D. Monro's Lectures on Anatomy Page 5.  
and Surgery Sect. 1.

When we consider Gentlemen the Office of a Physician or Surg.  
one of w.<sup>ch</sup> I am to suppose all present mean to be w.<sup>ch</sup> is to  
preserve health or to cure disease - i. e. to prevent or to redress  
Disorders in y.<sup>e</sup> human body, it will appear to you evidently  
to follow, that the foundation of their Science must consist  
in y.<sup>e</sup> just knowledge of y.<sup>e</sup> situation, structure, connexion and  
properties of the several Organs, & of y.<sup>e</sup> several powers by w.<sup>ch</sup> its  
Functions are perform'd in health this knowledge being  
acquir'd by taking aunder the parts of our body, or by dissecting  
it, the art is term'd Anatomy - But by it we ought to under-  
stand that the dissection is conducted in a skillful manner;  
& further: Every experiment and aid is call'd in that art  
has yet furnish'd to disclose, not only the Structure but  
the Oeconomy of the Body. - The Physician applies his  
Anatomical knowledge to physic in one or two ways,  
either, by a proper direction and modification of y.<sup>e</sup> machinery  
He enables it to resist such impressions as w.<sup>ch</sup> prove hurtfull  
to it, to rectify the irregularities of its own functions, or to  
subdue and expell such matter as being acquir'd disturbs  
& interrupts its functions: or, in a more simple and  
Mechanical manner, by the mere application of the hand  
& the assistance of proper Instruments, he endeavours to  
cure or palliate Diseases w.<sup>th</sup> little or no assistance of the  
Machine itself - In the former of these ways he is said  
to perform the Office of Physician: in the latter to execute  
the Business of a Surgeon. - The dependance of both upon  
Anatomy will appear evident on the slightest reflection. -  
Unless the Physician knows exactly the situation and  
connexion of the several Organs, their particular use  
their importance to the general welfare, he can, conse-

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

and termination of the Circulating & Absorbent Vessels, & how far these may influence the body consider'd as an hydraulic Engine. The Nerves: their particular sensibility: the general Sympathy: The degree of Motion: the manner, and cause of this, it will be impossible to determine w<sup>o</sup> Seat of an inward disorder: to foresee the Symptom & probable Event, or to lay down rational Indication of Cure, adapting of known Effects of a remedy to w<sup>o</sup> nature of the part diseas'd.

The Chirurgical branch is still more dependant upon Anatomy for unless w<sup>o</sup> Surgeon be intimately acquainted w<sup>o</sup> w<sup>o</sup> several Circumstances enumerated: It knowes still more particularly w<sup>o</sup> Situation & Connexion of Nerves and Vessels, it will be impossible to determine how far an Operation may be advisable or whether w<sup>o</sup> Patient runs more danger from the disease being committed to Nature than he w<sup>o</sup> do from the Operation.

His Ignorance perhaps in one Case will deter him from attempting the only possible means of Cure while in another he is led to do something that is unnecessary or improper — Nay I w<sup>o</sup> carry this further, supposing an Operation is advis'd to be perform'd as I apprehend that w<sup>o</sup> common want of dexterity of hand w<sup>o</sup> Surgeons most of them profess, providing it be skilfully conducted, is sufficient for most Cases, their general Success will be in proportion to their Skill in Surgery w<sup>o</sup> entirely depends on Anatomy. — And an Anatomist tho' he has never seen a particular kind of an Operation perform'd may with more safety undertake it than another who is deficient in Anatomical knowledge, tho' he has seen w<sup>o</sup> Operation perform'd a number of Times; for an Operation is only a piece of Dissection perform'd on a living Body, & Anatomist proceeds upon certain Principles, knowes the Reason

3.

of every step & when to place his greatest caution; and in case anything unforeseen <sup>shd.</sup> happen he knows how to remedy it; whereas the other imitator only certain movements of the hand or Instrument without knowing certainly what he is doing, & if anything unforeseen happens from his Ignorance or Confusion he is altogether at a stand - he is rash perhaps where y<sup>e</sup> utmost Caution is requir'd, & tedious and giving pain where there is no real danger. — In y<sup>e</sup> Manual Branch the Art can only make a slow progress of Improvement by Observation or Accident without the knowledge of Anatomy: & if we look back to the different periods of Physic we will find that the Improvements in Anatomy & Surgery have constantly kept an Uniform pace. — Nor is it alone sufficient that we understand fully y<sup>e</sup> Structure of the sound state: we must likewise know the changes that are made by disease: otherwise informing our opinions concerning them we may be led into dangerous mistakes: nor need we be surpris'd if mistakes <sup>shd.</sup> take place: if we consider y<sup>e</sup> all our Organs are supply'd & in a great measure compos'd of Branches of y<sup>e</sup> Hydraulic System: So that an affection of a Single part may influence all the rest in various degrees. — Next let us reflect y<sup>t</sup> all our Organs are influenc'd by one living principle, w<sup>ch</sup> may react upon all in a manner w<sup>ch</sup> our Ignorance of its nature renders it impossible for us to reduce to rule; nay even <sup>tho</sup> we know the external appearance of the Power yet the nature of the Orowous Energy or of that Medium by w<sup>ch</sup> the minds of Animals are connected to the corporeal part, altogether escapes our Observation & perhaps mocks human investigation — When these circumstances are held in view we perceiv'd y<sup>e</sup> vanity of pretending a priori

to investigate the Cause of Diseases & thereby necessity we  
 are under of beginning our reasoning far from the Top  
 of that Chain by w<sup>ch</sup> Nature has laid together  
 causes & effects. — From the Dissection of morbid bodies,  
 to w<sup>ch</sup> we must have recourse, if we may not mistake in the  
 Cure of Diseases: for without dissections the attempts we  
 make to cure are the Experiments of Chance: but when we  
 know the changes that has taken place we are guided by  
 reality; may let us put on the one hand the most favorable  
 Supposition that one by administering a certain remedy  
 has remov'd a certain Symptom yet without knowing the  
 Cause of it, his observation cannot admit of a general  
 application for this Symptom may proceed from different  
 causes, & the Cure must be varied according to the N<sup>o</sup>. of it.  
 So we know by Dissection of <sup>the</sup> Dropsical Swellings may  
 depend upon a variety of causes, some of w<sup>ch</sup> require  
 Diametrically opposite means of Cure. — Again let us put  
 the most unfavorable Supposition of <sup>the</sup> by dissection we have  
 discover'd of <sup>the</sup> certain Symptom have proceeded from some  
 incurable disorder of the Bowels or else where, besides  
 saving your own reputation by a judicious prognostic  
 it is even of use to the patient, when instead of exhausting  
 his strength by attempting a radical Cure, we endeavour  
 merely to palliate <sup>the</sup> disease & support Nature in her  
 declining State: thereby rendering <sup>the</sup> remainder of life  
 more comfortable. — And when the first cause of Diseases  
 weakens our Observation as when it depends on upon the  
 Oeivous Influence & in contagious diseases where the  
 Infection is communicated to the Mass of Blood, it is still

highly useful to observe its Effects w<sup>ch</sup> become secondary 35.  
causes of new disorders. — But to insist farther upon the  
advantages of practical Anatomy may seem unnecessary  
and what shows y<sup>r</sup> sense of Physicians w<sup>ch</sup> regard  
to this work upon this Subject have been universally  
sought after. — The obvious & acknowledged  
necessity of practical Anatomy, or of the Dissection of morbid  
Bodies leads me back to observe y<sup>r</sup> absolute necessity  
there is of our being verily acquainted with the  
Structure in a sound State, in order to be able to point out  
y<sup>r</sup> deviations from it: and in proof of this it might be  
sufficient to have recourse to the mistakes of Physicians.  
But to endeavour to illustrate this by particular examples  
w<sup>o</sup>. at present be improper, as I am to suppose that  
you are ignorant of y<sup>r</sup> Subject; & it w<sup>o</sup>. be superfluous,  
as every step we take will afford abundant proofs of it.  
So I shall next proceed to consider the most fit method of  
studying Anatomy so as to attain a sufficient knowledge:  
& to propose the plan I am to follow; for I have made it a  
rule to avoid the form of a single preliminary Lecture,  
as we may be more agreeably entertained upon the  
Subject itself. — It must appear evident to you that  
an investigation of the functions of an Animal  
must be attended w<sup>th</sup> considerable difficulty, as we  
undertake to explain a machine not only of the most  
complicated, but of the most delicate mechanism, &  
w<sup>ch</sup> thro' y<sup>r</sup> influence of y<sup>r</sup> animating principle, possesses  
wonderful powers & has its operations varied in many ways

This multiplicity has determin'd many Physicians to  
divide y<sup>e</sup> Study into 2 distinct parts or Branches - The  
strictly speaking Anatomical & y<sup>e</sup> Physiological, the first  
taking account of y<sup>e</sup> pieces of w<sup>ch</sup> Machine is compos'd and  
describing them y<sup>e</sup> 2<sup>d</sup> shewing in what manner & by what  
causes they perform the <sup>part</sup> Functions. - Now admitting y<sup>e</sup> this  
Division can be properly made neither of em can be pursued  
without considerable interruptions; thus in y<sup>e</sup> anatomical  
Branch we cannot lay the pieces before us & join em again  
in y<sup>e</sup> Synthetic method; nor can we separate them and  
investigate y<sup>e</sup> machine properly without a previous knowledge  
of its basis, in y<sup>e</sup> analytic method; so must combine em &  
use a more complex method than we use in describing other  
pieces of machinery. - In y<sup>e</sup> physiological Branch again  
we are equally at a loss where to begin! If we begin with  
the Heart, as being the prime mover, the Heart derives its  
principle activity from the Brain, or if without the Brain  
this had an immediate dependance upon the heart so that  
we may say w<sup>th</sup> Hippocrates, y<sup>e</sup> in attempting to find a proper  
order we are endeavouring to discover the beginning of a Circle.  
But this may be sufficient to point out y<sup>e</sup> difficulties y<sup>e</sup>  
attend this study to shew to you the need there is for a proper  
method & to draw your attention to the one I am to  
propose. - It is unnecessary to explain the various  
methods y<sup>e</sup> have been propos'd, w<sup>ch</sup> are generally obscure  
& too much limited: where as I am to attempt one y<sup>e</sup> will  
be more clear & y<sup>e</sup> is more extensive in its views. -

The common way of describing the parts of y<sup>e</sup>. machine as inanimate must be dry and disgusting; & we cannot attend to a detail of facts so carefully without we at the same time see y<sup>e</sup>. application — Besides y<sup>e</sup>. functions of y<sup>e</sup>. body will be best understood while the parts lie before us so it will not only be more entertaining but more useful to adopt a method y<sup>e</sup>. will lead to the knowledge of the Structure & at y<sup>e</sup>. same time have such an Eye as to explain 'em as we proceed, & to apply 'em to the practice of physic & Surgery. — With this view the following plan is propos'd

1<sup>st</sup>. — It is customary w<sup>th</sup>. Writers & Teachers to promise some History of the Science they profess and may be said in defence of y<sup>e</sup>. method that it introduces Students to an acquaintance w<sup>th</sup>. y<sup>e</sup>. chief Improovers of y<sup>e</sup>. Art, & leads 'em to the sources of knowledge. — But it consists of an Impropriety, as the History of an art properly speaking comprehends the whole: neither does any Art attain to perfection in the order it is proper to treat of it. — I shall so far adopt this method as to begin with a short Hist<sup>y</sup> of y<sup>e</sup>. rise and progress of Anatomy, & shall from the great N<sup>o</sup>. of Authors, point out to you y<sup>e</sup>. chief sources of Improvement & select such as seem the most fit for your pursuit.

2<sup>nd</sup>. I shall next lay before you the principal materials of y<sup>e</sup>. human body as compos'd & endeavour to put these together in such a way as to give a general idea of its Oeconomy: for without an introduction of this sort, beginners will be at a loss to understand what is afterwards to be propos'd more particularly concerning y<sup>e</sup>. use of y<sup>e</sup>. parts & y<sup>e</sup>. application to the Practice.

8<sup>th</sup>

9. This will prepare us for entering upon y<sup>e</sup> particular branches of Anatomy, & for reasons before hinted I begin with y<sup>e</sup> study of the basis of a Body of y<sup>e</sup> bones & Organs connected w<sup>th</sup> these; w<sup>ch</sup> are for the support, attachment, and defence of the softer Bodies or Organs & from the general Basis of the body.

10<sup>th</sup> We are led to consider these Organs, w<sup>ch</sup> are immediately inserted into the Bones, take their rise from one bone & end in another; and w<sup>ch</sup> by their contraction make y<sup>e</sup> bones to approach one another & to perform y<sup>e</sup> various motions of the body, & whilst we observe y<sup>e</sup> effect of each muscle, we will divide 'em into Classes & consider y<sup>e</sup> Cooperation so far as may seem necessary.

11<sup>th</sup> The Bones and the Muscles afford a ground work or outline, by w<sup>ch</sup> we can with y<sup>e</sup> utmost precision describe the Circulation, & y<sup>e</sup> Connexion of all the other Organs: The Bowels, & Lungs & the Organs of the Senses, and then consider y<sup>e</sup> use of the parts, dividing 'em into their particular Classes.

12<sup>th</sup> And now knowing the distinguishing marks of y<sup>e</sup> several Organs, y<sup>e</sup> situation and connexions we are fully prepar'd for viewing the Body of an animal in a more extensive & entertaining light as having its Organs connected and communicating with one another so as to form a complete System.

13<sup>th</sup> And as in y<sup>e</sup> dissection we observe y<sup>e</sup> y<sup>e</sup> nutritious juice or fluid, y<sup>e</sup> Lymph is intimately mix'd w<sup>th</sup> y<sup>e</sup> general mass of

we are led to trace it to the different Organs & to observe the means by w<sup>ch</sup> it is convey'd & propelled in the several canals; the Heart & Arteries conveying it, to the several parts of y<sup>e</sup> Body, while it is return'd by the Veins, to complete the Circulation of the Mass, for preventing its coagulation and for the nourishment.

9<sup>th</sup> This tracing of y<sup>e</sup> Circulation by w<sup>ch</sup> several humors are describ'd opens other views, at the same a corresponding absorption carried on in Animals, this last is perform'd by certain Vessels y<sup>e</sup> have been long known to Anatomists & have been describ'd under the name of the Valvular Lymphatics: but the general use of these being misunderstood the doctrine will be found to have been placed in a much less important view than it may justly claim

10<sup>th</sup> Now after reflecting upon the Impressions made on y<sup>e</sup> Organs of Sense, & on the Labour of the Heart & Vessels in circulating the humors, in order to describe the complete Machine, it remains to shew the medium by which the animating part is connected with the Corporeal; & we shall find certain Cords derived from the Brain & distributed to every part of the Body, & by simple experiments we shall prove that thro' these we are sensible of impressions & are sollicit to action; and that by the means of muscles contract and perform their various functions.

11<sup>th</sup> After we have thus in a general way taken a view of the circulating, absorbent, & the nervous Systems

of animals their structure, powers & affections we will  
proceed to the particular branches of each & consider the  
effect of their distribution upon the various Organs - till we  
have seen the rise, course, & termination of the Viscera  
Arteries, Absorbent Vessels and nerves: we are not prepar'd  
for enquiring into or describing the intimate Structure of  
each Organ.

11<sup>th</sup> - So shall with this close the Anatomy of the Body, so far  
as takes place in the sound State. - This I shall do by  
means of preparations setting it in a variety of different  
points of view: then, I shall explain the functions of each  
so far as can be done with certainty and an usefull  
application to the practice.

12<sup>th</sup> Then having shewn you the Functions of the sound  
state, I shall give you some morbid preparations, or parts  
of diseas'd bodies, I have preserv'd in order to give you  
an Idea of the changes a disease produces. - and  
shew the foundation for the practical Anatomy  
or the Anatomical Pathology.

13<sup>th</sup> Besides the many observations relative to Surgery, as  
well as to physic which will be introduc'd into the Anatomical  
part of the course - I shall now consider, in a distinct  
part Surgery: or attempt to explain the manner of palliating  
or curing Diseases, or Accidents, by the Hand or Instrum<sup>ts</sup>  
and from the nature of the parts diseas'd & the changes  
made upon 'em; I shall lay down the proper Indications  
of cure: and the manner of conducting the Operation, where  
upon Anatomical principles we may venture sometimes  
to correct the present practice; I shall explain the several

Instruments and perform all y<sup>e</sup> Surgical Operations (11)  
before you: as also shew you the use of Bandages &  
other things necessary for the Cure.

4<sup>th</sup> Having finish'd y<sup>e</sup> human Anatomy, & what is dependant  
upon it, I shall illustrate y<sup>e</sup> more hidden functions by  
comparison of the Structure of other Animals: and in  
order to abridge the work I shall reduce y<sup>e</sup> Animals to  
Classes, & make a proper choice from each — and

5<sup>th</sup> Having exhausted now every means of throwing light  
upon the several animal functions, I shall conclude y<sup>e</sup> course  
w<sup>th</sup> a few Lectures upon such parts of y<sup>e</sup> Physiology as our  
Demonstrations did not lead me to consider.

## Lecture 2<sup>d</sup>

At our last meeting after endeavouring to point out  
the importance of Anatomy in y<sup>e</sup> practice of Physic &  
Surgery, I laid before you the plan w<sup>ch</sup> we follow in the  
present course. — Upon y<sup>e</sup> whole I propos'd to demonstrate  
y<sup>e</sup> Structure & to explain the functions of our Body so  
far as can be done w<sup>th</sup> certainty & w<sup>th</sup> usefull application  
to y<sup>e</sup> practice: to explain the nature of such accidents  
or Diseases as require y<sup>e</sup> assistance of y<sup>e</sup> Surgeon, and to  
perform y<sup>e</sup> operations before you & afterwards shew you  
y<sup>e</sup> applic<sup>n</sup> of Bandages & other Machines. — And I gave  
you my reasons for beginning w<sup>th</sup> y<sup>e</sup> Hist<sup>y</sup> of Anatomy.  
Formerly I w<sup>d</sup> to enter minutely into this Subject, &  
endeavouring to point y<sup>e</sup> principal discoveries in  
that have been made y<sup>e</sup> have been made in. Dup.

Anatomy — To mention all y.<sup>r</sup> most Eminent Authors.<sup>12</sup>  
But the subject grew to such an extent, that, tho' the  
reach into these Authors was by no means disagreeable  
to myself; yet on your acc.<sup>t</sup> I think it necessary to abridge  
it greatly y.<sup>t</sup> I may have more time for the other more important  
parts of our course: & I do this the more readily y.<sup>t</sup> you have  
as an opportunity of consulting in y.<sup>r</sup> public library of  
the University such Authors as you may think I mention in  
so cursory a manner. — In treating this subject I find it  
best to follow y.<sup>r</sup> order of Time: for tho' this is less entertaining  
in some respects yet we better in this way gratify our  
curiosity in observing y.<sup>r</sup> gradual steps by w.<sup>ch</sup> we advance to  
perfection: we do justice to y.<sup>r</sup> s.<sup>t</sup> discoveries of the Art, and  
to observe whence chiefly improvement is to be expected  
& w.<sup>ch</sup> is perhaps of y.<sup>r</sup> most consequence we are enabled to  
understand y.<sup>r</sup> foundation of the Theory & practice of the  
Ancient Writers in different ages, since we must consider  
Anatomy as constantly subservient to the practice.  
As the Antiquity of a science is a presumption of its import.<sup>ce</sup>  
we generally Teachers endeavour to trace y.<sup>r</sup> rise of that  
they profess, as far as possible back, pointing out every  
circumstance y.<sup>t</sup> might have contributed to its s.<sup>t</sup> introduction  
or after improvement while at y.<sup>r</sup> same time such inquiries  
are of little use & afford little entertainment from the  
extreme uncertainty attend.<sup>g</sup> in at the distance of Time in  
w.<sup>ch</sup> they are plac'd. — But we are not here as in  
tracing y.<sup>r</sup> rise of the other Arts allow'd to indulge in  
conjecture, for we are ty'd down by y.<sup>r</sup> sacred writings  
w.<sup>ch</sup> expressly tell us y.<sup>t</sup> y.<sup>r</sup> Sons of our s.<sup>t</sup> Parents offer'd up

13

Sacrifices Long before animal Food was permitted in w.<sup>ch</sup>  
or also in Butchery, when animal food was permitted to  
Proch, a regular division of parts became necessary. some  
parts were reckon'd impure & set aside, while otherwise  
some were reckon'd more proper for the purpose intended  
& other parts again were allotted to y. Sacrificers. —  
In the Butchery too of y. larger Animals a division  
to a certain degree is necessary. — And when the World  
came to be more peopled & avarous, Roarive, & Ambition  
embroild mankind in wars, and we read very early  
of Rattles in w. y. Interiors of y. body w. a more frequent  
bas.<sup>h</sup> into view y. y. are now from their chiefly using sharp  
& cutting Weapons. — When Men came to be farther  
protected by Laws, Ease, & Security, led them to conceive  
many things th. had not before thought of so they  
endeavour'd to preserve y. bodies of those who had made a  
figure in Life, after their Death. — This practice was  
familiar to the Egyptians in the days of Joseph and from  
the term Mummy it seems to have come from y. Persians  
Mum, in their Language signifying Wax, w. w. ch. y. Vessels  
were stuff'd. But from this but no such accurate  
knowledge of Anatomy co. have been obtain'd as some  
fancy; for if you look into Herodote you will find that  
the Operators were oblig'd to extract the Bowels piecemeal  
to prevent y. Body from being maim'd. — This however w.  
y. inspection of wounds, must have convinc'd mankind of  
y. Analogy between y. Structure of their own Body & that  
of Quadrupeds. — At last we find y. Priesthood equally  
Ambitious in acquiring power & Ingenuity in contriv-  
ing y. means of doing so: pretending y. future Events

114

were usual to be by certain signs and tokens & y<sup>e</sup> these  
were more especially discoverable in y<sup>e</sup> Bowels of such  
Animals as were offer'd in Sacrifices: & y<sup>e</sup> credulity of  
Men keeping pace w<sup>th</sup> y<sup>e</sup> grossness of y<sup>e</sup> imposture, nothing  
of importance was undertaken without first consulting  
y<sup>e</sup> Ruzers, this too was begun in the Eastern Nations  
& took place amongst y<sup>e</sup> Romans from y<sup>e</sup> building of  
Rome. A little addition could indeed be made to the  
to the knowledge of Anatomy from this practice for  
nothing was done accurately; Thus if you look into S.  
Vins who takes particular notice of this, in one instance  
the Heart is said to be wanting; while in another 2 Hearts  
were said to be found, so y<sup>e</sup> y<sup>e</sup> whole was a mere illusion,  
& a few only of the Bowels were examin'd, yet these are  
perhaps, or at least the chief means, that for many ages  
introduc'd or improv'd our knowledge in Anatomy:  
So we dont find in y<sup>e</sup> sacred writings, nor in the Books  
of Homer or Herodotus y<sup>e</sup> Anatomy was considered as  
a science of use & Entertainment, nor are the Sons of  
Aesculapius celebrated for their skill in this Art. but for  
their skill in the Virtues of Herbs - at length y<sup>e</sup> curiosity of  
the Philosophers of Greece seems to have paid y<sup>e</sup> way  
for y<sup>e</sup> further improvement of Anatomy by admitting it  
into their studies as one of y<sup>e</sup> Branches of natural Philosophy  
Thales, Democritus, Empedocles, are celebrated for their  
improvements in anatomy: and Specimens of y<sup>e</sup> Skill  
are found quoted in diff<sup>t</sup> Authors. - But we are chiefly  
indebted to Hippocrates who first not only separated  
Medicine as a distinct Science in profession from the

15

study of philosophy, but seem to have considered Anatomy as chiefly and immediately subservient to Physic & Surgery. The degree in which the skill of Hippocrates ought to be placed has been in matter of very great dispute some pretending to find in him all that is useful, whilst others depreciate his skill in y<sup>d</sup> opposite extreme. — how far we can see we from a perusal of his works we discover in them a general knowledge & applic<sup>n</sup> of anatomy, but this is extremely superficial & in some circumstances highly erroneous. — He every where confounds y<sup>d</sup> Arteries w<sup>th</sup> y<sup>d</sup> veins, not only using y<sup>e</sup> same term of Phlegm to express both, but considering both as branches of the same general Tork — In like manner he confounds the nerves w<sup>th</sup> y<sup>d</sup> Tendons, not only under one Term, but so far is he from having y<sup>e</sup> smallest Idea of y<sup>d</sup> Office of y<sup>d</sup> Organs we now call Nerves, y<sup>t</sup> he attributes to the Blood Vessels nay farther I do not find in any of his works w<sup>th</sup> by y<sup>e</sup> more accurate Critics are allowed him, or are shown to have been wrote in y<sup>e</sup> 5<sup>th</sup> Century before y<sup>e</sup> Christian Era y<sup>t</sup> any dissection was made of y<sup>e</sup> human body. — For the proof of y<sup>e</sup> contrary given us by Dr. Haller viz<sup>t</sup> that he describes y<sup>e</sup> subclavian muscle is by no means sufficient, because y<sup>e</sup> is found in y<sup>e</sup> Ape y<sup>e</sup> common anatomical Martyr of y<sup>e</sup> age & Country soon after in other works generally publish<sup>d</sup> as belonging to Hippocrates, but wrote by his Sons and Disciples — y<sup>e</sup> are evident proofs that the human Body was dissected. — for we find the exact number of the lobes of the Lungs and of the Vertebrae, and there is a tolerable just parallel between y<sup>e</sup> y<sup>d</sup> spirit<sup>u</sup>al Viscera of a Man and of a Dog. — The Admirers of

Hippocrates not contented w<sup>th</sup> ascribing considerable knowledge of y<sup>e</sup> structure of y<sup>e</sup> body to him, have pretended y<sup>e</sup> he also understood much of its economy & especially y<sup>e</sup> he understood y<sup>e</sup> circulation of y<sup>e</sup> blood but I shall consider this matter afterwards when I come to y<sup>e</sup> real period when y<sup>e</sup> was discovered, when I shall say down all y<sup>e</sup> was known in former ages w<sup>ch</sup> regards it.

In y<sup>e</sup> following Centuries y<sup>e</sup> 4<sup>th</sup> & 3<sup>rd</sup> before y<sup>e</sup> Birth of Christ we find anatomy still cultivated by y<sup>e</sup> Philosophers.

Plato reasons with considerable ingenuity w<sup>ch</sup> regard to it: & Aristotle his contemporary, who lived in the Century after Hippocrates not only reasons from the Descriptions of others - but undertakes a rational Description of y<sup>e</sup> figure and structure of animals in w<sup>ch</sup> he was engaged by Alex. the great & we are told by Pliny y<sup>e</sup> Aristotle completed this undertaking in 50. Books, or Vol. of w<sup>ch</sup> 11. are still extant, unluckily these more immediately treating of y<sup>e</sup> dissection of Animals are lost, but in these remain. we find numerous marks of considerable skill: They seem to have been the first who assisted his descriptions by figures - an art extremely obvious and of unspeakable use & w<sup>ch</sup> has been so much overlook'd, that when it is revis'd near 1800. Years thereafter it is consider'd as a new Invention Near about y<sup>e</sup> same period we find a distinction made by Praxagoras of Cos: between y<sup>e</sup> vein & Arteries he supposing that the first contain'd an Air or Spirit at the same time he teaches us to judge of y<sup>e</sup> state of the Blood & of diseases by feeling y<sup>e</sup> Pulse. A

87

Circumstances very much overlooked by Hippocrates &  
from the want of it his Descriptions of Diseases ~~by~~  
are much less accurate if we are taught to believe  
We are ignorant of y. state of Learning in y. Eastern Nations  
at or before this period almost all we know is that the  
Philosophers of Greece travel'd into diff. parts for their improve-  
ment of Physic was bro. to some perfection in Egypt by the  
Physicians being confin'd to the treatment of a few disorders  
But now an Academy was form'd or founded at Alexandria  
by the Ptolemies the Successors of Alexander w. subsisted  
100. Years & in w. medicine & Anatomy in particular was so  
highly cultivated if y. Things themselves were sometimes  
present at dissections, & in y. works of Galen the names  
of many of the Anatomists are handed down to us; two of  
which more immediately merit our attention I mean  
Hierophilus & Erasistratus they seem to have been  
Contemporaries for y. same discoveries are ascrib'd to both.  
Besides numberless improvements in the names explanatory  
w. are many of 'em still retain'd, in y. names works of both  
Authors: there is a description of Vessels w. can only apply  
to these we call Arterials & w. take in our nourishment  
& in both we not only find y. nerves distinguish'd by a name  
appropriated to 'em in distinction from the other harder  
Substances the Tendons of the Muscles: but y. office of the  
nerves is ascertain'd to us by simple & decisive Experiments  
They have also describ'd the several parts of y. heart with valves  
We know little of y. state of medicine among the Romans  
for some ages, we find in y. Roman Writers pretty  
early after y. foundation of Rome, the Sum of Medicine

18

employ'd; but in reality their Physicians were slaves  
or freed-men who practis'd without knowledge of Anatomy  
or Surgery & without rational principles, & apprehend  
we may say y<sup>e</sup>. as Anatomy & Physic was introduc'd  
as a science by the Greek Physicians after y<sup>e</sup>. conquest  
of Greece; & in y<sup>e</sup>. era of Christ it does not appear that  
Anatomy was practis'd amongst y<sup>e</sup>. Romans.

Debus speaks of several Physicians before him; he  
has been supposed to have copied from Hippocrates  
& other ancient Writers, & certainly he seldom mentions  
himself but he himself practis'd Physic, for he himself  
gives us various methods of cure w<sup>ch</sup>. regard to disorders  
of y<sup>e</sup>. Eye; tho' I don't recollect to have seen any cur'd  
in the manner he proposes. — In the preface of his works  
he recommends y<sup>e</sup>. study of Anatomy & gives a slight description  
of y<sup>e</sup>. Organs of y<sup>e</sup>. body. w<sup>ch</sup>. tho' short is not incorrect it  
is in a great measure tho' by no means wholly borrow'd  
from y<sup>e</sup>. Greeks. — Not long after this Rufus and  
Coranus appear'd towards y<sup>e</sup>. beginning of the 2<sup>d</sup>.  
Century & wrote original pieces. — Towards the close of  
the 2<sup>d</sup>. Century then appear'd a most extensive & elaborate  
work wrote by Galen, w<sup>ch</sup>. is enrich'd w<sup>th</sup>. y<sup>e</sup>. learning of  
former ages, & in which we find many of the minute  
parts of y<sup>e</sup>. Body so accurately describ'd as to prevent y<sup>e</sup>.  
Moderns in numberless instances: y<sup>e</sup>. whole is connect'd  
so plausibly into a system, that his Opinions were  
adopted for more than 1200. Years till Experience &  
Experiments & more accurate observation were at length  
introduc'd and shew'd y<sup>e</sup>. fallacy of many parts of his

(19)

System - He has traced the Blood vessels farther than ever  
had been done before by arts w. were tho't to have been  
found out lately, likewise the first Origin, course  
and termination of y. nerves - in many parts he has  
thrown considerable light on the Functions of y. parts by  
decisive experiments as the use of the muscles, the  
action of the Heart, the state of y. Blood, the manner  
in which y. voice is form'd, y. use of the several nerves &c.  
But upon y. whole notwithstanding, I say y. Galen's Anat.  
was universally followed for 12. Cent. That his physiologi-  
cal abilities & Opinions were adopted still later, yet  
I must observe y. his descriptions were almost all  
drawn from quadrupeds, His opinions are not to be  
rec'd. but w. caution & reserve. - They are generally  
merely Hypothetical, and therefore in the present age  
are justly laid aside as being only the Sallies of  
a Superstitious Fancy.

In the 5<sup>th</sup> Century the Roman Empire was overrun  
in the West by barbarous Nations and Learning  
extinguish'd, w. did not soon revive again; while in the  
Eastern Empire y. Physicians still continued to build  
their practice upon the Anatomy of Galen. -  
In the 7<sup>th</sup> Century Alexandria was taken by the  
Arabians or Saracens, The Academy founded there  
and w. had subsisted near a thousand Years &  
a celebrated Library, the repository of y. Learning  
in y. Eastern parts of y. world almost entirely consum'd.  
At length when y. Saracens came to be better settl'd  
in their new possessions - they began to look into the

the remains of y<sup>e</sup> Greek and Roman Authors to translate their  
 works into their own Language, & there were plants in diff<sup>t</sup> parts of  
 Europe partic<sup>l</sup> in the Library of y<sup>e</sup> King of Spain several  
 translations of their originals which have been pub<sup>l</sup> but were  
 never published. But they made little or no improvement only have  
 discovered some new diseases partic<sup>l</sup> y<sup>e</sup> Small pox & Measles, &  
 mention some new remedies y<sup>e</sup> produce of their Country. But  
 in Anatomy no improv<sup>nts</sup> could be expected since by y<sup>e</sup> tenets  
 of their Religion a person is supposed to be defil<sup>d</sup> by touching  
 a dead Body. At length carrying y<sup>e</sup> knowledge  
 of them into the Western parts about y<sup>e</sup> 11<sup>th</sup> Century Academies  
 and Universities were instituted in Italy & at Montpellier in  
 France, only they contented themselves w<sup>th</sup> reading y<sup>e</sup> works  
 of y<sup>e</sup> Arabians. Till y<sup>e</sup> 12<sup>th</sup> Century by a decree from  
 the Emperor of Germany, Frederick y<sup>e</sup> 2<sup>d</sup> no person was to  
 practice physic who had not studied Anatomy and  
 Montanus Opera is handed down to us as having b<sup>e</sup>  
 taught it so from y<sup>e</sup> time of Galen sic<sup>e</sup> for near 1000 years,  
 the study of Anatomy so far from making any progress  
 had been upon the decline y<sup>e</sup> Greek learning was lost, &  
 the original improvements neglected, while y<sup>e</sup> writings of the  
 Arabians tho' very imperfect were substituted in their place  
 At length in y<sup>e</sup> begin<sup>ing</sup> of y<sup>e</sup> 16<sup>th</sup> Cent. we find an Origin<sup>l</sup>  
 work compos<sup>d</sup> by Melandinus abt<sup>y</sup> year 1515. w<sup>ch</sup> tho'  
 imperfect in description & more in its title, by an order  
 of y<sup>e</sup> Senate of Venice no other was allowed to be taught  
 by the Professors of Padua w<sup>ch</sup> gave great abundance of  
 Document. Before y<sup>e</sup> middle of the following Cent. i. e. in  
 1540. the art of printing was discovered & abt<sup>y</sup> y<sup>e</sup> same time

Constantinople was taken by y. Turks & learning ag.  
 wisd & diffus'd over Europe by y. haerd men who fled  
 from y. Slavery of y. Turks & carr. y. original works of y.  
 Turks along w. them into y. West of Europe, so that  
 before y. end of y. Cent. we find several very tolerable  
 compendia of Anatomy, partic. those of Guido and  
 Benedictus. — In y. 16. Cent. we find y. Spirit  
 of improvem. very lively sees. new discoveries made &  
 we find y. traces of some circumstances of w. there is  
 little to be found in y. Ancients in Nicolaus Massa  
 we find a descript. of Vesels w. can only apply to the  
 Lymphatic System. He speaks of y. gradid Arteries  
 and Structure of y. Duum, but y. merit of these Autho.  
 is much eclips'd by Vesalius — Sylvius — Fallopius —  
 Eustachius — perhaps I may add Columbus who in a few  
 years improv'd y. descript. of y. human Body more y.  
 Anatomists had done before in former ages — Vesalius  
 in y. 16. year of his age, was appointed Professor  
 Padua — He publish'd his Epitome of Anatomy & y.  
 his large work, in both of which he follows an excellent  
 order, a most elegant descript. of y. parts of y. human  
 Body in a pure & nervous stile — Vesalius is y. first  
 and not Nicolin according to Haller, who gives names  
 to the muscles — Fallopius follow'd him and he more  
 particularly describes y. Body in y. same order; every  
 where endeavouring to correct, improve & amend the  
 works of Vesalius. In like manner Eustachius imitat  
 Vesalius & Fallopius in deavours not only in words  
 but by Tables to describe y. p. of y. Body w. he does in a

(21)

a more simple & accurate manner y<sup>e</sup> was done in the  
teller of Hieracius. — We are now within 70. Years  
y<sup>e</sup> complete knowledge of the circulation of y<sup>e</sup> Blood  
by D. Harvey. — Anatomical knowledge was now  
more general in Europe — Fabricius Abigelius &  
Saporius succeeded one another in y<sup>e</sup> University of  
Padua & Hislin who succeeded them was for many  
years y<sup>e</sup> common standard of Anatomy — How  
great attention was paid to experiments by w. ch. alone  
we can attempt to disclose y<sup>e</sup> mysteries of nature;  
now we have describ'd y<sup>e</sup> manner in w. ch. nourishment  
is convey'd to the Body by Veselius, in y<sup>e</sup> year 1626.  
who happening to open some living animals observ'd  
the vessels upon the Intestines & mesenteries & attending  
to y<sup>e</sup> course of the Fluids found them directed constantly  
in one way, in conseq. of certain resistances made  
by Valves or Flood gates within them, and he at length  
found y<sup>e</sup> y<sup>e</sup> course of the Contents corresponded to  
y<sup>e</sup> in y<sup>e</sup> Intestines & stomach, w. ch. y<sup>e</sup> evidently serv'd  
to take in our nourishment, & as y<sup>e</sup> matter in our  
alimentary Canal is generally a mixt. of water & oil  
w. ch. gives y<sup>e</sup> appearance of Milk he gave them the  
name of Lacteals, we find mention of these imperfectly  
in Hippocrates, Hierophilus &c. but y<sup>e</sup> did not understand  
y<sup>e</sup> true use of them — The manner of y<sup>e</sup> circulation thro'  
the Body was found out by D. Harvey M. D. to King  
Charles y<sup>e</sup> 1. — He published a small tract de

Cordis et Sanguinis in v. he has prov'd y<sup>e</sup>. our Heart  
 Arteries, & Veins form a Circulation in v. the Blood  
 is mov'd w<sup>th</sup> constancy & rapidity: y<sup>e</sup>. from the Heart  
 it is convey'd by y<sup>e</sup>. Arteries into y<sup>e</sup>. most distant pts,  
 but the branches of these are join'd to the Veins as  
 when I join the Fingers of my Hands so y<sup>e</sup>. by y<sup>e</sup>. Veins  
 it returns ag<sup>n</sup>. to y<sup>e</sup>. Heart. Thus if a Ligature be thrown  
 round an Artery the Defile swell between y<sup>e</sup>. Ligature  
 and the Heart: but if the like is done before opening a  
 Vein the Vein swells beyond the Ligature, and if you  
 divide an Artery and a Vein, only y<sup>e</sup>. Artery y<sup>e</sup>. blood is  
 thrown from that side next to the Heart, while in the  
 Vein it is thrown from the most distant part of it;  
 and as the quantity evacuated in a given time is  
 considerable it is evident y<sup>e</sup>. they must be connected  
 w<sup>th</sup> one another. This Doctrine, is at once overturn  
 all the former Systems, explain'd a material pt<sup>t</sup> of the  
 Human Economy, & has'd the way for y<sup>e</sup>. discovery of  
 many important truths, did not fail to draw upon  
 it every numberless objections. At first they  
 endeavour'd to set aside his doctrine, but as some  
 has discover'd every Evidence y<sup>e</sup>. can be requir'd, &  
 not being able to invalidate the Truth of the System  
 they endeavour'd to shew y<sup>e</sup>. he learn'd it from some  
 ancient Author, & as this is an useful Enquiry I  
 shall enter upon it so far as appears useful.  
 Two very learn'd Critics Vanderlinden & Illmshaven  
 have labour'd to prove it Hippocrates understood

circulation of the Blood - Hippocrates supposed y. Blood motion is beyond a doubt - and compares y. body to a circle - but more particularly to examine the literary meaning his Expressions it appears perfectly evident he supposed the influx of blood in the same vessels w. he compares the motion of the sea - This comparing y. body to a circle y. clearest proof of the contrary, as he only means that Economy of the body is so unintelligible, that as in a circle we neither find beginning or end, so it is impossible to comprehend its Functions - Erasistratus fancied y. when the Blood passed into the Arteries a fever was occasion'd, and he imagin'd that y. Blood would in because the spirit went out whenely a disease was caus'd - Hierophilus again supposes that the right side of the Heart w'd force y. blood to all the parts of y. Body, whilst the left side was employ'd in conveying the spirit - Galen sets out with observing ag. Erasistratus & Hierophilus that our Arteries in a sound state of y. Body confine and transmit the Blood, This he says is decisive, he says an Artery in view, ties it in two places, cuts off the ty'd piece & finds it fill'd w. Blood. The diversities y. Division of the aneurism into 2 species & shew. y. in y. false as well as the true aneurism y. tumor is form'd and owing to blood collect'd in the Arteries or efus'd from them he traces y. Arteries in many places w. surprising accuracy, he supposes y. the Arteries and Veins communicate - He knew from having practis'd Arteriotomy y. y. Arteries discharge in a given <sup>time was</sup> a very great quantity of Blood

25.  
that the motion in them is rapid, & that the Blood flows from  
the side nearest the heart - and knew if a Ligature was  
thrust upon a member the veins swell beyond it. In  
describing the partition of the Heart he says if. y. Septum  
has no holes, so if. y. blood contain'd in the Arteries must  
pass thro' the Venae into them; & as a further proof of the  
Communication w. y. Veins have by means of Vesicles  
w. y. rest of y. Body, he obs. y. in Phthisis or Consumption  
where matter is collected, this descends into the Arteries and  
is hap'd off (by Urine). —

The next in the order of time are the Chinese Physicians it  
has been repeatedly affirm'd by the first Europeans who  
travell'd there of. the Chinese understood y. circulation  
of the Blood, and a word w. literally express'd it, and that  
they were very attentive to the pulse. — Next we find mention  
of Serapion — Dioscorides — Aretaeus — & Aetius but  
find nothing in them but what is copied from Galen —  
Aetius indeed speaks of a circulation but entirely form'd  
on conjecture. He suppos'd it was by no means either constant  
or rapid. but if. when we were awake the Blood pass'd by  
the Heart to the Arteries & in the time of sleep again  
return'd by the Veins. — Vesalius in the last Book of  
his Anatomy, upon the subject of the Arteries of Animals  
he proves w. Galen ag. Erasistratus &c. that y. Arteries  
naturally contain blood, & he repeats y. experiment of tying  
and cutting out an intermediate piece, he next observes  
ag. Galen y. y. Arteries possess no inher. power of dilating  
themselves, if. in dilatation they are passiv & not active  
or possess'd of a Vis insita as he suppos'd w. he proves by

decisive experiment he cuts an Artery transversely w<sup>th</sup> a knife  
 and y<sup>e</sup> motion instantly ceases beyond the Incision & lest it  
 might be supposed y<sup>e</sup> artery was deprived of its Energy, he  
 joins the two parts again by a hollow Tube, & y<sup>e</sup> motion is  
 again restored even in y<sup>e</sup> most distant part of y<sup>e</sup> artery. He  
 insists upon the rapid motion of y<sup>e</sup> blood in y<sup>e</sup> Artery and upon y<sup>e</sup>  
 great qu<sup>ty</sup> that is evacuated in a given time when y<sup>e</sup> Artery is  
 wounded. — He goes even a Step farther & asks by y<sup>e</sup> power of  
 arteries strike y<sup>e</sup> finger: & he solves it justly, y<sup>e</sup> artery  
 swells when the Heart contracts & y<sup>e</sup> contraction of y<sup>e</sup> Heart  
 of pulsion of y<sup>e</sup> blood is y<sup>e</sup> cause of y<sup>e</sup> swelling, y<sup>e</sup> contraction &  
 dilatations being exactly synchronous. — He describes a very  
 curious experiment w<sup>ch</sup> has been supposed to be the Invention  
 of Dr. Hook, the ob<sup>er</sup> y<sup>e</sup> upon opening y<sup>e</sup> thorax of an animal  
 the Lungs collapse; but upon inserting a Tube into the  
 Trachea Arteria & drawing in air, the free motion of y<sup>e</sup> heart  
 was again restored, and contracted as before with violence &  
 y<sup>e</sup> motion of the Arteries corresponding to it. — Now I think  
 it beyond all dispute that we are indebted to Dr. Harvey for having  
 explain'd the true motion of y<sup>e</sup> blood, & that before him any circum-  
 stances relating to it are merely Hypothetical prejudices prevent-  
 ing there before him from seeing the full force of y<sup>e</sup> experiments  
 & I am doubtful if Dr. Harvey has not more merit in seeing  
 thro' the plausible Systems of Galen and others than if  
 he had found it out by first making experiments upon the  
 Subject. — We are at first right pleas'd w<sup>th</sup> y<sup>e</sup> System of Galen  
 the drawing in the air by y<sup>e</sup> Lungs, the finding the Arteries empty  
 & the heart divided by a partition not perforated readily  
 had us to suppose w<sup>ch</sup> y<sup>e</sup> one side is attended for y<sup>e</sup> motion  
 of y<sup>e</sup> Blood & y<sup>e</sup> other only for y<sup>e</sup> motion of y<sup>e</sup> Spirit —

# Lecture 33.

(27)

Yesterday I gave you an acct. of y<sup>e</sup> history of Anatomy as far as to the discovery of y<sup>e</sup> circulation of y<sup>e</sup> Blood by D. Harvey and I have endeavour'd to explain what has been known in former ages with regard to this. Notwithstanding the clear Evidence w<sup>ch</sup> Harvey produc'd in proof of his Opinion yet several years elapsed before it was generally recd. amongst Anatomists. — within the space of 30. Years from the date of Harveys publication we find very tolerable compend's of Anatomy publish'd adapted to the new method by Glyson, Wighmore &c. and several considerable discoveries distinguished this period the duct of a curious Gland we name y<sup>e</sup> Pancreas was now discover'd. — Soon after a complete system of Vessels were observ'd by Bartholinus & Rudbeck nam'd *valvulae Lymphaticae* from the color of their Contents. — Picquet traces y<sup>e</sup> Trachea to the Thoracic Duct of w<sup>ch</sup> only an obscure description had been before and y<sup>e</sup> use of it unknown w<sup>ch</sup> is to convey Chyle to the Mass of Blood. — Lower ventur'd to substitute y<sup>e</sup> Blood of one animal for another, attempt'd a transfusion of it the force of y<sup>e</sup> artery of one animal pushing y<sup>e</sup> blood into y<sup>e</sup> vein of another, by means of a communicating Tube & in this way it was suppos'd many Diseases might be cur'd — but y<sup>e</sup> danger y<sup>e</sup> attends y<sup>e</sup> attempt & y<sup>e</sup> remain'd faint being soon communicated to the new man made it to be laid aside.

