"Used in the Care of Horses for Over 160 Years"

DIRECTIONS

Sprinkle Powder into the food which should be slightly damp.

They will be found to act beneficially upon Horses when out of condition, showing a loss of appetite, humors, staring coat, swollen legs, etc.

Horses: 1 x 20 ml. (10 gm.) measure.

Ponies or small Horses: 1 x 10 ml. (5 gm.) measure

As a general conditioner we recommend 1 x 20 ml. (10 gm.) measure to be given twice weekly.

Where it is desirable to improve the condition and stimulate the appetite, a 20 ml. (10 gm.) measure should be given alternate nights for a week, then repeated after a weeks interval.

Where a horse is generally out of sorts a 20 ml. (10 gm.) measure should be given in the evening feed every night until the animal is restored to its normal state.

The action of the powder will not keep a horse from work.
