Some people think you can catch AIDS from a glass.

You can't.

The California Medical Association and public health officials agree: AIDS is not spread through the air. AIDS is not spread by touching someone. AIDS is not spread by hot tubs. AIDS is not spread through the preparation or serving of food or beverages in restaurants or homes.

The virus that causes AIDS is spread by unprotected sex with an infected person, or by contaminated blood entering the blood stream—such as by sharing drug needles.

Fight the fear with the facts:
