it penes 2, ad also 2, 4, trates, dissolves and performeth all the actions of heat upon dense and hard metals, to wit, it atte. Matter. nuateth, incideth, drieth, caufeth falivation by the mouth, purgeth by the flool, moverh urine and fweat over all the body; neither doth it für up the thinner humors only, but in like fort the grosstough and viscous, as those which have the Lucs wateres find by experience, using it either in

ointments or Plasters.

Others affirm it very cold and moift, for that put into emplafters and fo applied, it affwageth pain by fupefaction, hindering the acrimony of pufiles and cholerick inflammations. But by its humidity it formeth feirthous tumors, diffolveth and diffipateth knots and taphoas knobs, belides, it caufeth the breath of fuch as are anointed therewith to flink, by no other reason, than that it putrefies the obvious humor by its great humidity. Avien's experiment confirms this opinion, who affirmeth, that the blood of an Ape that drunk Quick-filver, was found concrete about the heart, the careafs being opened. Matthiolus moved by these reasons, writes that Quick-filver killeth men 18.16.Dissect by the excessive cold and humid quality, if taken in a large quantity, because it congeals the blood and vital fpirits, and at length the very fubflance of the heart, as may be underflood by the hiftery of a certain Apothecary, fet down by Concilistor; who, for to quench his feaverish heat, in flead of wa- An History. ter, drunk a glass of Quick-filver, (for that first came to his hands ;) he died within a few hours after, but full he evacuated a good quantity of the Quick-filver by flool, the relidue was found in his flemach being opened, and that to the weight of one pound; belides, the blood was found concrete about his heart. Others use another argument to prove it cold, and that is drawn from the composition thereof, because it consilis of Lead and other cold metals. But this argument is very weak. For unquencht Lime is made of flints and flony matter, which is cold, yet neverthelefs it exceeds in hear. Paracelfits affirmeth, that Quick-filver is hot in the interior fubstance, but cold in Lib. 4. de nat the exterior, that is, cold as it comes forth of the Mine. But that coldness to be lost as it is prepared rown, by art, and heat only to appear and be left therein, fo that it may serve instead of a tincture in the transmutation of metals. And verily it is taken for a Rule amongst Chymists, that all metals are outwardly cold, by reason of the watery substance that is predominant in them, but that inwardly they are very hot, which then appears when as the coldness together with the moisture is segregated for by ealcination they become cautick. Moreover many account quick-filver poisson, yet experience denies it. For Marianus Santius Baralitanus tells that he faw a woman, who for certain causes Trast. de case and effects, would at feveral times drink one pound and a half of quick-filver, which came from her e offer.

again by flool without any harm. Moreover he affirmeth that he hath known fundry who in a deferrate Colick (which they commonly call miserere mei) have been freed from imminent death, by drinking three pounds of quick-filver with water only: For by the weight it opens and unfolds the twined or bound up gut, and thrusts forth the hard and stopping excrements: he added that that other have found this medicine effectual against the colick, drunk in the quantity of three ounces. Autonines Muss writes, that he usually giveth Quick-filver to children ready to die of the worms. Avien confirmeth this, averring that many have drunk Quick-filver without any harm, wherefore he mixeth it in his ointments against scales and scales in little children; whence came that common medicine amongst country people to kill lice by anointing the head with Quick-filver mixed with butter or sixuogia, Matthiolus affirmeth that many think it the last and chiefest remedy to give to women Quick silver in travel that cannot be delivered. I protest to fatisfie my felf concerning this matter, I gave to a whelp good for wo-pound of Quick-filver, which being drunk down, it voided without any harm by the belly. Where men in travel, by you may understand that it is wholly without any venemous quality. Verily it is the only and true Antidote of the Luce veneres, and also a very nt medicine for all malign ulcers, as that which more powerfidly impugns their malignity than any other medicines that work only by their first qualities. Befides, against that contumacious scab, which is vulgarly called Maluna fandis manis, there For the disease there is not any more speedy or certain remedy. Moreover Guido writes, that if a plate of lead be called Malaa befineared or rubbed therewith, and then for some space laid upon an ulcer, and conveniently fast. Jastis manifold, that it will soften the callous hardness of the lips thereof, and bring it to cicatrization, which thing

I my felf have often found true by experience. ny selt have often founds, Galen much commended Quick-filver against malign ulcers and cancers: Lib de comp Certainly before Guido, Gales much commence which many affirm poyfonous, because it confists med ferrad lacs. Neither doth Gales affirm that lead is poyfonous (which many affirm poyfonous, because it confists med ferrad lacs of much Quick-filver) but he only faith thus much, that water too long kept in leaden pipes and ci. Against many affirm that lead is poyfonous (which also leaders) but he only faith thus much, that water too long kept in leaden pipes and ci. Against many affirm that lead is poyfonous (which many affirm poyfonous, because it confists med ferrad lacs). flerns by reason of the droffiness that it useth to gather in lead, causeth bloody fluxes, which also is familiar to brass and copper. Otherwise many could not without danger bear in their bodies leaden bullets during the space of so many years, as usually they do. It is reported. It is declared by Theeducet Herey in the following histories, how powerful Quick-filver is to refolve and affwage pain and inflammations. Not long fince, (faith he) a certain Doctor of Physick his boy was troubled with Against the Parotides, with great swelling, heat, pain and beating; to him by the common confent of the Phy-Parotides, ficians there prefent, I applied an Analyse medicine, whole force was fo great, that the tumor manifetily subsided at the hrit dreiling, and the pain was much affwaged. At the second dreiling all the symptoms were more mitigated. At the third dressing, I wondring, at the so great effect of

(minimizer

Against lice

thereof.

an Anodyne Cataplaim, observed that there was Quick-filver mixed therewith, and this happened through the negligence of the Apothecary, who mixed the simple Anodyne medicine prescribed by us, in a mortar wherein but a while before he had mixed an ointment whereinto Quick-filver had entred, whose reliques, and some part thereof yet remained therein. This which once by chance succeeded well, I atterwards wittingly and willingly used to a certain Gentlewoman troubled with the like difeafe, poffetfing all the region behind the cars, much of the throat, and a great part of the cheek, when as nature helped by common remedies, could not evacuate neither by refolution nor fuppuration, the contained matter greatly vexing her with pain and pullation; I to the medicine formerly used, by the consent of the Physicians, put some Quick-silver, so within a few days, the tumor was digested and resolved. But some will say it resolves the strength of the nerves and limbs, as you may see by such as have been anointed therewith for the Larg venera, who tremble in all their limbs during the rest of their lives. This is true, if any use it too intemperately without meafure, and a difease that may require so great a remedy; for thus we see the Gilders, Plumbers, and fuch as dig in mines, by the continual afcent of the vapors of Quick filver to the brain, the fountain of the nerves, by refolving the fpirits, and diffipating the radical and fubftantifick moifture, maketh them fubject to the trembling of their joints. Verily, if it be killed and incorporate with hogsgreafe, and a lift befmeared therewith, which may encompass the body like a girdle, it will drive away lice, fleas and cinuices; and anointed about the navel, it kills the worms in the guts. and flies, &c. are two forts of Quick-filver, the one natural, the other artificial. The natural is found running or flowing in the veins and bowels of the earth, and amongst metals, and in the fornaces of filver-mines. The Artificial is made of minium (as it is in Vitrarvius) and of the powder of Ivory. Also it is probable that by art it may be extracted out of all metals, but chiefly out of Lead and Cinnabaris. You may eafily diffinguish these kinds by the dull and blackish colour, tough and gross substance, which as it runs, leaves an impression like melted grease, being as it were the excrement of lead.

How to purishe

The best Quick-silver of all is pure, clear, thin, and very white: it may be cleansed with the dross

of lead, and becomes more then being boiled in sharp vinegar, with sage, resonary, tyme, lavender,

Or essentially it by a pound at a time to a whelp to drink down, and being cast forth by it, boil it again in sinegar, for thus it hath wondrous faculties, and fitly given produceth marvelous effects; nothing is more contrary thereto than fire. For Quick-filver though of its own nature ponderous, flieth upwards by the force of the fire, and forfaketh gold by that means, than which nothing is more friendly to it.

> CHAP. XXXIX. Of the Unicarns Horn.

Here are very many at this day who think themselves excellently well armed against poyson and all contagion, if they be provided with fome powder of Unicorns-horn, or fome infusion made therewith. Therefore I have though it good to examine more diligently how much truth this inverterate, and grounded opinion hath. The better to perform this task, I will propound three heads, whereto I will direct my whole difcourfe. The first shall be of the signification of this word Unicorn. The second, whether there be any such thing really and truly so called, whether the second wheth or whether it be not rather imaginary; like as the Chimera and Tragelaphus? The third, whether that which is faid to be the horn of fuch a beaft, hath any force or faculty against poyfons? For the first, that is, the name, it is fomewhat more obscure what the word (being Lieum) in French may fignifie, than what the Latin or Greek word is. For the French name is further from the word and name imports. fignification; but it is so clear and manifest, that this word Unicornis amongst the Latines fignifieth a beaft having but one horn, as it is vulgarly known; the fame thing is meant by the Greek word Monoceror. But now for the fecond, I think that beaft that is vulgarly called and taken for an Unicorn, is rather a thing imaginary than really in the world. I am chiefly induced to believe thus, by these conjectures. Because of those who have travelled over the world, there is not one that professional than the same and th feth that ever he did fee that creature. Certainly the Romans conquered the world, and being most diligent fearchers after all things which were rare and so excellent, if any where in any corner of the world this beaft could have been found, they would have found it out, and engraven it upon their coins, or arms, as they did Crocodiles, Elephants, Eagles, Panthers, Lions, Tigers, and other creatures unknown to these countries. For these that have written of the Unicorn, either that they have heard, or that hath been delivered by tradition, or what they in their minds and funcies have conceived, you shall scarce find two that agree together, either in the description of the body, or in Lib. 8. cap. 21. the nature and condition of her. Pliny writes, that Unicoms are for the fashion of their bodies like to an horse; that is, as Cardane interprets it, of the bigness of an Horse, with the head of an Hart, the feet of an Elephant, the tail of a Boar, with one black horn in the midft of his forchead, of the length of two cubits. Muniter, who (as Matthislus jells) never faw Unicorns belides painted ones, doth on the contrary affirm them not to be of the bigness of an Horse, but of an Hind-call of three months old, not with seet like an Elephant, but cleft like those of Goars, with an horn not only of two, but oft-times of three cubits long, of a Weazle-colour, with a neck not very long, nor very hairy, but having few and thort hairs hanging to the one fide of the neck, the legs are lean and fimall, the buttocks high, but very hairy. Cardane differning from both these, writes that he hath Tom. 1. lib. 5. an horn in the middi of his forehead, but that it is only of the length of three hogers. Andrew Theoret Cap 5. capage. mentions an Unicom feen by a certain Turkish Sanjach, which was of the bigness of a Bull, of five or fix months old, and had one hom, but that not in the midst of his forehead, but upon the top of the crown of the head; he was legged and footed like an Afs, but longer haired, and had ears not much unlike the Rangifer, a beast not unknown in the fubpolar or Northern countries. Thus

What the

That there is no fuch beaft as an maicera.

Munfters opiing senicerus.

Thus various therefore is the report concerning the shape of this Beast. Neither is there less difference concerning her nature and conditions. For Pliny writes, that the Unicom is a most fierce beath, and hath a great bell owing voice, and that the cannot therefore be taken alive. Cardane renders a reason of this fierceness, Because (saith he) it inhabits the deserts of Ethiopia, a region squalid, and filthy, abounding with Toads, and fuch like veremous creatures. Others on the contrary affirm her to be of a most mild, amiable, and gentle nature of all others, unless one purposely offend her or tife her too harfhly, for feeing the feeds not by flooping her head to the ground, because the is hindred therefrom by the length of her horn, the must necessarily feed upon the fruit that hangeth upon trees; out of cratches or mans hand the fearlessly and harmselly takes all manner of fruits, herbs, theaves of corn, apples, pears, oranges and pulse. And herein they have proceeded so far, that they seign they will love Virgins, entifed by their beauty, so that stayed in the contemplation of them, and allured by their enticements, they by this means are often taken by hunters. In this opinion is Partomani opi-Lues Varteman, who denies that Unicoms are wild or fierce; for he faith, that he faw two, which nion of the were fent out of Athiopia to the Sultan, who kept them that up in Penns, in Mecha, a city of Arabia ture of the &-Felix, renowned by the Sepulcher of Mahomes. Theres travelling thither, tells that he diligently steers. inquired of the inhabitants, what their opinion was of fuch a beaft, yet could be never hear any ti-Whence it is easie to discern, that such beasts have neither been in our, nor in Vardings thereof. tomans times. The fo great variety of differiting opinions, eafily, induceth me to believe that this word, Unicorn, is not the proper name of any beaft in the world, and that it is a thing only feigned by Painters, and Writters of natural things, to delight the readers and beholders. For as there is but one right way, but many by-ways, and windings, to the fpeech of truth is but one, and that always fimple and like it felf; but that of a lie is diverte, and which may eafily refel it felf, by the repugnancy and incongruity of opinions, if one fhould fay nothing. What therefore (will fome fay of what creatures) are these horns, which we see wholly different from others, if they be not of United the Congruines of the congruines of the congruines of the congruines. corns? Theres thinks them nothing elfe than Elephants bones turned and made into the fashion that What the orwe fee them for thus in the Eastern Countries, forme crafty merchants and cunning companions turn, dinary uni hollow, and being fortned, draw to what length these please the teeth of the nsh Robard, which conshorm are lives in the Red and Æthiopian Sea, and being so handled, they sell them for Unicorns horn. Verily that which is termed Unicorns horn, being burnt, sends forth a finell like to Ivory... Now Cardanus affirms that the teeth and bones of Elephants made foft by art, may be drawn forth, and brought into what form you please like as Ox-bones are. For what is these in the world which the thirling defire of gold will not make men to adulterate and counterfeit a But it is time that we come to the third fcope. Grant there be Unicoms; must it therefore follow that their horns must be of The unicoms fuch efficacy against poylons? If we judg by events, and the experience of things, I can protest thus horn is not efficacy against poylons. In such efficacy against poylons, in such as I have had in cure. If the matter must be tried by witnesses and an poylon, of against poyfons, in fuch as I have had in cure. If the matter must be tried by witnesses and authorities, a great part of the Phylicians of better note have long fince bid it adieu, and have detractedfrom the divine and admirable vertues for which it formerly was fo much detired. And this they have done, moved thereto by many just, but two especial reasons. The first is of Rondeletius, who Lib. de parder, in this case affirms that horns are endued with no taste nor finell; and therefore have no effect in cap. 19. Physick, unless it be to dry: neither (faith he) am I ignorant that such as have them, much predicate their worth, so to make the greater benefit and gain by them, as of the shavings or ferapings of Unicoms horn, which they fell for the weight in gold, as that which is fingular good against poyfons and worms, which things, I think, Harts-horn and Ivory do no lefs effectually perform; which is the cause why, for the same disease, and with the like success, I prescribe Ivory to such as are poor, and Unicorns horn to the rich, as that they so much defire. This is the opinion of Rosdeletius, who, without any difference, was wont, for Unicorns horn, to preferibe not only Hartshorn or Ivory, but also the bones of Horses and Dogs, and the stones of Myrobalanes, Another reafon is, that whatfoever refilis poyfon is cordial, that is, fit to firengthen the heart, which is chiefly affailed by poyfors; but nothing is convenient to firengthen the heart, unless it be by laudable blood or spirit, which two are only familiar to the heart, as being the work-house of the arterious blood and vital spirits: For all things are preserved by their like, as they are destroyed by their contraries, for all things that generate, generate things like themselves. But Unicoms horn, as it contains no finell, fo neither hath it any acry parts, but is wholly earthy and dry; neither can it be converted into blood by the digeflive faculty, for as it is without juice, fo is it without fielh: For as it cannot be turned into Chylas, so neither is it fit to become Chymas, that is, juice or blood. Therefore it is joyned to the heart by no fimilitude, nor familiarity. Furthermore there is not a word in Hippocastes and Galon concerning the Unicoms horn, who notwithstanding have in fo many places, commended Harts-horn. Therefore D. Chapelain, the chief Physician of King Charles the ninth often used to say, that he would very willingly take away that custom of dipping a piece of Unicoms horn in the Kings cup, but that he knew that opinion to be fo deeply ingraffed in the minds of men, that he feared, that it would fearee be impugued by reason. Besides (he said) if such a superstitious medicine do no good, fo certainly it doth no harm, unless it be to their effaces that buy it with gold; or else by accident, because Princes, whilst they relie more than is fitting upon the magnified veror elfe by accident, became Princes, while they reach more than is meang upon the magnified vertues of this horn, neglect to arm themselves against poylons by other more convenient means, so that death oft-times takes them at unawares. When as upon a time I inquired of Lues Dures the Kings Physician and Protestor (by reason of the great opinion that all learned men justly had of his learning and judgment) what he thought of this horn; He answered that he attributed no faculties thereto; for the confirmation whereof he rendred the fecond reason I have formerly given, but more largely and elegantly; neither feared he to affirm it aloud, and in plain words to his auditory of learned men, coming from all parts to hear him. But if at any time (orecome by the fault of in what cases the times and place) he preferibed this hom ; that he did it for no other intent, than to help faint- good.

fectual against

Continue

ings or fwoundings that happen by the abundance of ferous humors, floating in the orifice of the ventricle, which makes men ill disposed, because this mixed with other things endued with the like faculty, hath power to drink up the waterish humidity by its earthy driness. But some will reply, that neither the Lemnian, nor Armenian earth, have any juice in them, neither any finell, nor acry spirit. It is granted; neither truly are such things truly and properly called cordial, but only by event and accident, for that by the excellent and aftrictive faculty they have, and flopping the paffages of the verfels, they hinder the poifon from entring into the heart. This is my opinion of the Unicoms horn, which if any do not approve of, he shall do me a favour, if for the publick good, he shall freely oppose his; but in the interim take this in good part which I have done.

The end of the one and twentieth Books

BOOK XXII. Of the PLAGUE.

CHAP. I.

The description of the Plague.

What the Plague is,

The original

the plague.

He Plague is a cruel and contagious difeafe, which every where, tike a common difeafe, invading Man and Beatt, kills very many; being attended, and as it were affociated with a continual Feaver, Botches, Carbancles, Spots, Naufcoufnels, Vomitings, and other fuch malign accidents. This difeate is not fo pernicious or hurtful, by any elementary quality, as from a certain poyfonous and venenate malignity, the force where-

of exceeds the condition of common putrefaction; Yet I will not deny, but that it is more hurtful in certain bodies, times and regions, as also many other diseases, of which Hippocrates makes men-Sell. 3. aphor. tion. But from hence we can only collect, that the force and malignity of the plague may be encreafed, or diminished, according to the condition of the elementary qualities concurring with it; but not the whole nature and effence thereof to depend thereon.

This peftiferous poyfon principally affails the vital fpirit, the store-house and original whereof is the heart, fo that if the vital fpirit prove ftronger, it drives it far from the heart; but if weaker, it being overcome and weakned by the hoftile affault, flies back into the fortrefs of the heart, by the How it comes like contagion infecting the heart, and so the whole body, being spread into it, by the passages of

> Hence it is, peftilent feavers are fometime fimple and folitary; otherwhiles affociated with a troop of other affects, as Botches, Carbuncles, Blanes and Spots, of one or more colours.

It is probable fuch affects have their original from the expultive faculty, whether strong or weak, provoked by the malignity of the raging matter: yet affuredly divers symptoms and changes arife, according to the conflitution of the body of the patient, and condition of the humor in which the buncles, &c.in virulency of the plague is chiefly inherent, and lattly in the nature of the efficient cause.

I thought good, by this description, to express the nature of the Plague, at this my first entrance into this matter; for we can fcarce comprehend it in a proper definition. For although the force thereof be definite, and certain in nature, yet it is not altogether certain and manifeft in mens minds, because it never happens after one fort: so that in so great variety, it is very difficult to set down any thing general and certain.

CHAP. II.

Of the Divine causes of an extraordinary Plague.

Amos 3. 1

The fecond

causes have their power from God as the first cause.

T is a confirmed, conflant, and received opinion in all Ages amongst Christians, that the plague and other difeases, which violently affail the life of man, are often sent by the just anger of God punishing offences. The Prophet Amor hath long fince taught it, faying, Shall there be affidite on ? Shall there be evil in a City, and the Lord hath not done it? On which truly we ought daily to meditate, and that for two causes: The first is, that we always bear this in mind, that we enjoy health; live, move, and have our beings from God; and that it defcends from that Father of Light; and for this cause we are always bound to give him great and exceeding thanks. The other is, that knowing the calamities, by fending whereof the Divine anger proceeds to revenge, we may at length repent, and leaving the way of wickedness, walk in the paths of Godliness. For thus we shall learn to see in God, our selves, the Heaven and Earth, the true knowledge of the causes of the places, and here of the second plague, and by a certain Divine Philosophy, teach God to be the beginning and cause of the second caules, which we cannot well without the first cause go about nor attempt, much less perform any thing. For from hence they borrow their force, order, and constancy of order; so that they serve as infiruments for God, who rules and governs us, and the whole world to perform all his works, by that constant course of order, which he hath appointed unchangeable from the beginning. Wherefore

Wherefore all cause of a plague is not to be attributed to these near and inferior causes or beginnings, as the Epicures and Lucianists commonly do, who attributing too much, yea all things to Nature, hath left nothing to Gods providence. On the contrary, we ought to think, and believe in all our doings. That even as God by his omnipotent Power hath created all things of nothing, fo he by his eternal Wisdom preferves and governs the same, leads and inclines them as he pleaseth, yea verily at his pleafure changeth their order, and the whole course of nature.

This cause of an extraordinary Plague, as we confess and acknowledge, so here we will not profecute it any further, but think sit to leave it to Divines, because it exceeds the bounds of Nature, in which I will now contain my self. Wherefore let us come to the natural causes of the

Plague.

CHAP. III.

Of the Natural causes of the Plague, and chiefly of the Seminary of the Plague by the corruption of the Air.

The general and natural causes of the Plague are absolutely two, that is, the infection of The general corrupt air, and a preparation and fitness of corrupt humors to take that infection; for it causes of the Plague.

generate into fuch an alienation as may equal the malignity of poyfon.

The air is corrupted, when the four feafons of the year have not their feafonableness, or degenerate from themselves, either by alteration or by alteration: as if the constitution of the whole year be moist and rainy, by reason of gross and black clouds; if the Winter be gentle and warm, for some contrary to put of the constitution of the constitution of the constitution of the whole search and warm, the contrary to put of the constitution of without any Northerly wind, which is cold and dry, and by that means contrary to putrefaction: year may be if the Spring which should be temperate, shall be faulty in any excess of difference; if the Anturn said to want thall be ominous by fires in the air, with stars shooting, and as it were falling down, or terrible their seasons comets, never seen without some disaster; if the summer be hot, cloudy and moits, and without winds, and the clouds flie from the South into the North. These and such like unnatural conflitutions of the seasons of the year, were never better, or more excellently handled by any, than by Hippocrates in his Books Epidomion. Therefore the air from hence draws the seeds of corruption and the peltilence, which at length, the like excels of qualities being brought in, it fends into the humors of our bodies, chiefly fuch as are thin and ferous; although the peltilence doth not always necessarily arise from hence, but some-whiles some other kind of cruel and insectious

But neither is the air only corrupted by these superiour causes, but also by putrid and filthy stink- How the air ing vapors foread abroad through the air encompating us, from the bodies and carkaffes of things may be cornot buried, gapings and hollowneffes of the earth, or finks and fuch like places being opened : for rupeed, the fea often overflowing the land in some places, and leaving in the mud or hollownerses of the earth (caused by earth-quakes) the huge bodies of monstrous fishes, which it hides in its waters, hath given both the occasion and matter of a plague. For thus in our time, a Whale cast upon the Tuscan

thore, prefently caused a plague over all that countrey.

But as fishes infect and breed a plague in the air, so the air being corrupted often causeth a petitience in the sea among sishes, especially when they either swim on the top of the water, or are infectsed by the petitient vapors of the earth lying under them, and rising into the air through the body of the water, the latter whereof Anistate saith, happeth but seldom. But it often chanceth, that the Liv. 8. 118. 2plague raging in any country, many filhes are call upon the coast, and may be seen lying on great nim. plague raging in any country, framy made are can open the coan, and any ality, fent forth from heaps. But fulphureous vapors, or fuch as partake of any other malign quality, fent forth from places under ground, by gapings and gulfs opened by earth-quakes, not only corrupt the air, but also infect and taint the feeds, plants, and all the fruits which we eat, and to transfer the petillene corruption into us, and those beafts on which we feed, together with our nourithment. The truth whereof Empedoeler made manifest, who by shutting up a great gulf of the earth, opened in a valley between two mountains, freed all Sicily from a plague caused from thence.

If winds rising Tuddenly shall drive such filthy exhalations from those regions in which they were

peftiferous, into other places, they also will carry the plague with them thither.

If it be thus, forme will fay, it should feem that wherefoever stinking and putrid exhalations arife, as about flanding pools, finks and flambles, there flould the plague reign, and flraight fur-focate with its noyfome poyfon the people which work in fuch places: but experience finds this

false.

We do answer that the Putrefaction of the Plague is far different, and of another kind than this Pelliferous tormson, as that which partakes of a certain fecret malignity, and wholly contrary to our lives, putrefaction is and of which we cannot easily give a plain and manifest reason. Yet that vulgar putrefaction where and of which we cannot easily give a plain and manifest reason. Yet that vulgar putrefaction where are different from ordinary to our lives, putrefaction is an office and of which we cannot easily give a plain and manifest reason. and of which we cannot easily give present and welcome the pelifierous contagion, as often as, purrefaction, doth easily and quickly entertain and welcome the pelifierous contagion, as often as, purrefaction, and whenfoever it comes, as joined to it by a certain familiarity, and at length, it felf degenerating into a pelliferous malignity, certainly no otherwise than those diseases which arise in the plague time, the putrid difeases in our bodies, which at the first wanted virulency and contagion, as Ulcers, putrid Feavers, and other fuch difeases, raised by the peculiar default of the humors, easily degenerate In a pestilent into pefillence, presently receiving the tainture of the plague, to which they had before a certain confliction of preparations. Wherefore in time of the Plague, I would advise all men to shun such exceeding the air, all different properties. tlinking places, as they would the plague it felf, that there may be no preparation in our bodies, or humors to careh that infection (without which, as Galen teacheth, the Agent hath no power over Lib. t. dediffer. the Subject, for otherwife in a plague-time, the fickness would equally feize upon all) so that the im- fit. Preffion of the petitierous quality may prefently follow that disposition-

CHILITIAN

putrefic.

A Southerly constitution of the air is the fuel of the Plague.

How the sir But when we say the air is pestilent, we do not understand that sincere, elementary, and simple, may be said to as it is of its own nature, for such is not subject to putrefaction; but that which is polluted with ill vapors rifing from the earth, flanding waters, vaults, or fea, and degenerates, and is changed from its native purity and fimplicity. But certainly amongst all the constitutions of the air, fit to receive a pelitient corruption, there is none more fit than an hot, moift and ftill feafon; for the excels of fach qualities eafily caufeth putrefaction. Wherefore the fourth wind reigning, which is hot and moiff, and principally in places near the fea, there fielh cannot long be kept, but it prefently is tainted and corrupted

Forther, we must know, that the pestilent malignity which riseth from the carkasses or bodies of men, is more easily communicated to men; that which rifeth from oxen, to oxen; and that which comes from sheep, to sheep; by a certain sympathy and familiarity of Nature: no otherwise than the Plague which shall seize upon some one in a Family, doth presently spread more quickly amongst the rest of the Family, by reason of the similitude of temper, then amongst others of an other Family, difagreeing, in their whole temper. Therefore the air thus altered and eliranged from its goodness of nature, necessarily drawn in by inspiration and transpiration, brings in the seeds of the Plague, and so consequently the Plague it self, into bodies prepared and made ready to

CHAP. IV.

Of the preparation of humors to putrefaction, and admission of pestiferous impressions.

Aving shewed the causes from which the air doth putrific, become corrupt, and is made partaker of a petillent and poyfonous conflitution; we must now declare what things may cause the humors to putrifie, and make them so apt to receive and retain the pestilent air and venenate quality.

Three exufes of the purrefaction of humors.

Paffions of the mind help for-ward the Putrefaction of the humors.

Humors putrific either from fulnels, which breeds obstruction, or by distemperate excels; or lastby admixture of corrupt matter and evil juice, which ill feeding doth specially cause to abound in the body: for the Plague often follows the drinking of dead and musty wines, muddy and standing waters, which receive the finks and filth of a City; and fruits and pulfe eaten without discretion in scarcity of other corn, as Peafe, Beans, Lentils, Vetches, Acoms, the roots of Fern, and Grafs made into Bread: For such meats obstruct, heap up ill humors in the body, and weaken the strength of the faculties, from whence proceeds a patrefaction of humors, and in that putrefaction a preparation and disposition to receive, conceive, and bring forth the feeds of the Plague: which the filthy feabs, malign fores, rebellious ulcers and putrid feavers, being all fore-runners of greater putrefaction and corruption, do tefline. Vehement pathons of the mind, as anger, forrow, grief, vexation and fear, help forward this corruption of humors, all which hinder natures diligence and care of concoction: For as in the Dog-days, the less of wine fabliding to the bottom, are by the firength and efficacy of heat, drawn up to the top, and mixed with the whole substance of the wine, as it were by a certain ebullition, or working; fo melancholick humors, being the dregs or lees of the blood, flirred by the paffions of the mind, defile or taint all the blood with their feculent impurity-

We found that, fome years agon by experience, at the battel of S. Dennis. For all wounds, by what weapon soever they were made, degenerated into great and filthy putrefactions and corruptions, with feavers of the like nature, and were commonly determined by death, what medicines and how diligently foever they were applied; which caufed many to have a falfe fulpition that the wea-pons on both fides were poyloned. But there were manifelt figns of corruption and putrefaction in the bloud let the fame day that any were hurt, and in the principal parts diffected afterwards that it was from no other cause, than an evil constitution of the air, and the minds of the Souldiers perverted by hate, anger and fear.

CHAP. V.

What figns in the Air and Earth prognosticate a Plague.

E may know a plague to be at hand and hang over us, if at any time the air and featons of the year fwerve from their natural conflitution, after those ways I have mentioned before; if frequent and long continuing Meteors, or fulphureous Thunders infect the air; if fruits, feeds, and pulse be worm-eaten: if birds for fake their nells, eggs, or young, without any manifest cause; if we perceive women commonly to abort, by continual breathing in the value of the continual breathing in the continual breathing in the continual breathing in the continual breathing in the continua porous air, being corrupted and hurtful both to the Embryon and original of life, and by which it being fuffocated, is prefently cast forth and expelled. Yet notwithstanding those airy impressions do not folely corrupt the air, but there may be also others raised by the Sun from the filthy exhalations and poylonous vapors of the earth and waters, or of dead carkafles, which by their unnatural mixture, eafily corrupt the air, subject to alteration, as that which is thin and moift, from whence divers Epidemical diseases, and such as are every where seize upon the common fort, according to the several kinds of the feveral kinds of corruptions, fuch as that famous Catarrb with difficulty of breathing, which in the year 1510 went almost all over the world, and raged over all the Cities and Towns of France, with great heaviness of the head (whereupon the French named it Cuculla) with a firaitness of the

heart and longs, and a cough, a continual feaver, and fometimes raving.

This, although it feized upon many more than it killed, yet because they commonly died who were either let bloud, or purged, it shewed it felf pessilent by that violent and peculiar and unheard of kind of malignity.

A Catarri with difficulty of

breathing kil-

ling many.

Why aborrions are fre-

ent in a pe-

filent feation,

Such also was the English Sweating-Sickness, or Sweating-Seaver, which unusual, with a great deal The English of terror invaded all the lower parts of Germany, and the Low-Countries, from the year 1525 unto Sweating fick the year 1530, and that chiefly in Autumn.

As foon as this peffilent difease entred into any City, suddenly two or three hundred fell sick on one day; then it departed thence to some other place. The people strucken with it, languishing, fell down in a swound, and lying in their beds, sweat continually, having a seaver, a frequent, quick, and unequal pulie; neither did they leave sweating, till the disease left them, which was in one or two days at the most: yet freed of it, they languished long after; they all had a beating or palpitation of the heart, which held fome two or three years, and others all their life after.

At the first beginning it killed many, before the force of it was known: but afterwards very few, when it was found out by practice and use, that those who furthered and continued their sweats, and strengthened themselves with cordials, were all reflored. But at certain times many other populations of the continued their sweats, and strengthened themselves with cordials, were all reflored. But at certain times many other populations of the continued their sweats. lar difeafes fprung up, as putrid feavers, fluxes, bloudy-fluxes, catarrhs, coughs, phrenfies, fqui-nances, plurifies, inflammations of the lungs, inflammations of the eyes, apoplexies, lethargies, finall pox and meazles, fcabs, carbuncles, and malign putiles. Wherefore the Plague is not always, nor The Plague is every where of one and the fame kind, but of divers; which is the cause that divers names are im- not the defiposed upon it, according to the variety of the effects it brings, and symptoms which accompany it, nite name of and kinds of putrefaction, and hidden qualities of the air.

They affirm, when the Plague is at hand, that Mushroms grow in greater abundance out of the what figns in Earth, and upon the furface thereof many kinds of poyfonous infetta creep in great numbers, as Spi- the earth fore ders, Catterpillars, Butter-flies, Grashoppers, Beetles, Hornets, Wasps, Flies, Scorpions, Snails, tell a plague, Toads, Worms, and fuch things as are the off-fpring of putrefaction. And also wild beafts tired with the vaporous malignity of their dens and caves in the Earth, forfake them, and Moles, Toads, Vipers, Snakes, Lizards, Afps and Crocodiles are feen to flie away, and remove their habitations in great troops. For thefe, as also some other creatures, have a manifest power by the gift of God, and the infliner of Nature, to prefage changes of weather, as rains, showers, and fair weather, and feafons of the year, as the Spring, Summer, Autumn, Winter, which they teffine by their finging, chirping, crying, flying, playing, and beating with their wings, and fuch like figns: fo alfo they have a perception of a Plague at hand. And moreover, the carkaftes of fome of them which took lefs heed of themselves, suffocated by the pestiferous poylon of the ill air contained in the earth, may be every where found, not only in their dens, but also in the plain fields.

These vapors corrupted not by a sample putresaction, but an occult malignity, are drawn out of How pessilent the bowels of the earth into the air, by the force of the San and Stars, and thence condensed into vapors may clouds, which by their falling upon corn, trees and grafs, infect and corrupt all things which the kill plants and earth produceth, and also kills those creatures which feed upon them's yet brute beatts sooner than trees. men, as which floop and hold their heads down towards the ground (the maintainer and breeder of this poyfon) that they may get their food from thence. Therefore at fuch times, skilful husbandmen, taught by long experience, never drive their Cattel or Sheep to pasture, before that the Sun, by the force of his beams, hath waited and diffipated into air, this petiferous dew hanging and abiding upon the boughs and leaves of trees, herbs, corn and fruits.

But on the contrary, that petilence which proceeds from fome malign quality from above, by rea-

fon of evil and certain conjunction of the Stars, is more hurtful to men and birds, as those who are

CHAP. VI.

By using what cautions in Air and diet, one may prevent the Plague.

Aving declared the figns forethewing a Pestilence: now we must shew by what means we may than the imminent danger thereof, and defend our felves from it. No prevention feemed more certain to the Antients, than most speedily to remove into places far distant from Change of plathe infected place, and to be most slow in their return thither again. But those, who by reason of ces the surest their business or imployments, cannot change their habitation, must principally have a care of two prevention of things. The first is, that they strengthen their bodies, and the principal parts thereof, against the Plague, dayly imminent invasions of the poylon, or the pestiferous and venenate Air. The other, that they chief account about the force of it, that it may not imprint its virulency in the body; which may be done by corresponding the excess of the quality inclining towards it. by the corresponding of its contexts. For it is, he recting the excels of the quality inclining towards it, by the opposition of its contrary: For if it be hotter than is meet, it must be tempered with cooling things; if too cold, with heating things: Yet this will not suffice: For we ought besides, to amend and purge the corruptions of the venenate malignity districted through it, by smells and persumes resisting the poyson thereof. The body will be structured that the interest of the poyson thereof. thengthened and more powerfully relat the infected Air, if it want excrementations humors, which may be procured by purging and bleeding; and for the reft a convenient diet appointed, as flamming Diet for premuch variety of meats, and hot and moift things, and all fuch which are easily corrupted in the flovention of the mach, and cause obstructions, such as those things which be made by Committemakers; we must share plague. fatiety and drunkenness, for both of them weaken the powers, which are preserved by the moderate we of meats of good juice.

Let moderate exercises in a clear Air, and free from any venemous tainture, precede your meals. Let the belly have due evacuation either by Nature or Art.

Let the heart, the feat of life, and the rest of the bowels be strengthened with Cordials and Antidotes applied and taken (as we shall hereafter shew) in the form of epithems, ointments, emplasters, waters, pills, powders, tablets, opiates, furnigations, and fuch like.

Make choice of a pure air, and free from all pollution, and far remote from stinking places, for

Discommodi- fuch as is most fit to preserve life, to recreate and repair the spirits, whereas on the contrary, a clouties of a clou-dy, or mifty Air, and fuch as is infected with gross and thinking vapors, dulls the spirits, dejects the dy or foggy Air. appetite, makes the body faint and ill coloured, oppressent the heart, and is the breeder of many dis-

(HILLIAN)

BOOK XXII.

Why the South wind is pestilent,

The Northern wind is healthful, because it is cold and dry. But on the contrary, the Southern wind because it is hot and moift, weakens the body by sloth or dulness, opens the pores, and makes them pervious to the peftiferous malignity. The Western wind is also unwholsome, because it comes near to the nature of a Southern: wherefore the windows must be shut up on that side of the house on which they blow, but open on the North and East fide, unless it happen that the Plague come from thence.

The efficacy of fire against the Plague.

Kindle a clear fire in all the lodging Chambers of the house, and perfume the whole house with Aromatick things, as Frankincenfe, Myrth, Benzoin, Ladanum, Szyrax, Rofes, Myrtle-leaves, Lavender, Rofemary, Sage, Savory, wild Tyme, Marjoram, Broom, Pine-apples, pieces of Fir, Juniperberries, Cloves, Pertumes: and let your cloaths be aired in the fame.

Moderate repletion good for prevention

There be forme, who think it a great prefervative against the pestilent Air, to keep a Goat in their houses, because the capacity of the house, filled with a strong sent which the Goat sends forth, prohibits the entrance of the venomous Air; which fame reason bath place also in sweet smells; and befides it argues, that fuch as are hungry are apter to take the Plague than those who have eaten moderately: for the body is not only firengthened with meat, but all the passages thereof are full by the vapors diffused from thence, by which otherwise, the infected Air would find a more easie entrance to the heart.

A ftrange Art to drive away the Plague.

Yet the common fort of people yield another reason for the Goat, which is, that one ill sent drives away another, as one wedge drives forth another; which calleth to my mind that which is recorded by Alexander Beneditius, that there was a Scythian Physician, which caused a Plague, arising from the infection of the Air, to cease, by causing all the Dogs, Cats, and such like beasts, which were in the City to be killed, and cast their carkaties up and down the streets, that so by the coming of this new putrid vapor as a firanger, the former pefliferous infection, as an old gueft was put out of its lodging, and fo the Plague ceafed. For Poyfons have not only an antipathy with their Antidotes, but also with some other poylons.

The antipathy of poilons with poilons.

Whilft the Plague is hot, it is good not to ftir out of door before the riling of the Sun: wherefore we must have patience, until he hath cleanfed the Air with the comfortable light of his beams, and dispersed all the foggy and nocturnal pollutions, which commonly hang in the Air in dirty, and especially in low places and Vallies.

All publick and great meetings and affemblies must be shunned.

Whether in the Plague-time one must travel by night orby day.

If the Plague begin in Summer, and feem principally to rage, being helped forward by the Summers heat, it is beit to perform a journy begun, or undertaken for necessary affairs, rather upon the night time, than on the day; because the insection takes force, strength and subtility of substance, by which it may more eafily permeat and enter in by the hear of the Sun; but by night mens bodies are more firong, and all things are more grofs and denfe. But you must observe a clean contrary course, if the malignity feem to borrow thrength and celerity from coldness: But you must always efchew the beams of the Moon, but especially at the Full: for then our bodies are more languid and weak, and fuller of excrementitious humors. Even as trees which for that cause must be cut down in their feafon of the Moon, that is, in the decrease thereof.

Why the Moon is to be thunned.

> After a little gentle walking in your Chamber, you must presently use some means that the principal parts may be strengthned by suscitating the heat and spirits, and that the passages to them may be Such as by the use filled, that so the way may be thut up from the infection coming from without. of garlick have not their heads troubled, nor their inward parts inflamed, as Country People and fuch as are used to it: to such there can be no more certain preservative and Antidote against the pefiferous fogs or mifts, and the noctumal obscurity, than to take it in the morning with a draught of good wine; for it being abundantly diffused prefently over all the body, fills up the passages there-

What water to be made

choice of in

the Pagne

time

Garlick good against the

Plague,

For water; if the Plague proceed from the tainture of the Air, we must wholly shun and avoid Rain-water, because it cannot but be infected by the contagion of the Air. Wherefore the water of Springs and of the deepest Wells are thought best. But if the malignity proceed from the vapors conof, and firengthneth it in a moment. tained in the Earth, you must make choice of Rain-water. Yet it is more safe to digest every fort of water by boyling it, and to prefer that water before other; which is pure and clear to the fight, and without either talte or fmell, and which belides fuddenly takes the extremelt mutation of heat and

CHAP. VII.

Of the Cordial Remedies by which we may preferve our Bodies in fear of the Plague, and cure those already infected therewith.

Aqua Threiaca-Lis good against the Plague both inwardly taken and outwardly appli-

Uch as cannot cat without much labour, exercise and hunger, and who are no lovers of Breaktaits, having evacuated their excrements, before they go from home must firengthen the heart with fome Antidote aganst the virulency of the infection. Amongst which Aqua Theriacalis, or Treacle-water, two ounces, with the like quantity of Sack, is much commended being drunk, and rubbing the Nottrils, Mouth and Ears with the fame, for the Treacle-water firengthens the heart, expels poving and is not all the fame. heart, expels poyton, and is not only good for a prefervative, but also to cure the disease it self:

For by sweat it drives forth the poyton contained within. It should be made in June, at which time
all simple medicines, by the world have a few and the poyton contained within. all simple medicines, by the vital heat of the Sun, are in their greatest efficacy.

The composition whereof is thus: Take the roots of Gentian, Ciperus, Tormentil, Diptam, or The composi-Fraxalla Elecampane, of each one ounce; the leaves of Mullet, Gardaus Benedictus, Devils-bit, too thereof. Burnet, Scabious, Sheeps-forrel, of each half a handful; of the tops of Rue a little quantity; of Myrtle-berries one ounce; of red Rofe-leaves, the flowers of Buglofs, Borage and S. Johan wort, of each one ounce; let them be all cleanfed, dried and macerated for the space of twenty four hours in one pound of white wine or Malmfie, and of Rose-water or Sorrel-water; then let them be put in a veffel of glass, and add thereto of Treacle and Mithridate, of each four ounces: then diffill them in Balmo Marie, and let the diffilled water be received in a Glass-Viol, and let there be added thereto of Saffron two drams, of Bole-Armenick, Terra Sigillata, yellow Sanders, flavings of Ivory and Harts-horn, of each half an ounce; then let the Glafs be well ftopped, and fet in the Sun for the fpace of eight or ten days. Let the preferibed quantity be taken every morning fo oft as shall be needful. It may be given without hurt to fucking children, and to Women great with child. But that it may be the more pleasant, it must be strained through an Hippocras-bag, adding thereto some

Some think themselves sufficiently desended with a root of Elecampane, Zedoary, or Angelica, rowled in their mouth, or chawed between their teeth.

Others drink every morning one dram of the root of Gentian bruifed, being macerated for the space of one night in two ounces of white wine.

Others take Wormwood-wine.

Others Jup in a rear egg one dram of Terra Sigillata, or of Harts-horn, with a little Saffron, and drink two ounces of wine after it

There be fome that do infuse Bole-Armenick, the roots of Gentian, Tormentil, Diptam, the berries of Juniper, Cloves, Mace, Cinnamon, Saffron, and fach like, in aqua vite and throng white wine, and fo diffil it in Balnes Marie.

This Cordial water that followeth is of great vertue. Take of the roots of the long and round A cordial wa-Ariflolochia, Tormentil, Diptam, of each three drams, of Zedoary two drams, Lignum Aloes, yel-ter. Arifolochia, Tormentil, Diptam, of each three drains, of Zedoary two drains, Lignon Aloes, yellow Sanders, of each one drain, of the leaves of Scordium, S. Johns-wort, Sorrel, Rue, Sage, of each half an ounce, of Bay and Juniper-berries, of each three drains, Citron-feeds one Drain, Cloves, Mace, Nutmegs, of each two drains, Maffick, Olibanion, Bole-Armenick, Terra Sigillata, thavings of Harts-horn and Ivory, of each one ounce, of Saffron one feruple, of the Conferves of Rofes, Buglofs-flowers, water-lillies and old Treacle, of each one ounce, of Camphire half a drain, of aqua vira half a pint, of white wine two pints and a half; make thereof a diffillation in Balneo Marie: The ufe of this diffilled water is even as Treacle water is. of this diffilled water is even as Treacle water is.

The e'ectuary following is very effectual. Take of the best Treacle three ounces, Juniper-berries A Cordial Ele-and Cardons-feeds of each one dram and a half, of Bole-Armenick prepared half an ounce, of the duary. powder of the electuary de genemis and Diamargariton frigidum, the powder of Harts-horn, and red Coral, of each one drain: mix them with the fyrup of the rinds and juice of Pome-Citrons as much as shall suffice, and make thereof a liquid Electuary in the form of an Opiate, let them take every morning the quantity of a Filberd, drinking after it two drams of the water of Scabious, Cherries,

The following Opiate is also very profitable, which also may be made into tablets. Take of the An Opiate, each half a dram; of the dried rinds of Citrons, Cinnamon, Bay and Juniper-berries, and Saffron, and Saffron, of Contain, I confermed the An Opiate, of Citrons and Sorrel-feeds, of each half a dram; of the dried rinds of Citrons, Cinnamon, Bay and Juniper-berries, and Saffron, of the dried rinds of Citrons, Cinnamon, Bay and Juniper-berries, and Saffron, of the dried rinds of Citrons and Saffron, of conferment and Saffron, of the dried rinds of Citrons and Saffron, of the dried rinds of the drie of each one feruple; of conferve of Rofes and Buglofs, of each one ounce; and fine hard Sugaras much as is sufficient; make thereof Tablets of the weight of half a dram, let him take one of them two hours before meat: or make thereof an Opiate with equal parts of conferves of Buglofs and Mel Anthofatum, and fo adding all the rett dry and in powder. Or take of the roots of Valerian, Tor-Another. mentil, Diptam, of the leaves of Rue, of each half an ounce; of Saffron, Mace, Nutmegs, of each half a dram; of Bole-Armenick prepared half an ounce; of conferve of Rofes and fyrup of Limons, as much as will be fufficient to make thereof an Opiate liquid enough. Or take of the roots of both Another. the Ariftelectriaes, of Gentian, Tormentil, Diptam, of each one dram and a half; of Ginger three drams; of the leaves of Rue, Sage, Mints and Penny-royal, of each two drams; of Bay and Juniper-berries, Citron-feeds, of each four feruples; of Mace, Nutmegs, Cloves, Cinnamon, of each two drams; of Lignum aloes, and yellow Sanders, of each one dram; of Male-Frankincenfe, i. Olibanson, Maftich, flavings of Harts-horn and Ivory, of each two fcruples: of Saffron half a dram; of Bole-Armenick, Terra Sigillata, red Coral, Pearl, of each one dram; of conferves of Rofes, Buglofs-flowers, water-lillies and old Treacle, of each one ounce; of Loaf-fugar one pound and a quarter: a little before the end of the making it up, add two drams of Confessio Alkermer, and of Camphire diffolved in Rose-water one scruple, make thereof an Opiate according to art, the dose thereof is from half a dram, to half a fcruple.

Treacle and Mithridate faithfully compounded, excel all Cordial medicines, adding for every half cause of them, one ounce and an half of Conferves of Rofes, or of Buglots, or of Violets, and three drams of Bole-Armenick prepared: Of these being mixt with stirring, and incorporated together, make a conferve: it must be taken in the morning the quantity of a Filberd. You must chale that treacle that is not lefs than four years old, nor above twelve: that which is formewhat new, is judged to be most meet for cholerick persons; but that which is old, for phlegmatick and old men. For at the beginning the firength of the Opium that enters into the composition thereof, remains in its full vertue for a year: but afterwards the more years old it waxeth, the firength thereof is more abolithed, to that at length the whole composition becometh very hot.

The confection of Alkermer is very effectual both for a prefervative against this disease, and also

The quantity of a Filberd of Rubarb, with one Clove chawed or rowled in the mouth, is supposed thu 2

(minim)

to repel the coming of the peffilent air : as also this composition following.

Take of preferved Citron and Orange pills, of each one dram; of conferve of Rofes, and of the roots of Buglofs, of each three drams; of Citron-feeds half an ounce; of Annife-feeds and Fennel-feeds, of each one dram; of Angelica-Roots four feruples; fugar of Rofes as much as fufficeth; A Confection to be taken in against the pe Make a Confection, and cover it with leaves of Gold, to take a little of it upon a fpoon before you ftilene Air.

go abroad every morning.

Or take of Pine-apple-kernels, and Piffick-muts, infufed for the space of fix hours in the water of Scabious and Rofes, of each two ounces; of Almonds blanched in the fore-named waters half a A March-pane pound: of preferved Citron and Orange pills, of each one dram and a half: of Angelica-roots four fcruples: make them according to art, unto the form of March-pane, or of any other fuch like confection, and hold a little piece thereof often in your mouth.

The Tablets following are most effectual in such a case. Take of the roots of Diptam, Tormen-

til, Valerian, Elecampane, Eringoes, of each half a dram; of Bole-Armeniek, Terra Sigillata, of each one feruple; Camphire, Cinnamon, Sorrel-feeds, and Zedoary of each one feruple, of the freeier of the electuary Diamargariton frigidum, two scruples; of emserve of Roses, Bugloss preserved, Citron-pills, Mithridate, Treacle of each one dram; of time Sugar diffolved in Seabinus and Cardinus-water, as much as shall suffice : Make thereof Tablets of the weight of a dram, or half a dram : take them in

the morning before you eat. Pills of Raffur,

The pills of Ruffus are accounted most effectual preservatives, so that Ruffus himselffaith, that he

never knew any to be infected that used them: the composition of them is thus

Take of the best Aloes half a dram, of Gum-Ammoniacum two drams, of Myrrh two drams and an half, of Martich two drams, of Saffron feven grains: put them all together, and incorporate them with the juice of Citrons, or the fyrup of Limons, and make thereof a mass, and let it be kept in leather: Let the patient take the weight of half a dram every morning two or three hours before meat, and let him drink the water of Sorrel after it, which through its tartness, and the thinnels of its parts, doth infringe the force and power of the malignity or putrefaction: For experience hath taught us, that Sorrel being eaten or chawed in the mouth, doth make the pricking of Scorpions unhurtful. And for those ingredients which do enter into the composition of those pills, Aloes doth cleanse and purge, Myrrh relists putrefaction, Mattich strengthens, Sastron exhilarates and makes

lively the spirits that govern the body, especially the vital and animal.

Those pills that follow are also much approved. Take of Aloes one ounce, of Myrth half an ounce, of Saffron one scruple, of Agarick in Trochisces two drams, of Rubarb in powder one dram, of Cinnamon two scruples, of Massich one dram; od a half, of Citron-sceds twelve grains: powder them all as is requifite; and make thereof a mass with the syrup of Maiden-hair: let it be used as a-

Other pills,

Cther pills.

If the mais begin to wax hard, the pills that must prefently be taken, must be mollified with the

fyrup of Limon

Take of washed Aloes two ounces, of Sastron one dram, of Myrrh half an ounce, of Ammoniacum diffolved in white wine one ounce, of hony of Rofes, Zedoary, red Sanders, of each one dram, of Bole-Armenick prepared two drams, of red coral half an ounce, of Camphire half a scruple : make thereof pills according to art. But those that are subject or apt to the hemorrhoids ought not at all, or very feldom to use those kinds of pills that do receive much Aloes.

They fay, that King Minbridates affirmed by his own writing, that who oever took the quantity of an hazel-nut of the prefervative following, and drank a little wine after it, should be free from poyfon that day, Take two Wall-nuts, those that be very dry, two Figs, twenty leaves of Rue, and three grains of falt: beat them and incorporate them together, and let them be used as is aforefaid.

This remedy is also said to be profitable for those that are bitten or stung by some venomous beast, and for this only, because it hath Rue in the composition thereof. But you must forbid women that are with child the use of this medicine ; for Rue is hot and dry in the third degree, and therefore it is faid to purge the womb, and provoke the flowers, whereby the nourithment is drawn away from the child. Of fuch variety of medicines, every one may make choice of that is most agreeable to his tafte, and as much thereof as thall be fufficient.

CHAP. VIII.

Of local medicines to be applied outwardly.

Hole medicines that have proper and excellent vertues against the pessilence, are not to be neglected to be applied outwardly, or carried in the hand. And fuch are all aromatical, aftringent, or spirituous things, which therefore are endued with vertue to repel the venomous and peftiferous air, from coming and entring into the body, and to firengthen the heart and brain. Of this kind are Rine, Balm, Rolemary, Seordium, Sage, Worm-wood, Cloves, Nutmegs, Saffron, the roots of Angelica, and Lovage, and fuch like, which must be macerated one night in sharp Vincear and Acus are Vinegar and Aqua vita, and then tied in a knot as big as an egg, or rather let it be carried in a fponge made wet, or foaked in the faid infusion. For there is nothing that doth fooner and better hold the fpirituous virtue and firength of aromatick things, than a fponge. Wherefore it is of principal ufeci-ther to keep or hold fweet things to the nofe, or to apply Epithems and formentations to the heart.

Those fweet things cooks and a local service of the political service is a service of the political service of the po

Those sweet things ought to be hot or cold, as the scason of the year, and kind of the petitlence is:

As for example, in the Summer you ought to insufe and macerate Cinnamon and Cloves, beaten together: with a little Saftware results of the search of gether: with a little Saffron in equal parts, of vinegar of Rofes, and Rofe-water, into which you must dip a sponge, which rowled in a fair linnen cloth, you may carry in your hand, and often

of what nature the medicines outwardly used ought

Take of Worm-wood half a handful; ten Cloves, of the roots of Gentian and Angelica, of each two drams; of vinegar and Rosewater, of each two ounces; of Treacle and Mithridate, of each one drams; of vinegar and reofewater, of each two dates; of vinegar and withindare, of each one dram; beat and mix them well all together, and let a fponge be dipped therein, and ufed as above faid. They may also be inclosed in boxes made of sweet wood, as of Juniper, Cedar, or Cypres, and so carried for the same purpose,

But there is nothing more easie to be carried than Pomanders: the form of which is thus: Take of yellow Sanders, Mace, Citron-pills, Rose and Myrtle-leaves, of each two drams; of Benzoin, Ladamon, Storax, of each half a dram; of Cinnamon and Saffron, of each two drams; or Benzoin, Phire and Amber-Greece, of each one Gruple; of Musk three grains. Make thereof a Pornander, with Rofe-water, with the infusion of Tragacanth. Or take red-Rofe-leaves, the flowers of Water-Pomanders. lillies and Volets, of each one ounce; of the three Sanders, Coriander-leeds, Citron-pills, of each half an ounce; of Camphire, one dram; let them all be made into powder, and with Water of

Roses and Tragacanth make a pomander.

In the Winter it is to be made thus. Take of Storax, Benzoin, of each one dram and a half; of Mask half a feruple, of Cloves, Lavander and Ciperus, of each two drams; of the root of Orris, i.e. Flower-de-luce, and Calamus aromaticus, of each two drams and a half; of Amber-Orecee, three drams; of Gum-Tragacanth diffolved in Rose-water and aqua vita, as much as shall suffice, make thereof a Pomander.

And for the same purpose you may also use to carry about with you sweet powders, made of Am-Sweet powber-Greece, Storax, Orris, Nutmegs, Cinnamon, Mace, Cloves, Sastron, Benzoin, Musk, Cam-ders, phire, Roses, Violets, Juneus odoratus, Marjoram, and such like, of which being mixed together, Powders may be compounded and made.

Take of the roots of Orris two drams; of Cyperus, Calamus aromaticus, red Rofes, of each halfan ounce, of Cloves half a dram, of Storax, one dram; of Musk, eight grains: mix them, and make a powder for a bag; or take the roots of Orris two ounces; red-Rofe-leaves, white Sanders, Storax, of each one dram; of Cyperus one ounce; of Calamus aromaticus, one ounce; of Marjoram, balfan ounce; of Cloves, three drams; of Lavander, half a dram; of Coriander-feeds, two drams; of good Musk, half a scruple; of Ladamum and Benzoin, of each a dram; of Nutmegs and Cinhamon, of each two dram: Make thereof a fine powder, and fow it in a bag.

It will be very convenient also to apply to the region of the heart, a bag filled with yellow Sanders, Bags, Mase, Cloves, Ginnamon, Saffron and Treacle shaken together, and incorporated, and sprinkled over with ftrong vinegar and Rofe-water in Summer, and with ftrong wine and Muskadine in the

The fweet Aromatick things that are fo full of spirits, smelling sweetly and strongly, have admirable vertues to strengthen the principal parts of the body, and to stir up the expulsive faculty to expel

Contrariwife, those that are shinking and unfavory, procure a desire to vomit, and dissolution of Unfavory the powers, by which it is manifest how foolish and absurd their perswasion is, that counsel such as things to be estate in a pestilent constitution of the Air, to receive and take in the stinking and unsavoury vapours of chewed.

falsy and privier, and that especially in the morning.

But it will not suffice to carry those preservatives alone, without the use of any other thing, but it will be also very profitable to wash all the whole body in Vinegar of the decoction of Juniper and Bay-berries, the Roots of Gentian, Marigolds, S. Johns-Wort, and such like, with Treacle or Mithidate also dissolved in it. For vinegar is an enemy to all poysons in general, whether they be hot or cold: for it relistes and hinderest pursesaction. Neither is it to be teared, that it should obstruct the power. For vinegar is in the body be bathed in it; for it is of subtil parts, and the spices. the pores, by reason of its coldness, if the body be bathed in it: for it is of subtil parts, and the spices boiled in it, have virtue to open.

Whofoever accounteth it hurtful to walh his whole body therewith, let him walh only his armholes, the region of his heart, his temples, groins, parts of generation; as having great and marvel-ous fympathy with the principal and noble parts.

If any millike bathing, let him anoint himfelf with the following Unguent. Take oyl of Rofes, An Unguent, four ounces; oyl of Spike, two ounces; of the powder of Cinnamon and Cloves, of each, one ounce and a half; of Benzoin, half an ounce; of Musk, fix grains; of Treacle, half a dram; of Venice-Turpentine, one dram and a half; of Wax, as much as shall suffice: make thereof a soft

You may also drop a few drops of oyl of Mastich, of Sage, or of Cloves, and such like, into the tars, with a little Civet or Musk.

CHAP. IX.

Of other things to be observed for prevention in fear of the Plague.

Enery is chiefly to be eschewed, for by it the powers are debilitated, the spirits dissipated, why venery and the breathing places of the body diminished, and lastly, all the strength of nature weaking ned. A sedentary life is to be shunned, as also excess in diet, for hence proceeds obstruction, the corruption of the juices, and preparation of the body to putrefaction and the pestilence.

Women must be very careful that they have their courses duely, for stopping besides the custom, they easily acquire corruption, and draw by contagion the rest of the humors into their society. Such as have faults a coherence proceed obstruction and the pestilence. as have fiftulaes, or otherwife old ulcers, must not heal them up in a pestilent season; for it is then Running ulcers as have fiffulace, or otherwise old usees, that there in convenient and declining places; that as by good in time of peltilence.

The Hemorrhoids, bleedings, and other the like accustomed evacuations, must not be stopped, un-

CHICATOR POR

Places to be

less they exceed measure. Moreover, they must at such times take heed that they touch or handle not any of those things wherein the feeds or fuel of the pettilence may lie hid; fuch as are hemp, flax, quilts and coverings wherein fuch as have had the plague have lain; skins and all leather things, hangings and cloaths. You must dwell far from Church-yards, especially from those wherein the corps of fuch as have died of the plague are not buried deep in the ground, as in the Church time of plague of Innocents in Paris, in which place by the fame reason it fundry times happens that the bodies are plucked up, rent and torn by dogs. Also let them dwell far from places of execution, shambles of fleth and fith, from tan-houses, diers, tallow-chandlers, cloth-dressers, farriers, skinners, and from the places wherein metals are cast or wrought. The filth and dung, especially of Swine, Privies, standing and muddy waters, and lattly all things of the like evil smell, must be far remote from your habitation; the belly must not be emptied into those places, into which the excrements of such as what compa- have the plague are cast. The company of such as usually visit those sick of the plague, must be esny to be avoid chewed, as of Physicians, Apothecaries, Surgeons, Nurse-keepers, Grave-makers, and Bearers:

ed. For though they have not the plague, yet coming out of a pestilent place, they may carry with them lying in their garments, the seeds thereof. You may gather this by such as have for a little while stayed in a perfumers shop, for the perfume disfused in the air, bestows the smell upon the garments of fuch perions, fo that gone from thence, fuch as meet them, will judg them to carry perfumes with them. They shall also thun long watchings, found sleeping, all pations of the mind, especially, anger, hunger, thirst, journying in the Sun, for that hath off times occasioned a diary seaver, You must do with them. which hath not feldom been feen to turn into a peftilent one: for by dilating the porcs of the skin, they have given entrance to the peftilent air, which by that means hath eafily taken hold of the hu-

and hot-hou-

then to be al-

mor disposed to putrefaction.

CHAP. X.

Of the Office of Magistrates in time of the Plague.

Agistrates ought to have a special care that no filth be heaped up, either in private or publick places: let all things be kept neat in every house, and let all the streets be kept clean, the dung and filth be carried forth of the City, as also the dead carkasses of killed dogs Why dogs and and cats, for because they oft-times lick and devour the excrements of fuch as have the fickness, therefore they may by their familiar entry into found houses, there propagate the plague: Wherefore they must either be driven forth of the City, or killed, and so be carried forth and buried deep in the ground. Wells, springs, and rivers themselves, must be freed and cleansed from all impurity. Care must be had that musty corn, tainted siesh, nor stinking sish be not set to sale. Publick baths and hot-houses must be prohibited, for that in these, mens bodies are weakned, and made more yielding and pervious to the peftiferous air. They shall commit the cure of such as have the plague,

to learned, skilful and honeft Phylicians, Apothecaries and Surgeons.

Such as are known to have the Plague, shall be separated from such as are free there-from, and be fent to such fit places as shall be provided for them; for this is better and more humanely done than to that up every man in his own house. They thall provide and fore-see that the houshold-stuff of such as have the plague be not set to sale. They shall set signs and noted marks upon the houses seized upon by this disease, less they should unawares run into danger: Wherefore to the same purpose they shall procure that the Surgeons and others that visit the fick of the Plague may be known by some conspicuous mark, that such as pass by them may be admonished of the danger; they shall also take Such as die of care that the bodies of the dead be buried as speedily as may be. For they sooner and more grievouthe Plague do fly putrefie in a short time, than the bodies of others of what death soever they die Wherefore, neither birds, nor ravenous beatts dare once touch their Bodies, though unburied; for by tafting them they should quickly come to their deaths. The keepers of the gates of the City shall be admonished, that they take special care that such as are infected, or come from a visited place, do not enter into the City stor from one, the evil may come to spread it self further: for one spark may set a whole City on fire, and one scabby sheep intest a whole slock. And because there is nothing which may more perfectly purge the air, and cleanse it from all manner of noisomness and insection, than fire;

they thall command that there be kindled and perpetually kept burning, fires made with odoriferous and firong finelling things, as Juniper, Turpentine, Broom, and the like.

In flead hereof Levinus tells, that the Souldiers of the Garrifon of Torry used in a Plague-time, to

difcharge their Cannons laded only with powder, turning their mouths upon the City, and that morning and evening, that by the vehemency of the moved air, the peftiferous fogs might be chafed away; and by the heat of the burned powder, the venenate and noiform quality of the air might be The villany of tive upon a murderous and impious kind of Bearers and Nurfe-keepers; which allured with a define fome base peoof gain (which whilft the Plague reigns, they get abundantly) anoint the walls, doors, thresholds, knockers of gates and locks with the filth and ointments taken from fuch as have the Plague, that the Plague within a while after feizing upon these also, the masters of them slying away, and the family different all the state of them. mily disperfed, they may there reign alone, and freely and without punishment carry thence what they please oft-times strangling such as lie ready to die, lest recovering, they might be their accusers. This I remember, happened at Lions, Anno Dom. 1565.

Lib. 2. de secult. mat. mirac.

ple.

CHAP. XI.

What caution must be used in chusing Physicians, Apothecaries and Surgeons, who may have a care of such are taken with the Plague.

T is the part of Magistrates in the so great necessity of the afflicted Common-wealth, to appoint learned, skilful and honeft Phyficians, Surgeons, and Apothecaries, and fuch as have more regard to the Law of God than to gain, to have the care and cure of fuch as are vifited: But principally let them not take Surgeons and Apothecaries called by proclamation with found of trumpet, that if they will take this charge, they shall become free without examination or reward. But let them rather be allured by gifts and honell rewards, not only then when as necessity urgeth, but also after the plague is over. For fuch fervant-Surgeons and Apothecaries as are called by proclamation, fo to gain freedom, are most commonly unskilful and unexperienced Dunces, who, conscious of their own ignorance, and fearing to undergo the examination of the Matters of their Companies,

refuse no hazard, however dangerous, with defire to obtain their freedom.

It is far worse and more dangerous to fall into the hands of such, than into the hands of thieves and marderers; for these by providence of strength, we may chance to escape; but we seek for and embrace the other, and having found them, lay our throats bare unto them, so by their unskilfulness to be butchered. Certainly by the fault of the times, and the neglect of Magistrates, it is almost come to this pals, that if any honeft and learned Phylicians and Surgeons shall undertake this cure, they are commonly forced thereto by the Magistrate, for fear of banishment or fining: Therefore because they do it against their wills, they show themselves less vigilant, cheerful and painful about the sick. They come unwillingly, and compelled thereto, because by the memory of the fore-past time, they sufficiently know, how fordid and basely Magistrates, when the Plague hath been over-past, have been in paying the promifed reward to men of their condition, who have floutly run into danger; for thence it happens, that during the reft of their lives they may fit idle at home, for that they are infamous, and feared by the people only for this, that a while agon they vifited fuch as had the Plague. Therefore I would have Magistrates prodent, faithful, and free in chusing honest, learned and skilful men, who may undergo this so difficult and dangerous a charge.

CHAP. XII.

How such as undertake the cure of the Plague ought to arm themselves.

Virit they must think and hold for certain, that they are not called to this office by men, but by Our lots are in God, fo directing the counfels and actions of men as he thinketh fit. Therefore they shall the hands of confidently enter into the cure thereof; for that our lot, life and death are in the hands of the the Lord. Lord: but notwithstanding they ought not to neglect remedies, which are given to men for preven-tion, lest by the neglecting the gifts of God, they may seem to neglect him also that is the giver of so many good and excellent benefits. Therefore, first let them by purging and bleeding, evacuate the humors fubject to putrefaction, and to conceive the feeds of the petillence. Let them make two Whereto fontanels by application of cauteries, to be as rivulets to evacuate the excrementations humors which make iffues it are daily by little and little heaped up in us; let one of them be in the right arm a little below the Plague, muscle Eponie; the other the space of three fingers under the knee on the infide of the left legis found by experience a very certain means of prevention. Let them wash their whole bodies with the following lotion. R. aque ros. aceti rosati, aut sambucini, vini albi aut malvatici, an. 1b. vi. rad. enule camp. angelice, gentian. bistorte, zedoar. an. 3111. baccar juniperi, & bedere, an. 311. salvie, rorismar. abforth. rate, an. m. j. corticis citri, \$\frac{3}{2}\$ betriace & mithridat, an. \$\frac{3}{2}\$. conquassand conquassand, bulliant lento igni, & serventur ad usion ante commemoratum. The epithems, unquents and Bags for cap. 8. Thereby described thall be applied to the region of the heart. I have read it noted by John Baptist Theodo- Epis. 2. fine, that amongst other things, Arsenick may be profitably applied to he region of the heart, that so it may by little and little accustom it felf to poylons, that afterwards it may be less harmed by their incursion, first making their affault upon it.

Let their garments be made of Chamlet, Dutch Serge, Satin, Taffaty, or the like. Or elfe if they What to wear, cannot of these, let them be of some other handsom Stuff, but not of Cloth, Freeze or the like, that they may take the venenate air, and carry it with them to the infection of the found. They shall oft-times change their cloaths, thirts and other linnen, and perfune them with aromatick things; let them warily approach the fick, more warily speak unto him, with their faces looking away from How to visit him rather than toward him, so that they may not receive the breath of his mouth, neither the va- your patients.

Pour nor finell of any of his excrements.

When as I upon a time being called to vifit one that lay fick of the Plague, came too near and An history. When as I upon a time to hear and heedlefly to him, and prefently by fudden casting off the cloaths he laid him bare, that so I might the better view a Bubo, that he had in his right groin, and two Carbuncles that were on his belly, then prefently a thick, filthy and putrid vapour ariling from the broken abfects of the Carbuncle, as out of a raked puddle, afcended by my nothrils to my brain, whereupon I fainted, and fell down fenfless upon the ground; raifed up a little after, all things seemed to me to run round, and I was ready to fall again, but that I stayed my self by taking hold of the bed-post. But one thing comforted me, that there appeared no figns that my heart was affected, either by pain or panting, or the firong and contumacious failing of my powers. An Argument that the animal fpirits were only diffipated by a venenate vapor, and that the substance of the heart was no way wronged, was a fineeling which took me so violently, that I sneeled ten times, and then fell a bleeding at the nose;

CHILITIES

which excretion, I believe, freed me from all the imprellion of the malignity. Let others, warned by this mine example, learn to be wifer and more wary in this case, lest they come to worse milhap than befel me.

are fuddenly

E must not stay so long before we pronounce one to have the Plague until there be pain and a tumor under his arm-holes, or in his groin, or fpots (vulgarly called Tokens) appear over all the body, or Carbuncles arife: for many die through venenate malignity, before these figns appear. Wherefore the chiefest and trucit figns of this difease are to be taken from the heart, being the manfion of life, which chiefly and first of all is went to be affailed by the force of the poyfon. Therefore they that are infected with the Peltilence, are vexed with often fwoundings and faintings; their pulle is feebler and flower than other, but fometimes more frequent, but that is especially in the night season; they feel prickings over all their body, as if it were the pricking of needles; but their notirils do itch especially by occasion of the malign vapours arising upwards from the lower and inner, into the upper parts, their breaft burneth, their heart beateth with pain under the left dug, difficulty of taking breath, ptiffick, cough, pain of the heart, and fuch an elation or puffing up of the Hypochondria, or fides of the belly, differeded with the abundance of vaours raifed by the force of the feaverish heat, that the patient will in a manner feem to have the Tympany. They are molested with a defire to vomit, and oftentimes with much and painful vomiting, wherein green and black matter is feen, and always of divers colours, answering in proportion to the excrements of the lower parts, the fromack being drawn into a confent with the heat, by reafon of the vicinity and communion of the veffels; oftentimes blood alone, and that pure, is excluded and cast up in vomiting; and is not only cast up by vomiting out of the stomach, but also very often out of the nothrils, fundament; and in women, out of the wombs the inward parts are often burned, and the outward parts are fliff with cold, the whole heat of the patient being drawn violently inward, after the manner of a Cupping-glafs, by the firong burning of the inner parts; then the eye-lids wax blew as it were through fome contufion, all the whole face hath an horrid afpect, and as it were the colour of lead, the eyes are burning red, and as it were fwoln, or puffed up with blood, or any other humor, shed tears, and to conclude, the whole habit of the body is formewhat changed, and turned yellow-

Many have a burning feaver, which doth shew it self by the patients ulcerated jaws, unquenchable thirst, driness and blackness of the tongue and it causeth such a phrensie by inflaming the brain, that the patients, running naked out of their beds, feek to throw themselves out of windows into the pits and rivers that are at hand. In fome the joints of the body are fo weakned, that they cannot go nor fland; from the beginning, they are as it were buried in a long fwound and deep fleep, by reason that the seaver sendeth up to the brain, the gross vapors from the crude and cold humors, as

it were from green woody newly kindled to make a fire-

Such fleeping doth hold him especially while the matter of the fore or carbuncle is drawn together, and beginneth to come to suppuration. Oftentimes when they are awaked out of sleep, there do spots and marks appear dispersed over the skin, with a sinking sweat. But if those vapors be fliarp that are flirred up unto the head, instead of sleep they cause great waking, and al-ways there is much diversity of accidents, in the urine of those that are insected with the Plague, by reason of the diverse temperature and condition of bodies: neither is the urine at all times, and in all men of the fame confidence and colour: For fornetimes they are like unto the urine of those that are found and in health, that is to fay, laudable in colour and substance; because that when the heart is affected by the venemous air, that entreth in unto it, the spirits are more greatly grieved and molefied than the humors: but those, i.e. the spirits, are infected and corrupted when these do begin to corrupt.

But Urines only thew the dispositions of the humors or parts in which they are made, collected together, and through which they pass.

This reason seemeth truer to me than theirs which say, that nature terrified with the malignities of the poylon avoids contention, and doth not relift or labour to digelt the matter that cauleth the

Many have their appetites so overthrown, that they can abstain from meat for the space of three

And to conclude, the variety of accidents is almost infinite, which appear and spring up in this kind of disease, by reason of the diversity of the poyson, and condition of the bodies and grieved parts: but they do not all appear in each man; but fome in one, and fome in another-

CHAP. XIV.

I is a most deadly fign in the Pestilence, to have a continual and burning Feaver, to have the tongue dry, rough, and black, to breath with difficulty, and to draw in a great quantity of breath, but breath out little ; to talk idly; to have Phrenfie and Madness together, with unquenchable and great provider. thirst and great watching; to talk idly; to have Phrenfie and Madnets together, which are to favoure very often and vehemently; turther, tosting and turning in the bed, with a loathing of meats, and dayly venits of a green, black, and bloudy colour; and the face pale, black, of an horrid and cruel aspect, bedewed with a cold sweat, are very mortal signs.

What signs in the Plague are mortal.

There are forme which at the very beginning have ulcerous and paintul wearmefs, pricking under Anulcero the skin, with great torment of pain; the eyes look cruelly and framgly, the voice waxeth hoarfe, and painful the skin, with great forment of pain's the eyes however, and that highly, the voice waxeth noarie, the tongue rough and flutting, and the understanding decaying the patient uttereth and talketh of from the befrivolous things. Truly those are very dangeroully sick, no otherwise than those whose urine is pale, gioning show black, and troubled like unto the urine of carriage-beasts, or lee, with divers coloured clouds or coneth the Plague tents; as blew, green, black, fatty and oily, as also refembling in thew, a Spiders web, with a round to be deadly.

body fwimming on the top.

If the flesh of the carbuncle be dry and black, as it were feared with an hot iron, if the flesh about it be black and blew, if the matter do flow back, and turn in, if they have a lask with greatly flinking, liquid, thin, clammy, black, green or blewith ordere; if they avoid Worms, by reason of the great corruption of the humors, and yet for all this the patient is never the better; if the eyes wax often dim, if the noffrils be contracted or drawn together, if they have a grievous cramp, the mouth be drawn afide, the mufeles of the face being drawn or contracted equally or unequally s if the nails be black; if they be often troubled with the Hicket, or have a Convultion and refolution over all the body, then you may certainly prognofficate that death is at hand, and you may use cordial medicines only, but it is too late to purge, or let bloud.

CHAP. XV.

Signs of the Plague coming by contagion of the air without any fault of the humors.

Ou shall understand, that the Pestilence proceeds from the corruption of the air, if it be very contagious, and disperseth it self into fundry places in a moment. If it kill quickly and many, so that whilit fundry persons go about their usual business, walk in the places of common refort, and through the fireets, they fuddenly fall down and die, no fign of the difease or harm appearing, nor any pain oppretting them; for the malignity of the corrupt air is quick and vety speedy in intecting our spirits, overthrowing the strength of the heart, and killing the Patient. The Patients are not troubled with great agitation, because the spirits dislipated by the rapid malignity of the poylon, cannot endure that labour; belides they are taken with frequent (woundings, why they few of them have Buboes, few have Blains come forth; and by the fame reason their urines are like have no fores; to those of found men.

CHAP. XVI.

Signs of the Plague drawn into the body by the fault and putrefaction of humors.

Ormerly we have reckoned up the causes of the corruption of humors from plenitude, obstruction, diffemper, and the ill juice of meats. Now must we deliver the figns of each corrupt humor which reigns in us, that it may be reduced to foundness and perfection of nature, by the opposition of its contrary, or elfe be evacuated by Physick. Therefore if the body be more yellow Signs of choese than usual, it is a sign of choler offending in quantity and quality. If more black, then of melancholer, ly; if more pale, then of phlegm; if more red, with the veins fwoln up and full, then of blood. Also the colour of the rising blains, tumors and spots, express the colour of the predominant humor, as also the excrements cast forth by vomit, stool, and otherwise; the heaviness and cheerfulness of the affected body; the manner of the present Feaver; the time of the year, age, region, dieta Such things as have a cutting, penetrating, attenuating, and cleanfing faculty, take away oblfruction. By means of obstruction, Feavers oft-times accompany the Plague, and these not only continual, but also intermitting, like tertians or quartans. Therefore that Plague that is fixed in the infection or corruption of a cholerick humor, thews it self by the forementioned signs of predominating choler, to wit, the heat of the skin, blains, and excrements; as also in the quickness of killing, and vehemency of the fymptoms, bitterness of the mouth, a painful and continual endeavour of going to stool, by reason of the acrimony of choler simulating and raking the guts in the passage forth. That which relides in the corrupt fubflance of groß humors, as of bloud, theweth it felf by thany and plentiful fweats, by a fcouring, by which are avoided many and various humors and oft-times also bloudy matter that proceeds from corrupt phlegm, it invades with more found fleep, and caussess weariness of all the members; when they are awakened out of their sleep, they are not foldom troubled with a trembling over all their joints, the entrance and way of the spirits into the members being obfirected by the grofness of the humors. That which is feated in the corruption of a melancholick humor, is accompanied with heaviness and pain of the head, much pensiveness, a deep and fmall pulse. But the most certain fign of the Plague residing in the corruption of the huthors, is to be taken from the urine. For the figns of the vitiated humors cannot but flew them- rine felves in the urines: therefore troubled urines, and fuch as are like those of carriage-beafts, as also looked upon. black and green, give certain notice thereof. But some are much troubled with thirst, others not Why some are at all; because choicr or phlegm sometimes only putrifie in the stomach or orince of the ventricle; much troubled fornetimes befides, they will weaken the government of the natural faculties of the part, as of the withthirft, others not at all. Ppetite. But if the Feaver happen by the default and infection both of the air and humors; then will there be a great confusion of the forementioned figns and fymptoms;

(tittling)

thereto.

Ou may well fore-tell the future motions and events of difeases, when you throughly know the nature of the difease, and accidents thereof, and the condition, function, and excellency of the body and grieved parts: Although that this may be spoken in general, that there is no certain prediction in petillent difeafes, either to health or death, for they have very unconstant motions, sometimes swift and quick, sometimes slow, and sometimes choaking or suffocating in a moment, while one breaths in the venomous air, as he is going about any of his necessary affairs, having puftles rifing in the skin with flurp pain, and as though the whole body was pricked all over with needles or the flings of Bees. Which I have feen with mine eyes in the Plague that was at Lions when Charles the French King lay there. It many times cometh to pass that the accidents that were very vehement and raging a little before, are suddenly asswaged, and the patients do think themselves better, or almost perfectly found. Which happens to Mary one of the Queen-most ther her maids, in that notable petilent conflictation of the air, that year when Charles the French King lay at the Cafile of Roffilion: for when the was infected, a great tumor or Bubo arose in her groin, and fuddenly it went in again, fo that the third day of her fickness, the faid the was without any grief or discase at all, but that the was troubled with the difficulty of making water; and I think it was because the bladder was inflamed by the reflux of the matter; that she was found in mind and body, and walked up and down the chamber on the fame day that the died. The firangeness of which thing made the King fo fearful, that he hasted to depart thence,

Although this disease doth spare no man of what age, temperature, complexion, diet and condition foever, yet it assaulteth young men that are cholerick and sanguine, more often than old men that are cold and dry, in whom the moisture, that is the nourisher of putrefaction by reason of their age, is confumed, and the ways, paffages and pores of the skin, whereby the venomous air should enter and pierce in, are more strait and narrow. And moreover, because old men do always stay at home, but young men for their necessary business, and also for their delight and pleasure, are always more abroad in the day time, in the air, where-hence the pollution of the Pellilence cometh more often.

What Plague That peftilence that comes by the corruption of the humors, is not fo contagious as that which most contagious cometh by the default of the air. But those that are Phlegmatick and Melancholick, are most come monly grieved with that kind of Pestilence; because in them the humors are more clammy and gross. and their bodies more cold and lefs perspirable, for which causes the humors sooner and more speedi-

Men that are of an ill juice, are also most apt to this kind of Pessilence, for in the naughty quality of the juice there is a great preparation of the humors unto putrefaction: You may know it by this, that when the Pessilence reigneth, there are no other diseases among the common people, which have their original of an ill juice, but they all degenerate into the Plague. Therefore when they begin to appear and wander up and down, it is a token that the Pessilence will shortly cease or is almost at an end

But here also I would have you to understand those to be of an ill juice, which have no pores in their skin, by which, as it were by rivers, the evil juice which is contrary to nature, may be evacua-Who least feb- ted and purged. And I have noted and observed, that those are less in danger of the Petillence lect to take the which have Cancerous Ulcers and flinking fores in their Nofes, and fuch as are infected with the French-Pox, and have by reason thereof, tumors and rotten Ulcers, or have the Kings-evil running upon them, the Lepsone or the Scab: and to conclude: all those that have Fistulaes and running in

> I think those that have quartane Feavers are the better priviledged for the same, because that by the fit causing sweat, that cometh every fourth day, they avoid much of the evil juice that was en-

> This is more like to be true, than to think that the poylon that cometh from without, may be driven away by that which lurketh within.

> Contrariwife, women that are great with child, as I have noted, because they have much ill juice being prohibited from their accustomed evacuations, are very apt to take this disease, and so feldom recover after they are infected.

Black or blew impostumes, and spots and pustles of the same colour, dispersed over the skin, argue eate is incura- that the difeafe is altogether incurable and mortal.

When the swelling or foregoeth or cometh before the Feaver, it is a good sign; for it declareth that the malignity is very weak and feeble, and that nature hath overcome it, which of it felf is able A deadly fign. to drive fo great portion thereof from the inner parts. But if the fore or tumor come after the Feaver, it is a mortal and deadly fign, for it is certain that it cometh of the venomous matter not translated, but dispersed; not by the victory of nature, but through the multitude of the matter, with the weight whereof nature is overcome.

When the Moon decreafeth, those that are infected with the Pestilence, are in great doubt and danger of death, because then the humors that were collected and gathered together before the Full of the Moon, through delay and abundance, do fwell the more, and the faculties by which the body is governed, become more weak and feeble, because of the imbecillity of the native heat, which before was powerfled and on the faculties by the form fore was nourified and augmented by the light, and so consequently by the heat of the Full Moon: For as it is noted by Aristotle, the Wainings of the Moon are more cold and weak: and thence it is that women have their mentional fluxes chiefly, or commonly, at that time.

In a gross and cloudy air, the petitlent insection is less vehement and contagious, than in a thin and

and fubtiliair; whether that thinness of the air proceed from the heat of the Sun, or from the North In what air wind and cold. Therefore at Paris, where naturally, and also through the abundance of filth that most contains about the City, the air is dark and gross, the petillent insection is less fierce and contagious than our. it is in Provence, for the fubrilty of the air filmulates or helps forward the Plagu

But this difease is mortal and pernicious wheresoever it be, because it suddenly affaulteth the heart, which is the Manfion, or as it were the fortress or castle of life: but commonly not before the figns and tokens of it appear on the body: and yet you shall scarce find any man that thinketh of calling the Phylician to help to preferve him from fo great a danger, before the figns thereof be evident to be feen and felt's but then the heart is affaulted: And when the heart is fo affaulted, what hope of life is there, or health to looked for? Therefore because medicines come oft-times too late, and this what effects malady is as it were a fudden and winged meffenger of our death, it cometh to pass, that so many die feat and confi thereof. And moreover, because of the first suspicion of this so dire and cruel a disease, the imagina-in the Plague, tion and mind (whose force in the diversly much ftirring up of the humors, is great and almost incredible) is so troubled with sear of imminent death, and despair of health, that together with the perturbed humors, all the firength and power of nature falleth and finketh down-

This you may perceive and know, by reason that the keepers of such as are sick, and the bearers which are not fearful, but very confident, although they do all the bafeft offices which may be for the fick, are commonly not intected, and feldom die thereof, if infected.

CHAP. XVIII.

How a pefilent Feaver comes to be bred in ut.

He Plague oft-times findeth fuel in our bodies, and oft-times allurements, to wit, the putrefaction of humors, or aptness to putrefie: but it never thence hath its first original, for that comes always from the defiled air; therefore a peftilent Feaver is thus bred in us: The petitlent air drawn by infpiration in the lungs, and transpiration into the utmost mouths of the veins of the Pl and arteries forced over the skin, the bloud or elfe the humors already putrefying or apt to putrefie always from therein, are infected or turned into a certain kind of malignity refembling the nature of the agent, the alr.

These humors, like unquencht lime when it is first sprinkled with water, send forth a putrid vapor, which carried to the principal parts and heart especially, interest the spirituous bloud boiling in the ventricles thereof, and therewith also the vital spirits; and hence proceeds a certain feaverills heat. This heat diffused over the body by the arteries, together with a malign quality, taints all, even the folid parts of the bones, with the pestiferous venom; and besides, causeth divers symptoms, according to the nature thereof, and the condition of the body and the humors wherein it is. Then is the conflict of the malignity affailing, and nature defending, manifelt; in which, if nature prevail, it using the help of the expulsive faculty, will fend and drive it far from the noble parts, either by fweats, vomits, bleeding, evacuation by flool or urine, bubbes, carbuncles, pulles, fpots, and other fuch kinds of breakings out, over the skin, but on the contrary, if the malignity prevail, and Signs that nanature be too weak, and yield, and that first he be troubled with often panting, or palpitation of the ture is oreheart; then presently after with frequent faintings, the patient then at length will die. For this is a great fign of the Plague or a peffilent Feaver, it prefently at the first, with no labour, nor any evathation worth the speaking of, their strength fail them, and they become exceeding faint. You may find the other signs mentioned in our preceeding discourse.

CHAP. XIX.

Into what place the Patient ought to betake himfelf so soon as he finds himself insected.

E have faid, that the perpetual and first original of the pessilence cometh of the Air; Change of the therefore so some is blasted with the pestiferous Air, after he hath taken some pre. Air conduceth fervative against the malignity thereof, he must withdraw himself into some wholesom the Plague. Air, that is, clean and pure from any venomous infection or contagion; for there is great hope of health by the alteration of the Air ; for we do most frequently and abundantly draw in the Air of all things, so that we cannot want it for a minute of time: therefore of the Air that is drawn in, de-Pendeth the correction, amendment, or increase of the poyson or malignity that is received, as the Air is pure, fincere, or corrupted.

There be some that do think it good to shut the patient in a close chamber, shutting the windows to prohibit the entrance of the Air as much as they are able: But I think it more convenient that these windows should be open from whence that wind bloweth that is directly contrary unto that which brought in the venomous Air: For although there be no other cause, yet if the Air be not moved, or agitated, but shut up in a close place, it will soon be corrupted. Therefore in a close Air peat up is and quiet place that is not subject to the entrasce of the Air, I would wish the Patient to make wind, apt to puttesse. or to procure Air with a thick and great cloth, dipped or macerated in water and vinegar mixed together, and tied to a long fiaff, that by toffing it up and down the clofe chamber, the wind or air
thereof may cool and recreate the Patient. The Patient must every day be carried into a fresh chamber, and the beds and the linnen cloaths must be changed: there must always be a clear and bright hre in the Patients chamber, and especially in the night, whereby the air may be made more pure, clean, and void of nightly vapors, and of the filthy and petitlent breath proceeding from the Patient, or his excrements. In the mean time, left (if it be in hot weather) the Patient (should be weakned or made more faint, by reason that the heat of the fire doth disperse and waste his spirits, the soor or ground of his chamber must be sprinkled or watered with vinegar and water, or strowed with the

branches of Vines made moift in cold water, with the leaves and flowers of Water-lillies, or Poplar, or fuch like. In the fervent heat of Summer he must abstain from Fumigations that do smell too strong-

CHILITIAN POPE

ly, because that by affaulting the head, they increase the pain.

If the Patient could go to that coft, it were good to hang all the chamber where he lieth, and also the bed, with thick or coarse linnen cloaths moistned in vinegar and water of Roses. Those linnen cloaths ought not to be very white, but somewhat brown, because much and great whiteness doth disperse the sight, and by wasting the spirits, doth increase the pain of the head; for which cause also the chamber ought not to be very lightsome.

Contrariwife, on the night feafon there ought to be fires and perfumes made, which by their mo-

derate light, may moderately call forth the spirits.

The materials Sweet fires may be made of little pieces of the w

The materials Sweet fires may be made of little pieces of the wood of Juniper, Broom, Ash, Tamarisk, of the rind for sweet fires, of Oranges, Limons, Cloves, Benzoin, Gum-Arabick, Orris-roots, Myrrh, grossy beaten together, and laid on the burning coals put into a chasing-dish. Truly the breath or smook of the wood or berries of Juniper, is thought to drive ferpents a great way from the place where it is burnt. The virtue of the Ash-tree against venom is so great, as Pliny testifieth, that a Serpent will not come under the shadow thereof, no, not in the morning, nor evening, when the shadow of any thing is most great and long, but he will run from it. Imy self have proved, that if a circle or compass be made with the boughs of an Ash-tree, and a fire made in the midst thereof, and a Serpent put within the compass of the boughs, that the Serpent will rather run into the fire than through the Ash-boughs.

There is also another means to correct the Air. You may sprinkle Vinegar of the decoction of Rue, Sage, Rosenary, Bay-berries, Juniper-berries, Cyprus-nuts, and such like, on stones or bricks red hot, and put in a pot or pan, that all the whole chamber where the Patient lieth, may be perfumed

with the vapor thereof.

Ferfumes.

Also Furnigations may be made of some matter that is more gross and clammy, that by the force of the fire the sum may continue the longer, as of Ladanum, Myrth, Mattich, Rolin, Turpentine, Storax, Olibanum, Benzoin, Bay-berries, Juniper-berries, Cloves, Sage, Rosemary, and Marjoram, stamped together, and such like.

Those that are rich and wealthy, may have Candles and Fumes made of Wax, or Tallow mixed

with fome fweet things.

A fponge macerated in Vinegar of Rofes, and Water of the fame, and a little of the decoction of Cloves, and of Camphire added thereto, ought always to be ready at the Patients hand, that by of-

ten smelling unto it, the animal spirits may be recreated and strengthened.

A fweet water The water following is very effectual for this matter. Take of Orris four ounces, of Zedoary, to finell to.

Spikenard, of each fix drams; of Storax, Benzoin, Cinnamon, Nutmegs, Cloves of each one ounce

and half; of old Treacle, half an ounce: bruife them into gross powder, and macerate them for the space of twelve hours, in four pound of white and strong wine; then distill them in a Lembick of glass on hot ashes, and in that liquor wet a sponge, and then let it be tied in a limen cloth, or closed in a box, and so often put into the nostrils. Or take of the vinegar and water of Roses, of each four ounces; of Camphire, six grains; of Treacle, half a dram, let them be dissolved together, and put

into a viol of glass, which the patient may often put into his nofe.

This Nodula tollowing is more meet for this matter. Take of Rofe-leaves, two pugils; of Orris, half an ounce; of Calamus aromaticus, Cinnamon, Cloves, of each two drams; of Storax and Benzoin, of each one dram and a half; of Cyprus, half a dram; beat them into a grofs powder, make thereof a Nodula between two pieces of Cambrick or Lawn of the bignefs of an hand-ball; then let it be moiftened in eight ounces of Rofe-water, and two ounces of Rofe-winegar, and let the patient finell to it often. Those things must be varied according to the time: For in the Summer you must use neither Musk nor Civet, nor such like bot things: and moreover women that are subject to fits of the Mother, and those that have Feavers or the head-ach, ought not to use those things that are so strong smelling and hot, but you must make choice of things more gentle: Therefore things are made with a little Camphire and Cloves bruised and macerated together in Rose-water and vinegar of Roses, shall be sufficient.

CHAP. XX.

What Diet ought to be observed, and first of the choice of Meat.

Why fuch as have the Plague may feed more fully.

Sweet candles.

A Nodala to

finell to,

He order of Diet in a petilent difease ought to be cooling and drying; not stender, but some what full; because by this kind of disease there cometh wasting of the spirits, and exfolution of the faculties, which inferreth often swounding, therefore that loss must be repaired as soon as may be, with more quantity of meats that are of easie concoction and digestion; Therefore I never saw any being infected with the Pestilence, that kept a stender diet, that recovered his health,

but died; and few that had a good ftomach, and fed well, died.

Sweet, groß, moilt and clammy meats, and those which are altogether, and exquisitely of subtil parts, are to be avoided, for the sweet do easily take fire, and are soon inflamed; the moilt will putresse, the groß and clammy obitruct, and therefore engender putresaction; those meats that are of subtil parts, over much attenuate the humors, and inflame them; and do fiir up hot and sharp wapours into the brain, whereof cometh a Feaver. Therefore we must eschew Garlick and Onions, Mustard, salted and spiced Meats, and all kind of pulse must also be avoided, because they engender groß winds, which are the authors of obstruction: but the decoction of them is not always to be resusted, because it is a provoker of urine. Therefore let this be their order of diet: let their bread be of Wheat or Barly, well wrought, well leavened and salted, neither too new, nor too stale: let them be fed with such meat as may be easily concocted and digested, and may encounter

Pulse must be

The manner of Diet.

gender much laudable juice, and very little excremental, as are the fieth of Wether-Lambs, Kids, Leverets, Pullets, Partridges, Pigeons, Thrushes, Larks, Quails, Black-birds, Turtle-doves, Moor-Hens, Pheafants and fuch like; avoiding Water-Fowls. Let the fielh be moiffned in Verjuice of unripe Grapes, Vinegar, or the juice of Limmons, Oranges, Citrons, tart Pomgranats, Barberies, Gooleberries, or red Currans, or of Garden and Wild Sorrel: for all these sowre things are very wholsom in this kind of difease, for they do stir up the appetite, relist the venomous quality and putrefaction of the humours, reftrain the heat of the Fever, and prohibit the corruption of the meats in the flo-mach. Although those that have a more weak stomach, and are indued with a more exact sense, and are subject to the Cough and discases of the Lungs, must not use these, unless they be mixed with Sugar and Cinamon.

If the Patient at any time be fed with fodden meats, let the broths be made with Lettuce, Purflain, Succory, Eorage, Sorrel, Hops, Buglofs, Creffes, Burnet, Marigolds, Chervil, the cooling Seeds, French-Barly, and Oat-meal, with a little Saffron, for Saffron doth engender many fpirits, and relifieth poifon. To these opening roots may be added, to avoid obstruction; yet much broth must be refused by reason of moisture. The fruit of Capers eaten at the beginning of the meal provoke the appetite and prohibit obfiructions; but they ought not to be feafoned with overmuch Oil and Salt, that they

may also with good success be put into broths.

Fithes are altogether to be avoided, because they soon corrupt in the stomach: but if the Patient be delighted with them, those that live in stony places must be chosen; that is to say, those that live in pure and fandy water, and about Rocks and Stones, as are Trouts, Pikes, Pearches, Gud-geons and Crevices boiled in milk, Wilks, and fuch like. And concerning Sca-fifth, he may be fed with Giltheads, Gurnarts, with all the kinds of Cod-fish, Whitings not seasoned with falt, and Turbuts.

Eggs potched and caten with the juice of Sorrel are very good. Likewife Barly-water fea-foned with the grains of a tart Porngranat, and if the Fever be vehement, with the feeds of white Poppy. Such Barly-water is easie to be concocted and digetted, it cleanfeth greatly and moistens and mollifieth the belly. But in some it procures an appetite to vomit, and pain of the head, and those must abstain from it. But in stead of Barly-water they may use Pap, and Bread crummed in the

decoction of a Capon.

For the fecond Course let him have Raisins of the Sun newly sodden in Rose-water with Sugar, For the se-

fowre Damask Prunes, tart Cherries, Pippins, and Catharine Pears.

And in the latter end of the Meal, Quinces roafted in the Embers, Marmalate of Quinces, and Con- In the end of ferves of Engloss or of Roses, and such like, may be taken: or else this Powder following.

Take of Coriander-feeds prepared two drams, of Pearl, of Rofe-leaves Shavings of Harts-horn and Ivory of each half a dram, of Amber two fcruples, of Cinamon one fcruple, of Unicorns horn, and the bone of a Stags heart of each half a scruple, of Sugar of Roses sour ounces: make thereof a Powder, and use it after meats.

If the Patient be formewhat weak, he must be fed with Gelly made of the slesh of a Capon, and Veal fodden together in the water of Sorrel, Cardans Benediclus, with a little quantity of Rofe Vinegar, Cinamon, Sugar, and other fuch like, as the prefent necessity shall feem to require.

In the night feafon for all events and mischances, the Patient must have ready prepared, broth of

meats of good digeftion, with a little of the juice of Citrons or Pomgranats.

This refigurative that followeth may ferve for all. Take of the Conferve of Buglofs, Borage, A refigurative Violets, Water-lillies, and Success, of each two ounces, of the powder of the Electuary Dismargary-drink. tum frigidion, of the Trochifees of Camphire of each three drams, of Citron-feeds, Cardinas-leeds, Sorrel-feeds, the Roots of Dillaminus, Tormentil, of each two drams, of the broth of a young Capon made with Lettuce, Purllain, Buglofs and Borage boiled in it, fix pints, put them in a Limbeck of glafs with the flesh of two Pullets, of fo many Partridges, and with fifteen leaves of pure Gold: make thereof a diffillation over a foft fire. Then take of the diffilled liquor half a pint, firain it through a woollen bag, with two ounces of white Sugar, and half a dram of Ginamon: let the Patient use this when he is thirfly. Or elfe put the flesh of one old Capon, and of a leg of Veal, two minced Partridges, and two drams of whole Cinamon without any liquor, in a Limbeck of glass, well luted and covered, and so let them boil in Balneo Maria, unto the perfect concoction. For so the fleshes will be boiled in their own juice, without any hurt of the fire; then let the juice be preffed out therehence with a Prefs: give the Patient for every dofe, one ounce of the juice with fome cordial waters, fome Trifantalum and Diamargaritum frigidum.

The Preferves of fweet fruits are to be avoided, because that sweet things turn into choler; but the Confection of tart Prunes, Chetries, and such like may be fitly used. But because there is no kind of fickness that fo weakens the strength as the Plague, it is always necessary, but yet sparingly and often to feed the Patient, still having respect unto his custom, age, the region, and the time: for through emptiness there is no great danger, less that the venomous matter that is driven out to the superincial parts of the body, should be called back into the inward parts, by an hungry stomach, and the flornach it felf should be filled with cholcrick, hot, thin, and sharp excremental humours, whereof

cometh biting of the flomach, and gripings in the guts.

tummings or

CHAP. VII.

What drink the Patient infelled ought to ufe.

F the Fever be great and burning, the Patient must abstain from Wine, unless he be subject to fwouning: and he may drink the Oxymel following in stead thereof.

An Oxymch

Take of fair Water three quarts, wherein boil four ounces of Honey until the third part be confumed, feumming it continually; then strain it, and put it into a clean vessel, and add thereto four ounces of Vinegar, and as much Cinnamon as will furfice to give it a tafte. Or else a fugred Water, as followeth. Take two quarts of fair Water, of hard Sugar fix ounces, of Cinamon two ounces; firain it through a woollen bag or cloth without any boiling, and when the Patient will use it, put thereto a little of the juice of Citrons. The Syrup of the juice of Citronsexcelleth amongst all others

that are used against the Pestilence.

The use of the Julip following is also very wholforn. Take of the juice of Sorrel well clarified half a pint, of the juice of Lettuce so clarified four ounces, of the best hard Sugar one pound, boil them together to a perfection; then let them be strained and clarified, adding a little before the end a little Vinegar, and so let it be used between meals with boiled Water, or with equal portions of the Water of Sorrel, Lettuce, Scabious and Buglofs: or take of this former described Julip strained and clarified four ounces; let it be mixed with one pound of the fore-named Cordial waters, and boil them together a little. And when they are taken from the fire, put thereto of yellow Sanders one dram, of beaten Cinnamon half a dram, ftrain it through a cloth: when it is cold, let it be given the Patient to drink with the juice of Citrons.

Those that have been accustomed to drink Sider, Perry, Beer or Ale, ought to use that drink still, so that it be clear, transparent and thin, and made of those fruits that are somewhat tart; for troubled and dreggifh drink doth not onely engender groß humours, but also crudities, windiness, and obstru-

ctions of the first region of the body, whereof comes a Fever-

Oxycrate being given in manner following, doth affwage the heat of the Fever, and reprefs the putrefaction of the humours, and the fiercenels of the venom, and also expelleth the Water through the Veins, if so be that the Patients are not troubled with spitting of bloud, cough, yexing, and alto-

gether weak of fromach, for fuch must avoid tart things.

Take of fair Water one quart, of white or red Vinegar three ounces, of fine Sugar four ounces, of Syrup of Roles two ounces: boil them a little, and then give the Patient thereof to drink. Or take of the juice of Limmons and Citrons, of each half an ounce, of the juice of fowre Pomgranats two ounces, of the Water of Sorrel and Rofes of each an ounce, of fair Water boiled, as much as shall suffice : make thereof a Julip, and use it between meals. Or take the Syrup of Limmons and of red Currans of each one ounce, of the Water of Lillies four ounces, of fair Water boiled half a pint : make thereof a Julip. Or take of the Syrups of Water-lillies and Vinegar, of each half an ounce, diffolve it in five ounces of the Water of Sorrel, of fair Water one pint; make thereof a Julip.

The drinking But if the Patient be young, and have a ftrong and good ftomach, and cholcrick by nature, I think it of cold water, not unmeet for him to drink a full and large draught of Fountain water, for that is effectual to reto whom, and thrain and quench the heat of the Fever; and contrariwife, they that drink cold water often, and a when profitavery finall quantity at a time, as the Smith doth sprinkle Water on the Fire at his Forge, do increase the heat and burning, and thereby make it endure the longer. Therefore by the judgment of Celfus, when the difease is in the chief increase, and the Patient hath endured thirst for the space of three or four days, cold water must be given unto him in great quantity, fo that he may drink past his fatiety, that when his belly and stomach are silled beyond measure, and sufficiently cooled he may vomit.

Some do not drink fo much thereof as may cause them to vomit, but do drink even unto satiety, and so use it for a cooling Medicin; but when either of these is done, the Patient must be covered with many cloths, and so placed that he may sleep; and for the most part after long thirst and watching, and after long fulness, and long and great heat, found fleep cometh; by which great sweat is fent out, and that is a prefent help.

But thirst must fornetimes be quenched with little pieces of Melons, Gourds, Cucumers, with the leaves of Lettuce, Sorrel and Purslain made moist or foaked in cold Water, or with a little square piece of a Citron, Limmon, or Orange, macerated in Rofe Water, and sprinkled with Sugar, and so held in

the mouth, and then changed

But if the Patient be aged, his firength weak, phlegmatick by nature, and given to Wine, when the state of the Fever is somewhat past, and the chief heat beginning to asswage, he may drink Wine very much allaid at his meat, for to reftore his firength, and to supply the want of the wafled spirits. The Patient ought not by any means to suffer great thirst, but must mitigate it by drinking, or elfe allay it by washing his mouth with oxycrate and such like; and he may therein alfo wash his hands and his face, for that doth recreate the strength. If the slux or lask trouble him, he may very well use to drink steeled Water, and also boiled milk wherein many stones coming red hot out of the fire have been many times quenched. For the driness and roughness of the mouth, it is very good to have a cooling, moistening, and lenifying lotion of the mucilaginous water of the infusion of the feeds of Quinces, Pfilinm, id eft, Flea-wort, adding thereto a little Camphire, with the Water of Plantain and Rofes, then cleanse and wipe out the hith, and then moisten the mouth by bolding thereto a little Camphire. If the roughnets holding therein a little Oil of fweet Almonds mixed with a little Syrup of Violets. If the roughness breed or degenerate into Ulcers, they must be touched with the Water of the infusion of fublimate, or

But because we have formerly made frequent mention of drinking of Water, I have here thought good to speak formewhat of the choice and goodness of Waters. The choice of Water is not to be neglected,

A Julip.

The commo dities of Oxycrate. To whom hurtful.

when profita-Lib.3. cap.7.

For drines.

neglected, because a great part of our diet depends thereon; for besides that we use it either alone or mixed with Wine for drink, we also knead bread, boil meat, and make broths therewith. Many The choice of think that rain-water which falls in Summer, and is kept in a Ciftern well placed and made, is the wholefomest of all. Then next thereto they judge that Spring-water which runs out of the tops of Mountains, through Rocks, Cliffs, and Stones: in the third place they put Well-water, or that which rifeth from the foots of Hills. Also the River-water is good, that is taken out of the midfly or fiream. Lake or Pond-water is the worft, especially if it fland ftill, for fuch is fruitful of and flored with many venemous Creatures, as Snakes, Toads, and the like. That which comes by the melting of Snow and Ice is very ill, by reason of the too refrigerating faculty and earthly nature. But of Spring and Well-waters there are to be judged the best which are inspid, without finell and colour, such as are clear, warmish in Winter, and cold in Summer, which are quickly hot and quickly cold, that is, which His sea, so are most light, in which all manner of Pulse, Turnips and the like, are easily and quickly boiled. 26.

Lastly, When as such as usually drink thereof, have clear voices and shrill, their chests found, and a lively and freth colour in their faces.

CHAP. XXII.

Of Antidotes to be used in the Plague.

Ow we must treat of the proper cure of this difease, which must be used as soon as may be possible, because this kind of poison, in swiftness exceedeth the celerity of the Medicin. Therefore it is better to err in this, that you should think every difease to be pestilent in a peffilent feafon, and to cure it as the Peffilence: because that so long as the Air is polluted with the feeds of the Peffilence, the humours in the body are foon infected with the vicinity of fach an Air, for that then there happeneth no difease void of the Pestilence, that is to say, which is not pestilent from

the beginning by his own nature, or which is not made petilent.

Many begin the cure with Bloud-letting, fome with Purging, and fome with Antidotes. We ta- The beginking a confideration of the fubiliance of that part that is affaulted, first of all begin the cure with an ning of the Antidote; because that by its specifick property it defends the heart from posson, as much as it is of-cure must be fended therewith. Although there are also other Antidotes which preserve and keep the heart and by Antidotes. the Patient from the danger of Poifon and the Peffilence, not only because they do infringe the power of the poison in their whole substance, but also because they drive and expel it out of all the body by

fweat, vomiting, fcouring, and fuch other kinds of evacuations.

The Antidote must be given in such a quantity as may be sufficient to overcome the poison; but In what quanbecause it is not good to use it in greater quantity than needeth, left it should overthrow our Na- tity they must ture, for whose preservation onely it is used's therefore that which cannot be taken together at once, be taken. must be taken at several times, that some portion thereof may daily be used so long, until all the accidents, effects and imprefions of the poilon be past; and that there benothing to be feared. Some of those Antidotes confist of portions of venemous things being tempered together, and mixed in an apt proportion with other Medicins whose power is contrary to the venom: as Treacle, which hath Why poylofor an ingredient the fleth of Vipers, that it being thereto mixed may ferve as a guide to bring all the noss t Antidote unto the place where the venenate malignity hath made the chief impreffion, because by Antidotes. the fimilitude of Nature and Sympathy, one poifon is fuddenly fnatched and carried into another.

There are other absolutely poisonous, which nevertheless are Antidotes one unto another; as a Scor- some poisons pion himfelf cureth the pricks of a Scorpion. But Treacle and Mithridate excell all other Antidotes, Antido for by firengthening the noblest part, and the mantion of life, they repair and recreate the wasted spi- other some rits, and overcome the poilon, not onely being taken inwardly, but also applied outwardly to the region of the heart, Botches and Carbuncles: for by an hidden property they draw the poilous unto them, as Amber doth Chaff, and digelt it when it is drawn, and spoil and rob it of all its deadly force; as it is declared at large by Galen, in his Book De Therines ad Pifonem, by most true reasons and experiment. But you will fay that these things are hot, and that the Plague is often accom-Panied with a burning Fever. But thereto I answer, there is not so great danger in the Fever as in the Petitlence, although in the giving of Treacle, I would not altogether seem to neglect the Fever, but think it good to minister or apply it mixed with cordial-cooling Medicins, as with the Trochifees of Camphire, Syrup of Limmons, of Water-lillies, the Water of Sorrel and such like. And for the fame cause we ought not to chuse old Treacle, but that which is of a middle age, as of one or two years old: to those that are strong you may give half a dram; and to those that are more Weak, a dram.

The Patient ought to walk prefently after he hath taken Treacle, Mithridate, or any other An-How to walk tidote, but yet as moderately as he can: not like unto many, which when they perceive themselves after the tato be infected, do not cease to course and run up and down, until they have no strength to suffain king of a their bodies; for so they dissolve Nature, so that it cannot suffice to overcome the contagion. After Antidote, moderate walking the Patient must be put warm to bed, and covered with many cloaths, and warm Brick-bats or Tiles applied to the foles of his feet; or in flead thereof you may use Swines bladders folled with hot Water, and apply them to the groins and arm-holes, to provoke fweat: for fweating in this difeafe is a most excellent remedy, both for to evacuate the humours in the Fever, and also to drive forth the malignity in the Petillence, although every fweat brings not forth the fruit of health of the first that he fave a Worsen at Missis in the first had been also to drive forth the first that he fave a Worsen at Missis in the first that he fave a Worsen at Missis in the first that he fave a Worsen at Missis in the first that he fave a Worsen at Missis in the first that he fave a Worsen at Missis in the first that he fave a Worsen at Missis in the first that he fave a Worsen at Missis in the first that he fave a Worsen at Missis in the first that the f of health. For George Agricula faith, that he faw a Woman at Mifnia in Germany, that did fweat fo for the space of three days, that the bloud came forth at her head and breft, and yet nevertheless

This Potion following will provoke fweat. Take the roots of China shaved in thin pieces one A Sudorifick ounce and half, of Gualseum two ounces, of the bark of Tamarisk one ounce, of Angelica-roots Potion.

tunning.

two drams, of the shavings of Harts-horn one ounce, of Juniper-berries three drams: put them into a viol of glafs that will contain fix quarts, put thereto four quarts of running or river-water that is pure and clear, macerate them for the space of one whole night on the ashes, and in the morning boil them all in Balneo Marie until the half be consumed, which will be done in the space of six hours, then let them be strained through a bag, and then strained again, but let that be with fix ounces of Sugar of Roses, and a little Treacle: let the Patient take eight ounces or sewer of that liquor, and it will provoke fweat. The Powder following is also very profitable. Take of the leaves of Dictammu, the Roots of Tormentil, Betony, of each half an ounce, of Bole-Armenick prepared one ounce, of Torna Sigillara three drams, of Aloes and Myrth, of each half a dram, of Saffron one dram, of Mastich two drams, powder them all according to Art, and give one dram thereof dissolved in Rose-water, or the water of wild Sorrel, and let the Patient walk so soon as he hath taken that Powder, then let him be laid in his bed to fweat, as I have shewed before.

Plague.

Another.

to be used in

A Sudorifick Powder.

A diffilled wa- The Water following is greatly commended against poison. Take the roots of Gentian and Cyter against the perus of each three drams; of Carduns Benedicius, Burnet, of each one handful; of Sorrel feeds, and Devils-bit, of each two pugils; of Ivy and Juniper-berries, of each half an ounce; of the Flowers of Buglofs, Violets, and red Rofes, of each two pugils: Powder them fomewat grofly, then foak or freep them for a night in white Wine and Rofe water: then add thereto of Bole-Armenick one ounce, of Treacle half an ounce, diffil them all in Balnes Marie, and keep the diffilled liquor in a viol of glass well covered or close stopped for your use: let the Patient take fix ounces thereof with Sugar and a little Cinnamon and Saffron: then let him walk, and then sweat as is aforesaid: the Treacle and Cordial water formerly prescribed, are very profitable for this purpose. Also the Water following is greatly commended. Take of Sorrel fix handfuls, of Rue one handful, dry them and macerate them in Vinegar for the space of four and twenty hours, adding thereto four ounces of Treacle: make thereof a diffillation in Balneo Marie, and let the diffilled water be kept for your ufe: and fo foon as the Patient doth think himfelf to be infected, let him take four ounces of that liquor, then let him walk and sweat. He must leave sweating when he beginneth to wax faint and weak or when the humour that runs down his body begins to wax cold, then his body must be wiped with warm cloths, and dried. The Patient ought not to fweat with a full flomach, for fo the heat is called away from performing the office of concoction, also he must not sleep when he is in his fweat, left the malignity go inwardly with the heat and spirits unto the principal parts: but if the Patient be much inclined to fleep, he must be kept from it with hard rubbing, and bands tied about the extreme parts of his body, and with much noise of them that are about him, and let his friends comfort him with the good hope that they have of his recovery; but if all this will not keep him from fleep, diffolve Cafterenn in tart Vinegar, and AquaVite, and let it be injected into his noftrils: and let him be kept continually waking the first day, and on the second, and third, even unto the fourth; that is to fay, unto the perfect expulsion of the venom; and let him not sleep above three or four hours on a day and a night. In the mean time let the Phylician that shall be present confider all things by his firength; for it is to be feared that great watchings will diffolve the firength, and make the Patient weak: you must not let him eat within three hours after his sweating; in the mean feafon, as his strength shall require, let him take the rind of a Preserved Citron, Conserve of Roses, Bread toasted and steeped in Wine, the meat of Preserved Myrabolane, or some such like thing.

CHAP. XXIII.

Of Epithemes to be used for the strengthening of the principal parts.

Whereof they must be made

Here are also some topick Medicins to be reckoned amongst Antidotes, which must be out-wardly applied as speedily as may be, as cordial and hepatick Epithems for the safety of the noble parts, and ftrengthening of the faculties, as those that drive the venenate air far from the bowels: they may be made of cordial things not onely hot, but also cold, that they may temper the heat, and more powerfully repercufs. They must be applied warm with Scarlet, or a temper the heat, and more powerfully repercus. They must be applied warm with Scarlet, or a double linnen cloth, or a fost Sponge dipped in them, if so be that a Carbuncle do not possess regions of the most noble parts: for it is not fit to use repercussives a Carbuncle. You may make Epithems after the following forms: R. Aquar. ros.plantag. & solan. an. 3 iv. aqua acetos.vini grants. & aceti, an. 3 ii. santal. rub. & coral. rub. pulveris. an. 3 ii. theriac. vet. 3 s. campb.) i. croci) i. caryoph. 3 s. misce, stat epithema. Or else, Aav. rosav. neurosav. buslos, acetose, aceti rosav. an. th. s. theriae, & mithrid, an. 3 j. fiat epithema. Or elfe, Aqu. rofar, nemph, buglof, actofa, acti rofar, an. th. β. fant. rub. rof. rub. an. 3 iii, flor. nemph, violar, campbur, an. 3 β. mithrid. & theriae, an. 3 ii, strantur & miferantur fomul omnia. When you intend to use them take some portion of them in a vessel by its self, where with let the asset of the past of felf, wherewith let the affected bowel be formented warm.

Repercullives not fit to be applied to Carbuncles,

CHAP. XXIV.

Whether Purging and Bloud-letting be necessary in the beginning of Pestilent diseases.

Regions for and against Bloud-letting in the Plague. O foon as the heart is firengthened and corroborated with Cordials and Antidotes, we must come to phlebotomy and purging. As concerning Bloud-letting in this case there is a great controversic among Physicians. Those that wish it to be used, say or affirm, that the

peftilent Fever doth infix it felf in the bload, and therein also the Peftilent malignity taketh its feat; and therefore it will foon infect the other humours, unless that the bloud be evacuated, and the infection that remaineth in the bloud be thereby taken away. Contrariwife, those that do not allow phlebotomy in this case, alledge that it often cometh to pass that the bloud is void of malignity, when the other humours are infected with the venemous contagion. If any man require my judgment in this doubtful question, I say, that the pettilence sometimes doth depend on the default of the sing of this air : this default being drawn through the paffages of the body, doth at length pierce unto the in- controverse. trails, as we may understand by the absects which break out, one while behind the cars, some times in the arm-holes, and fometimes in the groins, as the brain, heart or liver are infected. And bereof also come Carbancles, and other collections of matter, and eruptions, which are seen in all parts of the body; by reason that Nature using the firength of the expulsive faculty, doth drive forth whatsoever is notion of hurtful. Therefore if the Physician will follow this motion of Nature, he must neither purge nor let bloud, lest that by a contrary motion, that is, by drawing in from without, the motion of Nature which proceeds outwardly from within, should be troubled. So we often fee in those who are purged or let bloud for such Buboes as come through unlawful copulation, that the matter is thereby made contumacious, and by drawing it inwardly, it speedily causeth the French Pox.

Wherefore when Buboes, Carbuncles, and other peftilent eruptions appear, which come through the default of the air, we ought to abitain from purging and phlebotomy; but it is sufficient to forearm the heart inwardly and outwardly with Antidotes that are indued with a proper virtue of relifting the poison. For it is not to be doubted, but that when nature is debilitated with both kinds of evacuation, and when the spirits together with the bloud, are exhausted, the venemous air will soon pierce, and be received into the empty body, where it exerciseth its tyranny to the utter destruction

In the year of our Lord God 1566, in which year there was great mortality throughout all France, An History; by reason of the Petillence and petillent diseases, I earnestly, and diligently inquired of all the Physicians and Chirurgions of all the Cities (through which King Charles IX, paffed in his progrefs unto Eryan) what fucces their Patients had after they were let bloud and purged: whereunto they all anfwered alike, that they had diligently observed, that all that were infected with the Petillence, and were let bleed some quantity of blood, or had their bodies somewhat strongly purged, thenceforwards waxed weaker and weaker, and four length died; but others which were not let bloud nor purged, but took cordial Antidotes inwardly, and applied them outwardly, for the most part escaped and recovered their health: for that kind of Pelilence took its original of the primitive and folitary default of the air, and not of the corruption of the humours.

The like event was noted in the lioarfness that we spoke of before; that is to say, that the Patients when purgwaxed worfe and worfe by purging and phlebotomy; but yet I do not difallow either of those remeing and bi dies, if there be great fulness in the body, especially in the beginning, and if the matter have a cruel ing may be violence, whereof may be feared the breaking in unto some noble part. For we know that it is confirmed by Hippocrates, that what difease soever is caused by repletion, must be cured by evacuation; 496:2256.0.3. and that in dileafes that are very tharp, if the matter do fwell, it ought to be remedied the fame day, 40.10/18.41 for delay in fuch difeafes is dangerous; but fuch difeafes are not caufed or inflicted upon mans body by reason or occasion of the petitlence, but of the difeased bodies, and diseases themselves commixed together with the peftilence: therefore then peradventure it is lawful to purge firougly, and to let a good quantity of blood, left that the petillent venom should take hold of the matter that is prepared, and so insect it with a contagion, whereby the pestilence taketh new and far greater strength; especially as Celfus admonisheth us, where he faith, that by how much the sooner those studen cap 110.3. invalions do happen, by fo much the fooner remedies must be used, yea, or rather rashly applied; therefore if the Veins swell, the face wax nery red; if the arteries of the Temples bear strongly; if the Patient can very hardly breath by reason of a weight in his stomach, if his spittle be bloudy, then ought he to be let bloud without delay, for the causes before mentioned. It seems best to open It feems best to open Why bloud the Liver-vein on the left arm, whereby the heart and ipleen may be better discharged of their abun-must be let on dant matter; yet bloud-letting is not good at all times, for it is not expedient when the body be, the Plante. ginneth to wax shift by reason of the coming of a Fever; for then by drawing back the heat and the Plague. fpirits inwardly, the outward parts being deftitute of bloud, wax stiff and colds therefore bloud cannot be let then without great loss of the firength, and perturbation of the humours. And it is to be noted, that when those plethorick causes are present, there is one Indication of bloud-letting in a simple pestilent Fever, and another in that which hath a Bubo, idest, a Botch, or a Carbancle joined therewith. For in one or both of these, being joined with a vehement and strong burning Fever, bloud must be letten by opening the Vein that is nearest unto the tumour or swelling against nature, keeping the strainess of the fibres, that this being open the bloud might be drawn more at the color of the strainess of the strai directly from the part affected; for all and every retraction of putrefied blond unto the noble parts, is to be avoided, because it is noisom and hurtful to Nature, and to the Patient. Therefore for example sake, admit the Patient be plethorick by repletion, which is called ad Vasa, id of, unto the Veffels, and ad Vires, id of, unto the firength; and therewithall he hath a tumour that is peffilent in the parts belongingunto the head or neck; the blood must be let out of the Cephalick or Median Vein, or out of one of their branches dispersed in the arm on the grieved side. But if through oc-casion of fat, or any other such like cause, those Veins do not appear in the arm, there be some that give counfel in such a case to open the vein that is between the fore-tinger and the thumb, the hand being put into warm water, whereby that Vein may fwell and be filled with bloud gathered thither by means of the heat.

If the tumour be under the harm-hole, or about those places, the Liver-vein or the Median must be opened which runneth alongst the hand: if it be in the groin, the vein of the ham, or Saphena,

(titilititis)

or any other vein above the foot that appeareth well, but always on the grieved fide. And Phlebotomy must be performed before the third day: for this discase is of the kind or nature of sharp difeafes, because that within four and twenty hours it runneth past help. In letting of blond your must have consideration of the strength. You may perceive that the Patient is ready to swoon when that his forehead waxeth moift, with a fmall fweat fuddenly arifing by the aking or pain at the fromach, with an appetite to vomit, and defire to go to ftool, gaping, blackness of the lips, and fudden alteration of the face unto paleness: and laftly most certainly by a fmall and flow pulse; and then you must lay your finger on the vein, and stop it until the Patient come to himself again, either by Nature, or elfe restored by Art; that is to say, by giving unto him Bread dipped in Wine, or any other such like thing; then if you have not taken blood enough, you must let it go again, and bleed so much as the greatness of the disease, or the strength of the Patient will permit or require: which being done, fome of the Antidotes that are preferibed before will be very profitable to be drunk, which may repair the firength, and infringe the force of the malignity.

CHAP. XXV.

Of purging Medicins in a Peftilent difeafe.

What Purges fit in the Plague,

F you call to mind the proper Indications, purging shall seem necessary in this kind of disease, and that must be prescribed as the present case and necessity requirets rightly considering that the difease is sudden, and doth require Medicins that may with all speed drive out of the body the hurtful humour wherein the noison quality doth lurk and is hidden; which Medicins are divers by reason of the diversity of the kind of the humour, and the condition or temperature of the Patient. For this purpose fix grains of Scammony beaten into Powder, or else ten grains are commonly minifired to the Patient with one dram of Treacle. Also Pills may be made in this form: Take of Treacle and Mithridate of each one dream, of Sulphur vivuum finely powdered, half a dram, of Diagridium four grains; make Pills thereof. Or take three drams of Aloes, of Myrrh and Saffron of each one dram, of white Hellebore and Afarabatea, of each 3 iv. make thereof a mais with old Treacle, and let the Patient take four scruples thereof for a dose, three hours before meat. Ruffus his Pills may be profitably given to those that are weak. The ancient Physicians have greatly commended Agarick for this difease, because it doth draw the noisom humours out of all the members: and the virtues thereof are like unto those of Treacle; for it is thought to strengthen the heart, and to draw out the malignity by purging. To those that are strong, the weight of two drams may be gi-ven, and to those that are more weak, half a dram. It is better to give the infusion in a decoction than infubstance, for being elected and prepared truly into Trochifces, it may be called a divine kind of Medicin.

Antimonium is highly praifed by the experience of many, but because I know the use thereof is con-demned by the Council and decree of the School of Physicians at Paris, I will here cease to speak of its Those Medicins that cause sweats are thought to excel all others, when the Pestilence cometh of the venemous air; among whom the efficacy of that which followeth, hath been proved, to the great good of many in that Pestilence which was lately throughout all Germany, as Matthias Rodler Chance-

our to Duke George the Count Palatine fignified unto me by Letters.

An effectual alfo purging Medicin,

They do take a bundle of Mugwort, and of the alhes thereof after it is burnt, they make a lee with fudorifick, and four pints of Water, then they do fet it over the fire, and boil it in a veffel of Earth well leaded, until the liquor be confumed, the earthy dregs falling into the bottom like unto falt, whereof they make Trochifees of the weight of a crown of gold: then they diffolve one or two of these Trochifees, according to the strength of the Patient, in good Muskadine, and give it the Patient to drink, and let him walkafter that he hath drunk it for the space of half an hour; then lay him in his bed, and there fweat him two or three hours, and then he will vomit, and his belly will be loofed as if he had taken Antimony; and fo they were all for the most part cured, especially all those that took that re-medy betimes: and before the disease went to their heart, as I my felf have proved in some that were fick at Paris, with most happy success. Truly Mugwort is most highly commended by the ancient The virtues of Phyficians, being taken and applied inwardly or outwardly, against the bitings of venemous Creatures fo that it is not to be doubted but that it hath great virtue against the Pestilence.

Pid. Rendelet. I have heard it most certainly reported by Gilbertus Hersaldus Physician of Monspelier, that eight lib. 2. de pif. 2.3. ounces of the pickle of Anchovies drunk at one draught, is a most certain and approved remedy against the Pestilence, as he and many other have often found by experience. For the Plague is no other thing but a very great putrefaction, for the correction and amendment whereof, there is nothing more apt or fit than this pickle or fubfiance of Anchovies, being melted by the Sun and force of the falt that is firewed thereon. There be forme which infuse one dram of Walwort feed in white Wine, and affirm that it drunk, will perform the like effect as Antimony. Others diffolyea little weight of the feed of Rue being bruifed in Muskadine, with the quantity of a Bean of Treacle, and fodrink it. Others beat or bruife an handful of the leaves or tops of Broom in half a pint of white-Wine, and so give it to the Patient to drink, to cause him to vornit, loose his belly and make him to Truly those that are wounded or bit with venemous Beasts, if they bind Broom above the wound, it will prohibit or hinder the venom from difperfing it felt, or going any further: therefore a drink made thereof will prohibit the venom from going any nearer the heart. Some take of the root of Elecampane, Couring T. of Elecampane, Gentian, Tormentil, Kermes-berries, and Broom, of the Powder of Ivory and Harts-horn, of each half a drams, they do bruife and beat all thefe, and infufe them for the space of four and and twenty hours in white Wine and Aqua Vite on the warm embers, and then strain it, and give the Patient three or four causes the second of the Cause and infuse the power of the Patient three or four ounces thereof to drink; this provokes Sweat and infringeth the power of the poisons; and the Potion following hath the fame virtue. Take good Mustard half an ounce, of Treacle

A Potion.

cle or Mithridate the weight of a Bean; diffolve them in white Wine and a little Aqua Vita, and let the Patient drink it, and sweat thereon with walking. You may also roaft a great Onion made hollow, and filled with half a dram of Treacle and Vinegar under the embers, and then firain it, and mix the juice that is preffed out of it with the water of Sorrel, Cardina Benedicine, or any other cordial thing, and with firong Wine, and give the Patient to drink thereof to provoke fweat, and to repel the malignity. Or elfe take as much Garlick as the quantity of a Nut; of Rue and Celandine of each twenty leaves; bruife them all in white Wine and a little Aqua Vite; then firain it and give the Patient thereof to drink. There be forne that do drink the juice that is prefled out of Celandine and Mallows, with three ounces of Vinegar, and half an ounce of the Oil of Wall-nuts, and then by much walking do unburthen their fromach and belly upwards and downwards, and fo are helped. When the venemous air hath already crept into and intected the humours, one dram of the dried leaves of the Bay tree macerated for the space of two days in Vinegar and drunk, is thought to be a most foveraign Medicin to provoke sweat, looseness of the belly and vomiting,

Matthiolus in his Treatife De Morbo Gallieo writeth, that the Powder of Morenry ministred unto the Patient with the juice of Carduns Benedicius, or with the Electuary De Gemmis, will drive away the Peffilence before it be confirmed in the Body, by provoking vomit, loofnets of the belly and feat: one dram of Caleanchum or white Copperas diffolved in Rofe water, performeth the like effect in the fame difeafe. Some do give the Patient a little quantity of the Oil of Scorpions with white Wine, to expel the poifon by vornit, and therewithall they anoint the region of the heart, the breit and the writis of the hands. I think these very meet to be used often in bodies that are strong and well exercifed, because weaker Medicins do evacuate little or nothing at all, but onely move the huthours, whereby cometh a Fever. When a fufficient quantity of the malignity is evacuated, then you that minister things that may firengthen the belly and flomach, and with-hold the agitation or working of the humours: and fuch is the confection of Alkermes,

CHAP. XXVI.

Of many Symptoms which happen together with the Plague: and first of the pain of the Head.

F the malignity be carried into the brain, and Nature be not able to expel it, it inflames not onely The cause of it but also the membranes that cover it: which inflammation doth one while hurt, trouble, or Phrenfie in abolish the imagination, another while the judgment, and fometimes the memory, according to the Plague, the fituation of the inflammation, whether it be in the former, or hinder, or middle part of the head is but hereof cometh always a Phrenice, with hery reducts of the eyes and face, and heaviness and burning of the whole head. If this will not be amended with Clysters, and with opening the Cephalick Vein in the arm, the arteries of the Temples must be opened, taking so much bloud out of them, as the greatness of the symptoms and the strength of the Patient shall require and permit. Truly the Thebenest of the greatness of the fymptoms and the strength of the Patient shall require and permit. incition that is made in opening an artery will close and join together as readily, and with as lit- opening an artle difficulty as the incition of the vein. And of fuch an incition of an artery cometh prefent help, by reason that the tensive and sharp vapours do plentifully breath out, together with the arterious bloud. It were also very good to provoke a flux of bloud at the nose, if Nature be apt to exonerate her felf that way. For as Hippocrates faith, when the head is grieved, or generally aketh, if matter, 49h.10. fell.6. water or blood flow out at the noftrils, mouth, or ears, it prefently cures the difease. Such bleed-ing is to be provoked by strong blowing, or striving to cleanse the nose by scratching or pricking of

the inner fide of the notirils, by pricking with an horfe-hair, and long holding down of the head.

The Lord of Fountains, a Knight of the Order, when we were at Eagon, had a bleeding at the nofe, An History, which came naturally for the space of two days, and thereby he was freed of a petitlent Fever which he had before, a great (weat ariting therewithall; and flortly after his Carbuncles came to suppura-tion, and by Gods grace he recovered his health being under my cure. If the bloud do flow out and To flay bleedcannot be flopped when it ought, the hands, arms, and legs must be tied with bands, and Sponges ing-wet in Oxycrate must be put under the arm-holes, Cupping-glasses must be applied unto the dugs, and to the region of the Liver and Spleen; and you must put into the nostrils the down of the Willow tree, or any other aftringent Medicin, incorporated with the hairs pluckt from the flank, belly or throat of an Hare, Bole-Armenick, Terra Sigillata, the juice of Plantain and Knot-grafs mixed together; and furthermore the Patient must be placed or laid in a cool place. But if the Patient be no-thing mitigated notwithstanding all these should, we must come to Medicins that procure

fleep, whose forms are these. Take of green Lettuce one handful, Flowers of Water-lillies and Violets, of each two pugils; one Medicins to heap of white Poppy bruifed, of the Four cold Seeds, of each two drams; of Licorice and Raifins of procure fleep. each one dram; make thereof a decoction, and in the straining dissolve one onnce and an half of Diasedium: make thereof a large potion to be given when they go to reft. Alfo Barly-cream may be Prepared in the water of Water-lillies and of Sorrel of each two ounces adding thereto fix or eight grams of Opnow, of the Four cold Seeds, and of white Poppy Seeds, of each half an ounce; and let the fame be boiled in Broth Lettuce and Purlain; also the Pills De Cymploffo, i. e. Hounds-tongue may be given. Clyfters that provoke fleep must be used, which may be thus prepared. Take of Barly-water half a pint, Oil of Violets and Water-lillies, of each two ounces; of the Water of Plantain and Purslain, or rather of their juices, three ounces; of Camphire seven grains, and the Whites of three Eggs: make thereof a Clyster. The head must be formented with Rose Vinegar, the hair being first shaved away, leaving a double cloth wet therein on the same, and often renewed. Sheepslungs taken warm out of the bodies, may be applied to the head, as long as they are warm. Cuppinga glaffes with and without fearification may be applied to the neck and shoulder-blades. The arms and legs must be strongly bound, being sirft well rubbed, to divert the sharp vapours and humours

(annum)

from the head. Frontals may also be made on this manner. Take of the Oil of Roses and Waterlillies, of each two ounces; of the Oil of Poppy half an ounce; of Opium one dram, of Rofe Vinegar one ounce, of Camphire half a dram, mix them together. Also Nodulaes may be made of the flowers of Poppies, Henbane, Water-lillies, Mandrags, beaten in Role water with a little Vinegar, and a little Camphire, and let them be often applied to the notirils: for this purpose Cataplaims also may be laid to the forehead. As, Take of the mucilage of the feeds of Pfiliam, i.e. Flea-wort, and Quince feeds extracted in Rofe water, three ounces; of Barly-meal four ounces, of the Powder of Rofe leaves, the flowers of Water-lillies and Violets, of each half an ounce; of the feeds of Poppies and Porflain, of each two ounces; of the water and vinegar of Rofes, of each three ounces; make thereof a Cataplasm, and apply it warm to the head. Or take of the juice of Lettuce, of Water-lillies, Henbane, Purplain, of each half a pint; of Rofe leaves in powder, the feeds of Poppy, of each half an ounce; Oil of Rofe three ounces, of Vinegar two ounces, of Barly-meal as much as fhall fuffice: make thereof a Cataplain in the form of a liquid Pultis. When the heat of the head is mitigated by these Medicins, and the inflammation of the brain affwaged, we must come unto digesting, and resolving formentations, which may disperse the matter of the vapours. But commonly in pain of the head, they do use to bind the forehead and hinder part of the head very firongly, which in this case must be avoided.

A Cataplasim.

CHAP. XXVII.

Of the beat of the Kidnies.

for the reins.

for the heart,

The noise of fleep.

He heat of the Kidnies is tempered by anointing with unquent, refrigerans Galeni newly made adding thereto the Whites of Eggs well beaten, that so the Ointment may keep moitt the longer; let this liniment be renewed every quarter of an hour, wiping away the reliques of the old. At the head of the Patient as he lies in his bed, shall be fet an Ewer or Cock with a Basin under it dropping was to receive the Water, which by the dropping may refemble rain. Let the foles of the feet and ter draws on a palms of the hands be gently feratched, and the Patient lie far from noife, and so at length he may fall to fome reft.

CHAP. XXVIII.

Of the Exuptions and Spots, which commonly are called by the name of Purples and Tokens.

The differences of the Plague. Their feveral names, and reasons of them.

When figns of

He skin in peftilent Fevers, is marked and variegated in divers places with fpots, like unto the bitings of Fleas or Gnats, which are not always simple, but many times arise in form like unto a grain of Millet. The more spots appear, the better it is for the Patient: they are of divers colours, according to the virulency of the malignity, and condition of the matter, as red, yellow, brown, violet or purple, blue and black. And because for the most part they are of a purple colour, therefore we call them Purples. Others call them Lenticulae, because they have the colour and form of Lentils. They are also called Papiliones, (i.) Butterflies; because they do suddenly seize or fall upon divers regions of the body, like unto winged Butterflies, fornetimes the face, formetimes the arms and legs, and formetimes all the whole body; oftentimes they do not onely affect the upper part of the skin, but go deeper into the flesh, specially when they proceed of matter which is gross and adult. They do sometimes appear great and broad, affecting the whole arm, leg or face, like unto an Enf pelas: to conclude, they are diverfe, according to the variety of the humour that offends in quantity or quality.

If they are of a purple or black colour, with often fwouning, and fink in fuddenly without any manifest cause, they fore-shew death.

The cause of the breaking out of those Spots, is the working or heat of the blood, by reason of the cruelty of the venom received or admitted. They often arife at the beginning of a petillent Fever: trany times before the breaking out of the Sore, or Botch, or Carbuncle, and many times after: but then they flew fo great a corruption of the humours in the body, that neither the fores nor carbon-cles will fuffice to receive them; and therefore they appear as fore-runners of death. Sometimes they break out alone, without a botch or carboncle, which if they be red, and have no evil fymptoms joined with them, they are not wont to prove deadly: they appear for the most part on the third or fourth day of the difease, and sometimes later, and sometimes they appear not before the Patient be dead; because the working or hear of the humours being the off springs of patrefaction, is not as yet dead; because the working or heat of the humours being the off-spring of putrefaction, is not as yet refirained and ceafed.

Wherefore then principally the putrid heat, which is greatest a little before the death of the Pa-Why they fomerimes aptient, drives the excremental humours, which are the matter of the ipots, unto the skin; or elfe because Nature in the last conflict hath contended with some greater endeavour than before (which pear after the death of the Patiene.

is common to all things that are ready to die) a little before the inflant time of death, the Petillent humour being prefently driven unto the skin; and Nature thus weakned by these extreme conflicts falleth down profrate, and is quite overthrown by the remnant of the matter.

CHAP. XXIX.

Of the cure of Eruptions and Spots.

Ou must first of all take heed left you drive in the humour that is coming outwards with They are to repercusives: therefore beware of cold, all purging things, phlebotomy, and drowfie or be cared by found sleeping. For all such things do draw the humours inwardly, and work contrary to But it is better to provoke the motion of Nature outwardly, by applying of drawing Medical Proposition Medicine to provoke sweat inwardly; for otherwise hy probling and cins outwardly, and ministring Medicins to provoke fweat inwardly; for otherwise by repelling and flopping the matter of the eruptions, there will be great danger, left the heart be opprefied with the abundance of the venom flowing back; or elfe by turning into the belly it infers a mortal bloudy flux: which discommodities that they may be avoided, I have thought good to set down this remedy, whose efficacy I have known and proved many times, and on divers persons, when by reason of the weakness of the expulsive faculty, and the thickness of the skin, the matter of the spots cannot break forth, but is constrained to lurk under the skin, lifting it up into bunches and knobs.

I was brought unto the invention of this remedy, by comparison of the like: For when I under- The indicari-ficod, that the effence of the French Pox (and likewise of the Pestilence) consisted in a certain on of caring hidden virulency and venemous quality, I foon descended unto that opinion, that even as by the taken from annointing of the body with the unguent compounded of Quick-filver, the gross and clammy humours which are fixed in the bones, and unmovable, are diffolved, relaxed and drawn from the center into the superficial parts of the body, by strengthening and stirring up the expulsive faculty, and evacuated by fweating and fluxing at the mouth; that foit should come to pass in pestilent Fevers, that Nature being strengthened with the same kind of unction, might unload her felf of fome portion of the venemous and pelillent humour, by opening the pores and paffages and letting it break forth into spots and puliles, and into all kind of eruptions. Therefore I have anointed many in whom Nature feemed to make paffage for the venemous matter very flowly, first loofing their belly with a Clyller, and then giving them Treacle-water to drink, which might defend the vital faculty of the heart, but yet not diftend the flomach, as though they had the French Pox, and I obtained my expected purpose: In stead of the Treacle-water you may use the decoction of Guaiacom, which doth heat, dry, provoke fweat, and repel putrefaction, adding thereto also Vinegar, that by the fubrilty thereof, it may pierce the better, and withfland the putrefaction. This is the deferi-

ption of the Unguent.

Take of Hogs-greafe one pound, boil it a little with the leaves of Sage, Thyme, Rofemary, of each An ointment of Hogs-greafe one pound, boil it a little with the leaves of Quick-filver, which hath been to draw them forth when half an handful, firain it, and in the firaining extinguish five ounces of Quick-tilver, which hath been to draw them forth boiled in Vincear with the fore-mentioned berbs; of Sal Nitrom three drams, the Yolke of three forth when first boiled in Vinegar with the fore-mentioned herbs; of Sal Nitrum three drams, the Yolks of three they appear Eggs boiled until they be hard, of Treacle and Mithridate, of each half an ounce, of Venice Turpen- too flowly. tine, oil of Scorpions and Bays, of each three ounces, incorporate them all together in a mortar, and make thereof an Unguent, wherewith anoint the Patients arm-holes and groins, avoiding the parts that belong to the head, breft, and back-bone: then let him be laid in his bed, and covered warm, and let him sweat there for the space of two hours, and then let his body be wiped and cleanfed; and if it may be, let him be laid in another bed, and there let him be refreshed with the decoction of a Capon, Reer-eggs, and with such like meats of good juice that are easie to be concocted and digefled, let him be anointed the fecond and third day, unless the spots appear before.

If the Patient flux at the mouth, it must not be stopped: when the spots and pussles do all appear, and the Patient hath made an end of sweating, it shall be convenient to use Diuretick Medicins, for by these the remnant of the matter of the spots, which happily could not all breath forth, may easily purged and avoided by urin.

If any Noble or Gentlemen refuse to be anointed with this unquent, let them be inclosed in the body of a Mule or Horfe that is newly killed, and when that is cold let him be laid in another, until the puffles and cruptions do break forth, being drawn by that natural heat, For fo Mathiblus writeth, in Process, libes, that Valentinus the fone of Pope Alexander VI. was delivered from the danger of most deadly poisson. Disfe.

CHAP. XXX. Of a postilent Bubo, or Plague-fores

Pestilent Balo is a tumor at the beginning long and movable, and in the state and full per- what a pestifection copped, and with a fharp head, unmovable, and fixed deeply in the glandules or lent said kernels, by which the brain exonerates it felf of the venemous and pettiferous matter into the kernels that are behind the ears, and in the neck: the heart into those that are in the armboles, and the liver into those that are in the groin, that is, when all the matter is gross and clamtry, fo that it cannot be drawn out by spots and pussels breaking out on the skin 5 and so the matter of a Carbuncle is sharp, and so servent, that it maketh an Eschar on the place where it is sixed. In the beginning, while the Bubs is breeding, it maketh the Patient to feel, as if it were, a cord or rope stretched out in the place, or a hardned nerve with pricking pain: and shortly after the matter is raifed up, as it were into a knob, and by little and little it groweth bigger, and is inflamed, these accidents before mentioned accompanying it. If the tumor be red, and increased by little

tunnania.

The figns of

and little, it is a good and falutary fign: but if it be livid or black, and come very flowly unto his just bigness, it is a deadly fign. It is also a deadly fign if it increase suddenly, and come to its just ry and deadly. bignets as it were with a fwift violence, and as in a moment, have all the fymptoms in the highest excefs, as pain, fwelling, and burning. Estbers or Sores appear fometimes of a natural colour, like unto the skin, and in all other things, like unto an œdematous tumor, which not withfianding will fuddenly bring the Patient to deftruction, like those that are black; wherefore it is not good to trust too much to those kinds of tumors.

CHAP. XXXI.

Of the Cure of Bubocs, or Plague-fores.

The uic of Cupping-glaf-fes in curing of a Bubo.

O foon as the Bubo appears, apply a Cupping-glass with a great flame unto it, unless it be that kind of Bubo which will suddenly have all the accidents of burning and swelling in the highest nature; but first the skin must be anointed with the Oil of Lillies, that so it being made more loofe, the Cupping-glass may draw the stronger and more powerfully: it ought to stick to the part for the space of a quarter of an hour, and be renewed and applied again every three quarters of an hour: for fo at length the venom should be the better drawn forth from any noble part that is weak, and the work of Suppuration or resolution, which soever Nature hath affailed will the better and fooner be absolved and perfected: which may be also done by the application of the fol-

Take of Unguentum Dialthea one ounce and a half, Oil of Scorpions half an ounce, of Mithridate diffolved in Aqua Vine, half a dram; this liniment will very well relax and loofen the skin, open the pores thereof, and fpend forth portion of the matter which the Cupping-glafs hath drawn thither: in flead thereof mollifying fomentations may be made, and other drawing and suppurating

Medicins, which thall be described hereafter.

A Liniment.

A Veficatory applied in a meet place below the Bubo profits them very much, but not above 3 as for example: If the Bubo be in the throat, the Velicatory must be applied unto the Boulder-blade on the fame fide; if it be in the arm-holes, it must be applied in the midst of the arm, or of the shoulder-bone on the inner fide; if in the groin, in the midst of the thigh on the inner fide, that by the double paffage that is open for to draw out the matter, the part wherein the venom is gathered together, may be the better exonerated.

Spurge, Crow-foot, Arimart, Bear-foot, Briony, the middle bark of Travellers joy, the rinds of Mullet, Flammula, or upright Virgins power, are fit for raifing blifters. If you cannot come by those fimple Medicins, you may apply this which followeth, which may be prepared at all times.

A compound Veficatory.

Take Canthorides, Pepper, Emphorbium; Pellitory of Spain, of each halfadram; of fower leaven two drams, of Mustard one dram, and a little Vinegar's the Vinegar is added thereto, to with-hold or restrain the vehemency of the Conthorides: but in want of this Medicin it shall suffice to drop scalding Oil or Water, or a burning. Candle, or to lay a burning. Coal on the place: for fo you may raise blifters, which must prefently be cut away, and you must see that you keep the ulcers open and flowing as long as you can, by applying the leaves of red Colworts, Beets, or Ivy dipped in warm Water, Why Vefea- and anointed with oil or fresh butter. Some apply Cauteries, but Veficatories work with more speeds tories are bet- for before the Eschar of the Cauteries will fall away, the Patient may die, therefore the Ulcers that teries in a pe- are made with Velicatories will fushice to evacuate the peliilent venom, because that doth work rather by its quality than by its quantity. Let the abfeefs be fomented as is shewed before, and then let the Medicin following, which hath virtue to draw, be applied.

flilent Bubo.

Fill a great Onion being hollowed, with Treacle and the leaves of Rue, then roaft it under the ing Cataplasms hot embers, heat it with a little Leaven, and a little Swines grease, and so apply it warm unto the abicefs or fore; let it be changed every fix hours. Or take the roots of Marth-mallows and Lillies of each half a pound; of Line, Fenugreek, and Muftard feeds, of each half an ounce; of Treacle one drain, ten Figs, and as much Hogs-greafe as thall fuffice: make thereof a Cataplasm according to Art. Or, Take of Onions and Garlick roasted in the embers, of each three ounces: bruise them with one ounce of fowre leaven: adding thereto Unguentum Bafiliean one ounce, Treacle one dram, Mithridate half a dram, of old Hogs-greafe one ounce, of Canthurides in powder one fcruple, of Pigeons dung two drams: beat them and mix them together into the form of a Cataplain. Hercunto old Rennet is very profitable; for it is hot, and therefore attractive, being mixed with old Leaven and Bafilicon: you cought to use this until the absects be grown unto its full ripeness and bigness; but it presently after the beginning there be great inflammation, with sharp pain, as it often happeneth, especially when the abscesses be of the kind of Carbuncles; we must abstain from those remedies that are hot and attractive, and also from those that are very emplastick and clammy, because they do altogether close the pores of the skin; or because they resolve the thinner part of the collected matter, which if it might remain, would bring the other fooner to supportation: or else because they may perchance draw more quantity of the hot matter than the part can bear, whereof cometh rather corruption than maturation : and laft of all, because they increase the Feder and Pain, which infer the danger of a Convultion or mortal Gangrene. Therefore in such a case it is best to use cold and temperate local Medicins, as the leaves of Henbane and Sorrel roafted under the coals, Galens Pultife, and

Against such as cut away Plague-fores.

There are many that for fear of death, have with their own hands pulled away the Bubo with a pair of Smaths Pincers: others have digged the flesh round about it, and so gotten it wholly out.

And to conclude, others have become so mad, that they have thrust an hot iron into it with their
own hand, that the venom might have a passage forth: of all which I do not allow one; for such
abscerses do not come from without, as the bitings of virulent Beasts, but from within, and moreover

over because pain is by these means increased, and the humour is made more malign and sierce. Therefore I think it sufficient to use Medicins that relax, open the pores of the skin, and digetly portion of the venom by transpiration, as are these that follow. Take the roots of Marsh-mallows A digetlive and Lillies of each fix ounces, of Camomil and Melilot-flowers of each half a handful, of Lin-fome feeds half an ounce, of the leaves of Rue half an handful: boil them and firain them, dip sponges in the firaining, and therewith let the tumour be fomented a long time. Or take the crum of An anodyne hot bread and sprinkle it with Treacle-water, or with Aqua Vine, and Cows-milk or Goats-milk, Cataplain and the yolks of three Eggs; put them all on flupes or flax, and apply them warm unto the place.

Or, Take of fowre Rie-leaven four ounces, of Bafilicon two ounces, three yolks of Eggs, Oil of Lillies two ounces, Treacle one dram: let it be received on flupes, and applied in like manner. Or, Take of Dischylon and Bafilicon of each two ounces, Oil of Lillies one ounce and a half: let them be melted and mixed together, and let it be applied as is above faid. When you fee, feel and know, why it is beaccording to reason, that the Bubo is come to perfect suppuration, it must be opened with an inci-Gon-knife, or an actual or potential Cautery, but it is best to be done with a potential Cautery, unless Plague-fore that happily there be great inflammation, because it doth draw the venom from beneath unto the with superficial parts, and maketh a larger orifice for the matter that is contained therein: neither must tial Cautery. it be looked for, that Nature should open it of her felf; for then there were danger that lest while Nature doth work flowly, a venemous vapour should bestirred up, with striking the heart by the arteries, the brain by the nerves, and the liver by the veins, should cause a new increase of the venemous infection. For fear whereof there be some that will not expect the perfect maturation and suppuration, but as it were in the midft of the crudity and maturity, will make an orifice for it to pass forth at : yet if it be done before the tumor be at his perfect maturity, Pain, a Fever, and all accidents are ftirred up, and enraged, whereof cometh a malign ulcer that often degenerates into a Gangrene. For the most part about the tenth or eleventh day the work of suppuration seemeth perfected and finished; but it may be sooner or later, by reason of the application of Medicins, the condition of the matter, and flate of the part: when the matter cometh forth, you must yet use suppurative and mollifying Medicins, to maturate the remains thereof; in the mean while cleanting the ulcer by putting mundificatives into it, as we shall declare in the cure of Carbuncles. But if the tu-How to draw mor feem to fink in, or hide it felf again, it must be revoked and procured to come forth again, by forth a fore applying of Cupping-glaffes with fearification, and with sharp Medicins, yea, and with Cauteries go in again. both actual and potential.