With regard to authors the h<sup>is</sup> of Books was soon greatly increas'd & it will be better to divide them into 2 periods the one reaching to the end of the 17<sup>th</sup> Century the other reaching from the Beginning of this Cent. to the present time. — Many in the last Cent. was publish'd in Italy as Cellini Gallia & Sances. &c.

but the most celebrated is Marcell. Malpighi. who is perhaps  
 the first person who had a clear demonstration of the  
 Human System by seeing the Blood pass from y. Arteries  
 of y. Arteries into the Veins without y. interposition of any  
 Parenchymatous substance as was formerly supposed.  
 however he too frequently substituted the Structure of other  
 Animals for the human, this still is very diffuse & perplex'd.  
 In Switzerland there seems to have been little improvement  
 in anatomy by dissections of y. human body, but Wepser  
 made some Experiments on other Animals.

In France the System of Bilin was followed Duvern. Dion.  
 Vieuss. &c. wrote upon Anatomy but now later works are  
 substituted in their place. In Germany little effort  
 of Dissection has been of y. human body, yet many hard  
 & useful works have appeared among 'em. But y. Dutch  
 have made y. most considerable advances in Anatomy the h.  
 & value of their works exceeding y. of any other nation.

Wieringius. Swammerdam. Thunck. Oran. &c. Bidloo &  
 Bartholin were supplanted by Diemerbroeck, & Verheyen  
 was considered as y. fittest for Beginners. Bidloo  
 explain'd y. Structure of y. human body w. excellent  
 Figures. Erud. Neusch was celebrated for a Description of  
 several parts of w. no other Authors had any Idea.

The British Writers likewise improv'd the Notions of the body  
 considerably but less so by dissection than the Italians  
 and the Dutch several Authors were conspicuous in the  
 knowledge of the Circulation as Glysson. Wharton, & Sydenham.  
 Since Bidley & Parter. & W. Couper have been considered as  
 knowing Anatomists - Couper's work was an acc. of y. muscles

under the title of *Anatomia reformat* in the descriptions of which he is highly elegant. — With regard to the present century in Italy, we find the art of anatomical enquiry subsisting for some time till of late it is upon the Decline. — The Chief works are those of Sanctuario, Valsalva, and Morgagni the last of whom merits our particular attention. In France the chief writer is Winslow, who is perhaps the first Author since the 16. Cent. who considers the body in its true situation, this system is justly considered as the most correct if we have as far as we can learn Anatomy by the art of Dissection. — We have works from Sicily and w. I shall mention and very ingenious pieces, by Petit, Ferrius, Bertin & a number. From the Germans we have an excellent compend by Theister on Anatomy. — A History of y. Ligaments by Bidewright. — The Anatomy of the Eye by Tin. — of the nerves by Meikle. — of the gravid Uterus by Puler. &c. &c. To close the account of y. Germans I must mention Dr. Haller who has improv'd Anatomy & Physiology more than any in the age we live in. In Holland we sever'd valuable pieces by Dr. Albinus who with y. most indefatigable Industry has publish'd some of the largest and most correct works y. have appear'd upon Anatomy. — But I proceed to mention more particularly such books as I imagine to be fittest for your perusal in order to attain a sufficient knowledge of the art. — It is evident y. in Anatomy from mere description & figures we cannot acquire a sufficient knowledge of the art for the practice of physick & Surgery, yet Books seem to prepare us for what we see demonstrated, to enable us to

judge what is new and recall to our memory what is dem-  
onstrated. — In the study of all Sciences it is best for  
Beginners to content themselves with a few Books, there-  
fore I shall endeavour to point out to you what Books  
may be necessary to those who prosecute <sup>Study</sup> in  
general: and I shall endeavour to mention to you where  
we may find assistance in any partic<sup>r</sup>. Enquiry in w<sup>ch</sup>  
we may be engag<sup>d</sup>. — Perhaps previous to Anatomy, or  
y<sup>e</sup>. dissection of y<sup>e</sup>. Body, we sh<sup>d</sup>. endeavour to acquire some  
general Idea of the subject, for this purpose Theil  
is gen<sup>ly</sup>. recommended but I wd. prefer Cheselden, as his  
Descriptions are short. The endeavours to explain them  
by Figures w<sup>ch</sup> are tolerably well delineated.

The very accurate System of Winslow I wd. recommend  
as in it you will find y<sup>e</sup>. utmost attention paid not  
only to the shape, and so far as Dissection can possibly  
illustrate; if we find fault with him it is from his treating  
the parts of the least importance w<sup>th</sup>. y<sup>e</sup>. same accuracy  
as those of the greatest. I being little acquainted w<sup>th</sup> the  
arts of Malpighi & Ruysch he scarce ventures to  
explain the very minute parts of Anatomy.

Dr. Heister's compend of Anatomy I advise who endeavour  
to explain in a small size the principal circumstances  
relative to each Organ. With the descriptions of  
Winslow we ought to pursue a System of Tables  
to endeavour to supply what Winslow himself  
intended: formerly the Tables of Vesalius were very  
generally studied; the Character of it you

you are sufficiently acquainted w<sup>th</sup>. but when I spoke (31.)  
of it you surely understood me to make allowance for the  
time in w<sup>ch</sup>. it appeared, his Figures are very elegant and the  
situation of every part most beautifully shown. — but  
nowadays instead of his System we pursue y<sup>e</sup>. more  
exact and simple System of Eustachius — But if we mean  
to study w<sup>th</sup>. still greater accuracy along w<sup>th</sup>. Eustachius  
we sh<sup>d</sup>. consult the Anatomy of Bidloo, w<sup>th</sup>. the Plates  
of M<sup>r</sup>. Cowper w<sup>ch</sup>. are executed w<sup>th</sup>. a high degree of Elegance  
likewise upon the Authority of the late D<sup>r</sup>. Albinus I will  
venture to recommend a small Book wrote by my Father  
After we have made ourselves sufficiently acquainted  
with the Skeleton we ought to study the Cartilages and  
Ligaments and their Connexion and for this we have  
excellent assistance from D<sup>r</sup>. Meadbright whose work is as  
complete as the Subject will admit of and likewise  
D<sup>r</sup>. Winslow's Treatise of the Bones. — In the acquiring  
a competent knowledge of the muscles we have recourse  
to a very elegant work of D<sup>r</sup>. Albinus — i.e. his *Historia  
Musculorum*, in it he refers to the Tables of Vesalius  
Eustachius and others.

The Bones & Muscles as I observed formerly serve as y<sup>e</sup>.  
outline by w<sup>ch</sup>. we can examine and describe y<sup>e</sup>. other Organs  
We now have recourse therefore to Winslow & the Tables of  
Eustachius & Bidloo for understanding y<sup>e</sup>. relative  
Situation of the parts. — We then consider the Body in a more  
extended way as having a communication form'd by means  
of the vascular and nervous systems: and considering y<sup>e</sup>.  
Heart as the prime mover, we ev<sup>er</sup>. first study y<sup>e</sup>. Anatomy  
of that Organ & in the late very learn'd Mons<sup>r</sup>. Senac we  
have ample assistance in his Treatise upon y<sup>e</sup>. Heart 2. Vols.

The first Vol. is employ'd on the Anatomy of y. heart and is rather more diffuse & prolix than is necessary, but he manages his subject with such skill and address that he leads one on inevitably both in the physiology & pathology. We would then follow the course of the Blood and upon this Subject we will have the Curiosity of looking into the origin. work of D. Harvey, who is extremely short but perfectly distinct & nothing is wanting in it but what a few later observations have supply'd as anatomical injections & the applic. of y. Microscope by w. ch. we can see the Blood pass in a continued stream from the Arteries into the Veins. — From the circulation we are led to y. absorbent or imbibing system; and here besides consulting the original works of Bartholine & Rudbee we find a condid. <sup>the</sup> n. of absorbent vessels illustrated by Knuck & for the want of a more complete & extensive work I wd. refer I publish'd in 1757. at Berlin of w. ch. I have lodg'd several copies in the Library for your perusal. — I wd. also now put into your hands a work publish'd of the late M. Hewson where you have a tolerable full description of y. Lymphatic System but on too small a scale — For the study of the Nerves we have recourse to Eustachius & likewise some very accurate Tables by D. Meikle present professor at Berlin, who shew'd me Tables of all y. Nerves & it only remains that he shd. compare 'em with nature to render them still more accurate but being too much engag'd in the practice of physick y. work has never been publish'd. — Some of the Organs require more partic. attention from y. n. of y. entering into y. structure as the Eye, Ear &c. For these we have y. excellent works of Duverney, Valisario & Haubron. There is also one by Scava

in this Subject: and the justly admired D.<sup>r</sup> Linn who did (38.)  
not live to do what he intended in the physiology of this Subject.  
After thus making ourselves sufficiently acquainted w.<sup>th</sup> the  
Anatomy of the Body in a sound State, certainly we should  
think it necessary to study the Changes w.<sup>ch</sup> are produced by  
Disease, & of late years we have a very excellent Treatise by  
Morgagni De Sedibus morborum and since w.<sup>ch</sup> we have additional  
Observations of M.<sup>r</sup> Vicautaud. Morgagni's are too minute to  
be read or understood - Vicautaud's too superficial but the  
former fault is sooner remedied than the latter - To throw some  
light on the Functions of the human Body it is necessary to  
make some comparison between the human structure &  
w.<sup>ch</sup> of Animals; & for this purpose we w.<sup>ch</sup> first understand  
their natural history, to enable us to separate w.<sup>ch</sup> into proper  
Classes, & w.<sup>ch</sup> you will find done in the Linnaean System of  
Quadrupeds I might refer to Buffon, & for the dissections  
of larger Animals I may refer you to Anatomy of Animals  
collected by Blavier and Valentini For Insects see <sup>Swammerdam</sup>  
and for an abridg.<sup>d</sup> to the purpose of Physiology, as I find  
myself at a loss for a proper Author, I am w.<sup>ch</sup> some necessity  
of recommending a very imperfect Copy many years ago published  
from notes taken from my Father under the Title of an Essay  
of Comparative Anatomy.

Surgery to w.<sup>ch</sup> it is so intimately related and subservient  
this being only a piece of Dissection, performed on a living  
Animal - Observing w.<sup>ch</sup> same order I did in Anatomy I w.<sup>ch</sup>  
pitch upon some proper System they are all doubtless  
is w.<sup>ch</sup> best yet extant, there w.<sup>ch</sup> an acc.<sup>t</sup> of all that was done  
before his time, w.<sup>ch</sup> modern improvements & very tolerable  
Tables representing w.<sup>ch</sup> Instruments & w.<sup>ch</sup> method of operating

only we are to remember, if of art was then only emerging (34)  
from a rude state. If Surgeons at that time treated wounds  
I doubt too artfully, scarcely knowing more of what nature they  
suffer: and I may observe of my Father was one of the 1<sup>st</sup> who  
first introduced into this Island the simple method of dressing  
in Surgery, w<sup>ch</sup> is now in common use, we could not look into  
a little Syllabus there I shew you 2. very excellent pieces  
the first by Patner his Institutiones Chirurgicae. The other  
a short compend of the celebrated D<sup>n</sup> Ludovic w<sup>ch</sup> he compos'd  
when he had consider'd Patner for some years as a sufficient  
guide & for those confining themselves to the practice of physic  
or other work on this subject need be recommend'd by of  
Patner, he is learned and judicious. This Book is w<sup>th</sup> a  
spirit and elegance of stile but before we can enter upon the  
practice of Surgery w<sup>th</sup> safety we've recourse to the works  
of later Surgeons & we have several excellent ones  
detach'd pieces as those of Le Dran, Puteau, &c. in this  
Island the works of Sharp, w<sup>ch</sup> as far as they go are a most  
excellent compend of Surgery, there are also the works of  
Gouck, Warner, Pott, White, Brownfield, &c. and one  
lately of Mr. Hill. We have also many things relating to  
Surgery in the Medical Essays of this Place, and in the  
Memoirs of y<sup>e</sup> French Academy.

### Lecture 4<sup>th</sup>

We propose that we sh<sup>o</sup>. consider the Functions of the several  
parts of the human Body as well as their Structure, &c.  
The necessity we are under, on acct<sup>o</sup> of Beginners, to premise  
an acct<sup>o</sup> or to give some Idea of y<sup>e</sup> general economy of our body  
for without this the conclusions drawn from demonstrations  
w<sup>o</sup> not will be understood. We distinguish y<sup>e</sup> Animal

(36)

By distinguishing or observing of. whilst Animals in common with vegetables live, grow, & in a certain degree feel, they possess the farther property of volition - They will & w<sup>th</sup> out any external impulse perform certain actions w<sup>ch</sup> duly considered are found to be attended w<sup>th</sup> some wise & useful consideration. Hence we suppose of. to the body is conjoin'd a principle superior to matter somewhat of. acts and animates the whole. The Body of the Animals consisting of Solids and fluids, the former wearing down the latter dissipating & degenerating for the continuance of life we see then the necessity of a fresh supply - Hence animals are provided w<sup>th</sup> Organs of sense, the purpose of these, & whether from our being unable to conceive any farther power in Animals or that they really possess it not, we observe nearly of. same number in of. of the Vegetable Kingdom: But in order of. of. Animal may reach to what it perceives & judges to be useful, we must next imagine of. they are possess'd of a power of moving from place to place, for of. are few Animals so happily situated as to live upon of. surrounding Elements. For this purpose therefore of. Body needs to be supported by a hard substance such as the Bone is, & in order to increase the surface of of. Bones, & at some time to ease us of of. unnecessary Load, you observe of. of. a Bone is divided it is hollow. - Bone is merely a hard, rigid, inflexible substance sufficient for the purposes of motion, but the support must be divided into a N<sup>o</sup> of pieces in order to render the motions ready and various; accordingly you view of. human Skeleton consisting of a very great N<sup>o</sup> of Bones. Next to prevent them from slipping off from one another, & at the same time to allow them to play with ease, we find that the extremities of of. Bones are tipped w<sup>th</sup> a softer substance such as you are all acquainted with call'd Cartilage, or Gristle & the Surface of this is render'd slippery by Ligaments of an span'd

36.  
would obstruct it, whilst further to prevent one Bone from  
sliding off from another, the extremities are inclos'd in a mem-  
brane or piece which joins them together and w<sup>ch</sup> we for that  
reason name Ligament, or if the separation of the two pieces  
be attended with danger to life we find the neighbouring pt<sup>s</sup>  
or bones glued together by Cartilage as in this way y<sup>e</sup> Sternum  
is connected to the Ribs, as also y<sup>e</sup> several pieces w<sup>ch</sup> compose  
the Trunk of the Body, and as the Cartilage is soft & light  
there is no necessity for forming it hollow within, but it is so  
tho' out, thus we find the basis of y<sup>e</sup> Body fit for being  
mov'd & to give it motion it only remains y<sup>e</sup> we conceive  
tho' is capable of contraction, to be stretched between the  
diff<sup>t</sup> Bones, & these as you all know are the Flesh of Animals  
divided into regular parcels, & call'd from their contractile  
power Muscles. — That y<sup>e</sup> muscles may contract & shorten  
readily we find y<sup>e</sup> are compos'd of a vast n<sup>o</sup> of soft fibres  
that at the same time they may be poss<sup>d</sup> of sufficient  
strength. — Hence y<sup>e</sup> necessity of enlarging the surface of y<sup>e</sup>  
Bones, in order to give room for y<sup>e</sup> attachment of y<sup>e</sup> muscles;  
nor is this alone suff<sup>nt</sup> we find a farther contrivance: The  
beginning of a muscle may be any where along y<sup>e</sup> Surface  
of whole extent of y<sup>e</sup> Bone, but the termination must be near  
to the extremity of the Bone — e.g. many y<sup>e</sup> joint of my Elbow, be  
otherwise y<sup>e</sup> effect w<sup>d</sup> have been in a great measure lost: &  
and as there w<sup>d</sup> not be room here for inserting all the  
soft fleshy fibres of y<sup>e</sup> muscles, so these are connected y<sup>e</sup>  
sinews or what Anatomists call the Tendons, w<sup>ch</sup> being  
firmer y<sup>e</sup> muscle require less room for their insertion  
into the Bone: Just as if we meant to move a large log  
of wood & to employ several Men for that purpose

they w<sup>d</sup> not endeavour to lay hold of the wood w<sup>th</sup> their hands 37  
but w<sup>d</sup> tie a rope to it in a great y<sup>e</sup> a great length might comprise  
together in y<sup>e</sup> action. In y<sup>e</sup> manner as we to consider the Ligaments  
as mere chords & not as possessing y<sup>e</sup> power of contraction w<sup>ch</sup>  
is inherent in y<sup>e</sup> aed fibres of our Body: or if it sh<sup>d</sup> happen  
that the tendon of a muscle: pass over a h<sup>d</sup> of joints, & y<sup>e</sup> y<sup>e</sup>  
perform a very large flexion to prevent y<sup>e</sup> consequences y<sup>e</sup> w<sup>d</sup>  
arise from inserting y<sup>e</sup> tendons at a considerable distance  
they are ty<sup>d</sup> down with sheaths as in y<sup>e</sup> p<sup>ar</sup> 20.

Now in consequence of our progressive motion we transport  
the Body from place to place and lay y<sup>e</sup> substances proper  
for nourishment, these we tear to pieces by y<sup>e</sup> interworking  
& muscular power of y<sup>e</sup> Jaws, and y<sup>e</sup> internal pt. of the  
mouth and Fauces th<sup>e</sup> being still muscular, the fleshy fibres  
push the body downwards, till it is lodg<sup>d</sup> in y<sup>e</sup> receptacle  
of an animal - viz. y<sup>e</sup> Stomach. In y<sup>e</sup> Stomach y<sup>e</sup> food undergoes  
from a variety of circumstances two principal changes,  
whilst it is digested it is at y<sup>e</sup> same time like to y<sup>e</sup> constitution  
of y<sup>e</sup> animal so as to be rec<sup>d</sup> into y<sup>e</sup> Body w<sup>th</sup> safety, this  
way is produced by a h<sup>d</sup> of concurring circumstances,  
as the preparation before it is taken in, its farther subdivision  
by the teeth, y<sup>e</sup> mixture of various Liguors, y<sup>e</sup> warmth of  
many animals, y<sup>e</sup> digesting powers w<sup>ch</sup> diff<sup>r</sup> ones evidently  
possess - It join<sup>d</sup> to all these a process like unto Fermentation by  
w<sup>ch</sup> y<sup>e</sup> food is digested & assimilated: & as we find a long Tube  
lead downwards from the Stomach viz. y<sup>e</sup> Intestinal Canal  
compos<sup>d</sup> of materials evidently resembling those of the Stomach  
we w<sup>d</sup> conclude y<sup>e</sup> y<sup>e</sup> Food is chan<sup>d</sup> farther in a similar  
and pass along this Tube, whilst by its length y<sup>e</sup> Surface  
is increas<sup>d</sup> & suff<sup>r</sup> room given to y<sup>e</sup> mouth of y<sup>e</sup> vessels w<sup>ch</sup>  
take the food into y<sup>e</sup> Constitution; y<sup>e</sup> vessels parts being pushed

downward by means of the like muscular force & 38.  
howsoever by Laws of. are original and into the action being  
determined whatever way of. irritation may happen to be apply'd  
If you are merely to speculate about the actual vessels  
without examin. of. by dissection, we might be at a loss to  
determine of. part. manner of of. Course I might conceive  
of. every part of of. Canal supply'd a correspondent part of of.  
Body of. of. Stomach furnish'd Chyle to of. head of. rest tract  
of Intestines supply'd the Chest, the lower part of. extremities &  
of. Belly, & in fact we find in some few Animals a division is  
found somewhat of of. sort, as some species of Worms in their  
But in man of. smaller branches run together to form  
larger & at length they are all united in one Canal w. from  
its running upwards thro' of. Thorax before it terminates  
is call'd of. Thoracic Duct, w. same name, being defended  
by the containing parts of the Thoracic viscera, it termin-  
at of. joining of of. principal veins of of. arm & neck: the  
Subclavian & Jugular Veins & here we find of. Chyle  
blended with of. red blood, being found into a large  
vein near of. heart - how as we know of. thro' of. Lacteals  
of. nourishment of animals is convey'd it evidently  
follows of. from of. pt. a point of of. Body there must be  
passages leading to all others or tracing of Lacteals  
we must be led to discover of. gen. & constant motion of of.  
Blood - But before we wd. proceed to trace of. passages  
of of. Circulation we wd. surely wish to be acquainted w.  
the general Properties of the mass of Blood. -  
especially as of. matter is of real importance in the  
practice of physic. - The general acct. given of it but  
which of late years has been corrected in many particulars  
is of. of. blood consists of globules, the Opinion is founded

on the opinion of Leeuwenhoek a Dutch Writer of y<sup>e</sup> last 39.  
Century who improv'd y<sup>e</sup> Microscope and employ'd it in  
a more extensive way y<sup>e</sup> had been done before and his  
acc. was more readily rec. as several circumstances generally  
known, appear to coincide with it. The general matter in a  
Microscope appears to be of a red color and appears to be  
globular a common expression us'd for want of a better.  
These Leeuwenhoek tells us are compos'd of other more minute  
He defines the number to be six, that by a struggle of the  
Animal, a sudden action or convulsion of its muscles, they  
instantaneously loose y<sup>e</sup> red color and assume y<sup>e</sup> appearance  
of y<sup>e</sup> Serum, may he went farther a step and alledges that  
the Serum consists in like manner of globules Divisible  
into 3. aqueous particles The suppos'd y<sup>e</sup> y<sup>e</sup> is still a  
further descending Series of Globules.

Hippocrates. Boerhaave & DuRoi <sup>Boerhaave</sup> that when they put a  
vessel of Blood in a moist Bellar y<sup>e</sup> red color very soon  
was lost by y<sup>e</sup> Globules melting down into a Serum - and when  
a purgative medicine is given to a patient a quantity of  
a watery viscus Viscus is discharg'd by the Intestines  
and the patient grows pale, as if the purgative had melted  
down y<sup>e</sup> red globules into the Serum.

Now let us see how far the Facts or conclusions I have  
mention'd may be depended upon.

1<sup>st</sup> That y<sup>e</sup> are red globular parts in our Blood is beyond all  
Doubt; y<sup>e</sup> these may be melted down or broken is likewise  
certain; but after having very frequently view'd y<sup>e</sup> Blood  
w<sup>th</sup> Microscopes both in y<sup>e</sup> circulation & out of it, & with  
glasses too furnish'd of higher magnifying powers y<sup>e</sup> Leeuwenhoek  
I never could find any reason for supposing y<sup>e</sup> y<sup>e</sup> red parts

consist of a certain number of smaller globules, I have (110.  
now found a single instance where a red globule broke  
down into a serum or colorless one, only I have seen an appear<sup>ance</sup>  
y<sup>e</sup>. might have deceiv'd one, that on turning y<sup>e</sup>. light strongly  
upon the Object, what appear'd before of a red color appear'd  
more transparent & a glass of red wine and water will shew  
the same appearance by altering y<sup>e</sup>. position with regard  
to the Light — and what is much more to the purpose I wo.  
venture to deny that any microscope can demonstrate  
Globules in the Serum, I do not deny but that it may be  
globular, but I maintain y<sup>e</sup>. y<sup>e</sup>. are too small to be seen  
by us, and it is extremely improbable to suppose y<sup>e</sup>. y<sup>e</sup>. colour  
of a Body who. change merely by y<sup>e</sup>. separation of its parts  
without any thing being added or subtracted from it.  
The color of a large glass containing red wine appears deeper  
y<sup>e</sup>. y<sup>e</sup>. of a small glass, but y<sup>e</sup>. color is equally intense in all  
the parts y<sup>e</sup>. an equally diffus'd. — But to make a more  
direct appeal to experiments, I have said y<sup>e</sup>. globules are  
not to be seen in the Serum, neither by condensing, agitating  
It. and tho' y<sup>e</sup>. red globules are broke down amongst water  
until y<sup>e</sup>. entirely disappear, they constantly retain their  
Colour, so y<sup>e</sup>. a certain size of y<sup>e</sup>. globules & y<sup>e</sup>. red color have no  
necessary connexion, and there has been undoubtedly some  
mistake in y<sup>e</sup>. experiments of Boerh. & De Waer. by adding  
too great a quant.<sup>y</sup> of water, and diluting the color has over-  
look'd y<sup>e</sup>. true appearance for at Diff. times I have kept y<sup>e</sup>.  
Blood of Animals 14. or 15. Months in a moist & warm place  
and the color still remain'd. — The other Arg<sup>mt</sup>. will bear a  
very different interpretation can we imagine y<sup>e</sup>. 2. or 3. y<sup>e</sup>.  
of Mercury or Saltp<sup>r</sup>. what have y<sup>e</sup>. effect of breaking Down

all y<sup>e</sup> globules in the blood of a person, for we observe (41.)  
the same degree of pallidity is bro<sup>u</sup> on by anything y<sup>e</sup> relaxes  
or debilitates y<sup>e</sup> body, as a piece of lead moves &c. We suppose  
that a long continued course of purgatives shall alter the  
texture of y<sup>e</sup> blood, by means of y<sup>e</sup> effect they have on the  
constitution but this is a very diff. case from the former. —  
The most diff. circumstance, is to explain y<sup>e</sup> change of  
color in the blood y<sup>e</sup> is extravasated — but y<sup>e</sup> difficulty is  
lessen'd by y<sup>e</sup> y<sup>e</sup> red globules may be divided into very  
small parts still retaining y<sup>e</sup> color, so y<sup>e</sup> it may happen y<sup>e</sup>  
they may be broken down into invisible parts and be  
readily absorb'd upon y<sup>e</sup> serous parts. And in fact we  
see blood y<sup>e</sup> has still retain'd its color after extravasation  
as in y<sup>e</sup> piles &c. We say therefore y<sup>e</sup> the parts of our blood  
cannot be suddenly chang'd into each other & are in  
their nature essentially diff. that y<sup>e</sup> Serum cannot be  
converted into red blood — I do not mean to say, but this  
can only be effected by a repeated circulation, & there is  
no more affinity between these parts than there is between  
the nourishment of y<sup>e</sup> body and y<sup>e</sup> circulatory red blood. —  
The general make of blood consists chiefly of 3. visible parts  
1. the red globular part as we shall call it for want of a  
name more expressive. — a second part resembles very  
much y<sup>e</sup> urine of Animals & we call that Serum mean<sup>g</sup>.  
y<sup>e</sup> it differs from the liquor we usually call Serum  
in not containing what is by heat, acid spirits or acids  
coagulable. — the third p<sup>t</sup> is coagulable w<sup>ch</sup> is totally diff.  
from y<sup>e</sup> red part & is call'd y<sup>e</sup> gluten or coagulable Lymph  
& y<sup>e</sup> coagulation of y<sup>e</sup> blood is entirely owing to this;  
When blood is drawn if you receive it into a glass w<sup>th</sup> water  
& agitate y<sup>e</sup> blood as it falls w<sup>th</sup> a stick, y<sup>e</sup> water will work

of y<sup>e</sup> red globules w<sup>ch</sup> will be diffused & remain fluid in the water, while the coagulable pt. is left adhering to the stick like to the consistence of glue but softer.

Blood likewise contains likewise a quantity of matter or elastic liq<sup>r</sup>. — The general properties of the v<sup>is</sup>ible pt. are three — the red part is evidently the heaviest of the mixt<sup>r</sup> always subsiding in the Serum, and we have seen it probably observ<sup>d</sup>, in y<sup>e</sup> coagulable part likewise, y<sup>e</sup> under part of a clot of blood of a much darker color than the upper: the figure of this part is found to vary in different Animals: — In man it puts on in general a round shape but not a spherical: I us<sup>d</sup> formerly to alledge y<sup>t</sup> the globules were perfect spheres, but I am now plainly convinc<sup>d</sup> of y<sup>e</sup> contrary: my Friend Dr. North who took his degree here ten years ago, & who was present at our first Lecture, first pointed this out to me. In several Treatise upon the Heart y<sup>e</sup> very accurate Author describes y<sup>e</sup> globules of y<sup>e</sup> blood as being flat like a Lens or magnify<sup>g</sup> glass. He tells us that he examin<sup>d</sup> them floating in water, & observing him I was mislead. But if Torry be follow<sup>d</sup>, who in y<sup>e</sup> year 68, sent an account of y<sup>e</sup> blood with Microscopes of a very high magnifying power to the Royal Society: & if instead of wat<sup>r</sup> y<sup>e</sup> Serosity of blood or urine is employ<sup>d</sup>, the globules are of a very different shape. — Dr. North soon after the publication of Torry and the Instruments, had an opportunity of examining y<sup>e</sup> blood w<sup>th</sup> him at Naples: Only Torry imagin<sup>d</sup> y<sup>e</sup> y<sup>e</sup> was a perfusion in the globules w<sup>ch</sup> North think<sup>s</sup> owing to an impuration in his Glas. & y<sup>e</sup> y<sup>e</sup> middle substance is fill<sup>d</sup> up — Mr. Heurion having given us a just description of y<sup>e</sup> red globules only perhaps y<sup>e</sup> comparison of em to Whilling's is not so accurate & y<sup>e</sup> more resemble the shape of a single Gloucester Cheese, or we may compare

glutin is kept in a fluid by the heat & more especially  
 by the motion of animals. It is not exposed to y. <sup>recess</sup>  
 in affecting it least in the common manner y. y.  
 However does it however coagulates without being  
 exposed to the air within y. vessels of animals for if you tie  
 a vessel in two places, keep the intermediate piece for  
 some hours and y. open it, you will find nearly the same  
 operation of parts y. happens when y. blood is exposed to  
 the air. — we may know from being acquainted  
 with the texture of the blood from some general Idea  
 of the purposes w. the several parts serve in health in  
 the vessels of animals. — The red particles give a certain  
 momentum to the mass, and perhaps the very difficulty  
 w. w. they pass thro' y. extremities, and the exertion of  
 the Defile they thereby occasion, may have a more  
 extensive effect than we are aware of. — The Serosity  
 serves to dilute the mass, & especially to preserve the  
 figure of y. red globules, and as it w. apparently a  
 certain degree of repulsion that there is between them  
 two parts to prevent them from uniting, for when the  
 Globules seem to be in contact they readily separate  
 again and we can't say but a small quantity of y. fluid  
 may be interposed, but when they are put in water, y.  
 readily mix with it. The Lymph. or coagulable part, gives  
 a certain body to the mass prevent y. ready effusion of the  
 Serum into the several Cavities of the Body, such as  
 occurs in the Dropsy &c. — Like a mucilage of Gum Arabic,  
 it keeps up the separation of the red part and this part is  
 also best fitted for y. nourishment of the Body —  
 We may likewise understand several appearances of y.

appear in the bodies of animals: we find sometimes, (Alb.)  
that has been nam'd pelypis, within the Heart & larger  
Arteries; now can we admit y.<sup>d</sup> Lymphic part of our  
Blood can be coagulated without the access of Air, we cannot  
understand these. The Coagulation or Coagulum in general  
is firm. If we may conceive on certain occasions the  
Arts may run together as in fainting fits, and y.<sup>d</sup> upon  
the body being restor'd to its vigor y.<sup>d</sup> action of the Heart may  
undo the clot beginning to form; but if the person continues  
in this Vanquish'd State, and the powers of Life, are  
not sufficient to separate the parts, the groundwork of a  
pelypus may be laid. We can also understand y.<sup>d</sup> happens  
thowards, the mouths of the Vessels do not continue to pour  
out their blood silently, and the Coagulation form'd in  
the mouths of the Vessels contributes very considerably  
to this, while at y.<sup>d</sup> same time other Circumstances  
occur. Also with regard to the Buff coat upon the  
Blood in Inflammatory Diseases, if we follow the system  
of Leuwenhoek we find no proper manner of explaining it,  
but here y.<sup>d</sup> is no new principle form'd & the appearance may  
appear tho' the change upon the Blood be extremely slight,  
may caused y.<sup>d</sup> present the sudden coagulation, rendering  
the principles more apparent, y.<sup>d</sup> red globules as being  
easier subsiding, & y.<sup>d</sup> Lymphic appearing more pure  
upon y.<sup>d</sup> surface forming y.<sup>d</sup> buff coat tho' in several  
Cases there may be a certain degree of a mottled  
appearance, as we appear from the difference in the  
Delour

# Lecture 5.

45.

From last meeting I began to explain of gen. structure of  
some of y<sup>r</sup> bodies and after observing y<sup>e</sup> necessity of a fresh  
supply of nourishment for y<sup>e</sup> continuance of life I proceeded to give you  
an acct. of y<sup>e</sup> blood as seems necessary to be known for the  
advances of physiology, and in its practice. — in proceeding  
the Veins we find it is convey'd w<sup>th</sup> y<sup>e</sup> blood from y<sup>e</sup> terminated  
y<sup>e</sup> Thoracic duct downwards to the heart in a large vein the  
form by the meeting of several others and w<sup>ch</sup> is nam'd by  
Anatomists y<sup>e</sup> vena Cava inferior: & y<sup>e</sup> first part of the  
w<sup>ch</sup> we meet with standing projected from y<sup>e</sup> rest, like the  
beak of a quadruped from its form is nam'd y<sup>e</sup> Pericardium  
as likewise perceiv'd another large cavity w<sup>ch</sup> Anatomists  
have call'd the Belly, venter, or Ventricle of the Heart  
from y<sup>e</sup> Ventricle we find a passage leading out, & we readily  
conceive that this must be divided into y<sup>e</sup> diff<sup>t</sup> parts of y<sup>e</sup>  
Body from an erroneous Idea entertain'd a long time by  
Physicians & w<sup>ch</sup> was universally rec<sup>d</sup> for many ages, & that  
has been call'd Artery from y<sup>e</sup> supposition of its containing Ar-  
terial blood, but as y<sup>e</sup> blood descends from y<sup>e</sup> vein onto y<sup>e</sup>  
Ventricle, & there is a large passage for communication  
to the Ventricle, & no other Outlet for it, we conclude y<sup>e</sup>  
Artery receives y<sup>e</sup> blood; & you will observe y<sup>e</sup> Artery  
gates serving to direct the course of y<sup>e</sup> blood surrounding  
the communication bet<sup>w</sup> y<sup>e</sup> Ventricle and Ventricle, w<sup>ch</sup> from  
its having three principal attach<sup>ts</sup> is call'd the three  
pointed Valve & y<sup>e</sup> it very readily opens from y<sup>e</sup> Ventricle  
but if you attempt to do it from y<sup>e</sup> Ventricle you find  
resistance, again if we examine y<sup>e</sup> mouth of the Artery

find membranes y<sup>e</sup> have y<sup>e</sup> same effect as the (16.  
lodgates and differing only in their shape w<sup>ch</sup> that the artery  
may close. — And at the same time we perceive y<sup>e</sup> the  
heart is a fleshy Organ & y<sup>e</sup> it is muscular and possesseth there-  
fore the power of contraction, and if we suppose y<sup>e</sup> blood to  
fill it, and the fibres of y<sup>e</sup> heart to be shortned, it is evident  
y<sup>t</sup> the blood will be thrown from the heart w<sup>th</sup> very considerable  
force: so the motion does not depend upon y<sup>e</sup> Vis a tergo  
of the style or blood pushing forward the blood; but it  
receives a new force from y<sup>e</sup> heart, so far in a general  
way but more particularly we shall find y<sup>e</sup> circulation  
in w<sup>ch</sup> y<sup>e</sup> blood moves is double upon us, and is more  
extensive than we at first imagine, for having traced it  
thru the Vena Cava superior into the Auricle then into  
the Ventricle, then into an artery, this artery does not  
supply the whole of our body, y<sup>e</sup> is so far from being y<sup>e</sup> case  
y<sup>t</sup> it is entirely spent upon the Lungs, dividing into two  
great branches one sent to each side of the Chest; this  
is called the pulmonary artery and is entirely spent  
but within the substance of y<sup>e</sup> Lungs, dividing into very  
minute parts. The whole of the style then and the blood  
passing into the Lungs by the pulmonary artery we  
sh<sup>d</sup> expect to find corresponding vessels w<sup>ch</sup> sh<sup>d</sup> return  
it to the rest of y<sup>e</sup> body y<sup>e</sup> distribution may be general  
accordingly you perceive the pulmonary veins w<sup>ch</sup> return  
from the Lungs y<sup>e</sup> whole of the blood to the Heart again  
in consequence of y<sup>e</sup> division of y<sup>e</sup> Vessels within y<sup>e</sup> Lungs  
a new impulse is req<sup>d</sup>. the first stroke the blood rec<sup>es</sup>  
from y<sup>e</sup> heart being lost upon the Lungs, so these veins  
terminate in another Auricle w<sup>ch</sup> from its situation

call the posterior, while the former is called *y. anterior* (47).  
nicle: at *y. bottom* of *y. foot*. and we find another cavity of  
posterior or left ventricle; and from *y. proceeds* another very  
great artery w. supplies all the rest of the Body, and to w.  
Anatomists have given *y. name* of *aorta*, w. is like in manner  
of valves, is muscular & possesses a very considerable  
power of Contractility. Now we find *y. y. aorta* is very generally  
dispersed over the whole Body, But as we are still but in  
viewing the whole course of *y. aorta*, it will be better to keep  
a view of the principal branches into *y. y. aorta* divides  
and first I shall shew you an artery in the *kidney* injected  
with wax, and the flesh enclosed by an acid: it divides into  
a vast number of exceedingly minute *y. y.* and the artery is  
exactly attended w. its corresponding vein, as you will  
be *y. y. bulk* of *y. y. of the body*, and also the shape is m.  
owing to the division of the blood vessels. Let us next take  
one of the membranous viscera as the Stomach, or Intestine,  
this form a very beautiful network every where, & you  
observe the pieces of Intestines w. I have spread out &  
try'd, after injecting them to be so much painted, and  
however we take a view of *y. y. innervation* of *y. Intestines*  
in their wet preparation, their vessels w. appear to be  
very small now appear to be thicker to others *y. y.* are  
great deal smaller, and all the whole innervation coats  
appear of an uniform red color in consequence of *y. y. injecting* of  
the vessels, so that the parts are only to be distinguished  
by applying the Microscope & reflecting on the smallness  
of the globular *y. y.* are veins in the blood, *y. y.* we are oblig'd  
to use *y. y.* highest magnification to distinguish with these  
vessels: *y. y.* of these vessels must be very small for these

lobules fill w. ultimate branches of y. Arteries, and  
have seen a change in the shape in some degree while the  
lobules pass'd from the Artery to the corresponding vein  
a find it in almost every pt. of the Body y. color is chang'd  
by an injection on the flesh, the skin of y. head &c.

We next enquire into y. communication between y. Arteries &  
Veins, by making experiments after death, I have thrown  
an Injection into the Common Artery, & made it return by  
the Common Vein; so tracing y. veins from y. beginning  
to the heart we are led back to the place from w. we set out  
completing the circulation in w. y. blood is mov'd.

After determining y. course of the blood, we can next prove  
y. its motion in this course is constant & rapid, a very few  
simple experiments are suff. to satisfy us of this. We obs.  
the constant Labour of the heart by feeling the pulse, w.  
struck w. y. finger only because y. blood is drove violently  
into the Arteries; and if we attend to the size & p. of times y.  
Organ beats, it will be very evident y. a great q. of blood  
is thrown out in a short space of time, or not satisfied  
with a quantity upon it, we apply to experim. we observe  
that from a Vein wounded, and still more from an Artery  
a very great quant. of blood is soon discharged; and we  
find y. a wound in a small artery is sufficient to kill  
an animal and hence we know y. y. blood is convey'd  
constantly from all other parts to y. place wounded  
and a curious experim. first made by D. Sauer, of  
transfusing y. blood from one Animal into another  
is also in proof of this, and by the application of the  
Microscope we can see the blood pressing on a certain  
uninterrupted & rapid Stream into y. begin. of y. Veins

Next if we attend to the motion of the Blood as described 29.  
in the human body, and similar Animals we find if there  
are Arteries in w<sup>ch</sup> the Blood is mov'd, yet a smaller circle is  
describ'd thro' the Lungs and a larger thro' the rest of y<sup>e</sup> body  
or if we attend to the parts necessary to carry on a Circulation  
viz. An Arterial, Ventricle an Artery and a Vein and if we  
apply y<sup>e</sup> name of Heart to denote an organ capabl<sup>e</sup> of driving  
the blood in a Circulation when an Artery and vein is  
add'd we have two hearts one employ'd for pushing the  
Blood thro' y<sup>e</sup> Lungs w<sup>ch</sup> serve a variety of useful purposes  
in the Economy, continually throwing out a superfluous  
matter with the Air & receiving from it something nec-  
essary to Life, also y<sup>e</sup> procure to w<sup>ch</sup> y<sup>e</sup> blood in its course  
thro' y<sup>e</sup> Lungs is subjected, in their alternate course of  
inspiration and expiration must have a considerable  
effect, In some other Animals y<sup>e</sup> process is more simple  
as in a Frog, where the Lungs only receive a small branch  
from y<sup>e</sup> Arteries & there is but one Arterial & one Venous  
Next let us attend to the use of y<sup>e</sup> two parts forming each  
circulation, here I shew you the two parts separate from  
each other fill'd w<sup>th</sup> wax, & then y<sup>e</sup> flesh connect'd, and  
so little is the connexion y<sup>e</sup> in addn to keep 'em together  
I was oblig'd to cut a hole in the partition between the  
Ventricles & tie them together. Next let us consider y<sup>e</sup>  
separation of each p<sup>t</sup>. We may consider the Vein as  
a Tube entirely serving to convey y<sup>e</sup> chyle and y<sup>e</sup> blood to  
the Heart without paying much regard to its living power  
w<sup>ch</sup> perhaps are not very sensibly requir'd, I do not say  
y<sup>e</sup> they are not possess'd of living power, but we may

we must overlook these, and may chiefly consider  
 them as tubes of sense to conduct the fluids: they Artery  
 may be considered in like manner, in y<sup>e</sup> first place as vessels  
 to convey y<sup>e</sup> blood as a tube from the heart to y<sup>e</sup> most distant  
 extremities & dispersing it in a proper manner but besides  
 we find in y<sup>e</sup> Arteries very considerable activity, for as soon  
 as y<sup>e</sup> impulse from the heart ceases, they draw themselves  
 together, in a certain degree, owing, as it w<sup>o</sup>. appears to the  
 Elasticity they possess; but upon attending more particularly  
 to the Structure of y<sup>e</sup> body & of y<sup>e</sup> Arteries, we find that they  
 likewise possess in a considerable degree, y<sup>e</sup> living or contractile  
 power giving new impulse or force, to the blood in its course  
 and a great force must evidently employ'd to drive the blood  
 into vessels y<sup>e</sup> are so much divided and expos'd to so many causes  
 of resistance; to overcome these we see the necessity of y<sup>e</sup> ventricle  
 being muscular & of their being possess'd of a great number of  
 muscular fibres, y<sup>e</sup> only difficulty y<sup>e</sup> seems here is to say what  
 purpose y<sup>e</sup> Arteries serve! but a slight reflection shows y<sup>e</sup> it  
 serves a double purpose, first as a receptacle to the blood  
 returning by the veins, whilst y<sup>e</sup> Arteries is in action, and  
 without this whilst y<sup>e</sup> ventricle was contracting y<sup>e</sup> blood  
 must have been stopp'd in y<sup>e</sup> veins, & these like y<sup>e</sup> Arteries  
 must have attain'd, swell'd, and this w<sup>o</sup>. have had a very  
 bad effect upon their tender beginnings; so whilst y<sup>e</sup> ventricle  
 is in action y<sup>e</sup> Arteries receive as much blood as passes in  
 from y<sup>e</sup> veins, & as soon as y<sup>e</sup> ventricle ceases from action  
 y<sup>e</sup> Arteries y<sup>e</sup> was fill'd with blood is empty'd into it; and the  
 suddenness w<sup>o</sup>. at the Arteries empty'd itself serves as a  
 fresh stimulus to y<sup>e</sup> ventricle to renew its impulse with due  
 force & to irritate & stimulate it to a fresh action: and if we  
 conceive rightly how y<sup>e</sup> parts in one of our hands separate

we easily can understand how both operate for the same thing is done at y<sup>e</sup> same Time in both: we wo. suppose so assuming upon it, y<sup>e</sup> one tract only receiv. what the other has transmitted, y<sup>e</sup> they therefore wo. act together; but we also see other reasons for their being Synchronous, for one of em cannot contract without affecting the other, the Fibres of y<sup>e</sup> Septum between them being in common to both so let us first suppose the two Auricles 1<sup>st</sup> in action & next the two Ventricles in action the arteries must act at the same time w<sup>th</sup> y<sup>e</sup> Auricles, for let us suppose y<sup>e</sup> all y<sup>e</sup> parts of y<sup>e</sup> circulating System are moderately distended with blood, & y<sup>e</sup> both Auricles & both ventricles were likewise full, w<sup>ch</sup> is y<sup>e</sup> most unfavorable supposition, & yet as the Ventricles are much thicker y<sup>e</sup> the Auricles & more y<sup>e</sup> stronger, and as all are stimulated to act at the same instant the Ventricles must act first and throw y<sup>e</sup> blood into the Arteries, whilst the Ventricles is acting; the auricle is prevented from emptying itself, so upon the Ventricles ceasing the y<sup>e</sup> Auricles are still full & at the same time the Arteries are now more distended, so upon the Ventricles being relaxed, y<sup>e</sup> blood will enter them from y<sup>e</sup> Auricles, at the same time y<sup>e</sup> the Arteries push on their Contents and therefore y<sup>e</sup> Auricles & Arteries are Synchronous in their Action, but act at a time diff<sup>t</sup> from the Motion of y<sup>e</sup> Ventricles, now whilst we attend to this Explanation we perceive a reason why the Arteries beat & y<sup>e</sup> veins want pulsation for the Blood is drove from the ventricle of the heart with a sudden violence into the Artery and tho' all the Branches are wider than the Trunk yet y<sup>e</sup> Quant<sup>y</sup> of blood to be put in motion is so great and the action of the Heart so quick that a portion of the Blood remains in the Trunk of y<sup>e</sup> Arteries greater than what

was in them before, detaching them and also forcing them to change their place, in consequence of w<sup>ch</sup> circumstances, y<sup>e</sup> fingers receive the stroke, a great way from the heart, y<sup>e</sup> force is however in a great measure lost before it reaches the most distant Extremities, & hence y<sup>e</sup> blood, when y<sup>e</sup> Influence of y<sup>e</sup> hearts action ceases, & when y<sup>e</sup> action of y<sup>e</sup> Arteries is left considerable moves in an almost uniform stream and in y<sup>e</sup> way it passes into the Veins, & at this is no Circumstance in consequence of y<sup>e</sup> Interposition of y<sup>e</sup> Pusille, y<sup>e</sup> can make an alternate stop of the motion, it appears nearly uniform except it be in a small part of y<sup>e</sup> Venae Cavae near to the heart, with regard to the regularity of this motion as the cause of it th<sup>o</sup> it wd. be improper to enter upon the Subject; or yet to consider fully the Manner of this Circulation. It evidently serves to convert the Chyle into proper nourishment as for changing it into blood, In milk & Chyle as well as blood there is a coagulable part & they contain Globules but they are smaller y<sup>e</sup> those in the Blood an oily & certainly of a round figure, and more inflammable than the other parts, whereas we are uncertain w<sup>ch</sup> regard to the Inflammability of y<sup>e</sup> red Globules of the Blood; and that there is a necessity for y<sup>e</sup> continual Ejection of the Machine for preserving a due mixture of the Animal fluid when it is formed for as I have observed the Coagulation can take place without the Air having access. By this means too y<sup>e</sup> putrefaction to w<sup>ch</sup> all Animal Bodies are prone is in various ways prevented: for by the motion the putrescent matter is thrown off just as the putrid matter is thrown off from the Sea by means of the Tides, also the food is continually put to the several

Organs of the Body, to supply the constant waste of both  
 our Solids & Fluids; while at the same time the solid parts  
 of our Solids & the fruitful liquor or parts of our fluids are  
 excreted, & new Liquors prepared or created for a variety of purposes  
 and perhaps the connexion is maintained between the living  
 principle of the Body, by a process of that nature: further the  
 Circulation serves for the healing of wounds & for repairing  
 the loss of substance; and many other curious processes depend  
 upon it, as the heat of animals w<sup>ch</sup> is evidently connected w<sup>th</sup>  
 the degree of the Circulation.

