Primary Care Trust

ALL ABOUT HIV+

HIV infects one particular component of the immune system, the CD4 (or Helper T) cells. In simple terms, the CD4 cells are a kind of white blood cell, which float in your bloodstream, co-ordinating your body's response to an infection. As more and more CD4 cells are destroyed by HIV, so the body loses its ability to fight disease. When this happens, a person will be diagnosed as having AIDS.