When the Cauteries are applied it shall be very good to apply a Vesicatory a little below it, that there might be forme passage open for the venom while the Eschar is in falling away. For so they that are troubled with the French Pox, so long as they have open and slowing ulcers, so long are they void of any pain that is worth the fpeaking of; which ulcers being closed and cicatrized, they do prefently complain of great pain. If you suspect that the Bulbo is more malign by reason that it is of a green or black and inflamed colour, as are those that come of a melancholick human by adultion transactions. mour by adultion, turned into a gross and rebellious melancholick humour, so that by the more copious influx thereof into the part, there is a danger of a gangrene and mortification; then the When reper-places about the abfeefs must be armed with repercusives, but not the abfeefs it felt: and this may custives may be the form of the repercusives: Take of the juice of Housleek, Purslain, Sorrel, Night-shade, of be applied. each two ounces; of Vinegar one ounce, the Whites of three Eggs, of Oil of Roses and Water-lillies of each two ounces and an half, thir them together, and apply it about the Bubo, and renew it often a or boil a Porngranate in Vinegar, beat it with Unquentum Rofatum, or Populeun newly made, and apply it as is aforefaid. If these things do not stop the influx of other humours, the absects it felf and the places about it must be scarified round about, if the part will permit it; that the part exonerated of portion of the venom may not fland in danger of the extinction of the proper and natural heat, by the greater quantity and malignity of the humours that flow unto it. In fearifying you must have care of great veffels, for fear of an irrepugnable flux of bloud, which in this cafe is very hard to Why too be flaid or refifted, both because the part it self is greatly inflamed, and the humour very fierce; much bleed. for the expulsion whereof, Nature careful for the prefervation of the part and all the body besides, feemeth to labour and work. But yet you must suffer so much of the bloud and humour to flow out as the Patient is able to abide without the loss of his firength. Moreover, you may spend forth the superfluous portion of the malignity, with relaxing, mollifying, and resolving somentations: as, Take the roots of Marth-mallows, Lillies and Elecampane, of each one pound; of Line-seeds and Fenugreek, of each one ounce, of Fennel-feeds, and Annife-feeds, of each half an ounce, of the leaves of Rue, Sage, Rofemary, of each one handful, of Camomil and Melilot flowers, of each three handfuls; boil them all together and make thereof a decoction for a fomentation; use it with a Sponge according to Art. Also after the aforesaid scarification, we may put Hens, or Turkies that Lay Eggs (which therefore have their fundaments more wide and open, and for the fame purpose Put a little salt into their fundaments) upon the sharp top of the Bubo, that by shutting their Bills at several times they may draw and suck the venom into their bodies, far more strongly and better than Cupping-glaffes, because they are endued with a natural property against position, for they cat and concoct Toads, Efts, and fuch like virulent Beafts: when one Hen is killed with the poifon that the hath drawn into her body, you must apply another, and then the third, fourth, with, and fixth, within the space of half an hour. There be some that will rather cut them, or else use whelps cut afunder in the midft, and applied warm to the place; that by the heat of the Creature that is yet fearce dead, portion of the venom may be diffipated and exhaled. But if nevertheless there be any fear of a Gangrene at hand, you must cut the flesh with a deeper fearification, not onely avoiding the great veffels, but also the nerves, for fear of convultion; and after the scarincation and a fufficient flux of bloud, you must wash it with Ægyptiacum, Treacle and Mithridate dissolved in Sea water, Aqua Vite and Vinegar. For such a lotion hath virtue to stay putresaction, repel the ve-

Community ...

Liniments ling away of the Eichar.

nom, and prohibit the bloud from concretion: but if the Gangrene cannot be avoided to, Cauteries may be applied to the part: especially actual, because they do more effectually repel the force of the poison, and strengthen the part. Presently after the impression of the hot Iron, the Eschar must be Lindmens points, and its against the figure and the munctions they are wont to haften the falling away of the Eschar. Take of the mucilage of Marshmallows and Line-feeds, of each two ounces, fresh Butter or Hogs-greafe one ounce, the yolks of three Eggs; incorporate them together, and make thereof an Ointment: Butter, Swines-greafe, Oil of Roles with the yolks of Eggs, perform the felf fame thing. When the Elchar is fallen away, we must use digestives. As, Take of the juice of Plantain, Water-Betony, and Smallage, of each three ounces, honey of Roles four ounces, Venice Turpentine five ounces, Barly flower three drams, Aloes two drams, Oil of Rofes four ounces, Treacle half a dram: make a mundificative according to Art-Or, Take of Venice Turpentine four ounces, Syrup of dried Rofes and Wormwood, of each an ounce, of the powder of Aloes, Mastich, Myrrh, Barly-flower, of each one dram, of Mithridate half an ounce s incorporate them together. The unquent that followeth is very meet for putrefied and corroding Against eating ulcers: Take red Orpiment one ounce, of unquenched Lime, burnt Alum, Pomgranat Pills, of each fix drams, of Olibanum, Galls, of each two drams, of Wax and Oil as much as shall suffice: make thereof an unguent. This doth mundifie firougly, confume putrefied flesh, and dry up virulent hu-The praise of midities that engender Gangrenes. But there is not a more excellent unguent than Agyptiacum increafed in strength, for besides many other virtues that it hath, it doth consume and waste the proud fielh; for there is neither Oil nor Wax that goeth into the composition thereof, with which things the virtue of sharp Medicins convenient for such Ulcers, is delaid, and as it were dulled and hindered from their perfect operation, so long as the ulcer is kept open. There have been many that being difeafed with this difeafe, have had much matter and venomous filth come out at their abfects; to that it feemed fufficient, and they have been thought well recovered, yet have they died fuddenly-

Maggilacum,

CHAP. XXXII.

unloaded of the burthen of the venenate humours.

In the mean while when these things are in doing, cordial Medicins are not to be omitted to streng-then the heart: And Purgations must be renewed at certain seasons, that Nature may be every way

Of the Nature, Caufes, and Signs of a Postilent Carbanele.

What a Garbuncle is.

When fo cal-

Symptoms of Carbuncles.

and Carbancle differ.

Peftilent Carbuncle is a small tumor, or rather a malign pushe, hot, and raging, confisting of bloud vitiated by the corruption of the proper substance. It often cometh to pass through the occasion of this untamable malignity, that the Carbuncle cannot be governed or contained within the dominion of Nature. In the beginning it is scarce so big as a seed or grain of Millet or Peafe, flicking firmly unto the part and immovable, so that the skin cannot be pulled from The figus of a the flesh; but shortly after it increases his to a Bubo, unto a round and sharp head, with great Carbanele.

Garbanele. Head, pricking pain, as if it were with needles, burning and intolerable, especially a little before night, and while the meat is in concocting, more than when it is perfectly concocted. In the midit thereof appeareth a bladder puffed up and filled with fanious matter. If you cut this bladder, you shall find the flesh under it parched, burned and black, as if there had been a burning coal laid there, whereby it feemeth that it took the name of Carbuncle; but the flesh that is about the place is like a Rainbow, of divers colours, as red, dark green, purple, livid and black; but yet always with a flining blackness, like unto Stone-Pitch, or like unto the true precious stone which they call a Carbunch whence forme also fay it took the name. Some call it a Nail, because it inserreth like pain as a Nail driven into the fleth. There are many Carboncles which take their beginning with a crufty ulcer without a pufile, like to the burning of an hot Iron: and these are of a black colour, they increase quickly, according to the condition of the matter whereof they are made. All peftilent Carbuncks have a Fever joined with them, and the grieved part feemeth to be so heavy, as if it were covered or preffed with lead tied hard with a ligature: There cometh mortal fwounings, faintings, toffings turning, idle talking, raging, gangrenes and mortifications; not onely to the part, but also to the whole body; by reason (as I think) of the oppression of the spirits of the part, and the suffication of the natural heat, as we see also in many that have a pessilent Bubo: for a Bubo and Carbuncle are How the Mar- tumors of a near affinity, so that the one doth scarce come without the other, consisting of one kind of matter, unless that which maketh the Bubo is more gross and clammy, and that which causeth the Carbuncle more sharp, burning and raging, by reason of its greater subtilty, so that it maketh an Eschar on the place where it is, as we noted before.

CHAP. XXXIII.

What Prognofticks may be made in Postilent Euboes and Carbuneles.

Ome having the Peffilence have but one Carbuncle, and forme more, indivers parts of their body, and in many it happeneth that they have the Bubo and Carbuncle before they have any Fever; which giveth better hope of health, if there be no other malign accident therewith: for it is a fign that Nature is the Victor, and hath gotten the upper-hand, which excluded the peffilent venom before it could come to affault the heart. But if a Carbuncle and Bubo come after the Fever, it is mortal; for it is a token that the heart is affected, moved and incenfed with the furious rage of the venom, whereof prefently cometh a feverilh heat or burning, and corruption of the humours, fent as it were from the center unto the fuperficies of the body. It is a good fign, when

Why it is deadly to have a fore Fever.

the Patients mind is not troubled, from the beginning until the feventh day; but when the Bubo or Carbuncle finketh down again thortly after that it is rifen, it is a mortal fign, especially if ill accidents follow it. If after they are brought to suppuration they presently wax dry without any reafon thereof, it is an ill fign: Those Carbaneles that are generated of bloud have a greater Eschar than those that are made of choler, because that bloud is of a gross consistence, and therefore occupieth a greater room in the fleth: contrariwife, a cholerick humour is more finall in quantity and thib, and it taketh little room in the upper part of the flesh onely, as you may see in an Enginels. And I have feen Carbuncles whose Eschars were as broad and as large as half the back : also I have seen others, which going up by the fhoulders to the throat, did fo ear away the flesh that was under them, that the rough artery or wind-pipe might be feen bare, when the Eschar was fallen away. I had once a Carbuncle which was in the midft of my belly, fo that when the Efchar was fallen away, I might very plainly fee the Peritonium or Rim; and the cicatrice that remaineth is as broad as my hand; but they do not spread themselves so far, without the great danger or death of the Patient. There also forme Carbuncles which beginning at the parts under the chin, disperse themselves by little and little unto the battle-bones, and so strangle the Patient. So in many the Bubees in the Groin arise above a great part of the muscles of the Epigastrium. Truly of those abscesses that are so large and great in Huge pestilent quantity, and so terrible to be seen, there is great danger of death to the Patient, or at least to the about grieved part; for after the confolidation the part remaineth as if it were leprous, which abolitheth the monly deadly.

action of the part, as I have feen in many. Often-times also the corruption of the matter is so great, that the flesh leaveth the bones bare : but Carboneles often leave the joints and ligaments quite refolved, through the occasion of the moisture that is foaked and funk into them; for they often cast our putrefied and virulent fanious matter, whereby eating and creeping ulcers are bred, many bliffers and puttles ariting up in the parts round about it; which fhortly breaking into one, make a great ulcer. These come very seldom and slowly unto suppuration, or at least to cast our laudable matter, especially if they have their original of choler; because the matter is sooner burned with heat than Suppurated. Therefore then, if they can be brought to suppuration by no Medicins, if the tumor fill Deadly Carremain black, if when they are opened, nothing at all, or elfe a very little tharp moisture doth come forth, they are altogether mortal, and there is fcarce one of a thousand who hath these accidents that recovereth health. Difperfed fmall blifters, coming of vapours flirred up by the matter that is under the skin, and are there flaid and kept from paffage forth, do not necessarily fore-shew death in Carbuncles. But if the part be fivollen or puffed up, if it be of a green or black colour, and if it feel nei-ther pricking nor burning, it is a fign of a mortal gangrene. Buboes or Carbancles feldom or never come without a Fever: but the Fever is more vehement when they are in the emunctories or nervous parts, than when they are in the fleshy parts; yet it is less, and all symptoms are less and more tolerable in a man that is strong and of a good temperature: Carbuncles not onely affect the outward, but also the inward parts, and oftentimes both together. If the heart be vexed in such fort with a Carbuncle that nothing thereof appeareth forth on the superficial parts, all hope of life is past, and those suddenly die, eating, drinking, or walking, and not thinking any thing of death. If the Carbuncle be in the Midriff or Lungs, they are foon suffocated: if it be in the Brain, the Patient becometh frantick, and so dieth: if it be in the parts appointed for the passage of the urine, they die of the suppression of their water, as it happened in the Queen-mothers waiting maid, at the Castle of Refilier, of whom I spake before: if it be in the Stomach, it inferreth the accidents that are shewed in this History following.

While I was a Surgeon in the Hospital of Paris, a young and firong Monk of the order of S. Vittor, An History. being overfeer of the Woman that kept the fick people of that place, fell into a continual Fever very fuddenly, with his Tongue black, dry, rough, (by reason of the putrefied and corrupted humours, and the vapours rising from the whole body to that place) and hanging out like unto a Housids, with unquenchable thirth, often (wouning and defire to vomit : he had convultions over all his body, through the vehemency and malignity of the difease, and so he died the third day. Wherefore those that kept the fick people in the Hofpital, thought that he had been poisoned, for the certain knowledge whereof the Governours of the Hofpital commanded his body to be opened. I therefore calling to the a Phylician and Surgeon, we found in the bottom of his fromach, a print or impreffion, as it it had been with an hot iron or potential Cautery, with an Eschar or crust as broad as ones nail, all the reft of his flomach was greatly contracted and shrunk up together, and as it were horny; which We confidering, and effectally the Efchar which was deep in the fubflance of the fromach, we all faid with one voice, that he was ptifoned with Sublimate or Arfenick. But behold, while I was fewing up his belly, I perceived many black fpots differfed diverfly throughout the skin: then I asked my company what they thought of those fpots? truly (faid I) it feemeth unto the Surgeon denied it, and the Purple spots or marks that are in the Petillence. The Physician and the Surgeon denied it, and faid that they were the bitings of Fleas. But I perswaded them to confider the number of them over all the whole body, and also of their great depth, and depression into the fieths for when we had all the whole body, and also of their great depth and depression into the slesh; for when we had threst Needles deep into the slesh in the midst of them, and so cut away the slesh about the needle, How to distinwe found the fleth about the needle to be black: moreover his notirils, nails, and ears, were livid, and guifn Purple all the conflictation of his body was contrary, and far unlike to the bodies of those that died of other spots from ficknesses or diseases. Also it was credibly reported unto us by those that kept him, that his Face was to altered a little before he died, that his familiar friends could hardly know him. We perfuaded by these proofs, revoked our former opinion and sentence, and made a Certificate to be sent unto the Governours and Mafters of the Hospital, setting our hands and feals unto it, to certifie them that he died of a peftilent Carbuncles

CHAP. XXXIV.

Of the Cure of a Peftilent Carbuncles

flick, very hot, and great drawers are Carbuncle.

Y the fore-named figurs of a peftilent Carbuncle, and especially by the bitterness of the pain, malignity of the venomous matter, and by the burning Fever that is therewithall annexed I think it manifell, that very hot, emplaffick, and drawing Medicins should not be applied to this kind of turnor, because they prohibit or hinder the exhalation, or wasting forth of the venenate malignity, because that by stopping the pores of the skin, they increase and cause a greater heat in the part than there was before. Therefore it is better to use resolving Medicins which may affwage heat, and resolve the pores of the skin. Therefore first the place must be somented with Water and Oil mixed together, wherein a little Treacle hath been dissolved, leaving thereon simple wet therein; we may also use the deposition of Mullows, the Book of Living Living the Fig. 1. wet therein: you may also use the decoction of Mallows, the Roots of Lillies, Line-leeds, Figs, with Oil of Hyperican, to make the skin thin, and to draw forth the matter; and the day following you must

The top of a when, why, and with what to be burned,

The falling of fon. the Eschar Scribe promifeth health. A twofold indication.

apply the Cataplasin following.

Take the leaves of Sorrel and Henbane, roast them under the hot ashes, afterwards beat them with four yolks of Eggs, two drams of Treacle, Oil of Lillies, three ounces, Barly-meal as much as shall suffice: make thereof a Cataplasm in the form of a liquid Pultise: this asswageth heat and furthereth suppuration. Or, Take the roots of Marth-mallows and Lillies, of each four ounces, Line-feeds half an ounce, boil them, beat them, and then firain them through a Serfe, adding thereto of fresh Butter one ounce and half, Mithridate one dram, of Barly-meal as much as shall suffice: make thereof a Cataplasm according to Art. Those Cataplasms that follow, are most effectual to draw the venomous matter forth, and to make a perfect supparation, especially when the flux of the matter is not so great, but that the part may bear it. Take the Roots of white Lillies, Onions, Leaven, of each half an ounce; Mustard-feeds, Pigeons dung, Sope, of each one dram; fix Snails in their shells, of fine Sugar, Treacle and Mithridate, of each half a dram; beat them altogether and incorporate them with the yolks of Eggs: make thereof a Cataplasin, and apply it warm. Or, Take the yolks of fix Eggs, of Salt powdered one ounce, of Oil of Lillies and Treacle, of each half a dram; Barly-meal as much as will fuffice: make thereof a Cataplasm. Take of ordinary Diachylon sour ounces, of **Unguention Englishment two ounces Oil of Violets half an ounce: make thereof a Medicin. Many ancient Professor greatly commend Scabious ground, or brayed between two stones, and mixed with old Hogs-greafe, the yolks of Eggs, and a little Salt, for it will cause supportation in Carbuncles, also an Egg mixed with Barly-meal, and Oil of Violets doth mitigate pain, and supportate. A Raddish-root out in flices, and fo the flices laid one after one unto a carbuncle or petilient tumor, doth mightily draw out the poifon. The juice of Colts-foot doth extinguish the heat of Carbuncles: the Herb called Devils-bit being bruised, worketh the like effect. I have often used the Medicin following to the heat of Carbuncles with very good fuccefs; it doth also affwage pain and cause suppuration. Take of the Soot scraped from a Chimney sour ounces, of common Salt two ounces, beat them into small Powder, adding thereto the yolks of two Eggs, and ftir them well together, until it come to have the confiftence of a Pultife, and let it be applied warm unto the Carbuncle. In the beginning the point or head of the Carbuncle must be burned, if it be black, by dropping thereinto fealding hot Oil, or Aqua fortis; for by such a burning the venom is suffocated, as touched by lightning, and the pain is much leffened, as I have proved oftentimes: neither is it to be feared left that this burning should be too painful, for it toucheth nothing but the point of the Carbuncle, which by reason of the Eschar that is there, is void of sense. After this burning, you must go forward with the former described Medicins, until the Eschar seemeth to separate it self from the flesh round about it, which is a token of the Patients recovery, for it fignifieth that Nature is firong and able to refift the poi-After the fall of the Eschar, you must use gentle mundificatives, as those which we have prefcribed in a Peffilent Bubo, not omitting fometimes the use of suppurative and mollifying Medicins: that while the groß matter is cleanfed, that which is as yet crude may be brought to supportation: the then the indication is two-fold, the one to suppurate that which remains as yet crude and raw in the part, and the other to cleanfe that which remains concocted and perfectly digetted in the ulcer.

CHAP. XXXV.

Of the itching and inflammation happening in Peftilent Ulcers, and how to cicatrize them.

jacent parts are troubled with itching.

He parts adjoining to a petitlent Ulcer, oft-times are superficiarily excoriated by reason of ulcerous pufiles, which here and there, with burning and great itching prick and vellicate the part. The cause may happen either externally or internally; internally, by a thin and biting fanier, which (weating from the Ulcer, moiftens the neighbouring parts. But externally by A fomentation of the porce of the skin, induced by the continual application of Medicins. To remote this steel by the place must be fomented with discussing and relaxing things, as Agua forth, which the Goldmiths have used for separating of Metals, Alum-water, the water of Lime, Brine, and the like why these Ulcers left by Carbuncles and pelitlent Buboes, are difficultly cicatrized, by reason of the corresponding from the declarity of the place of the blood, which being in cers are hard roding famies proceeding from the cholcrick or phlegmatick and falt blood, which being in to be cicatrifault by the corruption of the whole fubitance, caufeth the abfects: betides, fuch Ulcers are commonly round, and therefore the whole fubitance, caufeth the abfects: monly round, and therefore hard to be cicatrized, for that the Quitture hath no free paffage forth; fo the fanies, of its own nature acrid and corroding, doth by delay acquire greater acrimony and nitrofity; fo by its burning touch diffolying the adjacent flesh, it hinders the conjunction

and unition of the lips of the ulcer: but in the interim, the lips of the ulcer become callous, which unless they be helped by cutting, or eating Medicins, the ulcer cannot be healed; for that by their density they hinder the sweating out of a sufficient quantity of the dewy glew, to heal up the ulcer. Now the ulcer being plained and brought equal to the other fleth, we must use Epuloticks; that is, Two form of fuch things as have a faculty to cicatrize Ulcers by condenfing and hardning the furface of the fieth: Epuloticks. Of these there are two kinds; for some without much biting bind and dry, such are Poingranatpills, Oak-bark, Tutia, Litharge, burnt Bones, Scales of Brafs, Galls, Cypress-nuts, Minium, Anti-mony, Bole-Armenick, the burnt and washed shells of Oysters, Lime nine times washed, and many Metalline things. Others are next to thefe, by which proud flesh is consumed; but such must be spatingly used: Of this kind is washed Vitriol, burnt Alum, which excellesh other Epuloticks, by reafon of the excellent drying and aftringent faculty confolidating the fleth, which by being moilined by an excrementitious humour, grows lank. For that the fear which is made, is commonly unlightly Remedies as in this kind of Ulcers, as red, livid, black, fwollen, rough, by reason of the great adultion impringians the detection in the part, as by a burning coal: therefore I have thought good here to tet down some means, forming of by which this deformity may be corrected or amended. If the scar be too big, or high, it shall sears. be plained by making convenient ligation and straight binding to the part a Plate of Lead rubbed Over with Quick-filver; but you may whiten it by anointing it with Lime nine times washed, (that fo it may be more gentle, and lofe the acrimony) and incorporated with Oil of Rofes. Some take two pound of Tartar or Argal, burn it, and then powder it; put it in a cloth, and so let it hang in a moift Vault or Cellar, and fet a Veffel under it to receive the dropping of Liquor, which is good to be rubbed for a good space upon the scar. The same faculty is thought to be in that moisture of tegs, which sweats through the shell, whilest they are roasted at the coals; as also anguentum citrition and Emplast, decomfa newly made. The three following compositions are much approved. CHAP. XXXVI.

Of Sundry kinds of Evacuations, and first of Sweating and Vomiting.

He petilent malignity is not onely evacuated and fent forth by the eruption of puttles and fpots, but also by Sweat, Vomit, Bleeding at Nose, at the Hamerboads, by the Courses, a why the perfect of the Belly, and other ways; so that Nature by every kind of excretion may be freed nity is not ear from the deadly poison, especially that which is not as yet arrived at the heart. But chief regard ried away by trust be had to the inclination of Nature, and we must attend what way it chiefly aims at, and what kind of excretion it affects. Yet fuch evacuations are not always critical, but usually symptomatiwe mall have
tal, for that off-times Nature is so irritated by the untamable malignity of the matter, that it can chief regard
no way digest it, but is forced by any means to send it away crude as it is. Wherefore if Nature to the motion
of Nature tray feem by the moitiness of the skin, the suppression of Utin, and other signs to affect a crisis and of Nature excretion by Sweat, you then shall procure it by the formerly mentioned means. It is delivered by Sweat. the Ancients, that all Sweats in acute diseases are falutary, which happen upon a critical day which are universal and hot, and fignified before the critical day. But in this rapid and deadly difcale of the Plage, we must not expect a Crifis, but as foon as we can, and by what means we may, to A crise must face Nature from fo dire and potent an Enemy.

But off-times the tough and grofs excrementitious humours may be purged by Vomit, which could plague, but off-times the tough and grofs excrementitious humours may be purged by Vomit, which could plague. Therefore also by this manner of excretion may we hope for the exclusion of the petilent venom, if there be nothing which may hinder; and Nature by frequent nau-fooutnels may feem to affect this way: the endeavour thereof thall be helped by giving form half a pint of warm Water to be drunk with four ounces of common Oil, an ounce of Vinegar, and a little luing of the characteristic of the control of the property of Dice of Raddilh: after the taking of the potion, it is fit to thrust into the throat a Goose-quill dipped How to proin the fame Oil, or elfe a branch of Rofemary: or elfe by thrufting in the fingers, fo to procure vo-cure Vomit, thit; also a portion of eight ounces of the mucilaginous water of the decoction of Line-feeds will Procure Vomit. Or elle, R Rad. raph. in taleol. fell. vel fem. ejus, & fem. atriplicus, an. 3 iij. bulliant in agua com, and fufficit pro dofi, in colatura diffolve oxym. & fyr. acet. an. § p. exhibeatur potio larga & tepida.

Or elfe, ik Oxym. Gal. § vj. ol. com. § ij. parester potio tepid. But Nature truth not be forced, unlefs of why vomit own accord it undertake this motion, for forced and violent vomiting, diffends the nervous ibres must not be forced. of the ventricle, dejects the firength, breaks the veffels of the lungs, whence proceeds a deadly fpitting forced. of blood. Wherefore if the fromach shall trouble it self with a vain and hurtful defire to vomit, it shall rather be strengthened with bags of Roses, Wormwood, and Sanders, using inwardly the juice of Quinces and Berberries, and Broths made for the fame purpole.

CHAP. XXXVII.

Of Spitting, Salivation, Belching, Hickgring, and making of Water.

The effect of Spitting in Pefillent difeafes

Hat long evacuations may be made by Spitting and Salivation, you may learn by the example of fuch as have a Pleurifie; for the matter of the Pleurifie being turned into pas, the purulent matter fuckt up by the rare and spongeous substance of the lungs, and thence drawn into the affers arteria, is lastly cast out by the mouth.

The force of Salivation. There is none ignorant how much fuch as have the Lucs Veneres are helped by Salivation and Spitting. But these shall be procured by a Massicatory of the roots of Irest, Pellitory of Spain, Massich, and the like; the mucilage of Line-seed held in the mouth will work the same effect.

The force of Speczing.

That fuch as have a moift brain may expel their superfluous humours by freezing and blowing their noses; the brain, by the firength of the expulsive faculty, being stirred up to the exclusion of that which is harmful, may be known by the example of old people and children which are daily purged by their noses; the brain is stirred up to both kinds of exerction from causes either internal or external: from the internal, as by a phlegmatick and vaporous matter, which contained in the brain, offends it: externally, as by receiving the beams of the Sun in the nostrils, or by tickling them with a feather, or blowing into them the powder of Hellebore, Enphorbium, Pyrethrum, Musicard-feeds, and the like Sternutamentories. For then the brain is traitned by its own repulsive faculty, to the excretion of that which is troublous unto it. Sneezing breaketh forth with nosse, for that the matter passeth through straits, to wit, by the straitning passages of the Os cribrosium, which is seared at the roots of the nostrils. It is not fit to cause sneezing in a body very plethorick, unless you have first premised general Medicins, lest the humours should be more powerfully drawn into the brain, and so cause an Apoplexy, Versigo, or the like symptoms.

The commodities of BelchingBy Belching, the flatulencies contained in the ventricle, being the off-fpring of crudity, or flatulent meats, are expelled: these by their taste and finell, pleasing, sinking, sweet, bitter or tart, shew the condition and kind of crudity of the humours from whence they are raised: now vomiting freeth the stomach of crudities, but the diffemper must be corrected by contraries, as altering things to be

Prescribed by the Physician.

Hicketting is a contraction and extension of the nervous fibres of the stomach, to cast forth such things as are too contumaciously impact in the coats thereof; yet repletion onely is not the cause thereof, but sometimes inanition also; so oft-times a putrid vapour from some other place, breaking into the stomach, as from a pestilent Bubo or Carbuncle; also all acid and acrid things, because they prick, vellicate and provoke the tunicles of the ventricle, as Vinegar, spiced things, and the like; often and contumacious hicketting after purging, a wound or vomiting, is ill; but if a convulsion

prefently happen thereon, it is deadly.

Several remedies must be used according to the variety of the causes: for repletion helps that hicketting that proceeds from inanition, and evacuation that which happens by repletion: that which proceeds from a putrid and venemous vapour, is helped by Treacle and Antidotes; that which isocrasioned by acid and acrid things, is cured by the use of gross, fatty, and cold things.

The whole body purged by urin. Now the whole body is oft-times purged by urin, and by this way the feverilh matter is chiefly and properly accustomed to be evacuated: not a few being troubled with the Luce Venerea, when as they could not be brought to falivation by unction, have been cured by the large evacuation of urin caused by Diuretick Medicins. Diureticks wherewithall you may move urin, are formerly described in treating of the Stone. But we must abstrain from more acrid Diureticks, especially when as inflammation is in the bladder; for otherwise the noxious humours are sent to the affected part, whence there is danger of a deadly Gangrene. Therefore then it is better to use diversion by sweat.

When we ought to abftain from Disreticks,

CHAP. XXXVIII.

Of the Menstrual and Hæmorrhoidal Purgation.

How to provoke the Conrfes. Ot onely Reafon, but also manifold experience induceth us to believe that Women by the benefit of their menstrual purgation, escape and are freed from great, pestilent, and absolutely deadly diseases; wherefore it must be procured by remedies, both inwardly taken, and outwardly applied: these may be taken inwardly with good success, Cassa Lignes, Cinnamon, the Bark of the Root of a Mulberry, Sassiron, Agarick, Nutmeg, Savine, Diagridam, and divers others. But if the affect require more vehement Medicins, the roots of Tithymal, Antimony, Cantharides (taken in small quantity) move the Courses most powerfully; frictions and ligatures made upon the thighs and legs conduce hereto, as also Cupping in the inner and middle part of the thighs, the opening of the Vein Saphena, Leeches applied to the orisice of the neck of the Womb, Pessaries, Nodulaes, Clysters, Baths, Fomentations made of odoriserous things, which by the fragrancy of their odour, or rather by their heat may attenuate and cut gross humous, open the obstructed orisices of the Veins; such are the Roots of Marsh-mallows, Orris, Parsly, Fennel, Knecholm, the Leaves and Flowers of St. Johns Wort, Asparagus, Rocket, Balm, Chervile, Mugwort, Mints, Penny-royal, Savory, Rosemary, Rue, Tyme, Sage, Bay-berries, Broom, Ginger, Cloves, Pepper, Nutmegs, and the like; the vapour of the boiling whereof, let the Woman, setting upon a perforated seat, receive by a funnel into the neck of her Womb, covering her self warm on all sides, that so nothing may otherwise break forth. Of the same things may be made baths, as well general, as particular. Also Pessares are good made after this manner: R Theriae, Mitheidam, 5 shows well general, as particular. Also Pessares are good made after this manner: R Theriae, Mitheidam, 5 shows well general, as particular.

Lafily, you may apply Horfe-leeches, or you may open them with a lancet, if they hang much forth of the fundament, and be (wollen with much bloud. But if they flow too immoderately, they may be staid by the same means as the Courses.

CHAP. XXXIX.

Of procuring evacuation by flool, or a flux of the belly.

Ature oftentimes, both by its felf, of its own accord, as also helped by laxative and purging Medicins, casts into the belly and guts, as into the fink of the body, the whole matter of a pelitilent disease, whence are caused Distributes, Lienteries, and Dyfenteries; you may diffinguish these kinds of fluxes of the belly, by the evacuated excrements: For if they be thin and fincere, that is, retain the nature of one, and that a fimple humour, as of Choler, Mclancholy, or Phlegms and if they be call forth in a great quantity, without the ulceration or excertain of the guts, vehement or fretting pain, then it is a Distribute, which forme what a Distribute also call Fluctus Humovalis. It is called a Lienteria, when as by the refolved retentive faculty of rises is the floragh and guts caused by ill humours, either there collected, or flowing from some other place; or by a cold and moilt different things, and off-times mixt, with blood, are call forth. A Dyferteria is, when as many and different things, and oft-times mixt with bloud, are cast forth what a Dywith pain, gripings, and an ulcer of the guts, caused by acrid choler, fretting in funder the coars of states is.

But if in any kind of discase, certainly in a pestilent one, sluxes of the belly happen immoderate in quantity, and horrible in the quality of their contents, as liquid, viscous, frothy, as from melted greafe, yellow, red, purple, green, alh-coloured, black, and exceeding flinking. The cause is various, and many forts or ill humours, which taken hold of, by the pettilent malignity, turn into divers various and fpecies, differing in their whole kind, both from their particular, as also from Nature in general, by finking single common of the common reason of the corruption of their proper substance, whole inseparable sign is stench, which is oft-times the Flague.

In the Camp at Amiens, a peftilent Dyfentery was over all the Camp, in this the firongeft Souldiers An Miffory. Furged forth meer bloud. I diffecting fome of their dead bodies, observed the mouths of the Medical Kiralek veins and arteries, opened and much fwollen; and whereas they entered into the guts, were just like little Catyledons, out of which as I preffed them, there flowed bloud. For both by the excelling heat of the Summers Sun, and the minds of the enraged Souldiers, great quantity of acrid and cholerick humour was generated, and so flowed into the belly: but you shall know whether the greater or lesser guts be ulcerated, better by the mixture of the bloud with the excrements, than by the life of the min to the one you must rather work by Clysters; but in the other by Mean the fite of the pain's therefore in the one you must rather work by Clysters; but in the other by Me-

dicins taken by the mouth.

Therefore, if by gripings, a Teneform, the marmaring and working of the guts, you suspect in a Therefore, if by gripings, a Teneform to disburden it self by the lower parts, neither in the mean peffilent difeafe, that Nature endeavours to disburden it felf by the lower parts, neither in the mean while doth it succeed to your defire, then must it be helped forward by Art, as by taking a potion of \$\(\beta \). A Potion. of Hiera fimplex, and a dram of Diaphenicon diffolved in Wormwood water.

Also Clytters are good in this case, not onely for that they asswage the gripings and pains, and draw by continuation or fucceffion, from the whole body, but also because they tree the Melaraick veins and gues from obstruction and stuffing; so that by opening, and as it were unlocking of the paffages, Nature may afterwards more freely free it felf from the noxious humours. In such Clyfiers they also sometimes mix two or three drams of Treacle, that by one and the same labour they may retund the venenate malignity of the matter-

Y y 3

There

Suppositories.

There may also be made for the same purpose Suppositories of boiled Honey, 3 j. of Hiera piera and common Salt, of each 3 \$\beta\$. or that they may be the fironger, of Honey \$\frac{1}{3}\$ ii. of Ox-gall \$\frac{1}{3}\$ i. of Scammony, Emphrobium, and Coloquintida powdered, of each 3 \$\beta\$. The want of these may be supplied by Nodules made in this form. R Vitell. over. nu. iii. fellis bubuli, & mellis, an. \$\frac{1}{3}\$ \$\beta\$. falls com. \$\frac{1}{3}\$ \$\beta\$. let them be flirred together, and well incorporated, and fo parted into linnen rags, and then bound up into Nodulaes of the bigness of a Filberd, and so put up into the fundament; you may make them more acrid, by adding some powder of Euphorbium or Coloquintida.

A haffy pud-ding to flay the lask.

D.chappelains Medicin to stay a scouring.

Ointments.

Clyfter to flay a thux.

A Clyfter for ulcerated guts

A very aftringent Clyfter.

Iolent and immoderate foourings, for that they refolve the faculty, and lead the Patient into a confumption and death; if they shall appear to be such, they must be staid in time by things taken and injected by the mouth and fundament. To this purpose may a pudding be made of Wheat-flour boiled in the water of the decoction of one Pomgranat, Berberries, Bole-Armenick, Terra figillata, and white Poppy-feeds, of each 3 j. The following Almond-Milk flreng-thens the flomach, and mitigates the acrimony of the cholerick humour, provoking the guts to ex-Take sweet Almonds boiled in the water of Barly, wherein Steel or Iron hath been quenched; beat them in a marble Mortar, and fo with fome of the fame water, make them into an Almond-

milk, whereto adding 3 j. of Diarrhodon Abbasis, you may give it to the Patient to drink.

This following Medicin I learnt of Dr. Chappelain, the Kings chief Phylician, who received it of his Father, and held it as a great fecret, and was wont to prescribe it with happy success to his Patients. It is thus: R Bol. Armen. terra figil. Lapid. heman. an. 3 j. picis navalis, 5 j. \$\beta\$. coral rub marg. elest. corn. cervi inft. & liti in aq. plant. an. 3 j. faccar 20 f. \$\beta\$ ij. fiat pulvis. Of this let the Patient take a spoonful before meat, or with the yolk of an Egg.

Christopher Andrew in his Occasaria, much commendeth Dogs dung, when as the Dog hath for three days before been fed cools with bears.

days before been fed onely with bones. Quinces roafted in Embers, or boiled in a Pot, the Conferve of Cornelian Cherries, Preferved Berberries and Myrabolans, roafted Nutmeg taken before meat firengthen the flomach and flay the lask; the Patient must feed upon good meats, and these rather roasted than boiled. His drink shall be Calibeate-water of the decoction of fowre Pomgranats beaten, or of the decoction of Quince, Medlars, Services, Mulberries, Bramble-berries, and the like things, endued with a faculty to bind and wafte the excrementitious humidities of the body: these waters shall be mixed with syrup of red Currans, Julip of Rofes, and the like.

Let the region of the fromach and belly be anointed with Oil of Mastich, Moschatelium, Myrtles and Quince. Also cut of bread newly drawn forth of the Oven, and steeped in Vinegar and Rose-water may be profitably applied; or else a Cataplasm of red Roses, Sumach, Berberries, Myrtles, the pulp of Quinces, Mastich, Bean-slour, and the Honey of Roses made up with Calibeat-water.

Quinces, Mastich, Bean-flour, and the Honey of Roles made up with Calibeat-water.

Anodyne, abstergent, astringent, consolidating and nourishing Clysters shall be injected. These following retund the acrimony of humours, and asswape pain. Refo. latine, hype-acetos, portul, an. m. j. flor. violar. & nemph. an. 3 i. [5. flat clyster. Or else, Reformb. bord.mund. sem. plant an. m. j. flat decollio, in colatura adde olei ros. 3 ij. vitell.vor. ij. flat clyster. Or, Reformb. bord. capic. capic. vervecin. una cum pelle, 1b ij. in qua coquantur fol. violar. malv. mercur. plantag. an. m. j. bord. mund. 3 j. quatur sem. finglid. major. 3 s. in colatura 1b s. dissolve cass. recenter extrast. 3 j. alaviol. 3 iv. vitell. over-ij. sacc. rub. 3 j. slat clyster. Or, Refore. barnem. melil. aneth.an. p.j. rad.bismal. 3j. flat decoliio in latics colature adde munag. som. lin. sanur. extrasti. in acous mulv. 3 ii. sacca, rub. 3i. olei cham. & aneth. an. 3j. sl. colatura adde mucag, sem, lin. fanugy, extract in aqua malv. 3ij, saccar, rub. 3j, olei cham. & aneth. an. 3j, s. vitellor.over.ij.fiat clyfer.

Such Clyffers must be long kept, that they may more readily mitigate pain. When shaving of the guts appear in the flools, it is an argument that there is an ulcer in the guts; therefore then we mult

use detergent and consolidating Clysters, as this which follows: Re Hordei integr. p. ij. rof.rub.flor. chamam, plantag. apii, an. p. j. fiat decotiio, in colatura diffolve melis rofat. & fyr. de abfunth. an. 3 j. l. vitel.ovor. ij. This following Clytter confolidateth. Re Succi plantage centined. & portulac. an. 3 j. bol. armen. fang.dracan. amyl. an. 3 j. fevi bircini diffoluti, 3 iij. fiat clytter. Alfo Cows milk boiled with Plantain, and mixed with Syrup of Roses, is an excellent medicin for the ulcerated guts.

This following Clyfter binds. R. Cand. equin. plantpolygon. an. m. j. fiat decollio in lattle seftulate adquart. iij. & in colatura adde boli armen. figil.fang. dracon. 3 ij. albumina quaturo over. fiat clyfter. Of evacuation by infenfible transfiration.

He peftilent malignity, as it is oft-times drawn by the pores, by transpiration into the body, Tumors are fo oft-times it is fent forth invilibly the fame way again. For our native heat, that is oft-times difnever idle in us, disperseth the noxious humours, attenuate into vapours and air through custed by the the unperceivable breathing-places of the skin. An Argument hereof is, we see that the turnors and some of the skin through the unperceivable breathing-places of the skin. abfeefes against Nature, even when they are come to suppuration, are off-times resolved and discussed the safe they by the onely efficacy of Nature, and Heat, without any help of Art: Therefore there is no doubt ted. but that Nature, being prevalent, may free it fell from the pelillent maliguity by transpiration, some Abscess, Bubo, or Carbuncle being come forth, and some matter collected in some certain part of the body: For when as Nature and the native heat are powerful and strong, nothing is impossible to it, especially when the passages are also in like manner free and open.

CHAP. XLII.

How to cure Infants and Children taken with the Plague.

F that it happen that fucking or weaned children be infected with the Peftilence, they must be cured after another order than is yet described. The Nurse of the sucking child must the Nurse govern her self so in Diet, and the suse of Medicins, as if the were insected with the Petti-must be described at lence her felf: Her Diet confisteth in the use of the fix things Not natural. Therefore let it be mo-ed when a derate; for the fruit or profit of that moderation in Diet cannot chuse but come unto the Nurses fick, milk, and so unto the Infant that liveth by the milk. And the Infant it self must keep the same Diet as near as he can, in fleep, waking, and expullion, or avoiding of fuperfluous humours and excrements of the body. Let the Nurse be sed with those things that mitigate the violence of the severish heat: as cooling broths, cooling herbs, and meats of a moderate temperature: the must wholly abstain from Wine, and anoint her Nipples as often as the giveth the Infant suck, with water or juice of Sorrel tempered with Sugar of Rofes. But the Infants heart south befortified against the vio-lence of the increasing venom, by giving it one scruple of Treacle in Nurses milk, the broth of a Pullet, or forme other cordial Water. It is also very necessary to anoint the region of the heart, the crnunctories, and both the wrifts with the fame Medicin: neither were it unprontable to fmell often unto Treacle diffolved in Rofe-water, Vinegar of Rofes, and a little Aqua Vita, that fo Nature may be frengthened against the malignity of the venom. When the children are weaned, and Medicins may may be itrengmented against the manginity of the venous. When the emindred are weared, and medicins in formewhat well grown, they may take Medicins by the mouth; for when they are able to concect be given to and turn into bloud meats that are more gross and firm than Milk, they may easily actuate a gen-such as are the Medicin. Therefore a potion must be prepared for them of twelve grains of Treacle difforward weaned. We with a little of the Syrup of Succosy in some cordial Water, or the broth of a Capon: unless that are more given by the configuration of Rose in former of Rose in f that any had rather give it with Conferve of Roses, in form of a Bole; but Treacle must be given that any had rather give it with contents of recess, in form of a Bole: but Treache must be given to children in very finall quantity, for if it be taken in any large quantity, there is great danger left that by inflaming the humours, it infer a Fever. Furthermore, Broth may be prepared to be taken often, made of a Capon feafoned with Sorrel, Lettuce, Purflain, and cooling Seeds, adding thereto Bole-Armenick, and Terra Sigilista of each one ounce, being tied in a rag, and formetimes preffed out from the decoction. For Bole-Armenick, whetherit be by its marvellous faculty of drying, or be formed to the property of the property of the formed to the property of the formed to the property of the property of the formed to the property of the property of the formed to the property of the property of the formed to the property of the formed to the property of the prope by fome hidden property, hath this virtue, that being drunken (according as Galen witneffeth) it Lib. 9 floop. c.74 cureth those that are insected with the Pestilence, it so be that they may be cured by Physick; so that those that cannot be cured with Bole-Armenick, cannot be preserved by any other Medicins. But because the bodies of children are warm, moilt, and vaporous, they are easily delivered of some The benefit of portion of the venenate matter through the pores of the skin, by provoking sweat with a deco-children. Gion of Parily-feeds, Prunes, Figs, and the Roots of Sorrel, with a little of the powders of Harts-horn, or Ivory. But that the fweat may be more abundant and copious, apply fponges dipped and preffed out in the hot decoction of Sage, Rofemary, Lavender, Bays, Cammotnil, Melilot, and Mallows, or elfe Swines bladders half filled with the fame decoction, to the arm-holes, and to the groins. In the time that they fweat, let their Faces be fanned to cool them. Also let a Nodula of Treacle, diffolved in Vinegar and water of Roses, be applied to the Nostrils, but always use a moderation in sweating, because that children are of a substance that is easie to be diffipated and resolved: so that often times, although they do not fweat, yet they feel the commodities of fweating, the matter of the venom being diffipated by the force of the heat through the pores of the skin. But in the fweating while the face is fanned, and sweet and cordial things applied to the nostrils, Nature must be recreated and strengthened, which otherwise would be debilitated through sweating, that it may be better able to expel the venom. After that the fweat is wiped away, it were very profitable to take a potion of Conferve of Rofes, with the powder of Harts-horn or Ivory, diffolved in the waters of Bu-glofs and Sorrel, the better to cool and defend the heart. If there appear any tumour under the anni-holes, or in the groin, let it be brought to maturation with mollifying relaxing, drawing, and then with a suppurative fomentation, or Cataplasm; always using and handling it as gently as you may, confidering the age of the Infant. If you have need to purge the Patient, the purgation following may be preferibed with great profit. Take of Rhubarb in powder one dram, infufe it in the The form of a water of Cardum Benedicum, with one scruple of Cinamon, in the straining dissolve two drams of Furge to be Directly the straining dissolve two drams of given to a given to a Discathelicon, of fyrup of Rofes laxative three drams: make thereof a fmall potion. This is the child.

cure of the Peftilence, and of the Peftilent Fever, as far as I could learn from the most learned Phyficians, and have observed my self by manifold experience by the grace and permission of God; of whom alone, as the Author of all good things that mortal men enjoy, the true and certain Preferva-tives against the Pesilence, are to be desired and hoped for.

The End of the Two and Twentieth Book.

BOOK XXIII.

Of the Means and Manner to repair or supply the Natural or Accidental Defects or Wants in Mans Body.

CHAP. I.

How the loss of the Natural or true Eye may be covered, hidden or shadowed.

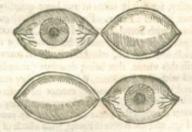

The fourth duty of a Chirurgeon.

Aving at large treated in the former Books of Tumors, Wounds, Ulcers, Fractures, and Luxations, by what means things diffolved and diflocated might be united, things united feparated, and fuperfluities confumed or abated: Now it remains, that we speak of the fourth Othice or Duty of the Chirurgeon, which is to supply or repair those things that are wanting by Nature, through the default of the first conformation, or afterwards by some mischance. Therefore if that through any mischance, as by any inflammation, any mans Eye happen to be broken or put out, and the humours spilt or

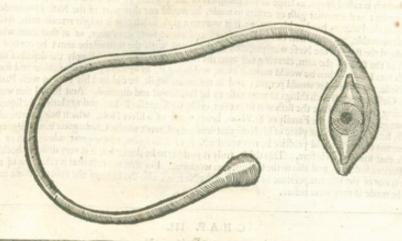

waited; or if it be thrucken out of its place or cavity wherein it was naturally placed by any violent ftroke; or if it walte or confirme by realon of a confirmption of the proper fubiliance, then there is no hope to reflore the fight or function of the Eye, yet you may cover the deformity of the Eye fo loft (which is all you can do in fuch a cafe) by this means: If that when you have perfectly cured and healed the Ulcer, you may put another Eye artificially made of Gold or Silver, counterfeited and enamelled, so that it may from to have the brightness or gemmy decency of the natural Eye, into the place of the Eye that is so lost.

The Forms of Eyes artificially made of Gold or Silver, polified and enamelled, frewing both the inner and outer fide.

But if the Patient be unwilling, or by reason of some other means, cannot wear this Eye so prepared, in his head, you may make another on this wife. You must have a firing or wire of Iron bowed or crooked, like unto womens Ear-wires, made to bind the head harder or loofer, as it pleafeth the Patient, from the lower part of the head behind above the ear, unto the greater corner of the Eye; this rod or wire must be covered with filk, and it must also be formewhat broad at both ends, lest that the sharpness thereof should pierce or prick any part that it cometh unto. But that end wherewith the empty hollowness must be covered, ought to be broader than the other, and covered with a thin piece of leather, that thereon the colours of the eye that is lost may be shadowed or counterfeited. Here followeth the Figure or portraiture of fuch a string or wire.

The form of an Iron Wier wherewith the deformity of an eye that is loft, may be shadowed or covered.

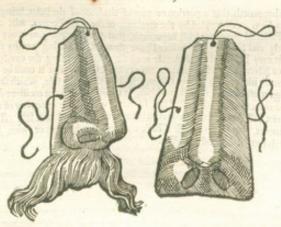

CHAP. IL

By what means a part of the Nofe that is cut off, may be reflored s or how in stead of the Nofe that is cut off, another counterfeit Nofe may be fastned, or placed in the stead.

Hen the whole Nose is cut off from the Face, or portion of the Nostrils, from the Nose, it cannot be restored or joined again; for it is not in Men as it is in Plants. For Plants Why the parts have a weak and feeble heat; and furthermore, it is equally dispersed into all the substance of the Plant or Tree, neither is it easie to be consumed or wasted; for when the boughs or branches may grow a feet grain, but they are set gain, but they are set gain, but those must necessarily run, and disperse it self-continually into all the parts thereof. But contrariwise, the separated parts of more perfect living Creatures, as of Men, are incontinently deprived of life; because they have their nourillment, life, sense, and whole suffernation not of themselves, by faculties flowing or coming unto them from some other parts; neither are they governed by their own heat, as Plants, but by a borrowed heat: so that above or beside the natural faculty of the liver, another vital faculty cometh unto it from the heart.

Wherefore inflead of the Nofe cut away or confumed, it is requifite to fubflitute another made by Art, because that Nature cannot supply that defect: this Nose so artificially made, must be of Gold, Silver, Paper, or linnen cloths glewed together, it must be so coloured, counterfeited, and made both of fashion, figure and bigness, that it may as apply as is possible, resemble the natural Nose: it must be bound or staid with little threds or laces unto the hinder part of the head or the hat. Also if there be any portion of the upper lip cut off with the nose, you may shadow it with annexing some such thing that is wanting unto the nose, and cover it with the hair on his upper lip, that he may not want any thing that may adom or beautiste the face. Therefore I have thought it necessary to set down the sigure or form of both these kinds.

The form of a Nofe artificially made, both alone by it felf, and also with the upper lip
expered with the hair of the Beard.

A supply of the defects of Mans Body. BOOK XXIII

526

A strange cure for a cut off Note,

There was a Surgeon of *Listy* of *late years which would reflore or repair the portion of the Nose that was cut away, after this manner. He first scarified the callous edges of the mained Nose round about, as is usually done in the cure of Hare-lips: then he made a gash or cavity in the muscle of the arm, which is called *Bierpr*, as large as the greatness of the portion of the Nose which was cut away did require: and into that gash or cavity so made, he would put that part of the Nose so wounded, and bind the Patients head to his arm, as if it were to a post, so fast that it might remain firm, stable and immovable, and not lean or bow any way; and about forty days after, or at that time when he judged the flesh of the Nose was perfectly agglutinated with the flesh of the arm; he cut out as much of the flesh of the arm, cleaving fast unto the nose, as was sufficient to supply the defect of that which was lost, and then he would make it even, and bring it, as by licking, to the sashion and form of a Nose, as near as Art would permit; and in the mean while he did feed his Patient with Panadoes, Gellies, and all such things as were ease to be swallowed and digested. And he did this work of curing the place where the flesh was so cut out, onely with certain Balms, and agglutinative liquors. A younger Brother of the Family of St. Thean, being weary of a silver Nose, which being artificially made, he had worn in the place of his Nose that was cut off, went to this Chinurgeon into *Baly,* and the means of the foresaid practice he recovered a Nose of flesh again, to the great admiration of all those that knew him before. This thing truly is possible to be done, but it is very difficult both to the Patient suffering, and also to the Chinurgeon working. For that the flesh that is taken out of the arm is not of the like temperature as the flesh of the Nose is; also the holes of the restored Nose cannot be made as they were before.

An Hiftory.

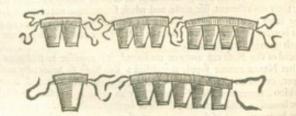

CHAP. III.

Of the placing of Teeth artificially made, in stead of those that are lost or wanting.

Toftentimes happeneth that the fore-teeth are moved, broken or firicken out of their places by fome violent blow, which caufeth deformity of the mouth, and hinders plain pronunciation. Therefore when the jaw is reflored (if it were luxated or fractured) and the gums brought into their former hardness, other teeth artificially made of Bone or Ivory may be put in the place of those that are wanting, and they must be joined one fall unto another, and also so fashed unto the natural teeth adjoining, that are whole: and this must chiefly be done with a thred of Gold or Silver, or for want of either, with a common thred of Silk or Flax, as it is declared at large by Hipperates, and also described in this Figure following.

Self. 2. lib. de

The Figure of Teeth bound or fastned together.

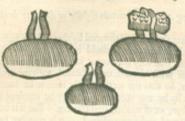

CHAP. IV.

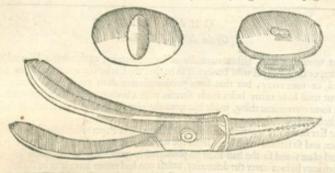

Of filling the hollowness of the Palat.

The causes and hure that ensues of the lost Palar, Any times it happeneth that a portion or part of the bone of the Palat, being broken with the flot of a Gun, or corroded by the virulency of the Later Veneres, falls away; which makes the Patients, to whom this happeneth, that they cannot pronounce their words diffinctly, but obscurely and fnuffling: therefore I have thought it a thing worthy the labour, to them the means how it may be helped by Art. It must be done by filling the cavity of the Palat with a Plate of Gold or Silver, a little bigger than the cavity it self is. But it must be as thick as a French Crown, and made like unto a dish in Figure; and on the upper side, which shall be toward the brain, a little Sponge must be fastned, which when it is moistned with the moisture distilling from the brain, will become more swollen and pussed up, so that it will fill the concavity of the Palat, that the artificial Palat cannot fall down, but stand fast and firm, as if it shood of it self. This is the true Figure of those Instruments, whose certain use I have observed not by once or rwice, but by manifold trials in the battels fought beyond the Alps.

The Figure of Plates to fill or Simply the defells of the Palat,

The Figure of another Plate of the Palat, on whose upper side there is a button, which may be turned when it is put into its place, with a small Ravens bill, like this whose Figure is here expressed.

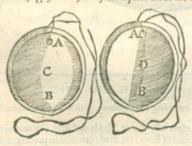

CHAP. V.

How to help fuch as cannot freak by reason of the lost of some part of the Tongue.

Hance gave place and authority to this remedy, as to many other in our Art. A certain A remedy man dwelling in a Village named Troy le Chafteau, being fome four and twenty mile from found our by Bourger, had a great piece of his tongue cut off; by which occasion he remained dumb accident. fome three years. It happened on a time that he was in the Field with Reapers, he drinking in a woodden dish was tickled by fome of the standers by, not enduring the tickling, he suddenly broke out into articulate and intelligible words. He himself wondring thereat, and delighted with the novelty of the thing, as a miracle, put the same dish to his mouth just in the same manner as before, and then he spake so plainly and articulately, that he might be understood by them all. Wherefore a long time following he always carried this dish in his boson to utter his mind, until at length Necessay, the Mistris of Arts and giver of Wit, inducing him, he caused a woodden instrument to be nearly cut and made for him, like that which is here delineated, which he always carried hanging at his neck, as the onely Interpreter of his mind; and the Key of his Speech.

An Instrument made to supply the defect of the Speech when the Tongue is cut off.

The use of the Instrument is this. A Sheweth the upper part of it which was of the thickness of a Nine-pence, which he did so hold between his cutting teeth, that it could not come out of his mouth, nor be seen. B Sheweth the lower part, as thick as a Six-pence, which he did put hard to the rest of his tongue, close to the membranous ligament which is under the tengue. That place which is depret and somewhat hollowed, marked with the letter C, is the inner part of the instrument, between the out-side of the same. He hanged it about his neck with the string that is tied thereto.

Textor the Phylician of Bourger shewed me this Instrument: and I my self made trial thereof on a young man whose tongue was cut off, and it succeeded well, and took very good effect. And I think other Surgeons in such cases may do the like.

CHAP.

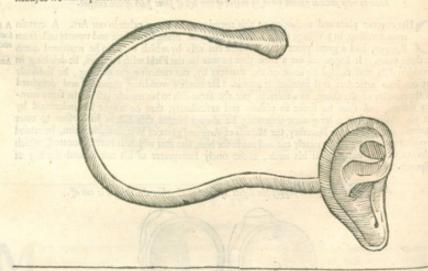

Of covering or repairing certain defects or defaults in the face.

Toftentimes happeneth, that the face is deformed by the fudden flashing of Gun-powder, or by a petilient Carbancle, to that one cannot behold it without great horrour. Such persons must be so trimmed and ordered, that they may come in seemly manner into the company of others. The lips if they be either cut off with a sword, or deformed with the eroson or eating of a petilient Carbancle or ulcerated Cancer, so that the teeth may be seen to lie bare with great deformity. If the loss or consumption of the lip be not very great, it may be repaired by that way which we have prescribed in the cure of hare-lips, or of an ulcerated Cancer. But if it be great, then must there be a lip of gold made for it, so shadowed and counterfeited, that it may not be much unlike in colour to the statural lip, and it must be fastned and tied to the hat or cap that the Patient weareth on his head, that so it may remain stable and firm.

C H A P. VII. Of the defells of the Esrs.

Such as want their Ears, either naturally or by misfortune, as through a Wound, Carbuncle, Cancer, or the biting of wild Beafts: if so be that the Ear be not wholly wanting, wasted, confumed, or torn away; but that some portion thereof doth yet remain, then must it not be neglected, but must have many holes made therein with a bodkin; and after that the holes are cicatrized, let some convenient thing, made like unto the piece of the Ear that is lost, be tied or fastned unto it by these holes.

But if the Ear be wholly wanting, another must be made of Paper artificially glewed together, or else of leather, and so fastned with laces, from the top or hinder part of the head, that it may stand in the appointed place; and so the hair must be permitted to grow long, or else some cap worn under the hat, which may hide or cover the deformity, unless you had rather have it to be shadowed or counterfeited by some Painter, that thereby it may refemble the colour of a natural Ear; and so retain it in the place where it ought to stand, with a rod or wier coming from the top or hinder part of the head, as we have spoken before in the loss of the Eye: and the form thereof is this.

CHAP. VIII.

Of amending the deformity of Such as are crook-backt.

Causes of crookedness,

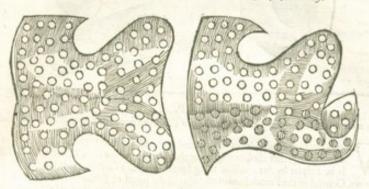

He bodies of many, especially young Maids or Girls (by reason that they are more moist and tender then the bodies of Boys) are made crooked in process of time, especially by the wrenching aside and crookedness of the back-bone. It hath many causes, that is to say, in the first conformation in the womb, and afterwards by missfortunes as a fall, bruise, or any such like accident; but especially by the unhandsome and undecent situation of their bodies when they are young and tender, either in carrying, fitting or standing, (and especially when they are taught to go too foon) faluting, sewing, writing, or in doing any such like thing.

In the mean while, that I may not omit the occasion of crookedness, that happens feldom to the Country People, but is much incident to the Inhabitants of great Towns and Cities, which is by reason of the straightness and narrowness of the garments that are worn by them, which is occasioned by the folly of Mothers, who while they cover to have their young daughters bodies so small in the middle as may be possible, pluck and draw their bones awry, and make them crooked. For the ligaments of the back-bone being very tender, soft and moist at that age, cannot stay it straight and strongly.

firongly; but being pliant, cafily permits the spondels to slip away inwards, outwards, or sidewise, as they are thrust or forced.

The remedy for this deformity is to have breft-plates of Iron, full of holes all over them, whereby they may be lighter to wear; and they must be so lined with bombaste that they may hurt no place of the body. Every three moneths new plates must be made for those that are not yet arrived at their fall growths for otherwife by the daily afflux of more matter, they would become worfe. But these Plates will do them small good that are already at their full growth.

The form of an Iron Brest-plate, to amend the crookedness of the Body.

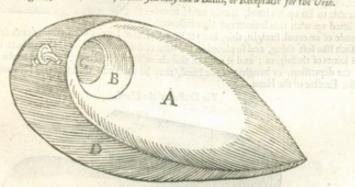

CHAP. IX.

How to relieve such as have their Urin flow from them against their wills, and such as want their Tards.

N those that have the Strangury, of what cause soever that malady cometh, the urin passeth from them by drops, against their wills and consent. This accident is very grievous and troublesom, especially to men that travel: and for their fakes onely I have invented the instrument here beneath described. It is made like unto a close breech or hose; it must be of Lattin, and to contain An Instrument forme four ounces: it must be put into the Patients hofe, betwixt his thighs, unto which it must be for fisch as cantied with a point by the ring. Into the open and hollow mouth of this infirument, which is noted with the letter C, the Patient must put his yard; and into this concavity or holloweek greath a five with the letter C, the Patient must put his yard; and into this concavity or hollowness goeth a stay formewhat deep, it is marked with the letter B, and made or placed there, both to hold or bear the end of the yard, and also by his close joint that it must have unto the vessel, to stay the urin from going back again when it is once in. But the letters A and D, do signific all the instrument; that, the former part, this the hinder part thereof. Now this is the shape thereof.

The Figure of an Instrument, which you may call a Basin, or Receptacle for the Urin.

Those that have their Yards cut off close to their bellies, are greatly troubled in making of Urin, to that they are constrained to fit down like women. For their ease, I have devised this Pipe or Conduit, having an hole through it as big as one finger, which may be made of Wood, or rather

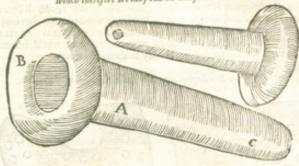

A and C do flew the bigness and length of the Pipe. B Sheweth the brink on the broader end. D Sheweth the outside of the brink. This Instrument must be applied to the lower part of the lower part of it will not be applied to the lower part of the it will receive the Urin better, and carry it from the Patient as he standeth upright.

An Hiftory.

A supply of the defett of Mans Body.

BOOK XXIII.

The description of a Pipe or Conduit, serving in stead of the Yard in making of water, which therefore we may call an artiscial Yard.

CHAP. X.

By what means the perished function or action of a thumb or finger may be corrected and amended.

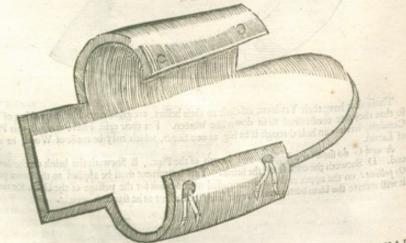

Hen a finew or tendon is cut clean afunder, the action in that part, whereof it was the author, is altogether abolithed; so that the member cannot bend or stretch out it self, unless it be holpen by Art: which thing I performed in a Gentleman belonging to Anna of Montmorency, General of the French Horsemen, who in the battel of Dreax received so great a wound with a Back-sword upon the outside of the wrist of the right hand, that the tendons that did erect or draw up the Thumb were cut clean in sunder; and also when the wound was throughly whole and consolidated, the Thumb was bowed inwards, and sell into the palm of the hand, so that he could not extend or list it up, unless it were by the help of the other hand, and then it would presently fall down again; by reason whereof he could hold neither Sword, Spear, nor Javelin in his hand, so that he was altogether unprostable for War, without which he supposed there was no life. Wherefore he consulted with me about the cutting away of his Thumb, which did hinder his gripings, which I refused to do, and told him that I conceived a means how it might be remedied without cutting away. Therefore I caused a case to be made for it of Lattin, whereinto I put the Thumb: this case was so artificially saltned by two strings that were put into two rings made in it above the joint of the hand, that the Thumb stood upright and straight out, by reason whereof he was able afterwards to handle any kind of weapon.

The form of a Thumb or Finger-stall of Iron or Lattin, to lift up or credi the Thumb, or any other Finger that cannot be credied of it felf.

If that in any man the finews or tendons which hold the hand upright, be cut afunder with a wound, so that he is not able to lift up his hand, it may easily be crected or lifted up with this Instrument that followeth,

being made of an equal, firaight, thin, but yet firong plate of Lattin, lined on the inner fide with fills or any fuch like foft thing, and fo placed in the wrift of the hand, that it may come unto the Palm, or the first joints of the fingers; and it must be tied above with convenient stays, and so the discommodity of the depression, or hanging of the hand, may be avoided: therefore this Instrument may be called the Erector of the Hand.

CHAP.

CHAP. XI.

Of belping these that are Vari or Valgi, that is, erock-legged, or erock-footed, inwards or outwards.

Hose that are said to be Vari, whose feet or legs are bowed or crooked inwards. This de-what Variation is either from the first conformation in the womb, through the default in the Mother, is, who hath her legs in like manner crooked; or because that in the time when the is great with child, she commonly his with her legs across; or else after the child is born; and that either because his legs be not well swathed when he is laid into the Gradle, or else because they be not well placed in carrying the infant; or if he be not well looked unto by the Nurse when he learneth to go; for the bones are very tender, and almost as slexible as Wax.

Eut contrariwife, those are called Valgi whose legs are crooked or bowed outwards. This may what Valgated come through the default of the first conformation as well as the other; for by both, the feet also and is the knees may be made crooked; which thing whosoever will amend, must reftore the bones into their proper and natural place; so that in those that are varsus, he must thrust the bones outwards, as though he would make them valgous: neither is it sufficient to thrust them so, but they ought also to be retained there in their places after they are so thrust, for otherwise they being not well established, would slip back again.

They must be staid in their places, by applying of collars and bolsters on that side whereunto the bones do lean and incline themselves; for the same purpose boots may be made of leather, of the thickness of a testione, having a slit in the former part all along the bone of the leg, and also under the sole of the foot, that being drawn together on both sides, they may be the better fitted and sit closer to the leg. And let this Medicin following be applied all about the leg. Be Thuris, massich, aloes, A Plaster to beli armeni, an. 3 j. aluminis roch, refuse pini sicce, substitutione pulveris, an. 3 ii. farine volat. 3 j. 3 album hold fast recover, q.f. make thereof a Medicin. You may also add a little Turpentine, lest it should dry sooner, or stored bones. The armore vehemently than is necessary. But you must beware, and take great heed, lest that such as were of late varous or rustgam, should attempt or strain themselves to go before that their joints be construed; for so the bones that were lately set in their places, may slip asside again. And moreover, until they are able to go without danger, let them wear high shoes tied close to their feet, that the bones may be staid the better and more tirmly in their places; but let that side of the soal of the shoe be under-laid whither the foot did incline before it was restored.

The Form of little Boots, whereof the one is open and the other flout.

CHAP. XII.

By what means Arms, Legs, and Hands may be made by Art, and placed in flead of the natural Arms, Legs, or Hands that are cut off and loft.

Nature, and supply the defect of members that are perished and lost. And hereof it cometh that we may perform the functions of going, standing and handling with Arms and Hands made by Art, and undergo our necessary standing and extensions with both of them. I have gotten the forms of all those members made so by Art, and the proper names of all the Engines and Instruments whereby those artificially made are called, to my great cost and charges, of a most ingenious and excellent Smith dwelling at Paris, who is called of those that know him, and also of firangers, by no other name than the Little Lorins, and here I have caused them to be pourtraid, or set down, that those that stand in need of such things, after the example of them, may cause someth, or such like Workman, to serve them in the like case. They are not onely profitable for the necessity of the body, but also for the decency and comeliness thereof. And here follow their forms.

The form of an Hand made artificially of Iron.

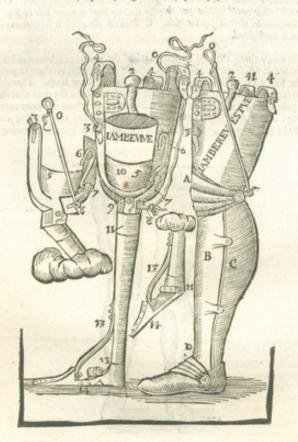

This Figure following showeth the back-fide of an Hand artificially made, and so that it may be tied to the arm or sleeve.

The Form of an Arm made of Iron very artificially.

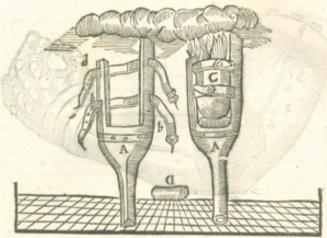

The description of Legs made artificially of Iron.

timmin

The Form of a Woodden Leg made for poor Men.

A Sheweth the stump or stock of the woodden Leg. BB Sheweth the two stays which must be on both sides of the Leg, the shorter of them must be on the inner side. CC Sheweth the Pillow or Bolster wherever the Knee must rest in the bostom between the two stays, that so it may rest the foster. DD Sheweth the thougs or girths with their round buckles put through the two stays on either side to stay the Knee in his place sirm and immovable, that it slip not aside. E Sheweth the thigh it self, that you may know after what sassion it must stand.

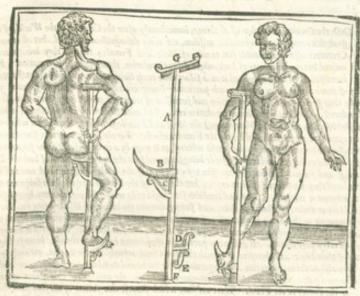

It happens also many times, that the Patient that had the nerves or tendons of his Leg wounded, long after the wound is whole and confolidated, cannot go but with very great pain and torment, by reason that the foot cannot follow the muscle that should draw it up. That this malady may be remedied, you ought to fasten a linnen band made very strong unto the shoe that the Patient weareth on that his pained foot; and at the knee it must have a flit where the knee may come forth in bowing of the Leg: and it must be trussed up fast unto the Patients middle, that it may the better lift up and erect the foot in going. This hand is marked in the Figure following with the letters AA.

CHAP. XIII.

Of amending or helping of Lameness or Halting.

Alting is not onely a great deformity, but also very troublesom and grievous. Therefore if that any be grieved therewith by reason that one of his legs is shorter than the other, it may be holpen by putting under his short foot this sitting Crutch, which we are now about to describe. For by the help of this, he shall not onely go upright, but also more easily and with little labour or no pain at all. It was taught me by Nicolas Piccard Chirurgeon to the Duke of Loratu. The Form thereof is this:

A Sheweth the staff or still of this Crutch, which must be made of Wood. B Sheweth the Seat of Iron whereen the thigh resteth, just under the huttock. C Sheweth a prop which stayeth up the feat whereon all the
weight of the Patients body resteth. D Sheweth the stirrup, being made of Iron, and howing crooked upwards, that the foot may stand stron, and not slip off it when the Patient goeth. E Sheweth the Prop that
stayeth or holdeth up the stirrup to strengthen it. F Sheweth the foot of the still or crutch made of Iron
with many pikes, and compassed with a ring or fernle, so to keep it from slipping. G The cross we head
of the crutch which the Patient must put under his arm-hole to lean upon, as it is to be seen in the Figure:

Cion.

Fatal necessity of death: then for as much as each particular living creature against the most certain and may endure by their species or kind, by propagation and succession of creatures, which is by procreation, so long as the World endureth. In this conjunction or copulation replenished with such deletable pleasure, (which God bath chiefly established by the Law of Matrimony,) the Male and Female yield forth their seeds, which present what Seed is, by mixed and conjoined, are received and kept in the Females womb.

For the feed is a certain should mith that all division to the process of a it more to a certain should not be presented in the second of the certain should not be considered.

It is mixed and conjoined, are received and kept in the Females womb. For the feed is a certain showns or foamly homouse replenished with vital shirit, by the benefit whereof, as it were by a certain challition or fermentation, it is pussed up, and fivelen bigger, and both the feeds being separated from the more pure bloud of both the Parents, are the material and formal beginning of the issue; for the feed of the Male being cast and received into the womb, is accounted the principal and efficient cause; but the feed of the Female is reputed the subject matter, or the matter wherein it workels. Good and landable feed ought to be white, shining, claiming, knotty, smelling like unto the Elder or Palm, deletiable to Bees, and sinking down in the bottom of Water being put into it, for that which swimmeth on the water is esteemed unsprintful; for a great portion contest from the brain, yet some thereof salls from the whole body, and from all the parts both sim and soft thereof. For unless it come from the whole body and every part thereof, all and every part of the issue cannot be formed thereby, because like things are engendred of their like: and therefore it cometh that the Child resembleth the Parent, not onely in stature and favour, but also in the conformation and proportion of his limbs and members, and complexion and temperature and favour, but also in the conformation and proportion of his limbs and members, and complexion and temperature. The conditions of good feed. Seed falleth. from all the parts of the body. and favour, but also in the conformation and proportion of his limbs and members, and complexion and tempe-

wherefore rature of his introd parts, so that diseases are oft-times bereditary, the weakness of this or that entrail being many diseases translated from the Parent to the Child. There are some which suppose this falling of the seed from the whole are hereditary.

How seed is to be understood according to the weight and matter, as if it were a certain portion of all the blowd form. The parent of formation and life, and also the formative faculty to fall down from all the parts into the seed, that is wronght or perfected by the Testicles. For proof and confirmation whereof, they alledge that many perfect, sound, absolute, and well proportioned children, are born of lame and decrept Parents.

body.

CHAP. XXIX.

Why the generative parts are endued with great pleasure.

What moveth 2 man to copulation,

Certain great pleasure accompanieth the function of the parts appointed for generation; and before it in living Creatures that are of a lufty age, when matter aboundeth in those parts, there goeth a certain fervent or furious delire: the causes thereof many, of which the chiefest is, That the kind may be preserved and kept for ever, by the propagation and substitu-fore cannot be solicitous for the same kind. For brute Beasts which want reason, and there-sort cannot be solicitous for the preservation of their kind, never come to carnal copulation unless they be moved thereunto by a certain vehement provocation of unbridled Lust, and as it were by the stimulation of Venery. But Man that is endued with reason, being a divine and most noble creature, would never yield nor make his mind so subject to a thing so abject and sithy as is carnal copulation, but that the venerous ticklings, raised in those parts, relax the severity of his mind. of his mind; or Reason admonished him that the memory of his name ought not to end with his life, but to be preserved unto all generations, as far as may be possible, by the propagation of his seed or iffue. Therefore by reason of this profit or commodity, Nature hath endued the genitals with a few more reason of this profit or commodity, Nature hath endued the genitals with a few more reason. tals with a far more exact or exquifite fense than the other parts, by sending the great linews unto them, and moreover she hath caused them to be bedewed or moistned with a certain whayis humans. whayish humour, not much unlike the feed sent from the glandules or kernels called postate, fituated in Men at the beginning of the neck of the bladder, but in Women at the bottom of the womb this moifture bath a certain flarpness or biting, for that kind of humour of all others can chiefly provoke those parts to their function or office, and yield them a delectable pleasure, while they are in execution of the fame. For every former of the control of the fame. in execution of the fame. For even fo whayish and sharp humours, when they are gathered together under the skin is the ther under the skin, if they wax warm, tickle with a certain pleafant itching, and by their motion in-fer delight; but the new wax warm, tickle with a certain pleafant itching, and by their motion infer delight: but the nature of the genital parts or members is not firred up or provoked to the expal-fion of the feed with these provocations of the humours, abounding either in quantity or quality only, but a certain great and box foiring the humours, abounding either in quantity or quality only. but a certain great and hot spirit or breath contained in those parts, doth begin to dilate it self-more and more, which causeth a certain incredible excess of pleasure or voluptuousness, wherewith the

genitals being replete, are spread forth or distended every way unto their full greatness. The Yard is given to Men whereby they may cast out their feed directly or strainly into the Womans wombs to Women whereby they may receive that feed to east forth, by the open or wide mouth of the same neck, and also that they may east forth their own feed fent through the spermatick vessels unto their tefficles; these spermatick vessels, that is to say, the Vein lying above, and the artery lying below, The easte of do make many sexions or windings, yet one as many as the other, like unto the tendrils of Vines solding of the diverfly platted or folded together, and in those folds or bendings the bloud and spirit which are spermatick carried unto the tellicles, are concocted a longer time, and fo converted into a white feminal fub-flance. The lower of these flexions or bowings do end in the Stones or Testicles. But the Testicles for as much as they are loofe, thin, and fpongeous, or hollow, receiving the humour which was begun to be concoched in the fore-named veffels, concoch it again themfelves: but the Tefficles of Men concoct the more perfectly for the procreation of the iffue, and the reflicles of Women more imper-womens Tefeetly, because they are more cold, less, weak, and feeble, but the Seed becometh white by the conflicles more tack or touch of the Telticles, because the substance of them is white. The male is such as engen-imperfect. dereth in another, and the female in her felf, by the spermatick vessels which are implanted in the inner capacity of the womb. But out of all doubt, unless Nature had prepared so many allure- why many ments, baits, and provocations of pleafure, there is fearce any man to hot and delighted in vene- men and worous acts, which confidering and marking the place appointed for humane conception, the loathformers of the filth which daily falleth down into it, and wherewithall it is humefted and moiffned, pulation, and the vicinity and nearness of the great gut under it, and of the bladder above it, but would shun the embraces of Women. Nor would any Women desire the company of Man, which once preme-ditates or fore-thinks with her felf on the labour that the should sustain in bearing in the burthen of

her child nine Moneths, and of the almost deadly pains that she shall suffer in her delivery. Men that use too frequent copulation, oftentimes in flead of feed cast forth a crude and bloudy Why the humour, and foractimes meer bloud it felf; and oft-times they can hardly make water but with facth immogreat pain, by reason that the clammy and oily moisture, which Nature hath placed in the glan-derate copudules called the Proflate, to make the passage of the urin slippery, and to defend it against the sharp-lation. nefs of the urin that paffeth through it, is wasted, fo that afterward they shall fland in need of the help of a Surgeon to cause them to make water with ease and without pain, by injecting of a little Oil out of a Syringe into the conduit of the Yard. For in generation it is fit the man cast forth his feed into the womb, with a certain impetuolity, his Yard being fliff and diffended, and the Woman to receive the fame without delay into her womb being wide open, left that through delay the feed wax cold, and so become unfruitful by reason that the spirits are diffipated and consumed. The Yard is diffended or made fliff, when the nervous, spongeous and hollow substance thereof is replete and puffed up with a flatulent spirit. The womb allures or draws the masculine seed into it felf by the mouth thereof, and it receives the womans feed by the horns from the spermatick veffels which come from the Telticles into the hollowness or concavity of the womb, that so it may be tempered by conjunction, committion and confusion with the mans feed, and so redured or brought unto a certain equality: for generation or conception cannot follow without the concourse of two seeds, well and perfectly wrought in the very same moment of time, nor without a landable disposition of the words both in temperature and complexion: if in this mixture why a male, of feeds the mans feed in quality and quantity exceed the womans, it will be a man-child; if not, and why a feed woman-child, although that in either of the kinds there is both the mans and womans feed; male is enjectas you may fee by the daily experience of those men who by their first wives have had boys onely, dred. and by their fecond wives had girls onely: the like you may fee in certain women, who by their first husbands have had males onely, and by their fecond husbands females onely. Moreover, one and the fame man is not always like affected to get a man or woman-child; for by reason of his age, temperature and diet, he doth fometimes yield forth feed endued with a mafculine virtue, and fometimes with a feminine or weak virtue, fo that it is no marvel if men get fometimes men and fometimes women-children.

nerous copula-

generation.

CHAP. II.

Of what quality the Seed is, whereof the male, and whereof the female is engendred.

Ale Children are engendred of a more hot and dry feed, and women of a more cold Why menand moist: for there is much less strength in cold then in heat, and likewise in moi-children are sture than in driness; and that is the cause why it will be longer before a Girl is for-some formed in the score worth than a boy. In the seed lieth both the procreative and the formative process. and in the womb than a boy. In the feed lieth both the procreative and the formative power; than women. As for example, In the power of Melon-feed are fituate the Stalks, Branches, Leaves, Flowers, the Seed is As for example, In the power of melon-rect are install. The like reason is of other seeds; so Apple, that in power Fruit, the Form, Colour, Smell, Taffe, Seed and all. The like reason is of other seeds; so Apple, that in power from whence from whence Brafts engrafted in the flock of a Pear-tree bear Apples: and we do always find and fee by experience, each string that the tree (by virtue of grafting) that is grafted, doth convert it felf into the nature of the Siens cometh or wherewith it is grafted. But although the child that is born doth refemble or is very like unto the floweth Father or Mother, ashis or her feed exceedeth in the mixture; yet for the most part it happeneth that the Children are more like the Father than the Mother, because that in the time of copulation, the mind of the woman is more fixed on her husband, than the mind of the husband on, or towards like unto their his wife: for in the time of copulation or conception, the forms or the likeness of those things that Fathers, are conceived and kept in mind, are transported and impressed in the Child or issue: for so they affect the Exhibition who have the Child or issue: for so they affect the Exhibition who have the Child or issue: firm that there was a certain Queen of the Athiopians who brought forth a white child, the reason was (as the confessed) that at the time of copulation with her King, the thought on a marvelous white

Commission

When children should be gotten.

Why oftentimes the child refembleth the Grandfather.

thing, with a very firong imagination. Therefore Hefiod adviseth all married people not to give themselves to carnal copulation when they return from burials, but when they come from Featls and Plays, left that their fad, heavy, and penfive cogitations, should be so transfused and engraften in the iffue, that they should contaminate or infect the pleasant joyfulness of his life with fad, pensive or paffionate thoughts. Sometimes it happeneth, although very feldom, the child is neither like the Father nor the Mother, but in favour refembleth his Grandfather, or any other of his Kindred; by reason that in the inward parts of the parents, the engrafted power and nature of the Grandfather lies hidden; which when it hath lurked there long, not working any effect, at length breaks forth by means of some hidden occasion: wherein Nature refembleth the Painter, making the lively pourtraiture of a thing, which as far as the subject matter will permit, doth form the iffue like unto the Parents in every habit; fo that often-times the difeases of the Parents are transferred or participated unto the children, as it were by a certain hereditary title: for those that are crook-backt, get crook-backt children; those that are lame; those that are leprous, leprous; those that have the stone, children having the stone; those that have the ptisick, children having the ptisick; and those that have the gout, children having the gout: for the feed follows the power, nature, temperature, and complexion of him that engendereth it. Therefore of those that are in health and found, healthy and found; and of those that are weak and diseased, weak and diseased children are begotten, unless happily the feed of one of the Parents that is found doth correct or amend the diseased impression of the other that is diseased, or else the temperate and found womb as it were by the gentle and pleafant breath thereof.

Why fometimes those that are difeafound children.

CHAP, III.

What is the easife why Females of all brute Beafts, being great with young, do neither defire, nor admit the Males, until they have brought forth their Toning.

Why the fenfe of Venercous acts is given to brute beafts

Why of brute beafts the Males raging with luft, follow after the Females. Wherefore a copulation.

He cause hereof is, for as much as they are moved by sense onely, they apply themselves unto the thing that is prefent, very little or nothing at all perceiving things that are past and to come. Therefore after they have conceived, they are unmindful of the pleasure that is past, and do abhor copulation; for the sense or seeling of lust is given unto them by Nature, onely for the prefervation of their kind, and not for voluptuousness, or delectation. But the Males raging, fwelling, and as it were stimulated by the provocations of the heat or servency of their lust, do then run unto them, follow and defire copulation, because a certain strong odor or smell cometh into the air from their fecret or genital parts, which pierceth into their notirils, and unto their brain, and fo inferreth an imagination, defire, and heat. Contrariwife, the fenfe and feeling of venerous actions feemeth to be given by nature to Women, not onely for the propagation of iffue and for the conferwoman when vation of mankind, but also to mitigate and asswage the miseries of mans life, as it were by the enticements of that pleafure: also the great flore of hot bloud that is about the heart, wherewith men child, defireth abound, maketh greatly to this purpose, which by impulsion of imagination, which ruleth the humours, being driven by the proper paffages down from the heart and entrails into the genitals, doth ftir up in them a new luft.

The Males of brute Beafts, being provoked or moved by the filmulation of luft, rage and are almost burst with a Tenigo or extension of the genital parts, and sometimes wax mad; but after that they have satisfied their lust with the semale of their kind, they presently become gentle, and leave off fuch hercenels.

CHAP. IV.

What things are to be observed, as necessary unto generation in the time of capulation.

How women may be mo-ved to Venery and Conceprion.

Hen the Husband cometh into the Wifes Chamber, he must entertain her with all kind of dalliance, wanton behaviour, and allurements to Venery; but if he perceive her to be flow, and more cold, he must cherish, embrace, and tickle her, and shall not abruptly, the nerves being suddenly distended, break into the field of Nature; but rather shall creep in by little and little, intermixing more wanton kiffes with wanton words and speeches, handling her secret parts and dugs, that the may take fire, and be enflamed to venery; for fo at length the womb thall strive and wax fervent with a defire of caffing forth its own feed, and receive the mans feed to be mixed together. ther therewith. But if all these things will not suffice to enslame the woman, for women for the most part are more flow and slack unto the expulsion or yielding forth of their seed, it shall be need fary first to force here. fary first to foment her secret parts with the decoction of hot herbs made with Muscadine, or boiled in any other good Wine, and to put a little Musk or Civet into the neck or mouth of the womb: and when the shall perceive the efflux of her feed to approach, by reason of the tickling pleasure, the must advertise her husband thereof, that at the very instant time or moment, he may also yield forth his feed, that by the concentration of the tickling pleasure, the must also yield forth his feed, that by the concourse or meeting of the feeds, conception may be made, and so at length a child formed and born. And the iteration of the feeds, conception may be made, and so at length a child formed and horn. And that it may have the better fuccers, the husband must not prefently separate himself from his wises embraces, left the air firike into the open womb, and so corrupt the seeds be-fore they are perfectly mixed together. When the man departs, let the woman lie fill in quiet, laying her less or her thinks. laying her legs or her thighs acrofs, one upon another, and raifing them up a little, left that by motion or downward fination, the feed thould be thed or fpilt: which is the cause why the ought at that time not to talk, especially distinct. not to talk, especially chiding, nor to cough, nor sneez, but give her self to rest and quietness, if it be possible.

of the feeds, most necessary for genera-

CHAP. V.

By what figns it may be known, whether the Woman have conceived, or not.

If the feed in the time of copulation, or prefently after be not spile, if in the meeting of the feeds the whole body do fornewhat shake, that is to say, the womb drawing it felf together for the compression and entertainment thereof, if a little seeling of pain doth run up and down the lower belly, and about the navel, if the be fleepy, if the loath the embracings of a man, and if her face be pale,

it is a token that the hath conceived. In forte, after conception spots or freekles arise in their face, their eyes are depressed and sunk in, Spots or the white of their eyes waxeth pale, they wax giddy in the head, by reafon that the vapours are rai-fed up from the mentional bloud that is stopped, fadness and heaviness grieve their minds, with loath-that are with ing and waywardness, by reason that the spirits are covered with the smoaky darkness of the vapours: that pains in teeth and gums, and fwouning oftentimes corneth, the appetite is depraved or overthrown, with aptness to vomit, and longing, whereby it happeneth that they loath meats of goods juice, and Why many long for and defire illaudable meats, and those that are contrary to nature, as coles, dirt, alhes, flinklong for and defire illaudable meats, and those that are contrary to nature, as cores, out, annes, timaing falt-fish, fuch fowre, authere and tart fruits, pepper, vinegar, and fuch like acrid things, and other, child refate
altogether contrary to nature and use, by reason of the condition of the suppressed humour aboundlaudable
ing and falling into the orifice of the fromach. This appetite so depraved or overthrown, endureth
means, and defree those that in some until the time of child-birth; in others it cometh in the third moneth after their conce-are illaudable ption, when hairs do grow on the child: and lafily, it leaveth them a little before the fourth moneth, and contrary because that the child, being now greater and stronger, consumes a great part of the excremental to Nature. and superfluous humour. The suppressed or stopped terms in women that are great with child, are The suppressed terms in women that are great with child, are The suppressed terms in women that are great with child, are The suppressed terms in women that are great with child, are The suppressed terms in women that are great with child, are The suppressed terms in women that are great with child, are The suppressed terms in women that are great with child, are The suppressed terms in women that are great with child, are The suppressed terms in women that are great with child, are The suppressed terms in women that are great with child, are The suppressed terms in women that are great with child, are The suppressed terms in women that are great with child, are The suppressed terms in women that are great with child, are the suppressed terms in women that are great with child, are the suppressed terms in women that are great with child, are the suppressed terms in women that are great with child, are the suppressed terms in women that are great with the suppressed terms in women that are great with the suppressed terms in divided into three parts; the more pure portion maketh the nutriment for the child, the fecond fed Terms diafcendeth by little and little into the dugs, and the impureft of all remaineth in the womb about the three parts. Infant, and maketh the fecondine or after-birth, wherein the Infant lieth as in a foft bed. Those women are great with child, whose urin is more sharp, tervent, and somewhat bloady, the bladder not onely waxing warm by the compression of the womb; fervent, by reason of the bloud contained in it, but also the thinner portion of the same bloud being expressed, and sweating out into the bladder. A fwelling and hardness of the dugs, and veins that are under the dugs in the breasts and about Hip. T. de Mark them, and milk coming out when they are preffed, with a certain filiring motion in the belly, are a certain infallible figns of greatness with child. Neither in this greatness of child-bearing, the veins of the dugs onely, but of all the whole bedy, appear full and fwelled up, especially the veins of the thighs and legs; fo that by their manifold folding and knitting together, they do appear varieous, whereof cometh fluggiffness of the whole body, heaviness and impotency, or difficulty of going, especially
when the time of deliverance is at hand. Lastly, If you would know whether the Woman have conceived or not, give unto her when the goeth to fleep, fome Mead or honied water to drink; and if the have a griping in her guts or belly, the hath conceived; if not, the hath not conceived.

CHAP. VI.

That the womb, so soon as it hash received the feed, is presently contrasted or drawn together.

Fter that the feeds of the Male and female have both met, and are mixed together in the capacity of the womb, then the orince thereof doth draw it felf close together, left the feeds should fall out. There the Females feed goeth and turneth into nutriment, and the increase why the feof the Males feed; because all things are nourished, and do increase by those things that are most far male feed is miliar, and like unto them. But the similitude and familiarity of feed with feed is far greater than nutriment for with bloud; fo that when they are perfectly mixed and coagulated together, and so wax warm by the firaight and narrow enclosure of the womb, a certain thin skin doth grow about it, like unto that that will be over unskimmed Milk.

Moreover, this concretion or congealing of the feed, is like unto an Egg laid before the time that it should: that is to fay, whose membrane or tunicle that it compasses it about, hath not as yet increafed or grown into a shelly hardness about it; in folding-wise are seen many small threds dividing themselves, over-spread with a certain clarmy, whitish or red substance, as it were with black bloud. In the midst under it appeareth the navel, from whence that small skin is produced. But a man may understand many things that may appertain unto the conception of mankind by the observation of twenty Eggs, setting them to be hatched under an Hen, and taking one every day and breaking it, does way to understand the Chick restorate. and diligently confidering it; for in fo doing, on the twentieth day you shall and the Chick perfectly man conce-formed with the navel. That little skin that fo compaffeth the Infant in the womb, is called the ption, fecundine or Cherisa, but commonly the after-birth.

This little skin is perfectly made within fix days, according to the judgment of Hippocrates, as pro-15b.de nat. pare has little skin is period; as pro-fitable and necessary not onely to contain the feeds fo mixed together, but also to suck nutriment through the orifices of the vetlels ending in the womb. Those orifices the Greeks do call Caryledoner, What the coand the Latins Acetabula, for they are as it were hollowed eminences, like unto those which may be tyledasts are. feen in the feet or frout of a Cuttle-fish many times in a double order, both for the working and holding of their meat. Those eminences called Acetabula, do not so greatly appear in women as in many brute beasts. Therefore by these the secondine cleaveth on every side unto the womb, for the confervation, nutrition, and increase of the conceived feed.

CHAP.

CHAP. VII.

Of the generation of the Navel.

Fter the Woman hath conceived, to every one of the aforefaid eminences groweth prefently another veffel, that is to fay, a Vein to the Vein, and an Artery to the Artery: these soft and yet thin veffels are framed with a little thin membrane, which being fpread under, flicketh to them; for to them it is in flead of a membrane, and a ligament, and a tunicle, or a defence; and it is doubled with the others, and made of the Vein and Artery of the Navel. These new small vessels of the Infant, with their orifices, do answer directly one to one, to the Cotyledones or eminences of the womb; they are very finall and little, as it were the hairy fibres that grow upon roots that are in the earth; and when they have continued to a longer time, they are combined together, that of two they are made one Veffel, until that by continual connexion, all those veffels go and degenerate into two other great veffels, called the Umbilical veffels or the veffels of the navel, because they do make the navel, and do enter into the childs body by the hole of the navel. Here Galen doth admire the fingular providence of God and Nature; because that in such a multitude of vessels, and in so long a passage or length that they go or are produced, the vein doth never consound it self, nor stick to the artery, nor the artery to the vein; but every veffel joineth it felf to the veffel of its own kind. But the Umbilical vein, or Navel vein, entering into the body of the child, doth join it felf prefently to the hollow part of the liver; but the artery is divided into two, which join themselves to the two Iliack arteries along the sides of the bladder, and are presently covered with the Peritoneum; and by the benefit thereof annexed unto the parts which it goes unto. Those small veins and arteries are as it were the roots of the child; but the vein and artery of the Navel are as it were the body of the Tree, to bring down the nutriment to nourish the child. For first we live in the womb the life of Hipperatts Tree, to bring down the nutriment to nourith the child. For fill we have a called called all the Plant, and then next the life of a Sensitive Creature: and as the first tunicle of the child is called that compais the compais the infant in about on every fide. These membranes are most thin, yea for their thinness like unto the Spiders the womb, ac- web, woven one upon another; and also connexed in many places by the extremities of certain small eerding to the and hairy substances, which at length by the adjunction of their like do get strength; whereby you may understand what is the cause why by divers and violent motions of the Mother in going and dancing, or leaping, and also of the Infant in the womb, those membranes are not almost broken-For they are so conjoined by the knots of those hairy substances, that between them nothing, neither the urin, nor the fweat can come, as you may plainly and evidently perceive in the diffection of a wo-mans body that is great with child, not depending on any other mans opinion, be it never foold or inveterate: yet the ftrength of those membranes is not so great, but that they may be soon broken in the birth, by the kicking of the child.

The Vein nefelf with the artery.

judgment of Gates in his Book De afa Partium, by the name of the Secondines,

CHAP. VIII.

Of the Umbilical Veffels, or the Veffels belonging to the Navel.

An old opinion confuted.

Any of the ancient Writers have written that there are five Veffels found in the Navel-But yet in many, nay all the bodies I fought in for them, I could never find but three; that is to fay, one Vein, which is very large, fo that in the paffage thereof it will receive the tag of a point, and two Arteries, but not fo large, but much narrower, because the child wanteth or flandeth in need of much more bloud for his conformation, and the nutriment or increase of his parts, than of vital spirit.

To what use the knots of the childs Navel in the womb ferve.

These Vessels making the body of the Navel, which, as it is thought, is formed within nine or ten days by their doubling and folding make knots like unto the knots of a Franciscan Friers girdle, that flaying the running bloud in those their knotty windings, they might more perfectly concoct the fame: as may be feen in the ejaculatory spermatick vessels, for which use also the length of the Name of the length of the Name of the length of vel is half an ell; fo that in many Infants that are fomewhat grown, it is found three or four times doubled about their neck or thigh.

The child in ment by his Navel, not by his Mouth.

As long as the child is in his Mothers womb, he taketh his nutriment onely by the Navel, and not womb ta- by his Mouth; neither doth he enjoy the use of eyes, ears, nostrils, or fundament, neither needeth he keth his nourithe functions of the heart. For the spirituous bloud goeth unto it by the arteries of the Navel, and into the Iliack arteries; and from the Iliack arteries unto all the other arteries of the whole Body, for by the motion of these onely the Infant doth breath. Therefore it is not to be supposed that How the shild the air is carried or drawn in by the lungs unto the heart, in the body of the child, but contrariwife breatheth. from the heart to the heart of th from the heart to the lungs. For neither the heart doth perform the generation or working of bloud, or of the vital spirits. For the lifue or Infant is contented with them as they are made and wrought by his Mother. Which, until it hath obtained a full, perfect, and whole description of his parts and or pulsars. of his parts and members, cannot be called a Child, but rather an Embryon, or an imperfect fub-

CHAP. IX.

Of the abullition or swelling of the feed in the womb, and of the concretion of the bubbles or bladders, or the three principal entrails.

N the fix first days of conception the new vessels are thought to be made and brought forth of the eminences or conception the mothers veries, and dispersed into all the whole seed, as as they were fibres, or hairy strings. Those, as they pierce the womb, so do they equally and in like manner penetrate the tunicle Cherion. And it is carried this way, being a passage not onely necessary for the nutriment and conformation of the parts, but also into the veins diversly woven and dispersed into the skin Charias. For thereby it cometh to pass, that the feed it self boileth, and as it were fermenteth or fwelleth, not only through occasion of the place but also of the bloud and vital spirits that flow unto it; and then it rifeth into three bubbles or bladders like unto the bubbles which are occasioned by the rain falling into a river or channel full of water. These three bub- The three bles or bladders, are certain rude, or new forms, or concretions of the three principal entrails, that bladders, is to fay, of the liver, heart, and brain. All this former time it is called feed, and by no other when the name; but when those bubble arise, it is called an embryon, or the rude form of a body until the feed is called an embryon, or the rude form of a body until the feed is called an embryon, or the rude form of the navel is formed, an embryon. it fucketh groffer bloud, that is, of a more full nutriment out of the Cotyledons. And this bloud, because it is more grofs, easily congeals and curdles in that place, where it ought to prepare the liver fully and abfolutely made. For then it is of a notable great bigness above all the other parts; Why the liver and therefore it is called Parenchyma, because it is but only a certain congealing or concretion of is called Pase bloud brought together thither, or in that place. From the gibbous part thereof springeth the resolution greater part or trunk of the hollow vein, called commonly vena cava, which doth disperse his small than subject to the problem. branches, which are like unto hairs, into all the substance thereof and then it is divided into two branches, whereof the one groweth upwards, the other downwards unto all the particular parts of

In the mean scasion the arteries of the navel suck spirituous bloud out of the eminences or Cotyledone of the mothers arteries, whereof, that is to fay, of the more fervent and spirituous bloud the heart is sormed in the second bladder or bubble, being endued with a more sleshy, sound, and thick fubflance, as it behoveth that veffel to be, which is the fountain from whence the heat floweth, and

hath a continual motion.

In this the virtue formative bath made two hollow places, one on the right fide, another on the left. In the right, the root of the hollow vein is infixed or ingraffed, carrying thither necessary nutriment for the heart: in the left is formed the flamp or root of an artery, which prefently doth divide it felf into two branches; the greater whereof goeth upwards to the upper parts, and the wider unto the lower parts, carrying unto all the parts of the body life and vital heat.

CHAP. X.

Of the third Bubble or Blad der, wherein the head and the brain is formed.

He far greater portion of the feed goeth into this third bubble, that is to fay, yielding mat- Why the ter for the conformation of the brein, and all the head. For a greater quantity of feed greater portion ought to go unto the conformation of the head and brain; because these parts are not fanction or the head and brain; because these parts are not fanction or the head and brain; because these parts are not fanction of the head and brain; because these parts are not fanction of the head and brain; because the heart and liver; but in a manner without blend, heavy marrow, cartibout ration of the guine or bloody, as the heart and liver; but in a manner without bloud, hony, marrow, cartilagi- ration of the nous, nervous, and membranous, whose parts, as the veins, arteries, nerves, ligaments, panicles, head and and skin, are called fpermatick parts; because they obtain their first conformation almost of feed brain, only: although that afterwards they are nourished with blood, as the other fleshy and musculous parts are. But yet the bloud, when it cometh unto those parts, degenerateth, and turneth into a thing fornewhat spermatick, by vertue of the affirmulative faculty of those parts. All the other parts of the head form and fashion themselves unto the form of the brain, when it is formed; and those parts which are situated and placed about it, for defence especially, are hardened into

The head, as the feat of the fenfes, and manfion of the mind and reason, is situated in the highest why the head place; that from thence, as it were from a losty tower or turret, it might rule and govern all the o- is placed on the control of the state of the control of the state of the control of the state of the control of the contr ther members, and their functions and actions that are under it : for there the foul or life, which is the top of the the rectrefs or governess, is situated; and from thence it floweth, and is dispersed into all the whole body. body. Nature hath framed these three principal entrails, as props and sustantial the whole of all the rest of the body: for which matter also she hath framed the bones.

The first bones that appear to be formed, or are supposed to be conformed, are the bones called Ta Hum, connexed or united by spondyls that are between them; then all the other members are framed and proportioned by their concavities and hollownesses, which generally are seven, that is to fay, two of the ears, two of the noie, one of the mouth, and in the parts beneath the head one of the fundament, and another of the yard or conduit of the bladder; and furthermore in women, one of the neck of the womb, without the which they can never be made mothers or bear

When all these are finished, nature, that the might polish her excellent work in all forts, hath covered all the body and every member thereof with skin. Into this excellent work or Micro-Essido 48.52 of mar fo perfect, God, the author of nature and all things, infufeth or ingrafteth a foul or life which S. Augustine proveth by this fentence of Moses: If any man smite a woman with child, so Asa

Territoria de la constanta de

So therefore the rude lumps of flesh called mole that engender in womens wombs, and mon-The Mola in

So therefore the rude lumps of fielh called mola that engenter in the womb lifters of the like breeding and confused bigness, although by reason of a certain quaking and shive the womb in fiers of the like breeding and confused bigness, although by reason of a certain quaking and shive with not as the vering motion, they feem to have life, yet they cannot be supposed to be endued with a life or a child. reasonable soul: but they have their motion, nutriment and increase wholly of the natural and infixed faculty of the womb, and of the generative or procreative spirit that is ingraffed naturally in the

the very inftant time when the child is absolutely perfected in the lineaments of his body, and so given

But even as the infant in the womb obtaineth not perfect conformation before the thirtieth day, fo likewife it doth not move before the fixtieth day: at which time it is most commonly not perceived by women, by reason of the smalness of the motion. But now let us speak briefly of the life or foul, wherein confifteth the principal original of every function in the body, and likewife of generation.

CHAP. XI. Of the life or foul.

He foul entreth into the body fo foon as it hath obtained a perfect and absolute diffinction The life goeth # not into the and conformation of the members in the womb, which in male children, by reason of the more firong and forming heat which is ingraffed in them, is about the fourtieth day, mass of seed that doth enand in females obout the fourty hith day; in some sooner, and in some later, by reason of the efficagender the and in females obout the fourty fitth day; in folia footier, and in females obout the workers. Neither child, before cy of the matter working, and pliantness or obedience of the matter whereon it workets. Neither child, before cy of the matter working, and pliantness or obedience of the matter whereon it workets. doth the life or foul being thus inspired into the body presently execute or perform all his functions, the body of the child and because the infiraments that are placed about it cannot obtain a firm and hard confishence necessary each part thereof hath for the lively, but especially for the more divine ministeries of the life or foul, but in a long process of his perfect Those instruments of the soul are viriated either in the first conformation, as when the form or faproportion and form. Why the life

fhion of the head is fhaped upwards or pyramidal, as was the head of Therfires, that lived in the time of the Trojan war, and of Triboules and Tomin that lived in later years; or also by some casualty, as by the violent handling of the midwife, who by compression, by reason that the scull is tender and soft, hath caused the capacity of the ventricles that be under the brain to be too narrow for them: or by a execute all his fall, fireak, diforder in diet, as by drunkenness, or a feaver, which inferreth a lethargy, excellive fleepinefs, or phrenfie.

Prefently after the foul is entred into the body, God endueth it with divers and fundry gifts: hereof it cometh that some are endued with wisdom by the spirit; others with knowledge by the same spirit; others with the gift of healing by the same spirit; others with power, dominion and rule; others with prophetie; others with diverlities of tongues; and to others, other endowments, as it hath pleafed the divine providence and bounty of God, to beflow upon them, against which no man ought to contend or speak. For it is not meet that the thing formed should say unto him that formed it, why half then made me thus? hast not the Patter power to make of the same lump of clay one vessel to house and another to dishonour? It is not my purpose, neither belongeth it unto me nor any other humane. creature to fearch out the reason of those things, but only to admire them with all humility : But yet I dare affirm this one thing, that a noble and excellent foul neglecteth elementary and transitory things, and is ravilhed and moved with the contemplation of celethial, which it cannot freely enjoy before it be feparated from this earthly inclosure or prison of the body, and be reflored unto its

What the foul or life is.

or foul doch not prefently

1 Cer. c. 12.

offices.

The life is in body and in every portion thereof. given to humane forms.

Therefore the foul is the inward Eureleebia or perfection, or the primitive cause of all motions and functions both natural and animal, and the true form of man. The Ancients have endeavoured to express the obscure sense thereof by many descriptions. For they have called it a celetial fpirit, and a fuperior, incorporeal, invitable, and immortal effence, which is to be comprehended of it felt alone, that is, of the mind or underflanding. Others have not doubted but that we have our fouls infpired by the univerfal divine mind, which as they are alive, fo they do bettow life on the bodies unto whom they are annexed or united. And although this life be differred into all the whole body, and into every portion of the fame, yet is it void of all corporal weight or foul is fimple and invifible.

mixtion, and it is wholly and alone in every feveral part, being fimple and invifible, without all composition or mixture, yet endued with many virtues and faculties, which it doth utter in divers and the reason parts of the body: For it feeleth, imagineth, judgeth, remembreth, understandeth, and ruleth all our defires, pleasures, and animal motions; it feeth, heareth, finelleth, tasteth, toucheth; and it are bath divers names of these searchs of these parts of the p hath divers names of thefe fo many and fo great functions, which it performeth in divers parts of the body. It is called the fool of life; because it maketh the body live, which of it self is dead. It is called the spirit or breath; because it inspireth our bodies. It is called reason; because it discerneth truth from fallhood. truth from falthood, as it were by a certain divine rule. It is called reafon; because it insmindful of things past, in recalling and remembring them: And it is called the rigor or courage; because it giveth visor and called the rigor or courage; it is cause it giveth vigor and courage to the fluggish weight, or mass of the body. And latily, it is called the sense and mederstanding: because it comprehended things that are sensible and intelligible. Because it is incorporeal, it cannot occupy a place by corporeal extention; although not withstanding

withflanding it filleth the whole body. It is simple, because it is but one in effence, nor increased, nor diminished: for it is no less in a Dwart than in a Giant; and it is like perfect and great in an infant as in a man, according to its own nature.

But there are three kinds of bodies informed by a foul whereby they live: the first being the Three kinds most imperfect, is of plants; the second of brute beasts; and the third of men. The plants live by of living bodies informed by an intellective foul. And as the sensitive soul of dies. a vegetative; beafts by a fensitive; and men by an intellective foul. And as the fensitive foul of brute beafts is endued with all the vertues of the vegetative; fo the humane intellective comprehend-eth the vertues of all the inferior, not feparated by any division. In the home in the lective comprehend-foul containeth eth the vertues of all the inferier, not feparated by any division, but by being indivisibly united in self-all the with reason and understanding, into one humane form and soul whereon they depend. But because powers of the we have faid a little before, that divers functions of the life are refident, and appear in divers parts of inferiour, the body, here in this place, omitting all others, we will profecute those only which are accounted the principal.

The principal functions of the humane foul, according to the opinion of many, are four in num-The principal functions of the manual tous, according to the opinion of this proceeding from for many faculties, and confequently from one foul; they are thefe: The what the Common Senfe, Imagination, Reafoning, and Memory. And they think that the common or incommon senfe teriour sense doth receive the forms and images of sensible things, bein carried by the spirit through the passage of the nerves, as an instrument of the external senses, as it were a medienger to more senses and it serves not only to receive them, but also to know, perceive, and discern go between them; and it serves not only to receive them, but also to know, perceive, and discern double. them. For the eye, wherein the external fense of seeing consisteth, doth not know white or black. Therefore it cannot discern the differences of colours, as neither the tongue raftes, nor the nose favoors nor the ears found, nor laftly, the hands their touching quality; yea, the eye doth not of it felf perceive that it feeth, nor the nofe that it fmelleth, nor the ears that they hear, nor the tongue that it taffeth, nor the hands that they touch. For all these things are the offices and functions of the common sense; for this sense knoweth that the eye hath seen something, either white, black, red, a man, horfe, theep, or fome fuch like material thing ; yea, even when the fight is gone and past; and so likewise the nose to have smelled this or that savour, the car to have heard this or that found, the tongue to have tafted this or that tafte, and the hand to have touched this or that thing, be they never to diverte. For all the external fenfes, and all the functions thereof do end, and are referred to the Common fenfe, as it were the lines of a circle from the circumference into the center, as it is expressed in this figure.

For which cause it is called the common or principal sense; for that therein the primitive power what cause of feeling or perceiving is fituated, for it ufeth the ministery or fervice of the external fenfes, to the internal . know many and diverse things, whose differences it doth differm and judge; but simple things, that the common true or false, or any argumentation, belongeth only to the mind, understanding, or reason. For The common this was the counsel of nature, that the external senses should receive the forms of things super-senses and the counsel of things super-senses are super-senses. ficially, lightly, and gently only; like as a glass, not to any other end, but that they should prefent knoweth those ly fend them unto the Common fense, as it were unto their center and prince, which he (that things that are is to say, the Common sense) delivereth to be collected unto the understanding or reasoning sa-simple only. culty of the foul, which Avicen and Averrois have supposed to be situated in the former part of the

Next unto the common fense followeth the phantasise or imagination, so called because of it what imagination and Ideas that are conceived in the mind, called of the Greeks Phantasimata, nation is. This doth never reft but in those that sleep: neither always in them, for oft-times in them it caufeth dreams, and caufeth them to suppose they see and perceive such things as were never perceived by the fenfes, nor which the nature of things, nor the order of the world will permit. The power of this faculty of the mind is so great in us, that it often bringeth the whole body in subjection

For it is recorded in history, that Alexander the Great sitting at Table, and hearing Timotheur the Mussician sing a Martial sonnet unto his Cythern, that he presently leaped from the Table, and called for arms; but when again the Musician mollisted his tune, he returned to the Table and sate down as before. The power of imagination caused by musical harmony was so great, that is subjected to it the courage of the worlds conqueror, by whose various motion, it would now as it were cause him to courage of the worlds conqueror, by whose various motion, it would now as it were cause him. to run headlong to arms, and then pacific and quiet him, and fo caufe him to return to his chair and banquetting again. And there was one whofoever it was, who fome few years agon feeing the Turk dance on a rope on high with both his feet faitned in a balin, turned his eyes from to dangerous a fight or fpectacle, although came of purpose to see it, and stricken with such tear that his body shook and heart quaked, for sear left that by sudden falling down headlong he should break his neck. Many looking down from an high and lofty place, are so stricken with fear, that suddenly they fall down headlong, being so overcome and bound with the imagination of the danger, that their own strength is is not able to furtain them. Therefore it manifestly appeareth that God hath dealt most graciously and lovingly with us, who unto this power of imagination, hath joined another, that is, the faculty or power of reason and understanding; which differning false dangers and perils from true, doth furtain and hold up a man that he may not be overthrown by them.

Concerning the Generation of Man. BOOK XXIV. 542 After this, appeareth and approacheth to perform his function, the faculty of Reafon, being the Prince of all the principal faculties of the foul; which bringeth together, composeth, joineth and re-What Reafon duceth all the fimple, and divided forms or images or things into one heap, that by dividing, collect-ing, and reasoning it might discern and try truth from fallhood.

This faculty of Understanding or Reason is subject to no faculty or instrument of the body, but is The functions free, and penetrateth into every fecret, intricate and hidden thing with an incredible celerity: by which a man feeth what will follow, perceiveth the originals and causes of things, is not ignorant of of Reafon. the proceedings of things; he compareth things that are past with those that are present and to come, decreeing what to follow, and what to avoid. This bridleth and with-holdeth the furious motions of the mind, bridleth the over-hasty motions of the tongue, and adminishent the speaker that before the words pass out of his mouth, he ought with diligence and discretion to ponder and contider the thing whereof he is about to fpeak. After Reason and Judgment followeth Memory, which keeping and conserving all forms and images that it receiveth of the senses, and which Reason shall appoint, and as a faithful keeper and conserver, receiveth all things, and imprinteth and sealeth them as well by their own virtue and What memory power, as by the impulsion and adherence of those things in the body of the brain, without any impression of the matter; that when occasion serveth, we may bring them forth there-hence as out of a treasury or store-house. For otherwise to what purpose were it to read, hear, and note so many things, unless we were able to keep and retain them in mind by the care and custody of the Memory or Brain? Therefore affuredly God hath given us this only remedy and preservative against the oblivion and ignorance of things, which although of it felf and of its own nature it be of greater efficacy, yet by dayly and often meditation it is trimmed and made more exquitite and perfect. And Wifdom the hence it was that the Antients termed wifdom the daughter of memory and experience. Many have daughter of memory and supposed that the mansion or feat of the Memory, is in the hinder part, or in the ventricle of the Corebellum, by reason that it is apt to receive the forms of things, because of the engrafted driness and experience. hardness thereof. CHAP. XII. Of the natural excrements in general, and especially of those that the child or infant being in the womb excludeth. What an ex-Efore I declare what excrements the infant excludeth in the womb, and by what paffages, I crement is. think it good to fpeak of the excrements which all men do naturally void; All that is called an excrement which nature is accustomed to separate and east out from the laudable and nou-There are many kinds of those excrements. The excre-The first is of the first concoction, which is performed in the stomach, which being driven down into the intestines or guts, is voided by the fundament. first concocti-The fecond cometh from the Liver, and it usually is three-fold, or of three kinds; one choler-The excreick, whereof a great portion is fent into the bladder of the gall, that by Iweating out there
ment of the feit might fiir up the expulsive faculty of the guts to expel and exclude the excrements. The other
cond concelliis like unto whay, which goeth with the blood into the veins, and is as it were a rebiele thereto
the introduction of the balls and into exerc smiller vein for to nouriff the whole boto bring it unto all the parts of the body, and into every capillar vein for to nourish the whole body; and after it hath performed that function, it is partly expelled by sweat, and partly sent into the bladder and so excluded with the urine. The third is the melancholick excrement which being drawn by the milt, the purer and thinner part thereof goeth into nourishment of the milt, and after the remnant is partly purged out downwards by the Hemorrhoidal veins, and partly fent to the orifice of the fiornach, to thimulate and provoke the appetite. The last cometh of the last con-The excrecoction which is diffolved in the habit of the body, and breathed out, partly by infentible transpirathird conco tion, is partly confumed by fweating, and partly floweth out by the evident and manifelt paffages ction is triple. that are proper to every part: as it happeneth in the brain before all other parts; for it doth unload it felf of this kind of excrements by the paffages of the nofe, mouth, ears, eyes, palat-bone and futures of the skull. Therefore if any of these excrements be stayed altogether, or any longer than it is meet they should the default is to be amended by diet and medicine. Furthermore there are other forts of excrements not natural, of which we have entreated at large in our book of the Pestilence.

When the infant is in the mothers womb, until he is fully and absolutely formed in all the li-The vie of the neaments of his body, he fends forth his urine by the paffages of the navel or machine. But a little before the time of child-birth, the machine is closed, and then the man-child voideth his urine by the conduit of the yard, and the woman-child by the neck of the womb. This urine is gathered together and contained in the conduit of the yard, and the woman-child by the neck of the womb. navel-firing. together and contained in the coat Chorion or Allanteides, together with the other excrements, that The figes of five and contained in the coat Chrism or Allantsides, together with the other excrements. The figes of five and carried the floating or fwimming child. But in the time of child-birth, when the infant by kicking freedy and carried the membranes, those humors run out, which when the midwives perceive, they take it as a certain fign that the child is at hand. For if the infant come forth together with those waters, ance.

the birth is like to be more easie, and with better fucces; for the neck of the womb and all the genitals are so by their most relaxed and made slippery, that by the endeavour and stirring of the infant, the birth will be more easie, and with better succes: contrastwife, if the infant be not excluded before all these three contrastwife, as it were in

not excluded before all these humors be wholly flown out and gone, but remaineth as it were in a dry place, presently through driness the neck of the womb and all the genitals will be contracted and drawn together, so that the birth of the child will be very difficult and hard, unless the neck of the womb, to amend that default, be anointed with oyl or some other relaxing liquorMoreover

Moreover, when the child is in the womb, he voideth no excrements by the fundament, unless it be when at the time of the birth, the proper membranes and receptacles are burit by the firiving of the infant; for he doth not take his meat at the mouth; wherefore the from the is idle then, and the infant; for he doth not take his meat at the mouth; wherefore the fromach is idle then, and doth not execute the office of turning the meats into chylus, nor of any other concoction; wherefore nothing can go down from it into the gars. Neither have I feldom feen infants born without Children born any hole in their fundament, fo that I have been confirmed with a knife to cut in finder the membrane or tunicle that grew over and flopped it. And how can fuch excrements be engendred, when the child being in the womb, is nourilled with the more landable portion of the mentional bloud; therefore the iffue or child is wont to yield or avoid two kinds or forts of excrements, follong as he is in the research of the control has been considered by in the womb, that is to fay, fweat and urine, in both which he fwims; but they are feparated by themselves, by a certain timicle called Allantoides, as it may be seen in kids, dogs, sheep, and other brute beafts, for as much as in mankind the tunicle Charina and Allantoides or Farcominatis, be all one 47h. 24-fell, 5, membrane. If the woman be great of a man-child, the is more merry, firong and better coloured, all the time of her child-bearing; but if a woman-child, the is ill coloured, because that women are not fo hot as men.

The males begin to fiir within three months and a half, but females after: if a woman conceive a male-child, the hath all her right parts thronger to every work; wherefore they do begin to fet forwards their right foot first in going, and when they arise they lean on the right arm, the right dog 496.47. [63.5] will sooner swell and wax hard: the male-child stir more in the right side than in the lest, and the female-children rather in the left than in the right fide.

CHAP. XIII.

With what travail the Child is brought into the world, and of the cause of this labour and travail.

Hen the natural prefixed and preferibed time of child-birth is come, the child being then grown greater, requires a greater quantity of food: which when he cannot receive in forth: therefore then he is moved with a flronger violence and doth break the membranes wherein he is contained. Then the words, because it is no able to endure such violent motions, nor fusiain or hold up the child any longer, by reafon that the conceptacles of the membranes are broken afunder, is relayed, and then the child purfuing the air which he feeleth to enter in at the mouth of the womb, which then is very wide and gaping, is carried with his head downwards, and so cometh into the Why theinfant world with great pain both unto it felt, and also unto his Mother, by reason of the tenderness of his is born sometimes with his body, and also by reason of the nervous neck of his mothers womb, and separation of the bone called Os Ilium from the bone called Os facrum. For unless those bones were drawn in funder, how in the time of could not only twins that cleave full together, but also conschild along come forth for the time of the bone. could not only twins that cleave fall together, but also one child alone, come forth forth at so narrow child birth, a passage as the neck of the womb is; Not only reason, but also experience confirmeth it; for I o the bones of this and or pened the bodies of women prefently after they have died in travail in child-birth, in whom I have them and of found the bones of Ilium to be drawn the bredth of ones form Or form or the bredth of ones form Or form and one form of the bredth of ones form of the bredth of found the bones of Ilium to be dreawn the bredth of ones finger from Os farrum: and moreover, in drawn and exmany unto whom I have been called, being in great extremity of difficult and hard travail, I have tended one not only heard, but also felt the bones to crackle and make a noise, when I laid my hand upon the from another. coccyx or rump, by the violence of the diffention. Also honest matrons have declared unto me that they themselves, a few days before the birth, have felt and heard the noise of those bones separating themselves one from another with great pain. Also a long time after the birth many do seel great pain and ach about the region of the coccyx and Os factions, so that when nature is not able to repair the diffolved continuity of the bones of Ilium, they are confirmined to halt all the days of their life after. But the bones of the share called Off a pubis, I have never seen to be separated, as many do also affirm.

It is reported that in Italy the coccyx or rump in all Maidens is broken that when they come to be An Italian to married they may bear children with lesser travail in child-birth; but this is a forged tale, for that ble. bone being broken, is naturally and of its own accord repaired, and joined together again with a Cal-In, whereby the birth of the child will be more difficult and hard.

CHAP. XIV.

Of the fituation of the infant in the womb.

Eafon cannot flew the certain fituation of the infant in the womb, for I have found it alto- The fination gether uncertain, variable and diverse both in living and dead women: in the dead by of the infant opening their bodies prefently after they were dead; and in the living by helping them by in the womb the industry of my hand, when they have been in danger of perifhing by travail of child-birth: for by a diverse, patting my hand into the womb, I have felt the infant coming forth, fometimes with his feet forand fornetime with his hands and feet turned backwards, and fornetimes forwards, as the figure following plainly describeth.

Thave often found them coming forth with their knees forwards, and fornetimes with one of the feet, and fometimes with their belly forwards, their hands and feet being lifted upwards, as the former figure theweth at large.

Sometimes have found the Infant coming with his feet downwards Striding awide, and sometimes beadlong stretching one of his arms downward out at length and that was an Hermaphrodis e, as this figure plainly declaresb.

One time I ob ferred in the birth of twins that the one came with his bead forwards , and the other with his feet, according as here I have thought good to de-(cribe them.

In the bodies of women that died in travail of child I have fornetimes found children no bigger than if they had been but four moneths in the womb, fituated in a round compafs like a hoop, with their head bowed down to their knees, with both their hands under the knees, and their heels close to their buttocks. And moreover, I protest before God that I found a child being yet alive in the body of his mother (whom I opened fo foon as the was dead) lying all along firetched out, with his face upwards, and the palms of his hands joined together, as if he was at prayer.

CHAP. XV.

Which is the legitimate and natural, and which the illegitimate or unnatural time of child-birth.

Mankind hath no certain ing forth young.

Oall living creatures, except Man, the time of conception and bringing forth their young is certain and definite; but the iffue of Man cometh into the world, formetimes in the feventh, fometimes in the eighth, and fometimes which is most frequent, in the ninth month; fometimes in the tenth month; yea fometimes in the beginning of the eleventh month.

Maffirmus reports that I wim Patricia the Protect the formal his beginning of the eleventh month. Maffurinus reports that Lucius Papyrius the Pretor, the fecond heir commencing a fuit, gave the poffeilion of the goods away from him, feeing the Mother of the Child affirmed that the went thirteen months therewith, being there is no certain definite time of Child-birth. The child that is born in the lively account. the fixth month, cannot be long lived, because at that time all his body or members are not perfectly finished, or absolutely formed. In the seventh month it is proved by reason and experience that the why the child infant may be long lived. But in the eighth month it is seldom or never long lived: the reason is scarce alive thereof is, as the Astronomers suppose, because at that time Saturn ruleth, whose coldness and driness in the eighth is contrary to the original of life: but yet the physical reason is more true; for the Physicians say that the child in the womb doth off-times in the seventh month string to be set at liberty from the inthat the child in the womb doth oft-times in the feventh month firive to be fet at liberty from the inclosure of the womb, and therefore it contendeth and laboureth greatly, and fo with labouring and firiving it becomes and therefore it contendeth and laboureth greatly, and fo with labouring and firriving it becometh weak, that all the time of the eighth month it cannot recover his firength again, whereby it may renew his accustomed use of firriving, and that some by such labouring and striving hart themselves, and so die. Yet some strong and lusty women are thought to bring forth their children, being lively and strong, on the scalable and lusty women are thought to bring forth their children, being lively and strong, on the scalable and lusty women are thought to bring forth their children, being lively and strong, on the scalable and lusty women are thought to bring forth their children, being lively and strong, on the scalable and lusty women are thought to bring forth their children. 2.7. 4. de bif. dren, being lively and frong, on the eighth month, as Ariftotle testifieth of the Egyptians, the Poets of the inhabitants of the Isle of Nazars, and many of the Spaniards. Furthermore I cannot fusficiently marvel, that the worth, which all the size of the Spaniards. marvel, that the womb, which all the time of child-bearing is fo closed together, that one can fearer

put a probe into it, unless it be by superfortation, or when it is open for a short time to purge it self, that presently before the time of child-birth, it should gape and wax so wide, that the infant may pass through it, and presently after it close up again as if it had never been opened. But because that the travail of the first time of child-birth is wont to be very difficult and grievous, I think it not unmeet that all women, a little before the time of their first travail, amoint and relax their privy parts with the unquent here described. R. Sper. ceri, 31j. ol. amygd. dul. 3iv. cere alb. o medul. cervin. 31ij. axing, anf. & gallin, an. \$\frac{2}{3}\], tereb. venet. \$\frac{2}{3}\], make thereof an ointment to anoint the thighs, thare, privy parts and genitals. Furthermore, it thall not be unproficable, to make a trufs or girdle of most thin and gentle dog-skin, which being also anointed with the same unguent, may serve very necessarily for the better carrying of the infant in the womb. Also baths that are made of the deco-ction of mollifying herbs, are also very profitable to relax the privy parts a little before the time of the birth. That is supposed to be a natural and case birth, when the infant cometh forth with his head The natural forwards, prefently following the flux of water; and that is more difficult, when the infant cometh and eafle forwards, prefently following the flux of water; and that is more difficult, when the infant cometh child-births with his feet forwards: all the other ways are most difficult. Therefore Midwives are to be admonished that as often as they perceive the child to be coming forth none of those ways, but either with his belly or his back forwards, as it were doubled; or elfe with his hands and feet together, or with his head forwards, and one of his hands ftretched out, that they fhould turn it, and draw it out by the feet ; for the doing whereof, if they be not fufficient, let them crave the affiftance and help of fome expert Chirurgion.

CHAP, XVI. Signs of the birth at hand.

Here will be great pain under the navel, and at the groins, and spreading therehence toward the Vertebrae of the loins, and then especially when they are drawn back from the Os facrown, the bones Ilia and the Coccyoe are thrust outward, the genitals fwell with pain, and a certain Fever-like flaking invades the body, the face waxeth red by reafon of the endeavour of nature, arthe dunto the expulsion of the infant. And when these signs appear, let all things be prepared ready to the child-birth. Therefore first of all let the woman that is in travail be placed in her bed conver- some the wo niently, neither with her face upwards, nor fitting, but with her back upwards and fornewhat high, man that trithat the may breath at more liberry, and have the more power or firength to labour. Therefore the vaileth in ought to have her legs wide one from another, and crooked, or her heels formewhat bowed up towards child birth must be play her buttocks, so that the may lean on a staff that must be placed overthwart the bed. There are some that in her bed. do travail in a fiool or a chair made for the fame purpose: others standing on their feet, and leaning on the post or pillar of the bed. But you must take diligent heed that you do not exhort or perswade the woman in travail to firive or labour to expel the birth before the fore-named figus thereof do manifeftly thew that it is at hand. For by fuch labour or pains the might be wearied or fo weakned, that that when the thould firive or labour, the shall have no power or irrength to to do. If all these things do fall out well in the child-birth, the business is to be committed to nature, and to the Midwife. And the woman with child must only be admonished that when the feeleth very strong pain, that she prefently therewith strive with most strong expression, shutting her mouth and note it she please, and at the same time let the Midwife with her hands force the infant from above downwards. But if the birth be more difficult and painful, by reason that the waters wherein the infant lay are flown out long before, and the womb be dry, this ointment following is to be prepared. R. busyri recentis fine An unction to Tale in ague arremific lost, \$\frac{1}{2}\], mutaginis fiction, fortin line & althes, com agus faline extracte, an. \$\frac{1}{2}\], factor agus fiction, \$\frac{1}{2}\], mataginis fiction, fortin line & althes, com agus faline extracte, an. \$\frac{1}{2}\], factor and the decic liliarum, \$\frac{1}{2}\], make thereof an outtient, wherewith let the Midwite often anoint the fecret parts. Many times it happeneth that the infant cometh into the world out of the womb, having his head towered or wrapped about with a portion of the fecundine or tunicle wherein it is inclosed, especially, when by the much, ftrong, and happy ftriving of the mother, he cometh forth together with the water wherein it lieth in the worth, and then the Midwives prophese or fore-tell that the child shall be happy, because he is born as it were with a hood on his head. But I suppose that it doth betoken health of body both to the infant and also to his mothers; for it is a token of case deliverance. For health of body both to the infant and and to his another; for that membrane out with him, but it What a wowhen the birth is difficult and painful, the child never bringeth that membrane out with him, but it What a woremaineth behind in the paffages of the genitals or fecret parts, because they are narrow. For even so man is travail
that the birth is difficult and painful, east her skin thereby to renew her age, creepeth through some contacts the the Snake or Adder when the thould caft her skin thereby to renew her age, creepeth through forme fently after her narrow or firait passage. Presently after birth, the woman so delivered must take two or three spoon-deliverance.

fulls of the oil of fweet almonds extracted without fire, and tempered with fugar. Some will rather use the yolks of eggs with fugar, fome the wine called Hypocras, others cullifes or gelly: but always divers things are to be used, according as the Patient or the woman in child-bed shall be grieved, and as the Phylician shall give counsel, both to case and asswage the furious torments and pain of the throws, to recover her thrength and nourish her.

The cause of the afterthrows.

Throws come prefently after the birth of the child, because that then the veins (nature being wholly converted to expulsion) cast out the reliques of the menstrual matter that been suppressed for the space of nine months, into the womb with great violence, which because they are gross, slimy and dreggifh, cannot come forth without great pain both to the veins from whence they come, and also unto the womb whereunto they go: also then by the conversion of that portion thereof that re-maineth into wind, and by the undifferent admission of the air in the time of the child-birth, the womb and all the fecret parts will fwell, unlefs it be prevented with fome digefting, repelling or mollifying oil, or by artificial rowling of the parts about the belly.

CHAP. XVII.

What is to be done prefently after the child is born.

Why the fecondine or after-birth muft be taken away prefently after the birth of The binding of the childs

The defaults

what are com-

dren newly

must be speedily amended.

Refently after the child is born, the Midwife must draw away the secundine or after-birth, as gently as the can: but if the cannot, let her put her hands into the womb, and fo draw it out, separating it from the other parts; for otherwise if it should continue longer, it would be more difficult to be gotten out, because that presently after the birth the orifice of the womb is drawn together and closed, and then all the secundine must be taken from the child. Therefore the navel-firing must be tied with a double thred an inch from the belly. Let not the knot be too hard, lest that part of the navel-string which is without the knot, should fall away fooner than it ought, neither too flack or loofe, left that an exceeding and mortal flux of blood should follow after it is cut neither too flack or loofe, left that an exceeding and mortal flux of blood mond onto into the childs after the birth. off, and left that through it (that is to fay, the navel-firing) the cold air flouded enter into the childs body. When the knot is fo made, the navel-firing must be cut in funder the bredth of two singers beneath it with a sharp knife. Upon the section you must apply a double linnen cloth dipped in oyl of Roses, or of sweet Almonds, to mitigate the pain; for so within a sew days after, that which is beneath the knot will fall away being deflitute of life and nourishment, by reason that the vein and artery are tied so close, that no life nor nourishment can come unto it: commonly all Midwives do let it lie unto the bare belly of the infant, whereof cometh grievous pain and griping, by reason of the coldness thereof which dieth by little and little as destitute of vital heat. But it were far better to rowl it in fost cotten or lint, until it be mortified, and so fall away.

These midwives do unadvisedly, who so so from as the infant is born do presently tie the navelstring and cut it off, not locking first for the avoiding of the secundine. When all these things are
done, the infant must be wiped, cleansed and rubbed from all filth and excrement with oil of Roses or Myrtles. For thereby the pores of the skin will be better thut, and the habit of the body the more firengthened.

There be some that wash infants at that time in warm water and red wine, and afterwards anoint them with the fore-named oils. Others wash them not in wine alone, but boil therein red Roses and the leaves of Myrtles, adding thereto a little falt; and then using this lotion for the space of five or fix days, they not only wash away the filth, but also resolve and digest, if there be any hard or contused place in the infants tender body, by reason of the hard travail and labour in child-birth-Their toes and singers must be handled, drawn asunder and bowed, and the joints of the arms and legs must be extended and bowed for many days and often; that thereby that portion of the excremental humor that remaineth in the joints by motion may be heated and refolved. If there be any default in the members either in conformation, construction or fociety with those that are adjoining to The defaults of them, it must be corrected or amended with speed. Moreover, you must look whether any of the nature of formation and of the nature of formation and of the nature of formation and of the nature of conformation ral paffages be flopped, or covered with a membrane, as it often happeneth. For if any fuch cover or flop the orifices of the ears, nothrils, mouth, yard or womb, it must be cut in funder by the Chirurgion, and the paffage must be kept open by putting in of tents, peffaries or dofels, left otherwise they flould join together again after they are cut. If he have one finger more than he should naturally, if his ringers do cleave close together, like unto the feet of a Goose or Duck, if the ligamental mentbrane that is under the tongue be more short and siffer than it ought, that the infant cannot suck, nor in time to come, fpeak, by reason thereof; and if there be any other thing contraryto nature, it must be all amended by the industry of some expert Chirurgion.

Many times in children newly born, there sticketh on the inner fide of their mouth and on their tongue, a certain chalky fubiliance, both in colour and in confidence; this effect proceeding from the diffemperature of the mouth, the French-men call it the white Cancer. It will not permit the infant to fuck, and will shortly breed and degenerate into ulcers that will creep into the jaws, and Remedies for even unto the throat and unless it be cleanfed speedily, will be their death. For remedy whereof, it must be cleanfed by Deterfives, as with a linnen cloth bound to a little stick, and dipped in a medicine of an indifferent confidence made with oil of fweet almonds, hony and fugar. For by rubbing

this gently on it, the filth may be mollified, and so cleansed or washed away. Moreover it will be very meet and convenient to give the infant one spoonful of oil of almonds, to make his belly loofe and flippery, to affwage the roughness of the weafon and guller, and to disfolve the tough phlegm, which causeth a cough, and sometimes difficulty of breathing. If the eye-lids cleave together, or if they be leaved to the cough phlegm, which causeth a cough, and sometimes difficulty of breathing. cleave together, or if they be joined together, or agglutinated to the coats corner or adeata; if the watery tumor called hydroxid respectively. watery tumor called hydrocepholos affect the head, then must they be cured by the proper remedies formerly preferibed, against each disease.

Many

Many from their bath have fpots or marks, which the common people of France call Signer, that is, marks or figns. Some of their are plain and equal with the skin, others are raifed up in little tumors, and like unto warts, fome have hairs upon them, many times they are smooth, black or pale; yet for the most part red. When they rife in the face, they spread abroad thereon many times with great deformity. Many think the cause thereof to be a certain portion of menstrual matter cleaving to the sides of the womb, coming of a fresh flux, if happily a man do yet use copulation with the woman, or elfe diffilling out of the veins into the womb, mixed and concorporated with the feeds at that time when they are congealed, infecting this or that part of the iffue being drawn out of the feminal body, with their own colour. Women refer the caufe thereof unto their longing when they are with child; which may imprint the image of the thing they long for or defire, in the child or iffue that is not as yet formed (as the force and power of imagination in humane bodies is very great:) but when the child is formed, no imagination is able to leave the impression of any thing in it, no more Anold sable of than it could/cause horns to grow on the head of King Chypus as he sleep presently after he was return- King Chypus as those that are great, and those that are on the lips, nostrils, and eye-lids. But those that are like which uncutunto warts, because they are partakers of a certain malign quality and melancholick matter, which rable, may be irritated by endeavouring to cure them, are not to be medled with at all, for being troubled and angered, they foon turn into a Cancer (which they call Noli me tangere) those that are curable Which and are small, and in such parts as they may be dealt withall without danger. Therefore they must be how they are pierced through by the roots with a needle and a thred, and so being litted up by the ends of the thred, they must be cut away, and the wound that remaineth must be cured according to the general me-

There are force that suppose the red spots that are raised up into little knobs and bunches, may be washed away and confumed by rubbing and anointing them often with mentitual bloud, or the bloud of the secundine or after-birth. Those that are hairy and somewhat raised up like unto a Want or Mouse, must be pierced through the roots in three or four places, and straitly bound, so that at length being deflitute of life and nutriment, they may fall away: after they are faln away, the ulcer that remaineth must be cured as other ulcers are. If thereby any superfluous sless remain, it must be taken away by applying Agyptiscion, or the powder of Mercury, and fuch like: but if it be doubted that it cometh from the root of the tumor that may haply remain, it must be butned away by the root

with oyl of vitriol or aqua fortic.

There is also another kind or fort of spots, of a livid or violet colour, coming especially in the face about the lips, with a fost, slack, lax, thin, and unpainful tumor, and the veins as if they were varieous round about it. This kind of tumor groweth greater when it anseth on children that are wayward and crying, and in men of siper years that are cholerick and angry, and then it will be of a diverse colour, like unto a lappet and slap of slesh that hangeth over the Turky-cocks bill. When they have depressing, or coased their angry, the tumor will return to his own natural colour again. But have done crying, or ceafed their anger, the tumor will return to his own natural colour again. But you must not attempt to cure it in people that are of these conditions.

CHAP. XVIII.

How to pull away the secundine or after-birth.

Suppose that they are called fecundines, because they do give the woman that is with child why it is calthe fecond time, as it were a fecond birth; for if there be feveral children in the womb at led the fecanonce, and of different fexes, they then have every one their feveral fecundines, which thing is very necessary to be known by all Midwives. For they do many times remain behind in the womb when the child is born, either by reafon of the weakness of the woman in travail, which by con- The causes of tending and labouring for the birth of the child, hath spent all her strength: or else by a tumor the staying of ting suddenly in the neck of the womb, by reason of the long, and difficult birth, and the cold air the secundaries unadvisedly permitted to strike into the orifice of the womb. For so the liberties of the ways or paffages are stopped and made more narrow, so that nothing can come forth: or else because they are doubled and folded in the womb, and the waters gone out from them with the infant, so that they remain as it were in a dry place: or elfe because they yet slick in the womb by the knots of the veins and arteries, which commonly happeneth in those that are delivered before their time. For even as apples which are not ripe, cannot be pulled from the tree but by violence: but when they are ripe, they will fall off of their own accord: so the secundine before the natural time of the birth can hardly be pulled away but by violence; but at the prefixed natural time of the birth it may

Many and grievous accidents follow the flaying of the fecundine; as fuffocation of the womb, of-Accidents that ten fwounding, by reason that gross vapors arite from the putrefaction unto the midriff, licart and follow the brain, therefore they must be pulled away with speed from the womb, gently handling the navel, if staying of the brain, therefore they must be punce away with speed from the woman must be placed as she was wont secondines, it may be so possibly done. But if it cannot be done so, the woman must be placed as she was wont secondines. When that the child will not come forth naturally, but must be drawn forth by arr. Therefore the of drawing out with oil, must put it gently into the womb, and finding out the child with oil. that the child with one and the child with oil, must put it gently into the womb, and finding out the of drawing out the the fecunding havel-firing, must follow it until it come unto the secundine, and if it do as yet cleave to the womb that remain as by the Cotyledons, the must shake and move it gently up and down, that so when it is shaken and ter the birth-loofed, she may draw it out gently; but if it should be drawn with violence, it were to be feared left corruption of blood flied out of the veffels, and thence cometh inflammation, an abfects or a mortal down of the gangrene. Neither is there lefs danger of a convultion by reason of the breaking of the nervous bodies, womb-

THE OWNER OF THE PERSON NAMED IN

neither is there any less danger of the falling down of the womb. If that there be any knots or clods of bloud remaining, together with the fecundine, the Midwife must draw them out one by one, so that not any may be left behind.

The accidents the violent

Some women have voided their fecundine, when it could not be drawn forth by any means, long after the birth of the child, by the neck of their womb, piece-meal, rotten and corrupted, with many grievous and painful accidents. Also it shall be very requisite to provoke the endeavour pulling of the womb, together with the fecundine. The fermutation of the expullive faculty by flermutatories, aromatick fomentations of the neck of the womb, by mollifying injections: and contrariwife, by applying fuch things to the notirils as yield a rank facundine. together, or with half a dram of the powder of favin, or with the hair of a womans head, burnt and beaten to powder, and given to drink; and to conclude, with all things that provoke the terms or courfes.

CHAP. XIX.

What things must be given to the infant by the mouth, before he he permitted to suck the teat or dug.

To draw flegts from the childs mouth.

T will be very profitable to rub all the inner fide of the childs mouth and palat gently with treacle and hony, or the oil of fweet almonds extracted with fire, and if you can, to caufe it to fwallow force of those things: for thereby much flegmatick moiture will be drawn from the mouth, and also will be moved or provoked to be vornited up from the flormach; for if these excremental humors shall be mixed with the milk that is sucked, they would corrupt it, and then the vapors that arise from the corrupted milk unto the brain would infer most pernicious accidents. And you may know that there are many excremental things in the flornach and guts of children by this, because that so soon as they come into the world, and often before they suck milk or take any other thing, they void downwards many excrements diverily coloured, as yellow, green and black. Therefore many, that they may speedily evacuate the matter that causeth the fretting of the guts, do not only minister those things fore-named, but also some laxative syrup, as that that is made of daflegmatick flo- mask-Rofes. But before the infant be put to fuck the mother, it is fitting to prefs fome milk out of her breft into its mouth, fo that fo the fibres of the flomach may by little and little accustom themfelves to draw in the milk.

Milk foon corrupted in a

CHAP. XX.

That mothers ought to nurse or give such unto their own children.

The mothers milk is most the child.

Hat all mothers would nurse their own children were greatly to be wished; for the Mothers milk is far more familiar nourishment for the infant than that of any Norse: for it is nothing else but the same blood made white in the dugs, wherewith before it was nourished in the womb. For the mother ought not to give the child suck for the space of a few days after the birth, but full recognish the partiest expression and modified of the recognish to express the partiest expression and modified of the recognish. birth, but first to expect the perfect expurgation and avoiding of the excremental humors. And in the mean time let her cause her brests to be sucked of another, or many other children, or of some wholfome or fober maid, whereby the milk may be drawn by little and little unto her brefts, and also by little and little purified.

For a certain space after the birth, the milk will be troubled, and the humors of the body moved: fo that by long flaying in the dugs, it will feem to degenerate from its natural goodness as the grosness of it is somewhat congealed, the manifest heat in touching, and the yellow colour theory of tellifieth evidently. Therefore it is necessary that others should come in place thereof the place of the place thereof the place of the pla when it is fucked out, wherewith the infant may be nourished. But if the mother or the Nurse chance to take any disease, as a Feaver, Scouring, or any such like, let her give the child to author to give it such that the child have the child because the Nurse and the child to author to give it such that the child have the child because the Nurse and t ther to give it fuck, left that the child chance to take the Nurfes difeases. And moreover, mothers ful in bringing up and attending their children, because for the most part they are far more vigilant and care ful in bringing up and attending their children than hired and mercenary Nurses, which do not for much regard the infant, as the gain they shall have by the keeping of it, for the most part. Those that do not nurse their own children, cannot rightly be termed mothers: for they do not absolute that do not nurse their own children, cannot rightly be termed mothers: for they do not absolute that do not nurse their own children, cannot rightly be termed mothers: for they do not absolute that do not nurse their own children, cannot rightly be termed mothers: for they do not absolute that the first own children is not considered and believe the Roman Emperor was the first own to far. wont to fay. For it is a certain unnatural, imperfect and half kind of mothers duty, to bear a child, and prefently to abandon or put it away as if it were forfaken: to nourish and feed a thing in their womb (which they preither known are fee) with their control of the contro womb (which they neither know nor fee) with their own bloud, and then not to nourish it when they fee it in the world alive, a creature or reasonable soul, now requiring the help and sustentiation

The disease of the Nurse is

of the mother.

CHAP. XXI. Of the choice of Nurfes.

Any husbands take fuch pity on their tender wives, that they provide Narries for their chil-dren, that unto the same that they provide Narries for their children, that unto the pains that they have fuftained in bearing them, they may not also add the trouble of author hard had add the trouble of nursing them: wherefore such a Nurse must be chosen which hath had tree children. For the nurse them: two or three children. For the dugs which have been already fucked and accustomed to be filled, have the veins and arteries more large and capable to receive the more milk. In the choice of a Nurse there is ten things to be considered as a large and capable to receive the more milk. there is ten things to be confidered very diligently, as her age, the habit of her body, her behaviour,

the condition of her milk, the form not only of her dugs or breafis, but also of her teats or nipples, the time of her child-birth, the fex of her last infant or child, that she be not with child, that she be found and in perfect health. As concerning her age; the ought not to be under twenty five years, The best age nor above thirty five: the time that is between is the time of strength, more temperate and more of a Narie. wholfome and healthy, and lefs abounding with excremental humors. And because her body doth not then grow or increase, the must of necessity have the more abundance of blood. After thirty five years in many the mentirual fluxes do ceafe, and therefore it is to be supposed that they have the less nutriment for children.

The Nurse also must be of good habit, or square or well set body, her breast broad, her colour live- The best habit ly, not fat, nor lean, but well made, her slesh not soft and tender, but thick, and hard or strong, of body in a live- thick, and hard or strong, of body in a live- thick, and hard or strong, of body in a whereby the may be the more able to endure watching and taking of pains about the child; the must Nurfe.

not have a red or freekled face, but brown or fornewhat thadowed, or mixed with redness: for truly fuch women are more hot than those that are red in the face, by reason whereof they must needs concoct and turn their meat the better into blood. For according to the judgment of Sextus Charonenfis, Lib. de infantre as blackish or brown ground is more fertile than the white : even so a brown woman hath more store of milk. You must look well on her head, lest she should have the scurf or running fores; see that her teeth be not foul or rotten, nor her breath flinking, nor no ulcer nor fore about her body, and

that the be not born of gouty or leprous Parents.

She ought to be quick and diligent in keeping the child neat and clean, chaffe, fober, merry, of what beha-She ought to be quick and diligent in keeping the child near and clean, chaite, toocr, merry, of what behaalways laughing and finding on her Infant, often linging unto it, and speaking distinctly and plain-vior the Nurse
ly, for the is the only Mistress to teach the child to speak. Let her be well manner'd, because must be,
the manners of the Nurse are participated unto the Infant together with the milk. For the
whelps of dogs, if they do suck Wolves or Lionesses, will become more sierce and cruel than otherwise they would. Contrariwise, the Lions whelps will leave their favageness and sierceness,
if that they be brought up and nourished with the milk of any Ritch, or other targe least. If if that they be brought up and nourished with the milk of any Bitch, or other tame beaft. If a Goat give a Lamb fack, the fame Lambs wool will be more hard than others; contrariwife, if a theep give a Kid fuck, the fame Kids hair will be more foft than another Kids hair. She ought to be fober, and the rather for this cause, because many Nurses being overladen with wine and banquetting, often fet their children unto their breafis to fuck, and then fall afleep, and fo fuddenly ftrangle or

She must abstain from copulation: for copulation troubleth and moveth the humors and the bloud, Why the and therefore the milk it felf, and it diminisheth the quantity of milk, because it provoketh the Nurse must 253 menstrual flux, and causeth the milk to have a certain strong and virulent quality, such as we may Perceive to breath from them that are incenfed with the fervent luft and defire of Venery. And pulation, thoreover, because that thereby they may happen to be with child, whereof ensueth discommodity both to her own child that is within her body, and also to the Nurse-child; to the Nurse-child, because that the milk that it sucketh will be worse and more deprayed that otherwise it would be, by reason that the more laudable bloud after the conception remaineth about the womb, for the nutrithent and increasing of the infant in the womb; and the more impure blood goeth into the dugs, which breedeth impure or unclean milk: but to the conceived child, because it will cause it to have fearcity of food; for fo much as the fucking child fucketh, fo much the child conceived in the womb,

Also she ought to have a broad breast, and her dugs indifferently big, not slack or hanging, but what dugs a of a middle consistence, between soft and hard; for such dugs will concoct the blood into milk Narse ought to the better, because that in firm fielh the heat is more firong and compact. You may by touching have, try whether the flesh be folid and firm, as also by the dispersing of the veins, easily to be seen by reason of their swelling and blewness, through the dugs, as it were into many streams or little rivulets; for in slesh that is loose and slack, they lie hidden. Those dugs that are of a competent bigness, receive or contain no more milk than is sufficient to nounish the instant. In those dugs that are great and hard, the milk is as it were suffocated, stopped or bound in, so that the child in sucking can search draw it out, and moreover, if the dugs be hard, the child putting his mouth to the breast, may strike his nose against it, and so hurt it, whereby he may either refuse to suck, or if he doth the present of suck, by continual sucking, and placing of his nose on the hard breast, it may become the Proceed to fuck, by continual fucking, and placing of his note on the hard breaft, it may become flat, and the nostrils turned upwards, to his great deformity, when he shall come to age. If the teats or nipples of the dugs do frand fornewhat low or depressed inwards on the teps of the dugs, the child can hardly take them between its lips, therefore his sucking will be very laborious. If the nipples or teats be very big, they will so fill all his mouth, that he cannot well use his tongue in sucking or in swallowing the milk.

We may judg of or know the nature and condition of milk, by the quantity, quality, colour, fa- what is to be vor and tafte; when the quantity of the milk is so little, that it will not fuffice to nourish the infant, observed in it cannot be good and laudable; for it argueth fome differmperature either of the whole body, or at the milk. left of the dugs, especially a hot and dry differmerature. But when it superaboundeth, and is more than the infant can fpend, it exhaulteth the juice of the Nurfes body, and when it cannot all be drawn out by the infant, it cluttereth, and congcaleth or corrupteth in the dugs. Yet I would rather with it to abound, than to be defective, for the superabounding quantity may be pressed out before the child be fet to the breaft-

That milk that is of a mean confidence between thick and thin, is effectived to be the best. For The laudable it betokeneth the firength and vigor of the faculty that engendreth it in the breafis. There-confifence of fore if one drop of the milk be laid on the nail of ones thumb, being first made very clean and the milk. Gir, if the thumb be not moved, and it run off the nail, it fignifieth that it is watery milk : but if it flick to the nail, although the end of the thumb be bowed downwards, it theweth that it is too gross and thick; but if it remain on the nail so long as you hold it upright, and fall from it

THE PROPERTY OF THE PARTY OF TH

when you hold it a little afide or downwards by little and little, it sheweth it is very good milk. And that which is exquisitely white, is best of all. For the milk is no other thing than blood made

Why the milk ought to be very white.

Why a woman that hath red hair, or fre-cles on her

Therefore, if it be of any other colour, it argueth a default in the bloud: fo that if it be brown, it betokeneth melancholik bloud; if it be yellow, it fignifieth cholerick bloud; if it be wan and pale, it betokeneth phlegmatick bloud; if it be formewhat red, it argueth the weakness of the faculty that engendreth the milk. It ought to be fweet, fragrant and pleasant in smell; for if it strike into the noftrils with a certain sharpness, as for the most part the milk of women that have red hair and little freckles on their faces doth, it prognofticates a hot and cholerick nature : if with a certain eles on her fowerness, it portendeth a cold and melancholick nature. In taste it ought to be sweet and as it face eannot be were suggered, for the bitter, saltish, sharp, and stiptick, is naught. And here I cannot but admire a good Nurse, the providence of nature, which hath caused the bloud wherewith the child should be nourished to be turned into milk: which unless it were so, who is he that would not turn his face from, and abhor fo grievous and terrible a spectacle of the childs mouth so imbrued and befineared with bloud? what mother or Nurse would not be amazed at every moment with the sear of the blood so often shed out, or fucked by the infant for his nourifhment? Moreover, we should want two helps of futientation, that is to fay, Butter and Cheefe.

Neither ought the child to be permitted to fuck within five or fix days after it is born, both for the reason before alledged, and also because he hath need of so much time to rest quiet, and ease himself after the pains he hath fuffained in his birth: in the mean feafon the mother must have her breatts. drawn by fome maid that drinketh no wine, or elfe the may fuck or draw them her felf with an arti-

ficial infirument which I will describe hereafter.

Why that Nurse that man child is to be preferred Nurse whose child was born before the

That Nurfe that hath born a man child, is to be preferred before another, because her milk is the better concocted, the heat of the male child doubling the mothers heat. And moreover, the women that are great with child of a male child, are better coloured, and in better firength, and better able to do any thing all the time of their greatness, which proveth the same : and moreover before another the blood is more laudable, and the milk better. Furthermore it behoveth the Nurfe to be brought Why the can- on bed, or to travail at her just and prefixed or natural time: for when the child is born before his not be a good time of fome inward cause, it argueth that there is some default lurking and hidden in the body and humors thereof.

CHAP. XXII.

What diet the Nurfe englet to use, and in what situation she englet to place the infant in the Cradle.