Lecture 6<sup>th</sup>

At our last meeting Yesterday we endeavoured to draw the  
 Course of the Blood in its course; and we found that they are carried  
 constantly & rapidly in a Circle, when we attended more particularly  
 to the parts of it we found y<sup>t</sup> the Blood is twice pushed out from  
 the Heart & as often returns before it reaches y<sup>e</sup> same place  
 again. — I then explain'd y<sup>e</sup> effect of each part of y<sup>e</sup> Circulation  
 & when y<sup>e</sup> is understood we easily comprehend y<sup>e</sup> manner  
 in w<sup>ch</sup> the two hearts expelate y<sup>e</sup> y<sup>e</sup> part of each upon the  
 Arteries & veins. — In describing y<sup>e</sup> general course of y<sup>e</sup>  
 Blood it was not necessary to mention y<sup>e</sup> Arteries & Veins  
 farther y<sup>e</sup> in the most general way. — But when we reflect  
 on what we have seen and know of the Texture of y<sup>e</sup> Blood,  
 that there are parts discernable by y<sup>e</sup> Microscope, in its  
 particles of considerable size, whilst nothing of y<sup>e</sup> sort can be  
 shew'd in y<sup>e</sup> Serum or in y<sup>e</sup> Lymph; & if at y<sup>e</sup> same time  
 you consider y<sup>e</sup> very great diff<sup>er</sup> of Color w<sup>ch</sup> is observ'd even  
 in the outer parts of the Body, and still more when dissected  
 we wo<sup>uld</sup> conclude y<sup>t</sup> there are Arteries w<sup>ch</sup> are included there

Globules, & y<sup>e</sup> all the terminations of y<sup>e</sup> Arteries don't (511)  
take in the gen<sup>l</sup> mass, but y<sup>e</sup> there are many of 'em w<sup>ch</sup> receive  
y<sup>e</sup> humors as they come only, & w<sup>ch</sup> are named several Lymphatic  
may be by some of them even of coagulable part of y<sup>e</sup> Blood  
may be excluded & of watery part only admitted. — But  
besides the circulation of extremities of Arteries you can't  
must suppose y<sup>e</sup> y<sup>e</sup> are others intended for y<sup>e</sup> separation of  
parts from y<sup>e</sup> blood y<sup>e</sup> are thrown out of y<sup>e</sup> course of circulat<sup>ion</sup>  
how without this is the Tongue or the Eye to be kept moist  
or our Lungs to fill within y<sup>e</sup> thorax, or our Joints to move  
without any considerable friction? We can't conceive  
y<sup>e</sup> there must be recurring branches w<sup>ch</sup> make a separation  
& with open mouths discharge fluids into y<sup>e</sup> diff<sup>erent</sup> Cavities  
& in proportion to the gen<sup>l</sup> secretion there must be an  
Absorption, & the fluids must be in a constant state of  
Change; for, without this they wd. be continually collecting  
& the whole Cavities of y<sup>e</sup> Body wd. become dropical; and  
by fermenting by y<sup>e</sup> heat of our Body they wd. be raised  
up into putrefaction so must suppose y<sup>e</sup> they are every  
where imbibing; or absorbent Globules corresponding w<sup>th</sup>  
the recurring ones; & surely without any applie<sup>d</sup> to dissect<sup>ion</sup>  
we wd. conclude y<sup>e</sup> absorbent vessels must be veins, in w<sup>ch</sup>  
y<sup>e</sup> face of the blood is greatly broke, from y<sup>e</sup> almost infinite  
number of minute branches into w<sup>ch</sup> y<sup>e</sup> Arteries are divided  
& in fact we find y<sup>e</sup> if an Artery is fix<sup>d</sup> in an Artery or  
y<sup>e</sup> Capillary one, & another into y<sup>e</sup> correspond<sup>ing</sup> vein the  
blood will ascend 10 times higher in the Artery y<sup>e</sup> it does  
in the Vein, so that it appears to have lost  $\frac{9}{10}$  of its force  
But before we can speak more particularly concerning y<sup>e</sup> Absorb<sup>ent</sup>  
it is necessary to open a new fact; that besides these  
Veins w<sup>ch</sup> are known to all, w<sup>ch</sup> shine thro' the skin and

use of a red color there are found in Animals mammulæ 55.  
Vessels evidently veins, as they swell beyond the pressure  
of a wide maner to heart but instead of contain. y. red parts  
of the Blood in its sound state, they contain a pellucid  
Liquor like to the Lymph of y. blood when y. red globules  
are separated from it, so they are termed Lymphatic Veins  
and as they are found to be crowded w. flood gates, when  
where there are wanting in y. red veins y. accompany 'em,  
they are generally termed y. valvula. Lymphatic vessels:  
so y. there are two kinds of veins correspond. w. y. artery.  
And we trace y. course of the valvula. Lymphatic Veins  
upward we find y. they terminate in the Thoracic Duct  
along with the Lactical Veins. and these veins in their  
Course pass thro' small glands or kernels w. we may  
distinguish under the Skin in many places as in the  
Groin & in the Neck; I need not at present be particular  
in explaining the Structure of y. glands it is sufficient  
y. you know y. Lymphatic vessels pass into one Side  
of them, & come out at y. other. Now y. we are acquaint  
with y. existence of two kinds of veins, I have spoke in  
a general way of y. termination of y. Arteries let us next  
trace these valv. Lymphatic from their beginn. we must  
have recourse here to observations made upon the Animals  
upon their larger Branches, to y. effects of diseases, or  
on Medicines, for their minute beginn. altogether escape  
our observation, & as the Lymph. vessels dont contain  
Globules y. are to be distinguished by the microscope  
we are oblig'd to more indirect means for ascertaining  
their first beginn. and tho' there are Lymph. Arteries  
Arteries, we in like manner see none of 'em because  
their fluids are without Globules that are not to be

distinguished by the Glass. — If you look into the  
 Anatomical writings, y<sup>e</sup> universal Doctrine is y<sup>e</sup> y<sup>e</sup> red veins  
 generally known, not only return y<sup>e</sup> red p<sup>ts</sup> of y<sup>e</sup> Blood to the  
 Heart, but likewise y<sup>e</sup> they return y<sup>e</sup> colourless fluids, w<sup>ch</sup>  
 it is supposed they suck in by their minute branches  
 & mix'd w<sup>th</sup> y<sup>e</sup> Blood in its course, whilst y<sup>e</sup> valvular  
 Lymphatic veins are supposed to be the continuation of  
 the Serum or y<sup>e</sup> Lymph<sup>atic</sup> Matter. — But instead of  
 such a supposition I shall here offer substitute another  
 explanat<sup>n</sup> w<sup>ch</sup> I apprehend will appear at first sight more  
 probable; & they certainly w<sup>ch</sup> I shall endeavour to  
 establish from a variety of Circumstances. Does it not  
 appear more consistent w<sup>th</sup> y<sup>e</sup> simplicity w<sup>ch</sup> obtains in y<sup>e</sup>  
 works of nature to imagine y<sup>e</sup> red Arteries divide into  
 red & colourless Branches y<sup>e</sup> veins w<sup>ch</sup> we know sh<sup>d</sup> consist  
 with em, for circulating y<sup>e</sup> thinner parts of y<sup>e</sup> Blood as  
 well as y<sup>e</sup> red globules; & y<sup>e</sup> as a red Artery separates  
 into a red & colourless termination, a red vein is likewise  
 form'd of red and colourless humors, whilst y<sup>e</sup> associated  
 humors, for the purposes hinted at, are suck'd in by veins,  
 found to be colourless, & by y<sup>e</sup> valvular Lymphatics  
 Is not this likewise more consistent w<sup>th</sup> Analogy, w<sup>th</sup> what  
 respects y<sup>e</sup> Arterial Vessels, w<sup>ch</sup> we find always accom-  
 pany y<sup>e</sup> red veins with the same form'd Arteries of the  
 Intestines. But I shall afterwards mention a variety of  
 other Circumstances all concurring in proof of y<sup>e</sup> point,  
 from attending to y<sup>e</sup> structure of these vessels partly  
 to the number of valves w<sup>ch</sup> they are every where found  
 in the deepest parts of y<sup>e</sup> body as well as in y<sup>e</sup> superficial  
 & muscular; and when y<sup>e</sup> valves are wanting in these  
 Veins; for tho' I mention'd the Valves in the Veins

when considering y<sup>e</sup> course of y<sup>e</sup> Circulation there are  
 none to be found in the 3 great Cavities of y<sup>e</sup> Head, Throat &  
 Abdomen. — From observations made upon them after y<sup>e</sup>  
 Circulation of y<sup>e</sup> Blood is interrupted from sev<sup>l</sup> experiments  
 w<sup>ch</sup> I have made w<sup>ch</sup> regard to them, since I had occasion to  
 consider y<sup>e</sup> Subject in this place — and from observing  
 y<sup>e</sup> effect w<sup>ch</sup> acid medicines and y<sup>e</sup> matter of Diarrhoea  
 have upon the Body & from sev<sup>l</sup> other Considerations we are  
 led to y<sup>e</sup> same Conclusion; and upon y<sup>e</sup> whole I shall prove  
 y<sup>e</sup> white y<sup>e</sup> red veins serve merely for Circulation y<sup>e</sup> valvular  
 Lymph<sup>ex</sup> serve merely for the purpose of absorption, & there is  
 so far from being reason to suppose y<sup>e</sup> either perform a  
 double office, y<sup>e</sup> I think the contrary may be clearly  
 demonstrated I admit of y<sup>e</sup> same division of y<sup>e</sup> artery  
 w<sup>ch</sup> the systematic Writers have supposed, viz. y<sup>e</sup> receiving  
 branches as sent off & y<sup>e</sup> they are divided into colour'd &  
 colourless ones: but instead of admitting that y<sup>e</sup> red veins  
 receive y<sup>e</sup> absorbent vessels, & y<sup>e</sup> y<sup>e</sup> receive fluid from the  
 Valvular Lymph<sup>ex</sup>; I suppose y<sup>e</sup> at both y<sup>e</sup> colour'd and  
 colourless ones come from the red artery y<sup>e</sup> both serve to form  
 the red veins; whilst y<sup>e</sup> valvular Lymph<sup>ex</sup> are not continued  
 from either but begin with open mouths and take up a  
 fluid diffus'd into Cavity. — Having now seen y<sup>e</sup> necessity  
 of Secretion & its absorption corresponding. — Having  
 endeavour'd to determine the vessels by w<sup>ch</sup> y<sup>e</sup> last office  
 is perform'd we return to consider more particul<sup>r</sup>ly of y<sup>e</sup>  
 manner & of the purpose of Secretion.

You certainly wd. suppose, what is found to be true  
 in fact y<sup>e</sup> in many places y<sup>e</sup> arteries by y<sup>e</sup> most simple  
 apparatus, press out thinner fluids merely to  
 lubricate & prevent y<sup>e</sup> coarctation of neighbouring

And still further changes in y<sup>e</sup>. Glands; but w<sup>ch</sup>. regard  
 y<sup>e</sup>. communication which y<sup>e</sup>. Glands have w<sup>th</sup>. y<sup>e</sup>. glands, then  
 not yet a single experiment w<sup>ch</sup>. explain this structure.  
 I shall therefore in an after part of our course endeavour  
 to explain to you y<sup>e</sup>. structure of y<sup>e</sup>. most of y<sup>e</sup>. glands of the  
 Body. By means of a glandular structure, we find a  
 variety of useful purposes serv<sup>d</sup>. at present it may seem  
 very unnecessary to reduce these to gen<sup>l</sup>. heads, & I shall  
 only point out a few of them. - Besides merely lubricat<sup>g</sup>  
 y<sup>e</sup>. parts, and allow<sup>g</sup>. y<sup>e</sup>. motions to be perform<sup>d</sup>. w<sup>ch</sup>. have  
 these are sev<sup>l</sup>. glandula. viscera w<sup>ch</sup>. are connected w<sup>th</sup>. our  
 Alimentary Canal; these are sev<sup>l</sup>. glands w<sup>ch</sup>. separate  
 Spitte or Saliva to the Mouth, & we find y<sup>e</sup>. pancreas  
 pouring a Liquor into y<sup>e</sup>. Cavity of y<sup>e</sup>. Intestines, and  
 along with this y<sup>e</sup>. bile entering, & all these fluids are  
 mix<sup>d</sup>. w<sup>th</sup>. y<sup>e</sup>. nourishment we take in, y<sup>e</sup>. it may be re<sup>ad</sup>  
 into y<sup>e</sup>. Constitution w<sup>th</sup>. safety; & as I observ<sup>d</sup> before we  
 accordingly find y<sup>e</sup>. all animals are provided with a  
 Stomach into w<sup>ch</sup>. this nourishment is first re<sup>ad</sup>. Proceeding  
 a step as we find y<sup>e</sup>. animal fluids are mix<sup>d</sup>. w<sup>th</sup>. y<sup>e</sup>. nutri-  
 tion. & y<sup>e</sup>. they are of general import. to it, so we shall  
 find y<sup>e</sup>. nutritive fluid is separ<sup>d</sup>. for y<sup>e</sup>. purposes of  
 y<sup>e</sup>. w<sup>ch</sup>. pt<sup>l</sup>. by a secretion perform<sup>d</sup>. by y<sup>e</sup>. Glands & not by  
 y<sup>e</sup>. vessels, of w<sup>ch</sup>. I shall give you a proof y<sup>e</sup>. is certain. -  
 We seem to perceive still other more important offices; to  
 many it appears very evident & it is probable in a certain  
 degree, y<sup>e</sup>. communication, by a similar process is  
 maintain<sup>d</sup>. between y<sup>e</sup>. mind & body of Animals; as y<sup>e</sup>. the  
 Brain & y<sup>e</sup>. Nervous system by y<sup>e</sup>. glands I before mention<sup>d</sup>.  
 & at y<sup>e</sup>. same time it seems to be evident chiefly by a  
 secretion, y<sup>e</sup>. animals are enabled to continue their  
 Lives. To insist upon y<sup>e</sup>. w<sup>ch</sup>. Organs we had w<sup>ch</sup>. too  
 much of our present purpose, but there is one cloth

began w<sup>ch</sup> you sh<sup>d</sup>. know viz. the Brain & y<sup>e</sup> parts  
 proceed from it, by means of w<sup>ch</sup> we receive impressions  
 are rendered sensible of Injury done to the Body, & are  
 enabled to give y<sup>e</sup> muscles their proper movements. From  
 inspecting y<sup>e</sup> Brain, the leading circumstances on these  
 We find upon y<sup>e</sup> Surface of it a vascular dark color'd  
 substance, from its situation nam'd cortical or external  
 y<sup>e</sup> Bark as it were or outer cover. of y<sup>e</sup> Brain: & from its  
 color resembling amber it has been call'd the Cortical  
 Diveritious part of y<sup>e</sup> Brain: cutting deeper we find  
 closely connected w<sup>th</sup> it a white matter, w<sup>ch</sup> from its  
 softness has been call'd Medulla, tho' it is in reality  
 harder y<sup>e</sup> Cortical Substance, when we attend to the  
 medullary part of y<sup>e</sup> Brain w<sup>ch</sup> y<sup>e</sup> naked eye & more  
 especially with a Glass, we observe y<sup>e</sup> it is compos'd  
 of threads laid parallel to each other, & y<sup>e</sup> number  
 of 'em is almost infinite: if we cut still deeper we  
 perceive coming off, from y<sup>e</sup> underp<sup>t</sup>. of y<sup>e</sup> Brain includ  
 under y<sup>e</sup> term both y<sup>e</sup> Cerebrum & y<sup>e</sup> p<sup>t</sup>. cerebellum  
 threads call'd nerves, the largest of w<sup>ch</sup> pass down y<sup>e</sup>  
 Bones w<sup>ch</sup> support y<sup>e</sup> trunk of y<sup>e</sup> Body or is lodg'd w<sup>th</sup> in  
 y<sup>e</sup> Spine under y<sup>e</sup> name of spinal marrow, from this  
 smaller nerves are sent off in its progress & towards the  
 end of it we find an appearance like unto y<sup>e</sup> hair hang  
 from y<sup>e</sup> tail of a Horse, & therefore nam'd Cauda equina  
 & upon examining this by dissection we find y<sup>e</sup> nerves  
 thin & fibrous just as y<sup>e</sup> began, & y<sup>e</sup> we may divide  
 into small parts almost without end, or at least so  
 as our observation goes. The Brain itself has a  
 vascular membrane w<sup>ch</sup> very numerous vessels close

adhering to y<sup>e</sup> Cortical Substance of the Brain, & (61.  
sending Branches every where into it; y<sup>e</sup> Anatomists  
have call'd y<sup>e</sup> pia mater, no matter for y<sup>e</sup> mean<sup>g</sup> of y<sup>e</sup> name  
This same membrane we find continued over y<sup>e</sup> nerves:  
Upon the Brain its office has been supposed very import<sup>t</sup>  
in assisting y<sup>e</sup> functions of y<sup>e</sup> Nerves and Brain, & upon  
tracing the nerves beyond y<sup>e</sup> the Cavity of y<sup>e</sup> head & backbone  
we find y<sup>e</sup> y<sup>e</sup> membrane performs similar offices and its  
importance is perhaps even much greater y<sup>e</sup> has been  
(generally supposed). — Divided y<sup>e</sup> substance we  
find another w<sup>ch</sup> closely connects the bones in the head  
& has no connection w<sup>th</sup> y<sup>e</sup> Brain, for a Dura is interpos'd  
y<sup>e</sup> Authors have nam'd y<sup>e</sup> dura mater; it is a membrane  
of a much harder consist<sup>nce</sup> y<sup>e</sup> other & is extremely tough.  
But tho' upon examin<sup>g</sup> y<sup>e</sup> head y<sup>e</sup> membrane appears rather  
to belong to the Bone y<sup>e</sup> to y<sup>e</sup> brain, & to seem as close to  
the Brain, yet upon proceeding the Nerves, we find this  
every where inclosing them, & giving 'em a very g<sup>o</sup> degree of  
toughness & their strength is entirely owing to y<sup>e</sup> dura mater  
being continued, or to a substance w<sup>ch</sup> like it y<sup>e</sup> we may con-  
sider it as the same. — As y<sup>e</sup> Office of giving Impulses  
& motion belong to y<sup>e</sup> Nerves; for if you divide the Nerve  
belonging to any part it instantly loses all feeling, & it  
y<sup>e</sup> altho' y<sup>e</sup> Circulation be continued rapid & free. — Experiments  
of y<sup>e</sup> kind I have made upon frogs when cutting y<sup>e</sup> Nerve  
or burning it w<sup>th</sup> a hot Iron, without y<sup>e</sup> Nerve's feeling  
it; & in like manner it loses all power of moving y<sup>e</sup> part.  
When we now review y<sup>e</sup> principal Circumstances, I have  
mention'd that in proportion to y<sup>e</sup> waste y<sup>e</sup> is made in  
the Body as y<sup>e</sup> discharge from y<sup>e</sup> skin, Lungs & Kidneys

it receives a fresh supply of y<sup>e</sup> heart & Brain influence (62.)  
ing each other continue a motion w<sup>th</sup> increasing vigor; we  
will find it difficult to see a plain y<sup>e</sup> end of Life, & must  
learn y<sup>e</sup> y<sup>e</sup> duration of animals is to be limited by experience  
But the accidents to w<sup>ch</sup> all animals are exposed & w<sup>ch</sup>  
must in time hurt or destroy y<sup>e</sup> functions as well as the  
Beauty of y<sup>e</sup> machine render it necessary, y<sup>e</sup> they sh<sup>d</sup> have  
y<sup>e</sup> power of propagating their species, so far w<sup>th</sup> regard to the  
general Idea of leading circumstances in y<sup>e</sup> Structure &  
Economy of Animals as I thought necessary to a more  
particular examination of particular parts

## Lecture 7<sup>th</sup>

In y<sup>e</sup> next family given I shall begin with y<sup>e</sup> Bones  
There in many Instances, as in y<sup>e</sup> head & Trunk seem for  
y<sup>e</sup> defence of y<sup>e</sup> softer Organs; & every where they seem  
for their attachment & support: & without know<sup>ing</sup> y<sup>e</sup> exact  
shape of y<sup>e</sup> w<sup>th</sup> bones, and y<sup>e</sup> motions they are capable  
of being made to perform, we surely can have no just  
Idea of y<sup>e</sup> muscles &c. — I will upon y<sup>e</sup> whole follow  
a small book published by my Father as a Text: but I  
shall take y<sup>e</sup> liberty as often as may seem necessary to  
differ from it, particularly with regard to y<sup>e</sup> Conclusions drawn  
from y<sup>e</sup> Structure &c. of y<sup>e</sup> w<sup>th</sup> parts, the first part of y<sup>e</sup>  
Book treats of y<sup>e</sup> Bones a basis of y<sup>e</sup> body in a general  
sh<sup>d</sup> be by no means in a superficial way, for we find y<sup>e</sup>  
various circumstances relating to them accurately  
described; in y<sup>e</sup> 2<sup>d</sup> part of it y<sup>e</sup> Skeleton is considered  
But it will be more consistent, w<sup>th</sup> the plan I have laid  
down to address y<sup>e</sup> common order & to take y<sup>e</sup> description

of y<sup>e</sup> Skeleton first as being more simple, & then having  
 mentioned y<sup>e</sup> component parts in a superficial way we are  
 better prepar'd for considering y<sup>e</sup> intimate structure of y<sup>e</sup> <sup>var.</sup> <sup>several</sup>  
 substances y<sup>e</sup> are join'd to y<sup>e</sup> bones w<sup>ch</sup> is a subject y<sup>e</sup> leads into  
 a very large field for enquiry: besides unless y<sup>e</sup> parts<sup>ly</sup> pieces  
 of y<sup>e</sup> machine are known how can we divide y<sup>e</sup> articulations  
 &c. into Classes, or know y<sup>e</sup> uses of y<sup>e</sup> component parts, or  
 perhaps ought rather to end our enquiries in Anat<sup>y</sup> here: &  
 having examin'd y<sup>e</sup> Structure of all y<sup>e</sup> softer parts, conclude  
 w<sup>th</sup> y<sup>e</sup> intimate Structure of y<sup>e</sup> Bones: However it is not the  
 same here as it is in treating of several of y<sup>e</sup> Organs of y<sup>e</sup>  
 Body as the Brain, Lungs &c. where we find light thrown  
 upon these Organs by tracing y<sup>e</sup> blood vessels & nerves from  
 their source; but here in y<sup>e</sup> bones y<sup>e</sup> small branches y<sup>e</sup>  
 enter on one side of y<sup>e</sup> marrow vessels. - But to give  
 you a very general Idea of their structure - viz. y<sup>e</sup> Bones  
 are their rigidity to a vast quant<sup>y</sup> of Earth entering into  
 their Composition, for when a Bone is burnt in the fire it  
 very nearly retains its shape, & scarcely loses more y<sup>e</sup> <sup>part</sup> <sup>of</sup>  
 its weight. The Bone is cover'd every where w<sup>th</sup> a membrane  
 w<sup>ch</sup> is connect'd to them by numerous vessels, as well as by  
 fibres serving y<sup>e</sup> purpose of Ligaments; whilst y<sup>e</sup> external  
 Surface of it is connect'd very loosely to y<sup>e</sup> neighbouring parts  
 by a Substance resembling Cotton, viz. y<sup>e</sup> cellular <sup>rare</sup> matter.  
 only y<sup>e</sup> fibres of it are connect'd into Layers & when  
 drawn out, y<sup>e</sup> membrane by its elasticity is br'd back  
 to its proper place. - This membrane passes from one  
 articulation to another over y<sup>e</sup> intervening Substance -  
 Bones when open'd are Cavensous and these Cavities  
 contain marrow, y<sup>e</sup> sides of y<sup>e</sup> Bones are fibrous w<sup>ch</sup>

appears after softening 'em by means of an acid, H. vide (621).  
Haller's Anatomy p. 6. The solid part of y<sup>e</sup> bone serves for the  
formation of y<sup>e</sup> cancelli &c. — The marrow is contained in  
a fine membrane w<sup>ch</sup> lines y<sup>e</sup> Cavities; & it is cons<sup>er</sup>v<sup>d</sup>. of this  
membrane y<sup>e</sup> marrow is not effus<sup>d</sup> when it is expos<sup>d</sup> to  
y<sup>e</sup> heat of boiling water like any other Oil, but can be struck  
out of y<sup>e</sup> Bone like a Cylinder (Q.) 16. H. The Bones are intent<sup>d</sup>  
for enlargement & increase of motion — In some places of the  
Body where motion is necessary at first, but is afterwards  
lost, as in the Head y<sup>e</sup> edges are ragged, & are join<sup>d</sup> by a row  
of Teeth to each other, but where motion is intended to be  
continued thro' life they are either join<sup>d</sup> together by a soft  
Substance call<sup>d</sup> Cartilage or Rivet, or are ty<sup>d</sup> together by  
membranes call<sup>d</sup> Ligaments: if a free motion is dangerous  
we find a Cartilage is interpos<sup>d</sup>, as in y<sup>e</sup> Spine & ribs, if a  
free motion be safe and useful, we find y<sup>e</sup> membranes  
or capsular Ligaments are employ<sup>d</sup>, as in y<sup>e</sup> Joint of y<sup>e</sup> knee  
thigh, &c. To prevent y<sup>e</sup> rubbing and loss of Substance w<sup>ch</sup>  
we arise if y<sup>e</sup> hard bones acted against each other they are  
cover<sup>d</sup> with thin crusts of Cartilage, & these again are cover<sup>d</sup>  
with y<sup>e</sup> continuation of the inner layer of y<sup>e</sup> ligament w<sup>ch</sup> is  
moistend by a liquor secreted by glands within the  
Joint, just as we see y<sup>e</sup> axle tree of a carriage w<sup>ch</sup> greave to  
prevent y<sup>e</sup> attrition, so the basis of y<sup>e</sup> body is in this way  
fitted for being mov<sup>d</sup>: and we now proceed to examine the  
several pieces w<sup>ch</sup> compose it, & w<sup>ch</sup> are more numerous y<sup>e</sup> they  
appear at first sight especially when we look to the skeleton  
of an Adult; because the number of pieces exceeds the  
number of motions or joints: thus there are a number of  
Bones in the Cranium of an all without motion, also the

number of pieces are greater at first than afterwards (66.  
for reasons w<sup>ch</sup> I shall have occasion to consider, as in  
the thigh bone, where cartilaginous substances are united  
to the extremities called Epiphyses & when these are again  
connected with y<sup>e</sup> bone they are call'd Apophyses or processes  
and these again in diff. parts get diff. names as trichants  
&c. — But for a general view of y<sup>e</sup> Skeleton if we attend  
to the direction & Situation of y<sup>e</sup> general pieces w<sup>ch</sup> regard to  
each other, at first they do not appear to be plac'd in the  
most favorable way, for if you attend to the general  
pillar, you find y<sup>e</sup> vert. pieces of w<sup>ch</sup> it is compos'd  
are not plac'd perpendiculary over one another as a  
man w<sup>o</sup>. near a fabrick, but there are sev. turns made  
forming upon y<sup>e</sup> whole an S-like Situation tho' a person  
in every situation of y<sup>e</sup> body may throw y<sup>e</sup> weight upon  
the common basis, or make it fall between y<sup>e</sup> feet, yet  
he is under a necessity of employing a number of muscles  
to support himself, so is worn in any of even y<sup>e</sup> most  
favorable posture but to balance y<sup>e</sup> parts and adapt  
to a great variety of motions w<sup>ch</sup> are perform'd man readily  
but upon taking a nearer view of y<sup>e</sup> Skeleton, we find y<sup>e</sup>  
we may reduce y<sup>e</sup> bones into 3 gen<sup>l</sup>. Classes, from the  
Circumstances nearly of their shape. — 1. The long and  
round shap'd bones as those of the Arm, thigh, leg &c.  
2. The thin flat bones as in y<sup>e</sup> head &c. & many Anatom  
ists have contented themselves w<sup>th</sup> reducing 'em all under  
these 2 gen<sup>l</sup>. Heads; but I apprehend w<sup>ch</sup> sh<sup>d</sup>. add a third  
so we find a 3<sup>d</sup>. of Bones y<sup>e</sup> are irregular, as in y<sup>e</sup> Joints  
of y<sup>e</sup> feet &c. We divide y<sup>e</sup> body into certain regions,  
the Head: Trunk: & Extremities: — The Head consists of  
the Brain Case, y<sup>e</sup> Bones of y<sup>e</sup> Face & 2 Jaws — and in  
the end I follow a copite ad Calam w<sup>ch</sup> is just as  
convenient as any other I shall begin w<sup>th</sup> considering the

Cranium or Braine case. — It very much resembles  
an Egg w<sup>th</sup> a small end turn'd forwards.

In accounting for this particular figure, as we w<sup>th</sup> Dr. Pellin  
to suppose y<sup>e</sup> Bones are dispos'd to shoot in this manner  
or are not rather to consider y<sup>e</sup> Brain & Cerebellum as the  
mold on w<sup>ch</sup> y<sup>e</sup> bones afterwards grow; & w<sup>ch</sup> we are to consid<sup>r</sup>  
the shape as being some way useful to the Brain in its  
functions; & going one step farther we say y<sup>e</sup> of all other  
shapes it is y<sup>e</sup> most convenient: the spherical figure in  
general is not much very capacious, but resists more  
to any accident: but the oblong shape is evidently more  
conven<sup>t</sup> to us y<sup>e</sup> perfect round shape, thus in posing  
forwards between two H<sup>o</sup> sides of y<sup>e</sup> head and is expos'd  
to Injury: By lengthning out y<sup>e</sup> fore & back part the  
resistance is increas'd, as in y<sup>e</sup> Case of y<sup>e</sup> Shell of an Egg  
where tho' it is a brittle substance, y<sup>e</sup> resistance is very  
considerable when you press y<sup>e</sup> ends of it together, & y<sup>e</sup>  
flatness of the sides of y<sup>e</sup> head y<sup>e</sup> ear is less expos'd to injury  
& would make a stronger impression upon the Organ  
y<sup>e</sup> Circle of Vision is consid<sup>r</sup> increas'd by our taking in  
a larger field. — That accidents & diseases can alter  
y<sup>e</sup> shape is very evident & it is even influenced by the  
weight of the Brain being down upon it, & we find  
y<sup>e</sup> farther we advance in life it makes y<sup>e</sup> deeper &  
deeper impression. Formerly when y<sup>e</sup> diff<sup>r</sup> nations of  
Europe were more addicted to particular Customs y<sup>e</sup>  
head dress had more influence, & the shire pretended y<sup>e</sup>  
he could distinguish of what country a person was from  
the effects these diff<sup>r</sup> customs had upon the shape of y<sup>e</sup> head  
we also observe, that collections made within y<sup>e</sup> Brain  
push it out on y<sup>e</sup> side w<sup>ch</sup> is from any accident or custom y<sup>e</sup>

The head is inclin'd over to one side, & the Brain becomes  
 larger on y<sup>e</sup> side: after remarking y<sup>e</sup> general shape and  
 figure, we w<sup>o</sup>. make we w<sup>o</sup>. make a cut into y<sup>e</sup> Skull, &  
 examine the structure of it more accurately: when a Section  
 is thus made horizontally, we discover y<sup>e</sup> plates of y<sup>e</sup> bone  
 & y<sup>e</sup> interposed Cancelli. In anatomical books you will  
 find it described as consisting of two Tables & an intermediate  
 Cancelli Diploe, so w<sup>o</sup>. suppose y<sup>e</sup>. there is some what particu-  
 lar, but y<sup>e</sup>. structure is in common to all y<sup>e</sup>. bones in y<sup>e</sup>. body  
 & y<sup>e</sup>. os ilium &c. have y<sup>e</sup>. same appearance: Comparing y<sup>e</sup>.  
 Tables of y<sup>e</sup>. skull w<sup>th</sup> each other, y<sup>e</sup>. inner Table is describ'd  
 as being thinner & more brittle call'd Vitrea, & y<sup>e</sup>. there is  
 some differ<sup>ence</sup> I allow; but it is by no means very consid<sup>er</sup>able. &  
 is various in diff<sup>erent</sup> subjects. The inner Table is somewhat  
 more subjected to pressure, w<sup>ch</sup>. makes a slight diff<sup>erence</sup> but  
 this has no considerable influence in practise. Thus  
 when matter is collected in the Diploe we are told from  
 the nature of y<sup>e</sup>. inner Table it may make its way readily  
 into y<sup>e</sup>. Brain; but on the contrary I say supposing y<sup>e</sup>.  
 inner Table was only half y<sup>e</sup> thickness of y<sup>e</sup>. other, for y<sup>e</sup>.  
 most part of y<sup>e</sup>. matter w<sup>o</sup>. push outwards y<sup>e</sup>. assistance  
 being less; for in going inwards it cuts upon y<sup>e</sup>. convex  
 part of y<sup>e</sup>. Bone; & in some skulls w<sup>ch</sup>. I have seen, & where  
 there are scrupulous appearances, or where there has  
 been what may be call'd a Spina Ventosa, you observe  
 y<sup>e</sup>. y<sup>e</sup>. external Table is first eroded at the y<sup>e</sup>. in many  
 Instances y<sup>e</sup>. matter goes inwards is beyond all doubt  
 as when y<sup>e</sup>. skull is eroded by y<sup>e</sup>. less venerea, here the  
 Disease may more readily attack y<sup>e</sup>. innu. Table, as it

chiefly attacks of prey upon y<sup>e</sup>. harder substances: 68.  
y<sup>e</sup>. in judging with regard to matter found here we are  
more to be determin'd by y<sup>e</sup>. Symptoms y<sup>e</sup>. by the seat;  
when y<sup>e</sup>. patient complains of pains without intermission  
tho' perhaps w<sup>th</sup>. some degree of remission, & we find symptoms  
of an oppress'd brain, y<sup>e</sup>. Surgeon led by y<sup>e</sup>. accident or y<sup>e</sup>.  
Appearance, w<sup>ch</sup>. in gen<sup>l</sup>. adenatous, w<sup>o</sup>. make an opening  
& if y<sup>e</sup>. matter is not lodg'd in y<sup>e</sup>. Diploe, he sh. go farther,  
for if y<sup>e</sup>. internal periosteum & dura mater be kept entire  
the danger from a mere perforation of y<sup>e</sup>. Brain is alto-  
gether inconsiderable if we prevent y<sup>e</sup>. air from having  
access. — Surgeons lay down other rules grounded  
upon y<sup>e</sup>. structure of y<sup>e</sup>. Cranium, many of 'em tell us y<sup>e</sup>.  
when we are to trepan a part we may proceed quickly w<sup>th</sup>.  
we are sensible of a very considerable quantity of  
resistance from y<sup>e</sup>. softness of y<sup>e</sup>. diploe, but after that  
we are to work w<sup>th</sup>. much more caution. But it will  
be very unsafe to trust to y<sup>e</sup>. effort, as we are often not  
sensible of y<sup>e</sup>. want of resistance for in sev. instances  
y<sup>e</sup>. Tables of y<sup>e</sup>. bones grow closely together, nor is the  
thickness y<sup>e</sup>. same in almost any pt of y<sup>e</sup>. head, w<sup>ch</sup>. may  
depend upon a variety of circumstances for y<sup>e</sup>. Cranium  
contains an Organ y<sup>e</sup>. is constantly straining to extend  
itself, & from y<sup>e</sup>. distribution of y<sup>e</sup>. Arteries th. y<sup>e</sup>. effort  
may be stronger in one part y<sup>e</sup>. it is in another: y<sup>e</sup>. Brain  
too may grow luxuriantly and when the lbers of y<sup>e</sup>.  
Brain push out much y<sup>e</sup>. bone may be even diaphanous  
and in old persons we are always to be more cautious  
for in comparing skulls of persons of diff<sup>t</sup>. ages, we observe  
that the several bones are constantly becoming thinner

to be put in. we should fill up a void for in y<sup>e</sup> case of the Hydrocephalus I have found an uncommon N<sup>o</sup>. of y<sup>e</sup> Intestines of y<sup>e</sup> bones. — It is of some consequence to be aware of these in practice for they are sometimes very large, & a Surgeon might be in danger of mistaking a piece of this kind for a piece of a fractured bone; but y<sup>e</sup> firmness of y<sup>e</sup> or trig. & its having small edges, while the fracture is more disposed to run in straight lines may serve to distinguish them. — Several y<sup>e</sup> Sutures as we advance in life become less observable & at length entirely disappear, y<sup>e</sup> bones running together. y<sup>e</sup> first happens in y<sup>e</sup> inner table when we find y<sup>e</sup> y<sup>e</sup> Sutures are constantly much less visible y<sup>e</sup>. They are on y<sup>e</sup> outside; for you will observe y<sup>e</sup> nature begins to form y<sup>e</sup> suture pieces at their middle, y<sup>e</sup> fibres gradually proceeding like rays from y<sup>e</sup> centre of a circle; & if we suppose that nature in both Tables, pushes y<sup>e</sup> fibres w<sup>th</sup> equal force, y<sup>e</sup> outer Table descends a large distance, & y<sup>e</sup> fibres will be more repulsed & appear more separated, while y<sup>e</sup> fibres of y<sup>e</sup> inner table will be kept closer together running into one another. And in some old skulls y<sup>e</sup> several Sutures are with scarcely to be remark'd on y<sup>e</sup> outside. After showing the several Sutures, & y<sup>e</sup> appearances their occasion: I point out to you still other marks upon y<sup>e</sup> Skull, w<sup>ch</sup> are beautifully scatter'd like y<sup>e</sup> branches of a tree; these marks are made by blood vessels. — w<sup>th</sup> age y<sup>e</sup> marks become larger & deeper as y<sup>e</sup> Skull becomes partu<sup>r</sup>. thin over these places: so probably in case of a fracture near in, it or any readily get into one of these fenow's & run along it, these Cavities y<sup>e</sup> are occasion'd by y<sup>e</sup> beating of y<sup>e</sup> vessels, & long pressure upon these parts, occasioning a greater absorption

and is not as Dr. Albinus supposed to a disposition in  
the Bones to grow around the Vesicle.

## Lecture 8<sup>th</sup>

As y<sup>e</sup>. s<sup>u</sup>. Bones in y<sup>e</sup>. Cranium of an Adult rem<sup>o</sup>. divided  
& yet are without motion, we wd. wish to have explain'd to us  
Why, instead of one single ossification, the Cranium consists  
of a number of pieces y<sup>e</sup>. ossification begins in a N<sup>o</sup>. of points  
at y<sup>e</sup>. same Times. — If you look into y<sup>e</sup>. writings of Anat.  
you will find s<sup>u</sup>. purposes enumerated, but I apprehend  
y<sup>e</sup>. many of them are to be considered merely as secondary,  
& y<sup>e</sup>. we sh<sup>o</sup>. explain it in y<sup>e</sup>. following manner.

We begin by attending to a plain fact, y<sup>e</sup>. every bone s<sup>h</sup>. forms  
in a small point: and from y<sup>e</sup>. y<sup>e</sup>. fibres are extended, in y<sup>e</sup>.  
flat bones, like rays from y<sup>e</sup>. centre of a Circle; we take that  
as a fact & say y<sup>e</sup>. by y<sup>e</sup>. ossification begins in a N<sup>o</sup>. of points  
y<sup>e</sup>. whole Fabric is soon completed. 1<sup>st</sup> The spherical figure  
is more exactly form'd just as a polygon in proportion to y<sup>e</sup>.  
number of sides approaches nearer to y<sup>e</sup>. circle, as y<sup>e</sup>. room  
w<sup>o</sup>. having Sides is nearer to y<sup>e</sup>. Circle y<sup>e</sup>. if it had 4. only.  
But there are other Considerations perhaps of greater  
weight, for as y<sup>e</sup>. ossification begins in points, and the  
fibres we perceive from thence diverge like rays from a  
Candle y<sup>e</sup>. Bone becomes thinner y<sup>e</sup>. farther we go from y<sup>e</sup>.  
beginning; so unless a N<sup>o</sup>. of pieces had been employ'd, we  
sh<sup>o</sup>. have found y<sup>e</sup>. thickness of y<sup>e</sup>. Skull very unequal:  
then by y<sup>e</sup>. intervention of membranes 1<sup>st</sup> Nature after  
y<sup>e</sup>. bone yields more equally to y<sup>e</sup>. growth of y<sup>e</sup>. Brain,  
for we find y<sup>e</sup>. a part grows in Size nearly in proportion  
to its softness & y<sup>e</sup>. harder parts w<sup>o</sup>. more difficulty: so  
w<sup>o</sup>. regard to y<sup>e</sup>. teeth w<sup>o</sup>. are still harder y<sup>e</sup>. the Jaw bones

They do not grow in the same proportion w<sup>th</sup> them  
 and as the last primary purpose we ought to observe  
 the change of shape w<sup>th</sup> y<sup>e</sup> head undergoes in delivery  
 when it comes down in an oblong form, But these are  
 w<sup>th</sup> the other secondary advantages attend<sup>g</sup> y<sup>e</sup> structure  
 of y<sup>e</sup> Fractures dont extend so far as y<sup>e</sup> otherwise w<sup>o</sup> have  
 done; just as a fracture of a large piece of Ic. will run  
 much farther y<sup>e</sup> if a number of plates of Ic. had been laid  
 together: a Suture however does not absolutely interrupt  
 a fracture, if y<sup>e</sup> blow is violent and if y<sup>e</sup> person is far  
 advanced in life, y<sup>e</sup> fracture may go from one Suture to  
 another: next in certain diseases the bones of y<sup>e</sup> head are  
 separated from each other, & y<sup>e</sup> very frequently happens  
 in Children partic<sup>ly</sup> in y<sup>e</sup> Hydrocephalus intermissus I  
 have disputed w<sup>th</sup> Subjects where y<sup>e</sup> water was contained in  
 very consid<sup>er</sup>able quantity within y<sup>e</sup> brain in a subject of 3.  
 Years old I found 3 Bls. In one of 9. years the w<sup>o</sup> y<sup>e</sup> a  
 great dilatation must have taken place & we have Instances  
 of y<sup>e</sup> like happening in Adults, we have one Instance of  
 this kind from D. Simpson at St. Andrews in y<sup>e</sup> medic.  
 Trays & another from W. Hill Surg<sup>n</sup> in Dumfries.  
 D<sup>r</sup> Simpson assured me y<sup>e</sup> he could lay his forefinger  
 between y<sup>e</sup> parietal Bones & it was sucking water he made  
 a drain & a watery matter was discharged from it in  
 great quant<sup>ty</sup> y<sup>e</sup> he had we observed before, & at the end  
 of 6. months y<sup>e</sup> patient was considerably relieved, now  
 in such cases, without y<sup>e</sup> yielding of y<sup>e</sup> Bones y<sup>e</sup> disease  
 must have prov<sup>d</sup> fatal by y<sup>e</sup> compression of the Brain  
 And in young Ch<sup>ld</sup> the p<sup>er</sup>icranium is intimately  
 with the lining of y<sup>e</sup> Bones a dura Mater connected at y<sup>e</sup>  
 w<sup>th</sup> Sutures, & besides a N<sup>o</sup> of communicating fibres we  
 find a great communication of Vesels at these y<sup>e</sup> at

any other part of y<sup>e</sup> head, w<sup>ch</sup> may be attended w<sup>th</sup> some ease, for (73)  
tho' we lay aside y<sup>e</sup> Theory of y<sup>e</sup> Arteries y<sup>e</sup> openings or left  
in y<sup>e</sup> head for allow<sup>ing</sup> y<sup>e</sup> passage of Fuliginous vapours, yet a  
discharge made at these places will have more effect y<sup>e</sup> when  
made over y<sup>e</sup> most solid parts of the Bone. — We now begin  
to examine each of y<sup>e</sup> pieces w<sup>ch</sup> have been shown to compose  
the Cranium & we begin with y<sup>e</sup> Frontal.