Oth in eating, drinking, fleeping, watching, exercifing and refting, the Nurfes diet must be divers, according as the nature of the child both in habit and temperature shall be, as for example, if the child be altogether of a more hot bloud, the Nurfe both in feeding and ordering her felf ought to follow a cooling diet. In general let her eat meats of good juice, moderate in quantity and quality, let her live in a pure and clear air, let her abstain from all spices, and all falted and spiced meats, and all tharp things, wine, especially that which is not allayed or mixed with water, and carnal copulation with a man; let her avoid all perturbations of the Anger greatly mind, but anger especially; let her use moderate exercise, unless it be the exercise of her arms burreth die and upper parts rather than the large collaboration of the and upper parts, rather than the legs and lower parts, whereby the greater attraction of the blood that must be turned into milk, may be made towards the dugs. Let her place her child beft for the may be the better fent from the brain unto the paffages that are beneath it. Let her fwathe it fo as the neck and all the back bone may be firaight and equal. As long as the child fucketh, and is flood be pla. not fed with fironger meat, it is better to lay him alway on his back, than any other way, for the ced in the back is as it were the keel in a thin the county of the coun back is as it were the keel in a thip, the ground-work and foundation of all the whole body, whereon the infant may fafely and eatily reft. But if he lie on the fide, it were danger left that the bones of the ribs being foft and tender, not firong enough, and united with flack bands, flould how under the weight of the roll. bow under the weight of the reft, and so wax crooked, whereby the infant might become crookbacked. But when he beginneth to breed teeth, and to be fed with more frong meat, and also the bones and connexions of them begin to wax more firm and hard, he must be layed one while on this fide, another while on that, and now and then also on his back. And the more he groweth, the more let him be accustomed to lie on his fides ; and as he lieth in the Cradle, let him be turned unto that place whereat the light cometh in, left that otherwise he might become purblind, for the eye of its own nature is bright and lightform, and therefore always defireth the light, and abborreth darkouse. and abborreth darkness; for all things are most delighted with their like, and shun their contraries Therefore unless the light comes directly into the childs face, he turneth the himself every way being very forrowful, and thriveth to turn his head and eyes that he may have the light; and that often turning and rowling of his eyes at length groweth into a cuftom that cannot be left; and so it cowhy an arch meth to pass that the infant doth either become pur-blind, if he set his eyes stedfastly on one things of wickers or elfe his eyes do become trembling, always turning and unftable, if he cast his eyes on many must be made things that are round about him: which is the reason that Nurses, being taught by experience, cause over the childs over the head of the child lying in the Cradle, an arch or vault of Wickers covered with cloth to be made, thereby to reflect the child support of the childs. made, thereby to reftrain, direct, and effablish the uncertain and wandering motions of the childs

If the Nurfe be fquint-eyed, the cannot look upon the child but fide-ways, whereof it co meth to pass that the child being moift, tender, flexible, and prone to any thing with his body, and fo likewise with his eye, by a long and daily custom unto his Nurses sight, doth soon take the like

Nurfe. The exercise Cradle.

the cradle. Why a fquint- eyes causeth the child to be

fquint-eyed.

custom to look after that fort also, which afterwards he cannot leave or alter. For those evil things which we learn in our youth, do flick firmly by us; but the good qualities are easily changed into worfe. In the eyes of those that are squint-eyed, those two muscles which do draw the eyes to the greater or lesser corner, are chiefly or more frequently moved. Therefore either of these being confirmed in their turning afide by long use, as the exercise of their proper office increaseth the firength, soon overcomes the contrary or withstanding muscles, called the Antaganists, and brings them into their fubjection, fo that, will they, nill they, they bring the eye unto this or that corner as they lift. So children become left-handed, when they permit their right hand to languish with How children idleness and fluggishness, and strengthen their left hand with continual use and motion to do every become action therewithall, and fo bring by the exercise thereof more nutriment unto that pairt. But if men (as forme affirm) being of ripe years, and in their full growth, by dayly fociety and company of those that are lame and halt do also halt, not minding to to do, but it cometh against their wills, and when they think nothing thereof, why should not the like happen in children, whose fost and tender fubfiance is as flexible and pliant as wax unto every impreffice? Moreover, children, as they become lame and crook-backt, fo do they also become squint-eyed by the hereditary default of their

CHAP. XXIII. How to make pap for Children:

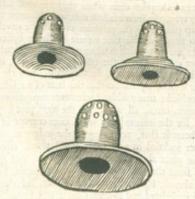

Ap is a most meet food or meat for children; because they require moist nourithment; and it must be answerable in thickness to the milk, that so it may not be difficult to be concocled or digested. For pap hath these three conditions, so that it be made with wheaten flower, Three lauda-and that not crude, but boiled: let it be put into a new earthen pot or pipkin, and so set into an ble conditions oven at the time when bread is fet thereinto to be baked; and let it remain there until the bread be of pap.

baked and drawn out: for when it is fo baked, it is lefs clammy and crude. Those that mix the meal crude with the milk, are constrained to abide one of these discommodities or other, either to red to make give the meal grofs and clammy unto the child, if that the pap be only first boiled over the fire in a the pap with-pipkin or skellet, fo long as shall be necessary for the milk; hence come obstructions in the mesaraick all. why the meal where with the standard of the liver, fretting and worms in the guts, and the stone in the reinst wherewith the Or elfe they give the child the milk, despoiled of its butterish and whayish portion, and the terrestri-al, and cheefe-like, or curd-like remaining, if the pap be boiled so long as is necessary for the meal: made, must for the milk requireth not so great, neither can it suffer so long boiling as the meal. Those that first be boiled or baked, do use crude meal, and have no hurt by it, are greatly bound to nature for so great a bene- or baked. But Galen willeth children to be nourifhed only with the Nurfesmilk, fo long as the Nurfe Lib. Let fauit. hath enough to nourith and feed it. And truly there are many children that are contented with milk tund. only, and will receive no pap until they are three months old. If the child at any time be cottive, and cannot void the excrements, let him have a cataplasm made with one dram of Aloes, of white Acaraplasm to and black Hellebore, of each fifteen grains, being all incorporated in as much of an Ox gall as is fuf-relax t ficient, and extended or spread on Cotton like unto a pultis, as broad as the palm of ones hand, and childs belly. to apply it upon the navel warm: Moreover, this cataplasm hath also virtue to kill the worms in the belly. Many times children have fretting of the guts, that maketh them to cry, which cometh of Fer the fret-This must be cured by applying unto the belly sweaty or moist wooll, macerated in oil of ting of the

If when the childs teeth begin to grow, he chance to bite the nipple of the Nurfes breaft, there will be an ulcer very contumacious and hard to be cured; because that the sucking of the child, and the rubbing of the cloths do keep it always raw; it must be cured with fomenting it with Alum-water, and then prefently after the fomentation putting thereupon a cover of lead, for the sleets made like unto a hat, as they are here described, with many holes in the top, whereat both the or tours. milk, and also the fanious matter that cometh from the ulcers may go out; for lead it felf will cure ulcers.

urs in chil-

The figure of leaden Nipples to be put upon the Nipple or Teat of the Nurse, when it is ulcerated.

Children

dettititiet.

Children may be caused to cease their crying four manner of ways, that is to say, by giving them the teat, by rocking them in a cradle, by finging unto them, and by changing the cloud and fwathes wherein they are wrapped. They must not be rocked too violently in the cradle, left that the milk that is fucked should be corrupted by the too violent motion, by reason whereof they must not be handled violently any other way, and not altogether prohibited, or not suffered to cry. For by crying the breast and lungs are dilated, and made bigger and wider; the natural parts the stronger, and the brain, nosirils, the eyes and mouth are purged, by the tears and filth that come from the eyes and nofirils. But they must not be permitted to cry long or fiercely, for fear of breaking the production of the Peritoneum, and thereby causing the falling down of the guts into the cod, which rupture is called of the Greeks Enterscele; or of the caul, which the Greeks call Epiplocele.

What moderate crying worketh in the infant. What immoderate crying saufeth.

CHAP. XXIV. Of the weaning of Children.

When children must be weaned.

Why children

Whatchildren are firong and found of body

An often cause of fudden crookedness,

Any are weared in the eighteenth month, some in the twentieth; but all or the most part in the second year : for then their teeth appear, by whose presence nature seemeth to require force harder meat than milk or pap, wherewith children are delighted, and will feed more earneftly thereon. But there is no certain time of weaning of children. For the teeth of fome will appear fooner, and fome later; for they are prepared of nature for no other purpose than to chaw the meat. If children be weaned before their teeth appear, and be sed with meat that is somewhat hard and solid, according to the judgment of Avien, they are incident to many weared before difeases coming through crudity; because the stomach is yet but weak, and wanteth that preparation their teeth ap- of the meats which is made in the mouth by chawing; which men of ripe years cannot want with-pear. out offence: when the child is two years old, and the teeth appear, if the child more vehemently How children defire harder meats, and doth feed on them with pleafure and good fuccefs, he may be fafely weaned for it cannot be supposed that he hath this appetite of hard meats in vain, by the inflinct of nature. Yet he may not be weaned without fuch an appetite, if all other things be correspondent, that is to fay, his teeth and age; for those things that are eaten without an appetite, cannot pront. But if the child be weak, fickly, or feeble, he ought not to be weaned. And when the meet time of weaning cometh, the Nurse must now and then use him to the teat, whereby he may leave it by little and little, and then let the teat be anointed or rubbed with bitter things, as with Aloes, water of the infusion of Colorynthus, or Worm-wood, or with Musiard, or Soot steeped in water, or such like. Children that are feabby in their heads, and over all their bodies, and which void much phlegm at their mouth and notirils, and many excrements downwards, are like to be firing and found of body; for fo they are purged of excremental humors: contrariwife, those that are and fair of body, gather the matter of many difeases in their bodies, which in process of time will break forth and appear. Certainly, by the fudden falling of fuch matters into the back-bone many become crook-backt.

CHAP, XXV.

By what figns it may be known whether the child in the womb be dead or alive.

A most certain fign of the hild dead in ahe womb.

When the child is dead in the womb he is more heavy than he was before being alive.

fuffer that which is dead.

F neither the Chirurgions hand, nor the mother can perceive the infant to move, if the waters be flowed out, and the fecundine come forth, you may certainly affirm that the infant is dead in the womb, for this is the most infallible fign of all others: for because the child in the womb doth breath but by the artery of the navel, and the breath is received by the Catyledon of the arteries of the womb, it must of necessity come to pass that when the secundine is se-parated from the infant, no air nor breath can come unto it. Wherefore so often as the secundine is excluded before the child, you may take it for a certain token of the death thereof: when the child is dead, it will be more heavy to the mother than it was before when it was alive, because it is now no more sustained by the spirits and faculties wherewith before it was governed and ruled, for so we see dead men to be heavier than those that are alive, and men that are weak through hunger and famine to be heavier than when they are well refreshed, and also when the mother inclines her body any way, the infant falleth that way also even as it were a stone. The mother is also vexed with sharp pain from the privities even to the navel, with a perpetual defire of making water, and going to flool, because that nature is wholly busied in the expulsion or avoi-That which is dance of that which is dead: for that which is alive will expel the dead to far as it can from it tell, because the one is altogether different from the other; but likeness, if any thing, conjoins and unites things together: the genitals are cold in touching, and the mother complaineth that the feeleth a coldness in her womb, by reason that the heat of the infant is extinguished, wherewith before her heat was doubled: many filthy excrements come from her, and also the mothers breath flinketh, the fwoundeth often, all which for the most part happen within three days after the death of the child: for the infants body will fooner corrupt in the mothers womb than it would in the correction. Lib, de tamento. it would in the open air, because that, according to the judgment of Galen, all hot and moist things, being in like manner inclosed in a hot and most place, especially if by reason of the thickness or firainess of the place they cannot receive the air, will speedily corrupt. Now by the riling up of fish was found in the place they cannot receive the air, will speedily corrupt. the rifing up of fuch vapors from the dead unto the brain and heart, fuch accidents may foon follow, her face will be clean altered, feening livid and ghatfly, her dugs fall and hang loofe and lank, and her belly will be more hard and (wollen than it was before. In all bodies to putrifying.

ing, the natural heat vanishesh away, and in place thereof succeedeth a preternatural, by the work-why the belly ing whereof the putrified and dissolved humors are shirred up into vapors, and converted into wind, of a woman and those vapors, because they possess and fill more space and room (for Naturalists say that of one will be more part of water ten parts of air are made) do so push up the putrified body into a greater bigness. You child is deal and the state of the parts of th thay note the fame thing in bodies that are gangrenate, for they cast forth many sharp vapors, yet within her nevertheless they are swollen and puffed up.

Now fo foon as the Chirurgion thall know that the child is dead by all thefe fore-named figns, he fore when was alive. shall with all diligence endeavor to fave the mother so speedily as he can, and if the Physicians cannot prevail with potions, baths, furnigations, flemutatories, vomits, and liniments appointed to expel the infant, let him prepare himself to the work following, but first let him consider the strength of the morant, for if he perceive that the be weak and feeble by the finalness of her pulse, by her finall, The figns of a feldom and cold breathing, and by the altered and death-like colour in her face, by her cold (weats, womin that is and by the coldness of the extreme parts, let him abstain from the work, and only affirm that she week, will die thortly; contrariwife, if her thrength be yet good, let him with all confidence and industry deliver her on this wife from the danger of death.

than it was be-

CHAP. XXVI.

Of the Chirurgical extractions of the child from the womb either dead or alive.

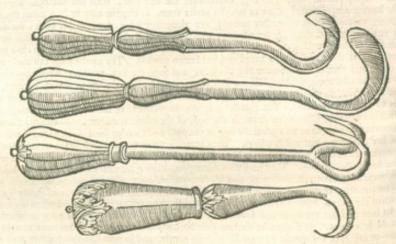

Herefore first of all the air of the chamber must be made temperate, and reduced unto a After what fore certain mediocrity, fo that it may neither be too hot nor too cold. Then the must be the woman in aprly placed, that is to fay, overthwart the bed fide, with her buttocks formewhat travail must be vine a hard stuffed pillow or boulder under them, so that the may be in a mean feutre of placed when high, having a hard stuffed pillow or boulster under them, so that she may be in a mean figure of the child befituation, neither fitting altogether upright, nor altogether lying along on her back; for fo the ing dead in her may rest quietly, and draw her breath with ease, neither shall the ligaments of the womb be extended fo as they would if the lay upright on her back, her heels must be drawn up close to her drawn our. buttocks, and there bound with broad and fost linnen rowlers. The rowler must first come about How she must her neck, and then crofs-wife over her shoulders, and fo to the feet, and there it must crofs again, be bound. and fo be rowled about the legs, thighs, and then it must be brought up to the neck again, and there made fast, so that the may not be able to move her felf, even as one should be tild when he is to be cut of the flone. But that the may not be wearied, or left that her body flould yield How the Chior fink down as the Chirurgion draweth the body of the infant from her, and so hinder the work, rargion ought or fink down as the Chirurgion draweth the body of the infant from her, and to infanter the work, to prepare let him cause her feet to be set against the side of the bed, and then let some of the strong standers by to prepare hold her faft by the legs and thoulders. Then that the air may not enter into the womb, and that his patient to the work may be done with the more decency, her privy parts and thighs must be covered with a the drawing warm double linnen cloth. Then must the Chirurgion, having his nails clotely pared, and his rings out of the child from (if he wear any) drawn off his ingers, and his arms naked, bare, and well anointed with oil, gent-the womb. The flaps of the neck of the womb afunder, and then let him put his hand gently into the thouth of the womb, having first made it gentle and slippery with much oil; and when his hand is in, let him find out the form and situation of the child, whether it be one or two, or whether it be a Mole or not. And when he findeth that he cometh naturally with his head toward the Bowtheinfant mouth or orifice of the womb, he must lift him up gently, and so turn him that his feet may come that is dead in forwards, and when he hath brought his feet forwards, he must draw one of them gently out at the must be turn neck of the womb, and then he must bind it with fome broad and foft or filken band a little above ed, bound and the heel with an indifferent flack knot, and when he hath fo bound it, he must put it up again into the drawn out. womb, then he must put his hand in again, and find out the other foot, and draw it also out of the womb, and when it is out of the womb, let him draw out the other again whereunto he had before tied the one end of the band, and when he hath them both out, let him join them both close together, and fo by little and little let him draw all the whole body from the womb. All other women or Midwives may help the endeavour of the Chirurgion, by preffing the patients belly with their hands downwards as the infant goeth out : and the woman her telf by holding her breath, and clofing her mouth and nofirils, and by driving her breath downwards with great violence, may very much help the expulsion. I with him to put back the foot into the womb again after he hath tied it, because if that he should permit it to remain in the neck of the womb, it would hinder the entrance of his hand when he putteth it in to draw out the other. Eur it there be two children in the womb at once, let the Chirurgion take heed left that he take not of either of them a leg for by drawing them fo, he shall profit nothing at all, and yet exceedingly hart the woman. Therefore that he may not be so deceived, when he hath drawn out one toot and tied it, and put it up again, let him with his hand follow the band wherewithall the foot is field, and fo go unto the foot, and then to the groin of the child, and then from thence he may foon find out the other foot of the fame child: for if it thould happen otherwife, he might draw the legs and the thighs out: but it would come no further, neither is it meet that he should come out with his arms along by his fides, or be drawn out on that fort, but one of his arms must be stretched out above his head, A cautiou to a his fides, or be drawn out on that fort, but the or his aline that were delivered of word frangling and the other down by his fide; for otherwise the orifice of the womb, when it were delivered of word frangling fuch a gross trunk, as it would be when his body should be drawn out with his arms along by his of the infant fuch a gross trunk, as it would be when the body should come unto the neck, only by the acfides, would fo fhrink and draw it felf when the body should come unto the neck, only by the acthe body. cord of nature requiring union, that it would firangle and kill the infant fo that it cannot be drawn therehence unless it be with a hook put under, or fathed under his chin, in his mouth, or in the Whythe child therehence unless it be with a noon put unless, as if he would come with his hands forwards, or if must not be hollowness of his eye. But if the infant lieth as if he would come with his hands forwards, or if must not be health that way, yet it must drawn out his hands be forth already, fo that it may feem he may be drawn forth eafily that way, yet it must with his hands not be fo done; for fo his head would double backwards over his shoulders, to the great danger of sorwards. Bbb 2

An hiftory.

Once I was called unto the birth of an infant, whom the Midwives had affaied to his mother. draw out by the arm, so that the arm had been so long forth that it was gangrenate, whereby the child died; I told them prefently that his arm must be put in again, and he must be turned otherwise. But when it could not be put back by reason of the great swelling thereof, and also of the mothers genitals, I determined to cut it off with an incision knife, cutting the muscles as near as I could to the fhoulder, yet drawing the fiefh upwards, that when I had taken off the bone with a pair of cutting pincers, it might come down again to cover the fhivered end of the bone, left otherwise when it were thrust in again into the womb, it might hurt the mother. Which being done, I turned him with his feet formand. with his feet forwards, and drew him out as is before faid. But if the tumor either naturally or by fome accident, that is to fay, by putrefaction, which may perchance come, be fo great that he cannot be turned according to the Surgeons intention, norbe drawn out according as he lieth, the turnor must be diminished, and then he must be drawn out as is aforefaid, and that must be done at once. the wind As for example, if the dead infant appear at the orifice of the womb, which our Midwives call the wherewish the Garland, when it gapeth, is open and dilated, but yet his head being more great and puffed up with infant being wind fo that it cannot come forth, as caused to be so through that disease which the Greeks call Mu-crophiseephalor, the Surgeon must fasten a hook under his chin, or in his mouth, or else in the hole of lethand is puf- his eye, or elfe, which is better and more expedient, in the hinder part of his head. For when the fed up that he foull is fo opened, which is better and index whereat the wind may pass out, and so when the turnor cannot be got falleth and decreaseth, let him draw the infant out by little and little; but not rashly, less he should then out of the break that whereon he hath taken hold: the figure of those hooks is thus.

dead in the womb, fwel-

The form of Hooks for drawing out the infant that is dead in the womb.

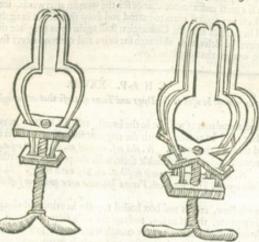

But if the breast be troubled with like fault, the hooks must be fastned about the channel-bone: if there be a Dropfie or Tympany in the belly, the hooks must be fastned either in the short ribs, that is to fay, in the muscles that are between the ribs, or especially, if the disease do also descend into the feet, about the bones that are above the groin; or elfe putting the crooked knife here pictured into the womb with his left hand, let him make incition in the childs belly, and fo get out all his entrails be the incition of the world by the control of the world by the world by the control of the world by the control of the world by the by the incision: for when he is so bowelled, all the water that caused the Dropsie will out. But the

How the head of the infant if and that the head onely remaineth behind in the womb, which I have fornetimes against my will, and the womb with great forrow feen; then the left hand, being anointed with oil of I illies and the control of the month. the remain in with great forrow feen; then the left hand, being anointed with oil of Lillies, or fresh Butter, must the womb sebe put into the womb, wherewith the Surgeon must find out the mouth, putting his finger into it;

parated from they with his right hand be must rear up the book (according to the mouth). parated from then with his right hand he must put up the hook (according to the direction of the left hand) gent the body, may be drawn out. It, and by little and little, and fo faften it in the mouth, eye, or under the chin; and when he bath firmly fixed or faftened it, he must therewith draw out the head by little and little, for fear of loofthat are here described, which therefore I have taken out of the Surgery of Francis Datechamps; for they are for made, that the characteristic described in th they are fo made, that they may eafily take hold of a spherical and round body with the branches, as

with fingers. But it is not very easie to take hold on the head when it remaineth alone in the womb, by reason being alone in of the rounduess thereof, for it will flip and flide up and down, unless the belly be pressed down, the womb, is more distincted and on both fides, thereby to hold it unto the infirmment, that it may with more facility take hold thereon. so be got out, thereon,

CHAP. XXVII.

What must be done unto the woman in travail prefently after ber deliverane.

Here is nothing so great an enemy to a woman in travail, especially to her whose child is Cold an enedrawn away by violence, as cold: wherefore with all care and diligence the must be kept my to women and defended from cold. For after the birth, her body being void and empty, doth easily in travail, receive the air that will enter into any thing that's empty, and hence the waxeth cold, her womb is diffended and puffed up, and the orifice, or the veffels thereof are that and closed, whereof cometh Suppression of the after-birth, or other after-purgations. And thereof cometh many grievous acci- what accidents, as hysterical suffocation, painful fretting of the guts, fevers, and other mortal diseases.

What woman foever will avoid that discommodity, let her hold her legs or thighs across; for in the taking of cold in a world leading, those parts that were separated will be joined and close together again. Let her belly be man that is also bound or rowled with a ligature of an indifferent bredth or length, which may keep the cold delivered of air from the womb, and also press the blood out that is contained in all the substance thereof. Then child. give her fome Capon-broth or Caudle, with Saffron, or with the powder called Pulvis ducis, or elfe bread toasted and dipped in wine wherein spice is brewed, for to restore her strength and to keep away the fretting of the guts. When the secundine is drawn out, and is yet hot from the womb, it Secundine away the fretting of the guts. When the fecundances drawn out, and is yet hot from the womb, it Secundanes must be laid warm unto the region of the womb, especially in the winter, but in the Summer the must be laid to hot skin of a weather newly killed must be laid unto the whole belly, and unto the region of the the region of loins. But then the curtains must be kept drawn, and all the windows and doors of the chamber than the kept thut with all diligence, that no cold air may come unto the woman that travaileth, but that she may lie and take her rest quietly. The Weathers skin must be taken away after that it hath lain five or fix hours, and then all the region of her belly must be anointed with the ointment following.

R. spermatis Ceti, 313. olei anygdal. dulcium & hypericon. an. 318. sevi hircini, 33. olei myrtillor. 33. But if through the violence of the extraction the genital parts be torn, as antient writers affirm it What must be done when the hath come to pass, so that the two holes, as the two holes of the privy parts and of the fundament have been torn into one, their that which is rent must be stirched up, and the wound cured accordin child-birth. ing to art. Which is a most unfortunate chance for the woman afterwards, for when the shall travail again, the cannot have her genital parts to extend and draw themselves in again by reason of the scar. So that then it will be needful that the Chirurgion shall again open the place that was cicatrized, for otherwise she shall never be delivered, although the strive and contend never so much. I have done the like cure in two women that dwelt in Paris.

CHAP. XXVIII.

What cure must be used to the Dugs and Teats of those that are brought to bed.

To drive the milk downward.

By what rea-

F great flore and abundance of milk be in the breaft, and the woman be not willing to nurse her own child, they must be anointed with the unguent following to repel the milk, and cause it to be expelled through the womb. R. olei rof. myrtini an. 3ii, aceti rof at. 3j. incorporate them together, and therewith anointing beforeinkle them the powder of Myrtles, and then apply the plaister following. R. pulu mastichini, nucis mosebut. an. 3ij. nucis cupress 3iij. balanst. myrtil. an. 3is. Iros, florent. 3 : olei myrtini 3iij. terebinth. Veneta 3ij. cera nova quantum suffect, make thereof a fott plaifter.

The leaves of brook-lime, creffes and box boiled togethe in urine and vinegar, are thought a prefent remedy for this purpose, that is to say, to draw the milk from the breast. And others take the clay that falleth down into the bottom of the trough wherein the grindstone, whereon swords are grownd, turneth, and mix it with oil of roses, and apply it warm unto the dugs, which in short space, as it is thought, will affwage the pain, stay the inflammation, and drive the milk out of the The decoction of ground-Ivy, Peruwincle, Sage, red Rofes, and Roch Allum being prepared in oxycrate, and used in the form of a fomentation, is thought to perform the like effect: the like virtue have the less of red wine, applied to the dugs with vinegar, or the diffilled water of un-ripe Pine-apples applied to the breafts with linnen cloths wet therein, or hemlock beaten and applied with the young and tender leaves of a gourd.

This medicine following is approved by use: Take the leaves of Sage, Smallage, Rue, and Cherfon, and which vil, and cut or chop them very fmall, and incorporate them in vinegar and oil of Rofes, and fo apway capping-ply it warm to the breaft, and renew it thrice a day. In the mean time let Cupping-glaffes be ap-glaffes being plied to the inner fide of the thigh and groin, and also above the navel; For this is very effectual to groin or above draw the milk out of the breafts into the womb by the veins whereby the womb communicateth with the navel, do the breafts. Moreover, they may let children or little whelps fuck their breafts, whereby they may draw wilk our of the breaft, whereby they may let children or little whelps fuck their breafts, whereby they may draw out the milk that is fixed faft in their dugs, inflied whereof we have invented this infirument of glafs, wherewith, when the broader orifice is fatined or placed on the breaft or dug, and the pipe turned upwards towards her mouth, the may fuck her own breaits her felfa

> The form of a little glass, which being put on the nipple, the woman may fuck her own breasts.

Instead of this instrument, a viol of glass being first made warm, and the mouth thereof applied to the nipple or teat, by reason of the heat and wideness thereof will draw the milk forth into the bottom thereof, as it were by a certain sucking. The after-purgations being first evacuated, which is done for the most part within twenty days after the birth, if the woman be not in danger of a feaver, nor have any other accident, let her enter into a bath, made of manjerom, mint, fage, rolemary, mugwort, agrimony, peny-royal, the flowers of camomil, melilote, dill, being boiled in most pure and clear running water. All the day following let another fuch like bath be prepared, whereunto let these things tollowing be added. And after the fomenta-let woollen cloths or stupes of linnen cloth be dipped in the liquor, and then pressed out and laid to When all these things are done and past, the woman may again keep company with her

CHAP. XXIX.

What the causes of difficult and painful travail in child-birth are.

The fault dependent formetimes on the mother, and formetimes on the infant or child within The coases of He fault dependent iometimes on the mother, and iometimes on the mant or child within The cases of the womb. On the mother, if the be more fat, if the be given to gormandize or great the difficult cating, if the be too lean or young, as Savanarola thinketh her to be, that is great with child-birth child at nine years of age, or unexpert, or more old, or weaker than the should be either by nature or by some accident: as by diseases that the hath had a little before the time of child-birth, or with a great stux of bloud. But those that fall in travail before the full and prefixed time are very difficult to deliver, because the fruit is yet unripe, and not ready or easie to be delivered. If the neck or orifice of the womb be narrow, either from the first conformation, or afterwards by some chance, as by an ulcer cicatrized: or more hard and callous, by reason that it hath been torn before at the birth of fome other child, and so cicarrized again, so that if the cicatrized place be not cut even in the moment of the deliverance, both the child and the mother will be in danger of death; alto the rude handling of the midwite may hinder the free deliverance of the child. Oftentimes women The paffions are letted in travail by fhamefacedness, by reason of the presence of some man, or hate to some woman of the mind

If the fecundine be pulled away fooner than it is necessary, it may cause a great flux of blood to birth. fill the womb, fo that then it cannot perform his exclusive faculty, no otherwise than the bladder when it is diffended by reason of over-abundance of water that is therein, cannot cast it forth, so that there is a floppage of the urine. But the womb is much rather hindred, or the faculty of child-birth is flopped or delayed, if together with the flopping of the fecundine, there be either a Mole or fome other body contrary to nature in the womb. In the fecundines of two women whom I delivered of two children that were dead in their bodies, I found a great quantity of fand like unto that which is found about the banks of rivers, fo that the gravel or fand that was in each fecundine was a full pound

Also the infant may be the occasion of disficult child-birth, as, if too big, if it come overthwart, The earles of if it come with its face upwards, and its buttocks forwards, if it come with its feet and hands both difficult child if it come with its face upwards, and its bottocks forwards, if it come with its feet and nanos both forwards at once, if it be dead and fwoun by reason of corruption, if it be monstrous, if it have two birth that are bodies or two heads, if it be manifold or seven-fold, as Albuerasis affirmeth he hath seen, if there he in the infant. a mole annexed thereto, if it be very weak, if when the waters are flowed out, it doth not move nor flir, or offer it self to come forth. Yet notwithstanding, it happenest sometimes that the souls is The external neither in the mother nor the child, but in the air, which being cold, doth so bind, congeal and causes of diffinake stiff the genital parts, that they cannot be relaxed: or, being contrariwise too hot, it weakneth cult child, the woman that is in travail, by reason that it wastes the spirits, wherein all the strength consistents. the woman that is in travail, by reason that it wasteth the spirits, wherein all the strength consisteth: or in the ignorant or unexpert midwife, who cannot artificially rule and govern the endeavors of

the woman in travail.

The birth is wont to be easie, if it be in the due and prefixed natural time, if the child offer him- Which is an felf luftily to come forth with his head forwards prefently after the waters are come forth, and the ease birth, mother in like manner lufty and firong: those which are wont to be troubled with very difficult child-birth, ought a little before the time of the birth, to go into an half-tub filled with the decoction child-birth. of mollifying roots and feeds, to have their genitals, womb and neck thereof to be anointed with much oil, and the intestines that are full and loaded must be underburthened of the excrements, and then the expulsive faculty provoked with a sharp clyster, and the tumors and swelling of the birth concurring therewith, the more easie exclusion may be made. But I like it rather better, that the woman in travail should be placed in a chair that hath the back thereof leaning backwards, than in her bed, but the chair must have a hole in the bottom, whereby the bones that must be dilated in the birth, may have more freedom to close themselves again.

CHAP. XXX.

The eastfe of Abortion or untimely birth.

Bortion or untimely birth is one thing, and effluxion another. They call abortion the fudden What Aborti-exclusion of the child already formed and alive, before the perfect maturity thereof. But on is. that is called effluxion, which is the falling down of feeds mixed together and coagulated but What Effluxion of a few days only in the forms of membranes or tunicles, consecuted blood and of on in for the space of a few days, only in the forms of membranes or tunicles, congealed blood and of an unshapen or deformed piece of flesh; the Midwives of our country call it a false branch or bud-This effluxion is the cause of great pain and most bitter and cruel torment to the woman: leaving

Women are in more pain by reason of the effluxion than at the true birth. The causes of Abortion.

behind it weakness of body far greater than if the child were born at the due time. The causes of abortion or untimely birth, whereof the child is called an abortive, are many, as a great fcouring, a strangury joined with hear and inflammation, sharp fretting of the guts, a great and continual cough, exceeding vomiting, vehement labour in running, Jeaping, and dancing, and by a great fall from on high, carrying of a great burthen, riding on a trotting horse, or in a Coach, by vehement, often and ardent copulation with men, or by a great blow or stroke on the belly. For all these and fuch like vehement and inordinate motions diffolve the ligaments of the womb, and fo cause abertion and untimely birth.

Girding of the belly may cause untimely

Also whatsoever presseth or girdeth in the mothers belly, and therewith also the womb that is within it, as are those Ivory or Whale-bone busks, which women wear on their bodies, thereby to keep down their bellies; by these and such like things the child is letted or hindred from growing to his full firength, fo that by expression, or as it were by compultion, he is often forced to come forth before the legitimate and lawful time. Thundering, the noise of the shooting of great Ordnance, the found, and vehement noise of the ringing of Bells constrain women to fall in travail before their time, especially women that are young, whose bodies are fost allack and tenderer, than those that be of riper years. Long and great fasting, a great flux of blood, especially when the infant is grown formewhat great: but if it be but two months old, the danger is not so great, because then he needeth not fo great quantity of nourithment; also a long difease of the mother, which confumeth the blood, cauteth the child to come forth being deflitute of store of nounthment before the fit time. Moreover, fulness, by reason of the eating great store of meats, often maketh or canfeth untimely birth; because it deprayeth the strength, and presset down the child; as likewise the use of meats that are of an evil juice, which they lust or long for. But baths because they relax the ligaments of the womb, and hot-houses, for that the fervent and chooking air is received into the body, provoke

cause untimely

Bip. 496. 53.65 ter, and cannot hold up the infant, by reafon of the weight thereof, but are broken: Moreover sudment without any manifest cause, those have the Cotyledons of their womb full of filth and matter, and cannot hold up the infant, by reason of the weight thereof, but are broken: Moreover sudment of travail before their time; and are accounted to the proof of the mind, whether they be through anger or fear. great and vehement trouble in the body. Those women that are like to travail before their time, their dugs will wax little; therefore when a woman is great with child, if her dugs fuddenly wax finall and flender, it it a fign that the will travail before her time; the cause of such shrinking of the dugs is, that the matter of the milk is drawn back into the womb, by reason that the infant wanteth nourishment to nourish and succor it withall. Which scarcity the infant not long abiding, striveth to go forth to feek that abroad which he cannot have within; for among the causes which do make the infant to come out of the womb, those are most usually named with Hippocrates, the necessity of

a more large nutriment and air.

Hip. aph. 38.

Therefore if a woman that is with child have one of her dugs small, if the have two children, the is like to travail of one of them before the full and perfect time: fo that if the right dug be finall, it is a man-child, but if it be the left dug, it is a female. Women are in far more pain when they bring forth their children before the time, than if it were at the full and due time; because that whatfoever is contrary to nature, is troublefome, painful, and also oftentimes dangerous. If there be any error committed at the first time of child-birth, it is commonly seen that it happeneth always after at each time of child-birth. Therefore, to find out the causes of that error, you must take the counsel of some Physician, and after his counsel endeavor to amend the same. Truly this plaister counsel of some Physician, and after his counsel endeavor to amend the same. following being applied to the reins doth confirm the womb, and fray the infant therein. How to preserve the infant in the womb, when the mother is dead.

fant is fooner come to maturity and perfection in a hot woman than in a cold, for it is the property

F all the figns of death appear in the woman that lieth in travail, and cannot be delivered, there must then be a Surgeon ready and at hand, which may open her body so foon as the is dead, whereby the infant may be preferved in safety; neither can it be supposed sufficient if the mothers mouth and privy parts be held open; for the infant being inclosed in his mothers womb,

womb, and compaffed with the membranes, cannot take his breath but by contractions and dilata- Why it is not tions of the artery of the navel. But when the mother is dead, the lungs do not execute their office fufficient to and function: therefore they cannot gather in the air that compaffeth the the body by the mouth or preferve life in the child to afters arteris into their own substance, or into the arteries that are dispersed throughout the body hold open the thereof, by reason whereof it cannot fend it unto the heart by the veiny artery which is called arteria mouth and priwasalis: for if the heart want air, there cannot be any in the great artery which is called arteria aerta, vy parts of the whose function it is to draw it from the heart, as also by reason thereof it is wanting in the arteries mother so soon of the womb, which are as it were the little conduits of the great artery, whereinto the air that is and the child brought from the heart is derived, and sloweth in unto these little ones of all the body, and likewise alive in her of the womb. Wherefore it must of necessity follow that the air is wanting to the cotyledons of the body. fecundines, to the artery of the infants navel, the iliack arteries alfo, and therefore unto his heart, and so unto his body: for the air being drawn by the mothers lungs, is accustomed to come to the infant by this continuation of passages. Therefore because death makethall the motions of the mothers body to ceafe, it is far better to open her body fo foon as the is dead, beginning the incition at of the woman the cartilage, Xipboides, or blade, and making it in a form femicircular, cutting the skin, mufcles that dieth in and permutant, not touching the guts: then the womb being lifted up, must tait be cut, left that travel must be cut page to cut page to otherwise the infant might perchance be touched or hurt with the knife.

You shall oftentimes find the child unmovable, as though he were dead; but not because he is dead indeed, but by reason that he, being deflitute of the access of the spirits by the death of the mother, hath contracted a great weakness; yet you may know whether he be dead indeed or not by handling the artery of the navel; for it will beat and pant if he be alive, otherwise not; but if How it may be there be any life yet remaining in him, shortly after he hath taken in the air, and is recreated with known wh the access thereof, he will move all his members, and also all his whole body. In so great a weakness there the infant or debility of the strength of the child, by cutting the navel-string, it must rather be laid close to be alive or now the region of the belly thereof, that thereby the heat (if there be any jot remaining) may be flirred up again. But I cannot furficiently marvel at the infolency of those that affirm that they have feen women whose bellies and womb have been more than once cut, and the infant taken out, when it could no otherwise be gotten forth, and yet notwithstanding alive a which thing there is no man can perswade me can be done without the death of the mother, by reason of the necesfary greatness of the wound that must be made in the muscles of the belly, and substance of the womb; for the womb of a woman that is great with child, by reason that it swelleth, and is diflended with much bloud, must needs yield a great flux of blood, which of needfity must be mortal. And to conclude, when that the wound or incision of the womb is cicarrized, it will not permit or fuffer the womb to be dilated or extended, to receive or bear a new birth. For these and fuch like other causes, this kind of cure, as desperate and dangerous, is not (in mine opinion)

CHAP. XXXII. Of Superfetation.

Uperfectation is when a woman doth bear two or more children at one time in her womb, and What superfethey be enclosed each in his feveral fecundine: but those that are included in the same secundine, are supposed to be conceived at one and the same time of copulation, by reason of the great and copious abundance of feed, and these have no number of days between their conception and birth, but all at once. For as prefently after meat the fromach which is naturally of a good temper, is contracted or drawn together about the meat, to comprehend it on every fide, though small in quantity, as it were by both hands, so that it cannot rowl neither unto this or that fide, fo the womb is drawn together unto the conception about the feeds, as foon as they are brought into the capacity thereof, and is so drawn in unto it on every side, that it may come together into one body, not permitting any portion thereof to go into any other region or fide, fo that by one time of copulation the feed that is mixed together, cannot engender more children than one, which are divided by their fecundines. And moreover, because there are no such cells in the A womans one, which are divided by their fecundines. And moreover, because there are no tuch cells in the A womans wombs of women, as are supposed, or rather known to be in the wombs of beasts, which therefore womb is not bring forth many at one conception or birth. But now if any part of the womans womb doth not diffinguished apply and adjoin it self-closely to the conception of the seed already received, left any thing should either given by nature for no purpose, it must of necessary follow that it must be filled with air, which the reason of will alter and corrupt the feeds; therefore the generation of more than one instant at a time, has superfectation. Ving every one his feveral fecundine, is on this wife. If a woman conceive by copulation with a man as this day, and if that for a few days after the conception, the orifice of the womb be not exactly thut, but rather gape a little, and if the do then use copulation again, so that at both these times of copulation there may be an effusion or perfect mixture of the scribe feed in the words, there will follow a new conception or superfectation. For superfectation is no other than a certain fecond conception, when the woman already with child, again ufeth copulation with a man, and so conceiveth again, according to the judgment of Hippocrates. But there may be many to despond than, and so conceiveth again, according to the judgment of Hippocrates. causes alledged why the womb which did join and close doth open and unloose it self again. For setationibus there be forme that suppose the womb to be open at certain times after the conception, that there why the may be an iffue out for certain excremental matters that are contained therein, and therefore that womb after the conception with a matter that womb after the conception with the concep the woman that hath fo conceived already, and shall then use copulation with a man again, shall the conception

Others fay that the womb of it felf, and of its own nature is very defirous of feed or copula- times aftertion, or elfe being heated or inflamed with the pleafant motion of the man moving her thereto, wards open;

doth at length unclose it felf to receive the mans feed: for likewise it happeneth many times that the orifice of the flomach being flut after eating, is prefently unloofed again, when other delicate meats are offered to be eaten: even fo may the womb unclose it felf again at certain fefaons, whereof come Lib. 7. esp. 11. manifold iffues, whose time of birth and also of conception are different. For as Pliny writeth, when there hath been a little space between two conceptions, they are both hastened, as it appeared in Hereules and his brother Iphicles; and in her which having two children at a birth, brought forth one like unto her husband and another like unto the adulterer. And also in the Procomesian slave or bond-woman, who, by copulation on the same day, brought one forth like unto her master, and another like unto his fleward: and in another who brought forth one at the due time of childbirth, and another at five months end. And again, in another, who bringing forth her burden on

the feventh month, brought forth two more in the months following. But this is a most manifest argument of superfectation, that as many children as are in the womb (unless they be twins of the same sex) so many secundines are there, as I have often seen my self. And it is very likely that if they were conceived in the fame moment of time, that they should all be included in one secundine. But when a woman hath more children than two at one burden, it feemeth to be a monftrous thing, because that nature hath given her but two breasts. Although we shall hereafter rehearse many examples of more numerous births.

CHAP. XXXIII.

Of the tumor called Mola, or a Mole growing in the womb of women.

The reason of the name.

Whata Mola

F the Greek word Myle, which fignifieth a Mill-flone, this tumor called Mola hath its name: for it is like unto a Mill-flone both in the round or circular figure, and also in hard confiftence, for the which felt fame reason the whirl-bone of the knee is called of the Latins Mola, and of the Greeks Myle. But the tumor called Aiola, whereof we here intreat, is nothing elfe but a certain false conception of deformed flesh, round and hard, conceived in the womb as it were rude and unperfect, not diffinguished into the members, coming by corrupt, weak, and difeafed feed, of the immoderate flux of the terms, as it is defined by Hippocrates. This is inclosed in no fecundine, but as it were in its own skin.

Lib. de fteril;

There are some that think the Mola to be engendred of the concourse or mixture of the womans feed and mentional blood, without the communication of the mans feed. But the opinion of Galen is, cap. 7. lib. 4. ds that never any man faw a woman conceive either a Mola, or any other fuch thing without a copular tion of man, as a Hen layeth eggs without a Cock: for the only cause and original of that motion is How the Atola in the mans feed and the mans feed doth only minister matter for the generation thereof. Of the fame is engendred, opinion is Avicon, who thinketh the Mola, to be made by the confluxion of the mans feed that is unfertile, with the womans; when as it, because untruitful, only puffs up or makes the womans feed to fwell as leaven into a greater bigness, but not into any perfect shape or form. Which is also the opinion of Fernelius, by the decrees of Hippocrates and Avien: for the immoderate fluxes of the courses are conducing to the generation of the Mola, which overwhelming the mans seed, being now unfruitful and weak, doth constrain it to desire from its enterprise of conformation already between the course of the Mola, which overwhelming the mans seed, being now unfruitful and weak, doth constrain it to desire from its enterprise of conformation already between the course of the Mola, which overwhelming the mans seed to the conformation already between the course of the Mola and the Mola and the course of the Mola and the gun, as vanquithed or wholly overcome: for the generation of the Mela cometh not of a simple heat working upon a clammy and grofs humor, as worms are generated; but of both the feeds, by the efficacy of a certain fpirit, after a fort prolitical, as may be understood by the membranes wherein the Mola is inclosed, by the ligaments whereby many times it is fashed or bound to the true conception or child, engendred or begotten by superfectation; and finally, by the increase, and great and fluggish weight. If all men were not periwaded that the conflux of a mans feed must of necessity concur to the generation of the Mola, it would be no small cloak or cover to women to avoid the fhame and reproach of their light behaviour.

CHAP. XXXIV.

How to difeern a true conception from a false conception or Mola.

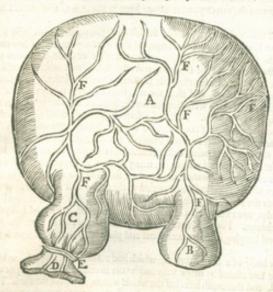

The figns of a nota inclosed in the womb.

Hen the Mola is inclosed in the womb, the same things appear as in the true and lawful conception. But the more proper figns of the Mola are these: there is a certain pricking pain, which at the beginning troubleth the belly as if it were the colick ; the belly will (well fooner than it would if it were the true iffue, and will be diffended with great hardness, and is more difficult and troublesome to carry, because it is contrary to nature, and void of foul or life. Prefently after the conception the dugs will fwell and puff up, but thortly they By what facult fall and become lank and lax; for nature fendeth milk thither in vain, because there is no iffue in the womb the womb that may fpend the fame. The Mola will move before the third month, although it movethe more, be obscurely, but the true conception will not: but this motion of the Mola is not of the intelon of the Most lectual foul, but of the faculty of the wornb, and of the spirit of the feed dispersed through the different substance of the Mosta; for it is nourished and increaseth after the manner of plants, but not by the motion of reason of a feed or feed to feel or feed through the motion of reason of a feed or feed to feel or feed through the motion of reason of a feed or feed to feel or feed through the motion of reason of a feed or feed to feel or feed through the motion of reason of a feed or feed through the motion of reason of a feed or feed through the motion of reason of a feed or feed through the motion of reason of a feed or feed through the motion of reason of a feed or feed through the motion of reason of a feed or feed through the motion of reason of a feed or feed through the motion of reason of a feed or feed through the motion of the feed dispersed through the feed disper the motion of reason of a soul or spirit sent from above, as the infant doth. Moreover, that motion that the the infant in infant hath in its due and appointed time, different much from the motion of the Mola; for the womb.

The mola doth child is moved to the right side, to the left side, and to every side gently, but the Mola, by reaturn to each son of its heavines, is hard, and rowleth in manner of a stone, carried by the weight thereof unfide of the to what side sover the woman, declined has self. The woman that hath a Mola in her womb, fide of the to what fide foever the woman declineth her felf. The woman that hath a 'Mola in her womb, womb, as the doth daily wax leaner and leaner in all her members, but especially in her legs, although not-fireation of the withstanding towards night they will swell, so that the will be very slow or heavy in going, the natural

natural heat forfaking the parts remote from the heart by little and little : and moreover, her belly fwells, by reason that the menstrual matter resteth about those places, and is not conformed in the nourishment of the Mola; the is swoln as if the had the dropsic, but that it is harder, and doth not rise again when it is pressed with the singers. The navel doth not fland out as it will do when the true issue is contained in the womb, neither do the courses flow as they do sometimes in the true true iffue is contained in the womb, neutral do the courses how as they do iometimes in the true conception; but fometimes great fluxes happen, which eafe the weight of the belly. In many when the Mola doth cleave not very faft, it falleth away within three or four months, being not as yet come unto its just bigness; and many times it cleaveth unto the sides of the womb and Cotyledons very firmly, fo that fome women carry it in their wombs five or fix years, and fome as long as they live.

The wife of Gailiam Roger Pewterer, dwelling in S. Vitters firect, bore a Mola in her womb A History? feventeen years, who being of the age of fifty years, died; and I having opened her found the body of her womb to be almost loosed, and not tied or bound by its accustomed ligatures, but as it were hanging only by the neck, and furthermore cleaving to the Kall adjoining to it, having but only one tefficle, and that on the right fide, and that fomewhat broader and loofer than ufual: the horns were not to be feen except it were on that fide, the veffels were on the neck only, and there very manifest and pussed up, it was as big as a mans head. When I had taken it out of her body, I brought it home unto my house, that at my leisure I might find out what was contained in it fo long; therefore on a certain day, calling together the chief Phylicians of Parir, as Malfileus, Alexis, Vigor de S. Pont. Feure, Brovet, Violais, Grealmus, Ravin, Marescotius, Milotus, Hautin, Riolans, Latin, Vigor de S. Pont. Luffen; and Surgeons, as Brun, Cointerel, Guillemean; all these being prefent, I opened the womb,

on of a Mole carried feventhe womb.

A vain or un-profitable con-

The Mola kills

the infant in

the womb.

ned unto it.

ception.

The descripti- and I found it in all the body thereof, and in the proper tunicle, so scirrhous, and so hard that I could hardly cut or make a knife to enter it: the body thereof was three fingers thick. In the midli of the capacity thereof I found a lump of flesh as big as both my fifts, like unto a Cowsudder, cleaving to the fides of the womb, but in a certain place, of a very thick, unequal and cloddish substance with many bodies therein, even as are commonly found in Wens and Griftles, differred through it as if it were bones. The judgment of all that were prefent was, that this great tumor at the first was a Mola, which in process of time degenerated into a scirrhous body, together with the proper subfrance of the womb. Moreover, in the middle of the neck of the womb, we found a tumor as big as a Turkies egg, of fubstance hard, cartilaginous and bony, filling all the whole neck, but especially the inward orifice of the womb, which the common people of France do call the Garland, so that by that paffage nothing could go out, or enter into the womb: all that tumor weighed nine pounds and two ounces, which I, by reason of the novelty of the thing, keep in my closet, and before I have described it.

As long as the woman carried this Mola in her womb, the felt most sharp pain in her belly; the region of her belly was marvellous hard, diftended and large, as if it were a woman that had many children at once in her womb; fo that many Physicians when the time of child-birth was past, Supposed that swelling of the belly to come of the Dropsie, and affaied to cure it as they would the Dropsie; but for all the medicines they could use, the belly became never the lesser. Oftentimes the urine was stopped for the space of three days, and then the making of urine was very painful unto her, and many times also her excrements were stopped for the space of a week, by reason that the guts were preffed by the weight of the Mola. At certain feafons, as every third month, there came exceeding great fluxes; the matter thereof could not be carried through the capacity of the womb, as we faid before, because it was exactly that and stopped, but through the vessels by which Virgins, and also certain other women great with child evacuate their mentitual matter. If the Mola be expelled or cast out in the first or second month, as many times it so happeneth, it is called of women an unprofitable or false conception. Sometimes there are found in one womb two or three moles separated one from another, and sometimes bound or tied to the found and perfect infant : As it happened in the wife of Valeriala the Phylician, which was delivered of a Mola which the had carried in her womb twelve months, annexed with a child of four months old, which had deprived the Infant of its room and nutriment. For it is always to be certainly supposed, that the Molas when it is faft- as a cruel beaft, by its fociety, and keeping from its nutriment and place, kills the infant that is join-

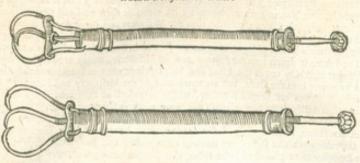

ed unto it. I remember once I opened the body of a dead woman, which had a Mola in her womb, as big 25 a Goofe-egg, which when nature had affaied by many vain endeavors to cast out, remained notwithflanding, and at length putrified, and therewith infected the whole womb, whereof the died. There be fome which judging themselves great with child, do about the ninth or tenth month expel no other thing but founding blafts of wind; whereby the womb fuddenly falling down, and waxing more flender, they are faid in a mockery to have been delivered of a fart. To conclude, whatfoever refembles being with child, if it be not excluded at the due and lawful time of child-birth by its own accord, or by the strength of nature, then must it be expelled by art.

> CHAP. XXXV. What care must be used to the Mola.

LL things that provoke the flowers and fecundines, and exclude the Infant, being dead, are to be prescribed, given inwardly, put up, and applied outwardly, as Trochifces of more rbs, hermodactyls, and fuch like, first having fomentations that are relaxing and mollifying always applied to the places. You must use these medicines, and phlebotomy, diet and baths then and so long as it shall seem necessary to the Physician that is present. But if it happens that the Mole is separated or loosed from the womb, and nature cannot expel it when it is so loosed, let the Chirurgion place the woman in that fituation that we faid the was put in, when the child was to be drawn from her. Then opening her genital parts, let him take hold on it by putting an infirement into The Chirurgiit, which by reason of the likeness thereof is called a Gryphons Talon; for it cannot be taken hold on
cal extraction otherwise, by reason of the roundness thereof; for it hath no place whereon it may be taken hold of: therefore when one taketh hold on it with his hand, it cannot be holden fast by reason of the slipperiness thereof, but will run and slip back into the hollowness of the womb, like unto a bowl or ball; but it may be more eafily taken hold on with the Gryphons Talon, if the belly be preffed on both fides that it may remain fill while the Gryphons Talon takes hold on it; for when it hath taken good hold on it, it may be eafily drawn out. When the Mala is drawn out, the fame cure mult be unfer the morning of the property of the morning of the state of the morning of the state of the morning of the state of the s fed to the woman, as is used to a woman after that the is delivered of child.

Those shings that provoke the flowers forcibly, do alof the Mola.

The Figure of an Instrument called a Gryphons Talon, to draw out the Mola when it is loofe in the womb.

CHAP. XXXVI.

Of Tumors or swellings happening to the Paracteas or sweet-breads, and the vohole Mesentery.

He tumors of other places and parts in the belly ought diligently to be diftinguished from the Mola, and other tumors of the womb. For when the tumors arife in the glandula called Pancreas, and in all the whole Mesenterium, many unskilful Surgeons take them for Molast or scirrhous tumors of the womb, and so go erroneously about to cure them, as shall appear by these Histories following,

Ifabel Rolans the wite of John Bony dwelling in Paris in the fireet Moncey near to St. Gervife his An History. Church, being threefcore years of age, departed this life in the year of our Lord 1578. on the two and twentieth day of Ollober, and her body being opened in the prefence of Doctor Milos the Phylician; he, when the Mefentery was taken out of the body, caused it to be carried home to his hour. that at his leifure he might find out the cause of this mortal disease, which was always suspected to be in the Mesentery. Therefore on a time calling Varadem, Brove, Chappel, Maresonius, Arragonius, be hoped. Baillinius, Reburrius, and Riolan, all Doctors of Phytick, and my felf and Pineus Surgeons, to his house to fee the fame: Where we found all the Melentery and the Pancreas in the Melentery (wollen and puffed up with a marvellous and almost incredible tumor, so that it weighed ten pound and an half, alrogether feirrhous on the outlide, cleaving on the hinder part onely to the vertebraes of the loins; but on the fore-part to the Perisoneum being also scirrhous and wholly cartilaginous. Moreover, but on the fore-part to the Peritoneum being also scirrhous and wholly cartilaginous. Moreover, Apostumes of there were infinite other abscelles in the same Mesentery, every one closed in his several cist, some fill-divers kinds led with a honey-like, some filled with a tallow-like, some with an albugineous, and some with a in the Mostate-waterish liquor or humour, whereof some also were like unto pap; and to conclude, look how many riam. ableeffes there were, for many kinds or differences of matters there were. It was then eight years. The accidents fince that tumour began to grow by little and little without feeling and pain unto fisch a greatness, that come because that the Melentery it felf was without pain in a manner. For the woman her felf could when the Melentery it felf was without pain in a manner. For the woman her felf could when the Melentery it felf was without pain in a manner. For the woman her felf could when the Melentery it felf was constrained to keep her bed, because the had a continual Fever, the paragred from the bedies at the large as the lived, and also because that the Melentery hering as it were separated or include. which endured fo long as the lived, and also because that the Mesentery, being as it were separated or joining. torn from its roots or feat, did rowl up and down in the belly, not without the feeling of grievous pain: for, as we faid before, it did flick but onely to the vertebraes of the loins and Peritoness nothing at all to the guts and other parts whereunto it is as it were naturally knit or joined.

Therefore because the weight and heaviness thereof depressed the bladder, it caused a great difficulty in her making of water, and also because it rested on the guts, it made it very painful for her to go to flool, to that the excrements would not come down except the took a tharp Clyfter to cause them: and as concerning Clysters, they could not be put up high enough by reason of the greatness of the tumor which enclosed and shut the way; and suppositories did no good at all. It was also very difficult for her to take breath, by reason that the midriff or disable agms was compressed with the tumor. There were some that did suspect it to be a Mola, others thought that it came by reason of the greatness of the tumor. There were some that did suspect it to be a Mola, others thought that it came by reason of the dropsic. Affuredly this disease caused the dropsic to ensure, neither was the cause thereof obscure, for the sunction of the Liver was frustrated by reason that the con
Misterian. coction or the alteration of the Chylus was intercepted by occasion of the tumor; and moreover the Liver it felf had a proper difease, for it was hard and feirrhous, and had many abscesses both within, and without it, and all over it. The milt was fearce free from putrefaction, the Guts and Kall were fomewhat blew and spotted, and to be brief, there was nothing found in the lower

There is the like History to be read, written by Philip Ingress, in his book of Tumors, of a Tomas tertain Moor that was hanged for theft; for (faith he) when his body was publickly diffected, capa. in the Mesenterison were found seventy scrophulous tumors, and so many abscesses were contained or enclosed in their feveral cifts or skins, and slicking to the external tunicle, especially of the greater guts: the matter contained in them was divers; for it was hard, knotty, clammy, glutinous, liquid and waterish; but the entrails, especially the Liver and the Milt, were found free from all manner of a tainture, because (as the same Author alledgeth) Nature being strong had fent all the evil juice and the corruption of the entrails into the Mefentery; and verily this

566 Concerning the Generation of Man. BOOK XXIV. Moor, so long as he lived, was in good and perfect health. Without doubt the corruption of su-Lib.6.part. nov. perfluous humours for the most part is so great (as is noted by Ferneline) that it cannot be received in the receptacles that Nature hath appointed for it; therefore then no finall portion thereof falteth into the parts adjoining, and especially into the Mesentery and Paneres, which are as it were
sink of the bothe sink of the whole body. In those bodies which through continual and daily gluttony abound with choler, melancholy and phlegm, if it be not purged in time, Nature being strong and lusty, doth repel and drive it down into the Paweress and the Melentery, which are as places of no great repute, and that especially out of the Liver and Milt by those veins or branches of the Vena Porta which end or go not into the Guts, but are terminated in the Mesentery and Pancreas. In these places diverse humours are heaped together, which in process of time turn into a loose and soft tumour, and then if they grow bigger, into a stiff, hard and very scirrhous tumor. Whereof Fernelius affirmeth that in those places he hath found the causes of choler, melancholy, fluxes, dysenteries, and writer attentions at each line. cachexiaes, atrophiaes, confumptions, tedious and uncertain fevers, and laftly of many hidden difcases, by the taking whereof some have received their health, that have been thought past cure.

The Scrophu- Moreover Ingrassas affirmeth out of Julius Pollux, that Scrophulaes may be engendred in the Melenlaes in the Me-tery which problem differs from the melentery, which nothing differs from the mind and opinion of Galen, who faith that Scrophulaes are no-thing elfe but indurate and Scirrhous kernels. But the Mesenterium with his glanduls being great fenterium. and many, making the Paneress, doth eftablish, firengthen and confirm the divisions of the vessels. Also the feirrbus of the proper substance of the womb is to be distinguished from the mola; for in the bodies of some women that I have opened, I have found the womb annoised with a scirrhous turnor The Scirrbus of the womb. as big as a mans head, in the curing whereof Phylicians nothing prevailed, because they suppofed it to be a mula contained in the capacity of the womb, and not a feirthous tumor in the body CHAP. XXXVII. Of the cause of barrenness in Men. Here are many causes of barrenness in Men, that is to say, the too hot, cold, dry or moist diffemper of the feed, the more liquid and flexible confiftence thereof, so that it cannot flay in the womb, but will prefently flow out again: for fuch is the feed of old men How the feed and striplings, and of such as use the act of generation too often and immoderately: for thereby the seed becometh crude and waterish, because it doth not remain his due and lawful time in the tefficles, wherein it should be perfectly wrought and concocted, but is evacuated by wanton copulation. Furthermore, that the feed may be fertile, it must of necessity be copious in quantity but in quality well concocted, moderately thick, clammy, and puffed with abundance of fpirits; both thefe conditions are wanting in the feed of them that use copulation too often; and moreover because the wives of those men never gather a just quantity of feed landable both in quality and consistence in their tefficles, whereby it cometh to pass that they are the less provoked or delighted with vene-reous actions, and perform the act with less alacrity, so that they yield themselves less prone to conception. Therefore let those that would be Parents of many children use a mediocrity in the use of Venery. The Woman may perceive that the mans feed hath some distemperature in it, if when she hath How the cutreceived it into her womb, the feeleth it tharp, hot or cold, if the man be more quick or flow in ting of the veins behind the act. Many become barren after they have been cut for the Stone, and likewife when they have the cars mahad a wound behind the ears, whereby certain branches of the jugular veins and arteries have been cut, that are there, fo that after those vessels have been cicatrized, there followed an interception keth men bargen. of the feminal matter downwards, and also of the community which ought of necessity to be between the brain and the tefficles, so that when the conduits or passages are stopped, the stones or tefficles cannot any more receive, neither matter nor lively spirits from the brain in so great quantity as it was wont, whereof it must of necessity follow, that the feed must be lesser in quantity, and weaker in quality. Those that have their testicles cut off, or else compressed or contused by violence, cannot beget children, because that either they want that help the testicles should minister in the act of generation, or else because the passage of the seminal matter is intercepted or stopped with a Callus: by reason whereof they cannot yield forth feed, but a certain clarmry humour contained in the glanduls called Proflate (yet with fome feeling of delight). Moreover the defects or imperfections of the yard-may cause barrenness: as, if it be too thort, or The defaults if it be fo unreasonable great that it renteth the privy parts of a woman, and so causeth a flux of of the Yard. bloud, for then it is so painful to the woman, that the cannot void her feed, for that cannot be excluded without pleasure and delight; also if the shortness of the ligament that is under the Yard doth make it to be crooked, and violate the stiff straitness thereof, so that it cannot be put directly of straightheir the crooked. or firaightly into the condent, and violate the full firaitness thereof, to that it cannot be put of the Yard rightly into the condent of the Yard rightly in the end thereof, but a little higher, so that they cannot ejaculate or cast out their feed into the condent of the Yard rightly in the end thereof, but a little higher, so that they cannot ejaculate or cast out their feed into the womb. Also the particular Paltie of the Yard is numbred amongst the causes of barrenness, and you may The fign of the Palfie in herove whether the Palife be in the Yard by dipping the genitals in cold water, for except they do draw themselves together, or thrink up after it, it is a token of the palite; for memoers that have the Palite, by the touching of cold water, do not thrink up, but remain in their accustomed laxity and loofeness; but in this case the genitals are indued with small sense, the seed cometh out without pleasure or stiffness of the Yard, the stones in touching are cold, and to conclude, those that have their bodies daily waxing lean through a consumption, or that are vexed with an evil habit or disposition. the Yard.

fition, or with the obstruction of some of the entrails, are barren and unfertil, and likewise those in whom some noble part necessary to life and generation exceedeth the bounds of Nature with some great diffemperature; and laftly, those who by any means have their genital parts deformed.

Here I omit those that are with holden from the act of generation by inchantment, magick, witch-Magick bands ing and inchanted knots, bands and ligatures; for those causes belong not to Physick, neither may and enchanted knots, bands and ligatures; for those causes belong not to Physick, neither may and enchanted knots, ted knots, they be taken away by the remedies of our Art. The Doctors of the Canon Laws have made mention of those magick bands which may have power in them, in the particular Title, De frigidis, maleseistis, impotentibus & incantatis: also St. Augustin hath made mention of them, Tract.7. in Joan.

CHAP. XXXVIII.

Of the barrenness or unfruitfulness of Women.

Woman may become barren or unfruitful through the obstruction of the passage of the seed, The cause why or through firaitness and narrowness of the neck of the Womb coming either through the she neck of default of the formative faculty, or else afterwards by some mischance, as by an Abscess, the womb is Schirrhus, Warts, Chaps, or by an Ulcer, which being cicatrized, doth make the way more narrow, narrow. fo that the Yard cannot have free paffage thereinto. Moreover the Membrane called Hymen, when The membrane called Hymen, when the prace called the called Hymen and the prace called Hymen. it groweth in the midft or in the bottom of the neck of the womb, hinders the receiving of the mans brane called feed. Also if the womb be over-flippery, or more loofe, or over-wide, it maketh the woman to be barren; so doth the suppression of the mentional fluxes, or the too immoderate flowing of the Courfes or Whites: which cometh by the default of the womb, or fome entrail, or of the whole body, which confumeth the menstrual matter, and carrieth the seed away with it.

The cold and moift different arture of the womb, extinguishes and fuffocates the Mans feed, and The cause of maketh it that it will not flay or cleave unto the womb, and flay till it be concoched: but the more the flox hot and dry doth corrupt for want of nourithment, for the feeds that are grown either in a marith Women. or fandy ground cannot profper well: also a Mola contained in the womb, the falling down of the womb, the leanness of the womans body, ill humours bred by eating crude and raw fruits, or great, or over-much, whereof obstructions and crudities follow, which hinder her fruitfulness. Furthermore, by the use of superfactive things, the seminal matter is congealed and restrained, and though it flow and be east out, yet it is deprived of the prolifick power, and of the lively heat and spirits, the orifices or cotyledones of the Veins and Arteries are stopped, and so the passage for the mentitual matter into the womb, is stopped. When the Kall is so tar that it girdeth in the womb narrowly, it hindereth the fruitfulness of the woman, because it will not permit the mans feed to enter into the womb. Moreover the sat and slessly habit of the man or woman hinder generation. For it hindereth them that they cannot join their centrals together; and by how much the more For it hindereth them that they cannot join their genitals together: and by how much the more bloud goeth into fat, by fo much the lefs is remaining to be turned into feed and menfitual bloud, which two are the originals and principals of generation. Those women that are speckled in the face, formewhat lean, and pale, are more given to Venery than those that are red and fat. Finally, Hippocrates sets down four causes onely why women are barren and unfruitful. The fifst is, Gal. lib. 12. De
because they cannot receive the mans feed by reason of the fault of the neck of the womb; the setond, because when it is received into the womb, they cannot conceive it: the third is, because they

drift is Probe

still differ. cannot nourishit: the fourth, because they are not able to carry or bear it until the due and lawful 2008. 310 4: time of birth. These things are necessary to generation; the Object, Will, Faculty, concourse of the Seeds, and the remaining or abiding thereof in the womb, until the due and appointed natural

CHAP. XXXIX.

The figns of a distempered Wombi.

Hat woman is thought to have her womb too hot, whose Courses come forth sparingly The figns of a and with pain, and exulcerate by reason of their heat, the superfluous matter of the hot Wombs bloud being dissolved or turned into wind by the power of the heat: whereupon that incinstrual bloud that sloweth forth is more gross and black. For it is the property of heat, by digesting the thinner substance, to thicken the rest, and by adustion to make it more black. Furthermore, she that hath her genitals itching with the desire of copulation, and the shall teel it more sharp as it goeth through the passages. That woman hath too cold a womb whose Flowers are either stopped, or slow sparingly, and those pale and not well coloured. coloured.

Those that have less desire of copulation, have less delight therein, and their feed is more liquid. The figure of a and waterish, and not fixining a linnen cloth by flicking thereunto, and it is sparingly and slowly cold Womb. cast forth. That womb is too moist that floweth continually with many liquid excrements, which The signs of a therefore will not hold the feed, but presently after copulation suffereth it to fall out; which will ear moist Womb. The signs of too dry a womb appear in the little quantity of the Courses, in the The signs of too dry a womb appear in the little quantity of the Courses, in the The signs of the course of the c profusion of a small quantity of feed, by the defire of copulation, whereby it may be made slippery by dry Wombs the moilture of the feed, by the fiffures in the neck thereof, by the chaps and itching, for all things for want of moisture will soon chap, even like unto the ground, which in the Summer by reason of great drought or drines, will chap and chink this way and that way, and on the contrary with moisture it will close and join together again as it were with glew.

A woman is thought to have all opportunities unto conception when her Courfes or Flowers do A meet time cease, for then the womb is void of excremental filth, and because it is yet open, it will the more eatily ption.

eafily receive the mans feed, and when it hath received it, it will better retain it in the wrinkles of the Cotyledones yet gaping as it were in rough and unequal places. Yet a woman will eafily con-ceive a little before the time that the Flowers ought to flow: because that the mensional matter falling at first like dew into the Womb, is very meet and fit to nourish the seed, and not to drive it out again, or to fuffocate it.

Those which use copulation when their Courses fall down abundantly, will very hardly or feldom conceives and if they do conceive, the Child will be weak and discased, and especially if the womans bloud that flows out be unfound; but if the bloud be good and laudable, the Child will be fubject to There are fome Women in whom prefently after the flux of the Terms, the all plethorick difeafes. orince of the Womb will be closed, so that they must of necessity use copulation with a man when their menstrual slux sloweth, if at least they would conceive at all. A Woman may bear children from the age of fourteen until forty or fifty; which time whofoever doth exceed, will bear until threefcore years, because the menstrual fluxes are kept, the prolifical faculty is also preserved: therefore many Women have brought forth children at that age; but after that time no woman can bear, as Ariftotle writeth.

drift ligide bift. anim. 4. 2. & c.s. Lih.7,cop 14. Lib.6, cap. 12.

Yet Pliny faith that Cornelia (who was of the house of the Scipioss) being in the fixty second year of her age, bare Volusius Saturnius, who was Consul; Valescus de Tarenta also affirmeth that he saw a Woman that bare a child on the fixty fecond year of her age, having born before on the fixtieth and fixty first year. Therefore it is to be supposed that by reason of the variety of the air, region, diet and temperament, the menssional flux and procreative faculty ceaseth in some sooner, in some later; which variety taketh place also in men. For in them, although the feed be genitable for the most part in the fecond feventh year, yet it is unfruitful until the third feventh year. And whereas most men beget Children until they be threefcore years old, which time if they pass, they beget till seventy yet there are some known that have begot children until the eightieth year. Moreover, Pliny writeth that Mafiniffa the King begot a Son when he was fourfcore and fix years of age, and also Cate

Lib. r. de bill. Anim.c.1.6-2.6

16.7.649.14.

the Cenfor after that he was fourfcore.

CHAP. XL.

Of the falling down, or perversion, or turning of the Womb.

What is the falling down of the Womb The causes.

He Womb is faid to fall down and be perverted, when it is moved out of its proper and na-tural place; as when the bands and ligatures thereof being loofed and relaxed, it falleth down unto one fide or other, or into its own neck, or elfe paffeth further, fo that it comes out at the neck, and a great portion thereof appears without the privy parts. Therefore what things foever refolve, relax, or burft the ligaments or bands whereby the Womb is tied, are supposed to be the causes of this accident. It sometimes happens by vehement labour or travel in Child-birth, when the Womb with violence excluding the issue and the secundines, also follows and falls down, turning the innerside thereof outward. And sometimes the fooline rathness of the Midwise when the downstleaves the Womb with the Infant, or with the secundine advantage of the midwise when turning the innerlide thereof outward. And fometimes the foolih rathness of the Midwile witer the drawth away the Womb with the Infant, or with the fecundine cleaving fait thereunto, and fo drawing it down and turning the innerlide outward. Furthermore, a heavy bearing of the Womb, the bearing of the carriage of a great burthen, holding or firetching of the hands or body upwards in the time of greatness with child, a fall, contusion, shaking or jogging by riding either in a Waggon or Coach, or on Horse-back, or leaving or dancing, the falling down of a more large and abundant humour, great griping, a strong and continual cough, a Tenssinas or often desire to go to stool, yet not voiding any thing, freezing, a manifold and great birth, difficult bearing of the Womb, an afthmatical and orthopnoical difficulty of breathing, whatfoever doth weightily prefs down the Diaphragma or Midriff, or the muscles of the Epigalirium, the taking of cold air in the time of travel with child, or in the flowing of the menstrual flux, sitting on a cold marble stone, or any other such like cold things are thought oftentimes to be the occasion of these accidents, because they may bring the Womb out of its place. It falls down in many (faith Ariffetle) by reason of the defire of copulation that they have, either

Arift. Lib.7. de hifter, exim.

The progno-

by reason of the lustiness of their youth, or else because they have abstained a long time from it.

You may know that the Womb is fallen down by the pain of those parts wherein it is fallen, that is
to say by the entrails, loins, or sacram, and by a tractable tumor at the neck of the Womb, and often with a vifible hanging out, of diverfe greatness, according to the quantity that is fallen down. It is feen sometimes like unto a piece of red flesh, hanging out at the neck of the Womb, of the bigness and form of a Goofe-egg; if the woman fland upright, the feeleth the weight to lie on her privy parts; but if the fit or lie, then the perceiveth it on her back, or go to the flood, the flraight gat called intellinent relinent will be preffed or loaden as if it were with a burthen; if the lie on her belly, then her with a burthen; if the lie on her belly, then

her urin will be stopped, so that she shall fear to use copulation with a man. When the Womb is newly relaxed in a young woman, it may be foon cured; but if it hath been long down in an old woman, it is not to be helped. If the Pallie of the ligaments thereof have excallented the falling of the care admits of cure, is but if it falls down by means of putrefaction, it cannot possibly be cured. The great country thereof have one has been barrely be cured. canoned the falling it fearce admits of cure, is but if it falls down by means of putrefaction, read-not possibly be cured. If a great quantity thereof hang out between the thighs, it can hardly be cured; but it is corrupted by taking the air, and by the falling down of the urin and filth, and by the motions of the thighs in going it is ulcerated, and so putrefies.

I remember that once I cured a young Woman who had her Womb hanging out at her privy parts as big as an Egg, and I did so well perform and perfect the Gure thereof, that afterwards the conceived, and bare children many times, and her Womb never fell down.

An Hiffory.

CHAP.

CHAP. XLL

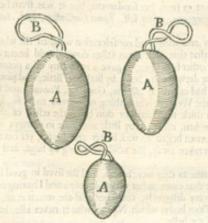

The excre of the falling down of the Womb.

Y this word, falling down of the Womb, we understand every motion of the Womb out of Remedies for its place or feat: therefore if the Womb afcend upwards, we must use the same medicins as the afcention in strangulation of the Womb. If it be turned towards either side, it must be restored and of the Womb. drawn back to its right place, by applying and using cupping-glaffes. But if it descend and fall down into its own neck, but yet not in great quantity, the woman must be placed to that her buttocks may be very high, and her legs across; then Cupping-glasses must be applied to her navel and Hypogastrium, and when the Womb is brought into its place, injections that bind and dry strongly must be injected into the neck of the Womb, stinking furnigations must be used unto the privy parts, and sweet things used to the mouth and nose. But if the womb hang down in great quantity between the thighs, it must be cured by placing the woman after another fort, and by using other kind of Medicins. First down of the of all the must be so laid on her back, her buttocks and thighs so listed up, and her legs so drawn back down of the womb, pro-as when the child or secundine are to be taken or drawn from her; then the neck of the Womb, and perly so calwhatfoever hangeth out thereat, must be anointed with Oil of Lillies, fresh Butter, Capons Greafe, led, and fuch like; then it must be thrust gently with the fingers up into its place, the fick or pained woman in the mean time helping or furthering the endeavour by drawing in of her breath as if the did fup, drawing up as it were that which is fallen down.

After that the Womb is reflored unto its place, whatfoever is filled with the ointment must be wiped with a foft and clean cloth, lest that by the slipperiness thereof the womb should fall down against the genitals must be somented with an aftringent decoction, made with Poingranate Pills, Cypress Nurs, Galls, Roch Allum, Horse-tail, Surnach, Berberies, boiled in the water wherein Smiths and their less than the state of the state quench their Irons; of those materials make a powder, wherewith let those places be sprinkled: let a Pessary of a competent bigness be put in at the neck of the Womb, but let it be eight or nine singers in length, according to the proportion of the grieved Patients body. Let them be made either with Lattin, or of Cork covered with Wax, of an oval form, having a thread at one end, whereby they

may be drawn back again as need requires.

The forms of oval Peffaries.

A Shews the body of the Peffary.

Sheweth the thread wherewith it must be tied to the shigh.

When all this is done, let the fick woman keep her felf quiet in her bed, with her buttocks lywhen all this is done, let the lick woman keep her left quiet in her bed, with her buttocks lying very high, and her legs acrofs, for the space of eight or ten days: in the mean while the application of Cupping-glasses will shay the Womb in the right place and seat, after it is restored thereunto: but if the hath taken any hurt by cold air, let the privy parts be somented with a discussing and heating somentation, on this wise: Re Fol. alth. sale. Layend, rosiner, arienis. flor. characteristic, an in β. sem. ans. framegr. an. 3 j. let them be all well boiled in water and wine, and and heating make thereof a decoction for your use. Give her also Clysters, that when the Guts are empited of somentations the excrements, the Womb may the better be received in the void and empty capacity of the last the season the bladder is also to be emptied, for otherwise it were dangerous less than the excrements, the Womb may the better be received in the void and empty capacity of the belly: for this reason the bladder is also to be emptied, for otherwise it were dangerous left that the Womb lying between them, both being full, should be kept down, and cannot be put up into its own proper place by reason thereof. Also Vomiting is supposed to be a singular remedy to draw How vomiting its own proper place by reason thereof. the Womb that is fallen down: furthermore also it purgeth out the phlegm wich did moisten is profitable and relax the ligaments of the womb, for as the Womb in time of copulation at the beginning of to the falling the conception it moved downwards to meet the feed, so the Stomach, even of its own accord, is down of the life. the conception it moved downwards to theer the feed, to the stock and its own accord, is womb. lifted upwards when it is provoked by the injury of any thing that is contrary unto it, to cast it out with greater violence; but when it is so raised up, it draws up together therewith the Peritoneum, the Womb and also the body or parts annexed unto it. If it cannot be reflored unto its away of the place by these prescribed remedies, and that it be alcerated and so putrefied that it cannot be restorated by the Presents of Art to cut it cannot be restorated. red unto his place again, we are commanded by the Precepts of Art to cut it away, and then to cure it is patrefied.

Concerning the Generation of Man. BOOK XXIV. 570 the Womb according to Art; but first it should be tied, and as much as is necessary must be cut off, and the rest seared with a Cautery. There are some women that have had almost all their womb cut off, without any danger of their life, as Paulus teflifieth. Tib. 6. John Langius Phylician to the Count Palatine writeth, that Carpus the Chirurgeon took out the womb of a Woman of Bosonia, he being prefent, and yet the woman lived and was very well after it. Tracide mirand Antonius Benevenius Phylician of Florence writeth, that he, called by Ugolius the Phylician to the cure of a woman whose womb was corrupted and fell away from her by pieces, and yet the lived ten years An Hiftory. There was a certain woman, being found of body, of good repute, and above the age of thirty years, in whom, thortly after the had been married the fecond time, which was in Anno 157 r. having no child by her first husband, the lawful figns of a right conception did appear: yet in procels of time there arofe about the lower part of her privities the fenfe or feeling of a weight or heavinefs, being fo troublefor unto her by reason that it was painful, and also for that it stopped her urin, that the was conftrained to disclose her mischance to Christopher Mombey a Surgeon, her neighbour dwelling in the Suburbs of S. Germans; who having feen the tumor or fwelling in her groin, affwaged the pain with mollifying and anodyne Fomentations and Cataplains; but prefently af-ter he had done this, he found on the inner fide of her lip of the orifice of the neck of the womb, an Impollume rotten and running, as if it had been out of an abfects newly broken, with fanious matter, formewhat red, yellow, and pale, running a long time. Yet for all this the feeling of the heaviness or weight was nothing diminished, but did rather increase daily, so that from the Year of our Lord 1573. The could not turn her felf being in her bed on this or that fide, unless the laid her hand on her belly to bear and ease her self of the weight; and also the said when the turned her felf, the feemed to feel a thing like a Bowl or Rowl in her belly unto the fide whereunto the turned her felf, neither could the go to flool, or avoid her excrements flanding or fitting, unless the lift up that weight with her hands towards her flomach or midriff: when the was about to go the could fearce let forwards her feet, as if there had fornething hanged between her thighs, that did hinder her going. At certain feafons that rotten apoflume would open or unclose of it fells and flow and run with its wonted fanious matter, but then she was grievously vexed with pain of the head, and all her members, swouning, loathing, vomiting, and almost cheaking, so that by the persuasion of a soolish woman she was induced and contented to take dutimornium, the work-Actimenium ing and the firength thereof was fo great and violent, that after many vomits, with many frettaken in a potion doth cause tings of the guts, and watery dejections of flools, she thought her fundament fell down, but being certified by a woman that was a familiar friend of hers, unto whom the shewed her felf, that there fall down. was nothing fallen down at or from her fundament, but it was from her womb, the called in the Year of our Lord, 1575. Surgeons, as my felf, James Guillemean, and Antony Vienze, that we might help her in extremity. When we had diligently and with good confideration weighed the whole effate of her difease, we the subflance agreed with one consent, that that which was fallen down should be cut away, because that by the of the Womb black colour, stinking, and other such signs, it gave a testimony of a putresied and corrupted thing-drawn out.

Therefore for two days we drew out the body by little and little, and piece-meal, which seemed unto the Physicians that we had all the control of the Physicians that we had a subto the Phylicians that we had called, as Alexins, Gandinus, Feurens, and Violaneus, and also to our felves, to be the body of the Womb; which thing we proved to be fo, because one of the testicles came out whole, and also a thick membrane or skin being the relick of the Mola, which being sup-purated, and the abscess broken, came out by little and little in matter; after that all this body was fo drawn away, the fick woman began to wax better and better, yet notwithflanding for the space of nine days before it was taken away, the voided nothing by fiege, and her urin also was stopped for the space of four days. After this all things became as they were before, and the lived in good health three Moneths after, and then died of a Pleurifie that came on her very fuddenly; and I having opened her body, observing and marking every thing very diligently, could not find the womb at all, but in flead thereof there was a certain hard and callous body, which Nature, who is never idle, had framed in flead thereof, or to fill the hollowness of the belly. CHAP. XLII. Of the Tunicle or Membrane called Hymen. N some Virgins or Maidens in the orifice of the neck of the womb, there is found a certain Tu-Whether nicle or Membrane, called of ancient Writers Hymen, which prohibiteth the copulation of a man, there be a and caufeth a woman to be barren; this Tunicle is supposed by many, and they not of the common fort onely, but also learned Physicians, to be as it were, the enclosure of the Virginity or Maidencalled Hymre. head. But I could never find it in any, feeking of all ages from three to twelve, of all that I had under my hands in the Hospital of Paris. Yet once I faw in a Virgin of seventeen years, whom her mother had contracted to a man, and An Biffory, the knew nevertheless there was formething in her privy parts that hindred her from bearing of children, who defired me to see her, and I sound a very thin nervous membrane a little beneath the Nymphes peer parts that hindred her from bearing of the little beneath the Nymphea, near unto the orifice of the neck of the womb, in the midft there was avery little hole whereout the Terms might flow; I feeing the thickness thereof, cut it in funder with my Scissars, and told her Mother wide of a distribution of the state of the second of and told her Mother what the thould do afterwards; and truly the married thortly after and bore children. Realthy Cl. 1. Lib.11. cap.16. children. Realdus Columbus is of my opinion, and faith that this is feen very feldom; for thefe are his words, Under the Nymphes in many, but not in all Virgins, there is another membrane which when it is prefent (which is but feldom) it floppeth, fo that the Yard cannot be put into the orifice of

of the Womb, for it is very thick; above towards the bladder it hath an hole by which the Courfes flow out. And he also addeth, that he observed it in two young Virgins, and in one elder Maid.

Avices writes, that in Virgins in the neck of the Womb there are Tunicles composed of Veins and Likes feet, ar.

Ligaments very little, rising from each part of the neck thereof, which at the first time of copulation Trast. 1.49.1. are wont to be broken, and the bloud run out. Almanfor writeth, that in Virgins the passage of the neck of the Womb is very wrinkled, or narrow and ftrait, and those wrinkles to be woven or staid together with many little veins and arteries, which are broken at the first time of copulation.

These are the judgments of Physicians of this membrane: Midwives will certainly affirm that The tritles of cylinow a Virgin from one that is defloured, by the breach or foundness of that membrane. But bout the membrane are foundness of that membrane. For that Midwives are foundness of the property of they know a Virgin from one that is defloured, by the breach or foundness of that membrane. by their report, too credulous Judges are foon brought to commit an errour. For that Midwives brane called can fpeak nothing certainly of this membrane, may be proved by this, because that one faith Hyers. that the fituation thereof is in the very entrance of the privy parts, others fay it is in the midft of the neck of the Womb, and others fay it is within at the inner orifice thereof, and some are of an opinion, that they fay or suppose that it cannot be seen or perceived before the sirft birth. But truly of a thing fo rare, and which is contrary to Nature, there cannot be any thing fpoken for cer-Therefore the blood that cometh out at the first time of copulation, comes not always by the breaking of that membrane, but by the breaking and violating or renting of the little veins which are woven and beforead all over the superficial and inward parts of the Womb and neck thereof, defeending into the wrinkles, which in those that have not yet used the act of genera-tion, are closed as if they were glewed together, although that those Maids that are at their due What Yirgins time of marriage, feel no pain nor no flux of bloud, especially if the mans Yard be answerable to at the first time of coputhe neck of the wornb. Whereby it appears evidently how greatly the inhabitants of Fez, the Melation do nor tropolitan City of Mauritania are deceived; for Leo the Affrican writeth, that it is the cultom bleed at their amongst them, that so foon as the married man and his spouse are returned home to their house privy pares. from the Church where they have been married, they presently shut themselves into a Chamber, Lib. 3. and make faft the door, while the marriage dinner is preparing: in the mean while fome old or grave Matron flandeth waiting before the Chamber to receive a bloudy linner cloth the new marriade husband is to deliver her there; which when the hath received, the brings it into the midft of all the company of guests, as a freth spoil and testimony of the married wifes Virginity, and then for joy thereof they all fall to banquetting folemnly. But if through evil fortune it happeneth that in this time of copulation the spouse bleedeth not in the privy parts, she is restored again unto her Parents, which is a very great reproach unto them, and all the Guefts depart home fad, heavy, and without dinner.

Moreover there are fome, that having learned the most filthy and infamous Arts of Baudery, pro- The filthy deflitute common Harlots, make gain thereof, making men that are naughtily given to believe that cent they are pure Virgins, making them to think that the act of generation is very painful and grie- and Harlots, yous unto them, as if they had never used it, before, although they are very expert therein indeed; for they do cause the neck of the Womb to be so wrinkled and shrunk together, so that the sides thereof shall even almost close or meet together; then they put thereinto the bladders of Fishes, or gall of Beasis filled full of bloud, and so deceive the ignorant and young Letcher by the defrand and deceit of their evil Arre, and in time of deceive the ignorant and young Letcher by the defrand and deceit of their evil Arre, and in time of deceive the ignorant and young Letcher by the defrant and young Letcher by the defraud and deceit of their evil Arts, and in time of copulation they mix fighs with grouns, and woman-like cryings, and Crocodiles tears, that they may feem to be Virgins, and never to have dealt

with man before.

CHAP. XLIII.

A memorable History of the Membrane called Hymen.

Toba Wieras writeth that there was a Maid at Cambarge, who in the midft of the neck of the womb Lie de Proft. had a thick and ffrong membrane growing overthwart, fo that when the monethly Terms dawn. cap. 38. come out, it would not permit them, fo that thereby the mentitual matter was stopped and flowed back again, which caufed a great tumor and differition in the belly, with great torment, as if the had been in travel with child: the Midwives being called, and having feen and confidered all that had been done, and did appear, did all with one voice affirm, that the fuffained the pains of child-birth, although that the Maid her felf denied that the ever dealt with man. Therefore then this forefaid Author was called, who when the Midwives were void of counfel, might help this wretched Maid, having already had her urin flopt now three whole weeks, and perplexed with great watchings, lofs of appetite, and loathing: and when he had feen the grieved place, and marked the orifice of the neck of the womb, he faw it flopped with a thick membrane; he knew also that that fudden heads of the country of the words and the reflect of the received place. breaking out of bloud into the Womb and the veffels thereof, and the paffage for those matters that was stopped, was the cause of her grievous and tormenting pain. And therefore he called a Chitargeon prefently, and willed him to divide the membrane that was in the midft, that did ftop the flux of bloud; which being done, there came forth as much black, congealed and putrefied bloud as weighed fome eight pounds. In three days after the was well and void of all dileafe and pain. I have thought it good to fet down this example here, because it is worthy to be noted, and profitable to be imitated, as the like occation thall happen.

CHAP. XLIV.

Of the strangulation of the Womb.

What is the of the Womb.

He strangulation of the Womb, or that which cometh from the Womb, is an interception or flopping of the liberty in breathing or taking wind, because that the Womb, swollen or pusfed up by reason of the access of gross vapours and humours that are contained therein, and also fnatched as it were by a convultive motion, by reason that the vessels and ligaments distended with fulness, are so carried upwards against the midriff and parts of the brest, that it maketh the breath to be short, and often as if a thing lay upon the brest and pressed it.

Why the womb fwelleth,

The accidents that come the firangling

Moreover the Womb (welleth, because there is contained or inclosed in it a certain substance, caufed by the defluxion either of the Seed or Flowers, or of the Womb or Whites, or of fome other humour, tumor, abfects, rotten apoflume, or fome ill juice, putrefying or getting, or ingendring an ill quality, and refolved into grofs vapours. These, as they affect fundry or divers places, infer divers or fundry accidents, as rumbling and noise in the belly; if it be in the guts, desire to vomit, after (with seldom vomiting) cometh weariness and loathing of meat, if it trouble the Stomach. Choaking with ffrangulation, if it affail the breft and throat; fwooning, if it vex the heart; madnets, or elfe that which is contrary thereto, found fleep or drowlinefs, if it grieve the brain: all which oftentimes prove as malign as the biting of a mad dog, or equal the flingings or bitings of venomous

Why the ftrangulation that cometh of the corraption of the feed, is more

The cause of turnings of the womb into divers parts of the body.

The womb is arcident, but by it felt,

vers accidents of ftrangulation of the

The cause of fleepines in the firangulation of the

It hath been observed that more grievous symptoms have proceeded from the corruption of the Seed than of the mensional bloud. For by how much every thing is more perfect and noble, while it is contained within the bounds of the integrity of its own nature, by so much it is the more grievous and perilous, when by corruption it hath once transgressed the laws thereof. But this kind of accident doth very feldom grieve those women which have their menstrual flux well and than that that
firual flux as they fhould, and do want and are defittute of husbands, especially if they be great eaters,
corruption of and lead a solitary life. When the vessels and ligaments of the Womb are swollen and diffended as
the blood. we faid before, so much as is added to their latitude or breadth, so much is wanting in their length: and therefore it happeneth that the Womb, being removed out of its feat, doth one while fall to the right fide towards the liver, fometimes to the left towards the milt, fometimes upwards unto the midriff and fromach, fornetimes downwards, and fo forwards unto the bladder, whereof cometh an Ifchury and Strangury; or backwards, whereof cometh oppression of the straight Gut, and suppresfion of the excrements, and the Tenefinas. But although we acknowledge the womb to decline to those parts which we named, yet it is not

not to greatly by accident onely, as when it is drawn by the proper and common ligaments and bands, when they moved by an are contracted or made thorter, being diffended with fulnets, but also of it felf, as when it is forced accident, but or provoked through the grief of fomething contrary to Nature that is contained therein: it was dreth fornetimes unto one fide, and fornetimes unto another part with a plain and evident natural motion, like unto the stomach which embraceth any thing that is gentle and mild, but avoideth any thing that is offensive and hurtful; yet we deny that so great accidents may be stirred up by the falcome fuch dis ling of it alone unto this or that fide, for then it might happen that women that are great with child whose wombs are so distended by reason that the child is great, that it doth press the midrist, might be troubled with a firangulation like unto this; but much rather by a venomous humour breathing out a malign and gross vapour, not only by the veins and arteries, but also by the pores that are invifible, which pollutes the faculties of the parts which it toucheth with its venomous malignity and infection, and intercepts the functions thereof. Neither doth the variety of the parts receiving onely, but also of the matter received, cause variety of accidents.

For some accidents come by suppression of the terms, others come by corruption of the Seed; but if the matter be cold, it bringeth a drowliness, being lifted up unto the brain, whereby the woman finketh down as if the were altonished, and lieth without motion and fense or feeling, and the beating of the arteries, and the breathing are fo fmall, that fometimes it is thought they are not at all, but that the woman is altogether dead. If it be more grofs, it inferreth a convultion; if it participate of the nature of a grofs melancholick humour, it bringeth fuch heavinels, fear and forrowfulness, that the party that is vexed therewith shall think that the shall die presently, and cannot be brought out of her mind by any means or reason; if of a cholerick humour, it causeth the maddrowfie mad ness called Favor Uterinus, and such a pratting that they speak all things that are to be concealed into and a giddiness of the head, by reason that the animal spirit is suddenly shaken by the admixtion of a putrefied vapour and hot spirit: but nothing is more admirable, than that this disease taketh the Patient formetimes with laughing, and formetimes with weeping; for forme at the first will weep and then laugh in the same difease and state thereof.

But it exceedeth all admiration which Hollerins writeth, ufually happened to two of the daughters of the Provoit of Rosen. For they were held with long laughter for an hour or two before the fit, which neither for fear, admonition, nor for any other means they could hold; and rich Parents chid them, and asked them wherefore they did fo, they answered that they were not able to flay their The afcention of the Wornb is diligently to be diftinguished from the firangulation there of the womb of; for the accidents of the afcention and of the firangulation are not one; but the woman is onely is to be diffine oppreffed with a certain pain of the heart, difficulty of breathing or fwouning, but yet without fear, without raving or idle rable.

without raving or idle talking, or any other greater accident.

Therefore oftentimes contrary caufes infer the afcention: that is, overmuch drinefs of the Womb,

Though the defect of moisture, whereby it is forced after too violent and immoderate

An Hiftory.

The afcention laughter. the fbrangulamoon.

evacuations of the Flowers, and in Child-bed, and fach like, and laborious and painful travel in Child-bed, through which occasion it waxeth hot, contrary to Nature, and withereth and turneth it felf with a certain violence unto the parts adjoining, that is to fay, unto the Liver, Midriff: if happily it may draw fome moisture there-hence unto it. I omit that the Womb may be brought unto its place upwards by often finelling to aromatick things, yet in the mean while it infers not the firangulation that we described before.

CHAP. XLV.

The figns of imminent strangulation of the Womb.

Efore that these fore-named accidents come, the Woman thinks that a certain painful thing arifeth from her Womb unto the orince of the fromach and heart, and the thinketh her felt to be oppreffed and choaked, the complaineth her felt to bein great pain, and that a certain lump or heavy thing climbs up from the lower parts unto her throat, and floppeth her wind, her heart burneth and panteth. And in many the Womb and Veffels of the Womb fo (well, that they cannot fland upright on their legs, but are conftrained to lie down flat on their bellies, that they may be the less grieved with the pain, and to press that down strongly with their hands that seemeth to arise upwards, although that not the Womb it self, but the vapour ascendeth from the Womb as The Womb is we faid before: but when the fit is at hand, their faces are pale on a fudden, their understanding is felf doth nor darkened, they become flow and weak in the legs, with unableness to stand. Hereof cometh found the afcension fleep, foolish talking, interception of the lenses and breath, as if they were dead, loss of speech, the as the vapour contraction of their legs, and the like.

CHAP. XLVI.

How to know substher the Woman be dead in the strangulation of the Womb, or not.

Have thought it meet (because many Women, not onely in ancient Times, but in our own and Women Hour Fathers memory have been fo taken with this kind of fymptom, that they have been suppofed and laid out for dead, although truly they were alive:) to fee down the figns in fuch a cafe dead Therefore first of all it may be proved whether she be alive or dead, which do argue life and death. which do argue life and death. Incretore lift of all it may be proved whether the be alive or dead, How Women by laying or holding a clear and smooth Looking-glass before her mouth and notivils. For if the that have the breath, although it be never so obscurely, the thin vapour that cometh out, will stain or make the sufficient of Glass dusky. Also a fine downish feather taken from under the wing of any Bird, or else a fine flock the womb, here were the complete that the womb, it is a sufficient to the womb. being held before the mouth, will by the trembling or flaking motion thereof, flew that there is formed breath, and therefore life remaining in the body. But you may prove most certainly whether there be any spark of life remaining in the body, by blowing some freezing powders of Pellitory of Spain, and Hellebore in the nostrils. But though there no breath appears, yet must you not judge the woman for dead, for the small vital heat, by which being drawn into the heart, the yet liveth, is contend with transformation onely, and requires not much arreading, which is performed by the contends with transformation onely, and requires not much arreading, which is performed by the contented with transpiration onely, and requires not much attraction, which is performed by the con-traction and dilatation of the Brest and Lungs unto the preservation of it self. For so Flies, Gnats, How Flies, Pismires, and such like, because they are of a cold temperature, live unmoveably inclosed in the caves Gnats, and Pismires, and such like, because they are of a cold temperature, live unmoveably inclosed in the caves Gnats, and of the earth, no token of breathing appearing in them, because there is a little heat left in them, which Pilmires do may be conferved by the office of the arteries and heart, that is to fay, by perspiration, without the winner with thotion of the breft, because the greatest use of respiration is, that the inward heat may be preserved out breathing by refrigeration and ventilation. Those that do not mark this, fall into that error which almost cost the life of him who in our time first gave life to Anatomical administration, that was almost decaied and neglected.

For he being called in Spain to open the body of a Noble-woman which was supposed dead an History, through thrangulation of the Womb, behold at the second impression of the Incision-knite, the began fuddenly to come to her felf, and by the moving of her members and body, which was supposed to be altogether dead, and with crying, to thew manifelt figns that there was fome life remaining in her. Which thing firuck fuch an admiration and horrour into the hearts of all her friends that were prefent, that they accounted the Phytician, being before of a good fame and report, as infamous, odious, and deteftable, fo that it wanted but little but that they would have feratched out his eyes prefently: wherefore he thought there was no better way for him, if he would live fafe, then to forfake the Country. But neither could he fo also avoid the horrible prick and inward wound of his Conscience (from whose judgment no offender can be absolved) for his inconsiderate dealing, but within few days after being confumed with forrow, he died, to the great loss of the Common-

Wealth, and the Art of Physick.

CHAP. XLVII.

How to know whether the strangulation of the Womb comes of the suppression of the Flowers, or the corruption of the Seed.

Here are two chief causes especially, as most frequently happening, of the strangulation of the The figns of Womb: but when it proceedeth from the corruption of the Seeds all the accidents are more furfocant grievous and violent: difficulty of breathing goes before, and shortly after comes depri- the Womb Vation thereof; the whole habit of the body feemeth more cold than a flone: the Woman is a Wi- coming of dow, or elic hath great flore or abundance of Seed, and hath been used to the company of a man, by corrupt feed,

of the suppresfion of the Flowers. The figns of

tisfied, and every way fulfilled her luft, and then prefently on a fudden begins to contain her felf; The figns it is very likely that the is suffocated by the suppression of the Flowers, which formerly had them well when it comes and sufficiently, which formerly had been fed with hot, moist and many meats, therefore engendring of the suppression. much bloud, which fitteth much, which is grieved with fome weight and fwelling in the region of the belly, with pain in the flomach, and a defire to vomit, and with fuch other accidents as come by the suppression of the Flowers. Those who are freed from the fit of the suffocation of the womb, either by Nature or by Art, in a short time their colour cometh into their faces by little and little, and ing of or from the whole body beginneth to wax firong, and the teeth, that were fet and closed fast together, begin the fufficiation (the jaws being loofed) to open and unclose again; and lastly, fome moisture floweth from the se-of the Womb. (the jaws being loofed) to open and unclose again; and lastly, fome moisture floweth from the server parts with a certain tickling pleasure; but in some women, as in those especially in whom the neck of the womb is tickled with the Midwifes finger, in fiead of that moisture comes thick and gross feed, which moisture or feed when it is fallen, the womb being before as it were raging, is reflored unto its own proper nature and place, and by little and little all fymptoms vanish away. Men by why the fup. unto its own proper nature and place, and by fittle and little all tymptoms varial aways prefion of the fupprefion of their feed have not the like fymptoms as women have, because Mans feed is not feed is not pe- fo cold and moift, but far more perfect and better digetted, and therefore more meet to refift putter. rilous or dead-faction, and whileft it is brought or drawn together by little and little, it is diffipated by great and violent exercise.

CHAP. XLVIII.

Of the Cure of the Strangulation of the Womb.

The pulling of the bairs of the lower parts are profitable both for this malady and for the cause of the fame.

Eeing that the strangulation of the womb is a sudden and sharp disease, it therefore requiresh a present and speedy remedy; for if it be neglected, it many times causeth present deaths Therefore when this malady cometh, the fick woman must prefently be placed on her back, having her breft and flomach loofe, and all her cloaths and garments flack and loofe about her, whereby the may take breath the more eafily; and the must be called on by her own name with a loud voice in her ears, and pulled hard by the hairs of the temples and neck, but yet especially by the hairs of the fecret parts, that by provoking or causing pain in the lower parts, the Patient may not onely be brought to her felf again, but also that the sharp and malign vapour ascending upwards, may drawn downwards: the legs and arms must be bound and tied with painful ligatures, all the body must be rubbed over with rough linnen cloths befprinkled with Salt and Vinegar, until it be very fore and red; and let this peffary following be put into the womb. It Succi mercur. artemif. an. \$ ij. in quibus diffolve pul.brned. \$ iij. pul.radic.enule camp.galang.minor. an. 3 j. make thereof a peffary. Then let the foals of her feet be anointed with Oil of Bays, or with fome fuch like Oil; let a great cuppingglass with a great flame be applied to the belly below the navel, to the inner part of the thigh, and to the groin, whereby both the matter that climbs upwards, and also the womb it self running the same way, may be brought downwards or drawn back. There may be made a fumigation of Spices to be received up into the womb, which that it may the eafier be done, the womb may be held open by putting in the Influence that of the womb may be held open by putting in the Inftrument here following deferibed, into the neck thereof. Let it be made of gold, filver, or lattin, into the form of a peffary; at the one and thereof, that is to fay, that end which goeth up into the neck of the womb, let there be made many holes on each fide, but at the lower end let it be made with a Spring, that it may open and thut as you will have it. Also it must have two Laces or Bands by which it must be made fast into a Swathe or Girdle tied about the Pa-

Some hold it for a secret to rub the Navel with the juice of Gar-

CHAP, XLIX.

Of Womens Monethly Flux or Courfes.

Sually they call the flux of bloud that iffueth from the focret parts of Women, Monethly The reason of Flowers or Couries, because it happeneth to them every Moneth so long as they are in the names of health. There be some which call them Terms, because they return at their usual time, the monethly in the French men call it Separator, because in such as sit much, and are given to plentiful feed. ing, it endureth almost for the space of seven days. Some call them purgations, because that by this all a Womans body is purged of superfluous humours. There be some also that call those Fluxes Flowers, because that as in Plants the flower buddeth out before the fruits; so in Women-kind the Flux goeth before the iffue, or the conception thereof.

For the Courses flow not before a Woman be able to conceive, for how should the feed being cast the Womb have his nourishment and increase, and how should the child have his nourishment when it is formed of the feed, if this necessary humour were wanting in the womb? yet it may be

appearing at all.

What women have this menfirmal flux ofly, and for a longer space than others.

What women have this flux more feldom, lefs, and a far more fbort time than others.

Why young women are new of the Moon.

Why old women are pur-ged in the wane of the Moon.

What women fome Women may conceive without the flux of the Courses: but that is in such as have so much of do conceive, the humour gathered together, as is wont to remain in those which are purged, although it be not so great a quantity that it may flow out, as it is recorded by Arifforde. But as it is in fome very great, and in some very little, so it is in some seldom, and in some very often.

There are forme that are purged twice, and fome thrice in a moneth, but it is altogether in those who have a great Liver, large Veins, and are filled and fed with many and greatly nourithing meats, which fit idlely at home all day, which having flept all night, do notwithflanding lie in bed fleeping a great part of the day also, which live in a hot, moift, rainy and southerly air, which use warm baths of sweet waters and gentle frictions, which use and are greatly delighted with carnal copulation: in these and

fuch like Women, the Courfes flow more frequently and abundantly.

But contrariwife, those that have small and obscure veins, and those that have their bodies more furnished and big either with flesh or with fat, are more seldom purged, and also more sparingly, because that the superfluous quantity of bloud useth to go into the habit of the body. Also tender, delicate and fair Women are less purged than those that are brown, and endued with a more compact flesh, because that by the rarity of their bodies, they suffer a greater wasting or distipation of their fubstance by transpiration. Moreover, they are not so greatly purged with this kind of purgation, which have fome other folernn or accustomed evacuation in any other place of their body, as by the note or Hæmorrhoids.

And as concerning their Age, old women are purged when the Moon is old, and young women when the Moon is new, as it is thought. I think the cause thereof is, for that the Moon ruleth moil purged in the bodies; for by the variable motion thereof the Sea floweth and ebbeth; and Bones, Marrow, and Plants abound with their genital humour.

Therefore young people which have much bloud, and more fluxible, and their bodies more fluxible, are foon moved unto a flux, although it be even in the first quarter of the Moons rising or increasing but the humours of old women, because they wax stiff as it were with cold, and are not so abundant, and have more denfe bodies and straighter vessels, are not so apt to a stux, nor do they so easily slow, except it be in the full of the Moon, or else in the decrease; that is to say, because the bloud that is gathered in the full of the Moon falls from the body even of its own weight, for that by reason of the decreafing or wane of the Moon, this time of the Moneth is more cold and moifu

CHAP. L.

.The Caufes of the Monethly Flux or Courfes.

The material eause of the Monethly flux,

The final

A man exceedeth a woman of his bloud. A man is more hot than a woman, and menftrual.

Ecause a woman is more cold, and therefore hath the digestive faculty more weak, it cometh to pass, that the requireth and defireth more meat or food than she can digest or concect. And because that superfluous humour that remaineth is not digested by exercise, nor by the efficacy of strong and lively heat, therefore by the providence or benefit of Nature, it sloweth out by the veins of the womb, by the power of the expulsive faculty, as its own certain and prefixed feafor or time. But then especially it beginneth to flow, and a certain rude portion of bloud to be expelled being love for a superior of bloud to be expelled. Monethly flux led, being hurtful and malign otherwise in no quality, when Nature hath laid her principal foundabegins to flow. ica, being martin and manigh otherwhie in no quality, which teature bath had her principal tions of the increase of the body, so that in greatness of the body she hath come as it were in a manner to the highest top, that is to say, from the thirteenth to the nitieth year of her age-

Moreover, the child cannot be formed in the womb, nor have his nutriment or increase without this flux: therefore this is another final cause of the monethly flux. Many are persuaded that wo men do far more abound with bloud than men, confidering how great an abundance of bloud they A woman ex- cast forth of their secret parts every moneth, from the thirteenth to the sittieth year of their age how much women great with child, of whom also many are mentirual, yield unto the nutriment in quantity of and increase of the child in their wormbs, and how much Physicians take from women that are with child by opening of a vein, which otherwise would be delivered before their natural and prefixed time; how great a quantity thereof they avoid in the birth of their children, and for ten or twelve days after, and how great a quantity of milk they fpend for the nourithment of the child when they give fuck, which milk is none other thing than bloud made white by the power of the kernels that are in the dues, which doth fuffice to nourifh the child he he are the contract of the child he he are the contract of the child when they are in the dues, which doth fuffice to nourifh the child he he are the contract of the child he he are the contract of the child he he are the child he he can be contracted as the child when the child he he can be contracted as the child he he can be contracted as the child when the child when the child when the child he he can be contracted as the child when the child w are in the dugs, which doth fuffice to nourilh the child, be he great or little; yet notwithlianding many Nurses in the mean while are menstrual: and as that may be true, so certainly this may be true, that one dram (that I may fo fpeak) of a mans bloud is of more efficacy to nourith and increales, than two pounds of womans bloud, because it is far more perfect, more concocted, wrought, and better replenished with abundance of spirits: whereby it cometh to pass that a man endued with a more firong heat, doth more eafily convert what meat foever he eateth unto the nourithment and fubttance of his body; and if that any fuperfluity remains he doth early digeft and featter it by infensible transpiration. But a woman being more cold than a man, because the taketh more than the can concoct, doth gather together more humors, which because the cannot disperse, by reason of the unperfectness and weakness of her heat, it is necessary that the should suffer, and have her mouthly purgation, especially when the concernation of the purgation, especially when the concernation of the concernation of the concernation. ly purgation, especially when the groweth unto some bigness: but there is no such need in a man-

CHAP. LI.

The causes of the Superession of the Courses or Menstrust Flux.

He Courfes are suppressed or stopped by many causes, as by sharp, vehement, and long discases, by fear, forrow, hunger, immoderate labours, watchings, fluxes of the belly, great bleeding, harmorrhoids, fluxes of bloud at the mouth, and evacuations in any other part of the body whatfoever, often opening of a Vein, great fwears, ulcers flowing much and long, feabbinefs of the whole skin, immoderate großnefs and clamminefs of the bloud, and by cating of raw fruits, and drinking of cold water, by fluggiffiness and thickness of the vessels, and also the obstruction of them by the defaults and difeafes of the womb, by diftemperature, an abfects, an ulcer, by the obstruction of the inner orifice thereof, by the growing of a callus, caruncle, cicatrize of a wound or ulcer, or membrane growing there, by injecting of aftringent things into the neck of the womb, which place many women endeavour toolifhly to make narrow: I speak nothing of age, greatness making the with child, and nurling of children, because these causes are not besides nature, neither do they re- orifice of the

Many Women, when their Flowers or Terms be flopped, degenerate after a manner into a certain is rewarded manly nature, whence they are called Viragines, that is to fay, flout, or manly Women; therefore with the discommodity of their voice is more loud and big, like unto a mans, and they become bearded.

In the City Abdera (faith Hippocrates) Phaethula the wife of Pythese at the first did bear children, the Flowers. and was fruitful, but when her husband was exiled, her Flowers were stopped for a long time: but What women when these things happened, her body became manlike and rough, and had a beard, and her voice are called VIwas great and shrill. The very same thing happened to Nampsia the wife of Gorgippus in Thasia.

Lib. 5. Epidem? Those Virgins that from the beginning have not their Monethly flux, and yet nevertheless enjoy fett., their perfect health, they must necessarily be hot and dry, or rather of a manly heat and driness, that The women their perfect health, they man becchartly be not and dry, of rather of a manny near and difficult that are called they may fo differile and difficult by transpiration, as men do, the excrements that are gathered; that are called Viragins are

commodity of

CHAP. LII.

What accidents follow the suppression or stopping of the Monethly Flux or Flowers.

Hen the Flowers or monethly Flux are flopped, Difeafes affect the Womb, and from thence pass into all the whole body. For thereof cometh Suffocation of the Womb, Why the thence pass into all the whole body. For thereof cometri same and secret parts, strangury, or Head-ach, Swouning, beating of the Heart, and swelling of the breits and secret parts, strangury, or Nandershole. Vomitings, difficult bloodings of inflammation of the Womb, an Abfcefs, Ulcer, Cancer, a Fever, Naufeoufnefs, Vomitings, difficult and flow concoction, the Dropfie, Strangury, the full Womb prefling upon the orifice of the bladder, loweth the black and bloudy Urin, by reason that portion of the blond sweateth out into the bladder. In many suppression of Women the flopped matter of the Monethly Flux is excluded by Vomiting, Utin, and the Hæmor- the Flowers, rhoids, in fome it groweth into Variess. In my Wife when the was a Maid, the Menstrual matter Histories of fuch as were was excluded and purged by the Noffrils. The Wife of Peter Fewre of Caffeandun, was purged of her Menstrual matter by the Dugs every moneth, and in such abundance, that scarce three or four their Mencloaths were able to dry it and fack it up.

In those that have not the Flux monethly to evacuate this plenitude by some part or place of the the Nose and body, there often follows difficulty of breathing, Melancholy, Madness, the Gout, an ill disposition of Dugs. the whole body, diffolution of the firength of the whole body, want of appetite, a Confumption, the Falling-fickness, an Apoplexy.

Those whose bloud is laudable, yet not so abundant, do receive no other discommodity by the suppression of the Flowers, unless it be that the Womb burns or itcheth with the desire of copulation, by reason that the Womb is distended with hot and itching bloud, especially if they lead a fedentary life. Those Women that have been accustomed to bear children, are not so grieved and To, what weevil at ease when their Flowers are stopped by any chance contrary to Nature, as those Women men the supwhich did never conceive, because they have been used to be filled; and the vessels by reason of presson of the their cuflomary repletion and diffention are more large and capacious: when the Courles flow, the appetite is partly dejected, for that Nature being then wholly applied to expulsion, cannot throughly most grievous concoct or digeft; the Face waxeth pale and without its lively colour, because that the heat with the spirits, go from without inwards, so to help and aid the expulsive faculty.

CHAP. LIII.

Of provoking the Flowers or Courfes.

but first let the basilick Vein of the arm be opened, especially if the body be plethorick, left
that there should a greater attraction be made into the Womb, and by such attraction or showing in,
must be openthere should come a greater obstruction. When the Veins of the Womb are distended with so great
ed before the
a swelling that they may be seen, it will be very profitable to apply Horse-leeches to the neck therein the foot.

Horse-leeches of: Peffaries for Women may be used, but furnigations of aromatick things are more meet for Horse leeches Maids, because they are bashful and sharne-faced. Unguents, Liniments, Emplasters, Cataplasins to the neck of that ferve for that matter, are to be preferibed and applied to the fecret parts; Ligatures and Fri- the Womb.

THE OWNER OF THE OWNER OWNE

Plants that provoke the Flowers,

An apozeme to provoke

ctions of the thighs and legs are not to be omitted, fomentations and flemutatories are to be used, and Cupping-glasses are to be applied to the groins; walking, dancing, riding, often and wanton copulation with her husband, and fuch like exercises, provoke the Flowers. Of Plants, the Flowers copulation with her husband, and fuch like exercites, provoke the Flowers. Of Plants, the Flowers of St. Johns Wort, the Roots of Fennel, and Afparagus, Brufcus or Butchers-broom, or Parfly, Brookline, Bafil, Balm, Betony, Garlick, Onions, Crifta Marina, Cofimary, the Rind or Bark of Caffia Fifula, Calamint, Origanum, Penniroyal, Mugwort, Thyme, Hyffop, Sage, Marjoram, Roferrary, Hore-hound, Rue, Savin, Spurge, Saffron, Agarick, the Flowers of Elder, Bay-berries, the Berries of Iwy, Scammony, Cantharides, Psynthemm or Pellitory of Spain, Empherbium. The aromatick things are Amountment, Squinanth, Nutmegs, Calamus Aromaticus, Cyperus, Ginger, Cloves, Galingal, Pepper, Cubibes, Amber, Musk, Spikenard, and fuch like; of all which let Fotnentations, Fumigations, Baths, Broths, Boles, Potions, Pills, Syrups, Apozems, and Opiars, he made as the Phylician gations, Baths, Broths, Boles, Potions, Pills, Syrups, Apozems, and Opiats, be made as the Phylician thall think good.

The Apozeme that followeth is proved to be very effectual: R. Fol. & flor. diclam. an. p.ij. pintpinel. m. | 5. emnison capillar. an.p. j. artemif. thymi, marjor. origan. an. m. \(\beta \). rad. rub. major. petrofelin. fenicul. an. \(\beta \) j. \(\beta \). rad. peon. biftort. an. \(\beta \) \(\beta \): cicerum rub. sem. peon. fenicul. an. \(\beta \) \(\beta \). make thereof a decoction in a fufficient quantity of Water, adding thereto Cinnamon 3 iii. in one pint of the decoction diffolve (after it is firained) of the Syrup of Mugwort and of Hyflop, an. 3. indiagraphed. abbat. 3 j. let it be strained through a bag, with 3 ij. of the Kernels of Dates, and let her take 3 iv. in the

Let Pellaries be made with Galbanum, Ammoniacum, and fuch like mollifying things, beaten into a massin a mortar with a hot pessle, and made into the form of a Pessary, and then let them be mixed with Oil of Jasmine, Employebium, an Ox gall, the Juice of Mugwort, and other such like, wherein there is power to provoke the Flowers, as with Scammony in Powder: let them be as big as ones thumb, fix fingers long, and rowled in Lawn, or fome fuch like thin linnen cloth; of the fame things Nodulaes may be made. Also Pellaries may be prepared with Honey boiled, adding thereto convenient powders, as of Scammony, Pellitory, and tuch like. Neither ought these to stay long in the neck of the Womb left they should exulcerate, and they must be pulled back by a thred that must be put through them, and then the orifice of the Womb must be formented with white Wine of the

decoction of Penniroyal or Mother-wort.

But it is to be noted, that if the suppression of the Flowers happeneth through the default of the flopped orifice of the Womb, or by inflammation, these maladies must first be cured before we come unto those things that of their proper strength and virtue provoke the Flowers: as for example, if fuch things be made and given when the Womb is inflamed, the bloud being drawn into the grie-red place, and the humours sharpened, and the body of the Womb heated, the inflammation will be increased. So if there be any superfluous shell, if there be any Callus of a wound or ulcer, or if there be any membrane flutting the orifice of the Womb, and fo stopping the flux of the Flowers they must first be consumed and taken away before any of those things be administred. But the opportunity of taking and applying of things, must be taken from the time wherein the lick Woman was wont to be purged before the flopping, or if the never had the Flowers, in the decrease of the Moon; for so we Why Hot-how shall have Custom, Nature, and the external efficient cause to help Art. When these Medicins are used, the Women are not to be put into Baths or Hot-houses, as many do, except the malady proceed from the dentity of the Vetfels, and the grossness and clamminess of the bloud. For Sweats hinder are to be pro. the mentitual Flux, by diverting and turning the matter another way.

What causes of the stopping of the Flowers must be cured be-fore the difease it felf.

The fitteft time to pro-Flowers. those in whom the Flowers valord.

dents.

CHAP. LIV.

The figns of the approaching of the Menstrual Flux.

Hen the Monethly flux first approacheth, the Dugs itch and become more fwollen and hard than they are wont; the woman is more delirous of copulation, by reason of the ebullition of the provoked blond, and the acrimony of the bloud that remaineth; her What women voice becometh bigger, her fecret parts itch, burn, fwell, and wax red. If they flay long, the hath do love, and pain in her loins and head, nauseousness and vomiting troubleth the stomach: notwithstanding, if those matters which flow together in the womb, either of their own nature, or by corruption, be act of genera- cold, they loath the act of generation, by reafon that the Womb waxeth feeble through fluggithness tion when the and watery humours filling the fame, and it floweth by the fecret parts very foftly. Thole Maids that are marriageable, although they have the menfitual flux very well, yet they are troubled with Head-ach, naufcouineis, and often vomiting, want of appetite, longing, an ill habit of body, difficulty moneths are flooped.

Head-ach, naufcoufness, and often vomiting, want of appetite, longing, an ill habit of body, dimensionally with what accidents those of breathing, trembling of the heart, fwouning, melancholy, fearful dreams, watching with fadness cidents those that are mar- and heaviness, because that the genital parts burning and itching, they imagine the act of generation, riageable and whereby it cometh to pass that the seminal matter, either remaining in the testicles in great abun-are not mar-ried, are trou-bled.

The crust of the Wornb The cause of the Womb.

Maids that live in the Country are not fo troubled with those Diseases, because there is no such lying in wait for their Maiden-heads, and also they live sparingly and hardly, and spend their time in fo many accicontinual labour. You may fee many Maids fo full of juice that it runneth in great abundance, as if they were not mentioual, into their Dugs, and is there converted into milk, which they have in as with child, nor bath born shild. with child, nor hath born children, hath milk, the wants the mentional fluxes; whereby you may understand that that conclusion is not good which affirmeth that a Woman which hath milk in her brefts either to be delivered of child. brefts, either to be delivered of child, or to be great with child; for Cardanae writeth that he knew

one Antony Buzzus at Genua, who being thirty years of age, had fo much milk in his breatls as was fufficient to nurfe a child; for the breeding and efficient cause of milk proceeds not onely from the The efficient engrafted faculty of the glandulous fubflance, but much rather from the action of the mans feed, for cause of the proof whereof you may fee many men that have very much milk in their breafts, and many women milk is to be that almost have no milk, unless they receive mans feed. Also Women that are irrong, and losty like noted. unto men, which the Latines call Viragines, that is to fay, whose feed cometh unto a manly nature, when the Flowers are stopped, concoct the blood, and therefore when it wanteth passage forth, by the likeness of the subflance it is drawn into the dugs, and becometh perfect milk: those that have the Flowers plentifully and continually for the space of sour or five days, are better purged and with more happy fuccess than those that have them for a longer time.

CHAP. LV.

What accidents follow immoderate fluxes of the Flowers or Courfes.

F the mentional Flux floweth immoderately, there also follow many accidents; for the concoction is frustrated, the appetite overthrown, then follows coldness throughout all the body, exolution of all the faculties, an ill habit of all the body, Leannels, the Droptie, an Hectick Fever, Convultion, Swouning, and often fudden death: if any have them too exceeding immodever, Convultion, Sworling, and often indeed the first woman is also troubled with a con-rately, the bloud is sharp and burning, and also stinking, the fick woman is also troubled with a con-tinual Fever, and her tongue will be dry, ulcers arise in the gums and all the whole mouth. In women the Flowers do flow by the veins and arteries which rife out of the spermatick vessels, and the Flow end in the bottom and fides of the womb; but in virgins and in women great with child, whose do flow in a children are found and healthful, by the branches of the Hypogastrick vein and artery, which are Woman and fored and dispersed over the neck of the womb. The cause of this immoderate flux is in the quantity or quality of the bloud; in both the fault is unreasonable copulation, especially with a man an unreason that hath a Yard of a monthrous greatness, and the dissolution of the retentive faculty of the vessels: ble flux of oftentimes also the Flowers flow immoderately by reason of a painful and a difficult birth of the blood, child, or the after-birth, being pulled by violence from the cotyledons of the womb, or by reason The critical that the principal of the most of the property of the that the veins and arteries of the neck of the womb are torn by the coming forth of the Infant with Flowers. great travel, and many times by the use of sharp Medicins, and exulcerating Pellaries. Off-times The figns of also Nature avoids all the juice of the whole body critically by the womb after a great disease, which bload flowing flux is not rashly or saddenly to be stopped. That mentional bloud that sloweth from the womb, is from the womb or neek more grofs, black, and clotty, but that which cometh from the neck of the womb is more clear, li- of the womb. quid and red.

CHAP. LVI.

Of stopping the immoderate slewing of the Flowers or Courses.

Ou must make choice of such meats and drinks as have power to incrassate the bloud; for as the Flowers are provoked with meats that are hot and of fubtil parts, so they are stopped by fuch meats as are cooling, thickning, aftringent, and fliptick, as are Barly-waters, fodden Rice, the extreme parts of Beafls, as of Oxen, Calves, Sheep, either fried or fodden with Sorrel, Purflain, Plantain, Shepherds-purfe, Sumach, the bods of Brambles, Berberies, and fine of limenodes. It is supposed that a Harts-horn burned, washed, and taken in astringent water, will stop all immoderate Fluxes; likewife Sangnis draconis, terra figillata, bolus armenus, lapis hematites, Coral beaten into most subtil powder, and drunk in steeled water; also Pap made with milk wherein steel hath oftentimes been quenched, and the flower of Wheat, Barley, Beans, or Rice, is very effectual for the fame. Quinces, Cervices, Medlars, Cornelian-berries, or Cherries, may likewife be eaten at the fecond Courfe. Julips are to be used of seeled waters, with syrup of dry Roses, Pomegranats, Sorrel, Myrtles, Quinces, or old Conferves of red Roles, but Wine is to be avoided: but if the strength be so extenuated, that they require it, you must chuse gross and astringent Wine tempered with siecled water; exercifes are to be fluuned, especially Venerous Exercises, Anger is to be avoided, a cold The inflituair is to be chosen, which (if it be not so naturally) must be made so by sprinkling cold things on tion or order the ground, esecully if the Summer or heat be then in his still strength; sound sleeping stays all of life, evacuations except sweating. The opening of a Vein in the arm, Cupping-glasses saftened on the breasts, bands, and painful trictions of the upper parts are greatly commended in this malady.

But if you perceive that the cause of this accident lieth in a cholerick ill juice mixed with the

bloud, the body must be purged with Medicins that purge choler and water; as Rhubarb, Myroba- Purging, lans, Tamarinds, Sebestens, and the purging Syrup of Roses.

CHAP. LVII.

Of local Medicins to be used against the immoderate slowing of the Courses.

Lio Unquents are made to flay the immoderate flux of the Terms, and likewife injections and peffaries. This or fuch like may be the form of an Unquent. ik Ol. Maftieb. & myrt. An unquent. and petiaries. berberis, sumaeb. balant. alumin. roch. an. 7. j. make thereof a decoction, and inject it in a syringe blunt-pointed into the Womb, left if it should be sharp, it might hurt the sides of the neck of the womb, alfo Snails beaten with their shells, and applied to the navel, are very profitable. Quinces rosted under the Coals, and incorporated with the powder of Myrtles and Bole-Armenick, and put into the neck of the womb, are marvellous effectual for this matter. The form of a pellary may be thus: R. Gallar, immaturar, combust, & in aceto extinctor, 3 is, ammo, 3 is, sang. deac, puls, rad, fymphys, simusch, masticle, succi acacie, cornu cerust, colophon, myrrhe, sovie ferri, an. 3 is, captur. 9 is. mix them, and incornal state of the state of th porate them all together with the juice of Knot-grafs, Syn-green, Night-shade, Henbane, Water-lillies, Plantain, of each as much as is sufficient, and make thereof a Pessary.

Cooling things, as Oxycrate, Unguentum rofatum, and such like, are with great profit used to the region of the loins, thighs, and genital parts: but if this immoderate flux do come by erofion, so that the matter thereof continually exulcerateth the neck of the womb, let the place be anointed with the milk of a the-Afs, with Barley-water, or binding and aftringent mucilages, as of Pfillium, Quinces,

Gum Tragacanth, Arabick, and fuch like.

CHAP. LVIII.

Of Womens Fluxes, or the Whites.

The region of The differences.

Efides the fore-named Flux, which by the Law of Nature happeneth to Women monethly, there is also another called a Woman Flux, because it is onely proper and peculiar to them: this fornetimes wearieth the Woman with a long and continual diftillation from the womb, or through the womb, coming from the whole body without pain, no otherwise than when the whole superfluous filth of the body is purged by the reins or urin's sometimes it returneth at uncertain feafons, and fometimes with pain and exulcerating the places of the womb: it differeth from the menfitual Flux, because that this for the space of a few days, as it shall feem convenient to Nature, caffeth forth laudable bloud; but this Womans Flux yieldeth impure juice, fornetimes fanious, fometimes ferous and livid, otherwhiles white and thick, like unto Barly-cream, proceeding from flegmatick bloud: this last kind thereof is most frequent. Therefore we see women that are flegmatick, and of a foft and loofe habit of body, to be often troubled with this difeafe; and therefore What women they will fay among themselves that they have the Whites. And as the matter is diverse, so it will are apt to this stain their smocks with a different colour. Truly if it be perfectly red and sanguin, it is to be thought it cometh by erofion, or the exfolution of the fubfiance of the veffels of the womb, or of the neck thereof: therefore it cometh very feldom of bloud, and not at all except the woman be either great with child, or cease to be mentitual for some other cause; for then in stead of the monethly flux there sloweth a certain whayish excrement, which stainesh her cloaths with the colour of water wherein flesh is washed.

Also it very seldom proceeds of a melancholick humour, and then for the most part it causeth a Cancer in the womb. But oftentimes the purulent and bloudy matter of an ulcer lying hidden in the womb, deceiveth the unskilful Chirurgeon or Phylician: but it is not so hard to know these difeafes one from the other; for the matter that floweth from an ulcer, because (as it is faid) it is put rulent, it is also leffer, groffer, flinking, and more white. But those that have ulcers in those places, especially in the neck of the womb, cannot have copulation with a man without pain.

an ulcer in the womb may be the white Flowers.

Womens flux

cometh very feldom of bloud.

flux.

CHAP. LIX.

Of the causes of the Whites.

Ometimes the cause of the Whites confisienth in the proper weakness of the words, or else in the uncleanness thereof; and sometimes by the default of the principal parts. For if the brain or the flomach be cooled, or the liver flopped or scirrhous, many crudities are engendred, which if they run, or fall down into the womb that is weak by Nature, they cause the flux of the Womb or Whites: but if this Flux be moderate, and not flurp, it keepeth the body from malign diseases; otherwise it useth to infer a Consumption, Leannels, Palenels, and an ordematous swelling of the legs, the falling down of the womb, the dejection of the appetite and all the faculties, and continual fadness and forrowfulness; from which it is very hard to persuade the sick woman, because How it letteth that her mind and heart will be almost broken, by reason of the shame that she taketh, because such filth floweth continually; it hindereth conception, because it either corrupteth, or driveth out the feed when it is conceived. Oftentimes if it floppeth for a few Moneths, the matter that flayeth there caufeth an abfeefs about the womb in the body or neck thereof; and by the breaking of the abfeefs there followeth rotten and cancerous ulcers, fometimes in the womb, fometimes in the groin, and of-

Another form of a Dilater, or Speculum Matricis, whereof the declaration followeth.

A Shewesh she Screw which shutteth and openeth the Dilater of the Matrix.

B Shewesh the Arms or Branches of the Instrument, which ought to be eight or nine singers long.

But these Dilaters of the Matrix ought to be of a bigness correspondent to the Patients body; let them be put into the Matrix, when the woman is placed as we have faid, when the child is to be drawn out of her body. That instrument is most meet to tie the Warts, which we have described in the re-

laxation of the Palat or Dunla: let them be tied harder and harder every day until they fall away Therefore for the curing of Warts there are three chief fcopes, as Bands, Sections, Cauteries; and Three Cope Therefore for the curing of Warts there are three chief feopes, as Bands, Scétions, Cauteries; and Three fopes, left they grow up again, let Oil of Vitriol be dropped on the place, or Aqua fortis, or fome of the lee of the cure of whereof potential Cauteries are made. This Water following is most effectual to confume and warts in the wafte Warts. Re Aq. plantag. 3 vi. virid. era 5 ij. alum. recb. 5 iii. fal. com. 3 β. vii. rom. 6 finblim. an. An effectual 3 β. beat them all together, and boil them; let one or two drops of this water be dropped on the water to congrieved place, not touching any place elle; but if there bean ulcer, it must be cured as I have shewed some Warts, before. A certain man studious of Phylick, of late affirmed to me, that Ox-dung tempered with the Unguent to leaves or powder of Savin, would waite the Warts of the womb, if it were applied thereto warm; confirme which, whether it be true or not, let Experience, the Mittress of things, be judge. Verily, Gantharidez warts, put into unguents will do it, and (as it is likely) more effectually; for they will confume the callonings which proweth between the Tocs or Fingers. I have proved by experience, then the Warts. lonfiness which groweth between the Toes or Fingers. I have proved by experience, that the Warts that grow on the hands, may be cured by applying of Purilain beaten or stamped in its own juice. The Leaves and Flowers of Marigolds, do certainly perform the felf-fame thing.

CHAP. LXIII.

Of Chaps, and those wrinkled and bard Excrescences, which the Greeks call Condylornata.

Haps or Fiffures, are cleft and very long little Ulcers with pain very fharp and burning, by weat chaps reason of the biting of an acrid, salt and dry humour, making so great a contraction, and are often-times narrowness in the fundament and the neck of the womb, that scarcely the top of ones singer may be put into the orifice thereof, like unto pieces of Leather or Parchment, which are wrinkled and parched by holding of them to the fire. They rise sometiment, which are wrinkled and parched by holding of them to the fire. They rise sometiment to that the Patient can neither speak, eat, nor open his mouth, so that the Surgeon is constrained to cut it. In the cure thereof, all tharp things are to be avoided, and those which mollifie are to be The Cure, used, and the grieved place or part is to be moistned with Fomentations, Liniments, Cataplasins, Emplafters; and if the malady be in the Womb, a dilater of the matrix or peffary mult be put thereinto very often, fo to widen that which is over hard, and too much drawn together or narrow, and then the cleft little ulcers must be cicatrized. Condylomata are certain wrinkled and hard bunches, What condyloand as it were excreteences of the flesh, riting especially in the wrinkled edge of the fundament and mata are, neck of the womb. Cooling and relaxing medicins ought to be used against this disease, such as are The Cure. Oil of Eggs and Oil of Lin-feed, take of each of them two ounces, beat them together a long time in a leaden Mortar, and therewith anoint the grieved part; but if there be an inflammation, put thereto a little Camphir.

CHAP. XLIV. Of the itching of the Womb.

N Women, especially such as are old, there oftentimes cometh an itching in the neck of the What the itch Womb, which doth fo trouble them with pain, and a defire to feratch, that it taketh away their of the Womb.

fleep. Not long fince a woman asked my counfel, that was fo troubled with this kind of ma- An Hiftory. bdy, that the was constrained to extinguish or stay the itching burning of her secret parts by sprinkling cinders of sire, and rubbing them hard on the place. I counselled her to take Egy-Priseum diffolved in Sea-water or lee, and inject it in her fecret parts with a Syringe, and to wee flupes of flax in the fame Medicin, and put them up into the Womb, and fo the was cured. Many The cause of times this itch cometh in the fundament or tefficles of aged men, by reason of the gathering together the itch, or conflux of falt phlegm, which when it falleth into the eyes, it causeth the Patient to have much ado to refrain scratching: when this matter hath disperied into the whole habit of the body, it caufeth a burning or itching feab, which must be cured by a cooling and moistining diet, by phlebotomy and purging of the falt humour, by baths and homs applied, with fearification and anothining the whole body with the Unction following. CHAP. LXV.

Of the relaxation of the great Gut, or Intestine, which happenesh to Women.

Any Women that have had great travail and firains in Child-birth, have the great inte- The Casie. ftine (called of the Latins, Craffum intestimum) or Gut, relaxed and slipped down; which kind of affect happeneth much to children, by reason of a phlegmatick humour moistening the sphincter-muscle of the fundament, and the two others called Levatores. For the cure therethe Care.

of, first of all the Gut called relians intestinuon, or the strait Gut, is to be formented with a decoction of heating and refolving herbs, as of Sage, Rofemary, Lavender, Tyme, and fuch like; and then of afringent things, as of Rofes, Myrtils, the rinds of Pomegranats, Cyprefs-nuts, Galls, with a little Allum; then it must be sprinkled with the Powder of things that are aftringent without biting: and

BOOK XXIV. 584 Concerning the Generation of Man. An effectual last of all, it is to be restored, and gently put into its place. That is supposed to be an effectual and remedy. fingular remedy for this purpole, which is made of twelve red Snails put into a Pot with 3 15 of Alum, and as much of Salt, and shaken up and down a long time, for so at length when they are dead there will remain an humour, which must be put upon Cotton, and applied to the Gut that is fallen down. By the same cause (that is to say, of painful child-birth in some women) there ariseth a great swelling in the Navel; for when the Peritonann is relaxed or broken, fornetimes the Kall, and fornetimes the ces and figns. Guts flip out: many times flatulences come thither, the cause, as I now shewed, is over great straining or firetching of the belly, by a great burthen carried in the Womb, and great travel in child-birth: it the fallen-down Guts make that tumor, pain joined together with that tumor doth vex the Patients and if it be preffed, you may hear the noise of the guts going back again: if it be the Kall, then the turner is soft, and almost without pain, neither can you hear any noise by compression: if it be wind, the tumor is loofe and fost, yet it is such as will yield to the pressing of the finger with some sound, and will soon return again: if the tumor be great, it cannot be cured, unless the Peritoneum be cut, as it is said in the cure of Ruptures. In the Church-Porches of Paris, I have seen Beggar-women, who An History. by the falling down of the Guts, have had fuch tumors as big as a bowl, who notwithstanding could go, and do all other things as if they had been found and in perfect health: I think it was because the feets or excrements, by reason of the greatness of the tumor, and the bigness or wideness of the inteffines, had a free paffage in and out. CHAP. LXVI. Of the relaxation of the Navel in Children. Frentimes in Children newly born, the Navel (welleth as big as an Egg, because it hath not been well cut or bound, or because the whayish humours are flowed thirther, or because that part hath extended it felf too much by crying, by reason of the pains of the fretting of the Childs guts, many times the Child bringeth that tumor joined with an abfeels with him from his An abfeels not Mothers Womb: but let not the Chirurgeon affay to open that abfeels, for if it be opened, the guts to be opened, come out through the incifion, as I have feen in many, and especially in a Child of my Lord Martigues; for when Peter of the Rock, the Chirurgeon, opened an abfects that was in it, the bowels ran out at the incition, and the Infant died; and it wanted but little that the Gentlemen of my Lords retinue that were there, had ftrangled the Chirurgeon. Therefore when John Gromontins the Carver defired me, and requested me of late that I would do the like in his Son; I refused to do it, because An Hiftory. it was in danger of its life by it already; and in three days after the abfeefs broke, and the bowels gushed out, and the child died. CHAP. LXVII. Of the pain that Children have in breeding of Teeth. Hildren are greatly vexed with their Teeth, which cause great pain when they begin to The time of breeding of the Teeth. break as it were out of their shell or sheath, and begin to come forth, the gums being broken, which for the most part happeneth about the feventh moneth of the Childs age-This pain cometh with itching and feratching of the gums, an inflammation, flux of the belly, where of many times cometh a Fever, falling of the Hair, a Convultion, at length death. The cause of the pain is the solution of the continuity of the Gums by the coming forth of the Teeth. The figns of The cause of the pain in breeding that pain is an unaccustomed burning, or heat of the Childs mouth, which may be perceived by the Nurfe that giveth it fuck, a fwelling of the Gums and Cheeks, and the Childs being more way-ward and crying than was wont, and it will put its fingers to its mouth, and it will rub them on its The figns. Gums as though it were about to feratch, and it flavereth much. That the Physician may remedy The Cure. this, he must cure the Nurse as if she had the Fever, and she must not suffer the Child to suck so oftens, but make him cool and mosts, when he thirsteth, by giving him at certain times Syrupus Alexandronus, syrup, de Limenibus, or the syrup of Pomgranats with boiled Water; yet the Child must not hold those things that are actually cold long in his mouth, for such by binding the Gums, do in some fort fray the Teeth that are newly coming forth; but things that lenifie and mollific are rather to be used, that is to fay, such things as do by little and little relax the loofe flesh of the Gums, and also asswage

the pain. Therefore the Nurfe shall oftentimes rub the Childs Gums with her singers anointed or besmeared with Oil of sweet Almonds, fresh Butter, Honey, Sugar, mucilage of the seeds of Psilinus, or of the seeds of Marsh-mallows extracted in the water of Pellitory of the Wall. Some think that the brain of a Hare, or of a sucking Pig roasted or sodden, through a secret property, are effectual for the same: and on the out-side shall be applied a Cataplasm of Barly-meal, Milk, Oil of Roses, and the Yolks of Eggs. Also a sick of Liquorice shaven and bruised and anointed with Honey, or any of the fore-named Syrups, and often rubbed in the mouth or on the gams, is likewise prostable: so

ture; therefore in fuch a case, before the fore-named mortal accidents come, I would persuade the Chirurgeon to open the gums in such places as the Teeth bunch out with a little swelling, with a Knise or Lancet, so breaking and opening a way for them, notwithstanding that a little slux of blood will follow by the tention of the gums: of which kind of remedy I have with prosperous and happy success made trial in some of mine own Children in the presence of Fenerus, Alimus, and Corinus, Doctors

what power of the fore-named Syrups, and often rubbed in the mouth or on the gums, is likewise professional for the gums has also any Toy for the Child to play withall, wherein a Wolves tooth is fet, for this by feratching the gums hash doth affwage the painful itching, and rarifie the Gums, and in fome weareth them that the Teeth to affwage the appear the fooner. But many times it happener that all thefe and fuch like medicins profit nopain of them. The fooner of the contumacy of the gums, by hardness or the weakness of the Childs naturally at all, by reason of the contumacy of the gums, by hardness or the weakness of the Childs naturally at all, by reason of the contumacy of the gums, by hardness or the weakness of the Childs naturally at all, by reason of the contumacy of the gums, by hardness or the weakness of the Childs naturally at all, by reason of the contumacy of the gums, by hardness or the weakness of the Childs naturally at all, by reason of the contumacy of the gums, by hardness or the weakness of the Childs naturally at all, by reason of the contumacy of the gums, by hardness or the weakness of the Childs naturally at all, by reason of the contumacy of the gums, by hardness or the weakness of the Childs naturally at all, by reason of the contumacy of the gums, by hardness or the weakness of the contumacy of the gums.

Doctors of Physick, and Gnillemean the Kings Chirurgeon, which is much better and more fafe than to do as fome Nurses do, who, taught onely by the inftinct of Nature, with their nails and feratching, break and tear, or rent the Childrens gums. The Duke of Nevers had a fon of eight moneths old, an Bistory, which died of late, and when we, with the Physicians that were present, diligently fought for the cause of his death, we could impute it unto nothing else than to the contumacious hardness of the gums, which was greater than was convenient for a child of that ages for therefore the Teeth could not break forth, nor make a paffage for themselves to come forth: of which our judgment this was the trial, that when we cut his gums with a knife, we found all his Teeth appearing as it were in an array, ready to come forth, which if it had been done when he lived, doubtlefs he might have been

The End of the Four and Twentieth Book.

BOOK XXV.

Of MONSTERS and PRODICIES.

THE PREFACE.

E call Monsters, what things soever are brought forth contrary to the common decree and order of Nature. So we term that Infant monfrows which is born with one arm alone, or with two What a Monheads. But we define Prodigies, those things which happen contrary to the whole course of Na-ster is. ture, that is, altogether differing and differing from Nature: as if a man floud the delivered of a Snake or a What a Dog. Of the first fort are thought all those, in which any of those things which ought, and are accustemed to digy is, be, according to Nature, is wanting, or doth abound, is changed, worn, covered, or deformed, here, or not put in be, according to Nature, is wanting, or any assuma, is evanged, worn, covered, or acjorined, must, or not put in its right place: for sometimes some are born with more singers than they should, other some but with one singer: some with those parts juined which should be joined, others with those parts juined which should be divided: some are born with the privities of both sexes, male and semale. And Arithotle saw a Gost with a hern upon Lib 4 gen. exist. ber since. No living Creature was ever born which wanted the Heart, but some have been seen wanting the cap.4. her fines. No tering Greature was ever norm moneo wanted the Fleats, but joine have been known to have manting one of the Reins. And none have been known to have manted the whole Liver, although fome have been found that had it not perfect and whole: and there have been those which wanted the Gall, when by Nature they thould have had it; and besides it hat been feen that the Liver, contrary to its natural site, hath lien on the left side, and to Spleen on the right. Some Women also have had their Privities closed, and not perforated, the membranens obstacle, which they call the Hymen, also have had their Privities closed, and not perforated, the membranens obstacle, which they call the Hymen. bindering. And men are sometimes born with their Fundaments, Ears, Noset, and all the rest of the passages shut, and accounted monstroms, Nature erring from its intended scope. But to conclude, those Monsters are thought to portend some ill, which are much differing from their Nature.

CHAP. I.

Of the causes of Monsters; and first of those Monsters which appear for the glory of God, and the punishment of Mans wickedness.

Here are reckoned up many causes of Monsters, the first whereof is the glory of God, that his immense power may be manifest to those which are ignorant of it, by the sending of those things which happen contrary to Nature: for thus our Saviour Christ answered the Disciples (asking whether He or his Parents had offended, who being born blind, received his sight from him) that neither He nor his Parents had committed any fault so great, but this so happened onely that the glory and majesty of God should be divulged by that miracle, and such great works.

Another cause is, that God may either punish mens wickedness, or shew signs of punishment at hand, because Parents sometimes lie and join themselves together without law and measure, or luxutiously and beastly, or at such times as they ought to forbear by the command of God and the Church, fuch monstrous, horrid and unnatural births do happen.

At Verona, An. Dom. 1254. a Mare foaled a Colt with the perfect face of a Man, the reft of the body like an Horse: a little after that the Wars between the Florentines and Pifans began, by which all Italy was in a combustion.

The Figure of a winged Monster.

About the time that Pope Julius the second raifed up all Italy, and the greatest part of Christendom against Lewis the Twelsth, the King of France, in the Year of our Lord 1512, (in which Year, upon Eafter day, near Ravenna was fought that mortal battle, in which the Popes Forces were overthrown) a Monster was born in Raveina, having a Horn upon the Crown of his head, and befides, two wings, and one foot alone, most like to the feet of Birds of prey, and in the knee thereof an eye, the Privities of male and female, the reft of the body like a man, as you may fee by this Figure.

The third cause is, an abundance of seed and overflowing matter. The fourth, the fame in too little quantity, and deficient. The fifth, the force and efficacy of imagination. The fixth, the ftraightness of the Womb. The feventh, the disorderly fite of the party with child, and the polition of the parts of the body. The eighth, a fall, firain, or fireak, especially upon the belly of a woman with child.

CHAP. II.

Of Monsters caused by too great abundance of Seed.

Eeing we have already handled the two former and truly final causes of Monsters, we must now come to those which are material, corporeal, and efficient causes, taking our beginning from that we call the too great abundance of the matter of feed. It is the opinion of those Philosophers which have written of Monsters, that if at any time a Creature bearing one at once, as Man, shall cast forth more feed in copulation than is necessary to the generation of one body, it cannot be that onely one should be begot of all that: therefore from thence either two or more must arise: whereby it cometh to pass, that these are rather judged wonders, because they happen feldom, and contrary to common custom. Superfluous parts happen by the same cause that Twins and many at one hard. and many at one birth, contrary to Natures course, do chance, that is, by a larger effusion of feed, than is required for the framing of that part, that fo it exceeds either in number or elfe in great-nels. So Antin tells that in his time in the Eaft, an Infant was born, having all the parts from the belly unwards double, here the stime in the Eaft, an Infant was born, having all the parts from the belly upwards double, but from thence downward fingle and fample: for it had two heads, four eyes, two breafts, four hands, in all the reft like to another child, and it lived a little while. Celias Rhadgings faith, four hands, in all the reft like to another child, and it lived a little while. Rhodiginas faith he faw two Monsters in Italy, the one male, the other female, handsomely and neat-made through all their bodies, except their heads, which were double; the male died within a few days after it was born, but the female (whose shape is here delineated) lived five and twenty years, which is contrary to the common custom of Monsters; for they for the most part are very short-lived, because they both live and are born, as it were, against Natures consent; to which may thort-lived, because they both live and are born, as it were, against Natures consent; to which may

be added, they do not love themselves, by reason they are made a from to others, and that by that

But it is most remarkable which Lycosthemes telleth of a *Woman-monster; for, excepting her two heads, she was framed in the rest of her body to an exact perfection: her two heads had the like defire to eat and drink, to sleep, to speak, and to do every thing; she begged from door to door, every one giving to her freely. Yet at length she was banished Bavaria, lest that by the frequent looking upon her, the imagination of Women with child, strongly moved, should make the like impression in the Insants they bare in their Wombs.

The Effigies of a 4 Maid with two beads.

The Effigies of two * Girls whose Backs grew together.

In the Year of our Lord 1475, at Verma in Italy, two Girls were born with their backs flicking together from the lower part of the flouders unto the very buttocks. The novelty and ftrangeness of the thing moved their Parents, being but poor, to carry them through all the cluef Towns in Italy to get money of all fuch as came to see them.

The Figure of a Man with another growing out of him.

In the Year 1530, there was a man to be feen at Paris, out of whose belly another, perfect in all his members except head, hanged forth as if he had been grafted there. The man was forty years old, and he carried the other implanted or growing out of him, in his arms, with such admiration to the beholders, that many ran very earnestly to see him.

The Effigies of a borned or booded Moriftee.

At Duiers, a finall Village fome ten miles from Turin in Survy, in the Year 1578, upon the feventeenth day of January, about eight of the Clock at night, an honest Matron brought forth a Child having five horns, like to Rams horns, set opposite to one another upon his head: he had also a long piece of fleth, like in some fort to a French-hood which Women use to wear, hanging down from his forehead by the nape of his neck almost the length of his back: two other pieces of fleth, like the collar of a shirt, were urapped about his neck: the singers ends of both his hands somewhat resembled a Hawks Talons, and his knees seemed to be in his hams: the right leg and the right foot were of a very red colour; the rest of the body was of a tawny colour: it is said he gave so terrible a scritch when he was brought forth, that the Midwives, and the rest of the Women that were at her labour, were so frighted that they presently left the house and ran away. When the Duke of Sarvy heard of this Monster, he commanded it should be brought to him, which performed, one would hardly think what various censures the Courtiers gave of it.

The Monfter you fee here delineated, was found in the middle and innermost part of an *Egg, with the face of a Man, but hairs yielding a horrid representation of Snakes; the chin had three other Snakes firetched forth like a beard. It was first seen at Annua, at the house of one Baneberon a Lawyer: a Maid breaking many Eggs to butter, the white of this Egg given a Cat, presently killed her. Lassly, this Monster coming to the hands of the Baron Seneey, was brought to King Charles the nineth being then at Merg.

* The shape of a Monster found in an Egg.

The Effigies of a monstrons b Child, having two beads, two arms, and four legs.

In the Year 1546. a Woman at Paris in her fixth Moneth of her account, brought forth a * Child having two heads, two arms, and four legs. I diffecting the body of it, found but one heart, by which one may know it was but one Infant. For you may know this from Artistle, whether the mon-firous birth be one or more joined together, by the principal part: for if the body have but one heart, it is but one; if two, it is double by the joining together in the conception.

In the Year 1569, a certain Woman of Tours was delivered of * Twins joined together with one head, and naturally embracing each other. * Renatus Circus the famous Chirurgeon of those parts, fent me their Sceleton.

The Partraiture of * Twins joined together with one Head.

Munifer writes that in the Village Briffan, not far from Worms, in the Year 1495 he faw two 'Girls perfect and entire in every part of their bodies, but they had their Fore-heads to joined together that they could not be parted or fevered by any art: they lived together ten years, then the one dying, it was needful to feparate the living from the dead: but the did not long out-live her fifter, by reason of the malignity of the wound made in parting them assuder.

In the Year of our Lord 1570, the twentieth of July, at Paris in the firest Gravilliers, at the fign of the Bell, these two Infants were born, differing in sex, with that shape of body that you see here expressed in the Figure. They were baptized in the Church of S. Nicolas of the Fields, and named Ludovicus and Ludovica, their Father was a Mason, his name was Peter Germane, his simame Petit Dien (1) Little-God, his Mothers name was Masbea Petronilla.

The shape of the Infants lately been at Paxis.

In the Year 1572. in Post de See near Angers, a little Town, were born upon the tenth day of July, two Girls, perfect in their limbs, but that they had but four fingers apiece on their left hands: they clave together in their fore-parts, from their breft to their navel, which was but one, as their heart also but one; their liver was divided into four lobes; they lived half an hour, and were baptized.

The Figure of two Girls joined together in their breasts and belly.

The Figure of a Child with two beads, and the body as big as one of four moneths old.

Fardellib.24.

Celius Rhodiginus tells, that in a Town of his Countrey called Sarzano, Italy being troubled with Civil Wars, there was born a Monster of unusual bigness; for he had two heads, having all his limbs answerable in greatness and tallness to a Child of four Moneths old: between his two heads, which were both alike, at the setting on of the shoulder, it had a third hand, put forth, which did not exceed the ears in length, for it was not all seen: it was born the 5. of the Ides of March, 1514.

The Figure of one with four legs and as many arms.

Jovianus Pontanus tells in the Year 1529. the nineth day of January, there was a manchild born in Germany, having four arms, and as many legs,

In the Year that Francis the first, King of France, entered into League with the Swiffies, there was born a monster in Germany, out of the midst of whose belly there stood a great head; it came to mans age, and his lower, and as it were inserted head, was nourished as much as the true and upper head.

In

The shape of two manstrous Twins, being but of one onely Sex.

The shape of a Monstrous Pig.

In the Year 1572, the last day of February, in the Parish of Vinban, in the way as you go from Carnuta to Paris, in a small Village called Border, one called Cyriana Giranda the Wife of James Moreham a Husbandman, brought forth this Monster whose shape you see here delineated, which lived until the Sunday following, being but of one onely Sex, which was the Female.

In the Year 1572. on Eafter Monday at Metz in Lorain, in the Inn whose Sign is the Holy Ghoft, a Sow pigged a Pig which had eight Legs, four Ears, and the Head of a Dog; the hinder part from the belly downward was parted in two as in Twins, but the fore-parts grew into one; it had two Tongues in the mouth, with four Teeth in the upper Jaw, and as many in the lower. The Sex was not to be diffinguished, whether it were a Bore or Sow Pig, for there was one flit under the Tail, and the hinder parts were all rent and open. The shape of this Monster, as it is here set down, was fent me by Borgesian the famous Physician of Metz.

CHAP. III.

Of Women bringing many Children at one birth:

Oman is a Creature bringing usually but one at a birth: but there have been some who have brought forth two, some three, some four, some five, six, or more at one birth. Empedacles thought that the abundance of seed was the cause of such numerous births: 4-Degeneries, the Stoicky affirm the divers Cells or Partitions of the Womb to be the cause; for the seed being variously parted into these Partitions, and the conception divided, there are more children brought forth; no otherwise than in Rivers, the Water beating against the Rocks, is turned into divers circles or rounds. But Aristale saith there is no reason to think so; for in Women that parting of the Womb into Cells, as in Dogs and Sows, taketh no place; for Womens wombs have but one cavity, Parted into two recesses, the right and left, nothing coming between, except by chance diffinguished by a certain line; for often Twins lie in the same side of the Womb. Aristales opinion is, that a Woman cannot bring forth more than five children at one birth. The said of Angelius opinion is, that a Woman cannot bring forth more than five children at one birth. The said of Angelius opinion is, that a Woman cannot bring forth more than five children at one birth. The said of Angelius opinion is, that a woman cannot bring forth more than five children at one birth, three Boys and two Girls. Alburasis affirms a Woman to have been the Mother of severitiis, there Boys and two Girls. Alburasis affirms a Woman to have been the Mother of severitiis that twelve children were born at one birth; and that there was another in Peloponness which four saps.

Finy reports that it was extant in the writings of Phylicians, Liberasis. Liberasis, Liber

Ecc 2

Martin

tunnaner-

The Picture of Dorothy great with child with many children.

Martin Comerus the Author of the Polific History, writeth that one Margaret, a wo-Polith Hiftory. man iprung from a noble and ancient Family near Cracovia, and wife to Count Virboflaus, brought forth at one birth thirty five live children, upon the twentieth day of January in the Year 1296. Franciscus Pieus Mirandula writeth, that one Dorothy an Italian had twenty children at two births; at the first nine and at the fecond eleven, and that the was fo big, that the was forced to bear up her belly, which lay upon her knees, with a broad and large fearff tied about her neck, as you may fee by this Figure.

And they are to be reprehended here again, who affirm the cause of numerous births to confift in the variety of the Cells of the Womb; for they feign a Womans Womb to have feven Cells or Partitions, three on the right fide for Males, three on the left fide for Ferrales, and one in the midft for Hermaphrodites or Scrats: and this untruth hath gone fo far, that there have been fome that af-firmed every of the feven Cells to have been divided into ten Partitions, into which the feed difperfed, doth bring forth a divers and numerous increase, according to the variety of Cells fumilhed with the matter of feed; which, though it may feem to have been the opinion of Hippocrates in his Book De Natura Pueri, notwithflanding it is repugnant to reason, and to those things which are manifeftly apparent to the eyes and fenfes.

Lib.4. de Ger, anim- cop.44-

The opinion of Artificale is more probable, who faith Twins and more at one birth, are begot and brought forth by the fame cause that the fixth finger groweth on the hand, that is, by the abundant plenty of the feed, which is greater and more copious than can be all taken up in the natural fra-ming of one body; for if it all be forced into one, it maketh one with the parts increased more then is fit, either in greatness or number; but if it be, as it were, cloven into divers parts, it causeth more than one at one birth.

CHAP. IV.

Of Hermaphrodites, or Scrats.

Nd here also we must speak of Hermaphrodites, because they draw the cause of their go neration and conformation from the abundance of feed, and are called fo, because they are of both Sexes, the Woman yielding as much feed as the Man. For hereupon it commeth to pass that the forming faculty (which always endeavours to produce formething like it felf) doth labour both the matters almost with equal force, and is the cause that one body is of both fexes.

Yet forme make four differences of Hermaphrodites; the first of which is the male Hermaphrodites; dite, who is a perfect and absolute male, and hath only a slit in the Perincom not perforated, and from which neither Urin nor Seed doth flow. The fecond is the female, which believes her natural Privity, bath a flethy and skipny fimilitude of a mans Yard, but unapt for erection and ejaculation of feed and was really be Code and a state of the code of the culation of feed, and wanteth the Cod and Stones; the third difference is of those, which about they bear the express figures of members belonging to both fexes, commonly for the one against the other, yet are found many for generation, the control of water: the other, yet are found unapt for generation, the one of them onely ferving for making of water: the fourth difference is of those who are able in both sexes, and throughly perform the part of both man and woman, because they have the genitals of both sexes complete and perfect, and also the right brest like a man, and should be the sexes of both sexes complete and perfect, and also the right woman, because they have the genitals of both sexes complete and perfect, and also the rightbrest like a man, and the left like a woman: the Laws command those to chuse the sex which they
will use, and in which they will remain and live, judging them to death if they be found
to have departed from the sex they made choice of; for some are thought to have abused both,
and promisenously to have had their pleasure with men and women. There are signs by which
the Physicians may discern whether the Hermaphrodites are able in the male or female sex; or
whether

whether they are impotent in both: these figns are most apparent in the Privities and Face; for if the matrix be exact in all its dimensions, and so perforated that it may admit a mans Yard, if the the matrix be exact in all its dimentions, and to periorated that it may admit a mans Yard, if the Courfes flow that way, if the hair of the head be long, flender and foft, and to conclude, if to this tender habit of the body a timid and weak condition of the mind be added, the Female fex is predominant, and they are plainly to be judged Women. But if they have the Perineum and fundament full of hairs, (the which in Women are commonly without any) if they have a yard of a convenient largeness, if it thand well and readily, and yield feed, the Male fex hath the preheminence, and they are to be judged men. But if the conformation of both the genitals, be alike in figure, quantity, and are to be judged men. But if the comodination of both the generals, be anne in ngure, quantity, and efficacy, it is thought to be equally able in both fexes: although by the opinion of Arifolde, those Lib4. degice, who have double genitals, the one of the male, the other of the female, the one of them is always per-animosph.

The Figure of Hermaphrodite Twins cleaving together with their backs.

Anno Dom. 1486. in the Palatinate, at the Village Robach, near Heidelberg, there were Twins, both Hermaphrodites, born with their backs flicking together.

The Effigies of an Hermaphrodite having four bands and feet.

The same day the Venetians and Genoeses entered into league, there was a Monster born in Italy having four arms and feet, and but one head; it lived a little after it was baptized. James Ruef a Helvetian Chirurgeon faith he faw the like, but which befides had the Privities of both fexes, whose figure I have therefore fet forth, Page 590.

CHAP. V. Of the changing of Sex.

Maine Lufitanus reports that in the Village Efquina, there was a maid named Maria Pateca, who at the appointed age for her Courses to flow, had in flead of them a mans Yard, lying before that time hid and covered, so that of a Woman she became a Man, and therefore laying afide her Womans habit, was cloathed in mans, and changing her name, was called *Emanuel*; who when he had got much wealth by many and great negotiations and commerce in *India*, returned into his Country, and married a wife: but *Luftranue* faith he did not certainly know whether he had

any children, but that he was certain he remained always beardlefs. Anthony Loqueneux, the Kings Keeper or Receiver of his Rents of St. Quintain, at Vermandois, lately affirmed to me that he faw a man at Reims, at the Inn having the fign of the Sman, in the Year 1560, who was taken for a Woman until the fourteenth year of his age, for then it hap-Pened as he played formewhat wantonly with a Maid which lay in the fame bed with him, his members (hitherto lying hid) started forth and unfolded themselves: which when his Parents knew (by help of the Ecclesiastick power) they changed his name from Joan to John, and put him in mans

Some years agone, being in the Train of King Charles the Nineth, in the French Glafs-house, I was shewed a man called Germane Granierus, but by some Germane Maria (because in former times when he was a Woman he was called Marie) he was of an indifferent stature, and well set body, with a thick and red beard; he was taken for a Girl until the sisteness of his Age, because there was no fign of being a man feen in his body, and for that amongst Women, he in like attire did those things which appertain to Women: in the fifteenth year of his age, whilest he somewhat carnettly purfued Hogs given into his charge to be kept, who running into the Corn, he leaped violently over a ditch, whereby it came to pass that the stays and foldings being broken, his hidden members fuddenly broke forth, but not without pain; going home, he weeping complained to

his Mother that his guts came forth: with which his Mother amazed, calling Phylicians and Surgeons to counfel, heard he was turned into a man; therefore the whole buliness being brought to the Cardinal the Bishop of Lenancure, an affembly being called, he received the name and habit of

Play reports that the fon of Caffinar of a Girl became a Boy, living with his Parents; but by the command of the Sooth-fayers he was carried into a Defart Ifle, because they thought such Monsters did always shew or portend some monstrous thing. Certainly women have so many and like parts lying in their womb, as men have hanging torth; onely a strong and lively heat feems to be wanting, which may drive forth that which lies hid within: therefore in process of time the heat being increased and stourishing, and the humidity (which is predominant in child-hood) overcome, it is not impossible that the virile members, which hitherto sluggish by detect of heat, buy hid, may be put forth; especially if to that strength of the growing heat some vehement concussions, that it is not fabulens that some women have been changed into men: but you shall find in no history, men that have degenerated into women; for Nature always intends and goes from the imperfect to the imperfect, but not basely from the more perfect to the imperfect.

CHAP. VI.

Of Monsters caused by the defect of Seed.

F, on the contrary, the feed be any thing deficient in quantity, for the conformation of the Infant or Infants, fome one or more members will be wanting, or more flort and decrepit. Hereupon it happens that Nature intending Twins, a Child is born with two heads, and but one arm, or altogether lame in the rest of his limbs.

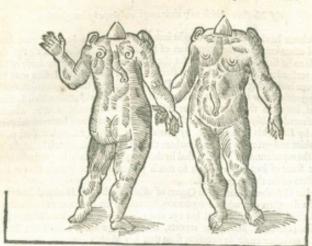

The Effigies of a monstrous child, by reason of the defect of the matter of Seed.

Anno Dom. 1573. I faw at St. Andrews Church in Paris, a Boy nine years old, born in the Village Parpuvilla, fix miles from Guife; his Fathers name was Peter Renard, and his Mother, Marquete: he had but two fingers on his right hand, his arm was well proportioned from the top of his shoulder almost to his wrist, but from thence to his two fingers ends it was very deformed; he wanted his legs and thighs, although from the right buttock a certain unperfect Figure, having onely four Toes, seemed to put it self forth; from the midst of the left buttock two Toes sprung out, the one of which was not much unlike a mans Yard, as you may see by the Figure.

In the Year 1562, in the Calends of November, at Villa Branes in Gafesny, this Monster, a headless woman, whose Figure hereafter follows, was born, which figure Dr. John Altinus the Physician gave to me, when I went about this Book of Monsters, he having received it from Fontanus the Physician of Angelestre, who seriously affirmed he saw it.

The Figure of a monstrous woman without a head, before and behind.

The Effigies of a man without arms, doing all that is usually done with hands.

The Effigies of a Monter with two heads, two legs, and but one arm.

A few years agone there was a man of forty years old to be feen at Paris, who although he wanted his arms, notwithflanding did indifferently perform all those things which are usually done with the hands; for with the top of his shoulder, head and neck, he would strike an Ax or Hatchet with as sure and strong a blow into a post, as any other man could do with his hand; and he would last a Coachmans whip, that he would make it give a great crack, by the strong refraction of the air; but be eat, drank, plaid at Cards, and such like, with his feet. But at last he was taken for a Thief and

Mirderer, was hanged and fashed to a wheel.

Also not long ago there was a Woman at Paris without arms, which nevertheless did out, few, and do many other things, as if she had her hands.

We read in Hippocrater, that Attaginis his wife brought forth a child all of shell without any bone, and notwithstanding it had all the parts well formed. or facilities and byers.

CHAP. VII.

Of Monsters which take their cause and shape by imagination.

The force of magination upon the body and humours.

Gen. cap.30.

He Ancients having diligently fought into all the fecrets of Nature, have marked and obferved other causes of the generation of Monsters: for, understanding the force of in agination to be so powerful in us, as for the most part, it may alter the body of them that imagine, they foon perfuaded themselves that the faculty which formeth the Infant may be led and governed by the firm and firong cogitation of the Parents begetting them (often deluded by nocturnal and deceitful apparitions) or by the mother conceiving them; and so that which is strongly conceived in the mind, imprints the force into the Infant conceived in the womb; which thing many think to be confirmed by Moser, because he tells that Jacob increased and bettered the part of the sheep granted to him by Laban his Wifes father, by putting rods, having the bark in part pulled off, finely ftreaked with white and green, in the places where they used to drink, especially at the time they engendered, that the representation apprehended in the conception, should be presently impressed in the young; for the force of imagination hath fo much power over the Infant, that it fets upon it the notes or characters of the thing conceived.

We have read in Heliodorus, that Persia Queen of Æthiopia, by her Husband Hidustes, being also an Ethiope, had a daughter of a white complexion, because in the embraces of her husband, by which the proved with child, the earnestly fixed her eye and mind upon the picture of then fair Andromeda flanding opposite unto her. Damascene reports, that he saw a Maid hairy like a Bear, which had that deformity by no other cause or occasion than that her Mother earnestly beheld in the very inflant of receiving and conceiving the feed, the image of St. John covered with a Camels skin, hanging upon the posts of the bed.

They say Hippocrates by this explication of the causes, freed a certain Noble-woman from sufficion of adultery, who being white her self, and her husband also white, brought forth a child as black as an Ethiopian, because in copulation the strongly and continually had in her mind the picture of the Ethiope.

The Effigies of a Maid all bairy, and an Infant that was black by the imagination of their Parents.

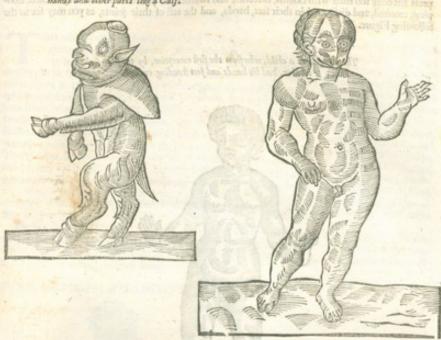

There are fome who think the Infant once formed in the Womb, which is done at the utmost within two and forty days after the conception, is in no danger of the Mothers imagination, neither of the feed of the Father which is cast into the Womb, because when it hath got a perfect figure, it can not be altered with any external form of things; which whether it be true or no, is not here to be inquired of: truly I think it best to keep the woman all the time she goeth with child, from the sight of such there and so of fuch shapes and figures.

In Stequer a Village of Saxony, they fay, a Monster was born with four feet, eyes, mouth, and note like a Calf, with a round and red excrescence of slesh on the fore-head, and also a piece of slesh like a hood hung from his neck upon his back, and it was deformed with its thighs torn and cut.

The

The effigies of a borrid Monfter, having feet, The effigies of an Infant with a face like a Fragi hands and other parts like a Calf.

Anno Dom. 1517. in the Parish of Kings-wood in the Forest of Biera, in the way to Fontainbleau there was a Monster born with the face of a Frog, being seen by John Bellanger, Chirurgeon to the Kings Engineers, before the Justices of the Town of Harmon, principally John Bribon the Kings Procurator in that place. The Fathers name was Amadams the Little, his Mothers Magdalene Sarbucala, who troubled with a Fever, by a Womans perfuation, held a quick Frog in her hand until it died; the came thus to bed with her husband and conceived: Belanger, a man of an acute wit, thought this was the cause of the monstrous deformity of the child.

CHAP. VIII.

Of Monfters caused by the straitness of the Womb.

E are confirmined to confels by the event of things, that Monfiers are bred and caufed by the firaitness of the Womb; for so Apples growing upon the Trees, if before they findeness come to just ripeness they be put into firait Vessels, their growth is hindred. So form Whelps which Women take delight in, are hindred from any further growth by the littleness of the place in which they are kept. Who knows not that the Plants growing in the Earth, are hindred from a longer progress and propagation of their roots, by the opposition of a Flint, or any other so-hid body, and therefore in such places are crooked, slender and weak, but on the other part, where they have free nourithment, to be firait and firong? for feeing that by the opinion of Naturalifis, the place is the form of the thing placed, it is necessary that those things that are shut up in straiter spaces, prohibited of free motion, should be lessened, depraved, and lamed.

Empedacles and Diphilus acknowledged three causes of monstrous births: The too great or small

matter of the feed, the corruption of the feed, and depravation of growth by the firaitness or figure of the womb, which they thought the chiefest of all, because they thought the cause was such in natural births, as in forming of Metals and fulible things, of which Statues being made, do lefs exprefs the things they be made for, if the molds or forms into which the matter is poured, be rough, feabrous, too firait, or otherwise faulty.

CHAP. IX.

Of Monsters caused by the ill placing of the Mother, in sitting, lying down, or any other face of the body in the time of her being with child.

E often too negligently and carelelly corrupt the benefits and corporal endowments of Nature in the comlines and dignity of conformation: it is a thing to be lamented and pitied in all, but especially in women with child, because that fault doth not onely hurt the Mother, but deforms and perverts the Infant which is contained in her womb: for we moving any manner of way, must necessarily move whatsoever is within us. Therefore they which sit idlely at home all the time of their being with Child, as cross-legged, those

the womb

which holding their heads down, do few or work with the needle, or do any other labour, which prefs the belly too hard with cloaths, breeches, and fwathes, do produce children wry-necked, flooping, crooked, and disfigured in their feet, hands, and the rest of their joints, as you may see in the following Figure.

The Effigies of a child, who from the first conception, by the fite of the Mothet, had his hands and feet standing crooked.

CHAP. X.

Of Monsters caused by astroke, fall, or the like occasion.

Here is no doubt but if any injury happen to a Woman with child, by reason of a stroke, fall from on high, or the like occasion, the hurt also may extend to the child. Therefore by these occasions the tender bones may be broken, wrested, strained, or depraved after some other monstrous manner: and more, by the like violence of such things, a Vein is often opened or broken, or a stux of bloud, or great Vomitting is caused by the vehement concussion of the whole body, by which means the child wants nourishment, and therefore will be small and little, and altogether monstrous.

CHAR XI.

Of Monsters which have their original by reason of hereditary diseases.

By the injury of hereditary difeafes Infants grow monstrous, that is, monstrously deformed for Crook-backed produce Crook-backed, and often-times so crooked, that between the bunch behind and before, the head lies hid, as a Tortoise in her shell: so Lame produce Lame, Flat-nosed their like, Dwarss bring forth Dwarss, Lean bring forth Lean, and Fat produce Fat.

CHAP. XII.

Of Monsters by the confusion of Seed of divers kinds.

Hat which followeth is a horrid thing to be spoken; but the chaste mind of the Reader will give me pardon, and conceive that, which not onely the Stoicks, but all Philosophers, who are busied about the search of the causes of things must hold, That there is nothing obscene or filthy to be spoken. Those things that are accounted obscene may be spoken without blame, but or filthy to be spoken. Those things that are accounted concene may be spoken without blame, but they cannot be acted or perpetrated without great wickedness, fury and madness; therefore that ill which in obscurity confiss not in word, but wholly in the act. Therefore in times past there have which in oblcurity contains not in word, but whonly in the act. Therefore in times palt there have been fome, who nothing fearing the Deity, neither the Law, nor themselves, that is, their soul, have so abjected and profitated themselves, that they have thought themselves nothing different from Beasts: wherefore Atheists, Sodomites, Out-laws, forgetful of their own excellency and divinity, and Beafts: wherefore Athents, Sodomites, Out-laws, forgettal of their own excellency and divinity, and transformed by filthy laft, have not doubted to have filthy and abominable copulation with Beafts. This fo great, fo horrid a crime, for whose expiation all the fires in the World are not sufficient, though they too maliciously crafty, have concealed, and the conscious Beafts could not utter, yet the generated mif-shapen iffue hath abundantly spoken and declared, by the unspeakable power of God, the revenger and panisher of such impious and horrible actions. For of this various and promiscuous consustion of feeds of a different kind, Monsters have been generated and born, who have been partly Men and partly Beafts.

The like deformity of iffue is produced, if Bealts of a different species do copulate together, Nature always affecting to generate something which may be like it self: for Wheat grows not but by sowing of Wheat, nor an Apricock but by the setting or grafting of an Apricock, for Nature is a most diligent preferver of the species of things.

The Effigies of a Monster half Man and half Dog.

Anno Don. 1493. there was generated of a Wo-man and a Dog an iffue, which from the navel up-wards perfectly refembled the shape of the Mother, but therehence downwards the Sire, that is, the Dog. This Monfter was fent to the Pope that then reigned, as Volaterane writeth: also Cardane men- carden lib. 14. tions it; wherefore I have given you the Figure de var, reran

The Figure of a Monster in Face resembling a Man, but a Goat in bis other Members.

Celius Rhodiginus writes that at Sibaris, a Herdfinan called Chrathis fell in love with a Goat, and accompanied with her, and of this detestable and brutish copulation an Infant was born, which in legs refembling the Dam, but the face was like the Fathers.

The Figure of a Pig, with a Head, Face, Hands, and Feet of a Man.

Anno Dom.
1110 in a certain Town of
Liege (as faith
Lycoftbenes) a
Sow farrowed
a Pig with the
Head; Face,
Hands and
Feet of a Man,
but in the reft
of the body
refembling a
Swine.

Anno Dom. 1564. at Ernxels at the house of one Joss Dillapeers, in the Street Warmorshvoells, a Sow farrowed fix Pigs, the first whereof was a Monster representing a Man in the Head, Face, Forefeet and Shoulders, but in the rest of the body another Pig, for it had the genitals of a Sow-pig, and it sucked like other Pigs: but the second day after it was farrowed, it was killed of the People together with the Sow, by reason of the monstrousness of the thing. Here solloweth the Figure thereof.

The Effigies of a Monster half Man and half Swine.

Anno Dom. 1571. at Answerp, the wife of one Miebsel a Printer, dwelling with one John Molline a Graver or Carver, at the Sign of the Golden Foot in the Camiftrate, on S. Thomas his day, at ten of the Clock in the Morning, brought forth a Monster wholly like a Dog, but that it had a shorter neck, and the head of a Bird, but without any Feathers on it. This Monster was not alive, for that the Mother was delivered before her time; but she giving a great scritch in the instant of her deliverance the Chimney of the house fell down, yet hurt no body, no not so much as any one of sour little children that sate by the fire-side.

The Figure of a Monster like a Dog, but with a Head like a Bird.

Lewis Gelias writeth that he hath read in an approved Author, that an Ewe once brought forth a Lion, a Beaft of an unlike and adverse nature to her.

An.Dom.1577. in the Town of Blandy three miles from Melon, there was lambed a Lamb having three heads, the middlemoft of which was bigger than the reft; when one bleated they all bleated. John Bellanger the Chirur-geon of Melo affirmed that he faw this Montter, and got it drawn, and fent the figure thereof to me with that humane Monfler that had the head of Frog, which we have formerly described.

There are fome Monsters in whose genera-tion by this there may feem to be some divine cause, for that their beginnings cannot be derived or drawn from the general caule of Monsters; that is, Nature, or the errours thereof, by reason of some of the fore-mentioned particular causes: such are these Monfters that are wholly against all Nature, like that which we formerly mentioned of a Lion

yeaned by an Ewe.

Yet Attrologers (left there should feem to be any thing which they are ignorant of) refer the causes of these to certain constellations

and afpects of the Planets and Stars, according to Aritotles faying in his Problems; in confirmation whereof they tell us this tale. It happened in the time of Albertus Magnus, that in a certain Village, a Cow brought forth a Calf which was half a man: the Townsmen apprehended the Herdsman, and condemned him as guilty of fuch a crime, to be prefently burnt together with the Cow; but by good luck Albertus was there, to whom they gave credit, by reason of his much and certain experience in Aftrology, that it was not occasioned by any humane wickedness, but by the efficacy of a certain polition of the Stars that this Monfter was born.

CHAP. XIII.

Of Monsters occasioned by the craft and Subtilty of the Devil.

N treating of such Monsters as are occationed by the craft of the Devil, we crave pardon of the courteous Reader, if peradventure going further from our purpole, we may feem to fpeak more freely and largely of the Exiftence, Nature, and Kinds of Devils. Therefore first it is manifest that there are Conjurers, Charmers, and Witches, which whatfoever they do, perform it by an agree-how they ment and compact with the Devil, to whom they have addicted themselves: for none can be admitted into that Society of Witches, who hath not forfaken God the Creator, and his Saviour, and hath not transferred the Worship due to Him above, upon the Devil, to whom he hash obliged himfelf. And affuredly, who foever addicts himfelf to thefe Magical vanities and Witcherafts, doth it either What indubecause he doubts of Gods Power, Promises, steady and great Good Will towards us: or else for that exth them he is madded with an earnest defire of knowing things to come y or else because disdaining poverty, thereto. he affects and defires from a poor effate to become rich on the fudden. It is the confiant opinion of all, both Ancient and Modern, as well Philosophers as Divines, that there are some such men; which when they have once addicted themselves to impious and devillish Arts, can by the wondrous craft of the Devil, do many firange things, and change, and corrupt bodies, and the health and life of them, and the condition of all mundane things. Also experience forceth us to confels the fame; for punishments are ordained by the Laws against the Proteffors and Practifers of such Arts; but there are no Laws against those things which neither ever have been, nor ever came into the know-ledge of men: for such things are rightly judged and accounted for impossibilities, which have never been feen or heard of.

Before the birth of Chrift there have been many such People; for you may find in Exader and LeProduct 216

Witten Laws made against such persons by Moster, by whom God gave the Law to his People. The Unit cap. 19. Lord gave the fentence of death to Ochafias by his Prophet, for that he turned unto these kind of people. We are taught by the Scriptures that there are good and evil fpirits, and that the former are termed Angels, but the latter Devils; for the Law is also faid to be given by the Ministry of Angels: and it is faid that our bodies thould rife again at the found of a Trumpet, and at the voice of an Gal 3-19.

Arch-Angel. Christ faid that God would fend his Angels to receive the Elect into the Heavens.

1. The 4-1.

The Hittory of 7th testifieth that the Devil sent fire from Heaven, and killed his Sheep and Cattel, and raised winds that shook the four corners of the house, and overwhelmed his children in the raines thereof. The History of Achab mentioneth a certain lying spirit in the mouth of the Tob is. falle Prophets. Satan entring into Judas moved him to betray Christ. Devils who in a great num- see, 16 44.

wils in Mines

Devils are

Spirits.

ber possessed the body of a man, were called and obtained of Christ that they might enter into Swine, whom they carried headlong into the Sea.

In the beginning God created a great number of Angels, that those divine and incorporeal spirits might inhabit Heaven, and as Messengers, signific Gods pleasure to men, and as Ministers or Servants, perform his commands, who might be as Over-feers, and Protectors of humane affairs. great number there were fome who were blinded by pride, and thereby also cast down from the presence, and heavenly habitation of God the Creator. These harmful and crafty spirits delude The Power of evil (pirits omens minds by divers jugling tricks, and are always contriving fornething to our harm, and would ver mankind.

The differenin a fhort space destroy mankind, but that God restrains their sury; for they can onely do so much
ces of Devilsas is permitted them: Expelled Heaven, some of them inhabit the Air, others the bowels of the Earth;
there to remain till God shall come to judge the World: and as you see the Clouds in the Air somewhiles to resemble Centaurs, otherwhiles Serpents, Rocks, Towers, Men, Birds, Fishes, and other
theres: so these strains there shares into all the shares and more thought the strains of things; as offered ver mankind, shapes: so these spirits turn themselves into all the shapes and wondrous forms of things; as ofttimes into wild Beafts, into Serpents, Toads, Owls, Lapwings, Crows or Ravens, Goats, Affes, Dogs, Cats, Wolves, Bulls, and the like. Moreover, they oft-times affume and enter humane bodies, as well dead as alive, whom they torment and punish, yea also they transform themselves into Angels of Light.

They feign themselves to be shut up and forced by Magical Rings, but that is onely their deceit The delutions and craft; they wish, fear, love, hate, and oft-times as by the appointment and decree of God, they punish Malefactors: for we read that God fent evil Angels into Egypt, there to defiroy. They howl of Devils. in the night, they murmur and rattle as if they were bound in chains, they move Benches, Tables, Counters, Props, Cupbords, Children in the Cradles, play at Tables and Cheis, turn over Books, tell Money, walk up and down Rooms and are heard to laugh, to open Windows and Doors, cast founding Vessels, as Brass and the like, upon the ground, break Stone-pots and Glasses, and make other the like noifes. Yet none of all these things appear to us when we arise in the morning, neither find we any thing out of its place or broken. They are called by several names, as Devils, Evil spirits, Incubi, Smeath, Hobgoblins, Fairies, Robin-good-fellows, Evil angels, Sathan, Lucifer, the Father of Lies, Prince of Darkness, and of the World, Legion, and other names agreeable to their Offices and Their Titles and Names.

CHAP. XIV.

Of the subterrene Devils, and such as haunt Mines.

Easis Lavater writes, that by the certain report of fuch as work in Mines, that in fome Mines What the De? there are feen spirits, who in the shape and habit of Men, work there, and running up and down feem to do much work, when notwithstanding they do nothing indeed. But in the mean time they hurt none of the by-standers, unless they be provoked thereto by words or laughter: for then they will throw fome heavy or hard thing upon him that hurt them, or injure them fome other way.

The fame Author affirms that there is a filver Mine in Rhetia, out of which Peter Brief, the Governour of the place, did in his time get much Silver. In this Mine there was a Devil, who chiefly on Friday, when as the Miners put the Mineral they had digged into Tubs, kept a great quarter, and made himfelf exceeding buffe, and poured the Mineral as he lifted, out of one Tub into another. It happened one day that he was more busic than he used to be, so that one of the Miners revised him, and bad him be gone on a vengeance to the punishment appointed for him. The Devil offended with this imprecation and fcoff, fo wrested the Miner, taking him by the head, twining his neck about, he set his sace behind him, yet was not the Workman killed therewith, but lived, and was known by divers for many years after.

CHAP. XV.

By what means the Devils may deceive us.

Ur minds involved in the earthy habitation of our bodies, may be deluded by the Devils divers ways: for they excel in purity and fubtilty of effence, and in the much use of things: belides, they challenge a great preheminence, as the Princes of this World, over all fablunary bodies. Wherefore it is no marvel if they, the Teachers and Parents of Lies, should cast clouds and mifts before our Eyes from the beginning, and turn themselves into a thousand shapes of things and bodies, that by these juglings and tricks they may shadow and darken mens minds.

CHAP. XVI. Of Succubi and Incubi.

Owerful by these fore-mentioned Arts and Deceits, they have fundry times accompanied with The reason of then in copulation, whereupon fuch as have had to do with men, were called Succepti; those the name. which made use of Women, Incubi. Verily St. Augustine seemeth not to be altogether against Lib.15. de civ. it, but that they, taking upon them the shape of man, may fill the genitals, as by the help of Nature, to the end that by this Dei,cap. 12, 6 to the end that by this means they may draw afide the unwary, by the flames of Luft, from Vertue and

John Rufe, in his Book of the Conception and Generation of Man, writes that in his time, a An History.

certain Woman of monstrous lust, and wondrous imprudency, had to do by night with a Devil that turned himfelf into a man, and that her belly fwelled up prefently after the act, and when as the thought the was with child, the fell into fogrievous a difease, that the voided all her entrails by frool,

Medicins nothing at all prevailing.

The like History is told of a fervant of a certain Butcher, who thinking too attentively on Vene- An History. rous matters; a Devil appeared to him in the shape of a Woman, with whom (supposing it to be a Woman) when as he had to do, his genitals so burned after the act, that becoming inflamed he died

with a great deal of torment.

Neither doth Peter Paludanus, and Martin Arelatensis think it absurd to affirm that Devils may be- An opinion get children, if they shall ejaculate into the Womans womb feed taken from some man either dead confused. or alive. Yet this opinion is most absurd and full of fallity, mans feed confisting of a seminal or fanguinous matter, and much spirit: if it run otherwise into the womb than from the testicles, and flay never so little a while, it loseth its strength and efficacy, the heat and spirits vanishing away; for even the too great length of a mans yard is reckoned amongst the causes of barrenness, by reason that the feed is cooled by the length of the way. If any in copulation, after the ejaculation of the feed, prefently draw themselves from the Womans embraces, they are thought not to generate, by reason of the air entering into the yet open womb, which is thought to corrupt the seed. By which it appears how falle that Hiftory in Averrois is, of a certain Woman that faid the conceived with child Averrois his Hiftory conby a mans feed shed in a Bath, and so drawn into her womb, she entering the Bath presently after vist of falsehis departure forth. It is much less credible that Devils can copulate with Women, for they are hood, of an absolute spirituous Nature; but bloud and slesh are necessary for the generation of man. What natural reason can allow that the incorporeal Devils can love corporeal Women? And how can we think that they can generate, who want the infiruments of generation? How can they who neither eat nor drink be faid to fwell with feed? Now where the propagation of the species is not necessary to be supplied by the succession of individuals, Nature hath given no defire to Venery, neither hath it imparted the use of generation; but the Devils once created were made immortal by Gods appointment: If the faculty of generation should be granted to Devils, long since all places had been full of them. Wherefore if at any time Women with child by the familiarity of the Devil, feem to of the Devil. travel, we must think it happens by those Arts we mentioned in the former Chapter, to wit, they use to stuff up the bodies of living Women with cold clouts, bones, pieces of iron, thorns, twisted hairs, pieces of wood, Serpents, and a world of such trumpery, wholly differting from a Womans nature: who afterwards, the time, as it were, of their delivery drawing nigh, through the world of the state her that was falfly judged with child, before the blinded, and, as it were bound up eyes of the by-flanding women, they give vent to their impostures. The following History, recorded in the Writings of many most credible Authors, may give credit thereto.

There was at Confluence a fair Damosel called Margaret, who served a wealthy Citizen: she gave An History.

Whenever the

it out every where that she was with child by lying with a Devil on a certain night. Wherefore the Magistrates thought it sit she should be kept in Prison, that it might be apparent both to them and others, what the end of this exploit would be. The time of deliverance approaching, she felt pains like those which Women indure in travail; at length, after many throws, by the Midwives help, in fiead of a child, she brought forth iron nails, pieces of wood, of glass, bones, stones, hairs, tow, and the like things, as much different from each others as from the nature of her that brought them forth, and which were formerly thrust in by the Devil to delude the too credulous minds

The Church acknowledgeth that Devils by the permission and appointment of God punishing Our first are our wickedness, may abuse a certain shape, so to use copulation with mankind. But that an hutche Devils at mane birth may thence artie, it not onely affirms to be false, but detests as impious, as which believes there us. that there was never any man begot without the feed of man, our Saviour Christ excepted. Now what confusion and perturbation of Creatures thould possess this world (as Cassianus faith) if Devils could conceive by copulation with men? or if Women should prove with child by accompanying them, how many Monfters would the Devils have brought forth from the beginning of the world? how many Prodigies by cafting their feed into the wombs of wild and brute Beafts? for by the opinion of Philosophers, as often as Faculty and Will concur, the effect mult necessarily follow: now the Devils never have wanted will to diffurb mankind, and the order of this World; for the Devil as they fay, is our common enemy from the beginning; and as God is the author of order, and beauty, so the Devil, by Pride, contrary to God, is the causer of confusion and wickedness.

Wherefore if power should accrew equal to his evil mind and nature, and his infinite defire of

milchief and envy; who can doubt but a great confusion of all things and species, and also great deformity would invade the decent and comely order of this Universe, Monsters arising on every fide: But feeing that Devils are incorporeal, what reason can induce us to believe that they can be delighted with venerous actions: and what will can there be whereas there is no delight, nor any decay of the species to be feared? seeing that by Gods appointment they are immortal, so to remain for ever in punishment; so what need they succession of individuals by generation? wherefore if they neither will not can, it is a madness to think that they do commix with Man.

CHAP. XVII.

Of Magick and Supernatural Diseases and Remedies.

Hat I may refresh the mind of the Reader, invited to these Histories of Monsters raised up by the Art of the Devil, Witches, and Conjurers, his Servants, Thave thought good to add the following History of certain Difeases, and remedies supernatural, and wholly magi-Lib, a, de ab 'It. call out of Fernelius. There are Diseases, which as they are sent amongst men by God being offended, cauf.cap,16. to they cannot expect cure otherwise than from God, from whence they are thought supernaturally to have their effence and cure. Thus the Air oft-times, yet chiefly in the time of King David, being defiled with the Peffilence, killed fixty odd thousand persons.

Witches hure by the Devils affiftance.

An Hiftory.

An Hiftery.

Thus Hezeebiss was struck with a grievous disease: Job was defiled with filthy Ulcers by Saran at Gods command. And as the Devil, the cruel enemy of mankind, commonly ufeth by Gods permission to afflict those: so wicked persons by the wondrous subtilty of the Devil, offer violence and do harm to many. Some invoke I know not what Spirits, and adjure them with Herbs, Exorcifins, Imprecations, Incantations, Charms: and others hang about their necks, or otherwise carry certain Writings, Characters, Rings, Images, and other fuch impious stuff. Some use Songs, Sounds, or Numbers: fornetimes Potions, Perfumes, and Smells; fornetimes Geftures and Jugling. There be fome that make the portraiture of the absent Party in Wax, and boast that they can cause or bring a difease into whatsoever part thereof they prick, by the sorce of their Words and Stars, into the like

part of the party absent; and they have no few other tricks to bring other diseases.

We know for certain that Magicians, Witches, and Conjurers, have by charms so bound some that they could not have to do with their Wives; and have made others fo impotent, as if they had been gelt or made Eunuchs. Neither do wicked men onely fend difeafes into mans body, but also Devils themselves. These truly are soon distracted with a certain Fury, but in this one thing they differ from simple Madness, for that they speak things of great difficulty, tell things past and hid, disclose the secrets of such as are present, and revile them many ways, and are terrified, tremble and

grow angry by the power of divine words.

One not very long agon, being by reason of heat exceeding drie in the night-time, rising out of his fleep, and not finding drink, took an apple that he found by chance, and cating it he thought his laws were that and held faft as by ones hands, and that he was almost strangled: and also now posfessed of a Devil entering into him, he seemed in the dark to be devoured of a huge exceeding black Dog, which he, afterwards restored to his former health, orderly related to me. There were divers who by his pulfe, heat and the roughness of his tongue, thought him to be in a Fever, and by his

watching, and the perturbation of his mind, thought him onely to rave.

Another young Noble man, forme few years fince, was troubled at fet times with a shaking of the body, and as it were a Convulsion, wherewith one while he would move onely his left arm, another while the right arm; and also fornetimes but one finger onely, fornewhiles but one leg, fornetimes the other, and at other times the whole trunk of his body, with fuch force and agility, that lying in his bed, he could fearce be held by four men; his head lay without any shaking, his tongue and speech was free, his understanding found, and all his senses perfect even in the height of his sit. He was taken at the least ten times a day, well in spaces between, but wearied with labour: it might have

been judged a true Epilepfie, if the understanding and senses had failed.

The most judicious Physicians who were called to him, judged it a Convulsion, confin-german to the Falling-fickness, proceeding from a malign and venomous vapour impact in the spine of the Back, whence a vapour difperfed it felf over all the Nerves, which pass from the spine every way into the Limbs, but not into the Brain. To remove this, which they judged the cause, frequent Clyticrs are ordained, and firong Purges of all forts, Cupping-glaffes are applied to the beginnings of the Nerves, Fomentations, Unctions, Emplafters, first to diffcus, then to strengthen and wear away the malign quality: These things doing little good, he was sweated with Baths, Stoves, and a Decoction of Gnaisenom, which did no more good than the former, for that we were all far from the knowledge of the true cause of his Disease: for in the third mometh, a certain Devil was found to be the Author of all this ill, bewraying himfelf by voice, and unaccustomed words and sentences, as well Latin as Greek (though the Patient were ignorant of the Greek Tongue:) he laid open by speaking of many Secrets of the By-standers, and chiefly of the Physicians, deriding them for that he had abufed them to the Patients great harm, because they had brought his body so low by needless Pur-

The Devil thews himfelf

When his Father came to visit him, he would cry out long before he came at him, or faw him, Drive away this Visitant, and keep him from coming in here: or else plack his Chain from about his neck; for on this (as it is the custom of the French Order of Knights) there hangs the image of St. Miebael. If holy and divine things were read before him, he shook and trembled more violently. When bis Fit was over, he remembered all that was done, and affirmed he did it again this will, and that be was forry for it. The Devil, forced by Ceremonies and Exorcifins, denied that he was dammed angry, and are for any crime, and faid that he was a fpirit: being asked who he was, and by what means and power terrified by divine things, he faid that he had many habitations into which he could betake himfelt, and in the time of his reft, he could remember them. divine things. he faid that he had many habitations into which he could betake himaca, after things in the time of his reft, he could torment others: that he was caft into this body by a certain person whom he would not name, and that he entered by his feet up to his neck, and that he would go forth again the fame way, when as his appointed time was come. He spoke of fundry other things, as others which are possessed use to do.

Now I speak not these things.

Now I speak not these things as new or strange, but that it may appear that Devils sometimes entering into the body, do forme whiles torment it by diverfe and uncouth ways; other whiles

they do not enter in, but either agitate the good humours of the body, or draw the ill into the principal parts, or with them obstruct the veins or other passages, or change the structure of the instruments, from which causes innumerable diseases proceed: of these, Devils are the authors, and wretched and forlorn persons the Ministers: and the reason of these things is beyond the search of Nature.

Pliny tells that the Emperour New in his time found triagical arts most vain and false: but what need we alledge profane Writers, when as those things that are recorded in Scripture of the Pythonife, of the Woman speaking in her belly, of King Nebuchodonozor, of the Magicians of Pharaob, and other such things not a few, prove that there both is, and hath been Magick. Play tells of Desarchus, that he talling of the entrails of a sacrificed child, turned himself into a Wolf. We read in Homer that Circe in the long wandring of Ulyffer, changed his Companions into Beafts, with an inchanted Cup or Potion: and in Virgil, that the growing Corn may be fpoiled or carried away by inchantments: which things, unlefs they were approved and witneffed by many mens credits, the wifdom of Magistrates and Lawyers, would not have made for many Laws against Magicians, neighbor of Magistrates and Lawyers. ther would there have been a mulet imposed upon their heads by the Law of the Twelve Tables, who had inchanted other mens Corn. But as in magical Arts the Devil doth not exhibit things themselves, as those which he cannot make, but onely certain shows or appearances of things: so in these which are any ways accommodated to the use of Physick, the Cure is neither certain nor safe, but deceitful, captious, and dangerous,

I have feen the Jaundice over the whole body, cured in one night, by a written fcroul hanged It is but a deabout the neck; also I have feen Agues chased away by words and such ceremonies, but in a short ceitful cure while after they returned again and became much worse. Now there are some vain things, and vemed by the rily the fanfies of old Women, which because they have long possessed the minds of men, weakened Devil.

with too much superstition, we term them superstitious. These are such as we cannot truly say of them, wherefore and whence they have the faculties afcribed to them? for they neither arife from the temperament, neither from the other manifest qualities, neither from the whole substance, neither from a divine or magical power, from which two last mentioned, all Medicins beyond Nature, and which are confequently to be used to Difeases, whose effences are supernatural, must proceed. Such Old Wives superstitions like old Wives Medicins and Superfittious remedies, are written Figures and Characters, Rings, where perfittious reither the affiliance of God or Spirits is implicated. The results are written and Characters, Rings, where neither the affittance of God or Spirits is implored. Let me ask you, Is it not a superfittious Medicin to heal the Falling-lickness, to carry in writing the name of the three Kings, Galfar, Melchior, Diseases, and Balthasar, who came to worthip Christ? To help the Tooth-ach, if one whilet Mass is faying, touch his teeth, saying these words, Os non comminants ex ex? To stay Vomiting with certain Ceremonies and words, which they absent pronounce, thinking it sufficient if that they but onely know

I faw a certain fellow that with murmuring a few words, and touching the part, would franch bloud out of what part foever it flowed: there be fome who to that purpose fay this, Delatere ejas exivit sanguis & aqua. How many Prayers or Charms are carried about to cure Agues? fome taking hold of the Patients hand, fay, A que facilis sibi Febris bee fit, atque Marie virgini Christi partus. Another washeth his hands with the Patient before the Fit, faying to himself that solemn Pfalm, Exaltabo to Deus, mens Rex, &c. If one tell an Ass in his Ear that he is fluing by a Scorpion, they fay that

As there are many superstitious words, so there are many superstitious writings also. To help fore Eyes, a Paper wherein the the two Greek Letters T and A are written, must be tied in a thread, and hanged about the neck. And for the Tooth-ach this ridiculous faying, Strigiles facilifying deutate, dentinon delorem perfanate. Also off-times there is no finall superstition in things that are contwards ly applied. Such is that of Apollonius in Pliny, to fearifie the Gums in the Tooth-ach, with the tooth of one that died a violent death: to make Pills of the skull of one hanged, against the bitings of a mad Dog: to cure the Falling-fickness by eating the fleth of a wild Beatt killed with the same iron wherewith a man was killed: that he shall be freed from a Quartan Ague who shall drink the Wine whereinto the Sword that hath cut off a mans head, shall be put; and he, the parings of whose nails shall be tied in a linnen cloth to the neck of a quick Eel, and the Eel let go into the Wine where the property of the Wilsten heading and the Beatle while he hid morning and the Physics. The pain of the Milt to be affwaged, if a Beafis Milt be laid upon it, and the Phy-Water again. The pain of the Milt to be allwaged, if a Bealts Milt be faid upon it, and the Phyfician fay that he cures or makes a Medicin for the Milt. Any one to be freed from the Cough, who shall spit in the mouth of a Toad, letting her go away alive. The Halter wherein one hath been hanged put about the Temples, to help the Head-ach. This word Abracadabra, written on a Paper, after the manner described by Serenm, and hanged about the neck, to help Agues or Fevers, especially Semi-tertians. What truth can be in that which fundry affirm, that a leaf of Latbris, which is a kind of Spurge, if it be placked uppered will conference but here here and oppositely semiwhich is a kind of Spurge, if it be plucked upwards, will caufe vomit, but broken downwards will thove to Stool? You may also find many other superstitious sections concerning herbs, such as Galen reports that Andrew and Pampbilus writ, as incantations, transformations, and herbs dedicated Like de Sing.

I had thought never in this place to have mentioned these and the like, but that there may be everywhere found fuch wicked persons, who leaving the Arts and Means which are appointed by God to preserve the health of Mans body, sly to the superstitious and ridiculous remedies of Sorcerers, or rather of Devils, which notwithflanding the Devil fometimes makes to perform their wished for effects, that so he may still keep them ensured and addicted to his service. Neither is it to be approved which many say, that it is good to be healed by any Art or Means, for that healing is a good work. This faying is unworthy of a Christian, and favours rather of him that trusts more to the Devil than in God. Those Empericks are not of the Society of Sorcerers and Magicians, who heal simple wounds with dry lint, or lint dipt in water: this Cure is neither magical nor miraculous, as many suppose, but wholly natural, proceeding from the healing Fountains of Nature; Wounds and Fractures which the Surgeon may heal by onely taking away the impediments,

BOOK XXV. Of Monsters and Prodigies. 606 ments, that is pain, defluxions, inflammation, an abfeefs and gangrene, which retard and hinder the cure of fuch difeases. The following examples will sufficiently make evident the Devils maliciousnefs, always wickedly and craftily plotting against our fafety and life. A certain Woman of Florence (as Langins writes) having a malign ulcer, and being troubled with intolerable pain at the flomach, fo that the Phylicians could give her no case: behold on a sudden Liv. 1918.38.17. the vomited up long and crooked nails and brafs needles wrapped up with wax and hairs, and at length a great gobbet of flesh, so big that a Giants jaws could scarce swallow it.

But that which happened in the year of our redemption 1530. in a certain Town called Figureflat, in the Bishoprick of Eister, exceeds all credit, unless there were Eye-witnesses of approved integrity yet living. In this Town one Utrich Nuloffer, an Husbandman, was tormented with griewous pain in the one fide of his belly; he fuddenly got hold of a iron Key with his hand under the skin, which was not hurt, the which the Barber-Surgeon of the place cut out with a Razor; yet for all this the pain ceafed not, but he grew every day worfe than other: wherefore expecting no other remedy but death, he got a Knife and cut his throat. His dead body was opened, and in his flormach were found a round and loggifth piece of wood, four fieel knives, part fharp, and part toothed. like a Saw, and two sharp pieces of iron, each whereof exceedeth the length of a span; there was alfo as it were a ball of hair. All thefe things were put in by the craft and deceit of the Devil. Thus far Langins. CHAP. XVIII. Of the Coxenages and crafty Tricks of Beggars. Aving treated of Monsters, it follows that we speak of those things which either of themfelves, by reason of their nature full of admiration, have some kind of monstroatness in them, or else from some other ways, as by the crast and cozenage of men. And because to the last mentioned crasts of the Devil, the subtle devices of begging. Companions are somewhat alike, therefore I will handle them in the next place, that the Surgeon being admonished of them, may be more cautious and cunning in difcerning them when he meets with them.

Anno Dom. 1525, when I was at Anjou, there flood a crafty Beggar begging at the Church door, who tying and hiding his own arm behind his back, thewed in flead thereof, one cut from the body of one that was hanged, and this he propped up and bound to his breft, and fo laid it open to view, or littled here all and any for the more little as a confederation of the confederation o An hiflory of a counterfeit ATUL. as if it had been all enflamed, so to move such as passed by, unto greater commisseration of him. cozenage lay hid, every one giving him money, until at length his counterfeit arm not being furely fafined, fell upon the ground, many feeing and observing it; he being apprehended and laid in prifon, by the appointment of the Magistrate was whipped through the Town, with his false arm hanging before him, and fo banished. I had a brother called Jobn Parey, a Surgeon, who dwelt in Vitre in Britain; he once observed a young woman begging, who shewed her breast, as if it had a cancrous ulcer thereon, looking scarfully by reason of much fordid filth, wherewith it seemed to desile the cloth that lay under it. But when Another of a ancrous breft. as he had more diligently beheld the womans face, and the fresh colour thereof, as also of the places about the ulcer, and the good habit of the whole body agreeable to that colour (for the was formewhat fat, and of a very good habit of body) he was eafily hereby induced to suspect some roguery and deceit. He acquainted the Magistrate with this his fuspicion, and got leave that he might carry her home to his house, so to search her more narrowly. Where opening her breast, he found under her arm-pit, a Sponge moifined with a commixture of beafts blond and milk, and carried through an El-der-pipe to the hidden holes of her counterfeit Caneer. Therefore he foments her breaft with warm water, and with the moisture thereof looseth the skins of black, green, and yellow Frogs laid upon it, and fluck together with Glew made of Bole-armenick, the White of an Egg, and Flour; and thefe being thus fetched off, he found her breaft perfectly found. The Beggar being calt for this into prilon, confessed that the was taught this trick by a Beggar that lay with her, who himself also, by putting about his leg an Oxes Milt, and perforating it in sundry places, that so the fore-mentioned siquor might drop out, counterfeited an Ulcer of a monstrous bigness and malignity, covering the edges of the Milt on every side with a filthy cloth. This Beggar was delicated as proposed after that early not be found and for the milt on every side with a filthy cloth. was diligently enquired after, but could not be found; and to the was whipped and banished. Within lefs than a year after, there came into the fame City a notable crafty Companion, who presently taking up the Church-doors, laid open his Wares; to wit, a Kercher with some small Of one feig

ing himself lesprous.

The propose pieces of money lying thereon, a wooden Barrel, and *Cliquets, where-with he would ever now pieces of money lying thereon, a wooden Barrel, and *Cliquets, where-with he would ever now and then make a great noise: his face was spread over with great thick putiles, being of a blackish things made and then make a great noise: his face was spread over with great thick putiles, being of a blackish things made and then make a great noise: his face was spread over with great thick putiles, being of a blackish things made and then make a great noise: his face was spread over with great thick putiles, being of a blackish things made and then make a great noise with Glue like those that have the Leprosic: this his ghassily look made him to be pittied by all men, which was the cause that every one gave him money. Then my brother came somewhat nearer him, and asked him how long he had been troubled with this so cruel Discome what his Parents both died of this wicked Disease, so that their members sell away by womb, and that his Parents both died of this wicked Disease, so that their members sell away by hoarse to get the will leather, that they will make a great noise with them, and then flackned the fwathe with his hand, the freesler to draw his breath; which when my brother are used by the French Eeggars.

Rowler that was about his neck, then washed his face with warm water, so that the counterfeit glued putiles were dissolved, and his face (free from all tainture) shewed it self of a good and natural.

ral colour and shape. Then he laid bare his whole body, and diligently viewed each part, and found no sign of a Leprosie, one or other. Which when the Magistrate once heard, he made him to be put in prison, and to be thrice whipped through the Streets of the City, with his Barrel hanging before him, and his Cliquets behind him, adding thereto the punishment of perpetual bandhment. It happened that as he was whipped the third Market-day, the People cried out to the Hangman in jest, that he should not fear to lath him foundly, for being leprous he could not feel it; the Executioner incited by this cry of the People, did so belabour him, that the Wretch did of his Whipping within a short while after, having a just reward for his wickedness. For these Impostors, besides that they live like drones, seigning this or that Disease, and so being idle, enjoy the fruits of others labours: they also divers times conspiring together, take away the lives and goods of honest and substantial Citizens and other people: for there are some of them that in an evening, as men that have no habitation, desire lodging for a night, and it being granted them, they, when as the Master of the house and his Family are alseep, open the doors to their Comrades, men as wicked as themselves, and kill and carry away all they can. themselves, and kill and carry away all they can.

Certainly we may juffly affirm, that this crafty way of begging is the Mother and School of all A multitude of Beggars dishonefty: for how many acts of bawdry and poisoning every where corrupt the Wells and publick hurful to the Fountains? How many places have been burnt under the shew of begging? Where can you get more City. fit Spies? Where more fit Undertakers and Workers of all manner of Villany, than out of the crew

of these Beggars?

Some of them there are, who befracar their faces with foot laid in water, fo to feem to have the How to disco-Jauridice. But you may at the first fight had out the deceit, by the native whiteness of the outer ver such as coat of the eye, called Adnata, which in such as truly have the Jaundice, user to be died and overcast with a yellowish colour; also you may be more certain thereof, if you wet a cloth in Water or Spittle, and fo rub the face; for the adventitious yellownels will quickly vanish, and the true native colour shew it felf.

Some there be, who not content to have mangled, and filthily exulcerated their limbs with can-flick herbs, and other cauteries; or to have made their bodies more (wollen, or elfe lean, with medicated drinks; or to have deformed themselves some other way, but from good and honest Citizens, who have charitably relieved them, they have stollen their children, have broken or dislocated their arms and legs, have cut out their rongues, have depressed the cheft or whole breast 5 that with these as their own children, begging up and down the Countrey, they may get the more relief, pitifully complaining that they came by this mischance by Thunder or Lightning, or some other strange

Laftly, They part the Kingdom amongst themselves as into Provinces, and communicate by Letters one to another, what news or new quaint devices there are to conceal or advance their Roquery

ters one to another, what news or new quaint devices there are to conceal or advance their requiery: to which purpose they have invented a new Language onely known to themselves, so to discourse together, and not to be understood by others. [We here vulgarly term it Canting.]

Dr. Fleelle, a Physician of Paris, intreated me to bear him company to his Country-house at Champigny, four miles from Paris. Where as soon as we arrived, and were walking in the Court, there came presently to us a good lusty well flesh manly woman, begging alms for St. Finere sake, and taking up her Coat and her Smock, she shewed a great gut hanging down some half a foot, which seemed as if it had hanged out of her fundament, whereout there dropped alth like unto pas, which had all stained her Legs and Smock, most beastly and filthy to look upon. Fleelle asked how long had all frained her Legs and Smock, most beastly and filthy to look upon. Fleesle asked how long the had been troubled with this Difease; she answered that it was four years since the north had it. Hence he eafily gathered that the played the counterfeit: for it was not likely that fuch abundance of purulent matter came forth of the body of fo well flesht and coloured a Woman; for the would rather have been very lean and in a confumption. Wherefore provoked with just anger, by reafon of the wickednels of the deceit, he run upon her and threw her down upon the ground, and trod her under his feet, and hit her divers blows upon the belly, fo that he made the gut which hung ar her, to come away, and by threatning her with more grievous punishment, made her confe is the cozenage, and that it was not her gut, but of an Ox, which being filled with bloud and milk, and tied at both ends, the put the one of them into her fundament, and let the filth flow forth at very little holes.

Not very long ago, a Woman equally as shameless, offered her self to the Overseers of the Poor of Of one feign Paris, intreating that the might be entered for one of their Pentioners, for that her Womb was fallen down by a dangerous and difficult birth, wherefore the was unable to work for her living. Then they commanded that the fhould be tried and examined, according to the cuftom, by the Surgeous which are therefore appointed: who feeing how the whole bufiness was carried, made report the was a Counterfeit, for the had thrust an Oxes bladder, half blown and beforecared with beatily bloud by the neck, whereto she had fastned a little Sponge, into the neck of her Womb, for the Sponge being filled and swollen up by the accustomed moisture of the Womb, so held up the Oxes bladder that hanged thereat, that the might fafely go without any fear of the falling of it out, neither could it be pulled forth but with good force. For this her device the was put into Prifon, and being first whipped, was after banished. This cozenage is not much unlike theirs, who by fitly applying a Sheeps Paunch to their groin, counterfeit themselves to be bursten,

Anno Dom. 1561. there came to Paris a lufty, frout, and very fat Norman Woman, being about Of a Beggar Anno Dom. 1561. there cause of the form door, did cast to meet with rich Women, and that feigned fome thirty years old, who begging from door to door, did cast to meet with rich Women, and that feigned fome thirty years old, who begging from door to door, did cast to meet with rich Women, and that feigned very familiarly and pitifully would relate unto them her misfortune, faying, the had a Snake in her have a Snake Very familiarly and pititully would be something the state of the stat putting their hand to her Belly, adding also that the was troubled day and night with its unceffant gnawing of her guts. The novelty of this sad chance, moved all topity and admirations wherefore as much as they could, they affisted her with means and counsel. Amongst the rest, there was

a Woman of great devotion and charity, who fending for Doctor Hollering Chevall and me, asked us if this Snake could by any means be gotten forth. Hollering gave her a throng purgation, hoping that by firring up the expulsive faculty, the Serpent might be cast forth together with the noxious humours. But this hope had no fuch fucces. Wherefore when as we met again, we thought it fit to put a Speedium matricis into the neck of her womb, so to see if we could discern either head or tail: but I making large dilatation of her Womb, could see no such thing, oncely we observed a certain voluntary motion, whereof she her self was the author, by contracting and dilating the muscles of the lower belly. Which when as we had observed, perceiving the deceit and imposture, we thought good so to terrific her, and make her contest the deceit, to tell her that the impofture, we thought good fo to terrifie her, and make her confefs the deceit, to tell her that the
must take another, but that a more firong purgation; that what we could not do by the former, as more gentle, we might attain to by the latter, as far ftronger. She diffembling all fear, and confcious of her craft and diffimulation, after we were gone in the evening, packing up her fluff, and a great deal more then her own, the fecretly fiole away, not bidding her Hoffels farewel; and thus at length the fraud was apparent, to the lofs of the honest Gentlewoman. I faw this baggage fix days after, fitting luftily upon a Pack-horse, at the Gate Montmartre, and laughing heartily with such as brought Sea-hith to Town: and the was returning (as it was most likely) into her Countrey, feeing her couze-

nage was difcovered here,
Such as feign themselves dumb, draw back and double their tongues in their mouths. Such as falling down counterfeit the Falling-fickness, bind straitly both their wrists with plates of iron, rumto ble and rowl themselves in the mire, sprinkle and defile their heads and faces with Beatls bloud, and thake their limbs and whole body. Lastly, by putting Soap into their mouths, they foam at the mouth like those that have the Falling-sickness. Othersome with Flour make a kind of Glue, wherewith they befreear their whole bodies, as if they had that Leprolic or Scab that is vulgarly termed felves leprous. Malum fancii Manis. Neither must we think this Art of Counterfeiting and cheating Begging to be new, and of late invention; for long ago it flourished in Asia, even in the time of Hoperates, as may appear in his Book De Aere, Locis, & Aquis. But by how much this diffeafe hath taken more deep root, and grown more inveterate by process of time, by so much it must more diligently and carefully be looked to and prevented, by cruelly punishing such Counterfeits: for that by this feigned begging, as the Nourither of Sloth, and Shop of all difhonelty, that which is taken from the good is bestowed upon the ill, and one wicked and counterfeit Beggar hurts all other wretched people.

CHAP. XIX.

Of strange or monstrous accidents in Diseases.

Hat monftroufness foever was in the last mentioned parties, it was made up by the craft of Beggars for filthy gain. But if there be any monftroufness in the following narrations it is of Nature, but working as it were miraculously, by some secret and occult means; for thus there are oftentimes Monfiers in Difeafes. Before the Town of St. John de Angeley, a Souldier called Francis, of the Company of Captain Murer, was wounded with a Harquebuz-shot on the belly, between his navel and fides; the bullet was not taken out, because the Surgeons who fearched him diligently, could not find it: wherefore he was troubled with grievous and tormenting pains, until the nineth day after he received the wound, the bullet came forth at his fundament wherefore within three weeks after he was perfectly whole. He was healed by Simon Crinay, the Surgeon of the French Companies.

James Pope, Lord of St. Albans in Daupbine, was wounded at the Skirmish at Chafenay, having three Harquebuz bullets entering into his body, one whereof pierced under his throat, where it bun-cheth out as with a knot, near to the pipe of his lungs, even to the beginning of the Vertebre of the neck, in which place the Leaden bullet fluck, and as yet doth remain. Hercupon he was afflicted with many and fearful fyrnptoms, as a Fever, and a great fwelling of his whole neck, so that for ten whole days he could swallow nothing but broths and liquid things. Yet he recovered, and remaineth well at this present, by the cure of James Dalam the Surgeon.

Alexander Benedicius makes mention of a certain Country man, who, that into the back with a dart, drawing out the shaft, the head was left behind, being in length about the bredth of two fin-gers, but hooked and tharp on the fides. When as the Surgeon had carefully and diligently fought for it, and could by no means find it, he healed up the wound, but two moneths after this crooked head came forth at his fundament.

The fame Author telleth that at Venice a Virgin swallowed a needle, which force two years after the voided by urin, covered over with a flony matter, gathered about vifecus humours.

meedle voided by urin.

Catherine Perlan, the wife of William Guerrier, a Draper of Paris, dwelling in the Jewry, as the rode of Milliam Guerrier, a Draper of Paris, dwelling in the Jewry, as the rode of Meedle run.

on Horfe-back into the Country, a needle out of her Pin-cuthion, got under her by accident, ran ming in arthe to deep into her right buttock, that it could not by any Art or force be plucked forth. Four buttock, came moneths after the fent for me to come to her, and the told me that as often as the had to do with her forth at the husband, the fusered extreme pricking pain in her right groin; putting my hand thereto, as I felt it, my fingers met with fomething fharp and hard, wherefore I used the matter fo, that I drew forth the needle all rufty: this may be accounted as a miracle, that Steel, naturally heavy, should rife upwards from the buttock to the groin, and pierce the mufcles of the thigh, without cauling an abscess.

Anno Dom. 1566, the two fons of Lawrence Collo (men excellent incutting for the Stone) took forth a Stone of the bigness of a Wall-nut, in the midit whereof was a needle, just like those that Shoe-makers use: the Patients name was Peter Coopsis, dwelling in the Street Galand, at the place

called Manhers at Paris, and I think he is yet living. This Stone was thewed to King Charles the Ninth, for the monttrousness of the thing, I being then prefent, which being given me by the Surgeon, I preferve amongst my other rarities.

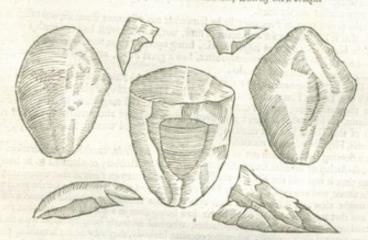

The Figure of a Stone taken forth of the Bladder of a Confectioner.

Anno Dom. 1570. the Dutchess of Ferrara at Paris, fent for John Collo to take a Stone out of a Confectioner. This Stone, though it weighed nine ounces, and was as thick as ones fift, yet was it happily taken out, the Patient recovering, Francis Rouffet and Joseph Javelle, the Dutchefs Physicians, being present. Yet not long after this Confectioner died by the stoppage of his water, by reason of two other little stones, which about to descend from the Kidnies to the Bladder, flaid in the midway of the Ureters. The figure of the extracted ftone was this.

Anno Dom. 1569. Laurence Collo the younger, took three flones out of the Bladder of one dwelling at Marly, called commonly Tire-vii, because being troubled with the Stone from the tenth year of his age, he continually scratched his Yard, each of the Stones were as big as an Hens Egg; of colour white, they altogether weighed twelve ounces. When they were prefented to King Charles, then lying at St. Maure des Fauffez, he made one of them to be broken with a Hammer, and in the midft thereof there was found another of a Chefnut colour, but otherwife much like a Peach-Itone, These three Stones, bestowed on me by the Brethren, I have here represented to the life.

The Effigies of the three fore-mentioned Stones, whereof one is broken.

I have in the diffecting of dead Bodies, observed divers Stones of various forms and figures, as of Pigs, Whelps, and the like. Dalechampius telleth that he faw a man, which by an Abfeefs of his Loins, which turned to a Fiffula, voided many Stones out of his Kidnies, and yet notwithflanding Loins, which turned to a rintua, vouce many stones out of many stones of the Kings most learned and skilful Physician, having in cure a Woman, troubled with cruel torment and pains of the Belly and FunA Scone by ful Physician, having in cure a Woman, troubled with cruei torment and pains of the Belly and Bun-A. Stone by dament, sent for me, that by putting a Speeulum into the Fundament, he might see if he could perture any discernable cause of so great and pertinacious pain: and when as he could see nothing which might further him in the finding out of the cause of her pain (following Reason as a Guide) which might further him in the finding out of the cause of her pain (following Reason as a Guide) have also could be suffered to the fundament. by giving her often Clythers and Purgations, he brought it fo to pass, that the at length voided a Stone the at her Fundament of the bigness of a Tennis-ball: which once avoided all her pain ceased.

Hippocrates tells us that the Servant of Dyferis in Lariffa, when the was young, in using Venery was 5 Epid. Hippocrates tells us that the Servant of Dygers in Longo, when the was young, in using venery was 5 Epid.

Inuch pained, and yet formetimes without pain, yet the never conceived. But when the was fixty A Stone come years old, the was pained in the afternoon as if the had been in labour. When as the one day before ing out of the noon had caten many Leeks, afterward the was taken with a most violent pain far exceeding all most of the words.

The former of the control of the control of the words. The follows her former, and the felt a certain rough thing rifing up in the orifice of her womb: but the falling

into a fwound, another woman putting in her hand, got out a sharp stone of the bigness of a whirl, and then the forthwith became well, and remained to.

Lib.1. cap. de pelp. cand.

In a certain Woman, who, as Hollerius tells, for the space of four Moneths was troubled with an incredible pain in making water, two flones were found in her heart, with many abfeeffes, her Kidnies and Bladder being whole.

Anno Dom. 1558. I opened in John Bourlier a Tailor, dwelling in the street of St. Honore, a watry abfeefs in his knee, wherein I found a ftone, white, hard, and fmooth, of the thickness of an Al-No part of the mond; which being taken out, he recovered. Gertainly there is no part of the body wherein ftones

body wherein be found. A Needle fwallowed, came forth at: the Navel forme givo years after.

flones may not breed and grow. Anthony Eurevenius a Florentine Physician writes, that a certain Woman swallowed a brass Needle without any pain, and continued a year after without feeling or complaining of it: but at the end thereof the was molested with great pains in her belly; for helping of which she asked the advice of all the Phylicians she could, making in the interim no mention of the swallowed Needle. Wherefore the had no benefit by all the Medicins the took; and the continued in pain for the space of two years, until at length the Needle came forth at a little hole by her Navel, and the recovered

A fprig of Grais fwallowed came forth whole again between the ribs. A Knife fwallowed, came forth at an abfeels in the groin.

Sword fwal-

lowed, came forth at the

the Womb

fundament. Wonderful

A Scholar named Chambelant, a Native of Bourges, a Student in Paris, in the Colledge of Preffe, fwallowed a stalk of Grass, which came afterwards whole out between two of his ribs, with the great danger of the Scholars life. For it could not come there unless by passing or breaking through the lungs, the encompaffing membrane, and the intercoftal mufcles; yet he recovered, Fernelius and Haguet having him in cure,

Cabrolle Chirurgeon to Monficur the Marshal of Anville, told me that Francis Guillines the Chirurgeon of Sommiers, a fmall Village forme eight miles from Mompelier, had in cure, and healed a certain Shepherd, who was forced by Thieves to fwallow a Knife of the length of half a foot, with a Horn handle of the thickness of ones thumb: he kept it the space of half a year, yet with great pain, and he fell much away, but yet was not in a Confumption, until at length an abfects riting in his groin, with great flore of very flinking quitture, the Knife was there taken forth in the presence of the Juflices, and left with Joubert the Physician of Mompelier.

Monfieur the Duke of Roban had a Fool called Guido, who swallowed the point of a Sword of the The point of a length of three fingers, and he voided it at his Fundament on the twelfth day following, yet with much ado: there are yet living Gentlemen of Britany, who were eye-witnesses thereof.

There have been fundry Women with child, who have so cast forth piece-meal children that have

died in their Wombs, as that the bones have broke themselves a passage forth at the Navel, but the excretions of flefh, diffolved as it were into quitture, flowed out by the neck of the womb and the fundament, the Mothers remaining alive, as Dalechampine observes out of Albucrasis.

It is not very ftrange that there have been Women, who troubled with a fit of the Mother, have bled with the lain three whole days without motion, without breathing, or pulfe that were any way apparent, and

so have been carried out for dead.

A certain young man, as Fernelius tells, by formewhat too vehement Exercise, was taken with such An Impo-flume (pit out, of the bigness a Cough, that it left him not for a moment of time, until he therewith had cast forth a whole impoflume of the bigness of a Pigeons Egg, wherein, being opened, there was found quitture exquisitely white and equal. He spit bloud two days after, had a great Fever, and was much differented, yet notwithstanding he recovered his health.

Anno Dom. 1578. Stephana Chartier dwelling at St. Maure des Fauffez, a Widow of forty years old, being fick of a Tertian Fever, in the beginning of her Fit vomited up a great quantity of choler, and together therewith three hairy Worms, in figure, colour, and magnitude like the Worms called Bear-worms, yet fornewhat blacker; they lived eight whole days after without any food! the Chirurgeon of this Town brought them to Dr. Milst, who shewed them to Feure, Le Gross, Marefest,

and Courtin, Phylicians, and to me alfo.

This narration exceeds not only all admiration, but alfo belief,

This following History, taken out of the Chronicles of Mentrele, exceeds all admiration. "A certain Frank-Archer of Mendon, four miles from Paris, was for Robbery condemned to be hanged: in the mean time it was told the King by the Phylicians, that many in Paris at that time were troubled with the Stone, and amongst the rest the Lord of Boseage, and that it would be for the good of many if they might view and differn with their eyes the parts themselves wherein so cruel a disease did breed, and that it might be done much better in a living than in a dead body; and that they might make trial upon the body of the Frank-Archer, who had formerly been troubled with these pains. The King granted their request; wherefore opening his body, they viewed the breathing parts, and fatisfied themselves as much as they defired, and having diligently and exactly reflored each part to its proper place, the body, by the Kings command was fewed up again, and dreffed and cured with great care. It came to to pass, that this Frank-Archer recovered in a few days, and getting his par-

don, got good flore of money belides. Alexander Benedicius tells, that he saw a Woman called Victoria, who having lost all her teeth, and

being bald, yet had others come up in their places, when as the was fourfcore years old. Stephen Tofferer a Chirurgeon of Orleance, told me that not long ago he cured one Charles Verignal Streams of Orleance, of a received in his bern, when he ago he cured one There the ham. a Serjeant of Orleaner, of a wound received in his ham, whereby the two tendons bending the ham, were quite cut afunder. He took this order in the cure; he caused the Patient to bend his leg, then he sewed toogether the series of the cut afunder. were quite out afunder. He took this order in the cure; he caused the Patient to bend his leg, then he fewed together the ends of the cut tendons, then placed the member in that fite, and handled with that Art, that at length he healed the wound, the Patient not halting at all. Truly this is a memorable thing, and carefully and heedfully to be imitated by the young Chirurgeon.

How many have I feen, who wounded and thrust through the body with Swords, Arrows, Pikes, Bollets, have had portion of the brain cut off by a wound of the head, an arm or leg taken away by a Cannon-bullet, yet have recovered; and how many on the contrary, have died of light and small wounds, not worth the speaking of?

wounds, not worth the speaking of?

Pralt. 128.64. cap.I.

A certain man was shot near to his grojn with an Arrow, whom we have seen, saith Hipps- 5- Epiden. training was the fear to his group with an intropy, whom we have been, taken propo-erater, and he recovered beyond all mens expectation. The arrows head was not taken forth, for it was very deep in, neither did the wound bleed very much, neither did he halt: but we found the head and took it forth fix years after he was hurt. Now Hippocrater gives no reason of its so long fray, but that he faith it might be suspected it lay hid between the Nerves, and that no Vein or Artery was cut thereby.

CHAP. XX.

Of the wonderful original, or breeding of some Creatures.

E have read in Boiffey, that a certain Workman of Arignion, when as he lived in that Boiff. in Riffer. City, opened a leaden Coffin, wherein a dead body lay, that was so closely soldered Production of the law in and as he opened it, he was bitten by a Serpent that lay that the air could not get in; and as he opened it, he was bitten by a Serpent that lay mon thing for therein, with fo venomous and deadly a bite, that it had near to have cost him his life. Yet the a Serpent to original cause of this Creature is not so prodigious as he supposeth, for it is an usual thing for a Ser-breed of the pent to breed of any putrified carkass, but chiefly of mans.

Baptiffa Les writes, that in the time of Pope Martin the fifth, there was a live Serpent found en- A live S closed in a vast but solid Marble, no chink appearing in such dense solidity, whereby this living Creating in a folid Marture might breath.

Whilest in my Vineyard, that is at Mendon, I caused certain huge stones to be broken to pieces, a The cause of Toad was found in the midst of one of them. When as I much admired thereat, because there was ful generated increase, or live, the Some center wished me in generated. no space wherein this Creature should be generated, increase, or live, the Stone-cutter wished me rio not to marvel thereat, for it was a common thing, and that he faw it almost every day. Certainly it may come to pals, that from the more moift portion of flones, contained in places moift and under ground, and the celestial heat mixing and diffusing it self over the whole mass of the World, the matter may be animated for the generation of these creatures.

CHAP. XXI.

Of the wondrous nature of some marine things, and other living creatures.

He last mentioned creatures were wonderful in their original, or rather in their growth: but these which follow, though they be not wonderful of themselves, as those that consist of their own proper nature, and that working well and after an ordinary manner; yet they are wondrous to us, or rather monfirous, for that they are not very familiar to us. For the rarity and vafiness of bodies, is in some fort monfirous. Of this fort there are many, especially in the Sea, whose secret corners and receptacles are not pervious to men: as Tritons, which from the middle upwards are reported to have the shape of men: and the Sirens, Neveides, or Meremaids, who (according to Pliny) have the faces of women, and fealy bodies; yea, whereas they have the shape of man; nei- Lis. 9. ther yet can the fore-mentioned confusion and conjunction of feeds take any place here, for as we lately faid, they confift of their own proper nature.

When Mens was Prefident of Egypt, and walked on the banks of Nilus, he faw a Sea-monfler in the shape of a man coming forth of the Waters; his shape was just like to a man even to the middle, with his countenance composed to gravity, his hair yellow, yet intermixed with some grey, his sto-mach bony, his arms orderly made and jointed, his other parts ended in a Fish. Three days after in the morning, there was feen another Sea-monfler, but with shape or contenance of a woman, as appeared by her face, her long hair, and fwollen breafts: both these Monsters continued so long above water, that any one might view them very well.

The Effigies of the Triton and Siren of Nilus.

In our times (faith Rondeletins) in Norway was a monster taken in a tempestuous Sea, the which as many as faw it, prefently termed a Monk, by reason of the shape which you may here see set forth.

The Figure of a Fish resembling a Menk.

The Figure of a Fish in the babit or shape of a Bishop.

Anno Dom. 1531. there was feen a Sea-monster in the habit of a Bishop, covered over with scales:
Rondoletins and Gesner have described it.

Gefree professeth that he received from Jerome Cardane this Monster, having the head of a Bear, the feet and hands of an Ape.

The Effigies of a Sea-monster beaded like a Bear.

The Effigies of a Lion-like Scaly Sea-monster.

Not long before the death of Pope Paul the Third, in the midst of the Tyrrhene Sca, a Monster was taken, and prefented to the Successor of this Paul: it was in fhape and bigness like to a Lion, but all fealy; and the voice was like a mans voice. It was brought to Rome to the great admiration of all men, but it lived not long there being defittute of its own natural place and nourishment, as it is reported by Philip Forest.

An. Dom. 1323. the third day of November, there was feen at Rame this Sea-thonfier, of the bigness a child of five years and little agents it of a child of five years old, like to a man even to the Navel, except the Ears; in the other parts it refembled a Fifh.

The Effigies of a Sea-monfter wish a mans Face.

Gefair makes mention of this Sea-Monster, and faith that he had the Figure thereof from a Painter, who took it from the very Fish, which he saw at Antwerp. The head looks very ghastly, having two horns, prick-cars, and arms not much unlike a man, but in the other parts it was like a Fish. It was taken in the IBvian Sea, as it came ashore out of the water to catch a little child: for being hurt by stones cast by Fishermen that saw it, it returned a while after to the shore from whence it sled, and there died.

The Effigies of a Sea-Devil.

Gefirer tells us that a Sea-Monsier, with the head, mane, and breast of a Horse, and the rest of his body like a Fish, was seen and taken in the Ocean Sea, brought to Rome, and presented to the

Olaus Magnus tells that a Sea-Monster taken at Bergen, with the head and shape of a Calf, was given him by a certain English Gentleman. The like of which was presented lately to King Charles the Nineth, and was long kept living in the Waters at Fountain-blesse, and it went oft-times ashore. This is much different from the common Sea-Calf or Seal.

The Effigies of a monstrous * Sea-Calf.

This great Monster was feen in the Ocean Sea, with the head of a Boar, but longer tusks, tharp and cutting, with feales fet in a wonderful order, as you may fee by the following Figure.

* This here flgured is the Sea-Morfe, taken commonken common-ly by our men in their Green-tend Voyages: and I judge the Sea-boar and Elephant to be the iame, but the abo but that the Painter hath fliewed his skill too much in the one;and the other is an old Morie, as this here figured is a young

The Effigies of a Sea-bore.

Olaus Magnus writes that this Monster was taken at Thyle, an Island of the North, Anno Dontal 538. it was of a bigness almost incredible, as that which was seventy two foot long, and fourteen high, and feven foot between the eyes: now the liver was so large that therewith they filled five Hogsheads; the head resembled a Swine, having as it were a half Moon on the back, and three eyes in the midst of his fides; his whole body was fealy.

The Effigies of a monftrons Sea-Swing.

The Sea-Elephant, as Hellor Bottim writes in his description of Scotland, it is a Creature that lives both in the Water and ashore, having two teeth like to Elephants, with which as oft as he desires to fleep, he hangs himfelf upon a Rock, and then he fleeps fo foundly, that Mariners feeing him at Sea, have time to come afhore and bind him, by caffing firong ropes about him. But when as he is not awakened by this means, they throw flones at him, and make a great noife; with which awakened he endeavours to leap back into the Sea with his accuflomed violence, but finding himfelf faff, he grows fo gentle, that they may deal with him as they pleafe. Wherefore they then kill him, take out his fat and divide or cut his skin into thongs, which because they are firong and do not rot, are much effectived of much effeemed of.

The Effigies of a Sea-Elephant.

The Brabians of Mount Mazoven, which runs alongft the Red Sea, chiefly feed on a Fish called Orobone, which is very terrible and much feared by other Fish, being nine or ten foot long, and of the breadth agreeable thereto, and it is covered with scales like a Crocodile.

A Crocodile is a vast Creature, coming sometimes to be fifteen foot long, and seeing it is a Creature that doth not bring forth young, but eggs, it uses the most to lay some fixty eggs, no bigger than Goose eggs, riling to such bigness from so small beginnings (for the hatched young one is proportionable to the egg.) the is very long lived.

It

It hath fo small and useless a tongue, that it may feem to have none at all. Wherefore seeing it lives both on Land and Water; as it lives on Land it is to be taken for a tongue, but as it lives part of the life in the Water, it hath no use of a tongue, and therefore it is not to be reputed one. For Fifthes either wholly want tongues, or else have them so impedite and bound, that they serve for little use. The Crocodile onely of all other things moves the upper jaw, the lower remaining unmo- The Crocovable: for her feet, they are neither good to take nor hold any thing; the hath eyes not unlike those codile onely of Swine, long teeth flanding forth of the mouth, most sharp claws, a scaly skin, so hard that no moves the up weapon can pierce it. Of the Land Crocodile (resembling this both Land and Water one) is made per jaw. the Medicin Croediles, most singular for fore-eyes, being anointed with the juice of Leeks, it is good expende dili-against suffusions or dimness of the fight; it takes away treckles, pusiles, and spots; the Gall anointed gentre Plinis on the eyes helps Cataracts, but the bloud clears the fight.

There faith they live in the Fountains of the River Nilus, or rather in a lake flowing from the 6.8.

There faith they live in the Fountains of the River Nilus, or rather in a lake flowing from the 6.8.

There is a lake flowing from the 6.8.

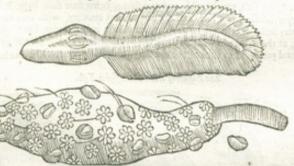

The result have been supported by the fountains of the back, fo that commended in the fountains, and that he faw fome that were fix paces long, and a yard crofs the back, fo that commended in the fountains of the flow paces long, and a yard crofs the back, fo that the flow paces long, and a yard crofs the back, for that the flow paces long, and a yard crofs the back, for that the flow paces long, and a yard crofs the back, for that the flow paces long, and a yard crofs the back, for that the flow paces long, and a yard crofs the back, for that the flow paces long, and a yard crofs the back, for that the flow paces long, and a yard crofs the back, for that the flow paces long, and that the flow paces long, and a yard crofs the back, for that the flow paces long, and that the flow paces long, and a yard crofs the back, for that the flow paces long, and the flow paces their very looks were formidable. They catch them thus: When as the Water of Nilus falls, the flow they rake Egyptians let down a line, having thereto fafined an iron hook of fome three pound weight, made Crocodiles. very large and firong; upon this hook they put a piece of the fleth of a Camel or foune other Beaft; which when as he fees, he prefently falls upon it, and devours it hook and all, wherewith when he finds himself to be cruelly pulled and pinched, it would delight you to fee how he frets and leaps aloft; then they draw him thus hooked, by little and little to the shore, and fasten the rope furely to the next tree, left he should fall upon them that are about him; then with Prongs and such things they To be labour his belly, whereas his skin is foft and thin, that at length they kill him, and uncafing him, they make ready his fleth and eat it for delicious food. John Lerein in his History of Brafil, cap. 10. writes that the Salvages of that Countrey willingly feed upon Crocodiles, and that he faw forme who brought into their houses young ones, wherewith their Children gathering about it, would play without receiving any harm thereby.

True (faith Pliny) is that common opinion, Whatfoever is brought forth in any part of Nature, Lib 9. cap. i. that also is in the Sea, and many other things over and above, that are in no other place. You may perceive that there are not onely the refemblances of living Creatures, but also of other things; if you look upon the Sword, Saw, Cucumer, like in finell and colour to that of the Earth, that you may less wonder ut the Sea-seather and Grape, whose Figures I have here given you out of Rondoletius.

The Sea-feather is like those feathers of Birds which are worn in hats for ornament, after they are trimmed and drest for that purpose. The Fishermen call them Sea-pricks, for that one end of them refembleth the end of a mans yard when the prepace is drawn off it. As long as it is alive it fwells and becomes fometimes bigger and fometimes leffer; but dead, it becomes very flaccid and lank: it shines bright on the night like a Star.

You may by this gather, that this which we here express, is the Grape whereof Pliny makes mention, because in the furface and upper part thereof it much refembles a fair bunch of Grapes; it is fornewhat longish like a mishapen Club, and hangs upon a long stalk; the inner parts are nothing but confusion, fornetimes diftinguished with little glandules, like that we have here figured alone by it felf.

The Figure of the Sea-feather and Grape.

In the Sea near the Island Hiffaniela in the West-Indies, there may be seen many monstrous Fishes, amongst which Theret in his Cosmography thought this most rare and observable, which in the vulgar Language of the Natives is termed Aloer. For it is just like a Goose, with a long and strait neck. with the head ending tharp, or in a Cone, not much unlike a Sugar-pear, it is no bigger than a Goofe, it wanteth feales, it hath four fins under the belly for fwimming; when it is above water you would fay that it were a Goofe.

The Sarmatian, or Eastern German Ocean contains Fishes unknown to hot Countries, and very monffrous. Such is that which refembling a Snail, equals a Barbel in magnitude of body, and a Stag in the largeness and branches of her horns: the ends of her horns are rounded as it were into little Balls, thining like unto Pearls, the neck is thick, the eyes thining like unto little candles, with a roundish nose set with hairs like to a Cats, the mouth wide, whereunder hangs a piece of fiesh very ugly to behold. It goes on four legs, with so many broad and crooked feet, the which with a long tail, and variegated like a Tiger, ferves her for Fins to fwim withal. This Creature is fo timerous, that though it be an Amphibium, that is, which lives both in the Water and afhore, to find the season of the sea leafon. The flesh thereof is very good and grateful meat, and the bloud medicinable for such as Ggg 2

locum, lib. 28.

Tom.lib.20.

The bloud of have their livers ill affected, or their lungs ulcerated, as the bloud of great Tortoifes is good for the great Tortoi-ies good for the Leprofie, Leprofie. Theres in his Cosmography affirmeth that he saw this in Denmark.

In a deep Lake of Fresh water, upon which stands the great City or Town of Themisinian, in the Kingdom of Mexico, which is built upon Piles, like as Venice is, there is found a Fifth of the bigness of a Calf, called by the Southern Salvages Andura, but by those of the place, and the Spaniards the Conquerors of that place, Hoga. It is headed and eared almost like a Swine; from the chaps hang five long bearded appendices, of the length of some half a foot, like the beard of a Barbel. It hath field very grateful and good to cat. It bringeth forth live young like as the Whale. As it swins in Waters it forms green, willow, red, and of many colours, like a Chameleon; it is most frequently Waters it feems green, yellow, red, and of many colours, like a Chameleon: it is most frequently conversant about the Shore-sides of the Lake, and there it feeds upon the leaves of the Tree called called Hoga, whence also the Fish hath its name. It is fearfully toothed, and a sierce Fish, killing and devouring such as it meeteth withal, though they be bigger than her self: which is the reason why the Fishermen chiefly desire to kill her, as Theret affirmeth in his Cosmography.

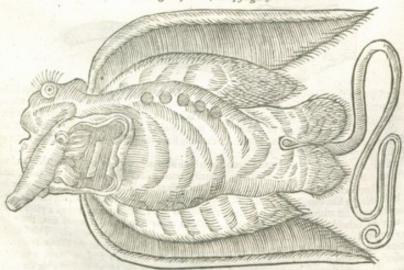

Andrew Theret in his Cofmography writes, that as he failed to America, he faw infinite flore of flying Fishes, called by the Salvages Bulampech, who rifing out of the Water, flie some fifty paces, escaping by that means from other greater fish that think to devour them.

This kind of flying Fish exceeds not the bigness of a Mackrel, is round-headed, with a blewish back, two wings which equal the length of almost all their body. They off-times flie in such a multitude, that they fall foul upon the fails of Ships, whilest they hinder one anothers flight, and by this means there fall upon the Decks, and become a previous the Sailers; which there there we have read means they fall upon the Decks, and become a prey to the Sailers: which fame thing we have read confirmed by John Lereus in his History of Brefil.

In the Venerism Gulf, between Venice and Ravenna, two miles above Quieza, Anno Done. 1550. there was taken a flying Fifh, very horrible and monfrous, being four foot long, it had a very great head, with two eyes flanding in a line, and not one against another, with two ears, and a double mouth, a snout very slessly and green, two wings, five holes in her throat, like those of a Lamprey, a tail an ell long, at the fetting on whereof there were two little wings. This Monster was brought alive to Quinza, and prefented to the chief of the City, as a thing whereof the like had not been formerly feen.

The Figure of a monstrous flying Fish.

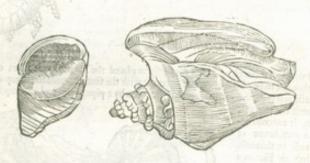

There

There are so many and different forts of shells to be found in the Sea, that it may be truly faid, that Nature, the hand-maid of the 'Almighty, different if the framing of them. In fo great diversity I have chiefly made choice of three to treat of here, as those that are worthy of the greatest of the choice of three to treat of here, as those that are worthy of the greatest of the choice of three to treat of here, as those that are worthy of the greatest of the choice of three to treat of here, as those that are worthy of the greatest of the choice of three to treat of here, as those that are worthy of the greatest of the choice of three to treat of here, as those that are worthy of the greatest of the choice of three to treat of here, as those that are worthy of the greatest of the choice of three to treat of here, as those that are worthy of the greatest of the choice of three to treat of here, as those that are worthy of the greatest of the choice of three to treat of here, as those that are worthy of the greatest of the choice of three to treat of here, as those that are worthy of the greatest of the choice of three to treat of here, as those that are worthy of the greatest of the choice of three to treat of here, as those that are worthy of the greatest of the choice of three to treat of here, as those that are worthy of the greatest of the choice of three to treatest of the choice of three to treatest of the choice test admiration. In these lie hid certain little Fishes, as Snails in their shells, which Aristotle calls 4.De bist.exia. teft admiration. In these lie hid certain little runes, as onains in their mens, which them to be the common companions of the *crusted and shell-fishes, as \$4.4.

Cancelli, and he affirment them to be the common companions of the *crusted and shell-fishes, as \$4.4. Cancelli, and he aftermeth them to be the common companions of the transfer that as "Ey crufted is those which in their feeder or kind are like to Lobflers, and the to be bred without shells; but as "Ey crufted is those which in their feeder or kind are like to shell fishes. It is one of these that is termed when the companions of the state there exists and there inhabit, they are like to shell-fishes. It is one of these that is termed Lossers, they creep into mens, and there instant, they are take to men-nines. It is one or their that is termed Lobflers, the Hermit. He hath two formewhat long and flender horns, under which are his eyes, always Shrimps, and flanding out of his head, as those which he cannot pluck or draw in, as Crabs can. His fore-feet such like. flanding out of his head, as those which he defends himfelf, and carries meat to his mouth, having two The defeription on of the Herhave claws upon them, wherewith ne defends minier, and carries meat to his mouth, having two other on each fide, and a third being a leffer, the which he ufeth in going. The female lays eggs, which hang forth at her back part as if they were put upon a thred, being joined together by certain little membranes. Lafily, in the opinion of Ælian, the Cancellus, or finall Cray-tift is born Like-sup-31. naked and without a shell, but within a while after, she of many which she sinds empty, makes choice of a fit one, and when as grown bigger, the cannot be contained or dwell any longer therein, or elfe being flimulated with a natural defire of copulation, the removes into a more capacious and convenient one. These little Cray-fishes oft-times fight together for their habitation, and the strongger carries away the empty shell, or else makes the weaker to quit possession. Now the shell is either their shelts. of a Norita or Turbo, and off-times of a small purple; and entering into possession, the carries it about, time for two there feeds and grows; and then feeks a more capacious one, as Ariftotle faith in the formerly-cited causes. place.

The Effigies of the empty Shells whereinto the Cancelli use to creep to dwell.

Some think that this Bernard the Hermit is that kind of Cancellus which is by Pliny termed What the Pienner; but in truth the Pienner is not a kind of Cancellus, or Cray-fish, but of a little Crab. water, or Dwarf-Now in Ariffelle there, is much difference between Cancellus and Cancer parvus, though Pliny may Crab is. feem to confound them; for he is bred naked, having his crust onely, but without a shell: where-fore seeing that by Nature he wants it, he diligently searches for it, and dwells in it, when as he hath found it: But the Pinneter is not bred by it self alone, but in Pinne and some others, and he chanfound it: But the Pinneter is not bred by it left alone, but in Pinne and fome others, and he changeth not his habitation, because (as Arithate thinks) being of the kind of Dwart-Crabs, it never grows big, neither dwells it in empty shells. Now the Pinne, or Pin, is a kind of shell-sish, it what the Pine breeds in moddy places, and is always open, neither is it at any time without a Companion, which as is, they therefore call the Pinneter, or Pinnephylax, (i.e.) the Pin-keeper, as Pliny faith. Verily that Lib.9.cap.41. these things are thus, you may plainly perceive by these words of Atheneus. Chrystopus Solensia 5. Lib.3.Diipne. De Honest. & Volupte, faith, the Pinne and Pinneter affish and further each other, neither can they live assessed to the kind of Oissers, but the Pinnete is a Direct Code. De Honel. & Volume. Lith, the Pinna and Pinnater albut and mitther each other, neither can they live afunder. The Pinna may be referred to the kind of Oifiers, but the Pinnater is a Dwarf-Crab: the Pinnater is a Dwar

But that which by these Authors is attributed to the Dwarf-Crab, the same by Cicero is ascribed Lib, 2, de nate to the little Shrimp: Now the Pions (faith he) opening her two large shells, enters into confederacy decrease, with the little Shrimp for getting of food; wherefore when little Fishes swim into her gaping shell, then the Pinna, admonished by the Shrimps biting her, shutsher shell; thus two unlike Creatures get their living together. But Planarch feems to make the Pinna to be the Pearl-Oilter in that Work of his, whereas he enquireth whether the craft of Water or Land-beafts be the greater.

BOOK XXV.

The Figure of him out of his Cell.

The Effigies of Bernard the Hermit boused in his Shell.

Plin. lib.g. 6,29.

But amongst the most miraculous Fishes may fitly be placed the Nantilos, or Sailer, of some called Pompylos (it is thought to be a kind of Polypus) it comes with the face upwards to the top of the Sea, raifing it felf by little and little, that casting forth all the water by a pipe, as if it had a Pump, it easily floats;

then putting back the two first tendrils or arms, it extends between them a membrane of wondrous finencis or thinnels, which gathering air like as a Sail, and the rowing with the reft of her arms, guides her felf with her tail in the midft, as a Rudder. Thus the fails along in imitation of Pinnaces, and if any thing affright her, the prefently takes in Water, and finks her felf.

How the Whale may he recknowed amongs Mon-

The better to flore this Treatife of Monsters, abusing the name with the Poets, we will reckon up the Whale amongst the Sea-monsters, by reason of his monstrous and wondrous magnitude. Now the Whale is the greatest by mach, of all the Fishes of the Sea; for most commonly this Beast is thirty fix cubits long, eight high, the slit of his mouth is eighteen foot long, teeth they have none, but in stead thereof in each Jaw, horny black Excrescences or Fins [which we vulgarly the word limits have light and listle and listle and in small hairs like to a Suring Listle port. term Whale-bones] which by little and little end in fmall hairs like to a Swines briffles, which coming and flanding out of his mouth, are in flead of Guides, left whileft he fwims with a blind and rapid violence, he might run against a Rock. His eyes are distant one from the other the space of four Ells, which outwardly appear fmall, but inwardly they are bigger than a mans head; where fore they are deceived that fay that they are no bigger than an Oxes eyes: his note is thort, but in the middle of his fore-head he hath a pipe whereat he draws in the air, and cafts forth a whole shower or River of water, that therewithal he will even fink the Vessels or Boats of Mariners, when he hath filled himself, hereard reactions have a second reaction. when he hath filled himself beyond measure, he cries out or roars with so great or firong a voice, that he may be heard two miles off. He hath two very large fins upon his fides wherewith he fwims, and under which in the time of danger he hides his young; he hath none upon his backHis tail in fire is like to the tails of Delebins, as like it is young; His tail in fite is like to the tails of Dolphins, neither is it much unlike in flape, which when he moves, he fortoffeth the Sea, that he drowns and overturns the Boats that he toucheth. You may by diffecting the feet the Mark feet the male by diffecting them find that a Whale brings forth live young, and gives them fack; for the male hath Tefficles and a Yard, but the female a Womb and Dugs. They are taken in divers places about Winter, but chiefly about the Coaft of Aquitain, at a small Town which is vulgarly called Biarrit, fome six miles distant from Bayon: whereunto I being sent by King Charls the Nineth when he was at Bayon, to cure the Prince of Rache Sur-Tou. I was an eye-witness how they are caught; and also I consimmed that which I had formerly read to that purpose, in that excellent and most true

Whale brings forth young, and nickles them.

true History of Fishes fet forth by Rondoletius. Now at that Town there is a little hill, in the top How they are whereof there is a Tower of very great antiquity, from which as from a watch-Tower they keep watch whether or no any Whales fwim that way. Wherefore the Watch-men from the Tower, ci-ther feeing, or by the horrible noife hearing a Whale to pass that way, they give warning thereof to the inhabitants by the beating of Drums, and ringing a Bell: which fign once given they all run forthwith, as to extinguish the City if it were on fire, being furnished with weapons and all things fitting for that purpose. For the people of that country are very diligent and expert in catching the Whale. Wherefore in each of the boats furnished with all things either to affail or flie, there are put ten luftie rowers, and divers others furnished with harping irons to firike the Whale, which being cast and fastned in her, they loose out huge long ropes, fastned to them, until such time as he be dead, then together with the ropes, and affisted by the waves of the Sea, they draw the Whale (wearied with running and labouring, and fainting by reason of the magnitode and multitude of his wounds, being in the time of their conflict diligently chafed and driven toward the shore) on land, and merrily part the prey, each whereof hath his share, according to the number of the irons thrown, the magnitude of the wound, and the necessity and excellency of the wounded part for life: each of their harping-irons are known by their peculiar marks. In the heat of the skirmish many stand up and down in boats, onely for this purpose, to take up such as chance to fall into the Sea, left they should be drowned. The Males are caught with more difficulty, the why the Fe-Females more catily, especially if their young ones be with them; for whileft they linger to help and males are fuccour them, they lose the occasion of escaping. The slesh is of no esteem, the tongue onely is more easily commendable, for being very large, and of a very lax fulfitance, it is powdered, and by most the Males.

Gentlemen accounted for a dainty. The lard is dispersed over many Countries, to be boiled the Males. and earen with fifth in the time of Leut, that Gormandizers may have formething to ferve them in the ad of fleth which is then forbidden. There is great flore of Fat in them in the parts under the skin and belly, which melted, concretes not again, by reason of the subtility; they keep it to burn in Lamps, and to use about their Ships. The houses of the Fish-eaters are built with their bones; also Orchards in the Coast of Aguitame, are fenced with these bones. The First that stand forth of their mouths which are compromise called Whale-hours, being dried and polithed, force to make Royce for mouths, which are commonly called Whale-bones, being dried and polithed, ferve to make Busks for Women, Whip-fraves, and little Staves, as also to stiffen garments. Many make feats or stools of the Vertebre, or spondils of the back-bone.

The manner of cutting up the Whale.

In the River Scalde, ten miles from Antwerp, Anno Dom. 1477. the fecond day of July, there was a Whale taken, of a blackish blue colour, the had a spout-hole in the top of her head, out of which the tail great flore of water: the was fifty eight footlong, and fixteen foot high, her tail was fourteen foot broad, from the eye to the end of her note, was some fixteen foot. Her lower jaw was fix foot on each fide, the had twenty five teeth, which the could hide in her upper jaw, there being holes for them, it being wholly toothless; for which one thing this Whale may be judged monftrous, for that Nature bath denied them teeth, and for that in Creatures that are not horned, it is so ordained by Nature that when they have teeth in their lower jaw, they should have others also in the upper to answer them, so to claw their ment. The longest of these teeth exceeded not six inches.

There is (as Pliny reports) a very small Fish accustomed to live upon Rocks, it is called Echemis, Liby. exp. 25.

never exceeding the length of a foot; it is thought that thips go more flowly if this flick to them: 641,32.65,25, wherefore the Latins have also given it a name of Remora, for that a thip being under fail with a The wondrous good wind, may by the Eebracis lefting on her, as if the would devour her, be fluid against the Sailers power of the wills, and stand still as if the were in a state tharbor. Wherefore the is said in the Asian fight to have Remora. flaid the flip of Marcus Antonius, hastening to go about and incourage his Souldiers, so that he was forced to enter into another ship, and thereupon Cafars Navy came upon them too hastily, and

before they were provided.

She also staid the Ship of the Emperous Cains coming from Aftura to Antes, his Ship of all the Navy making no way; neither did they longer wonder at this flay, the cause being presently known, force forthwith leaping into the Sea to find the cause thereof, there found her about the Ship, even flicking to the Rudder, and they shewed her to Caine, being wrath that this so small a thing should Bop him, and countermand the endeavour of forty Rowers.

Therefore this little Fifth tames and infringes the violence and madness of the world, and that

with no labour, not without holding, or any other way, but onely by flicking thereto. Certainly, however it comes to pafs, who from this example of holding of Ships, can doubt of any power or effect of Nature, in Medicins which grow naturally? Yea, and without this example, the Torpedo out of the Sea also may be fufficient; who afar off and at a diffance, if it be touched with a Spear or Rod, will be appeared to the first hour every nimble to you away. will benumb even the firongest arms, and retard the feet, how ever nimble to run away.

CHAP. XXII.

Of the admirable Nature of Birds, and of some Beasts.

Hat there be divers things not onely in the Sea, but also in the Air and Earth, which by the wonderful condition of their own Nature may equal that of Monsters, the onely Estrich may serve for a witness. It is the biggest of Birds, though indeed it partly resembles a Bird, nd partly a Beaft, (and it is familiar to Africa and Æthiopia) as which, contrary to the nature of

The Effrich is between a Bird and a Beaft.

The wondrous force of her

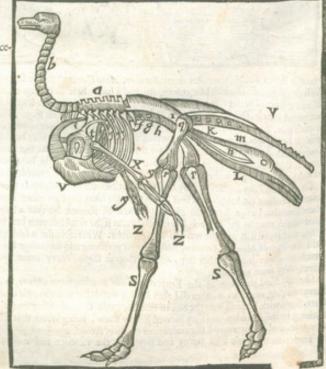

Beafts, hath feathers, and against the custom of Birds, cannot flie alofts for it hath not feathers fit to flie, but like unto hairs, yet will it outrun a horse. The natural force of the flomach in concocting, is mi-raculous; as to which nothing is untamable : the lays eggs of a won-drous largeness, to that they may be framed into cups: their feathers are most beautiful, as you may perceive by this following Figure.

The Figure of an Estrick.

Any one may eafily gather of what a prodigious magnitude an Effrich is, by the greatness of its bones. Three of these Birds were kept at the Kings charge, by the Marefchal De Rets: one whereof dying, it was bestowed upon me, whereof I have with great diligence made a Sceleton.

The delineation of the Scc leton of an Estricb.

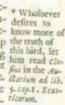

- A Sherrs the head, which was somewhat thicker than the head of a Crane, of the length of ones hand, plain from the crown even to the beak; the beak being divided to the middle region of the eye, being roundish at the
- B The neck a yard long, confisting of seventeen Vertebree, each subcreef on each side is surnished with a transfeerse process looking downwards, of some singers length, excepting the two which are next the head, as
- C The back is of a foots length, confitting of Seven Vertebra.
- D The holy-bone of two foot long, in whose top there is a transverse process, under which there lies a great hole.
- F G H After which there follows the cavity or focket, whereinto the head of the thigh home is received and bid. This externally and on the fide produceth a perforated home, noted with the letter L. perforated I fay at the beginning, for it is prefently united at the letter K. then it is forked and divided into two other bones, whereof one is bigger than the other. The less is noted with the letter L. then they are both united at the letter M. each of them is half a foot and four inches long. But from that part whereas they first began to be divided, to that sobereas they are united, there is a hole four four fingers broad, but the length of ones hand, or more, and it is noted with the letter N. The refidue of the bone is like to a pruning Knife three inches broad, but fix in length: the end whereunder is the letter O. it is joined by coalitim.
- P The rump confiring of nine Vertebrae, like to a manr. The thigh bones are two, whereof that which is noted with the letter O. is of the length of a foot, and of thickness equal to a horses thigh. The other next moder (which peracenture you may call the leg-bone) noted with R. is a foot and half long: it bath joined thereto the Fibula, or lesser focil of the length, but which grows smaller as it comes lower.

 S. Is the leg, to which the son adheres, being one foot and a half long, divided at the end into two classes, the one bioger, the other less each one consists of three bones.
- one bigger, the other left, whereof each one confits of three boxes.
- T Eight ribs, which are inferred into the Stermon, the three middlemost of these have a bony production like
- V Is the Sternon, emplifying of one bone of some foots length, representing a buckler; to this there is joined another bone, which stretched over the three first ribs, is in stead of clavicles or collar-bones.
- X The first base of the wing, which is one foot and half long.
- Y Two bones under this, equivalent to the ell and wand, under which there are fix other bones compeling the point of the wing, noted with Z.
- This whole Seeleton is feven foot long, and so many foot or more high from the feet to the beak : there are many other observable things in his composure, but I have thought sit to omit them for

Jerome Cardane in his Books De Subtilitate, writes that in the Island of the Moluccus you may The description of the Bird formetimes find lying upon the ground, or take up in the waters, a dead Bird called a Manucodista, on of the Bi that is in Hebrew, the Bird of God, it is never feen alive. It lives aloft in the air, it is like a Swallow in body and beak, yet diffinguished with diverse coloured feathers: for those on the top of the head are of a golden colour, those of the neck like to a Mallard, but the tail and wings like Peacocks;

*it wants feet: where- * Whofoever fore if it become wea-ry with flying, or de-know more of fire fleep, it hangs up the truth of the body by twining the Feathers about him read clathe Feathers about him read cla-forne bough of a tree. Garian ad lib. It paffeth through the 5. cap.t. Etxoair, wherein it must re- ticarans. main as long as it lives, with great celerity, and lives by the air and dew onely. The Cock hath a cavity depreft in the back, wherein the Hen lays and fits upon her egs. I faw one at Paris which was presented to King Charles the

We have read in Therets Cosmography, that he saw a Bird in America, which in that Countrey Tom. 2011. 21. Speech is called Tomes, in this very montrous and deformed, for that the beak in length and thickness, 622. exceeds the bigness of the rest of the body; it feeds on pepper, as the Black-birds and Festars with us do upon twy-berries, which are not less not than Pepper.

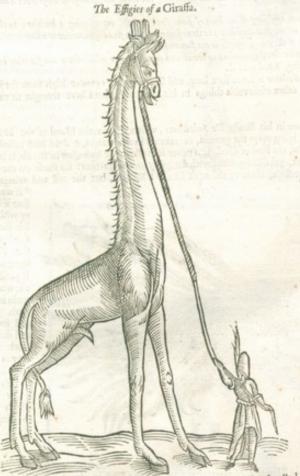

A certain Gentleman of Provence brought a Bird of this kind from that Country, to prefent it to Ring Charles the Nineth, but dying in the way he could not prefent it alive. Wherefore the Ring wished the Mareschal De Rets to give her to me, that I might take forth her bowels and embalm her, that the might be kept amonest the Kings rarities. I did what I could, yet not long after the rotted: the refembled a Crow in body and feathers, but had a yellowith beak, clear, fmooth,

and toothed like a Saw, and of such length and thickness as we formerly mentioned. I keep it yet

Tem. 1.cap. 11. 150-4.

as a monfirous thing, Theres writes, that in the Island Zeesters there is frequently found a certain wild Beast called Hulphalis, of the bigness of an Ethiopian Monkey. It is a very monstrous Creature, but in nothing more than that it is thought to live upon the air onely; the skin as if it were died in grain, is of a scarlet colour, yet it is in some places spotted and variegated: it hath a round head like to a bowl, with feet round, broad, and wanting hurtful nails. The Moors kill it and use to cat the fleth of it, being

first bruised, that so it may be the more tender. Thevet. 108.1. In the Realm of Cameta, of Abob, of Benga, and other Mountains of Cangipa, Plimatia, and Catagan, 116.11. cap.13. which are in the inner India, beyond the River of Ganges, fome five degrees beyond the Tropick of Camer, is found a Beaft, which the Western Germans call Giraff. This Beaft in head, cars, and cloven feet, is not much unlike our Doe; it hath a very slender neck, but is some fix foot long, and there are few Beafts that exceeds him in the length of their legs: his tail is round, but reacheth no farther then his hams, his skin is exceeding beautiful, yet formewhat rough, having hair thereon formewhat longer than a Cow, it is spotted and variegated in some places with spots of a middle colour between white and chefnut, fo as Leopards are: for which cause by some Greek Historians it is called Camelespardalis: It is to wild before it be taken, that with the good-will it will not formuch as be feen. Therefore it inhabits and lives onely in defert and fecret places, unknown to the reft of the Beafts of that Region; the prefently flies away at the fight of a man, yet he is taken at length, for that he is not very speedy in running away; once taken he is as easily and speedily tamed as any wild Beast whatfoever. He hath above his crown two firait homs covered with hairs and of a foot length. When as he holds up his head and neck, he is as high as a Lance. He feeds upon Herbs, and Leaves, and Boughs, of Trees; yea, he is also delighted with bread.

Such as fail in the Red-fea along the Coast of Arabia, meet with an Island called by the Arabians Cademota: in that part thereof where the River Plate runs, is found a wild Beaft called by the barbarous Inhabitants Paraffowpi, being of the bigness of a Mule, headed not unlike one, yet rough and haired like to a Bear, have set of a last called a Hart: haired like to a Bear, but not of fo dark a colour, but inclining to yellow, with cloven feet like a Hart: the hath two long homs on her head, but not branched, formewhat refembling those for much magnified horns of Unicoms. For the North and Colour, but he had a representation of either Beast fied horns of Unicoms. For the Natives of the place, bitten by the venomous tooth of either Beaft or Fish, are prefently helped and recovered by drinking the water wherein such horns have been institled for fix or feven days free. fuled for fix or feven days space, as There in his Cosmography reports.

at make being raters in

In one of the Islands of the Melaceaes there is found a Beast living both on Land and Water like as a Crossdile; it is called Campurch, it is of the bigness of an Hart, it hath one horn in the fore-head moveable after the falhion of the nose of a Turky-cock: it is some three foot and a half long, and never thicker than a mans arm; his neck is covered over with an ash colours, he hath two feet like to a Gooses seet, wherewith he swims both in fresh and falt-waters. His fore-seet are like to a Stags, he lives upon sith. Many have perswaded themselves that this beast is a kind of Unicorn, and that therefore his horn should be good against possons. The King of the Island loves to be called by the name of this Beast; and so also other Kings take to themselves the names of the wild Beasts, Fishes, or Fruits, that are most precious and observable in their dominions, as There reports.

The Figure of an Elephant.

Committee of the

The Indian Elephanes are the Africani

Mauritania and Æthiopia and that part of Africk that is beyond the Defarts and Syrtes, bring forth Elephants; but those of India are far larger. Now although in the largeness of their body they exceed all four-footed Beafts, yet may they be more speedily and easily tamed than other Beafts. For they may be taught to do many things above the common nature of Beafts. Their skin is fomewhat like to a Buffles, with little hair upon it, but that which is, is ash-coloured, his head large, his neck thort, his ears two handfuls broad, his nofe or trunk very long, and hanging down almost to the ground, hollow like as a Trumpet, the which he useth in flead of an hand, his mouth is not far from his breft, not much unlike a Swines, from the upper part whereof two large teeth thrust forth themfelves, his legs are thick and firong, not confifting of one bone as many formerly have falfly believed (for they kneel to admit their Rider, or to be laden, and then rife up again of themselves) his feet are round like a Quoit some two or three hands bredth, and divided into five clefts. He hath a tail like a Buffle, but not very rough, some three hands bredth long 3, wherefore they would be much troubled with Flies and Wasps, but that Nature hath recompenced the shortness of their tails by another way; for when they find themselves molested, they contract their skin so strongly, that they suffocate and kill these little Creatures taken in the wrinkles thereof; they covertake a man running by going onely, for his legs are proportionable to the rest of his body.

How they keep Flies from them.

They feed upon the leaves and fruits of Trees, neither is any tree fo strong and well rooted, which they cannot throw down and break. They grow to be fixteen handfuls high; wherefore fuch as ride upon an Elephant are much troubled as if they went to Sea. They are of fo unbridled a nature, that they cannot endure any head-fiall or reins; therefore you must fuffer them to take the course and way they pleafe. Yet do they obey their Countrey-men without any great trouble, for they feem after some fort to understand their Speech, wherefore they are easily governed by their known voices and words. They throw down a man that angers them, first taking him up with their trunk and lifting him aloft, and then letting him fall, they tread him under foot, and leave him not before he be dead. Ariftatle writes that Elephants generate not before they be twenty years old: they know not adultery, neither touch they any female but one, from which they also diligently abitain when they know the hath once conceived. It cannot be known how long they go with young; the reafon is for that their copulation is not feen, for they never do it but in fecret. Their females bring forth reiting upon their hind legs, and with pain like Women; they lick their young, and these presently see and go, and suck with their mouths, and not with their trunks. You may see Elephants teeth of a monftrous and stupendious bigness, at Venice, Rome, Naples, and Paris; they term it Ivory, and it is used for Cabinets, Harps, Combs, and other such like uses.

We have read in Theret, that in Florida there are great Bulls, called in that Countrey Tongue Beautrol, they have homs of a foot long, a bunch on their backs like a Carnel, their hair long and yellow, the tail of a Lion; there is scarce any Creature more sierce or wild, for it can never be tarned, unless it be taken from the dam. The Salvages use their hides against the cold, and their horns as

an antidote against poison. The fame Author affirms, that whilest he failed in the Red Sea, he saw a Monster in the hands of a certain Indian Merchant, which in the bigness and shape of his limbs was not unlike a Tiger, yet had the face of a Man, but a very flat nose: besides his fore-feet were like a mans hands, but the hind like the feet of a Tigre; he had no tail, he was of a dun colour: to conclude, in head, ears, neck, and face it refembled a man, but in the blackish and curled hair, a Moor: for the other parts they were like a Tiger; they called it Thanacib.

The Figure of a Beaft called Thanacth.

This following Monster is so strange that it will scarce be believed, but by those that have seen it: it is bred in America, and by the Salvages called Hait, of the bigness of a Monkey, with a great belly, almost touching the ground and the head and face of a child: being taken it mourns and

Lib. 9. de Hift. anim. cap. 28,

Their horn good against Tom. 1. (ib. 2. cap.10-

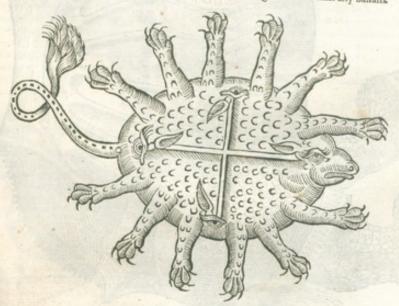

and fighs like to a man that is troubled and perplext; it is of an afh-colour, hath the feet divided into three claws, four fingers long, and fharper than those of a Lion: it climbs Trees and lives there more frequently than upon the ground, the tail is no longer than the bredth of three fingers. It is ftrange and almost monstrous that these kind of Creatures have never-been seen to seed upon or eat any thing: for the Salvages have kept them long in their houses to make trial thereof, wherefore they think them to live by the Air.

The Figure of the Beaft called Haiit.

I have taken this following Montler out of Leo's Affrican History; it is very deformed, being round after the manner of a Tortoile two yellow lines crofting each other at right angles, divide his back; at every end of which he hath one eye, and also one ear, so that such a creature may see on every side with his four eyes, as also hear by his so many ears: yet hath he but one mouth, and one belly to contain his meat, but his round body is encompassed with many seet, by whose help he can go any way he please without turning of his body, his tail is something long and very hairy at the end. The inhabitants affirm, that his bloud is more effectual in healing of wounds than any balfam.

Blood as good as Ballom.

It is firange that the Rhinserres should be a born Enemy to the Elephant; wherefore he whets his horn, which grows upon his nose, upon the Rocks, and so prepares himself for sight, wherein he chiefly affails the belly, as that which he knows to be the softest: he is as long as an Elephant, but his legs are much shorter, he is of the colour of Box, yet somewhat spotted. Pompey was the first that PHELESTER

The nature of his colour is very The ftrange wonderful, for he changeth it now and then in nature of the his eye and trill, and whole body hefide; and he colour of the his eye and tail, and whole body befide; and he Chameleon.

lefs it be red or white. His skin is very thin, and
his body clear; therefore the one of thefe two,

either the colour of the reighbouring things in either the colour of the neighbouring things in fo great subtilty of his clear skin, easily thines as in a glass, or else various humours diverily firred up in him, according to the variety of his affections, represent divers colours in his skin, as a Turky-cock doth in those fleshy excrescences under his throat, and under his head: he is pale when he is dead. Mathiolas writes that the right eye taken from a living Chameleon takes away the white spots which are about the thorny coat of the eye; his body being beaten, and mixed with Goats milk, and rubbed upon any part, fetcheth off hairs; his gall discusset the Cataracts of the eye.

CHAP. XIII. Of Celeftial Monfters.

PEradventure it hath not been firange that Monfiers have been generated upon the Earth, and in the Sea: but for monfiers to appear in Heaven, and in the upper Region of the Air, exceeds all admiration. Yet have we often read it written by the Ancients, that the Face of Heaven hath been deformed, by bearded, tailed, and haired Comets; by Meteors reprefenting burning and the Politics Daries Shields. Troops of Clouds hoffilely affailing each only the Politics Daries Shields. ing Torches and Lamps, Pillars, Darts, Shields, Troops of Clouds hoffilely affailing each other; Dragons, two Moons, Suns, and the like Monsters and Prodigies.

Timming the same

The Figure of a fearful Comet.

Antiquity hath not feen any thing more prodigious than that Comet which appeared with bloudy hair in Vvertein, upon the ninth day of Ottober, 1528. for it was so horrible and fearful a spectacle, that divers died with fear, and many fell into grievous difeafes going from the East to the South; it endured no longer than one hour and a quarter: in the top whereof was feen a bending arm holding a great Sword in a threatning hand; at the end thereof appeared three Stars, but that over which the point of the Sword directly hanged, was more bright and clear than the reft: on each fide of this Comet were feen many Spears, Swords, and other kinds of Weapons died with bloud, which were inter-mixed with mens heads, having long and terrible hair and beards, as you may fee in this Figure.

Also there have been seen great and thick bars of Iron to have fallen from Heaven, which have prefently been turned into Swords and Rapiers. At Sugolish in the Borders of Hungaria, a Stone fell from Heaven with a great roife, the feventh day of September, Anno Dom. 1514, it weighed two hundred and fifty pound: the Citizens hanged it up with a great iron chain put through it, in the midft of the Church of their City, and used to thew it as a miracle to Travellers of better note

that pals that way. * Plany reports that clathing of armour, and the found of a Trumpet were heard from Heaven often, before and after the Cimbrian War. The fame Author writes that in the third Confulthip of Marias the Amarines and Tudortines faw the Heavenly Armies coming from Eaft and West, and so joining, those being vanquished which came from the East. Which same thing was feen in Lufalia, at a Town called Jubea, two hours after midnight, Anno Dom. 1535. But in Anno Dom. 1550. upon the 19 day of July, in Saxony not far from Wittenburg, there appeared in the air a great Stag, incompatied with two armed Holts, making a great noise in their conflict, and at the fame inflant it rained bloud in great abundance; the Sun feemed to be cloven in two pieces, and Prefages of the the one of them to fall upon the Earth. A little before the taking of Confiantinople from the Christians, taking of Cost there appeared a great army in the Air appointed to fight, attended on with a great company of Dogs and other wild Beafts. Julius Objequine reports that in Anno Dom. 458, it rained fieth in Italy, in great and leffer pieces, part of which were devoured by the Birds before they fell upon the Earth: that which fell upon the Earth kept long unputrified, and unchanged in colour and finell. Anno Dom. 989. Otherhot third being Emperour, it rained Corn in Italy. Anno Dom. 180. it rained Milk and Oil in great abundance, and Fruit-bearing Trees brought forth Corn. Lycothenes tells that in the time of Charles the Fifth, whilest Maidenburg was belieged, three Suns first appeared about seven of the clock in the Morning, and then were seen for a whole day, whereof the middlemost was the brightest, the two others were reddish, and of a bloudy colour; but in the night time there appeared

brightest, the two others were reddill, and of a bloudy colour; but in the night time there appeared three Moons. The fame appeared in Bavaria, Anno Dom. 1554.

But if fo prodigious and strange things happen in the Heavens besides the common order of Nature, shall we think it incredible that the like may happen in the Earth. Anno Dom. 542. the whole Earth quaked, Mount Æina cast forth stames and sparks of sire, with which many houses of the neighbouring Villages were burned. Anno Dom. 1531. in Portugal there was an Earthquake for eight days, and it quaked seven or eight times each day; so that in Lithon alone it cast down a thousand and fifty houses, and more than six hundred were spoiled. Ferrara lately was almost wholly demolished the sevent states of the strategy was almost wholly demolished. by a fearful Earthquake. Above all which ever have been heard, is that Prodigy which happened in the time of Pliny at the death of Nero the Emperor, in the Marucine field, the whole Olive-field of Vellius Marcellar, a Roman Knight, going over the High-way, and the Fields which were against it coming into the place thereof. Why should I mention the miracles of Waters, from whose depth and it reams, fires and great flames have oft broke forth. They tell out of St. Augustin, that the fire of the Sacrifices which for those seventy years of the Babylonian captivity endured under the Water, was extinguished, Anticobus felling the Priethood unto Jafon. What miracle is this, that the Fire should live in the Water, above its force and natural efficacy, and that the Water should forget the extinguishing faculty! Verily Philosophers truly affirm that the Elements which are understood to be contrary, and to take it in resident and the should be contrary. to fight in variety among themselves, are mutually joined and tied together by a marvellous con-

BOOK XXVI.

Of the FACULTIES of SIMPLE MEDICINS, As also of their Composition and Use.

THE PREFACE.

Mongst the causes which we term healthful, and other remedies which pertain to the health of Man, The excellen-Mongs: the causes which we term healthful, and other remedies which persain to the health of Man, The excelled and the expelling of Diseases, Medicins easily challenge the prime place; which (as it is delivered by cy of Medicins Solomon) God bath produced out of the Earth, and they are not to be abborred by a Wise man; cans, for there is nothing in the World, which source, and as by a mirraele, assigned the borrid torments of Diseases. Therefore Herophilus cased them sittingly administred, The Hands of the Gods, And hence it was that such that the physicians as excelled in the knowledge of Medicins, have amongs the Ancients acquired an opinion of Diswinity. It cannot by words be expression but also for the driving away of Disease. is very necessary not onely for the preventirn, but also for the driving away of Diseases.

CHAP. I.

What a Medicin is, and how it differeth from nourissment.

E define a Medicin to be that which hath power to change the body according to one or more qualities; and that, such as cannot be changed into our Nature: contrary whereto we term that nourifhment which may be converted into the fubfiance of our Bodies. But we define them by the word Power, because they have not an absolute nature, but as by relation and depending upon the condition of the bodies by

which is meat to this, is medicin to that. Thus for example, Hellebore is nourithment to the Quail, but a medicin to man: Hemlock is nourithment to a Starling, but poison to a Goose: the Ferula is food to an Afs, but poifon to other Cattel. Now this divertity is to be attributed to the different natures of Creatures. It is recorded in History, that the same by long use may happen in men. They report that a Maid was presented to Alexander the Great, who nourished with Napellus, and other poifons, had by long use made them familiar to her, so that the very breath she breathed was deadly to the by-standers. Therefore it ought to seem no marvel, if at any time it happen, that Medicins turn into the nature and nourishment of our bodies: for we commonly may see Birds and Swine feed upon Serpents and Toads without any harm: and laftly,

Serpente Ciconia pullos Nutrit, & inducit per devia rura lacerta: It's eadem sumpris querunt animalia pennis.

The Stork with Scrpents and with Lizards caught, In wayless places nouritheth her brood: And they the fame purfue, when as they're taught To use their Wing, to get their wish'd-for food.

CHAP. II.

The difference of Medicins in their matter and substance.

Ven as the concealed glory of worldly riches lieth hid in the bowels of the Earth, and depth. The Earth the of the Sea and Water, as Gold, Silver, and all forts of Metals, Gems, and pretious Stones, Mother of Rifurnished with admirable Virtues; fo we may behold the superficies of this Earth cloathed ches and Meches an with almost an infinite variety of Trees, Shrubs, and Herbs: where we may contemplate and wonder at the innumerable diversities of Roots, Leaves, Flowers, Fruits, Gurns, their Smells, pleasant Tastes and Colours, but much more at their Virtues. This same Mother Earth, as with her Bress, nourifheth marvellous diffinet kinds of living Creatures, various in their fpringing, increase and firength, wherein the immense goodness of God, the great Architect and framer of all things, doth most clearly appear towards man, as who hath fubjected to our government, as a Patrimony, so ample and plentiful provision of Nature for our delight in nourishment and necessity of healing. Therefore the ancient Phylicians have rightly delivered, that all forts of Medicins may be abundantly had from living Creatures, Plants, the Earth, Water, and Air.

Medicins are taken from living Creatures either whole and entire, or elfe the parts and excre- what Medi-Medicins are taken from living Creatures ettile. Strong and extres what precauses ments of them. We oft-times use in Phylick whole Creatures, as Foxes, Whelps, Hedge-hogs, Frogs, eins taken Snails, Worms, Crabs, and other living Creatures. We also make use of forme parts of them, as the from living Creatures. Liver of a Wolf or Goat, the Lungs of the Fox, the Bone of the Stags heart, Cranium humanum, Fat, Bloud, Flesh, Marrow, the Gods of the Castor, or Beaver, which is therefore termed Castorous, and fuch

BOOK XXVI. Of simple Medicins, and their Use. 630 other particles that are useful in Physick. We know that also there are some Medicins taken from Excrements, as Horns, Nails, Hairs, Feathers, Skin; as also from Urin, Dung, Spittle, Honey, Eggs, Wax, Milk, Wool, Sweat, and others of this kind, under which we may comprehend Musk, Civet, Pearl, Oefipur, and fundry others of this nature. We take Medicins from Plants, both whole, and also from their parts, whether Trees, Shrubs, or What from Herbs. For we oft-times use Succory, Marth-mallows, Mallows, Plantain, and the like, whole: but otherwhiles onely the roots of Plants, their Pith, Wood, Bark, Shoots, Stalks, Leafs, Flowers, Seeds, Plants. Fruits, Juices, Gums, Rofins, Moffes, and the like. Things taken from the Earth, for the use and matter of Medicin, are either Earths, Stones, or Minerals. The forts of Earth are Bole-Armenick, Terra sigillata, Fullers-earth, Chalk, Potters-clay, and such like. Stones, are the Pumice, Marchasite of Gold, Silver, Brass, Marble, the Load-stone, Plaister, Chalk, Sulphur vivum, Lapis specularis, and others. Metals and Minerals, are Gold, Silver, Tin, Lead, Brass, Iron, Steel, Antimony, Ceruse, Brimstone, Cinnabar, Litharge of Gold and Silver, Tutty, What from the Earth. true Pompholyx, Verdigreece, Alum, Roman Vitriol, Coprafs white and green Salts of fundry kinds, both of Arfenicks, and fuch like. The following Medicins are from Fresh water, Rain water, Spring water, River water, and all things thence arising, as Water-Lentils, common Flags, Water-Lillies, Water-Mints, and all the Creawhat from nie Water. tures that live therein. From the Salt water are taken Salt, Aleyonium, all forts of Coral, Shells of Fish, the Herb Androface (which grows in plenty in the Marshes at Fontignan and Cape de Sete) Alphaltum, which is found in the Dead Sea. From the Air proceeds Mansa, therefore called Mel Aerium (i.e.) Honey of the Air, and also all other kinds of dew that are useful in Physick, by reason of the Virtues they receive from the Sun Wint from which raifeth them up; from the Air, whereas they make fome flay; as also from the Plants, whereupon they fall and refide. CHAP. III. The differences of Simples in their Qualities and Effects. LI the mentioned forts of Simples are endued with one or more of the Four Faculties, whereof I now purpose to treat. The first Faculty common to all the rest, and as it were their foundation, flows from the four first qualities of the prime Bodies or Elements, that is, Heat, Coldness, Driness and Moisture; and this either Simple or Compound, as one or two of these prime qualities exceed in the temper of the temper of the Medicin, as may appear by this following.

The Simple quality is either to Heat, Cool, Humeet, or Dry. The Compound ariting from two joined qualities, either Heats and Dries, Heats and Moistens, Cools and Dries, Cools and Moiftens. Heat moderate, Heats, Attenuates, Rarifies, opens the Paffages, Digefts, Suppurates. Immoderate, Inflames and burns, Bites, whence follows Violent attraction, Rubrification, Confumption, Colliquation, an Eschar, Mortification. Cold moderate, Cooleth, Condenfeth, Obstructeth. Immoderate, Congeals, Stupenes, Mortifics. Moniture moderate, Humeces, Lubricates, Levigates and mitigates, Glues. Immoderate, Obstructs, lifts up into a flatulent tumour, especially if it be a vaporous humidity. Driness moderate, Dries, Rarines, Attenuates, Immoderate, Binds, Contracts or shrinks, causeth Chops and Scales. The effect of these qualities is diffinguished, and as Galen observes, digested into these orders, which we term Degrees, fo that by a certain proportion and measure they may serve to oppugn Diseases, 1. Simp. C 1. de aliment. as the fame Galen affirms. For to a Difease (for example) hot in the second degree, no other Medicin must be used than that which is cold in the like degree: wherefore all simple Medicins are, Hot, Cold, Moift, or Dry; in the beginning, middle, or extreme, of the first, second, third, or fourth degree.
The Heat, Coldness, Moisture, Driness, of the first, second, third, fourth degree, is either obscure,

Examples of

manifelt, vehement, or excellive. An example of heat diffinguished thus by degrees, may be thus; warm water is temperate; the degrees of that which is a little hotter, is the first degree of heat; if manifestly hot, it is in the second degree; but if it heat more vehemently, it may be thought to come to the third; but if it feald, then we know that it hath arrived to the fourth degree of heat. Such also is the distinction of coldness, moisture, and driness by degrees. Wherefore it will be worth our labour to give you examples of certain Medicins, diftinguilhed in their order and degree, by which you may the more easily give conjecture of the reft.

THE PERSON NAMED IN

Simple Medicins hot in the First degree. Abfynthium, Althan, Amygdala dulcia, Beta, Brassica, Chamamelum, Ladanum, Semen Lini, Saccarum, Ervum, sive Orobas, Vinum novum: for old is judged hot in the second or third degree, as it is me. as it is more or less years old.

Second degree. Ammoniacum, Artemifia, Anethum, Fanugracum, Mastiche, Salvia, Marribiem, Melissa, Apium, Chamapitys, Crocus, Ficus, Thus, Myrrha, Mel, Nuoc mosebata, Pix netraque, suma arida corporibue particulisque solidavribus aptior, tum liquida delicativibus, Seylia, Sarcocolla, Bryonia, Sal, Operanax, Ammi. panax, Ammi.

Third degree. Abrotanum, Agnus castus, Anisum, Afarum, Aristolochia, Chamadrys, Sabina, Calamintha, Cinnamonum, Iris, Juniperus, Hyfopus, Origanim, Agarum, Artitolocolas, Ruta Sativa.

Fourth degree. Allium, Gapa, Eupharbium, Najturitum, Pyrethrum, Sinapi, Tithymali, Anacardi, Chelide-

Chelidonium minus, Galeno. Yet ours, by reason of the gentleness of the air, and moisture of our soil, is not so acrid. Ruta sylvestris. This, as all wild and not cultivated things, becomes more strong and acrid than the Garden-Rue.

Simples cold in the

First degree. Atriplex, Hordeson, Cydonia mala, Malva, Pyra, Pruna, Rofa, Viola.

Second degree. Acacia, Cueurbita, Cueumir, Mala granata acida, dulcia enim temperata sunt potius, Plantago, Polyganum, Solanum hortenfe; nam id quod somniferum dicitur, vi refrigerandi ad papaver ac-

Third degree. Hyofeyamau, Solanum somniferum, Portulaca, Sempervivum, Mandragora.

Fourth degree. Cienta, Papaveris genera omnia, excepto Corniculato; buic enim incidendi & abstergendi vim attribuit Gal. Certe nitrosium & salsion gustu percipitur, quo sit ut calide & sicca sit natura,

Simples moift in the

First degree. Buglossum, Viola, Malva, Rapum, Spinacia. Second degree. Ammoniacum, Latinca, Cacurbita, Cucumis, Melones, Portulaca.

Simples dry in the

First degree. Thus, Chamemelon. Braffica, Sarcocolla, Crocus, Faha, Fanugracum, Hordrum inisgrum Second degree. Artemifia, Pix arida, Orobus, Plantago, Balantia, Nux mofebata, Lens, Maftiche, Mel, Sal, Anethon, Myrrba.

Third degree. Abrotomum uftum, Abfyntbium, Myrtus, Acetum, Aloe, Milium, Cuminsum, Sanguis deaconis, Galla, Sabina.

Fourth degree. Piper, Allium, Nasturtium, Sinapi, Euphorbium.

Those we mentioned have dethemselves and their own nature all such qualifies; yet do they The effects of produce far other effects by accident, and besides their own nature in our bodies, by reason of which the first qualities by accident. they are termed accidental causes. This shall be made manifest by the following examples.

External heat by accident refrigerates the body within, because it opens the passages and pores, and calls forth the internal heat, together with the spirits and humours by sweats: whence it follows that the digestion is worse, and the appetite is diminished. The same encompassing heat also humechs by accident, whileft it diffuses the humours concrete with cold: for thus Venery is thought

The like may be faid of Cold, for that it heats, not by its proper and native, but by an adventitious force: whereof you may make trial in Winter, when as the ambient cold, by thutting the Pores of the body, hinders the breathing forth and diffipation of the native heat. Whence it is in-Wardly doubled, and the concoction better performed, and the appetite strengthened. This same Cold also dries by accident, when as it by accident repercusses the humour that was ready to slow down into any part, and whileft it concretes that which is gathered in the part: for thus, by the immoderate use of repercussers, an ordematous tumor proceeding from gross and viscid phlegm, degenerates into a feirrbur.

Drines and Moisture, because they are more passive qualities, shew their effects by not so manifest operations, as heat and cold do; but in comparison of them they are rather to be judged as matter, or a subject.

CHAP. IV.

Of the Second Faculties of Medicins.

E term those the Second Faculties of Medicins, which have dependance upon the first, which are formerly mentioned, as it is the part of Hear to Rarine, Attract, Open, At-V tenuate, Levigate, Cleanse. Of Cold, to Condense, Repercuss, Shut up, Incrassate, Exasperate, Constipate. Of Mosture, to Soften, Relax. Of Drinest, to Harden, Stiffen.

Hence we term that an attractive Medicin, which hath an attractive faculty, as on the contrary, that a Repercuffive that repels; a detergent, that which cleanses viscous matter. We call that an Emplastick Medicin, which not onely thuts up the pores of the body, but reduces the liquid bodies therein contained to a certain equality and substance. Thus also Emollients, Relaxers, and the rest; have their denominations from their effects, as we shall declare hereafter.

CHAP. V.

Of the Third Faculties of Medicins.

He third Faculty of Medicins depends for the most part upon the first and second Faculties fometimes conjoined, otherwhiles separate. Also sometimes it follows neither of these Faculties, but a certain property and inexplicable quality, which is onely known by experience. Now the operations of this third Faculty are to agglutinate, to fill with flesh, to cicatrize, to affwage pain, to move or stay the Urin, Milk, Seed, the Courses, Sweats, Vomits, and perform such like operations, in or about the body.

Thus the generation of fleth is produced by the concourse of two Faculties, that is, of drying and cleanfing. But driness and affriction produce a glutinating and cicatrizing faculty. A hot and attenuating faculty causeth Sweats, moves Urin, the Courses, and the like in the body; but contrary Faculties retard and stop the fame.

To mitigate pain, proceeds onely from the Faculty, to wit, from heat, or a moderately heating

dent,

BOOK XXVI. Of simple Medicins, and their Use. 632 faculty to procure reft, from cold onely, or coldness joined with some moisture. But to procure vomit, proceeds neither from the first nor second faculty, but from a certain occult and effential property, which is naturally implanted in Agarick, and other naufcous and vomitory Medicins. CHAP. VI. Of the Fourth Faculty of Medicins. He Fourth Faculty of Medicins is not of the fame condition with those that are formerly The fourth faculty of Medi-cins depends mentioned; for it depends not upon them, or any other manifest or elementary quality, cons depends but on an occult property of the whole fubfiance; by means whereof it works rather occult proper upon this than that part, upon this rather than that humour. Wherefore Phylicians cannot by any reason find out this faculty, but onely by experience, as we have said a little before of Medicins procuring Vomit. Hence it is that names are given to those Medicins from those parts that they chiefly respect : For they are termed Cephalicks which respect the Head, as Betony, Marjoram, Sage, Rofemary, Statebar. Pneumonicks, which respect the Lungs; as Liquorice, sweet Almonds, Orris, Elecampane, Cordials, that firengthen the heart; as Saffron, Cinamon, Citrons, but chiefly their Rinds, Buglofs, Coral, Ivory. Stomachical, which respect the Stomach, and the orifice thereof; as Nutmeg, Mint, Anife, Maflick, Pepper, Ginger. Hepaticks, which respect the Liver; as Worm-wood, Agrimony, Spikenard, Succory, Sanders, Spleneticks, which have relation to the Spleen; as Tyme, Epithyoum, Broom-flowers, Ceterach, Capers, the Bark of their Roots, the Bark of Tamarisk. Diureticks, fuch as respect the Kidneys and Urinary passages; as the Roots of Smallage, Asparagus, Fennel Butchers-broom, the four greater Cold Seeds, Turpentine, Plantain, Saxifrage. Arthriticks, or fuch as firengthen the joints; as Cow-flips, Chamepitys, Elecampane, Calamint, Hermodactyls, and the like. To this Rank may be referred purging Medicins, which, furnished with a specifick property, thew their efficacy on one Humour more than on another Humour, and that impact more in one part than in another. For thus Agarick chiefly draws phlegm from the Head and Joints, Rhubarb, draws choler chiefly from the Liver, and hurts the Kidneys. But let us here forbear the confideration of things, as not pertaining to Surgery. But forne Medicins of this kind are furnished with one fimple faculty, otherfome with more, and those contrary, whereof your talle may give you fufficient notice: for Rhubarb at the first touch of the tongue is found acrid and hot; but when you come to chaw and throughly to taffe it, you shall find it to partake of an earthly astriction. Therefore because tastes give notice of the faculties of Medicins, therefore I have thought good to treat of them briefly. CHAP. VII. Of Tafter. Afte, as Galen delivers according to Ariftotle and Theophrafian, is a certain concoction of moisture in driness, caused by means of heat, which we know or differn by the tongue well Lib. 1. fimpl. There are nine differentempered, and fittingly furnished with spittle and his nerves. There are nine differences of tastes; for there are three judged hot, to wit, the acrid, bitter, and salt: three cold, the acid, Differences of saftes auftere, and acerb: three temperate, the fweet, the oily or fat, and the infipid. Now they are thought fo many according to the different degrees of concoction; for it appears greater in hot talles, and as it were a certain affation; but less in cold, but indifferent, and as it were an elixation in things temperate: therefore Nature observes this order in the concoction of sapid bodies, that are the first the accept taste should take place, then the ausiere, and lastly the acid: from these (as it were) rudiments of concoction, arifes an infipid, then an oily, then a fweet perfectly concocted and temperate. This concoction exceeding the bounds of mediocrity, there arises a falt taste, then a bitter, and then an acrid with the highest excess of almost a fiery hear. Yet I would be thus understood, that all things that are by Nature fapid, do not always afcend to the height of fweetness by the degrees of acerbity, autherity, and acidity, as though it were of absolute necessity, that all things that are sweet, should be acerb, austere, and acid. For there are many things found, especially in Plants and their Fruits, which when they shall arrive to their perfection and maturity, are acid, bitter, or falt: but being yet unripe, and not come to full perfection, they have a certain fweetness, which afterwards, by a further digeftion, or perfection and concoction, acquire a bitter, authere, or acid rafte. For thus bitterness in Worm-wood and Aloes, acrimony in Pepper or Pellitory, is a perfection of Nature, as full ripenels and perfect concoction, and not an excels of heat in that Species. Also accebity and aufterity is a perfection of Nature, and not a rudiment in Services and Cornelians; acidity or tartness is also in verjuice. But in very many things it so falls out, that the sweet or farty tastes become fo, and acquire their perfection by concoction, as in Grapes, Figs, Pears, Apples, and almost all other fuch Fruits, as we usually feed upon. Therefore I will now treat of each of them in order, The acerb tatte is cold and terrefirial, and of a fubfiance abfolitely grofs, being lefs humid then the auftere, but much lefs than the acid. It notably cools and dries, it condenfates, binds, repels, especially from the furnishing and in Pomegrafirst beginning with cold tastes. The acerb tafte. cially from the fuperficies, and it also exasperates; this taste resides, and may be found in Pomegranate Pills, Galls, Sumach, and Cyprefs-nuts.

The auftere.

The auftere is nightful in temper and effects to the acerb, but formewhat moifter; for the acerb

absolutely confits in a terrestrial and cold substance. Wherefore this, increased by a degree of concoction, acquires more store either of heat alone, or else of moisture alone, or else of both together:

THE THE PARTY OF T

BOOK XXVI. Of simple Medicins, and their Ufe. 633 moisture, I fay, and that is either Airy or else Watery. Therefore it these fruits, which before their maturity are acerb, have an accession of heat, then do they become sweet, as you perceive by Chefnuts; but if there be an accession of moisture onely, and that more gross, of acerb they become auflere: for both the taffes are in the like degree of cold, but the auflere is the moifier. But if to the fame frigidity remaining in Fruits, a certain humidity accrew, then is there caused an acid tasse. But if they have an accession of a waterish moisture and heat, they will acquire a sweet talte, or else oily, if the humidity accrewing with the heat be airy. I have judged it requifite to admonish you hereof, that you might know by what means sapid bo-dies mitigated become sweet of acerb, as it were by these interposed degrees of austerity, acidity, and oilinels, as they acquire a various accession of heat and moisture separately, or conjunctly, Now by all that we have delivered, you may gather, that all acerband auftere things are cold and dry; and as they are cold, they repel and hinder defluxions: as they are dry and terrestrial, they condenfate, incraffate, conflipate, and firaiten the paffages; yea, and they also cicatrize: but acerb things perform this far more powerfully, as those which are absolutely terrene, cold, and dry, not partaking of moisture or water. Now austere things confish (as it were) in a middle matter, that is, in a more dilure terrene body, as it is apparent in Services, unripe Grapes, Cornelians, Medlars, Crabs, wild Pears, and all forts of unripe Fruits, whence it is termed a crude tafte. The acid taffe is of a cold and waterish nature, but most subtle, by benefit whereof it penetrates The acid taffe. and divides almost as powerfully as the acrid. Ir incides or divides, attenuates, bites, cleanles, opens obstructions, repels and dries. For by the means of the deep piercing cold, it repels all defluxions; and by the drying faculty, which is firong even in its watery confiftence, it flays and flops all bleedings, the Hæmorrhoids and Dyfenteries. The force thereof is chiefly manifest in Vinegar, as also in the juice of Citrons, Sorrel, Cherries, Berberries, and the like. And this is the nature of cold tafles, now it is time we fpeak of fuch as are temperate. The infipid is unproperly termed a tafte, as that which is rather a privation of tafte, it is in fome. The infipid. fort cold, and of a very waterith and grofs nature, it inspiffates, constipates, and stupities. This kind of taffe is chiefly manifest in Water, next in Gourds, Citruls, and many such like things. The oily traffe is hot, humid, airy; therefore it humeets, relaxes, mollifies, lubricates. kind are Oil, Butter, Fat which is not rancid by age, nor acrid by nature, as that of Lions and The fweet taffe is made by a moderate and well concocting heat, confifting in a matter more The fweet. tennious and hot than the intipid, but in formewhat more gross than the oily, from which in the first qualities it doth not differ; therefore it is of a hot, airy, and temperate nature. fweet thing detergeth, levigates, concocts, ripens, relaxes, and affwageth pain. Examples of this tatic may be had in Sugar, Hony, Manna, fweet Almonds, Milk, and other like. Now let us come Therefore every The falt tafte is hot and aftringent, lefs earthy than the bitter, as that which refides as it were in The falt. a middle matter. For it proceeds from an earthy driness, which is formerly torrified and attenuated by the force of heat in a watery humidity. Wherefore that which is falt contracts the pores, cuts, cleanfes, digefis, or rather dries up the humours by the drinefs thereof, without any manifest fense of heat, whence it is that it vindicates from putrefaction. Under this kind are contained all forts of Salt; as Salt-peter, niter, fal ammuniacum, fal gemme, common Salt, Sea-water, and fuch other like. The bitter taffe is hot, earthy, and drying a for the matter thereof is grofs and earthy, which the The bitter abounding heat hath torrified and dried up. Wherefore bitter things taken inwardly, purge and earry away superflatous humours: and outwardly applied, they mundine and deterge ulcers, they open the mouths and paffages of the Veins oft-times by their abstergent faculty, whence it is that they move the Courfes and Hamorthoids. The principal things endued with this tatte are Aloes, Gell, Wormwood, Gentian, the lefter Centaury, Coloquintida, Fumitory, Soot, and fach like. The acrid taffe is hot, of a jubtile and fiery viature; for it is kindled of a hot, fabile, and dry The acrid. matter, neither can it conflit in any other. Therefore that which is acrid, heats, pricks, or bites the mouth by actimony, it heats, and oft-times burns, it penetrates, opens the paffages, attenuates, attracts and draws forth grofs humours, evacuates and fends forth Urine, the Courfes, and Sweat: befides it oft-times is feptick, bliftering, and efcharotick; and laftly, burning and cauflick. The feptick and putrefactive things are Sublimate, Chamelen, the juice of Thapfis. The Velicatories are Dittander, Cantharides, Crow-foot, Muffard, Pellitory of Spain, Euphorbium. But the cauthick and efcharotick are Lime, Oak-alhes, and the like. East we know Medicins not onely by the tafte, but also by our other fenses, as Touch, Sight, Hearing, Smell. And as by the Tafte, so also by these we judge of, and try the goodness of Medicins, and distinguish the true legitimate from the adulterate. The Touch judges what are hot and cold, moift and dry, rough and gentle, or fmooth, hard and foft, brittle or friable, glutinous and viscid, drie or flippery. We approve of the goodness of Medicins by their colour, brightness or duskinefs, whereof the eye is judge; for we commend that Senna which is fornewhat greenith, but dif-like the whitish: as also we like well of such Cassia as is black both within and without, thining and full, and not dry and thrunk up. Yet the judgment of the first qualities by the colour is deceitful, or none at all; for fuch things as are white, or the colour of Snow, are not therefore cold: for fundry of them are hot, as Lime. Neither are red things to be therefore judged hot, for Rofes are cool. Also Medicins are chosen by the smell; for such as have a good, fresh, and a natural smell, are commonly hot, and in their perfect vigor. On the contrary, things that want smell, are for the

most part cold and evanid. By Hearing we diffinguish things full from such as are empty: thus we chase Cassia, which shaken, makes no noise with the grains or feeds rathing in it. Hitherto we have explained the first, second, third, and sourch faculty of Medicins in general, and have

shewed how they may be found out: now must we more particularly treat of their second and third faculties, because by reason of those they chiefly come into use in Surgery. Yet let me first briefly shew by what means and arts they may be prepared. CHAP. VIII. Of the Preparation of Medicins. O prepare Medicins, is nothing elfe, then by Art to make them more commodious for Use and Composition; whereby they are either made, More gentle. By Bruifing; as when Medicins are broken by firiking and rubbing or grinding in a Mortar, and that either of Brass, Iron, Lead, Glass, Wood, Marble, and other like; Confidering the thing which is to be beaten, the strength or force wherewith it must be performed, the time or space, the situation, the things to be added, the confiftence which the thing beaten must be of. More Stron By Searling; whereby we separate the Purer and Finer from the more Impure and Gross, which is done by Sieves and Searles made of Wood, Parchment, Horse-hair, Silk, Lawn. Wherein is to be noted, that the fame confideration is to be had in Searling, as in beating: therefore fuch things as are to be finely powdered, must be searfed in a finer Searle; such as are more gross, in a coarfer. More pleafant.

By Diffulving or Mollifying; which is nothing else but a dissolving of a Simple or a Compound Medicin of a thick or hard confiftence, either into a mean confiftence, or a little more liquid or foft, which is performed either by heat onely, for by heat gums and horns are mollified; or by liquor, as by Vinegar, Water, Wine, Juice of Limmons, &cc. More wholfer By Deficeation or bardning; which is nothing elfe but the confurning of the superfluous and hurtful moisture; and this is performed, either by the Sun, or by Fire. By Infasion; which is nothing elfe but the tempering or macerating of a Medicin a little beaten or cut, in some liquor appropriate and fit for our purpose, as in Milk, Vinegar, Water, Oil, and the like, so long as the nature of the Medicin requires. To Insusson, Nutrition may be reduced, which is nothing elfe but as it were a certain accretion of the Medicin, by being moistned, macerated, rubbed, or ground with some moisture, especially with heat. By Eurning; that is, by consuming the humidity which is in them. And that, either that they may be the better powdered, being otherwise too glutinous, or that they may lay aside their gross essence, and become of a subtiler temper; or that they may put off, or partly lofe forme fiery quality, as Acrimony, Gal. lib. 4.cap. 9. Simplicium. Or that they may acquire a new colour. Now all things are burnt, either alone; as fuch things as have a farty moissure, as Hairs, fweaty Wooll, Horns: or elfe with some combustible matter, as Sulphur, Alum, Salt, Barley, &cc. More fit for mixture.

By Boiling, or Elization; which is performed by a humid heat, as burning is by a drie; and that either that we may increase the weak faculties of such Medicins as are boiled, by boiling them with fuch as are fironger; or elfe to weaken fuch as are too firong, or elfe wholly to diffipate fuch as are contrary: Or that, one faculty may arise of fundry things of different faculties being boiled together, or for the longer keeping them, or bringing them to a certain form or confi-fience: All which are done, by Fire, or Sun. By Washing or Cleansing, whereby the impurity of the Medicin is wasted away or cleansed; and such things are either hard, as Metals, Stones, parts of living Creatures, condenfed Juices, and other like: Or foft, as Rofins, Gums, Fats, Oils. And thefe ought first to be finely beaten, that the water may penetrate in all their substance. Or to be dissolved, and cast into the Vessel filled with Water, and so stirred, and then suffered to subside, so that the Fat may swim alost. And this must be done so long that the Water retain nothing thereof in colour, smell or ratio. fmell, or taffe.

Of simple Medicins, and their Use.

CHAP. IX.

THE THEORY

BOOK XXVI.

Of Repelling or Repercustive Medicins.

Aftringenes are under, ftood by the name of Repellers. The differences of Repercultives.