At first it is composed of 2 pieces, & sometimes y<sup>e</sup> division  
remains in Adults & it is alledg<sup>d</sup> y<sup>e</sup> y<sup>e</sup> happens more freq<sup>ly</sup>  
in y<sup>e</sup> Female y<sup>e</sup> in y<sup>e</sup> male, & y<sup>e</sup> Sagittal Suture may be  
continued to the nose, & may be taken for a fracture; but  
it is easily distinguished, when y<sup>e</sup> 2 pieces of y<sup>e</sup> bone meet  
in y<sup>e</sup> middle their Edges turn inwards, at meet<sup>ing</sup> w<sup>ch</sup> least  
assistance: here between y<sup>e</sup> two great Lobes of y<sup>e</sup> Brain. —  
The Tab<sup>le</sup> below describes its covering from y<sup>e</sup> Dura Mater  
& we must attend to y<sup>e</sup> situation of y<sup>e</sup> Sinus, & as either a  
ridge stands out here or a furrow runs along y<sup>e</sup> inside of  
we can't perform y<sup>e</sup> operat<sup>ion</sup> of y<sup>e</sup> Trepan without being in  
danger of wounding y<sup>e</sup> Sinus, & y<sup>e</sup> matter from w<sup>ch</sup> cannot  
easily get out; so y<sup>e</sup> Surg<sup>on</sup> if he has a Choice ought not to ch<sup>oose</sup>  
y<sup>e</sup> Trepan here — The Eye & especially y<sup>e</sup> Lacrymal Gland  
is partly protected by a very convex<sup>d</sup> projection of y<sup>e</sup> Bone;  
& without attending to y<sup>e</sup> alig<sup>ment</sup> might be led to apply the Trepan  
too low, & instead of penetrating into y<sup>e</sup> Cavity of y<sup>e</sup> Cranium  
y<sup>e</sup> Instrument might only make its way thro' y<sup>e</sup> Orbit, & y<sup>e</sup> open<sup>ing</sup>  
sho<sup>uld</sup> be made y<sup>e</sup> breadth of a Finger above y<sup>e</sup> Edge of y<sup>e</sup> super-  
ciliary ridge: the Orbital plate is generally thin & y<sup>e</sup> a fresh  
bone w<sup>ch</sup> is pointed inw<sup>ard</sup> &c. — The frontal Sinus is an entire  
wanting in Child<sup>ren</sup> we perceive nothing farther y<sup>e</sup> a spongy  
bone & y<sup>e</sup> Lacryms small: their Size increases w<sup>th</sup> age, & are  
more or less in proportion to y<sup>e</sup> size of y<sup>e</sup> face, there is  
frequently too a vault in y<sup>e</sup> diff<sup>erent</sup> wid<sup>th</sup> & there are frequently

has a variety in its diff. sides frequent. it is in some imperfect.  
Partitions, tho' it gen. communicates with the cavity of the nose.  
In applying the Trepan we ought to shun these Cavities as much  
as possible; for etc. The history of the Eye, is not sent from  
the external Carotid, according to Whewell, but from the Internal  
Hippocrates thought the fever was cur'd by a few drops of Blood drawn  
from the nose & it has been propos'd by Dr. Blair when the head is much  
affected in fevers to open the frontal Duct but it is by no means  
to be recommended. for the same reason Hippocrates says the fever  
from the nose prov'd the cure of the fever is to be doubted, as it was  
perhaps rather owing to the evacuation of Crises from the general  
struggle of nature some of the Blood vessels gave way & supposing  
the way was established, we wd. rather open another Vessel at the  
Temporal Duct. Carotid Bone.

Under the Sagittal Suture we find the continuation of the sinus  
mentioned in speak. of the last bone; & at the large venous  
Canal is follow'd by the Sinus. viz. the Superior  
Longitudinal Sinus, is continued here, the remark we made  
with regard to the Trepan applies here: In most Subjects we  
find branches from the veins in the inside which communicate  
with the branches on the outside; but the cutting of these is not  
so material as Surgeons have supposed for tho' the vein is  
divided close to the Skull we can stop the Hemorrhage by  
Compression. — The connexion of these Bones with the  
frontal is very curious: the upper part of the Frontal is set off  
on their Arch but at the sides of the parietal are more in  
danger of being compress'd, the parietal now proper over  
the frontal & at this part the frontal is remarkably strong,  
so that this part of the head has very advantage it can  
be given it for resisting pressure. — At the Birth there is  
a want of Bone when the two pieces of the Skull is joined  
with the parietal Bone — 87. and there is a membrane

in place of it & the ossification here extends in a very gradual  
manner for persons are generally 2 years of age before it is finished.  
is completed: — On laying the hand on the *Bregma* a pul-  
sation is perceived from whence we call *fonticulus* *Bregm.*  
pulsation has been made use of to distinguish whether a  
Child be dead or alive in the Time of Labour it is not yet part  
of the Head w<sup>ch</sup> presents but it is very, & till however the *Bregma*  
may be reach'd by the finger but little confidence is to be  
plac'd on this mark: it is want of it, stirring of it, Child  
it is fatal of it water, it is separation of it, *cuticle*, & it is want  
of pulsation in the umbilical Chord &c. are more to be trust'd  
to than this. It is very possible that a Union of the Brain  
may happen in laborious births w<sup>ch</sup> we. Physicians have  
have recourse to Incisions: where we observe Tumors in  
in the heads of Children as it is probable that these will in  
a few days disappear of themselves. further may be observ'd that  
the bones are very much separated in the *Hydrocephalus*: & in  
it is divers of water is generally lodg'd within the substance  
of the Brain; but rare it is extremely possible, may it w<sup>ch</sup>  
appear equally reasonable to suppose that the water may be  
collected between the membranes of the Brain & it may be  
advisable to let it off by an operation; and in the place the  
*Bregma* is the proper place taking care to avoid the middle  
of it & to make an opening at one side, as a slight scratch of a  
Lancet will be sufficient. Occipital Bone: It has been  
suppos'd that the sagitt<sup>e</sup> suture is sometimes contain'd by *framen*  
*magnum* as well as to the nose, probably it is finding a  
large or bignest corn. pretty as down into it may have  
given occasion to the mistake, but there is nothing in the  
formation of the bone to countenance it. Occipital  
Bone in the Operation of the Trepan on an *os* longitudinal

Since as also y<sup>e</sup> lateral ones, but care may occur  
where y<sup>e</sup> Surg<sup>y</sup> is to balance between y<sup>e</sup> danger y<sup>e</sup> attends  
y<sup>e</sup> perform<sup>y</sup> of operation, & y<sup>e</sup> neglect of it, as where y<sup>e</sup> bone  
is bent in upon y<sup>e</sup> Brain; but wh<sup>o</sup> the depression happen  
to be situated between y<sup>e</sup> ridge w<sup>ch</sup> views as y<sup>e</sup> Rain day  
bet<sup>n</sup> y<sup>e</sup> smooth part of this bone, & y<sup>e</sup> w<sup>ch</sup> is mark'd by the  
muscle, between y<sup>e</sup> place at y<sup>e</sup> Lambdoidal Suture  
there is no danger; & if an extravasation happens, this is  
one of y<sup>e</sup> best places for making an open<sup>y</sup> of blood or matter  
falling by its weight upon y<sup>e</sup> membranes w<sup>ch</sup> divide y<sup>e</sup>  
Brain & cerebellum.

### Lecture 9<sup>th</sup>

We proceed next to examine the Temporal Bones of w<sup>ch</sup>  
Langeau say down at a rule y<sup>e</sup> we are never to apply the  
Screw to, we wd. be at a loss to give a good reason for y<sup>e</sup>  
if we did not know y<sup>e</sup> gen<sup>l</sup> belief y<sup>e</sup> y<sup>e</sup> tendons of y<sup>e</sup> body  
are highly sensible parts, & y<sup>e</sup> y<sup>e</sup> slightest irritation of  
them may bring on fatal symptoms; & therefore as the  
Temporal muscle is cover'd w<sup>th</sup> a Tendinous Aponeurosis,  
they carefully avoid this place, but in what afterwards  
prove y<sup>e</sup> freedom may be us'd w<sup>th</sup> tendons w<sup>th</sup> out  
danger - & I have caus'd y<sup>e</sup> tendon Aponeurosis to be cut by a  
crucial Incision, without any bad consequ<sup>ce</sup> following it  
& suppose this fear just, whenever this happens to be a  
depression of y<sup>e</sup> Bone y<sup>e</sup> danger wd. be greater from allow<sup>g</sup>  
it to remain y<sup>e</sup> from cutting y<sup>e</sup> tendon. And y<sup>e</sup> Bone may  
become y<sup>e</sup> Subject of Operation in consequ<sup>ce</sup> of fracture in sev<sup>l</sup>  
ways, it may be push'd inwards; a fissure from y<sup>e</sup> top of y<sup>e</sup>  
head may extend downwards, where y<sup>e</sup> cause is violent,  
from the parietal bone thro' y<sup>e</sup> suture; y<sup>e</sup> later M<sup>r</sup> Sandon

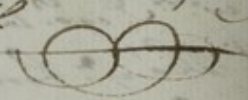

177  
A young man in Edinburgh was killed in this way, by a fall  
from his House, & the parietal bone was broken & the fissure  
extended to the root of the Os petrosum, & thro' there was  
no laceration in the Skin, yet upon applying Cloths to the ear  
part of the Brain was found upon them w<sup>ch</sup> they co. not well  
out for, but after his death they found the os. bone was fractured  
& the matter torn & likewise the membrane of the Drum  
the part of the Brain had actually got thro' the ear: & I  
have met with another Case w<sup>ch</sup> was pretty similar to this  
There is still another way in w<sup>ch</sup> the os. bone may be affected w<sup>ch</sup>  
I've suggested by the common papers on palsy & Anatomy  
and w<sup>ch</sup> I wd. be very well to admit as a possible case:  
that thro' the os. bone on the Top of the Head be not fractured, yet  
by the force of a blow, the lower part of the parietal Bone  
may start outwards & break the scale of the temporal &  
I find a drawing of the kind sent by a Surgeon to my father  
where the starting of the parietal Bone seems to have had  
the effect thro' perhaps, the matter did not occur to the Surgeon  
in the first sight. Next we proceed to an Examination  
of the Spheroid & after the Ethmoid Bones.  
It is very necessary to be well acquainted with the several  
parts of the Spheroid Bone, for thro' its Situation it  
can hardly be the subject of any Surgical Operati<sup>on</sup>  
excepting perhaps a simple cure of a tumor growing in  
the throat & back part of the nose, many of the principal  
Vessels & Nerves of the body pass thro' here & so it would  
be to attend to the situation of the Bone to judge of their  
Situation; & it likewise forms very principal parts  
of the Nose & Eye.

73.

Review of the general Circumstances with regard to Bones  
of Cranium, their Situation the Advantages of the  
Subcircular figure &c. for the sake of beginners.

What Anatomists have nam'd the Two Hemispheres of the  
Brain only form about  $\frac{1}{4}$  fourth part of a Spheroid.

The gen<sup>l</sup> Situation of  $\frac{1}{4}$  Cerebr<sup>o</sup> &c. — The Blood Vessels.

The Dura Mater receives its blood from &c.

The Brain & Cerebellum are supply'd w<sup>th</sup> two pair of very  
large Arteries of internal Carotid Vertebrae &c.

The blood is return'd first by veins in the common manner

but after many of  $\frac{1}{4}$  small branches have run together

they are cover'd by the Dura Mater & have got within the

head the name of Sinus. — The Longitudinal Sinus

divides at  $\frac{1}{4}$  Tentorium into two branches, w<sup>ch</sup> I consider as

nearly equal, for tho' it may appear to go entirely to  $\frac{1}{4}$  right

side, yet other veins are added to these, w<sup>ch</sup> turn to the left,

so for any purpose in Anatomy we may consider it as

dividing into two equal parts, these getting out of the

head are nam'd internal jugular veins.

Next we mention the sev<sup>l</sup> nerves, first the Olfactory &c.

The 10<sup>th</sup> pair of  $\frac{1}{4}$  head is better nam'd by Winslow

Suboccipital. — We next proceed to consider the structure

of the Jaws: the several Bones of which have got their

names from their Shape or Situation.

119. 153. 152.

160

For a brief & sufficiently accurate description of  
these Part. Paper see Whilo's Anatomy page 126.

Lecture 11. ~~111~~

79.

In the upper Jaw, as in the Cranium, there are a considerable number of Bones, by w<sup>ch</sup> the Ossification, beginning at a N<sup>o</sup>. of points at once is sooner completed, & this irregular shape found: and you will observe y<sup>t</sup> arising of the Bones here have y<sup>e</sup> effect of protecting y<sup>e</sup> orbits of enlarging y<sup>e</sup> face & giv<sup>g</sup> attachment to the muscles &c. — Under Jaw. — Persons sometimes luxate their under Jaw by opening their mouth too wide, for the Condyles are then in a very critical Situation standing upon the ridge of a Bone, & they may slip upon the flat part of y<sup>e</sup> Ligamentous process & then be entangled, & this is y<sup>e</sup> real hindrance to the aduaction. — So in order to disengage it, we must draw the Jaw forwards a little & downwards, before we attempt to push it back, w<sup>ch</sup> even in weakly persons requires a good deal of Force.

After the Jaw Anatomists gener<sup>lly</sup> enter upon the Structure of the Teeth: But I apprehend y<sup>e</sup> reasons y<sup>e</sup> determine us to avoid in general the Structure of y<sup>e</sup> Basis of y<sup>e</sup> Bones sh<sup>d</sup>. apply here we shall only observe in general that in a Child there are only six Sockets on each side, & 5. of the Teeth only appear before 7. Years of Age, when the number is gradually increased to 8. Other Anatomists have divided in three classes, & given them names which are abundantly proper. I proceed next to demonstrate y<sup>e</sup> Bones & Cartilages found immediately behind the under Jaw, so as rather to make parts of y<sup>e</sup> Head & Jaw than of y<sup>e</sup> Trunk of the Body.

Os Hyoides. — At the top of y<sup>e</sup> Wind pipe we find 4. Cartilages w<sup>ch</sup> seem to give passage to the Air: and a fifth w<sup>ch</sup> covers the passage, & as y<sup>e</sup> passage is nam<sup>d</sup> Epiglottis, the Os is call<sup>d</sup> Epiglottis.

I show you two Chords or Ligaments upon which perhaps 30.  
we shall find our voice depends; these join to the roots of the  
Anterior Cartilage, with regard to these the make a Tri-  
angular opening, the basis of w<sup>ch</sup> I can shut at pleasure  
If I bring them forwards a stretch 3m by means of the  
Anterior Cartilage, so these Cartilages moving upon  
each other can be so influenced by the muscles as to give  
different degrees of Tension to these Ligaments and it  
is in this way we form y<sup>e</sup> voice & increase the strength of  
it at pleasure.

## Lecture 10<sup>th</sup>

We now proceed to consider y<sup>e</sup> structure of the Trunk of y<sup>e</sup> Body  
and we are naturally led to begin with the Chain of Bones  
w<sup>ch</sup> are connected intimately with the head, support y<sup>e</sup> Trunk,  
and by their Joints guiding give motion to the whole -  
This is y<sup>e</sup> Spine (163) with regard to y<sup>e</sup> mechanism of  
the Cartilages in y<sup>e</sup> vertebrae see medicinal Essays Vol. 5. tit. 57.  
After we have seen y<sup>e</sup> structure in y<sup>e</sup> sound body, & considered  
y<sup>e</sup> reasons of each part of y<sup>e</sup> structure we are enabled to judge  
of the Diseases or accidents to w<sup>ch</sup> this part is subject by experience  
subjected. — The diminution of height 169.

Artificial Curvatures — 170. — Causes of these viz old Age 169.  
The most unnatural Curvature of wearing Stays w<sup>ch</sup> if they are  
too high or too low give uneasiness & make y<sup>e</sup> person turn over  
to y<sup>e</sup> other side, whence a curvature is necessarily form'd, &  
the disease soon grows more complicated than we might at  
first sight have been able to conceive, for the endeavour or  
effort w<sup>ch</sup> by an instinct of nature we are led to make in order to  
throw the body upon the common basis, occasions a counteracting

171.

curvature the other way, I can see you view a curvature  
 in this manner you will be apt to draw a faulty conclusion or  
 prognosis. For when it has continued for any length of Time  
 the cure is generally difficult, when taken in Time the cure is  
 to be effected. My Father used to give some Instances of y. kind  
 of a Boy who had contracted a curvature by leaning from  
 side upon a Chair w. generally stood one on one side of the Fire; so  
 had the Chair to be placed upon the other side w. ch. proved a cure  
 But in gen. if y. curvature be made sideways & in two places  
 we ought to be extremely cautious in our prognosis, as I should  
 seldom see any success from our endeavours to remedy the  
 Complaint; for what is of advantage to the one is of prejudice  
 to the other as an diff. Inclination of y. body, besides y. bones  
 on the one side are now become thinner & on the other thicker  
 than natural & we can't apply a general measure on acct. of  
 the Situation of the part.

Luxations of y. Spine happen very rarely, so that a learned  
 Person. Meckow has been able to collect only a few Instances  
 We wd. expect it to occur at the Top of the neck where it may be  
 in sev. diff. ways; If you look into Phil. Surgical notes he  
 gives a Description of this Sort: A Man lifted a Boy from y.  
 Ground by the head, the Boy struggled & soon grew pale & upon  
 letting him go he was found to be motionless & died in a few  
 minutes, so y. most probable Conjecture is, y. perhaps the  
 2<sup>nd</sup> Verteb. by the weight of the body was drawn away from  
 the 1<sup>st</sup> & the toothlike process turn'd backwards upon the  
 Spinal marrow or y. from the body's being turn'd circularly  
 round y. 2<sup>nd</sup> Verteb. was turn'd off from y. 1<sup>st</sup>. There is a 2<sup>d</sup> way  
 in w. it may happen very readily - y. 1<sup>st</sup> Verteb. may slip  
 off from y. 2<sup>nd</sup> & toothlike process remaining, but y. oblique

neck of the first separating from y<sup>e</sup> oblique process of  
 the second, & catching upon it and the membrane being at  
 the same time torn in other luxations - a Luxation  
 happened ab<sup>t</sup>. a year ago in this place - A Gentleman about  
 50. who was d<sup>o</sup>. very much, was thrown backwards in a  
 chair upon the floor on a carpet & his head did not strike  
 the ground - he had no pain in that place nor was any  
 bruise to be observ<sup>d</sup>, yet from y<sup>e</sup> very instant of y<sup>e</sup> fall  
 he found a want of motion in all the other parts of y<sup>e</sup> body  
 he could neither move his legs or arms, or assist himself in  
 any shape. yet he was sensible in the Act of what had  
 happen<sup>d</sup>. About 12. hours after he grew quite insensible  
 the eye was fix<sup>d</sup> in his head & only saw him y<sup>e</sup> 1<sup>st</sup> 2<sup>o</sup> 3<sup>o</sup> 4<sup>o</sup>  
 5<sup>o</sup> 6<sup>o</sup> 7<sup>o</sup> 8<sup>o</sup> 9<sup>o</sup> 10<sup>o</sup> 11<sup>o</sup> 12<sup>o</sup> 13<sup>o</sup> 14<sup>o</sup> 15<sup>o</sup> 16<sup>o</sup> 17<sup>o</sup> 18<sup>o</sup> 19<sup>o</sup> 20<sup>o</sup> 21<sup>o</sup> 22<sup>o</sup> 23<sup>o</sup> 24<sup>o</sup> 25<sup>o</sup> 26<sup>o</sup> 27<sup>o</sup> 28<sup>o</sup> 29<sup>o</sup> 30<sup>o</sup>  
 31<sup>o</sup> 32<sup>o</sup> 33<sup>o</sup> 34<sup>o</sup> 35<sup>o</sup> 36<sup>o</sup> 37<sup>o</sup> 38<sup>o</sup> 39<sup>o</sup> 40<sup>o</sup> 41<sup>o</sup> 42<sup>o</sup> 43<sup>o</sup> 44<sup>o</sup> 45<sup>o</sup> 46<sup>o</sup> 47<sup>o</sup> 48<sup>o</sup> 49<sup>o</sup> 50<sup>o</sup> 51<sup>o</sup> 52<sup>o</sup> 53<sup>o</sup> 54<sup>o</sup> 55<sup>o</sup> 56<sup>o</sup> 57<sup>o</sup> 58<sup>o</sup> 59<sup>o</sup> 60<sup>o</sup>

 101<sup>o</sup> 102<sup>o</sup> 103<sup>o</sup> 104<sup>o</sup> 105<sup>o</sup> 106<sup>o</sup> 107<sup>o</sup> 108<sup>o</sup> 109<sup>o</sup> 110<sup>o</sup> 111<sup>o</sup> 112<sup>o</sup> 113<sup>o</sup> 114<sup>o</sup> 115<sup>o</sup> 116<sup>o</sup> 117<sup>o</sup> 118<sup>o</sup> 119<sup>o</sup> 120<sup>o</sup> 121<sup>o</sup> 122<sup>o</sup> 123<sup>o</sup> 124<sup>o</sup> 125<sup>o</sup> 126<sup>o</sup> 127<sup>o</sup> 128<sup>o</sup> 129<sup>o</sup> 130<sup>o</sup> 131<sup>o</sup> 132<sup>o</sup> 133<sup>o</sup> 134<sup>o</sup> 135<sup>o</sup> 136<sup>o</sup> 137<sup>o</sup> 138<sup>o</sup> 139<sup>o</sup> 140<sup>o</sup> 141<sup>o</sup> 142<sup>o</sup> 143<sup>o</sup> 144<sup>o</sup> 145<sup>o</sup> 146<sup>o</sup> 147<sup>o</sup> 148<sup>o</sup> 149<sup>o</sup> 150<sup>o</sup> 151<sup>o</sup> 152<sup>o</sup> 153<sup>o</sup> 154<sup>o</sup> 155<sup>o</sup> 156<sup>o</sup> 157<sup>o</sup> 158<sup>o</sup> 159<sup>o</sup> 160<sup>o</sup> 161<sup>o</sup> 162<sup>o</sup> 163<sup>o</sup> 164<sup>o</sup> 165<sup>o</sup> 166<sup>o</sup> 167<sup>o</sup> 168<sup>o</sup> 169<sup>o</sup> 170<sup>o</sup> 171<sup>o</sup> 172<sup>o</sup> 173<sup>o</sup> 174<sup>o</sup> 175<sup>o</sup> 176<sup>o</sup> 177<sup>o</sup> 178<sup>o</sup> 179<sup>o</sup> 180<sup>o</sup> 181<sup>o</sup> 182<sup>o</sup> 183<sup>o</sup> 184<sup>o</sup> 185<sup>o</sup> 186<sup>o</sup> 187<sup>o</sup> 188<sup>o</sup> 189<sup>o</sup> 190<sup>o</sup> 191<sup>o</sup> 192<sup>o</sup> 193<sup>o</sup> 194<sup>o</sup> 195<sup>o</sup> 196<sup>o</sup> 197<sup>o</sup> 198<sup>o</sup> 199<sup>o</sup> 200<sup>o</sup>

marrow is extremely frequent, and the danger attend<sup>d</sup> upon  
them is in most part not for the most part sufficiently avoid<sup>d</sup>.  
I have attended now 9. or 10. persons in whom one particular  
part of the Spine began to swell out, in some cases of patient  
had been sickly when young, in others there was a scrophulous  
taint, & in one of swelling was in consequence of a Blow, but in the  
greater N<sup>o</sup>. no cause was assign<sup>d</sup>: but the spinal process was it  
first observ<sup>d</sup> to be enlarg<sup>d</sup> & gradually increasing the  
neighbouring Vertebra came to be affected. — The Bone affected  
the Spinal marrow & an Inflammation is communicated to the  
Membrane the dura mater w<sup>ch</sup> is found to be considerably  
thickened, & so must have compr<sup>ess</sup>d the marrow. I had an  
Instance of its proving fatal: it was at first painfull,  
& a total paralysis was but on the whole body came to be  
affected. — But I am at last to mention any probable  
means for giving relief. I've try<sup>d</sup> various methods to be  
tried w<sup>th</sup> out any considerable effect; in almost all of them  
blood was drawn repeatedly from the part. Issues were made  
very near to it, in some there was a scrophulous taint, the  
the patients took saline purgatives some the Bark,  
theu Cintra, & others were try<sup>d</sup> with a long course of the  
Dickensons pill and yet generally very little change was  
made upon the bones, and we can<sup>t</sup> expect to be very successful  
in the disease is so degenerat<sup>d</sup> — and has perhaps made  
considerable progress before the patient took advice. — In one of  
the cases the patient was about 50. Upon his death I examin<sup>d</sup>  
the part and found no such compr<sup>ess</sup>ion on the spinal marrow  
as might have been expected, but the membrane within the  
Bones was very greatly thickened, & instead of a shining  
natural appearance, was of a dark purple color. But  
it is only from attending to a vast variety of diff<sup>erent</sup> cases.

...cause is, produce it. we shall be able to give any consist<sup>le</sup> 81. 5.  
relief. I have indeed had an opportunity of a year past. the  
trial with it, proving to a greater length, & w<sup>th</sup> consid<sup>er</sup> relief,  
after 17. month had been affected for about 10. Weeks: It is  
very therefore to be more worth it, while to purchase it, any  
other yet known Medicine.

### Lecture 13<sup>th</sup>.

We proceed to examine of false vertebrae. Salspius first  
describes a disease w<sup>ch</sup> he calls Spina Bifida: it is a Tum<sup>or</sup> of  
found project<sup>ed</sup> about 1/2. An inch, of nature of w<sup>ch</sup> is of its lent<sup>ness</sup> 1/2.  
has not been well described; only it is found to communicate  
w<sup>th</sup> the Cavity of the Spine, and w<sup>th</sup> a Ligum<sup>ent</sup> is contain<sup>d</sup> within  
it; I have had occasion two or 3. times to dissect a Tum<sup>or</sup> of  
this kind, in one case w<sup>ch</sup> matter forming a part of the Tum<sup>or</sup>  
was push<sup>d</sup> out when the spinal process of one or two of the  
Vertebrae are want<sup>ing</sup>. w<sup>ch</sup> want of these has been consider<sup>d</sup> as  
an w<sup>ch</sup> cause of the Comp<sup>l</sup>. but we may rather consider it as w<sup>ch</sup>  
Effect of the disease, w<sup>ch</sup> watery Tum<sup>or</sup> separ<sup>at</sup>ed. w<sup>ch</sup> protuberant parts of  
the Vertebrae. The holes on the back part here are exceeding<sup>ly</sup>  
great w<sup>ch</sup> nerves here are very small; there is a Difficulty in  
giving a good reason for this formation, we may suppose  
w<sup>ch</sup> nerves will have more room, will be in less danger  
from rupture, or from fracture &c. but still this is not satisfy<sup>ing</sup>  
ing: & we cannot see why we are expos<sup>d</sup> to pointed Systems  
&c. in this part. — Os Coccygis. — Notwithstanding of  
what Dr. Smellie has w<sup>ch</sup> to w<sup>ch</sup> contrary, this bone becoming  
more rigid as we advance in life is one reason why  
Elderly women have more difficulty in Labor it is indeed  
a small circumstance compar<sup>d</sup> w<sup>th</sup> many others, yet it is  
certainly one: & it has been Instances where w<sup>ch</sup> Os Coccygis  
was found to be completely ossify<sup>d</sup> & yet w<sup>ch</sup> Labour was  
easy it only follows w<sup>ch</sup> w<sup>ch</sup> pulsio was sufficiently large

in other respects, for the yielding of it part perhaps  
 half an Inch must be of considerable service; When from  
 or other cause this part is press'd outwards it is br'd back by  
 the musculus Coccygeus. — *Opa innominata* — 192. This is  
 the proper place for making the comparison between the Male &  
 Female Pelvis. — From the greater laxity of parts, the  
 ossification seems to advance somewhat more slowly, & the  
 Bones in general neither become so thick nor so hard in  
 the Female as in the male: hence when two origin<sup>e</sup> pieces of  
 Bone run together, so as to form a ridge, as in the os frontis,  
 this ridge is more remarkable in the male: again if the 2.  
 pieces do not unite together, we find the want of bone more  
 frequent in the Female. From the same general cause, &  
 from the less active Life of the Female, we find the want  
 of Impressions made by the muscles on the bones being not so  
 distinct as in the male. And from the very same circumsta<sup>ce</sup>  
 of strength we find that the furrows made by the blood  
 vessels are more superficial in the female, in so much of  
 in the Osteology we always have recourse to the male Skel<sup>eton</sup>  
 for pointing out these marks in the Bones. Besides  
 this Buffon alleges that the Thorax in the Female is some  
 what deeper than in the male, if it may act more in res-  
 piration when the Diaphragm is stretch'd in time of pug-  
 nancy. But the chief difference is in the formation of the  
 Pelvis, witht. any regard to proportion it is ev'd. At first  
 sight that the pelvis in the Female is larger than that of the  
 Male, if we regard proportion, I follow the painters and  
 Statuaries, we wo. say that the distance between the  
 shoulders of a well made man compar'd w<sup>th</sup> the distance  
 between the tops of the Opa Ilii is in the proportion of three

to two. In females again they alledge it is aver'd, (86. -  
but in that circumstance they exaggerate, for the pelvis is  
never found a third wider than the shoulders.

Next let us make the more partic<sup>r</sup>. comparison. v. The Ossa  
Ilio are larger, at the Basin there is an wid<sup>t</sup>. difference of size,  
the top of the os Sacrum is a good deal broader, so that if arch  
form'd by the Os Ilium & the pubis is wider, they describe a  
wider circle or rather oval. Nay to be very partic<sup>r</sup>. the  
Cartilage between the ossa pubis is remarkably thicker, &  
that not merely increases the Diameter in it's sound state, but  
it is more readily relax'd. Next comparing the under parts,  
there is still a greater difference in the size of the opening below,  
w<sup>ch</sup>. depends upon the os Sacrum being turn'd farther back-  
wards: In a recent subject the os Coccygis is more mov-  
-able: next we observe a circumstance w<sup>ch</sup>. is generally  
overlook'd that the hole in the Back of the Os Ilium is a good  
wider: now surely larger bloodvessels and nerves are not  
needed for the Legs &c. but it is to thrust the ossa Ischia  
more outwards & at a greater distance from each other; &  
comparing the angles form'd by the two ossa pubis, they  
form very nearly a right angle, whereas in the male  
the angle is acute. By these two circumstances then, the  
Ossa Ischia are push'd farther out, on the sides of the Pelvis  
are made almost perpendicular in the female. The last  
circumstance to be notic'd, is that the depth of it's Cartilage  
in the male is much greater than in the female, & thence  
besides the angle w<sup>ch</sup>. the ossa pubis form, the space is en-  
-larg'd by that circumstance. — Next with Smellie  
who first wrote rationally, upon that subject, let us obs.  
the different proportions of the parts of the Pelvis: we

(87)

need not pretend to keep to the number of Inches, as qua-  
 rters of Inches with Smellie: only it is not circular but  
 oval, & the breadth is greater than the depth, generally from  
 B. to C. Inches, & the depth from D. to E. If we examine  
 below these proportions, when the Os Coccygis is stretch'd,  
 are nearly revers'd, tho' not exactly so as he alleges, the  
 depth below, being almost equal to the breadth above, &  
 the breadth equal to the depth. If we measure it depth  
 in different places, behind it is about 6. Inches, at the  
 sides about 4. & at the Os pubis abt. 2. Inches. These  
 are the general proportions. — Next let us compare the  
 Head of the Child with the pelvis, & endeavor to discover  
 the manner in w<sup>ch</sup> the head passes thro' the Pelvis. —  
 The Head has in like manner the Oval shape like the  
 top of the pelvis, but not exactly so, for the length is  
 greater in proportion to the sides, being 5. Inches in  
 depth or thereabouts, & scarcely 4. over. In y<sup>e</sup> uterus y<sup>e</sup>  
 head is naturally undermost, falling down by its own  
 weight, so y<sup>t</sup> it is generally y<sup>e</sup> first part of the body y<sup>e</sup>  
 enters the pelvis, & the efforts of the uterus, abdominal  
 muscles, & Diaphragm, makes it slip down, when it  
 finds most room, i. e. with the Ears turn'd towards the  
 Back & Belly of the mother, & in this way it descends  
 till it is stopp'd by the Os Ischia, & now y<sup>e</sup> direction  
 is chang'd & the top of the Head presents nearly at the  
 Vertex: the only difficulty, & w<sup>ch</sup> Smellie has not suff-  
 -iciently is to tell why the hind head presents in that  
 manner, and not with the forehead, now I apprehend  
 we can readily determine it, y<sup>t</sup> it is the wedge like  
 shape of the head, w<sup>ch</sup> gives it that determination

The vertex being rounder & more slippery than the face: the chest even in a dead Child will be pushed in, w.<sup>ch</sup> will bring this two too to be the undermost part, & y.<sup>s</sup> will still more readily happen in a living Child, where the muscles drawn into action will give the head that situation w.<sup>ch</sup> is the most favorable: it is push'd round theu you in that manner as it comes forward to the Os uteri.

## Secture 14.<sup>th</sup>

It remains that we examine these bones w.<sup>ch</sup> with the Dorsal Vertebra complete the Thorax. — Ribs their general structure demonstrated. — The Cartilages by w.<sup>ch</sup> the ribs are connected to the Sternum are essentially different in their nature from the Bone, this appears from the smoothness of the spits where they are joined to the bone: w.<sup>ch</sup> instead of the Cartilage being the rib, in a soft state, the rib has a more forcible growth, whereby the cartilage is restrain'd from growing: When they are ossify'd, this takes place in a very irregular way, beginning at a great many different places in the cartilage, & does not proceed from the Ribs. These Cartilages have a kind of imperfect joint where they bend more considerably at the Sternum & we do somewhat of the same kind when we cut the Cartilage by the rib, tho' it is not so very evident here. — We find y.<sup>s</sup> head of the rib is articulated w.<sup>th</sup> y.<sup>s</sup> Cartilage w.<sup>ch</sup> joins the bodies of the vertebra together, now why there is not upon the middle of the bodies of the vertebra, w.<sup>ch</sup> we w.<sup>d</sup> have imagin'd w.<sup>d</sup> have been a firmus prop, but the adhesion from the constant motion of the Ribs is left

Faint handwritten text at the top of the page, possibly a preface or introductory section.

Letter to the Hon. the Secretary of the Admiralty

Main body of handwritten text, likely the letter's content, starting with 'I have the honor to acknowledge...'.

222

Lower section of handwritten text, possibly a signature or a concluding paragraph.

89.  
hence, by their playing upon a soft substance; & the Subur  
of the ribs comes to be more supported, by being join'd to the  
transverse processes: besides if the head of the rib had been  
connected to the middle of a vertebra, we co. not have given  
the rib its proper degree of obliquity, they wo. have been press'd  
closer together in the flexion of the Spine, hence we co. not  
will have bend'd the body forwards, & curv'd at the same  
time. The connexion of the rib to the transverse process,  
not only adds to the security, & hinders the head of y. rib  
from starting out, but it regulates y. manner of its motion  
only admitting of that rolling motion w. the ribs possess  
in aspiration. — We find y. the obliquity of y. ribs  
is continually increasing: y. efficient cause of this, is the  
greater thickness of y. dorsal vertebra, & in conseq. of this  
the greater distance of the transverse processes: & y. final  
cause is for allowing the greater motion of the lower than  
of the upper ribs: for they are not mov'd as Dr. Boerhaave  
& such as have followed him, have suppos'd so many  
of em upwards & so many downwards, but they are all  
mov'd uniformly in one way — i. e. in inspiration upw'd  
while the Cartilages from their elastic nature serve to push  
them back mechanically, & it is in consequence of this, y.  
the body after death is always in y. state of Expiration,  
the Cartilages pushing down the ribs. For the Diaphragm  
it ascends into the Thorax, in expiration like to the crown  
of a hat, is push'd downwards in inspiration, whereby  
the length of the Thorax is increas'd from the Top: y. ribs  
are at the same time push'd out at a greater distance  
from each other, & the Sternum rais'd forwards, where-  
by room is made for the lungs to get behind y. heart &c.

We chiefly live however by the action of the Diaphragm 90.  
& Life can be continued with: the motion of the ribs or  
Sternum, w<sup>ch</sup> is sometimes very completely stop'd, & we  
have Instances where almost all y<sup>e</sup> bones of y<sup>e</sup> body  
have run together, & when the Cartilages of the Sternum  
were entirely obliterated, & their place solid bone found:  
w<sup>ch</sup> must have taken place gradually, & y<sup>e</sup> respiration  
been perform'd all the while; so y<sup>t</sup> the principal motion  
must be perform'd by the Diaphragm. From y<sup>e</sup> connexion  
of the ribs to the Cartilages, & of these to the Sternum, you  
may sometime or other meet with a dislocation of one Cartilage  
or ribs, they may be made to start from the Sternum or from y<sup>e</sup>  
ribs, & need to be replac'd as in other dislocations. Next  
from the manner in w<sup>ch</sup> the Sternum is supported upon a  
soft bed of Elastic matter, & y<sup>t</sup> the bulk th<sup>o</sup> of it is very con-  
siderable, & the strength of the parts increased from the  
consid<sup>le</sup> q<sup>ty</sup> of Osseous matter employ'd in forming it, we  
may suppose the fracture of it will be very rare, & accord-  
ingly we find very few Instances of it in Authors. where  
the fracture does happen, the bones do not pass over each  
other but are retain'd in their place by the Cartilages, so  
the Surgeon need only apply some slight compress  
to keep the surface smooth, In some Cases however  
the bones do pass each other, the one part being  
push'd within the other, we have a Case of this kind  
in Parey, & the method he had recourse to was very  
proper, he bend'd the Body backwards upon a Band  
whereby the Abdominal viscera connect'd to y<sup>e</sup> Sternum  
were put upon the stretch, & the patient making an  
effort at the same Time the pieces were disengag'd.

91.) When the ribs are broke considering the constant motion to which they are subjected, & the care that is always taken to keep fractur'd bones in a state of rest, we wd be apt to imagine that the fracture wd. not heal without difficulty: but there is no fracture in the body that heals so easily; & many persons I am assur'd have had their ribs broke with<sup>out</sup> knowing it: for here the neighbouring parts make the extension, and counter extension as Surgeons speak: or keep the ends from riding over each other, and keep the broken rib of its proper length: & farther as I have shew'd that we can live without any motion of the Ribs, the sense of uneasiness leads the person to breathe almost entirely with the Diaphragm so if the motion of his ribs comes to be very inconsiderable. One other part of the thorax has been thought a cause of much disorder, viz. the Cartilage Ensisiformis. If you look into the authors quoted in our text you will find that dangerous complaints have been occasion'd from the parts of it being turn'd into the Bowels: you'll however find no clear proof, that this was certainly the cause of the Complaint, & you will seldom or ever find it naturally turn'd so far inwards as to become a cause of any considerable Complaint, It may be broke off, & beat inwards, but it may be easily replac'd, or it will only be necessary to use some soft Substance for pushing the Bone outwards, and to keep it in that situation, till the bottom of

it shall grow together again. — I have seen it 92.  
turn'd so much outwards in some diseases as in  
Ascites, that it hurt the Teguments to such a degree as  
to occasion an ulceration of them. — The only other rem-  
ark I have to make is that you sh<sup>d</sup>. attend to y<sup>e</sup>. furrow  
that I pointed out to you on the ribs for lodging the  
Intercostal vessels, when cutting into the Cavity of the  
Thorax, for water, pus, or Air, or Blood, we wd. in such  
cases avoid the under edge of the rib, & keep near to the  
upper edge, taking care only not to hurt it so as to bring  
on a Caries: for tho' the principal trunk is secured by  
the Rib, considerable branches may come in our way.

### Lecture 15.<sup>th</sup>

We are now fully prepar'd for entering upon the Recent  
Subject, having examin'd all the Bones but these of  
the Extremities, & it is surely very nearly the same whe-  
ther we had finish'd the Skeleton, or y<sup>t</sup>. we as yet that till  
we come to the recent Anatomy of the Extremities: nay y<sup>e</sup>.  
advantage is rather in our favour, we will surely under-  
stand the muscles of the arm their insertions in y<sup>e</sup>. bones  
&c. better the day after we have seen the bones demon-  
strated than a month after seeing them.

You will now recollect what I propos'd to y<sup>e</sup>. our  
formerly as our general plan: I endeavour'd to shew  
you the impropriety, of attempting at once to investigate  
the intimate structure of each organ, this wd. lead us  
into too wide a field, & many, of the demonstrations  
wd. appear extremely unintelligible, thus if when we  
come to examine the Liver, I sh<sup>d</sup>. prevent you with

a preparation of the vena portarum and another of the Hepatic Duct, w<sup>ch</sup> I have seen done: but being ignorant of the Course of the blood we cannot understand them. So, when the recent Subject is first brought before us, we sh<sup>d</sup>. avoid <sup>the</sup> prosecution of the Blood vessels, of the Lymphatic vessels & of the nervous System. We sh<sup>d</sup>. prosecute the several Organs, divided into Clases, merely from what is obvious; we sh<sup>d</sup>. attempt to understand the general size of each, the Colour, Consistence, Situation and Connexion with other Organs: its division into gen<sup>l</sup>. Lobes and parts, & so far as we can judge by dissection, its obvious purpose, by finding the Gall-bladd<sup>r</sup> connected to the Liver, & Ducts coming out of the Liver leading to it, we say that the Liver serves for the separation of the Bile: & so much we can say without knowing anything of its preparation. In this view we are nearly at Liberty to choose our Method, & it is not very material whether we begin with the head and go downwards w<sup>ch</sup> some Anatomists; or with others w<sup>ch</sup> we begin with the Abdomen, where the Bowels are more corruptible than the other organs are: for keeping out of sight the Blood vessels there is no reason for examining the Brain before the Abdomen, or the Abdomen before the Brain. — I shall therefore take that method which I have upon experience found to be most useful. — viz. after shewing the structure of the common Trunkents,

I first explain the Eye, and the Brain, the Eye being (94.)  
ready to sink by the dissipation of the humours, & the  
Brain to become flaccid in a short time, whereas, for a  
few days, the abdominal viscera undergo very little  
change. Then I go to the Abdomen, the Thorax &c. I end  
with the Extremities of the Body. — On, I propose that  
in this Subject we sh<sup>d</sup>. examine the obvious circumstances  
already pointed out, relating to the muscles, bowels, glands,  
the Organs of the Senses, & the articulations of the Body:  
& I think it beyond all doubt proper that instead of ex-  
-amining every one of the muscles before we examine the  
Bowels, we should take them together: for we learn nothing  
of the shape and connexion of the muscles in one part:  
from knowing those circumstances with regard to them  
in another, & they are not like the blood vessels and nerves  
to be considered as one System: but dividing 'em into Claps  
as we prosecute the Bowels &c. we may attend to each Clap  
singly. So with regard to the abdomen having seen the  
Bones, we examine the muscles, then opening <sup>the</sup> Abdomen  
we examine the situation of the Bowels, w<sup>ch</sup> we can now  
describe by that of the muscles, w<sup>ch</sup> we had immediately  
seen before. I now proceed then to shew you some of the  
parts in <sup>order</sup> I have mention'd and I begin with the  
Seguments. At this meeting I shall confine myself  
to a demonstration, because where parts are very minute,  
I want to give you time to examine them fully, before I  
attempt to explain their use. & first the appearance of <sup>the</sup>  
Seguments by dissection: but I shall join with these some  
preparations, because in fact we learn more from these  
than from the mere dissection, they tracing the vessels of the

skin, I can't explain any partic<sup>r</sup>. circumstances with regard to it, only that every part of it is supplied by blood from the blood vessels that are next to it.