634

Epelling or Repercussive Medicins are cold, and of gross and earthy parts; by which name also aftringent Medicins are understood, because they hinder the falling down of the humours upon the part. Repercussives are such, either of their nature, and of themselves, or else by accident, being not such of their own nature. These which of themselves are such, are of two kinds; for some are waterish and most, without any attrictive faculty which almost wholly proceeds from an earthy effence; wherefore that faculty of Repelling which they posses, they have it wholly from coldness. Of this kind are Lettuce, Purslain, Sow-Thistle, Ducksmeat, Kidney-wurt, Cucumers, Melons, Gourds, House-leek, Mandrake-apples, Night-shade, Henbane, and the like, which cool powerfully, and unless they be taken away before the part wax blackish, they extinguish the natural heat. Othersome are of an earthy effence, and therefore aftrictive; but yet tome of these are hot, othersome cold. Such things as are cold of temper, and of an earthy consistence, are properly and truly called Repellers. Of these some account of these are Simple, othersome Compound: the Simples are Plantain, Vine-leaves, Leaves of Roses, Oaks, Brambles, Cyprels,

prefs, Berberies, Sumseb, all unripe Fruits, Verjuice, Vinegar, red Wine, the juice of fower Pomgranats, Acacia, the Juice of Berberies and Quinces, Hyperatic, Pomgranat Pills, Oak-bark, the Flowers of Wild Pomgranats, the Meal of Barley, Beans, Panick, Oats, Millet, Orobas mixed with Juices in form of a Pultis, Bole-armenick, Sangais Draconis, Cerufs, Litharge, Terra Sigillata, Fullers-earth, Chalk, Marl, the Load-flone, Lead, Corals, all Marchalites, Antimony, Spodium, true Pompholyx, all forts of Earth, and other things of the like nature.

Now Compound things are, Oleum refaceum, emphaciumu, myridlorum, papareris, cydonirum, nenupharic, unquentum refatum, albiqui rbafis, campharatum, emplafirum diacalcitheus, diffolved in vinegar and oil
of Roles, deficeatirum rubrum, papulem, emplairum nigrum feu tetrapharmacum of Galens description, empl. why things of
tentra rupturam, de cerufa, pro matrice. All such cold se percutives are more effectual if they be affocia- (abel) parts ted with tenuity of fubiliance, either of themselves, or by mixture with some other things: for to this are of purpose we often mix Vinegar, Camphire, and the like things of subtil parts, with repercustives of mixed with gross parts, that they may serve as vehicles to carry in the repercustive faculty. Repercustives of gross repercusives. parts and hot, are Wormwood, Centaury, Gentian, Agrimony, Savin, Coriander, Mint, Bay-leaves, Cardamomes, Calamas aromaticus, Aloes, Spikenard, Saffron, Nutmeg, Cinnamon, Amber, Salt, Alum, Coporas, Sulphur, Oleum absynthinum, Mastichinum, Nardinum, Costimum, Geratum, Gal. Stomachicum, Santalinum, Emplasirum Diacaleitheor. But such things as repel by accident, are Bandages, Compress Repellers by fers, Linnen cloths, and Rowlers of all sorts, Cases, Cauteries, Bloud-letting, Cupping, painful Friaccident. ctions in the opposite parts, and other such like things as are properly faid to make revultion. The when and to use of repercutaives is to force back the humour which flows from any other place into the part, and what parts rethus they mitigate the heat of such inflammation as that defluxion of humours hath caused, yea, oft-percutaives times to affwage and help pain, the Fever, Abfeels, malign ulcers and mortification. Such repercuffives mult always be so opposed to the disease, that respect may be had to the temper, com- plied. plexion, and particular nature of the part whereto they are applied: for all parts cannot equally bear the like force of repercutives, as nervous and other (permatick and cold parts. Furthermore there are fome parts whereunto we may by no means apply repercuffives, as the groins, arm-pits, and those glandules or kernels which are behind the ears and brain, left the humour should retire back into some of the principal parts: the like reason is also of bodies; for the bodies of Women, Children, Eunuchs, cannot endure to ftrong repercussives and the like excess of cold as the manly and vigorous bodies may. Belides, every difeate requires not repercultives; for if the body be replete with ill humours, if it be plethorick, the use of repercualives, unless after general purgation, cannot be fafe; as neither if the humour which is in motion shall be venerate, grofs, acrid, critical, or shall cause great pain in the part, for then on the contrary we must rather make use of attractives. But now if the discasse be great, weak repercussives will avail nothing against it, as Lettuce against a great inflamation, and thou shalt do ill if thou set upon a small defluxion with powerful repellers; for by that means the skin is straitned, and the passages thereof stopt, whereby the inflamation is increased, or elfe brought to a feirrbar. Wherefore let the Surgeon have a care that he temper the force of his Repercutives according to the magnitude of the dileafe.

CHAP. X.

Of attractive Medicins.

N attractive Medicin is contrary to the repeller; the Greeks call it Heldicam, it is of a hot What an atand thin substance, whereby it draweth forth into the superficies of the body that which lieth tractive Medicia in the center, although sometimes it doth it by an occult quality, otherwhiles by accident, as by the acrimony. Those things which by a manifest quality do attract, are either Simple or Compound.

The Simple are, Beyonia, allium, capa, porrum, arifolochia, bermodallyli, cyclamen, lilium, figilium beata Attractives by Maria, arum, afarum, astrodelus, gentiana, pyrethrum, ruta, sabina, calamentum, amnes tithymallorum species, a manifest viscum, abrotonum, anagalis, urtica, ranunculus, struthium, and such like; Ammoniacum, bdellium, galbanum, sagapenum, enphorbium, ashbaltum, cinis è face vini vel aceti, calx viva, sulphur, sal ammoniacue, omnis falis species, auripigmentum, oleum vetsu, adeps leonis, ursi, eanis, anseris, vipere, ranarum, axungia pores, ve-tustate aeris, aut attritu rotarum. Composita vero, ut oleum de spica, philosophorum, de terebinthina, de croco, de scorpionibus, rutaceum, vulpinum, laurinum, aneshinum, de vitriolo, unquentum Agrippæ, aragon, seu auxiliare, martiatum, enulatum, theriaca, mithridatum, empl. de meliloto, diachilon magnum & parvum, oxycroceum, divinum.

Those things which draw by a secret property in Nature, as are the Load-stone, Quick-silver, Pio- By an occult ny, Amber, all Antidotes and Triacles that are remedies against the bitings of venomous Beatls, and all purging Medicins.

Thole which draw by accident, perform it otherwife than of their own Nature; they have that By accident, quality out of putrefaction and corruption, as Doves dung, Goats dung, Cows dung, Mans dung, and all kind of dungs: also Leven, old Cheese, and such like,

Cupping-glaffes, Leeches, Syringes, rougher and harder Frictions, Sucking, Pain, firaight Ligations. Cauteries, do also draw, but after a different manner from them spoken of before.

Attractive Medicins must neither burn nor discuss, and being very strong and sharp, they should be tempered and mixed with Oil of Rofes, and other knitives: but to weak ones should be added Oil of Bays, Calx viva, and such like to strengthen them. The use of attractives is to draw poison toward Their use. the skin, and to haften forward critical abfeeffes; and they make those parts which are benummed and confumed, to have life; they reftore the refrigerated parts by drawing thither the spirits, they draw forth the viscous sith of malign ulcers that lies hid in the nerves and hollow passages of them; they also draw out scales of bones, splinters of wood, nails, thoms, arrows, and that matter which is unpact in hardned inflamations.

Committee 11

CHAP. XL

Of resolving Medicins.

ving Medicin The differen ses thereof.

Hat is called a refolving Medicin which by heat, and the tenuity of his fubfiance openeth the pores, attenuates the humours, diffipates and discuffeth by evaporating the unprofitable matter. There are two forts of these kinds of Medicins, the one is called Aresticum, or rarifying, the other is termed Disploreticum, or digefting.

The Aresticson by a mean heat, and not dry, and indued with a tenuity of fubitance, openeth and relaxeth the skin, and draweth forth the matter thut up under it, whereby it may cafe pain, like as Anodynes, because it doth not much depart from a temperate heat.

But the Diaphoreticion being much hotter, whatfoever flicketh in the part being there impact, it doth by thin vapour infenfibly diffipate: therefore the acrid and hot things are in this cafe to be made use of rather than attractives, because that cold and großness is more difficultly to be digested, and the length and involution of the ways being to be confidered. The Arestick, which we may call weak Refolvers, are either Simple or Compound.

The Simples are these, Bismalva tota, parietaria, adianthum, mercurialis, ebulus, valeriana, rosmarinus, salvia, thymus, chamamelum, melilotum, anethum, farma bordei, tritici, seminis lini, sanng aci, nigella, surfur, adeps galline, anferis, anatis, cuniculi, vituli; almost all Metals unless such as are acrid. pounds are, Oleum chamemolinum, anethinum, liliaceum, catellorum, lumbricorum, Keirimon, de vitellis ovorum, de tritico, amygdalarum dulcium, unquentum de althea, empl. diachylum, ireatum. Diaphoreticks or digeftives, are also both Simple and Compound: The Simple are Arrivoluchia, enula campana, iris, capa scylle, sigillum Salomonis, sigillum Beate Marie, bryona, panis porcinus, dracunculus, assbodelus, origanum; mentha, pulegium, sabina, serpillum, calamentha, bysopus, urrica, arremisia, tavendula, chamapitys, anisum, saniculum, cuminum, piper, nux moschata, coviandrum, bacca lauri & juniperi, farina fabarum, lupinorom, orobi, milii, frumenti, furfur, mica panis, acctsom tepidsom, occycratum, vinson vetus aut aromaticum, mel, aqua visa, muris, adeps tauri, equi, leonis, canis, birci, medulla cervi, cruris bovis & arietis, ammaniscum, galbanum, opopanan, sagapenum, myerba, bdelimu, thus, terebinthina, pix nigra, ladanum, stirax, calanuta, ben-jainum, stereus caprinum, columbinum, caninum, bubulum, & alia stercorum species. Compound Diaphoteticks are, Oleum anygdalarum amararum, juniperinum, laurinum, de feorpionibus, trinum, coltinum, nardi-num, de terebinthina, de eroco, canabinum, raphaninum, è eucumere agresti, vulpinum, rataceum, philosophorum, de lateribus, de euphorbio, de tartaro, de petroleo, de herva, five recininum unquent. Arippa, aragon, maritatum, enulatum, empl. de Viga, without addition, and with addition, expersesum, discaleithear, diffolved in a digefting oil to the form of a cerot.

Areeticks are profitably used in the increase and state of superficial tumours.

The use of Diaphoreticks

But Diaphoreticke are not to be used in the increase of tumours, unless some astringent be added, lest by their more strong digestion, they should draw and increase the defluxion: but when the tumors decline, they are then onely to be used in the parts chiefly where the skin is dense and hard, and when the tumor is cold and gross, and lying hid deep in the body, so that the virtue of Medicaments can hardly come thereto: but consideration is to be had of the parts to which resolutives are to be appropriately come thereto: plied; for you may not apply Relaxers or Diaphoreticks to the Liver, Spleen, Stomach, or Bowels, unless you add fome aftringents, of which a great part must be Aromaticks.

To the parts where fense is more dull, may be applied the stronger Diaphoreticks; but those parts which are endued with a more exquisite fense, as the Eye and the Nerves, to them we must apply weaker. When the matter is gross and cold, things cutting and attenuating, and then emollient are to be used, and so by degrees come to diaphoreticks; otherwise that onely is resolved which is the most subtil of unprobable matter, the groffer becoming concrete and hardned. But if the part be afflicted with a continual defluxion, so that there may be danger of a Gangrene or Sphacel, it is not lawful then to make use of Resolvers, but you must in the place where the humour flows, divide the skip by Carifornian and it is not be said to the skip by Carifornian and it is not be said to the skip by Carifornian and it is not be said to the skip by Carifornian and then are successful to the skip by Carifornian and then are successful to the skip by Carifornian and then are successful to the skip by Carifornian and then are successful to the skip by Carifornian and the skip by Carifornian and then are successful to the skip by Carifornian and the skip by Carifornian and the skip by Carifornian and the skip by the skip by the skip by Carifornian and the skip by the skin by fearification, as it is most learnedly noted by Hollerius, in that profitable Book of his left to posterity, whose Title is, De Materia Chirurgica.

CHAP. XII.

Of Suppuratives.

What a Sup-purative Me-dicin is.

Suppurative Medicin is faid to be that, which shutting the pores, and preventing transpiration by his emplastick consistence, increaseth the matter and native heat, and therefore turneth the matter cast out of the Vessels into pas and fanier. It is of nature hot and moist, and proportionable to the native heat of the part to which it is applied, and of an emplaffick confiftence, that fo it may hinder the native heat from being exhaled; in which respect it different from emplants for Differences of lients and malacticks, of which we shall speak hereafter. There be two kinds of Supporatives: for Supparatives, forme do it of themselves, and by their proper quality; others by accident. Those things which by

their own firength do bring to suppuration, are either Simples or Compounds. Simples are, Radix liliorum, capa, alimm, malvarum omnium folia o femina, bugloffum, acanthus, fenecio, viola, parietaria, crocus, caules, ficus, paffula mundata, with a decoction of their things, farina tritici,
femina, parietaria, crocus, caules ficus, paffula mundata, with a decoction of their things, farina tritici, farina volatilis, farina hordei excorticati, lolii, feminis lini & fanugraci, galbanum, ammoniacum, fiyrax pinguis, ladanum, vifeum aucupatorum, thus, pix, cera, refina, colla, adeps fuillue, vitulinus, vaccinus, caprinus, butyeum, visellus ovi, afipus humida, stereus suillum, columbinum, caprinum, pueri. Compounds arc, Oleum liliorum, lumbricorum, de croco, unguent basilicum, emplast, diaciviton conimuse, magnum, de mucilaginibus.

Those things de fi

Those things do suppurate by accident, which work it onely by the means of an Emplattick confi-

aratives

flence: for fo oft-times aftringents, because they are of earthy and thick parts, are found to suppurates fuch are unquentum de bolo nutritum, and fuch like. Such also are those which by their coldness keep the heat in, and shut the pores. Hence it is that the qualities of Sorrel are commended to generate pas : for whileft it keepeth the heat within, it increaseth his effects, to the thickning of the suppurable matter, and the overcoming other rebellious qualities. We use things ripening in great inflammations, whose growth we cannot hinder with Repellers, or increase with Resolvers or Discussers.

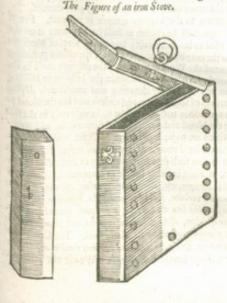

CHAP. XIII. Of Mollifying things.

Hat is defined to be a mollifying Medicin, which by a fironger heat than that which is pro- gale cony, the per to suppuratives, without any manifest quality of drying or moissining, again malaxeth 5-sing, or fosteneth hardned bodies: wherefore this differs from that which suppurates, because the same of the body, or part to the same of the body, or part to the same of the body. that they be hot in the first or second degree, according to the several tempers of the body, or part to mollients dis-which it is applied, working rather by the quantity of heat, than the quality s contrariwise, that which fer. mollineth being indued with a greater heat, rather worketh by the quality of the heat, being otherwife in driness and moisture temperate.

Although as many things agree together in fome respects, though of a diverse nature, so many emollients are such as are hot in the first degree, and drie in the second and third, that so they may the better disperse and diffuse that which is congealed, by taking away a little of the humidity, which is contained within the part affected: but not by exhaulting it wholly by the violence of heat or driness: for hereon would follow a greater hardness.

Things mollifying, are either Simple or Compound, and those again strong or weak. The weak The differen Things mountying, are entire sampees competer, although folia malve, bifmalve, liliorum, anethi fimmitates, ces of emol!!are, Radix liliorum alborum, encumeris agrefiis, although folia malve, bifmalve, liliorum, anethi fimmitates, ces of emol!!viola, branca urfina, fimen malva, bifmalva, lini, fanugraci, carici pingues, paffula mundata, pedum, capitum, intestinorum vervecinorum decollum, adeps excjunioribus & castrasis domesticis faminis animalibus, adeps fuil-lus, vitulinus, badinus, caprinus, bubulus, vulpinus, gallinaceus, anferinus, anatinus, olorinus, ssficaces. The weaker are things more gentle; as, Butyrum, Isna fuecida, eera pinguia, virellus ova, medulla ex offi-bus, eervina, ovilla, caprina. The compound are oil, wherein are boiled mollifying herbs; as, Oleon filturum, chamamelinum, mnygdalarum dulcium. Stronger emollients arc, deeum, adept taurinus, arfinus, cervinus, leoninus, pardalinus, apri, equi sevum, pinea, picea, abietina, terebinishina, ammoniacum, bdelium, siyrax, galbanum, ladanum, propoli, opopanax, ung. de althea, emp. diaebylon commune & magnum, de mucila-ginious, ceronium, ocyerocum Joannis de Vigo.

We use emollients in scirrhous turnours of the muscles, or in the lips of Ulcers, in any of the limbs, Their use belly, glandules, bowels, by reason of a gross, cold, and viscous matter, either phlegmatick or melan-cholick. Yet those tumors which come of melancholy, commonly turn to Cancers, which are exa-sperated by mollifying things. On the contrary, such as proceed from a phlegmatick matter, are brought to an equality of confidence, by the use of emollients. Furthermore, there are three things obserobservable in the use of emollients: the first is duly to consider how much the affected part differs vable in the from his proper and natural temper and proportion, that so we may apply an equivalent remedy, ents. The fecond is, that we diffinguish the natures of the parts. The third is, that we artificially gather after what manner this mollifying must be performed; that is, whether we should mingle with the emollients deterrive or discussing Medicins. For there are many desperate scirrhous sumours, that is, fuch as cannot be overcome by any emollient Medicin, as those which are grown so hard, that they have loft their fense; and thereupon are become fmooth and without hairs. Here you must observe that the part fometimes becomes cold in fo great an excefs, that the native heat plainly appears to languish, so that it cannot actuate any Medicin. That this languishing heat may be resuscitated, an fron flove shall be set near to the part, wherein a good thick piece of iron heated red hot shall be enclosed, for so the Stove will keep hot a long time.

A The case of the Stove. B The iron Bas to be heated. C The lid to flut the Stovel

THURSDAY ...

CHAP. XIV.

Of Deserfives, or Mundificatives.

Deterfive is defined to be that which doth deterge or cleanse an ulcer, and purge forth a double kind of excrement; of the which one is thicker, which is commonly called forder, which is drawn forth from the bottom of the ulcer, by the efficacious quality of the Medicins; the other is more thin and watery, which the Greeks call leber, the Latins Sanies, which is taken away by the driness of the Medicin; and therefore Hippocrates hath well advised that every ulcer must be cleansed and dried.

Deterfives,

Their ule.

Of Deterfives, fome are simple, forne compound, some stronger, some weaker. The simple are either bitter, sweet, or sowre: the bitter are Gentiana, Aristolochia, iria, enula, seylla, serpentaria, centantium minus, absynthium, marrabium, perforata, abrotonon, apium, ebelidonium, rata, bysopus, setisosa, artemista, eupatorium, aloe, sumus terra, bedera terrestris i a Lucivium made with the asses of these things, Lupini, orobus, amygdala amara, saba, terebinthina, myrrha, mostiche, sagapenum, galbanum, ammoniacum, the galls of Beatts, strena capriumu, urina bene colla, squama aris, ar ustum, arugo, scoria aris, antimonium, cala, chalcitis, miss, sor, alumen. The sweet are Viola, rosa, melilotum, sicus pingus, datiyli, uva passa, glycyrrbixa, aqua bordei, aqua mulsa, vinum dulce, mel, saccarum, serum lassis, manna, thus. The sharp are all kind offower things, Capreoli vitium, acetum, and other acid things. The Compound are, Syropus de absynthio, de sumaria, de marrabio, de expatorio, de artemisa, acetosu, licivium, steum de vivilas ovor de terebinthina, de tartaro, unguentum mundificativum de apio, apostolorum, pulvia mercurialis. We use fusch things as deterge, that the superstuous matter being taken away. Nature may the more conveniently regenerate sleth to sill up the cavity: But in the use of them, consideration is first to be had of the whole body, whether it be healthy, plethorick, or ill disposed; there is consideration to be had of the part, which is moister and drier, indued with a more exquisit or duller sense. But oft-times acidents betal ulcers besides nature, as a Callus, a defluxion of a hot or otherwise malign humour, and the like symptoms. Lassly, consideration is to be had, whether it be a new or inveterate ulcer; for from hence, according to the Indication, remedies are appointed different in quantity and quality: fo that oft-times we are constrained to appoint the bitter remedy in stead of the sweet. Neither truly with a painful and drie ulcer doth any other than a liquid detersive agree: neither

CHAP. XV.

Of Sarcoticks.

No Medicin truly Sarcotick. Hat Medicin is faid to be Sarcotick, which by its drinefs helps Nature to regenerate fielh in an ulcer, hollow, and diligently cleanfed from all excrements. But this is properly done by bloud indifferent in quality and quantity. Wherefore, if we must speak according to the truth of the thing, there is no Medicin which can properly and truly be called farcotick: For those which vulgarly go under that name, are onely accidentally such; as those which without biting and erosion, do drie up and deterge the excrements of an ulcer, which hinder the endeavour of Nature in generating of fleth. For as by the Law of Nature, from that nourishment which flows to the nourishing of the part, there is a remain, or a certain thin excrement, flowing from some other place, called by the Greeks Icher, and by the Latins Samies. Thus by the corruption of the part there concretes another groffer excrement, termed Rypos by the Greeks, and Sordes by the Latins. That makes the ulcer more moist, this more filthy. Hence it is, that every wound which requires restitution of the lost substance, must be cured with two forts of Medicins, the one to drie up and waste the superfluous humsdity thereof, the other to fetch off the filth: and by how much the wound is the deeper, by so much it requires more liquid Medicins, that so they may the more easily enter into every part thereof.

But diversity of things shall be appointed according to the various temper of the part. For if the affected part shall be moits by Nature, such things shall be chosen as shall be less drie; if on the contrary the part be drie, then such things shall be used as be more drie; but many forts of Medicins shall be affociated with the farcoticks, according to the manifold complication of the affects possessing the user. Therefore Nature onely is to be accounted the Workmaster, and the efficient cause in the regenerating of slesh, and laudable bloud the material cause, and the Medicin the helping or affishing cause, or rather the cause without which it cannot be: as that by cleansing, and moderately drying without any vehement heat, takes away all hinderances of incamation, and orders and fits the bloud to receive the form of slesh. This kind of Medicin according to Galen, ought to be drie only in the first degree, lest by too much driness it might drink up the bloud and matter of the stuture slesh, which not-withstanding is to be understood of Sarcoticks which are to be applied to a declicate and temperate body. For it the user be more moist, or the body more hard than is fit, we may ascend to such things as are drie even in the third degree. And hence it is that such drie Medicins may first be called Detersives, and then presently Sarcoticks. A Sarcotick Medicin is either simple or compound, stronger or weaker. Simple Sarcotick Medicins are, Aristolochia utraque, iris, acorus, draeamenlas, afaram, symptom, saran, spaniar, plantago, rubia major & minor, eorumque succi. Terebinthina lota & roon lota, resma pini, gummi, analicum, sarcoticks, and then presently sarcoticks, colophonia, manna, thuris, cortex ejus dem, aloe, olibanum, myroba, mel, cinum, sangui draeconis, libargyou, sara, sposium, pompbolyx, tutia, plumbum ustum lotum, scoria ferri. The Compound Sarcoticks are, Oleum bypericonis, ol. oversem, malichinum, & cereter alea, que balfami nomine appellantur, magnetitum amreum, emp. de betonica, Vigonis de janua,

Simple Sarcoticks.

Compound Sarcoticks.

before that the ulcer be cleanfed and freed from pain, defluxion, inflammation, hardness, and diftemper. In using these things we consider the temper of the body, and the affected part: For off-times a part otherwise less dry by nature, requires a more powerful drying medicine, and stronger farcotick, than another part which is more dry, and this for some other reason, which ought to come into our consideration: For example, the glans would be more dried than the prepuce, although it be of a temper less dry, because it is the passage of the urine. Wherefore we must diligently observe the condition of the affected parts, and thence taking indication, make choice of more discoveries. For highest that which is too little, and that which is no much furcisist. firong farcoticks. Foth both that which is too little, and that which is too much farcotick, makes a fordid ulcer: the first because it dries not sufficiently; the latter for that by its acrimony it causeth defluxion. Therefore diligent care must be used in the examination hereof.

CHAP. XVI.

Of Epuloticks, or skinning medicines.

N Epulotick medicine is that which covereth the part with skin; it is faid to be fuch as by drines and astriction without biting deficcates, binds, and condensates the flesh into a certain callous fubfiance, like to the skin, which we commonly call a cicatrice or fear: yet this, as the generating of flesh, is the work of nature. A medicine therefore is faid to be Epulotick, for that it allifs nature in fublituting and generating a fear, in flead of the true skin, whillt it con-furnes the fuperfluous humidities, condenfates, incraffates, and binds the next adjacent flesh: therefore it ought to dry more powerfully than a farcotick. Epulotick medicines are of three kinds: the first is the true epulotick, which onely dries and binds. The second is an acrid and biting epulotick, which onely dries and binds. The second is an acrid and biting epulotick, which, for that it wastes the proud fielh, is called so; and this must be sparingly used, and that only to hard and rutlick bodies. The third is that which only dries without attriction. The things whereof they consist are these: Aristolochia utraque, gentiana, iris, centaurium majus, pentaphyllon, symwhereot they contin are there: 2 erytotochia urraques germons, iris, centarium majus, pentapoyans, fymphytim majus, ekamadys, betonica, cauda equina, enpatorium, verbenaca, plantaginis & fymphyti folia, galla, bacca myrti, glandes & esrum calices, balaufiia, cupreffi nuces, malicorium, cortex quereus, cortex tamaricis, cartex light aloes, ocacia, colophonia, farcocolla, fanguis draconis, ladanum, litbargyeos auri, argenti, cerufa, plumbum ufium, alumen mfum, tutbia, fquamma aris & ferri, & corum fooria, aruga, flor aris, as ufum & lotum, fulphur vivum, chryfocolla, corali, bolus armenus, terra figillata, cineres buccinarum, efteerum, filicis, effaufta & ficeata, earies lignorum, ung, diapompholygos, ung, alb. rbafit, deficeativum rubrum, emp. de cerufa, de betonica, diacalcitheos, emp. nigrum.

We use Epuloticks when as the ulcer is almost filled up, and equal to the adjacent skin. In the Their use of these we must also have respect to the tenderness and hardness of the body; for such things as

are corrofives to tender and delicate bodies, are epulotick to hard and ruffick bodies. Also we must have regard, whether the body be plethorick, or replete with ill humours, for such do not easily admit cicatrization. Also it is most worthy of your observation, to mark whether the ulcer that is to be cicatrized be fed or nourithed by the prefent defect of any part, as the liver, fpleen, lungs, or a varix lying about it. for it cannot be cicatrized before these impediments (if any such be) be taken away. Laftly, the callous lips of an ulcer, unless they be fearified or foftened, hinder cicatrization. Therefore all fuch defaults must be taken away, and then fuch an epulotick applied, as may not by

the too much driness leave the scar too hollow, or the too little, leave it too high.

CHAP. XVII.

Of Agglutinatives.

Gglutinating or agglutinative medicine is of a middle nature, between the farcotick and epulotick, more firong than the former, and weaker than the latter, for it is dry to the fecond degree. It by the drying and aftrictive faculty, void of all detertion, conjoins parts parts that are diffant, or rather lends helping hands to nature the principal agent in this work. Glutinatives, whether they be strong or weakly such, do agglutinate either by their proper or accidental nature: Of this fort are Plantaginis omnes species, confolida utraque, buglossa, millefolium, verbena, Agglutinative pimpinella, pilofella, cauda equina, sempervivum, telephium, sanicula, attracilis, folia quercus & dracun- m culi, salix, ebulus, sambucus, pentaphyllon, veranica, cortex pini, ulmi, palme quercus. Aqua vitis, aq. e folliculis ulmi, succus calaminthe, vinum austerum, terebinthina, myerba, sanguis deaconis, bolus armerus, terra figillata, omnia denique acerba.

Glutinatives by accident are those that hinder defluxion, and bind the part, as Sutures, Bandages, Glutinatives Reft. Rowlers, and the like. We use glutinative in green, and as yet blondy wounds, whence the by accident. Greeks call a glutinative medicine Enema, although fornetimes they are used to inveterate, maligu, fiftulous and finuous ulcers; for they hinder the defluxion from coming to the lips of ulcers. You trauft confider, when as you intend to apply them, whether the skin be whole or no: For ulcers knit together, or heal more difficultly, if the skin be rubbed off, or cut, or otherwise lost. Neither ought You to be unmindful of the forementioned cautions and indications drawn from the fex, the tendernefs of hardness of the affected body, the continuance and magnitude of the ulcer: for hence indication must be taken, what the quantity and quality of the medicin ought to be.

Cathereticks.

Septicks and Veficatories,

Escharoficks. Their use,

canicula,

Tillian in 111

CHAP. XVIII.

Of Pyroticks, or casoftick Medicines.

Hat medicine is faid to be Pyrotick or Cauftick, which by its acrimony and biting, commonly confifting in an earthy confiftence, either fuperficially corrodes, or more deeply eats and putrefies, or laftly, burns and confumes the skin and fleth, fo that it even pierces into of Caufticks.

Three degrees callous and hard bodies. Therefore there are three degrees of Pyroticks; for forme are termed Catherestick or correcting, for that they waste the proud fleth of an ulcerated or any other part, and thefe are canons and hard bodies. I herefore there are three degrees of Pyroticks; for ionic are termed Cathere-tick or corroding, for that they waste the proud flesh of an ulcerated or any other part, and these are judged the weaker fort of the Pyroticks. Othersome are termed Septick or putrifying, as those which destroy and dissolve the tender and new sprung up flesh, and raise blisters in the skin, and these are more powerful than the cathereticks. Lassly, there are othersome termed most powerful Escharoticks, which by their fiery and terreshrial quality cause escharor cruss; whereupon they are also termed Ruptoria, and potential Cauteries: Now all these differences are taken from that they are more or lefs powerful, for it oft-times happens, that according to the different temper and confistence of the parts, according to the longer or shorter stay, a Catheretick may penetrate as far as a Septick, and on the contrary, an Escharotick may enter no farther than a Septick. These are judged Catheretick, Spongia usta, alumen ustum & non ustum, vitriolum ustum, calx mediocriter lota, arugo, chalcanthum, squamma aris, oleum de vitriolo, trochisci andronis, phasionis, asphodelarum, ung. Ægyptacum, apostolorum, pulvis mercurii, arsenicum sublimatum. Septicks and Vesicatories are, Radix scille, bryonie, sigili beate Marie, buglossa, radix ranunculi, panis percini, apium, risus, lae tithymallorum, lae sici, euphorbium, anacardus, sinapi, cantharides, arsenicum sublimatum: For all these weaken the native temper and confidence of the part, and draw thereunto humors plainly contrary to nature. Escharoticks or Causticks are, Calx viva, fex vini eremata & prespine aceti, ignis, whereto are referred all Cauteries, as well actual as potential, whereof we shall treat hereafter. We use Cathereticks in tender bodies, and difeafes not very contumacious; therefore by how much they are lefs acrid and painful, by fo much oft-times they penetrate the deeper, for that they are less troublesome by delay; but we use Septicks, and sometimes Escharoticks in ulcers that are callous, putrid, and of inexhausted humidity, but principally in Cancers, Carbuncles, and excessive Hæmorrhagies. When as we make use of these, the patient must have a convenient diet appointed, must abstain from wine:
lastly, they must not be used but with great discretion; for otherwise they may cause Feavers, great inflammations, intolerable pains, Swounings, Gangrenes, and Sphacels. Cauteries heedfully used, strengthen and dry the part, amend an untameable diffemper, dull the force of poylon, bridle putrefaction and mortification, and bring fundry other benefits.

CHAP. XIX.

Of Anodynes, or such as mitigate or asswage pain.

Efore we treat of Anodyne medicines, we think it fit to fpeak of the nature of pain. Now pain What pain is. is a forrowful and troublefome fenfe, caufed fome fudden diffemper, or folution of continuity. There are three things necessary to cause pain; The efficient cause, that is, a sudden departure from a natural temper or union: the sensibleness of the body receiving the dolorifick cause: lattly, the apprehension of this induced change, caused either by difference or union; for otherwise with how exquifite foever fenfe the body receiving the causes indued with, unless it apprehend and mark it, there is no pain prefent. Hence is that Aphorisin of Hippocrates, quienne, parte aliqua corporis dolertes dolerem omnino non fentium, bis mens agrotat, that is, Whosoever pained in any part of their bodies do wholly feel no pain, their understanding is ill affected and deprayed. Heat, cold, moisture, and drinefs, induce a fudden change of temper; and heat and cold cause sharp pain, draness moderate, but moisture scarce any at all: for moisture causeth not pain so much by its quality, as it doth by the quantity. Both the forementioned qualities, especially affociated with matter, as also certain external causes too violently affailing, such as these that may cause contusion, cut, prick, or too much extend. Wherefore pain is a symptom of the touch, accompanying almost all diseases; therefore ofe-times leaving these, they turn the counsel of the Physician to mitigate them, which is performed either by mitigating the efficient causes of pain, or dulling the sense of the part. Hercupon they make three differences of Anodynes: For some serve to cure the difference on the mitigate it, othersome supplies, and are narcotick. We term such curative of the diseases, which resist, and are contrary to the causes of diseases. Thus pain, caused by a box diseases, which resist, and are contrary to Thus pain, caufed by a hot diffemper, is taken away by oil of Rofes, Oxy crate, and other fuch like things, which amend and take away the cause of pain, to wit, the excels of heat. Pain caused by a cold difference, is amended by Oleson Lastrimon, Nardinson, de Castoros. Pain occasioned by two much drines, is helped by Hydreleum, a bath of fresh and warm water. Last-ly, by this word Anodyne, taken in the largest sense, we understand all purging medicines, Phle-botomy, Scarification, Cauteries, Cuppings, Glysters, and other such like things as evacuate any store of the doloristic matter. But such as are properly termed Anodynes, are of two forts: for some are temperate, others hot and moist in the field deliver, and conference have are stored that are temare temperate, others hot and moift in the first degree, and consequently near to those that are temperate, these are to those that are temperate, the consequences are to those that are temperate, the consequences are the conseq Analyses are. emperate, others hot and moin in the first degree, and contequently near to those the perate: these preserve the native heat in the proper integrity, thus they amend all differnperatures; of this kind are accounted Sallad oil, oil of fweet Almonds, the yolks of eggs, and a few other fuch like things, thefe firengthen the native heat, that thus increased in substance, it may with the more facility overcome the cause of pain: besides also, they rarifie, attenuate, digest, and consequently evacuate both gross and visid home. both groß and vifeid humors, as also cloudy flatulencies hindred from passing forth: such are florer chamaeneli, meliloti, croesse, oleum chamaenelinum, anethinum, oleum lini oleum ex femine alibea, lumbricorum, everum, ex tritico, butyrum, lana fuccida, fuillus adeps, vitulinus, galinacem, anferinus, humanus, ex anguilla

eunienla, & aliis. Lac muliebre, & vaccinum, mucago seminis lini, fenugraci, althee, malve, vel ejus-modi seminum decollum: as also Decollum biliorum, violarie, capitis, pedum, & intestinorum arietis & badi. Narcoticks, or stupesying medicines, improperly termed Anodynes, are cold in the fourth degree, Narcotick

therefore by their excefs of cold, they intercept or hinder the paffage of the animal spirits to the part, whence it is that they take away fenfe: of this fort are byofcyamus, cicuta, folanum manicum, mandra-termed ano

gora, papaver, option, ardiffina vincula.

You may make use of the first fort of Anodynes in all diseases, which are cured by the opposition. The use of of their contraries: but of the fecond, to expugn pains that are not very contumacious, that by them, their application we may relift defluxion, inflammation, the feaver, and other fymptoms. But whereas the bitterness of pain is so executive great that it will not stoop to other medicines, then at the length must be come to the third fort of Anodynes. Yet oft-times the bitterness of pain is so great, that very narcoticks must be applied in the first place, if we would have the part and the whole man to be in fafety. Yet the too frequent use of them, especially alone without the addition of failton, myrrh, eastercom, or forme such like thing, useth to be very dangerous: for they extinguish the native heat, and cause mortification, manifelled by the blackness of the part. But intolerable pains, to wit, fuch as are occasioned by the excess of inflammation and gangrenes, may be sooner thitigated by opening a vein, purging and scarifying the part affected, than either by properly termed anodynes or narcoticks, to wit, that pain may be the remedy of pain. By purgers we here understand not only such as taken by the mouth, produce that effect; but also such as outwardly applied perform the fame, as those whereof Aetius makes mention, As

CHAP. XX.

Of the composition and use of Medicines.

Itherto we have spoken of the faculties of simple medicines; now we think good to say formething of the compounding of them: for fo by the Architect are had and known every thing apart, and then he fettles the workmen to the building, the conceived form of which hath been in his mind ever fince he did enterprise it. Therefore the composition of di-vers medicaments with their qualities and effects, is a mingling appointed by the art of the Phyfician. Hence therefore rhenam, alor, rofa, abfyribinm, although they have divers substances and Gal. 2. fing. 4 faculties, yet are notwithstanding called simple medicines, because they have that variety from defavit tried. Nature, not from Art. But we many times call simple such things as are compounded by art, as expm, fimpl. oxyfacels. fimplex, as compared to greater compositions. And therefore oftentimes we use compound medicines, because always the simple medicine alone, hath not firength enough to oppugn the diffease. For many times the fick labour with manifold, and not simple affects, from which there being taken a various indication, we gather contrary fimple medicines, to apply to every affect, in one composition. But oftentimes the nature of the part of the Patient, or of the body affected, requireth another kind of medicament which may be proper for the removing that difease; wherefore it is so made to oppugn the disease and not offend the body; and we mingle many other together, whose effects may temper one another. Moreover the composition of medicines was necessary, that because those things which have not a good taste, colour, or finell, by Art, or composition, might be made more grateful. Compound medicines of which we intend to speak, are Glysters, Suppositories, Naduli, Pessaries, Oils, Liniments, Ointments, Emplasters, Cerats, Pultisses, Cataplasms, Fornentations, Embrocations, Epithemates, Vesicatories, Cauteries, Calyria, Evaluations, Embrocations, Epithemates, Vesicatories, Cauteries, Calyria, Evaluations, Emplasters, Carteries, Calyria, Evaluations, Embrocations, Epithemates, Vesicatories, Cauteries, Calyria, Evaluations, Emplasters, Carteries, Calyria, Evaluations, Carteries, Carteries, Calyria, Evaluations, Carteries, Carteries, Carteries, Carteries, Calyria, Evaluations, Carteries, Baths. But fift it is expedient that I fay fomething of weights and measures, with their notes, by which medicines commonly are measured and noted by Phylicians.

CHAP XXI.

Of weights and measures, and the notes of both of them.

Very weight arifeth from a beginning and foundation, as it were; for as our bodies do arife of A grain the the four first fimple bodies or elements, into which they are often refolved: fo all weights do beganing of the four first fimple bodies are the beginning and end of the rot. arife from the grain, which is as it were the beginning and end of the reft. Now hereby is what is meant understood, a barly-com or grain, and that fuch as is neither too dry, or overgrown with mouldiness, by a grain. or rancid, but well conditioned, and of an indifferent bigness.

tuning or my

Obeles. A dram. An ounce A pound,

Ten grains of these make an Obolus; two Oboli, or twenty grains make a scruple, three scruples, or fixty grains make a dram, eight drams make one ounce, twelve ounces make one pound medicinal, which is for the most part the greatest weight used by Physicians, and which they seldom exceed; and it is refolved into ounces, drams, feruples, oboli and grains, which is the leaft weight-To express these weights we use certain notes; the pound is expressed by this note, the the ounce by this 3, the dram thus 3, the scruple thus 9, the obolus with the beginning letter thus obol. the grain with his beginning letter thus, g. But sometimes we measure the quantity of medicines by measures and not always by weights; and therefore we express a handful by this note, m. a pugil thus, p. number thus, n. and the half part of every weight and measure is expressed by this hote, p. put after every note of the aforefaid weights and measures of the same fort, as the half pound, the half ounce, \$15. and so of the rest. Moreover, in describing the same medicament we use the notes sometimes of weights, sometimes of measures; and therefore it is to be noted that herbs, given or dry, are figned with these notes, m. p. but those which are dry and to be brought to powder, with these notes, 3.3.p. Roots, by these notes, 3.3.p.m. Barks, by these notes, 3.3. Seeds, by these notes, 3.3. Fruits, by these notes, an.p.3.3.9. Flowers, by these notes, p.m.3.3. Pulses, by these notes, p.5.3. All other medicaments either dry or liquid, are described with these notes, ib. 3.3.9. obol. g.

Having expounded these things, let us come to the description of compound medicines, beginning with glysters first, as the remedy which is most common and familiar, and almost chiefly necessary of all others.

CHAP. XXII. Of Glyfters.

What a glyfler is.

Glyfter is an injection prepared first and properly for the gross intestines and fundament; for fornetimes glyflers are used and made for the stomach, spleen, reins, bladder, womb, mesentery, and also for the head, from whence oftentimes by sharp glyflers, the hurtful matter is brought downwards, as we see in Apoplexies. Therefore there is no part of the body which receives not fome benefit by glyfters, but more or lefs according to the vicinity they have Differences of with the belly, and the firength of the glyfier: for there are divers forts of glyfiers, fome emolliglyfiers.

one of the belly, and the firength of the glyfier: for there are divers forts of glyfiers, fome emollients, others evacuating, fome anodynes, fome aftringents, fome cleanling, forme farcotick, and
epulotick, and fome may be faid to nourith. They may be all made of the parts of plants or beafts, with compound medicines either folutive, or altering, and others according to the advice of the Physician. The parts of plants which are used to this purpose, are roots, seeds, leaves, flowers, fruits, flouts, juices, mucilages. Parts of beafts are yolks of eggs and whites, hony, chickens, capons, old cocks well beaten, hands and feet of theep, the inteffines, whey, milk, fewet, axungia, and fuch like in decoctions, wherein we mingle and diffolve fimple and compound medicines. We fornetimes use without any other medicament, to make a glytter with oil alone, as oil of nuts for the Colick, of whey alone, the decoction of the head and feet of the sheep alone, and of the deco-

The marefials of glyfters.

Their quantity

ction of Cicers and barly do we prepare Glyfters. The quantity of a Glyfter is formetimes lefs according to the diverse disposition of men and their difeases: for weak children the quantity is less: for women with child, and in the colick, dysentery, lientery, or when much hardened excrement is within. But when we would abundantly move the excrement, and there is nothing that may hinder, the dofe of a glyfier for the most part is half a pound, one pound, or three quarters of a pound. The glyfter mult be injected warm or hot, more or less, according to the nature or condition of the fick; for being cold it offends the inte-flines, and the neighbouring nervous parts, which are cold of themselves. It must be given by degrees, for being injected fuddenly, the wind which is ufually in the guts will beat it back again, whence comes intolerable pain. But this will be more clear by that we shall teach concerning the differences of glyfters, whereof there shall be sufficient examples.

An emollient

R. malv. violar. bifmalv. acamb. an. m. j. radic. alth. lilior. an. 33. pafful. ficuum ping. 3 S. fiat de-

cottio ap. Ibj. in qua diffore caff. butyr. recent. an. 3j. ol. viol. 3iij. fiat Clyfter.

Glyfters that do evacuate, are prepared by the counfel of the Phylician, and of divers Simples, being boiled for feveral purposes. Therefore if the humors be cold which are to be evacuated, the Glyster shall be after this manner. R. Salvie, origani, abrotoni, chamem. melilot, an. m. B seminom anifi, fanic. eumini, an. 3iij. semin. cathar. 3ij. Make a decoction of them, wherein diffolve Displan-Hier. Simpl. an. 3 b. ol. aneth. chamem. an. 3). B. Mellis Antho. face. rub. an. 3) fiat Clyffer.

To evacuate Cholerick matter, prepare a Glyffer after this matter, R. quat. remolient. paret. Gickov. endi. an. m. \(\beta \). Semen. quat. frigid. Major. an. 3ij. bordei integri, p. j. Make a decoction of them; and diffolve in it Caff. \(3j \). Ol. viol. mellis viol. an. \(3j \). fiat Clyfter.

To evacuate melancholy, this Glyfler following will be ufeful. R. Famiter. Centaur. ntineris, Mercurialis, an. m. j. Polyp. Qn. folicul. fome, an. 3iij. feminis agai cofti, Thymi, an. 3iij. Make a decoccion and diffolve therein Confell. Hameeb. 3 B. Caff. recens extracti. 3iij. olei violati, Illion. an. 3jib. Sac. smb. mellis viol. an. 3jib. falia, 3j. And those Glysters do not only evacuate the humors that oftend, but also correct the diffemper of the bowels and inward parts. For the Glysters prescribed against pituitous and melancholick matter, help the cold differences; but since which is the challest the hot diffemper. and melancholick matter, help the cold difference; but that which is for choler, the hot difference. Purging medicines, which are diffolved in the decoction of Glytters, are very firong, as, Confed.

Hameels. Benedictae, Which are diffolved in the decoction of Glysters, are very firong, as, Conjul-Hameels. Benedicta, Diaprun. Solutivum, Diapheniem, being used from 3vj. to 3j. at most: but the weaker and more gentle are Carbolicon, Cassia, Hiera simplex, from 3vj. to 3ij. at most. An Anodyne Glyster is usually made without such things as purge or evacuate: as, Rv. Plon. Clas-mem. melil. Aneth. an. p. j. vad. Bismal. 3j. boil them in milk, and to the decoction add, Macaginis seminis lini, fanugraci, extrasta in aqua Malva, 3ji. saccari albi, olei anethi, chamameli, an. 3j. vitellas.

Glyfter. album, overum duorum, fiat Clyfter. We use the self-ind of Glyfters in Dysenteries, and in the immoderate flux of the Harmorthoid veins, having first evacuated the moderate flux of the Harmorthoid veins, having first evacuated the self-ind excrements. Glyfters which be farcotick, epulotick, and cleanfers of the greater guts, and fit for the curing of ulcers, are to be prepared of fuch medicines as are described before in their proper Chapters.

Alimentary Glyfters are made of the decoction of Chickens, Capons, Cocks, being boiled to a Nourithing gelly, and ftrongly preffed forth. They are also prepared of Marrow gelly, which are not altogether to strong as those which are commonly taken by the mouth, because the faculty of concoction in the guts, is much weaker than that of the stomach. Oftentimes also the matter of these kind of Glyfters is prepared in wine, where there is no pain of the head or fever, but more frequently in the decoction of Barly, and in Milk, adding the yolks of Eggs, and fome finall quantity of white fugar, left by the cleaning faculty it move the guts to excretion. And therefore Sugar of Rofes is thought better, which is conceived to be somewhat binding. Here you may have examples of facts is thought better, which is conceived to be somewhat binding. Here you may have examples of facts of steh Glysters. R. Decollismis Capi perfette colli th. j. β. sacchari albi, ξ β. mise, flat Clyster. R. Decollis Publi & Gallatine, th. β. vini opt. ξiv. flat Clyster. R. Decolli bordei mundati, & in cremorem redalli th. β. latins boni th j. Vitellor overnom duos, flat Clyster. We use these kind of Glysters to strengthen children, Their use, old and weak men, and bodies that are in a Consumption. But in the use of these there are three things to be observed: First that the freculent excrements may be taken away, either by firength of nature, or by art, as by a Suppository, or an emollient Glyster, left the alimentary matter being mingled with them, should so be infected and corrupted. The other is, that there be great quantity given, that so form may ascend to the upper guts. That third is, that the sick sleep after the taking of it; for so it is more easily converted into nourishment, and the alimentary matter is better kept, for fleep hindereth evacuations. In Glyffers of this kind we must beware of Salt, Hony and Oil; for the two first provoke excretion by their acrimony, and the last by his humidity doth relax and habricate. They who think no kind of Glyster can nourish or fusiain the body, rely upon this reason : That it is necessary whatsoever nourisheth, should have a triple commutation or concoction in the Their Argubody: first, in the stomach; secondly, in the liver; thirdly, in all the members. But this is re- ment that depugnant to reason and experience: to reason, for that a certain sense of such things as are desective, ny Glytters to is implanted in all and every of the natural parts of our body. Therefore seeing nutrition is a repletion of that which is empty, without doubt the empty and hungry parts will draw from any place that nourishment that is fit and convenient for them, and in desect thereof, whatsoever they meet that is fit and convenient for them, and in desect thereof, whatsoever they meet with, which by any familiarity may affwage and fatisfie their defire. But the alimentary Glyflers, by us described, confist of things which agree very well with the nature of our bodies, and such as are boiled and ordered with much art, fo to apply the chylification to be performed in the flomach. Therefore they may be drawn in by the mefaraick veins of the guts; which according to Galen, have a certain attractive faculty. And thence they may be eafily carried through the gate-vein, liver, and fo over the whole body. And experience teacheth, that many fick people, when they could secondly, by take nothing by the mouth, have been furfained many days by the help of thefe kind of Glyliers, experience. What is more to be faid? We have feen those who have taken a Suppository by the fundament, and womited it at the mouth ; by which it also appeareth that something may flow without danger of the fick from the guts into the fromach.

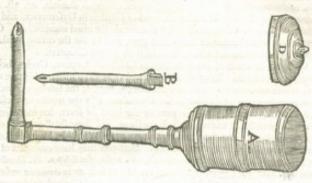

Commonly they give Glysters any hour of the day, without any respect of time ; but it should not be done unless a great while after meals, otherwise the meat, being hindred from digettion,

will be drawn out of the flomach by the Glyffer.

Glytlers are used to help the weaker expulsive faculty of the guts, and by consequence also of the The common other parts, both that such as through want of age, and old people, and such as by reason of great use of glytlers. imbecillity by fickness cannot admit of a purging medicine, may by this means at least ease themfelves of the trouble and burden of hurtful humors. Galen hath attributed to Storks the invention of Glyfters, which with their bills, having drunk Sea-water, which from faltness hath a purging quality, wall themselves by that part, whereby they use to bring away the excrements of their meats, and of the body. But a Glyster is fitly taken after this manner: whilest the Syringe is expressed, let the patient hold open his mouth; for by this means all the mutcles of the Abdomen, which help by compression the excretion of the guts, are relaxed ; Let him wear nothing that may gird in his belly, let presson the excretion of the guts, are relaxed; Let him wear nothing that may gird in his belly, let him lie upon his right fide, bending in a femicircular figure; and fo the Glyster will the more casily pass to the upper guts, and (as it were) by an overflowing, wer and washall the guts and excrements. It hapneth otherwise to those who lie upon their left fide; for the Glyster being so injected, is conceived to abide, and (as it were) to stop in the Intestinum rellum, or Colon, because in this site these two intestines are oppressed, and as it were that up with the weight of the upper guts. A little while he may lie upon his back after he hath received the Glyffer, and prefent after he may turn The fick has bimfelf on either fide. And if there be pain in any part, fo long as he is able, may incline to ving received that fide; Moreover, because there are many who cannot by any reason be persuaded to the that fide; Moreover, because there are many who cause of foolith fhamefaitness hindring must turn to their buttocks to him that should administer the Glysler, a foolith shamefaitness hindring must turn to their fide gries. them: therefore I thought good in this place to give the figure of an Infirument, with which one may give a Glyfier to himfelt, by putting up the pipe into the fundament, lifting the buttocks a little up. The pipe is marked with this letter A. The body of the Syringe, whereinto the Glyfter must be Put, with this Letter B.

Timming and

The figure of a Glyster-pipe and Syringe, by benefit whereof a man may give himself a Glyster.

CHAP. XXIII.

Of Suppositories, Nodules, and Peffaries.

Suppository is a certain medicament, formed like unto a tent, or gobbet of paste, such as is commonly used to fat Fowl. It is put into the fundament, that it might excite the sphin-Other-muscle to fend forth those excrements which are knit in the guts. Anciently it had the form of an Acorn, whence it is called to this day Glans. The Suppositories we now usually make, have the form of a Peffary, that is round and longish, in the form of a Wax-Candle. They are either weak, stronger, or sharp; the weak are made of the shalks or the roots of Beets, of Lard, boiled Hony with Salt, or of Cafile-fope. The stronger of purging powders, as Hiera, with Salt and Hony, or the juices of sharp herbs, or mingled with the galls of beasts. It is commonly made

thus: as, R. Mellis 3j. Salis ant pulveris alterius irritantis 3j.
R. Mellis coĉii 3j. pul. Colocynthidos 3 . Salis gemme 3j. fiat Suppositorium. We use Suppositories, when the fick by his infirmity is unwilling, or not able to bear or away with a Glyfter, as in burning Feavers: or, when as one being injected, is flow and refleth in the guts. And we use the fharper Suppositories in soporiferous affects of the head, that they might provoke the dull faculty of the guts to expulsion. As also when the condition of the disease is such, that by the use of Glysters there is manifest hurt; as in an Extendele, where the gut so swells, that over and above if it be filled by the glyster infused, it would the more press the Peritoneum, so that straight-ways by the relaxed or broken part it might eafily be devolved into the Cod.

Nodules have the fame use with Suppositories, and are oftentimes substituted in stead of Glysters. They are made of gentle medicines, as the yelks of Eggs with a little Salt and Butter, or of Gall and Hony tied up in a cloth in the form of a Filbert; the tiring of it may hang forth, whereby the Nodule in the fundament may be drawn forth. This description may be an example of Nodules: R. Vitellum unius ovi, cui adde falis modicum, felis vervecis, mellis an. 3 [5 butyri 311] mifce fiant Noduli filo appenfi.

A Peffary is groffer than a Suppository, and is appointed for the womb, being made with Cotton-

Wool or Silk steeped in some medicament, and then put into the neck of the womb.

A Peffary is used either to ulcers of the neck of the womb, or for the procuring or stopping of the Menstrua, or against fordid and hurtful humors of the womb, causing hysterical pussions, and therefore to be wasted away and evacuated. Therefore in the composition of Pessaries are used gums, juices, feeds of herbs, roots, and many other things, according to the advice of the Phylician, they are also made of a folid consistence, the bigness of a singer, that they may enter into the neck of the womb; these being tied with a string, which must hang forth to pluck it out withall when occasion serves. This following may be an example of their description. R. myrrb, aloes an. 31 sabin, semin, nigel, artemis, an. 31; radie, ellebor, nig. 3; croci, 3; com succo mercurial, & mille siat Pessus let it be tied to the thigh with a thred. Or thus, R. mastieb, thuris, an. 3ii, alaon, ros. rub. and cupres. an. 313. ladan. bypoci, sumach. myrtil. an. 3113. stant pessi cum succe arnoglos. & cotoniorum. According to this example others may be made for to mollifie, to bind, to cleanfe, to incarnate, to cicatrize and cover the ulcers of the womb: they are to be put up when the patient lieth in bed, and to be kept all night,

Peffaries are also made of medicinable powders, not only mixed with some juice, but also with those powders alone being put into a little bag of fome thin matter, being flusfed with a little cotton, that it might be of a convenient stiffnels, and this kind of Pessaries may be used profitably in the falling of the mother,

CHAP XXIV.

Roperly and commonly we call oil that juice which is pressed forth of Olives; but the word is used more largely, for we call every juice of a fluxible, unchaous, and aiery substance, Oil. There are three differences of these oleaginous juices: The first is of those things which yield oil by expression, as well fruits as seeds being brussed, that by beating the oily juice may be pressed forth; some are drawn without fire, as oil of sweet and bitter almonds, oil of nuts, of Palma Christi. Others are made to run by the help of fire, by which means is gotten oil of bays, linsted-oil, rape-oil, oil of hemp, and such like: The manner of drawing oil from seeds is set down by Messee in his third book.

The fecond fort of those oils which are made by the infusion of simple medicines in oil, wherein they leave their qualities: and this is done, three several ways, the first is by boiling of roots, leaves, oils by infustops of slowers, fruits, seeds, gums, whole beasts, with wine, water, or some other judge, with common on any other oil, until the wine, water, juice be consumed, which you may perceive to be perfectly done, if you cast a drop of the oil into the fire, and it maketh no noise but burneth. It is to be remembred that fornetimes the seeds or fruits are for a certain time to be macerated before they are set to the fire, but it must be boiled in a double vessel, less the oil partake of the fire.

After this manner is made oleum colimum, rataccum, de creco, cydoniorum, myrillorum, maftichimum, de emphorbio, vulpinum, de forpionibue, and many others. The fecond is by a certain time of mace-ration, fome upon hot albes, others in horfe-dung, that by that moderate heat the oil might draw forth the effects of the infused medicines into it self. The third is by infolation, that is, when these or these flowers, being infused in oil, are exposed to the Sun, that by the heat thereof the oil may change, and draw into himself the faculty of the flowers which are infused: of this kind are oil of roses, camonil, dill, lilles, of water-lilles, violets and others, as you may see in Mesue.

The third kind is properly that of the Chymifts, and is done by refolution made after divers manners, and of this fort there are divers admirable qualities of divers oleaginous juices, whether they of oils by rebe made by the Sun or Fire, or putrefaction, as we shall speak in his place hereafter.

We use oils when we would have the virtue of the medicament to pierce deep, or the substance of the medicines mingled with the oil to be soft and gentle. Moreover when we prepare oils that should be of a cooling quality the common oil of the unripe Olive is to be used: of that should the oil of roses be made.

Again when we would prepare oils of heating qualities, fuch as are Oleum Philosophorum, or of Tiles, fweet and ripe oil is to be chosen,

C H A P. XXV. Of Liniments.

Liniment is an external medicine of a mean confiftence between an oil and an ointment, for what a linibility, which is the reason why a Liniment is more efficacious in ripening and mitigating pain, than simple oil. The varieties of Liniments are drawn from their effects, some cool, others heat, some humest, some ripen, others by composition are made for divers uses. The matter whereof they are usually made, is oil, axungia, suct, butter, all those things which have an oily substance or consistence, as styrax liquida, turpentine, the mucilages of senugreek, marsh-mallows, marrow, and other like. To these are sometimes added powders of roots, seeds, slowers, rinds, metals, but sparingly, that the liniment may be of a liquid consistence.

An example of a liniment that is good to attenuate, heat, and digeft, is this that followeth. R. Ol. amygd. amar. lilior. an. 53. axong. anat. galin. an. 33. butyr. fal expert. 33. moves. fem. alth. fanney. extract. in aq. byffop. an. 34. pulver. croci, iren, an. 35. fiat lirimentum. This may be an example of a liniment to humect and mollifie. R. ol. amygd. dulc. 31. axong. human. 36. mucog. femin. malv. extract. in aq. parietar. 36. fiat linimentum; you may add a little faffron. There be many others like these which may be made for divers affects. They are easily applied to every part of the body, because they are not so liquid as oils: the reason is, they are more agreeable to any of the parts. If they be to enter into any crooked narrow passage, such as the ear, they must be more liquid, and have more oil: if they be to stick on the part, they will admit of more axongia and fact.

They are deceived who think that the difference between liniments and ointments is, that there is no wax in liniments as there is in unquents; for there be form unquents which admit not any wax to be added, as Ægyptiseum, and all fuch as are used in gangrenes, and all forts of putrid users; because to these kinds of diseases all fatty things, as oils, fats, rosins, and wax, are enemies. Therefore we substitute in the place of them in Ægyptiseum, hony and verdigrease; for of these it hath his consistence, and his quality of cleansing.

Of Ointments.

Interests are of a more folid confiftence than Liniments, and are therefore of more force. Observents

Their differences are partly taken from their effects; for force heat, others cool, force dry, and their differences, and force humoft, force cleanfe, force corroborate, force waste dead flesh, and others force.

lets may be had in March. They must be bruifed and mingled very well, and fer in a warm place for eight days; then add one pint of ftrong Vinegar, and boil them till it be confumed, which may be perceived by casting a little of it into the fire, then strain it forth, and put up the ointment. Ointments are used to overcome the contumacy of a flubborn evil by their firm and close flicking to, especially if there shall need no Medicin to go further into the body.

CHAP. XXVII. Of Cerats and Emplasters.

" Uch affinity there is in the composition of a Cerat and Emplaster, that oftentimes the one is what a Cera: taken for the other, as is usually done in Ointments and Liniments. A Cerat is a composi-is tion more folid and hard than an Ointment, and fofter than a Plafter, having his name from The differen-Wax, which taking away the fluidness of the Oil, bringeth him to his confidence. The differences ces. of Cerats are taken some from the parts by which they are called, as Ceratum/tomachieum: some from the effects, as Ceratum refrigerans Galeni: others from the simple Medicaments which are the chief in the composition, as Ceration Santalinum. The proper matter of Cerats is new Wax and Oils, being appropriated to the grief of these or those parts; so that Liniments and Ointments do fearce differ from Cerats, if they admit of Wax: for if Ointment of Rofes thould have Wax added

Cerats which are made with Rolins, Gurns, and Metals, do rather deferve the names of Emplaferes than Cerats.

And therefore Ceratum ad Hernius we commonly call Emplafram contra Ruptu-If that pain or inflammation do grieve any part, we make Cerats of Platter diffolved with Oil, left that the more hard and heavy confidence of the Emplaster should be troublesom to the part, and hinder perspiration; and therefore laying aside the composition of Cerats, let us speak of Em-

An Emplafter is a composition which is made up of all kind of Medicins, especially of fat and Emplasters, dry things, agreeing in one gross, viscous, folid, and hard body, sticking to the singers. differences of Emplatters are taken from those things, which the variety of Ointments are taken from. Of those things which go into the composition of an Emplatter, some are onely used for their quality and faculty, as Wine, Vinegar, Juices. Others to make the confiltence, as Litharge (which according to Galen, is the proper matter of Emplatics) Wax, Oil, and Rofin. Others be useful for both, as Gums, Metals, parts of Beafts, Rofin, Turpentine to digeff, to cleanfe and dry. Of Emplafters, forne are made by boiling, forne are brought into a form without boiling; those which be made without fire, do suddenly dry, nor are they viscous: they are made with Meal and Powder, with fome juice, or with fome humid matter mingled with them. But Platiers of this kind may rather be called hard Ointments or Cataplasms: for Plasters properly so called are boiled. fome of them longer, fomethorter, according to the nature of those things which make up the composition of the Emplaster: Therefore it will be worth our labour to know what Emplasters do ask more, or which lefs boiling. For Roots, Woods, Leaves, Stalks, Flowers, Seed, being dried, and brought into Powder, are to be added last, when the Plaster is boiled as it were, and taken from the fire, lest the virtue of these things be lost. But if green things are to be used in a composition, they are to be boiled in some liquor, and being pressed forth, that which is strained to be mingled with the rest of the composition; or if there be piece to be used, it is to be bruised and pressed forth, which is fo to be boiled with the other things, that nothing for the quality is to remain with the mixture, as we use to do in Empl. de Janua, seu Betoniea, & Gratia Dei. The same is to be done

Communica Str

with Mucilages, but that by their clamminess they do more resist the fire. But there doth much of Oil and Honey remain in their Plasters when they are made. Those juices which are hardned by concretion, as Alors, Hypoeiftis, Aeseia, when they are used in the composition of a Plaster, and be yet new, they must be macerated and dissolved in some proper liquor, and then they are to be boiled to the confumption of that liquor. Gums, as Opopanax, Galbanum, Sagapenum, Ammoniaeum, must be diffolved in Wine, Vinegar, or Aqua vita, then firained and boiled to the confumption of the liquor, and then mixed with the rest of the Plaster. And that they may have the exact quantity of Gums and Pitch, it is necessary that first they be dissolved, strained, and boiled, because of the sticks and fordid matter which are mingled with them. You must have respect also to the liquor you use to diffolve them in; for Vinegar of the best Wine doth more powerfully penetrate, than that which is

of weak and bad Wine.

Other Gums, which are drier, are to be powdered, and are to be mingled with Plasters last of all. Metals, as As untum, Chalcitis, Magnes, Bolis Armenius, Sulphur, Auripigmentum, and others, which may be brought to Powder, must be mingled last, unless advice be given by long boiling to dull the fierce qualities of them. The like confideration is to be had of Rofin, Pitch, and Turpentine, which must be put in after the Wax, and may not be boiled but very gently; but the Fatsare mingled whiles the other things are boiling. The Litharge is to be boiled with the Oil to a just consistence, if we would have the Platter dry without biting. Cerufs may endure as long boiling, but then the Platter thall not be white, neither will the Litharge of filver make a Platter with fo good a colour as Litharge of gold. Moreover, this order must be observed in boiling up of Plasters: the Litharge must be boiled to its confishence; Juices or Mucilages are to be boiled away, then add the Fats, then Signs of a Plathe the dry Rofin, Wax, Gums, Turpentine, and after them the powders: You shall know the Plafter is fter perfectly boiled enough by its confiftence, groß, hard, glutinous, and sticking to the fingers, being cooled in the air, water, or upon a stone. Also you shall know it by its exact mixtion, if that all the things become one mass hard to be broken.

The quantity

648

The quantity of things which are to be put into a Platter can hardly be described, but an artifiof things to be cial conjecture may be given, by confidering the medicaments which make the Plafter friff, and of a confiftence, and the just hardness and fortness they make being boiled. Wax is not put into such Plafters wherein is Labdamon, for that is in flead of Wax. For if there shall be in the composition of a Platter fome emplattick Medicaments, the Wax shall be the less; contrariwise, if they shall be almost all liquid things, the Wax shall be increased so much as shall be necessary for the con-fishence of the Plaster. The quantity of the Wax also must be altered according to the time, or the air; therefore it is fit to leave this to the art and judgment of the Apothecary. Emplafters are fometimes made of Ointments by the addition of Wax, or dry Rofin, or fome other hard or foliad matter. Some would that a handful of Medicaments powdered, should be mingled with one ounce, or an ounce and half of Oil, or fome fuch liquor, but for this thing, nothing can certainly be determined: onely in Platters described by the Ancients there must be great care had, wherein he must be very well verfed, who will not err in the deferibing the dose of them; and therefore we will here give

you the more common forms of Plasters.

Property of the control of the contr fire it is to be boiled to a just confidence; after the mucilage by degrees must be put in, which being confirmed the juices must be added and the icthyocolla, and they being wasted too, then put to the

Wax and Rolin, then taking the whole from the fire, add the alipus and rerebinibina.

We use Plasters when we would have the remedy stick longer and firmer to the part, and would The use of not have the strength of the Medicament to slie away or exhale too suddenly.

Plasters.

CHAP. XXVIII. Of Cataplasms and Pultiffer.

Ataplasms are not much unlike to Emplasters less properly so called, for they may be spred The matter of upon linnen cloths and stoups like them, and so applied to the grieved parts. They are composed of Roots, Leaves, Fruits, Flowers, Seeds, Herbs, Juices, Oils, Fats, Marrows, Meals, Rosins. Of these some must be boiled, others crude. The boiled are made of Herbs boiled tender, and so drawn through an hair Searse, adding Oils and Axangiaes thereto. The crude are tender, and to drawn through the residence of the part or diffcafe, as the Physician shall think fit. The quantity of Medicins entering these compolitions can scarce be defined, for that they must be varied as we would have the composition of a softer or harder body. Verily they ought to be more gross and dense when as we deline to tipen any thing, but more foft and liquid when we endeavour to difcufs. We use Cataplains Their ase. to affwage pain, digeft, difcufs and refolve unnatural tumors and flatulencies. They ought to be

Of simple Medicins, and their Use. BOOK XXVI. 650 moderately hot and of fubtle parts, fo to attract and draw forth; yet their use is suspected, the body being not yet purged, for thus they draw down more matter into the affected part. Neither multiwe use these when as the matter that is to be discussed is more gross and earthy, for thus the subtler parts will be onely discussed, and the gross remain impact in the part, unless your Cataplasm be made of an equal mixture of things, not onely discussing, but also emollicit, as it is largely handled by

Pultises differ not from Cataplasms, but that they usually consist of Meals boiled in Oil, Water, Honey, or Axungia. Pultifes for the ripening of tumors are made of the Flour of Barley, Wheat and Milk, especially in the affects of the entrails; or elfe to drie and bind, of the Meal of Rice, Lentils, or Orabas, with Vinegar; or to cleanse, and they are made of Honey, the Flour of Beans and Lupines, adding thereto fome old Oil, or any other Oil of hot quality, and fo making a discussing Pultile. Also Anodyne Pultifes may be made with Milk; as thus for example, Re Farin. triticee, 3 ij. mice panis parisi-mi, 3 iij. decequantur in latte, & fiat pulticula. Re Farin. bordei & fab. an. 3 ij. far. orab. 3 iij. decequan-tur in hydromelite, addendo mellis quart. j. olei anyg. amar. 3 ij. fiat pulticula. We use Pultises for the same purpose as we do Cataplasmes, to the affects both of the internal and external parts. We sometimes use them for the killing of Worms, and such are made of the Meal of Lupines boiled in Vincgar, with an Oxes gall, or in a decoction of Wormwood, and other fuch like bitter things.

A ripening Cataplaim,

CHAP. XXIX.

Of Fementations.

Forum or Fomentation is an evaporation or hot lotion, chiefly used to mollifie, relax, and affwage pain, confifting of Medicins having thefe faculties. A Fomentation commonly ufeth to be moift, being usually made of the same things as Embrocations, to wit, of Roots, Seeds, Flowers, boiled in Water or Wine. The roots here used are commonly of Mallows, Marth-mallows, and Lillies. The Seeds are of Mallows, Marth-mallows, Partley, Smallage, Line, Fenugreek. Flowers are of Camomil, Melilot, Figs, Raifins, and the like: all which are to be boiled in Wine, Water, or Lye, to the confumption of the third part, or the half: as,

R Rad. alth. & lil. an. 3 ij. sem lini, sænug. cumin. an. 3 iij. slo.cham.melil, & aneth.an. p.j. simmit. origm. In imitation hereof you may eafily describe other

Fomentations, as occasion and necessity shall require.

We use Fomentations before we apply Cataplains, Ointments, or Plasters to the part, that so we may open the breathing places or pores of the skin, relax the parts, attenuate the humour, that thus the way may be the more open to the following Medicins. The probability further burged, Fornentations may be used to what parts you please. They may be applied with a female Spunge, for it is gentler and foster than the male: with Felt, woollen Cloths, or the like dipped in the warm decoction wrung out, and often renewed; otherwise you may fill a Swines bladder half full (especially in pains of the fides) of the decoction, or allow the boards. pains of the fides) of the decoction, or elfe a ftone-bottle, fo to keep hot the longer; yet fo, that the bottle be wrapped in Cotton, Wool, or the like foft thing, that so it may not by the hardness and 2. The wills in roughness offend the part, according to Hippocrates.

Their ufe. 7

CHAP. XXX.

Of Embrocations.

What an Embrocation is.

N Embroche or Embrocation, is a watering, when as from an high we (as it were) shower down fome moisture upon any part. This kind of remedy is chiefly used in the parts of the head, and it is used to the coronal suture, for that the skull, is more thin in that part, so that by the firacula or breathing places of this future, more open than those of the other futures, the force of the Medicin may more easily penetrate unto the Meninger, or membrans of the brain. The matter of Embracations is Roots, Leaves, Flowers, Seeds, Fruits, and other things, according to the intention and will of the Phylician. They are boiled in Water and Wine, to the half or third part. Embrocations may also be made of Lye or Brine against the cold and humid affects of the brain. Sometimes of Oil and Vinegar, otherwhiles of Oil onely. R Fol. plantag. & folan. an. m. j. fon. portal. & course b. an. Z. ii. marril. Z. ii. for m escurb. an. 3 ij. myrtil. 3 j. flor. nymph. & rof. an. p. f. flat decoll. ad 1b j. cum aceti 3 ij. fi alte fub eundem fit ex qua irrigetur pars inflammata.

In affects of the brain, when we would repercuis, we often and with good fucceis use Oil of Roses

Their ufe;

with a fourth part of Vinegar. We use Embrocations, that together with the air drawn into the body by the Diafiele of the Arteries, the fabtler part of the humour may penetrate, and so cool the inflamed part; for the chief use of Embrocariors is in the humour may penetrate, and so cool the inflamed part; for the chief use of Embrocations is in hot affects. Also we use Embrocations, when as for fear of an harmour that or the flying afunder of a broken or diflocated member, we dare not loofe the bandages wherein the member is bound. For then we drop down fome decoction or oil from high upon the bandages, that by thefe the form of the member is bound. that by thefe the force of the medicin may enter into the affected member. CHAP.

CHAP. XXXI.

Of Epithemes.

Pithema, or an Epitheme, is a composition used in the diseases of the parts of the lower and What an Epimiddle belly, like to a fomentation, and not much unlike an embrocation. They are made theme is, of Waters, Juices, and Powders, by means whereof they are used to the heart, cheft, liver, and other parts. Wine is added to them for the more or lefs penetration, as the condition of the hot or cold affect thall feem to require; for if you defire to heat, more Wine must be added, as in swooning by the clotting of bloud, by the corruption of the feed, by drinking forme cold poifon; the contrar is to be done in a fainting by diffipation of the spirits by severish hears, also Vinegar may be added. The matter of the Medicins proper to the entrails is formerly described, yet we commonly use the species of Electuaries, as the species electuaries, the Liver being affected, and Diamargariton In the sixth in affects of the heart. The proportion of the Juices or Liquors to the Powders uses to be this, to Chapter, to every pint of them § j. or § j. \(\beta \). Of these, of Wine or else of Vinegar § j. You may gather this by the following example:

Re Aqu. rof. bugl. borag. an. 3 iij. succi seabios. 3 ij. pul. elest. diamarg. frigid. 3 ij. cort.citri sicci 3 j. A cordizl Epi-coral.rof. ebor. an. 3 s. sem. citri & card.beni an. 3 ij. s. croci & mosebi, angr.v. addendo vini albi 3 ij. stat theme. Epithema pro corde.

Epithemes are profitably applied in hectick and burning Fevers to the Liver, heart, and cheft, if fo Their ute; be that they be rather applied to the region of the lungs than of the heart; for the hear of the lungs being by this means tempered, the drawn in air becomes less hot in the pestilent and drying Fevers, They are prepared of humecting, refrigerating, and cordial things, so to temper the heat, and recreate the vital faculty. Sometimes also we use Epithemes to strengthen the heart, and drive therehence venenate exhalations, lifted or raifed up from any part which is gangrenate or fphacelate. Some Cotton, or the like, fleeped or moifined with fuch liquors and powders warmed, is now and then to be applied to the affected entrail: this kind of remedy, as also all other topick and particular Medieins, ought not to be used, unless you have first prentised general things.

CHAP. XXXII.

Of Potential Cauteries.

Hat kind of Pyrotick which is termed a Potential Cautery, burns, and caufeth an eschar. The use of po-The use of these kinds of Cauteries is to make evacuation, derivation, revulsion, or attraction of the humours by those parts whereto they are applied. Wherefore they are often and with good fuccefs used in the punctures and bites of venomous Beafts, in a venomous, as also in a peffilent Bubo and Carbuncle, unless the inflammation be great: for the fire doth not onely open the part, but also retunds the force of the poison, calls forth, and plentifully evacuates the conjunct matter. Also they are good in phlegmatick and contumacious tumours; for by their heat they take away the force and endeavours of our weak heat. Also they are profitably applied to stanch bleedding, or eat and waste the superstuous slesh of ulcers and wens, to bring down the callous lips of ulcers, and other things too long here to infift upon.

The materials of these Cauteries are Oak-ashes, Pot-ashes, the ashes of Tartar, of Tithymals or The matter of Spurges, the Fig-tree, the stalks of Coleworts, and Beans, cuttings of Vines, as also fal animoniacion, them.

alkali, axingia vitri, sal nitrum, Roman Vitriol, and the like; for of these things there is made a Salt, which by its heat is caustick and escharotick, like to an hot iron and burning coal: Therefore it violently loofes the continuity by eating into the skin, together with the fleth thereunder. I have thought good here to give you divers forms of them.

Take of unquenche Lime extinguished in a bowl of Barbers Lye three pounds: When the Lye The forms of is fetled let it be firained, and into the firaining put of Axungia viri, or Sandiver, calcined Argol, them of each two pounds, of Sal nitrum & ammoniacum, of oach four ounces, these things must be beaten into a gross powder, then must they be boiled over the fire, and after the boiling let them remain in the latest few and twenty hours for the fire, and after the boiling let them remain in the Lye for four and twenty hours space, being often stirred about, and then strained through a thick and double linnen cloth, lest any of the earthy dross get thorow together with the liquor. This strained liquor, which is as clear as Water, they call Capitellion, and they put it in a brazen Bafin, such as Barbers use, and so for it upon the fire, and as soon as it boils, they keep it with continual stirring, lest the Salt should adhere to the Basin; the Capitellion being half boiled away, they put has been the salt should adhere to the Basin; the Capitellion of the side away, they put has been the salt should adhere to the Basin; the Capitellion of the side away, they put has been the salt should adhere to the Basin; the Capitellion of the side away, they put has been the salt should be salt and salt should be salt and salt should be salt as the salt should be salt sh in two ounces of powdered vitriol, fo to haften the falling of the efchar, and so they keep the Ba-fin over the fire till all the liquor be almost wasted away. Then they cut into pieces the Salt or that earthy matter which remains after the boiling away of the Capitellum, and with a Knife or hot iron Spatula, form them into Cauteries of fuch figure and magnitude as they think fitting, and fo they lay themup, or keep them for use in a Vial or Glass closely stopped, that the air get not

Take a bundle or fufficient quantity of Bean-stalks or husks of Colewort stalks two little bundles, of cuttings of Vines four handfuls, burn them all to affect, which put into a Veffel of River-water, fo let them infuse for a days space, being stirred ever now and then; to this add two pounds of unquenched Lime, of Assenges wire half a pound, of calcined Tartar two pounds, of Sal mirer four ounces, infufe all these, being made into powder, in the foresaid Lye for two by three days some start of the sale of the three days space, often stirring it, then strain the Capitellum or liquor through a thick cloth until it become clear. Put it into a Bafin, and fet it over the fire, and when as the moisture is almost

wholly spent, let two or three ounces of Vitriol be added; when the moisture is sufficiently evaporated, make cauteries of that which remains, after the formerly mentioned manner.

Take of the aftes of found, knotty old Oak as much as you please, make thereof a Lye; pour this Lye again upon other fresh ashes of the same Wood: let this be done three or four times, then quench fome Lime in this Lye, and of these two make a Capitellum, whereof you may make most approved Cauteries: For fuch athes are hot in the fourth degree; and in like fort the ftones, whereof the Lime by burning becomes fiery and hot to the fourth degree : Verily I have made Cauteries of Oak-affice onely, which have wrought quickly and powerfully. The Capitelium or Lye is thought fufficiently

The fign of ftrong, if that an Egg will fwim therein without linking. Or, good Capitel-Lum.

Take of the afnes of Bean-stalks three pounds, of unquencht Lime, Argol, of the ashes of Oakwood, being all well burnt, of each two pounds. Let them for two days space be insused into a vef-fel full of Lye made of the ashes of Oak-wood, and be often stirred up and down. Let this Lye then be put into another veffel, having many holes in the bottom thereof, covered with firums or firawpipes, that the Capitelian flowing thorow these strait passages may become more clear. Let it be put twice or thrice upon the asses, that so it may the better extract the heat and caustick quality of the asses. Then putting it into a Barbers Basin, set it over the fire, and when it shall begin to grow thick the fire must be increased, and Cauteries made of this concreting matter.

The following Cauteries are the best that ever I made trial of, as those that applied to the arm in the bigness of a Peafe, in the space of half an hour without pain, especially if the part of it self be painless and free from inflammation, eat into the skin and flesh even to the bone, and make an ulcer of the bigness of ones singers end, and they leave an Eschar so moist and humid, that within sour or five days space it will fall away of it self without any scarification. I have thought good to call these Cauteries Silken or Velvet ones, not onely for that they are like Silk, gentle and without pain, but chiefly because I obtained the description of them of a certain Chymitt (who kept it as a great

fecret) for fome Velvet and much entreaty. Their description is this:

Take of the aftes of Bean-fialks, of the aftes of Oak-wood well burnt, of each three pounds, let them be infused in a pretty quantity of River water, and be often stirred up and down, then add thereto of unquencht Lime four pounds, which being quencht, ftir it now and then together for two days space, that the Capitelium may become the stronger, then strain it through a thick and strong linnen cloth, and thus strained, put it three or four times upon the ashes, that to it may draw more of the caustick faculties from them, then boil it in a Earbers Basin, or else an earthen one well leaded, upon a good Charcoal sire, until it become thick. But a great part of the secret or Art confiss in the manner and limit of this boiling; for this Capitellian becoming thick and concreting into Salt, must not be kept fo long upon the fire, until all the moisture shall be vanished and spent by the heat thereof: for thus also the force of the forefaid Medicins, which also consists in a spirituous substance, will be much diffipated and weakned; therefore before it be come to extreme drinefs, it shall be taken from off the fire, to wit, when as yet there thall fome thick moisture remain, which may not hinder the Cauteries from being made up into a form. The made up Cauteries thall be put up into a Glass most closely luted or stopped, that the air may not dissolve them, and so they shall be laid up and kept in a dry place. Now because the Powder of Mercury is near to Cauteries in the effect and faculty thereof, which therefore is termed Pulvis Angeliem, for the excellency, therefore I have thought good to give you the description thereof, which is thus:

Pe Auripigmenti citrini, floris eris, an. § ij. falis nitri, fb j. β. alumin. roche, fb ij. vitrisli fb iij. Let them all be powdered, and put into a Retort, having a large Receiver well luted put thereto. Then ry or Angeli- fet the Retoit over a Fornace, and let the diffillation be made first with a gentle fire, then encreased by little and little, fo that the Receiver may wax a little reddifh.

Re Argenti vivi, to (: aqua fortis, to j. ponantur in phiala, & fiat pulvis, ut sequitur.

Take a large earthen pot, whereinto put the Vial or bolt-head wherein the Argentum viruum and Aqua fortis are contained, fetting it in allies up to the neck thereof, then fet the pot over a Fornace, or upon hot Coals, fo that it may boil and evaporate away the Aqua fertis; neither in the interim will the Glafs be in any danger of breaking when all the water is vanished away, which you may know is done when as it leaves fmoaking; fuffer it to become cold, then take it forth of the affect of the collision of the affect of the collision. and you shall find calcined Mercury in the bottom, of the colour of red Lead, separated from the white, yellow, or black excrement; for the white that concretes in the top is called Sublimate, which if it should remain with the calcified Mercury, you shall make it into powder, and put it in a brass veffel upon forme coals, flirring or turning it with a Spatula for the space of an hour or two: for thus it will lofe a great part of the acrimony and biting, whence it will become lefs painful in the operation.

CHAP. XXXIII.

Of Veficatories.

What Veficatory and ru-britying Mcdicins are.

Eficatory and rubrifying Ointments, Cataplains, or Plafters, are made of acrid Medicins which have power to draw forth to the superficies of the body such humours as lie deep, by exulcerating the skin and caufing bliffers. Their matter is the fame with feptick medicins; as, Sinapi, anaecrdus, cantharides, enphorb. radices feylle, beyon, and the like, which with Hony, Turpentine, Leaven, Gum, or Rofin, may be made into Cataplaims, Ointments, or Plaiters; therefore the compositive of Velicatories, or earlier, their configuration of the first profession of the composition of Velicatories. fore the composure of Vesicatories, or rather their consistence differs not from that of hard or soft Unguents. Therefore I will give you one example or description of them, which is thus:

18. Cantharid, employebit, finapi, an. 3 \$\partial mellis anaeardini, \$\partial modies acess, \$\partial fermions (not) fit fails, excipiantur, \$\partial fint tesseament.

Some of the Ancients think it better to make up these Medicins with

The descripticatory.

with water rather than with vinegar, because experience teacheth that vinegar abates the strength of mustard. We use this kind of medicin in long diseases, when as we cannot any thing prevail with Their use, other medicins a especially in the Head-ach, Meagrim, Epilepsie, Sciatica, Gout, the bites and punctures of venomous creatures, pestilent Carbuncles, and other inveterate and contumacious diseases.

Also we use their, when as we would restore life and strength to a dead or decayed part, for thus they are drawn back together with the heat; for which purpose we must make choice of more gentle Vesicatories, as such which onely rubrise, so that the part may onely become red, and not be burnt: the part must first be strongly rubbed, that the decayed and dull heat may be rouzed and stirred up, the pores of the skin more opened, that the force of the Medicin may enter the deeper into the body.

CHAP. XXXIV.

Of Collyria;

A Collection is a Medicin proper for the Eyes, made of Powder finely levigated and ground into What a collection of Alebabel, as the Arabians and our Alchymists term it: yet the word in a more general acception, is used for any liquid Medicin, made with Liquors and Powders, and applied or used to any part. Wherefore Collection of three kinds, some are most or liquid; which are properly called Collections, others dries, which are of the same constitence with Trochisters, others have consolitence of Honey, or a limitent. The liquid serve for the greater and lester corners of the Their use. Eyes; those of the constitence of Honey are meet for the Apple of the Eye, but the drie are to be made into Powder, and so blown into the Eyes: also sometimes they are to be distolved in some juice, or other convenient liquor, that so they may be made into most Collection.

Other convenient liquor, that to they may be made into mont convers.

Therefore Collyria have diverse uses, and are applied to several parts according to the intention and counsel of the Phylician: for liquid Collyria put into the corners of the eyes do more readily mitigate the heat of their inflammation, by reason they enter more easily by the tenuity of their substance; such things as have a more firm confishence adhere more tenacionally, and work more certainly. Moith Collyria are made of Juices, Mucilages, Waters of Herbs, Flowers, Seeds, Metalline bodies, Galls, and other such like Medicins, which are Repercussives, Resolvers, Detergents, Anodynes, and the like, according to the nature of the present disease.

Sometimes they are made of Juices and diffilled Waters onely; otherwhiles Powders or drie ColIyria made into Powder, are mixed with them, together with the white of an Egg. Powders are
preferibed to 3 ij, and liquors to 3 iv. or 3 v. in Medicins for the Eyess but for other parts, as when
it is to be injected into the Utrinary paffage, they may be preferibed to the quantity of a pint. Drie
Colyria are made of Powders exceeding finely beaten or ground, and incorporated with some juice,
whence it is that they differ little from Trochifees. Wherefore the Collyrium album Rhafis is now
unfully termed a Trochifee, and kept with them. Catharetick Powders are not applied in the form
of a moift Collyrium, but in the form of a limitnent, that is, incorporated with Fat or Oil. All these
things shall be made more plainly by the following examples.

of a most Collyrium, but in the form of a miniment, that is, incorporated with Fat or Oil. All these things shall be made more plainly by the following examples.

R. Aq. plant. & rofar. 3 ij. album ovi unum bene agitatum, mise, fiat collyrium. R. Aq. rofar. & viol. an. A Repercuscular of trackly alb. Rhas. cum. opis, 5 ij. siat collyrium. Oa R. We use Collyris in Wounds, Ulcers, Futulaes, Suffusions, Inflammations, and other discases of the

CHAP. XXXV.

Of Errbines and Sternutatories.

Refines are Medicins appointed to be put into the Nofe to purge the Brain of its excrementiatious humours by the Nottrils, or to deterge such excrements as are therein, by reason of an emplatice. Liquid Errhines are either liquid or drie, or else hard, and of the Their differences of Herbs, as Beets, Coleworts, Marjeroun, Pintpernel, Hyssop or Balm, or of their decoctions taken alone, or mixed with Wine, or Syrup, as exymal feillin Syrup of Hyssop, Roses, or mel antibosia, sometimes Powders are mixed with the Liquous, as of Pepper, Employeb. Pellitory of Spain, Hore-hound, nigel. Rom. caster, Myrth, white Ellebore, Sow-bread, and other like, in a small quantity, to wit, to 5 j. little more or less according to the vehemency of the disease. We will make this more plain by examples.

R. Succi beta, majoran. brasse, an. 3 j. deparentiar, & modice bulliant cann vini albi, 5 ij. exymal. feillit. The form of 3 ß. stat Errbinam. When as you defire to attract more powerfully from the brain, you may dissolve one.

R. Succi bette, majoran, brajec, an. 5]. aeparentur, & module builtant cum vini albi, 5 ij. oxymel. feillit. The form of \$\frac{3}{5}\$, fast Errbinum. When as you defire to attract more powerfully from the brain, you may diffolve one, in Errhins fome purging Medicins; as Agarick, diaphenicon fenna, earthaman, and the like: hence doth arife the diffinction of Errhins into fuch as are meet to purge phlegm, choler, and melancholy. This following example is fet down by Rondeletius. R. Rad. pyreth. irid. an. 5 p. puleg. calam. arig. an. m.j. agar. An Errhine trockife. 3 iii. flor. aribus & fazebad. an. p.j. flat decotio in colatur. It is difforwardly antibolati & feillit, an., iii. purging flat caput pargium. But it is better to this purpose to make use of purging Simples, as Agarick, Turbith, Coloquintida, and the like, then of Compositions, as Diaphanicon, for these make the decoction more thick, and less fit to enter the passages of the Nostrils, and the seve-like bones, but apt rather there to cause obstruction, and intercept the freedom of respiration.

R Succi bere, 3 j. aqfalv. & betan.an. 3 ij. F. cafter. 9 B. piper. & pyreth. an. 9 j. flat caput purglum. with Powder.
Kkk 3

THE PROPERTY OF

A Scernutatory.

To whom they are

Dric Errhines that are termed flernutatories, for that they cause sneezing, are made of powders onely, to which purpose the last mentioned things are used; as also aromatick things in a small quantity, as to 3 ij. at the most: as, R Major, nigel caryoph, zinzih, an. 3 j. acor, pyreth. & panis porcin, an. 9 f. euphorb. 9 j. terantur, & in nares mittautur, ant infussionatur. Exthines of the confidence of Emphalters, by the Latins vulgarly called Nafalia, are made of the described Powders or Gums dissolved in the juice of some of the sorrementioned herbs, incorporated with Turpentine and Wax, that so they may The matter of the better be made into a pyramidal form to be put into the notfrils. As R Majoran, falt. nigel. Diffeoid errhines. pip. alls. caryoph. galang. an D j. pyreth. emphorb. an. 3 β. panis porcin. ellebor. alls. an. D j. terantur. o in pulveron redigantur. And then with Turpentine and Wax as much as shall be sufficient; make them up into Nasalia of a pyramidal or taper fashion. We use Errhines in investerate diseases of the brain; as the Epilepsie, sear of blindness, an Apoplexy, Lethargy, Convulsion, the lost sense of the brain; as the Epilepsie, sear of blindness, and exacustions. less to prove the property of the prop Smelling: yet we brit use general remedies and evacuations, left by incezing and the like concustion of the brain for the exclusion of that which is offensive thereto, there should be made a greater at-The manner traction of impurity from the fubjacent parts. Liquid things must be drawn up into the nostrils warm of using them, out of the palm of the hand, to the quantity of 3 15, the mouth being in the interim filled with water, left the attracted liquor should fall upon the palat, and so upon the lungs: drie Errhines are to be blown into the note with a pipe or quill: solid ones must be fastned to a thred, that they may be drawn forth as need requires, when as they are put up into the noftrils. The morning (the belly being empty) is the fitteft time for the use of Errhines. If by their force the nose shall be troubled with an itching, the pain thereof must be mitigated by Womans milk, or Oil of Violets. The use of attractive Errhines is hurtful to fuch as are troubled with difeases of the Eyes, or ulcers in the nose, as it oft-times falls out in the Lucy Venerea: wherefore in this case it will be best to use Apophlegmatisms which may divert the matter from the Nofe.

CHAP. XXXVI.

Of Apophlegmatisms, or Masticatories.

What an Apophlegmation The differen-

Pophlegmatismoi, in Greek, and Masticatoria in Latine, are Medicins which kept or held in the mouth and somewhat chawed, do draw by the mouth forth of the brain excrementitious humours, especially phlegm: now they are chiefly made four manner of ways; the first is when as the Medicins are received in Honey or Wax, and formed into Pills, and fo given to chaw The fecond is, when as the same things are bound up in a fine linner cloth, so to be held in the mouth. The third is, when as a decoction of acrid Medicins is kept in the mouth for a pretty The fourth is, when as fome acrid Medicin, or otherwise drawing phlegm, as pellitory of Spain, Mattich, and the like, is taken of it felt to the quantity of a Hafel-nut, and to chawed in the mouth for fome space. The matter of Masticatories is of the kind of acrid Medicins, as of Pepper, Mustard, Hysfop, Ginger, Pellitory of Spain, and the like; amongst which you must make the chiefly of fuch as are not troubleform by any ingrate taffe, that fo they may be the longer kept in the mouth with the lefs offence and loathing. Yet Masticatories are sometimes made of harsh or acerb Medicins; as of Berberies, the stones of Prunes or Cherries, which held for some space in the mouth, draw no lets flore of phlegm than actid things; for the very motion and rowling them up and down the mouth attracts because it heats, compresses and expresses: the quantity of the Medicin cught to be from 3 β. to 3 j. β. as, R. Pyreth, ftaphyfag, an. 3 j. β. mafich. 3 β. patteressur & involvant, nodulis in mafticatoria. Or is Zinzib finap, an. 3 · j. emphorb. 3 ij. piper. 3 β. excipsantur melle, & fiant patitili pro maticatoriis. R. Hyffopathymorigan. falv. an. p.j. boil them in water to wath the mouth withall. Or is Zinzib. caryoph. an. ξ , pyreth. pip. an. 3 ... ftaphylagr. 3 ij. maltiches ξ β, excipiactur, fiant pafilli promafticatoriis. We use malticatories in old discases of the brain, dimness of the sight, deafners, pultles of the head and face, and fometimes to divert the excrements which run to the Nofe being ulcerated.

The use of Mafticatories

To whom hurtful.

Masticatories are very hurtful to such as have their Mouths or Throats ulcerated, as also to them whose lungs are subject to inflammations, distillations and ulcers; for then Errhines are more pro-fitable to derive the matter of the disease by the nostrils. For though the humour drawn from the Brain into the mouth by the means of the malticatory, may be thence cast forth by coughing and spitting, yet in the interim Nature will be so inured to that passage for the humour, so that it will run that way when as we sleep, and fall down upon the parts thereunder, weak either by Nature or by Accident.

The time fittest for the use of Apophlegmatisms is the morning, the body being first purged; if any ingrateful rafte remain in the mouth, or adhere to the tongue by using of Malticatories, you shall take it away by washing the mouth with warm water, or a decoction of Liquorice and Barley.

CHAP. XXXVII.

Of Gargarifins.

What a Gargle is. The differences thereof.

Gargle or Gargarilin is a liquid composition fit for to wash the mouth and all the parts thereof, to hinder defluxion and inflammation, to heal the ulcers, which are in those parts, to affwage pain. Their composition is two-fold, the first is of a decoction of Roots, Leaves, Flowers, Fruits, and Seeds it for the difease: now the decoction is to be made either in fair water alone, or with the admixture of white or red wine, or in the decoction of Licorice and Barley, or of personal things as the Goral things, as the intention of the Phylician is to repel, cool, or hinder inflammation; as in the tooth-ach caused by matter which is yet in motion; to discus, as in the tooth-ach already at the

height; or to cleanfe, as in the ulcers of the mouth; or to dry and bind, as when it is fit to heal the ulcers already cleanfed.

The other way of making of Gargarifins is without decoction, which is, when as we make them Their maner, either of diffilled Waters onely, or by mixing them with Syrups, Mucilages, Milk, the Whey of Goats milk carefully frained. There are mixed sometimes with a decoction, diffilled Waters and Mucimilk carefully ltrained. There are timed authorities with a decoction, diffined waters and Muci-lages, Mel rofatum, oxymel fumplen, diamneum, hiera piera, oxyfaechara, fyrup, de rofas fiecis, fyru-par aectofin, and other things, as the prefent case shall seem to require; as Alum, Balanstia, Myrrh, Olibanum, Ginger, Pepper, Cinamon, drie Roses, and many such things; even so that oft-times there enter into Gargles such Medicins as have so bitterness, which is the cause that neither. Against one Carthaenter into Gargies inco means, as reintering or spain, Carthamas, Turbich, and fuch things as have no bitterness, which is the cause that neither Agarick nor Coloquintida ought to enter into Gargarisms.

The quantity of liquor for a Gargarifin is commonly from the f. to the j. mix therewith forme \$ii. of Syrups, but put Powders fparingly, as forme \$iii. Alum may formetimes be put into \$\frac{3}{2}\$ vj. let mucillages be extracted out of \$\frac{3}{2}\$ ij. of Seeds: let these serve for some examples.

lages be extracted out of 3 13. of Seeds: set there terve for toute examinates.

we use Gargarifina.

We use Gargles in the Morning fasting after general Purgations; they are sometimes taken or Adetersive, used cold, when as malign, acrid, and thin humours fall down, sometimes warm; but let these things be done according as the Phytician shall advise.

CHAP. XXXVIII. Of Dentifricer.

the montrare continues, fuch as are Coral white and red, Harts-horn, Scuttle-bones, Alum, Crystal, whereof they Purnice, Salt-nitre, myrrh, Frankincenfe, Balanefia, Acoms, all forts of shells of Filhes: all these are consist to be made into Powder either by burning, or without it; for Scuttle-bones burnt cast forth a sinking and unpleasant smell. To these for Smell sake are added certain aromatick things, as Cinamon, Cloves, Nutmegs, and the like: fuch Powders if mixed with forne Syrups, as accomel feelisticum, or with mucilage of Gum Arabick and Tragacanth, will become Opiats, to be made into a pyramidal form of fome fingers length, round and fquare, and tharp pointed, that dried they may ferve for Dept-

Sometimes emollient Roots are boiled with Salt or Alum, that dried again they may be used for Dentifrices: most ones are made of drying herbs.distilled together with drying and aftringent things. All the differences shall appear by the following examples. R. Lapidis slong, pamicis & comm convergence of the configuration of the configuration of the pulvis from the configuration of the pulvis from the pulvis from the dentifricis. Ot, R. Offis sapa, 3 \(\beta, \text{math.} \) and \(\beta, \text{in am.} \text{math.} \) is aluminis, carbinis, rivisions, and \(\beta, \text{in am.} \) 3 \(\beta, \text{in am.} \) is aluminis, carbinis, rivisions, and \(\beta, \text{in continuous} \), carbinis, and \(\beta, \text{in continuous} \), continuous, and \(\beta, \text{in continuous} \), for pulvis qui excipiatur mucagine gummi tragacanth. \(\beta, \text{formenture pyramides longe, focund, pro dentificio. \)

Or \(\beta, \text{Rad. malv. inniv. } \text{ bissimalv.} \) in conjuntur in acus sals and aluminossa, deinde siccensur in furno pro dentificio. \(\beta, \text{Sali } \frac{3}{2} \text{v.} \), alumin. \(\frac{3}{2} \text{ii.} \), theris, massiches, sangus dracens, an. \(\frac{3}{2} \text{s.} \), and of illenture in aluminossa, an. \(\frac{3}{2} \text{s.} \)

Dentifrices are not onely known good to polith, cleanfe, and strengthen the teeth; but we also oft- Their use, times use them for the Tooth-ach, the Diseases of the mouth, and users of gums. You may use them in the morning, before and after meat.

The Ancients of Lentisk-wood made themselves Tooth-picks, and such devices to strengthen their loofe Teeth, which also at this day is in use with those of Languedock, with whom this Wood is plentiful, so that it may be brought thence for the use of Noble-men and Gentlemen; Myrrh may also ferve for this fame use, and any other astringent Wood.

Our people commonly use the stalks of Fennel, yet have they no faculty to fasten the Teeth, but their fmell is grateful.

CHAP. XXXIX.

Of Bags or Quilts.

Hyficians term a bag or facculus, the composition or mixture of drie and powdered Medicins what a bag or lyficians term a bag or facentiat, the composition of markets of the area positions what about put in a bag; therefore it is as it were a driefomentation. Their differences are not drawn quilt is then from the variety of the part whereto they are applied; fuch as are Their differences. from any other thing than from the variety of the part whereto they are applied: fuch as are Their d for the head must be made into the fashion of a Cap; those which be for the whole ventricle must be made into the form of a Cithern; those for the Spleen, like to an Oxes Tongue: lastly, such as are for the Liver, Heart, and other parts, must be made according to the figure of those parts. Their matter is usually taken from whole Seeds fried in a Frying-pan, or made into powder; there are

A Powder for

gation is. Their diffe rences and matter.

licks of the Lucy Vennes.

A moift Fume for the ears.

(Test 15.

THE PARTY NAMED IN

fometimes added Roots, Flowers, Fruits, Rinds, Cordial Powders, and other drie Medicins, which may be eafily brought into Powder, and conduce to the grieved parts; the quantity is different according to the magnitude of the affected parts: In the Books of Practifers it is commonly found preferibed from ξ ii), to ξ v). β. Sometimes Flowers and dry Herbs are preferibed by handfuls and pugils; and here there is need of an artificial conjecture to conceive and appoint a fit quantity of Powders: but let us give you fome examples.

A quilt for the flomach,

Re Rofar, rub. p.j. mastich. § s. coralli rub. 3 iij. sim. anis, & fænican. 3 ij. nucis moschat. 3 j. summitat. absynth. & menth. an. m.j. tritis omnibus, siat sacculus consistus & compunitus pro ventriculo.

K. Fursuris macri, p. j. milii. § j. salis, 3 ij. rosar, rub. stor xorismar. stæchados, caryoph. an. m ij. sol. beton. & salv. an. 3 iij. tritis omnibus siat cucupha, intersuta & calesalla sumo thuris, & sandaracha exoustorum, capiti A cap for a cold head.

A quilt for the R Flor, borag, bugloft. & violar, an. p.ij. cortic, citri ficci, macis ligni aloes, rafuræ eboris, an. 3 j. offis de corde cervi, croci, an. 9 ij. fol. meliff. co. β. pulveris diambra, 3 f. contritis omnibus fiat facculus e ferico pro corde, irrorandus aqua feabisfa. heart.

We use bags for the frengthening of the noble parts, as the brain, heart, liver: as also for those less noble, as the stomach: lattly for discussing statulencies in what part soever: as in the Colick, and in a bastard plurishe proceeding from statulencies. The powders must be strewed upon carded Their ufc. bombast, that they run not together, and then they must be sewed up or quitted in a bag of Linner

> We often-times moiften thefe bags in Wine or diffilled water, and fometimes not with the fubflance thereof, but by the vapour onely of fuch liquors put into a hot dish: thus oft-times the bags are heated by the vapour onely, and oft-times at the fire in a dish by often turning them. These if intended for the heart, ought to be of Crimson or Scarlet Silk, because the Scarlet-berry, called by the Arabians Kermes, is faid to refresh and recreate the heart. Certainly they must always be made of fome fine thing, whether it be Linnen or Silk.

CHAP. XL.

Of Fumigations.

Suffitus or Furnigation is an evaporation of Medicins having fome viscous and fatty moisture: What a Fumiof Fumigations forme are drie, and otherforme moith, the drie have the form of Trochifces or Pills: their matter ought to be fatty and vifcous, fo that it may fend forth a finoak by being burnt: fuch are Ladanam, Myrth, Mastick, Pitch, Wax, Rofin, Turpentine, Castoreum, Styran, Frankincense, Olibanam, and other gums, which, may be mixed with convenient Powders: for the state of Powders and the yield them a body and firm confiftence; the fumigations that are made of Powder only, yield neither To firong nor long a fume.

The quality of the Powders must be from \$ \$\varphi\$. to \$\varphi\$, \$\varphi\$, but the Gums to \$\varphi\$ ij. 2s, \$\varphi\$. Sandaracha, malticles, refar. an. \$\varphi\$ j. benjoini, galang, an. \$\varphi\$ iij. terebinishin. exceptantin, \$\varphi\$ from trocbifei, quibm inconsis suffirmigentur teguments capitis. *\varphi\$ Marchastite, \$\varphi\$ ij. bdelii, myrrha, styracis, an. \$\varphi\$, core stave, \$\varphi\$ terebinish, quod sufficie, fiant formula pro suffirmigis. *\varphi\$ Cinnabaris, \$\varphi\$ ij, styracis \$\varphi\$ benjoini, an. \$\varphi\$ ii. cons terebinish, fiant trocbifei pro suffirmigis per embotum.

We use Furnigations in great obstructions of the Brain, Ulcers of the Lungs, the \$\varphi\$ ithms, an old Cough, Pains of the Sides, Womb, and the diseases of some other parts; formetimes the whole body is supposed as in the cure of the Luces Venera to procure (wear) sometimes could some one part where-A Cephalick For the hardness of the

furnigated, as in the cure of the Eurs Venerea to procure fweat : fornetimes onely fome one part whereto fome relicks of the Lucs adheres: such Furnigations are made of Cinnabaris, wherein there is much Hydrargyrum. The Furne must be received by a funnel, that so it may not be dispersed, but may of using them. all be carried unto the part affected, as is usually done in the affects of the Wornb and Ears.

In fumigations for the Brain and Cheff, the vapour would be received with open mouth, which thence may pass by the weason into the Chest, by the Palat and Noshrils into the Brain : but in the interim let the head be vailed, that none of the vapour may flie away. Moift Fumigations are made formewhiles of the decoction of herbs, otherwhiles of forme one fimple Medicin boiled in oil; formetimes a hot fire-stone is quencht in Vinegar, Wine, Aqua Vine, or the like liquor, so to raise a humid vapour. We oft-times use this kind of Futnigation in overcoming schirrhous affects, when as we

would cut, discuss, penetrate deep, and drie: take this as an example thereof.

R. Laterem unum fair crassium, and marchastam ponderis 1b j. heat it red hot, and then let it be quencht in sharp Vinegar, pouring thereon in the mean while a little Aqua Vine, make a Furnigation The manner of a moift Fumigation. for the grieved part.

Fumes of the decoction of Herbs do very little differ from Fomentations properly fo called a for they differ not in the manner of their composure, but onely in the application to the affected parts:

therefore let this be an example of a humid Furnigation.

R. Abfynth, falv. rus. origan, an. p.j. rad. bryon. & afar. an. 3 1. forn finap. & cumin. an. 3 1. decognanture. in duabus partibus aque, & una vini pro fuffisu auris cum emboto: and oft-times fuch Furnigations are made for the whole body, whereof we thall treat hereafter.

CHAP. XLI.

Of a particular or Half-Bath.

Semicapinon or Half-bath, is a Bath for the one half of the body; that is, for the parts from the belly downwards: it is called also an Infosio, because the Patient sitted to bathe in the decoction of Herbs: in which form and respect a Semican imm differs from a Forner-tation, What an toleftation .

tation; for it is composed of the same matter, to wit a decoction of Herbs, Roots, Seeds, Fruits, but The matter. in this the quantity of the decoction is the greater, as we shall teach by the following example.

in this the quantity of the decoction is the greater, as we man teach by the following example.

R. Malt. bifinalt. com toto, an. m.j. [?. betw. fasifrag. pariet. an. m.j. fem. melon. milis jolis, alkelengi, an. A half-bath 3 iij. cicer. rub. p. ij. rad. apis, grammins, famiculi, eryngit, an. 5 j. decapaantur in fufficiente aque pro infoffu.

We use these half-baths in affects of the Kidnies, Bladder, Worth. Fundament, and lowerbelly, or otherwise when as the Patient by reason of weakness and sear of diffiguring the spirits, cannot suffer or away with a whole Bath. The manner of using it is thus the first processing the search agreement of using it is the processing the search agreement of using it. or other parts of Plants, and cause the Patient to lit upon them; yet in the noterim keep the vapours of using it. from the head left they thould offend it, by cashing over it a linnen cloth, or elfe let him not enter thereinto until the vapour be exhaled.

CHAP. XLII.

Of Baths.

Aths are nothing else than as it were a fomentation of the whole body, both for preferving The Faculties health, and the cure of Discases: this is a very commodious form of Medicin, and among of Eaths. other external Medicins much celebrated by the Greek, Arabian, and Latin Phylicians. For a Bath, belides that it digels the acrid humours, and footy excrements lying under the skin, mitigates pains and wearinefs, and corrects all excess of difference: moreover in the cure of Fevers, and many other contumacious and investerate Differes it is the chief and laft remedy, and as it were the refuge of health, flored with pleafing delight. Baths are of two forts, fome Natural, others Artifi- Natural Eaths: cial. Natural, are those which of their own accord, without the operation or help of Art, prevail or excel in any Medicinal quality. For the water which of it self is devoid of all quality that is perceivable by the tafte, if it chance to be firaitned through the veins of Metals, it furnishes and impregnates it fell with their qualities and effects: hence it is that all such water excells in a drying faculty, fometimes with cooling and attriction, and otherwhiles with heat and a difcuffing quality. Baths whose waters being hot or warm, do boil up, take their heat from the cavities of the Earth and Mines filled with fire; which thing is of much admiration whence this fire should arise in subterrene places, what may kindle it, what feed or nourish it for fo many years, and keep it from being extinct. Some Philosophers would have it kindled by the beams of the Sun, others by the force of Lightning penetrating the bowels of the Earth's others by the violence of the Air vehemently or violently agitated, no otherwise then fire is struck by the collision of a Flint and Steel. Yet it is better to refer the cause of so great an affect unto God the maker of the Universe, whose providence piercing every way into all parts of the World, enters and governs the fecret parts and paffages thereof. Notwithflanding they have feemed to have come nearest the truth, who refer the cause of heat in Watersunto the store of Brimston contained in certain places of the Earth, because among all Minerals it hath most fire and matter fittest for the nourithing thereof. Therefore to it they attribute the flames of fire which the Sicilian Mountain Atna continually fends forth. Hence allo it is that the most part of such waters smell of Sülphur, yet others smell of Alum, others of Nitre, others of Tar, and some of Coperas.

Now you may know from the admixture of what Metalline bodies the Waters acquire their fa- How to know culties by their taile, fent, colour, mud, which adheres to the channels through which the water runs, Baths have as alfoby an artificial feparation of the more terrefirial parts from the more fubtil. For the earthy their efficacy, drofs which fubfides or remains by the boiling of fuch waters, will retain the faculties and fubtiance of Brimftone, Alum, and the like Minerals: betides also, by the effects and the cure of these or these Diseases, you may also gather of what nature they are. Wherefore we will describe each of these kinds of Waters by their effects, beginning first with the Sulphureous.

Sulphureous Waters powerfully heat, dry, refolve, open, and draw from the center unto the furface of the body; they cleanfe the skin troubled with Scabs and Tetters; they cause the itching of of natural sulcers, and digest and exhaust the causes of the Gout, they help pains of the Colick and hardned plureous wa-Spleens. But they are not to be drunk, not onely by reason of their ungrateful smell and taste, but ters. also by reason of the maliciousness of their substance, offensive to the inner parts of the body, but chiefly to the liver.

Aluminous waters taffe very aftrictively; therefore they drie powerfully, they have no fuch manifeft heat, yet drunk, they loofe the belly: I believe by reason of their heat and nitrous quality they waters, cleanse and stay defluxions, and the Courses flowing, too immoderately; they also are good against the Tooth-ach, eating Ulcers, and the hidden absecties of the other parts of the mouth.

Salt and nitrous Waters thew themselves sufficiently by their heat: they heat, dry, bind, cleanse, Of alt and discuss, attenuate, resist putrefaction, take away the blackness coming of brusses, heal scabby and malign ulcers, and help all ordematous tumors.

Bituminous Waters heat, digett, and by long continuance foften the hardned finews; they are Of bitumidifferent according to the various conditions of the bitumen that they wash, and partake of the qua- nous. lities thereof.

Brazen Waters, that is, such as retain the qualities of brass; heat, drie, cleanse, digest, cut, bind, are of brazen. good against eating Ulcers, Fiftulaes, the hardness of the Eye-lids, and they waste and eat away the flethy excrescences of the Nose and Fundament.

Iron Waters cool, drie, and bind powerfully, therefore they help abfeeffes, hardned milts, the weak- of iron. neffes of the florach and ventricle, the unvoluntary shedding of the Urin, and the too much flowing terms, as also the hot distemper of the Liver and Kidnies. Some such are in Lucan Territory in

Leaden Waters refrigerate, drie, and perform such other operations as Lead doth; the like may of Leaden.

Their diffe-

timming and

be faid of those Waters that flow by Chalk, Plaster, and other such Minerals, as which all of them take and perform the qualities of the bodies by which theypafs.

Of hot baths.

How Waters or Baths help cold and moift difeases, as the Palsic, Convulsion, the stiffness and attraction of the Nerves, trembling, palpitations, cold distillations upon the joints, the inflations of the members by a dropsie, the Jaundice by obstruction of a gross, tough, and cold humour, the pains of the fides, colick, and kidnies, barrenness in women, the suppression of their Courses, the suffocation of the Womb, causless weariness: those diseases that spoil the skin, as tetters, the seprose of both forts, the feab, and other difeafes arifing from a groß, cold, and obstruct humour, for they pro-

hurtful. The faculties

Yet such must shun them as are of a cholerick nature, and have a hot liver, for they would cause a Cachexia and Dropfie by over-heating the liver. Cold Waters or Baths heal the hot differnper of of cold baths, the body and each of the parts thereof, and they are more frequently taken inwardly than applied outwardly; they help the laxness of the bowels, as the resolution of the retentive faculty of the stomach, Entrails, Kidnies, Bladder, and they also add strength to them. Wherefore they both temper the heat of the liver, and also strengthen it, they stay the Diarrhau, Dysentery, Courses, unvoluntary fledding of Urin, the Goverbara, Sweats and bleedings. In this kind are chiefly com-mendable the Waters of the Spaw in the Country of Liege, which inwardly and outwardly have almost the same faculty, and bring much benefit without any inconvenience, as those that are commonly used in the drinks and broths of the Inhabitants.

Of artificial

warm water.

The Spaw.

In imitation of natural Baths, there may in want of them be made artificial ones, by the infuling and mixing the Powders of the formerly described Minerals; as Brimstone, Alum, Nitre, Bitumen alfo you may many times quench in common or rain water, Iron, Brafs, Silver and Gold heated red hot, and so give them to be drunk by the Patient; for such waters do oft-times retain the qualities and faculties of the Metals quenched in them, as you may perceive by the happy fuccess of such as have used them against the Dysentery.

The faculty of a Bath of

Befides thefe, there are also other Baths made by Art of simple Water, sometimes without the admixture of any other thing, but otherwhiles with medicinal things mixed therewith, and boiled therein. But after what manner foever these be made, they ought to be warm, for warm water humeelts, relaxes, mollifies the folid parts, if at any time they be too drie, hard and denfe; by the afcititious heat it opens the pores of the skin, digefts, and attracts, and difcuffes fuliginous and acrid excrements remaining between the flesh and the skin. It is good against Sun-burning and weariness, whereby the fimilar parts are dried more than is fit. To conclude, whether we be too hot or cold, or too drie, or be nauseous, we find manifest profits by Baths made of sweet or warm water, as those that may supply the defect of frictions and exercises: for they being the body to a mediocrity of temper, they increase and strengthen the native colour, and by procuring sweat discuss statulencies: therefore they are very ufeful in hectick Fevers, and in the declention of all Fevers, and against raving and talking idlely, for the procuring fleep. But because water alone cannot long adhere to the body, let Oil be mixed or put upon them, which may hold in the water, and keep it longer to the skin.

Oil into Baths.

These Baths are good against the inflammations of the lungs and sides, for they mitigate pain, and help forward that which is suppurative to exclusion, when as general remedies according to Art have preceded; for otherwife they will cause a greater defluxion to the afflicted parts: for a Bath (in Galeas opinion) is profitably used to Diseases when as the morbifick matter is concocted. To this purpose is chosen Rain-water, then River-water, so that it be not muddy, and then Fountainwater; the water of flanding Lakes and Fens is not approved of, for it is fit that the water which is made choice of for a Bath of fweet water, should be light and of subtil parts; for Baths of waters which are more than immoderately hot or cold, yield no fuch commodity but verily they hurt in this, that they shut up or close the pores of the body, and keep in the fuliginous excrements under the skin; other Baths of sweet or fresh water consist of the same matter as Fomentations do; whence it is that fome of them relax, others mitigate pain, others cleanse, and othersome procure the Courfes, that is compounded of a decoction of Ingredients or Plants having such operations. To these there is fometimes added Wine, otherwhiles Oil, fometimes fresh Butter or Milk, as when the Urin is stopped, when Nephritick pains are violent, when the Nerves are contracted, when the habit of the body wastes and wrinkles with a hectick drines, for this corrugation is amended by relaxing things, but it is watered, as it were fatted by humeching things which may penetrate and transfuse the oily or fatty humidity into the body thus rarified and opened by the warmness of 2

Anodyne Baths are made of a decoction of Medicins of a middle nature, fuch as are temperate and relaxing things, with which we may also sometimes mix resolving things; they are boiled in Water and Wine, especially in pains of the Colick proceeding from vitreous phlegm, or gross and thick fla-Why we must tulencies contained or shut up in the Belly, Kidnies, or Womb. In such Baths it is not sit to sweat, not continue in the bath till but onely to fit in them fo long until the bitterness of the pain be affwaged or mitigated, left the we fweat.

powers weakned by pain, should be more resolved by the breaking forth of sweat: emollients are fometimes mixed with gentle detergents, when as the skin is rough and cold, or when the featls or crust of scabs is more hard than usual, then in conclusion we must come to strong detersives and driers; lafily, to drying and fornewhat aftrictive Medicins fo to firengthen the skin, that it may not it felf so case and open to receive defluxions. By giving you one example, the whole manner of

prescribing a Bath may appear.

Baths though noble remedies approved by use and reason, yet unless they be fitly and discreetly used in time, plenty, and quality, they do much harm; for they cause thakings and chilness, pains, alequity

A mollifying and anodyne Bath. observed in the use of

density of the skin, or too much rarefaction thereof, and oft-times a resolution of all the faculties. Wherefore a man must be mindful of these cautions before he enter into a Bath: First, that there be no weakness of any noble and principal bowel, for the weak parts easily receive the humors which the Bath hath diffused and rarified, the ways lying open, which tend from the whole body to the principal parts. Neither must there be any plenty of crude humours in the first region, for so they should be attracted and diffused over all the body: therefore it is not onely fit that general Purgations should precede, but also particular by the Belly and Urine: besides, the Patient should be strong, that can fasting indure a Bath as long as it is needful. Lastly, the Bath ought to be in a warm and silent place, left any cold air by its blowing, or the Water by its cold appulfe, cause a thivering or shaking of the body, whence a Fever may enfue.

The morning is a fit time for bathing, the flomach being fasting and empty, or fix hours after The fitteft meat, if it be requisite that the Patient should bathe twice a day, otherwise the meat yet crude would time for bathing be shatched by the heat of the Bath, out of the stomach into the Veins and habit of the body. Many, of all the feafons of the year, make choice of the Spring and end of Summer, and in thefe times they chuse a clear day, neither troubled with stormy winds, nor too sharp an air. As long as the Patient is in the Bath, it is fit that he take no meat, unless peradventure to comfort him he take a little bread moithed in Wine, or the juice of an Orange, or fome Damask Prunes to quench his thirft: his firength will flew how long it is fit that he should stay in; for he must not stay there to the refolution of his powers, for in Baths the humid and fpirituous fubltance is much diffipated. Coming How to order forth of the Bath, they must prefently get them to bed, and be well covered, that by fweating, the ex- the Patient crements, drawn unto the skin by the heat of the Bath, may break out: the Sweat cleanfed, let them coming forth use gentle Frictions, or Walking; then let him feed upon meat of good juice and easie digestion, by reason that the stomach cannot but be weakned in some fort by the Bath.

The quantity of meat is judged moderate, the weight whereof thall not oppress the stomach: Venery after bathing must not be used, because to the resolution of the spirits by the Bath, it adds another new cause of further spending or dislipating them. Some wish those that use the Bath by reason of some contraction, pain, or other affects of the Nerves, presently after bathing, to dawbor belinear the affected nervous part with the Clay or Mud of the Bath, that by making it up as it were in this place, the virtue of the Bath may work more effectually, and may more throughly enter into the affected part.

These cautions being diligently observed, there is no doubt but the profit by Baths will be great and wonderful: the same things are to be observed in the use of Stoves, or Hot-houses, for the use and wondering and Hot-houses is almost the same, which the ancients therefore used by turn, so that coming forth of the Bath they entered a Stove, and called it also by the name of a Bath, as you may gather from fundry places of Galen in his Methodus Med. wherefore I think it fit in the next to speak of them.

CHAP. XLIII. Of Stoves or Hot-boufes.

Toves are either drie or moift: Drie, by railing a hot and drie airy exhalation, so to imprint their The differen-faculties in the body, that it thereby waxeth hot, and the pores being opened, run down with ces of Stoves. fweat. There are divers ways to raife fuch an exhalation: at Parie, and wherefoever there How made, are Stoves or publick Hot-houses, they are raised by a clear rire put under a vaulted Fornace, whence it being presently diffused, heats the whole Room; Yet every one may make himself such a Stove

as he shall judge best and fittest.

Alfo you may put red hot Cogle-flones or Bricks into a Tub, having first laid the bottom thereof with Bricks or iron Plates, and so set a feat in the midst thereof; wherein the Patient fitting, well covered with a Canopy drawn over him, may receive the exhalation arising from the fiones that are about him, and so have the benefit of sweating : but in this case we must out look to and see the Patient; for it fometimes happens that fome, neglected by their Keepers otherwise imployed, become faint, and their fense failing them by the diffipation of their spirits by the force of the hor exhalation, have funk down with all their bodies upon the stones lying under them, and so have been carried half dead and burnt into their beds. Some also take the benefit of sweating in a Fornace or Oven, as foon as bread is drawn out thereof. But I do not much approve of this kind of fweating, because the Patient cannot as he will, much less as he pleafeth, lie or turn himself therein.

Humid Stoves or Sudatories are those wherein Sweat is caused by a vapour or moist heat: this va-

pour must be raised from a decoction of Roots, Leaves, Flowers, and Seeds, which are thought fit for Avaporous pour must be raised from a decoction of Roots, Leaves, Flowers, and Seeds, which are thought fit for Stove or Earth. this purpose; the decoction is to be made in Water or Wine, or both together. Therefore let them all be put into a great veffel well luted from the top of whole cover Iron or Tin pipes may come into a Bathing Tub standing near thereto, between the two bottoms thereof, by means whereof the hot va-Pour may enter thereinto, and diffuse it self therein. Now it is fit the Bathing-tub should be furnished with a double bottom, the one below and whole, the other formewhat higher and perforated with many holes, whereupon the Patient fitting, may receive a Sudorifick vapour over all his body:
now this vapour, if at any time it become too hot, must be tempered by opening the hole, which the third for the fame purpose be made in the top of the Pipe, that so it may be opened and shur at pleasure. In the interim the Tub shall be clotely covered wherein the Patient sits, he putting forth pleafure. In the interim the 1 to hair to clothly collected defect of his Paper his, ne putting forth onely his head, that so he may draw in the cold air. In defect of his Pipes the Herbs shall be boiled by themselves in a Caldron or Kettle, and this shall be fet thus hot into the Bathing-tub at the Patients feet, and so by casting into it heated stones, a great and sudorifick vapour shall be raised.

THE THE PARTY NAMED IN COLUMN

The delineation of a Bathing-tub having a double bottom, with a Vessel near thereto, with Pipes coming therefrom, and entering between the two bottoms of the Tub.

CHAP. XLIV.

Of Fuel, that is, Washes, and fuel things for the smoothing and beautifying of the skin.

His following Difcourfe is not intended for those Women which addicted to filthy luft, feek to beautific their Faces as baits and allurements to filthy pleafures: but it is intended for those onely, which the better to refirain the wandring lufts of their husbands, may endeayour by Art to take away those spots and deformities which have happened to fall on their faces ei-

As the colour of the skin is, fech is the humour that is thereunder,

The colour that appears in the face, either laudable or illaudable, abundantly shews the temper both of the body, as also of those humours that have the chief dominion therein: for every humour dies the skin of the whole body, but chiefly of the face, with the colour thereof: for choler bearing fway in the body, the face looks yellowish; phlegm ruling, it looks whitishor pale; if melan-choly exceed, then blackish or swarth; but if bloud have the dominion, the colour is fresh and red-Yet there are other things happening externally which change the native colour of the face, as Sunburning, cold, pleafure, forrow, fear, watching, fafting, pain, old difeafes, the corruption of meats and drinks: for the flourishing colour of the cheeks is not onely extinguished by the immoderate use of Vinegar, but by drinking of corrupt Waters the face becomes fwollen and pale.

On the contrary, laudable meats and drinks make the body to be well coloured and comely, for that they yield good juice, and confequently a good habit. Therefore if the fpots of the face proceed from the plenitude and ill disposition of humours, the body shall be evacuated by bloud-lettings if from the infirmity of any principal bowel, that must first of all be firengthened; but the care of all things belongs to the Physician: we here onely feek after particular remedies which may fmooth the face, and take away the spots and other defects thereof, and give it a laudable colour.

Waters where with to wash the face.

First the face shall be washed with the water of Lilly-flowers, of Bean-flowers, Water-lillies, of difilled Milk, or elfe with the Water wherein fome Barley or Starch hath been freeped. The dried face shall be anointed with the Ointments presently to be described; for such washing cleanseth and prepareth the Face to receive the force of the Ointments, no otherwise than an alumed Lye prepares the hairs to drink up and retain the colour that we defire. Therefore the Face being thus cleanfed and prepared, you may use the following Medicins, as those that have a faculty to beautifie, extend,

Compound-liquors where-with to wath the face.

When as you would use this powder, put into the palm of your hand a title Oil of Mastich, or of fweet Almonds, then presently in that Oil diffolve a little of the described powder, and so work it into an ointment, wherewith let the face be anointed at bed-time: but it is fit first to

wash the face with the formerly described water, and again in the morning when you arise.

When the face is freed from wrinkles and spots, then you may paint the cheeks with a rose and How to paint fourishing colour; for of the commixture of white and red ariseth a native and beautiful colour; the face, for this purpose take as much as you shall think fit of Brasil and Alchunet; steep them in Alum-wafor this purpote take as much as you man think in or to the form the form in Anam-water, and therewith touch the cheeks and lips, and fo fuffer it to dry in: there is also Spanish red made for this purpose; others rub the mentioned parts with a Sheeps-skin died red: moreover the friction that is made by the hand onely, causeth a pleasing reducts in the face, by drawing thither the

CHAP. XLV. Of the Gutta Rofacea, or a ftery face.

His Treatife of Fuel, puts me in mind to fay fomething in this place of helping the preter- Why worfe in natural redness which possesses the note and cheeks, and off-times all the face besides, one Winter then while with a tumor, otherwhiles without, fometimes with puftles and fcabs, by reafon of in Summer. the admixture of a nitrous and adult humour. Practitioners have termed it Gutta rofacea. This shews both more and more ugly in Winter than in Summer, because the cold closeth the pores of the skin, so that the matter contained thereunder is bent up for want of transpiration, whence it becomes acrid and biting, fo that as it were boiling up, it lifts or raifeth the skin into pufiles and feabs; it is

a contumacious difeafe, and oft-times not to be helped by Medicin.

For the general method of curing this difeafe, it is fit that the Patient abfrain from Wine, and from Diet all things in general that by their heat inflame the bloud, and diffuse it by their vaporous substance: he shall shun hot and very cold places, and shall procure that his belly may be soluble, either by Nature or Art. Let bloud first be drawn out of the bafiliea, then from the vena frontie, and lastly from the vein of the nose. Let Leeches be applied to fundry places of the face, and cupping-glasses with scarification to the shoulders.

For particular or proper remedies, if the Difeafe be inveterate, the hardness shall first be softened Remedies. with emollient things, then affaulted with the following ointments, which shall be used or changed by the Chirurgeon as the Phylician shall think fit.

But feeing the forementioned Medicins are acrid, and for the most part eating and corroding, it cannot be but that they must make the skin harsh and rough; therefore to smooth and levigate it

again, you thall make use of the following ointment. To finosth the skin.

Re Tereb.ven.tam din lote, ut acrimonium nulam habeat, butyrifalis expertis, an. 3 j. 6. olei vitel. over. 3). axung. porci in aqua rofarum lota, 3 B. cera parum, fiat linimentum ad ufum. To the fame purpose you may also make use of some of the fore-mentioned Medicins.

CHAP. XLL

To black the Hair.

What things are fit to die the hair.

T first the hairs (to take the fuew or tincture, and to retain it) must be prepared with Lye, wherein a little Roch-alum is dissolved. Thus the fatty scales may be washed and taken away, which hinder, and (as it were) keep away the finear, that it cannot adhere or penetrate into the body of the hair. Then must we come to particular or proper and sitting Medicins for this purpose. These ought to be aromatick and cephalick, and somewhat stiptick, that by their odoristrous and astringent power that may strengthen the animal faculty. Furthermore, they must be of fubtil parts, that they may enter even into the Inner roots of the hairs.

Re Sulphuris, vitrioli, gallarum, caleis viva, lithargyri, an. 3 ij. scoria ferri, 3 %. in polinem reducantur, com ag. communi incorporentur, us indefias mussfa; with this at bed time let the hairs be rubbed, and

in the morning let them be smoothed with the same.

Re Calcis lota, 3 j. lithargyristringque 3 1. cum decollo gallarum, corticum nucum, fist maffis, addendo olei chamem. 3 ij. iv Litharg. auri, 3 ij. ciner. clavellat. 3 j. | . calcis viv. 3 j. dissolve omnia cum urina bo-minis donoc acquirant consistentiam unquenti pro unclione capillorum. R Calcis lot.e, 3 ij. cum decosti. salvascort. granat. fiat pasta ad formam pastis satis liquida : let the hair at bed-time be died herewith, and washed in the morning with Wine and Water.

How to wash

A water to

Now the manner of washing lime is thus: Infuse in ten or twelve pints of fair water one pound of Lime, then pour out the water by ftopping the veffel, putting more in the ftead thereof; the third time in flead of common water pour thereon the water of the decoction of Sage and Galls, let the Lime lie therein for fo many hours, then in like manner pour it off by flopping the Veffel; and thus you shall have your Lime well walked. There is also found a way how to die or black the hair by onely pouring of fome liquor thereon: as, Re Argenti puriffini, 3 is reducantur in tenuiffuna, laminas, ponantur in ampulla vitrea cum 3 is, aque feparationis auri & argenti & aque rofar. 3 vi. The preparing of this water is thus: put into a Vial the water of feparation and the filver, and fee it upon hot coals to to diffolve the filver, which being done, then take it from the fire, and when it is cold, add thereto the Rofe-water. But if you would black it more deeply, add more filver thereto; if lefs, the film of black the hair, nas, pons then a smaller quantity: to use it, you must steep the Comb wherewith you comb your head in this

The End of the Six and Twentieth Book,

BOOK XXVII. OF DISTILLATION.

CHAP. I.

What Diffillation is, and how many kinds thereof there be.

Aving finished the Treatise of the Faculties of Medicins, it now seems requisite that we speak somewhat of Chymistry, and such Medicins as are extracted by sire. These are such as contact of a certain fifth effence separated from their earthy impurity by Diffillation, in which there is a fingular, and almost divine efficacy in the cure of Difeases. So that of so great an abundance of the Medicins, there is scarce any which at this day Chymifts do not diffil, or otherwife make them more frong and effectual

than they were before. Now Distillation is a certain. Art or way by which the liquor or humid part what Distillaof things, by the virtue and force of fire, or fome femblable heat (as the matter shall feem to require) tion is is extracted or drawn, being first resolved into vapour, and then condensed again by cold. Some call this Art Sublimation, or Subliming, which fignifies nothing elfe but to feparate the pure from the unpure; the parts that are more fubril and delicate from those that are more corpulent, grofs, and excrementitious; as also to make those matters whose substance is more gross, to become more pure and fincere, either for that the terrefirial parts are ill united and conjoined, or otherwise confused into the whole, and dispersed by the heat and so carried up; the other groffer parts remaining together in the bottom of the Vessel. Or distillation is the extraction or estusion of moisture distilling drop by drop, from the nose of the Alembick, or any such like Vessel. Before this estusion or falling down of the Liquor, there goes a certain concoction performed by the virtue of heat, which feparates the fubflances of one kind from those of another that were confusedly mixed together in one body, and so brings them into one certain form or body, which may be good and profitable for divers Diseases. Some things require the fleat of a clear fire, others a flame, others the heat of the Sun, others of Ashes, Four degrees Some things require the fleat of a clear fire, others a hame, others the heat of the Sun, others of Aines, Four de or Sand; or the Filings of Iron; others Horfe-dung, or boiling Water, or the oily vapour or fleam of heat. thereof. In all these kinds of fires, there are four considerable degrees of heat. The first is contained in the limits of warmth, and such is warm water, or the vapour of hot Water. The second is a little hotter, but yet so as the hand may abide it without any harm; such is the heat of ashes. The third exceeds the vehemency of the second; wherefore the hand cannot long endure this without hurt; and such is the heat of Sand. The fourth is so violent that it burneth any thing that

The first degree is most convenient to distill such things as are subtil and moist, as Flowers. The What here The first degree is most convenient to distil such things as are subtil and most, as Flowers. The What heave second such as are subtil and dry, as those things which are odoriserous and aromatical, as Cinas street for mon, Ginger, Cloves. The third is fittest to distil such things as are of a more dense substance and what things fuller of Juice; such as are some Roots and Gums. The fourth is fit for Metals and Minerals, as Alam, Vitriol, Amber, Jet, &c. In like manner you may distil without heat; as we use to do in those things which are distilled by straining, as when the more pure is drawn and separated from that which is most unpure and earthy, as we do in Lae Virginale, and other things which are strained through an Hypocras bag, or with a piece of cloth cut in form of a Tongue, or by settling, or by a vessel made of Ivy wood: sometimes also some things may be distilled by coldness of humidity, and we make the Oil of Tartar, Myrrh, and Vitriols, by laying them upon a marble in a cold and most

Commission of the last

CHAP. II.

Of the matter and form of Fornaces.

the best for Fornaces.

the beft for Fornacci,

He matter and form of Fornaces uses to be diverse; for some Fornaces use to be made of Bricks and Clay, otherforce of Clay onely, which are the better and more latting, if to be the Clay be fat and well tempered with Whites of Eggs and Hair. Yet in fudden occaficus when there is prefent necessity of distillation, Fornaces may be made of Bricks, so laid together A round form that the joints may not agree, but be unequal; for fo the firucture will be the fironger, The belt and fitteft form of a Fornace for diffillation is round; for fo the heat of the fire carried up equally diffuses it self-every way, which happens not in a Fornace of another Figure, as square or triangular, for the corners disperse and separate the force of the fire. Their magnitude must be such as shall be sit for the receiving of the Vessel. For their thickness so great as necessity shall seem to require. They must be made with two bottoms, distinguished as it were into two Forges, one below which may receive the after of the coals or the like other fuel, the other above to contain the burning coals or fire. The bottom of this upper must either be an iron grate, or else it must be perforated with many holes, that fo the aftes may the more eafily fall down into the bottom, which otherwise would extinguish the fire; yet some Fornaces have three partitions, as the Fornace for Reverberation. In the first and lowest the ashes are received, in the second the coals are put, and in the third the matter which is calcined or else distilled. The third ought to have a semicircular cover, that so the heat or flame may be reflected upon the contained matter. The lower partition thall have one or more doors, by which the fallen-down after may be taken forth, but the upper must have but one whereby the coals or wood may be put in. But in the top or upper part of the Fornace where it shall feem most fit, there shall be two or three holes made, that by them you may blow the fire, and that the smook may more freely pass out. But these fore-mentioned doors must have their shutters, much like an Ovens mouth. But in defect of a Fornace, or it matter to build one withall, we may use a Kettle, set upon a Treefot, after the manner that we shall presently declare, when we come to fpeak of that diffillation which is to be made by Balnesen Marie.

CHAP. III.

Of Veffels fit for Diffillation.

Leaden Veffels ill.

Braß worse, The best Vesfels for Diftil-

Effels for Diffillation confift of different matter and form; for they are either of Lead, Tin, or Brass, or else earthen Veffels; and these are sometimes leaded, sometimes not: or else they are of Gold, Silver, or Glass. Now for leaden Veffels they are worse than the reft, and utterly to be refused, especially when as the liquors which are drawn by them are to be taken and utterly to be refuted, especially when as the liquors which are faid to be in Lead; by into the body by the mouth, by reason of the malignant qualities which are faid to be in Lead; by which occasion Galon condemns those waters which run, and are contained in leaden pipes, which which occasion Galon condemns those waters which the contained in leaden pipes, which the contained in leaden pipes, which was the contained in leaden pipes. by reason of their saltilhness and acrimony which savors of Quicksilver, cause Dysenteries. There-fore you may perceive such Waters as are distilled through a leaden head to be indued with a more acrid and violent piercing vapour, by reason the portion of that saltness diffolved in them, and as it were shaven from the Alembick, or head, defiles the distilled Liquors, and whitens and turns them into a milky substance: but Copper or Brass heads are more hurtful than Lead, for they make them were the work of the control of the co the Waters that come through them to favour or participate of Brafs. Those that are of Gold and Silver are lefs hurtful; but the greatness of the cost hinders us from making heads of such Metals; therefore we must have a great care that our Vessels for Distillation be either of Potters metal leaded, or elfe of Brafs, or of that Jug-metal which is commonly called Terra Betomorafis, and these rather than of Lead, or any other Metal. Verily Glasses are thought the best; and next to them earthen Vessels leaded, then of Jug-metal, and lassly these of Tin. There is great variety of Vessels for distillation in form and figure; for some are of an Oval or Cylindrical figure, that is, of a round and longish, others are twinted and creeked others of other shapes, as you may be in the healer of the longith, others are twined and crooked, others of other shapes, as you may see in the beaks of the Chymifts. Of this almost infinite variety of Figures I will in fit place give you the delineation and use of such as shall feem to be most necessary.

CHAP. IV.

What things are to be considered in Distillation.

Inft make choice of a fit place in your house for the Fornace, so that it may neither hinder any thing, nor be in danger of the falling of any thing that shall lie over it. When you shall dittil any thing of a malign or venerate quality, ye shall stand by it as little as you may, lest the vapour should do you any harm: when you provide Glass Vessels for Distillation, make choice of such as are exquisitely baked without share or cracks and such as are exquisitely baked without share or cracks and such as a construction. Let not fuch as are exquifitely baked, without flaws or cracks, and fuch as are every where forooth. Let not the fire as 6.0 f. the fire at first be very violent, not onely for fear of breaking the Vessels, but also for that the inst fire in Distillation must be gentle, and so increased by little and little. The things to be distilled ought not to be put in too gentle, and so increased by little and little. more to be put in too great quantity into the body of the Still, left they fhould rife up or flic over; hot things that they may be more effectual must be twice or thrice distilled, by pouring upon them their own distilled Water, or other fresh materials, or else by distilling them severally and by themselves of this kind are Gums, Wax, Pats, or Oils.

Bot

most other

But in each other repeated diffillations you must formething leffen the force of the fire; for the matter attenuated by the former distillation cannot afterward endure so great heat; but aromatick things, as Cloves, Cinnamon, &c. as also the chymical oils of Sage, Rolemary, Thyme, &c. ought not to be diffilled or rectified over again, for that we must presently after the first distillation have a not to be diffilled or rectified over again, for that we made preferrely after the more watery fubflance of the whole li-diligent care to feparate them from the phlegm, that is the more watery fubflance of the whole li-quor, to which purpose we must have regard to that which is distilled, for there are some things * By Agaz via to in this and

which fend over their phlegm, as Vinegar, others wherein it comes laft, as * Aqua vita.

If you would give to things to be diffilled another tafte or finell than that which they have naturally, you may mix them with fome odoriferous thing, as Cinnamon, Camphire, or Musk, or mean no-the like, as you pleafe, and so distill them together. The distilled liquors drawn by the heat of albest thing but the or fand, favour of and retain a certain empyreuma, or finatch of the fire; for the helping of which, spirit of wine, you shall put them into glasses close stopt, and so expose them to the Sun, and now and then open the glaffes that this fiery impression may exhale, and the Phlegman be consumed, if that there shall be any. But though in all diffillation there are many things to be observed, yet are there two things chiefly worthy of note. The first is, the matter that is to be distilled and wrought upon, that is, of what kind it is, and what the Nature thereof may do and fuffer. The other is the Furnace, which ought to be provided of a convenient matter, and figure of that which is to be diffilled; for you cannot draw any thing of any matter, neither of every mixture being diffilled, can you rightly expect Oil or Water: For mixt bodies do not confift of an equal portion of the four Elements, but some are more acry, others more fiery, some participate more of the Water, others more of the Earth, and that presently from their original. Therefore as watery things yield more Water; so airy and fiery things yield more Oil when they are diftilled; neither are all inflruments fit for the extracting of every liquor. Moreover you must note, that the watery liquor formetimes comes forth in the first place, and presently after by the help of a stronger fire follows the oily, which we find happens as often as the Plant or parts of the Plants which are distilled, are of a cold temperament; for in hot things it happens otherwise, for the first liquor which comes forth is oily, and the following waterish.

CHAP. V.

Of what fashions the Vessels for the destilling of Waters ought to be.

Or the diffilling of any kind of Waters, two kind of Veffels are necessary, which are comprehended under this original name of an Alembick. They call one of them the body, or an Alembick, are condensated or turned into water. It is called the head, because it stands over the body, like as an head; from the head there comes out a pipe or nose, whereby the distilled liquor flows drop by

- G The Receiver.

Why those the faculties of distilled Waters it is certain that those which are drawn in Ealne Marie which are distilled in the taste, acidity, hardness, for the things distilled in the things which are distilled, but also the taste, acidity, hardness, fiveetness, bitterness, and other qualities, so that they will neither savor of speak nor burning; for the mild and gentle heat of a bath contains of things by its humidity, the more subtil parts of the Plants that are distilled, that they may not be distipated and of things,

and exhaled, contrary to which it usually happens in things which are diffilled by the burning heat of Wood or Coals: for these have a certain nitrous and acrid taste, favouring of the smoak of fire. Befides, they acquire a malign quality from the veffels out of which they are diffilled, especially if they be of Lead, whence they contract qualities hurtful to the principal, vital, and natural parts.

Therefore the Plants which are thus diffilled, if they be bitter by nature, presently become insipid, as you may perceive by Wormwood-water thus diffilled. Those things which are diffilled in Bal-neo Maria are contained in a glass Vessel, from which they can borrow no malian quality. Therefore the matters fo drawn are more effectual and pleasing in taste, finell, and fight. You may draw Waters not onely from one kind of plant, but also from many compounded and mixed together: of these some are alimentary, others Medicinal, yea and purging; others acquired for smell, others for washing or smoothing of Womens faces, as we shall show hereafter.

CHAP. VI.

Hose the materials must be prepared before Distillation.

Hings before they be put in the Alembick must undergo a preparation, that is, they must be what things cut small, beaten and macerated, that is, steeped in some liquor, that so they may be the need note more eafily diffilled and yield the more water, and retain their native smell and faculties; materated beyet fach preparation is not convenient for all things; for there be forme things which need no incifion diffelved. or maceration, but must rather be dried before they be distilled, as Sage, Thyme, Rosemary, and the like, by reason of their too much humidity; it will be sufficient to sprinkle other things with some liquor onely. In this preparation there are two things observable, to wit, the time of the insusion, and condition of the liquor wherein these things ought to be insused. The time of the insusion is different according to the variety of the matter to be macerated; for things that are hard; folid, dry or whole, must be longer macerated than such as are tender, freihly gathered or beaten: whence it is that Roots and Seeds require a longer time of infulion; flowers and leaves a fhorter, and the like of things. The liquors where infution must be made, ought to be agreed the they may be infuted. For hot ingredients require hot liquors, and cold fach as are cold, wherein they may be infuted. The liquors where infusion must be made, ought to be agreeable to the other things in-

Such things as have not much juice, as Betony, Wornswood, and the like, or which are very odoThe inacerariferous, as all aromatick things, would be infufed by Wine; fo to preferve their finell, which othertion of Plans
wife by the force of the fire, by reason of the tenuity of the subtrance easily vanishes. But if we dejuice. fire that the diffilled liquor should more exactly retain and have the faculty of the things whereof it is diffilled, then must you infuse it in the juice thereof, to some such appropriate liquor that it may fwim in it whilest it is distilled, or at least let it be sprinkled therewith.

CHAP. VII.

Of the Art of Distilling of Waters.

Efore I describe the manner how to diffil Waters, I think it not amis briefly to reckon up The varieties how many forts of diffilled Waters there be, and what the faculties of them are. Therefore of diffilled of Diffilled Waters fome are medicinal, as the Waters of Rofes, Plantain, Sorrel, Sage, and the like: others are alimentary, as those Waters that we call Refiguratives; othersome are composed of both, fuch as are these restaurative Waters which are also mixed with Medicinal things; others are

The delineation of a Balneum Marix; which purging, as the distilled water of green and fresh Rhumay also serve to distil with asher.

barb; otherfome ferve for fmoothing the skin, and others for finell; of which fort are those that are distilled of aromatick things. To diffil Rofe-water, it will be good to macerate the Rofe-water. Roses before you dittil them for the space of two or

three days, in some formerly distilled Rose water, or their preffed-out juice, luting the Veffel close; then putting them into an Alembick closely luted to his head and his Receiver, and fo put into a Balneem Marie, as we have formerly described.

Shews the Fornace with the bale to take forth the after.

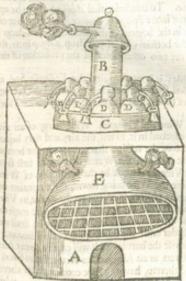

B Shews another Fornace as it were fer in the other; now it is of Brass, and runs through the midit of the Kestle made also of Brash, that so the contained water or ashes may be the more cafily heated.

C The Kettle wherein the Water, Afhes or Sand, are con-

D The Alembick fet in the Water, After or Sand, with the Mouths of the Receivers.

E The bostom of the second brass Fornace, whose top is marked with B, which consains the fire.

The diffilled Alimentary liquors are nothing elfe Reflauratives. than those that we vulgarly call Restauratives; this is

Commission of the

the manner and art of preparing them. Take of Veal, Mutton, Kid, Capon, Pullet, Cock, Partridge, Pheafant, as much as shall feem fit for your purpose: cut it small, and lest it should require heat, or empyrenens from the fire, mix therewith a handful of French Barley, and of red Rofe-leaves dry and fresh, but first steeped in the juice of Pomgranats, or Citrons and Rosewater with a little Cin-

But if you defire that this Restaurative should not onely be Alimentary, but also Medicinal, you shall add thereto such things as shall resist the disease, such as are Cordial Powders, as of El. Diamargarit. frigid. de gemmis, aremat. rofat. Conserve of Bugloss, Borrage, Roots, Herbs, Seeds, and other things of that kind. But if it be in a pestiferous season, Treacle, Mithridate and other Antidotes shall be added; each of these shall be laid in ranks or orders one over another, which is vulgarly termed stratum super stratum, in a glass Alembick, and distilled in Balnes Marie with the heat of Ashes, or elfe of warm Sand, as the Figure shews.

Another way of making reflaurative Liquors.

There may be made other Restauratives in shorter time with less labour and cost. To this purpose the flesh must be beaten and cut thin, and so thrust through with a double thred so that the pieces thereof may touch each other; then put them into a Glafs, and let the thred hang out; fo flop up the Glass close with a linnen cloth, Cotton or Tow, and lute it up with Paste made of Meal and the Whites of Eggs,; then fet it up to the neck in a Kettle of Water, but fo that it touch not the bottom, but let it be kept upright by the formerly described means; then make a gentle fire thereunder, until the contained flesh by long boiling shall be disfolved into juice, and that will commonly be in some four hours space. This being done, let the fire be taken from under the Kettle, but take not forth the Glass before the Water be cold, left the fire being hot it should be broken by the sudden appulse of the cold air. Wherefore when as it is cold, let it be opened, and the thred with the pieces of flesh be drawn forth, so that onely the juice may be left remaining; then strain it through a bag, and aroma-tize it with Sugar and Cinnamon, adding a little juice of Citron, Verjuice or Vinegar, as it shall best like the Patients palat.

After this manner you may quickly, eafily, and without great cost have and prepare all forts of Reflauratives, as well medicated as simple. But the force and faculty of purging Medicins is extracted after a clean contrary manner than the Oils and Waters which are drawn of aromatick things as Sage, Rosemary, Thyme, Annifeeds, Fennel, Cloves, Cinnamon, Nutmegs, and the like. For the firength of these, as that which is subtil and airy, flies upward in distillation; but the strength of purging things, as Turbith, Agarick, Rhubarb, and the like, fubfides in the bottom. For the purgative faculty of these purgers inseparably adheres to the bodies and substances.

Now for fweet Waters and fuch as ferve to fmooth the skin of the face, they may be diffilled in Baluco Marie, like as Rofe-water.

CHAP. VIII.

How to diffil Aqua Vitx, or the Spirits of Wine.

Ake of good White or Claret Wine or Sack which is not fowre or mufty, nor otherwise corrupt, or of the Lees, that quantity which may ferve to fill the Veffel wherein you make the distillation to a third part; then put on your head furnished with the nose or pipe, and so Spirit of Wine make your distillation in Balneo Marie. The oftner it is distilled, (or as they term it) rectified, the feven times more noble and effectual it becomes. Therefore forme distill it seven times over.

At the first distillation it may suffice to draw a fourth or third part of the whole; to wit, of twenty four pints of Wine or Lees, draw fix or eight pints of diffilled liquor.

At the second time the half part, that is, three or four pints. At the third diffillation the half part again, that is, two pints; so that the offner you diffill it over, the less liquor you have, but it will be a great deal the more efficacious. I do well like that the first diffillation be made in Ashes, the second in Balano Marie. To conclude, that Aqua vine is to be approved of, neither is it any oftner to be diffilled, which put into a Spoon or Sawcer, and there fet on fire, burns wholly away and leaves no liquor or moisture in the bottom of the Vessel; if you drop a drop of oil into this same Water, it continually falls to the bottom; or if you drop a drop into the palm of your hand, it will quickly vanish away, which are two other notes of the probation of this

The faculties of the Spirit of Wine.

The faculties and effects of Aqua vite are innumerable; it is good against the Epilepsie, and all cold Difeafes, it affwages the pain of the Teeth, it is good for punctures and wounds of the Nerves, Faintings, Swounings, Gangrenes and mortifications of the flesh, as also put to other Medicins for a

The diffilling of Wine and ferent.

There is this difference between the diffilling of Wine and Vinegar; Wine being of an airy Vinegar is dif. and vaporous fubfiance, that which is the best and most effectual in it, to wit, the airy and fiery liquor, comes from it prefently at the first distillation. Therefore the residue that remains in the bottom of the veffel, it is of a cold dry and acrid nature; on the contrary, the Water that comes first from Vinegar, being distilled, is insipid and flegmatick. For Vinegar is made by the corruption of Wine, and the Correction of the formation of the and the fegregation of the fiery and airy parts; wherefore the Wine being fowre, there remains nothing of the former fubfiance but phlegm; wherefore feeing phlegm is chiefly predominant in Vinegar, it first rifes in distillation. Wherefore he that hopes to distill the Spirit of Vinegar, he must cast away the phlegmant in 6.10. away the phlegmatick substance, that first substance that first rifes, and when by his taste he shall per-ceive the spirit of Vinegar, he shall keep the fire thereunder until the flowing liquor shall become as thick as honey; then must the fire be taken away, otherwise the burning of it will cause a great sink. The Vessels fit to disk! The Vessels fit to dishit Aque Vite and Vinegar are divers, as an Alembick or Retort set in Sand or

Affects; a Copper or Brass bottom of a Still, with a head thereto, having a Pipe coming forth thereof

which runs into a Worm or Pipe fafined in a Barrel or Veffel filled with cold Water, and having the lower end coming forth thereof; whose figure we shall give you when as we come to speak of the drawing of Oils out of Vegetables.

CHAP. IX.

Of the manner of Relitifying, that is, how to increase the strength of Waters that have been once distilled.

O rectifie the Waters that have been diffilled in Balano Marie, you must fer them in the Sun. The first way, in glasses well stopped and half filled, being fer in Sand to the third part of their height, that the Water waxing hot by the heat of the Sun, may separate it self from the phlegsin mixed therewith, which will be performed in 12 or 15 days. There is another better way to do this, The second. which is to diffil them again in Bulneo with a gentle fire, or if you will put them into a Retort furnished with his Receiver, and fet them upon Chrystal or Iron bowls, or in an Iron mortar directly opposite to the beams of the Sun, as you may learn by these ensuing figures.

A Resert with his Receiver, standing upon Chrystal Another Resert with his Receiver, standing in a Mar-bowls, just opposite to the Sun-heams. ble or Iron Mortar, directly apposite to the Sun.

CHAP. X. Of Distillation by filtring.

Ou shall set three Basins or Vessels of convenient matter in that site and order that each may be higher than other; that which fixeds in the highest place, shall contain the liquor to be distilled; and that which fixeds lowest shall receive the distilled liquor. Out of the first and fecond Veffel shall hang shreds or pieces of Cloth or Cotton, with their broader ends in the liquor or upper Veffel; and the other sharper ends hanging down, whereby the more subtil and defecte siquor may fall down by drops into the Veffel that stands under it; but the grosser and more seculent part may subside in the first and second Veffel. You by this means may at the same time distill the same siquor divers times, if you place many Vessels one under another after the fore-mentioned manner, and so put shreds into each of them, so that the lowest Vessel may receive the purified liquor. In stead of this distillation Apothecaries oft-times use Bags.

This manner of distillation was invested to make more clear and pure Waters, and all juices and

This manner of diffillation was invented to make more clear and pure Waters, and all juices and compositions, which are of such a liquid consistence. You may take an example from Lac Virginia, or Lac Virginia.

THE PERSON NAMED IN

CHAP. XI.

What, and how many ways there are to make Oils.

Oi's by Expreffion,

By Infufion.

Ou may by three means especially draw to extract the Oils that you defire, Expression; and so are made the Oils of Olives, Nuts, Seeds, Fruits, and the like. Under this is thought to be contained Elixation, when as the beaten materials are boiled in Water, that so the Oil may swim aloft, and by this means are made the Oils of the Seeds of Elder and By Infufen.

Dane-wort, and of Bay-berries. Another is by Infufion, as that which is by infufing the parts of Plants and other things in Oils. The third is by Diffillation, fuch is that which is drawn by the heat of the fire, whether by afcent or by descent, or by concourse: The first way is known by all; now it is thus: Take Almonds in their husks, beat them, work them into a mass, then put them into a bag made of hair, or elfe of firong cloth first steeped in Water or in white Wine, then put them into a Press and so extract their Oil. You may do the same in Pine-apple-kernels, Hazel-nuts, Coco-nuts,

Of Eggs,

Oil of Bayber-Oil of Bays may be made of ripe Bay-berries newly gathered; let them be beaten in a Mortar and for boiled in a double Veffel, and then forthwith put into a Prefs, fo to extract Oil as you do from Almonds, unless you had rather get it by boiling as we have formerly noted. Oil of Eggs is made of the Yolks of Eggs boiled very hard; when they are fo, rub them to pieces with your fingers, then fry them in a Pan over a gentle fire, continually ftirring them with a Spoon until they become red, and the Oil be refolved and flow from them; then put them into a hair-cloth, and fo prefs forth the Oil. The Oils prepared by Infusion are thus made; make choice of good Oil, wherein let Plants, or Creatures, or the parts of them be macerated for fome convenient time, that is, until they may feem to have transfuled their faculties into the Oil, then let them be boiled, fo firained or preffed out. But if any aquofity remain, let it be evaporated by boiling. Some in compounding of Oils add Gurns to them,

of which though we have formerly fpoken in our Antidotary, yet have I thought good to give you Oil of St. Johns this one example. R. Flor. hyper. th B. immittantur in phialam cum flo. cent. & gum. elemi, an. 3 ij. olei.

Wort. com. th ij. Let them be exposed all the heat of Summer to the Sun. If any will add Agua vita wherein some Benzoin is dissolved, he shall have a most excellent Oil in this kind. Oil of Mastich is made Ex olei rofati 3 xij, maftich, 3 iij, vini optimi 3 viij. Let them all be boiled together to the confumption of the Wine, then strain the Oil and referve it in a Vessel.

CHAP. XII.

Of extracting of Oils of Vegetables by Diffillation.

What Oils are to be drawn by Expression.

Lmost all herbs that carry their Flowers and Seeds in an umble, have feeds of a hot, fubtil, and airy fubflance, and confequently oily. Now because the oily fubflance that is contained in simple bodies, is of two kinds; therefore the manner also of extracting is two-fold-For fome is groß, earthy, vifcous, and wholly confused and mixed with the bodies out of which they ought to be drawn, as that which we have faid is usually extracted by Expression; this because it most tenaciously adheres to the groffer substance and part of the body, therefore it cannot by reason of this natural großness, be lifted up, or ascend. Othersome are of a stender and airy substance, which is eafily fevered from their body, wherefore being put to distillation it eafily rifes: fach is the oily substance of aromatick things, as of Juniper, Annifeeds, Cloves, Nutmegs, Cinamon, Pepper, Ginger, and the like odoriferous and spicy things. This is the manner of extracting Oils out of the control of the cont The first manthem; let your matter be well beaten and infused in water to that proportion, that for every pound ner of drawing Oils by diing Oils by diof the material, there may be ten pints of water; infuse it in a Copper bottom, having a head thereto either tinned or filvered over, and furnished with a cooler filled with cold water. Set your Veffel upon a Fornace having a fire in it, or else in Sand or Asses. When as the water contained in the
head shall wax hot, you must draw it forth, and put in cold, that so the Spirits may the better be condensed, and may not slie away: you shall put a long necked Receiver to the nose of the Alembick, and
you shall increase the fire, until the things contained in the Alembick boil.

There is another manner of performing this distillation: The matter preserved and insused as we

There is another manner of performing this diffillation: The matter preferved and infufed as we have formerly declared, shall be put in a brafs or copper bottom covered with his head, to which shall be fitted, or well luted, a Worm of Tin; this Worm shall run through a barrel filled with cold warren. that the Liquor which flows forth with the Oil, may be cooled in the paffage forth; at the lower end of this Worm you shall fet your Receiver. The fire gentle at the first, shall be increased by little and little, until the contained matter, as we formerly faid, do boil; but take heed that you make not too quick or vehement a fire, for fo the matter fwelling up by boiling, may exceed the bounds of the con-

taining vessel, and so violently slie over.

Observing these things, you shall presently at the very first see an oily moisture flowing forth to-gether with the waterish. When the Oil hath done flowing which you may know by the colour of the diffilled liquor, as also by the confidence and taste, then put out the fire; and you may separate the Oil from the Water by a little Vessel made like a Thimble and tied to the end of a stick; (or, which is the confidence of the confidence which is better, with a Glass Funnel or Instrument made of Glass for the fame purpose.) Here you What Oils fall other form that there be forme Oils that fwim upon the top of the water, as Oil of Annifeeds; othersome on the contrary, which fall to the bottom, as Oil of Cinamon, Mace, and Clove

o the bostom.

Moreover you must note that the waterish moisture, or Water that is distilled with Oil of Annifeed and Cinamon, is whitish, and in success of time, will in some small proportion turn into Oil. Also these Waters must be kept several, for they are far more excellent than those that are distilled by Balner

Marie, especially those that first come forth together with the Oil. Oils are of the same faculties with the bodies from whence they are extracted, but much more escenal: for the force which formerly was diffused in many pounds of this or that Medicin, is after distillation contracted into a few drams. For example, the faculty that was disperfed over one pound of Cloves, will be contracted into two ounces of oil at the most: and that which was in a pound of Cinamon will be drawn into 3 j. β, or 3 ij. at the most of Oil. But to draw the greater quantity with the leffer charge, and without fear of breaking the Veffels, whereto Glasses are subject, I like that you dittil them in Copper Veffels: for you need not fear that the Oil which is distilled by them will contract an ill quality from the Copper: for the waterish moisture that flows forth together therewith will hinder it, espestally if the Copper shall be tinned or silvered over. I have thought good to describe and fet before your eyes the whole manner of this operation.

A Fornace with fes Veffels to extrait the Chymical Oils, or Spirits of Sage, Rosemary, Tyme, Lavender, Antifords, Fennel Seeds, Cloves, Nutmegs, Cinamon, Pepper, Ginger, and the like; as also to defil the first of Wine, of Vinegar and Aqua Vitre. Instead of the Barrel and Worms, you may use a bead with a bucket or rowler about it.

- A Shews the bottom, which engls to be of Copper and tinned on the infide,
- B The Head.
- C The Barrel filled with cold water to refrigerate and condenfase the Water and Oil that run through the Pipe or Worm that is put through it.
- A Pipe of Braft or Lattin, or rather a Worm of Tin runng abrough the Barrel.
- E The Alembick fet in the Fornace with the fire under it.

Now because we have made mention of Cinamon, The descrip-Pepper, and other Spices which grow not here with tion of Pep us, I have thought good to describe these out of The-per, vets Cosmography, he having feen them growing. Pepper grows upon Shrubs in India, these Shrubs send forth little branches whereon hang clufters of Berries,

like to Ivy-berries, or bunches of small black Grapes or Currans: the leaves are like those of the Citron-tree, but tharpifh and pricking.

The Indians gather those Berries with great diligence, and flow them up in large Cellars, as soon as they come to perfect maturity. Wherefore it oft-times happens that there are more than 200 Ships upon the Coast of the leffer Jana, an Island of that Country, to carry thence Pepper and other Spices. Pepper is used in Antidotes against Poisons; it provokes urin, digelis, attracts, resolves, and cures the Pepper is tiled in random personal property applied and taken inwardly against a cold stomach: in Sauces it The uses helps concoction and procures appetite: you must make choice of such as is black, heavy, and not thereof.

flaccid. The Trees which bear white, and those that bear black Pepper, are so like each other, that the Natives themselves know not which is which, unless when they have their fruit hanging upon

them, as the like happens upon our Vines which bear black and white Grapes.

The Tree that yields Cinamon grows in the Mountains of India, and bath leaves very like to Bay- The Cinamon leaves: branches and shoots at certain times of the year are cut from this Tree, by the appointment Tree, of the King of that Province, the Bark of which is that we term Cinamon. This is fold to no stranger unless at the Kings pleasure, and he setting the price thereof, it is not lawful for others to cut thereof.

Galen writes that Cinamon is of very fubtil parts, hot in the third degree, and partaking of fome 7. 5142. affriction; therefore it cors and diffolves the excrements of the body, threngthens the parts, provokes the Courses when as they stop by reason of the admixture of gross humours: it sweetens the breath, and yields a fine taste and smell to Medicins, Hippocras, and Sauces. Of Cinamon there is made an excellent Water against all cold Diseases, and also against Swounings, the Plague, and Poisons. The composition thereof is this: Take of the choicest and best Cinamon one pound, beat it grossy, and An excellent thereto of Rose water four pints, of white wine half a pint: being thus mixed, put them into a Cinamon Class, and so let them stand in infusion 24 hours, often stirring of them. Then distill them in Bal-Water.

CHAP. XIII.

Another manner how to draw the Effence and Spirits of Herbs, Flowers, Seeds, and Spices; as also of Ehubarh, Agarick, Turbith, Hermodallyls, and other Purgers:

Ou may extract the Effences and Spirits of the things mentioned in the title of this Chapter, as thus: Take Sugar, Rhubarb, Cinamon, or any other Material you please, cut it finall, or else beat it, then put it into a Glass with a long neck, and pour thereupon as much Agua wite as shall be sufficient to cover the Materials or ingredients, and to over-top them some ingers bredth, then ftop up the Glafs very clofe, that no air enter thereinto: Thus fuffer it to infufe for eight days in Balnes, with a very gentle heat; for thus the Aqua vite will extract the faculties of the Ingre-

A fign that the spirit of Wine hath the ingredients,

dients which you shall know that it hath done, when as you shall fee it perfectly tinctured with the colour of the ingredients. The eight days ended, you thall put this fame Aqua vite into another Veffel filled with the like quantity of the fame materials prepared after the fame manner, that it may wine nath fetchr out the alfo take forth the tincture thereof, and do thus three or four times, until the Aqua vite be deeply tinctured with the colour of the infufed Ingredients.

But if the materials from whence you defire to extract this spirit or effence, be of great price, as Lignum Aloes, Rhubarb, &c. you must not think it sufficient to insuse it once onely, but you must go over it twice, or thrice, until all the efficacy be extracted of thereof; you may know that it is all

A fign that the

A fign that the ingredients thus done, as is fitting, put all the liquor tinctured and furnished with the colour and fare loft their firength of the Ingredients, into an Alembick, filled and closely luted to its head, and so put into Balneum Maria, that so you may extract or draw off the Aqua vita, to keep for the like purpose, and so you shall have the spirit and effence remaining in the bottom.

Now if you defire to bring this extract to the height of honey, fet it in an earthy-pot well leaded, upon hot albes, so that the thin part thereof may be evaporated, for thus at length you shall have a most noble and effectual effence of that thing which you have distilled, whereof one scruple will be more powerful in purging, than two or three drams of the thing it felf.

CHAP. XIV.

How to extract Oil out of Gums, condensed Juices, and Rosins, as also out of some Woods.

What a Retore is.

LL Oils that are drawn out of Gums, Oily Woods, and Metals, are extracted by that veffel which we vulgarly term a Retort. It must be made of Glass, or Jug-metal, well leaded, and of fuch bigness as shall be convenient for the operation you intend, though commonly it should be made to hold some gallon and an half of water; the neck thereof must be a soot and a half or at least a foot long. The Receiver is commonly a Vial whereinto the neck of the Retort is sitted and inferted. Then the Retort shall be fet in an earthen filled with ashes, or Sand, and so fet into a Fornace, as you may fee by this Figure.

The Figure of a Fornace, with his earthen Pan and Receiver. A Shews the Fornace. B The earthen Pan or Vessel to

fet the Retort in. C The Retort or Cucurbite. D The

The differences of Gums.

Of Gums, some are liquid, some solid; and of the folid, fome are more folid than otherfome; those that are folid are more troubleforn to diffil than the liquid, for they are not so easily diffolved or melted, neither do they yield fo well to the fire, fo that oft-times they are burnt before they be dissolved; whence it is that fome for every pound of folid Gum, add two or three bounds of most clear and liquid Oil of Turpentine. Befides, liquid things are also hard to be distilled, because when as they come to be through-hot at the fire, they fwell up to much, that they exceed, or run out of the Retort, and so fall into the Receiver, as they were put into the Retort, especially if so be that the fire be too hot at the first. Many to shun this inconvenience, add to the things put into the Retort, fome Sand, as it were to balaft it withal,

How to make Oil of Turpentine.

Cautions in

diffilling of

Gums.

Oil of Rosin and Turpentine is thus made; Take two or three pounds of Turpentine and put it into a Retort of fuch largeness that three parts thereof might remain empty, and for every pound of Turpentine add three or four ounces of Sand; then place the Retort in an earthen Pan filled with fifted affies, and fet it upon the Fornace as is fit, and to the neck thereof fit and closely lute a Receiver.

Lafily, Kindle there-under a foft fire at the first, lest the contained materials should run over; increase this fire by little and little, and take heed that the things become not too hot on a fudden. first a clear and acid liquor will drop out, wherein a certain sediment uses to concrete; then will flow forth a most clear oil, fornewhat resembling the watry and phlegmatick liquor: then must the fire be fornewhat increased, that the third oily, clear, thin, and very golden coloured liquor may rise and did it is the clear of the coloured liquor may rise and did it is the clear of the coloured liquor may rise and did it is the clear of the coloured liquor may rise and did it is the coloured liquor may rise and diftil: but then also a clearer and more violent fire must be raised, that so you may extract an Oil, that will be red like a Carbuncle, and of a consistence indifferently thick. Thus therefore you may that will be red like a Carbuncle, and of a confiftence indifferently thick. extract four kinds of Liquors out of Turpentine, and receive them being different in feveral Receivers vers; yet I judge it better to receive them all in one, that fo by diftilling them again afterwards you may separate your desired Oil; now there will ten or twelve ounces of Oil flow from a pound of Turpentine. This kind of Oil is effectual against the Palsie, Convulsions, Punctures of the Nerves,

and wounds of all the nervous parts.

But you shall thus extract Oil out of Wax: Take one pound of Wax, melt it, and put it into a Glass Retort set in Sand or Ashes, as we mentioned a little before in drawing Oil of Turpentine, then distill it, by increasing the fire by degrees. There distills nothing forth of Wax, besides an oily sub-speciand a little Philesis are continued this oil. Substance presently concretes into a certain butter-How to make Oil of Wax. france and a little Phlogma, yet portion of this oily fubstance presently concretes into a certain butter-like matter, which therefore would be diffilled over again: you may draw 3 vi. or vij. of Oil from one pound of Wax. This Oil is effectual against Contusions, and also very good against cold affects.

The faculties

CHAP. XV.

Of extracting Oils out of the harder forts of Groms; as Myerb, Mostich, Frankincense, and the like.

Some there be who extract these kinds of Oils with the Retort set in Ashes or Sand, as we mentioned in the former Chapter, Of Oils of more liquid Gume, adding for every pound of Gumes, two pints of Aques Vine, and two or three ounces of Oil of Tutpentine, then let them insuse for eight or ten days in Balnes Marie, or else in Horse dung; then set it to distil in a Retort. Now this is the true manner of making. Oils of Myrrh; Take Myrrh made into sine Powder, and there—How to make with fill hard Eggs in stead of their Yolks, being taken out; then place the Eggs upon a Gridiron, Oil of Myrrh, or such with some moist place, as a Cellar, and set under them a Leaden-earthen pan; the Myrrh will dissolve into an oily water, which being presently put into a Glass and well storped with or fuch like Grate, in fome thou place, as a Cenar, and let under thema Leauer-cartnen pan; the Myrrh will diffolve into an oily water, which being prefently put into a Glafs and well fropped, with an equal quantity of rectified Agna Vite, and to fet for three or four moneths in hot Horfe dung, which paft, the veffel shall be taken forth, and so stopped that the contained liquor may be poured which paff, the veffel shall be taken forth, and so stopped that the contained liquor may be poured into an Alembick, for there will certain gross settling by this means remain in the bottom, then set your Alembick in Baluee, and so draw off the Aqua Vita and phlegmatick liquor, and there will remain in the bottom, a pure and clear Oil, whereto you may give a curious colour by mixing there with some Alkanet, and a smell by dropping thereinto a little Oil of Sage, Cinamon, or Cloves.

Now let us show the Composition and manner of making of Balsams, by giving you one or two low examples; the first of which is taken out of Vefalius his Surgery; and is this,

R Terebinthept, lb j. el. laur. 3 iv. gum. elem. 3 iv. st. st. thuris, myerbe, gum. bedere, centaur. majoris, Vesilius his light aloes, an. 3 ii. galange, caryophyl. confolide majoris, Cinamoni, macis moschat. zedosrie, zinzib. dictam.

In albi, an. 3 j. elei vermium terrestrium, 3 ii. aqua vite lb vj.

The manner of making it is thus; Let all these things be beaten and made small, and so insused for three days space in Acua Vite, then distilled in a Retort, just as we said you must distil Oil of Turpentine and Wax. There will show hence three forts of Liquors; the first waterish and clear, the other thin and of pure golden colour, the third of the colour of a Carbuncke, which is the true

Turpentine and Wax. There will flow hence three forts of Laquors; the first waterish and clear, the other thin and of pure golden colour, the third of the colour of a Carbuncle, which is the true Balfam. The first liquor is effectual against the weakness of the stomach coming of a cold cause, for that it cuts phlegm and discusses shallouncies; the second helps fresh and hot bleeding wounds, as also the Palife; the third is chiefly effectual against these same effects. The composition of the following Balfamum is out of Fallopius, and is this. Resemble clark, the lark of former limi, the perfect properties of the perfect of the p then prefently after a reddith oil, most profitable for wounds,

Now you must know that by this means we may easily distil all Axungiaes, Fats, parts of Creatures, Woods, all kinds of Barks and Seeds, if fo be that they be first macerated as they ought to be, yet so that there will come forth more watry than oily humidity. Now for that we formerly What Franfrequently mentioned Thus or Frankincense, I have here thought good out of Thevets Cosmogra, kincense is, phy to give you the Description of the Tree from which it flows. The Frankincense Tree (faith he) grows naturally in Arabia, resembles a Pine, yielding a moisture that is presently hardned, and it congrows naturally in Arabia, retembles a Pine, yielding a moniture that is prefently hardned, and it concretes into whitish clear grains, fatty within, which cast into the fire, take slame. Now Frankin-cense is adulterated with Pine-rosin and Gum, which is the cause that you shall seldom find that with us, as it is here described; you may find out the deceit thus, for that neither Rosin nor any other Gum takes slame; for Rosin goes away in smoke, but Frankincense presently burns. The small also bewrays the counterfeit, for it yields no grateful smell as Frankincense doth. The Arabians wound the Tree that so the liquor may the more readily slow forth, whereof they make great The faculties can. It siles up bollow ulcers and cicatrizes them; wherefore it enters as a chief incredient into the top of gain. It fills up hollow ulcers and cicatrizes them; wherefore it enters as a chief ingredient into thereof.

artificial Balfam; Frankincense alone made into Powder and applied, stanches the bloud that flows out of the wounds.

Matthiolas faith, that it being mixed with Fullers-earth, and oil of Roses, is a singular remedy against the inflammation of the Brelis of Women lately delivered of child.

CHAP. XVL

The making of Oil of Vitrial.

Ake ten pounds of Vitriol, which being made into Powder, 'put it into an earthen pot, and The fign of fet it upon hot coals until it be calcined, which is when as it becomes reddiff after fome perfectly calcined in the or fix hours, when as it shall be throughly cold, break the pot, and let the Vitriol be cined vitriol. again made into Powder, that fo it may be calcined again, and you shall do thus fo often and long until it shall be perfectly calcined, which is when as it shall be exactly red; then let it be made into until it shall be perfectly calcined, which is when as it shall be exactly red; then let it be made into Powder, and put it into an earthen Retort, like that wherein Aqua fortis is usually drawn, adding for every pound of your calcined Vitriol of Tile-sherds, or powdered Brick one quarter; then put the Retort surnished with its Receiver into a Fornace of Reverberation, always keeping a strong fire, and that for the space of 48 hours, more or less according to the manner and plenty of distilling liquor. You shall know the distillation is simished when as the Receiver shall begin to recover his particle particles and power of the same as the receiver shall begin to recover his particle particles. his native perfpicuity, being not now filled with vaporous spirits, wherewith as long as the humour diffills it is replenished and looks white, with advisable

A Fornace or Reverberation furnished with his Retort and Receiver

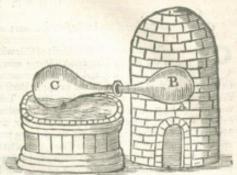

Now for the Receiver there are two things to be observed. The first is, that it be great and very capacious, that it may not be diftended and broken by the abundant flowing of vaporous fpirits, as it doth oft-times happen; another thing is, that you fet it in a veffel filled with cold water, left it should be broken by being over-hot; you may eafily perceive all this by this Figure.

B The Retort.

D The Veffel filled with cold Water.

CHAP. XVII.

A Table or Catalogue of Medicins and Instruments serving for the Cure of Difeases.

Edicins and Medicinal meats fit for the cure of Difeafes, are taken from living Creatures, Plants, and Minerals. From living Creatures are taken, Horns, Hoofs, Hairs, Feathers, Shells, Scalls, Seales, Sweats, Skins, Fats, Flesh, Bloud, Entrails, Urin, Bones, Extreme parts, Heart, Liver, Lungs, Brain, Womb, Seeundine, Testieles, Pixels, Bladder, Sperm, Tail, Coats of the Ventriele, Expirations, Brotles, Silk, Webs, Tears, Spittle, Honey, Wase, Eggs, Milk, Butter, Cheefe, Marrow, Renatt-Smells whether they be stinking or sweet, as also Poisons: whole Creatures themselves: as, Foxes, Whelps, Hedg-bogs, Frogs, Worms, Crabs, Cray-sishes, Scorpions, Horsteebes, Swallows, Dungs.

From Plants, that is, Trees, Shrubs, and Herbs, are taken, Rosts, Moß, Pith, Siens, Buds, Stalks, Leaves, Flowers, Cups, Fibers, or Hairy threads, Ears, Seeds, Bark, Wood, Meal, Juices, Tears, Oils, Gums, Rofins, Rossenness, Mass or Spiffament, Manna, which falling down like Dew upon Plants prefently concretes. Whole Plants, as Mallows, Onions, &cc.

Metals or Minerals are taken either from the Water or Earth, and are either kinds of Earth, Stones, or Metals, &c. The kinds of Earth are, Bole-Armeniek, Terra figillata, Fullers-earth, Chalk, Oker, Plajter, Lime. Now the kinds of Stonesare, Flints, Lapis Judaicus, Lapis Lyncis, the Pumice, Lapis Plaster, Lime. Now the kinds of Stones are, Finns, Laple Sapphire, Chrysoline, Topace, Load-stone, the Hernatites, Amiantus, Galactites, Spange-stones, Diamonds, Sapphire, Chrysoline, Topace, Load-stone, the Linds of Salts. Pyrites or Fire-fione, Alabafter, Marble, Cryfial, and many other precious Stones. The kinds of Salts as well Natural as Artificial are. Common Salt, Sal Nitrum, Sal Alkali, Sal Ammoniacom, Salt of Uris, Salt of Tartar, and generally all Salts that may be made of any kind of Plants. Those that are commonly called Minerals, are, Marchafte, Antimony, MacGony-glaft, Turty, Arfnick, Orpimens, Lazzore, or Plants of the Control Blue, Roje-agar, Brimtone, Quick-filver, White Coperas, Chaleitie, Pfory, Roman Virrol, Colcother, Virrol or Green Coperas, Alumen feitfile, Common Alume, Alumen Rotundum, Alumen liquidum, Alumen plumofurn, Borax or Burrace, Bitumen, Naptha, Cinnabaris, or Vermilion, Lithurge of Gold, Lithurge of Silver, Chrysocolla, Scandaracha, Red Lead, White Lead, and divers other. Now the Metals themselves are, Gold, Silver, Iron, Lead, Tim, Brass, Copper, Steel, Lattin, and such as arise from these; as the Scales, Verdigresse, Rush, &c. Now from the Waters, as the Sea, Rivers, Lakes, and Fountains, and the mud of these Waters, are taken divers Medicins, as White and Red Cond, Pearls, and infinite other things which Nature the Hand, maid of the green Archival of the Water, and infinite other things. which Nature the Hand-maid of the great Architect of this World, hath produced for the cure of Dil eales; fo that into what part foever you turn your eyes, whether to the furface of the Earth, or the The choice of all bowels thereof, a great multitude of Remedies present themselves to your viewwhich is taken from their fubfiance, or quantity; quality, action, place, feafon, fmell, tafte, fight, figure, and weight, other circumfiances, as Sylvius hath abundantly flowed in his Book written upon this Subject. Of these Simples are made divers. Compositions: as, Collyvia, Caputpurgia, Eclegmata, Dentifices, Dentificalpia, Apophlogmatismi, Gargarisms, Pills, Boles, Potions, Emplasters, Unguents, Ceratis, Liniments, Embrocations, Fomentations, Epithemes, Attrastives, Resolvers, Supparatives, Emallients, Mundificatives, Incarnatives, Cicatrizers, Patrisfers, Corrosoves, Aglutinatives, Anodynes, Apazemes, Julips, Sympton Patrick, Control of the Control o rups, Powders, Tablets, Opiats, Conferves, Preserves, Confections, Kowls, Vomits, Sternatatories, Sudorifices, Clysters, Pessaries, Suppostavies, Fumigations, Trochifees, Frontrails, Caps, Stomachers, Bags, Baibs, Half-baibs, Vingins Milk, Fuci, Pications, Depilatories, Vesicatories, Potential Conteries, Nose-gays, Fans, Canapies, or extended cloths to make wind, Artificial Fountains to diffil or drop down Liquors.

Now those that are thought to be nourishing Medicins are, Reftauratives, Culifes, Expressions, Gellies, Prifaur, Early-creams, Panadocs, Almond milk, March-panes, Wafers, Hydrofacchar, Hydromel, and such other drinks; Muciliages, Oxymel, Oxycrate, Rose-Vinegar, Hydralium, Methoglin, Sider, Drink of Cervisian Rose Vinegar, Vinegar, Vinegar, And Control of Cervisian Rose Vinegar, Oxymel, and Control of Cervisian Rose Vinegar, Oxymel, Ox ces, Ale, Beer, Visegar, Verjuice, Oil, Seceled Water, Water brewed with Bread-crimer, Hippocras, Perry, and

fuch like. Waters and diffilled Oils, and divers other Chymical Extractions: As the Waters and Oils of hot, drie and aromatick things, drawn in a Copper Alembick, with a cooler, with ten times as much wa-Watershap of Herbs; now the Herbs mult be drie, that the diffillation may the better fucceed.

Waters are extracted our of Flowers put into a Retort, by the heat of the Sun, or of Dung, or of bean of profiled an heap of preffed-out Grapes, or by Balmo, if there he a Receiver, put and closely luted thereto. All kinds of Salt of things calcined, diffolved in Water, and twice or thrice filtred, that so they may be some more pure and fit to the diffolved in Water, and twice or thrice filtred, that so they may be come more pure and fit to yield Oil. Orber

Other Distillations are made either in Cellars by the coldness or moistness of the place, the things being laid either upon a Marble, or else hanged up in a Bag; and thus is made Oil of Tartar, and of Salts, and other things of an aluminous nature.

Bones must be distilled by descent, or by the joining together of Vessels. All Woods, Roots, Barks, Shells of Fishes, and Seed, or Grains, as of Corn, Broom, Beans, and other things whose juice cannot be got out by expression, must be distilled by descent, or by the joining together of Vessels in a Rever-

beratory Fornace.

beratory Fornace.

Metals calcined and having acquired the Nature of Salt, ought to be diffolved and filtred, and then evaporated till they be drie; then let them be diffolved in diffilled Vinegar, and then evaporated and dried again; for fo they will eafly diffil in a Cellar upon a Marble or in a Bag. Or elfe by putting them into a glaffic Retort, and fetting it in Sand, and fo giving Fire thereto by degrees, until all the watery humidity be diffilled; then change the Receiver, and lute another close to the Retort; then increase the Fire above and below, and thus there will flow forth an Oil very red coloured. Thus are all Metalline things distilled, as Alums, Salts, &c.

Gums, disungie, and generally all Rofins, are diffilled by a Retort fet in an earthen Veffel filled with Ashes upon a Fornace; now the fire must be increased by little and little according to the diffe-

rent condition of the distilled matters.

The Veffels and Infiruments ferving for Diffillation are commonly thefe.

BOstoms of Alembicks. The heads of them, from whence the liquors drop. Refrigeratories. Veffels for Gublimation. For reverberation. For diffiling by descent. Crucibles and another such. Veffels for Calcination, Hair-strainers, Bags, Earthen Platters. Vessels for circulation, as Pelicans, Earthen Basins for filtring, Fornaces, the secret fornaces of Philosophers, the Philosophers Egg, Cucurbites Retorts, Bolt-beads, Vrinals, Receivers, Vossels so fitted together that the lowermost receives the month of the uppermost, whence they may be termed conjuned Vessels: they are used in distilling per descension. Marks exquisitely smooth for distillations to be made in Cellars, Pots to dissolve calcined Metals in.

A Catalogue of the Surgeons Infiruments mentioned in this whole Work.

R logs wherein little Lancets lie bid, to open Imposthumes. Trunks or hollow Instruments going with springs.

A vent, or cooler for the womb made like a Pessary. Hollow Tents. Sundry Cauteries, as slat, round, sharp-pointed, cutting, Oc. Constrictory rings to twitch or bind the Columella. Speculium Oris, Ocul. Ani, sharp-pointed, cutting, O.c. Congressory rings to twinch or toma the Columbia. Specialism Oris, Ocul. Anti, Uteri. A Trunk or Pipe with an actual Cantery in it. Crooked Kniver. A Pipe in form of a Quill. Divers Trusses, with one or more boliters. A shoulder-hand to be put about the neck, to bold up a Truss. A Needle to draw through a golden Wier, &c. Pipes with sensitely, and Needles sit for sutners. Cutting Mullets. Mullets onely to hold and not to cut. Mullets to take furth splinters of bones. Mullets to draw Teeth. An Incision knife. onely to bota and not to cut, between to rang justo printers of bones, to much to arow sectio. An incipan knife, Scrapers to plain or finosib the bones, or elfe to cut them. Cutting or bollow Scrapers. A leaden Mallet to drive the Scrapers or Chizzels into the feull. A Gimblet in shape and use, resembling that which Coopers use to lift up the sink staves of their cask withall. Levatories of which kind is the three-sooted one. Old Leavatories, which taken up by their bandles, and their tongues being put under the depress bones, lift them up. Saws. A Desquanatory Trepan. Pliers to take forth splinters of bones. A Gimblet to perforate the shall. A Trepan to the chall, with the Scrue. Point, or Pitreer, Brace, and Cover or Cap, thus bear is S. A Definantary Trepan. Pliers to take forth plinters of bones. A Gimblet to perforate the shell. A Trepan fit to draide the shell, with the Serue, Point, or Piercer, Brace, and Cover or Cap, that keeps it from running in too far. A Plate to fet one foot of the Compass upon. A enting pair of Compasses both open and shout, a sit infirmment to depress the Dura Mater without buring thereof. A Syringe to make injection mitball. A pair of Pincers with boles through them to take up the skin for making a Seton. Setons as well drie as mosified with einterness. The Beaks of Crows, Parats, Swans, Ducks, Lizards, Cranes, are either strain, crooked, toothed, or smooth. Catch-bullets, and Pliers to draw forth pieces of mail, and splinters of bones that lie deep in. Hollow and smooth Dilaters diversly made for the different wounds of the parts. Probes sis for to put slammlass into month of the parts of the parts. and proof Disares divergy man or crooked, perforated or unperforated. Served Mullets to draw first bar-bed beads of arrows, and the like. Lancets to let blond, and fearifie, as well first as crooked. A Pyulcos, or Matter-drawer. Ligatures, Bands, Swathes, Thougs of Leather, Woollen, Linnen, round, flet, fown sogethers Again some are upper binders, other under-binders. Again, these are either expressing or else containing, and that Again some are upper binders, other under-binders. Again, these are either expression or else containing, and that either the applied Medicin, or the tips of mounds, or members put in a sit posture, which therefore they call a Sarcotick Ligature. Thred, Bestims or Clews of Thred or Tarn. Pledgets, Compresses, Bolsters, doubled Cloths. Ferula, or Splints. Casses, Junks, Glossomies. Attabis, a kind of Glossomy. A Pully with its wheels, and wooden, and iron Fins whereon the wheels may run. Ropes as well so draw and extend, as hold up the member, &c. Serue-pins, A Handwice, Hooks, Bustons or Stays to fasten to the kin to hold together the lips of the woulds, Lint custions, Pillows, Linnen Cloths. Files, Dentiscalpia, Dentificia, Dentiscia, Coethseters, Guiders of the Work. A Bathing Chair or Seat, Bathing Tubr, Half Tubr, Caldrons, Fromels, with all other circumstances belonging to a Bath. Stoves, or Hot-bouses to sweat in. Cocks to turn and let out Water. A Gimblet to break, the Stone. Hooks, Hollow Probes slit on the upper sides. Winged Inframents to draw furth banes. An Instrument to cleanse the Bladder. Spatulaes straight and crooked. Cupping-glasses. Hone A Gimblet to break the Stone. Lawrence to describe the Bladder. Spatulaes straight and crooked. Cupping-glasses, Horns, Pipes, or Catheters to wear Caruncles. Artificial members, as Eyer of Gold enamelled, &c. An Urinal or Case to save the water in. An Artificial Tard. Crutches, Nipples, or Leaden Covers for sore Breits. Griffins Talons to draw forth a Mola out of the Womb. A Sucking Glass to draw a Breit withall. Pessaries both long and oval. Syringes to give Glysters, as also to make injection into the Ears and Womb.

The Effigies of HIPPOCRATES of COOS, the Prince of PHYSICIANS.

I Victum, Hippocrates, quòd te potuere superbæ
Eoî numquam flectere Regis opes,
Cecropidæ fronti ex auro sulgente coronam
Promeriti memores imposuere tuæ.
Gratia sed levis est, Actæis tantus Athenis
Nec fuit hinc uni quàm tibi partus honos.
Nam quòd quæ recreent languentia corpora morbo
Pæonias sueris promere largus opes;
Sed tua tam sundit, quàm magni machina Mundi
Gratia, & insignis tam tua sama volat.

SELECT APHORISMS concerning SURGERY, Collected out of the Aphorisms of the

HIPPOCRATES.

Aphor.27. W Hofoever being suppurate or hydropical, are burnt, or cut therefore, if all the Mat-Sell.6. Water flow forthat once, they certainly die.

31. 6. The drinking of Wine, or a Bath, Fomentation, Bloud-letting, or Purging, help the pains

of the Eyes. 38. 6. Such as have hidden, or not ulcerated Cancers, had better not to cure them. For healed, they quickly dies not cured, they live the longer,

55. 6. Gouty pains ufually thir in the Spring and Fall. 28. 6. Eunuchs are not troubled with the Gout, neither do they become bald.

49. 6. Whofoever are troubled with the Gout, have eafe in forty days, the inflammation ceafing.
66.5. In great and dangerous Wounds, if no fwelling appear, it is ill.
67. 5. Soft tumour are good, but crude ones ill.

25. 6. For an Eryfipelas, or Inflammation to return from without inwards, it is not good; but to come from within outwards, is very good.

7. An Eryfipelas coming upon the bearing of a bone, is evil.
 7. Putrefaction or suppuration coming upon an Eryfipelas, is ill.

21. 6. If Varices or Hamorthoids happen to such as are mad, their madness ceases.

21. 7. A flux of bloud enfuing upon a great pulfation in ulcers, is ill.

26. 2. It is a better that a Fever happen upon a Convulsion, than a Convulsion upon a Fever.
 4. 6. Those Ukers that have the skin smooth or shining about them, are evil.

18. 6. The Wound is deadly whereby the Bladder, Brain, Heart, Midriff, any of the fmall Guts. Stomach, or Liver are hurt.

45. 6. Whatfoever Ulcers are of a years continuance or more, the bone must necessarily scale, and the fears become hollow.

2. 7. The bone being affected, if the flesh be livid, it is ill.

14. 7. Stupidity and lack of Reason upon a blow on the Head, is evil.

24. 7. A Delirium happens if a bone (to wit, the skull) be cut even to the hollowness thereof. Whilest Pas or matter is in generating, Pains and Fevers happen rather than when it is already made.

18. 5. Cold things are hurtful to the Bones, Teeth, Nerves, Brain, Spinal Marrow; but hot things are good.

46. 2. Two Pains infeffing together, but not the fame place, the more vehement obscures the other.

74. 7. A corruption, an Abscels of the bone is caused by the corruption of the flesh.

50. 6. Coacar. present a livid or drie Ulcer, or yellowish, is deadly.

19. 6. When as a Bone, or Griffle, or Nerve, or finall portion of the Cheek, or the Prepuce is cut afunder, it neither increases, nor grows together.

24. 6. Aph. \$ 513. Cosess. It any of the small guts be cut, it knits not again.
50. 7. Those that have the Brain sphacelate, that is, corrupt, they die within three days; if they escape these, they recover.

9. 7. Bleeding at a wound causing a Convulsion, is the fore-teller of death.

20. 5. Cold is biting to Ulcers, hardens the skin, causes pain, not easily coming to suppuration, 50. 8. Core. Those who have the Temples cut, have a convultion upon the parts contrary to the Section.

44. 7. Whofoever being suppurate are burnt or cut, if pure and white quitture shall flow forth, they escape; but if that which is bloudy, seculent, and stinking, then they die.

Galen Comment. ad Aphor. 29. 2. It is not fit to take in hand to cure such as are in a desperate case, but to leave them, one foretelling the end of the difeafe.

Celfus, cap. 10. lib. 20. It is better to trie a doubtful remedy than none at all.

The Effigies of GALEN the Prince of PHYSICIANS
next to HIPPOCRATES.

A Quum erat Hippocratem divino è semine Divûm
Orbem muneribus conciliare sibi:
Scripta sed involvit tam multo ænigmate, verum
Ut quamvis solers nullus habere queat;
Pergamei auxilio nisi sint monimenta Galeni,
Qui doctà ambages sustulit Arte senis;
Ergò màcte esto virtute, arcana resolvens,
Quæ nulli suerant nota, Galene, priùs;
Obstringensque orbem æterno tibi munere totum,
Æternis sacras te quoque temporibus.

40. The quitture that flows from an ulcer is laudable, which is white, fmooth and equal.

The End of the Seven and Twentieth Book

BOOK XXVIII

How to make Reports and to Embalm the Dead.

Why a Surgeon must be careful in making of Reports.

What judg-ment is diffi-

Wounds termed great for three respects.

How long a Surgeon muft furpend his judgment in fome cafes. General figns judge of Difeafes.

deadly by the

ctured skull,

Ow it onely remains that we instruct the Surgeon in making and framing his Report or Opinion, either of the Death of any person, or of the weakness or deprivation of any member in the function or execution of its proper office and duty. Herein it is meet that he be very confiderate, that is to fay, ingenious or wife in making his Report, bebecause the events of Diseases are often-times doubtful and ancertain, neither can any

man fore-tell them certainly, whether they will be for life or death, by reafon of the manifold nature of the Subject of which we speak, and also the uncertain condition of the humours both in their kind and motion. Which was the cause why Hipperater even in the first of his Aphorisms pronounceth that Judgment is discount. But first of all, it is very expedient that a Surgeon be of an honest mind, that Judgment is difficult. But fift of an, it is very expedient that a surgeon be of an noneit mind, that he must always have before his eyes a careful regard of true piety, that is to say, the sear of God and faith in Christ, and love toward his Neighbors, with hope of lite everlatting, lest that he being carried away by favour, or corrupted with money or rewards, should affirm or testifie those wounds to be small that are great, and those great that are small; for the report of the wound is received of the Surgeon according to the Civil Law.

It is recorded in the Works of ancient Phylicians, that Wounds may be called great for three respects. The first is by reason of the greatness of the dissolved Unity, or resolution of Continuity; and such are these wounds, which made by a violent stroke with a Back-sword have cut off the Arm or Leg, or overthwart the Brest. The second is by reason of the dignity or worthiness of the part; now this dignity dependent on the excellency of the action; therefore thus any little wound made with a Bodkin, or Knife, in any part whose substance is noble, as in the Brain, Heart, Liver, or any other part whole action and function is necessary to preferve life, as in the Weason, Lungs, or Bladder, is judged great. The third is, by reason of the greatness and ill habit, or the abundance of ill humours, ordebility of all the wounded body; fo those wounds that are made in the nervous parts, and old decaied people, are faid to be great. But in searching of wounds let the Surgeon take heed that he be not deceived by his Probe. For many times it cannot go into the bottom of the wound but sloppeth and slicketh by the way, either because he hath not placed the Patient in the same posture wherein he was when he received his hurt; or else for that the stroke being made down-right, slipt aside to the right or left hand, or elfe from below upwards, or from above downwards, and then he may expect that the wound is but little, and will be cured in a thort time, when it is like to be long in curing, Therefore from the first day it behooveth him to suspend his judgment of the wound until the ninth, for in time the accidents will thew themselves manifelly whether they be small or great, according to the condition of the wound or wounded bodies, and the state of the air according to his primitive qualities, or venomous corruption.

But generally the figns whereby we may judge of difeases whether they be great or small, of long or short continuance, mortal or not mortal, are four. For they are drawn either from the nature and effence of the Difease, or from the cause or effects thereot, or else from the similar to the continuance, mortal or not mortal, are four. For they are drawn either from the smaller proportion, and comparison of those Diseases, with the season or present constitution of the times. Therefore, if we are called to the control of the size of of fore if we are called to the cure of a green wound, whose nature and danger is no other but a simple folution of Continuity in the mufculous flesh, we may presently pronounce that wound to be of no danger, and that it will foon be cured. But if it have an Ulcer annexed unto it, that is, if it be fa-nious, then we may fay it will be more difficult and long in curing; and so we may pronounce of all Diffasts, taking a favorable of the curies. Difeafes, taking a fign of their effence and nature. But of the figns that are taken of the caufes, let this be an example. A wound that is made with a sharp-pointed and heavy weapon, as with an Halberd being stricken with great violence, must be accounted great, yea and also mortal, if the accidence has severed as the constant of the caufes and the constant of the caufes.

dents be correspondent.

But if the Patient fall to the ground through the violence of the ftroke, if a cholerick vomiting follow thereon, if his light fail him, together with a giddiness, if bloud come forth at his eyes and no firils, if diffraction follow with lofs of memory and fenfe of feeling, we may fay that all the hope of life remaineth in one finall fign which is to be deduced from the affects of the wound. But by comparing it unto the feafon that then is, and difeafes that then affault Mans Body, we may fay, that all those that are wounded with Gun-shot, are in danger of death, as it happened in the Skirmishes at the Siege of Ross, and at the battle of Saint Denis. For at that time, whether it were by reason of the fault of the Heavens, or Air, through the evil humours of mans body, and the diffurbance of them, all wounds that were made by Gun-shot, were for the most part mortal. So likewise at certain seafons of the year, we fee the Small-pox and Meazles break forth in children, as it were by a certain pe fillent contagion to the definaction of children onely, inferring a most cruel vomit and lasks and Signs of a fra. in such a Scason the judgment of those Diseases in ot difficult. But you by the following signs of a fra. may know what parts are wounded. If the Patient fall down with the fireke, if he lie tentlets as it were alleep, if he avoid his excrements unwittingly, if he be taken with giddinefs, if bloud as it were alleep, if he avoid his excrements unwittingly, if he be taken with giddinefs, if bloud come out at his Ears, Mouth, and Nofe, and if he vomit choler, you may undertiand that the skull is fractured, or pierced through, by the defect of his understanding and discourse. You also may know when the skull is fractured, by the judgment of your external senses, as if by seeling it with your singer you find it elevated or depressed beyond the natural limits, if by siriking it with the end of a Probe, when the Perieranium or nervous film that investeth the skull is cut cross-wise, and so divided

wided there from it, it yield a base and unperfect found like unto a pot-sherd that is broken, or rather like to an earthen Pitcher that hath a clest, or rent therein.

But we may fay, that death is at hand if his Reafon and Understanding fail him, if he be speechlefs, if his sight forsake him, if he would tumble headlong out of his bed, being not at all able to remove the other parts of his body; if he have a continual Fever, if his tongue be black with drines, if
the edges of the wound be black or drie, and cast forth no fanious matter, if they resemble the colour
effalted fielh, if he have an Apoplexy, Phrensie, Convultion or Palsie, with an involuntary exerction,
or absolute suppression of the Urine and Excrements. You may know that a man hath his throat,
that is, his weason and wind-pipe cut: First by the sight of his wound, and next by the abolithment
of the function or office thereof both ways, for the Patient can neither speak nor swallow any meat
or drink; and the parts that are cut assunder, divide themselves by retraction upwards or downwards
one from another, whereof cometh sudden or present death. You may know that a Wound hath
pierced into the brest or concavity of the body, if the air come forth at the wound making a certain

pierced into the brest or concavity of the body, if the air come forth at the wound into some or or
concavity of the breath is unfavoury and flinking, by reason that
the putrifying bloud is turned into some failure.

The standard of the standar

We may know that the Lungs are wounded by the foaming and fpumous bloud coming out both Signs that the at the wound, and caft up by vomiting; he is vexed with a grievous thortness of breath, and with Lungs are pain in his fides. We may perceive the Heart to be wounded by the abundance of bloud that cometh out of the wound, by the trembling of all the whole body, by the faint and small pulse, paleness of the face, cold sweat, with often swooning, coldness of the extreme parts, and sudden death.

When the Midriff (which the Latins call Displangers) is wounded, the Patient feeleth a great The Midriff, weight in that place, he raveth and talketh idlely, he is troubled with shortness of wind, a cough, and fit of grievous pain, and drawing of the intrails upwards. Wherefore when all these accidents appear we may certainly propounce that death is at hand.

pear, we may certainly pronounce that death is at hand.

Death appeareth fuddenly, by a wound of the hollow Vein, or the great Artery, by reason of the The Pear Cegreat and violent evacuation of blond and spirits, whereby the functions of the Heart and Lungs are the and great Artery.

Attery.

The Marrow of the back-bone being pierced, the Patient is affaulted with a Palife or Convultion The spinal very fuddenly, and sense and motion faileth in the parts beneath it, the excrements of the bladder are marrow.

When the Liver is wounded much bloud cometh out at the wound, and pricking pain disperseth it The Liver, felf-even unto the sword-like griftle, which hath its situation at the lower end of the brest-bone called light accidents, yea, and sometimes death.

When the Stomach is wounded, the meat and drink come out at the wound, therefolloweth a vomiting of pure choice; then cometh fweating and coldness of the extreme parts, and therefore we

ought to prognofficate death to follow such a wound.

When the Milt or Spleen is wounded, black and gross bloud corneth out at the wound, the Patient The Spleen, will be very thirfly, with pain on the left side, and the bloud breaks forth into the belly, and there puterfying causeth most malign and grievous accidents, and often-times death to follow.

When the guts are wounded, the whole body is griped and pained, the excrements come out at the The Guts, wound, whereat also oft-times the guts break forth with great violence.

When the Reins or Kidnies are wounded the Patient will have great pain in making his Urin, and The Ridnies, the bloud cometh out together therewith; the pain cometh down even unto the Groin, and Yard, and Tefficles.

When the Bladder and Ureters are wounded, the pain goeth even unto the intrails; the parts all The Bladder, about and belonging to the Groin, are diffended, the Urine is bloudy that is made, and the fame also cometh oftentimes out of the wound.

When the Womb is wounded the bloud cometh out at the privities, and all other accidents appear The Womb. like as when the Bladder is wounded.

When the Snews are pricked or cut half afunder, there is great pain in the affected place, and there The Nerves; followeth a fudden Inflammation, Flux, Abfeefs, Fever, Convultion, and oftentimes a Gangrene or Mortification of the part, whereof cometh death, unlefs it be fpeedily prevented.

Having declared the figns and tokens of wounded parts, it now remaineth that we fet down other figns of certain kinds of death, that are not common, or natural, whereabout when there is great firife and contention made, it oftentimes is determined and ended by the judgment of the different Physician or Surgeon.

Therefore if it chance that a Nurfe either through drunkenness or negligence, lies upon the Infant Signs that an lying in bed with her, and so stilles and smothers it to death: if your judgment be required, whether Infant is smother first died through the default or negligence of the Nurse, or through some violent or sudden thered, or disease that lay hidden and lurking in the body thereof, you shall find out the truth of the matter by over-laid.

For if the Infant were in good health before; if he were not froward or crying; if his mouth and noffrils, now being dead, be moifined or bedewed with a certain foam; if his face be not pale, but of a violet or purple colour; if when the body is opened the Lungs be found fwollen and puffed up, as it were with a certain vaporous foam, and all other intrails found; it is a token that the Infant was fiffled, finothered or ftrangled by fome outward violence.

LIB. XXVIII. How to make Reports, 682 If the Body or dead Corps of a man be found lying in a Field, or House alone, and you be called by a Magistrate to deliver your opinion, whether the man were slain by Lightning or fome other violent death; you may by the following figns find out the certainty hereof.

Signs of fach

For every body that is blafted or ftricken with lightning, doth cast forth or breath out an unas are slain by wholsome, stinking or supplier finell, so that the Birds and Fowls of the air, or Dogs will not once touch it, much less prey or feed upon it: the part that was stricken often times found, awithout a wound; but if you fearch it well, you shall find the bones under the skin to be bruised, broken or shivered in pieces. But if the Lightning hath pierced into the body, with making a wound therein (according to the judgment of Pliny) the wounded part is far colder than all the rest of the body. For lightning driveth the most thin and fiery air before it, and striketh it into the body with great violence, by the force Lib.2.cap.54whereof the heat that was in the part is foon difperfed, wasted, and confumed. Lightning doth always leave force impression or fign of some Fire either by ustion or blackness: for no Lightning is without Fire. Moreover whereas all other living Creatures when they are firicken with Lightning, fall on the contrary fide, onely man falleth on the affected fide, if he be not turned with violence toward the coast or region from whence the lightning came. If a man be firicken with Lightning while he is afleep, he will be found with eyes open; contrariwife, if he bestricken while he is awake, his eyes will be closed, as Pliny writeth. Philip Commines writeth that those Bodies that are stricken with lightning, are not subject to corruption as others are.

Therefore in ancient time it was their custom neither to burn nor bury them; for the brimstone which the Lightning bringeth with it, was unto them in flead of Salt, for that by the driness and fiery heat thereof it did preserve them from putresaction. Also it may be inquired in judgment, Whether any that is dead and wounded, received these wounds alive or dead. Truly the wounds that are made of a living man, if he die of them, after his Signs of wounds given to a living or or death will appear red and bloudy, with the fides or edges fwollen, or pale round about: contrariwife, those that are made in a dead man, will be neither red, bloudy, fwollen nor puffed up. For all the faculties and functions of life in the body do cease and fall together by death; so that thenceforth no dead man. fpirits nor bloud can be fent, or flow into the wounded place. Therefore by these signs which shall appear, it may be declared that he was wounded dead or alive. The like question may come in judgment when a man is found hanged, whether he were dead or Signs whether one be hanged alive. Therefore if he were hanged alive, the impression or print of the rope will appear red, pale, or alive or dead. black, and the skin round about it will be contracted or wrinkled, by reason of the compression which the cord hath made; also oftentimes the head of the aftern arteria is rent and torn, and the second fpondyl, and the neck luxated or moved out of his place. Also the arms and legs will be pale by rea-fon of the violent and sudden suffocation of the spirits: moreover there will be a foam about his mouth, and a fearny and filthy matter hanging out of his noftrils, being fent thither both by reason that the Lungs are suddenly heated and suffocated, as also by the convulsion and concustion of the brain, like as it were in the Falling-fickness. Contrariwise, if he be hanged dead, none of these figns appear: for neither the print of the rope appears red or pale, but of the same colour as the other parts of the body are, because in dead men the bloud and spirits do not flow to the grieved Wholoever is found dead in the Waters, you shall know whether they were thrown into the Water Whether one found dead in alive or dead. For all the belly of him that was thrown in alive will be swollen and puffed up by reason of the water that is contained therein; certain clammy excrements come out at his mouth came therein and nofirils, the ends of his fingers will be worn and excoriated, because that he died striving and digging or fcraping in the fand or bottom of the River, feeking fomewhat whereon he might take hold to fave himself from drowning. Contrariwife, if he be thrown into the Waters, being dead before, his belly will not be fwollen, because that in a dead man all the paffages and conduits of the body do fall togeter, and are flopped and clofed, and for that a dead man breaths not, there appeareth no foam nor filthy matter about his mouth and nofe, and much lefs can the tops of his fingers be worn and excoriated, for when a man is already dead, he cannot firive against death death. But as concerning the bodies of those that are drowned, those that swim on the upper part of the Water being swollen or puffed up, they are not so by reason of the water that is conteined in the belly, but by reason of a certain vapour, into which a great portion of the humors of the body are converted by the efficacy of the putrefying heat. Therefore this fwelling appeareth not in all men which do perifh, or elfe are cast out dead into the Waters, but onely in them which are corrupted with the filthiness or muddiness of the Water, long time after they were drowned, and cast on the But now I will declare the accidents that come to those that are sufficiated and stifled or smo of fuch as are fmothered by thered with the vapour of kindled or burning Charcoals, and how you may fore-tell the causes thereof by the hiltory following. In the year of our Lord God 1575. the tenth day of May, my felf with Robert Gleanline Doctor of Phylick, was fent for by Mr. Hamel, an Advocate of the Court of Phylick, was fent for by Mr. Hamel, an Advocate of Charcoal. the Court of Parliament at Paris, to see and shew my opinion on two of his servants, of whom the one was his Clerk, and the other his Horse-keeper. All his Family supposed them dead, because they could not not have been seen as the court of their hodies. they could not perceive or feel their Arteries to beat, all the extreme parts of their bodies were cold, they could neither speak nor move, their faces were pale and wan, neither could they be raifed up with any violent beating or plucking by the hair. Therefore all men accounted them dead, and the question was onely of what kind of death they died, for their Master suspected that some body had strangled them, others thought that each of them had stopped one anothers wind with their hands: and others judged that they were taken with a sudden Apoplexy. But I presently

prefently enquired, whether there had been any fire made with Coals in the house lately? whereanto their Master giving ear, sought about all the corners of the Chamber, (for the Chamber was very little and close) and at last sound an earthen pan with Charcoal half-burned; which when we once faw, we all affirmed with one voice, that it was the cause of all this missfortune, and that it was the malign sume and venomous vapour which had smothered them, as it were by stopping the passages of their breath. Therefore I put my hand to the regions of their hearts, where I might perceive that there was fome life remaining by the heat and pulfation that I felt, though it were very little, wherefore we thought it convenient to augment and increase it. Therefore first of all artificially opened their mouths, which were very fast closed, and flicking obstinately together; and thereinto both with a fpoon and also with a filver pipe, we put Aques vite often distilled with dissolved Hiera and Triacle; when we had injected these Medicins often into their mouths, they began to move and to thretch themselves, and to cast up and expel many viscous excremental and filthy humours at their mouths and noftrils, and their Lungs feemed to be hot, as it were in their throats.

Therefore then we gave them vomitories of a great quantity of Oxymel, and beat them often violently on the last spondil of the back, and first of the loins, both with the hand and knee (for unto this place the orince of the flornach is turned) that by the power of the vomitory Medicin and concustion of the ftomach, they might be confirmed to vomit. Neither did our purpose fail us, for pre-fently they voided clammy, yellow and spumous phlegm and blood.

But we not being contented with all this, blowed up into their nostrils, out of a Goose-quill, the

powder of Emphorbium, that the expulsive faculty of the brain might be flirred up to the expulsion of that which oppressed it; therefore presently the brain being shaken, or moved with sneezing, and inftimulated thereunto by rubbing the Chymical oil of Mints on the Palate and on the Cheeks, they expelled much vifcous and clammy matter at their nothils.

Then we used Frictions to their arms, leggs, and back-bones, and ministred sharp Clysters, by whose efficacy the belly being abundantly loolened, they began presently to speak, and to take things that were minifired unto them of their own accord, and so came to themselves again.

In the doing of all these things, James Guillemens Surgeon to the King at Paris, and John of St. Ger-mans the Apothecary, did much help and further us.

In the Atternoon that the matter being well begun might have good faccefs, John Hanry and Lewis Thibant, both most learned Physicians, were fent for unto us, with whom we might consult on other things that were to be done. They highly commended all things that we had done already, thought it very convenient that Cordials should be ministred unto them, which by ingendering of laudable humours, might not onely generate new fpirits, but alfoattenuate and putrefie those that were cloudy in their bodies. The rest of our consultation was spent in the inquiry of the cause of so dire a mischance. For they said it was no new or strange thing, that men may be smothered with

the furne and cloudy vapour of burning Coals.

For we read in the Works of Fulgofius, Volateronus, and Egnatius, that as the Emperour Jovinian Lib. 9. 12. 12. travelled in Winter time towards Rome, he being weary in his journey, refled at a Village called An Hiftory. Didastanes, which divideth Bithynia from Galatia, where he lay in a Chamber that was newly made, and plastred with Lime, wherein they burned many Coals, for to drie the Work or Plastering, that was but as yet green on the Walls or Roofs of the Chamber. Now he died the very fame night being fmothered or firangled with the deadly and poisonous vapour of the burned Charcoal, in the midit of the night; this happened to him in the eighth moneth of his Reign, the thirteenth year of his Age, and on the twentieth day of August. But what need we to amplifie this matter by the antient Histories, seeing that not many years since three servants died in the house of John Bigine Goldfinith, who dwelt at the turning of the Bridge at the Change, by reason of a fire made with Coals in a close Chamber without any Chimney where they lay: and as concerning the causes, these were alledged; Many were of Opinion that it happened by the default of the vapour proceeding from the burned Coals, which being in a place void of all Air or Wind, infers such like accidents as the vapour or Must of new Wine doth, that is to fay, pain and giddiness of the head. For both these kinds of Vapour, befides that they are crude, like unto those things whereof they come, can also very fuddenly obtimes the original of the Nerves, and so cause a Convultion, by reason of the grossness of their fubflance.

For fo Hippocrater writing of those accidents that happen by the vapour of new Wine, speaketh s sell-5. Aphs. If any man being drunken, do fuddenly become speechless and bath a convultion, he dieth, unless he

have a Fever therewithal; or if he recover not his speech again, when his drunkenness is over.

Even on the same manner the wapour of the Coals affaulting the Brain, caused them to be speechless, unmoveable, and void of all sense, and had died thorstly, unless by ministring and applying warm Medicins into the mouth and to the noftrils, the grossnels of the vapour had been attenuated, and the expulsive faculty moved or provoked to expel all those things that were noisom: and also although at the first tight the Lungs appeared to be grieved more then all the other parts, by reason that they drew the malign vapour into the body, yet when you confider them well, it will manifefily appear that they are not grieved, unlefs it be by the fympathy or affinity that they have with the brain when it is very grievoutly afflicted.

The proof hereof is, because prefently after there followeth an interception or defect of the Voice, Senfe and Motion: which accidents could not be, unless the beginning or original of the Nerves were intercepted or letted from performing its function, being burthened by force matter contrary to Nature.

And even as those that have an Apoplexy do not die but for want of respiration, yet without of the death any offence of the Lungs, even so these two young mens deaths were at hand, by reason that their of such as respiration or breathing was in a manner altogether intercepted, not through any default of the bave the Apoplexy.

Lungs, but of the Brain and Nerves diffributing fense and motion to the whole body and especially to the infiruments of respiration. Others contrariwise contended and faid, that there was no default in the Brain, but conjectured the interception of the vital spirits letted or hindered from going up into the brain from the heart, by reason that the passages of the Lungs were stopped, to be the occasion that sufficient matter could not be afforded for to preserve and feed the animal spirit. Which was the cause that those young men were in danger of death, for want of respiration, without which

Continue Services

there can be no life.

For the heart being in such a case, cannot deliver it self from the suliginous vapours that encompassit, by reason that the Lungs are obstructed by the grossness of the vapour of the Coals, whereby inspiration cannot well be made, for it is made by the compassing air drawn into our bodies; but the air that compasseth us doth that which Nature endeavoureth to do by inspiration, for it moderateth the heat of the heart, and therefore it ought to be endued with four qualities. The first is, that the quantity that is drawn into the body be fufficient. The fecond is, that it be cold, or tem-perate in quality. The third is, that it be of a thin and mean confiftence. The fourth is, that it be of a gentle benign fubfiance.

But these four conditions were wanting in the air which those two young men drew into their

bodies being in a close Chamber.

Conditions of For first it was little in quantity, by reason that finall quantity that was contained in that little the air good to breath in. close Chamber, was partly confumed by the fire of coals; no otherwise than the air that is contained in a Cupping-glafs is confumed in a moment by the flame fo foon as it is kindled.

Furthermore it was neither cold nor temperate, but as it were inflamed with the burning fire of

Thirdly, It was more gross in confishence than it should be, by reason of the admixtion of the grosfer vapour of the coals: for the Nature of the air is fo that it may be foon altered, and will very

quickly receive the forms and impreffions of those substances that are about it. Laftly, it was notiforn and hurtful in fubflance, and altogether offensive to the airy fubflance of our bodies. For Charcoals are made of green wood burnt in pits under ground, and then extin-guillied with their own fume or fmoak, as all Colliers can tell. These were the opinions of most learned men, although they were not altogether agreeable one unto another, yet both of them depended on their proper reasons. For this at least is manifest, that those passages which are common to the Brest and Brain, were then stopped with the grossness of the vapours of the coals: whereby it appeareth that both these parts were in fault, for as much as the consent and connexion of them with the other parts of the body is so great, that they cannot long abide found and perfect without their mutual help by reason of the loving and friendly sympathy and affinity that is between all the

parts of the body one with another. Wherefore the ventricles of the Brain, the paffages of the Lungs, and the fleepy Arteries being flopped, the vital spirit was prohibited from entering into the Brain, and consequently the animal spirit retained and kept in, so that it could not come or disperse it self through the whole body,

whence happeneth the defect of two of the faculties necessary for life.

It many times happeneth, and is a question too frequently handled, concerning Womens Maidenheads; whereof the judgment is very difficult. Yet fome ancient Women and Midwives will brag that they affuredly know it by certain and infallible figns. For (fay they) in fuch as are Virgins there is a certain membrane of parchment-like skin in the neck of the Womb, which will hinder the thrusting in of the finger if it be put in any thing deep; which membrane is broken when first they have carnal copulation, as may alterwards be perceived by the free entrance of the finger. Belides, fuch as are deflowered have the neck of their womb more large and wide; as on the contrary, it is more contract, firait, and narrow in Virgins. But how deceitful and untrue thefe figns and tokens are, shall appear by that which followeth; for this membrane is a thing preternatural, and which is forced and to be the followeth; and the followeth is forced as the first preternatural and which is fearce found to be in one of a thousand, from the first conformation. Now the neck of the Womb will be more open or firait, according to the bigness and age of the party. For all the parts of the body

have a certain mutual proportion and commenfuration in a well made body. Joubertus hath written, that at Lellaure in Gafcony, a Woman was delivered of a child in the nineth year of her age, and that the is yet alive, and called Joan de Parie, wife to Videau Beche the Receiver of the Americanents of the King of Navarre: which is a most evident argument, that there are fome Women more able to accompany with a man at nine years old, than many other at fifteen, by reason of the ample capacity of their womb, and the neck thereof: besides also, this passage is exlarged in many by fome accident, as by thrufting their own fingers more firong thereinto by reason of fome itching, or by the putting up of a Nodule or Pelfary, of the bigness of a mans Yard, for to bring down the Course. Neither to have milk in their brests is any certain fign of lost Virginity-For Hippocrates thus writes: But if a Woman which is neither with child, nor hath had one, have

milk in her brefts, then her Courfes have failed her.

Morcover, Aristotle reports that there be men who have such plenty of milk in their brefts, that it may be fucked or milked out.

Cardan writes, that he faw at Venice one Authory Enffey, fome 30 years old, who had milk in his breft in fuch plenty, as fufficient to fuckle a child, so that it did not onely drop but spring out with violence like to a womans milk. Wherefore let Magithrates beware, left thus admonifhed, they too rafhly affent to the reports of Women. Let Phylicians and Chirurgeons have a care left they do too impudently bring Magistrates into an errour, which will not redound fo much to the Judges difgrace as to theirs.

But if any defire to know whether one be poisoned, let him fearch for the symptoms and figns in the fore-going and particular Treatife of Poilons. But that this doctrine of making Reports may be the ealier, I think it fit to give prefidents, in imitation whereof the young Chirusgeon may frame

Of the figns of

Virginity.

others. The first president shall be of death to ensues a second of a doubtful judgment of life and death; the third of an impotency of a member; the fourth of the hurting of many members

1 A.P. Chirurgeon of Paris, this twentieth day of May, by the command of the Council, entered A certifican into the house of one John Broffey, whom I found lying in bed, wounded on his head, with a wound of death. in his left temple, piercing the bone with a fracture, and effracture or depretion of the broken bone, scales and meninger into the substance of the brain, by means whereof his pulle was weak, he was troubled with raving, convultion, cold (weat, and his appetite was dejected. Whereby may be gathered that certain and speedy death is at hand. In witness whereof I have figured this Report with myown hand.

By the Coroners command I have withted Peter Lucey, whom I found fick in bed, being wounded Another in a with a Halbard on his right thigh. Now the wound was of the bredth of three fingers, and so deep doubtful case, that it pierces quite through his thigh with the cutting also of the Vein and Artery, whence insued much effusion of bloud, which hath exceedingly weakned him, and caused him to swound often; now all his thigh is fwollen, livid, and gives occasion to fear worse symptoms, which is the cause that the health and fafety of the party is to be doubted of.

By the Julices command I entered into the house of one James Bertey, to visit his own brother; I In the loss of found him wounded in his right arm, with a wound of some four fingers bigness, with the cutting a member. of the tendons bending the leg, and of the Veins, Arteries, and Nerves. Wherefore I affirm that he is in danger of his life, by reaton of the malign fymptoms that usually happen upon such wounds, such as are great pain, a Fever, Inflammation, Abscess, Convultion, Gangrene, and the like. Wherefore he frands in need of provident and careful dressing, by benefit whereof if he escape death, withour doubt he will continue lame during the remainder of his life, by reason of the impotency of the wounded part. And this I affirm under my hand.

We the Surgeons of Paris, by the command of the Senate, this twentieth day of March, have ville Anotherin the ted Malier Lewis Vertoman, whom we found hart with five wounds. The first insticted on his head, parts of divers ted Mafier Levis Vertamon, whom we found hart with five wounds. The first inflicted on his head, parts, in the middle of his fere-head-bone, to the bigness of three fingers, and it penetrates even to the second table, so that we were forced to plack away three splinters of the same bone. The other was athwart his right check, and reacheth from his ear to the middle of his nose, wherefore we slitched it with four stitches. The third is on the middle of his belly, of the bigness of two singers, but so deep that it ascends into the capacity of the belly, so that we were forced to cut away portion of the Kall coming out thereat, to the bigness of a Walnut, because having lost its natural colour, it grew black and course field. The fourth was upon the back of his left hand, the bigness of the surprises. and patrefied. The fourth was upon the back of his left hand, the bigness almost of four fingers, with the cutting of the Veins, Arteries, Nerves, and part of the bones of that part; whence it is that he will be lame of that hand, howfoever carefully and diligently healed.

Now because by hurting the spinal marrow men become lame sometimes of a leg, it is sit you. know that the spinal marrow descends from the brain like a Rivulet for the distribution of the Nerves, which might diffribute fenfe and motion to all the parts under the head; wherefore if by hurting the spinal marrow the Patients arms or hands are resolved or numb, or wholly without fense, it is a fign these nerves are burt which come forth of the hith, fixth, seventh Vertebre of the neck. But if the same accidents happen to the thigh, leg, or foot with refrigeration, so that the excrements flow voluntarily, without the Patients knowledge, or else are totally suppress, it is a fign that the finews which proceed from the Vertebre of the loms and holy-bone are burt, or in fight that the infews which preced than the branch of the ions and hoty-hone, are bart, or in fault; fo that the animal faculty beflowing fenfe and motion upon the whole body, and the benefit of opening and flutting of the fphincler mufcle of the bladder and fundament, cannot flew it felf in these parts, by which means sudden death happens, especially if there be difficulty of breathing

Being to make Report of a Child killed by the Mother, have a care that you make a discreet Re- A causion in Being to make Report of a China kines by the blother, have a cale that you have a causion in port, whether the child were perfect in all the parts and members thereof, that the Judge may equally making Repunish the author thereof. For he meriteth far greater punishment, who hath killed a child pertectly port of a woman haped and made in all the members; that is, he which hath killed a live child, than he which hath man with that has for child being child being killed an Embryon, that is, a certain concretiou of the spermatick body. For Moses punishers the for-killed mer with death, as that he should give life for life, but the other with a pecuniary mulch. But I judg it

If to exemplifie this report by a prefident.

I A.P. By the Judges command vifited Miftrifs Margaret Ulmargy, whom I found fick in bed, having a firong Fever upon her, with a convulsion and efflux of bloud out of her womb, by reason of a wound in her lower belly, below her navel on the right fide, penetrating into the capacity of her belly, and the wound therein; whence it hath come to pass, that the was delivered before her time of a male child, perfect in all his members, but dead, being killed by the fame wound, percing through his feull into the marrow of the brain. Which in a fhort time will be the death of the Mother alio. In testimony whereof, I have put my hand and feal.

The manner how to Embalm the Dead.

Had determined to finish this my tedious work with the precedent Treatise of Reports; but a better thought came into my head, which was, to bring Man, whose cure I had undertaken, from his Infancy to his End, and even to his Grave; to that nothing with the precedent to the process of the pr from his Infancy to his End, and even to his Grave; fo that nothing might be here defective which the Surgeon might by his Profession perform about Mans body either alive or dead. ly there hath scarce ever been a Nation so barbarous, which hath not onely been careful for the Burial, but also for the Embalming or preserving of their dead bodies. For the very Seythians, who

have feemed to exceed other Nations in barbaroufness and inhumanity, have done this; for (accor-

The reason of

building of the

Egyptians Py-ramids.

ding to Herodorns) the Seysbians bury not the corps of their King, before that being imbowelled and in the embalming their
dead.

The like care thened the corps of their friends of their entrails and flesh, they plastered them over, and then they thus rough-cast them, they painted them over with colours so to express the dead to the life; they inclefed them thus adorned in a hollow pillar of Glafs, that thus inclofed they may be feen and yet not annoy the Spectators with their finell. Then were they kept for the space of a year, in the hands of their next kindred; who, during this space, offered and facrificed to them. The year ended, they carried them forth of the City, and placed them about the Walls each in his proper Vault, as Herodotus affirms. But this pious care of the dead did far otherwise affect the Egyptians than it did other Nations: For they were fo studious to preserve the memory of their Anceflors, that they embalmed their whole body with aromatick ointments, and let them in translucent Urns, or glass Cells, in the more eminent and honoured part of their houses, that so they tnight have them daily in their fight, and might be as monuments and inciters to fir up them to imitate their Fathers and Grandires Vertues. Befides also the bodies thus embalmed with aromatick and balfamick ointments, were in flead of a most fure pawn, so that if any Egyptian had need of a great fum of money, they might cafily procure it of fuch as knew them and their neighbours, by pawning the dead body of forne of their dead Parents. For by this means the Creditor was certain, that he which pawned it, would fooner lofe his life than break his promife. But if all things fo unhappily succeeded with any, so that through poverty he could not fetch home his pawn again, but was forced to forego it, he was so infamous amongst all men, during the rest of his life, as one banished, or forlorn; and losing his freedom he shall become a servant, yea, soomed and reviled of all men, he should be accounted unworthy to enjoy the light and society of men. And certainly the Egyptians understanding the life which we here lead, to be of thort continuance, comparison being made with that which we are to live after separation of the foul from the body, they were more negligent in building their houses they dwelt in, but in rearing the Pyramids which should serve them in flead of Sepulchres, they were so beyond reason sumptuous and magnificent, that for the building one of these Edinces so renowned over all the World, which King Chapes begun, a hundred thousand men were every three moneths, for twenty years space there kept at work: It was sive furlongs, and being square, each side was 800 foot long; and so much in height. Almost all the pieces of marble went to the building thereof, were thirty foot long, engraven and carved with various workmanship, as Horodian reports. But before the bodies were committed to these magnificent Sepulchres, they were carried to the Salters and Embalmers, who for that purpose had allowance out of the publick stock. These besmeared them with aromatick and baltamick Ointments, and fewed up the incitions they made, then firewed them over with Salt, and then covered them with Brine for 70 days, which being expired, they washed them, being taken thence, and all the filth being taken off, they wrapped them in Cotten cloths, glued together with a certain gurn's then their Kinfimen placed them thus ordered in a woodden Coffin carved like to a This was the facred and accustomed rite of Embalming and Burying dead bodies amongst the Egyptions which were of the richer fort. Our Countrymen the French, flirred up with the like delire, embalm the bodies of their Kings and Nobles with Spices and fweet Ointments. cuftom they may feem pioufly and christianly to have taken from the Old and New Testament, and the ancient and laudable cuftom of the Jews: for you may read in the New Testament that Joseph bought a fine linnen cloth, and Nicodemus brought a mixture of Myrrh and Aloes about 100 pound weight, that they might embalm and bury the body of Jesus Christ our Saviour, for a fign and argument of the renovation and future integrity which they hoped for by the Resurre-ction of the dead. Which thing the Jews had received by Tradition from their Ancestors. For Joseph in the Old Testament commanded his Physicians that they should embalm the dead body of his Father with Spi

Join 19.39.

Gr# 50-2-

The manner of embalming for a long con-

But the body which is to be embalmed with Spices for very long continuance, must first of all be imbowelled, keeping the heart apart, that it may be embalmed and kept as the Kinsfolks shall think fit. Alfo the brain, the feull being divided with a Saw, shall be taken out. Then shall you make deep incisions along the arm, thighs, legs, back, loins and buttocks, especially where the greater Veins and Arteries run, first that by this means the bloud may be pressed forth: which otherwise would putrefie and give occasion and beginning to putrefaction to the rest of the body; and then that there may be space to put in the aromatick powders; the whole body shall be washed over with a Sponge dipped in Aqua vitæ and firong Vinegar, wherein shall be boiled Wormwood, Aloes, Co-loquintida, common Salt and Alum. Then these incisions, and all the passages and open places of the body, and the three bellies shall be stuffed with the following Spices grouly powdered. it Pulve rofar. chamem. melil. balfami, menthe, anethi, falvie, lavend. rorifmar. marjoran. thymi, abfynthii, esperi, calami aromat. gentiane, veos florent. affe odorate, caryophyll. nucis mofchat. cinnamomi, flyracis, calamite. benjoini, myrrhe, aloes, fantal. omnium quod fufficit. Let the incisions be fewed up, and the open spaces that pophing follows: they forthwish be started whether the incisions be fewed up, and the open spaces that pophing follows: ces that nothing fall out; then forthwith let the whole body be anointed with Turpentise diffolved with Oil of Roles and Camomil, adding, if you shall think it fit, forme Chymical Oils of Spices, and then let it be accounted to the control of the then let it be again strewed over with the fore-mentioned Powder; then wrap it in a linen cloth,

How to embalm bodies when as we want spices.

and then in Cere-cloths. Lastly, let it be put in a Coshin of Lead fure soldered and filled up with drie sweet herbs. But if there be no plenty of the fore-mentioned Spices, as it usually happens in belieged Towns, the Surgeon

fhall be contented with the powder of quenched lime, common alhes made of Oak-wood.

For thus the body being over and above washed in strong Vinegar or Lye, shall be kept a long time if so be that a great dissolving heat do not bear sway, or if it be not put in a hot and moist place.

And

And this condition of time and place is the cause why the dead bodies of Princes and Kings, though embalmed with Art and coit, within the space of fix or seven days, in which they are kept to be shewed to the people after their embalming, do cast forth so grievous a scent, that none can induce its so that they are forced to be put in a leaden Cossin. For the air which encompassed them groweth so hot by reason of the multitude of people showing to the spectacle, and the burning of lights night and day, that the small portion of the native heat which remaineth being dislipated, they easily putresse, especially when as they are not sufficiently used and macerated in the liquor of aromatick things, as the Egyptians anciently used to do, steeping them in brine for 70 days as I for they eatily putrefie, effectively used as they are not infit montened and macerated in the liquor of aromatick things, as the Egyptians anciently used to do, steeping them in brine for 70 days, as I formerly told you out of Hordow. I put in mind hereby, use, that so the embalming may become the more durable, to steep the bodies (being imbowelled, and pricked all over with tharp bodkins, that so the liquor hindering putrefaction may penetrate the deeper into them) in a wooden Tub filled with strong Vinegar of the decoction of aromatick and bitter things, as Aloes, Rue, Wormfilled with strong vinegar of the decoction of aromatick and bitter things, as Aloes, Rue, Wormfilled with strong vinegar of the decoction of aromatick and bitter things, as Aloes, Rue, Wormfilled with strong vinegar of the decoction of aromatick and bitter things, as Aloes, Rue, Wormfilled with strong vinegar of the decoction of aromatick and bitter things, as Aloes, Rue, Wormfilled with strong vinegar of the decoction of aromatick and bitter things, as Aloes, Rue, Wormfilled with strong vinegar of the decoction of aromatick and bitter things, as Aloes, Rue, Wormfilled with strong vinegar of the decoction of aromatick and bitter things, as Aloes, Rue, Wormfilled with strong vinegar of the decoction of aromatick and bitter things, as Aloes, Rue, Wormfilled with strong vinegar of the decoction of aromatick and bitter things, as Aloes, Rue, Wormfilled with strong vinegar of the decoction of aromatick and bitter things are decorated with the strong vinegar of the decoction of aromatick and bitter things. wood, and Coloquintida; and there keep them for twenty days, pouring thereinto eleven or twelve pints of Agus vite. Then taking it forth, and fetting it on the feet, I keep it in a clear and drie place. I have at home the body of one that was hanged, which I begged of the Sheriff, embalmed after this manner; which remains found for more than 25 years, to that you may tell all the muscles of the right side, (which I have cut up even to their heads, and plucked them from those that are next them for diffinctions fake, that so I may view them with mine eyes, and handle them with my hands as often as I pleafe, that by renewing my memory I may work more certainly and fürely, when as I have any more curious operation to be performed) the left fide remain whole, and the Lungs, Heart, Diaphragma, Stomach, Splene, Kidnies, Beard, Hairs, yex and the Nails, which being pared, I have often observed to grow again to their form and bigness.

And let this be the bound of this our immense labour, and by Gods favour, our rest; to whom Almighty, All-powerful, Immortal and Invisible, be ascribed all honour and glory for ever and ever:

Labor improbus omnia vincit.

The End of the Treatife of Reports, and Embalming the Dead.

BOOK XXIX.

The Apology and Treatife, containing the Voyages made into divers places, by Ambrose Parey of Laval in Maine, Counfellor and Chief Chirurgeon to the King.

Ruly I had not put my hand to the Pen, to write on fuch a thing, were it not that fome of what the have impudently injured, taxed, and more through particular liatred, diffraced me, than Adversary ac-for zeal or love they bear to the publick good; which was, concerning my manner of cufeth the Au-tying the Veins and Arteries, writing thus as followeth:

Male igitur & nunium arroganter inconfultus & temerarius quidam, vasorum tofionem post The words of emortui membri resectionem à veteribus omnibus plurimum commendatam & semper probatam damnare aussus the Adversa-est, novum quendam deligandi vasa modum, contra veteres omnes medicos, sine ratione, experientià & judicio docere cupiens, nec animadvertit majora multo pericula ex ipfa vaforum deligatione quam acu partem fadocere cupient, nec animadvertit majora multo pericula ex ipfa vaforum deligatione quam acui partem fanam profunde transfigendo administrari vult, imminere quam ex ipfa ustione. Nam si acu nervosam aliquam partem, vel nervosam ipsum pupugerit, dum si a novo & imssirato modo venam absurde conatur constringere, nova instammatio necessario consequeture, à qua Convulsio & à convulsione cita mors. Quarum
sum) quam musiculorum aponeuroses denudasses. Adde quod foreipes quibus post sessionem iterum carnem
dilacerat, cum retralia versus originem vasa se posse extrabere somana, non minorem adserant dolorem
quam ignita serramenta admota. Quod si quis laniatum expersus incolumis erasseri, is Deo optimo maximo, cujus benesicentia erudelitate ista & carnissicina liberatus est, maximas gratias habere & semper anero dobat; which is thus: Ili then, and too arrogantly a certain indiscreet and rash person would gere debet; which is thus: Ili then, and too arrogantly a certain indifferent and rath person would blame and condemn the cauterizing of Vessels after the amputation of a rotten and corrupted member, much praised and commended, and always approved by the Ancients; defining to thew member, much praifed and commended, and always approved by the Ancients; defiring to shew and teach us without Reason, Judgment, and Experience, a new way to tie the Vessels, against the opinion of the ancient Physicians, taking no heed, nor being well advised, that there happens far greater perils and accidents, through this new way of tying the Vessels (which he will have to be made with a Needle, piercing deeply the found part) then by the burning and ution of the faid Vessels; for if the Needle shall prick any nervous part, yea the Nerve it sels, when he shall by this new and reasons against the vessels way, absurdly constrain the vessels by binding it, there must need to be the new and reasons are successful to the selection of the selecti reflets; for if the Necole man price any factors part, yet the New Action in the main by this new and unaccuflomed way, abfurdly confirmin the vein by binding it, there must necessarily follow a new Inflammation; from the Inflammation a Convulsion, from a Convulsion, Death: for fear of which accidents, Galen never durft flitch transverfal wounds, (which notwithstanding were less dangerous) before he had discovered the Aponeuroses of the Muscles. Moreover the Pincers with which, after the fection, the fleth is again dilacerated, while he thinks to draw the Vetfels out which are drawn in toward their original, bring no lefs pain than the cautering irons do. And

if any one having experimented this new manner of cruelty have escaped danger, he ought to reuder thanks to Almighty God for ever, through whose goodness he hath been freed from such tyranny, feeling rather his executioner than his methodical Chirurgeon.

The Authors answer.

O what fweet words are here, for one who is faid to be a wife and learned Doctor? he remembers not that his white beard admonisheth him, not to speak any thing unworthy of his age, and that he ought to put off and drive out of him all envy and rancour conceived against his neighbour. So now I will prove by Authority, Reason and Experience, that the faid Veins and Arteries ought to

Anthorities.

S for Authorities, I will come to that of that worthy man Hippocrates, who wills and com-mands the cure of Fiftulaes in the Fundament by ligature, as well to confume the callofity, as to

avoid hemorrhagy. In the Book of Fifulaes of the Fundament, Chap. 3. Book 5. leaf 4.

Galen, Treatile 2. chap. 17 in his Method, fpeaking of a Flux of Bloud made by an outward cause, of whom fee here the words, It is (faith he) most fiere to tie the root of the Veffel, which I understand to be that which is most near to the Liver or the Heart.

Avicen, Treatife 3. Doch.1. chap. 3. commands to tie the Vein and the Artery, after it is discovered towards his original.

Guido of Cauliac, speaking of the wounds of the Veins and Arteries, injoineth the Chirurgeon to make the ligature in the Veffel.

Mafter Hollier in the 3. Book, chap. 4. of the matter of Chirurgery, speaking of a flux of bloud, commands expresly to tie the vessels.

Calmerbens in 12. chap, of the wounds in the Veins and Arteries, tells a most fure way to stay a flux of bloud by ligature of the Veffel.

Celfus, Chap. 26. Book. 5. from whom the faid Physician hath snatched the most part of his Book, chargeth expresly, to tie the Vessels in a flux of bloud happening to wounds, as a remedy most easier and most fure.

Vefalius in his Chirurgery, Chap.4. Book 3. willeth that the Veffel be tied in a flux of bloud.

John de Vigo, Book 1. Treatife 1. tteating of Hæmorrhagy in bleeding wounds, commands to tie

the Vein and the Artery. Tegaultius, Chap. 12. Book 2. treating of the means to flay the flux of bloud, commands to pinch

the Vein or Artery with a Crow or Parrots bill, then to tie it with a very strong thred. Peter of Argillata of Bullange, Treatife 4. Chap. 11. Book 1. discouring of a flux of bloud, and the

means to ftop it, giveth a fourth way exprefly, which is made by ligature of the Veffels.

John Andreas a Cruce, a Venetian, Book 1. Sect. 3. Chap. 16. Pag. 5. upon the 88 Chapter of the Book of Paul, makes mention of a method to flay a flux of bloud by the ligature of the Veffels.

D' Alechamp commands to tie the Veins and Arteries.

See then (my little good man) the Authorities which command you to tie the Veffels. As for

the Reasons, I will debate of them. The Hæmorrhagy (fay you) is not fo much to be feared in the section of the Kall, as that of the Varices, and the incilion of the temporal Arteries, as after the Amputation of a member. Now you your felf command that in cutting the Varices, the flux of bloud be flopped by the ligature of the Veffels. In the Book 2. Chap. of Angealogy, leaf 176, you command the fame in the Book of Stitches, Chap. 1. Speaking of the slitch with the amputation and section of the Kall, changed by the outward air; fee here your own words: After that must be considered concerning the Kall: for if there be any part corrupted, putrefied, withered, or blackish: first having tied, for fear of a flux of bloud, you do not bid afterwards to have it cauterifed. But to fay the truth, you have your eyes thut, and all your fenfes dulled, when you would fpeak against fo fure a method, and that it is not but through anger and an ill will. For there is nothing which hath more power to drive Reason from her seat, than Choler and Anger. Moreover when one comes to cauterize and difmember the parts, oftentimes when the Eschar comes to fall off, there happens a new flux of bloud: As I have feen divers times, not having been yet inspired by God, with so fure a means then when I used the heat of fire. Which if you have not found, or understood this method in the Books of the Ancients, you ought not thus to tread it under your feet, and speak unluckily of one, who all his life hath preferred the profit of the Common-wealth before his own particular. It is not more Gales in Book than reasonable to be found upon the saying of Hippocrates, in the Chapter of Burning, Book 2. Leat 4-of the Mrth. 206. upon whose Authority you serve your felf, which is thus. That what the medicament cureth not, the iron doth; and what the iron doth not amend, the fire exterminateth: It is a thing which favours, not of a Christian, to fall to burning at the first dash, without staying for any more gentle Aph. 2.Book 1, remedies. As you your felf write in the first Book, leaf 5, speaking of the conditions required in a In the Book of Chirurgeon to cure well; which paffages you borrow from fome other place: for that which may be done gently without fire, is much more commended than otherwife. Is it not a thing which all

and in the Book of Art Arte Panue.

> Let us come to Reason. Ow fo it is, that one cannot apply hot irons but with extreme and vehement pain in a fentible part void of a Gangrene, which would be cause of a Convulsion, Fever, yea, oft-times of Death. Moreover it would be a long while afterwards before the poor Patient were cured, because that by the action of the converse of the conver because that by the action of the fire there is made an eschar, which proceeds from the subject fleth, which being fallen, Nature must regenerate a new fleth in stead of that which hath been burned; as also the bone remains discovered and bare; and by this means, for the most part there re-

> Schools hold as a Maxim, that we must always begin with most easie rendies, which if they be not sufficient, we must then come to extreme, following the doctrine of Hippocrates? Gales commands in the place before alledged, to treat or dress the diseased quickly, sately, and with the least pain that is notified.

Of what the Eschar is quade.

pain that is possible.

mains an ulcer incurable. Moreover there is yet another accident. It happeneth that oftentimes the cruft being fallen off, the flesh not being well renewed, the bloud iffueth out as it did before. But when they shall be tied, the ligature falls not off until the first flesh have very well covered them again: which is proved by Galen in the fifth Book of his Meth. faying, that Elcharotick Medicins which cause a Crust or Eschar, whensoever they fall off, scave the part more bare than the natural hawhich cause a Crust or Eschar, whentoever they tall on, leave the part more pare than the natural na-bit requires. For the generation of a crust proceeds from the parts subject, and which are fituate round about it, being also burned, as I may say: wherefore by how much the part is burnt, by so much it loseth the natural heat. Then tell me when it is necessary to use escharotick Medicins, or Words of the cautering irons? 'Tis when the flux of bloud is caused by crosson, or some gangrene or putrefa- Adversary, chion. Now is it thus? in fresh bleeding wounds there is neither gangrene, nor putrefaction. Therefore, the cauteries ought not to be there applied. And when the Ancients commanded to apply hot irons to the mouths of the veffels, it hath not been onely to flay the flux of bloud, but chiefly to correct the malignity, or gangrenous putrefaction which might spoil the neighbouring parts. And it must be here noted, that if I had known such accidents to happen, which you have declared in your Book, in drawing and tying the vessels, I had never been twice deceived; nor would I ever have left by my writings to posterity, such a way of stopping a flux of bloud. But I writ it after I had seen it done, and did it very often with happy success. See then what may happen through your inconsiderate counsel, without examining, or itanding upon the facility of tying the faid vessels. For see, here is your scope and proposition, to tie the vessels after amputation is a new remedy, say you, then it must not be used; it is an ill argument for a Doctor.

But as for that (fay you) one must use fire after the amputation of members, to consume and Propositiona drie the putrefaction, which is a common thing in gangrenes and mortifications, that indeed hath of the Adver-no place here, because the practice is to amputate the part above that which is mortified and corrupted; as Celfis writes and commands, to make the amputation upon the fecond part, rather than to leave any whit of the corrupted. I would willingly ask you, if when a vein is cut transverse, and In Book 5. ch. that it is very much retracted towards the original, whether you would make no conscience to 26, and Book that it is very much retracted towards the original, whether you would make no confcience to 26, and Book burn till that you had found the orifice of the vein or artery; and if it be not more easie onely 7-ch.33, with a Crow-bill to pinch and draw the veifel, and so tie it? In which you may openly shew your ignorance, and that you have your mind seized with much rancor and choler. We daily see the ligature of the veifels practifed with happy success, after the amputation of a part, which I will now verifie by Experiences and Histories, of those to whom the said ligature hath been made, and persons 2.

yet living.

The 16. of June 1582. In the prefence of Mr. John Liebaud Doctor in the Faculty of Phylick at Experiences.

Parit, Claud Visrd (worn Surgeon, Mr. Mathurin Huran Surgeon of Monlieur de Souvray, and my felf, A notable liiJohn Charbonel Mafter Barber-Surgeon of Paris, well understanding the Theorick and Practick of story.

Surgery, did with good dexterity amputate the left leg of a Woman tormented the space of three years with extreme pain, by reason of a great Caries which was in the bone Astragal, Ceboides, great years with extreme pain, by reason of a great Caries which was in the bone. Altragal, Ceboides, great and little foel, and through all the nervous parts, through which the felt extreme and intolerable pains night and day: the is called Mary of Hostel, aged 28 years or thereabouts, wife of Peter Horse Esquire of the Kitchin to the Lady Duebess of Uzez, dwelling in the street of Verbass, on the other side St. Marin in the Fields, dwelling at the sign of the St. Johns head; where the said Charbonel cut off the said leg the bredsh of four large singers below the Knee, and after that he had incided the sich, The operation and sawed the bone, he griped the vein with a Crow-bill, then the artery, then tied them; from of charbonel. whence I protest to God (which the company that were there can witness) that in all the operation that was fuddenly done, there was not spilt one Porrenger of blond; and I bid the faid Charbonel to let it bleed more, following the precept of Hipperates, that it is good in all wounds and invete-rate ulcers, to let the bloud run; by this means the part is lefs fubject to inflammation. The taid of the Book of Charbonel continued the dreffing of her, who was cured in two moneths, without any flux of Ulcers, bloud happening unto her, or other ill accident; and she went to see you at your lodging being per-

Another History of late memory, of a Singing-man of our Ladies Church, named Mr. Colt, who Another History broke both the bones of his leg which were crushed in divers pieces, informach that there was no flory.

Hope of cure, to withstand a Gangrene and mortification, and by confequence death. Monsteur Helin Doctor Regent in the Faculty of Phylick, a man of hopour and good knowledge, ClandViard and Simon Peter, twom Surgeons of Parir, men well exercised in Surgery; and Balthazar of Lestre, operation and Leonard de Lestresal, Matter Barber-Surgeons, well experimented in the operations of Surgery, done by Viard were all of opinion, to withstand the accidents aforesaid, to make entire amputation of the whole leg, a little above the broken and shivered bones and the torn nerves, veins, arteries; the operation was nimbly done by the said Viard, and the bloud stanched by the ligature of the vessels in the presence of the said Helin, and Mr. Tonsard great Vicar of our Ladies Church, and was continually dressed by the said Lesebenal, and I went to see him otherwhiles: he was happily cured without the application of hot irons, and walketh luftily with a wooden leg.

In the year 1583, the 10. day of December, Touffiant Poffon born at Ronieville, at this prefent Another Hidwelling at Beauvair near Dourdan, having his leg all ulcered, and all the bones cariez'd and rot-flory. ten, prayed me for the honour of God to cut off his leg, by reason of the great pain, which he could no longer endure. After his body was prepared, I caused his leg to be cut off, four fingers below the results of his knee, by Daniel Powlet one of my fervants, to teach him, and to embolden him in fuch works; and there he readily tied the veffels to flay the bleeding, without application of hot irons, in the prefence of James Guilleman ordinary Surgeon to the King, and John Charbonel Materials. fier Surgeon of Paris: and during the cure was visited by Mr. Laffile and Mr. Courtin, Doctors Regent in the Faculty of Medicin at Paris. The faid operation was made in the house of John Gabel Inn-keeper, dwelling at the fign of the White Horse in the Greve. I will not here forget to say, the Nnn3

Hanning the real of the least

Another Hi-

the Lady Princess of Montpenfier, knowing that he was poor and in my hands, gave him money to pay for his Chamber and Diet, He was well cured, God be praifed, and is returned home to his house with a woodden leg.

A Gangrene happening by an Anticedent canic.

A Gangrene happened to half of the leg, to one named Nicolas Mefinager, aged 76 years, dwelling in St. Hamerer fireet, at the fign of the Basket, which happened to him through an inward cause, so that we were conftrained to cut off his leg to fave his life: and it was taken off by Anthony Renaud, Mafter Barber-Surgeon of Paris, the 16. day of December 1583. in the prefence of M. Le Fort, and M. La Nave, fwom Surgeons of Paris; and the bloud was franched by the Ligature of the Veifels, and he is at this prefent cured and in health, walking with a woodden leg A Water-man at the Port of Nefle, dwelling near Monfieur de Mas, Post-master, named John Boof-

fereau, in whose hands a Musket brake asunder, which broke the bones of his hand, and rent and

Another Hiflory.

Operation done by Guilleman.

tore the other parts in fuch fort, that it was needful and necessary to make amputation of the hand two fingers above the wrift: which was done by James Guilleman, then Surgeon in ordinary to the King, who dwelt at that time with me. The operation likewise being readily done, and the blond flanched by the ligature of the veffels, without burning irons, he is at this prefent living. A Merchant Grocer dwelling in St. Denis fireet at the fign of the great Tournois, named the Judge,

Another Hiflory. Operation done by the Author.

who fell upon his head, where was made a wound near the temporal muscle, where he had an artery opened, from whence iffued forth bloud with great impetuolity, infomuch that common remedies would not ferve the turn ; I was called thither, where I found Mr. Ruffe, Mr. Cointeret, Mr Viard, Iwom Surgeons of Paris, to flay bloud; where prefently I took a needle and thred and tied the artery, and it bled no more after that, and was quickly cured. Mr. Roffeller can witness it, not long fince Deacon of your Faculty, who was in the cure with us.

Another Hiftory. Another operation.

A Serjeant of the Chaftlet dwelling near St. Andrew des Arts, who had a firoke of a Sword upon the throat in the Clacks Meadow, which cut afunder the jugular vein extern: as foon as he was hurt he put his handkerchief upon the wound, and came to look me at my house, and when he took away his handkerchief, the bloud leaped out with great impetuolity: I fuddenly tied the vein toward the manner of flanching bloud by cauteries, I leave it to be fupposed whether he had been cured; I think he had been dead in the hands of the Operator. If I would recite all those whose veffels were tied to flay the bloud, which have been cured, I should not have ended this long time; so that methinks there are Histories enough recited to make you believe the bloud of veins and arteries is furely flanched without applying any outward cauteries.

DE BATTAL

He that doth strive against Experience, Deigns not to talk of any learned Science.

Book 6,c.4. Book 2, 0.4. Book 3, c.9. Seft.7.

Ow my little Mafter, feeing that you reproach me that I have not written all the operations of Surgery in my Works, which the Ancients write of, I should be very forry for it: for then indeed might you justly call me Garafex. I have left them because they are too cruel, and am willing to follow the Moderns, who have moderated fuch cruelty: which notwithstanding you have followed flep by flep, as appeareth by the operations, here written, extracted from your Book, which you have drawn here and there from certain ancient Authors, fuch as follow, and fuch as you have never practifed nor feen.

In the fecond Book of the Chapter of Hypopatife, Book 4. ch. laft of the In the 4. ch. of the 16.Book of my Work. Book 6.c.7. Book 1.c. c

The First Operation. O inveterate fluxions of the Eyes, and Meagrims, Paulus Ægineta as also Albucasis command to make Arteriotomy; see here the words of the same Æginete. You mark the arteries which are behind the Ears, then divide them in cutting to the very bone, and make a great incition, the bredth of two fingers, even till the artery be found, as you command to be done in your Book; but I holding the opinion of Galen, who commands to drefs the difeafe quickly, fafely, and with the least pain that is pollible; I teach the young Surgeon the means to remedy fuch evils in opening the arteries behind the ears, and those of the temples, with one onely incision, as a letting bloud, and not to make a great incision, and cut out work for a long time.

In the 2. Book chap of Parifrythifm.

The Second. O Fluxions which are made a long time upon the Eyes, Paul Æginete and Albucafis command to make incition, which they call Perifeyahifmus or Auginlogy of the Greeks; and fee here the words of Paul: In this Operation first the bead is soaved, then taking beed of touching the temporal muscles, a transfeerse incision must be made, beginning at the left temple, and finishing at the right; which you have put in your Book word for word, without changing any thing: which sheweth openly you are a right. We must be the part of the word of the word of the word of the word. right Wound-maker, as may be feen in the Chapter which you call the Crown-cut, which is made In the 26, ch, half round under the Coronal future from one temple to another, even to the bone. Now I do not Book teach fuch a cruel kind of remedy, but infiruct the Operator by Reafon, Authority, and notable proof of my Works, of a fure and certain way to remedy fuch affections without butchering men in this kind.

The third. IN the cure of Empyena, Paul Æginete, Albucafis and Celfius commanded to apply fome thirteen, Eook 6, ch-44. Others fifteen Cauteries to give iffue to the matter contained in the breft, as the faid Celfius in the Eook 2, ch. 3. aforefaid place appointeth for Afthmatick people, which is a thing out of all reason (with respect to their bonce has a forefaid place appointeth for Afthmatick people, which is a thing out of all reason (with respect Book 3.ch, 22. to their honor be it spoken) that fince the Surgeons scope is to give iffue to the matter therein contained, there is no other quellion then to make apertion, to evacuate the matter in the most inferiour part, I have thewed the young Surgeon the means to do it fafely, without tormenting the Patients for nothing.

The Fourth Operation.

N Paps that are too great, Paul Eginet and Albucafis commands to make a crofs-incidion, to take Gaido of Casout all the fat, and then join together the wound by flitch: in brief, it is to flay a man alive, list the 2. which I have never practifed, nor counfel it to be done by the young Surgeon.

The Fifth Operation Librafis and Paul Agines will cauterize the Liver and the Splene with hot irons, which the Modenis have never practifed; for indeed Reason is manifestly repugnant thereunto. The Sixth Operatio

N the Paracentefis which is made in the third kind of Droplie called Afeites, Celius Ascelianus commandeth diverse apertions to be made in the belly. Albueafis applies nine actual Cauteries, b.2. c.32. b.6. that is to fay, four about the Navel, one upon the Stomach, and one upon the Splene, one upon the c.47, and 48. Liver, two behind the Spondyls, one of them near the breft, the last near the Stomach. Atias is In the 5. book likewife of the fame opinion, to open the belly with diverse cauteries. Paul Æginet commands to ch.1. De litterapply five actual cauteries to make the faid Paraeutefir. But abborring fuch a kind of burning, of the which you fpeak much in your third Book. I thew another kind of practice, the which is done by making a fimple incition in the faid belly, as may be feen in my Works, with happy fuccets, I do not teach young men in my Works the manner of burning, which the Ancients have called infibulare, that is not in practice, though Celfia writeth of it. that is not in practice, though Celfus writeth of it.

The Seventh Operation, N the Sciatick proceeding from an internal caufe, and because the viscous humours displace the In the 7. look bones, P. and commands to burn or canterize the faid joint to the bone: Disferrides commands c.25, book 6, the fame, which I do not find expedient, taking indication from the fabjacent parts: for there where c.76, book 2. one would burn, it is in the place of four twin-mufcles, under which paffeth the great nerve defcendone would burn, it is in the place of four twin-mulcies, under which paffeth the great nerve deteending from the Holy-bone; which being burnt I leave it to your centure what might happen, as Galen

Ladder, the arms and legs tied and bound: then afterwards having raifed the Ladder to the ton of the tensor the Ladder, the arms and legs tied and bound : then afterwards having raifed the Ladder to the top of 22, and 22, a Tower, or the ridge of an house, with a great rope in a pully, then to let the Patient fall plumb down upon the hard pavement; which Hippocrates fays was done in his time. But I do not thew of any fuch way of giving the Strapado to men; but'I shew the Surgeon, in my Work, the way to reduce them furely, and without great pain. Moreover I should be forry to follow the faying of the faid Hippocrates, in the third Book De Morbis, who commands in the disease called Volvulus, to cause the belly to be blown with a pair of Bellows, putting the nosel of them into the intestimum reclium, and then blow there till the belly be much firetched, afterwards to give an emollient Clylier, and to flop the Fundament with a Sponge. Such practice as this is not made now adays, therefore won-der not if I have not fpoken of it. And you not being contented to patch together the operations of the abovefaid Authors, you have also taken divers in my Works, as every man may know: which sheweth manifestly that there is nothing of your own in your Surgrous Guide, I leave out divers other unprofitable operations which you quote in your Book, without knowing what Beafts they are, in never having feen them practifed; but because you have found them written in the Books of the Ancients, you have put them into your Book.

Moreover you say that you will teach me my leffon in the operations of Surgery, which I think you cannot do: because I have not onely learned them in my study, and by the hearing of many years the lesions of Doctors of Phylick: but as I have faid before in my Epistle to the Reader I was relident the space of three years in the Hospital of Paris, where I had the means to use and learn divers works of Surgery, upon divers Difeafes, together with the Anatomy, upon a great number of dead bodies, as oftentimes I have fufficiently made trial publickly in the Phylicians School at Paris, and my good luck hath made me feen much more. For being called to the fervice of the King of France, (four of which I have ferved.) I have been in company at Battles, Skirmilhes, Affaults and Befieging of Cities and Fortreffes; as also I have been that up in Cities with those that have been befieged, having charge to dress those that were hurt. Also I have dwelt many years in this great and famous City of Paris, where (thanks be to God) I have lived in very good reputation amongst all men, and have not been electmed the least in rank of men of my Protestion, seeing there was not any cure, were it never so difficult and great, where my hand and my counsel have not been required, as I make it appear in this my Work. Now dare you (these things being underftood) fay you will teach me to perform the works of Surgery, fince you never went further than your fludy? The operations of the fame are four in general (as we have declared heretofore) where you may make but three; that is to fay, join that which is feparated, feparate that which was conjoined, and to take away that which was superfluous, and the fourth which I make, is as much necessary, an industrious invention to add to Nature that which is wanting, as I have thewed here above. Also it is your will that the Surgeon make but three operations above-said, without medling to ordain a simple Cataplasm, saying it is that which comes to your part belonging to the Phylician. And that the Ancients (in the discourse which you have made to the Reader) have divided the practice of Phylick into three kinds, that is to fay, Diet, Medicin, and Chirurgery. But I would willingly demand of you, who hath made the partition, and where any thing should be done? who are those which are content with their part, without any enterprise upon the other? For Hippocrates, Galen, Asicen, in brief, all the Phylicians, as well Greeks and Latins as Arabians, have never fo treated of the one, that they have not treated of the other, for the great affinity and tie that there is between them two, and it should be very difficult to do otherwise. Now when you will vilifie Chirurgery fo much, you speak against your felt; for in your Epistle you have dedicated to Monsieur Marignes, you say, that Chirurgery is the most noble part of Physick, as well by

46. book 2. c.

fection of the ents, c.16.of

reason of the original antiquity, necessity, as certainty in her actions; for the works Luce aperta, as learnedly writeth Celsias in the beginning of the Seventh Book; therefore it is to be believed you never went out of your Study, but to teach Theorick (if you have been able to do it.)

A fair fimili-

The operations of Chirurgery are learnt by the eye, and by the touch. I will fay that you much refemble a young Lad of Low-Britany, of plum buttocks, where was fuff fufficient, who demanded leave of his Father to come to Paris, to take France; being arrived, the Organist of our Ladies Church met with him at the Palace-gate, who took him to blow the Organs, where he was remaining three years:he faw he could fornewhat speak French, he returns to his Father, and told him that he spake good French, and moreover he knew well to play on the Organs: his Father received him very joy-fully, for that he was fo wife and learned in a thort time. He went to the Organist of their great Church, and prayed him to permit his Son to play on the Organs, to the end he might know whether his Son was become fo skilful a Mafter as he faid he was; which the Organist agreed to very willingly. Being entered to the Organs, he cast himself with a full leap to the Bellows; the Master Organist bid him play, and that he would blow: then this good Master answers, Let him play himself on the Organist bid him play, and that he would blow: then this good Master answers, Let him play himself on the Organist for would for him, he could do nothing but play on the Bellows. I think also, my little Master, that you know nothing else, but to prattle in a chair; but I will play upon the Keys and make the Organis found: (that is to say) I will do the operations of Chirurgery, that which you cannot in any wife do, because you have not gone from your Study or the Schools, as I have said before. But also as I have said already in the Epistle to the Reader, that the Labourer doth little profit by talking of the Seasons discourse of the manner of tilling the Farth, to the way what Seasons are proved. talking of the Seafons, discourse of the manner of tilling the Earth, to shew what Seeds are proper to each foil; all which is nothing if he put not his hand to the Plough, and couple the Oxen together. So likewife it is no great matter if you do not know the Pradicks for a man may execute Chirurgery well, although he have no tongue at all. As Cornelius Celfus hath very well remarked in his first Book, when he faith, Morbos non eloquentia, sed remedin curari, que si quis elinguis, usu discretus bene norit, hune aliquanto majorem medicum futurum quam si sine usu linguam suam excoluerit; that is to fay, Difeases are not to be cured by Eloquence, but by Remedies well and duly applied, which if any wife and different man though he have no tongue, know well the use thereof, this man in time shall become the greater Physician, than if without practice his tongue were dipt with Oratory, the which you your felf confess in your faid Book by a Tetrastich which is thus:

> To talk's not all in Chirargions Art, But working with the hands; Aprly to dreß each grieved part, And guide fire, knife, and bands.

Arifistle in the first Book of his Metaphysicks, the first Chapter, saith, Experience is almost like unto Science; and by the same, Art and Science have been invented. And indeed we see these which are experimented, attain sooner to that which they intend, than those which have Reason and not Experience, because that the said Experience is a knowledge of singular and particular things; and Science on the contrary, is a knowledge of things universal. Now that which is particular is more healable than that which is universal; therefore those which have Experience are more wise and more effectined, than those which want it, by reason they know what they do. Moreover I say, that Science without Experience, bringeth no great affurance.

Alcint, a Doctor of Milan, boafted one day of himfelf, that his glory was greater and more famous than that of Counfellors, Prefidents, Mafters of Request, because that it was by his Science and his Instructions that they became such: but he was answered by a Counfellor, that he was like unto a Whetstone, which made the Knife sharp and ready to cut, not being able so to do it it selfs and al-

ledged the Verses of Horace, that,

Fungebatur vice cotis acutum Reddere qua ferrum valet, excors ipfa secandi.

See you now (my little Mafter) my answers to your calamniations, and pray you, if you bear a good mind (to the publick good) to review and correct your Book, as foon as you can, and not to hold young Chirurgeons in this errour by the reading of the fame, where you teach them to use hot irons after the amputation of members, to stay a flux of bloud, seeing there is another means and not so cruel, and more sure and casie. Moreover if to day after an assault of a City, where divers Souldiers have had arms and legs broken and shot off by Cannon-bullets, Cutlas and other inframments of War, to stay the flux of bloud, if you should use hot irons, it would be needful to have a Forge, and much Coals to heat them: and also the Souldiers would hold you in such horrour for this cruelty, that they would kill you like a Calf, even as in times past they did one of the chiefest Chirurgeons of Rame, which may be found written before, in the third Chapter of the Introduction of Surgery, the first Book. Now left the Sectators of your writings should fall into such inconveniency, I pray them to follow the method aforesaid, the which I have shewed to be true and certain, and approved by Authority, Reason, and Experience.

The Voyage of Thurin, 1535.

Oreover I will here shew to the Readers the places where I have had means to learn the Art of Surgery, for the better instructing of the young Surgeon: and first in the year 1536, the King of France sent a great Army to Thurin, to recover the City and Castles which the Marquess of Guast, Lieutenant-General of the Emperour, had taken: where the High Constable of France the Great Master, was Lieutenant-General of the Army, and Monsieur de Montain Colonel-General of the Foot, of which I was then Surgeon. A great part of the Army arrived in the Country of Suzzes

~ 111

we found the Enemy which flopt the paffage, and had made certain Forts, and Trenches, informuch that to hunt them out and make them leave the place, we were forced to fight, where there were divers hurt and flain, as well of the one fide as of the other; but the enemies were confirmined to retire, and get into the Cafile, which was caused partly by one Captain Ratt, who climed with divers The retiring Souldiers of his company upon a little Mountain; there where he shot directly upon the enemies, he received a fhot upon the ancle of his right foor, wherewith prefently he fell to the ground; and faid then, Now is the Ratt taken. I dreffed him, and God healed him. We entered the throng iuto the City, and paffed over the dead bodies, and fome which were not yet dead; we heard them cry tander our Horfes feet, which made my heart relent to hear them. And truly I repented to have forfaken Paris to fee fuch a pitiful spectacle. Being in the City, I entered into a Stable thinking to lodge my own, and my mans horse, where I found four dead Souldiers and three which were leaning against the wall, their faces wholly distigured, and neither faw nor heard, nor spake; and their clothes did yet flame with Gun-powder which had burnt them. Beholding them with pitty, there happened to come an old Souldier who asked me if there were any possible means to cure them's I told him no: he prefently approached to them, and cut their throats without choler. Seeing this great cruelty I told him he was a wicked man; he answered me that he prayed to God, that whenfoever he should be in such a case, that he might find some one that would do as much to him, to the end he might not miscrably languish. And to return to our former discourse, the enemy was summoned to render, which they soon did, and went out, their lives only saved, with a white staff in their hands; the greatest part whereof went and got to the Castle of Villane, where there was about 200 Spaniards; Monfieur the Confiable would not have them behind, to the end that the way might be made free. This Cafile is feated upon a little mountain, which gave great affurance to them within, that one could not plant the Ordnance to beat upon it, and they were furnmoned to render, or that they should be cut in pieces; which they starly refused, making answer, That they were as faithful fervants to the Emperor, as Manufester the Constable could be to the King his Brave answer Master. This answer heard, they made by torce of arms; two great Cannons to be mounted in the of the Sournight with cords and ropes, by the Swissers and Lanfquenets, when as the ill luck would have it, diers. the two Cannons being feated, a Gunner by great negligence fet on fire a great bag of gun-powder, wherewith he was burned together with ten or twelve Souldiers; and moreover the flame of the powder was a cause of discovering the Artillery, which made them, that all night they of the Castle did nothing but shoot at that place where they discovered the two pieces of Ordnance, wherewith they killed and hurt a great number of our people.

The next day early in the morning a Battery was made, which in a few hours made a breach, which being made, they demanded to parly with us; but twas too late for them for in the mean time our French foot feeing them amazed, mounted to the breach, and cut them all in pieces, except a fair young lufty Maid of Piedmont, which a great Lord would have kept and preferved for him to keep him company in the night, for fear of the greedy Wolf. The Captain and Enfign were taken alive, but foon after were hanged upon the gate of the City, to the end they might give exam-ple and fear to the imperial Souldiers not to be for afh and foolish, to be willing to hold such places punishment. against so great an army. Now all the faid Souldiers of the Cassle, seeing our people coming with a most violent fury, did all their endeavor to defend themselves, they killed and hurt a great company a most violent tary, and an their endeavor to detend themselves, they killed and burt a great company of our Souldiers, with Pikes, Muskets, and Stones, where the Surgeons had good flore of work cut out. Now at that time I was a fresh-water Souldier, I had not yet seen wounds made by gun-shot at the first dressing. It is true, I had read in John de Vigo, in the First Book of wounds in General Counsel of the eight Chapter, that wounds made by weapons of fire did participate of Venenosity, by reason Vigo. of the Powder, and for their cure he commands to cauterize them with oyl of Elders scalding-hot, and the privated a little Treach and not to fail before I would apply of the fail and in which should be mingled a little Treacle, and not to fail, before I would apply of the faid oyl knowing that fuch a thing might bring to the patient great pain, I was willing to know first, before I applied it, how the other Surgeons did for the first dressing, which was to apply the said oyl, the hottest that was possible, into the wounds, with Tents and Setons; infomuch that I took courage to do as they did. At last I wanted oyl, and was constrained in stead thereof, to apply a digeflive of Yolks of Eggs, Oyl of Rofes, and Turpentine. In the night I could not fleep in quiet, fearing fome default in not cauterizing, that I should find those to whom I had not used the burning Experience of oyl, dead impoyfoned; which made me rise very early to visit them, where beyond my expectation, a bold mans I found those to whom I had applied my digestive medicin, to feel little pain, and their wounds happy sheees without inflammation or tumor, having rested reasonable well that night: the other to whom was used the said burning-oyl I sound them severish, with great pain and tumor about the edges of their wounds. And then I refolved with my felf, never to cruelly to burn poor men wounded with gunfhot. Being at Thurm, I found a Surgeon, who had the fame above all others for the curing of wounds of gun-flot, into whose favor I found means to infimuate my felf, to have the Receit of his Balm, as he called it, wherewith he dreffed wounds of that kind, and he held me off the space of two years, before I could possible draw the Receit from him. In the end by gifts and presents he gave it me, which was this, To boil young whelps new pupped, in oyl of Lillies, prepared Earth-worms, with Receit of an which was this, To boil young when pupped, in oylor Lines, prepared Earth-Worlds, with Receit of an Turpentine of Venice. Then was I joyful and my heart made glad, that I had underflood his remedy, excellent which was like to that which I had obtained by great chance. See then how I have learned to drefs balm for wounds made with gun-floot, not by Books. My Lord Marthal of Montain remained Lieutenant-wounds with gun-floot, having ten or twelve thousand men in Garrison through the Crisis General for the King in Piedmont, having ten or twelve thousand men in Garrison through the Cities and Caffles, who often combated with Swords and other weapons, as also with Muskets; and if there were four hurt, I had always three of them; and if there were question of cutting off an arm or a leg, or to trepan, or to reduce a fracture or diflocation, I brought it well to pass. The faid Lord Marthal fent me one while this way, another while that way, for to drefs the appointed Souldiers which were beaten as well in other Cities as that of Thurin, informach that I was always in the

Dances of the Countrey Wenches. Wrefilers. Linle Britain a good Wrefiler.

The little Eri-

The body opened by the Author,

Forest which marched upon the Sea. Ifaw a thing also whereat I marvelled much, which was, that the bullets of great pieces made great rebounds, and grazed upon the water as upon the ground-Now to make the matter thort, the English did us no harm, and returned whole and found into England, and left us in peace. We staid in that Countrey in Garrison, till we were affored that their Army was dispersed. In the mean time our Horsemen exercised their feats of activity, as to run at the Ring, right in Duel, and others; fo that there was fill fomething to imploy me withal. Mounficur De Estampes, to make sport and pleasure to the faid Mountieur De Roban and Laval, and other Gentlemen, caused divers Countrey Wenches to come to the Feasts, to sing songs in Low Britain Tongue, where their harmony was like the croaking of Frogs, while they are in love. Moreover he made them dance the Britany Triory, without moving Feet or Buttocks; he made them hear and fee much good. Otherwhiles they caufed the Wraftlers of the Cities and Towns, to come where there was a Prize for the best, and sport was seldom ended, but that one or other had a leg or arm broken, or the shoulder or hip displaced: there was a little man of Lew Britany of a square body and well fet, who held a long time the credit of the Field, and by his skill and tirength, threw five or fix to the ground; there came to him a great Schoolmaster, who was faid to be one of the best Wrestlers of all Britany: he entered into the Lifts, having taken off his long Jacket, in Hole and Doublet, and being near the little man, he feemed as if he had been tied to his girdle. Notwithstanding when each of them took hold of the Gollar, they were a long time without doing any thing, and they thought they would remain equal in force and skill: but the little man cast himself with an ambling leap under this great Pedant, and took him on his shoulder and east him on his kidnies spread abroad like a Frog, and then all the Company laught at the skill and strength of the little Fellow. This great Datree had a great fpight, for being cast by so little a man: he rose again in choler, and would have his revenge. They took hold again of each others collar, and were again a good while at their hold without falling to the ground: in the end this great man let himself fall upon the little, and in falling, put his elbow upon the pitch of his fromach, and burft his heart, and killed him frank dead. And knowing he had given him his deaths blow, took again his long Caffock, and went away with his tail between his legs, and hid himfelt, feeing that the little man came not again to himself, either for Wine, Vinegar, or any other thing that was presented unto him; I drew near to him, and selt his pulse which did not beat at all, then I said he was dead: then the Britans who affifled the Wreftling, faid aloud in their jabbering. That is not in the fort. And fome faid that the faid Pedagogue was accustomed to do so, and that but a year pass he had done the like in a Wrestling. would needs open the body to know the cause of this sudden death, where I found much bloud in the Thorax, and in the inferiour belly, and I strived to find out any apertion in the place, from whence might iffue fo great a quantity of bloud, which I could not do for all the diligence I could make. Now I believe it was per Diapedesin, or Anastomosia, that is to say, by the apertion of the mouths of the vessels, or by their porolities: the poor little Wrestler was buried. I took leave of Messearch

Roban, de Laval, and Estamps. Mountieur de Roban gave me a present of fifty double Duckets, and an ambling Horse, and Mountieur de Laval another for my Man, and Mountieur de Estamps, a Diamond of thirty Crowns, and fo I returned to my house at Paris.

The Voyage of Perpignan, 1542.

Little while after Mounfeur de Roban took me with him Post to the Camp of Perpignan; being there, the Enemy made a Sally forth, and came and inclosed three pieces of our Artillery, where they were beaten back to the Gates of the City: which was not done without hurting and killing many, and amongst the rest de Briffac, (who was then chief Master of the Artillery) received a Musket (hot upon the (houlders, returning to his Tent; all the others that were hurt followed him, hoping to be dreft by the Surgeons that ought to drefs them. Being come to his Tent and laid on his bed, the bullet was fearched for by three or four the most expert Surgeons of the Army, who could not find it, but faid it was entered into his body.

In the end he called for me, to see if I were more skilful than they, because he had known me be-Address of the fore in Piedmont: by and by I made him rife from his bed, and prayed him to put his body into that Author. posture as it was when he received his hurt; which he did, taking a Javelin between his hands as he held the Pike in the skirmish. I put my hand about the wound, and found the bullet in the flesh, making a little tumor under the Omphate: having found it, I showed them the place where it was, and it was taken our by Master Nielelas Lavernant, Surgeon to Mounsieur the Dalphia, who was the

Kings Lieutenant in that Army, yet notwithfianding the honour remained to me for finding it.

I faw one thing of great remark, which is this: That a Souldier in my prefence gave to one of An Hiffory.

his fellows a firoke with an Halbard upon the head, penetraing even to the left ventricle of the brain, without falling to the ground. He that firook him faid, he had heard that he cheated at Dice, brain, without falling to the ground. Fre that intoo unit raid, he had heard that he cheated at Dice, and that he had drawn a great fum of money, and that it was his cuftom to cheat. I was called to drefs him, which I did as it were for the laft, knowing well that he would quickly die: having dreft him, he returned all alone to his Lodging, which was at leaft two hundred paces diffant: I bid one of his companions fend for a Prieft to dispose of the affairs of his foul: he helped him to one who flaid with him to the last gasp. The next day the Patient sent for me by his She-friend in a Boys apparel to come to dress him, which I would not do, searing he should die under my hands a and to appared to come to dress nin, which I would not take off the drefting till the third day, by reason he would die though he were never touched. The third day he came staggering, and found me in my Tent accompanied with the Wench, and prayed me most affectionately to dress him, and shewed me a Purse wherein he had an hundred or fix fcore pieces of Gold, and that he would content me to my defire; for all that, yet notwithstanding I left not off to defer the taking off his dressing, fearing, left he should die at the same instant. Certain Gentlemen desired me to go dress him, which I did at their request, but in drefling him he died under my hands in a Convultion. Now this Priest accompanied him until death, who seized upon the Purse, lest another should take it, saying, he would say Masses for his foul. Moreover he furnished himself with his cloaths and with all the rest of his things. I have recited this History as a monstrous thing that the Souldier fell not to ground when he had received this great stroke, and was in good senses even till death. Soon after the Camp was broken for divers causes; the one because we were advertised that sour Companies of Spaniards were entered into Perpignan; the other, that the Plague begun much in our Camp, and it was told us by the People of the Country, that thortly there would be a great overflowing of the Sea, which might drown us all; and the prefage which they had, was a very great wind from Sea, which arose in such manner that there remained not one Tent which was not broken and overthrown, for all the strength and diligence could be given ; and the Kitchins being all uncovered, the wind raifed fo the duft and fand, which falted and powdered our meat in fuch fort that we could not eat it, fo that we were confirmed to boil it in Pots and other veffels well covered.

Now we did not uncamp our felves in fo good time, but that there were many Carts and Carters, Mules and Mule-drivers drowned in the Sea, with great lofs of Baggage. The Camp broken, I re-

turned to Paris.

The Voyage to Landrefy, 1544. Ing Francis raised a great Army to victual Landressy; on the other side, the Emperour had no less people, yea much more; that is to say, eight thousand Germans, ten thousand Spaniseds, six thousand Wallows, ten thousand English, and about thirteen or fourteen thousand Horse, law the two Armies near one another, within Canon-shot, and it was thought they would never part without giving battel. There were some certain soolish Gentlemen who would approach the Enemies Camp; certain shot was made at them, and some died at the place, others had their legs or arms carried away. The King having done what he defired, which was to victual Landrefy, retired himself with his Army to Gnife, which was the day after All-Saints, One thousand Five hundred Forty four, and from thence I returned to Paris.

The Voyage of Boulogn, 1545.

Little while after we went to Banlogn, where the English feeing our Army, left the Forts which they had, that is to fay, Monlambert the little Paradife, Monplaifer, the Fort of Shatillan, the Partet, the Fort Dardelot. One day going through the Camp to dress my hurt people, the Enemies who were in the Tower of Order, that off a piece of Ordnance, thinking to kill Horfemen which staid to talk with one another. It happened that the bullet paffed very near one of them, which threw him to the ground, and 'twas thought the faid bullet had toucht him, which it did not at all, but onely the wind of the faid bullet in the midst of his coat, which went with fuch a force that all the ontward part of the thigh became black and blue, and he had much ado to frand. I dreft him, and

made him divers fearifications to evacuate the contufed bloud, which the wind of the faid bullet had made; and the rebounds that it made on the ground, killed four Souldiers which remained dead in the place. I was not far from this ftroke, so that I felt somewhat the moved air, without doing me any more harm than a little fear which made me floop my head very low, but the bullet was already passed far beyond me. The Souldiers mocked me to be astraid of a bullet already gone. (My little Master) I think if you had been there, that I had not been affraid alone, and that you would have had your share of it. What shall I say more? Mounticur the Duke of Guife, Francis of Lorsin, was hurt before Bullogne with a ftroke of a Lance, which above the right eye, declining towards the note, entered and palled quite through on the other between the webs and the ear, with fo great violence that the head of the Lance, with a great part of the wood was broken and remained within, in fuch fort that it could not be drawn out but with great force, yea with Smiths Pincers. Notwithfranding all this violence which was not done without breaking of Bones, Nerves, and Arteries, and other parts; my faid Lord, by the help of God, was cured: the faid Lord went always with open face, which was the cause that the Lance went through on the other side.

The Voyage of Germany, 1552.

Went the Voyage to Germany in the year 1552: with Mountieur de Raban Captain of fifty Horles, where I was Surgeon of his Company, which I have faid already. In this Voyage Mountieur the High Conftable of France was General of the Army: Mountieur de Chafillon, fince Admiral, was chief Colonel of the Foot, having four Regiments of Lanfquenets, under the Conduct of these Captains, Record and Ringrave, having each of them two Regiments, each Regiment was of ten Enligns, and each Entign of five hundred men. And befides these, was Captain Ghartel, who conducted the Troops that the Protestant Princes had sent to the King. This was a very great Company of Foot, accompanied with fifteen hundred Horse, with the following of each one two Archers, which might make four thouland and five huddred Horfe, befides two thousand Light-Horfe, and as many Masketiers on Horle-back, of whom de Annalle was General, befides the great number of Nobility who came for their pleafure. Moreover the King was accompanied with two hundred Gentlemen of his house, and likewife with divers Princes; there was also for his Troop that served him, the French, Scottiffs, and Smiffers Guards, amounting to fix hundred men on Foot, and the Companies of Mounfieur the Dolphin, Mefficres de Guife, de Aumalle, and of the Marthal of St. Andrew, which amounted to four hundred Lances, which was a marvellous thing to fee fuch a fair Company; and in this equipage the King entered into Thew and Mers. I will not omit to tell that it was ordained: that the Companions of Messieres de Roban, of the Count of Sancerr, of Jarnac, which was each of them of fifty Horle, went by the Wings of the Camp; and God knows we had (carrity of Victnals; and I protest to God, that at three diverse times I had thought I should have been familied, and it was not for want of money, for I had enough, and we could not have victuals but by force, by reason that the Peasants withdrew it all into the Cities and Castles.

One of the Servants of a Captain of the Company of Mountieur de Roban, went with others thinking to enter into a Church where the Peafants were retired, thinking to find Victuals by force or love: but amongst the rest this man was beaten, and returned with seven wounds with a Sword in the head, the least of which penetrated the second table of the scull; and he had four other upon the arms, and upon the right shoulder, which cut more than one half of the blade-bone, or Omplate. He was brought back to his Masters Lodging, who seeing of him so wounded, and they were to depart thence the morrow after at the break of day, and not thinking ever he could be cured, made him a Grave, and would have cast him therein; saying, that or else the Prasart would massacre and kill him; I moved with pity, told him that he might be cured if he were well dreft: divers Gentlemen of the Company prayed him that he would cause him to be brought along with the Baggage, seeing I had the willingness to dress him; to which he agreed, and after that I had clothed him, he was put up in a Cart upon a Bed well covered and well accommodated, which one Horfe did draw. I did the office of a Phylician, Apothecary, Surgeon, and Cook : I dreft him even to the end of his cure, and God cured him, in fo much that all these three Companies admired at this cure. The Horse-men of the Company of Mounfieur de Roban, the first Muster that was made, gave me each one, one

Crown, and the Archers half a Crown.

The Voyage of Danvilliers, 1552.

T the return from the German Camp, King Henry belieged Danvilliers; those within would not render. They were well beaten, and our powder failed us; in the mean time they that much at our people. There was a Culverin-shot passed a traverse the Tent of Mountieur de Roban which hit a Gentlemans leg, which was of his train; which I was fain to milh the cutting off, the

which was done without applying hot irons The King fent for Powder to Sedan, which being come, they began a greater battery than before, in fuch fort that they made a breach. Meffiers de Guife and the High Contiable being in the Kings Chamber, told him that they concluded the next day to make affault, and that they were afforded that they have been been a solution. they should enter into it, and that they should keep it secret, less the enemy were advertised. And all of them promised not to speak of it to any one. Now there was a Groom of the Kings Chamber who lay under the Kings bed in the Camp to fleep underflood that they refolved the next day togive an affault; he prefently revealed it to a certain Captain, and told him that for certain, the day fol-lowing affault thould be given, and that he had heard it of the King, and prayed the faid Captain that he would not feet. he would not feeal a word of it to any body, which he promifed; but his promife was not kept; for at the fame inflant he went and declared it unto a Captain, and this Captain to another Captain, and from the Captains to force of the Souldiers, faying always, fay nothing. It was fo well hid that the next day early in the morning, there was feen the greatest part of the Souldiers with their round hole.

Another Hi-

hose and their breeches cut at the knee for the better mounting of the breach. The King was advertifed of the rumor which run through the Camp, that the affault must be given, whereof he much marvelled, seeing there were but three of that advice, which had promised one to another not to tell it to any one. The King fent for Monfieur de Guife, to know if he had not talked of this affault; he fwore and affirmed to him he had not told it to any body, and Monfieur the Conftable faid as much; who faid to the King, he must expresly know who had declared this fecret Counsel, seeing they were but three. Inquisition was made from Captain to Captain, in the end the truth was found; for one said it was such an one told me, another said as much, till at length they came to the first, who declared he had learned it of a Groom of the Kings Chamber, named Guyard, born at Bloss, the fon of the deceased King, Francis his Barber. The King sent for him into his Tent, in the presence of Monsieur de Gnise, and of Monsieur the Constable, to understand from him whence he had it, and who told him that this affault was to be given. The King told him, that if he did not tell the truth, that he would cause him to be hanged; and then he declared, he lay down under his bed thinking to fleep, and so having heard it, he declared it to a Captain who was a friend of his, to the end he might prepare himfelf with his fouldiers the first for the affault. After the King knew the truth, he told him he should never serve him again, and that he deserved to be hanged, and forbad him ever to come again to the Court. My Groom of the Chamber went away with this fad What it is to news, and lay with one of the Kings Surgeons in Ordinary, named Mafter Lewis, and in the night reveal the fe-gave himfelf fix wounds with a knife, and cut his throat; yet the faid Surgeon perceived nothing cress of Printill morning, till he faw the bed bloudy, and the dead body by him, he much marvelled at this fpe-etacle upon his waking, and was afraid left they should fay, he was the cause of this murther; but was foon freed, knowing the cause to be from desperation, having lost the good amity which the King bore to him. The said Gayard was buried. And those of Danvilliers when they saw the breach large enough for them to enter in, and the Souldiers prepared for the affault, yielded them-felves to the mercy of the King. The chief of them were prifoners, and the Souldiers fent away without arms. The Camp being broken up, I returned to Paris with my Gentleman whose leg I had cut off. I dressed him, and God cured him; I sent him to his house merry with his wooden leg, and was content, faying that he had eleaped good cheap, not to have been milerably burnt, as you write in your book, my little Master.

Little while after, King Henry levied an Army of thirty thousand men, to go makespoil about The King of Hedin. The King of Navarre who was then called Monsieur de Vendosme, was chief of the Ar-Navarre pray at S. Dawie in Farner, shaping while the Companies of the Author my, and the Kings Lieutenant. Being at S. Dennis in France, flaying while the Companies paffed to follow his by, he fent for me to Paris to come speak with him; being there, he prayed me, and his request was a command, that I would follow him this Voyage; and I about to make my excuse, told him my wife was sick in her bed; he made me answer, That there were Physicians at Paris to cure her; and that he as well left his own, who was as well descended as mine; promiting me that he would use me well, and forthwith gave command that I should be lodged as one of his Train. Seeing this great affection, which he had to lead me with him, I durft not refuse him. I went and met with him at the Castle of Compt, within three or four leagues of Hedin, there where there was the Emperors Souldiers in garrifon with a number of Peafants round about s. he caused them to be summoned to render themselves; and they made answer they should never have them but by pieces, and let them do their worst, and they would do their best to defend themselves. They put considence in their ditches full of water, and in two hours with a great number of Bavins, and certain empty Casks, way was made to pals over the Foot, when they must go the affault, and were beaten with five pieces of Cannon, till a breach was made large enough to enter in, where they within received the affault very valiantly, and not without killing and hurting a great number of our people with musket-fault very valiantly, and not without killing and hurting a great number of our people with musket-fnot, pikes, and flones. In the end when they faw themdelves confirmined, they put fire to their powder and munition, which was the canfe of burning many of our people, and theirs likewife, Hiftory of and they were all almost put to the fword. Notwithstanding some of our Souldiers had taken twenty or thirty, hoping to have ranfom for them. That was known, and ordered by the Council, that it should be proclaimed by the Trumpet through the Camp, that all Souldiers who had any Spaniards prifoners, were to kill them, upon pain to be hanged and strangled, which was done upon cold blood. From thence we went and burnt divers Villages whose barns were full of all kind of Grain, to my grief. We went along even to Townshow, where there was a very great Tower where the The 'taking of Enemies retired, but there was no man found in it, all was pillaged, and the Tower was made to the Callle of Land by a Mine, and then with Gunpowder turned topsie-turvy. After that, the Camp was broken. leap by a Mine, and then with Gunpowder turned topfie-turvy. After that, the Camp was broken up, and I returned to Paris. I will not yet forget to write that the day after the Cafile of Comps was taken, Monsieur de Vendosne sent a Gentleman to the King to make report to him of all which had had passed, and amongst other things, told the King that I had greatly done my duty in dressing those that were wounded, and that I had shewed him eighteen bullets which I had taken or drawn out of the hurt bodies, and that there were divers more which I could neither find, nor draw out, and told more good of me than there was by half. Then the King faid he would have me into his fervice, and commanded Monfieur de Goguier his chief Physician to write me down as entertained one of his Surgeous in ordinary, and that I should go meet with him at Rheimes within ten or twelve days, which I did, where he did me the honour to command me that I would dwell near him, and that he would do me good. Then I thankt him most humbly for the honour it pleafed him to do me, in calling me to his fervice.

The Voyage of Mets. 1552. HE Emperor having belieged Mitt, and in the hardelt time of winter, as each one knows of fresh memory: and that there was in the City five or fix thousand men, and amongst the

Hiftory.

The hurt of Monfieur de Picate trepand and cu-

rest seven Princes; that is to say, Monsieur the Duke of Guise the KingsLieutenant, Messieurs d' Auguien, de Conde, de Montpenfier, de La Roch upon Yon, Monfieur de Nemeurs, and divers others Gentlewith a number of old Captains of War, who often made fallies forth upon the enemies, (as we (hall fpeak hereafter) which was not without flaying many, as well on the one fide as the other. For the most part all our wounded people died, and it was thought the medicaments wherewith they were dressed were poisoned; which caused Monsieur de Guise and other Princes to fend to the King for me, and that he would fend me, with Drugs to them, for they believed theirs were poisoned, feeing that of their hurt people few escaped. I do not believe there was any poyson, but the great strokes of the Cutlasses, musket-shot, and the extremity of cold was the cause. The King caused one to write to Monsieur the Marshal of S. Andrew, who was his Lieutenant at Verdun, that he found fome means to make me enter into Mess. The said Lord Marshal of S. Andrew, and Monsieur the Marshal of old Ville, got an Italian Captain, who promifed them to make me enter in, which he did, and for which he had fifteen hundred Crowns: the King having heard of the promife which the Italian Captain had made, fent for me, and commanded me to take of his Apothecary named Daigue, fuch and as many Drugs as I thould think fit for the hurt who were belieged, which I did, as much as a post horse could carry. The King gave me charge to speak to Monsieur de Guise, and to the Princes. and Captains who were at Mets. Being arrived at Verdun, a few days after the Monfieur the Marthal of S. Andrew, caused horses to be given to me, and my man, and for the Italian, who spake very good high Dutch, Spanish and Walloon, with his own natural tongue. When we were within eight or ten Leagues of Mets, we went not but in the night, and being near the Camp, I faw a league and half off bright fires about the City, which feemed as if all the earth had been on fire, and I thought we could never pass through those ares without being discovered, and by consequent be hanged and strangled, or cut in pieces, or pay a great ranforn. To fpeak truth, I wished my felf at Paris, for the imminent danger which I forefaw. God guided fo well our affairs that we entred the City at midnight with a certain Token, which the Captain had with another Captain of the Company of Monfieur de Guife: which Lord I went to, and found him in bed, who received me with great thanks, being joyful of my coming. I did my meffage to him of all that the King had commanded me to fay to him: I told him I had a little letter to give to him, and that the next day I would not fail to deliver it him. That done, he commanded me a good lodging, and that I should be well used, and bid me I should not tail to be the next day upon the Breach, where I (hould meet with all the Princes, and divers Captains; which I did; who received me with great joy, who did me the honour to embrace me, and tell me I was very welcome, adding withall they did not fear to die if they should chance to be hurt. Monsieur de la Roch upon You was the first that feashed me, and inquired of me what they said at the Court concerning the City of Mess: I told him what I thought good. Then prefently he defired me to go fee one of his Gentlemen, named Monfieur de Magnane, at this present Knight of the Kings Order, and Lieu-tenant of his Majesties Guard, who had his leg broken by a Cannon-shot. I found him in his bed, his leg bended and crooked, without any dressing upon it; because a Gentleman promised him cure, having his name and his girdle, with certain words. The poor Gentleman wept and cried with pain which he felt, not fleeping night nor day, in four days: then I mockt at this imposture and false promise. Presently I did so nimbly restore and dress his leg, that he was without pain, slept all night, and fince (thanks be to God) was cured, and is yet at this prefent living, doing fervice to the King. The faid Lord of the Roch upon Ton fen me a tun of wine to my lodging, and bid tell me, when it was drunken, he would fend me another. That done, Monfieur de Guife gave me a lift of certain Captains and Lords, and commanded me to tell them what the King had given me in charge which I did, which was to do his commendations and thankfgiving for the duty they had done and did in the keeping of the City of Mets, and that he would acknowledge it. I was more than eight days in acquitting my charge, because they were many; first to the Princes and others, as the Duke of Horace, the Count of Martiger, and his brother Monfieur de Bauge, the Lords Montmorancy and d' Anvile, the Marihal of France Monficur de la Chapel, Bonnivet Carong now Governour of Roban, the Va-dafine of Chartres, the Cont of Lude, Monficur de Biron now Marihal of France, Monficur de Rondon the Rochfowcant, Bezelalle d' Errez the younger, Monfieur de S. John in Dolphiny, and many others which it would be too long to recite; and chiefly to divers Captains who had very well done their duty in defence of their lives and City. I demanded afterwards of Monficur de Guife, what pleafed him I should do with the Drugs which I had brought him; he bid me impart them to the Surgeons and Apothecaries, and chiefly to the poor hurt Souldiers in the Hofpital which were in great number's which I did and can affere you, I could not do fo much as go and fee them, but they fent for me to visit and drefs them. All the befieged Lords prayed me carefully to folicite above all others Montieur de Pienne who was hurt at the breach by a ftone raifed by a Cannon shot in the Temple with a fracture and depseifion of the bone. They told me that prefently when he received the firoke, he fell to the earth as dead, and cast blood out of his mouth, note and ears, with great vomitings, and was fourteen days without speaking one word, or having any reason; there happened to him also startings formewhat like Convultions, and he had all his face swelled and livid. He was trepand on the fide of the temporal muscle upon the Os Coronale. I dreft him with other Surgeons, and God cured him 5 and he is at this day living. God be thanked. The Emperor caused battery to be made with forty double Canners. Cannons, where they spared no powder night nor day. Presently when Monsieur de Guife saw the Artillery feated to make a breach, he made the nearest houses be pulled down to make Ramparts, and the posts and beams were ranged end to end, and between two clods of earth, beds and packs of wood, and the posts and packs of wood, and the posts and packs of wood. of wool, and then other posts and beams were put again upon them as before. Now much wood of the houses of the Suburbs, which had been put to the ground for fear left the enemy should be lodged, close covered, and that they should not help themselves with any wood, ferved well to repair the breach. Every one was busied to carry earth to make the Ramparts night and day. Messers, the ed the Baskets. Princes, Lords and Captains, Licutenants, Ensigns, did all carry the Basket, to give example to the

the Souldiers and Citizens to do the like, which they did: yea, both Ladies and Gentlewomen, and those which had not Baskets, helped themselves with Kettles, Panniers, Sacks, Sheets, and with what else they could to carry Earth; informuch that the Enemy had no sooner beaten down the Wall, but he found behind it a Rampart more strong. The Wall being fallen, our Souldiers cried to those without, the Fox, the Fox, the Fox, and spake a thousand injuries one to another. Monfieur de Gnise commanded upon pain of death that no man should speak to them without for sear left there should be some Traitor who would give them intelligence what was done in the City; the command made, they tied living Cats at the end of their Pikes, and put them upon the Wall, and cried with the Cats, Misn, Misn.

Truly the Imperialists were very much vexed to have been follong making a Breach, and at fo great expence, which was the breach of fourfcore fleps, to enter fifty men in front, where they found a Rampart more strong than the Wall; they fell upon the poor Cats and shot at them with their Muskets, as they use to do at Birds. Our people did oftentimes make fallies by the command of Mounsieur de Guise. The day before there was a great press to make themselves enrolled, who must make the falley, chiefly of the young Nobility, led by well experimented Captains. In so much that it was a great favour to permit them to fally forth and run upon the Enemy: and they fallied forth always the number of one hundred or fixfeore armed men with Cutlaffes, Muskets, Piffols, Pikes, Partifans, and Halberts, which went even to their Trenches to awaken them. Where they presently made an Alarm throughout all their Camp, and their Drums sounded plan, plan, ta, ti, ta, ta, ti, ta, ta, tou, touf, touf: likewise their Trumpets and Cornets sounded, to the saddle, to the faddle, to the faddle, to horfe, to horfe, to horfe, to the faddle, to horfe. And all their Souldiers cried, Arm, arm, to arms, arm, to arms, like the cry after Wolves, and all divers Tongues, according to their Nations: and they were feen to go out from their Tents and little Lodgings, as thick as little Bees, when their Hive is discovered, to succour their fellows who had their throats cut like Sheep, The Horfe-men likewife came from all parts a great gallop, Patati, patata, patati, patata, ta, ta, patata, patata, and tarried well, that they might not be in the throng, where throaks were imparted to give and receive. And when our men faw they were the throng, where fireaks were imparted to give and receive. And when our men law they were forced, they returned into the City, ftill firing, and those who run after were beaten back with the Artillery which they had charged with Flint-flones, and four-fquare pieces of Iron; and our Souldiers who were upon the faid Wall made a volly of flot, and shoured down their bullets upon them like hail, to fend them back to their lodging, where divers remained in the place of the combat, and also our men did not all come off with whole skins, and there ftill remained forme for the Tithe, who were joyful to die in the Bed of Honour. And when there was a Horfe hurt, he was flayed, and who were joyful to die in the neu of Honour. And when there was a more nure, he was hayed, and eaten by the Souldiers in ficad of Eeef and Bacon, and it was fit I must run to drefs our hurt men. A few days after other Sallies were made, which did much anger the Enemies, because they did not let them sleep but little in safety. Mounfieur de Guise made a War-like stratagem, which was, He sent a Pesant who was none of the wisest with two pair of Letters toward the King, to whom he gave ten crowns, and promifed the King should give him an hundred, provided he gave him the Letters. In the one he fent word that the Enemy made no fign of retiring himfelf, and by all force made a great breach, which he hoped to defend, yea to the losing of his life, and of all those that were within; and that the Enemy had so well placed his Artillery in a certain place which he named, that with great difficulty it was kept that they had not entered into it, feeing it was a place the most weak of all the City: but he hoped quickly to fill it up again in fuch fort, that they cannot be able to enter-One of thele Letters was fewed in the lining of his doublet, and he was bid to take heed that he told it not to any man. And there was also another given to him, wherein the faid Mountieur de Guife fent word to the King, that he and all the belieged did hope well to keep the City, and other matters which I ceafe to fpeak of. They made the Petant go forth in the night, and prefently after he was taken by one that flood Sentinel, and carried to the Duke of Albe to understand what was done in the City, and they asked him if he had any Letters, he faid yes, and gave them one; and having feen it, he was put to his Oath whether he had any other, and he fwore, not; then they felt and fearched him, and found that which was fewed to his doublet, and the poor meffenger was

The faid Letters were communicated to the Emperour, who caused his Gouncil to be called there. Where it was resolved, since they could do nothing at the first breach, that presently the Artillery should be drawn to the place which they thought the most weak, where they made great attempts to make another breach, and digged and undermined the Wall, and endeavoured to take the Tower of Hell, yet they durst not come to the affault. The Duke of Albe declared to the Emperour that the Souldiers died daily, yet more than the number of two hundred, and that there was but little hope to enter into the City, seeing the Season, and the great quantity of Souldiers that were there. The Emperour demanded what people they were that died, and if that they were Gentlemen of remark or quality; answer was made, that they were all poor Souldiers; then said he it makes no matter if they die, comparing them to Caterpillars and Grashoppers, which eat the buds of the Earth. And if they were of any salhion, they would not be in the Camp for twelve shillings the Month's and therefore no great harm if they died. Moreover he said, He would never part from before that City, till he had taken it by Force or Famine, although he should lose all his Army; by reason of the great number of Princes which were therein, with the most part of the Nobility of France. From whom he hoped to draw double his expence, and that he would go once again to Paris, to visit the Parisans, and make himself King of all the Kingdom of France. Mountieur de Visit the Parisans, and make himself King of all the Kingdom of France, Mountieur de Visit the Princes, Captains, and Souldiers, and generally all the Citizens of the City, having understood the intention of the Emperour, which was to extirpate us all, they advised of all they had to do: And since it was not permitted to the Souldiers nor Citizens, no nor to the Princes, nor Lords themselves to eat either fresh Fish, or Venison, as likewise some Partridges.

Woodcocks, Larks, Plovers, for fear left they had gathered fome peftilential air which might give us any contagion; but that they should content themselves with the Ammunition Fare; that is to fay, with Bisket, Beef, powdered Cows Lard, and Gammons of Bacon: Likewife Fifh, as Green-fifh, Salmon, Sturgeon, Anchovies, Pilchers, and Herrings; also Peafe, Beans, Rice, Garlick, Onions, Prunes, Cheefe, Butter, Oil, Salt, Pepper, Ginger, Nutmegs, and other Spiceries, to put into Pies, chiefly to Horfe-flesh, which without that would have a very ill tafte; divers Citizens having Gardens in the City, fowed therein great Radishes, Turnips, Carrets, and Leeks, which they kept well and full dear against the extremity of hunger. Now all these Ammunition Victuals were distributed by weight, measure, and justice, according to the quality of the person, because we knew not how long the Siege would last. For having understood from the mouth of the Emperour, that he would never part from before Mess till he had taken it by Force or Famine; the victuals were leffened, for that which was wont to be distributed to three, was now shared amongst four, and defence made they should not fell what remained after their dinner, but 'twas permit-ted to give it to the Wenches that followed the Camp, and rose always from Table with an appe-tite, for fear they should be subject to take Physick. And before we would yield our selves to the mercy of our Enamies, had refolved to eat our Affes, Mules, Horfes, Dogs, Cats, and Rats; yea, our Boots, and other Skins which we could foften and frie. All the belieged did generally resolve to defend themselves with all forts of Instruments of War; that is to say, To rank and charge the Artillery, at the entry of the breach, with Bullets, Stones, Cart-nails, Bars and Chains of iron. fo all kinds and differences of artificial Fire, as Boerres, Bariquadoes, Granadoes, Ports, Lances, Torches, Squibs, burning-Faggots. Moreover, Scalding Water, melted Lead, Powder of unquencht Lime to blind their eyes. Also they were resolved to have made holes through and through their houses, there to lodge Musquetiers, there to batter in the flank and hasten them to go, or else make them lie for altogether. Also there was order given to the Women to unpaye the streets, and to cast out at their Windows, Billets, Tables, Tresses, Forms, and Stools, which would have troubled their brains: Moreover, there was a little further a strong Court of Guard, filled with Carts and Pallifadoes, Pipes and Hogsheads filled with earth for Barricadoes to serve to interlay with Faulcons, Faulconets, Field-pieces, Harquebuffes, Muskets, and Piftols, and Wild-fire, which would have broken legs and thighs, in so much that they had been beaten in head, in flank, and in tail; and when they had forced this Court of Guard, there was others at the croffing of the fireets, each diffant an hundred spaces, who had been as bad companions as the first, and would not have been without making a great many Widows and Orphans. And if Fortune would have been fo much against us, as to have broken our Courts of Guard, there was seven great Bastallions ordered in fquare and triangle to combat altogether, each one accompanied with a Prince to give them boldness, and encourage them to fight, even till the last gasp, and to die all together-Moreover it was refolved, that each one should carry his Treasure, Rings, and Jewels, and their Houshold-stuff of the best, to burn them in the great place, and to put them into ashes rather then the Enemy should prevail and make Trophies of their spoils; likewise there was people appointed to put fire to the Munition, and to bear out the heads of the Wine Casks, others to put the fire in each house, to burn our Enemies and us together: the Citizens had accorded it thus, rather then to fee the bloudy Knife upon their Throat, and their Wives and Daughters violated, and to be taken by force by the cruel inhumane Spaniards. Now we had certain Prifopers which Mounfieur de Guife fent away upon their Faith, to whom was fecretly imparted our last resolution, will and desperate minds; who being arrived in their Camp, do not deter the publishing, which bridled the great impetuolity and will of the Souldiers to enter any more into the City to cut our Throats, and to enrich themselves of our pillages. The Emperour having understood this deliberation of the great Warriour the Duke of Gnife, put Water in his Wine, and reftrained his great choler and fury; faying, He could not enter into the City without making a great flaughter and butchery, and fpill much blood, as well of the Defendants as of the Affailants, and that they fhould be dead together, and in the end could have nothing elfe but a few after, and that after-ward it might be spoken of that, as of the destruction of Jerusalem already made by Titus and The Emperour then having understood our last resolution, and seeing their little prevailing by their battery and undermining, and the great Plague which was in his whole Army, and the indisposition of the Time, and the want of Victuals and Money, and that his Souldiers forfook him, and went away in great companies; concluded in the end to retire themselves, accompanied with the Cavalry of the Van-guard, with the greatest part of his Artillery, and the Battalia-The Marquels of Brandenburg was the last which decamped, maintained by certain Bands of Spa-niards, Bobemians, and his German Companies, and there remained one day and a half after, to the great grief of Mountieur de Gnife, who caused four pieces of Artillery to be brought out of the City, which he caused to be discharged at him on one side, and the other to hasten them to be gone, which he did full quickly, with all his Troops. He being a quarter of a league from Mets, was taken with a fear left our Cavalry should fall upon him in the Rere, which canfed him to put fire to him to put fire to his Munition Powder, and leave certain pieces of Artillery, and much Baggage, which he could not carry, because the Van-ghard, and the Battalia, and great Cannons, had too much broken the way. Our Horfe-men would by all means have gone out of the City to have fallen upon their breech, but Mountieur de Guife would never permit them, but on the contrary we should rather make plain their way, and make them Bridges of Gold and Silver, and let them go, being like to a good Shepherd, who will not lofe one of his Sheep. See now how our well-beloved imperialisis went away from before the Contention of the content of the away from before the City of Mets, which was the day after Christmas day, to the great contentment of the befieged, and honour of Princes, Captains, and Souldiers, who had endured the travels of this Siege the space of two moneths. Notwithstanding they did not all go; there wanted twenty thousand who were dead, as well by Artillery, as by the Sword, as also by the Plague, Cold, and Honors.

hunger, and for fpite they could not enter into the City to cut our throats, and have the pillage: and also a great number of their Horses died, of which they had eaten a great part in stead of Beef and Bacon. They went where they had been encamped, where they found divers dead bodies not yet buried, and earth all digged like St. Lanceaux Church-yard in the time of the Plague. They did likewife leave in their Lodgings, Pavillions and Tents, divers fick people; also Bullets, Arms, Carts, Waggons, and other Baggage, with a great many of Munition Loaves, spoiled and rotten by the rain and snow, yet the Souldiers had it but by weight and measure; and likewise they left great provision of Wood, of the remainders of the Houses of the Villages which they had pluckt down two or three miles compass. likewise divers other Houses of Pleasure belonging to the Citizens, accompanied with fair Gardens, and Grass-plats filled with Fruit-trees, for without that they had been starved with cold, and had been constrained to have raised the Siege sooner. The said Mounsieur de Guise caused the dead to be buried, and dress their fick people; likewise the Enemies left in the Abby of St. Armed divers of their hurt. Souldiers which they could not lead with them; the said Mounsieur de Guise souldiers of their hurt. Souldiers which they would not have done the like toward others (because the Spaniard is most cruel, persidious, and inhumane, and therefore Enemy to all Nations) which is proved by Lopez a Spaniard, and Benzo of Milan, and others who have written the History of America, and the West-Indust, who have been constrained to contest that the cruelty, avarice, blasphemy, and wickedness of the Spaniards, have altogether alienated the poor Indians from the Religion which the said Spaniards are said to hold. And all write, they are less worth than the library of Milan, the process of the said to hold. And all write, they are less worth than the

the Rengion which the rind spanish are the trible displaced one to the faid Indians.