You all know the general parts of the Segments witht. any dissection: you have seen an insensible substance rais'd by a Blister, what we call Scarf Skin, within that there is the sensible true skin and under the true skin there is a soft elastic substance w<sup>ch</sup>. connects that loosely to the parts beneath; because we find a certain degree of resistance upon drawing it out, & upon letting it go again, it falls back to its place, & you all know there is a good deal of fat under the skin, more or less of it in different places: as also that there are a number of hairs in the skin, there are too a number of pores in the skin from w<sup>ch</sup>. unctuous matters may be squeezed out, as in the face, w<sup>ch</sup>. is expos'd to the Air and upon squeezing the sides of these a kind of sebaceous matter is thrust out w<sup>ch</sup>. looks like a species of small worm. — The cuticle is remarkably thickened in some places; as in the soles of the feet, & in general the Cutis vera is somewhat thicker in such places, it is in some measure double, or we observe within it a softer skin, w<sup>ch</sup>. in the European is extremely thin, and difficultly separated, but in the Negro it is thicker and is separated more easily: y<sup>e</sup>. substance not being expos'd to the Air renders it a good deal softer than the outer layer. — The first who describ'd

it accurately was Malpighius he tho<sup>t</sup> it was proper- 96.  
= ad so call'd Peticulum mucosum but the best name is  
Corpus mucosum: it is white and opaque, not so clear as  
the other part of the Cuticle: in the Negro the Corpus muc-  
= osum is of a darker colour, but the color is not confin'd  
= entirely to this, as has been very generally alledg'd, for  
we find it likewise on the other surface: looking still more  
narrowly, we find the inner part of the Corpus mucosum  
is mark'd with the ridges of the Cutis vera, so that it is  
extended over all its inequalities: & when the Cuticle is  
separated from the Cutis vera by dipping the part in boil-  
= ing water, we find still a degree of resistance from a No<sup>o</sup>  
of very minute fibres; & it was first I believe demonstrated  
by my father 40. years ago, & these very fibres make  
a close connexion. Next upon the surface of the Cutis  
vera we find ridges, the surface of w<sup>ch</sup> is very beautiful,  
as upon the extremities of the fingers: next upon examin-  
the cut edge of it for the thickness and consistence, we find  
that this varies a little in different places: half way in it  
is opaque, of a whitish colour, & the deeper we go it becomes  
the softer, & there is a greater quantity of Liquor in it, till  
at length we trace it into the fatty and cellular substance.  
The cellular substance forms every where Cavities w<sup>ch</sup>  
communicate with each other; & if water is collected  
under the skin, in the superior parts of the body, it falls  
by its weight to the most depending parts, & upon blow-  
in Air it is in like manner spread every where, not  
only along the surface of the Body but it also penetrates  
between the muscles, w<sup>ch</sup> are all connected loosely to  
each other, in the same manner that the skin is

97. connected to them: This therefore may be considered as  
the universally connecting medium of the human  
body. D. Haller carrying this to an extreme des-  
cribes most parts as being little else y<sup>t</sup>. Cellular  
Substance compacted together. — This Substance  
sustains the fat: it is a mistake that the fat is  
poured out into the very same cells, that in dropical  
Cases contain the water: I shall shew you the  
contrary with the Microscope: it has been figur<sup>ly</sup>  
show'd that the marrow consists of little globules,  
and that it is contain'd in shut sacs: but nobody  
has conceiv'd so of the fat, I find however that  
upon cutting a little bit of the fat and exposing  
it to the microscope, it is contain'd in like manner  
in shut sacks, flocks like a cluster of Pearl. —  
The nails we find are a part of the Cuticle, & insepa-  
-ate with it. — In the Arm pit and groin  
I find very minute Glands about the size of the  
heads of very large pins, w<sup>ch</sup> are plac'd under the  
Skin, & w<sup>ch</sup> have been little attended to, as their  
Colour is darker than the fat you may see in  
it. — When a nerve is follow'd into the Skin it  
is soon lost in very minute branches. —  
We sometimes find a growth from the surface of  
the skin, particularly in those places w<sup>ch</sup> discharge  
a quantity of viscid matter, here I shew you  
a growth from the papilla of a woman's breast.  
Another of a horny consistence, w<sup>ch</sup> I cut out from

a persons forehead. — Another w<sup>ch</sup> has lain these 98.  
hundred years or more in our Library and which grew  
in like manner from the forehead, & was cut out by a  
Surgeon, the length of it is about 7. Inches, & it seems to  
be of the same nature with the other. —  
I shall next shew you a new skin form'd, or, Structure  
of the Cicatrice of the skin, after having cut out the skin,  
& allow'd the part to heal up again: I find a vast No.  
of vessels in the Cicatrice, w<sup>ch</sup> appears more vascular than  
the skin, dow in any other part: we see vessels coming  
from all sides to it, & that these are intermix'd, but it  
remains a question whether these new vessels communicate  
with each other, as is the case with the rest of the blood  
vessels. In order to determine this I durst not trust to  
the Eye, or to the microscope, but I cut into the belly of  
an animal by a longitudinal Incision till the cavity  
of the Abdomen was fully open'd, I then allow'd it  
to heal by sewing the opposite sides together: I after  
that cut transversely above and below: I then made  
another cut parallel to the former by w<sup>ch</sup> means I had  
cut quite round a certain portion of the skin & Abdomen:  
I then injected the vessels from the heart & I found if  
there were numerous vessels fill'd in that part I had  
now cut round. — I proceed to demonstrate the ex-  
ternal parts of the Eye: & the coverings of the skull, to  
prepare us for the structure of each of these organs; &  
I begin with the head, on one side the skin taken off, we  
find under the skin above the Ear first a muscle some-  
what of the shape of a Fan with its spokes spread, &  
the narrow part connected to the Ear: 47. upper part

grows thin, & is join'd to a Tendon & lies under it. skin <sup>99.</sup>  
of the head, it is nam'd the superior auri, or attollens  
Aurem: on the fore & back part of the head we find two  
thin muscles connected by a Tendon, w<sup>ch</sup> is common to  
both, so they are call'd Occipito frontalis within the  
Attollens Aurem I get hold of a firm tendinous subst<sup>ce</sup>  
w<sup>ch</sup> is the covering of the temporal muscle: & if remov'd  
we have a fine view of that muscle: it does not arise  
ly from the Bone, but also on the outside from it. tendinous  
Aponurosis: & we find a cell<sup>l</sup> Substance only connecting  
it to the Zygomatic process. here you obs. it. if a suppur<sup>n</sup>  
begins upon the side of the head, it may appear again  
at the bottom of the Cheek, with<sup>o</sup> any appearance of an  
intermediate swelling, the matter passing down below of  
Zygomatic process. The onse pains is taken to leave this  
tendinous aponurosis in this manner if we may ascribe  
a mistake that D<sup>r</sup>. Haller & some of his disciples have  
gone into, in attempting to determine the degree of sen-  
sibility of our periosteum by making experim<sup>ts</sup> upon it.  
tendon: but the proper periosteum of the Cranium is  
quite distinct from it. Tendon & is only loosely connected  
to it: in so much it. matter may collect between them &  
spread some way before it gets vent. I shew you it. appear-  
ance of the skin of the Cranium, w<sup>ch</sup> is thick, the cellul<sup>l</sup>  
Subst<sup>ce</sup> is shorter: there is some fat, but it is harder  
here it. elsewhere, & it makes more a part of the body of  
the skin, & this greater thickness & hardness of it. skin is  
also increas'd by the quantity of the hair w<sup>ch</sup> is rooted in  
that part & passes thro' the cutis vera. — Next we wou'd

examine the muscles & external parts of the Eye. (100. 1.)

The one side of the skin is only separated & you have a very good view of the whole of the covering upon it. Eye lids made by Orbicularis muscle. Albinus has unnecessarily used two names for this, calling the inner part of it Biliary, & the outer part Orbicular but we may as well apply 20. names, as there is no particular distinction, at the inner part of the Eye is the chief connexion, where it runs into a Ligamentous subst. which is connected to the nasal process of the superior maxillary Bone — Next raising this muscle, I find Coarugator Superciliorum: & going a little deeper to examine the muscles within the Orbit I find 4. attollens palpebrar. super. the under Eye Lid falling down by its own weight — I next shew you the muscles of the Ball itself as far as can be done in this view, which I must obs. is the most useful thing in the eye we are concerned with in doing any operation upon the Eye. We find 4. are call'd straight, one above, another below, & one on each side, & which are pretty equal in size, two obliqui, viz. the Inferior & Superior or Trochlearis. — The remaining parts are fill'd up by a quantity of fat forming a cushion on which the Eye Ball is supported & plays. — Within the Orbit we also find a very consid. Gland that separates the Tears, call'd Glandula Lacrymalis, & the puncta Lacrym. into which the Tears are suck'd they w. pass into what is call'd the Lacrymal Sac.

106.

## Lecture 16.<sup>th</sup>

I have mention'd to you the Cuticle divided into two layers: 1.  
Cutis vera: under it the Cell<sup>l</sup>. Substance, or Tela Cellulosa,  
with that the fat or Tunica Adiposa, from the fat the hairs are  
sent off in most places of the body: In a few places we can  
demonstrate Glands plac'd within the Skin, the ducts of w<sup>ch</sup>  
perforate it. I need not now to mention what we find describ'd  
as a Tunica propria musculorum, because this is nothing more  
than the Subcutaneous Cellular Substance collaps'd upon the  
substance of the muscles: or of a Tunica Carnosa, or panniculosa,  
w<sup>ch</sup> is proper to Quadrupeds w<sup>ch</sup> have the power of corrugating  
the Skin by this muscular substance under it, we only find  
something like it on the head &c. as the Occipital & Frontal  
muscles, but we do not find it a common Sequent.

Let us now consider what we may conclude with regard to  
each of these Coats, First with the Cellular Substance, w<sup>ch</sup> is  
not to be describ'd as a general Covering, but rather as the  
Medium connecting covering to the other parts, as we find  
it common to all, & as I said Dr. Haller carrying this to an  
extreme undertakes to prove that many parts of the Body  
are nothing else but this condensed membrane.

I have prov'd the communie<sup>n</sup>. w<sup>ch</sup> the sev<sup>l</sup>. Cells have with  
each other: we found that it is soft and yielding, having a  
consid<sup>le</sup>. degree of elasticity: & it is found to be insensible: in  
consequence therefore of its toughness Elasticity & insensibility  
it is excellently fitted for a connecting substance it yields  
easily when any part is stretch'd, & by its contractibility  
seems to replace it: it also seems to conduct the nerves &  
Bloodvessels to their distribution on the Skin, whereby

They are less in danger of being torn from the Cell<sup>s</sup>. Subst<sup>ce</sup> (102)  
we find connected. — The Tunica Adiposa, but w<sup>ch</sup> is to be con-  
sider'd as distinct from it, just as the marrow is distinct from  
the cancelli within the Bones, w<sup>ch</sup> may be compar'd to y<sup>e</sup> Cell<sup>s</sup>  
Substance elsewhere; — Upon examining the Omentum  
w<sup>ch</sup> is intended to lubricate the surface of the Bowels I find when  
View'd thro' the Microscope bags appearing round & exceeding  
small, yet the oil sweats out, we may therefore consider this  
as an instance of what Anatomists call a follicle, & connected  
to these Bags we perceive a number of vesic<sup>l</sup>s or Exhalents,  
so it appears that the fat is in a continual state of change, &  
consum'd more particularly by Exercise & Fatigue, & as we obs.  
that the nourishment we naturally receive from y<sup>e</sup> aliment<sup>ry</sup>  
Canal is white and opaque or a mixture of oil with other sub-  
stances, there is ground for supposing y<sup>t</sup> as y<sup>e</sup> fat is absorb'd  
into the Circulating mass, it may give a similar opacity to  
the parts of the Blood; from its thus exuding thro' the  
membranes in w<sup>ch</sup> it is thus deposited we perceive several  
of its most important offices, that it serves to prevent the  
accretion of the diff<sup>t</sup> parts by being interpos'd between em,  
as it thus gradually escapes: in like manner it allows y<sup>e</sup>  
several membranes to play & slide upon each other: it fills  
up the inequalities of the several parts, whereby it gives order  
form & figure to the body: it also defends the diff<sup>t</sup> Organs of  
our body from compression in the different postures they  
assume, they being absorb'd into the Circulating Mass, &  
is chiefly consum'd by exercise, it performs more especial  
purposes, as preventing the bad effects of Exercise: I we w<sup>d</sup>  
imagine y<sup>t</sup> the fat serves for the nourishment of Animals, as  
we know fat substances are remarkably nutritious; so

The fat from the bulbs of the body may have of same effect 103.  
In dormant animals we find at the beginning of the winter  
a consid. quantity of fat accumulated, w<sup>ch</sup> is greatly dimin-  
ish'd during the time they continue in that state, as in the  
Case of Hedgehogs &c. & I think it seems very probable that  
the subcutaneous fat sweats thro' the pores of the skin, w<sup>ch</sup> is by  
no means so inconceivable as has been supposed: for this  
exudation not only takes place after death, but we find for  
instance that the Gall bladder tinges all the parts in its  
neighbourhood, & in like manner the fat may exude thro'  
the diff: pores. — From the fat the hairs are vent out, &  
upon examining the root we find the structure to be very  
curious & beautiful we obs. a Bulb, or rather an appearance  
of two, the one smaller than the other: upon the surface of y<sup>e</sup>  
Bulb we see evidently vessels w<sup>ch</sup> contain red blood dispos'd.  
If we can give the same acct. of y<sup>m</sup> as of the vessels that are  
dispos'd on the Bags, w<sup>ch</sup> contain the oil, & we find in the  
Bulb a matter varying in different parts according to the  
Colour of the hair, if we trace the hair itself we shall find y<sup>t</sup>  
each is compos'd of still smaller fibres, as in a Bristle, these  
are ty'd together by very minute fibres, along which the  
coloring matter from the Bulb passes, whether it is push'd  
in by force, or passes by such a power of attraction as cap-  
illary tubes are found to possess it is impossible to determine.  
From this structure may be explain'd sev<sup>l</sup> circumstances  
w<sup>ch</sup> at first sight appear unaccountable. Thus by age  
there is a natural change in the color of the Hair, & we can  
conceive this readily to happen if from the remaining vessels  
of the bulb becoming too small for allowing color'd matter  
to pass, in this Case the hair returns to its constituent

parts; & the ground work of the Hair in all persons is (105.)  
the same, the matter from the bulb giving the colour, so we  
can understand how alike change may be produced by  
Disease, as in Consumptions &c. Here the fat is in general  
consum'd, so there may be a want of secretion, w<sup>ch</sup> is made  
at the root of the hair, in consequence of w<sup>ch</sup> it becomes loose  
& readily falls out. — So if we attend to the Eruptions of  
happen on the skin, we shall find that these are more  
frequent in these parts, where a quantity of hair is col-  
lected than in other places, so we are led to conclude of  
Disease does not so much affect the substance of the skin  
as the roots of the hair: so of the practice of cutting out of hair  
in these cases we seem to be proper as the bulb thereby more  
easily discharges its contents. — Over the fat we have  
seen the true skin extended: in most places it is intimately  
connected w<sup>th</sup> the fatty Bags, as well as with the cellular  
Substance, so the inner side of the skin appears a great  
deal softer than the outer: it is compos'd of a vast number  
of fibres, matted together in a most regular manner, as in  
a glove, many of them we consider as proper to the skin,  
perhaps we may admit of a great part of it consists of  
cellular membrane more condensed, but at the same time  
a quantity of nerves, & a great subdivision of blood vessels  
do enter it, w<sup>ch</sup> we can inject & see divided into very minute  
branches. If we attend to the thickness in diff. places, we  
find that there is originally a difference in this respect, that  
these parts of the body w<sup>ch</sup> are the most expos'd to pressure have  
originally & within the uterus a greater thickness than the  
rest, so the back parts of the body have a greater thickness  
than the fore parts, but the vascular & sensible Substance

105.  
increases according to the force to w<sup>ch</sup> it comes to be ex-  
posed: In some places the number of vessels entering is  
greater than in others, thence the difference in color. — The  
Cellular Substance serves to join the skin to the deeper p<sup>ts</sup>.  
& when stretch'd to bring it again into its place. And ac-  
cording to the state of the body, its being expos'd to more or  
less heat &c. the skin draws itself together by means of  
a vast number of joints you observe in it, & w<sup>ch</sup> surrounds  
extremely minute spaces. Upon the skin we find its surf-  
ace very beautifully figur'd in some parts, in these chiefly  
that are apply'd to objects as on the points of the fingers,  
also in some measure in the points of the Toes: the surface  
is form'd into Ridges, & these are subdivided into Tubercles  
to w<sup>ch</sup> Authors have given the name of papilla; from the  
Analogy of what is seen upon the Tongue &c. & not only  
is the structure figur'd, but when we mean to examine  
any substance very accurately, the several risings are  
fill'd with blood, & the nerves are render'd more sensible  
by the distention, as in the case of the penis: the  
Nipple in women, & the papilla in the Tongue. —  
The uses of the skin are so very obvious that I need scarcely  
to mention 'em: by its Insensibility to Injury, it serves as  
a defence to the Animal: leading us to shun anything w<sup>ch</sup>  
gives pain, whilst by that partic<sup>r</sup> degree of feeling we  
propose in the skin in general, & in some parts more than  
others, we are enabled to judge of the nature of external  
Surfaces, moving the Body upon the skin, or the skin  
upon the body, or Object, & we may suppose w<sup>ch</sup> of papilla  
upon the skin, are rais'd in the manner I mention'd.  
The skin serves to defend the Inferior parts from too great

an evaporation, whilst by the division of the vessels upon  
its surface somewhat beautiful is continually discharg'd:  
and in the warmer Countries what passes this way exceeds  
the quantity of Urine, & we may suppose that there is not  
only a corresponding Absorption; but perhaps we may  
suppose that we receive thro' the pores of the skin a some-  
thing necessary to Life, resembling what we receive thro'  
the Lungs.

Corresponding to the surface of the Cutis Vera we find the  
Cuticle every where figur'd entering between the furrows  
of the skin, so that we must use boiling water, or must  
allow the parts to putrefy, in order to separate it. —  
The Cuticle we find to consist of two layers, the external  
which is thicker & harder, & as we observe that Nature  
changes the external covering of many Animals yearly,  
as in the Lobster, & as the nails, w<sup>ch</sup> are evidently a part  
of the Cuticle are gradually push'd forwards, & as a  
scaly matter is constantly separating from the surface  
of our body, it has been suppos'd that the body is continually  
throwing off its Cuticle, & that as one part separates another  
is form'd beneath it: I have observ'd that the colour, w<sup>ch</sup>  
is universally alleg'd to be found only in the inner  
Layer, is to be found in both; & the difference between the  
outer & inner part is very much owing to condensation,  
& to the drying of the outer part: upon drying the inner part  
we find it to be nearly the same as the outer, tho' the  
color may be partly dispos'd by the Air, & they both agree  
in their Texture; they are by no means easily corrupted:  
coming off in the form of a membrane after the putre-  
faction has advanced very far in the skin itself, & in

107) The parts beneath: the Cuticle is extremely dense, so that matters are evaporated thro' it with very considerable difficulty: whereas when it is taken off the skin itself and parts beneath soon grow dry and hard, as Anatomists frequently experience.

It is altogether insensible, & we never find that by disease it acquires Sensibility. It is well fitted therefore for protecting the Extremities of the nerves, & for allowing to apply the Skin to the examination of Objects. The only other point is with regard to the manner of its formation, whether we are to consider it as a Substance extravasated & crusted upon the surface, or organized and having vessels, but these are too small to be the subject of demonstration. Some of the latest and most accurate Anatomists, as Meckel and Haller, are of opinion, that the Cuticle is merely an humour pour'd out from the Extremities of the exhalant vessels & harden'd upon the surface of the Skin, this they infer from several obvious Considerations: viz. we do not demonstrate vessels in the Cuticle, when we inject the vessels of the Skin, & make them red: nor can we ever force a colour'd matter thro' the pores of the Cuticle in a dead body, without making a separation of it: & when a Blister is apply'd the water gets between the Skin and Cuticle, so they conceive that the water is naturally pour'd out there, but that now the Quantity being increased a separation ensues, the water not passing so fast thro' the inorganic pores, as it is pour'd out by the

108.  
of talents: & when the Blister is cut & the Cuticle re-  
-mou'd in a few days it is again found. So much for the  
probability of their opinion; I apprehend however that  
if every circumstance is held in view we shall form a  
very different conclusion concerning it: The first; we  
are by no means to admit that the Cuticle wants vessels  
because we cannot demonstrate them. For we find the  
Dornes of the Eye, the Cartilages of many other organiz'd  
Substances into w<sup>ch</sup> we can push a little Injections;  
neither are we to say with Meckle that if the Cuticle  
were organiz'd, the compression wo. stop the passage of  
Liquors thro' it, as in the pul, it is no doubt wonderful  
that compression sh. not have a greater effect than it has,  
yet the same reasoning wo. apply to a want of vessels in  
the Cutis vera w<sup>ch</sup> is equally exposed to pressure.

In like manner when we apply a Blister if we co. prove  
that the Blister had no other effect, but to occasion the  
effusion of a quantity of Liquors, the separation of the  
Cuticle co. not upon the other supposition be very well ac-  
-counted for: but persuaded of the Organic Structure, I have  
repeatedly examin'd the matter, & find that it is not the  
useless & hurtful part alone that passes out here, but that  
the Lymph Serum of the Blood are discharged, & it happens  
here as when we irritate any sensible part & inflame  
it, as when the Eye is irritated, not merely the Serum &  
Lymphatic parts are effus'd, but if irritation continuing,  
the red parts of the Blood pass into y<sup>e</sup> cellular substance  
likewise: so the vessels are considerably alter'd & chang'd,  
The weaker give way, their continuation is broke off, &  
Liquor effus'd which is by no means natural. And

109. The regeneration of the Cuticle only shews that of  
Cutis vera is capable of supplying it, & that of divided  
vessels are again continued: so let us compare the  
Cuticle with the nails, as we to consider these as pro-  
-duced by an exsudation, we see a regular structure;  
fibres growing lengthways, & we may suppose the  
vessels of the Cuticle may be equally organic as those  
of the nails. Let us also examine the Analogy of other  
parts, where the Cuticle is continued, in the Stomach  
and Elementary Canal, w<sup>ch</sup> are covered in like manner,  
so that we may suppose the common Teguments  
pass down into the Elementary Canal, & that there  
is a similarity of structure, only the Vessels are  
larger in the one part than in the other, & the quantity  
of matter they pour out more considerable. Besides  
we can perceive little holes dispos'd upon the ridges  
of the skin: Upon tying the finger loosely there is  
a greater effusion produc'd, & we can plainly per-  
-ceive that the exhalent vessels penetrate into the  
Cuticle: I do therefore conclude that these fibres I  
shew'd you passing from the Surface of the Cutis vera  
are the continuation of the exhalent vessels of the Skin:  
That the nerves do not enter the Cuticle appears pro-  
-bable whether we attend to the Dissection of skin or to  
the properties of the parts.

I proceed to the demonstration w<sup>ch</sup> I began with Yes-  
-terday of the Eye. — The Eye lid is a doubling of the Skin  
w<sup>ch</sup> is inverted at the edge of the Eye lid, & then laid  
over the forepart of the Ball, so that the common  
Teguments form the edge of the Eye lid, they become

indeed a great deal thinner, but the same general (110.)  
structure remains and the vessels skinning thro' communi-  
cate their colorance w<sup>ch</sup> we find y<sup>t</sup> where an Inflamm<sup>n</sup> attacks  
the Eye, the loose skin within the Eye lid swells out so  
sometimes as almost to cover the whole of the Corner. —

In the doubling of the Eye lid I find a firm substance, the  
shape of w<sup>ch</sup> you see when I turn out the Eye lid; it is intend<sup>d</sup>  
to prevent the Eye lid from winking, to stretch it properly,  
I make it take the figure of the Ball, this is call<sup>d</sup> y<sup>t</sup> Sclerony  
Cartilage, & is largest in the upper Eye lid, w<sup>ch</sup> chiefly profess  
= motion. Immed<sup>ly</sup> within the hairs upon the Eye lid we  
perceive a vast N<sup>o</sup> of small openings, y<sup>t</sup> are just visible to  
the naked Eye, they are the mouths of ducts w<sup>ch</sup> are situated  
upon the Cartilage below the inner skin: their length is  
nearly equal to the breadth of the Cartilage, & y<sup>t</sup> matter they  
contain appears yellowish when we look at y<sup>t</sup> ducts lying  
upon the Cartilage, but upon squeezing the ducts we find  
it whiter: these ducts prevent the Injury y<sup>t</sup> w<sup>o</sup> arise from  
the meeting of our Eye Lids, by lessening the friction.  
These are very often the Subject of disease, when y<sup>t</sup> Eyes  
are tender: & we are oblig<sup>d</sup> to supply the want of y<sup>t</sup> matter  
hence the use of Ophthalmic Ointments.

### Lecture 17<sup>th</sup>

Merely a demonstration of the Brain, & any Criticisms  
that were made were again mention<sup>d</sup> in

### Lecture 18<sup>th</sup>

The Brain and Cerebellum form a very principal part of  
the nervous System, w<sup>ch</sup> we are afterwards to examine &

M. to consider very particularly. I shall therefore  
take notice only of such uses of the parts as are  
obviously deduc'd from the simple dissection of 'em.  
When cut the Cranium circularly we find a very  
considerable Adhesion of the inner membrane, *i. e.*  
Dura mater to it, & when it is drawn a sunder  
we obs. a vast number of red points, w<sup>ch</sup> are the  
extremities of lacerated vessels, & hence we conceive  
that the dura mater serves as *i. e.* external peri-  
-osteum to the inner table of the skull, & for use  
as foreign to it is that of supplying the bone with  
vessels: so conclude *i. e.* Surgeons in performing  
operations, as using the Trepan sh. be extremely  
cautious not to detach men of it *i. e.* is absolutely  
necessary: for the same consideration *i. e.* we avoid  
to scrape the periosteum from a Bone, viz. lest  
we sh. bring on a Caries. — We obs. further  
that there can be no such motion of *i. e.* dura  
mater as was formerly alleg'd, & upon attend-  
-ing to the communication w<sup>ch</sup> the vessels upon  
the opposite sides of the skull have with each  
other, it appears probable *i. e.* the affection of the  
external membrane may disorder *i. e.* dura  
mater: but not however in such a degree as M<sup>r</sup>  
Pott has supposed: where the pericranium is  
separated by violence the dura mater will be  
detach'd too, but this is not from *i. e.* commun<sup>ty</sup>  
of the vessels, but from the same violence affect<sup>ing</sup>  
both: in such cases we find *i. e.* dura mater adher-  
-ing. As the thickness of the dura mater is more

112  
considerable than the external periosteum we are led  
to conceive it serves as a soft cushion to defend the  
very tender substance of the Brain. I next made about  
into a vessel call'd sinus, w<sup>ch</sup> we found to be of. I think  
of a vein cover'd by the dura mater, & we observ'd the  
small branches entering at the sides of that: we shall  
afterwards find several useful purposes serv'd by  
this structure, that the vein is greatly strengthened by  
it, & several dangers thereby avoided: and the small  
branches passing obliquely thro' the dura mater, w<sup>ch</sup>  
oblique passage serves the office of valves.

We next took asunder the 2. hemispheres of w<sup>ch</sup> Brain,  
and found a process of the dura mater going down to  
a considerable way betwixt them, & from observing w<sup>ch</sup>  
appearance of the dura mater we see some foundation  
for saying that this is a double membrane, the two  
layers of which adhere very closely, & the middle  
parts are softer & connect'd by strong cellul<sup>l</sup>. threads.  
Raising the Brain from the Cerebellum we found a  
similar membrane stretch'd betwixt em: w<sup>ch</sup> evidently  
presents one part of the Brain from gravitating upon  
another in the different postures of the body: while 're  
two membranes, the falx and Tentorium mutually  
support each other: & in some very large and swift  
animals we find this partition form'd of Bone.  
Going still deeper we find that the dura mater runs  
down into the spine, serving the same office to the  
Spinal marrow as to the Brain in general, & lastly  
we obs. where the nerves go out to the external parts w<sup>ch</sup>  
Membrane is wrapt close about them as in w<sup>ch</sup> Optic

113) now when this membrane terminates in the  
Sclerotic Coat. — Next we describe the app-  
-earance of the surface of the Brain & Cerebellum:  
both are very much convoluted, but particularly the  
Cerebellum the evident purpose of this is to increase  
the external surface in order to give room for the  
very minute divisions of the blood vessels for the  
pia mater, or vascular membrane descending  
between each of the convolutions: and the several  
doublings of the Pia Mater are kept together by a  
very fine coat without vessels, the Arachnoid, w<sup>ch</sup> is  
connected to the Pia Mater by cellular substance:  
I we may consider it likewise as depending the  
very tender vessels of the pia mater. — Perhaps  
further the Arachnoid Coat may prevent concretions  
better than a membrane with a great number of  
different vessels, & we find that nature guards ag-  
-ainst the Contact of the dura Mater w<sup>th</sup> the surface  
of the Brain by the interposition of a Liquor. —  
If the Liquor w<sup>ch</sup> at any time be collected in un-  
-usual quantity so as to form a Hydrocephalus  
Externus, the water w<sup>ch</sup> fall down into the Spinal  
Marrow, between the two membranes in conseq.  
of w<sup>ch</sup> the vertebra may be push'd outwards so  
as to give the appearance of the Spina Bifida, so  
that this may depend upon a Dropsical dispos-  
-ition, whether of the spinal marrow or of the  
Brain: It does not however in all Cases depend  
upon a general disposition of conoading matter; or

upon a diminished Absorption: for the water may be <sup>(111.)</sup>  
confined to a particular part of the spine, perhaps proceed-  
ing from a certain degree of Inflammation & a concretion  
of parts in consequence of w<sup>ch</sup> a watery Tumor may be  
formed. Next cutting into the substance of the Brain &  
Cerebellum: we obs. that the Cortical or Circutious  
substance is by no means so thick as we are apt to conceive  
it: the Deception is owing to the convulsion convolutions  
of the Brain, the thickness being only about 1/6. part of an  
Inch. — The Cortical substance has very when the  
pia mater immediately apply'd to it: next y. medullary  
substance is every where connected with the Cortical, so  
that we can't shew medullary fibres with<sup>out</sup> being able  
to trace them back to a Cortical Substance, or a Cortical  
Substance w<sup>ch</sup> does not form medullary.

We next trace the fibres of the medullary substance, w<sup>ch</sup> we  
can see with the naked Eye, & we can see y. the nerves  
are every where their Continuation, but I obs. to you that  
all the medullary fibres are not continu'd to form nerves;  
some of 'em are continu'd in a direction that is the most  
unfavorable to the formation of nerves, & the fibres that  
compose the Substance of the Brain and Cerebellum  
is much greater than that of all the nerves join'd together.  
Within the Brain we find many Tubercles: & there seems  
to be a necessity some how or other, for reasons that  
perhaps we can't conjecture, that y. several Tubercles be  
kept from adhering to each other, Hence we find ventricles  
within the Brain; & as it is use to observe these Hollows for  
the sake of Diseases particularly of water collected there:  
I to judge how far it will be proper to follow Surgeons

in Operations they propose to perform here: you have seen their place and manner of communication: I have demonstrated that the two lateral ventricles communicate with each other, under the Anterior Crus of the Fornix, between these and of. Chorioid plexus, the communication large enough to receive a large sized Quill. at the same they communicate with the 3. ventricle, the hole being open underneath. & that the third by the *Iter ad quantum ventriculorum* communicates with the 4<sup>th</sup> so that P. D. Haller is mistaken in denying the communication of the lateral ventricles: & he was probably misled by some affirming that they had found water collected in one ventricle and none in another; w<sup>ch</sup> may have been the Case: Thus we can suppose such a Degree of Inflammation to have taken place as to have occasion'd a concretion of parts: or a Scirrhous Tumor might occasion it: — But accurate observations of this kind have not been made: & the water might run out from the one ventricle into the other, in consequence of which it w<sup>o</sup>. be collaps'd: so that this Circumstance gives the greatest & clearest proof of the communication. — He is also mistaken in alledging that the fourth ventricle communicates with the Spinal Marrow: probably he was misled by Ruysch who upon opening the Spina Bifida found the water to run down from the head, but the water must have

110  
been collected between the Pia Dura Mater: or if  
we shall we find that the water in the ventricles com-  
municates with the Spinal marrow, such a aperture  
has taken place, as sometimes happens in y. Abdomen  
in the Case of the Ascites; the water breaking out where  
there is the least resistance. It is pretty certain that  
the Glandula pituitaria is of the same nature w<sup>th</sup> the  
Lymphatic Glands in the rest of the Body.

From the Situation of water contain'd within y. ventricles  
you will I apprehend at once reject the proposal of  
perforating into it with a Trocar, there is no success to  
be expected, for before we reach the water from the side  
of the Brain, we must wound it to a great depth, if we  
keep in the middle we must wound y. Corpus Callosum.  
But suppose that by a wish a person could effect the  
evacuation of the water; that any circumstance wd.  
produce Death, by allowing the parts to collapse:  
& therefore as water happens 20. times at least for once  
in any other place, the perforating the skull will seldom  
be of use; & if upon making an opening at the side  
of the Cranium, we find the water is much deeper: we  
ought to push our Enquiries no farther.

Having fully examin'd the Eye with the Ossanium &  
its contents, We proceed to examine the other parts:  
Beginning with the Abdomen, naming first its mus-  
cles, then its viscera: The Thorax: Jaws: & Throat, and  
finish with the Extremities. At this meeting I propose  
to shew you the muscles of the Abdomen.

The spermatic Chord does not pass thro' y. internal  
oblique according to Douglass, but passes lower as

117. Albinus describes it; so that the ring is only in the external oblique. — You can have no difficulty of understanding the action of the abdominal muscles, without premising more than a few of the most simple observations, such as one upon thinking a little readily recollects. You know that the muscles are composed of fleshy fibres or threads: to allow the general body of the muscle to play with ease, there is a thick coat over it of Cellular Substance, w<sup>ch</sup> collaps<sup>d</sup> gives the appearance of the membrana propria musculorum, but as every fibre is active, & as the fibres are not only swell<sup>d</sup> out, but are thrown into a zig zag form, to allow of this the Cellular Substance dips in between all the fibres of our Body, most of the muscles are of a red colour w<sup>ch</sup> they receive from the blood circulating along the fibres, but that is not essential to the proper effect of a muscle, for the flesh of a fish is white, & in the human body some parts possess a muscular power w<sup>ch</sup> have a very different color: but we generally find the muscles of this color, more especially those that serve for the general motions of the Body, & its Extremities. Next in the few examples you have seen you have constantly observ<sup>d</sup> that the muscles begin and end tendinous. I explain<sup>d</sup> the use of Tendon formerly: & of fibres from some necessity

of nature, are bulky and tender, hence a vast number  
of 'em are needed, and room is not given for *y.* insertion  
of them all, so the Tendons serve the same purpose *y.* a  
rope does to a number of men in pulling any heavy  
substance. These Tendons run nearly in *y.* same direc-  
tion with the flesh, & hence it is generally conceiv'd *y.*  
they are nothing more than a muscular part harden'd,  
and accordingly when the muscles are press'd we find  
them Tendinous: but notwithstanding *y.* *y.* apparent  
continuation, they seem to be rather originally so  
form'd; for in the youngest Status we find the inter-  
section form'd. In the Temporal muscles for instance  
the fibres of the Aponeurosis run in a diff.<sup>t</sup> direction  
from the flesh. But whether made originally out of *y.*  
muscle, or a substance essentially different from it, *y.*  
only circumstance w<sup>ch</sup> I need to insist upon at present  
is: that the Tendon has no contraction, so *y.* *y.* motion  
depends upon the length of the muscular fibres entirely;  
& the extent of the motion is in proportion to the N<sup>o</sup>. so  
Piscain run into a strange mistake in reckoning *y.*  
strength of the muscles from their weight. Every muscle  
in Action endeavors to contract: but while the muscles  
are in their strongest action they are lengthen'd out: &  
we can overcome perhaps with the force of our Arm  
100. but we can also allow 100. to overcome the force  
of the muscles of the Arm: & we shall scarcely find *y.*  
the muscular Energy is so suddenly thrown in as to  
overcome the resistance of both Extremities at *y.* same  
time

119. it passes in so gradually, that it ceases when the one yields, & thus we raise the Limbs alternately, the Terms therefore of Origin & Insertion of a muscle is improper, for what is origin in one part is insertion in another. Now these evident facts being mention'd, for I need scarcely say any thing with regard to the power of muscles in shortening themselves: with regard to their being hollow Bladders & inflated, that they can never shorten more than one third &c. for in many instances I shall shew that they shorten a great deal more, thus I can thrust my whole hand into my mouth, & then I can contract it so as to grasp, when the contraction is six times. I shall begin with the straight muscles w<sup>ch</sup> are most in view. As this is pushed out into a convex Line when it acts it brings itself straight, & therefore pushes in the Belly & compresses it. Next suppose it is brought to a straight Line, & that we are in the state of a full inspiration, it will draw down the lower Ribs, & assist in expiration: but if after the Ribs are br<sup>d</sup>: down, we wish to bend the Thorax, or to push any thing away before us, we move the whole upper part of the Body by means of it, or we draw the Body nearer to the pelvis. The last effect is that if the Thorax that if the Thorax be fix'd, the Pelvis will be drawn up towards the Thorax, thus a person can throw his heels over his head upon taking hold of a Bar of Iron suppose with his hands: the Dynamid-als concurs in producing this effect and serves further to compress the Bladder &c. With regard to the

190.  
Oblique their action may be added to the greatest simplicity: for the External Oblique has its fibres in the same direction with the Internal of the other, so may be consider'd as forming one Digestive muscle, & so with regard to the other two, when I draw down the Thorax or raise the Pelvis with a Degree of obliquity these muscles are employ'd; but in other respects their action is similar to that of the Pecti, for if I act with them all the slanting direction of the one Balancing that of the other the body is mov'd straight. — The remaining muscle is the Transversalis, its action is very much confin'd to the contraction of the Belly, it is contain'd in sheaths, & the effect of these is to increase the action of the Pectus muscle, & we accordingly do employ the Transversalis when we want to have its action more considerably increas'd.

By the action of the Abdominal muscles, the Contents of the Belly are carried downwards, delivery is assist'd, the Circulation of the Blood thro' the Viscer's promot'd, & when we act with the Abdominal muscles violently we throw the contents of the Stomach upwards by vomiting: also in Expiration while the ribs are replac'd by the Elasticity of the Cartilages, the Diaphragm is replac'd by pushing the Belly inwards.

### Lecture 10<sup>th</sup>

Within the Peritonaeum, besides the passage of the Blood vessels, & nerves, we find the Bowels serving 3. different purposes. — viz. those that serve for reception or preparation of the Element so call'd the Chylipoetic

121  
Viscera, or the stomach & alimentary canal, as also  
other viscera, that are assisting to this, & w<sup>ch</sup> pour in Liguors  
into the cavity, as the Liver & Pancreas, & we shall perhaps  
find it probable that the Spleen is subservient to y<sup>e</sup> Liver  
in preparing the Bile; when the Chyliferous viscera are  
removed we find the urinary Organs; & at the undermost  
part of the General Cavity we find part of the Organs of  
Generation, & to allow an easy motion, we shall find a  
quantity of fat, & an organ nam'd Omentum. With reg<sup>d</sup>.  
to the Structure of the Umbilicus it is easily conceiv'd a  
Fetus in utero swims in water, but it must somehow or  
other be connected to the Mother: & the connexion is made  
by a Chord of vessels w<sup>ch</sup> passes out at this place, consist<sup>g</sup>  
of two Arteries w<sup>ch</sup> are sent upwards from the Placenta & go  
out at this place, & a vein w<sup>ch</sup> enters at the same side;  
but immediately alters its direction, & runs up to the  
Liver. Now had either of the vessels pass'd directly thro'  
the Cavity of the Abdomen, the course of the Liguors  
might have been disturb'd by the motion of the Bowels,  
so they run on the outside of the Peritonium in y<sup>e</sup> Cellular  
Substance, & perforate the Linea Alba, or tendons of the  
Abdominal muscles, so the umbilicus is nothing more  
than a hole in the Tendons: & the vessels carry with 'em  
a thin sheath continu'd from the buttle: so after Birth  
there being no circulation in these vessels they cast off  
at the Umbilicus, & the opposite sides growing together  
form a little knot w<sup>ch</sup> makes a prominence at y<sup>e</sup> part:  
We find in the Adult nothing more than the Arteries  
shrink into a Ligament towards the pelvis: the rema-  
-ins of the Umbilical vein are better seen from this

circumstance that a doubling of the Peritonaeum supports it. — Hernia may happen here the Bowels may be pushed outwards covered with the Peritonaeum. — The 1<sup>st</sup> thing that comes into view when I lay the Belly open is the Omentum. — it never reaches so low as it is describ'd by Anatomists, & they are deceiv'd from the change which happens to the abdominal viscera, with reg<sup>d</sup> to their situation when we open the Body, the cooling of the Air in y<sup>e</sup> aliment<sup>l</sup> canal allowing them to subside, & further upon y<sup>e</sup> influx of the external Air every part subsides according to its Force, & a Collapse takes place here similar to that w<sup>ch</sup> happens to the Lungs upon opening the Chest; It is not continued farther than y<sup>e</sup> Umbilicus, the Intestines below that lay directly upon the Peritonaeum. — Stomachs, like to a Bag pipe with the large end towards the left side. — What is nam'd the Anterior side is rather the superior, when the Stomach is moderately distended; & the 2<sup>d</sup> curvatures may be consider'd as Anterior & Posterior with regard to their situation: also the orifices approach nearer to one another when the Stomach is moderately full, the Cardia being then not two Inches higher than the Pylorus. — It is not very necessary to distinguish that part of the small Intestines nam'd Jejunum, from its being supposed to be empty of Chyle, from that part nam'd Ileum, & Physicians seldom make y<sup>e</sup> distinction, comprehending both parts under the name of Ileum: so they call it an Ileac passion whatever part of the Gut may be affected. — The Intestines are nearly, but not altogether of a cylindrical shape when distended, their Coats are thin, & as you go down they gradually become more pellucid.

we can easily understand the formation of the  
\* Omentum

Paying no regard to the names w<sup>ch</sup> have been borrow'd (123.  
from Quadrupeds: we w<sup>d</sup>. say that the Ileum went  
into a great sack, w<sup>ch</sup> makes the Beginning of an Intestine  
universally nam'd the Colon, this enters the Caput Coli  
nearly at right Angles: then the Colon is lengthen'd out  
some way, & is lodg'd in the hollow of the Os Ileum, & this  
we w<sup>d</sup>. name the Caput Caecum Coli, & from y<sup>e</sup>. part goes  
of the appendix vermiformis. — In the Colon we find 3.  
portions of a Circle joining together to form it: & we find it  
drawn in between these Circles by cords running longit-  
udinally w<sup>ch</sup> have been nam'd Ligaments, but they are  
in reality muscular organs, & become broader as we descend  
towards the Extremity of the Gut. To explain the manner  
of the formation of the several Ligaments, then we find y<sup>e</sup>.  
Peritonaeum lining the Os Ileum, & following it, we find  
y<sup>e</sup>. it next comes forwards to cover the side of the Colon,  
where it ties it down, so y<sup>e</sup>. the substance call'd a Ligament  
is only the Continuation of the peritonaeum & the surface of  
the Bowel appears smooth & shining in consequ<sup>e</sup>. of its being  
cover'd with the peritonaeum, in the same manner that  
the Abdominal Muscles are. Then passing over y<sup>e</sup>. Gut  
& falling down upon the opposite side it forms the mes-  
entary, w<sup>ch</sup> is only the peritonaeum doubled, y<sup>e</sup>. it rises  
to form the mesocolon; & having seen the mesocolon and  
mesentery form by the peritonaeum, we next have y<sup>e</sup>. meso-  
colon over the colon to form the omentum, in like manner  
the Liver is cover'd by the peritonaeum, & a doubling goes  
down to the Stomach & forms the small Intestines Omentum,  
& y<sup>e</sup>. continu'd down from the Stomach forms the large  
Omentum, w<sup>ch</sup> receiving vessels & these separating fat,

124. 101.