And after a few days we fent a Trumpet to Thiomsile toward the Enemy, that they should fend back for their wounded men in facety, which they did with Carts and Waggons, but not enough. Mounfieur de Guife caused them to have Carts and Carters to help to carry them to the faid Thiomsile. Our faid Carters being returned back, brought us word that the way was paved with dead bodies, and that they never led back the half, for they died in their Carts, and the Spaniards seeing them at the point of death, before they had cast out their last gasp, cast them out of their Carts, and buried them in the Mod and Mire, saying, they had no order to bring back the dead. Moreover our Carters said, they met by the way divers Carts loaden with Eaggage sticking in the Mire, which they dust not fend for back, for fear less those of Mars should fall upon them. I will again return to the cause of their mortality, which was principally through Hunger, Plague, and Cold is for the Snow was two foot thick upon the earth, and they were lodged in the caves of the earth, onely covered with a little straw. Notwithstanding each Souldier had his Field-bed, and a covering strewed with glistering Stars, more bright than sine gold, and every day had white sheers, and lodged at the sign of the Moon, and made good chear when they had it, and paid their Host so well overnight, that in the morning they went away quite, shaking their ears, and they needed no Comb to take away the down out of their hairs either of head or beard, and found always a white Table-cloth, losing good Meals for want of Victuals. Also the greatest part of them had neither Boots nor Buskins, Slippers, Hose, or Shoes, and divers had rather have none than have them, because they were always in mud, half way of the leg; and because they went bare-legged, we called them the Emperous Apostles. After the Camp was wholly broken, I distributed my Patients into the hands of the Surgeons of the City of

The Voyage of Hedin, 1553.

Charles the Emperour caused the City of Thermenne to be belieged, where Mounticur the Duke of Savoy was General of the whole Army: it was taken by affault where there was a great number of our men slain and prisoners. The King willing to preyent that the Enemy should not also come to beliege the City and Castle of Hedin, sent Metiliers the Duke of Bonison, the Duke Horses, the Marquels of Villare, a number of Captains, and about eight hundred Souldiers, and during the siege of Thermeane, the said Lords fortified the said Castle of Hedin, in such fort that it seemed impregnable. The King sent me to the said Lord to help them with my Art, if there were any need. Now soon after the taking of Thermenne, we were belieged with the Army: there was a quick clear Fountain of Spring, within Cannon-shot, where there was about fourscore Whores and Wenches of the Enemies, who were round about it to draw Water. I was upon a Rampart beholding the Camp, and seeing so many idlers about the said Fountain, I prayed Mounticur de Pour Commissary of the Artillery, to make one Cannon-shot at that roguish Company; he made me much devial, answering me that such kind of people were not worth the Powder they should waste. Again I prayed him to level the Cannon, telling him, the more dead the favor Enemies, which he did through my request, and at that shot fifteen or fixteen were killed, and many hart. Our Souldiers salted forth upon the Enemies, where there was many killed and slain with Musket-shot and Swords, as well on the one side as of the other, and our Souldiers did often make fallies forth upon the Enemies before their Trenches were made; where I had much work out out, to that I had no rest night oor day for dressing the wounded. And I will tell this by the way, that we had put many of them in a great Tower, laid upon a little straw, and their Pillows were stones, their Coverlets were their Cloaks, of those that had any. Whilest the battery was making, as many thot as the Cannons made, the Patients sai

My little Mafter, if you had been there, you had been much troubled with your hot irons, you had need to have had much Charcoal to make then red hot, and believe they would have flain you like a Calf for this cruelty. Now through this Diabolical tempett of the Eccho from these thun-dering Instruments, and by the great and vehement agitation of the collision of the air resound-ing and reverberating in the wounds of the hort people, divers died, and others because they could not rest by reason of the groans and cries that they made night and day, and also for want of good nourishment, and other good usage necessary to wounded people. Now my little Master, if you had been there, you would hardly have given them Gelly, Restauratives, Cullifes, Pressures, Panado claused People. White Arthur Market People White do, cleanfed Barley, White Meats, Almond-milk, Prunes, Raifins, and other proper meats for fick people: your ordinance would onely have been accomplified in paper, but in effect they could have had nothing but old Cow-beet, which was taken about Hedin for our Munition, falted and half boiled, in for much that who would have eat it, he must pull it with the force of his teeth, as links of Point to Committee and the control of the control Birds of Prey do Carrion. I will not forget their Linen wherewith they were dreft, which was onely rewashed every day, and dried at the fire, and therefore drie and stubborn like Parchment. I leave you to think how their wounds could heal well. There were four lufty Whores to whom charge was given to wash their Linen, who discharged their duty under penalty of the Battoon, and also they wanted both Sope and Water. See then how the fick People died for want of nourithment, and other necessary things. One day our Enemies seigned to give us a general Assault, to draw our Souldiers upon the breach, to the end to know our countenance and behaviour: every one ran thiter; we had made great provision of artificial Fire to defend the breach: a Priest belonging to Mounfieur Du Bouillon took a Granado, thinking to throw it on the Enemies, and fet it on fire fooner than it ought to have done; it brake afunder, and the fire fell amongst our Fireworks, which were put into a house near the breach, which was to us a marvellous disaster, because it burned many poor Souldiers: it also took hold on the house it felf, and we had been all burned, had not great help been used for to quench it; there was but one Well there wherein was Water in our Caftle, which was almost quite dried up, and in flead of Water we took Beer and quenched it: then afterwards we had great scarcity of Water, and to drink the rest that remained, which we must strain through Napkins.

Now the Enemy seeing this smoke and tempest of the Fire-works, which cast a very great slame or clashing noise, they believed we had put the hre on purpose for the defence of our breach, to burn them, and that we had great store of others. That made them to be of another opinion than to take us by affault; they did undermine, and dig under the greatest part of our Walls, so that it was the way to overthrow wholly the Castle topsie-turvy, and when the Mines were finished, and that their Artillery thot, the whole Caftle did flake under us like an Earthquake, which did much aftonith us-Moreover he had levelled five pieces of Artillery which they had feated upon a little hill, to play upon

our backs when we would go to defend the breach.

The Duke Horace had a Cannon-thot upon one thoulder, which carried away his arm on one fide, and the body on the other, without being able to fpeak one onely word. His death was to us a great difaster for the rank which he held in his place.

Likewise Mountieur De Martigues had a stroke with a bullet which pierced through his Lungs > dreffed him, as I will declare hereafter. Then we demanded Parl, and a Trumpet was fent toward the Prince of Piedmont, to know what composition it pleased him to make us: His answer was, that all the Chief, as Gentlemen, Captains, Lieutenants, and Entigns, thould be taken for ransom, and the Souldiers should go out without Arms; and if they refused this fair and honest proffer, the next day we ought to be affured they would have us by affault, or otherwise. Conneil was held, where I was called to know if I would fign, as divers Captains, Gentlemen, and others, that the place should be rendred up. I made answer it was not possible to be held, and that I would fign it with my proper bloud, for the little hope that I had that we could resist the Enemies of the forthe great desire which I had to be out of this Torment and Hells for I slept not either night or day, by reason of the great number of hurt people, which were about two hundred. The dead bodies yielded a great putrefaction, being heaped one upon another like Fagots, and not being covered with earth, because we had it not; and when I entered into one lodging, Souldiers attended me at the door to go and drefs others at another; when I went forth, there was firiving who should have me, and they carried me like a Holy body, not touching the ground with my foot, in spite one of anothers nor could I satisfie so great a number of hurt people. Moreover I had not what was necessary to drefs them withall; for it is not fufficient that the Surgeon do his duty towards the Patients; but the Patient must also do his, and the affisiants and all exteriour things, witness Hippocrates in his first Aphorism. Now having understood the resolu-tion of the yielding up of our place, I knew our affairs went not well; and for fear of being known, I gave a Velvet Coat, a Satin Doublet, a very fine Cloth Cloak lined with Velvet, to a Souldier, who gave me a feurvy old torn doublet cut and flasht with using, and a leather Jerkin well examined and an ill-favoured Hat, and a little Cloak; I fmucht the collar of my Shirt with water in which I had mingled a little Soot; likewife'l wore out my flockings with a flone at the knees and at the heels as it they had been wore a long time, and I did as much to my thoes, in to much that they would rather take me for a Chimney-Sweeper than a Kings Surgeon. I went in this Equipage towards Mountain D. Mountain the control of th wards Mountieur De Martigues, where I prayed him that he would take otder that I might remain near him to drefs him, which he agreed to most willingly, and had as much desire I should remain with him as my self. Soon after the Commissioners, who had charge to elect the Pritoners, entered into the Castle the seventeenth day of July, One thousand Five hundred Fifty three, where they made Missioners the Duke of Boullon, the Marques of Villars, the Baron of Collan, Mountieur Du Post Commissary of the Artislery, and Mountieur De Martigner and I to be taken through the request that he made to them; and all other Gentlemen which they could perceive were able to pay

pay any ranforn, and the most part of the Souldiers and the chief of Companies, having such and fo many Prisoners as they would. Afterward the Spanift Souldiers entered by the breach without any relitance, for ours effectned they would hold their Faith and Composition that they should have their lives saved. They entered in with a great fury to kill, pillage, and to rifle all they retained: force hoping to have ranform, they field their Stones with Arquebus-cords, which was eaft over a Pike which two held upon their they treat their stones which a great violence and denision, as if they would ring a Bell, telling them that they must put themselves to the ransom, and tell of what Houses they were; and it they faw they could have no profit, made them cruelly die between their hands, or pre-fently after their genital parts would have fallen into a Gangrene and total Mortification; but they killed them all with their Dangers, and cut their Throats. See now their great cruelty and perfidioufnefs, let him truft to it that will. Now to return to my purpose: Being led from the Castle to the City with Mounficur De Martigues, there was a Gentleman of the Duke of Sawys, who asked me if Mountieur De Martignes wound were curable, I answered not; who presently went and told the Duke of Savoy; now I thought he would fend Phylicians and Surgeons to visit and drefs my faid Mountieur De Martigues: in the mean time I thought with my felt whether I ought to make it nice, and not to acknowledge my felf a Surgeon, for fear left they thould retain me to drefs their wounded, and in the cod they would know I was the Kings Surgeon, and that they would make me pay a great ransom. On the other fide I feared, if I should not make my felf known to be a Surgeon, and to have carefully dressed Mountieur De Martigues, they would cut my Throat, fo that I took a resolution to make it appear to them he would not die for want of good dressing and looking to. Soon after, see, there were divers Gentlemen accompanied with the Phylician and Surgeon of the Emperour, and those of the said Duke of Sarny, with six other Surgeons following the Army, to see the hurt of the said Lord of Marigues, and to know of the effence of the wound, and bow I had dreft it. Now all the affifiants had a very attentive ear to know if the wound were mortal or not; I began to make a discourse that Mounsieur De Martignes looking over the Wall to perceive them that did undermine it, received a fhor from an Arquebus quite through the body; prefently I was called to drefs him, I faw he cast our bloud out of his mouth and his wounds. Moreover he had a great difficulty of breathing, and cast our wind of his mouth and his woulds. Moreover he had a great dimenity of breatning, and calt our wind by the faid wounds with a whiftling, in fo much that it would blow our a candle; and he faid he had a most sharp pricking pain at the entrance of the buller. I do believe and think it might be fome little pieces of bones which prickt the Lungs. When they made their Systole and Diastole, I put my finger into him, where I found the entrance of the bullet to have broken the fourth rib in the middle, and scales of bones, which the faid bullet had thrust in, and the out-going of it had likewise broken the fifth rib with pieces of bones which had been driven from within cutward; I drew out fome, but not all, becanfe they were very deep and adherent. I put in each wound a Tent, having the head very large, tied with a thred, left by the infpiration it might be drawn into the capacity of the Thorax, which hath been known by experience to the detriment of the poor wounded; for being fallen in, it cannot be taken out, which is the cause that engenders patrefaction, a thing contrary to Nature. The faid Tents were anointed with a Medicin composed of Yolks of Eggs, Venice Turpentine, with a little Oil of Roses. My intention for putting the Tents was to flay the flux of blond, and to hinder that the outward air did not enter into the breft, which might have cooled the lungs, and by confequent the heart. The faid Tents were alfo put, to the end that iffue might be given for the bloud that was spilt within the Thorace. I put upon the wound great Emplatters of Discalcinbers, in which I had released Oil of Rofes and Vinegar to the avoiding of the inflammation; then I put great fupes of Oxyerste, and bound him up, but not too hard, to the end he might have easie respiration; that done I drew from him five porrengers of bloud from the Bafilick vein of the right arm, to the end to make revullion of the bloud which runs from the wounds into the Thorax, having hirl taken indication from the wounded part, and chiefly his forces, confidering his youth and fanguin temper; He prefently after went to itool, and by his Urin and Siege call great quantity of bloud. And as for the pain which he faid he felt at the entrance of the bullet, which was as if he had been pricked with a bodkin, that was because the Lungs by their motion beat against the splinters of the broken rib. Now the Lungs are covered with a coat coming from the membrane called Pleura, interweaved with Nerves of the fixth Conjugation from the brain, which was cause of the extreme pain he felt; likewise he had great difficulty of breathing, which proceeded from the bloud which was spilt in the capacity of the Thorse, and upon the Diaphragm, the principal instrument of respiration, and from the dilaceration of the muscles which are between each rib, which help alto to make the expiration and the infpiration; and likewife because the Lungs were torn and wounded by the buller, which hath caused him ever fince to spit black and putrid bloud in coughing. The Fever feized him foon after he was hurt, with faintings and swoonings. It feemed to me that the faid Fever proceeded from the putredinous vapours arifing from the bloud which is out of his proper veffels, which hath fallen down, and will yet flow down. The wound of the Lungs is grown great, and will grow more great, because it is in perpetual motion both steeping and waking, and is dilated and compress to be the air to the heart, and cast fuliginous repours out: by the unnatural heat is made inflammation, then the expulsive virtue is confirmed to call out by cough whatfoever is obnoxious unto it: for the Lungs cannot be purged but by coughing, and by coughing the wound is dilated, and grows greater, from whence the blood iffues out with great abundance, which bloud is drawn from the heart by the Vein Arterial to give them nourithment, and to the heart by the Vengenes; his meat was Burley-broth, Stewed Prunes, fometimes Panado; his drink

was Prifan : He could not lye but upon his back, which shewed he had a great quantity of blood

fpilt within the capacity of the Thorax; and being spread or spilled along the spondyls, doth not so much press the Lungs as it doth being laid on the sides or sitting.

What shall I say more, but that the said Lord Martigues since the time he was hurt hath not repofed one hour onely, and hath always cast out bloudy Urines and Stools. These things then Messers confidered, one can make no other prognostick but that he will die in a few days, which is to my great grief. Having ended my discourse, I dreft him as I was wont; having discovered his wounds,

the Phylicians and other affifiants prefently knew the truth of what I had faid.

The faid Physicians having felt his pulle and known his forces to be almost spent and abolished, they concluded with me, that in a few days he would die; and at the fame infiant went all toward the Lord of Savoy, where they all faid that the faid Lord Marignes would die in a fhort time; he answered, it were possible if he were well dreft, he might escape: Then they all with one voice said, he had been very well dreft, and follicited with all things necessary for the curing of his wounds, and could not be better, and that it was impossible to cure him, and that his wound was mortal of necessity. The Mounfieur De Savoy shewed himself to be very much discontented and wept, and asked them again it for certain they all held him deplored and remediless; they answered, Yes. Then a certain Sounish Impostor offered himself, who promised on his life that he would cure him, and if he failed to cure him, they should cut him in an hundred pieces: but he would not have any Physicians, Surgeons, or Apothecaries with him. And at the fame instant the faid Lord of Savey told the Physicians and Surgeons they should not in any wife go any more to see the faid Lord of Marrigues. And he fent a Gentleman to me to forbid me upon pain of life not to touch any more the faid Lord of Martignes, which I promifed not todo; wherefore I was very glad, feeing he should not die in my hands, and commanded the said Impostor to dress the said Lord of Martigues, and that he should have no other Physicians nor Surgeons but him; he came prefently to the faid Lord of Marriques, who told him:

Senor Cavallero el senor Duge me ha mandado que veniasse a curar vastra berida, yo os juro a Dios que antes de achio disse yo os hag a fubir a Cavello con la lanfa en puno contafque no ago que yo quos togne, Como ris y biberis todio comedas que sucren de vastro gusto y yohare la dieta pro V.M. y desto os deveu aseguirar sobre de mi, yo be sanado mun hos que senian magores heridas que la vastra. That is to say, Lord Cavallier, Mountieur the Duke of Satury bath commanded me to come drefs thy wound; I fwear to thee by God, that before eight days I will make thee mount on Horfe-back with thy Lance in thy hand, provided that no man may touch thee but my felf; thou shalt eat and drink any thing that thou haft a mind to, I will perform thy diet for thee, and of this thou mayeft be affored upon my promife-Thave cured divers who have had greater wounds than thine: and the Lord replied, God give your

Grace to do it.

He demanded of the faid Lord a Shirt, and tore it in little rags, which he put acrofs, muttering and murmuring certain words over the wounds; and having dreft him, permitted him to eat and drink what he would, relling him he would observe a diet for him, which he did, eating but fix Prunes and fix bits of bread at a meal, and drinking but Beer. Notwithstanding two days after, the faid Lord of Martigues died; and my Spaniand, feeting of him in the Agony, eclipfed himself, and got away without bidding farewel to any body; and I believe if he had been taken, he had been hanged for his false promises, which he had made to Mountieur the Duke of Savoy, and to divers other Gentlemen.

He died about ten of the Clock in the morning, and after Dinner the faid Lord of Savey fent Phyficians and Surgeons, and his Apothecary, with a great quantity of Drugs to embalm hims they

came accompanied with divers Gentlemen and Captains of the Army.

The Emperours Surgeon came near to me, and prayed me kindly to open the Body; which I refuted, telling him I was not worthy to carry his Plafter-Box after him. He prayed me agains which then I did for his fake, if it fo liked him. I would yet again have excused my felf, that feeing he was not willing to embalm him, that he would give this charge to another Surgeon of the Company; he made meyet answer, that he would it should be I; and if I would not do it, I might hereafter repent it. Knowing this his affection, for fear he should do me any displacture, I took the Ragron and professored it to all its single here. zor and prefented it to all in particular, telling them I was not well practifed to do fuch Operations, which they all refused.

The Body being placed upon a Table, truly I purposed to show them that I was an Anatomist, de-claring to them divers things should be here too long to recite. I began to tell all the Company that I was fure the bullet had broken two Ribs, and that it had passed through the Lungs, and that they should find the wound much enlarged, because they are in perpetual motion, sleeping or waking, and by this motion the wound was the more dilacerated. Also that there was great quantity of bloud fpilt in the capacity of the breft, and upon the midriff, and splinters of the broken ribs which were beaten in at the entrance of the bullet, and the iffuing forth of it had carried out. Indeed all which

I had told them was found true in the dead body.

One of the Phylicians asked me, which way the blood might pass to be east out by Uring, being contained in the Thorax. Lanswered him that there was a manifest Conduit, which is the Vota Azygur, which having nourished the ribs, the rest of the blood descends under the Diaphragm, and on the left fide is conjoined to the emulgent Vein, which is the way by which the matter in Pleanifies and in Emphema, do manifefily empty themselves by Urin and Stool. As it is likewise seen the pure milk of the breits of Women newly brought to bed, to defeend by the Mammillary veins and to be evacuated downwards by the neck of the womb without being mixt with the blood. And fuch a thing is done (as it was a line of the womb without being mixt with the blood.) thing is done (as it were by a miracle of Nature) by her expulsive and tequestring virtue, which is feen by experience of two glafs veffels called Mount-wine; let the one be filled with Water, and the other with Claret-wine, and let them be put the one upon the other, that is to fay, that which shall be filled with Water upon that which shall be filled with Wine, and you shall apparently see the Wine mount.

mount up to the top of the veffel quite through the water, and the water defeend atraverse the wine, and go to the bottom of the veffel without mixture of both; and if such a thing be done so exteriorly and openly to the sense of our eye, by things without life, you must believe the same in our understanding; That nature can make matter and bloud to pass, having been out of their vessels, yea, through the bones, without being mingled with the good bloud.

Our discourse ended, I embalmed the body, and put it into a Cossin; after that the Emperors Sur-

Our discourse ended, I embalmed the body, and put it into a Cossin; after that the Emperors Surgeon took me apart, and told me if I would remain with him, that he would use me very well, and that he would clearly me a new, also that I should ride on Horse-back. I thanked him very kindly for the honour he did me, and told him that I had no desire to do service to Strangers and Enemies to my Country: then he told me I was a Fool, and if he were Prisoner as I, he would serve the Devil to get his liberty. In the end I told him flat that I would not dwell at all with him.

The Emperours Phylician returned towards the faid Lord of Savy, where he declared the cause of the death of the said Lord of Marigner, and told him that it was impossible for all the men in the World to have cured him; and confirmed again, that I had done what was necessary to be done, and prayed him to win me to his service, and spake better of me than I deserved.

Having been perfuaded to take me to his fervice, he gave charge to one of his Stewards named Mountieur de Bouches, to tell me if I would dwell in his fervice, that he would use me kindly: a answered him that I thanked him most humbly, and that I had resolved not to dwell with any Stranger. This my answer being heard by the Duke of Savey, he was somewhat in choler, and said, He would send me to the Gallies.

Mounfieur de Vandeville Governor of Gravelin, and Colonel of the feventeen Enfigns of Foot, prayed him to give me to him, to drefs him of an ulcer which he had in his leg this fix or feven years; Mounfieur de Savoy told him, because I was of worth, that he was content, and if I rankled his leg, it would be well done; he answered, that if he perceived any thing, he would cause my Throat to be cut.

Soon after the faid Lord of Vandeville sent for me by four German Halbertiers, which affrighted me

Soon after the faid Lord of Vandeville fent for me by four German Halbertiers, which affrighted me much, not knowing whither they led me, they fpake no more French than I High Dutch: being arrived at his Lodging, he told me I was welcome, and that I was his; and as foon as I should have cured him of that ulcer in his leg, that he would give me leave to be gone without taking any ranform of me. I told him that I was not able to pay any ranforme.

Then he made his Physician and Surgeon in Ordinary to thew me his ulcerated legs having seen and considered it, we went apart into a Chamber, where I began to tell them that the faid Ulcer was annual, not being simple but complicated: that is of a round figure and fealy, having the lips hard and callous, hollow and fordid, accompanied with a great varicous vein which did perpetually feed it; befides a great tumour, and a phlegmonous diffemper very painful through the whole leg, in a body of cholerick complexion, as the hair of his face and beard demonstrated. The method to cure it (if cured it could be) was to begin with univerfal things, that is, with Purgation and Bleeding, and with this order of Diet, that he thould not use any Wine at all, nor any falt Meats or of great nourishment, chiefly those which did heat the bloud: afterward the Cure must begin with divers fearifications about the Ulcer, and totally cutting away the callous edges or lips, and giving a long or a triangular figure; for the round will very hardly cure, as the Ancients have left it in writing, which is feen by experience. That done the filth must be mundified, as also the corrupt fielb, which should be done with Unguentum Egyptiscum, and upon it a boliter dipt in juice of Plantain and Nightshade and Oxyerate, and rowl the leg, beginning at the soot, and finishing at the knee, not forgetting a little bolfter upon the varicous Vein, to the end no superfluities flould flow to the Ulcer. Moreover that he should take rest in his bed, which is commanded by Hipporates, who faith, that those who have fore legs should not use much standing or fitting, but lying And after those things be done, and the Ulcer well mundified, a plate of Lead rubbed with Quickfilver (hould be applied. See then the means by which the faid Lord Vandeville might be cured of the faid Ulcer; all which they found good. Then the Phylician left me with the Surgeon, and went to the Lord Vandeville, to tell him that he did affure him I would cure him, and told him what I was refolved to do for the cure of his Ulcer, wherefore he was very joyful. He made me to be called to him, and asked me if I was of the opinion that this Ulcer could be cured, and I told him, yes, provided he would be obedient to what he ought. He made me a promife he would perform all things which I would appoint; and as foon as his Ulcer should be cured, he would give me liberty to return without paying any ranforn. Then I befeeched him to come to a better composition with me, telling him that the time would be too long to be out of liberty, if I fluid till he was perfectly well; and that I hoped within fifteen days the Ulcer flould be diminished more than one half, and it should be without pain, and that his Physicians and Surgeons would finish the reft of the cure very eafily. To which he agreed, and then I took a piece of Paper, and cut it the largeness of the Ulcer, which I gave him, and kept as much my self. I prayed him to keep promise, when he should find his business done: He swore by the faith of a Gentleman he would do it. Then I refolved to drefs him well, according to the method of Galen, which was, that after all frange things were taken out of the Ulcer, and that there wanted nothing but filling up with flesh, I dreft him but once a day, and he found that very ftrange. And likewife his Phylician, which was but a Fresh-man in those affairs, who would perfuade me with the Patient, to dress him two or three times a day, I prayed him to let me do what I thought good; and that it was not to prolong the cure, but on the contrary to haften it, for the great defire I had to be in liberty. And that he would look in Galon in the fourth Book of the Composition of Medicaments secondary genera, who faith, that if a Medicin do not remain long upon the part it profits not fo much as when it doth continue long; a thing which many Phylicians have been ignorant of, and have thought it hath been better to change the Plafter often. And this ill custom is so inveterate and rooted, that thePatients themselves accuse often-times the Surgeons of negligence, because they do not oftner

remove their Emplafters; but they are deceived. For as you have read in my Works in divers places, the qualities of all bodies which mutually touch, operate one against another, and both of them suffer fomething, where one of them is much stronger than the other, by means whereof the said qualities are united; they familiarize with the time, although they are much differing from the manner, that the quality of the Medicament doth unite, and sometimes becomes like to that of the body, which is a very profitable thing. Therefore they say he is to be praised much who suff invented not to change the Platter so often, because it is known by experience this is a good invention.

Moreover it is faid, great fault is committed to drefs Ulcers often in wiping of them hard; for one takes not away onely the unprofitable excrement, which is the pur or fanies of the ulcer, but the matter whereof the flelh is engendered; wherefore for the reafons aforefaid it is not needful to drefs Ulcers for the

The faid Lord Vandeville would fee whether that which I alledged out of Galen were true and commanded the faid Phylician to look there, for that he would know it; he caufed the Book to be brought upon the Table, where my faying was found true, and then the Phylician was alhamed, and I very joyful. So that the faid Lord of Vandeville defired not to be dreffed but once a day, in for much that within fifteen days the Ulcer was almost cicatrized; the composition being made between us, I began to be merry. He made me cat and drink at his Table, when there were not men of more great rank with him.

He gave me a great red Scarf, which he commanded me to wear. I may fay I was as glad of it as a Dog that hath a clog, for fear he should go into the Vineyard and eat the Grapes. The Physician and Surgeon led me through the Camp, to visit their hart people, where I took notice what our Enemies did: I perceived they had no more pieces of Cannon, but twenty five or thirty pieces for the Field.

Mounlieur de Vandeville held Mounlieur de Bauge Prisoner, the Brother of Mounlieur de Martigues who died at Hedin. The faid Lord of Bauge was Prisoner in the Castle of the Heap of Wood, belonging to the Emperour, who had been taken at Theremenne by two Spanish Souldiers. Now the faid Lord of Vandeville having looked well upon him, conceived he must be a Gentleman of fome good House; and to be the better affured, he aaused him to have his Stockings pulled off, and seeing his Stockings and his Feet clean and neat, together with his fine white focks, it confirmed him the better in his opinion, that it was a man was able to pay fome good ranfom. He demands of the Souldiers if they would take thirty Crowns for their Prisoner, and that he would give it to them presently, to which they agreed willingly, because they had neither means to keep him, nor feed him: belides they knew not his worth, therefore they delivered their Prisoner into the hands of the said Lord of Vandeville, who presently sent him to the Castle of the Heap of Wood with a Guard of sour Souldiers, with other Gentlemen Prisoners of ours. The said Lord Eauge would not discover himself, who he was, and endured very much, being kept but with bread and water, and lay upon a little firaw. The faid Lord of Vandeville after taking of Hedin, fent word to the faid Lord Bange and other prifoners, that the place of Hedin was taken, and the lift of those that had been slain, and amongst the rest, Mounsieur de Martigues: and when the said Lord of Bange heard the sound of the death of his brother the Lord Martigues, he began much to weep and lament; his Keeper demanded of him, why he made formany and fo great lamentations? He declared unto them that it was for Mounfieur de Martiguer his brothers fake. Having underflood that, the Captain of the Caffle dispatched a man away quickly, to tell it to Mountieur de Vandeville that that he had a good prifoner; who having received this good news rejoiced greatly, and the next day fent me with his Phylicians and four Souldiers to the Wood-Caftle to know if this prifoner would give him fifteen thousand Crowns for a ransom, so he would fend him free to his own house; and for the present he defired but the security of two Merchants of Antwerp, that he would name. The said Lord Vandeville persuaded me that I would make his agreement with his prifoner. See then why he fent me to the Wooden Castle, and commanded the Captain of the Castle to use him well, and to put him into a Chamber hung with Tapettry, and that they should make the Guard more strong, and from that time they made him good chear at his expence.

The answer of the said Lord of Bange was, that to put himself to ransom he was not able; and that, that depended upon Mountieur de Estamps his Uncle, and of Mistress de Bressene his Aunt, and he had not any means to pay such a ransom. I returned with my Keepers to the said Lord Vanderille, and told him the answer of his said Prisoner, who told me perhaps he thould not get out at so good a rate; which was true, for he was discovered. And forthwith the Queen of Hungary and the Duke of Savey sent word to the Lord Vanderille, that this morsel was too great for him, and that he must send him to them, (which he did) and that he had enough Prisoners besides him. He was put to forty thousand Crowns ransom, besides other expences.

Returning toward the faid Lord Vandeville I paffed by St. Omer, where I faw their great pieces of Battery, whereof the greatest part was flawed and broken. I came also by Theremenne, where I did not fee so much as stone upon stone, unless the mark of a great Church. For the Emperor gave commandment to the Country people within sive or six leagues about, that they should empty and carry away the stones; in so much, that now one may drive a Cart over the City as is likewise done at Hedin, without any appearance of Castle or Fortress. See then the mischief which comes by the Wars-

And to return to my purpose, presently after my said Lord Vandeville was very well of his Ulcer, and little wanted of the entire cure, which was the cause he gave me my leave, and made me be conducted with a Pass-port by a Trumpet to Abbeville, where I took Post, and went and found King Henry my

with a Pafs-port by a Trumpet to Abberille, where I took Poft, and went and found King Henry my Mafter at Anfimon, who received me with joy, and a good countenance.

He fent for the Duke of Gnisse the High Constable of France, and Mounsieur d'Estres, to understand by me what had past at the taking of Hedin; and I made him a faithful report, and affured them I had seen the great Pieces of Battery, which they had carried to St. Omer. Whereof the

the King was very joyful, because he feared lest the enemy should come further into France. He gave me two hundred Crowns to retire my self to my own house, and I was very glad to be in liberty, and out of this great torment and noise of thunder from the Diabolick artillery, and far from the Souldiers, blasphemers and deniers of God. I will not omit to tell here that after the taking of Hedin, the King was advertised that I was not slain, but that I was a prisoner, which his Majesty caused to be written to my wife by Monsieur de Gognier his chief Physician, and that she should not be in any trouble of mind for me, for that I was fate and well, and that he would pay my ranform.

The Battle of S. Quintin, 1557. Fter the Battel of S. Quintin, the King fent for me to the Fere in Tartemis toward Monfieur the

A Marthal of Bourdillon, to have a pass-port by the Duke of Savoy to go to dress Monsieur the Constable, who was grievously hurt with a Pittol-shot in the back, whereof he was like to die, and remained a prisoner in his enemies hands. But the Duke of Savey would not give consent that I fhould go to the faid Lord Constable, faying, he would not remain without a Surgeon, and that he doubted I was not fent only to drefs him, but to give him fome advertisement, and that he knew I underflood formething elfe befide Surgery, and that he knew me to have been his prifoner at Hedin. Monfieur the Marthal of Rourdillon advertifed the King of the Dukes denial, by which means the King writ to the faid Lord of Bourdillon, that if my Lady, the Lord high Conflables wife, did fend any body of her house, which was an able man, that I should give him a letter, and that I should also have told him by word of mouth, what the King and Monticur the Cardinal of Lorrain had given me in charge. Two days after there arrives a fervant of the Lord Conflables Chamber, who brought him thirts and other linnen, for which the faid Lord Marshal gave pass-port, to go to the faid Lord Contrable; I was very glad thereof, and gave him my letter, and gave him his leffon, of that which his Mafter should do being prisoner. I had thought being discharged of my embassage to return toward the King. But the faid Lord of Bourdillon prayed me to fray with him at the Fere to drefs a great number of people who were hurt, and were thither retired after the battle; and that he would fend word to the King the cause of my stay; which I did. The wounds of the hurt people were greatly flinking, and tull of worms with gangrene and putrefaction; fo that I was confirmined to come with my knife to amputate that which was fpoiled, which was not without cutting off arms and legs, as also to trepan divers. Now there were not any medicines to be had at the Fere, because the Surgeons of our Camp had carried all with them; I found out that the Chariot of the Artillery tarried behind at the Fere, nor had it yet been tonched. I prayed the Lord Marshal that he would cause some of the drugs to be delivered to me that were in it; which he did, and there was given to me one half at a time : five or fix days after I was conftrained to take the reft, neither was there enough to drefs fo great a number of people, and to contract and flay the putrefaction, and to kill the worms that were entred into their wounds, I washed them with Ægyptiscom dissolved in wine and Aque vite, and did for them all which I could possible, yet notwithstanding all my diligence, very many of them died.

There were Gentlemen at the Fere who had charge to find out the dead body of Monfier de Bois-Dolphin the Elder, who had been flain in the battle; they prayed me to accompany them to the Camp to find him out amongst the dead, if it were possible, which indeed was impossible; seeing that the bodies were all disfavoured and overwhelmed with putrefaction. We saw more than half a league about us the earth covered with dead bodies, neither could we abide long there, for the cadaverous fents which did arife from the dead bodies, as well of men as of Horfes. And I think we were the cause, that so great a number of flies rose from the dead bodies, which were procreated by their humidity and the heat of the Sun, having their tails green and blew, that being up in the air made a shadow in the Sun. We heard them buz, or hum, which was much marvel to us. And I think it was enough to cause the Plague where they alighted. (My little Master) I would you had been there as I was, to diffinguish the ordures, and also to make report to them which were never there. Now being cloyed and annoyed in that Country, I prayed Monfieur the Lord Marshal, to give me my leave to be gone, and that I was afraid I should be sick by reason of my too great pains, and the flinks which did arife from the wounded, which did almost all die, for what diligence foever could be used unto them. He made other Surgeons come finish the dresling of the said hurt pains he had taken of the poor wounded. Then I returned to Paris, where I found yet many Gentlemen that had been hurt, and were there retired after the battle.

The Voyage of the Camp of Amiens, 1558.

THE King fent me to Dourlan, and made me be conducted by a Captain Govaft, with fifty men in Arms, for fear I should be taken by the enemies. And seeing that in the way we were always in alarums, I caused my man to alight, making him to be my master for that time, and I got upon his horse, which carried my mail, and took his cloak and hat, and gave him my ambling Mare. My man being put upon her back, one would have taken him for the matter, and I for the fervant. Those of Douclass seeing us far off, thought we were enemies, and let flie their Cannon-shot at us. Captain Gauest my conductor, made a sign with his hat, that we were not enemies, fo that they left thooting, and we entred into Donolan, with great joy. Those of Dourlan made a fally forth upon the enemies five or fix days before; who killed and hurt divers of our Captains, and good Souldiers; and amongst the rest Captain S. Aubin valiant at the sword, whom Monsieur de Guise loved very well, and for whom chiefly the King sent me thither, who being in the fit of a quartan fever, would needs go out to command the greatest part of his Company: a Spaniard seeing him that he commanded, perceived he was a Captain, and shot a musket-bullet quite through his neck; my Captain S. Aubin thought with this stroke he was dead, and

and with the fear (I protest to God) he lost his quartan ague, and was altogether freed from it. I deeffed him with Anthony Partal Surgeon in ordinary to the King, and divers other fouldiers: forme died,
others escaped quite with the loss of a leg, or an arm, or the loss of an eye, and they said they escaped
good cheap, escape that can. When the enemy had broken their Camp, I returned to Paria. Here
I hold my peace of my little Master, who was more at ease in his house, than I at the Wars.

The Voyage of Harbor of Grace, 1563.

Yet I will not omit to fpeak of the Voyage of the Harbor of Grace; then when they made the approaches to plant the Artillery, the English who were within it killed some of our Souldiers, and divers Pioneers, who undermined, who when they were seen to be so hurt that there was no hope of curing, their fellows stript them and put them yet alive into the Mines, which served them for so much hiling earth. The English seeing they could not withstand an affault, because they were very much attainted with diseases, and chiefly with the Plague, they colded, their lives and jewels faved. The King caused them to have ships to return to England, being glad to be out of this place insected with the Plague: the greatest part died, and carried the Plague into England, and since have not yet been exempted. Captain Sarlabous master of the Camp, was left there in Garrison, with six Ensigns on foot, who had no fear of the plague, and were very joyful to enter therein, hoping there to make to make good cheer. My little Master had you been there, you had done as they.

The Voyage of Rowen, 1562.

Ow for the taking of Romen, they killed divers of ours before the affault, and at the affault: the day after they entred into the City, I trepaned eight or nine, who were hurt at the breach with the firekes of frones. There was formalignant an air, that divers died, yea of very small hurts, informuch that fome thought they had poiloned their bullets: those within faid the like by us, for although they were well treated in their necessities within the City, yet they died also as well as those without. The King of Natur was hurt in the shoulder with a bullet some few days before the affault; I visited and helpt to dress him, with his own Surgeon, named M. Gilbert one of the chief of Mont-pelier, and others. They could not find the bullet, I fearched for it very exactly, I perceived by conjecture, that it was entred by the head of the Adjuterium, and that it had run into the cavity of the faid bone, which was the cause we could not find it. The most part of them faid it was entred and loft within the cavity of the body. Monfieur the Prince of the Roch upon Ton, who intimately loved the King of Navar, drew me to one fide, and askt me if the wound was mortal. I told him yea, because all wounds made in great joints, and principally contused wounds, were mortal according to all Authors who had written of them. He inquired of the others what they thought, and shiefly of the faid Gilbert, who told him that he had great hope that the King his Mafter would be cured, and the faid Prince was very joyful. Four days after the King and Queen-Mother, Monsieur the Cardinal of Bourbon his brother, Monfieur the Prince of Roeb upon Ton, Monfieur de Guife, and other great personages, after we had dreffed the King of Navar, caused a consultation to be made in their prefences, where there were divers Phylicians and Surgeons: each man faid what feemed good unto him, and there was not one of them, who had not good hope of him, faying that the King would be cured, and I perfitted always on the contrary.

Monfieur the Prince of the Rock upon Ton who loved me, withdrew me afide, and faid I was only against the opinion of all the rest, and prayed me not to be obstinate against fo many worthy men. I answered him, that when I saw any good signs of cure, I would change my advice. Divers consultations were made, where I never changed my word, and prognostick, such as I had made at the strict dressing, and always faid that the arm would fall into a Gangrene, which it did, what diligence foever could be had to the contrary; and he gave up his soul to God the eighteenth day of his burt, Monfieur the Prince upon Ton, having heard the death of the said King, sent his Physician and Surgeon toward me, named Fenre now in ordinary to the King, and the Queen-Mother, to tell me, that he would have the bullet taken out, and that it should be looke for in what place soever it could be found: then I was very joyful, and told them that I was well affured to find it quickly, which I did in their prefences and divers Gentlemen. It was lodged in the very midst of the cavity of the Adjutory bone. My said Prince having it, shewed it to the King and Queen, who all said my prognostick was found true. The body was laid to rest in the Gastle-Galliard, and I returned to Paris, where I found divers hurt men who were hurt at the breach of Rossen, and chiefly Italians, who defired me very much to dress them, which I did willingly; there were divers that recovered, and others died. I believe (my little Master) you were called to dress some of them, for the great num-

ber there was of them.

The Voyage of the Battel of Dreux, 1592.

The day after the battel was given at Dreux, the King commanded me, to go drefs Monfieur the Count of En, who had been hurt with a Piftol-thot in the right thigh, neer the joint of the hip; which fractured and broke the Or formir in divers places, from whence divers accidents did arife, and then death, which was to my great grief. The day after arrival I would go to the field, where the battel was given, to fee the dead bodies: I faw a league about: all the earth covered, where there was by effimation five and twenty thou(and men and more. All which were dispatched in the space of two hours. I would (my little Master) for the love I bear you, that you had been there to recount it to your scholers, and to your children. Now in the mean time while I was at Dreux I visited and dreft a great number of Gentlemen and poor souldiers, and amongst the rest many Smisser Captains: I dressed fourteen in one chamber only, all burt with Pistol-shot and other instruments of diabolical tire, and not one of the fourteen died. Monsiter the Count of En being dead, I made no long tarrying at Dreux: there came Surgeons from Paris who performed.

med well their duty towards the hurt people, as Pigray, Cointeret, Hubert, and others; and I returned to Paris, where I found divers Gentlemen wounded, who had retired themselves thither after the Battle to be dressed of their hurts.

The Voyage of the Battle of Moncontour, 1596. During the Battle of Moncontour, King Charles was at Plefits the Tours; where he heard they had won it; a great number of hurt Gentlemen and Souldiers withdrew themselves into the City and Suburbs of Tours, to be dressed and helped, where the King and Queen-Mother commanded me to shew my duty with the other Surgeons, who were then in quarter, as Pigray, du Blois, Portail, and one named Siret, a Surgeon of Tours, a man very skilful in Surgery, and ar that time Surgeon to the Kings Brother; and for the multitude of the wounded we were but litthe in repose, nor the Physicians likewise. Count Mansfield Governour of the Duchy of Lucemburg, Knight of the King of Spains Order, was greatly hurt in the battle, in the left arm, with a Pittol-flot, which broke a great part of the joint of the elbow, and had retired himself to Bourgueille near Towers; being there, he fent a Gentleman to the King, affectionately to befeech him to fend one of his Surgeons to help him in his hurt. Council was held what Surgeon should be fent. Mountieur the Marthal of Montmorency told the King and Queen, that it were best to send his chief Surgeon, and declared to him that the said Lord Mansfield was one part of the cause of winning the Battle. The King faid flat he would not that I should go, but would have me remain close to him. Then the Queen-Mother faid, I should but go and come, and that he must consider it was a firange Lord, who was come from the King of Spains fide, to help and fuecour him. And upon this he permitted me to go, provided that I should return quickly. After this resolution he fent for me, and likewise the Queen-Mother, and commanded me to go find the faid Lord Mansfield in the place, where I was to serve him in all I could, for the cure of his hurt; I went and found him , having with me a Letter from their Majesties: having seen it, he received me and found him., having with the a Letter from their stageness: having feen it, he received me with a good will, and from thenceforth discharged three other Surgeons that dreif him; which was to my great grief, because his hurt seemed to me uncurable. Now at Bourgueil there were retired divers Gentlemen, who had been hurt at the faid Battle, knowing that Mounfieur de Guise. retired divers Gentlemen, who had been nurt at the taid Battie, knowing that Mounfieur de Guife was there, who had been also very much hurt with a Pistol-shot through one leg, well assured that he would have good Surgeons to dress him, and also that he, being kind and liberal, would affort them with a great part of their necessaries. And for my part, I did help and aid them with all my Art, as much as it was pessible; some died, some recovered, according to their hurts. The Count Rhingrave died, who had such a shot into the shoulder, as the King of Navar before Rosen. Mounfieur de Bassaries Colonel of twelve hundred Horse, was hurt also in such a like please Gentlement. Rhingrave died, who had men a mot into the incuracit, as the King of Navar before Rosen. Mounfield de Baffampiere Colonel of twelve hundred Horie, was hurt also in such a like place as Count Manifeld, whom I dreit and God cured. God so blessed my work that within three Weeks I led him back to Paris, where I must as yet make some incitions in the arm of the faid Lord Mansfield, to draw out the bones which were greatly broken and cariefed: he was cured by the grace of God, and gave me an honeft reward, so that I was well contented with him, and he with me, as he hath fince made it appear: He writ a Letter to the Duke of Afest how that he wascured of his hurt, and alio Mounfieur de Baffompiere of his, and divers others, which I had dreft after the Battle of Moncontour, and counfelled him to befeech the King of France, my good Master, to give me leave to go fee Moun-

The Voyage of Flanders. Ounfieur the Duke of Afeet did not fail to fend a Gentleman to the King with a Letter, Ounfieur the Duke of Afest did not fail to fend a Gentleman to the King with a Letter, his chief Surgeon to come to fee the Marques of Auret his Brother, who had received a Musket-and Surgeons in those parts were much troubled to cure. The King sent for me, and commanded and surgeons in those parts were much troubled to cure. The King sent for me, and commanded told him I would imploy all that little knowledge which it hath pleased God to give me. I went then conducted by two Gentlemen of the Catile of Auret, which is a leave and a half form. then conducted by two Gentlemen of the Cattle of Aurer, which is a league and a half from Mons in Hainault, where the faid Marquels was: as foon as I arrived I vitited him, and told him the King had commanded me to come and fee him, and to drefs him of his hurt; he told me he was glad of my coming, and was much bound to the King to have done him the honour to have fent me to him. I found him in a great Fevers his eyes very much funk, with a countenance gaftly and yellow, his tongue drie and rough, and all the body emaciated and lean, his fpeech low like that of a dying man: then I found his thigh much fwelled, apoltemated, ulcerated, and cafting and gainly man and the state of the state o out a green flinking matter; I fearched it with a Probe, and by the fame I found a cavity near the groin, ending in the middle of the thigh, and others about the knee, fanious and cuniculous; alfo certain scales of bones, some separated, others not. The legs were much turnified, and soked with a pituitous humour, cold, moiff, and flatulent; in for much that the natural heat was in the way to be fuffocated and extinguished, and the faid leg crooked and extracted toward the buttocks, his rump ulcerated the bredth of the palm of an hand, and he faid he felt there a great pain and finarting, and likewife in his reins, in formuch that he could not take any reit night or day; neither had he any appetite to eat, but to drink enough: it was told me that he tell often into faintings and fwoonings, and fornetimes as it were by an Epilepfie, and had oftentimes defired to vomit, with fuch a trembling that he could not carry his hands to his mouth. Seeing and confidering all thefe great accidents, and the forces much abated; truly I was much grieved to have gone to him, because me thought there was little appearance that he could escape. withflanding to give him good courage and good hope, I told him that I would quickly fer him on foot by the grace of God, and the Phylicians and Surgeons help. Having feen him, I went

a walking into a Garden, where I prayed to God that he would give me the grace to cure him, and that he would give a bleffing to our Hands and Medicaments, to combat against formany complicated Maladies. I bethought in my mind the ways I must keep to do it. They called me to dinner, I entered into the Kitchin where I saw taken out of a great Pot, half a Mutton, a quarter of Veal, three great pieces of Beef, and two Pullets, and a great piece of Bacon, with great flore of good Herbs. Then I faid to my felf, this Broth was full of juice, and of good nouriftment. After Dinner all the Physicians and Surgeons affembled, we entered into conference in the prefence of Mountieur the Duke of Afeat, and fome Gentlemen that did accompany hims. I began to tell the Surgeons that I marvelled much they had made no apertions in the Marquelles. thigh, which was all aportumated, and the matter that iffued out was foul and flinking, which thewed it had a long time lurked there, and that I found with my Probe a Caries in the bone, and fmall scales which were already separated; they made me answer, He would never give con-fent, and likewise it was almost two Moneths since they could win him to put on clean Sheets on his bed, neither durft any one fearce touch the Coverlet, he felt fo great pain. Then faid I, for to cure him, we must touch other things than the Coverlet of the Bed. Each one faid what he thought best for the Lords grief, and for conclusion held it altogether deplorable. I told them there was yet fome hope, because of his youth, and that God and Nature do sometime such things which feem to Phylicians and Chirurgeons impossible. My consultation was, that all those accidents were come by reason of the buller hitting near the joint of the Knee, which had broken the ligaments, tendons, and apowerrosts of the muscles which tied the said joint together with the Os sensor; alfo Nerves, Veins, and Arteries, from whence had followed pain, inflammation, apostume, and ulcerand that we must begin the cure by the difease, which was the cause of all the said accidents, that is to fay, to make apertions, to give iffue to the matter retained in the interspaces of the Muscles, and in the fubflance of them: Likewife to the bones which caufed a great corruption in the whole thigh, from whence the vapours did arife and were carried to the heart, which caufed the Syncope and the Fever, and the Fever an universal heat through the whole body; and by consequent, depravation of the whole Occomomy; Likewise that the said vapours were communicated to the brain, which caused the Epilepsie and trembling, and to the Stomach disdain and loathing, and hindered it from doing its functions, which are chiefly to concoct and digett the meat, and to convert it into Chylue; which not being concocted, they ingender crudities and obfiructions, which makes that the parts are not nourifled, and by confequent the body dries, and grows lean, and because also it did not do any exercise; for every part which hath not his motion remaineth languid and arrophiated, because the heat and spirits are not fent or drawn thither, from whence follows mortification. And to nourith and fatten the body, Frictions must be made univerfally through the whole body with warm linnen cloths above, below, and on the right fide, and left, and round about; to the end to draw the blood and fpirits from within outward, and to refolve any foliginous vapours retained between the skin and the flesh; thereby the parts shall be nou-rished and restored, (as I have heretofore said, in the Tenth Book treating of the Wounds of Gun-(thot) and we must then cease when we see heat and redness in the skin, for sear of resolving that we have already drawn, and by confequent make it become more lean. As for the ulcer which he hath upon his rump, which came through his too long lying upon it without being removed, which was the cause that the spirits could not flourish or shine in it, by the means of which there fhould be inflammation, aposteme, and then ulcer, yea with loss of subflance of the subject flesh, with a very great pain, because of the Nerves which are differninated in this part: That we must likewise put him in another soft bed, and give him a clean Shirt and Sheets; otherwise all that we could do would ferve for nothing, because that those excrements and vapours of the matter retained to long in his bed, are drawn in by the Systole and Diastole of the Arteries which are differninated through the skin, and cause the spirits to change and acquire an ill quality and correspond which is seen in some that lie in a bed where one hath swet for the Pox, who will get the Pox by the putrid vapours which shall remain foaking in the Sheets and Coverlets. Now the cause why he could in no wife sleep, and was as it were in a Consumption, 'twas because he ate little, and did not do any exercise, and because he was grieved with extreme pain. For there is nothing that abateth so much the strength aspain. The cause why his tongue was dry and soul, was through the vehemency of the heat of the Fever, by the vapors which ascended through the whole body to the mouth. For as we say in a common Proverb, When the Oven is well best, the Threat say in the Whole body to the mouth. the Throat feels it. Having discoursed of the Causes and Accidents, I said they must be cured by their Contraries, and first we must appeale the pain, making apertions in the thigh to evacuate the matter retained, not evacuating all at a time, for fear left by a sudden great evacuation, there might happen a great decay of spirits which might much weaken the Patient and shorten his days. condly, to look to the great (welling and cold of his leg, fearing left it (hould fall into a Gangrene and that actual heat must be applied unto him, because the potential could not reduce the intemperature De Potentia ad Alimm, for this cause hot Bricks must be applied round about, on which should be cast a decoction of Nerval Herbs boiled in Wine and Vinegar, then wrapt up in forme Napkin, and to the feet an earthen Bottle filled with the faid decoction, thopt and wrapped up with fome linen cloths; also that fomentations must be made upon the thigh, and the whole leg, of a decoction made of Sage, Rosemary, Tyme, Lavender, Flowers of Cammonile, Mellot, and Red Rosesboiled in White Wine, and a Lixivium made with Oak-ashes, with a little Vinegar, and half an handful of Salt. This Decoction hath vertue to attenuate, incite, resolve and drie the gross viscous humour. The faid Fomentations must be used a long while, to the end there may be a great resolution; for being so done a long time treather, more is resolved than attracted. be a great refolution; for being fo done a long time together, more is refolved than attracted, because the humour contained in the part is liquified, the skin and the fielh of the muscles is ratified. Thirdly, that there must be applied upon the rump a great Platter made of the red deficency.

cative and Unquentum Comitifie, of each equal parts incorporated together, to the end to appeale his pain, and drie up the ulcer, also to make him a little down-pillow which might bear his rump aloft without leaning upon it. Fourthly, to refresh the heat of his Kidnies, one should apply the Unguent called Refrigerant Galeni freshly made, and upon the leaves of Water-Lillies. Then a Napkin dipt in Oxycrate, wrung and often renewed, and for the corroboration and firengthening of his heart a refreshing Medicin should be applied, made with Oil of Nemphar, and unguent of Roses, and a little Saffron diffilled in Rofe-Vinegar, and Treacle spread upon a piece of Scarlet, for the Spreade which proceeded from the debilitation of the natural strength troubling the brain. Also he must use good nourishment full of juice, as Rere Eggs, Damask Prunes stewed in Wine and Sugar, also Panado made of the broth of the great Pot (of which I have already spoken) with the white alto Panado made of the broth of the great For (or which I have already spoken) with the white flethy parts of Capons, and Partridge wings minced finall, and other roaft-meat eafie of digettion, as Veal, Goat, Pigeon, Partridge, and the like. The Sauce should be Oranges, Verjuice, Sorrel, sharp Pomgranats; and that he should likewise eat of them boiled with good herbs, as Sorrel, Lettuce, Purslain, Succory, Bugloss, Marigolds, and other the like. At night he might use cleanfed Barley with the juice of Nenuphar and Sorrel, of each two ounces, with five or fix grains of Opium, and of the Four cold Seeds bruifed, of each half an ounce, which is a remedy nourithing and medicinal, which will provoke him to fleep: that his bread should be of Meslin, neither too new nor too stale; and for the great pain of his head, his hair must be cut, and rub his head with Oxyrrhodinum luke-warm, and leave a double cloth wet therein upon it; likewife should be made for him a frontal of Oil of Rofes, Nenuphar, Poppies, and a little Opium and Rofe Vinegar, and a little Camphire and to re-new it fometimes. Moreover one should cause him to smell to the slowers of Henbane and Nenuphar bruifed with Vinegar, Rofe Water, and a little Camphire wrapped in a Handkerchief, which thall be often and a long time held to his nofe, to the end that the fraell may be communicated to the brain, and thefe things to be continued till that the great inflammation and pain be pair, for fear of cooling the brain too much. Belides, one may cause it to rain artificially, in pouring down fear of cooling the brain too much. Bendes, one may came it to rain arrancially, in pouring down from fome high place into a Kettle, and that it may make fuch a noise that the Patient may hear it is by these means sleep shall be provoked on him. And as for the retraction of his leg that there was hope to dress it, when evacuation was made of the matter, and other humours contained in the thigh, hope to drefs it, when evacuation was made of the matter, and other numours contained in the thigh, which by their extention (made by repletion) have drawn back the leg, which might be remedied in rubbing the whole joint of the Knee with **Disguestum Dialibase** and Oil of Lillies, and a little **Aqua vita**, and upon it to be laid black Wool with the greafe thereof. Likewife putting in the Ham a Feather pillow folded in double, and by little and little to make his leg to firetch out. All Ham a Feather pillow folded in double, and by incleans indice to make his leg to irreten our. All which my discourse was approved of by the Physicians and Chirurgeons. The consultation ended, we went to the fick Patient, and I made him three apertions in his thigh, from whence ended, we went to the nex Patient, and things that the fame time I drew out form feales of bones; nor would I let out too much abundance of the faid matter, for fear of too much decaying his strength: Then two or three hours I caused a Bed to be made near his own, where there were clear white fleets, then a firong man lifted him into it, and he rejoiced much in that he was taken out of his foul flinking Bed. Soon after he demanded to fleep, which he did almost four hours, where all the people of the house began to rejoice, chiefly Mountieur the Duke of Ascor

The days following I made injections into the bottom of the cavities of the Ulcer, made with Agyptiscum diffolved fometimes in apra vite, and fometimes in Wine. I applied to mundiffe and drie the spongy and loofe flesh, boliters; at the bottom of the sinuolities, hollow tents of lead, that the fanies might have paffage out; and upon it a great Emplatier of Discalcibbor diffolved in Wine: likewife I did rowl it with fach dexterity, that he had no pain, which being appealed, the Fever began much to diminish. Then I made him drink Wine moderately allayed with Water, knowing that it reflores and quickens the spirits; and all the things which were refled on in the confultation were accomplished, according to time and order; and his Pains and Fever ceased, he began to grow better, and discharged two of his Surgeons and one of his Phylicians, fo that we were but three with him. Now I remained there about two moneths, which was not without feeing divers lick people, as well rich as poor, which came to me about three or four leagues about. They gave meat and drink to the needy, all which he recommended to me, and prayed me alfo for his fake to help them. I protest I did not result any one, and did to them what I possibly could, wherefore he was joyful. Then when I saw he began to mend, I told him he must have a Confort of Violins and a Jester to make him merry, which he did: in one moneth we so wrought, that he could hold himself up in a Chair, and made himself to be carried and walk in his Garden, and at the Gate of his Cattle to fee the people pafs by. or three leagues about, knowing they could fee him, came the Feaft-day Male and Female, to fing and dance pell mell, in joy of his amendment, all being very glad to fee him, which was not done without good laughing and drinking. He caused still a barrel of Beer to be given them, and they drank all merrily to his good health. And the Citizens of Mont Hainault, and other Gentlemen neighbors, came to fee him in admiration, as a man coming from the Tomb. And as foon as he began to mend, he was not without company, and as one went out another came in to visit him: began to mend, he was not without company, and as one went out another came in to vint him: his Table was always well covered. He was greatly loved of the Nobility and of the Common People, as well for his liberality, as for his beauty and honefly, having a pleafant look and a gracious speech, in so much that those that beheld his sace were constrained to love him. The chief of the City of Mons came on Saturday to befeech him to permit me to go to Mons, where they had a great defire to feaft and make me good cheer for his fake. He told them he would pray me to go there, which he did. But I made him answer that they should not do me such honour, as also that they could not give me better cheer than I had with him. And he prayed me again affectionately to go thither, and that I should do that for his sake, to which I agreed. The day

after they fetcht me with two Coaches, and being arrived at Mons we found the dinner ready, and the chief of the City with their Wives, flaid for me with a good will. We went to the Ta-ble, and they placed me at the upper end, and drank all to me, and to the health of Mounfieur D' Auret, faying that he was very happy, and they likewife, to have obtained me to take him in hand, for that they knew that in this company he was greatly honoured and loved. After Dinner they led me back to the Cafile of Auret, where Mounfieur the Marquels flaid for me with great expectation to recount unto him, what we had done in our Banquet. I told him that all the company had drank divers times to his health. In fix weeks he began to uphold himfelf a little with Crutches, and grow very fat, and to get a lively natural colour. Now he had a defire to go to Bestumont, which is the dwelling place of Mountieur the Duke of Afent, and made himself be carried in a great chair with eight men by turns, and the Country-folks where we paffed along, knowing 'twas Mounfieur the Marquefs, fought and strove together who should carry him, and constrained us to drink, but it was but Beer, but I believe had it been Wine or Hippocras, they would have given it us with a very good will, fo much did they flew themfelves joyful to fee the faid Marquels, and prayed all to God for him. Being arrived at Beaumont, all the people came before us to do him reverence, and prayed God to blefs him, and keep him in good health. We entered into the Castle, where there was more than fifty Gentlemen which the Duke of Afest had fent for to come make good cheer with his Brother, who kept his Table furnished three days together: And after Dinner the Gentlemen ran at the Ring, played at Foils, and rejoiced to ice Mounfieur Auret, because they heard he would never come out of his Bed again, or be cured of his hurt. I was always at the upper end of the Table, where every one drank caroufes to him and me, thinking to make me foxt, which they could not do, for I drank but according to my old cufiom. A few days after we returned back and took leave of Madam the Dutchefs of Afent, who took a Diamond Ring from her finger, which the gave me, acknowledging I had very well dreft her Brother; which Diamond was better worth than fifty Crowns. Mounfeur Auret grew better and better, and walked all alone round about his Garden with Crutches. I begged leave of him divers times to come away to Paris, declaring that his Phylician and Surgeon would well do the reft that remained for the cure of his gricf. And now to begin a little to eftrange my felf from him, I prayed him to give me leave to go fee the City of Antwerp, which he willingly accorded to: and commanded his Steward to conduct me thither, accompanied with two Pages: we paffed through Malines and Brazzels, where the chief of the City prayed the faid Steward that at our return they might hear of it, and they had a great defire to feaft me, as they of Mons had done. I thanked them most kindly, and told them that I was not worthy of such honour. I was not two days and a half to see the City of Antwerp, where fome Merchants knowing the Steward, prayed him to do them the honour, that they might beflow a Dinner or Supper upon us. There was firiving who should have us, and they were all very joyful to hear of the good health of the Marquess of Annet, doing me more honour than I expected. To conclude, we came back to the Marquess making good cheer, and within five or fix days I asked my leave of him, which he granted with great grief, and gave me an honest Present, and of great value, and made me be conducted by the said Master of his House and two Pages, even to my house at Paris.

I have forgot to tell you that the Spanisrds have fince ruined and demolished his Castle of Aures, fackt, pillaged, risled and burnt all the Houses and Villages belonging unto him, because he would

not be of their fide, in the flaughters and ruines of the Low-Countries.

The Voyage of Bourges, 1562.

He King with his Camp remained not long at Bourges, but those within yielded it up, and went out with their Jewels faved. I know nothing worthy of memory, but that a Boy of the Kings Privy Kitchin, who being near the Walls of the City before the Composition was or the Kings Privy Kitchin, who being near the Walls of the City before the Compolition was made, cried with a loud voice, Hugonot, Hugonot, Shoot here, Shoot here, having his arms lifted up, and his hand firetched out, a Souldier fhot his hand quite through with a bullet: having received his firoke, he came and found me out to drefshim. My Lord High-Conftable feeing the Boy to have his hand all bloudy, and all rent and torn, demanded of him who had hurt him. Then there was a Gentleman who faw the fhot made, faid it was well befrowed, because he cried Hugonot, shoot here, shoot here. Then the faid Lord Conftable faid, this Hugonot was a good Musketees, and have a pitiful mind; for it was very likely if he would have thor at his head, he might have done and bare a pitiful mind; for it was very likely if he would have that at his head, he might have done it more easily than in the hand. I dreffed the faid Cook who was very fick, but at length was cured, but with lameness of his hand, and ever after his Companions called him Hugonot.

The Battle of St. Dennis, 1567.

Nd as for the battle of Saint Don's there were divers flain as well on one fide, as on the other: A ours being hurt, went back to Paris to be dreffed together with the Prifoners who were taken, whereof I dreffed a great part. The King commanded me, by the request of the Lady High-Constable to go to be house to drefe my Lord, who had received. Point they include of the Conflable, to go to her house to drefs my Lord, who had received a Pistol-shot in the middle of the spondyls of his back, whereby he presently lost all sense and motion of thighs and legs, with retention of excessions and legs, with retentions of excessions and legs. of excrements, not being able to cast out his Urin, nor any thing by the fundament, because that the Spinal marrow, (from whence proceed the sinews to give tense and motion to the inferious parts) was bruised backers and to be the cast of the spinal marrow. parts) was bruifed, broken, and torn by the vehemence of the bullet. He likewife lost his Reason and Understanding, and in a few days he died. The Surgeons of Paris were a long time troubled to drefs the faid wounded people. I believe (my little Mafter) that you faw fome of them. I be-feech the great God of Victories, that we may never be imploied in fuch evil encounters and difafters.

The Voyage of Bayonne, 1564.

Now I fay moreover, what I did in the Voyage with the King to Bayonne, where we have been two years and more, to compass all this Kingdom, where in divers Cities and Villages I have been called into confultations for divers diseases with the deceased Mounsieur Chaplain, chief Physician to the King, and Mounsieur Chaplains chief to the Queen-Mother, a man of great honour and knowledge in Physick and Surgery: making this Voyage, I was always inquisitive of the Surgeons if they had marked any rare thing of remark in their practice, to the end to learn some new thing. Being at Bayonne, there happened two things of remark for the young Chirurgeons: The first was, that I dress a Spanish Gentleman, who had a grievous great Impostume in his Throat: he came to have been touched by the deceased King Charles for the Evil. I made incision in his Aposteme, where there was found great quantity of creeping. Worms as big as the point of a Spindle. to have been touched by the deceafed King Charles for the Evil. I made incition in his Apoferne, where there was found great quantity of creeping Worms as big as the point of a Spindle, having a black head; and there was great quantity of rotten fielh. Moreover there was under his Tongue an Imposiume called Ramila, which hindered him to utter forth his words, and to eat and swallow his meat: he prayed me with his held up hands to open it for him, if it could be done without peril of his person; which I immediately did, and found under my Lancet a solid body, which was five stones, like those which are drawn from the bladder. The greatest was as big as an Almond and the other like little long Beans, which were five in number; in this aposteme was contained a stimp dumour of a yellow colour, which was more than four spoonfuls; I lest him in the hands of a Surgeon of the City to finish his cure.

Mounsteur de Fantain Knight of the Kings Order, had a great continual pestilent Fever accompanied with divers Carbuncles in divers parts of his body, who was two days without ceasing to bleed at the nose, nor could it be stanched; and by that means the Fever ceased with a very great sweat, and soon after the Carbuncles ripened and were by medressed, and by the grace of God, cured.

I have published this Apology to the end that each man may know with what foot I have always marched, and I think there is not any man fo ticklish, which taketh not in good part what I have faid, seeing my Discourse is true, and that the effect sheweth the thing to the eye, Reason being my Warrant against all Calumnies.

THE

PREFACE.

F how great consequence a more perfect knowledge of ANA-TOMY is to the Art of PHYSICK and CHIRUR-GERY, hath been frequently and abundantly made out by Anatomists, Physicians, and Chirurgeons, upon occasion, in their several Writings; though the thing it self speak so plainly in its own behalf, that much need not be said in this kind. The case is plain, that with the like facility and suc-

cess may a Mariner, making out some Unknown Land, steer his course through the Main Ocean, where nothing but Sea and Skie appears, without the help of his Card and Compass, as a Physician judge of the Natural Action, or Preternatural Affect of any part of the Body: or a Chirurgeon institute any Operation about the same, without the Anatomical knowledge thereof: and therefore no more shall be said to this effect.

Anatomy may be very commodiously reduced to four distinct Kinds, or distin-

guished according to so many Principal Parts.

- 1. Σπλαίχνολογία, Splanchnologie, that is, the description of the Bowels contained in the three Cavities or Bellies of the Body, the lower, middle, and supreme.
- 2. 'Oseodoria, Osteologie, which is the description of all the Bones of the Body.
- 3. Muodosia, Myologie, being the Anatomical History of all the Muscles.
- 4. 'Αγδαολογία, Angeiologie, describing all the Vessels of the Body, i. e. the Veins, Arteries, and Nerves: these last though baving no sensible Cavities, being reputed Vessels in the account of Anatomists.

Now though all these parts or kinds of Anatomy are needful both to Physick and Chirurgery, yet are they not all of a like necessity to both : but the first of more absolute necessity to the Art of Physick; the other three to Chirurgery. And therefore, though all four have been treated on by the learned Author of this Volume, yet in reason it could not but be advantagious and acceptable to Chirurgeons to have some further helps in our English Tongue, for improvement in the three latter kinds before-mentioned, or in some of them at least. Now for Osteologie, the parts themselves, or the dry bones are and may be kept at hand, for frequent view and contemplation upon them; whereby their feveral Figures, Articulations, and all other particulars observable about them, may be rendred familiar, in order to pra-Etice about Fractures and Luxations: and without such Autoplie, much cannot be acquired by the reading of Descriptions, or sight of Delineations. Toward Myologie there bath been a peculiar Tractate of late published in English, which may be useful in that respect to those who cannot peruse Latin Authors. So that the greatest want seemed to be in that kind or part of Anatomy, which is the last in the Enumeration, i.e. Angeiologie, or the Description of the Vessels; the more exact or particular knowledge whereof, especially of those in the habit of the

The Preface.

body, will appear, upon a true accompt, more necessary to the exercise of Chirurgical Operations, at greater certainty, and with more security, than the knowledge of the Muscles. Upon these considerations, being consulted by the Publisher of this Work, what Piece or Tractate in any kind, of Chirurgery or Anatomy, I thought might to good purpose be added thereunto; I resolved him that I could think of nothing more advantageous in this kind, than a fuller and more Anatomical Description of the Veins, Arteries, and Nerves, in the Body of Man, Translated out of the Anatomy of Spigelius; adding also the most useful Anatomical Figures relating to the faid Descriptions, of the same largeness as they are in the Edia tions of the faid Author in Folio; which were first taken out of Vesalius, and are the largest and fairest that are extant: the case being here, as in Mathematical Instruments, in which, how much the largeness conduceth to certainty in use, is well known. Accordingly he bath not spared for care and cost, in procuring a Scholar every way competent to Translate the Descriptions of these Parts out of the forementioned Author, and an able Artificer to Cut the Figures. And as the Work is now accomplished, I doubt not but good improvement may be made thereof by such Chirurgeons, as being not able to make use of the Original, stand in need of such helps, if they will not be wanting to themselves for industry in the use hereof.

J. G.

TRACT.

TRACT. I. CONCERNING THE VEINS.

CHAP. I.

Rechous up the Branches or Propagations of the Vena Portæ or the Gate-Vein, and explains an Aphorism of Hippocrates, that makes very much to the purpose.

Et us come now to the History of the Veins, in which we will begin with the Vena in they are fat. Porte or Gate-vein, as that which fpreads not fo wide and far as the Caus or hollow one. For it is wont to be diffributed onely through the lowest belly, and not what parts the at all to propagate it felf out of it; nor does it branch through all parts of that, but Gate vin is fuch onely as are appropriated to the nutritive faculty, namely the Liver, the bladder dispersed. of Gall, the Stomach, the Spleen, the Sweet-bread, Kall, Guts, and Melentery; for

the Hollow-vein fends its propagations to the reft, as the Reins, Bladder and those parts which serve for generation. But that the manner of this distribution may be more easily understood, for our The division better method in Teaching, likening the whole Vein to a Tree, we will divide it into four parts, one of the Gate of which we will call the Roots, as that part which is in the Liver; another the Trunk, which con- vela into the tinues it felf on, and is not divided; a third the Brancher, into which the Trunk is divided; a fourth, Boots, Trunks, Twigs or Sureles, fuch fmall Veins as the Trunk fhoots out at its fides; before it be divided into its Twigs.

Twigs or Sureles, Which terms ought diligently to be observed, because we have endeavoured by the propriety of these words to give light to this obscure Treatise concerning the Veins. But that they may more easily be committed to memory, and all that concerns this business be written with more breating for your leavest leaves a highest properties. vity, following fome very learned later Authors, we will give every part its name from the place of

From the outfide then of the Liver fome very little hairy Veins are prolonged towards its inner The Roots. Region, and by little and little meet together into greater branches, fo that at length they become five, which again gathered together like roots about the middle of the hollow fide of the Liver, but formewhat hinderly near to the back, make a notable flock or Trunk, which at length iffuing forth near to those eminencies of the Liver, which by the Greeks are termed Thinks Gates, is called the Gatevein, and now deferves the name of a Trunk.

This Trunk parting now from the Liver descends somewhat obliquely towards the left side, un- The Trunk. This Trunk parting now from the Liver descends ionsewhat obliquely towards the left lide, under the Gut called Duodement, where above the Rack-bones it gets a firm feat; but before it be divided into branches, two twigs fprout from it; the first of which being very small, arising out of the uppermost and forepart of the Trunk, as soon as it is come forth from the Liver, is feattered into The Twigs the neck and body of the bladder of Gall, or into its outer coat, with a numerous succession of very that grow out little branches, such as we have said above are called hairy Veins. This twig is called in Greek Kusuos, in Latin you may render it Vistealis, the Vein of the bladder of Gall. Vistaliss says there are two branches, which run through the bladder of Gall, whence they are called by some Cystica Castleau. genelle, the twin-veins of the Gall, but this makes no great matter. The fecond twig being greater than the former, but lower, arising from the same fore-part, and more to the right, is inserted into Pylorus or the lower mouth of the florach, into whose hinder part which looks towards the back, it featters many small branches, from whence it is commonly called Gastrieus, the stomach-branch, but Gastrieus. perhaps for memories fake it may be better termed *Pyloricus*, or branch of the lower mouth of the flo-mach, because there are others also which are called Stomach-branches.

Thefe two twigs being thus propagated, the Trunk runs downwards, and inclining all the way formewhat to the left, is divided into two notable branches, a right and a left one: the left is formething higher than the right, but leffer; the right lower, but greater: the left spreads it self through the Stomach, the Kall, one part of the Color or Colick gut, and the Spleen; the right through the

Guts and Melentery; that is called Splenies or Spleen-vein, or the linear one; this the Melenterick.

Now the Spleen-vein, after it is thus come forth from the Trunk, is carried athwart, being underpropt by the membrane of the Kall toward the Spleen, into which before it be confumed, it shoots ches. forth certain twigs, both from its upper part, and from its lowers from its upper part one, that afcenforth certain twigs, both from its upper part, and from its lowers from its upper part one, that afcenfireles rifing
ding obliquely to the left fide of the Stomach that looks towards the back, is divided into three profrom the up pagations, of which the outermost on either fide are conveyed into the Stomach, and prefently scat- per pare of ter into more twigs; but the middle one afcending through the fame hinder part spreads it felf the Splenickthrough the upper region of the Stomach, and compaffes the left orifice or mouth round about branch. through the opper region of its called Στεφανικόα or Coronaria, the Crown-vein of the Stomach. Coronaria. This again fends forth continually forcefmall branches upwards to the end of the Gullet, and others downwards through the Stomach. All this branch is called Gastriews, the Stomach-branch, because it is the greatest, and most capacious of all those, which come to the Stomach. From the lower part of the Spleen-branch arife two twigs; one, which is finall, fending forth other little Circles rifing iprigs to the right fide of the lower membrane of the Kall, and the Colick Gut annexed there- from the anto, is commonly called Epi-ois Dextra, you may Latin it Omegalis, the right Kall-vein lower part of Another answering to that branch, which arises from the higher part of the Spleen-vein, and begets the Crown-vein, is inserted in the lower membrane of the Kall, and presently after its Epiphis distrible is divided into two branches, which parting one from earther and presently after its Epiphis distribution of the Kall, and presently after its Epiphis distribution of the Common and the Common an rife is divided into two branches, which parting one from another a great distance beget many tra-

Note shat the Letters, which are enclosed thus [] refer to the particu-Ler Tables at the end of that Treatife where

branch.

other twigs, which are spent upon the lower membrane of the Kall, which like a Mesentery ties the Colick Gut to the back, as also upon that part of the Colick Gut, which is so tied. It is calcalled Epiplois, or Omentalis postica, the hinder Kall-vein. After the Spleen-branch has thus scattered many twigs, now drawing near to the Spleen, it is cleft into two branches, an upper and a lower one; which are broken into others in the very Parentyma or field of the Spleen. From the upper, fornetimes before it enters the Spleen, fornetimes when it is already entered, there fprouts A propagation of the upper forth a double or three-fold twig, very famous among the Writers of Phylick, which they commonly call Vas breve, the short Vessel, but we the Venal, to diffinguish it from the Arterial Vessel that answers to it: this is inserted into the left side of the bottom of the Stomach, sometimes also higher and about the left orifice or mouth. Which is the cause why some Physicians, and commonly Anatomifts too, have foolishly thought that the Melancholick humour is returned from the Spleen through this Veffel back into the Stomach, to provoke appetite. But you may often find Bodies, in which it is altogether wanting. From the lower branch, which goes A propagation of the lower to the nether part of the Spleen, one propagation arifes, which being pretty big, and notable, is reflected toward the right hand, like the fore-going, and compaffes the bottom of the Stomach to the left fide, and also fends many little branches to the higher membrane of the Kall on the

left fide; it is called Gastro-epiplois simistra, the left Stomach and Kall-vein.

There is also another notable Branch, which is found in most to arise from the lower Spleen-branch, very seldom from the Spleen it self. This is carried downwards, and scattering twigs over all the left side of the Colick Gut, goes on further by the whole length of the strait Gut, and

at length determines in the membranous fubfiance thereof, and in the fundament with many little twigs. Physicians make mention of this very often, and call it Hemorrhoidalis interna, the in-

ner Emroid Vein, to diffinguish it from the outer, which is derived from the hollow Vein. It is truly and properly called the Emroid Vein; I fay, properly and truly, because fornetimes they call by that name the Veins of the Nostrils, Gums, and Mouth, that cast forth bloud, and without pain. In this large fense the Philosopher took it, 3. De Part. Animal. where he makes Menstruous purgations also a species of the Emroids. But the Emroids properly so called by Physicians, are dilatations of

this Vein in the fundament, caused as well by black and yellow choler, as also by a falt flegm, as by the melancholick humour. And these are of two kinds; Geeg, blind Piles which cast out no bloud

but fwell out like the stone of a Grape into the fundament, or out of it: Others Aperta, open, which cast out the bloud which they contain. The learned Hippocrates hath left us a peculiar Book, a gol-

branch.

Propagations that artie before the divi-Mesenterick. Gaftro-spiplois.

den one indeed, concerning the cure of these. The remaining part of the Spleen-branch is spent upon the whole Spleen, and therein is scattered into divers and very small propagations, entering the very flesh of it about the hollow and middle line. And these are the springs which grow out of the Spleen-branch. The McGenterick Vein, or right branch of the Gate Vein is joined to the McGentery, as foon as it comes from the back, and is divided into two chief branches, which paffing through the Melentery betwixt its two coats, are each of them eleft into an infinit number of small branches, and they again into less twigs, which going to the Guts make up those Veins so famous among Phy-ficians, that are called the Mesaraick Veins. The first of these branches is called the right Mesar-terick Vein from the right side, wherein it is placed, and is likewise two-fold; whence it came to pass that Vesaliar, and almost all others who follow him, reckon three Mesartick Veins. This branch is inferted into the Jejunion or empty Gut, the Ileum or Circle Gut, the Geenm or blind Gut, and the right fide of the Colick Gut, where it lies next to the Reins and Liver: and although both its branches shoot forth many propagations from themselves, so that it is very hard to express any number of them, as well because they vary much by reason of their subjects, as also because they do not observe the very same order and course, yet it hath been observed, that for the most part there are fourteen, which afterwards are feattered into an infinite company of other twigs. These when they are come to the Guts, onely gape with their little mouths into their Coat, and enter not the cavity it felf, that being compassed about within with a certain crust. But as in most parts of our body, the divarications or divitions of the Veffels are attended with certain glandules, partly that they may make the fater progress, partly left they should fink down, and withall the flow and ebb of the bloud fo very necessary be hindered; so here also the divisions of the Vessels, which are scattered through the Mesentery, are bolisered up with certain glandules, which with their propagations observe such an exact propagation, that the greater glandules do sustain the greater branches, and the less the lesser. When these Glandules swell with a Scirrbas, the Vessels being prefit close together, and the diffribution of the Chylus through the Veins, and confequently of the bloud through the body being hindered, there follows a Confumption, and pining of the whole body. The left Mefenterick Vein is diffributed into the middle part of the Mefentery, and also that part of the Colick Gut which runs from the left region of the Stomach as far as to the firait Gut. The Hemorrhoidalis interna, or inner Emroid Vein, of which we spake a little before, some times arises from this Vein, as Vefalius hath observed, which affording some sprigs to the Colick Gut, at last running forward through the whole length of the strait Gut, determines in the tundament. But before the Mcsenterick Trunk be divided into these two branches, it first sends forth two propagations, one of which is called Gastro-epiplois dextra, or the right Stomach and Kall Vein, which creeps through the right bottom of the Stomach, before and behind, as also through the upper membrane of the Kall. brane of the Kall: the other called by others Intefinalit, or the Gut Vein, by us the Duodens, reaches to the middle of the Gut Duedenson, and the beginning of the Empty Gut or Jejunion, and descends

Destree Integrit all along through them.

The chief use of the Gate Vein is to nourish those parts which are seated in the lowest belly, which are seated in the lowest belly, which says the chief use of the Gate Vein is to nourish those parts which says which says and the control of the control of the Gate Vein is to nourish those parts which are seated in the lowest belly, which are seated in the lowest belly. and need a thicker and more faculent bloud, fuch as are all those parts which ferve for nutri-tion. For their bloud ought to be thicker, that it might be hotter, when heat is always more

powerful in a thicker body: fo then the Roots of the Gate-vein nourith the Liver, the Trunk mourishes the Pasereas or Sweet-bread; of the Twigs, the Cytiens, or Gall-twig mourishes the bladder of the Gall; the Spleen-branch, all the entrails which ferve for nutrition, except the Melentery, and the Guts, the Twig Pylorious, or of the lower mouth of the Stomach, the Gafrieus or Stomach-branch, both the Stomach and Kall-veins, and the flort veffel nortish the Stomach. For I do not think that the short vessel was made by nature for the carrying back of melancholick humors to the Stornach, but chiefly for its nourifilments fake; when that blood which is generated in the Spleen, is not a melancholy and excrementitious humor, but rather the best, formewhat thicker than other blood, and that because the parts that are to be nourished by the Spleen branch, needed a thicker blood, then they which are to be nourished by the Mesenterick. Spleen branch, needed a threach based, then they which are to be nouranted by the Metenterick. Both the Stornach and Kall-veins nourish the upper membrane of the Kall ; the right and the hinder Epiplois, or the Kall-veins, the lower. The Spleen is nourished by those two branches, into which the Spleen-vein is cleft, and which enter its parenchyma, or then through its middle line : the Melentery, and almost all the Guts by the two Melenterick branches; the Gut Diesdenson by the propagation called Dundons; but the empty Gut, the Houwer circle Gut, the blind Gut, and the right fide of the Colick or Colon by the right Mefenterick-branch. The left fide of the Colick and all the firait-Gut by the hemorrhoidal vein; but the middle part which lies under the Sto-mach, by the hinder Kall-vein. The fecond use is to attract the Clylur, and carry it to the Livee. The second whose veins are most famous for the making of bloud. But the fame veins which nourish the use.

Mesentery branch, do also attract the Chylur, as we shall shew you hereafter, when we shall insist upon the History of it. The third use is to empty out the excrements from the body through the Guts. Thus we see that the cholerick humour is fornetimes poured forth out of the Liver through the Mefenterick-branch in the bloody flux, and cholerick loofnels, and the metancholick through the Emroid-vein. The fourth use is to help the concochion of the Liver. Thus The fourth we see that the thicker part of the Chylus, which is called melancholy, is attracted by the splenick branch, not that the feat of melancholy is in the Spleen, but that it may be more attenuated, and better concocted by the benefit of the Arteries, which are most abounding in the Spleen, and so not diffurb, or hinder the concoction which is famed to be in the veins of the Liver, as it ufually happens, that whenfoever the Spleen is troubled with any difease, the work of making bloud is

But because there has been mention made here of the Emroid veins, it seemed that it would The explananot be intreasonable if I did refer to this place the explanation of a most excellent Aphorism, which tion of a ceris the twelfth of the fixth Section, when it cannot be underflood without the Hillory of Anatran Aphorism is the twellth of the lithfully explained by others, as was necessary. Hippocrates writes in it, of Bippocrates autopology indivity χεριάς by μια μαχ φυλαχθα κίαθου. Τόρου α υπηνείωσε is φείου, that is, he that is cured of old Emroids, unless one of them be preserved, is in danger of alling into a Dropsie, or Confumption. In explanation hereof we will irrit doubt of the Aphoritin, then we will dispute of the manner whereby a Droplie, or Confumption follows upon the Cure of old Emroids. But we may not without cause doubt of the truth of it, because the same Hipportates in a Book concerning the Emroids, which I think to be very much his own, whatfoever Mercurialis fay, though other wife a most learned man, bids us to burn the Emroids, and forbids us to leave any unburnt, but to burn them all. And truly Actius in his 14. Book, defirous to reconcile thefe two places, at those burn them all. That they remains in his one be preferred, being overcome, thinks that a manner of diet is to be underflood, not an Emroid, as if Hippornier thould fay: Thou thalt not cure one that hath long had the Emroids, unless the patient will diligenly observe a convenient manner of diet prescribed by thee; for otherwise there is danger of his falling into a Dropsie or Consumption, But Galen in his Comment upon that Aphorism writes expresly, that Hippocrater says, that unless one Emroid be preserved, such danger will ensue, and makes no mention at all of diet. And what is more, daily experience fufficiently witnesses, that such mischiess do ensue, though never so exact a diet be kept, and the reason taken from the manner, wherein they happen, and which we shall presently explain, does abundantly manifest it. Whence it is evident, that these two places of rlipportates are left flill in controversie and contradicting one another from this answer of Action. But the right answer will be, if we say, that Hippocrates when he writes in his Book of the Emroids, that for a perfect cure they must all be burnt, speaks not of old Emroids, but of such only as are lately come, or when nature has already endeavoured to expel the humour, which was otherwise purged out of the Emroids fome other way, whether it be by iffues, or by a Fiftula, or force ulcer in the Leg. For fach may be very well cured and without danger of Confumption, or Dropfie, the rather, if the entrails be yet whole and found, and especially it a good rule of diet follow. Nor does the cure of all old Emroids necessarily bring on a Droptic or Consumption, but only for the most part they threaten a danger of these diseases to ensue; for sometimes the melancholick matter being hurried up into the brains, there follows madness, as it happened to Aleippus, in Hipportates 4. Epidem. For, fays he, this Alcippus having the Emroids was forbidden to be cared, for after the cure he fell mad, but an acute Feaver following it, he was recovered. For explanation of the fecond doubt, first let us hear Galen, for he in his Commentary upon the Aphonism, fays, That the Emroids came by reason of faculent and melancholick bloud, which the Liver drives down to the mouths of certain veins, and fo this way being flopt, an abundance of groß humors burdens the Liver, and stifles the natural heat, which being extinguisht, no more bloud is generated, but onely water, which nature afterwards driving it into the Abdomen, or paunch, makes a Droplie. But if the Liver fend that abundance of melancholick humour to the Lungs, fome vessel being broken, there follows a Confumption. This interpretation of Galen, besides that it feems very obscure to us, is not altogether agreeable to truth. For first, it is false in my Judgment, which Galen fets down in his Comment, that it is impossible, that the Emroids should be

caused without an abundance of fæeulent and thick blood is when it may be proved both by reafons and authority, that they come also from choler and phlegm. By the Authority of Hippocrates, who in the beginning of his Book concerning the Emroids, witnesses that this disease is caused in this manner; to wit, when choler, or phlegm falling down into the veins of the Strait-Gut, heats the blood, which is in the veins. For these veins being heated attract the blood out of the little veins that are near, and when they are filled, the inward part of the Scat swells, and the heads of the veins appear out of it. But by reason it is proved thus; when madnesses are caused by phlegm, or choler, as Hippocrates witnessesh in his Book De Morbo Saero, the same Author in the 6. Aphorifm, 21. professes that that madness is taken away, if there follow swellings of the veins, or Emroids in those that are so mad. Now the madness would not be taken away, it melancholick humors did only come forth by the Emroids ; for then the caufe of the difease would not be purged out. But I my felf also have feen formerly in Germany some Noblemen, that were troubled with falt catarrhs, afterwards recovered by a great flux of the Emroids; that I am of opinion, that not only melancholy, but also sale phlegm and choler are wont to be purged out by the Emroids. Wherefore if it happen, that one, who has been long troubled with the Emroids, be cored afterwards, that choler and phlegm, either breed obstructions in the Liver, or Spleen, or being gathered together in some plenty by stretching the vessels contained in the Abdomen, or paunch, breaks through them, or by their quality corrodes and eats their way out, and makes a Dropfie in the Abdomen ; or elfe by raifing obfiructions in the Liver, and extinguishing the natural heat, generates much water, and ferous humour in flead of bloud, which passing through the veins, make a species of the Dropsie called Leucophlegmatia; but if the humor go back to the Breast, or Lungs, it breaks through, or eats out their vessels, and hence follows asspitting first of blood, then of corrupt matter, and from thence at last a Confumption, as Hippocrates teaches in his Aphorism. But in this place it is first of all to be observed, that there are two forts of propagations of veins, which make the Emroids: for there are fome propagations of the Gate-vein, of which we have already treated; but there are others of the Hollow-vein, which arise from the Iliacal branches, of which we are to speak hereafter. Now it the forementioned humors, whether melancholick, or cholerick, or phlegma-tick and falt, flow through the propagations of the Gate-vein, the internal Emtoids are cauted, which being cured, the matters flow back into the branches of the Gate-vein, that are feattered through the lower Belly into which the veins being loden with these humors unburden themselves, and make a species of the Dropsie called Ascines. But if they flow through the Branches of the Hollow-vein, they cause the external Euroids, and these being cured against the Precept of Hippersures. there is danger of a Confumption to enfue, because from hence there is an easie passage of the peccant matter through the Hollow-vein to the Lungs, nigh to the Heart. And this is that which we have of a good while observed, that many, who have been long troubled with Fittula's of the Fundament and afterwards cured, through the ignorance of Physicians, have fallen into a spitting of blood, and then into a Confiamption. Nay, we remember, that a Maid was once cured by us in Germany, which had a Fiftula in the middle of her Hip, and for three years had fought help from many in vain, but being cured the fell at leugth after three or four months into a spitting of much blood. Although the was fearce ten years old, I let her bloud prefently in the foot on that fide on which the had been troubled with the Fifula, and purging her body, and laying on a cautery near the place, in which the Fiftula had been, I easily freed her in this manner from imminent danger of a Confumption This spirting of blood happened from no other cause, but that sharp and cholerick matter, which when it could no longer find a way out by the Fishula, got up afterwards to the Lungs through the branches of the Hollow-vein. But Hippersates fays exprelly that there is danger of a Drophie, or Confumption to follow, because it sometimes falls out, that neither of these happen, but rather fome other difease insues, as it happened to Alcippus, who fell into a madness, and from that into an acute Feaver: fometimes also the bloudy flux follows, and others mischiefs. Sometimes also it happens, that they who are so cured, are preferved still in health, by abundance of urine, fiveatings, remedies, and a good rule of diet.

CHAP. II.

Treats of the Superiour, or ascendent Trunk of the Vena Cava, or Hollow vein, and the branches which it scatters through the Head.

The use of the

E are now to consider the other vein, which as we told you is called Cava, the Hollow one [a], which spreads it self much wider than the Gate-vein, as being distributed through out the whole body. For its office is to nourifh all those parts of our body, which conduce not to the concoction of the food, and those parts being spread far and wide, it is necesfary, that the Hollow vein also be very large, and extended to a great length: and because they ought to be nourifit with a thinner, and more elaborate blood, and not so thick and faculent, as that wherewith the Stomack, Spleen, and Gall are nourifly; therefore the bloud which the Hollowvein makes, and carries, is also more pure, thin and fincere.

The method of this vein.

The method In delivering the Hiftory of this vein, although we are not of their opinion, who derive its beginning either from the liver, or heart, yet because we must begin our Treatise of it foundations. where, we also thought fit to follow the received Cuftom of Anatomitts, and to for perficicities fake, we shall always speak of it, as if it took its birth from the Liver. that it foreads certain roots as it were in the Liver, just like the Gate-vein, in the History of which when for that reason we took our rife from those roots, we may not without cause begin thence also with the Hollow one. But this vein although it runs directly through the

whole Trunk of the body, and make one very notable flock [D] that is drawn out through the middle, and lowest belly, like one strait line continued, or rather in manner of a channel, or conduit pipe, is notwithstanding wont to be divided into two by reason of the Liver, and soone to be called the Ascendent Trunk, the other the Descendent. For indeed that is not that the Hollow with in the residual than the model of the time that the Hollow with in the residual than the first that the Hollow with its residual than the first that the Hollow with its residual to the first that the Hollow with its residual to the first that the Hollow with its residual to the first than the Hollow with its residual to the first than the Hollow with its residual to the first than the Hollow with its residual to the first than the Hollow with its residual to the first than the Hollow with its residual to the first than the Hollow with the first than the first than the Hollow with the first than the first than the Hollow with the first than the firs true, to which many perfeade themselves, that the Hollow-vein in its going forth from the true, to which many pertwade themserves, that the monow-ven in its going torth from the Liver, like the great Artery, when it comes out of the Heart, is eleft into two Trunks; but if hereafter, they be called Trunks by me, you must believe, that I do it only for orders fake in teaching. The Ascendent therefore or upper Trunk [AD] is that which stands about the Liver, I do is terminated about the Jingulum, or Hollow of the Neck; but that is called the Descendent, one [TV] which is beneath the Liver, and reaches down as far as the Legs. For least of the Ascendent for an afterwards divided into two branches, of which they of the Ascendent for and both of them are afterwirds divided into two branches, of which they of the Afcendent [m and q] are carried upwards to the head, as the Jugular or Neck-branches; or to the Arms, as the Brachiare carried upwards of the first the the Arms, after that we will come to the descendent Trunk, and its branches, that are digested

As therefore we have faid, that many little Veins like roots grow out of the Hollow fide of The Afternational interest inferred into the greater veins, and all of them at least the roots. the Liver, which always by degrees inferted into the greater veins, and all of them at length meet-dent Trunk ing together about the middle of it did make a Trunk + fo in the fame manner out of the circuit of the Convex fide of the Liver a numerous propagation of veins iffues forth, which afterwards meet together in one Trunk. This Trunk makes its way through the nervous part of the midriff on its right fide, and paffing through it goes undivided to the *Ingulum*, or Hollow of the Neck, and because it climbs upwards, it is commonly called the Ascendent Trunk by them who conceive that the Hollow-vein rifes out of the Liver. It is much leffer than the Defeendent, because the upper parts are nourished by it alone; but almost all the inferiour parts, that are contained in the lowest Belly, by the Gate-vein. But although it be not parted into any branches, until ed in the lowest Berly, by the Gate-vein. But authoright to the parted into any branches, until it come to the Jugulum's yet before that it fpreads fome propagations at its sides, and of those, propagation three notable ones. The first [ee] is that which is called Phrenica, or the vein of the Midriff, of the Afre on either side one, and is distributed throughout the whole Midriff, which is called $\phi f \phi s$, with dent Trunk. on either lade the, and is distributed to the neighbouring Pericardium, or purfe of the Heart, and the medialiumm, or partition of the Cheft; which when it has now got above, and entred the Cheft, it inclines a little to the left hand, and enters the Pericardium, and being hidden very close over against the eighth Rack-bone of the Chest, is very strongly infixt into the right ventricle [C] over against the eights track-bone of the could ghefs, that it forung from hence. But before it be so insixed, it sends out another propagation [bb] which is a notable one, and extends it self by the hinder part of the Heart, and the left side of it, towards the forepart, compassing the basis of the Heart like a Crown, from whence it is called Coronaria, or the Crown-vein of the Crown-ve through the left fide, as that which needed a more copious aliment than the right fide, because of through the left lide, as that which needed a more copious animent than the right lide, because of the continual, and greater motion there. But because the flesh of the Heart is hard, and folid, it ought therefore to be nourisht with a thicker blood, from whence it is, that this branch grows out of the vein, before it enters the Heart, to wit, when the blood is formewhat thicker, and not yet. attenuated in the cavities of the Heart. Near to the original of this there is a little valve, or floudattenuated in the cavities of the Reart. Near to the original of this there is a little valve, or floud-gate, which hinders the blood from flowing back to the Hollow-vein, as it might eafily do by reafon of the continual motion of the Heart. When the Hollow-vein has now gotten above the Heart, it becomes leffer, and perforates again the *Pericardium*, and forfakes the Rack-bones of the Back, and being got above the Gullet, the rough Artery, and the *Arta*, or great Artery, (which lean fo upon one another, that the Gullet takes hold of the bodies of the Rack-bones, the rough Artery lies upon that, and the Aorta again upon this) it climbs upwards through the midft of the division of the Lungs, where the right part is feparated from the left. But because by this means it could not get to the back, and the little branches, if it should have fent forth any such, had been very soft get to the back, and we fittle blanches, it is therefore it fends forth a third propagation [cc] as foon as it is got out of the Pericardium or purfe of the Heart. The Greeks call this vein 22000. the Latins fine pari, or carens conjuge, without a companion, or wanting a mate, because in a man the Latins for part, or described in a many there is but one, and it has no companion, or mate on the left fide, as other veins have; though in creatures that chew the end, it is double, and plainly to be perceived on both fides. But it iffus forth about the fifth Rack-bone of the Cheft out of the hinder part of the Hollow-vein, and the right fide, and goes downwards, not directly, but inclining a little toward the right hand, is as it were reflected backwards to the Back-bone; but as foon as it reaches the eighth, or ninth rib, it is cleft above the Spine of the Back into two branches, which running downwards pass through the division of the midriff, which is betwixt its two productions, and so are spread abroad into the lowest Belly: Of these the left, which is sometimes the greater, hiding it self about the transverse Processes of the Rack-bones, and under the lest production of the midrist and the original of the first bending Muscle of the thigh, is inserted into the left Emulgent, either near to its beginning, or (as it oft happens) into the middle of it. But the right, running on likewife under the membranes about the transverse processes of the right side, and the right production of the Septum or Midriff, and the beginning of the fame first bender of the thigh, which keeps the right tide, is implanted fometimes into the very Trunk of the Hollow-vein, fometimes into the first vein of the Loins. And we are indebted for this observation to the learned Fallspins, who would have the matter that is gathered together in the Cheft, whether it be watery, or purulent and corrupt, or fanguinous, to be evacuated by the benefit of the left branch

THERE WE SEE STATE OF THE SECOND

of this vein 3 of which notwithstanding we will say something briefly in the following Book-But this vein in its journey downwards shoots forth twigs on both fides, as well right, as left, of which the right are more notable, and larger, of which there are numbred almost always tenwhich run out to as many diffances of the lower ribs, and make the inferiour intercoftal veins. But I say they are almost always ten, because it happens very seldom, that all the distances of the ribs receive branches from this vein, the two uppermost, to wit, the first and second distance getting their furcles or twigs from the fourth branch, that is presently to be mentioned. But these twigs run firaight forwards near to the lower fide of the ribs, where there are cavities cut out for them, as we have taught in the second Book. And truly this place is diligently to be taken notice of by Students in Chirurgery, because of the opening of the Cheft in the difease called Empyema, that they may know that incition is to be made in the uppermost place of the rib, because in the lower the vessels would be harmed to the great indangering of life. But these veins do not run through the whole length of the true ribs, but are terminated together with the bony part. But the propagations of the Marnmary vein nourish the fix distances betwen the griftles of the seven true ribs, we shall tell you by and by. Yet in the bastard ribs they run even beyond the Gristles towards the Abdomen or Paunch, into whose Muscles they infinuate themselves. But there are certain other little branches propagated from the fame vein, by which nourithment is derived to the marrow of the Rack-bones, and the Mufcles, to wit, those about which they are carried : fome also are implanted into the Mediafinum near to the back. This vein fine pari without a companion, being thus conflituted, the Hollow vein afcends to the Jugulum, or Hollow of the Neck[D] being supported by the Mediafinum, and a certain foft and glandulous body, which the Greeks call and is placed in the highest part of the Chest, to defend the divarications of the veins there hanging up from all danger of breaking,

The division of the Hollow an branches.

And here the Hollow-vein is first divided into two notable branches [EE] from which all those veins arife, that run as well to the Head, as to the Arms, or to certain Multiles of the Abdomen. Of vein into the these one goes to the right side, and the other to the left, which as long as they yet are in the Chell, two Subclavian branches, are called Subclavia, Subclavian branches, because they go under the Claviculae, or Collar-bones; but as foon as they have gotten out of the Cheft, and attain to the Arm-hole, they are named Axillares, the Axillary-veins [F]. From both of them very many propagations iffue forth, some of which arise from their upper part, and some from their lower. In our receital of them we will observe this order, that they which are nearest to the Trunk, shall be first mentioned by us; and they last, which are farthest from it.

propagations from the lower part of the Subclavian branches. perior.

The first propagation then issues out near the very root of the divarication or division of the Trunk, and is called Intercoffalis Superior, the upper intercostal-vein ; [e] there is on either side one, which being very little, and defeending along by the roots of the ribs, as far as to the third rib, fends two twigs [ff] overthwart, like the vena sine pari, to the two distances of the upper ribs. But Intercollalis se if the vena sine pari send its propagations to all the distances (as it sometimes happens) then it is wanting not without cause. Sometimes the same vein arises from the Trunk of the Hollow-vein,

before its division into the Subclavian branches

Another vein [g] fometimes arifes from the forepart of the Bifurcation; fometimes from the root of the Subclavian-branch, and is double, on either fide one; fometimes also only one grows out of the middle of the Trunk, before it be divided; which at length, when it has attained unto the Breast-bone, is parted into a right, and a left branch. For Nature is wont to sport, as some times in its other works, so especially in the rife of veins, so that they are not spread in all bodies after the fame manner. But this is called Mammaria, the Mammary-vein, which, whenfoever it arifes, going toward the fore-part; firives to get up to the higher part of the Brelt-bone, and defeends by the fide of it, and when it comes to the Breast-blade, about its fides goes out of the Cheff, and runs on directly under the right Muscles of the Abdomen, even to the Navil, near to which it is joined by Anastomosis, or Inoculation [10] with an Epigastrick-vein [9] that ascends and meets it; by the benefit whereof arifes that notable fympathy betwixt the womb and Breafts of women, of which we shall speak more hereafter in the eighth Chapter, when we shall insist on that History of the Epigastrick-vein. But before it leave the Chest, in its descent, it distributes one branch apiece to the six distances betwixt the Grissles of the seven upper true ribs, of either fide, which are terminated with the Griffles near to the end of the bony part of the ribs, in which place we told you that the branches of vein fine pari, (with the extremities of which these are joined) were ended. From these veins, which are distributed in this manner to the distances of the Griffles, some others very worthy of our notice do arise, which are differninated both in the Muscles that lie upon the Breaft, and into the Paps. Near to these a shird [h] arises, and sometimes also grows out of the Trunk, which is called Medissima, because it spreads it self into the Mediastrians, or membrane that closes up the cavity of the Chett, being extended all along by it, with the left Nerve of the Midriff. The fourth [i] commonly called Cervicalis, or the Neckevein, is a large vein on both fides, which running obliquely, upward, and backward, to the Transverse Processes of the Rack-bones of the Neck, and climbing up through their holes. (from whence perhaps it might be better named Versibralis) affined forms to the Muscles that he next whence perhaps it might be better named Ventebralis) affords fprigs to the Mufcles that the next upon the Rack-bones. When this vein has got above the Transverse Process of the seven Rackbones, it derives a Notable branch to the Sinus or Canale; in the Neck, through the hole that is made for the outlet of the Nerves; and then another, when it comes above the Precess of the fixth spondyl, or Rack-bone, and again another, when it comes about until at lall it comes note. it comes to the Process of the first Rack-bone, which notwithstanding it does not touch, much less does it pass into the Skull, (as Vefalius would have it) near which it goes partly to the same finus or canale, partly it is distributed into the hinder part of the Neck. For there are two long same filled with blood, which are made out of the hard membrane of the Brain, one on each side, being

Manmaria

Mediaftina.

Caralcalia.

be ing placed at the fides of the marrow of the Neck. From these little branches are distributed, which nourish the marrow of the Back-bone, and the neighbouring parts; they being about the Juncture of the head with the first Rack-bone, and end near to the seventh Rack-bone of the Neck. These two finus, of which one is of the right, another on the left side, have some communion betwice themselves by a little pipe, and that a short one, which is derived overthwart from the one to the themselves by a little pipe, and that a more one, which is derived overthwart from the one to the other, for the most part about that region of the Neck, which is betwixt the second and third Rackbones. At last there is a sist with vein [1] which arises from the hinder part, called Muscula inferior, or the lower Muscle-vein, which is distributed in many branches to the Muscles in the lower part of the Neck, (and so extending the Head and Neck, from whence the vein might be rightlier and the Neck, (and so extending the Head and Neck, from whence the vein might be rightlier. called Cervicalis, or the Neck-vein) and also to those in the higher part of the Chest near to the Rack-

For the upper part of the Subclavian branches, whilst the Hollow-vein is yet in the Chest, three Propagations propagations is in the Subclavian branches, whilst the Hollow-vein is yet in the Chest, three Propagations propagations is in the Subclavian upward, under the Muscles that bend the Head. The former of the two looks more inward, and is called Jugularia internat, the inner Jugular-vein: the other inclines to the outer parts, and is commonly called Jugularia externat, the outer Jugular-vein. For both of them arise near to the Jugularian, or Hollow of the Neck, and ascend by that to the Head. The inner is greater, and transfer of the subclavian branches is less in a man, but in brutes it is contrary. But when almost all Appellations are Estimate. the outer is lefs in a man, but in brutes it is contrary. But when almost all Appellations are Estimated derived, and that best, not from the place, through which the veins pass, but from their insertion, derived, and that best, not from the piece, through which the veins pais, but from their miertion, perhaps they might be rightlier named Gephalice or Capitales, Head-veins. The inner Jugularvein [m] takes its original near to the joint, by which the Clavicles or Patel-bones are tied to the Cheit, and as foon as it arifes, it is joined with the arteria Carotis, or fleepy Artery, and a Nerve of the fixth pair, as companions in its journey, at the fide of the rough Artery, and climbing to the Chops, about the middle of the way is parted into two branches, of which one is called the outer, the other the inner branch. The outer is so called, because it comes not into the inner parts of the Head, but being divided into two at the corner of the lower Jaw, diffributes one branch to the Chops, and the other near to the Ears and Face. The inner branch, all the way is joined to the Chops, and the other hear to the Ears and the Skull, whither when it is arrived on the backfide, it is likewife cleft into two branches, but of unequal bigness. For the first [n] is greater backfide, it is likewise clear into two backers, is a consequent bigness. For the first [n] is greater and more hinderly, being carried backward obliquely, which having propagated fome twigs to the Mufeles under the Gullet, and in the forepart of the Rack-bones of the Neck, through the fecond hole of the Occipitum or Nowl-bone enters the Skull with the leffer branch of the Arteria fecond hole of the Occipinan of Providences of the Nerves defeends: and thus this branch enters the first [1] and fecond [2] fows of the thick membrane. The fecond branch [p] being smaller, the first [1] and second [2] fours of the thick membrane. The second branch [p] being smaller, and more to the forepart, quite forfaking the Arteria Caretis, or sleepy Artery, goes to the forepart of the Head, and after that by the way it has believed a Surcle not very notable upon the Gorne. This is dispersed through the basis, and fides of the thick membrane, with a numerous issue of branches, the prints whereof are observed in the inner surface of the bones of the forepart is the Head as two have field above in the second Book. We will call these two have field above in the second Book. of the Head, as we have faid above in the fecond Book. We will call these two branches, beof the Head, as we have taid above in the recond boon. We will can there two branches, because they go to the brain, Encephalici, as if you should say Gerebrater, of the Brain, and that shall be the greater Encephalicia, this the lesser. The external Jugular-vein [q] ascending under the Jugularis Exbe the greater Europeanean, this the factor and page of the Musician and the Musician Quadratus, or fquare Musicia, that draws down the Cheeks, by the fides terras of the Neck, when it comes to the Ear, is eleft into two branches [r] one of which I call Profundus, Prefundus, the deep one, because it enters the Muscles, and retires into the more inward parts, the other Cananaus the skin-branch. The deep or inner one [s] in its first divarications meets with Glandules about the Ghops, and fends forth propagations worthy of our notice to the Largue or Throttle, and the Glandules that grow to it, as also to the Muscles of the Chops, and of the bones called byuider, among that which creeps all along under the tongue, is a notable one, and is feattered into many little branches, which are feen, if the tongue be lift up, even before diffection. From this deep branch three other arife, which enter into the inner parts of the Head and the Skull. Three branches into the Chops, and Mouth, and enters the Skull, these entring The first, after it has spread little branches into the Gnops, and mouth, and enters the Skull, these entrithrough the first hole of the Temple-bone. The next [e] passes out of the fore part of the eye the skull, with some Surcles through the thicker Membrane upwards. The third is feattered out of the bredth of the Nostrils through the hole of the Os cribroson, or sive-bone into the same Membrane. These two nourish this forepart, to which the third some reaches not, but ends near to the partition of the Manillary Processes. But the outer or Skin-branch [u] creening by the third single of the United Skins of the United These two nourish this forepart, to which the third same reaches not, but ends near to the partition of the Mamillary Processes. But the outer or Skin-branch [u] creeping by the skin of the Head, catasta, and stayed up with the Glandules under the Ear, which they call Paratides, is divided into two branches; of which the Anteriour [x] is carried upward obliquely through the Cheeks to the inner corner of the Eye, distributing little branches by the way to the Nose; and going on to the Eyebrow, is joined with the remainder of the branch of the other side, and makes the strait vein, which they call vens frontis, the Fore-head vein, [y] and which in madness is opened to very great advantage. To this the Saryrift allodes, when speaking of a certain foolish fellow, he says, - Mediam pertundite venam.

The other or Posteriour branch is carried behind, and sends branches to the Temples [2] and skin of the Back-part [2] of the Head. A third vein which arises out of the upper part of the Subclavian branches, is commonly called Masscala superior, the upper Muscle-vein, in relation to another of the same name arising out of the lower part. It rive is the back-side of the Neck, in regard whereof we shall not do amiss to call it Cervicalis superior, or the higher Neck-vein [8]. But now let us return to the distribution of the Subclaviant

TIME.

vian vein, from which we have digreft. This vein, as foon as it gets out of the cavity of the Cheft The Division is called Axillaris [F], and when it comes to the Arm-pit, is divided into two notable branches, calof the Axillary led Cephalica or Head-vein [G] and Basilies [I], which are afterward differninated throughout the
win into two
whole Arm. But before the Axillary-vein be thus divided, it fends forth two twigs: the first [y] Its propagati- is called Scapularis interna the inner Blade-vein, and is diffributed through the Muscles on the inlide onsbefore its of the Shoulder-blade: the other [5] is named Scapularis externa, or the outer blade-vein, it is a division.

Sepalaris inblade. But the wein Exflices also, before it enters the Arm, shoots out two propagations; one
called Thorseica superior, or the upper Chest-vein [1] because it arises out of a higher part than the
Thorseica superior is a very notable one, and runs through the inside of the other part than the
Thorseica superior is a very notable one, and runs through the inside of the pectoral Muscle that brings the Arm forward to the Breft, it diffributes branches also to the other Muscles of the Breft, as also to the Theracics info skin of the Dugs in women. The other is called Theracics inferior, the lower Cheft-vein [2], a great rise. and notable one likewife, which descending along the fide of the fide of the Cheft is distributed espethrough the third broad Muscle or Langimus that moves the Arm backward scattering many little branches from it self, which afterwards are joined by Anastomesis or inoculation, with the branches of the vein fine pari, that fall out of the Cheft. And this vein fometimes grows out of the former, or the upper Cheft-vein. These branches being thus distributed, the Axillary-vein reaches into the Arm-

CHAP. III.

Shows how the Axillary-vein is distributed through the Arm.

The division of the Axillary vein.

HE Axillary-vein [F] therefore is cleft into two branches, as foon as it comes near to the Arm, but those branches are of different bigness. For the upper [G] which they call Cepbalicias, the Head-branch, is smaller; but the lower vein [1] called Bafflica, is almost thrice greater, The Cephalick also is as it were wholly just under the skin, and finks not with above one branch into the deeper retreats of the Mufcles; wherefore it has neither Artery, nor nerves for its companions, they being addicted to the more inward rooms of the body. But the Bafilick vein partly creeps on under the skin, partly hides it felf under the Mufeles, and therefore it ought with good reason to exceed the other in bigness, as being destined for the nourishment of more parts. It hath both Nerves and Arteries as companions in its journey, which is the cause why upon the cutting of this vein the blood spins out with a force; but of the contrary, the Cephalica being cut, it comes forth foftly: which we fee fome Phylicians unskilful in diffections, flanding by whilft the vein is opened, foolishly refer to the strength, or weakness of the mind or body. We are now to speak briefly of the manner of the distribution of both these veins through the Arm, beginning from the upper, as the leffer branch.

The Cepha-

The Cophalica [G] therefore is called by Vfaline Humeraria, or the vein of the Arm, because by the Arm it descends into the Hand; by others Cubit exterior, the outer vein of the cubit, from its situation, because it runs on the outside of the Cubit, as the Basilies contrariwise doth on the inside. By fome later writers it is commonly called Copbalica, the Head-vein, because it is wont to be opened in diseases of the Head, through the error of the Antients, who thought ignorantly that it arises from the external Jugular vein, and therefore empties the blood immediately immediately out of the Head. Eut it ariles from the upper part of the Axillary vein, and climbing over the Tendon of the Serratus or leffer Saw-Muscle, that bends the shoulder blade forward to the Breit, it runs betwixt the Muscle called Deltoides, which lifts up the Arm, and the beginning of the Pectoral Muscle, which brings it forward to the Breast, where it arises from the Clavicle or Collar-bone, and so it runs down by the Arm to the outfide of the first Muscle that bends to the Cubit, which they call Biceps, or the double-headed Mufcle; by reason whereof the more learned Chirurgeons have wisely used to make iffues betwixt the Mufcles Biceps and Deltoides; for iffues ought always to be made at the feat of fome notable vein, that the matter may more eafily be voided out. But although this vein be not divided into branches, whilst it is thus carried down by the upper part of the Arm, yet it scatters some twigs [u and e] of both sides into the aforesaid Muscles, and the skin. At length when it is come to the Cubit, it runs under the fleshy membrane, as a vein under the skin should, and pre-fents it felf to the figt without diffection. But about the very joint of the Cubit at the exemal pro-Three bran-tuberation of the Arm, it is wont to be divided [H] for the most part into three branches, an outer, the of the Ce-an inner and a middle one. The two former run under the skin, the third deeper. The first or middle one, [i] which is often wanting, is very little, and deeper, and penetrates into into the fubfiance of the Muscles, especially of those two that bend the second, and third joint of the finger, as also of the long supinator of the Radius, or wand of the Arm. The second [x] and inner, and chief of the three branches is carried down obliquely under the skin, and joins with the inner branch of the Bafilica, three tingers below the joint of the Cubit, with which it makes up the vein that Phylicians call Mediana, the middle vein [A]. This running down obliquely by the middle Region of the Cubit, diffributes many Surcles to the Radius or wand, and at length it fell is divided into two leffer branches; of which the outer [p] goes to the infide of the wrift, toward the thumb: the other and inner [o] runs to the fore, and middle fingers. The outer of these is called by some Cephalica manus, and is opened to very good purpose in the disease of the Head or Teeth. Now the third branch [] or outer Cephalick-vein climbs up to the Muscle called the long Sepinator Cubit, and in that fame place is joined with a little branch $[\tau]$ of the Bafilick-vein; being united thereto it goes on to the outfide of the wrift; and diffributes veins to that part of the Hand, which of the Eading on to the outfide of the wrift; and diffributes veins to that part of the Hand, which of the Radius, or wand, differing divers little veins into the skin, and to is carried obliquely [r] through the Radius, or wand, and having attained to the middle of its length enters the outfide of the lies before the little, and Ring-fingers, as also to the fingers themselves. This vein, especially that which

Three branphalick-vein.

Telputella.

which respects the little singer, is commonly called Salvatella, and the Section of it is much commended by Practitioners in Phylick in melancholy diseases. Which being sometimes called in question, and I having observed that experience does savour those Practitioners, endeavoured to and out the cause, and found that there are many inoculations here of this vein with the Arteries, and out the cause, and found that there are many inoculations here of this vein with the Arteries, as the inoculations are usually more frequentabout the extreme parts, as being more removed from the fountain of heat, and therefore wanting a horrer and more spirited blood. This vein therefore being cut, because the inoculations are so near, it cannot be but that the blood of the Arteries should be also be to out, which cannot be so well done by opening the veins of the Cubit, because the Anglomoser or Inoculations are somewhat more diffant from the place, in which the vein is opened. And hence it is, that the blood which is emptied out of the Hand, is much fairer and redder than that out of the Arterious blood there always runs out together with that of the wrige. it is, that the blood which is closed blood there always runs out together with that of the veins. But the Arm, because the Arterious blood there always runs out together with that of the veins. But there being fix times more Arteries then there are veins in the Spleen, it is necessary, that its diseases be much helped, when the peccant blood is drawn out of those vessels wherein it was.

The other branch of the Axillary-vein, that is the inner, and greater, is the Esfilies [I] which vein The other branch of the Axiliary-vein, that is the inner, and greater, is the Bafilea [1] which vein according to its fituation in different arms bath found different names among writers practifed in Phylick. For in the right arm it is called heparica or the liver-vein; but in the left Splonica, or the spleen-vein. They choose that to be opened in different granty propagations of the Glandules, that are frequent thereabout, it is carried down by the upper part of the Arm to the side of the double headed Mulcle, or Biespr, between the Muscles that bend and firetch out the Cubit, and not far from its The branches considered of the Chest, is divided [K] into two notable branches, of which one is called Protourlay of the bassless. egrefs out of the Cheft, is divided [K] into two notable branches, of which one is called *Profundus* of the bafflick or deep, the other *Subentanems*, or branch under the skin, from their fire and progrefs. The deep verification or deep, the other Subentanens, or branch under the skin, from their fire and progrefs. The deep vein. one or Profindas [L], which for the most part is the thicker, all the way it goes, penetrates into the more inward parts of the Arm; having the Axillary Artery, that runs into the Arm every where for its companion, as also the fourth branch of the third Nerve of the Arm. But it is carried betwith the two Muscles, which bend the Cubit, and having past its joint, is cleft [M] into two branches; of which the outer [N] near to the radius or wand, (from whence it might be called Radiens) goes down to the Hand, and scatters little branches toward the Thumb or Fore-finger, as also the middle one; but the inner branch [O] passing near to the bone of the Cubit, (from whence it deserves the name of Cubinens) distributes small branches to the middle, and little singers; but as the course sends its propagations to the Muscles on the outside of the Hand; so the inner to those on the course sends in the inner to those on the course sends its propagations to the Muscles on the outside of the Hand; so the inner to those on the course sends its propagations to the Muscles on the outside of the Hand; so the inner to those on the course sends its propagations to the Muscles on the outside of the Hand; so the inner to those on the course sends its propagations. it deserves the name of Cubineas) distributes small branches to the middle, and little singers; but as the outer sends its propagations to the Massless on the outside of the Hand; so the inner to those on the inside. The other is the branch Subenameus, or under the skin [P] which is carried down by Its division the inside of the Arm, scattering divers little branches to the skin, and parts adjacent, but when it into an outer is come to the inner protuberation of the Arm, it is divided [Q] into an outer, and inner branch, and seing united with the inner [R] is carried down obliquely; beneath the bow of the Arm, and being united with the inner branch [x] of the Cephalick, makes the vein called Mediana, [X] of which we spake before. But the outer [S] near to the inner protuberation of the Arm being divided into two branches, is carried by the greater along the Region of the usua or ell downward to the wrist, and scatters it self into the little Finger, but by the other it is derived to the inside of the Hand.

But in this place it is worth our pains to advertise with other the most learned Anatomists; that it ought not to be believed, that the fame order and courfe of veins is to be found in all men; when the diffection of the bodies does demonstrate, that scarce two in a thousand do accurately observe the same distribution of the veins. Wherefore we ought not to be so scrupulous in chooling out places for the opening of the veins, as forne that are unexperienced, are wont; but to choose that vein especially, which may be most safely opened because it is best seen. For some-times the Cephalick or Head-vein is so small, that it can hardly be discerned; and sometimes on the contrary the Basilick is so. Wherefore he shall do best, who will rather follow wife counsel, than

the scrupulous opinion of unskilful men,

CHAP. IV.

Explains the lower, or descendent Trunk of the Hollow-vein,

E have done with the upper Trunk, and branches of the Hollow-vein; it remains now that we treat also of the lower. Nevertheless (as we have above also admonish:) they are not indeed two Trunks, as Galen would have them, but one only, which reaches in one continued line from its division about the fifth Back-bone of the Loins [V] as far as to the Jugulum, or hollow of the Neck [D]: but, for methods sake in teaching, we thus divide it by reason of the Liver, which standing as it were in the middle of it, seems to part it into an upper and a lower than the property of the liver to the Hollow of the standard of the standard of the standard of the liver to the Hollow of the liver to the Hollo Trunk. As therefore that is the upper one [AD] which runs up from the Liver to the Hollow of the Neck; fo that is the lower [TV] which beginning at the fame Liver, is terminated at the Os faction, or Holy-bone. And as the upper did run on undivided through the Cheft, feattering only fome propagations at its fides; for the lower also flides down, intire through the whole Abdomen, or paunch, only fome twigs fprouting from it. But when it has attained to the fifth Rack-bone of the Loins, it is cleft into those two notable branches called *Iliaci* [XX] as the upper is into the Sub-Loins, it is cleft into those two novable brainers cancer that I have appeared into the Sun-clavian, which Iliacal branches afterward reaching into the Legs make the Crural-veins; as the Subclavian carried into the Arms make the Brachiales, or Arm-veins. Let us fpeak therefore in this Four pro-Chapter of the Trunk, and its propagations, as long as it yet is in the lower belly. Then let us gations arifing come to the crural branches.

For the descendent Trunk then [TV] before it part into the branches, arise four veins. For as Trunk before foon as it is come forth from the hinder part of the Liver, it declines to the right fide of the Back, Adipale.

The bafilick

Enalgenter.

The place in which the ftones of the Kidneys are bred.

Spermetica.

and fends forth a propagation from its own left fide which they call Adipola finishra, the left fatty vein [no the left fide] because it passes to the fat and outer membrane of the Kidneys, which arises from the Peritoneum or Rim of the Belly, as also to the Glandule that grows above the Kidneys. There is another [v on the right fide] answering to this on the left fide, but which does very feldom grow out of the Trunk, but rather from the upper fide of the middle part of the Emulgent vein; and because it is distributed in the same manner as the left is, it is called Adiposa dexera, the right Fatty vein. Yer sometimes you may see the contrary also to happen, and this right vein to come forth of the Trunk, and the left out of the Emulgent. For there are divers sportings of nature to be seen in the veins; and you cannot easily meet with a dead body in which you may not find something new, and differing from others. After this the Hollow-vein passing on, when it comes beyond the middle of the back, about the first Rack-bone of the Loins, it brings forth a second pair of veins, [p] very notable, which hastens directly to the Kidneys, upon whose substance it is wholly spent. And hence it is called Renale, the pair of Kidney-veins from its infertion; but from its use Emulgent, because the Kidneys seem by this pair to milk out the whey or force most sure themselves. Emulgent, because it is cause it is caused to the pair of relatively-veins from its intertion; but from its die Emulgent, because the Kidneys seem by this pair to milk out the whey or serous moisture in the blood, and to draw it to themselves. It is therefore very thick, but yet short, and not of equal length, nor rising directly opposite each to his sellow. It is short, because it did not need length, which for the most part is given by nature to vessels for some previous preparation. It is unequal, because it was fitting the left should be longer than the right, by reason that it was necessary to bring the few was not also as the second of the second the spermatical vein out of it. But the beginning of both answers not directly one to another, left one should be hindered by the action of the other. And the left is higher than the right, because the left Kidney is also feated higher than the right. But the Emulgent branches, as soon as they arise out of the Trunk, do not prefently go to the cavity of the Kidneys, but are first divided into two greater branches, and so accompanied with Arteries, enter the concavous fide of the Kidneys, and afterward being broken into leffer branches are scattered quite through the whole substance of the Kidneys, and at last determine with their small hairy ends in certain sleshy processes, which they call Manuallares. These veins do serve not only for the bringing of nourishment to the Kidneys, but also for the carrying down of the serve not only for the bringing of nourishment to the Kidneys, but also for the carrying down of the serve not only for the bringing of nourishment to the Kidneys, but also for the carrying down of the serve not only for the bringing of nourishment to the Kidneys, but also the carrying down of the serve not only for the bringing of nourishment to the Kidneys, and at last determine with their servers. through which it is itrained into the Pipes of the Ureters, and then gathered together into that eavity of theirs called the Pelvis, and fo drops down by little into the bladder, as we shall shew, when we open the history of the Kidneys. And here the place is to be noted, in which the flones of the Kidneys are wont to be generated, which is not in the Emulgent veffels, I mean veins, or Artery; but rather in the very cavity of the Kidneys, or in the Petris and pipes of the Ureters. For in these if a viscous matter be at any time received, either it is hardened there by reason of a notable heat, or else through cold is congealed into gravel or flone. For this matter is not only a crude and uncocked kind of blood, which like a mucous matter sometimes is went to abound in the mass of bloud, but oftentimes also that excrementitious phlegm which falls down from the head, through the veins and Arteries, both into the Hollow-vein and the great Artery, and fometimes into the Stomach and Guts. Of which this feems to be a manifelt fign, that they who are fubject to difeafes of the Stome, are very often troubled with reums and pains of the Colick; of which whilst fome perfwade themselves that it is caused by wind, daily experience hath taught me, that it comes from phlegm; because I have observed, that they who are troubled with the stone in the Kidneys, had their Colon or Colick-gut always suff with plenty of this phlegm, and that this being that this being taken away, the Stone has been no longer bred. And therefore oft times I give feouring Clyfters, and fach as gently purge phlegm, not only to fach as have the Stone already, but also to such as are threatned with the breeding of it, with a great deal of benefit to the Patients, but all those things are perpetually to be avoided, which drive out the stone, as well because most of that nature are hot, as also because they are able to drive down the crude matter plentifully to the Kidneys. We thought so the first of the fine of the stone are provided to the study of of that nature are hot, as also because they are able to drive down the crude matter plentitully to the Kidneys. We thought fit therefore to infish upon this, that we may accommodate the study of Anatomy to the very practice of Physick; especially seeing that the place wherein the stone is bred, is not commonly known, because the most famed Fernelius, whom the greatest number of Physicians does for the most part follow, Lib. 6. Patholog. c. 12, thinks that small gravel is bred in the proper substance of the Kidneys, and washed from thence by the showing of the Urine and carried into the cavity, and so the Urine full of gravel slides down through the Ureters into the Eladder. But if why the left Ridney is more subject to the Stone than the right; we must conclude that this happens, because the Colick-gut lies more upon the left Kidney, in whose cells this phlegm, of which we frake, abounding, either it sweats through the pores, and is suckt more jubject to the flore, cells this phlegm, of which we fpake, abounding, either it fweats through the pores, and is fuckt to the flore, into the Kidneys, or elfe by reason of its nearness, the Kidneys are exceedingly cooled; experience having often taught us, that this kind of phlegmatick matter is indeed actually exceeding cold in the as they have fufficiently perceived, who have voided it in great plenty by flool. After this there follows a third part [x and \frac{1}{2}] called fpermatice, or faminales, the spermatical, or seed veins, because they carry down matter for making of the seed. These differ in their original. For the left [\frac{1}{2}] arises from the inside, and middle part of the Emulgent, and communicating some factles of the seed of the see part of the Peritomenon, or rim of the belly, which covers the Muscles that lie in the Loins, it goes fast by the said Peritomenon, and descends obliquely; but when it has attained to the Os public, or the Share-bone, riding over it, it passes through the Peritoneum, and holes of the oblique and transverse Mascles of the Abdomen, with whose processes being sustained it is contorted into certain varieous circlings which are joined with the spermatical Artery by Anastomofes or Inoculations, and at length it ends in the Testicle of its own side. But the right spermatical vein [x] artises not out of the Emulgent, but the Trunk it self, and the forepart of it, a little beneath the Emulgent-vein, and afterwards observes a like comes with the forepart of it, a little beneath the chosen we may observe nature observes a like course with the former. And thus they are in males, though we may observe nature oftentimes varying in them: but in Women, although they arise in the same manner, and observe the same course with those in Men, as sar as the Holy-bone; yet they fall not out of the Perinneron,

nor reach into the share-bones, but before they come to the Testicles, are cleft into two unequal branches; the leffer of which is scattered into the fides of the womb, toward the bottom of it; the greater being joined to the spermatical Artery, and inoculated with it, enters into the Testicle on its own fide. Laft of all the fourth pair is called [X] Lumbures the Loin veins [444] two, or Lumbures three which the Hollow-vein fends forth from its back-fide, which looks towards the bodies of the Rack-bones of the Loins; and therefore they are not to be feer, unless the Trunk of the Hollow-vein be lifted up. These veins go in through the holes of the Rack-bones, through which the Nerves go out, and fo carry nourithment to the spinal Marrow. From them two other veins, tyed on both fides to the fide of the Marrow, afcend toward the brain, with which afterward two veins defeendfides to the fide of the Marrow, alcend toward the oran, with which afterward two veins detected-ing from the internal Jugular, are joined by an Another for Inoculation.

These propagations being thus sent out, when the Hollow-vein has almost attained to the Sacrom, The division

or Holy-bone, about the fifth Rack-bone of the Loins, it inclines under the great Artery, and is cut of the Trunk into two notable branches called *Hisci*, [XX] which having gone a little way are again cleft into into the two into two notable branches called Haze, [AA] which naving gone another way are again cleft into into the two two others [Y and Z] of unequal bigness, of which one is called the inner, the other the outer. Fixed branches lefs, the outer larger and greater. But before they be so divided, they scatter two other propagations, the surfect of which [5] is commonly called Massack surfection, the upper Muscle wein, which is differninated overthwart, through the Muscles of the Loins; and Abdomes or paunch, view of the Loins is the other [6] is named to the Loins in the other [6] is named to the Loins in the Loins in the other [6] is named to the Loins in the loss of the Loins. Sacra, or the Holy-vein, because it reaches forme little twigs to the upper holes of the Holy-bone, for Sacra,

the nourifhing of the faid bone and the spinal Marrow.

But from both the Iliacal branches many veins iffue, before they go out of the Perhonaum or Rim Propagations of the Belly toward the Legs; and from the inner branch two. The tirst [7] arises from the out- of the inner s fide called Mufcula media, the middle Mufcle-vein; because it is featured into all the Mufcles of listal branch the Buttocks, and into their skin: For it carries aliment to all those Muscles, which are of the outfide, or Back of the bone Himm, Hanch-bone, as also to the very joint of the Hip, and that for this cause it ought to be especially taken notice of by them who would somewhat curiously consider the cause of the ach in the Hip, or the Scianica. I should think that this vein may not be amiss called the cause of the act in the rip, of the behalfed into the Muscles called Clauses, or Muscles of the Clauses from its infertion, because it is implanted into the Muscles called Clauses, or Muscles of the Clauses. Clanea from its intertion, because it is inside, and is a notable vein, called Hypegafirica, or the Hypegafirica.

Buttocks. The other [8] grows out of the inside, and is a notable vein, called Hypegafirica, or the Hypegafirica. Buttocks. The other [5] grows out of the finite, and is a notable vein, called Hypogastrica, or the Hypogastrica, vein of the water-course, from its distribution into almost all the parts of the Hypogastrium, or water-course. From this issues a branch named Hemorrhoidalis externa, the outer Emroid-vein, because if Hamarrholdalia at any time it swells with a more freculent bloud, or hot, or falt, it makes the outward Emroids of externa, the Fundament. This affords twigs to the holes of the Os facrom, or Holy-bone, but beflows greater branches upon the Muscles of the Restaum intestinum, or the strait Gut, as far as to the outer skin of the Fundament. There is also another branch arising from the same Hypogastrick-vein, which we call Cyfficm, the Bladder-branch, and is worthy of observation both in men and women in men, because it is spent upon the Bladder; but in women, because in them being sustained with a fat membrane, it goes with some twigs to the Bladder; but with more to the bottom of the Womb; and with more manifelt ones to the Neck of it, by which veins alone fome think that the monthly courfes flow in Virgins, and fome also think the same in Women. But the monthly courses do not only flow out by these branches, but by those also which we told you were fent from the spermatical branch, and which go to the bottom of the wornb, not to the Neck. For the menfirmous blood isufually purged out, whether in Virgins or women, every month; not only through the Neck, but effectally through these passages of the Womb, called Constitution. Which we have them here at Padua, publickly in the Theater, the first year of our being Professor, in the carkass of a certain Woman having her monthly courses. For we saw that the Hypogastrick branches, and the spermatick vessels with the Testicles were filled with bloud, and that the Womb it self-did pour out a thicker blood, the little mouths of the veins in the inner part of the Womb lying open, and manifefully gaping. Yet I faw twice in others, that the mentiruous blood came out of the veins of the Neck only, not also out of the womb, and in another on the contrary that it flowed out of the Womb only. But the ordinary way is for women to be purged at them both, and not at one only, except when befides the intent of nature obfiructions do feem to hinder their flowing.

But we have observed, and seen divers times, whilest we were about the cure of Ulcers in the privy members, and the neck of the Womb, that at what time the monthly courfes do flow, the mouth of the Womb gapes. I faw also then, that those parts were dilated with a certain slinking moiffure, and that the neck of the Womb appeared much larger than it was wont to be at other times. And therefore no man need to wonder at that, which hath been observed by some Writers of our age, that in the time of their courses these parts have been so widened in some, that being new married, although they were true Virgins, they have for this reason been accused, and thought to have been defloured. Wherefore if it happen, that any who are new married, doubt of their Wives virginity, because they find the privy passage very wide, it will behave them to consider, whether their flowers were not at that time upon them. Now at length the remainder of the inner Blacal Trunk makes to the Share-bone, and taking to it a propagation of the outer Iliacal, together with which it makes one vein, and fo patting through the Peritoneum, and hole of the Sharebone, it spreads it self into the leg, and is extended almost beyond the middle of the Thigh on the

From the outer branch in like manner fome veins iffue: and first of all, that which is called propagations Epigathrica, or vein of the lower Belly [9] which arifes from the higher part of the branch, and is of the fo named, because it goes to the Muscles of the Epigastrium, to wit, the rich Muscles of the Abdonon. Iliacal branch. For passing with its chief branch out of the Peritaneum or Rim of the Belly, it climbs thrait up on apigastrica. both fides under the right Muscle, till it come near to the Navel, where it is joined by Austlomofis with the descending Mammary-veins. But this Anatomosis or inoculation is seldern found in men,

STREET, SQUARE,

but in women it is very conspicuous, from whence also Galen Lib. de Diffell. Ven. & Arter. Cap. 8: witneffeth, that great fympathy betwixt the womb and the Brefts or Dugs is caufed by thefe two veffels. But the most learned Hippocrates has explained this sympathy in many Aphorisms of the fifth Section. For in the fiftieth Aphorism he says, If you would stop the courses in a woman, apply a very great Cupping-glass to her Breasts. And in the thirty seventh; If the Bress of a great bellied woman, do of a suddain become small, the child proves Abortive. And in the thirty eighth; if one of the breatts of a great bellied woman become fmall, one of the Twins, that the goes with, proves Abortive; and that a Male, if the right Breaft be fmall; a Female, if the left; so the womb being difeafed, the Nipples become pale; and upon a Dropfie in the Womb they fwell up. But there is a fympathy also not only by reason of the veins, but also of the Nerves, that come from the fixth conjugation. Whence we see, that if the Brests of a Woman, or Virgin be handled, they are provoked to luft; fo that for this reason also those Women, that have great Breasts may be accounted more luftful, as Afra is in Martial. But it is convenient to note concerning the original of this Vein, that very often it arises out of the Crural branch, which we shall by and by describe, but oftner out of the Iliacal. Another vein is the Pudends [11] which arises from the inside of the outer Iliacal branch, after it is come out of the Peritoneum, or Rim of the Belly, and it is called Pudenda, because it is spent upon the privities of both Sexes. For in men it is distributed into the Serotum or God, and into the skin of the Yard; but in women it is propagated to the Lips and skin of the privy paffage, to the Nympha or wings, and other parts of it; but in both men and women to the Glandules, that lie about the leskes, whence arifes that conflux of matter into these Glandules, in a peffilent or venereous Bubo. Lattly, the Mufcula inferior, or lower Mufcle-vein [12] is that which goes to the joint of the Hip, and is differninated into the skin and mufcles thereabout, by reason whereof in my judgment by a stricter Appellation it might be better called Coondica, or Coxalis, the Hip-vein-

Fudenda.

Mufcula infe-

CHAP. V.

Reckens up the propagations, and branches of the outer Iliacal branch diffeminated through the Crus, or great foot, that reaches from the lower part of the Bustocks to the end of the Toes.

The division, of the Crural vein into a Trunk and branches. Four propagations of the Trunk before its division. Saphera. Four propagations of the vein Saphera.

He outer branch then of the Iliacal veins [Z] when it hath fent forth the faid propagations, falls out of the Rim of the Belly, and is carried to the Inguina or leskes through the upper and inner region of the Hip-bone, through which the first and second bending Muscles of the Thigh do descend, and makes the Crural-vein [L]. The History whereof that we may deliver in an easie method, we will divide it into Trunk, and Branches. But before the Trunk be cleft into its branches, it shoots out four propagations; the first of which is that they call Saphena, [13] and vein of the inner Ankle, because it runs near thereunto; it is also commonly called by Phylicians zena tali, but improperly, as we have faid above in our first Book. But it arises from the inner fide of the Trunk, prefently after its departure out of the Pertoneum, or Rim of the Belly, and having no Artery for its companion, runs strait downwards under the skin, through the infides of the Thigh and Leg; and when it is now come to the inner Ankle, it spreads it felt into the upper part of the Foot, and featters a branch overthwart, from which afterward many others arife, that are distributed in their order to every one of the Toes. This vein scatters other propagations by the way, but which are feldom found answerable one to another, either in number, or bigness, as we have already more than once intimated, that nature is found to sport in the veins, but especially in those of the joints. the first [17] of these propagations, not far from the original of the vein it felf, is dealt into the upper skin of the inner Region of the Thigh, in two branches; of which the outer, which is the thicker, creeps through the fore, and outlide of the Thigh, under the skin; but the inner goes more inwardly, and spreads it felf into the rim of the Belly. The second [18] is propagated, when the vein has now attained to the middle of the Thigh. The third propagation [19] arifes about the knee, and brings forth two off-fprings, one which is differninated into the skin of the forepart of the Knee, by the Patella or Whirl-bone, but the other into the skin of the Back-fide, where the bending of Ham is, about which it is rowled orbicularly. The fourth [20] is carried to the middle of the Tibis or Leg, with furcles forward, and backward, over against the Saphena, another vein [14] is brought forth from the outside of the Trunk, but shorter than the vein Saphena is, and reaches outward, and overthwart into the skin, that covers the forepart of the Hip-bone, as also into the Muscles of the same place which the later Anatomists call Isebia. These propagations being brought forth, the Trunk afterward is drencht into the Muscles that compass the bone of the Thigh, and sets out a third propagation [15] which they call Muscula the Muscle-vein; and there use to be two of them. For the outer, which is the lefs, fends thoots to the fecond, and fourth, extending Muscles of the Tibis or Leg, together with the skin; the inner, and greater, affords twigs to the third extender of the Leg, and to almost all the Muscles about the Thigh. After this the Trunk turning to the Backlide, and defeending by degrees, featters fome other twigs into the membranes of the Muscles, and by and by fends out a fourth vein, which runs into the backfide of the Thigh, and is called *Poplites*, the Humanian Color of the Chief of the Thigh, and is called *Poplites*, the chief of Ham-vein [16] much spoken of by writers of Physick, but especially by Hippocrates the chief of them, who 6. Epidem. 1. 5. commends much the opening of it in different of the Kidneys. But it is oftentimes feated too deep to be cut without very great difficulty. I have learnt by frequent experience, that iffues made in the Sura or call of the Leg, to which this vein spreads it self, have done a great deal of good in many difeafes. This vein, when it is propagated, tometimes receives the addition of a Spring from the inner branch of the Muscle-vein; ottentimes also two propagations of the Trunk, created in their commercial control of the Muscle-vein. iffue from the Trunk, one higher, and another lower, which afterward are united in their journey.

Bibla.

Mufcula.

Poplitas.

But prefently after it's rifen it featters fome branches into the skin of the Thigh, about the higher and hinder part of it; then it runs down directly through the middle of the Ham, or bending of the Leg, into the Calf, to which it diffibutes many Surcles, that run on with an uncertain courfe, fome directly, fome overthwart, fome obliquely. These little branches being thus differninated, the vein passes on as far as to the Talm, or Cockall-bone, and there at length determines.

And this is the progress of the Crural-Trunk, and these the propagations which it scatters, The division before it be divided. For lying upon the bone of the Thigh, it so descends, and runs side-long of the Trunk into two the state of the Thigh, in which place [\Delta] it is carried betwixt the two lowest, and hindring most head of the Thigh, in which place [\Delta] it is cleft assunder into two branches, an outer, and an inner one. But they are of unequal bigness, the outer being the smaller, and the inner the greater, but both of them [\Delta A] are scattered through the Leg, and lowest part of the Foot. The soner [\Delta] inits descent sends some propagations of the Muscles that are placed on the backlide of the Leg, and especially those which make the Calf, but most of all to the inner part [21] of the Gasteronomic externus, or outward Calf-massel, and so afterward continuing its course downward, when it is come to the lower Appendix of the Tibia or Leg, and has bestowed some shoots upon the skin, it is research to two lefter branches, that are likewise unequal, of which the inner [\Delta]] skin, it is reflected under the inner Ancle [22] and runs out as lar as to the great Toe. The outer [A] is prefently cleft into two leffer branches, that are likewife unequal, of which the inner [2] that is the greater, and lies deep, is wholly spent upon the Muscles of the Calf, running all along directly betwixt the two heads of the Gasterococomian externus, or first moving Muscle of the Foot, as also betwixt the Gasterococomian internus, or inward Calf-Muscle, and the Tibious amicus or forward Leg-Muscle, and at last betwixt the Muscles that bend the Toes, distributing some suress or forward where by the way to the Muscles, through which it passes. When it comes to the mid-length of the Leg, it is again subdivided into an inner, and an outer branch. The inner of these distributes a twig near to the joint of the Tibia or greater Leg-bone, and the bone called the Cockall, descends with the Tendons of the Muscles, and is divided into the great, the fore, and the middle Toes. The outer passes on near to the Fibula, or lesser bone of the Leg, and when it comes to the Liga-The outer paffes on near to the Fibula, or leffer bone of the Leg, and when it comes to the Ligament which ties together the greater, and leffer bones of the Leg, it shoots forth a branch, which perforating the Ligaments runs into the Foot, and is scattered into the Muscles which bend the Toes of the Foot outward.

But the outer and lefs branch [II] of the Crural-vein goes from that division of the outer branch, which is made near the Ham, to the upper Appendix of the Fibula, as alfo to the outer and hinder part of the Tibia, where scattering many little branches, it goes to the outer Ankle, and at last ends

And this is the univerfal Hiftory of the Hollow and Gate-veins, where we have perfected the whole course of their distributions. It seems yet to remain, that we speak of the Umbilical, and Arterious veins. But because the Umbilical vein is nothing else but a more notable propagation issuing out of the Gate-vein; and in a man grown performs the office of a Ligament, rather than a vein, because it keeps the Liver in its place; as the stories of them do witness, who upon the cutting off, or wounding of the Navil, have suddenly died, their respiration being hindered by the weight of the Liver falling out of its place, and pulling down the Disphragma or Midrift with it, we thought it not worth our pains to make any more mention of it in this place. But if any one will obtain a place of the place in the place in the place in the place. But if any one will obtain a place in the place worth our pains to make any more mention of it in this place. But it any one will continuely contend that it is a peculiar vein, with arguments fetcht out of his own Brain, we know no better counfel that we can give him, than to confult better with his own fenfe, or if he will contend further, to purge his head with Hellebore, that that dimnels of the eye-fight may be a little taken away. But we thall with thore convenience make mention of the Vena Arteriofa, or Arterial-vein, in the following Book, when we shall explain the history of the Arteria venesa, or venal Artery, because they are very like one amother, and therefore the fame pains may ferve them both.

An Explanation of the Table of the VEINS.

This Table delineates the Hollow-vein, entire, and free from all parts. Wherein we have marked the Trunks. and larger branches, with pretty great letters: but the propagations with little ones; and when they are at an end, with figures.

"He Afcendent Trunk of the Hollow-vein, the beginning whereof is about A, which notes the place, roberein the Liver should stand in the proportion of this signre, the end about D. For it passes on undivided from the convex part of the Liver, about which is scatters little branches, 222 ds far as to the Hollow of the Neck; but it featters some propagations, three in number. The first of these, & x, is called vena Phrenica the vein of the Midriff, which is distributed on both fides into the Midriff and Pericardium, or Purfe of the Heart growing thereto, as also into the Mediastinum or partition of the Cheft.

Another is Vena Coronaria the Crown-vein, bb, which embraces the basis of the heart in manner of a Crown, differfing many Surcles to the point of it. The third is the vein Azygos, or without a mate, ec, which issuing our from the right side of the Hollowvein, about the heart, about the fifth Rack-bone of the Cheft, goes down near to the right fide of the Rackbones, as far as to the second almost of the Loins. There are ten propagations ddd from this, fent to as many bony distances of the ribs which are called Intercostales inferiores, the lower veins betwiet the ribs.

Shews how the Trunk AD is bowed toward the

right side, because of the situation of the heart.

The orifice of the Hollow-vein reaching into the right ventricle of the heart.

D The division of the Ascendent Trunk about the Hollow of the Neck, into two branches EE, which they call fubclavia, or the veins under the Collar-bones. From these arise many propagations, some issuing from the lower, others from the upper part of them.

Out of the lower part iffire five. The first is called Intercostalis superior the upper vein between the ribs, c, and featters two Surcles ti, to the diftan-ces of the three upper ribs. The fecond is mammaria the vein of the dugs, g, which descending under the brist-bone, as far as to the strait Muscles of the Abdomen, is inscalated 10, with the Epigastrick vein climbing upward, 9, giving fureles to the griftly defances of the true ribs, as also to the Mediastinum, and Muscles that lie upon the Brest. The third cal-led Mediastina, h, is differninated into the Mediaftinum, or partition of the Cheft. The fourth vertebralis, or the vein of the Rack-bones, i, climbs up through the boles, that are bored in the transverse processes of the Rack-bones of the Neck, distributing brings to the Muscles, that lie upon the Rack-bones. The fifth is called Cervicalis or the vein of the hinder part of the Nick, I, destributed into the Muscles, feared on the lower part of the back fide of the neck and on the upper part of the Chest. Out of the upper part iffur three. The first is Jugularis interna, the inner vein of the Hollow of the Neck, m, which having feat over small sprigs from it its outer branch to the Chaps. and region of the Ear, is joined by the inner all the resy to the Arteria Carotis, or fleepy Artery, and is divided near to the skull into two branches called En-cephalici or of the Brain, by Spigelius; of which the hindmost and greater, n, basing entred into the skull through the second hole of the Nowl-bone, is infirted 0 0 into the first 1, and second 2 sinus of the thick membrane. But the formost and leffer, p, baving entred through the seventh hole of the wedg-bone, is scattered through the sides of the thick membrane. The second is the outer Jugular-vein, q, which get-ting up by the fides of the Neck is divided near to the Ears, t, into two branches; of which the one called Profundus, I, is varioufly differentiated into the Mufeles of the Laxinx or throttle, and the bone called byoides, as also into the Tongue, the Palat, and hollow-ness of the Nostvils, and lastly into the skull with three propagations, of which that which paffer t, out of the forepart of the eye, through the second hole of the wedg-bone, is very well delineated bere. The other called Subcutaneus, u, first of all spreads its fore-branch x, into the Muscles and sign of the Face, which joins with its fellow about the top of the nofe, and makes the Forebead vein y, then it iffues out another hinder branch, which partly creeps upward along the temples z, and partly is carried behind the cars to the skin of the back part of the head, a The third, Cervicalis superior, the upper vein of the Neck, Bis propagated into the Muscles behind on the back side of the nock. There are three firms or finall channels of the thick membrane of the brain; the first or right one is marked with 1 , the fecond or left one with 2 , the third with 3. The hinder part of this, which is nearer to the Nowl of the Head, is shadowed, but the fore part, which is next to the Forebead, is feen manifoftly-From this finus many little veins, which they call Ductus, are reacht forth to both fider.

Here the fubclavian vein takes on it the name Axillaris or the vein of the Armpit, and is divided into two branches, the Cephalick G, and the Bafilick I. But before this division it scatters two twigs; the first called scapularis interna, or the inner vein of the foulder blade, y, the other Scapularis externa, the outer blade vein 8, the Bafilick vein also I, before it outer blade vein 8, the Bafiliet vein also, which is enters the Arm, propagates two; one called Tho-racica superior, the upper Chest-vein, \(\xi\), which is distributed through the inside of the Pelloral Muscle, and in women, through the Dugs: the other called Thoracica inferior, the lower Chest-vein, \(\xi\), which defeending along the fide of the Chift, goes to the Muscle called Aniscalptor.

The Cephalick-vein, which, before its divifunt, finds away a sprig, v, into the Musele deltoides, and another \(\theta\), into the Musele of the Cubit.

When the Cephalick vein comes to the joint of the Cubit, at the outer bunching forth of the Armit is cut into three branches. H, The first, i, or deep and middle one goes to the Mufcles arising from the faid protuberation. The fecond, n, or inner goes to the making of the vein called Mediana >. The third u, or outer is carried obliquely, v, by the radius or lefter bone of the Cubit to the outside of the Arm, and so creeping on obliquely all the way, when it is come to the root of the wrift, it is joined with a little branch of the Bafilick-vein, T, and makes the vein called Salvatella. The Bastlick-vein, which on the right hand is cal-

led Hepatica, or of the Liver, on the left Lienaris, of the Spleen. This before its division fends out a Surcle,

arife from the outer prosuberation of the arm.

The division of the Basilick Vein K, into two branches, the one called Produndus or the deep one, the other Subcutaneus, or branch under the skin. The deep one L, when it comes to the bending of the Gubit, is divided into two, M, one of which called Radicus N, at the Radicus or lesser bone of the Cubit; the other called Cubitcus, O, at the greater bone of the Cubit, goes to the band.