## Lecture 20<sup>th</sup>

We proceed to examine the structure of the Bowels: 1<sup>st</sup> of the  
Alimentary Canal. — It is in general compos'd of 3.  
or as Anatomists for the most part reckon of 4 differ<sup>t</sup> parts.  
The external Coat is the continuation of the peritonaeum. —  
The 2<sup>nd</sup> is the fleshy or muscular, consisting of two rows of  
muscular fibres, one row dispos'd longitudinally, & w<sup>ch</sup> are  
exceedingly minute, but the inner layer of the fibres, & the heads  
of w<sup>ch</sup> are dispos'd circularly are very evident. The 3<sup>rd</sup> coat,  
the innermost one is generally nam'd villous: & this is  
connected to the muscular by what has been describ'd uni-  
-versally as the 4<sup>th</sup> Coat under the name of nervous, but I  
rather consider it the medium sewing to join these and  
resembling the subcutaneous cell<sup>l</sup> Substance, or w<sup>ch</sup> sewes  
the same office to the Intestines, w<sup>ch</sup> & subcutaneous cell<sup>l</sup>  
membrane does to the skin, in several respects however it  
seems different it wants the fatty Bags connected to the  
cell<sup>l</sup> subst<sup>ce</sup> & the threads are shorter, so we may follow  
Dr. Haller's description in saying w<sup>ch</sup> within the muscular  
Coat is a cell<sup>l</sup> subst<sup>ce</sup> w<sup>ch</sup> of nervous coat & w<sup>ch</sup> an other  
cell<sup>l</sup> subst<sup>ce</sup>. — On incising the small Intestines there  
are a N<sup>o</sup> of Bags or doublings of w<sup>ch</sup> villous & nervous Coat,  
w<sup>ch</sup> make a resistance to the contents w<sup>ch</sup> valvulae connid-  
-entes, by stretching them we can make the Gut smooth,  
but it requires some force to do this, & it is likely w<sup>ch</sup> they  
retain pretty constantly their place; probably the Villi  
are again lesser vessels similar to the larger, at least the  
Surface by means of the villi is very greatly increas'd:

125.  
The number of the Pugs or valves in the small Intestines  
are continually diminishing as you descend, & the appearance  
of the villæ are always in proportion to the appearance of the  
larger valves: & in the larger Intestines there is not much room  
for speaking of either. — When the small Intestines are join'd  
to the larger, we find a strait place or valve, w<sup>ch</sup> is of a very curious  
texture: You may imagine that the end of the Ileum w<sup>th</sup> all its  
Coats but the external enters between transverse or circular  
fibres of the Colon, w<sup>ch</sup> gives an oblong shape to the valve, & y<sup>e</sup>  
more you distend the Colon the more you straiten that valve,  
the circular fibres trying the more to bring themselves to a  
straight Line. But besides this, the membranes at y<sup>e</sup> sides,  
or ends of that valve are put upon the stretch w<sup>ch</sup> brings the  
two Lips to apply to each other: so faces lodg'd in the Caput  
Cacum Coli will not readily return thro' this valve.

The Appendix Vermiformis may be considered as y<sup>e</sup> beginn<sup>g</sup>  
of the Colon, as in the Fetus it lies in the same direction:  
but the weight of the Faces gradually push it down, so y<sup>e</sup>  
the Appendix in the Adult comes to make y<sup>e</sup> side of the Colon.  
In the whole tract of the Intestines, from the mouth perhaps  
downwards, we find a vast quantity of slime or mucus: For  
the separation of this, there are a vast number of exceedingly  
minute Glands, most of which & much more readily the  
Ducts from them, from their smallness escape our obser-  
vation; but in many places we can see the Bags contain<sup>g</sup>  
the Slime, as in the mouth of the Stomach, in y<sup>e</sup> Duoden-  
um, jejunum, Caput Coli, & in the appendix vermiform-  
is. In some Subjects they are vastly more distinct than  
in others.

120.

## Lecture 21<sup>st</sup>

We shall now stop to consider some of the principal things that we have seen with regard to the structure of the *Physiologiae viscerum*, & the division of the abdomen made by Physicians into certain regions in order to direct a little better in the application of remedies. — as the

Epigastric, behind which lies the stomach, & under it a share of the middle Dick of the Colon; & at the sides the Liver, Spleen & Pancreas, the turn the Colon makes on both sides with a share of the Kidneys.

Umbilical, containing the upper part of the small Intestines, with the sides of the Colon: & behind in the Loins the lower part of the Kidneys.

Hypogastric, containing part of the small Intestines, the under part of the Colon, Rectum &c.

The peritonaeum is a single membrane, so far as it is to be considered as a membrane: & owes its double appearance to the Condensation of the Cellular substance, & in some cases it has a morbid appearance, & we find a similar appearance in other parts of the Body. The Cellular substance very often ties it to the other parts, & it not only ties it to the other parts, lines the muscles but covers almost always the different viscera so as to give them an external Coat, & if we suppose a very accurate dissection made, & this Coat separated, we leave the peritonaeum entire & the Bowels upon the outside of it between the Peritonaeum & Spine: The various Substances therefore called Ligaments or supporting membranes are merely

27) The continuation of the peritonaeum, *y.* mesentery  
and mesocolon are a doubling of it; but *y.* Omentum  
has the peritonaeum quadruple: Dr. Haller describes  
it as a double membrane, & if you suppose the  
Colon drawn away from the stomach and the  
Omentum put upon the stomach it is only double:  
but take it as it lies over the Intestines, or if you  
open the Abdomen & cut thro' the Omentum, you  
cut thro' the peritonaeum 2. times, one doubling of  
it being produced from the stomach, and the other  
from the Mesocolon. The small Omentum is how-  
ever but double because it is form'd entirely from  
the Membranes from the Liver, which cover the  
Stomach only. Next you will observe that the  
small Omentum with both parts of the large  
Omentum, with the covering of the stomach,  
Colon & pancreas form one great sack which  
has no communication with the rest of the  
Abdomen but by the foramen of Winslow.  
I observ'd that the Bowels had a different  
situation after we open the Body from what  
they have in life; so *y.* tho' we speak of the  
Cavity of the Abdomen there is no such Cavity  
in it as appears in a dead body, it is quite  
full, & does not contain above a Teaspoonful  
of Liquor: so *y.* it is a difficult matter to open *y.*  
Abdomen without wounding the Bowels there-  
fore the thrusting in a Trocar is a very dangerous  
operation in a sound Animal, and it only

128.  
becomes safe when the parts are separated as in Secter  
by a collection of water, w<sup>ch</sup> goes between the Bowels and  
Abdomen, the mesenterij and Mesocolon keeping the  
Bowels connected to the Back bone, while the fore parts  
yield to the distention. — Whenever water is collected  
in the Abdomen it is in the Cavity of the Peritonaeum:  
& as that can be traced the whole extent of the Abdomen  
the water varies its situation according to the Situation  
of the Body: from this Circumstance Surgeons may  
discover a collection in the open Cavity, from its being  
in particular viscera. As it may happen y<sup>e</sup>. y. foramen  
of Winslow may be inflam'd & the sides of it grown  
together, & that after this water may be collected in y<sup>e</sup>. sac  
into w<sup>ch</sup> it opens, & w<sup>ch</sup> I have said is bounded by the  
Stomach, Mesocolon, & Omentum, & as it wd. not be easy  
from the feet to distinguish the seat of the water, a Surg.  
ought to be cautious in treating dropical Cases, he  
ought to enquire into the History of the Case, & he will  
probably find that the swelling was chiefly at first  
about the stomach & then fell downwards.

Therefore Surgeons generally open the left side from y<sup>e</sup>.  
consideration that the Bowels will fall least down  
there: but I wd. observe that the spleen is a more movable  
Body than the Liver, may be in a scirrhous state, &  
considerably enlarg'd. There is a Case of this kind mention'd  
by my Brother in his Treatise on the Dropsy, where the  
Spleen weigh'd about 120<sup>lb</sup>. and in that very Case the  
Paracentesis was perform'd, & it was found that y<sup>e</sup>.  
outside of the spleen had been wounded by the point

129. of the Intestines: so that there is <sup>not</sup> much in this reason for preferring the left side: but I apprehend we ought to prefer the right side on another Account tho' there may be no obnoxious Bowels; namely to favour the evacuation of the water that may be contained in the Large sack I mention'd by the foramen of Winslow. Let us next proceed to consider the particular Bowels, & I shall begin w<sup>th</sup> these we have not fully examin'd, the Elementary Canal, w<sup>ch</sup> I have said is compos'd of 3. or 4. Coats. The first Coat which it has from the Peritonium, by its smoothness allows one part to slide readily upon another: it does this the better that every where from its surface a secretion is made by pores which are invisible, Winslow describes them as if he had seen them, but that is a mistake, for I never ed. in a round body see Cylands in the Peritonium, but from every part of it we can squeeze out a Liquor; & there is a farther addition made to this from the fat of the Omentum. Next we wd. say of this covering gives all the hollow Bowels a very consid<sup>ble</sup>. additional strength, so that they don't so readily give way to air distending them. besides there are fewer vessels in this membrane, whereby it is less favourable to concretions forming in the abdomen, we find the outer Coat join'd to the muscular by Cellular Substance. The muscular Coat is compos'd of two Layers of fibres the external run along the

130.  
Canal, and the circular transverse; the effect of these  
fibres is very considerable, for no general pressure of the  
Abdomen c<sup>d</sup>. possibly push on the contents, & the food  
does not descend to the end of the Rectum by the pressure  
of the Diaphragm, or Abdominal muscles, for it turns  
of the Intestines evidently run almost as often upwards  
as downwards: & in diseases where a paralysis is bro<sup>t</sup>.  
upon these parts, altho' the patient continues to breathe  
& exercise the Abdominal muscles, yet if Alimentary  
Canal is gorg'd with feculent matter. With regard to  
the manner of action it is extremely curious. Dr. Haller  
comes by far the nearest to the true acct. of it; but by looking  
into the accounts of it are commonly given of it matter  
one w<sup>d</sup>. almost conceive of a contraction begins at our  
throat & never ceases till the substance is push'd down  
regularly from top to bottom, now instead of this the  
motions are going on at different places, & in different  
ways at the same time, according to the quantity and  
nature of the food, the general motion from its twisting  
& compressing the Gut is call'd peristaltic, & it is  
understood that that motion is continued from the Stomach  
down to the Rectum; but then naturally takes place an  
Antiperistaltic motion in Animals, so of it motion of  
our food very much resembles the water in the Ocean,  
by looking at w<sup>d</sup>. you can scarcely determine at first  
whether it is coming in or going out, only there is  
upon the whole a greater motion the one way of it. Other  
so in of Alimentary Canal the food is push'd on a certain  
way, of back a little, then on again, & the two Layers  
makes place of great

of fibres are both employ'd, but they act differently, the <sup>13700.</sup>  
longitudinal ones shortening the Canal, & the circular  
fibres straitening it: Thus suppose a morsel of food is  
taken down the first thing is the shortening of the Tube  
by the contraction of the longitud. fibres, & the circular  
fibres contract chiefly from above downwards, & if food  
is push'd on a considerable way, then the longitudinal ones  
acting first draw the Gut upon the food, when the other  
fibres act with more advantage, & the longitudinal have  
the advantage of being fix'd at the upper end by the con-  
traction of the circular fibres. The use of if. antiperistaltic  
motion is evident, that nature means not only to prepare,  
but to turn the food over & over so as to expose every part  
of it to the mouths of the vessels w. are to receive it, & if  
is done in a more accurate manner, & there is a much  
closer exertion of every fibre than may be aware of: we  
are by no means to apply the rules here that have  
been said down with reg. to muscles, that they are so  
many Bladders, & only contract to a certain degree;  
for here they contract in such a manner as to shut  
the passage altogether. Thus if a person swallows a  
small quantity of Quicksilver, in a short time it  
goes thro' the whole Canal, w. it cannot possibly do  
by means of its weight, on acct. of the several turns  
it makes, & must be push'd down by the ducts con-  
tracting so closely as to bring the opposite sides  
together. In consequence of the agitation our food suffers  
here it is probably farther dissolved, & perhaps the gen-  
tendency to putrefaction is in some measure pre-  
vented: also a new combination takes place of great

132. 40.  
pursue occasioning the pouring out of Liguors to  
animalize the food. Perhaps to discharge it like menstrua.  
The facultent part is pushed downwards to be discharged  
from the body: while the useful parts are received into  
the Lactial vessels: they are sucked in as I shall after-  
wards explain, but once these vessels are filled their  
muscular coat comes to be contracted, & being crowded  
with valves, the food is pushed upwards towards the  
heart: & this is done w<sup>th</sup> considerable force for after tying  
the Lactial duct; I have observed an effusion of Chyle  
about the mesentery, by a rupture of the larger vessels.  
Within the muscular coat we find the nervous & villous  
Coats; the nature of w<sup>ch</sup> has been very gen<sup>ly</sup> misunderstood,  
Authors after Raysser have compar'd the villous coat to  
the Cuticle upon the surface of the Body, but this is  
altogether improper, & it leads to another mistake, for  
in consequence of this the nervous coat is supposed to  
represent the skin: but it is with y<sup>e</sup> utmost difficulty  
that we can shew very minute nerves reaching any  
part of the nervous Coat. Now instead of this I say y<sup>e</sup>  
villous coat not only represents the Cuticle but y<sup>e</sup> Cutis  
Vera, the insensible skin on the inside is m<sup>ch</sup> thinner  
than the Cuticle, & is spun with difficulty, the villous  
Coat is beyond all doubt sensible, having both nerves  
& blood vessels. — The nervous Coat is rather to be  
compar'd to the Subcutaneous cellular membrane:  
only it does not contain, or suspend fat, so is a pure  
cellular Subst<sup>ce</sup> it is much more denser too, having  
much smaller Cells, & are however communicate, &

133.) upon the whole it serves the same purpose  
allowing the villous to play easily, & conducting its  
Boats and nerves. These two inner Coats form  
what are call'd valves, the Valvulae Conniventes:  
and again each of the valves are subdivided  
into villi which may be consider'd as serving  
nearly the same purpose, adding to the Surface,  
and are not to be consider'd as the mouths of  
one or two vessels, but as a fold of the inner coat:  
upon the whole we see nature endeavours to  
lengthen out the Inner Coat much more than the  
outer, & she aug'd make a greater difficulty to the  
passage of the food, so that it is retarded till  
it is fully prepar'd, & apply'd sufficiently to  
the surface of the Intestines.

To defend the Alimentary Canal from the  
acrimony of the substances we take in, there  
is a vast quantity of inuicous secreted; we  
can in some places shew it small Bago or  
Follicles, in which it is contain'd, & what  
we see in some few places we presume to  
take place in all. Now so far as we  
observe with regard to the general structure;  
must let us review the several parts of the  
Canal, & draw the useful conclusions we  
may be deduc'd from them beginning with  
the uppermost partion the Stomach and so  
tracing the Canal downwards. We shall  
first then attend to the passage of the Oesophagus

134. 90.  
into the Abdomen. — We find *q. q.* Oesophagus  
perforates the fleshy part of the Diaphragm, one way of  
this is very evident & material, had it pass'd through  
the tendinous part, the contents of the Stomach w<sup>d</sup>. have  
been easily thrown back into the Mouth, whereas by  
going thro' the fleshy part, & that swelling when *q.*  
Diaphragm ascends, the regurgitation is prevented:  
not that it is entirely shut, for I find *q.* I can swallow  
a Liqueur when I make an Inspiration, but it is with  
difficulty. — Next you have seen the situation of the  
stomach with respect to the other viscera: we can under-  
stand what is very often observ'd to happen in practice,  
that communications are made by erosions from  
one Bowel to another: thus where there was a rupture  
of the Liver, I have seen the matter thrown up  
by vomiting & pass'd by stool: or if there is an erosion  
at the forepart the Contents of the Stomach may be  
thrown out of the Body. In like manner I have seen  
an accretion of the Stomach to the Colon, & there was a  
Pace in the Infirmary where a communication was  
between 'em, so that Glysters were vomited in 10. min-  
utes after they were receiv'd, & a hardness w<sup>d</sup>. be dis-  
cover'd with the hand going across the Belly near the  
Arch of the Colon. — Such a communic<sup>n</sup> may have  
different effects according to its direction, thus it may  
be slanting so as to allow Liqueurs to go only one  
way, as in the case of the Gall Bladder, when there is  
such a slanting direction, for we can blow Air into

135. The Duodenum without distending it.

We shall next observe some circumstances with regard to the emptying of the stomach & of filling of it: we see very evident longitudinal fibres, and within these, circular ones, there is particularly a Band of longitudinal fibres running along the small curvature. Instead of the Stomach lying in a line with the Oesophagus when it is distended it comes forwards so as to make an Angle with it, which serves too to prevent our food by a moderate pressure from being thrown upwards into the Mouth, & the Pylorus is turn'd up or rais'd higher, & these membranes have the effect of straitening both Oesophagus considerably, especially the Cardia: so in vomiting, the pouring in a great Quantity of Liquor by distending the Stomach to a great degree, may shut the Oesophagus, and so endanger a rupture of the Stomach: & that this does not frequently happen, is owing to this, & every Bowel supports another, just as when I put a thin Bladder within strong Leather and distend it, I may foot about as I please, & every Bowel supports another, & all are supported by containing parts: and the Pylorus is rais'd up when the Stomach is distended, for a very evident purpose, for if it had hung down the more it was distended; the indigested Aliment w<sup>d</sup>. have got out, whereas it is only the lighter parts that ascend and get out: & the Ring at the Pylorus is

not merely compos'd of Coats, but is really a circular 190.  
Muscle, or Sphincter, w<sup>ch</sup> acts so vigilantly that you will  
scarcely find indigested food in the Intestines. — We know  
that ponderous Bodies will pass down, from the Stomach,  
& that Gall stones will be thrown up by vomiting; this  
leads me to observe the situation of the Pylorus, for w<sup>ch</sup> we  
are a good deal oblig'd to Winslow, that it does not rise  
so high as the other Orifice, but is situated obliquely &  
turn'd backwards. — In a Case I met with of a Boy who  
had swallow'd a Shilling, I follow'd what Winslow hints  
at, I gave a dose of Physic, then desir'd of the Boy shou'd  
be laid first on the right side, & from that posture  
frequently return'd to the Back, turning the mouth of the  
Pylorus to the spine, of the Shilling might have the  
chance of falling into the Duodenum, & whether in con-  
sequence of this I cannot say but in two days after the  
Shilling was pass'd. — Scarcely as we have found of  
the Elementary Canal in gen. enjoys an anti peristaltic  
motion, so in the Stomach there is a working from the  
right towards the left, as well as the other way, but very  
gently for ordinary: if however a very irritating substance is  
introduc'd by an instinct of nature of Anti peristaltic  
motion comes to be superior to the peristaltic & by means  
of contents of the Elem. Canal may be br<sup>o</sup>ught from a lower  
part of it upwards; I had occasion to see a  
Case of this kind with the late D. Gregory: there  
was an obstruction in the Colon, which after death  
was found to be almost shut, & the night before he  
vomited above nine pounds of faeculent matter ex-  
actly like to what was found in the Colon, and the

upper tract of the Alimentary Canal being in ag. 137.  
measure empty, the vomiting could not be owing to a gen.  
pressure, & we can't suppose all that quantity to have been  
in the Stomach, it must have fill'd at least the upper parts  
of the Intestines; but that of itself is not sufficient to occas.  
vomiting, the manner of which has been by some authors pro-  
perly explain'd, look at the description of it in many Authors  
& you will find that the common Account is, that the Dia-  
phragm is push'd down & the Abdominal muscles  
push'd inwards, so that the Stomach is as it were in a  
press in consequence of which the Contents are thrown up  
with violence; But that cannot be the Case for the back of  
the Larynx making the lower part of the Pharynx, if the  
Diaphragm was in violent action, the water going  
with the Air, the Glottis being open, would get into the  
Lungs. I conceive therefore that it proceeds in a manner  
as Nausea is produc'd & the motion of the Stomach is invert-  
ed: we act with the Diaphragm in a slow manner, so as to  
push down the Stomach, whereby we put the Abdominal  
muscles on the stretch: these are thrown into a convulsive  
motion, & the Diaphragm yielding gently, while the matter  
is thrown up the Air is thrown out at the same time w<sup>ch</sup>.  
The water when thrown up is generally mix'd with Air.

## Lecture 22<sup>nd</sup>

The Intestinal Canal is divided by Anatomists into  
the small and great Intestines, & these are again  
further divided. — The Intestine connect'd w<sup>th</sup> the Stomach  
is nam'd from its length Duodenum, we have seen it  
tied very closely to the posterior part of the Diaphragm.

138.  
by a Cell. Membrane, wanting a Mesentery & of course  
that very close covering w<sup>th</sup> the continuation of *ij.* mesentery  
gives & this is supply'd in some measure by the Course it takes  
From the greater Size of that Intestine than of these that im.  
follow, some of the old Anatomists as Bidan have us'd the  
term of *ventriculus Succenturiatus*, & perhaps the more this  
Idea is consider'd the more just it will appear, for besides *ij.*  
close adhesion for supporting the stomach in its place, we  
observe *ij.* Liquors of great Importance, *ij.* Bile & Pancreatic  
Juice, are pour'd in here: & in order to retain these longer *ij.*  
they may be better incorporated with the food, *ij.* Intestine with-  
out necessity makes several short turns; so that *ij.* food  
must undergo consid<sup>le</sup>. Alterations here. As soon as *ij.* Duo-  
denum has got to the left side it turns almost quite  
downwards, & now the mesentery begins to be added, & it  
gets the name of jejunum, from this the Ileum is continu'd;  
& you'll obs. that the upper end of the Jejunum is consid<sup>ly</sup>.  
wider *ij.* the lower end of the Ileum, or *ij.* the tract of our  
Intestines is somewhat of the conical shape, w<sup>th</sup> the larger  
end of the Cone upwards. Next we obs. a difference of colour,  
the Jejunum is always a great deal redder color'd, for *ij.* Vessels  
are in proportion to the greater Diameter thicker, & we obs. a  
greater N<sup>o</sup>. of vessels in the Jejunum *ij.* circulate red blood:  
& when it is laid open we find the valvulæ conniventes  
more remarkable, & the Villi or farther division of the *ij.*  
Valvæ likewise larger. We can acc<sup>t</sup>. for this w<sup>th</sup> Circumst<sup>es</sup>.  
upon the most simple principles. There is a greater Qu<sup>ty</sup>. of  
Food passing thro' the Jejunum *ij.* *ij.* Ileum, so *ij.* *ij.* sculent  
part as it descends, becomes more consistent & is more dis.  
in the Ileum, hence the necessity that a greater surface should

be applied in the Intestines for the separation of those  
 Liquors from the Blood, which serve to animalize & dissolve  
 the food: next the surface is increased for the purpose of greater  
 absorption, & the better execution of both the valves are  
 made larger to stop the too easy passage of the food. as we go  
 downwards the Mesentery becomes somewhat looser, & the  
 Bowels are more moveable, but there is no such exchange of  
 place as appears in a dead Body. — From the great  
 length of the mesentery, especially of the lower parts of it,  
 we can conceive two Circumstances possible, *viz.* mesentery  
 & gut may be twisted by a violent exertion: & if of Ventriculus  
 is of an <sup>un</sup>usual length, & there is a great quantity of fat this  
 may in like manner entangle the Intestine by being twist-  
 ed round a portion of it: & I have found *viz.* Appendix  
 Vermiformis was catch'd by a twisting of *viz.* mesentery.  
 You have seen the End of *viz.* Intestinum Ileum enter the *viz.*  
 Intestine, & then you observe a valve, of late Year's De Haen  
 &c. have propos'd *viz.* in certain cases, where one part of  
 the Intestine falls within another, that attempts sh<sup>d</sup>. be  
 made to disintangle them by throwing Injections into *viz.*  
 Colon, & forcing its valves. Now tho' I believe it is quon,  
 such as water, will pass it more readily than Air; I wou'd  
 advise you to do it with the utmost caution, for *viz.* valve  
 will sustain a pressure of 10. or 12. Inches of perpendicular  
 weight of water. I can most suppose farther *viz.* the action  
 of the muscular fibres has a very consid<sup>le</sup>. effect, so that *viz.*  
 fibres of the Colon, irritated by the Injection may contract  
 so as to shut the water still closer. In one person laboring  
 under the Stone passion, I threw in upwards of 10. of Aqua  
 with oil, w<sup>ch</sup>. is rather more than the Colon can contain

140. In another case 20. Springs full of air were thrown in  
w<sup>h</sup> must have occupy'd a space equal to 16. or 12. P<sup>ts</sup> of  
water, w<sup>o</sup> 9. The w<sup>o</sup> lve must have been forc'd.

I've a strong suspicion, w<sup>t</sup> greater changes are made  
upon the Aliment in the Intestinal Canal than  
Anatomists are commonly aware of, & that not  
only by the stagnation, but the Viguors secreted  
here particularly about the Caput Coli &c. must  
have a very considerable effect.

In the appendix vermiformis we find the mucous  
pores comparatively very large, & in the case I  
mention'd I found it distended with viscid stuff:  
it probably therefore serves to secrete a quantity of  
mucus to be added to the feculent matter. And in  
some of the Ope kind, where that is wanting it is  
supply'd by a spongy substance immediately  
under the valve of the Colon.

From the Appendix Vermiformis the three Ligam<sup>ts</sup>  
come out, & this part is to be consider'd as 9. bottom  
of the Caput Cecum Coli: its situation being  
alter'd by the weight of the matter it w<sup>o</sup>l, and you  
perceive the Advantage of this, that the Viguors  
all come from one point: for these being all in  
action at the same time, & this part being tied  
down by the peritonaeum passing over it with  
a meso colon, the other parts of the Colon are  
drawn down towards that for the shortening of it  
Intestine by means of the Longitudinal fibres.  
We find that the Colon from the several turns it

makes is contiguous to almost all the Abdominal 411.  
viscera, w<sup>ch</sup> is a circumstance that we ought never to lose  
sight of, otherwise we may be led into very considerable  
mistakes in judging of Diseases or in treating them.  
So when a Physician is about to examine the viscera on  
the suspicion of a Schirus he cannot form a proper Judgment  
without knowing the state of the Belly, as he may mistake  
hardened faeces for Schirus, & we have examples of matter  
a great deal more hard than the faeculent collecting with  
in the Intestinal Canal, & by not attending to this,  
& first giving an Injection, then a purgative, & a person  
may be put on very long courses of Cicuta & Mercury.  
With a view to such large Balls being lodg'd in the Colon;  
you will observe that on both sides it is ty'd down to the  
Pitonum, & there is a want of mesocolon, so we can see  
possibility of making an Incision into the Cavity of the  
Colon without going into the Cavity of the Abdomen on  
the right or left side, at the posterior part between the  
Ribs & Os Ileum. — And tho' such an operation is never to  
be undertaken witht. the most urgent necessity, in some  
few Cases it may be useful. — We likewise see  
use of Injections in many diseases, y<sup>t</sup>. besides emptying  
the Colon of its Contents, or in other Cases nourishing the  
Body, since the great Intestines have Lacteal vessels as  
well as the small; for I have shewn Lymph. Glands in  
the Colon, an Injection pour'd into the Colon, in cases of  
Inflam<sup>n</sup>. or Irritation, may have a very consid. effect, &  
not merely from the water exuding, or from a cert. degree  
of heat acting mechanically, but from that effect w<sup>ch</sup>. an  
agreeable applic<sup>n</sup>. has upon our nerves: in s<sup>ch</sup>. cases therefore

142. we may throw in a considerable quantity, in order  
to fill the whole Colon, & I have said that *Uj.* may  
be thrown into it. — You have seen *Uj. Intestini*;  
Rectum run down upon the hollow of the *os. sacrum*,  
& that the *peritonaeum* accompanies it, so this  
therefore in the erect posture becomes the lowest  
part of the Abdomen, so if any acid matter be there  
it may rest upon the turn of the Rectum, & eroding  
it may be discharg'd by stool: & I have met w<sup>th</sup>  
an instance where an Abscess of the Liver burst into  
the Cavity of the Abdomen, & there was a hole eroded  
there large enough to admit the finger, so I have  
no manner of doubt, that in this Case pus was  
discharg'd in considerable quantity by stool, and  
that without passing thro' the Tract of *Uj. Intestines*.  
I next shew you a few things with reg. to *Uj. Assistant*  
*Chylopoetic Viscera*, the Liver, Spleen & Pancreas:—  
we find no such valve in the Gall bladder as  
Winslow mentions. — And we find no reason to  
say with Haller that the one duct passes obliquely  
thro' the other, the passage being equal into both. —  
However upon introducing a probe we meet with  
resistence from certain Mugs that perform the  
office of valves, & the duct when fill'd with Air has  
a Tortuose appearance w<sup>th</sup> marks of constriction  
upon the outside. —  
Till we have seen the whole course of the Blood I  
sho'd think it improper to enter upon *Uj. partic<sup>o</sup>*  
*Office of these Viscera*. — We find a *Liquor com<sup>o</sup>*

from the Pancreas like to Spittle separated by the Salivary Glands. — We have nothing to guide us with regard to the Office of the Spleen. — We find Lymphatic Glands at the Root of the Omentum where it adheres to the Stomach; so that Lymph. Absorbents must come from it. Boerhaave & Haller suppose the office of the Omentum to be very extensive; but its principal if not its only use is to pour out an oil to lubricate the inner surface of the Peritonaeum to prevent concretions, & to allow the vis. Chylopoetic Viscera to play upon each other. In the human species we find it reaching scarcely lower than the Umbilicus, the matter flowing from it, readily falling down by its weight; whereas in the Quadruped it is drawn down as far as the Pelvis.

Lecture 23.

An Examination of the Organs of Urine and Generation.

Lecture 24.

I am of opinion that the Glandulae Renales have a Cavity, & contain a fluid: without however having the most distant conjecture with regard to the nature of that fluid. — As we advance in life the Back part of the Bladder comes to be lower than the beginning of the Uthra; so in sounding for the Stone, it may lie behind the Beginning of the Uthra, so beneath the Instrument it must therefore be turn'd this way.

We see three places at w<sup>ch</sup> Hernia may readily happen. 1<sup>st</sup> at the Umbilicus, where there is great danger of strangulation from the hardness of the Ring, w<sup>ch</sup> opens with

difficulty. Here in cutting the Ring, the Ligaments are of no  
more consequence than the Cellular Substance only we wd.  
rather avoid the vein as of being of some use in sustaining  
the Viscer; but the chief danger is in wounding the Bowels  
w<sup>ch</sup> we must carefully avoid. — 2<sup>d</sup> in the course of the  
Spermatic Chord: This Species of Hernia is more common  
than the Umbilical from the place being about the Groin  
it is call'd Inguinal but it wd. be better to call it scrotal,  
as it falls down to the Scrotum. — 3. We have the Crural or  
Femoral Hernia when the Bowels pursue the Course of the  
femoral vessels. — But tho' these are the most common:  
Hernia may happen in a variety of the other places: the  
Bowels may be push'd out into the Thorax, along with  
the Oesophagus, Aorta, or Vena Cava; or at the side of the  
Belly in the Interstices of the muscles &c. You'll observe  
that the Peritonaeum is push'd out before the Bowels in  
these Cases, but it is evident that if *v. Vesicae Urinariae*  
is the subject of Hernia, the upper part of it is not cover'd  
by the Peritonaeum: Therefore the muscular Coat of the  
Bladder is the first thing that presents after laying  
aside the common Ligaments.

We proceed to examine the coverings of the Testes.

Whether there is reason of the foundation of the term of  
Dartos muscle, for expressing a muscle under the skin of  
the Scrotum is doubtful, we see the part possess'd of a consid-  
erable power of contraction; & we obs. a degree of redness  
but we shall perhaps find that there is more of muscular  
power in our body than we are aware of, particularly  
every part of our skin is muscular, for it accommodates  
itself to heat and Cold in the living differently from

S 125.) what it does in the dead Body: but the motions of  
the Testicle within the Scrotum, particularly when  
the Testicle is inflam'd, does not depend upon the  
Dartos, so much as upon the Cremaster muscle, w<sup>ch</sup>  
has such a connexion with the Cellular substance that  
the Skin seems to be moved by it, & it may promote  
the Venation as well as the Excretion of the Semen.  
The Septum Scroti may be considered as Cellular  
substance, grown more dense by having the Layers  
press'd against one another.

The Vaginal Coat of the Spermatic Chord is little  
more than the Cremaster muscle with some few  
tendinous fibres that are sent down from the  
External Oblique & the Cellular Substance condens'd.  
The resistance however made by this Coat is such,  
that in some Cases water is confin'd very much to the  
course of the Chord by the compression of the Cellular  
Substance.

The vaginal Coat of the Testicle in  
the Adult is what at the upper part of the Testicle:  
This is the common sack of that kind of Hydroceles  
w<sup>ch</sup> the Surgeons are oblig'd to cure by the Operation.  
Heister calls the Vasa deferens a neve when he  
directs to avoid it, in cutting it into three parts  
When we cannot introduce the Catheter into the  
Bladder there is a necessity for puncturing it;  
M<sup>r</sup> Sharp advises that to be done above the Os  
Pubis: but this is evidently attended with a number  
of Inconveniencies, and we have a much better place  
for it, between the turn of the Urethra & Crus Penis;

there is a considerable space, and if you cut thro' the 146.  
Elevator Ani you can distinguish a little deeper than at  
the prostate Gland. So after cutting the skin with a  
Knife, you push up the Coccyx at the side of the prostate  
Gland: So after cutting the skin with  $\&$  you go into the  
Bladder without any danger of wounding *v. peritonaeum*,  
& at a distance from the neck of the Bladder, as well as  
from the entrance of the Uters. — And leaving a Tube  
in the opening till the disease is got better off: The urine  
runs out as fast as it is formed.

## Section 25.<sup>th</sup>

The name of villous apply'd to the inner coat of the Bladder;  
*v. et* is smooth is evidently improper. — We do not  
find all the fibres in the muscular coat running from the  
mouth to the fundus, but many of 'em running obliquely:  
& we can only say that many bundles of fibres begin at *v.*  
neck run up to the fundus, come down upon the opposite  
side & cross a little when they reach the neck; or *v.* we find  
the fibres very fitly dispos'd for contracting the Bladder in  
all its directions. — Some have describ'd a distinct  
Sphincter muscle, but in fact all that we can demonstrat  
is that the circular fibres grow a little thicker, & the longit-  
-udinal & oblique decussate each other, but with<sup>t</sup> forming  
a complete Circle as we do we at the Pylorus, or with<sup>t</sup>  
there being any distinct muscle as we find at the ex-  
-tremity of the Intest. rectum. — In the operation for  
Lithotomy, we are to keep entirely to the membranous  
part of the Uthra, carefully avoiding the Bulbous part  
which may occasion a very considerable Hemorrhage

147.) Now has been said with regard to the Glandula  
Douglasii being affected in the Syces Venerea than can be  
well prov'd, their very opening into the Uthra has not  
been clearly demonstrated: I wo<sup>d</sup> rather choose to refer  
the remarks with regard to the Organs of Generation  
till the blood vessels are consider'd.

With regard to the urinary organs the principal things  
that occur from the Demonstration are these.

That the Kidney is defended by a quantity of fat from the  
pressure of the Abdominal viscera: & by the like means  
it is defended from the Lumbar Vertebrae which lie  
behind it, the Tunica Adiposa being upon the back part  
as well as upon the fore. — We next find a proper  
membrane, not divid'd from the peritonaeum connect'd  
the several lobes that we find in the fetus: & this is  
in a consid<sup>ble</sup> degree form'd of Cellular substance con-  
dens'd, but not entirely, for the inner side of it has  
the same smoothness as a portion of the peritonaeum.  
When we cut the Kidney we obs. two Substances, 1.  
The Cortical Glandular or Vascular part, from this  
part we see tubes sent inwards, & as these are  
collected from the whole surface they give it Cortical  
appearance: at their ends we find the papilla from  
which the urine is discharg'd into the pelvis of the  
Kidney: & the papilla project into the Kidney to  
give room for more ducts, & also if the urine may  
requisitate or be push'd back into the mass of Blood  
so that inow the pelvis of the Kidney is distended, the  
papilla are the more compress'd; as the Kidney is

originally compos'd of a number of different Lobes, we find many Infundibula uniting into one common duct, like branches of veins collected: There is no certain rule with regard to the number and manner of joining: in some Infundibula there is a single papilla in some two &c. & also the number of Infundibula varies. — From the Pelvis of the Kidney the urine passes down to the Ureter & it gets the Conical shape from the number of Canals forming it: So Stones may more readily form here, & where they do they may not get down thro' the narrow ureter, but may remain in the Kidney. — We do not find the ureter entirely Cylindrical, but varying in its size & y. in different places, for which we can assign no cause except at the Turn where it gets into the pelvis: This explains the various motions of a stone in the ureter. — At the lower end it passes obliquely into the Bladder as to serve the place of a valve, & at the same time its mouth is contracted; so that a stone may readily be interrupted at its entrance: This in young Women gives room for an operation by which the life of a person may be sav'd: It has a dense Coat for the muscular, & another dense and smooth coat within it: & I have repeatedly seen the action of J. Ureter very distinctly, contracting itself like a worm upon the slightest irritation: It is material to consider this y. it is not to be divid'd as a mu membranous Tube: In the case of the descent of a stone, we see the advantage of giving opium: for by lessening the pain we take of the Spasm & bring on the relaxation of the muscular coat by w. means the urine may push on the stone into the Bladder.

The Bladder is of a curious & complex structure; & here the

common opinion with regard to the extent of muscular contraction is contradicted: for we know that the bladder can retain 10<sup>l</sup>. of urine, & its fibres are at the same time capable of contracting so in all directions as to expell every drop of this, which shews that muscular fibres possess a very extensive power: next we do not find any part of muscle sewing as a Sphincter, & yet we possess two opposite powers of pushing the urine out and stopping it at pleasure, thence we ded. that muscular fibres can act so that one part of the fibre is an antagonist to the other, or that we can employ parts of fibres to perform an office: that we can relax the one part & employ the other, w<sup>ch</sup> we can do alternately. —

The Internal Coat of the Bladder is very dilatible, so may be pushed out by a stone between the fibres of the muscular Coat, in w<sup>ch</sup> case there will be difficulty in extract. of a stone.

The Semen passes upwards thro' the Testicle, then thro' the Epididymis to be deposited in the vesiculae Seminales into w<sup>ch</sup> it regurgitates from the vas deferens, as the Gall to the Gall Bladder from the Liver: they a reverse motion, when necessary, it is thrown into the urethra, near to the mouths of the seminal ducts we find the mouths of the prostatic Glands opening, & also Cowpers Glands the nature of which we do pretend to explain, & in the whole course of the urethra we find Tubes pouring out mucus to defend the passage from the acrimony of the urine, w<sup>ch</sup> as it advances pushes out the mucus from them, & these are beyond all doubt generally affected in the gonorrhoea: tho' that disease may also affect the other parts. —

We next proceed to the consideration of the muscles of the Thorax.

Lecture 26<sup>th</sup>

An Illustration of the Contents of the Thorax.

Lecture 27<sup>th</sup>

You observe that the Trachea, or its left branch lies over the Aorta in such a manner, that they may adhere together in the Case of an Aneurism of the Aorta, & the Coats of both being consumed, the blood may burst into the Trachea and suffocate the person; We have an example of this kind in the memoirs of the Academy of Sciences.

I shew you a preparation of the Heart where the foramen Ovale is found open the person hang'd himself, & did not hang above 15. minutes, & was found to be quite dead &c.

Lecture 28<sup>th</sup>

As the Heart is the Centre of the vascular System, from w<sup>ch</sup> the Arteries begin, & to w<sup>ch</sup> all of veins return, whether circulating or Descent. of w<sup>ch</sup> afterwards we shall speak more to the purpose. — The Heart is a muscular Organ, lined within; & without by membranes cover'd. — The Internal membrane w<sup>ch</sup> is gl'd to the muscular fibres when it reaches the entrance to the Cavity of the Heart is reflected, becomes thicker, & by its continuation forms the pericardium: for it is evident that we can trace of membrane of the H<sup>t</sup> into the pericardium. The bell<sup>d</sup> Subote on of outside of of pericardium is connected with the vessels runs along of m for some way, & gives to 'em an addition. strength and

151.  
Gimmis. The uses of the external membrane and of the  
pericardium will readily occur when you recollect their  
situation & connexions. — We wd. say that of pericardium  
serves to sustain the heart in its place to prevent it from  
shifting too much from bearing upon the vessels of enteriti;  
From disturbing the functions of the Lungs: For this pur-  
-pose we have seen that both pleura, or the mediastinum  
is continued down over the pericardium. — when we cut  
into the pericardium we do. that the inner surface of it,  
& the outer of the heart are slippery & cover'd with a liquor  
: & besides this liquor w<sup>ch</sup> exudes from the extremities of  
vessels so very minute that they escape our observation,  
we perceive a quantity of fat constantly collected betw<sup>n</sup>.  
the outer membrane of the heart & the sheath, & y<sup>t</sup> in persons  
who are otherwise greatly emaciated: This fat must  
exude to mix with the secreted liquor, just as it does  
from the Omentum within the abdomen; so whilst the  
concretion of the heart to the neighbouring parts is pre-  
-vented it slides & plays without Injury to itself or to y<sup>r</sup>.  
neighbouring Organs. — Next let us go a little deeper &  
consider the flesh of the heart: its fibres are finer & more  
closely connected than they are in the other muscles;  
whereby they serve better to contain the Blood, & perhaps  
further they are endow'd with greater power of motion  
& are more exquisitely sensible than those of the other  
Organs or muscles. — The fleshy fibres in general  
proceed from or terminate about the mouths of the  
ventricles, & hence every part of the heart contracts  
towards this place: the Arteries descend towards it;

If the ventricles are drawn upwards towards it, & the heart is admirably adapted for straitening itself in all its dimensions: It is an error to suppose that the heart in action is made narrower only, they have been led to suppose this from observing that when the ventricle is in action, the heart strikes y. side, but this chiefly depends upon the particular kind of motion, of the ventricle, whilst at the same time it is but nearer to the side by the Atrium and Auricles filling at the same time: for the blood begins to be stopp'd, and accumulated while the ventricle is in action, in conseq. of w<sup>ch</sup> the heart turns as it were upon an axis, w<sup>ch</sup> is plac'd about the Basis of the Heart.

The Vena Cava meet to form the right Sinus venosus, w<sup>ch</sup> is evidently muscular, as is likewise the termination of the Vena Cava w<sup>ch</sup> as the same structure with the Sinus venosus, contracts like it & that in a very remarkable degree. What we call Auricle is to be consider'd as forming a common Cavity with the Sinus, for on the right side the Auricle is larger, & the Sinus Venosus less, on the left again disproportion is reversed. At the Entrance of the Inferior Cava we find a Protrusion of the Edge of the Auricle or valve nam'd after Eustachius, to prevent the Blood from falling down into the Cava in our erect posture. — When the Auricle is join'd to the Ventricle we find the valvula Tricuspidalis, so nam'd from its being broader in 3. places & w<sup>ch</sup> serves to direct the Course of the Blood into the ventricle. The connexion of the valve to the sides of the ventricle is made by fleshy pillars, the use of w<sup>ch</sup> is not as some Anatomists have suppos'd to open the valve, but to prevent the valve when the heart is in action, from being turn'd lock into the

153.  
Auricle: we are not to suppose that these pillars are in  
action at one time, & all the rest of the heart at another, but  
rather that they are in action at one time with the sides of the  
ventricle. The inside of the Ventricle is every where  
unequal, with a number of Carinae & Columns, and an  
attention to this might be sufficient to convince us that  
every drop of the Blood is not squeez'd out at every contract<sup>ion</sup>  
of the heart, but it is very nearly so, in so much that in  
small Animals it changes its colour, we never can im-  
agine that every fovea has its rising corresponding, to  
enter it, so that some small part of the Blood still rem<sup>ains</sup>.  
From the right ventricle we see the only passage left into  
the Pulmonary Artery, & at the mouth of the Artery we find 3.  
Valves nam'd Sigmoïdals, they are entirely membranous  
form'd of the inner membrane of the heart & Arteries lengthen'd  
out. — The pulmonary Artery is divided into 2. g<sup>d</sup>. branches  
one to each Lobe of the Lungs, & the Blood is return'd by  
2. great veins w<sup>ch</sup>. terminate in the left sinus: w<sup>ch</sup>. this  
sinus a small Auricle is connected: the Cavity of it, whole<sup>ly</sup>  
being nearly equal to that on the right side, but hardly  
so large: then we have a similar passage into the ventricle,  
& a passage from thence into the Aorta: the chief difference  
here being in the thickness & strength, for a greater force  
is necessary to drive the Blood thro' of very numerous  
branches of the Aorta, than to drive it thro' the Lungs: & if  
we are to judge of the force by the thickness it is nearly as  
3. to 1. The valves &c. are much the same as in the Right  
Ventricle: those at the beginning of the Aorta nam'd Semi-  
lunares. — The Blood then is carried by the Aorta to all  
the different parts of the Body, & is return'd again to the

154  
heart by the Vena Cava, as is evident from examining  
the heart, you will observe that a valvular structure is  
wanting in 2 places, where it might be expected, namely  
at the termination of the veins into the auricle. They are these  
not valves at the termination of the Cava & pulmonary  
veins to prevent the Blood from being thrown back. I  
apprehend of the reason of this may be readily given: there  
might be a danger from preventing a degree of regurgitation  
in certain Cases, from the forcing the blood constantly for-  
wards into the heart: but even in the ordinary course of it  
Blood a valve is not necessary, the current in it being  
sufficient to direct the course of the Blood: & it can only  
appear difficult to account for the want of valves; to those  
who look upon the heart as acting like a spring; so that  
as much force is used to fill the ventricle as it employs  
in emptying itself: But the ventricle is altogether relaxed  
as soon as it is empty'd, so that a very gentle effort of the  
Auricle is sufficient to fill it. Whereas in consequence  
of the suddenness & violence with which the ventricle contracts  
the Blood w<sup>d</sup>. have been thrown undequaque, were there  
not a valve between the Auricle and Ventricle.

We next proceed to the Structure of the Lungs.  
There are many things that entirely escape us here, we  
cant follow the Branches of the Blood vessels, or even of it  
Trachea to their termination without preparations.  
Therefore at present all we can consider is the general  
manner of the motion of the Lungs, & the use of the parts  
arising from their situation & connexion w<sup>th</sup> each other.  
You have seen that the Lungs are contiguous to it. pleura,  
every part of the Thorax pressing against another, & these

155/ who have entertained a contrary opinion, have been misled by drawing too close an Analogy between Animals of very different kinds; As from Birds where the Trachea Arteria perforates the Lungs, & communicates with Cavities beyond 'em. But the Lungs are adapted to follow the motions of the Thorax; & every circumstance shews the continuity of parts: even when the Lungs are in a collaps'd state they exactly represent <sup>if</sup> containing parts: & we often find partial and sometimes total adhesion of the Lungs to the pleura: upon opening the Thorax we see no passages by w<sup>ch</sup> the Air can get into it, we find the Lungs touching the pleura, & if we open the pleura under water no bubbles arise of air thro' the water. So that the Lungs fill the Chest, & we can very well understand the reason of this: we need only attend to the effect of the Air on a Weather Glass, where the weight of it is sufficient to sustain, the weight of about 30. perpendicular Inches of Quicksilver, as it is able to keep up water to the height of 30. feet and more: it is surely sufficient therefore to expand the Lungs & keep them contiguous to the pleura. — If this then is understood it only remains in order, to explain respiration, that we understand the structure of the Thorax & the manner in w<sup>ch</sup> its parts may be enlarg'd & contract'd: & we may view the Lungs merely as Bladders, & consider them as passive, as they certainly are with respect to their dilatation, and it is ridiculous for Surgeons, to talk of the Lungs expanding themselves so as to throw out matter of

is collected within *em*: With regard to their contraction (156)

They have a certain degree of Elasticity, as some of the muscular fibres of the Trachea extend to their remotest Cells; but the effect of these must be inconsiderable, so *q<sup>t</sup>* while the dilatation depends upon the containing parts the contraction depends almost entirely upon the very same thing. Let us consider therefore the structure of the Bones; Cartilages, Ligaments and Muscles. Any solid body may be enlarged in 3. ways, in length, breadth, & depth, so we dilate the Thorax in all these three ways.

The Diaphragm is excellently fitted for lengthening out the Cavities of the Thorax, for we've seen it puff'd up into the Thorax like the crown of a hat, & when in action its fibres become straight & the Cavities of the Thorax are elongated, & Abdominal muscles are put upon the stretch or are push'd outwards.

Next we observe *q<sup>t</sup>* our fibres Ribs are fitted for making the Thorax broader, for increasing the distance between the two sides: & at the same time for rendering it deeper, or for increasing its distance between the Sternum & Spine. Thus if you the ribs to be more perpendicular the Sternum is push'd away from the Spine, for the upper ribs being more fix'd, whilst the under ones are mov'd upwards towards them they are turn'd outwards: & as the ends of the Ribs have thrown in between them a cartilage *is<sup>h</sup>* is crooked this is thrust out so that the distance between the sides is increased.

The power by *is<sup>h</sup>* this motion is perform'd is beyond all doubt the Contraction of both the rows of Intercostal muscles at the same instant, when these contract the most moveable part moves towards the one that is the most fix'd. — The only difficulty here & which has

154. ) puzzled many Anatomists is to account for the obliquity of the Intercostal muscles, & next why there are two Rows of them. I apprehend it difficultly entirely depends upon Anatomists not having obs. a circumstance of the utmost moment, & which we noted before, that whenever extensive motion is required oblique fibres are employ'd, the oblique fibres giving a greater play than the straight and contracting more, in proportion to its greater length, brings the two Ribs much nearer, and in consequence of there being two Rows, the obliquity of y. one balances the obliquity of the other & raises the rib in an equal way, neither pushing it backward upon the Spine, or drawing it forwards upon the Sternum. — One difficulty more remains still, why the External Intercostal muscles, w<sup>ch</sup> run all from above obliquely forwards, are wanting near to the Sternum, & the Internal w<sup>ch</sup> run in the contrary direction are wanting near to the Spine? now it depends upon the circumstance of both Rows co-operating in raising the ribs, for if the external now had been bet<sup>r</sup> forwards to the Sternum the last fibres w<sup>d</sup>. have been fix'd to the solid bone of the Sternum, they w<sup>d</sup>. have drawn the ribs downwards, as soon therefore as they are brought so far forwards, that the distance at the place of the Invention leaves a considerable proportion of the distance of the origin of the muscle, from the Sternum the muscle is wanting: In like manner if the internal Row went farther back they w<sup>d</sup>.

158.  
come to be fix'd to the spine below & to the ribs above at some  
distance from the head; which must have drawn the first  
Rib down to the second &c. In considering these motions I  
speak of the Ribs in general, for there is no room for suppos.  
with Dr. Boerhaave that the motion of the Inferior ribs is  
different from that of the upper, they evidently all move in  
one direction, The motion is greater as we go farther from the  
top of the Thorax, the second rib having the motion of the  
first, & then its own motion, & so with regard to the rest. —  
Supposing we have made a full Inspiration, & after a  
little, suppose we feel an uneasiness, and we mean to  
expire, the parts are replac'd in this manner: The Diaphragm  
is replac'd by its elasticity in some measure, be-  
cause in its action it pulls down of elastic membranes  
within the Thorax; stretching the Mediastinum to a  
certain degree. — The Elastic Air contain'd within the  
Stomach and Intestines, & w<sup>ch</sup> does not readily escape,  
will also have some effect: but the Diaphragm is  
chiefly replac'd by the contraction of the Abdominal  
muscles, for as soon as we cease from acting with it  
The Abdominal muscles are sollicit'd to act, so press the  
Bowels of the Abdomen upwards against the Diaphragm  
so as to bring it to its natural place, which is more  
especially necessary in the erect posture, when we are  
sac'd horizontally the Elasticity of the parts & weight of  
the Bowels, in a manner as the Business. For replac'ing  
the Ribs we have seen that the Cartilages are suffic.  
for the purpose even in the dead Body in so much that  
we always find the body in the state of Expiration: but  
further as the Abdominal muscles in expiration are tro.

159. into action in order to replace the Diaphragm. —  
The external oblique being fixed to the ribs must also  
have the effect of drawing them downwards. when  
the muscles of the abdomen & say push the Bowels  
of the abdomen inwards and upwards, they must  
also have the effect of drawing the ribs directly down-  
wards: & when we want to perform the expiration  
with greater force, we exert these muscles in a still  
greater degree: But if we want to perform it with  
violence every muscle, tho' destined principally for  
the motions of the Trunk or Extremities may be  
brought to influence the Rib.

Now, after we understand the manner of respiration  
in Life, we readily know the use of the division of  
the Thorax by a partition the mediastinum, for we  
perceive that a wound made in the Thorax thro' the  
pleura must be attended with a great degree of  
danger, as in consequence of the Admission of air,  
a collapse of the Lungs from their natural elastic-  
ity must take place, & we co. not have in our power  
to dilate and contract 'em alternately, When as in  
consequence of this division, we can make a shift  
to live, tho' perhaps a very consid.<sup>le</sup> opening be made  
in one side, for the Lungs will not collapse when  
one side is wounded as they do in a dead body  
upon opening the Thorax, for then the other side is  
at rest, & their natural tone brings them to a  
small compass: but the oppression from a wound  
occasions a greater exertion with the other side in  
order to dilate the Thorax, & whilst a great deal  
of Air enters thro' the wound, some likewise goes

by the Trachea luteia to the wounded side so that (160.)  
there is a very small degree of dilatation in that side.  
In this Case too the expiration is performed with the  
like violence, & the Glottis is in a great measure con-  
tracted, hence the Air is thrown from the sound side into  
the wounded, so that there is an inspiration of the  
wounded side, while there is an expiration of it. other:  
In that way Life may be continued. Besides this  
partition serves for conducting of vessels, for supporting  
the parts &c. — I have mention'd the danger there is in  
cutting into the Cavity of the Abdomen, & we wd. think  
that the cutting into the Cavity of the Thorax, or of open<sup>n</sup>  
for the Empyema must also be attended with it. highest  
danger: & yet it is not mark'd out by Surgeons: may  
does not take place in fact, & the reason is this; The  
matter contain'd between the Lungs and the Ribs has  
same effect that the admission of the Air into the  
They are mechanically glid'd to the Ribs & prevented  
from collapsing, so that the Ribs drag the Lungs along  
with them in the different states of Respiration and  
the Air does not get into the Cavity of the Thorax. —

### Secture 29<sup>th</sup>

Having examin'd the containing parts, & contents of the  
3. principal Cavities of the Body we next proceed to  
neck & Top part of the Head. — It is with the small muscles,  
which with these already demonstrated complete the  
upper part of the face & side of the head: then the muscles  
that open or shut the fleshy part of the mouth, after them  
those that serve for opening or shutting the mouth by

moving the Jaw Bones: then going deeper we examine  
the muscles of the Tongue, & after them these of the palate,  
then these of the Throat, of the Pharynx & Larynx; & then  
we examine such as serve for the general motion of the  
head & neck first on the forepart, then turning the body  
these of the back part & finish with the Extremities. &c

### Lecture 30<sup>th</sup>

In the order of the demonstration we begin w<sup>th</sup> the muscles  
of the Lips, these perform a double office, for whilst they  
serve to make the motions w<sup>ch</sup> their names express, they  
serve likewise to explain to one another our Intentions, or  
to express our Passions: & this in a way w<sup>ch</sup> we all readily  
understand, but w<sup>ch</sup> we find difficult to describe: and I  
apprehend whether we appeal to reason or to fact we shall  
find that there is an original texture of w<sup>ch</sup> the meaning is  
readily understood, It is vain to suppose w<sup>th</sup> Dr. Parow  
that by habit alone we acquire that power: our bodies  
are better fitted to our minds: or in children we shall find  
the expression very much varied: nay in the face I have  
fancied that the disposition of the muscular fibres is  
purposely varied in different persons, for we do not find  
of any two descriptions even of accurate Anatomists  
agree: & we freq<sup>ly</sup> find in the face various nature.  
That however, habit has the power of giving one kind of  
expression more strongly mark'd, is beyond all doubt,  
thus we see persons of the same profession, & who are  
us'd to direct their attention to particular objects, have  
the same resemblance in their Countenances.

162. Next let us consider these less complex actions, those performed in receiving or confining food. — In opening the mouth to receive the food we employ all the muscles that raise or depress either of the Lips: we then shut the mouth by the action of the Orbicularis muscle, & press the flesh of the cheeks and Lips close by the Masseter and Buccinator for we scarcely assist much by the Elevator of the Lips which rather tend to separate the Lips from the Gums. — In the mean time by motion of the Jaws the food is manducated, the masseter, Temporal, & Pterygoides muscles are fitted for raising the Jaw upwards, & that w<sup>th</sup> different degrees of obliquity as they act on both sides more or less in concert, but it is chiefly the external Pterygoides w<sup>ch</sup> effects the lateral motions, mov<sup>g</sup> the Jaws alternately to the two sides: or it is used to bring the lower Jaw forwards beyond the upper Jaw, while it commonly falls within it. — Whilst the food is manducated it is confined by the motion of the Tongue from being thrown inwards, & this Organ we find capable of more varied motions than we wd. expect from viewing the muscles that are inserted into it. It depends upon y<sup>e</sup> circumstance, that the fibres of these muscles are continued into the substance of the Tongue: & it is probable that the terminations of these fibres act in a very different way from their origins, w<sup>ch</sup> the muscles

sewing to move the whole body of the Tongue, may 168.  
serve the purpose of a great variety: *ij.* *musc. Lingualis*  
particularly seems to have this varied action, just as  
the Sphincter of the Bladder has its action different from  
that of the very fibres that form it.

After the food is sufficiently manducated w<sup>th</sup> *ij.* *Tongue*  
we gather it up & carry it backwards into the Throat:  
w<sup>ch</sup> we chiefly do by the *Stylo. Glosi* muscles, w<sup>ch</sup> pull  
the Tongue backwards: while at the same time we raise  
the point of the Tongue to the roof of the mouth, by *ij.* rest  
of its muscles: By bringing the Tongue backwards w<sup>th</sup>  
the Bolus upon it we have now relax'd the muscles con-  
= meeting the tongue to the Epiglottis, w<sup>ch</sup> comes to be press'd  
down upon the Glottis, & therefore respiration to be  
stop'd: We now being in danger a sudden effort of  
nature succeeds to relieve us: The several muscles are  
now throw into a convulsive action, the Digestive mus-  
= cles upon which whole volumes have been wast'd abt.  
its action evidently serve for pulling down *ij.* lower  
Jaw, for when we open the mouth that muscle is slacken'd  
& there is no sure rule for determining the action of a  
muscle *ij.* to observe in what way you shorten it most.  
But next suppose I shut the mouth, & *ij.* endeavour to  
shorten it, it is only to be done by pushing up the *Os*  
*Hyoides*: and as soon as the food is prepar'd we shut  
the mouth, press the Jaws together, & then we make the  
effort of swallowing with this muscle. So *ij.* contrary to  
what *Albinus* alledges it is a muscle of deglutition: &  
a very principal one w<sup>ch</sup> with the other beneath them  
serve for the motions of the Jaws then act very

suddenly: and at the same time the *Coraco-* (164.)  
*hyoidaeus* of *Ruthow*, or more properly according to  
*Winslow* the *Omo-hyoidaeus*, or *Omo-plato-hyoidaeus*  
*Genio-hyoidaeus*, & the *Thyreo-hyoidaeus* act, that the  
*Larynx* may be pulled forwards, along with the  
*Oo-hyoides*: in consequence of this the *Pharynx* is  
dilated and room is made for the *Bolus* which is  
now thrown with violence over the *Epiglottis*: or the  
*Epiglottis* & *Larynx* are drawn forwards so as to  
leave the *Bolus* in the *Pharynx* and from the *Larynx*  
being the forepart of the *Pharynx* it is mechanically  
dilated. In the time of this Ejection the nostrils  
are shut in the most accurate manner: *D. Haller*  
imagines that the weight of the food is sufficient to  
prevent from being thrown into the nose, but a person  
can swallow standing upon the Crown of the head and  
we observe that if the *velum pendulum palati* be  
eroded the meat and drink are with difficulty pre-  
vented from getting into the nose, and we observe that  
if the *Elevator palati* have the power of shutting that  
in the most accurate manner. — The food being now  
thrown with a considerable jerk into the *Pharynx* it is  
immediately irritated to perform its exertions, and the  
fibres in a circular oblique manner begin their con-  
tractions from an instinct of nature which determines  
the motion downwards, and by the *Constrictores*  
*Pharyngis* the food is pushed down into the *Oesophagus*.  
But as soon as it has descended a certain way the  
*Digestive* and other muscles are relaxed, there being  
now no danger of the food ascending again they

165.  
The successive actions of the muscular fibres of the  
Oesophagus the food is thrust down into the Stomach.  
That the Pharynx is contracted in the most accurate  
manner & that this contraction follows the food  
close, appears from the accuracy with which we can  
swallow fluids, thus we can swallow water even  
when the head is undermost, and I find that I can  
swallow Air just as easily as water.

Douglas gives a very complicate description of the  
Muscles of the Pharynx from Valsalva. It is join'd  
to a great many places differently, as to the cunei-  
form process of the Os Occipitis, from the lower Jaw,  
from Styrigid process of the Sphenoid Bone &c.  
Valsalva observing all the connexions, divides it  
into so many muscles: But Albinus has more  
properly attended to the direction of the fibres, and  
finds as it were three layers, so describes them as  
three muscles, and as these have the faculty of  
constricting the Pharynx and squeezing down  
the food, he calls them Constrictores Pharyngis  
and from their situation as connected to the head,  
Os hyoides chiefly, or Larynx chiefly, superior middle  
and Inferior Constrictors.

That the Pharynx is contracted in the most accurate  
manner, and that this contraction follows the  
food close is evident from every experiment.

Persons with nervous experim Complaints  
frequently complain of an uneasiness from wind  
in the Stomach, and it is difficult to discover

from whence it proceeds: much of it may be <sup>165.</sup>  
evacuated from the food: but in a number of Cases I  
make no doubt that the patients uneasiness is much  
increas'd by swallowing a quantity of air. — an  
uneasiness is felt in the Stomach and the patient  
makes efforts to relieve himself, but instead of this  
the air is swallow'd in great quantity, and I can  
myself bring on an uneasiness in this way. —  
If we want to employ any farther power in  
swallowing we can draw the Larynx back against  
the food and assist the Constrictors by acting  
with the Stylo pharyngeus and omo-pharyngeus  
which press the Larynx against the Pharynx. —

## Secture 31.<sup>st</sup>

It is of use to observe that we can pass the finger  
from the mouth into the throat, and can turn it  
back till we come to touch the back part of the  
Septum Narium, so that we can examine all the  
Backpart of the opening from the nose into the  
Throat. —

In manducation and deglutition the numerous  
small Salivary glands within the mouth are  
compress'd. — When we open the lower jaw the  
muscles which open the mouth press the Inferior  
maxillary gland and the Sublingual, the Tongue  
at the same time presenting these glands from

cluding the effect of the external muscles: at the (167)  
same time the angle of the Jaw pushes back pressure  
upon the parotid Gland, the duct of which is pumped  
by the masseter muscles: and we observe so long as  
we continue the action of the Jaw the increased flow  
of the Saliva continues: so that the Glands are not  
merely emptied, but the secretion is increased: and  
if by any accident the duct of the parotid gland has  
been cut thro' or constricted, in the time of eating the  
flow of the Liguor is found to be very considerable.  
The Parotid Gland is exposed to external accidents, and  
as there is a considerable thickness between it and the  
mouth it comes sometimes to be difficult to continue  
the flow into the mouth: how this is to be done will  
come to be explained afterwards. — The duct of this Gland  
is small and thick so that upon any Calculous con-  
cretions occurring here it pushes the Liguor readily  
carries them forwards into the mouth: but are concretions  
infrequently found in the duct of the Inferior maxillary  
wh<sup>ch</sup> is a great deal larger than the duct of the parotid so  
that they may lodge in it and the flow of their Liguor  
still be continued: The mouth of that duct is very much  
contracted in proportion to its size. — As the duct is  
accompanied by a considerable nerve there is some  
danger in making an incision into it, tho' if the nerve  
may be readily avoided: It is next to impossible  
to heal the incision the orifice remaining  
open after: but the slanting direction of the

Direction of the Gut seems for all else so y<sup>e</sup> food from y<sup>e</sup> mouth does not  
 easily get into it. — In like manner the mucous glands are press'd  
 upon, when the contents are require'd, thus when we swallow y<sup>e</sup> food  
 we make the Tongue harder, press it against the palate & squeeze  
 out y<sup>e</sup> mucous mechanically as y<sup>e</sup> food passes along, y<sup>e</sup> muscles y<sup>e</sup>  
 form y<sup>e</sup> rest of y<sup>e</sup> Tongue being at y<sup>e</sup> same time in action to throw  
 y<sup>e</sup> food into the Pharynx, where y<sup>e</sup> Constrictor Pharyngis, squeeze  
 the small glands, y<sup>e</sup> are situated between its membranes & y<sup>e</sup>  
 muscles. — Muscles of the Larynx demonstrated.  
 The formation of y<sup>e</sup> voice is made as I obs<sup>d</sup>. before at this place;  
 by means of y<sup>e</sup> Ligaments of y<sup>e</sup> Larynx we shape y<sup>e</sup> voice into  
 Letters as y<sup>e</sup> sound passes thro' the mouth. — Till about 30. years  
 of Age. Varin began to examine this matter by experim<sup>ts</sup>. Anat.  
 spoke of it in a vague & indetermin'd manner: the gr<sup>t</sup>. question  
 to be determin'd is: Whether we are to compare the Voice to a wind  
 or to a Chorded Instrument. that y<sup>e</sup> diff<sup>er</sup>. between these may be clearly  
 understood, we obs<sup>d</sup>. of y<sup>e</sup> tones of Wind Inst<sup>ts</sup>. depend upon y<sup>e</sup>  
 Size & Situation of y<sup>e</sup> Aperture & y<sup>e</sup> Current of the Air thro' these  
 independant of y<sup>e</sup> materials of w<sup>ch</sup>. the consist, so flutes made of  
 Lead, Copper or Wood &c. may be play'd in concert, whereas in  
 the chorded Inst<sup>ts</sup>. y<sup>e</sup> Tones depend merely not on y<sup>e</sup> vibration  
 of the Chord, but also upon y<sup>e</sup> materials of w<sup>ch</sup>. y<sup>e</sup> rest of y<sup>e</sup> Inst<sup>t</sup>.  
 is compos'd; thus for example y<sup>e</sup> Tones of y<sup>e</sup> Violin depend  
 not merely on y<sup>e</sup> length & Tension of y<sup>e</sup> string but also on y<sup>e</sup>  
 nature of y<sup>e</sup> wood employ'd. it. Now. Varin contends y<sup>e</sup> our  
 Voice ought only to be compar'd to a chorded Inst<sup>t</sup>. so he  
 considers y<sup>e</sup> Ligam<sup>ts</sup>. of y<sup>e</sup> Larynx as y<sup>e</sup> form y<sup>e</sup> most straiten'd  
 pt<sup>s</sup>. of it as Chords w<sup>ch</sup>. produce y<sup>e</sup> sound: and y<sup>e</sup> these have a  
 very gr<sup>t</sup>. effect we must certainly allow to him; because in a  
 dead Animal, after cutting away y<sup>e</sup> parts of y<sup>e</sup> Inst<sup>t</sup>.

Cartilage &c. if air be blown from y<sup>e</sup> Lungs & suspended  
 given to these Chords we can in an imperfect manner imitate  
 y<sup>e</sup> voice of y<sup>e</sup> Animal; I shall afterwards show this in Birds  
 when we do it more readily; But I can't help suspecting strongly  
 may being fully convinced y<sup>t</sup> there is something more y<sup>e</sup> y<sup>e</sup>  
 to be taken into acct. for our muscles are as well adapted for  
 attuning y<sup>e</sup> structure of y<sup>e</sup> Glottis, as for attuning y<sup>e</sup> tension of  
 the Ligam<sup>ts</sup>. We perceive a manifest resemblance between  
 the Larynx and a Haut boy, but to show this still more  
 clearly, let us only attend to what happens when we mean  
 to sound very acute notes or grave ones; if the sound depends  
 actually upon them y<sup>e</sup> Ligam<sup>ts</sup> which alone be in motion, & b<sup>e</sup>  
 be made tense or be relaxed; but by an instinct of nature if  
 I mean to sound an acute note, I attempt to inspire,  
 I depress my Diaphragm, the weight of y<sup>e</sup> Air pushes down my  
 Lungs, & stretches y<sup>e</sup> Trachea in all its branches, & at y<sup>e</sup>  
 same Time y<sup>e</sup> Thyroid Cartilage is drawn strongly upward  
 & stretched to the full. — or let us observe what happens in  
 whistling, it is very evident y<sup>t</sup> y<sup>e</sup> notes depend upon the  
 aperture as well as upon the tension of y<sup>e</sup> sides of y<sup>e</sup> pipe  
 in Birds when y<sup>e</sup> Ligam<sup>ts</sup> of y<sup>e</sup> Larynx are relaxed at  
 y<sup>e</sup> bottom of y<sup>e</sup> Trachea, & when we make a hole higher  
 up we perceive y<sup>t</sup> not only y<sup>e</sup> strength but y<sup>e</sup> Tone of the  
 Voice is altered. So I am persuaded y<sup>t</sup> our Larynx possesses  
 y<sup>e</sup> advantage of a wind as well as a Chorded Inst<sup>mt</sup>. & y<sup>e</sup> the  
 voice is on y<sup>e</sup> act superior to any Inst<sup>mt</sup> in y<sup>e</sup> it unites them to  
 gether; & instead of being acted upon by solid bodies, as a  
 corded Instrument, it is acted upon in a much newer way by  
 y<sup>e</sup> air thrown out from y<sup>e</sup> Lungs. — We must proceed to  
 examine the muscles serving for y<sup>e</sup> motion of y<sup>e</sup> head  
 and of y<sup>e</sup> Trunk of the Body.

We scarcely find any Two Anatomists agree in describing  
 of muscles of the head, back &c. many of 'em widely cov-  
 very diff. purposes of Tendons running along of transverse  
 processes of vertebrae. use of ligam. <sup>to</sup> vertebrae.  
 They are sometimes described from vertebrae in one direction while others  
 follow in their whole length. Dr. Albinus says as of nature  
 of thing will allow has given us a best description of  
 muscles here, but has introduc'd of great confusion,  
 from his enumerating vertebrae upwards while he enumer-  
 ates ribs downwards, & says he describes of vertebrae  
 of back as connected to last rib. Douglas scarcely  
 takes notice of a muscle went along transverse process  
 of neck & w. is mark'd by Albinus under name of  
 Transversalis colli. Douglas applies term of Trans-  
 versalis to upper part of multifidus Spinæ. The  
 Scalenus muscle of Douglas is inconv. and you'll obs.  
 of Scalenus muscles are not so much of the throat as of  
 an apply'd to motions of neck, w. is by far of most  
 moveable part, however when I make my neck an immov-  
 able pillar I can act with 'em upon the throat. & when the  
 breathing is difficult I see one push up shoulder, keep  
 neck straight and draw it a little backwards, in order  
 to give a tension to muscles Scaleni. They may raise  
 upper ribs as much as possible: when we obs. in what  
 manner head can be mov'd, of combin'd action of  
 muscles in moving it is very simple. In gest. every muscle  
 draws its points as m. as articulation will allow in  
 a straight line, & all muscles have starting fibres twist

the head, but if a pair of these are in action at y<sup>e</sup> same time y<sup>e</sup> obliquity of one balancing y<sup>e</sup> obliquity of the other, they serve y<sup>e</sup> purpose of a straight muscle, so if I want to draw y<sup>e</sup> Occipital bone backwards in a straight line instead of employing muscles w<sup>ch</sup> run very nearly in y<sup>e</sup> same direct<sup>n</sup> we can employ y<sup>e</sup> musculi Trapezii w<sup>ch</sup> run very nearly in y<sup>e</sup> direction and y<sup>e</sup> head moves in a diagonal line between 'em; and by this means we can draw y<sup>e</sup> head m<sup>ch</sup> farther back y<sup>e</sup> we c<sup>d</sup>. have done by a muscle sent directly from y<sup>e</sup> bottom of the neck to the Occiput. If I mean to draw y<sup>e</sup> head straight forwards I employ all y<sup>e</sup> muscles on both sides whether straight or oblique; & in like manner when I mean to draw it backwards. but for pulling wide ways we an obly. to employ an anterior & a posterior muscle at y<sup>e</sup> same time so in order to bring y<sup>e</sup> mastoid process down to the Shoulder I act w<sup>th</sup> y<sup>e</sup> Sternomastoides & y<sup>e</sup> Splenius muscles w<sup>ch</sup> counteract one another. and by a succession of these motions I can make my head describe a Circle. Suppose I want to turn y<sup>e</sup> neck over y<sup>e</sup> left shoulder y<sup>e</sup> most immediate for y<sup>e</sup> purpose are y<sup>e</sup> obliqui inferior & superior that be very strong muscles; but I assist by y<sup>e</sup> Splenius of y<sup>e</sup> same side; & to do it w<sup>th</sup> full using: I also employ upon the opposite side the Sternomastoid muscle & y<sup>e</sup> Complexus for y<sup>e</sup> Splenius & Complexus cross each other, so are Antagonists y<sup>e</sup> Complexus therefore Splenius on y<sup>e</sup> opposite sides have y<sup>e</sup> same direction & must cooperate. And inverting y<sup>e</sup> action of these muscles w<sup>th</sup> turn y<sup>e</sup> head with y<sup>e</sup> same face backwards: the motions of y<sup>e</sup> Turn

muscle w. have done. If I mean to bring it backwards I (173)  
employ y<sup>e</sup>. whole of y<sup>e</sup>. Trapezius, but more especially y<sup>e</sup>. upper lower  
ends, but I can likewise employ y<sup>e</sup>. Rhomboides to make it  
advance forwards, I can employ y<sup>e</sup>. lesser Pectoral Musc. serratus  
but the large serratus has a greater effect draw. y<sup>e</sup>. whole Scapula  
forwards. — There are in all y<sup>e</sup>. muscles w. directly operate  
upon the humerus. to raise it we employ y<sup>e</sup>. Trapezius and  
supra spinatus; to pull it a little inwards at y<sup>e</sup>. same time  
we add y<sup>e</sup>. Coraco-brachialis & small part of y<sup>e</sup>. Infra spinatus.  
To draw down y<sup>e</sup>. arm we use y<sup>e</sup>. posterior parts of y<sup>e</sup>. Deltoid. &  
if I push it strongly against y<sup>e</sup>. side, I use y<sup>e</sup>. g<sup>o</sup>. pectoral and  
Latissimus Dorsi, so y<sup>e</sup>. it is by these muscles we support  
weights under y<sup>e</sup>. Arm. To bring y<sup>e</sup>. Arm back I employ a combina-  
tion of Muscles, the Latissimus Dorsi & Teres major, but to pre-  
vent them from rolling it, I act at y<sup>e</sup>. same time with y<sup>e</sup>. Teres  
minor & Infra spinatus; so y<sup>e</sup>. by these 4. muscles I bring y<sup>e</sup>. arm  
back w. considerable force. — To bringing y<sup>e</sup>. Arm forwards we  
employ y<sup>e</sup>. large pectoral Coraco-brachialis & Latissimus Dorsi  
By a succession of these motions we perform y<sup>e</sup>. circular motions  
with y<sup>e</sup>. arm, or we can draw a circle with a piece of Chalk upon  
a Wall. — The motions of y<sup>e</sup>. Elbow are very simple, for y<sup>e</sup>. purpose  
of flexion I employ y<sup>e</sup>. Biceps & Brachialis externus & for  
extension y<sup>e</sup>. triceps muscle. — It may not be amiss to observe  
the vast strength of our muscles we can sustain in Life a  
weight y<sup>e</sup>. is sufficient after Death to tear y<sup>e</sup>. muscles to pieces  
thus suppose I can raise in my hand to a right angle w.  
the humerus a weight of 100. w. lbs. by means of y<sup>e</sup>. Biceps  
and Brachialis; now these are inserted at all an Inch  
distant from y<sup>e</sup>. Center of motion whilst y<sup>e</sup>. weight act. at  
at the distance of 12. Inches nearly, & therefore the muscles  
actually support 12. times 100. or 800. Besides these muscles

are obliquely in order to increase their  $11^{\circ}$  but if they (174)  
had been straight in proportion to their number their force  
w<sup>d</sup>. have been greater, so y<sup>e</sup>. they w<sup>d</sup>. have supported, in stead  
of 360. 400. or 500. lb. & they not only support but overcome  
the weight, and farther y<sup>e</sup>. muscle is as much stretched  
at its origin as at its insertion, it is pulled at both ends  
equally, we must therefore say y<sup>e</sup>. round ligament muscles are  
able to overcome y<sup>e</sup>. resistance of 800. or of 1000 lb weight.

### Lecture 35.

It will obs<sup>er</sup>. y<sup>e</sup>. y<sup>e</sup>. are certain parts. Bones & muscles, within  
w<sup>ch</sup>. we find a Ligament secured, we find w<sup>ch</sup>. whenever a Tendon  
makes or makes a sudden turn & presses upon a hard substance  
as in y<sup>e</sup>. joint of y<sup>e</sup>. humerus, at y<sup>e</sup>. Elbow where y<sup>e</sup>. Tendon  
of y<sup>e</sup>. Biceps muscle cuts upon y<sup>e</sup>. bone, in like manner  
y<sup>e</sup>. Tendon of y<sup>e</sup>. latissimus dorsi passes round y<sup>e</sup>. humerus  
& presses upon it: these were first properly demonstrated  
by Albinus tho' a m<sup>an</sup>. in the body were unknown to him  
The Humerus is luxated more frequently y<sup>e</sup>. any other joint  
of y<sup>e</sup>. Body, & when y<sup>e</sup>. happens y<sup>e</sup>. Ligaments of y<sup>e</sup>. joints  
are more easily not merely relaxed or extended but they are  
actually torn: the Tendons of y<sup>e</sup>. Biceps by y<sup>e</sup>. bones slip  
out and are in their sheath w<sup>ch</sup>. is of us covered. Strengths.  
I never saw y<sup>e</sup>. luxation happen upwards; the luxation  
backwards is mentioned, but y<sup>e</sup>. space is m<sup>uch</sup>. confined  
by y<sup>e</sup>. ridge of y<sup>e</sup>. neck of y<sup>e</sup>. Scapula & by y<sup>e</sup>. short muscles,  
so y<sup>e</sup>. it must happen very rarely, the most common kinds  
therefore are where y<sup>e</sup>. Bone is pressed inwards & forwards  
or downwards & forwards into y<sup>e</sup>. axilla, and the first of  
these is by much y<sup>e</sup>. most frequent or is y<sup>e</sup>. proportion of  
9. out of 10. immediately under y<sup>e</sup>. Coracoid process, the

round Ball is to be left behind y<sup>e</sup> superior part of y<sup>e</sup> pectorial muscle: and it gen<sup>lly</sup> happens when a palle<sup>l</sup> throws out his arm in order to save himself. We distinguish it by y<sup>e</sup> follow<sup>g</sup> marks 1<sup>st</sup> y<sup>e</sup> head after passing y<sup>e</sup> coraco<sup>id</sup> process is drawn up by y<sup>e</sup> muscles higher y<sup>e</sup> Socket, y<sup>e</sup> arm becomes shorter y<sup>e</sup> distance between y<sup>e</sup> Peromion life and y<sup>e</sup> Elbow next y<sup>e</sup> Elbow is turned a little outwards: & from want of the Socket and straining of y<sup>e</sup> muscles y<sup>e</sup> motion is much less free & part<sup>ic</sup> y<sup>e</sup> head of y<sup>e</sup> bone being wedg<sup>d</sup> in between y<sup>e</sup> coraco<sup>id</sup> process & ribs under y<sup>e</sup> clavicle few can raise their hand so as to apply y<sup>e</sup> palm to the head: but we must not always trust to this mark, for if y<sup>e</sup> Ligam<sup>ts</sup> anterior of y<sup>e</sup> sacration perhaps were extended to y<sup>e</sup> muscles, y<sup>e</sup> patient may very readily raise his hand to his head next standing behind y<sup>e</sup> patient plac<sup>d</sup> upon a chair we are immediately sensible of a hollow under y<sup>e</sup> Peromion & we can press y<sup>e</sup> deltoid muscle into y<sup>e</sup> Sack of y<sup>e</sup> scapula & push y<sup>e</sup> hand forward we find a round hard swelling behind y<sup>e</sup> pectorial muscle. Making hold of y<sup>e</sup> arm and hand y<sup>e</sup> forearm, in order to roll it we make y<sup>e</sup> Ball roll behind y<sup>e</sup> pectoral, & if all these marks are attended to you will never fall into a mistake: next after know<sup>g</sup> y<sup>e</sup> Comp<sup>t</sup> we must attend to y<sup>e</sup> Circumstances w<sup>ch</sup> occasion y<sup>e</sup> resistance in reducing y<sup>e</sup> bones in a recent case. 1<sup>st</sup> y<sup>e</sup> sacration of y<sup>e</sup> Ligam<sup>ts</sup> the head of y<sup>e</sup> bone cannot be made to enter at y<sup>e</sup> hole from w<sup>ch</sup> it came out, y<sup>e</sup> edge of y<sup>e</sup> sacrated part catching y<sup>e</sup> round Ball. But this has seldom much effect for from y<sup>e</sup> sudden violence the part in y<sup>e</sup> Ligam<sup>ts</sup> must be more y<sup>e</sup> suff<sup>ic</sup> to receive the Bone back again. Next y<sup>e</sup> round Ball is catch<sup>d</sup> by y<sup>e</sup> edge of y<sup>e</sup> Socket, next with regard to y<sup>e</sup> muscles, a Tendon

passes over y<sup>e</sup> head of y<sup>e</sup> Bone to some distance as of the (176)  
Biceps, coming from y<sup>e</sup> Scapula passing over y<sup>e</sup> humerus  
going to the forearm, that tendon has no hold of y<sup>e</sup> head of  
y<sup>e</sup> humerus in its natural situat<sup>n</sup>. but as soon as y<sup>e</sup> humerus  
is displaced y<sup>e</sup> tendon is thrown over y<sup>e</sup> neck of y<sup>e</sup> Bone  
& passes in upon it, & y<sup>e</sup> head is catch'd upon reducing it  
in y<sup>e</sup> tendon of y<sup>e</sup> muscle w<sup>ch</sup> is a principal circumstance  
of y<sup>e</sup> reduction difficult, both y<sup>e</sup> long head & also  
y<sup>e</sup> short head of y<sup>e</sup> biceps, & w<sup>ch</sup> these y<sup>e</sup> Coraco Brachialis  
make a circumstance to y<sup>e</sup> reduction so when y<sup>e</sup> forearm is  
extended various efforts may be made to reduce it to its  
purpose, y<sup>e</sup> biceps being fully on y<sup>e</sup> stretch, but bending  
the forearm & slackening y<sup>e</sup> Biceps it may be reduced w<sup>ch</sup>  
case, and another way may have effect in a dead body it must  
have a much greater in y<sup>e</sup> liv<sup>g</sup> one, when y<sup>e</sup> muscles are  
stretch'd beyond their natural tone, & when they do not  
obey to our will, & are affected w<sup>ch</sup> a medially imped  
of any inflammation, w<sup>ch</sup> has often a great share in y<sup>e</sup> exist<sup>n</sup>.  
It frequently happens y<sup>e</sup> patient has some pain,  
at y<sup>e</sup> same time there is often a numbness in y<sup>e</sup> whole  
arm, from y<sup>e</sup> muscle being stretch'd & press'd upon by the  
head of y<sup>e</sup> humerus: & there is a degree of adematous  
swell<sup>n</sup> in y<sup>e</sup> arm from y<sup>e</sup> pressure of y<sup>e</sup> lymphatics eff<sup>s</sup>.  
we compar'd between y<sup>e</sup> head of y<sup>e</sup> humerus & ribs.

### Lecture 36<sup>th</sup>

The muscles of y<sup>e</sup> forearm & hand demonstrated.  
D<sup>o</sup> Pecain in computing y<sup>e</sup> strength of our muscles  
does not attend to y<sup>e</sup> N<sup>o</sup> of fibres but mainly to y<sup>e</sup> weight.  
but y<sup>e</sup> length only gives the muscle a greater sweep  
or play, & a shorter muscle may be much stronger.

The *Pollex* or *pollicis longus* is the muscle for his Example 177.  
is remarkably penniform & is a very pretty Instance of  
a penniform muscle. — with regard to the Aponeurosis  
we wd. avoid wounding it rashly in performing chirographic  
operations in act of its giving origin to muscles, and we  
can conceive it difficultly w. is. *flex. form.* here may get  
out first between *of. muscles* or *under of. Skin* & *of.*  
necessity there may be for a fistulous matter by incisions  
for I have seen such things when *of. suppuration* had  
begun in *of. inside of of. tendinous ligamentous mem.*  
obscure and running along *of. muscles* & spread down  
into *of. hand* & broke out in diff. parts of it: & further  
other matters *of. flex* may be confin'd, and give the  
appearance of circumscrit'd Tumors, as in the Case of  
Aneurism. & where *of. blood* may be confin'd by the  
Aponeurosis of the *Brachio.* — Next let us attend to  
the Combination of the several muscles. Let us now  
view 'em in their proper Places: There are 3. muscles  
w. *of. principally* serve for the flexion of *of. hand*, the  
*flexor radialis* & *ulnaris*, w. *of. palmaris longus*  
and when these operate *of. hand* is straight forward.  
From *of. posterior* part we find the same 2. antagonists  
to these, *of. 2. extensors* *radialis*, & *of. 2. extens. ulnaris*  
w. draw *of. hand* straight backward. we have little  
rotatory power in *of. fingers*, because both are turn'd  
by *of. rolling* of *of. radius* upon *of. ulna*. In *of. fingers*  
we find two flexors & but one extensor because we have  
more frequently occasion to bend *of. fingers* forcibly *of. to*  
extend them. Follow. *of. flexor* muscles we find *of. three*

178.

Tendons are not only ty'd down by 4<sup>th</sup> transverse  
ligaments of 4<sup>th</sup> wrist but further by 4<sup>th</sup> sheath of the  
fingers, because our joints are extremely bended &  
unless the starting up of the Tendon was prevented 4<sup>th</sup>  
effect of 4<sup>th</sup> muscle wd. be lost, for 4<sup>th</sup> muscular fibres  
being pernit down their effect is not so great as might be  
expected at first sight; With regard to the 2<sup>d</sup> & 3<sup>d</sup> fingers of  
of short muscles 4<sup>th</sup> *Supra-bicipitalis* & *interossei*, 4<sup>th</sup>  
*Supra-bicipitalis* have been quoted as a 3<sup>d</sup> flexor, but 4<sup>th</sup>  
root of it begins from 4<sup>th</sup> Tendon of 4<sup>th</sup> *profunda*, & they  
can only be made to act from 4<sup>th</sup> strength of the muscle  
and its motion more extensive; w<sup>ch</sup> 4<sup>th</sup> of 4<sup>th</sup> *supra-bicipitalis*  
flexor in draw 4<sup>th</sup> fingers farther forwards; but we  
often act moderately w<sup>th</sup> 4<sup>th</sup> flexor & w<sup>th</sup> 4<sup>th</sup> *Supra-bicipitalis*  
give 4<sup>th</sup> lateral motion: the *musculi interossei* also  
move 4<sup>th</sup> fingers sideways and are chiefly intended for  
4<sup>th</sup> lateral motion, but passing behind 4<sup>th</sup> ligament of  
join 4<sup>th</sup> metacarpal bones they bend 4<sup>th</sup> fingers in a  
little, & hav. made a great exertion w<sup>th</sup> 4<sup>th</sup> long extensors  
with regard to 4<sup>th</sup> rotation of 4<sup>th</sup> hand & fingers 4<sup>th</sup> ulna  
is immovable nearly so, & we may consider 4<sup>th</sup> axis  
& motion to be a line drawn from 4<sup>th</sup> head of the Radius  
above to 4<sup>th</sup> head of the ulna below. For 4<sup>th</sup> supination  
we use 4<sup>th</sup> *supinator Radii longus & brevis*; For the  
pronation 4<sup>th</sup> *pronator teres* or *longus* & 4<sup>th</sup> *pronator*  
*quadratus*: with 4<sup>th</sup> *pronator teres* we may assist  
in bend. 4<sup>th</sup> forearm but we never can act w<sup>th</sup> it w<sup>th</sup> out  
4<sup>th</sup> rolling 4<sup>th</sup> Radius but for rolling it w<sup>th</sup> more force we  
may employ 4<sup>th</sup> *biceps flexor Cubiti* 4<sup>th</sup> muscles of 4<sup>th</sup>  
Thumb & Four fingers & 4<sup>th</sup> *Flexor Carpi Radialis*.

## Lecture 37

(179)

With reg. to  $\frac{1}{2}$  motion performed by  $\frac{1}{2}$  muscles of the lower extremities, you will obs.  $\frac{1}{2}$  if I fix  $\frac{1}{2}$  Leg:  $\frac{1}{2}$  muscles  $\frac{1}{2}$  can only move it out upon  $\frac{1}{2}$  thigh. I think,  $\frac{1}{2}$  is one reason why nature has not furnished  $\frac{1}{2}$  merely from  $\frac{1}{2}$  thigh bone, but also from  $\frac{1}{2}$  trunk, as if we cut with  $\frac{1}{2}$  longest muscles of  $\frac{1}{2}$  leg w<sup>ch</sup> come from  $\frac{1}{2}$  Trunk of  $\frac{1}{2}$  body, on one side, & w<sup>ch</sup> these  $\frac{1}{2}$  come from  $\frac{1}{2}$  thigh only on  $\frac{1}{2}$  other  $\frac{1}{2}$  first are now made muscles of  $\frac{1}{2}$  thigh. — I shall in a gen<sup>l</sup> way demonstrate the cooperation of  $\frac{1}{2}$  muscles in their comon office viz. walk<sup>g</sup>. Suppose a person to rest equally on both heels &  $\frac{1}{2}$  he means to make a step forward,  $\frac{1}{2}$  <sup>is</sup> thing necessary is to draw  $\frac{1}{2}$  weight of  $\frac{1}{2}$  Leg w<sup>ch</sup> he intends to move suppose it is  $\frac{1}{2}$  left,  $\frac{1}{2}$  is done by acting w<sup>th</sup>  $\frac{1}{2}$  muscles of  $\frac{1}{2}$  of opposite side turning  $\frac{1}{2}$  trunk over & if I throw into action my abdominal muscles I make  $\frac{1}{2}$  motion & at  $\frac{1}{2}$  same time I fix  $\frac{1}{2}$  pelvis, not only by  $\frac{1}{2}$  weight my  $\frac{1}{2}$  side but  $\frac{1}{2}$  abductors of  $\frac{1}{2}$  thigh b<sup>ut</sup> into action w<sup>ch</sup> pull the pelvis over when  $\frac{1}{2}$  thigh is fix<sup>d</sup> & by  $\frac{1}{2}$  weight so by this I show  $\frac{1}{2}$  weight over upon  $\frac{1}{2}$  right leg and  $\frac{1}{2}$  right leg &  $\frac{1}{2}$  left having a slanting direction,  $\frac{1}{2}$  heel is necessarily raised from  $\frac{1}{2}$  floor & now fixing  $\frac{1}{2}$  right leg I begin to raise  $\frac{1}{2}$  left & I amply for the purpose.  $\frac{1}{2}$  the Flexors of  $\frac{1}{2}$  thigh  $\frac{1}{2}$  p<sup>ro</sup>cars may now I iliacus internus, w<sup>ch</sup> bend  $\frac{1}{2}$  thigh & draw it up: I at  $\frac{1}{2}$  same time bend  $\frac{1}{2}$  leg a little & by thus bending  $\frac{1}{2}$  thigh & leg I have room for giving it the wing forwards — I raise  $\frac{1}{2}$  thigh then in this

180.  
manner and I mean to step forwards; but if I am  
straight upon the right leg, & if other a little starting,  
if soal cannot touch if ground: in order to this I must  
allow if joints of if right to bend gently: I now mean  
to throw if weight forwards & by degrees to bring it  
from if right to the left: first by bending <sup>of Trunk</sup>  
itself for w. I employ if Psoas magnus & Ifiacus  
internus as before, but on if right side w. now draws  
forwards if Trunk as before being more moveable; I use  
support of a action of if Trunk by if Abdominal muscles,  
while those of if neck bring forwards if head. At the  
same time I mean to raise my thigh forwards upon  
my leg: & to push if weight still farther forwards I  
employ if extensors of if right leg, & as if leg is more  
fix'd if thigh they move if thigh & if whole Trunk  
forwards: By these means if weight is thrown more  
& more forwards but still not sufficiently, I still want  
more weight on if left leg to do if. I first employ the  
Quadratus lumborum muscles, & as it can't be bent downwards,  
if muscles must be shorten'd & if upper ends are immo-  
-able, if Iobane absolutely so, & even if similar can have  
little effect from its starting direction, so the heel is  
said, & of course if Tibia, if leg & if whole body upon it  
is thrown forwards. As soon as I am sensible if weight  
is thrown sufficiently upon if left leg to fix it more if  
Trunk: I now begin to employ if muscles of if right leg in  
pulling it forwards, & the whole of if weight falls per-  
pendic. upon if left leg: and to make another step w. if  
right I do if very same thing over again, only I give  
the leg a greater swing, after w. all the other actions  
are repeated in if very same manner.