Subcutaneus, or the branch next under the skin P, near to the inner protuberation of the arm is divided, Q, into two other, of which the inner R, together with the inner branch of the Cephalick x, makes up the vein Mediama h, which is likewise divided into two branches, the outer of which P, is called by some Cephalica manus, and goes to the Thumb, the inner o, to the fore and middle singers: The outer S, going to the wrist, is joined toward the little singer with the outer branch of the Cephalick vein about T.

The little valves, which are found in the veins of the joints, are handfornely cut out here, as it were to be feen through.

feen through.

The descendent Trunk of the Hollow-vein which begins about the Region of the Liver T, and ends about the fifth Rack-bone of the loins V. There are four twigs growing from this. The first v, called Adipola or fatty vein distributed to the membrane of the Ridneys. The second Φ the emulgent going to the Ridneys. The third, preparans vas, the preparing vessel; the right one χ, arising out of the Trunk T V, the left 4 out of the left Emulgent, both afterward going into the Testicles σ. The fourth is the three Lumbarcs or loin-veins, 444.

bares or loin-veins, 444.

The division of the Descendent Truck V, into the two Iliacal branches XX, both which are again divided into two other, an inner one Y, and an onter Z. But before this division two propagations are issued forth, Muscula lumbalis, or the Muscle-vein of the loins 5, and Sacra, or the Holy-vein O.

The Inner Iliacal-vein , before it goes out of the

Peritoncum, or rim of the belly, shoots out two propagations, the first called Glutzea 7, and the second Hypogastrica 8. The remainder of it passing through the Peritoncum, is spent upon the inside of the Thigh.

The outer Hiscal vein likewise before its going forth of the Peritoneum Scatters three propagations; The first called Epigastrica 9, going into the Muscles of the Epigastrium, and the strait ones of the Abdomen, where they are joined by Anastomolis, or insendation 10. The second called Pudensla, 11, spent upon the Privy Parts. The third Coxalis, 12, upon the Muscles of the Hip.

Muscles of the Hip.

Here the outer Iliacal vein having past through the Peritoneum or rim of the Belly enters the Grus, and begins to be called the Crural Trunk I, that is undivided as far as to the lower beads of the Thigh. But it reaches forth four propagations before its division. The first 13, is called Saphena, which creeps through the inside of the Leg, under the skin as far as to the ends of the Toes. Another 14, called lichia is spread out into the skin upon the Hip-bane. The third 15, named Muscula is sent to the Majeles, which extend the Leg. The fourth 16 named Pophice is distributed into the Calf of the Leg.

The vein Saphena also scatters from it self four furcles, the first 17, into the upper part of the ikin of the inside of the thigh: the second 18 about the meddle of the thigh: the third 19 into the knee: the middle of the Leg.

middle of the Leg.

The division of the Crural Trunk near to the two lower heads of the thigh into an inner branch Θ and an outer one Λ.

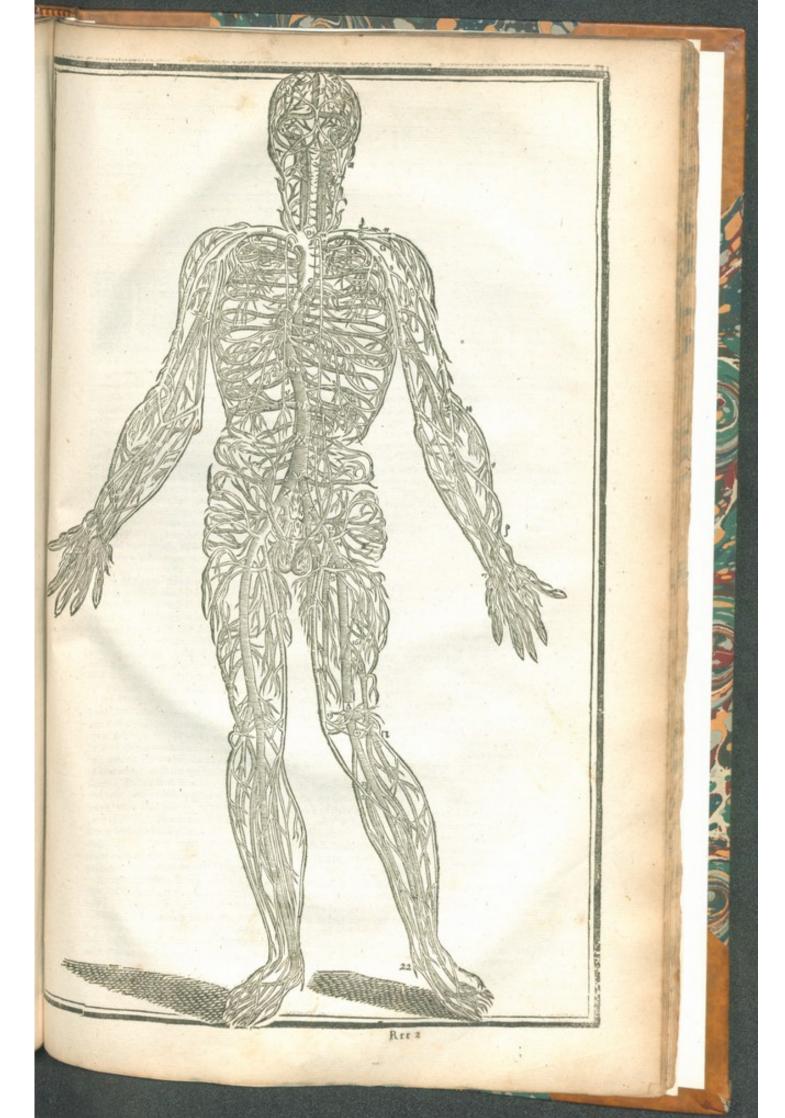

The inner distributes little branches to the Musicles of the Calf 21, and then runs down under the inner ankle to the great Toe 22.

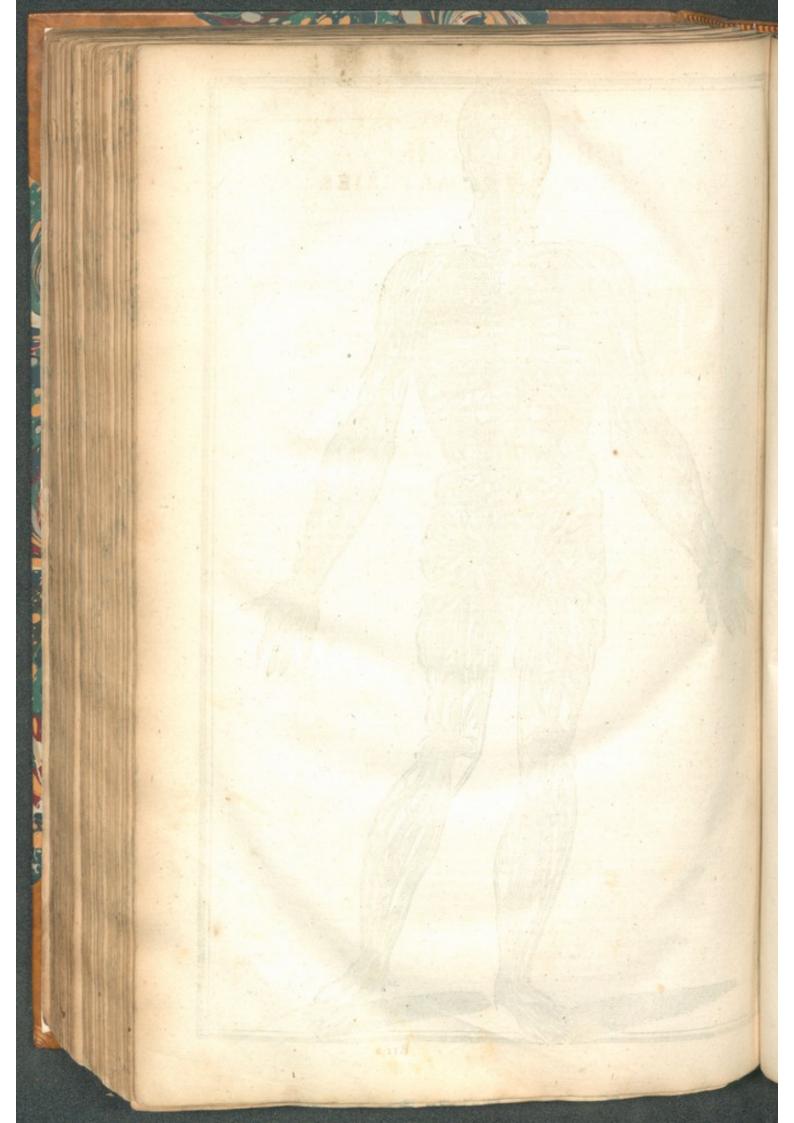

The outer prefently is cleft into two branches, an inner one Z, and an outer \(\Omega\). That is spent wholly upon the Muscles of the Calf, this passes an near to the Fibula or lesser bone of the Leg, through the outer and back side of the Leg.

TRACT. II. CONCERNING THE ARTERIES.

CHAP. I.

Shews the upper or afcendent Trunk of the great Artery, with its propagations that are distributed through the Head.

Here is no controversie among Writers of Anatomy concerning the number and The Original original of the Arteries, but an unanimous confent, that all the propagations, of the great which are scattered throughout the body, take their rise from one, which they Artery.

which are feattered throughout the body, take their rife from one, which they arrery. call Aorta, and that this is derived out of the Heart. But the Heart confifting of two finus or cavities, a right and a left one; this great Artery grows out of the left finus or ventricle [A], where it is largeft, and more hard, and grifly than elfewhere. But as foon as it is grown out, and before it fall out of the Pericardium or Purfe of the Heart, it prefently propagates two finall fprigs [a a] one of each fide, which they call Arteria Coronariae, the Crown Arteries, Arteria companier of a Crown, and from these many propagations are scattered downward all along the Heart in manie, the manner of a Crown, and from these many propagations are scattered downward all along the Heart. Crown Arteries, are more and greater about the left than the right ventricle, as we have also formerly said concerning the Vein, because the Heart needs a greater plenty of bloud on that side, as which beats with a perpetual and more violent motion, wherein more bloud is digested than the right saw of with a perpetual and more violent motion, wherein more bloud is digefted than the right finis or ventricle does: yet that propagation is bigger and longer, which arifes out of the right fide of the Artery: fometimes also there is onely one, at whose orifice a little valve is found. Those propagations being thus diffeminated, the Artery ascends somewhat under the Trunk of the rens Arteriols or Arterial vein, and pierces through the Pericardium, and having got above it, is cleft [B] into The divisions two branches, which because of their natural greatness we will call Trunks; and because one alcends of the great [C] and the other runs downward [Q] that shall be the ascendent Trunk, this the descendent. Artery into Yet the descendent and lower one is bigger by much than the upper, because that serves more parts what parts than this: For the ascendent one goes onely to some parts of the Cheft, to the Head and Arms; but what parts the lower to very many parts of the Chest, to all the lowest belly and the legs. That therefore we may treat of the great Artery with more perspicuity, we will first shough the arms. Trunks non-may treat of the great Artery with more perspicuity, we will first shough the arms. The order of Then we will fall upon the descendent one, and explain the manner of its distribution through the to be said. Chest, and lowest belly, and lastly through the legs. with a perpetual and more violent motion, wherein more bloud is digested than the right sorts or

Then we will fall upon the deteendent one, and explain the manner of its distribution through the Cheft, and lowest belly, and lastly through the legs.

The Ascendent therefore or upper Trunk of the Aorta [C], being fastened to the Oesphagus, or Gullet, climbs upward betwixt the rough Artery, and hollow Vein, and the mediastimom or partition of the Cheft. Which situation of it they ought diligently to observe, who defire to know the reason of that Aphorism, which is the four and twentieth of the fifth Section in Hipperrates: For says he, cold things, as Snow and Ice are enemies to the brest, provoke Coughs, and cause enoptions of blood, and distillations. Truly they are enemies to the brest, because whilest they are swallowed down through the Gullet, they cool the rough Artery that lies next that less next that they are fivallowed down through the Gullet. down through the Gullet, they cool the rough Artery that lies next to it, together with the Gullet, which part being of it felf cold, does eafily take harm from fo violent a cold: hence the Cough, and other difeases of the breft follow one another in a long row. But iffus of bloud happen in like manner, the great Artery being cooled, whereby the vital Spirits and the bloud are driven back to the Heart, and from thence are fent up forcibly to the Head, which being stuffed, eruptions of bloud are caused by its dropping forth at the Nostrils, as also Catarrhs and Dittillations, it being driven down undigested to the interiour parts. And hence also a reason may be rendered, why some upon drinking of cold water after vehement motions and exercise of body. have presently been see ven down undigetied to the interiour parts. And hence also a reason may be rendered, why some upon drinking of cold water after vehement motions and exercise of body, have presently been sufficated, the passion of the heart, and grievous swomings following thereupon. For the Artery being vehemently cooled, the bloud is congealed, as well that which was in the Artery or great Artery, as that which abides in the Heart; from whence happen at first searful symptoms, and then sudden death. But we have seen in these men, that a vein being opened, the bloud hath come out thick, and cold, and with very great difficulty, whence also we have not found a more present remedy for them, than such things, as by reason of the thinness of their parts have a power of dissolving the clots of bloud. Hence also a reason may be given, why in burning Fevers the Tongue becomes black, and the diseased can hardly swallow. For although it be true (which is the cause commonly affigned) that many vapours are sent up from the whole body to the head; yet we may assime ausse of this blackness to the nearness of the Artery, which being set on fire and inslamed; procures much mischief to the Gullet, and consequently to the Tongue it self.

But the ascendent Trunk, whilest it passes thus upwards, is divided into the two subclavian Artery

But the ascendent Trunk, whilest it passes thus upwards, is divided into the two subclavian Arte-The division ries [DD], of which one runs to the right side, and the other to the left. They are called subclavia of the ascenasiong as they are in the Chest, for the same reason as the subclavian veins are so called, because they dent Trunk run under the elavious or collar-bones: but as soon as ever they are fallen out of the chest, they dent Trunk run under the elavious or collar-bones: but as soon as ever they are fallen out of the chest, they chest run and are called Axillares [E]. From both the subclavian Arteries, when they the subclavian attained to the first rib (for before that they send forth no propagations) many springs is subclavian Arteries, well thought in under the subclavian attained to the sixth passes as lower part. From the lower, iffuses the upper Intercollal Arteries are subclavian Arteries. as well from their upper as lower part. From the lower, iffues the upper Intercollal Artery, or Inter-

artery of the rack-bones.

neck.

Intercostalis su- estalis superior [b], which being fastned to the roots of the ribs, bestows particular branches upon the up- the diffances of the four uppermost which run under the ribs, together with the veins, as far as to the per arery se-eween the ribs grifles, from which propagations are differfed into the marrow of the back, and the neighbouring muscles. From the upper part issues first that which is commonly called Corvicalis, or the Artery of Pirithralis, the the neck [c], but better Vertebralis, of the rack-bones, which arises more backward, and toward the bodies of the rack-bones, and afcending obliquely, near to the feventh rack-bone of the neck, like the neck-vein, paffes through the holes of the transverse processes, and upper rack-bones of the neck, where it shoots out many propagations which enter the spinal marrow through the common holes, at which the nerves go out. It sends also a pretty company to the muscles that are feated on the back-side of the neck, and ascends to the nowl-bone together with the vein, through whose first notable hole, by which the spinal marrow descends out of the head, it enters the skull. After this it is joined with its fellow of the other fide under the fpinal marrow, which remains yet in the skull, and fo runs firait forwards, under the middle of the bafir of the brain; but when it hath now attained to the folia or faddle of the wedg-bone, upon which the phlegmatick glandule lies, it is divided into two branches, a right and a left one, both which at the fide of the faddle creep to the fecond pair of nerves, where being broken on both fides into an infinite number of furcles, they are differfed betwirt the first and second pair of the nerves, and solden together with the thin membrane, make that com-Manuaria, the plication of veffels called plexas Chroides. The next is arteria mammaria, or artery of the paps [d], artery of the which being reflected under the breit-bone (accompanied with the mammary vein) defcends along its fides, and when it comes to the grifle called Enfi-formis, or the breft-blade, about the fides thereof goes out of the cheft, and running under the right mufcles of the abdomen, defeends directly through the lower fide of them, and at length near the navel, is joined by anaflomofic or inoculation [x] with the Epigaltrick Artery plying upward [i]. But before it leaves the cheft it featters particular branches to the fix diffances betwixt the grilles of the feven true ribs, which branches determine together with the grifles. A third [e] is otherwise called Musicula the Muscle-artery, but might be better and the more firstly named Cervicalu, being it is differninated into the Muscles that are placed in the region

Organization of the last

TRACT. II.

of the neck, as far as to the occipition or nowl of the head. These branches being sent out, the subclavian artery goes out of the cavity of the chest, and getting above the first ribs tends obliquely to the arm-pit, and so makes the axillary artery [E] which afterward is spread into the arm. But before that it scatters some propagations, and from its lower part three, of which the first is scapularis interna, the inner-blade Artery [t] which goes to the muscles on the hollow side of the shoulder-blade. Another is Thoraciea superior, the upper chest-artery [g], which goes to the pectoral muscle, that leads the shoulder forward to the brest, and the other muscles that he upon the brest, and is a pretty big one. The third is Thoraciea inferior, the lower artery of the chest [h], which is also a large one, and running down all along the side of the chest, is the greatest part of it scattered into the broad muscle called Lassifimus, which moves the shoulder backward from the brest. From the upper part of the axillary Artery arises one called scapularis externa, the outer Arteria axillathe breft. From the upper part of the axillary Artery arifes one called feapularis externs, the outer blade-artery[i], which climbing up to the top of the shoulder is diffeminated into the Muscles that cover the gibbous side of the shoulder-blade. The remaining part of the axillary artery passes on in company of the Bafilick vein to the arm, upon all which it is afterward spent, of whose distribution we

will speak in the following Chapter.

The fleepy Arteries.

branch of the brain. The division thereof into a leffer and greater branch.

That which remains yet of the afcendent Trunk [L] being furfained with the Thymas near to the upper part of the brest-bone, is divided into two branches [MM] which they call carotides or soponales, the fleepy arteries, because they being obstructed, or any way flopt, we presently fall assesses of which Valuerda witnesses in Anatom. lib. 6.c. 11. that Realdus Colombus made trial in a young man, among a great company of men. They are unequal in bigness, the right one being much thicker than the left, but they tend directly upward, being carried along the sides of the neck, and fatined to the rough artery, and to the internal jugular veins, by the benefit of a membrane, and when they are come to the cups, are divided into two branches [N] of which one is the outer, the other the inner one; that is the left, this is the greater. The current [O] for the propagations [1] to the cheeks and The division one: that is the lefs, this is the greater. The outer [O] fends propagations [f] to the cheeks and the outer, or branch of the goes to the back fide of the car, from which two branches under the ear enter the nether past through the first hole of it, that is feated at his processes, and throughout the length thereof are differnmented into the roots of all the length care which is place. into the roots of all the lower teeth, that which remains, going out at the fecond hole, which is placed at the chin, is feattered into the lip. The outer branch [q] creeps through the Temples and The inner, or fore-head, and is fpent upon the mufcles of the face. The inner branch [P] of the fleepy artery, or arteria Excepbalica, the brain-artery, is carried into the chops; and having leattered fome propaga-tions to the tongue and throttle, is divided about the bafu of the skull, into two unequal branches, to wit, a greater and a leffer one. The leffer and hindmost [s] is carried together with the greater Encephalick branch of the internal Jugular-vein, to the back-fide of the skull, enters through the fo-cond hole of the secipitium or nowl-bone, and goes into the finant or canale of the thick membrane. The greater and more forward [t] having entered the cavity of the skull through a hole made on purpose for it in the temple-bone, and attained to the saddle of the wedge-bone, going every where under the hard membrane; first of all propagates a branch on both sides into the side of the thick membrane, then in Beafts feattering an infinite number of furcles makes the Rete mirabile or wonder-ful net, which indeed may be found in a Man too, but it is very little, and feems but a shadow in respect of that in Beass. These surces being thus placed it pierces through the thick membrane of the brain, and having got out of it, sends another propagation out of the skull, through the second hole of the wedge. of the wedge-bone to the eye and its mufcles, as also to the temple mulcle, that lifts up the lower jaw, and then going straight up to the side of the phlegmatick glandule, it is divided into two branches, an outer, and an inner. The inner is joined with its fellow of the other side, and being joined they of the greater- are walted into many little arteries, which are dispersed through the thin membrane, and the very

fubflance of the brain, to the original of the optick nerves. The outer being reflected and fuffained with the thin membrane, goes into the forward ventricle of the brain's being divided into many furcles, which are united with those little arteries which arise from the vertebralis or artery of the rack-bones stome with those which it differminates through the basis of the head under the brain, but others with those which it differminates through the thin membrane and substance of the brain, together with which they make the plexas choroides.

CHAP. II.

Declares the History of the Axillary Artery, being distributed through the Arm.

He Axillary Artery therefore when it is come to the arm, taking the name of the Arm-trunk Prachialistrae-[FF] is carried in one undivided flock, beyond the bent of the cubit through the infide of car, the trunk the arm, differing forme finall propagations on both fides to the mufcles that lie on the in- of the arm. fide of the upper part of the arm. But it goes fast by the inner or deep branch of the Basilick Vein, as an unseparable companion of it, whose conduct and steps it every where follows. But presently falling down by the back-side of the upper part of the arm, where the muscles which extend the eabit flick to it, it fends forth two propagations [land m] the lower of which is a very notable one, and so it is writhed back toward the bent of the cubit, and having attained thereunto it reaches out and so it is writhed back toward the bent of the cubit, and having attained thereunto it reaches out two surcles [nn] one of each side, so manifest, that the pulse is there oftentimes evidently enough perceived. Then going under the bent of the cubit, through the inside of it, and sinking down betwixt the two mulcles that bend the second and third bones of the four singers, it is cut [G] into the division one of which is an outer, the other an inner one. The outer [H] is carried the radius, or lesser bone of the cubit (whence I call it Radius) and goes directly to the wrist, in two branchests which also places are sufficiently and goes directly to the wrist, in two branchests which also places are sufficiently sufficiently and goes directly to the wrist, in two branchests which also places are sufficiently suffic which place Physicians scel the pulse, it being very manifest, by reason that the artery lies next unter the skin. But not far from the root of the wrist it shoots our a little branch [o] which runs branch. under the tendons of the mufeles which extend the thumb, into the outlide of the hand, and is spent upon the mufeles, which are placed betwixt the first bone of the thumb, and that of the after-writh upon the muteles, which are placed betwise the fifth bone of the thumb, and that of the after-wrift, which supports the fore-finger. This branch being propagated, going under the inner annular ligament of the wrift, and the broad tendon of the palm mutele, it is divided into three branches [ppp] like the vein and nerve that are its companions. The first of these goes to the inside of the thumb, the fecond to the infide of the fore-finger, and the third to that of the middle. The first and fecond are each of them parted into two branches; the third is undivided. The inner branch of the trunk. The inner branch of the trunk. are each of them parted into two branches, the time is undivided. The inner branch of the trunk. The in of the arm [1] runs strait along the mina or greater bone of the cubit (and for that reason I call it branch. But it is so hidden among the muscles, that it is hardly perceived to beat, unless in lean folks; and therefore Physicians always lay their hands upon. the outer branch when they feel the pulse in the wrift. But it passes on under the transverse ligament of the wrift, and the tendon of the palm muscle, in company of a vein and nerve, and scatters two branches into the little finger, as many into the ring finger, and one into the outside of the middle.

CHAP. III.

Shows the Inferiour or Descendent Trunk of the great Artery, and the propagation thereof through the middle and lowest Bellier.

E have faid above, that the great Artery [A] as foon as it is gotten above the Pericardinan or Purfe of the Heart, is divided [B] into two branches; of which one goes upward, the other defcends to the parts below. We have already handled the upper branch; it remains that we explain the other alfo.

mains that we explain the other and.

The defeendent trunk thereof [Q] answering in proportion to the flock of a Tree, is carried down to the fifth rack-bone of the cheft, and declining fornewhat to the left cleaves to that fide of the body. The defection of the rack-bones, and so descends leisurely. When it has now past the midrist through that divident trunk.

The defection of the first on the first from refembling a femi-circle, which is betwirt the productions of the feptum transformum or midriff, prefently it runs out by the rack-bones of the loins, leaning upon the middle of their body, till it come to the last of them, where near to the Os sucrem it is divided [R] into two notable branches [SS] which with our Anatomitis we will call Hisee, the Iliacal arteries from their fituation. In this jour- its ney it featters many propagations from it felf, which are very worthy to be diligently observed, be- tions caute from thence we may eafily give a reason of many accidents in Diseases. But they are in number eight, the Intercostal arteries, the two Phrenice or arteries of the midriff, the Coclincal one, then the upper Mesenterick, the two emulgents, as many spermatical ones, at last the lower Mesenterick, and the Lumbares, or arteries of the loins. Of these the Intercostals are scattered, whilest the trunk is yet in the cheft; the reft, whileft it paffes on through the lowest Belly. But some of them accompany the branches of the gate-vein, as the Coeliacal, and both the Mesenterical arteries, others those of the hollow vein, as the reft. Now we will treat of these in order, beginning from the Intercostals or the nonlow verifies the relative placed uppermoft. Prefently therefore after the descendent trunk [Q] is is flued forth, from its backlide it lends over little branches on both sides to the difrances of the eight lower ribs, which they call Interestales inferiors, the lower arteries between the jurgostalusfiances of the eight lower nos, which they can amorphism of the poken above. These affociating friends the arthemselves with the veins and nerves, of the same name, go straight on by the lower side of the ribs series bewhere peculiar forms or channels are cut out for them. But as the Intercofial veins reach in the true given the ribs opely to the orifles, but in the baffard ones formewhat farther, to wir, to the other channels force into the original power ribs. ribs onely to the grifles, but in the baffard ones formewhat farther, to wit, to the fides of the abdument fo also the arteries end in them together with the bony parts of the ribs, but in these run out a little

Their pfe.

in Hippocrates.

farther. And these arteries send over some propagations through the holes of the nerves to the spinal marrow, and to the muscles that lie upon the rack-bones of the back, just as we have said the intercoftal veins were propagated. But the use of them is to diffuse the vital spirit, and the bloud to the muscles betwixt the ribs, besides which they have also another notable office, to wit, of carrying down the water and purulent matter that is gathered together in the cheft, into the great artery, and from thence by the emulgent branches to the bladder. Although I am not ignorant that the most learned Fallopius and others, who have read before me in this most famous University of Padua, have fhewn another way to their Auditors; by which either purulent matter or water might be conveyed forth by help of the kidneys, to wit, the vein fine pari, or without a companion, a little branch whereof in the left fide goes into the emulgent of the left kidney. But this way which we flew through the Intercottal arteries, is by much the shorter; that I pass by this, that any matter heaped together may be more cafily dispatched away through the arteries than the veins. Nor needs any one here to be affraid left the vital spirits should be infected from these excrementitious and ill humours, whereby the heart may incur fearful fymptoms; when we willingly grant (which experience also hathoften taught us) that whileft the corrupt matter is emptied out by the urine, the fick parties have often fallen into fits of (wouning, and other difeases; sometimes also have died suddenly when the peccant humour bath been of too great a quantity, or too bad a quality, and bath offered fo much violence to Nature, that the heat and spirits have been overcome therewith. But here a certain place in Hippocrates calls upon me to explain it, which has long and often troubled my mind. The place is in The explana-Coacis prenotionibus, where he tays, They, who together with the heart have their whole lungs inflamed, to that it falls to the fide, are deprived of motion all over; and the parties fo difeafed lie cold, fenflefs, and die the fecond or third day. But if this happen to the lungs without the heart, they live not fo long: yet fome also are preserved. I have often thought with my felf, what should be that fympathy of the heart and lungs with the brain and nerves, that from the inflammation of those parts, the Patient should be to deprived of sense and motion all over, when the same Hippocrates teacheth in the same place, that the discased suffer such deprivation in that part, and livid spots appear on the outfide about the rib, whereabout the Aorte (to be feems to call the lobes or divition of the lungs) being inflamed fall to the fides. But if they be not much inflamed, fo that they fall not down to the fide; he fays that there is a pain indeed all over, but no deprivation of fense or motion, nor any spots appear. Having deliberated often with my self, at length I came to be of this opinion; that there was no other cause, but the sympathy betwixt these Intercostal arteries, and the marrow in the back-bone. This sympathy arises from those propagations which we told you past through the holes of the rack-bones of the cheft into the back-bone. Wherefore if the langs and heart be to mightily inflamed, that great plenty of bloud rufh into the great artery, whereupon it fwells, as also these vessels betwixt the ribs, and consequently those surcles which go to the marrow of the back-bones truly it cannot be, but that both the marrow and the nerves which iffue out of it, be compreft; from whence what elfe can follows but the refolution of those parts, into which those nerves are implanted, and to which they impart the faculty of motion? This opinion feems to me to be wonderfully confirmed by a certain pretty observation, which the learned Cornelius Gemma hath in his Book, De Hemititree Pefilenti. A certain fludious young man, fays he, through the whole course of his disease, had his left eye less than the other. He was pained in the left side, especially all the time the fit raged; but about the erifu or judication thereof, the artery of his left leg being fwollen up was moved according to its length, that being to be feen by us it feemed to be turned upward and downward like a Rope pulled back. Who will not here willingly confess, that this matter was in the arteries, when the erifir was made by them? But from this that hath been faid a reason may be also given of another observation of Galen, which is 1.4. De locis Affest. c.4. where he says thus: In a certain man who was troubled with a vehement inflammation of the lungs, as well the outer as the inner parts of his arm, from the cubit to the very ends of his fingers laboured with difficulty of fenfe, and their motion also was formewhat impaired. In the fame man also the nerves which are in the first and second distances betwixt the ribs, fuffained harm. And a little after, This man was quickly reflored to his health, to wit, a medicin being applied to the place from whence the nerves iffue forth, near to the first and second spaces betwixt the ribs. By reason of the same branches betwixt the ribs John Valeriola, the son of that Phylician, whose observations we have, being yet a boy, suffered Convulsion-fits in a grievous

Phrmice, the arteries of the midriff,

Cullaca.

The two branches thereof. The right branch.

The arteries called Phrenice of the midriff, [xx] are two; one of each fide, which arifing out of the the Trunk, prefently after it is come forth of the hollow of the cheft, being divided into more branches, are scattered into the midriff, but especially into the lower fide of it, near to the rack-bones of the back. They sprinkle some small twigs also into the upper part, which afterwards go to the Pericardium or

purse of the heart, there where it grows to the midriff. The Calisca or Stomach artery is but one, so called, because it sends over branches to the Korlin, that is, the Stomach. This being most like to the splenick branch of the Gate-vein, affords many branches to the Stomach, Liver, Eladder of Gall, Kall, the Gut Duodenson, the beginning of the Jejunum or empty Gut, a part of the Colon or Colick Gut, the Sweet-bread and Spieen. But it ariles out of the fore-fide of the body of the trunk, and being flaid up all the way by the upper part of the lower membrane of the Kall, is divided into two notable branches, but of unequal bignets; one of which goes to the right the other to the left: that is the lefs, this is the greater. The right branch therefore is joined with the defeendent Gate-wein in the Pancross or Sweet-bread, that is placed under the hinder part of the floranch and lowing them there has a lower than the pancross of the Kall pages to the Livery and hinder part of the flornach, and leaning there upon the membranes of the Kall goes to the Livery and its finallness is worth the taking notice of, if you look upon the largeness of the Liver, which the Ancients long fince, and many at this day have made the Work-house of the Bloud. But it is inserted in the hollow part, near to the trunk of the Gate-vein, and is so small, because that part of the Liver which entertains the roots of the Gate-vein, needed not a greater artery; but the other part which

hath the propagations of the hollow vein, receives great plenty of vital spirits sent over from the heart through the hollow vein. Yet before it enters into the liver, it differninates in the way many furcles, Propagations I call Pyloricus, which arifes in the midway, and being divided into many little branches is feattered part, into the backlide of the right orifice of the fromach. The outer is called Cyline gemelle, the Twininto the backlide of the right of the divided into the bladder of gall, which are two little branches, and go into the bladder of gall, and From its prefently are divided into many propagations. From the lower fide likewife two arife. The first is lower part.

Epiplais dextra, or the right kall-artery, which is implanted into the right fide of the lower membrane of the kall, and part of the colick gut annexed thereunto. The outer is cleft into two branches, of 2. of the kan, and part of the gut-artery, paffes on to the duadenum, and the beginning of the jejuwhich one is called range and Gafro-epipleis dextra, the right flomach and kall-artery, forme-nam, or empty gut: the other named Gafro-epipleis dextra, the right flomach and kall-artery, forme-what larger than the former, turns down to the right fide of the bottom of the flomach, and being fupported by the upper membrane of the kall, iffues out fome shoots from the upper part to the fore and back-fides of the flomach; but from the lower to that membrane of the kall upon which it leans,

and back-fides of the flomach; but from the lower to that membrane of the kall upon which it leans.

The left and greater branch is called Arteria filenica, the Spleen artery, which flicking to the lower The left membrane of the kall and the glandules placed therein, paffes on together with the Spleen-vein, to branch, which it is faffined, and in the like manner diffiributes its propagations to the Spleen. But in the way Propagation likewife it diffributes branches from both parts of it: from the upper iffuse Gafirica the flomach artery, from its upp which reaches into the middle of the hinder part of the fromach, or that wherewith it leans upon the back, and aftending from there it compaffes the left oritice of the flomach round about like a Crown, and differiles little twigs, partly upward to the end of the Gullet; partly downward, and shoft errater and more numerous, into the flomach, and fo it makes the Arteria Coronaria or Crownthose greater and more manerous, into the stomach, and so it makes the Arteria Coronaria or Crownthole greater and more thankerous, which arifes from the Gate-vein, as we have faid in the fore-going artery, like to the Crown-vein, which arifes from the Gate-vein, as we have faid in the fore-going Treatife. But from its lower fide the Spleen-artery fends out the Epiplois fingles or left Kall-artery, From its about that part wherewith it now attains to the Spleen, which runs out into the left fide of the mem-lower part, brane of the lower part of the Kall. This artery prefently after its rife, is cleft into two branches, which part very far afunder from each other, from which many other arteries arife, that are all confumed upon the faid membrane of the Kall, and the Colick gut that is tied thereto. These branches being iffued, the Spleen-artery draws nearer to the Spleen, and just like the vein of the fame name. Its division-which accompanies it all the way, is cleft into two branches like the letter Y, one of which may be called the upper, the other the lower, which afterward entering by the hollow part of the Spleen are felled the upper, the other the lower, which are the farmed filled the upper, the other bare of little forigs, fo that there are five times more arteries there than veins. Whence it comes to pass, that in inflammations of the Spleen, if you lay your hand to the left Hypsebondrium, or place under the Grifle of the baffard ribs, it feems to pant. But before this entery of the artery, the lower branch makes a notable Anatomofis or inoculation with the lower branch of the vein, and propagates a twig to the lower membrane of the Kall. Eut from the upper branch iffues one called Gaftro-epiplois finishra, the left fromach and Kall-artery, which being faitened to the upper membrane of the Kall, is derived into the left fide of the bottom of the flomach, bestowing little branches upon the fore and back-fides of it, or also upon the upper part of the Kall. Another iffuing from the upper branch, make the was breve arteriofam, or fhort arterial veffel, carries, like the vein, its name-fake, to the left fide and orince of the flornach. The use of the right branch which The use of the goes to the Liver, befides the common one which it hath, is this, as often as the bladder of Gall is ob-right branch. fructed, to carry down the choler to the Guts, and especially to the Colon, into which some of its Why ulcers branches are implanted. Which is the reason, that in bloudy fluxes the Ulcers are almost always found are more frein the great Guts, and especially in the Colon, very seldom in the small ones. For this arrery, when great guts, and especially in the Colon, very seldom in the small ones. For this arrery, when great guts, either the Liver being over hot breeds abundance of choler, or the bladder of Gall is obstructed receitive the Liver being over hot breeds abundance of choler, or the bladder of Gall is obstructed receitive the Liver being over hot breeds abundance of choler, or the bladder of Gall is obstructed receitive the Liver being over hot breeds abundance of choler, or the bladder of Gall is obstructed receitive. ving into it felf flore of choler, carries it directly over to the Colon, or Colick gut. In like manner cleft. the use of the left branch, or Spleen artery, besides the common one, is to throw down choler, triclancholy, and wheay humours, if at any time the Spleen abound with them to the Guts. Moreover by this fame way the waterilh humours in fuch as have the Dropfie, are fornetimes committed either to the Guts, or to the Kidnies and Bladder. This fame branch is that by which the drink paffes fo fud-denly through the whole body, and by which ill homours are cast out by Vomit. This fame is the cause, that upon a full fromach we make little water, but more when the concoction therein is finished. For the Stomach being much differeded preffes it, but that once empty, it can perform its office. This fame branch teaches us that a flender diet is to be prescribed to them who are to take Purges, that the fame branch teaches us that a liender dict is to be preferibed to them who are to take Purges, that the way may be open for the Medicins, as well that by which the excrements are fent over the Stomach, as that by which they are conveyed to the Guts. This fame branch also, if you add the two Mefentericks, is the feat of the hypochondriacal Melancholy. For this disease arising from the oblitraction of the entrails which are contained in the lowest belly, it is necessary that the arteries here should fuffer very much, which the very symptoms that happen in this disease, may sufficiently inform us.

Mefenterica superior, the upper artery of the Mesentery [y] arises a little below the Coclincal, being distributed like the Meseraick Vein (which is its companion) with numerous propagations in the guts Misetarics so called Himm and Jejamim, as also that Region of the Colon which reaches from the hollow of the Liver prior. as far as the right Kidney, and fo for the most part into the upper part of the McCentery. In which An observaplace it is to be observed, that the Artery fometimes lies upon the Vein, sometimes on the contrary the Vein upon the Artery, and so is carried betwixt the membranes of the Mesentery. But these Arteries in many places in the Mcfentery have glandules, which were made for the free perspiration of the velfels, and especially of the Arteries; whereby it comes to pass, that these glandules labouring with a hard tumor or fairbus, the veffels are comprest, and a pining away of the whole body follows thereupon.

The Emulgent arteries [z] are two, one the right, and another the left one. Both iffue our under the fore-mentioned Artery, where the first and second rack-bones of the loins are coupled together by Emulgents. the ligament. But they arise out of either fide of the trunk, although not directly over against one another

which is found in great plenty in the Arteries.

The Spermatical or Seed-Arteries [\alpha] are likewife two, which arife out of thefore-part of the Trunk of the great Artery, their originals touching each other; for the left Artery iffues not from the emalgent, as the left fpermatical Vein does. Afterward in their defeent they are made fast to the Veins of their own fide, and in men are carried through the processes of the Peritanesian or Rim of the Belly to the Testicles; but in Women, when they come somewhat near to the Testicles, they are divided into two parts, one of which is carried to the Tefficles, the other to the bottom of the Womb. But the Arteries do so come to the Womb, that they onely water it at the sides, and pierce not at all into the inner parts of it. Which truly came to pais by the great providence of wifeft Nature, fince it had not been so safe to have brought them down to the inner surface of the Womb, by reason that in the coming forth of the Child very great issuings of bloud would be caused, to the no small danger of the Woman in Childbed, if the Arteries had been annexed to the Womb on the infide. Hence also it is, that in the time of delivery they flow by little and little, not rushing down

of little Sprigs upon their fubliance. Their use, besides the common one, is to purge out the whey,

Their Ufe.

Spermatica,

with violence. Mesenterica inseries, the lower Artery of the Mesentery [6], arises near to the Ossacrum, or great bone, a little above the division of the Trunk into the Iliacal branches, and goes into the left side of the Colon, and into the strait Gut, descending with the hamorrhoidal Veins to the very end of the Fundament, and making the hæmorrhoidal Arteries. It is questioned concerning the use of both the McGentericks, whether besides the common, they have any peculiar one. For Galen in his 4. Book of the Use of the Parts, seems to make mention of some other when he would have part of the Gbylas to be attracted by them. And in the Book, Whether bloud be contained in the Arteries, in the fifth Chapter he says, If we divide the lowest Belly, and the inner Membrane, we shall plainly see the Arteries in the McGentery filled with Milk in Kids newly yeared; but in living Creatures that are grown. full of fomething elfe. In which words Anatomical experience teaches us, that not onely the Meferaick Veins but Arteries also do manifestly draw the Chylus to them. Which being so indeed, it is altogether to be believed that the Chylus is either afterward transported by them into the Veins, or elfe turned into bloud by the Arteries themselves. Nor will this seem wonderful to any one v shall consider also that the Mothers bloud is conveyed through the Umbilical Arteries to the Child whileft it is yet that up in the Womb. But if the bloud which is received up by the Veins ought yet to be better worked, as any diligent inquirer into Nature will conclude it ought; truly that which is received by the Arteries will require to be fo much the more exactly laboured, by how much the better it is than that of the Veins. But it is so laboured in the Arteries themselves, and in the Spleen, being haled into the Cœliacal Artery and carried to the Spleen. And this is an excellent use of the Mccenterick Arteries, whilest a man enjoys perfect health; besides which we will add another also, as often as he leaves to be in health. For these Arteries take to them the excrements of the whole body, that they may carry them down to the Guts, in like manner as the Veins do, by which Nature doth both attract the Chylus, and likewise expell the noisom humours out of the body, as choler, phlegm, and melancholy. Choler is thus expelled oftentimes in continual and intermitting cholerick Fevers, a folution whereof follows by a loofness: Phlegm is so expelled, as often as bloudy Fluxes happen to such as have the Gout in the seet, which ease them of their pain, if the intent of Nature be advanced by the help of a wise Physician. Lastly, Melancholy is conveyed out by both the Mcsenberg with the property of the painting of the physician of the phys tericks, but especially by the hamorrhoidal branch: whence Hippocrates says, 6. Epidem. He which has the Emroids naturally, shall neither be troubled with the pain of the side, or instammation of the lungs, nor with Felons or black puttles, called Terminthi, nor with the Leprolic, Canker, or other dif-eafes. For there is a very great fympathy betwixt the breft and the hæmorrhoidal Artery, because the Trunk out of which it arises, descending from the heart, presently after it first issues from thence, propagates the intercostal branches. Moreover all black cholerick humors are purged by this means out of the whole body, that cankers and leprofie cannot be caufed by them. From thefe voluntary purgings which nature it felf has found out, we may now judg of such as are caused by the help of a Phytician, and may be termed artificial. For an opinion of some men hath prevailed much in out age, that the body cannot be purged by clyfter, but only by those medicines which are taken at the mouth. But I will not only believe, but also being taught it by experience can witness, that, if the Clysters contain in them purging medicines, the whole body is very commodiously cleanfed. For the whole Colick-gut receiving the matter of the Clyffer, the vertue it felf of the medicine draws down the poisome humors by the arteries out of the Aarta or great artery. Which being granted, we may give a reason (which we have seen very often) why Suppositories made of white hellebore produce the same symptoms, as are wont to be caused in them who have taken in white hellebore at the why anome mouth. In like manner from hence we may fetch the reason why the belly is strongly purged, the ing of the marregion about the mayel being anointed with purging medicines. For the vertue of the medicine is vet with such attracted by the arteries, and by them afterward it purges. These arteries are they by which the things as purged disease, and the Colick, as we things as parge difeate of the Colick is changed into the Gout, and on the contrary the Gout into the Colick, as we looken the loosens the belly.

How the Colick on the xight fide, had some ease whilft the Gout held him; but this disease being cured, had some ease whilft the Gout held him; but this disease being cured, he was pained more. The reason whereof was this, because that humor, which caused the Gout, was pained more. The reason whereof was this, because that humor, which caused the Gout, was and on the contrary. that we need not fly, if we fay that the humors are brought out of the crural arteries into the Trunk, and out of this into the Mefenterick branches, and laftly, out of these into the guts; for this is the

An observa-

shortest, and most convenient way. Nor is there any reason, that we should be assaid of that pollution of the vital spirits, which they will object to us if the excrementitious humors pass through the arteries; for this betrays their great ignorance as well in Anatomy as in folid Phylick: and it would be very case, if I would digrefs, to prove in this place, that a great part of the humors in our body flow down through the arteries. For in them the strength of nature exceeds, and is more vigorous, that whensoever it is provoked, it is most apt to expel; and the blood being stirred by their continual beating, as also by its own nature, makes all that is therein more fit to flow. And who will not believe that excrements are carried through the arteries, who confiders the flowing down from the spleen, in which there being five times more arteries, than there are veins, truly it is necessary that that ballast of the spleen be carried out through the Arteries,

The four, Lumbures or loin-arteries [yyy] arise out of the backfide of the trunk of the great artery, all along as it passes through the region of the loins. They run through the common holes in the rack-bones of the loins, and to their marrow, and also into the neighbouring muscles. And at the fide of the marrow, after they have entred the rack-bones, they climb up on both fides to the brain together with the veins of the loins. But they are all equally big, if you except those two, which iffue out near to the Os faerson or holy-bone, which are not only derived into the rack-bones to the marrow, and to the mufcles thereabout, but are also fent overthwart throught he Pernancion, and mufcle of the Abdomen. The two last are by some called Mussimus superiores the upper muscle-arteries, and are distinguisht from the Lumbares. And these are the arteries, which if we observe, we shall easily give the reasons of many things, of which Physicians do still dispute very hotly; but especially of that most difficult question, which is controverted among Physicians, by what ways, and in what manner the colick ends in a palite or in the falling sickness. For we have the observation in Panlas Egineta lib. 3. c. 43. where he fays: the colick, as it were by a certain peftilent contagion, ended with many in the falling fickness, with others in a resolution of the joints or palie, their fense reremaining; and they who fell into the falling fickness, for the most part died; but they who fell fie or Epilepsie into the palie, were most of them preserved; the cause of the disease being carried to another place in the folution. For the humor that caused the disease, came back out of the colick gut through the mesenterical arteries, from whence being afterward transported into the trunk of the great Artery, it came also to the Lumburer or arteries of the loins, which swelling with blood prest together the neighbouring nerves, from which came the pallie in the feet. And this we have often observed, as well in our felves, as in others, especially in former years, when these diseases at Padna were Epidemical. Yet the Passe is not always a perfect one, but often (as I am wont to call it) imperfect, because the power to walk is not whosly taken away, but the diseased frand on their feet with a great deal of dissipation. Many at that time being deceived in the knowledge of the disease, mistaking this for a great weakness of body contracted by their fickness, endeavouring to take it away by eating and drinking largely, but in vain. This also is the cause, why the Falling-fickness, and Lethargies too, as we have oft-times seen, follow after the Colick, because the matter being sent over from the Mesenterick arteries to those of the loins, may easily go from them into the brain, to which those very veffels are carried.

But the trunk of the great artery, when it is come to the last rack-bone of the loins, having taken its journey all the way, which we have shewed, under the hollow-vein at the left side, here gets above the vein, lest it should be worm away in that continual motion by the hardness of the holy-bone. But it is divided, no otherwise than the hollow-vein is into two notable branches [S.S.] which are called by Anatomitts the Iliacal arteries, from their fituation, and being carried downwards obliquely to the thigh refemble the Y of the Greeks turned upfide down. But they also just like the Iliacal veins, to which they are exactly answering, before they be implanted into the thigh, shoot out a pretty number of branches. But from the lower fide of the artery before the Iliacal branches be divided, iffue forth face the holy arteries, [3] which are notable ones, and carried downward, leaning same upon the holy-bone, pass through the holes thereof, and run to the marrow and backfide of the bone. And through these also there is a way for the matter, that makes the Colick to cause the Palse of the

After this a little below the division of the Trunk, the Iliacal arteries are subdivided into two branches, one of which is the inner and less, the other outer and greater. The less are subdivided into two branches, one of which is the inner and less, the other outer and greater. The less and inner [T] iffuse out two propagations, one from its outside, the other from its inside. The unter [e] is commonly called Muscula, by us more directly. Glassa the muscle of the battocks, because it runs down with its name sake vein, betwist the holy and hip bones, where they part one from another, and states many twigs into the muscles which lie upon the Os Ilinon, or hanch-bone, called Glassi, or the muscles of the buttocks; because they are the authors of them.

The inner is called Hypogastrica [7] which is very notable, and large, and being carried directly. The division down to the lower fide of the holy-bone, it affords certain propagations in men to the bottom and of the Iliacal neck of the bladder, as also to the strait gut, which also may be called the Hemorrhoidal arteries in a strain and the strain but in women; to whom this branch is formewhat larger, it diffributes a great number of propagatious, belides those to the forenamed parts, into the lower region also of the bottom of the womb. and likewife into its neck. Hence we may gather the reason, why, if the womb reach to the middle Glatte. of the hip. Convultions are caused, as Hippocrates witnesseth, lib. de natura multibri. As also if the wormb fall down to the hip, why the monthly flowers are support, and a pain is caused in the soft-the passification of the sides, and in the lowest belly. For the blood which nature drives to the wormb, cannot be laid in there, the arteries being prefit together with the falling down of it; fo that necessarily flowing back, it fills the neighbouring veins and arteries, which swelling up canse these pains, for we have oft-times seen in diffections; these veins so swoln, that they have been seven fold bigger then themoff-times feen in diffections, there veins to troop, that a woman vomiting blood is rid of her difeafe upon the fame. Hippocrates, where he witnesseth, that a woman vomiting blood is rid of her difeafe upon the iffuing

OR OTHER DESIGNATION.

iffuing forth of her Terms. Which happening by the confent of all, by revulfion or attraction of the humour to a contrary part, and that not by the benefit of the Veins, because the veins of the Stomach arife out of the Gate-vein, but they of the Womb from the hollow one; there is no other fympathy to be fought for, than that which is eaufed by the Arteries, especially when the Hypogastrick or Artery of the lower part of the loweit belly is not far diffant from the Cocliacal, or Artery of the Stomach. Hence likewife a reason will be given of the Aphorism that follows this, wherein he judgeth
the Hemorrhagia or abundant issuing forth of bloud at the notirils to be profitable when the monethly
Courses do fail. The remaining part of the leffer Iliacal Artery descends, and brings forth the Umbilical or Navel Artery [88], which is carried down near to the length of the great Artery, and is tied
with strong membranes to the sides of the bladder of urine. But it looses its hollowness in those
that are once out of the womb. After this [8] like the Iliacal vein which is joined to it, it goes
through the hole of the share-hone or Octobic which before it he nost it never it a reset it agree to through the hole of the share-bone or Os pubis, which before it be past, it takes to it a propagation iffued from the outer Iliacal branch, and so goes out of the hole, and being departed from it spends it self, in like manner as the inner Iliacal vein does upon the muscles; partly those with which or greater Iliacal branch. the hole is ftopt; and partly those which arise from the share-bone. At length being terminated at the middle almost of the length of the thigh, the end of it meets [], and is united with the ends of the branches [v], of the inner Muscle-artery of the Leg, of which we shall speak in the next Chapter.

1. The greater or outer Iliacal artery [V] produces likewife two propagations, the first of which [i]
Epigastrica, or is called Epigastrica, which arising from the outside of it, a little before it passes through the Peritoneums or rim of the belly, is reflected upward, and afcends by the infide of the strait mutcle, till about the Navel it be inoculated with the descendent Mammary Artery. The other [\lambda] is called Pudenda, which is a little inner propagation, being not divided into 60 many branches, as the vein of that name is.

Pratical or the But it arises presently after the Artery is gone out of the Peritoneum, and being carried overthwart

Artery of the along the commissione or joining together of the share-bones, is spent at the privy parts upon the skin of the Yard. That which remains of this Trunk, goes into the evan [X] whereof we shall now speak.

CHAP. IV.

The Propagations of the outer Iliacal branch, which are distributed through the Crus, or great foot, containing the thigh, leg, and foot.

Fror that the outer branch [V] hath propagated the fore-mentioned branches, it departs out of the Peritoneum or rim of the belly, and at the groin is carried into the Crm, by the same way which the crural vein takes, under which it goes, and is joined in company therewith every where, and so it makes the Trunk of the Crural Artery [X] (as we will always call it). But presently after it hath got beyond the Peritoneum, it issues forth a propagation from the out-fide, which is called Muscula erroralis exterior, the outer Muscle Artery of the Crue, which being carried downward is propagated into the Muscles that cover the fore-fide of the bone of the thigh. Sometimes over a gainst this but of one links below the source and the source of the cover and the cover are sourced to the cover and the cover are sourced to the cover and the cover are sourced to the cover are sourced to the cover are covered to the cover are sourced to the covered to times over against this, but often a little below, yet on the in-side another is brought forth, called Musicula eruralis interna, the inner Muscle-artery of the Crass [v] which is distributed in many branches through the third bending Muscle of the thigh, called Triceps, and those on the inside of the thigh, as far as the Knee; the ends of which branches are joined with the end of the inner Iliacal Artery, which we told you defeends through the hole of the fhare-bones to the Crus. These propagations being dispatched away, the Crural Trunk descends from the Groin, together with the crural vein; and is fo bent backward near to the bone of the thigh, that when it is come to the ham, it flands betweet hindmost heads of the thigh. For prudent Nature does always observe this, to carry down the Veffels about that fide of the joint where the bending is, left if they fhould go on that fide whereon the joint is extended, they fhould be comprefit. But in the very mid-way as it were, as it runs down through the thigh, it fends out a propagation $\lceil \pi \rceil$ which breaking into more furcles, runs out through the Muscles that are feated on the back fide of the thigh, together with the ham-vein, and at length descending through the ham (whence it is called Poplites the ham-artery) is distributed with many fprigs into the Califor the leg. But whileft it flays in the ham it fends out a propagation [6] on each fide to the fides of the joint of the Knee, which then finking deeper, are confumed partly in the joint it felf, partly upon the Muscles called Gasteroenemii that make the Calif; from whence they are called Surales, the Arteries of the Calf.

After that the Crural Trunk lies in the Ham [Y], it fends forth a propagation from its out-fide [a] which runs down near to the Fibula or leffer bone of the leg, and is hid betwixt the Muscle that moves the foot outward, and the fecond bending Muscle of the Instep, and distributes it self into the rest, that lie on the fore-part of the leg, as far as they are fleshy, and till they begin to be contorted by the outer ankle. A little under this same another Artery [T] is brought forth out of the back-side of the Trunk, which runs down as far as to the mixing together of the tendons of the Calf-muscless. Then another first lifting over of the form back-side of the Trunk by the form of the form back side of the Trunk by the form of the Calf-muscless. Then another [v] iffues out of the fame back-fide of the Trunk, but under the fecond, which defeet ding and patting through the transverse ligament, runs down by the top of the foot, and is diffused into the Muscles that move the toes outward. The remainder $[\Gamma]$ of the Trunk is carried downward by the back-fide of the leg, and about the inner ankle offers a furcle $[\phi]$ to the foot, which goes to the muscle of the great toe, and about the inner affice offers a turcle [4] to the Trunk it felflying hid among the tendons of the Muscles of the toes is cut [x] into two branches; of which the inner [4] beflows two fureles upon the great toe; two upon the tore toe, and one upon the middle; the outer [] two upon the little toe, and two upon the toes next to it, on the lower fide. But although the progress of the Arteries be for the most part fuch, as we have described, yet what we have faid formerly of the Veins, that their diffribution varies much, not onely according to the divertity of bodies, but also of fides in the body of the same man, is true also of the Arteries, which in divers men are diverfly diffributed.

An Explanation of the TABLE of the ARTERIES.

This Table comprises the Delineation of the great Artery, entire and free from all the Parts.

HI

I

He large beginning of the great Artery, where it issues out of the left ventricle of the heart: but presently after its rise, and before it yet falls out of the Pericardium or purse of the beautif shoots forth the two Coronary Arteries 22, which incompass the basis of the heart in manner of a Crown.

East prefently having past the Pericardium, it is divided B into two tranks; one of which is the ascendent G, the other the defeendent one Q.

B

The Ascendent trunk C, is by and by divided into the two subclavian Arteries DD, both which when they have attained to the first rib, scatter many propagations, partly from the higher partly from the lower side. From the lower side issues Intercostalis

From the lower fide iffues Intercoftalis fupcrion, the upper Arrey between the ribs b, communicating particular twigs to the di-

frances of the four upper ribs.

From the higher fide issue three. The first is Vertebralis, the Artery of the rack-bones c, creeping on by the trassverse processes of the neck, as far as to the skull. The second maximaxia, the Artery of the dugs d, subich descending under the brest bone, runs out as far as to the seas of the navel, and distributes strips into the distances of the gristles of the true ribs, and then into the muscles that lie upon the brest, at length about the navel it joins by anastromosis or inoculation x, with the ascending Epigastrick Artery t. The third Cervicalis, at the Artery of the back side of the neck c, is propagated to the muscles on the back side of the neck, as far as the novel of the beach.

These branches being iffued out, the subelacian Artery goes to the arm-pit, and takes the name of Axillaris about E, and so is diffused into the arm. Tet before it enters thereinto, it shoots out some twigs from both parts of it: from the lower three, of which the first f, is called Scapularis interna the inner blade Arrery, because it is spent upon the muscles that cover the bollow side of the shoulder-blade. The second is Thoracica fuperior, the upper cheft Arrery g, differfed into the muscles on the forefide of the cheft. The third h, Thoracica inferior, the lower Artery of the cheft, which defeending along the fides of the eleft, is inferted into the mufcle called Aniscalptor, that moves the upper part of the arm backward. Betwixt g and h, a little branch is placed, one of them which here are diffeminated into the glandules of the arm-pit. From the upper part iffines one i, called scapularis externa, the outer-blade Artery, being disposed of into the muscles, on the outside of the shoulder-blade.

In this place the axallary Artery changes its name, and is called Brachialis, the trunk of the Arm that is undivided as far as G, scattering two twigs I and to into the muscles that ever the bone of the upper part of the

orm on the back fide; and two other to to, one of each fide about the bending of the exhit.

The parting in twain of the Brachial Ar-

The parting in twain of the Brachial Artery under the bough of the cubit, into an outer H, and inner branch I.

The outer branch of this division, or Radius, running straight along the Radius or leffer hone of the cubit to the wrift, and distributing a branch 0 into the muscles feated between the first home of the thumb and that of the metacarpium or after-wrift, which suffains the fore-singer, and then three other PPPs which are dispersed into the first outer singers, the shumb and the two singers next thereunts.

The inner branch or Cubitcus paffing along the greater bone of the cubit; is as length confirmed in a double branch upon the two inner fingers, the ring-finger and the little one.

The remaining part of the Afgendent truck, which near to the upper part of the breft-bone is cleft into two branches M M called Carotides, or the fleepy arteries. Thefe tend directly upward by the fides of the neek, and being come to the chops are divided into two branches about N, one of which is the outer O, the other the inner P.

The outer Carotis propagates twigs † to the Baccæ or check puffs, and to the muscles of the faces but about the ear it is cut into two branches, a foremost one q, which is carried through the Temples; and a hinder one x, that is diffeminated along the back side of the ear under the skin.

The inner Carotis, going to the skull is divided near to the balis thereof into two branches; of which the one and leffer f, which goes into the finus on the fide of the thick membrane, is cut off here, whereabout it finks into the skull: the other and greater t enters the skull through a peculiar hole bored for it in the temple bone.

The Descendent Trunk of the great Artery, reaching downward to the rack-bones of the back,

From this before its division at R, many propagations are scattered, which we will now rebearse in order.

First then are Intercostales inferiores, the lower arteries between the ribs uuu, distributed to the distances of the eight lower ribs, from which propagations are brought to the marrow of the back-bone, and to the muscles that grow to the back and cheft. After this the trunk paffing on, distributes two more, called Phrenicæ, the arteries of the midriff x x, because they are disposed of into the midriff. Then follows, Cocliaca or the stemach-artery. After that, Mclenterica fuperior, the upper artery of the Mesentery y, reaching out into the Guts Jejunum and Heum, at alfo into that part of the Coloni which reaches from the hollow of the Liver as far as the right Kidney. After this the Emulgent Arteries z, propagated to the

V

kidnies. Then Spermatica, the Seed Artsries a, going to the testicles, under which is Mesenterica inferior, the lower Artery of the Mesentery &, deporting into the left side of the Golick, and into the strait gut, and making the bemorehoidal Arteries. Laftly, Lumbares, the Aeteries of the loins yyy, which going to the rack-hones of the loins joint by joint, are distributed into the peritoneum or rim of the belly, and the mufcles

growing to the rack-bones.

These branches being iffued forth, the trunk about the fifth rack-bone of the loins is divided into two branches S.S., caked the Ilia-R cal, both which are again broken into two other, an inner branch T, and an outer one V. But before this division in the very parting in twain of the trunk, arifes facts, the holy Artery 8, diffributed into the holes of the Os facrum, or boly bone, to the marrow thereof.

The inner Iliacal Artery before it falls out of the peritoneum, iffines forth two propa-g vions: from its outer fide, that called Glutan, diffributed into the mufcles of the buttocks; from its inner fide, that called Hypo-galirica?, going into the bladder and yard, and in momen also to the bottom of the womb. After this it runs down, and fends forth the umbilical arteries we, that tend upward near to the length of the great artery. The remainder taking to it a propagation from the outer Iliacal Artery, flips down through the bole of the flure-bone into the Crus, the end of it joining about 0, with the inner mufcle artery of the Crus v.

The outer Iliscal Artery likewife before it is going forth of the peritoneum, produces two. The first is called Epigastrica i, digefied into the mufcles of the Epigastrium, and the straight ones of the Abdomen, where it is joined by inoculation u, with the descending manumary artery d. The other called Pudenda , goes to the privy parts.

In this place the outer Hiscal artery ha-ving past the Peritoneum, enters the Crus, and begins to be called the Crural Trusk, which iffues out more propagations. The first is Muscula cruralis exterior, the outer muscle artery of the Crus u, that is propagated into the muscles that cover the foreside of the thigh bone. The second is the inner muscle arrery of the Crus, digested through the third bending muscle of the thigh, and those muscles that are on the inside of the thigh; the ends of it are pined with the ends of the inner Iliacal artery about c. The third is Poplitea, the ham-artery 7, running out into the muscles, on the back side of the thigh. The fourth is Suralis, the calf artery F B. which is double, iffuing out there, where the crural trunk is hid betwiet the two lower beads of the thigh, and spreading out on both sides into the joint of the knee, and the two heads of the sirst extending muscle of the

Here the great artery lies in the ham, where it is devided into branches of unequal bigness. A spring issuing from its out-side, and reacht out to the thula or lesser bone of the leg, betwixt the muscle that moves the foot outward, and the second bending one of the

The

TRACTIII CONCERNING THE NERVES.

CHAP. I.

Of the Nerves of the Brain.

Mong those eight Conjugations which arise from the Marrow of the Brain drawn out in length, whilest it is yet contained within the limits of the skull, that offers it self in the first place, which makes the Optick Nerver, that are so of the brain. The first place famous among all the Masters of Anatomy. For these are not onely the biggest, if thou look, upon their thickness; but also without doubt the softent of its original, all the Nerves of the body. But they arise out of the middle of the basis of the brain, on the fore-part, according to the opinion of the Ancients, but indeed, if the head be turned upside down in the diffection (which is the proper way) out of the beginning of the former trunks of the spinal marrow, that their original is as it were in the back part of the head, and presently each of them by little and little Progresse making towards its mate, they are united (not onely joined, as some would have it) over the saddle

making towards its mate, they are united (not onely joined, as fome would have it) over the faddle of the wedge-bone, and making one common fquare body, the marrow within them being mixed together. After that prefently separating again, each of them is carried obliquely into the eye of its Insertion own side, entering the orb thereof through the first hole of the wedge-bone, and entering at the very centre of the eye. In this pair we may easily show those two membranes, which are derived to the Nerves from the two Meninges of the Brain, as also the very inner marrowy substance, which comes from the body of the Brain. Yet the Nerve it self is not eleft into more branches, (as the other are) but lying hid makes the coats of the eye; and out of the thick membrane it forms that coat which is called *Cornes*, the homy one; out of the thin membrane that is called *Cornes*, the Grapy one; but out of the fubstance of the marrow the *Retima*, or Coat like a Net. For as soon as it is arrived at the centre of the eye, these membranes are disclosured. it is arrived at the centre of the eye, these membranes are displayed, and making a sphere contain the burnours in them. These Nerves convey the faculty of seeing to the eyes; wherefore, they being obstructed, or comprest, a blindness ensure. Galen hath ascribed holes to them, and Herophilus for the same reason called them Thomas 'On lows, the passages of the sight, teaching that there is a sensible hollowness plainly to be seen in them, whom for all that almost all most all these seed in a case of the sight, of starts and the same that there is a sensible hollowness plainly to be seen in them, whom for all that almost all Mortal Markowski and the starts and the same server as the starts and the same server as the same server as the starts and the same server as the same fible hollowness plainly to be seen in them, whom for all that almost all Anatomiss do contradict.

But I have heretosore shewed in the University of Padua, and in a great Assembly of them, that there are certain passages continuing from the beginning of these Nerves, as sar as to the place where they meet together, and presently after that vanish away toward the eye. And therefore I shewed that the Ancients may not onely be excused, but also that they writ the truth, especially when none of them have said that these passages were great, but onely such as did not altogether escape the sight, if one would make trial thereof in a great living creature, and by a clear light, and presently after it is killed. For Galen himself requires these three conditions, 7, place, 4, and lib, do ocalis, that one may see them. But before we depart hence, I will bring in some Problems, besides the History it self, I may also show the use of that which I say, especially when in our time they onely for the most part follow the shady of Anatomy, who imploy their industry in the behalf of Physick. The first therefore shall be, what is the cause that many upon sneezing often (especially when they have provoked it for the nonce) have of a sudden sallen blind. This happens, either because the branches of the sleepy Arteries, which are so near to the Ophappens, either because the branches of the sleepy Arteries, which are so near to the Optick Nerves, that they touch, are filled, and being so, press together those Nerves; or else because a copious, and that a phlegmatick humour hath fallen out of the brain into the Optick Nerves, and obstructed them. I have seen those that have been blind through the first cause, some Nerves, and obliructed them. I have feen those that have been blind through the first cause, sometimes cured by a Seton; But I never remember that any, in whom this arose from phlegmatick humours, have recovered, except one having the French Pox, who being anointed with Quickfilver, all the humous melting away, was restored to health. But it is not the part of a good and pious Physician to make use of those things, which being sull of danger, may do more harm, if they prove hurtful, than they can procure good, if they be profitable. And truly it is better not to cure blindness, than to cause death, although often-times Rashness helps them, whom Reason helps not, as the most elegant of Physicians Celsus fays elegantly. In the mean time in different the eyes, they who practise Physick, may learn rather to administer those things which eafes of the eyes, they who practife Phylick, may learn rather to administer those things which bring the phlegm out by the Palat, then to draw the noxious humours to the notirils. That I may bring the phlegm out by the Palat, then to draw the noxious humours to the notirils. That I may conceal beliefs the danger which they avoid, that more profit arifes from the Medicins that woid the phlegm out of the head through the mouth, which both long experience hath hither-to taught, and Anatomy perfuades, when the Optick Nerves in their original are not far distant from the palat, but farther from the spongy bone; and it is a preternatural way, by which the hamours are carried, as hath been already demonstrated by the learned Vefalius. Then it is disputed by the learned vefalius.

ted by what means the Eye can fall out of its orb, the Optick Nerve not being broke, whereof we may have very many histories. But it is not hard to give an answer, to wit, that the Nerves may be very much extended in length. Whilest therefore this Nerve receives much moisture in the

inflammations of the eyes, it eafily comes to pass that it is flackned; but the muscles themselves

TRACT. III.

32

fwelling very much, when they can no longer be contained in the orb, leap forth out of it. For this falling forth of the eyes most commonly proceeds from inflammations: such as are the stories of the most learned Vega, who cured a Woman in this case by procuring the flux of the terms, and a young man by digesting Ointments. But the question is very worthy to be made mention of, and that gives me an occasion to explain it, which I have read in some Authors, that such as were before blind, upon receiving of a wound overthwart the fore-head, and some upon a great loosiness of the belly arising on a studden, have received their sight, and that presently. The cause of their blindness was no other than the compression of these Nerves proceeding from the neighbour-vessels, to wit, the Veins and Arteries being swollen with bloud, which such a wound presently emptied. Wherefore I also sometimes, and not without success in that spress of blindness which the Barbarians call Gasta screens, open the middle vein of the fore-head, out of which I draw bloud so long, till it ceases to run of its own accord.

The fecond pair. Its original,

Branches. 1. 2. The fecond pair arifes, as the ancient Anatomilts fay, from the fides of the basis of the forepart of the brain, near to the original of the first pair. But the new diffection shews, that it issues
out at the inside of the beginning of the spinal marrow, and that they are so united in their original, that they make one common angle, which is the cause why both the eyes are moved together
to the same sides. It is much smaller, if you compare it with the first pair, and harder, and goes
out of the skull through the second hole of the wedge-bone, which is somewhat long, and so it
enters into the orb of the eye. By and by it is divided into many sprigs, which go to the muscle
of the eye; and the first climbing up above the first pair or the Optick Nerves, is disposed of into
the two muscles, as well that which lifts up the eye-lid, as that which lifts up the eye. Another
very conspicuous one is disseminated in many sureles into the muscle which moves the eye inward.
The third, no contemptible one neither, being divided first into two fibres, and by and by into more,
is sent into the muscle that draws down the eye. The sourth, into the lower or lesser of the oblique
muscle that rowls the eye about toward the outer angle; at length it issues out some thin fibres,
which being joined with the first pair are distributed to the outer membranes of the eye, so that this
second pair is propagated onely to four muscles of the eye, and to that which lists up the eye-lid,

tofe.
The third
pair,
Its original,
Branches.

1.

The use of this pair is to impart the faculty of motion to the muscles of the eyes.

An observa-

The third pair arifes with a very small Nerve out of the lower, and hinder part of the marrow of the brain, and runs directly forward under the basis of the brain, being tied to the second conjugation; together with which it enters into the Orb of the eye through the said second hole of the wedge-bone. By and by it is divided into four branches, of which the first offers a little branch to the upper and greater of the oblique muscles of the eye, or that called the muscle of the Pulley, and then falling out through the hole of the fore-head bone above the orb of the eye, in the skin and muscle of the fore-head, which ought rather to be called the muscle of the eye-brows. This branch is diligently to be taken notice of; because I have long since observed, that it being hurt with a slight wound, the eye-lid fell down, whilest the muscle of the eye-brow by reason thereof fell into a Palsie. I have seen also the same Palsie caused by cold and narcotic Medicins, somewhat unreasonably applied for the procuring of sleep. But hence also a reason may be rendered, why Hippocrates, Prognostick I. reckons it among the signs of death in acute diseases to sleep with the eyes half open. For this is an ill sign for that reason, because it signifies that the Nerves are very much dried, and so the basin it self, whence it comes to pass that they who are so distassed, for the most part suffering Convulsions afterward die. In some also a fore-runner of the Falling-sickness is wont to arise from the same cause in the eye-lids, the eyes and the whole face, when this third pair is pluckt by the humours begetting the Falling-sickness, and so a convulsion of the eyes and face is caused. The second branch is carried downward, and falls out through the hole of the face, is spen upon the muscles that move the upper lip and wing of the nose outward, as also upon the lip it self, and the gums of the teeth, called Insigni, or shredders. The third is sent through the hole of the eye, to the wide cavity of the notirils, being spread throughout

The fourth pair. Its original branches.

I.

The fourth pair arises out of the marrow of the brain on the back side, goes out of the skull through the fixth hole of the wedge-bone, and running strait down, propagates three branches from it self. The first is presently after its going out of the skull, which being writhed sometimes about in the manner of the tendrels of a Vein or Gourd, and united to two springs of the auditory Nerve (of which we are to speak next) afterwards distributes surcles to the temporal muscle that lists up the lower jaw, and that which moves it forward from the head, as also to the muscles of the cheeks. After this the pair running farther down, issues forth a second branch, which propagates surcles in order to the gums of the upper cheek-teeth called the grinders, and also to the teeth themselves. The third branch issuing forth from the back-side of the Nerve, and entering the hole of the lower jaw-bone that is bored in the inner surface of it, at the original of the processes, bellows little branches in order to the roots of the teeth, and at length going forth through the fore-most hole in the outer surface is terminated in the lower lip, and skin of it. The remainder of this Nerve is spent upon the coat of the tongue near to the root, and gives it the power of distinguishing spors or taking.

But note in this release to the root, and gives it the power of distinguishing fapors or taking, the third and

But note in this place, that these two pairs which we have now recounted, I say, the third and fourth are commonly reckoned for one by Anatomists, and that the third's but with this distinction, that they say this very pair arises with a double roots the one smaller, and the other thicker. They

A Note.

call that the smaller root, which we set down for the third pair; that the thicker, which we make the fourth. But we diffinguish them, because indeed they are not joined together, neither in their original, nor in their progress. But that which they account for the fourth pair, feems not to be diffinguished from the third; as Valuerda himself grants, lib.7. Anatom.cop.4.

diffinguished from the third; as Valuerda himself grants, lib.7. Anatom.cap.4.

The fifth pair isfues out of the marrow of the brain drawn out in length, on that fide whereon a The fifth pair part of the cerebellian or after-brain is joined to it, arising out of two Nerves, of which the one is Its original foster, the other harder. These go out of the membrane together, and enter the organs of hearing through the hole of the temple bone, that is bored in the story process thereof, being a large one and winding. After this that harder part goes forthwith to the fore-side, being carried through a The harder, peculiar channel, and returns backward again obliquely through the same bone, and departs into the first cavity of the inner car. From thence being more resected, it sends forth two propagations one higher, the other lowers but both pass through their peculiar holes. The upper is care the first cavity of the line; car. From the both pass through their peculiar holes. The upper is carried through the transverse hole of the same bone, through which also a little vein passes into the organ of hearing; and a little after it is come forth of it, it is joined with that branch of the fourth pair (as we have delivered, but as others commonly count the pairs of the third) which we told you was writhed about, like the tendrel of a Vine. The lower goes out through the third hole of the same bone, which is very narrow and windings and being carried overthwart above the muscle of the lower jaw, that moves it fidewards, descends into the chops, having differninated a pretty many propagations into the nostrils. But forthwith it is joined with the propagation of the fourth pair, that resembles the tendrel of a Vine, or that spring which goes to the tongue, from which it offers to the roots of the tests and muscles of the cheeks, as also to the tongue, from which fourth pair, that retembles the tendrel of a vine, or that iping which goes to the tongue, from which it paffes to the roots of the teeth and mufcles of the cheeks, as alfo to the skin that goes about the root of the outer, or little car. Anatomitis do believe, that by the means of the branch it comes to pafs, that they who are born deaf, are for the most part dumb also. But that foster part of The soft part, this pair is carried together with the hard part; and when it is come to that first cavity of the inner this pair is carried together. It is more than a dealer of the called the Anatom. Its use, ear, it is spread throughout it in manner of a membrane, and so it deserves to be called the Auditory Its use.

Nerve, as ministring all the spirits that serve for hearing The fixth pair ariles formewhat more toward the lower and hinder part than the fifth, and not The fixth with one, but with many little Nerves fevered from each other, which for all that are prefently pair, joined together, although they do not close so as to make one onely, but two diffinct ones always, its original. yet are they contained in one membrane, ariling from the Dura mening of the brain, which hath deceived many, so that they have accounted them for one. Being thus joined, they descend both deceived many, to that they have accounted them for one. Deing this joined, they deteem both together out of the skull, through the fecond and third hole of the nowl bone; through which The lefter branch of the fleeny Artery, and the greater of the Lipplar vein enter into the skull. fame the leffer branch of the fleepy Artery, and the greater of the Jugular vein enter into the skull.

There being then two Nerves, the one in its egress inclines more to the fore-part of the faid hole, and is the leffer of the two; the other to the hinder part, and is the greater. That prefently after its going forth of the skull, tends firaight downward to the mufcles of the tongue and chops, and to the

parts placed in the mouth, upon which it is wholly confumed.

This on the contrary fends its first propagation to the muscles seated on the back side of the neck, The greater especially to the first muscle of the shoulder-blade, called Guadlaris or the Cowl-muscle, and then ad-Nerve, and its hering to the seventh pair, and the aforesaid Artery and Vein, by the benefit of certain membranes, propagations. it runs down to the fide of the throttle, to whole mufcles, especially those feated in the inner cavity, it diffributes furcles overthwart. Here many propagations of Nerves meeting together, and parting afunder again, a certain texture is made, wherein knots are found not unlike to the glandules that are tied to the divarications of the veffels; which was first observed by the most learned Anatomist Fallepins, who would have it refemble the body of one alive. But the greater Nerve it felf going into the middle betwirt those same vessels which I spake of, is carried leisurely from the throttle to the rough Artery, and running down at the fide thereof, tends to the cheft.

But before it enters thereinto, it is divided over the hollow of the neck into two branches, of The branches which one is the outer and less, the other the inner and greater. We shall now speak briefly of of the greater the distribution and propagations of them, but so that being the right Trunk is distributed into Nerve. another manner than the left, we set down the History of each by it fells and first of the right, then

The outer branch then of the right Nerve fends out propagations prefently after the division to The propagation to the muscle that bends the head, called Magnideus, as also to that of the bone byoider, called freme tions of the bysides, and that of the Larinx or thrortle, called firmsibyroides; after this it enters the cavity of outerbranch the cheft, and when it comes to the Axillary Artery, iffuse forth from its infide fometimes three, of the right fometimes two furcles, one under another, which are turned about the faid Axillary Artery, as it were an axel-tree, or (to fay truly) a kind of pulley, and clofing together make one Nerve, which being failined to the right fide of the rough 'Artery, by the benefit of a membrane, runs back from the lower part thereof to the highest, and hastes to the right fide of the throttle, learning upon a glandarian than the course of the right fide. Having rough his line for the right line is forthered. dule which is placed at the root of the right fide. Having past this, it is forthwith divided into many furcles, which are front upon the muscles of their own fide, which are placed in the throttle, and have their heads downward, giving motion to them. And this Nerve is called Recurrent, the returning one from its progress, and is very famous among all, being so made by skilful Nature with great wildom, that it might be inferted into the mufeles of the throttle, whole heads look downward, when all the Nerves that give motion, cought to be inferted into the heads, and to look towards the end, not on the contrary. And because the throttle is an organ of the voice, but the voice cannot be uttered without motion of the massles, that either open the cartilages of the throttle, or flut them; therefore these Nerves, which impart to the muscles the power of moving and contracting themselves, being either bound hard or cut off, it happens for that cause, that the voice is taken away. This may be very handsomely shewn in Dogs. or in a Hog, because one continually makes a noise with barking, the other with granting.

The eighth pair.

Its original.

For one of these Nerves being cut off, half the voice is taken away i but both being cut, it is wholly The recurrent propagation being thus conflituted, the outer branch running down obliquely under the hollow of the neck, after that by the way it hath distributed furcles of an indifferent bigness into the Pleura, or membrane of the ribs, and into the coat of the lungs, and given others to the pericardium or purse of the heart, and to the heart it felf, it descends farther within the duplication of the mediaftinum, and near to the rack-bones is divided into two branches, which make the right Nerve of the left orifice of the flomach, are carried obliquely, and then piercing through the midriff, together with the gullet, to which for all that they afford never a branch, are confumed upon the left orifice of the ftomach, with many branches like a little Net, and so encompass it together with the left Nerve, that it feems wholly to consist of Nerves. Hence there is so great a sympathy of the fromach, not onely with the brain but with the heart alfo; that fuch difeases as pain the upper orifice, feem to be of the heart, and indeed to they are, the fame heart fuffering pain, beaute of this Nerve being pained. And this is the true case, to wit, the communion of this Nerve, not the near-ness of both the entrails, as others say. The inner branch goes to the inner side of the root of the first rib of the cheft, and cleaving to the Rack-bones under the Planta, runs down through the roots of the rest of the ribs, taking to it a little branch from every one of the intercostal Nerves that issue out of the lack-bones when the rest of the pack-bones there are the rest of the pack-bones. out of the back bone; then paffing through the midriff with the Defcendent Trunk of the great Out of the back bothe, then partial as far as to the Os facrams or great bone, at the region whereof it iffues out three proposations, which are diffributed into the natural inner parts. The first goes to the lower three propagations, which are distributed into the natural inner parts. membrane of the Kall, and descending through it is parted into three little branches, of which one is diffributed to the right fide of the fame membrane, and to that part of the Colick gut that is joined into it: Another the leaft of them, and a very finall one, to the guts duodenum and the jepunous about its beginning: the third to the bottom of the flornach on the right fide, and to the upper roembrane of the Kall, which is fomething the larger. That which remains of this propagation is fpent upon the hollow part of the Liver and the bladder of Gall. The fecond goes into the right kidney, and the membrane thereof. The third, which is greater than either of the former, descending to the first rack-bone of the loins, reaches into the right side of the Mesentery and into the Guts that are tied thereto entering the center of the Melentery in company of an Artery and a Vein. The remainder goes into the bladder, and in Women into the right fide of the bottom of the Womb. But the outer branch of the left Nerve faving that in its defcent it hath offered fprigs both to the Pleans, or membrane inverting the rib, and to the coat of the lungs, and that outwardly, as allo to the purfe of the heart, and heart it felf inwardly, at that part of the Defeendent Trunk of the great Artery, where it first issues out of the heart, and is bowed to the back bone, it fends forth three furcles which returning to the faid Artery close rogether into one back bone, it fends forth three furcles which returning to the faid Artery clote rogether into one Nerve, which is called forefer recurrent nerves, the left returning Nerve, and in like manner as the right one, takes its progrefs upward, and is propagated into the mafeles of the Larine, or throttle.

After this it iffues out a finall fprig, which is diffributed through the baffs of the heart, and coat of it in manner of hairs. Afterward the remainder defeeds inclining it felf obliquely to the right, and goes to the upper orifice of the Stomach, in the right fide whereof it is diffused, as the right branch was before into the left fide, being divided into many little branches in manner of a Net. From this a furcle is carried down along the upper part of the Stomach to the Pylorus, or lower orifice, which when it hath as it were interwoven with fome sprigs, it goes into the hollow of the Liver. The inner branch first of all takes to it propagations from the intercostal Nerves, and then passing through the midriff is divided into three. The first of them goes overthware to the Spleen, and in the way shoots out two spries a one, which is likewise sent into the lower membrane Spleen, and in the way floots out two fprigs 1 one, which is likewife fent into the lower membrane of the Kall and part of the Colick gut, which is tied thereto; another into the left fide of the bottom of the flomach, and into the upper membrane of the Kall. The fecond propagation goes into the left fide of the Mefentery, and the guts of that place; formetimes also it iffus fprigs, which run out with the ferringer peffels through the proceed of the Perinagra perfect the helly to the run out with the feminary veifels through the processes of the Perioneum, or rim of the belly to the testicles. The third goes to the left Kidney, and the fat membrane thereof. The remainder of the branch passes to the left fide of the bladder and of the bottom of the Womb. The use of this pair is manifest enough by the control of the bladder and of the bottom of the Womb. is manifest enough, as being very notorious, when the outer branch bestows little boughs upon the middle bowels, but the inner upon all those of the lowest belly, and the right branch upon those of the right fide, the left on those of the left. Besides this use it conduces by the returning branches also to the framing of the voice, by imparting the faculty of motion to the muscles of the throttle.

The seventh pair arises in the utmost part of the nowl-bone, where the marrow of the brain is ready to go out of the skull, and so is counted the hardest of all the Nerves that have their original within the skull. But it arifes in some roots separated from each other, which joining together on both fides into one, it goes out of the skull through the fourth and fifth holes of the nowl-bone (which are planted betwist that greatell one, which opens a way for the defect of the fpinal marrow, and that, at which the first raise case, out of t row, and that, at which the fixth pair goes out) and prefently after its egress is involved in one common membrane with the fixth pair, whence fome not fo diligently observing it, have believed that they were mixed one with another; and thus they defeend together. When it comes to the recot of the tongue, it diffributes furcles into all the mufeles thereof, fending over force also to certain mufeles of the bone bysides, and of the throttle, as also to those which take their beginning from the appendix called by light. The use of this context is a life to those which take their beginning from the appendix called by light. the appendix called hybrides. The use of this conjugation is to carry down the faculty of sense and motion from the brain to the muscles of the tongue.

To these seven raises and makes the carry down the faculty of sense and motion from the brain to the muscles of the tongue.

To these seven pairs, which are commonly so numbred, we add an eighth, which makes the Nerves of Smelling, by which a faculty is derived from the brain of apprehending the odors of things without. These are commonly affirmed to arise out of the marrowy substance of the brain, and which is in the basis thereof, near to the first pair; but the new diffection of the brain, and which is performed

performed by turning it upfide down, bath taught us that they arife at the utmost fides of the brain, in that part which is above the holes of the ears, whereby it is manifest, that hitherto onely one half They are very tharp at their original, and diltant one from the other, but of them hath been flewn. going forward by degrees, betwixt the uppermost and middle prominence of the brain, they grow thicker, and draw nearer one to another, and so at length they lie down above the finas or cavities of the spongy bone within the skull. These are thrust into the mammillary processes of the brain: but Galen and Marinas (whom almost all Anatomists have followed) would not call them by the name of Nerves, although they altogether agree therewith in their colour, course, and use, because they neither have productions like the rest of the nerves, nor go out of the cavity of the skull: but truly they feem to me to commit no other a fophism than they who have expelled the teeth out of the number of the Bones, because they are not invested on the out-fide with a membrane, as others are, although neither this makes any thing to the effence of the Bones, nor that to the effence of the Nerves.

CHAP. II.

Concerning the Nerves of the Spinal Marrow properly so called, and first of those of the Rack-bones of the Neck-

Ature, the wife Parent of all things, as the hath framed the Nerves, that they might ferve The Spinal for the carrying of the faculties and spirits that are generated in the brain, because the Marrow. brain it felt could not be diffused through the whole body: so when the fame of the mode at the spirit too want distance the mode at the spirit too want distance the mode at the spirit too want distance. conveniently beflow Nerves upon all the parts, by reason of their too great distance, she made the Spinal Marrow, which is nothing elfe but the marrow of the after-brain and brain, extended through the long Conduit-pipe of the Rack-bones of the back. And therefore we having already viewed those Nerves which take their original from the marrow of the brain, whilest it is yet contained in the skull; it remains now that we take a view of them also which come from the spondyls of the Back-bone: But it is called Marrow, not that it hath any affinity by reason of its substance with the Why it is cale marrow of the bones, but because like Marrow it is contained within the Rack-bones; but the sub-led Marrow. flance thereof is like that of the brain, which it felf also Plate called Marrow; and it is named also the Spinal Marrow, or of the Back, to diffinguish it from both those that are contained in the Backbone, but either in the skull, as the brain, or in the hollowness of the bones, as that which is properly bone, but either in the skull, as the brain, of in the homovalues of the brains and the brain it felf It is wrapt up called Marrow. This fubitance is covered with two membranes, no otherwise than the brain it felf It is wrapt up called Marrow. is, from whence it takes its original, the one thick, the other thinner, which are invested with a certain branes. third firong and membranous covering, that Galen thought to be the ligament of the Rack-bones. But it was made to that end, that it might diffribute fense and motion to the Muscles and Membranes, to which those pairs of the brain do not reach. Therefore when there is a good number of The Conjuga-Nerves arifing therefrom, yet we shall easily reduce them to some certain Classes or Companies, if we tions or Pairs fay that they all make up thirty pairs, of which seven belong to the marrow whilest it is carried of the Spinat through the Rack-bones of the Neck; twelve whilest it is carried through those of the chest; sive through those of the loins; and lastly, fix to that which is contained in the holes of the Ox facron, or great bone. But these Nerves go out through the holes of the Rack-bones, and either with a double original on the fore and hinder part, as it happens in the two first conjugations of the neck, and sive of the great bone, which arise not from the fides, that is, from the right or left part, but issue forth two branches before and behind; or elfe with a fingle one, through the hole bored in both fides of the Rack-bones, as happens in all the reft of the pairs, in which one Nerve iffues from the right fide, the other from the left. But the first and second pair have a double beginning, left if they should arise with a fingle one, that being fomewhat thicker might have been hurt by the joints of the Rack-bonesi or if the hole should be made larger, the Rack-bone (which was small enough of it self) should be liable to breaking. Therefore that both these evils might be avoided, the wise Opincer made a double beginning, one on the fore-part, another on the hinder. But the right branches go every where to the right tide, the left to the left, and they are diffributed on both fides after the fame manner.

The first Pair thereof [tab.1.s.1.] arises with its first and foremost propagation [tab.1.B] from the The first pair fore-part of the Spinal Marrow, and passes out betwixt the nowl-bone, and the first rack-bone of the of the neck; neck, near to the fides of that round ligament, wherewith the Tooth-like process of the fecond rackbone is ried to the fore-fide of the nowl-bone, and so it is distributed into the Muscles over the neck and under the gullet that bend the neck. With the other and hinder propagation, [sab,2-fig.1. C] it likewife falls out through the hole, that is common to the nowl-bone, and first rack-bone of the neck, towards the hinder part, but with a double fprig, one of which being finall is fpent upon the leffer firait mufcles and the upper oblique ones that extend the head; the other reaches out into the beginning of the mufcle which lifts up the Shoulder-blade

The fecond pair [tab.1.2.] with its fore-branch [tab.1.D] (which is flenderer than the hinder one, The fecond though both of them feem finall enough) arifing from the fore-part of the Marrow, goes forth betwixe pair, the first and second rack-bones at the side of the Tooth-like process, which branch is distributed into the Muscles that lie upon the neck, as well as the fore-branch of the first pair, which is wrapped together with it, and is almost wholly spent upon the skin of the face. With its hinder branch [140.2, fig.1. E] it slips out through the sides of the backward process of the second rack-bone, but presently is eleft into two branches of unequal bigness, of which that which is the thicker [tab.2.fig.1. F.] tends from the fore-part to the hinder, where the Mufcles feated on both fides of the hinder part of the neck do meet together, and there being mixed [tab.2.fig.1. G] with the third propagation of the third pair of the nerves, it runs out through the middle of the faid mufcles, returning from the hinder to the fore-parts, and so is distributed into all the skin of the head, as far as to the top of the Crown [14b.2, fig. 1. H] as also to the ears. The other branch, which is the flenderer, is inferted into the great strait muscles, and the lower oblique ones, that extend the head. Galen makes mention of shele branches

tib.4, de locis affeli. which place we shall not think much to transcribe hither, it making very much to the illustration of the use of this kind of learning. Not long since, says he, they ulcerated the head of a certain man, by laying on medicins vehemently heating, thinking by this means his sense, that was greatly impaired, might be recovered. But we cured this very man, having found out the feat of the disease as well from other accidents, as from the primitive or procatarctick causes. For we diligently examined him about every one of them, and found that this was one; when he had walked in much rain caused by a violent wind, his Cloak was wet about his neck, so that he felt himself affected with a vehement cold in that part; so then if you know that four Nerves ascend from the first Peack of the back-bone to the head, from which the skin about it receives its sense, you will easily find out the seas of the disease; that therefore being healed, the skin of the head was healed also, as having no primary disease.

The third pair. Its forebranch. The third pair [tab.1.3.] iffues out of the common hole in the fides, which is betwixt the fecond and third Rack-bones, and prefently after it gets out, is cleft into two branches, of which the more forward one [tab.1.1] is fubdivided into four propagations. The first [tab.2.K] goes to the first bending muscle of the neck, or the long one: the fecond [tab.1.L] runs down, and being united with a sprig of the fourth pair [tab.1.Q] ends in the muscles that lie under the gullet. The third [tab.1.M] climbs up, and joining with the thicker branch of the fecond pair but now mentioned [tab.2.fig.1.F] is spent upon the skin of the hinder part of the head. The fourth [tab.1.N] is imparted to the transverse muscles, or to the sirst pair of the extenders of the neck, and to that which lifts up the shoulder-blade, of which two muscles, that tends in the transverse processes of the neck, this begins therein; and at length it is digested into the square muscle that draws down the cheeks, which is called by Galen which we would be cheek. The hinder branch [tab.2.fig.1.O] is implanted into the second pair of muscles that extend the chest.

branch.

I. 2.

The hinder branch.

A question,

The fifth nerve, Its forebranch.

The hinder branch. The fixth pair. Its forebranch.

Its hinder branch. The feventh pair. The forebranch. The fourth pair [tab.1.nomb.1] iffues out of the common hole of the third and fourth Rack-bones, and like the third pair is divided into two unequal branches. The more forward and greater [tab.1.P] is cleft into three other twigs, of which the first [tab.1.Q] is joined with another branch of the third pair [tab.1.L] and goes to the first long pair of muscles that bend the neck. Another [tab. 1.R] goes to the transverse muscle, or first of those which extend the neck, and to the first of the shoulder-blade, called Cuculiaris, the Cowl-muscle. The third [tab.1.S] being smaller than the other, and joined with a muscle of the fifth pair, and another branch of the fixth pair, near to the mediation or membrane that parts the chest in the middle, and above the Pericardinan passes on downward, that out of these three principles the Nerve of the midriff may be made up. The hinder branch [tab. 2. sig. 1.T] goes toward the spine or ridge, under the muscles which are placed thereabout, to which also it affords a good number of branches, and from thence being led downward between the muscles on both sides of the neck, it is carried to the square muscle that draws down the cheeks. In this place it is worth our labour to inquire what may be the reason, that they who are troubled with a Resolution, or deprivation of motion in the whole body, have nevertheless the motion of their midriff for a while free: some make answer that this happens, because, although no spirits are sent over from the brain, yet they may be disfused out of the marrow of the back. But these men beg the question, when we suppose that no spirits come from hence, because we see that all the muscles of the whole body, to which nerves are fent from the marrow of the back. But these men beg the question. Therefore I thought sit to seek out for another answer, and to say that the midriff hath two motions, one that is voluntary, which we use whiles we breath strongly; another natural one, when the shores are extended and contracted of themselves. A man therefore

The fifth pair [tab. 1. momb. 5.] goes out betwixt the fourth and fifth rack-bones, and like the two last foregoing, is cleft into two branches. The forwarder of them [tab.1. U] iffues forth fome propagations. The first [tab.1. betwixt U and 6] goes to the muscles that bend the neck. Another [tab.1. X] together with propagations of the fourth and fixth pairs, fornetimes also of the seventh, to wit, then when the branch of the fourth is wanting, descends near to the fide of the gullet through the fore part of the Rack-bones of the neck, and is implanted into the midriff, and so makes the midriff Nerve. The third [tab.1. Y] is carried through the upper part and outside of the arm, to the second muscle of the arm, to wit, that which lifts it up, called Deltoider, from whence little branches are sent over to the first and feoond, that is, to the cowl-muscle, and the lifter up of the shoulder-blade. The fourth propagation [tab.1.b] at the neck of the shoulder-blade is elect into two, of which the some special poses into the muscle Deltoider at that part where it arises from the clavicle or canal-bone: the latter and thicker [tab.1.d] is inferted into the fourth pair of muscles of the bone byoider, called corneolyoiderum, and from thence imparts a small branch to the upper muscle over the shoulder-blade called supersequence, and to the muscle Deltoider, where it arises from the spine of the shoulder-blade. The hinder branch of the fourth pair is.

The fixth pair [tab.1.nmm.6.] goes out under the fifth rack-bone, and in like manner as the other pairs are, is divided into two branches. The forwarder and greater [tab.1.f.] after it hath propagated that [prig, [tab.1.g.]] which we faid is joined with the fourth and hith pair, [tab.1.S and X] to the making up of the nerve of the midriff [tab.1.i] paffing on farther is united with the two next following pairs, the feventh of the neck, and the first of the cheft, and is again feparated from them, and then again being joined with them it so weaves a certain net-like texture, from which nerves are iffered forth, that go to the arm. The hinder [tab.2.fig.1.1] is carried to the hind muscles which expend the head and needs

The feventh pair [tab.1.n.7.] is derived from the marrow of the neck, and iffues forth through the common hole of the fixth and feventh tack-bones. The forwarder and greater branch thereof [tab.

[tab.1. m] is joined prefently after its egress with the fixth nerve of the neck, and the first of the cheft, and for the greater part is carried with the rest to the arm. The hinder lesser branch [tab.2. fig. 1. n.] goes to the muscles, that lie upon the neck, and to the square one, that draws down the

CHAP. III.

Concerning the Nerves of the marrow of the rack-bones of the Cheft.

Welve Conjugations of Nerves iffue forth from the foinal marrow, whileft it runs through the rack-bones of the back, as the most learned Vefalius hath rightly opinioned, however there are but eleven holes bored in the twelve rack-bones thereof, as Columbus objected, because the first pair passes our between the last rack-bone of the neck and the first of the back, wherefore it ought to be numbred rather among the pairs of the cheft, than those of the neck. All these conjugations after their egress are divided into two; and the one branch which is the greater, always bends forward; the other which is the lefs is bent to the hinder parts, and to the mufcles that lie

upon the back.

The first pair then [tab.t. nam. 8.] of the nerves which issue forth from the marrow of the chest, The first pair. fame manner as the five pairs last mentioned do, and in like fort also is forthwith divided into two branches. The forwarder and greater [tab. 1.0] is united [tab.1.p] partly with the seventh nerve Its fore-of the neck, partly with the second of the chest, in that manner which we have before explained; and branch. of the neck, partly with the fecond of the cheft, in that manner which we have before explained; and fo afterward is wholly confirmed upon the arms, excepting one propagation [tab.1.q] which arifing at the beginning of it, is joined with the faid nerves, and runs into the fore-parts near the length of the fift rib of the cheft to the breft-bone, beflowing a fprig upon the fubclavian mufcle, after that being reflected upward is fpent upon the mufcles, which take their original from the top of the breft-bone; fuch are the mufcle that beinds the head called Malloidem; that which draws down the bone is the head saled the brekler like arifle of the draws down the bone. bone: fuch are the mancie that pends the near Canad happeneers that which draws down the bone bysides or fiernobysides, and the first of them which extend the buckler-like griftle of the throttle, called thywides, or the muscle fiernobysidess. But to the two last formetimes branches are fent over from the fixth conjugation of the brain, and the third of the chest. The same branch also when it from the fixth conjugation of the brain, and the third of the cheft. The fame brains and when it hath path the arm-pit, being ready to go to the arm, iffues forth a certain other propagation from its hinder part, which goes to the mufcles feated in the hollowness of the shoulder-blade. The hinder its hinder part, which goes to the fixed in the mufcles which grow to the rack-bones, and imparts branch. fome propagations to the second bending muscle of the neck, and to them which extend the head and neck; but when it hath attained to the fpine of the feventh rack-bone, it goes overthwart to the lower fide, and diffributes furcles into the first muscle of the shoulder-blade, or that like a Monks Cowl, and in the third of the fame, called Rhomboides, as also into the upper of the hindmost faw-

The fecond pair [tab, 1, mgm.9.] breaks out betwixt the first and second rack-bones of the cheft, The second and is cleft likewise into two branches. The forwarder [tab.1.5] is united with the first pair of the pair. The forecheft; and thus the first and second pairs of the cheft are united by turns, with the fifth, fixth, and feventh of the neck, that the one are not differend from the other, but make a net not unlike to those things which hang at Cardinals hats; from which afterward all the nerves that go to the arms, iffue forth and take their original. This spreads out a branch [tab.1.t] which goes to tweat through the first distance betwixt the ribs, according to the course of the first rim, as far as to the brest bone, making the first Intercostal nerve, from which surcles [tab.1.u] are distributed into the muscles that lie upon the chest. The hinder branch [tab.2.sig. 1. x] hath the same differnination with that of the The hinder

foregoing pair.

The other ten pairs [tab.1. namb. 10, 11, 12, and fo on to 19 inclusively] of the nerves of the cheft, The other ten observe the same manner both of their rise and distribution. For they all iffue out of the common pairs, holes of the rack-bones at the sides, and presently after their egress are eleft into two branches of the common pairs.

The other ten pairs [tab.1. namb. 10, 11, 12, and fo on to 19 inclusively] of the nerves of the cheft, The other ten holes of the rack-bones at the sides, and presently after their egress are eleft into two branches of the cheft, The fore-their fore-their ten pairs [tab.1. namb. 10, 11, 12, and fo on to 19 inclusively] of the nerves of the cheft, The other ten pairs [tab.1. namb. 10, 11, 12, and fo on to 19 inclusively] of the nerves of the cheft, The other ten holes of the rack-bones at the sides, and presently after their egress are eleft into two branches of the cheft, The other ten holes of the rack-bones at the sides, and presently after their egress are eleft into two branches of the cheft, The other ten holes of the rack-bones at the sides, and presently after their egress are eleft into two branches of the cheft, The other ten holes of the cheft, The other ten holes of the cheft, The other ten holes of the cheft of the chef holes of the rack-bones at the fides, and prefently after their egrefs are eleft into two branches of unequal bignefs, one of which is the forwarder and greater, the other the inner and lefs. The forward branches [tab.r.y] (which make the nerves between the ribs) are carried into the forefide, and branches a little branch in order according to its length, to the inner branch of the fixth materiolal Veins and Arteries, together with which they pass along the rib of the fore-part through the true ribs, go on as far as to the brest-bone; but they which belong to the bastard ones, are carried into the fore-part of the Abdomen above the Peritaneum or rim of the belly. From these nerves many branches are differentiated into the muscles between the ribs, not onely in the inner, but the outer branches are differninated into the marfeles between the ribs, not onely in the inner, but the outer onesalfo, as well into the other [tab.1.z] which lie upon the cheft; fuch as are the fourth and fifth muscles of the shoulder-blade, or the two foremost Saw-muscles, as also to the broad one, called Larissimas [tab.1.6] that moves the arm backward from the breit. In like manner a propagation goes from the fifth intercostal nerve, about the middle of the rib passing through the intercostal muscle into from the fifth interconar nerve, about the maddle of the 110 paning through the interconarmatcie into the fifth pair of the mafeles of the abdomin [tab.1.*] as also into the skin of the cheft; and being divided in four parts is distributed into the pectoral muscle that moves the arm forward to the breft, and vided in four parts is distributed into the pectoral findice that those sine affirmation to the prest, and also into the skin, from which some springs do afterward go to the nipples of the brest [tab.1.7] and impart to them a very sharp sense. The hinder branches [tab.2 fig.1.7] go backward to the spine Their hinder or ridge, between the muscles going to the rack-bones, which have the charge of extending the chest, branches. Yet are they not wholly spent upon the muscles, but when they have now attained to the tops of the spines, they fall out between the muscles of both sides, whereabout they are joined one to another, and to afterward they give nerves to all the mufeles which arife out of the tops of the spines of the rack-

Transport of the least of the l

bones. Such are the first extending muscle of the head, called *Triangularis* or *Splenieus*; the third muscle of the shoulder-blade, or *Rhomboides*; the first of the shoulder-blade or *Cucullaris*; the third broad muscle that leads the arm away from the brest, called *Anisesspor*, and the hinder saw-muscle. A good number also of surcles are distributed into the skin of the back.

CHAP. IV.

Concerning the Nerves of the Marrow of the Rack-bones of the Loins.

Rom the fpinal Marrow, whileft it is carried through the first of the Loins, although there be onely four holes, yet five pairs issue forth, the first being between the last rack-bone of the cheft, and the first loins. But they go forth through the common holes, and being gone forth, are distributed in like manner as we have said of the Nerve of the cheft; when from every one of them presently after its going out, one branch, and that the greater, spreads it self forward; the other and less, backward. The foremost branches run to the muscles of the abdomen, or outer and fore-part of the lowest belly; the hindmost to them which lie upon the spines of the rack-bones, and the bones without a name, from whence they impart some little branches also to the skin that covers the loins. But the fore-branches are knit together, the first with the second, the second with the third, the third with the fourth, and the fourth with the fifth in the same fashion as we have said the nerves of the arm were, whilest they make the net-like complication.

The first pair.

Its forebranch, pair. The first pair then [rab.1.num.20.] as the rest do also, going out under the Peritoneum or rim of the belly, through the common hole of the rack-bones, which is betwixt the last rack-bone of the chest and the first of the loins, presently after its egress is cleft into two branches. The fore-branch, which is greater, goes into the fielby parts of the midriff, and into the beginning of the first bending muscle of the thigh, called 4 dox.

The hinder

From this Nerve a certain furcle [tab.1.39.] takes its beginning, reaching out for the most part with the preparing artery to the testicle. The hinder branch [tab.2.fig.1.mm.42.] sends propagations into the muscles that lie upon the back side of the rack-bones of the loins, such as are the first and third of them which extend the chest, that being called Dorfi longissmum, this sacrolumbus s as also the muscles which extend the loins: but when they issue out from the tops of the spines, whereabout the said muscles are joined one to another, they run to the sides, and are implanted into the broad muscle that leads the arm outward from the brest, called Latissmum.

The second,

The fecond pair [tab.1.num.21.] goes out under the first bending muscle of the thigh, called \$\frac{1}{\phi}xs\$, betwixt the first and second rack-bones of the loins. The fore-branch thereof is distributed to the fecond bending muscle of the thigh, that fills up the cavity of Os Ilium, or the hanch-bone, and the first bending one of the leg, called Fascialis, as also to the skin of the thigh. The hinder branch going out of the Abdomen is distributed to the three muscles that extend the thigh, or the Glutai; and to that which extends the leg, called Mombrosolius, the membranous muscle.

The third.

The third pair [tab.1.mm.22.] iffues forth likewife under the first bending muscle of the thigh, betwixt the second and third rack-bone. The fourth branch thereof passes over near to the hanchbones, distributing two propagations; one which goes to the knee, and its skin; another [tab.1.51.] which accompanies the vein of the inner ankle, called saphona. The inner branch is restected and differninated into the muscles which lie upon the loins.

The fourth.

The fourth pair [sab.1.mom.23.] is the greatest of all the Nerves of the loins, and being carried under the said muscle that bends the thigh, as also under the Os pubis or share-bone, accompanies the Crural Ven and Artery.

The fifth.

The fifth and laft pair [tab.1.num.24.] iffues out betwixt the fourth and fifth rack-bones; the fore-branch whereof paffes through the hole which is betwixt the hip-bone, the Os pubis or there-bone, and the Os Ilium or hanch-bone, and diffributes fome propagations to the two muscles that turn the thigh about, called Obturatures, others to the fecond and third bending ones of the thigh, and others to the muscles of the yard. The hinder branch goes into the muscles and skin upon the rack-bones.

CHAP. V.

Concerning the Nerves of the Marrow of Os facrum, or the great bone.

The first pair,

Aft of all from the Marrow which is contained in the rack-bones of the Os facrom, the fix laft pairs of the nerves of the fpinal marrow do iffue forth. The first of these tab.1. num.25. goes out betwixt the last rack-bone of the loins and the first of the great or holy bone, in the very same manner as the rest that arise out of the rack-bones of the loins, and likewise after the same fort is divided into two branches. The fore-branch, although it be mixed with the crural nerves, sends yet a surele [tab.1.43.] over near to the inner region of Os Ilium, and is dispersed into the smalless of the abdomen, and into the second bending one of the thigh. The hinder [tab.2.fig.1. num.44.] is disseminated into the muscles that arise from the Os Ilium, or hanch-bone, and especially into the first of them that extend the thigh, or the greater Glutaus, as also into the skin of the battocks.

The other five pairs. The other five pairs have formething proper to themselves, so that before they go out of the bone, they are every of them double on each lide, and so from every one of them a double branch is carried on each lide, one to the fore-part, another to the hinder. The three uppermoit of the fore-branches, as that of the first pair also, go to the Gras, or parts of the body below the buttocks: the two lowest go into the muscles of the sundament and bladder; and in women to the neck of the womb, in men to the yard; but in both sexes to the outer privy parts. The hinder branches are distributed to the muscles scatted on the backtide of the bones Ilium and Sacrum. Of this fort are the first and third

extending mufcles of the cheft, or *Derft longiffmus*, the long mufcle of the back, and *facrolumbus*, that which bends the loins called *facer*, and the broad mufcle that leads the arm away from the breft; as also the three which extend the thigh, being the authors of the buttocks, and therefore called *glaves*, the buttock mufcles. And this is the utmost end of the spinal marrow, which reaching into the rump bone, called Os esceggis is in this manner terminated : And this is the history of the thirty pairs of the Nerves which go out of the spinal marrow, which is diligently and accurately to be committed to the memory, that we may know to what place remedies ought to be applied, if at any time from fome external canfe, as by a fall from aloft, or a bruife, or fome notable compression any pare shall have lost either motion, or fense, or both. For the remedies must be applied always to the beginning of that Nerve, not to the place in which the symptom is perceived.

CHAP. VI.

Concerning the Nerves which are distributed through the Arms.

Hose Nerves being now enumerated, which are dispersed through the muscles of the three bellies, and the parts contained in them; it remains that we deferibe those also, which are propagated through the arms, or extreme parts of the body. Here we meet with them first which are distributed through the arms, whereof there are fix pairs commonly set down by Anatomiss arising from the fifth, fixth, and seventh pair of the nerves that come out of the marrow of the neck, and from the first and second of those which issue out of the chest. These nerves go out through the common holes of the rack-bones, on both sides, and presently after their going out are united one among another with their forwarder and greater branches, by and by are separated one from another again, and joined again, and finally separated, so that they seem to make out a certain net-like texture, which cannot be better likened than to those strings of Cardinals Hats. This implication of Nerves goes forth under the clavicle or collar-bone, about the place where the Axillary Veins and Arteries go out of the hollow of the cheft, and from this all the Nerves of the arm take their original. But their rife is very uncertain by reason of their being so knit together; wherefore we in our relation of them will rather follow the footfleps of other men than our observations, left we should seem

to affect new opinions rathly, and without necessity.

The first Nerve then [tab.t.e] which is carried to the arm, is a double propagation, namely the The first third and fourth of the fore-branch of the fifth pair of the neck. For the one branch [tab.t.Y] is nerve of the carried to the second markle of the upper part of the arm called Deltaider, and to the skin that lies upon arm, the other lab.t. It is not to the skin that lies upon arm. it: the other [tab.1.b] goes toward the neck of the shoulder-blade, where it is cleft into two branches, the former of which [tab.1.c] goes into the muscle Deltoides, where it arises from the collar-bone; the latter [1ab.1.d] is inferted into the fourth pair of the mufcles of the bone byoider, called Coracabyoideum, and from thence affords a little branch to the upper fuperfeapular mufele, and the Deltoides at what place it arifes from the spine of the shoulder-blade. This Nerve runs out through the hinder side of the arm; but the other five are carried through the arm-pit into the arm, and in the fame are

The fecond Nerve [tab.1. 2] is thicker, and takes its original from that net-like complication, of The fecond, which we spake; yet from what nerve, cannot be evident enough. This is carried down through Its progress. the middle and fore-part of the arm, into which it enters under the first bender of the cubit, or the double-headed mufcle, at that part where its two heads are united one with the other, and where the tendons are inferted both of the pectoral muscle that leads the arm forward to the breit, and of the Describes that lifts it up. Being hid then under this mufele it fends forth two propagations [tab.1.] In one of each fide, which enters into the two heads of the mufcle biops; and after that about the middle of the length of the upper part of the arm, going under the fame double-headed muscle, it shoots forth another sprig [14b.1. †] by means whereof it is joined with the third nerve; and from thence descending it distributes in its progress a furcle [tab. 1.0] from its out-fide to the head of the longer of the two mufeles of the radius or wand that turns the palm of the hand downward. When it is come to the bending of the cubit, being led to the flethy membrane, near to the out-fide of the tendon of the faid double-headed muscle, it is distributed into the skin, being divided into two branches, of which one is the outer, the other the inner; that is the flenderer, this the thicker. The outer Its branches. then [tab.1.1] being carried down a good way with a branch of the Cephalick vein through the in-fide of the cubit, is diffribated $[tab.1.\lambda]$ to the fecond bone of the thumb. The inner branch [tab]. The inner 1. x] is fubdivided under the common vein of the arm, or the middle one called Mediana, into two branches, the outer whereof [tab.1.] going on obliquely under the skin leaving the vein goes away toward the radius as far as to the wrift: but the inner [tab.1.] being fastened to the inner branch of the Cephalick vein, when it goes more obliquely in the region of the cubit is elect into two special branches, of which one $[tab.1.\pi]$ is diffributed through the region of the leffer bone of the cubit, the other $[tab.1.\sigma]$ through the region of the writt, and from thence, that being pair,

The hinder Nerve of the arm [tab.1. p] or the third, which is carried to the arm, lies next under The third, the fecond, and in like manner with it arifes from that net-like texture. This Nerve, whileft it paffes the recond, and in the indicate with real real results and the arm, brings forth a propagation [tab.1.7] which is differred under the skin betwixt the pectoral muscle that leads the arm to the breft, and the muscle Deltaides that lifts up the fame. But when it hath first attained to the arm, it hides it felf under the mafele bicept, or first bender of the cubit, and passing on downward together with the second nerve, it fends out a little branch [tab.1.7] into the head of the fecond bending mufcle of the cubit. After ned one with the receives a branch [tab.1.0] from the fecond Nerve, by means whereof they are joined one with the fecond nerve, used one with the other, and then it goes further through the fore-part of the arm unto the bending of

the cubit, being always equally diffant from the fecond Nerve, and is carried into the protuberation of the infide of the arm, and the fore-part thereof. When it hath past this, it issues forth many propagations [tab.1. φ] which together with the branches that are derived from the fifth Nerve, which is carried through the hinder region of the same protuberation, are distributed into the muscles that are feated on the inside of the cubit, and arise from the inner protuberation of the arm: such are the two that bend the uttermost bones of the fore-singers, and that which bends the third joint of the thumb. After this it fends out another propagation, which is carried down between the said muscles through the radius together with a vein and artery to the wrist; and passing through under the transferred ligament, scatters some small springs into the muscle that moves the thumb outward from the singers, and the two that bend the first joint of the same. After this, when it is come to the palm of the hand, it is divided [tab.1. χ] into three branches; the first of which scatters two twigs into the thumb, the second as many into the fore-singer, the third sends one to the middle singer on the inside.

The fourth.

Its propaga-

The fourth Nerve [1ab.2.fig.1.] is the biggeft of all them which are carried to the arm, as being almost thrice thicker then the reit. This arises as well as the other, from the net-like complication, and from thence is carried down through the arm, in like manner as the third is, lying deep every where among the muscles, having the basilick vein and axillary artery for its companions. But presently after it hath entered the arm, it derives many, but fmall fprigs $[tab.2.fig.\omega]$ into the heads of the mufcles that extend the cubit; and before it is come to half the length of the upper part of the arm, it is contorted obliquely downward to the bone thereof, and paffes on betwixt that and the mufcles which extend the cubit. But before it be wholly reflected, it fends forth a furcle [1.16.2.fig.1.1] from its infide, which goes betwixt the faid mufcles, as also the second of them that bend the cubit, and is fpent upon the skin that clothes the infide of the arm, fome fibres being propagated upward and downward. Having differninated this propagation it goes by degrees through the hinder part to the outfide of the arm, being carried through the cavity of the outer protuberation of the upper bone of the arm that is cut out in the back fide thereof, where likewise it fends out a furcle [tab.2, fig.1. \Delta] going to the skin, that covers the lower part of the outlide of the arm; and then another [tab.2. fig. 1. O] which is diffributed into the skin, as far as to the wrift. After that near to the joint of the cubit it is divided into two branches, an outer and an inner one, which being hid deep, and among the mufcles, as the whole Trunk also, descend to the wrist. The outer branch [tab.2.fig.1. A] goes along the radius or wand, and when it is come to the wrift, paffes through the transverse ligament on the outer part, and by and by is fubdivided [tab.2.fig.1.\(\varphi\)] into two branches, of which one goes with a double fprig into the outlide of the thumb, the ris fpent partly upon the fore-finger, partly on the middle one. But the inner branch [tab.2.fig.1.11] reaching along the cubit featters more propagations; the first [tab.2 fig.1. >] into the first muscle that extends the fingers, the second [tab. 2. fig. 1. 4] into the fecond that extends the fingers; the third [sab.2.fig.1. 4] into the inner mufcle that extends the wrift. But in its progress [tab,2.fig.1. \O] it affords propagations to the three beginnings of the muscles that take their original from the ulma, or greater bone of the cubit. The remainder of it ends in the wrift, [tab.2.fig.1.31.]

The inner,

Its two bran-

ches. The outer.

The fifth Nerve. The fifth Nerve [1ab.1. mmm.32.] ariling lower than any of the fore-mentioned, out of the fame net-like complication, and being joined to the fourth, descends through the inside of the arm, between the muscles that bend and extend the cubit. This scatters no propagation from it self, but remains entire till it be come to the inner protuberation of the arm, at whose hinder cavity it is reflected, and is distributed afterward in the same manner with the third Nerve, which passes through the fore-slided the same protuberation. For both of them bestow propagations [1ab.1.33] upon the muscles which grow out of the inner protuberation of the arm, and keep the inside of the cubit. It is the sorth a propagation also [1ab.1.34] which being carried through the radius or wand, goes between the muscles which bend the second and third joints of the singers, and so to the palm of the hand, and send out the first branch, which being parted into two, is implanted into the inside of the little ingers then another, which being also cut in two, goes into the ring-singer, and at last another that goes to the outer part of the inside of the middle singer. But from this same fifth Nerve, and from the outside near to the middle of the length of the radius or wand, there grows out a certain other surfice that he little are also the side of the middle, which being divided into three branches is diffeminated into the outer-part of the middle,

The fixth.

The fixth Nerve [tab.1.0.36.] iffues out of the lowest part of the net-like complication, and going through the arm-pit and inside of the upper part of the arm and of the cubit, under the skin it makes haste to the inner protuberation of the upper bone of the arm, dispersing many sureles in its way to the neighbouring skin [tab.1.37.37.] But as soon as it hath attained to this protuberation, it is elect into many propagations, some of which lie under the branches of the basilick vein, some lie over, and so being carried under the skin, when they are come down to the wrist, they end [tab.1.38.]

CHAP. VIII.

Of the Nerves that are distributed through the Crura, or Thighs, Legs, and Feet.

Here are four pairs of Nerves which are propagated through the Critical. They arise from the three lower conjugations of the loins, and the four upper ones of the Os facrium, or great bone, which after they are gone forth through the common holes of the rack-bones as well as the Nerves, which are distributed through the arm, make a certain complication like the meishing of a net, but far greater than that other. Nor are these Nerves of equal bigness, but the first [tab.t.nam.46.] and the third [nab.t.56.] are small, wherefore also they reach but to the thigh; the tecond [tab.t.50.] is somewhat thicker and reaches to the leg, but the fourth [rab.t.61.] alone is thicker than the three other put together, and is carried down as sar as to the utmost ends of the toes.

The first Nerve then [tab.1.46.] grows out of the higher part of the Net-like complication. The first where the third Nerve of the loins is joined with the fourth [tab.1.47.] But it is presently carried Nerve. downward under the rim of the belly, to the thigh; lying upon the outside of the tendon of the first bending muscle of the thigh, to which when it is come, it sends out a propagation [tab.1.48.] which runs out through the skin on the fore-part of the thigh, as far as to the joint of the knee, and there ends, and affords surcles [tab.1.49.] to the first bending muscle of the leg, as also to the second and third that extend the farme. and third that extend the fame.

The second Nerve [tab.1.50.] arises out of the same complication, and below the first, over against The second. the connexion of the third and fourth rack-bones of the lons. This together with the crural Vein and Artery, (which are the outer Iliacal branches) defcends through the groin into the thigh, which when it hath attained to, presently it iffues forth a notable propagation [tab.1.51.] from its inside, lying upon the faphena or vein of the inner ankle, on the fore-part, all the way it goes under the skin through the inner parts of the eras to the great toe. But as the vein faphena it felf distributes fome fprigs in the way to the skin next to it, so also this Nerve sends out many propagations, of which that is the chief [rab.1.53.] which it gives to the fore-fide of the knee. But the trunk it felf [rab.1. The progrets 54.] when it hath fent out this propagation, paffes together with the trunk of the crural Vein and of the trunk. Artery into the thigh, and is feattered into the mufcles feated on the infide of the thigh, especially tab.1.55.] into the third bending one of the thigh, and the fourth extending one of the leg, and to afterward it is terminated above the knee.

The third [tab.1.n.56.] grows out of the complication under the fecond, over against the conjunction of the tourth and fitth rack-bones of the loins. This Nerve being carried down upon the second bending muscle of the thigh, called *Historian internate*, passes through the hole of the share-bone, and affords propagations [tab.1.57] to the two muscless that turn the thigh about, which they call *Obtaviatoria*, the stoppers, to wit, of that said hole, as also to the two muscless that erect the Yard, which they call the stoppers of the big. From these slike the two foreasters. artie out of the bone of the hip. From thence like the two foregoing Nerves, it defeends and diffributes little Nerves into the skin that cloths the inner part of the thigh [rab.1.58] the remaining part [tab.1.57] lies deep, the chief propagation whereof [tab.1.60] is ipent partly on the fecond, partly on the third mufcle that bend the leg.

The fourth Nerve [tab.1.n.61] is made up out of the fore-branches of the four upper pairs of the The fourth; great bone being united together. By reason whereof it passes the rest, yea and all the Nerves of the whole body, not onely in thickness, but in hardness also, as being made of the last, that is in the fpine, or ridge. This enters into the hinder part of the thigh through the cavity that is in the limiter part of the hip-bone. But prefently it fends forth a notable propagation [tab. 1.62] from its backlide, which flays a pretty while under the first extending muscle of the thigh, or Glutaus magnus the great buttock-muscle, and from thence is dispersed into the skin that covers the buttocks, and the back-fide of the thigh to the middle of its length. Then it fends other propagations [tab.1.63] on both fides, three for the most part to the heads of the third, fourth, and filth mufcles that extend the leg, and to the third bending one of the thigh. After this the The progress trunk of the nerve descends among the muscles seated on the hinder part of the thigh near to of the trunk, the bone, as far as half the length thereof, and distributes another branch [tab, 1, 64] to that fleshy the bone, as far as half the length thereot, and diffibutes another branch [tab, 1.64] to that flethy lump of the fifth bending muscle of the leg, called Bierpr, which grows to it on the infide, after it hath gone beyond the middle of the thigh. From hence also other furcles proceed, which are distributed into the skin on the backfide of the thigh. But the trunk it fell proceeding farther on, at length attains to the the knee betwixt the two heads of the bone of the thigh, and imparts a small branch [tab, 1.65] on each fide into the first extending muscle of the foot, and the fole muscle its division, called proceeding and by and by is divided [tab, 1.66] in the inner cavity of the knee or in the law. called Plantaris, and by and by is divided [tab. 1.66] in the inner cavity of the knee, or in the ham, into two unequal branches which are distributed along through the leg and foot. For there is not any Nerve which runs out through the leg, befides these two branches of the fourth, if you except any Nerve which runs out through the leg, bendes there two branches of the fourth, it you except onely that notable propagation, which being derived from the fecond Nerve, as we have faid, defeends in company of the Vein Saphena through the inner part of the Crus. The outer branch [tab. of the leg is joined with the tibis or greater bone thereof, feattering a propagation [tab.1.68] in the many which goes to the cause which goes to the way which goes to the outer ankle under theskin, distributing in the mean time many sprigs to the skin. But the branch it felf [tab.1.69] paffes between the mufeles feated on the forefide of the leg, and going through the long ligament of the tibis and fibula, or two bones of the leg, paffes together with the tendons of the mufcles that extend the toes under the transverse ligament, and difperfes little branches to the fides of the upper part of the toes. The inner branch [tab.1.72] is carried down through the backfide of the Crus, lurking betwixt the mufcle of the fole of the foot, and the first of them that move the foot obliquely, as also the long bending muscles of the toes; and being joined afterward with the branch of the outer, which passes through the ligament, it goes to the fole of the foot, and diffributes propagations into both the fides of the lower part of the toes.

The five pairs of the Nerves of the loins: the first 20, the second 21, the third 22, the fourth 23, the stiff 20, the second 21, the third 22, the fourth 23, the stiff pair of the loins 20, and descending from the stiff pair of the loins 20, and descending for the most part with the preparing Artery to the Testicle. The course of the Nerves through the muscles of the Abdouven, from which branches 41 ges into the muscle that leads the arm outward from the bost. The hinder branches of the Nerves of the loins. The fix pairs of the nerves of the great bone. Of the fix pairs of the nerves of the great bone. Of the fix pairs of the nerves of the stord 27, the fourth 28, the stift 29, the footh 30. A sirele reachs out from the toto-branch of the sunch-bane, and so to the muscles of the Abdouven that arise from that bone. Then another streading out from the hinder branch to the muscles seated on the back of Os Ilium, or the hanch bone. The termination of the stinal marrow passing on without a mate, and undivided. The subser the third Nerve of the loins meets with the fourth 47. A branch of this 48 goes to the skin, but 49 it is entangled among the muscles that are seated on the outside of the thigh. The scoond crural Nerve, a notable propagation whereof 51, runs out into the same course with the vein Saphena, to the end of the foot, and there ends about 52. In the mean time it proffers another notable sureless, to the end of the foot, and there ends about 52. In the mean time it proffers another notable sureless, to the fore-side of the knee. But the remainder of the trunk 54 enters deep into the thigh, and gives out a small branch 55. In the mean time it proffers another notable sureless, and the sureless of the special passes out a small branch 55. In the mean time it proffers another notable sureless, to the sureless out a small branch 55. But without question the chief.		24 is third 35.
der the skin imparting many springs to it 37,37, 38 37, the end of it is 38. The five pairs of the Nerves of the loins: the single 20, the second 21, the third 22, the fourth 23, the sifth 24. A certain branch arising from the stop spring the loins 20, and descending for the most part with the preparing Artery to the Testicle. The course of the Nerves through the mussels of the Abdottoen, from which branches 41 goes into the mussels that leads the arm outward from the binder branches of the Nerves of the loins. The fix pairs of the nerves of the great bone. Of these the sirst is 25, the second 26, the third 27, the fourth 28, the sight 29, the south 30. A siercle reacht out from the bott-branch of the sirst Nerve of the great bone to the inside of the banch-bone, and so to the mussels of the Ab- dotten that arise from that bone. Then another spreading out from the hinder branch to the mussels seated on the back of Os slium, or the hanch bone. The termination of the spinal marrow passen on without a mate, and musivided. The siry Nerve entering the cruss. This ari- ses where the third Nerve of the lains meets with the fourth 47. A branch of this 48 goes to the skin, but 49 it is entangled among the mussels that are seated on the outside of the thigh. The scoond crural Nerve, a notable propaga- tion whereof 51, runs out into the same course with the vein Saphena, to the end of the foot, and there ends about 52. In the mean time it proffers another notable sureless, to the fore-side of the home. But the remainder of the trunk 54 enters deep into the thigh, and gives out a small branch 55 the without question the ebies. The second crural Nerve, a natable propaga- tion whereof 51, runs out into the fame course with the vein Saphena, to the end of the foot, and there ends about 52. In the mean time it proffers another notable sureless, to the fore-side of the home. But the remainder of the trunk 54 enters deep into the thigh, and gives out a small branch 55 the without question the ebies.		The fixeh Nerve of the Arm, which goes un-
37, the end of it is 38. The five pairs of the Nerves of the loins: the figit 20, the fecand 21, the third 22, the fearth 23, the fifth 24. A certain branch arifing from the first pair of the loins 20, and descending for the most part with the preparing Artery to the Testicle. The course of the Nerves through the mussels of the Abdoment, from which branches 41 goes into the mussels that leads the arm outward from the brest. The fix pairs of the nerves of the great bone. Of these the first is 25, the second 26, the third 27, the fourth 28, the sifth 29, the stock 30. A surele reacht out from the tove-branch of the sirst Nerve of the great bone to the inside of the hanch-bone, and so to the mussels of the Abdoment that arise from the binder branch to the mussels of the hanch-bone, and so to the mussels of the Abdoment that arise from the hinder branch to the mussels seated on the back of Os Ilium, or the hanch bone. The termination of the spinal marrow passing on without a mate, and musivided. The first Nerve entering the crus. This arises where the third Nerve of the lains meets with the fourth 47. A branch of this 48 goes to the skin, but 49 it is entangled among the mussels that are seated on the outside of the thigh. The second crural Nerve, a natable propagation who the vein Saphena, to the end of the foot, and there ends about 52. In the mean time it proffers another notable sureles 53, to the fore-side of the knee but the pourte of 51, runs out into the same course with the vein Saphena, to the end of the foot, and there ends about 52. In the mean time it proffers another notable sureles 53, to the fore-side of the knee must be the pour of the thigh, and gives out a small branch 55, but without question the ebies.		der the chin imparting many flyigs to it 37, 37,
The five pairs of the Nerves of the loins: the first 20, the seemed 21, the third 22, the fourth 23, the sourch 21, the sourch 21, the fourth 23, the sourch 21, the sourch 21, the sourch 21, the sourch 21, the sourch 22, the sourch 21, the sourch 21, the sourch 21, the sourch 22, and descending for the most part with the preparing Artery to the Teticle. The course of the Nerves through the muscles of the Abdottoen, from which branches 41 goes into the muscles that leads the arm outward from the brost. The binder branches of the Nerves of the loins. The fix pairs of the nerves of the great bone. Of these the sirst 25, the second 26, the third 27, the fourth 28, the sifth 29, the sound 30. A surele reacht out from the tove-branch of the sirst Nerve of the great bone to the inside of the banch-bone, and so to the muscles of the Abdottoen that arise from the binder branch to the muscles seated on the back of Os llium, or the hanch bone. The termination of the shinal marrow passing on without a mate, and undivided. The surele third Nerve of the loins meets with the fourth 47. A branch of this 48 gots to the skin, but 49 it is entangled among the muscles that are seated on the outside of the thigh. The second crural Nerve, a notable propagation whereof 51, runs out into the same course with the vein Saphena, to the end of the foot, and there ends about 52. In the mean time it proffers another notable surele 53, to the fore-side of the knee. But the remainder of the trunk 54 enters deep into the thigh, and gives out a small branch 55. In without question the bedses.		
first 20, the second 21, the third 22, the fourth 23, the siste 24. A certain branch arising from the stop stop loins 20, and descending for the most part with the preparing Artery to the Testicle. The course of the Nerves through the mussels of the Abdomen, from which branches 41 goes into the mussels the arm outward from the brest. The binder branches of the Nerves of the loins. The fix pairs of the nerves of the great bone. Of these the sirst 25, the second 26, the third 27, the surface reachs out from the sore-branch of the sirst Nerve of the great bone to the inside of the banch-bone, and so to the mussels of the Ab- domen that arise from that bone. Then another freading out from the hinder branch to the mussels seading out from the binder branch to the mussels seading out from the binder branch to the mussels seading out from the binder branch to the mussels seading out from the binder branch to the mussels seading out from the binder branch to the mussels seading out from the binder branch to the mussels seading out from the binder branch to the mussels seading out from the binder branch to the mussels seading out from the binder branch to the mussels feated on the back of Os Ilium, or the hanch bone. The termination of the spinal marrow passing on without a mate, and undivided. The simber the third Nerve of the loins meets with the fourth 47. A branch of this 48 goes to the skin, but 49 it is entangled among the mussels that are seated on the outside of the thigh. The second crural Nerve, a nutable propaga- tion whereof 51, runs out into the same course with the vein Saphena, to the end of the foot, and there ends about 52. In the mean time it proffers another notable furcle 53, to the fore-side of the hore. But the remainder of the trunk 54 enters deep into the thigh, and gives out a small branch 55. L. So, but without question the chief.		The five trains of the Nerves of the loins : the
23, the fifth 24. A certain branch arifing from the most pair of the lains 20, and descending for the most pair with the preparing Artery to the Testicle. The course of the Nerves through the mussels of the Abdomen, from which branches 41 goes into the mussels that leads the arm outsward from the brest. The binder branches of the Nerves of the lains. The fix pairs of the nerves of the great bone. Of these the first is 25, the second 26, the third 27, the fourth 28, the fifth 29, the sixth 30. A sirecte reacht out from the tore-branch of the same bone, and so to the mussels of the Ab- domen that arise from the binder branch to the mussels seated on the back of Os Ilium, or the hanch bone. The termination of the shinal marrow passing on without a mate, and mussived. The first Nerve entering the crus. This ari- ses where the third Nerve of the lains meets with the fourth 47. A branch of this 48 goes to the skin, but 49 it is entangled among the mussels that are sested on the outside of the thigh. The second crural Nerve, a matable propaga- tion whereof 51, runs out into the same course with the vein Saphena, to the end of the foot, and there ends about 52. In the mean time it proffers another notable surcle 53, to the fore-side of the have. But the remainder of the trunk 54 enters deep into the thigh, and gives out a small branch 55 the without question the chief.		Got 20 the Good 2 to the third 22, the fourth
the first pair of the loins 20, and descending for the most part with the preparing Artery to the Testicle. 1 the course of the Nerves through the muscles of the Abdoment, from which branches 41 goes into the muscles hat leads the arm outward from the brost. 1 the brost. 1 the binder branches of the Nerves of the loins. 1 the first pairs of the nerves of the great bone. Of the first is 25, the second 27, the third 27, the fourth 28, the fifth 29, the sixth 30. 1 A sirele reacht out from the bott-branch of the sunch-bone, and so to the muscles of the Abdomen that arise from the binder branch to the muscles setted on the back of Os Ilium, or the hanch bone. The termination of the spinal marrow passing on without a mate, and undivided. 1 the first Nerve entering the crus. This arise where the third Nerve of the loins meets with the fourth 47. A branch of this 48 goes to the skin, but 49 it is entangled among the muscles that are feated on the outside of the thigh. 1 the second crural Nerve, a matable propagation whereof 51, runs out into the same course with the vein Saphena, to the end of the foot, and there ends about 52. In the mean time it proffers another notable sureless, to the tore-side of the home. But the remainder of the trunk 54 enters deep into the thigh, and gives out a small branch 55. In without questin the chief.		22 the fifth 24. A certain branch arifing from
the most part with the preparing Artery to the Telicle. The course of the Nerves through the muscles of the Abdoment, from which branches 41 goes into the muscle that leads the arm outward from the begit. The fix pairs of the nerves of the great bone. Of these the first is 25, the second 26, the third 27, the south 28, the sist 29, the south 30. A sirele reacht out from the tott-branch of the simple voice, and so to the muscles of the Abdomen that arise from that bone. Then another streading out from the hinder branch to the muscles seated on the back of Os slium, or the hanch bane. The termination of the stinal marrow passing on without a mate, and undivided. The simple very entering the cruss. This arises where the third Nerve entering the cruss. This arises where the third Nerve entering the cruss. This arises where the third Nerve, a matable propagation where the third Nerve, a matable propagation where the third Nerve, a matable propagation where of 51, runs out into the same course with the twee Saphena, to the end of the foot, and there ends about 52. In the mean time it proffers another notable surcles 3, to the fore-side of the knee. But the remainder of the trunk 54 enters deep into the thigh, and gives out a small branch 55. In without question the chief.		the first pair of the laine 20 and descending for
Telicle. The course of the Nerves through the musicles of the Abdomorn, from which branches 41 goes into the musicle that leads the arm outward from the binder branches of the Nerves of the loins. The fix pairs of the nerves of the great bone. Of these the sirst 25, the second 26, the third 27, the sourch 28, the sirst 29, the south 30. A siercle reacht out from the fore-branch of the sirst Nerve of the great bone to the inside of the hand-bone, and so to the musicles of the Abdomor that arise from the hinder branch to the musicles seated on the back of Os slium, or the hand bone. The termination of the spinal marrow passing on without a mate, and undivided. The first Nerve entering the cruss. This arises where the third Nerve of the lains meets with the fourth 47. A branch of this 48 goes to the skin, but 49 it is entangled among the musicles that are seated on the outside of the thigh. The second crural Nerve, a notable propagation whereof 51, runs out into the same course with the vein Saphena, to the end of the foot, and there ends about 52. In the mean time it proffers another notable surches, to the mean time it proffers another notable surches, and gives out a small branch to the surch action to the thigh, and gives out a small branch 55. In with out question the chief.	37	the first pair by the total 20, and anything for
The course of the Nerves through the muscles of the Abdomen, from which branches 41 goes into the muscle that leads the arm outpour from the broft. The hinder branches of the Nerves of the loins. The fix pairs of the nerves of the great bone. Of these the first is 25, the second 26, the third 27, the fourth 28, the sight 29, the sould 30. A surele reacht out from the tore-branch of the first Nerve of the great bone to the inside of the banch-bone, and so to the muscles of the Abdomen that arise from the hands to the muscles seated on the back of Os llium, or the hands bone. The termination of the shind marrow passing on without a mase, and undivided. The first Nerve entering the crus. This arises where the third Nerve of the loins meets with the fourth 47. A branch of this 48 gots to the skin, but 49 it is entangled among the muscles that are sested on the outside of the thigh. The second crural Nerve, a notable propagation whereof 51, runs out into the same course with the vein Saphena, to the end of the foot, and there ends about 52. In the mean time it proffers another notable furcle 53, to the fore-side of the knee. But the remainder of the trunk 54 enters deep into the thigh, and gives out a small branch 55.		
the Abdoment, from which branches 41 goes into the mufcle that leads the arm outward from the broft. The hinder branches of the Nerves of the loins. The fix pairs of the nerves of the great bone. Of the fix pairs of the nerves of the great bone. Of the fix pairs of the fixed 27, the fixed 26, the third 27, the fourth 28, the fifth 29, the fixed 30. A fixele reacht out from the fore-branch of the fixed reacht out from the fore-branch of the fixed on the banch-bone, and fo to the mufcles of the Abdomen that arife from that bone. Then another fixed ding out from the binder branch to the mufcles feated on the back of Os Ilium, or the hanch bone. The termination of the final marrow paffing on without a mate, and undivided. The first Nerve entering the cruss. This arifes where the third Nerve of the loins meets with the fourth 47. A branch of this 48 gots to the skin, but 49 it is entangled among the mufcles that are fested on the outside of the thigh. The fecond crural Nerve, a notable propagation whereof 51, runs out into the fame course with the vein Saphena, to the end of the foot, and there ends about 52. In the mean time it proffers another notable furcle 53, to the fore-fide of the knee. But the remainder of the trunk 54 enters deep into the thigh, and gives out a small branch 55. In without question the chief.	100	restricte.
into the mufcle that leads the arm outpard from the broft. The hinder branches of the Nerves of the loins. The fix pairs of the nerves of the great bone. Of these the first is 25, the second 26, the third 27, the fourth 28, the sistend 26, the third 27, the fourth 28, the sistend 26, the third 27, the fourth 28, the sistend 26, the third 27, the fourth 28, the sistend 26, the third 27, the first Nerve of the great bone to the inside of the banch-bone, and so to the musseles of the Ab- domen that arise from the hinder branch to the musseles seading out from the hinder branch to the musseles seading out from the hinder branch to the musseles seading out from the hinder branch to the musseles seading out from the hinder branch to the number seading out from the hinder branch to the numseles seading out from the hinder branch to the harch bone. The termination of the spinal marrow passing on without a mase, and undivided. The first Nerve entering the cruss. This ari- ses where the third Nerve of the loins meets with the fourth 47. A branch of this 48 gots to the skin, but 49 it is entangled among the musseles that are sested on the outside of the thigh. The second crural Nerve, a notable propaga- tion whereof 51, runs out into the same course with the vein Saphena, to the end of the foot, and there ends about 52. In the mean time it proffers another notable surcele 53, to the fore-side of the knee. But the remainder of the trunk 54 enters deep into the thigh, and gives out a small branch 55. But without question the chief.		The course of the Nerves tonningo the majeter of
the breft. The bunder branches of the Nerves of the loins. The fix pairs of the nerves of the great bone. Of the fix pairs of the nerves of the great bone. Of the fix pairs of the nerves of the great bone. Of the fix pairs of the nerves of the great bone. Of the fix pairs of the nerves of the great bone to the third 27, the fixerb 28, the fifth 29, the fixerb 30. A fixerle reach out from the fore-branch of the fixer Nerve of the great bone to the infide of the banch-bone, and fo to the muscles of the Abdomen that arife from that bone. Then another freading out from the hinder branch to the numbers feated on the back of Os Ilium, or the hanch bone. The termination of the final marrow passing on without a mate, and undivided. The first Nerve entering the cruss. This arifes rebere the third Nerve of the loins meets with the fourth 47. A branch of this 48 goes to the skin, but 49 it is extangled among the muscles that are feated on the outside of the thigh. The second crural Nerve, a nutable propagation whereof 51, runs out into the fame course with the vein Saphena, to the end of the foot, and there ends about 52. In the mean time it proffers another notable furcle 53, to the fore-side of the knee. But the remainder of the trunk 54 enters deep into the thigh, and gives out a small branch 55. In without question the ebies.	41 1.	the Abdomen's from more branches 41 goes
The binder branches of the Nerves of the loins. The fix pairs of the nerves of the great bone. Of the fix pairs of the nerves of the great bone. Of the fix pairs of the nerves of the great bone. Of the fix the first is 25, the fecand 26, the third 27, the fourth 28, the fifth 29, the fixth 30. A firrele reacht out from the fore-branch of the first Nerve of the great bone to the inside of the banch-bone, and fo to the muscles of the Abdomen that arise from that bone. Then another fired on the back of Os Ilium, or the hanch bone. The termination of the stinder branch to the muscles seated on the back of Os Ilium, or the hanch bone. The first Nerve entering the crus. This arises where the third Nerve of the loins meets with the fourth 47. A branch of this 48 goes to the skin, but 49 it is entangled among the muscles that are seated on the outside of the thigh. The second crural Nerve, a notable propagation whereof 51, runs out into the same course with the vein Saphena, to the end of the foot, and there ends about 52. In the mean time it proffers another notable surcles 3, to the fore-side of the knee. But the remainder of the trunk 54 enters deep into the thigh, and gives out a small branch 55. but without question the chief.		
The fix pairs of the nerves of the great bone. Of the fix the first is 25, the fecand 26, the third 27, the fourth 28, the fifth 29, the fourth 30. A firrele reacht out from the fore-branch of the first Nerve of the great bone to the inside of the banch-bone, and so to the muscles of the Abdomen that arise from that bone. Then another streading out from the hinder branch to the muscles seated on the back of Os Ilium, or the hanch bone. The termination of the stinum marrow passing on without a mate, and undivided. The first Nerve entering the cruss. This arises where the third Nerve of the loins meets with the fourth 47. A branch of this 48 goes to the skin, but 49 it is entangled among the muscles that are seated on the outside of the thigh. The second crural Nerve, a notable propagation whereof 51, runs out into the same course with the vein Saphena, to the end of the foot, and there ends about 52. In the mean time it proffers another notable surcles 53, to the fore-side of the knee. But the remainder of the trunk 54 enters deep into the thigh, and gives out a small branch 55. In the mean time it proffers another notable strings, and gives out a small branch 55. But without question the chief.	42 1.	the breft.
the fe the first is 25, the second 26, the third 27, the fourth 28, the sight 29, the south 30. A sirrele reacht out from the sort-branch of the sirrele reacht out from the sort-branch of the sirrele reacht out from the sort-branch of the sirrele reacht out from the sort of the inside of the shock-bone, and so to the musseles of the Abdomen that arise from the hinder branch to the musseles seated on the back of Os Ilium, or the hanch bone. The termination of the spinal marrow passing on without a mate, and undivided. The first Nerve entering the cruss. This arises where the third Nerve of the lains meets with the fourth 47. A branch of this 48 goes to the thin, but 49 it is entangled among the musseles that are seated on the outside of the thigh. The second crural Nerve, a notable propagation where of 51, runs out into the same course with the vein Saphena, to the end of the foot, and there ends about 52. In the mean time it proffers another notable surcle 53, to the fore-side of the knee. But the remainder of the trunk 54 enters deep into the thigh, and gives out a small branch 55. So the without question the chief.		The hinder branches of the Nerves of the tours.
the fourth 28, the fifth 29, the firsth 30. A firele reacht out from the fore-branch of the first Nerve of the great bone to the inside of the hanch-bone, and so to the muscles of the Abdomen that arise from the hinder branch to the muscless feated on the back of Os Ilium, or the hanch bone. The termination of the spinal marrow passing on without a mate, and undivided. The first Nerve entering the crus. This arises where the third Nerve of the loins meets with the fourth 47. A branch of this 48 goes to the skin, but 49 it is entangled among the muscles that are seated on the outside of the thigh. The second crural Nerve, a matable propagation whereof 51, runs out into the same course with the vein Saphena, to the end of the foot, and there ends about 52. In the mean time it proffers another notable surcle 53, to the fore-side of the knee. But the remainder of the trunk 54 enters deep into the thigh, and gives out a small branch 55. In the mean time it proffers another notable strips, and gives out a small branch 55. In the mean time it proffers another notable strips, and gives out a small branch 55. So the without question the chief.		The fix pairs of the nerves of the great bone. Of
the fourth 28, the fifth 29, the firsth 30. The shired manual makes and to the transparent services		55, but without question the chief.
		The third crural nerve, whose propagation 57

goes to the mufeles called Obturatores, and another 58 to the skin. The remainder 59 lies deep intangled in the mufeles whose chief propagation is 60, which is implanted in the second and third muscles that bend the leg.

The fourth, and that the thickest of all the Nerves of the crus, whose first branch is 62, which is inserted into the skin of the buttocks:

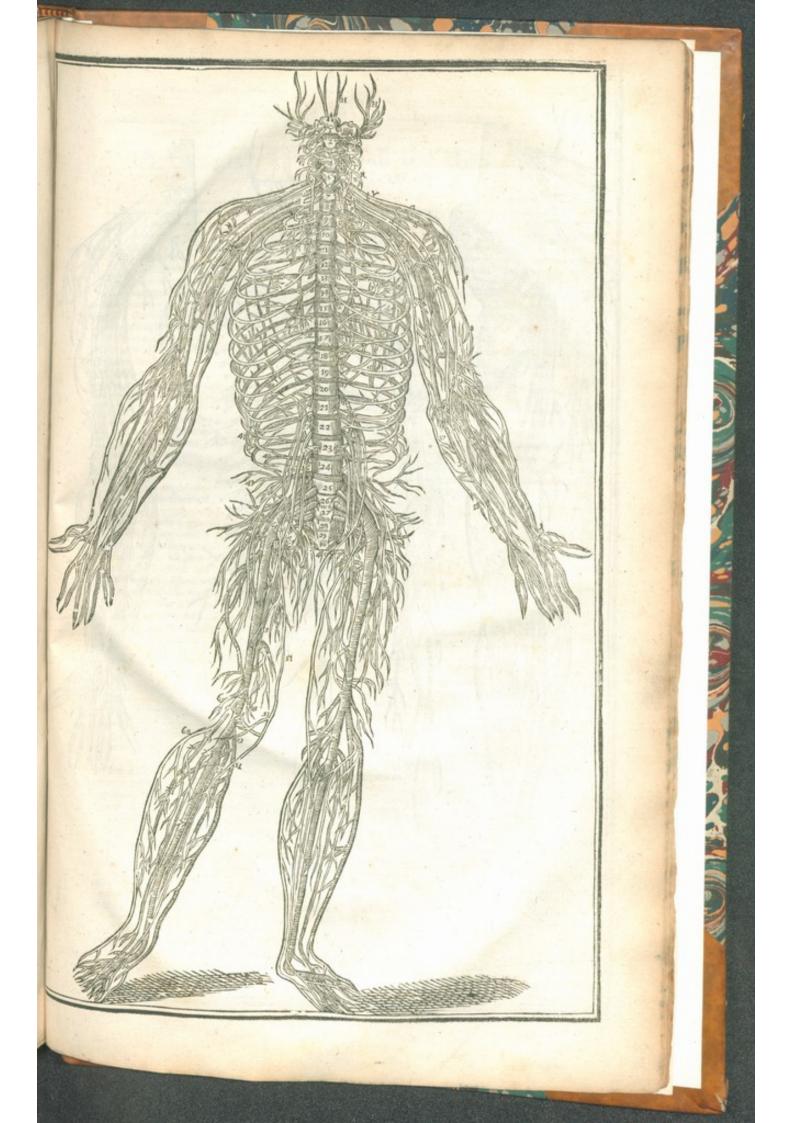

Nerves of the crus, whose first branch is 62, which is inserted into the skin of the battocks; another 63, is distributed into the heads of the muscles that arise from the appendix of the hip: a third 64 is given to the fifth muscle that bends the leg; and others 65 go into the outer eastmuscle, and that of the sole of the foot. But about the lower heads of the thigh it is divided 66 into two branches, to wit, an outer one 67, and an inner 72.

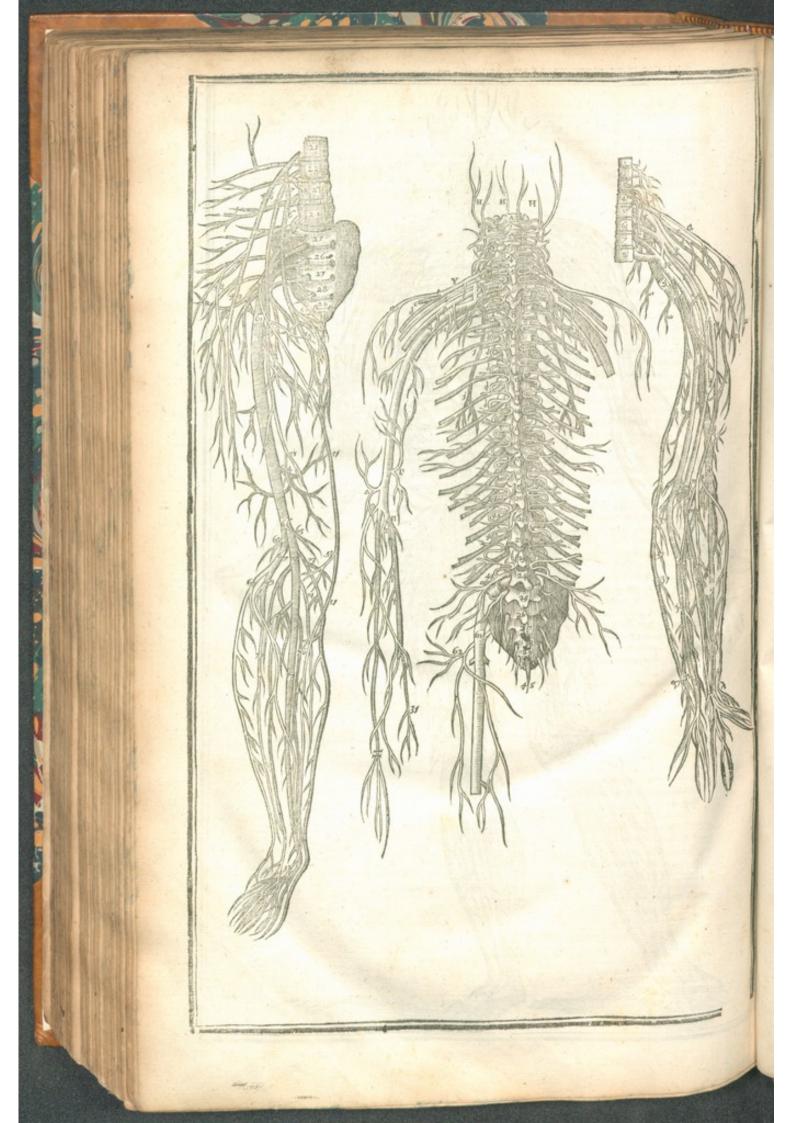

The outer branch, a propagation whereof 68 is fent under the skin that covers the outer part of the leg and the outfide of the foot. But the branch it felf 69 goes to the connexion of the leffer bane of the leg with the greater; fending forth another furcle 70 to the fore-part of the leg under the skin: the remainder of it 71 reaches along the tibula or leffer bone of the leg.

ches along the tibula or leffer home of the leg.

The inner branch, a propagation whereof 73 goes through the infide of the leg toward the ealf, and infide of the foot under the skin; and then another 74 is scattered into the skin; especially that which covers the ealf: another also 75,75 goes into the fore-part of the leg through the ligament that joins the leffer home of the leg to the greater, and afterward is spent on the upper side of the foot. The last propagation 76 runs out betwirt the inner and outer east-mussicle. The remainder of the trunk goes by the inner and let to the lower part of the foot, distributing two surcles apiece to the lower part of all the toes. The second and third signers of the second Table. These two Figures do exhibit the

The second and third figures of the second Table. These two Figures do exhibit the Nerves of the arm and leg in a larger form than the first Table does, so that all which concerns those Nerves, may be shown more accurately berein. But they have common characters, and the same explanation of the same serves for both.

A General Table of all the chief things treated of in this Work.