I was consulted in a case of an old woman who had her  
right knee dislocated in coming of a fall w<sup>th</sup> a burden  
of 40 lb. bone instead of a tray as usual on y<sup>r</sup>. No pulse is  
was put up upon it, bone in y<sup>r</sup> groin here y<sup>r</sup>. Leg may  
become rather shorter, but y<sup>r</sup>. Loss an still hand  
entwined, & as y<sup>r</sup> shall is more sensibly felt y<sup>r</sup>. can  
be little danger of mistaking it.

The Gentleman co. walk so well it was scarcely observed. —  
 The distinction of Luxation by limb becoming shorter of Joints  
 generally turn'd inwards, & head of bone back upon it, or inwards  
 of it, & the character turn'd forward. — The luxation of the Patella  
 is sometimes reduced w<sup>th</sup> considerable difficulty, suppose it  
 is luxated outwards w<sup>ch</sup> is of a w<sup>th</sup> kind for the inner side is  
 broader & stretch'd, & the high ridge of the Joint in its way then  
 the lig<sup>ts</sup> perhaps may be stretch'd w<sup>th</sup> out elevation. — The distinction  
 being of luxation is easy: I once met w<sup>th</sup> a case when the Patella  
 was wroted upon it, outside of it. The lig<sup>ts</sup> were press'd out of the Joints.  
 I therefore went to the outside of the Patella & in order to dis-  
 engage it I put my hand upon the fore part &  
 push'd it backwards with all my strength, in consequence of w<sup>ch</sup>  
 the inner side stretch'd forwards, was immediately disengag'd  
 & slip'd in w<sup>th</sup> a crack. — & this is the difficulty is not always  
 so great, cases may occur when it is only method of  
 succeeding.

Lecture 39<sup>th</sup>

To comply w<sup>th</sup> the Request of the Structure of the Joints it  
 remains to shew you the Properties of both the Extremities  
 When we from our knowledge of the Invention of the muscles  
 we know of a Tendon rubs upon a hard bone, or projecting  
 Substance we will find between it and the Substance  
 a Bursa interpos'd. upon examining we find the membrane  
 within is very smooth, a quantity of fat is constantly found at  
 the outside & a slippery liquor upon the inner side, w<sup>ch</sup> I have  
 seen collect'd in considerable quantity. Bursa bursa  
 behind the Tendo Achillis. — The Bursa on the lacrum is seat  
 of practice diseases & in fact I have seen the Bursa fill'd  
 w<sup>th</sup> a viscid matter and the size of an egg, & in cases  
 I have suspect'd it in vision when it is fully admitted  
 can not to be practic'd without danger from its accumulation.

between  $\text{dm}$  &  $\text{y}^{\circ}$  capsula ligam<sup>ti</sup> of  $\text{y}^{\circ}$  Joints. — 183.  
regard to  $\text{y}^{\circ}$  Laxations of  $\text{y}^{\circ}$  muscles, besides  $\text{y}^{\circ}$  anid.  
They are either to be by being out, by violent efforts, they  
may be true; from knowing this situation & insertions  
we may a first nature in a uniting  $\text{dm}$ , We are apt to draw  
wrong views of  $\text{y}^{\circ}$  Causes of these Laxations, as in case  
of  $\text{y}^{\circ}$  Tendon Petilles, w<sup>ch</sup> is more frequently Laxated, or of  
 $\text{y}^{\circ}$  Tendon  $\text{y}^{\circ}$  goes into  $\text{y}^{\circ}$  patella, or from  $\text{y}^{\circ}$  into  $\text{y}^{\circ}$  Tibia  
we are apt to imagine  $\text{y}^{\circ}$  it is  $\text{y}^{\circ}$  weight of  $\text{y}^{\circ}$  body falling  
down & bending the Joint suddenly,  $\text{y}^{\circ}$  occasions it, but it  
rather depends upon  $\text{y}^{\circ}$  exertion of  $\text{y}^{\circ}$  muscles itself, it is  
observ<sup>d</sup> to happen at  $\text{y}^{\circ}$  very instant of  $\text{y}^{\circ}$  exertion as in  $\text{y}^{\circ}$   
Tendon Petilles — My Father wd<sup>l</sup> mention the Case of John  
Duke of Burgundy who by an effort had  $\text{y}^{\circ}$  sheath tying down  
 $\text{y}^{\circ}$  peronei muscles, &  $\text{y}^{\circ}$   $\text{y}^{\circ}$  Tendon started out  
behind  $\text{y}^{\circ}$  fibula, so  $\text{y}^{\circ}$  these muscles came to be spa-  
smo-dically affected, & were replac<sup>d</sup> with difficulty, in  
such cases where we find the Cure has been neglected we  
endeavour by making a perfect compression to confine  $\text{y}^{\circ}$   
Tendon to its place.

### Lecture 40<sup>th</sup>

Next let us consider  $\text{y}^{\circ}$   $\text{y}^{\circ}$  joints. — The lower part of  $\text{y}^{\circ}$  pelvis  
is made as flexible as is consistent w<sup>th</sup> Safety, &  $\text{y}^{\circ}$  whole  
of  $\text{y}^{\circ}$  Bones prevented as much as possible by the  
Elasticity of  $\text{y}^{\circ}$  Psoas &  $\text{y}^{\circ}$   $\text{y}^{\circ}$  Ligaments & muscles  
lining and filling up  $\text{y}^{\circ}$  Cavity of the pelvis; but as the  
Bones of  $\text{y}^{\circ}$  pelvis support  $\text{y}^{\circ}$  whole weight of  $\text{y}^{\circ}$  Body  
in a transverse way & in a favourable situation we find  
 $\text{dm}$  not only join<sup>d</sup> together by very thick capsula lig<sup>ti</sup>  
& Cartilages, but glued to one another so  $\text{y}^{\circ}$  there is a

considerable resistance in separating them - see p. 184. (184.)  
The head of the thigh bone sunk very deep into the socket  
A quantity of liquor poured out to lessen friction upon  
every motion of the joint: we find the nature endeavours  
to agitate the glands, at the same time lodging them in  
Carnis so as to be in little danger of being caught by the  
head of the Bone, yet from violence in our exertions the  
Lig. fem. may press in upon them & destroy them & may be  
a cause of collections within the Joint. My Father saw a  
Case of this kind where by a fall upon the Trochanter a collect.  
of fetid matter was made in the Joint of the thigh, the gland  
at the bottom was consumed, so the head had been beaten  
too deep into the glands: In such Cases the necessity  
of making an Incision, is the less it can't be made  
w<sup>o</sup>ut considerable danger may come to be preferable to the  
confining the matter: In such Cases the Lig. fem. may come to  
be eroded & such an accretion of parts may happen if  
the head of the thigh bone may be fix'd to the acetabulum  
but in general it will make its way thro' the Lig. fem. before the  
Lig. fem. are consumed, thro' the acetabulum. The diffused in  
the cellular membrane substance w<sup>ch</sup> is loose to allow  
easy motion of the joint, so we wd. endeavour to prevent  
it by making an incision in the Capsula. Lig. fem. w<sup>ch</sup> is  
dangerous if it is of use to the Lig. fem. gives a considerable  
way upon the neck of the bone, depending a great deal  
lower the round ball of the bone is bent for making  
the Incision. — In the case of a fracture of the thigh  
bone it is evident w<sup>h</sup> whilst by machinery we endeavour  
to push down the thigh, we are to be more careful to pre-  
vent the patient from walking soon, because the body puts  
more unfavorably against this Bone than most  
others.

The Joint of  $4^{\text{th}}$  Ankle is entirely a pure hinge. (186.)

In  $4^{\text{th}}$  foot we find  $4^{\text{th}}$  lateral motion made chiefly by  $4^{\text{th}}$  Patella & upon it is  $4^{\text{th}}$  is particularly to be attended to in one disease viz.  $4^{\text{th}}$  Carus  $4^{\text{th}}$  Malfoot. At Birth  $4^{\text{th}}$  toes are sometimes turned very much inwards, now  $4^{\text{th}}$  Sup.  $4^{\text{th}}$  com-  
monly  $4^{\text{th}}$   $4^{\text{th}}$  flexion is entirely in  $4^{\text{th}}$  Joint of  $4^{\text{th}}$  Ankle, where as it is chiefly in  $4^{\text{th}}$  Joint farther forward so the ligaments to be apply'd chiefly to the foot. In  $4^{\text{th}}$  foot we find the Body supported upon an Arch,  $4^{\text{th}}$  sides of  $4^{\text{th}}$  anty'd together by very strong lig.  $4^{\text{th}}$  whereby when we make a step  $4^{\text{th}}$  shock is very considerably lessn'd;  $4^{\text{th}}$  In  $4^{\text{th}}$  a  $4^{\text{th}}$  supported by  $4^{\text{th}}$  Toes,  $4^{\text{th}}$  by being in reality  $4^{\text{th}}$  foot of  $4^{\text{th}}$  animal but by  $4^{\text{th}}$  spring of  $4^{\text{th}}$  muscles, w $^{\text{ch}}$  we manage so as to make every part of  $4^{\text{th}}$  basis yielding, has also a principal share here: Thus in dipping from a height, to lifting  $4^{\text{th}}$  fall by an motion of nature we draw up  $4^{\text{th}}$  Legs  $4^{\text{th}}$   $4^{\text{th}}$  weight may be supported by  $4^{\text{th}}$  spring of  $4^{\text{th}}$  muscles: In  $4^{\text{th}}$  Case of a very violent effort these tendons may be stretch'd, and having little elasticity  $4^{\text{th}}$  danger. Now  $4^{\text{th}}$  not only recover them w $^{\text{th}}$  difficulty but this is reason to believe  $4^{\text{th}}$   $4^{\text{th}}$  fibres are sometimes torn & then pain runs afterwards so well supply'd. Lastly with regard to Dislocations. Instead of considering them merely as positions bound by  $4^{\text{th}}$  pressure of  $4^{\text{th}}$  Tendons we are to consider as parts contriv'd for defending  $4^{\text{th}}$   $4^{\text{th}}$  Joints & chiefly for drawing  $4^{\text{th}}$  Tendons of the muscles at a greater distance from  $4^{\text{th}}$  Center of motion, and as really a Dig to the strength of  $4^{\text{th}}$  muscles; and we may view the Patella as  $4^{\text{th}}$  principal Secured bone in  $4^{\text{th}}$  body, & whilst  $4^{\text{th}}$  Bone protects  $4^{\text{th}}$  Joint of  $4^{\text{th}}$  Knee from injury, by showing the Tendon of  $4^{\text{th}}$  Extensor cum  $4^{\text{th}}$  Joint bringing it to  $4^{\text{th}}$  Tibia at a greater angle  $4^{\text{th}}$  force is increas'd just as we increase  $4^{\text{th}}$  force of

a hammer by lengthening of handle. By attending to 186.  
situation of of. Epiphyses there are several Errors we wd. avoid  
as to distinguish between a fracture or Luxation, where they  
separate from of. bone we ought to be very careful in of. applicat.  
of of. proper Bandages, & perhaps a greater length of time may be  
necessary here for of. Cure of in of. case of a fracture or luxation of of.  
bone. Lastly you can understand what happens in Practice that  
from Scrophulous & other internal Causes of. Epiphyses may be  
push'd from its place & distortions in of. Joints may proceed from  
of. Cause, two or 3. Cases of of. you will find in M. Faccin.

### Lecture N. 6<sup>th</sup>

In the Osteology we have seen many examples particul. in of.  
head where the n<sup>o</sup>. of pieces are more considerable of. n<sup>o</sup>. number  
of motions intended, or when of. bones are connected by a n<sup>o</sup>. of  
Teeth w. gives an appearance compar'd to a Suture of. obtains  
not only in of. Cranium but in of. face. In of. Jaws we see a  
union of of. Teeth made in a diff. manner, they are sunk into of.  
Jaws, & adhere to of. as a nail adheres to a board, so to use a  
gen<sup>l</sup>. term we wd. say of. bones are apply'd to each other for we may  
look of. membranes w. are almost obliterated or very thin  
& hold of. parts from their shape cohere, w. we might therefore  
call Synostosis to keep up a gen<sup>l</sup>. analogy.

With regard to of. n<sup>o</sup>. of diff. articulation in of. Trunk chiefly  
we see of. whenever a motion is intended but when of. danger  
of Separation is consid<sup>d</sup>. or whenever extent of motion is dangerous  
there is interpos'd a Cartilage, or of. w. a mixture of Ligam.  
of. has been nam'd Synchondrosis; but w. regard to of. kind  
of articulation the Cartilage is seldom found pure. Another  
kind of articulation is of. Synsarcosis from of. Connexion  
being by Ligaments, while of. Bones or selves have no

immediate adhesion but are lifted w<sup>th</sup> Cartilages (187)  
together w<sup>th</sup> Ligaments. This obtains particularly in  
extremities of y<sup>e</sup> body & it is of 3 kinds.

1. where there is a free motion in all directions, this is made by  
Ball & Socket, w<sup>ch</sup> is most remarkable at y<sup>e</sup> joining of y<sup>e</sup> two  
extremities to y<sup>e</sup> Trunk of y<sup>e</sup> Body: but we find few instances of y<sup>e</sup>  
same kind in y<sup>e</sup> Joints. — Next in a 10<sup>th</sup> of places we've

found a motion in a certain degree in all directions but very  
limited, or where y<sup>e</sup> surfaces of y<sup>e</sup> bones were almost flat &  
y<sup>e</sup> Ligaments very short parts. by y<sup>e</sup> joining of y<sup>e</sup> Tarsal &  
Carpal Bones w<sup>th</sup> those of the hand — the 3<sup>d</sup> kind is y<sup>e</sup> hinge

w<sup>ch</sup> is of 3 Species. — 1. y<sup>e</sup> Connexion of y<sup>e</sup> head to the  
Spine turning upon a Center pin, & we've no instance of y<sup>e</sup>  
same kind in y<sup>e</sup> other parts. — 2. where one or more

bones are included in one capsular Lig<sup>mt</sup> as y<sup>e</sup> joining of y<sup>e</sup>  
Humerus w<sup>th</sup> y<sup>e</sup> forearm, & where y<sup>e</sup> shape of y<sup>e</sup> Bones &  
length of y<sup>e</sup> Lig<sup>mt</sup> regulate y<sup>e</sup> motion to two directions, y<sup>e</sup>  
Lig<sup>mt</sup> at y<sup>e</sup> wide preventing y<sup>e</sup> lateral motion, & even  
y<sup>e</sup> same bones not readily performing a lateral motion

3. Where two bones move upon each other in diff<sup>t</sup> places &  
w<sup>th</sup> 2 joints, yet we consider 'em as one, thus y<sup>e</sup> back parts  
of all our Vertebræ have a pair of oblique processes, w<sup>ch</sup> are

intended for one motion, in like manner y<sup>e</sup> Osia are not  
only connected to y<sup>e</sup> vertebra by around Ball but like-  
wise to y<sup>e</sup> transverse processes, and thus too is y<sup>e</sup> radius

connected to y<sup>e</sup> Ulna, w<sup>ch</sup> conspire to accomplish one gen<sup>l</sup>  
motion, as in like manner do y<sup>e</sup> Tibia and Fibula, how  
very one of y<sup>e</sup> joints of y<sup>e</sup> Body can be reduc'd under one  
or other of these Natural<sup>l</sup> for y<sup>e</sup> Symplicis is only to be found  
in Quadrupeds, & y<sup>e</sup> Scapula & Humerus are connected in y<sup>e</sup>

up usual way to the bones of y<sup>e</sup> Body.

(188.)

Lecture 42<sup>nd</sup>

The situat<sup>n</sup> of the Arteries of y<sup>e</sup> mammae & dem<sup>o</sup>strat<sup>d</sup>.  
The Fat found here below y<sup>e</sup> skin & going pretty deep into the  
substance of y<sup>e</sup> gland seems wid<sup>d</sup> for y<sup>e</sup> purpose of defence,  
but it by no means proves this according to D. Haller, to  
contribute to y<sup>e</sup> formation of milk nor is his argument  
convincing y<sup>e</sup> if we inject y<sup>e</sup> milk ducts y<sup>e</sup> mercury gets  
into y<sup>e</sup> cellular membrane: w<sup>ch</sup> only shows y<sup>e</sup> the arteries  
& easily burst, but does not prove any communication:  
The N<sup>o</sup> of y<sup>e</sup> ducts are from 15 to 20. The ducts get their color  
from a serous duct gland w<sup>ch</sup> pours out a quantity  
of serous matter to prevent y<sup>e</sup> skin from being ex-  
posed: y<sup>e</sup> nipple is elastic & when drawn out collapses  
again whereby y<sup>e</sup> ducts in it become narrower & likewise  
crook<sup>d</sup> and the flow of y<sup>e</sup> milk is restrain<sup>d</sup> unless while  
y<sup>e</sup> child is apply<sup>d</sup>. - And y<sup>e</sup> manner of sucking merits  
attention: the child does not merely apply y<sup>e</sup> lips around  
y<sup>e</sup> nipple and y<sup>e</sup> make a void in y<sup>e</sup> mouth but it is a slight  
y<sup>e</sup> elongation of y<sup>e</sup> nipple & stimulates it so as to cause  
y<sup>e</sup> falling of y<sup>e</sup> cells; & y<sup>e</sup> child takes hold of it w<sup>th</sup> the tongue  
& drags it mechanically into y<sup>e</sup> mouth using y<sup>e</sup> tongue  
like y<sup>e</sup> sucker of a syringe; and y<sup>e</sup> membrane of y<sup>e</sup> lips of  
y<sup>e</sup> child is well rais<sup>d</sup> for excluding y<sup>e</sup> air, & y<sup>e</sup> tongue  
being drawn back for making a void, y<sup>e</sup> pursuit of y<sup>e</sup> air  
upon y<sup>e</sup> breast pushes y<sup>e</sup> milk where there is least resistance.  
But by y<sup>e</sup> insistent nature of y<sup>e</sup> child adds somewhat:  
for they apply y<sup>e</sup> hand to y<sup>e</sup> navel breast and even at y<sup>e</sup>  
same time use y<sup>e</sup> feet to push against y<sup>e</sup> they may act w<sup>th</sup>  
the greater force.

When one of y<sup>e</sup> ovaria is cut open we find within it a h<sup>o</sup>. (189)  
of vessels contain<sup>g</sup> a watery fluid, y<sup>e</sup> n<sup>o</sup>. of 'em much greater y<sup>e</sup>.  
D<sup>r</sup>. Haller and others have supposed. they only reckon. there  
y<sup>e</sup>. appear in cutting y<sup>e</sup>. Ovarium thro' in its middle part, but  
there are sev<sup>l</sup>. layers of vessels in y<sup>e</sup>. thickness of y<sup>e</sup>. Ovarium  
in sev<sup>l</sup>. Subjects I have counted to y<sup>e</sup>. n<sup>o</sup>. of 30. then an all cover  
w<sup>th</sup>. a hard substance of y<sup>e</sup>. Surface of y<sup>e</sup>. Ovarium has added to  
it y<sup>e</sup>. contin<sup>g</sup>. of y<sup>e</sup>. peritonaeum w<sup>th</sup>. every where a thick very  
to it by a very dense cellular substance. We find no holes  
naturally leading out from y<sup>e</sup>. Ovarium & yet afterward it  
will appear by and all doubt y<sup>e</sup>. y<sup>e</sup>. Ova discharge themselves  
upon y<sup>e</sup>. surface for y<sup>e</sup>. Chord w<sup>th</sup>. the y<sup>e</sup>. Ovarium to y<sup>e</sup>. uterus  
is solid, & is not as was supposed, a Tube sev<sup>l</sup>. for conveyance  
it is merely a Lig<sup>mt</sup>. & y<sup>e</sup>. only passage w<sup>th</sup>. we find bet<sup>wn</sup>. y<sup>e</sup>. Ovar.  
& Uterus, is thro' y<sup>e</sup>. Tube nam<sup>d</sup> Uterine or after its invention  
Fallopian: the mouth of this<sup>ie</sup> wid<sup>er</sup> more y<sup>e</sup>. suff<sup>ic</sup>. to contain  
an entire Ovary from y<sup>e</sup>. Ovar.<sup>m</sup> but y<sup>e</sup>. as it approaches the  
Uterus it becomes m<sup>ch</sup>. smaller, only admitting a large Ovary the  
around y<sup>e</sup>. mouth w<sup>ch</sup>. opens into y<sup>e</sup>. cavity of y<sup>e</sup>. Uterus or Uteri.  
We find a h<sup>o</sup>. of Fimbriae a fringe; & altho' they seem one  
uniform purpose of laying hold of y<sup>e</sup>. Ovarium as we say hold  
of any substance w<sup>th</sup>. y<sup>e</sup>. hand, yet it is found y<sup>e</sup>. y<sup>e</sup>. fimbriae  
vary in their shape in every subject. Their structure is muscular.  
The uterine Tube terminates at y<sup>e</sup>. lower end of y<sup>e</sup>. Uterus serving to  
convey y<sup>e</sup>. rudim<sup>t</sup>. of y<sup>e</sup>. fetus into it. I do not say y<sup>e</sup>. on entire  
ovum passes, but y<sup>e</sup>. merely somewhat is conveyed. The Uterus  
is spongy in its inner part & is full of vessels w<sup>th</sup>. orifices from  
w<sup>ch</sup>. blood is discharged into y<sup>e</sup>. cavity of y<sup>e</sup>. Uterus, at every  
menstrual period: the cavity of y<sup>e</sup>. Uterus becomes gradually  
of a roundish shape & forms the lower Uteri, & this part you  
see unequal with a h<sup>o</sup>. of Ridge or Valves & in these indentures  
a quantity of lime is deposited, & y<sup>e</sup>. texture is different from

190.  
The neck of the body of the uterus: the end of the Cervix Uteri or  
Cervix is directed backwards & rests against the Vagina which  
is kept in its situation, by the manner in which the uterus & its appendages  
is supported by the Ligamenta lata, which are doublings of the  
peritoneum of the same as if intervening is: to show of advantage  
of its situation & position a remark of the Ligament. latera  
by its distension of the uterus is gradually lessened in its breadth  
till in the last month of pregnancy we scarcely can show it  
except it does not merely support the uterus in its union & support  
of state, but is so formed by its outer cover may yield in propor-  
tion to its growth, & the Lamella are gradually separated from  
each other to keep the uterus more steadily in its place.  
The Vagina in passing down wards is likewise not a straight  
direction, but curves like the Intestini. rectum, & the lower part  
turns forwards, & is still in a greater degree. Within the  
Vagina we find Organs for secreting mucus & at the external  
part Cells which are capable of distension containing the Corpus  
Cervicis, & the manner of this distension we cannot at present  
explain, we only say it by their sensibility they seem to excite  
these motions of internal vessels are necessary for Conception,  
part of the Uterine Tubes towards the Ovarium & after in  
promoting is somewhat into the Cavity of the uterus: Without  
entering into the reason of it, it is a fact of which neighboring parts  
sympathize or suffer together: Thus suppose my middle finger  
has been bruised & inflamed, is one next it more readily  
partakes of the inflammation, & a man's dist. part, so in practice we  
find an irritation in the Bladder, uterus, or Rectum, &  
affection is propagated from one to the other, thus the  
menstrual flux can be retarded by an irritation begun in  
the Bladder or Rectum, & the Bladder will sympathize  
& a Stranguria be occasioned by an affection of the uterus  
& Vagina - next we can conceive of a mechanical Connexion

capacity of y<sup>e</sup> pelvis, but we can cut from y<sup>e</sup> Vagina into  
 the Bladder without meeting with any vessels or nerves of con-  
 siderable moment, I do not mean to say y<sup>e</sup> y<sup>e</sup> is y<sup>e</sup> best kind of  
 Operation, but only to point out y<sup>e</sup> possibility of it; & it may  
 become a necessary one, as when a Stone lodges at y<sup>e</sup> bottom  
 of y<sup>e</sup> Bladder, has irritated y<sup>e</sup> Coat & begun an Ulcerat<sup>n</sup>.  
 It is making its way thro' y<sup>e</sup> Vagina, I we've an Instance  
 of y<sup>e</sup> kind in Hildanus, & if in y<sup>e</sup> male we prefer y<sup>e</sup> later<sup>r</sup>  
 Operation to any other there is a further reason for pre-  
 serving it true, where there is wanting y<sup>e</sup> prostate gland,  
 & vesiculae Seminales: Likewise we can as in y<sup>e</sup> male  
 make y<sup>e</sup> puncture of y<sup>e</sup> bladder between y<sup>e</sup> Cues of y<sup>e</sup>  
 Uterus & Side of y<sup>e</sup> Vagina or it may be done directly  
 from y<sup>e</sup> Vagina passing an Inot. at pleasure near to  
 a fathom from y<sup>e</sup> neck of y<sup>e</sup> Bladder remembering y<sup>e</sup> y<sup>e</sup>  
 length of y<sup>e</sup> Uterus is about 2 Inches; & as y<sup>e</sup> membran<sup>e</sup>  
 of both Bladder & Vagina are of a consid<sup>l</sup>. thickness  
 there can be no danger of a Fistula, because we can  
 make an oblique passage w<sup>ch</sup> will have y<sup>e</sup> effect of a Valve

Lecture 43.

There are Two principal Arteries, or Two hearts in our body  
 y<sup>e</sup> w<sup>ch</sup> serves y<sup>e</sup> most gen<sup>l</sup>. purpose y<sup>e</sup> left, from y<sup>e</sup> heart it  
 is evident from y<sup>e</sup> view of y<sup>e</sup> human body y<sup>e</sup> y<sup>e</sup> other heart  
 or pulmonary Art. System is subservient to this: y<sup>e</sup> w<sup>ch</sup>  
 principal Artery after y<sup>e</sup> h<sup>ts</sup> itself is supply'd run to y<sup>e</sup> head  
 & terminate in y<sup>e</sup> Brain y<sup>e</sup> internal Carotid & Pulmon  
 Art. takes its rise from y<sup>e</sup> right side of y<sup>e</sup> heart. - From this  
 preparation of y<sup>e</sup> heart, you'll observe y<sup>e</sup> y<sup>e</sup> Arteries & Venae  
 are considerably more capacious y<sup>e</sup> is commonly believ'd  
 the right side of y<sup>e</sup> heart is flatter y<sup>e</sup> y<sup>e</sup> left, & we observe  
 y<sup>e</sup> y<sup>e</sup> viz<sup>z</sup> is greater. - The Two coronary Arteries one inter  
 pass<sup>d</sup> w<sup>ch</sup> small anastomosis taking place between 'em  
 an a few these passing over from y<sup>e</sup> one side of the heart

to the other I wd to alledge y<sup>e</sup>. There is some mistake in the  
description of Malpighius who describes y<sup>e</sup>. too as being  
originally at a distance of late years D. Haller has  
y<sup>e</sup>. plain y<sup>e</sup>. mistake from y<sup>e</sup>. Apparance in y<sup>e</sup>. (Heart)  
The Heart entirely receives its blood entirely from y<sup>e</sup>. left  
side from y<sup>e</sup>. Porta it sends almost y<sup>e</sup>. whole of its blood back  
into y<sup>e</sup>. right Ventriculo Quinto. — The nerves of y<sup>e</sup>. heart  
begin above in y<sup>e</sup>. neck and various branches an addedly  
the way, and some of y<sup>e</sup>. nerves pass near to y<sup>e</sup>. large Arteries  
thru of y<sup>e</sup>. near to y<sup>e</sup>. Arteries: We find y<sup>e</sup>. y<sup>e</sup>. tertiary vessels  
not behind y<sup>e</sup>. Valves upon being distended now y<sup>e</sup>. dilatation  
of y<sup>e</sup>. tertiary, it makes it of y<sup>e</sup>. figure of 8. portions of a circle  
join'd by angles to each other, & the use of these vessels to  
is. the name of Sinuses has been apply'd by Valae alia is very  
they are not merely y<sup>e</sup>. effect of use: y<sup>e</sup>. lowering of y<sup>e</sup>. resistance  
made to the blood of y<sup>e</sup>. Arteries yielding most this place, —  
Next it regard to y<sup>e</sup>. coats of y<sup>e</sup>. Arteries & Veins; & when you  
a piece of y<sup>e</sup>. Porta is. is a very elastic substance, & it  
shortens very considerably, nearly a 1/2 part: the coats are  
of considerable thickness, & as these require nourishment  
& growth like y<sup>e</sup>. rest of the Body, we find numerous small  
Arteries distributed on their coats what writers call Vasa  
Naxorum, the coats of y<sup>e</sup>. pulmonary Artery are supply'd  
from y<sup>e</sup>. Porta. — When y<sup>e</sup>. Coats are dissected we find upon  
y<sup>e</sup>. outside, besides common cellular substance, an in some  
few places y<sup>e</sup>. addition of membrane laid over y<sup>e</sup>. Artery  
as y<sup>e</sup>. pleura within y<sup>e</sup>. Cavity of y<sup>e</sup>. Thorax, we find a loose  
Cellular substance every where y<sup>e</sup>. separating that we obs.  
y<sup>e</sup>. outer part of an Artery is of a whitish color y<sup>e</sup>. whitens  
depends upon a Tough and Elastic Coat in is. a number of these  
exceedingly minute fibres an intension in all directions

so that we may very properly w.<sup>th</sup> Dr. Haller consider this (194)  
outer coat to be a cellular Substance condensed, for I cannot  
see any fibres run more in one direction, than they do in another  
so we shall call it Cellulo-membranous: within w.<sup>ch</sup> fibrous  
muscular coat we find an inner coat or we find w.<sup>ch</sup> is  
another coat w.<sup>ch</sup> is extremely thin but very dense, neither is  
it strong & it has less toughness, w.<sup>ch</sup> we w.<sup>ould</sup> have expected  
having scarcely any elasticity proper to arteries, for it w.<sup>ould</sup> outer  
Coats are dispersed it scarcely admits of being stretched; &  
these 3 Coats are connected to each other by w.<sup>ch</sup> is a cellular  
Substance of w.<sup>ch</sup> body as in w.<sup>ch</sup> Elementary Canal &c. in other  
Animals as w.<sup>ch</sup> of w.<sup>ch</sup> & especially in w.<sup>ch</sup> Whale w.<sup>ch</sup> fibrous  
Coat is still more evident & distinct next w.<sup>ch</sup> Coats and  
Structure of w.<sup>ch</sup> Veins, w.<sup>ch</sup> Coats of w.<sup>ch</sup> small are so thin and  
transparent w.<sup>ch</sup> we can't distinguish w.<sup>ch</sup> one from w.<sup>ch</sup> other  
but in w.<sup>ch</sup> large veins we find nearly w.<sup>ch</sup> same number  
of w.<sup>ch</sup> is somewhat reddish color'd in w.<sup>ch</sup> large Veins, in  
it we can distinguish fibres but much diff.<sup>erent</sup> from w.<sup>ch</sup>  
fibres of an Artery. — I find next w.<sup>ch</sup> blood a membranous  
thick Coat w.<sup>ch</sup> is tougher than w.<sup>ch</sup> within w.<sup>ch</sup> Arteries, & w.<sup>ch</sup>  
Elasticity of w.<sup>ch</sup> veins very much depends upon w.<sup>ch</sup> inner  
Coat, whereas in w.<sup>ch</sup> Arteries it depends chiefly on w.<sup>ch</sup> Outer  
Coat, w.<sup>ch</sup> Cellulo-membranous Substance too in other vessels w.<sup>ch</sup> we  
can separate w.<sup>ch</sup> internal Coats easier from w.<sup>ch</sup> external  
w.<sup>ch</sup> in w.<sup>ch</sup> Arteries. — I next shew you some marked  
preparations, w.<sup>ch</sup> pericardium thickened & adhering to  
the Heart, & w.<sup>ch</sup> shape of w.<sup>ch</sup> Cavities in some measure  
alter'd. — Lingula Case of a Woman ab.<sup>ove</sup> 50. of age who  
before her death slept her feet carrying a Tea-kettle  
with water, she immediately found a little pain but had

no considerable Corp<sup>s</sup> till within 24. hours of her death 1796.  
When in a moment when she was expiring w<sup>th</sup> no violent  
effusion, she was seiz'd w<sup>th</sup> a violent pain at her heart, &  
she immediately grew pale and fainted away w<sup>th</sup> pulse  
was scarcely to be distinguished & in 24. hours after she  
died. — I was present with Mr. Adie at 7. opening of y<sup>r</sup> body  
& we expected to find a rupture of y<sup>r</sup> heart, & y<sup>r</sup> Blood  
effus'd within y<sup>r</sup> pericardium, but when y<sup>r</sup> pericard.  
was laid in view it had quite a round appearance  
propos'd however w<sup>th</sup> y<sup>r</sup> notion of a rupture, perhaps  
more readily from y<sup>r</sup> death of y<sup>r</sup> late King's Death w<sup>ch</sup>  
was then recent. I put a pipe into y<sup>r</sup> Vera Cava superior  
& blew in a little Air, & I found y<sup>r</sup> Air immediately  
fill'd y<sup>r</sup> left side, I thought y<sup>r</sup> foramen ovale might be  
open, but pressing my finger on y<sup>r</sup> part of y<sup>r</sup> Muscle  
&c. y<sup>r</sup> Air went first into the Ventricle, so we cut  
down y<sup>r</sup> right Sid<sup>e</sup> from top to bottom, & we saw a very  
considerable opening & laceration of y<sup>r</sup> Septum between y<sup>r</sup>  
Ventricles, extending some way round. — Following y<sup>r</sup> blood  
from y<sup>r</sup> heart outwards, we find frequently a stricture  
of y<sup>r</sup> mouth of the Arteries, and Dilatations of the  
Valves of y<sup>r</sup> Aorta, & y<sup>r</sup> Ventricles enlarg'd & thickn'd  
in proportion: I have now been certain of y<sup>r</sup> stricture  
of y<sup>r</sup> mouth of the heart from y<sup>r</sup> Symptoms in half a  
Dozen of Cases, as sometimes can trace y<sup>r</sup> dilatations  
a great way along y<sup>r</sup> Arteries, even to the points of y<sup>r</sup>  
Lungs: and we find y<sup>r</sup> Aorta dilated in diff<sup>erent</sup> places  
within y<sup>r</sup> Perdomer. &c.

Lecture 1<sup>th</sup>.

196

We now proceed to trace the course of y<sup>e</sup> Blood, and you'll ob-  
 s<sup>e</sup>ve that of an Artery, many Authors have described an Artery  
 as if it were Conical, but if we attend thro' any place where  
 minute Branches are sent off, we find it is Conical  
 or we may compare an Artery to a Tree, w<sup>ch</sup> we likewise  
 are apt to imagine of a Conical figure, not attending to  
 y<sup>e</sup> Change made by y<sup>e</sup> Wood furnished to y<sup>e</sup> Branches, it  
 is likewise cylindrical, next y<sup>e</sup> manner in w<sup>ch</sup> an Artery  
 branches, consider y<sup>e</sup> proportion, w<sup>ch</sup> y<sup>e</sup> Branches bear to the  
 Trunk, as on y<sup>e</sup> right side of y<sup>e</sup> neck for instance & at  
 y<sup>e</sup> Bottom of y<sup>e</sup> Abdomen, it is evident y<sup>e</sup> 4<sup>th</sup> 2<sup>d</sup> Branches  
 joind together are larger y<sup>e</sup> 4<sup>th</sup> Trunk, and y<sup>e</sup> proportion  
 nearly as commonly alleg'd, as 3. to 2. y<sup>e</sup> 2<sup>d</sup> joind together  
 are a<sup>l</sup> larger y<sup>e</sup> 4<sup>th</sup> Trunk, w<sup>ch</sup> forms in those as we find  
 with divisions & subdivisions of Arteries freq<sup>ly</sup> repeated  
 as in y<sup>e</sup> mesentery, y<sup>e</sup> sum of all y<sup>e</sup> ultimate Branches  
 of an Artery. Their Capacity must be considerably greater  
 y<sup>e</sup> that of y<sup>e</sup> Trunk. Next with regard to y<sup>e</sup> kind of Angles  
 w<sup>ch</sup> y<sup>e</sup> Branches of y<sup>e</sup> Arteries form, in gen<sup>l</sup> we may ob<sup>s</sup>ve y<sup>e</sup>  
 y<sup>e</sup> Blood enters in a favorable situation, or y<sup>e</sup> Angles  
 are Acute, but in this there is y<sup>e</sup> utmost variety, which  
 partly depends upon necessity & Situation, partly upon  
 y<sup>e</sup> use w<sup>ch</sup> y<sup>e</sup> Arteries serve, for in many places we find  
 y<sup>e</sup> sent off in right Angles, & in some y<sup>e</sup> Angle is  
 turn'd back in y<sup>e</sup> most unfavorable way, y<sup>e</sup> Blood mov<sup>g</sup>  
 retrograde as it were, for y<sup>e</sup> while we may observe y<sup>e</sup>  
 near to the heart y<sup>e</sup> Angles of y<sup>e</sup> Arteries are greater  
 than at a Distance, nature seems to endeavour to render

197  
The law in all as equal as possible: you find many Arteries  
of the Trunk are destined for muscular Organs & vent of more  
straight duplex: whereas in the Extremities are almost  
even when acute, perhaps further we may remark they near  
to the heart the Arteries arising from the Trunk are spread  
into a greater N<sup>o</sup> of Branches following an Artery to the place  
where it is intended to be divided, we frequently find almost  
without exception of neighbouring Branches communicate  
or we find a beautiful network of Branches arising  
from the Arteries, & so on, altho' a N<sup>o</sup> of Branches were stopped  
of blood would penetrate to the Extremities of every Branch, & if  
in the Power of the Blood from the heart to its Distribution  
is any danger of a coagulum. However we find considerable  
Anatomical coils in the larger Branches, as in the muscular  
If we attend to the Calculations of the Arteries it is found to  
be a Sphero-cylinder by the most eminent Physiologists of the 17<sup>th</sup> & 18<sup>th</sup>  
C<sup>ts</sup>. How and of such arteries are circulate in the Tubules of  
the Kidney together don't exceed the breadth of an Inch, or the  
diameter of a hair exceed the diameter of the Artery at least in  
the proportion of 20 to one, or 400. such Arteries circulating  
of blood joined together would not be larger than a single hair  
Hence after we have forced an injection from the Artery into the  
Veins, or into the most minute branches of the Arteries we  
perceive little more than a uniform red Colour which is naked  
As in the innumerable Coats of the Alimentary Canal.  
The Veins returning from the Extremities of the Body imitate  
the Arteries in their appearance, and there must be a sameness  
of form, we find here too small Anatomical coils which are  
occasionally seen in the progress of the Veins toward the heart  
& these Anatomical coils are in general more frequent in the Veins:

fore in the space of an hour blood equal in weight to 30 199.  
Stones or perhaps to 3 times  $\frac{1}{2}$  weight of  $\frac{1}{2}$  Animal to w. ch. it  
belonge proper in  $\frac{1}{2}$  space. — Next you know  $\frac{1}{2}$  manner  
in w. ch.  $\frac{1}{2}$  blood is drove w.  $\frac{1}{2}$  velocity  $\frac{1}{2}$  it depende upon  $\frac{1}{2}$   
action chiefly of  $\frac{1}{2}$  Muscles and Ventricles of  $\frac{1}{2}$  heart  
and these act alternately, whilst  $\frac{1}{2}$  Muscles is filling from the  
Veins the Ventricle is emptying (whilst  $\frac{1}{2}$  Muscles empty  
empties itself  $\frac{1}{2}$  Ventricle is filling; &  $\frac{1}{2}$  use of each I am aware  
at some length to show,  $\frac{1}{2}$  by room being given by a substitute  
being added to the heart, there is no alternate considerable  
dilatation of  $\frac{1}{2}$  veins, for whilst the Ventricle is in action, the  
blood continues to flow as before from  $\frac{1}{2}$  veins into  $\frac{1}{2}$  Muscles  
and as soon as  $\frac{1}{2}$  ventricle ceases from its action,  $\frac{1}{2}$  Muscles  
now stimulated by  $\frac{1}{2}$  blood contracts and the blood flows  
into  $\frac{1}{2}$  Ventricle w.  $\frac{1}{2}$  great quickness whilst at  $\frac{1}{2}$  same time  
an addition is made from  $\frac{1}{2}$  veins hence  $\frac{1}{2}$  Muscles are smaller  
w.  $\frac{1}{2}$  Ventricles, and there is nothing plac'd to prevent the  
flow of blood continuing into the Muscles directly from  $\frac{1}{2}$   
Veins during the contraction of  $\frac{1}{2}$  Ventricle, What we know  
of one side of  $\frac{1}{2}$  heart we apply to both; we conceive  $\frac{1}{2}$  the  
Two Muscles are fill'd and empty'd at the same time but  
at a time diff. from  $\frac{1}{2}$  Ventricles: and I sh. think it unneces-  
sary to enter into  $\frac{1}{2}$  System of D. Nicolo who w. p. poses on  
to act at diff. Times, no other reason is necessary than  $\frac{1}{2}$   
the Muscles and Ventricles have a common Septum  
and we can't suppose  $\frac{1}{2}$   $\frac{1}{2}$  one half is relax'd &  $\frac{1}{2}$  other in  
action, & I have seen  $\frac{1}{2}$  Synchronous parts of these in action  
repeatedly in a living Animal. Whilst I speak of the Mus-  
Ventricles being empty'd at the same time I do not suppose  
 $\frac{1}{2}$  they are entirely empty'd but nearly so for  $\frac{1}{2}$  right side  
is somewhat more Capacious  $\frac{1}{2}$  the left, so  $\frac{1}{2}$  certainly

does not empty itself fully, but they do so very nearly (200.)  
and we may say of the Arteries in full & empty alternate  
But our blood while in a very diff. state these beginning  
of study are apt to apply what is said of Arteries and  
Veins to Arteries and even to the Veins; but Arteries of  
the Arteries do not come into contact when in action, only are  
more stretched at one time than at another, are more stretched  
when Arteries is in action, but they are by no means empty  
when the contract; and this leads us to attend to the cause of  
the pulse. — When we apply the Finger to an Artery we say  
in general of Arteries strikes the finger because the blood is  
driven into the heart into it with violence; but further what  
changes does this produce? are we to say of the Arteries is mostly  
dilated its diameter increased or are we to say as Dr. Mead  
of it is not dilated, but lengthened in consequence of w. ch. it changes  
its place? or are we to adopt both? I apprehend that we must  
for that to apprehend of an Artery is not dilated is impossible  
we find that it can be drawn out in its diameter as readily  
as in length, and it reacts with considerable force & Arteries  
muscular fibres or w. ch. elasticity in a great measure  
depends are placed in a circular manner; It is in vain  
to allege of when we make a computation of Arteries quantity  
of blood of Arteries heart supplies it appears to be considerable  
considering at Arteries same time of great capacity of Arteries  
Arteries, & therefore of Arteries changes in dilating or contract  
be observed, for in this computation it is taken for  
granted of Arteries whole is diffused uniformly, in Arteries  
System; but Arteries beat successively, and if  
you lay one hand on the Arteries Arteries or Arteries neck &  
another upon that on the Top of Arteries Foot you will perceive

21.  
one succeeds the other, and I have plainly seen  
dilation as well as  $\frac{1}{2}$  elongation & change of place in  
the Arteries, but both seem left to  $\frac{1}{2}$  Eye  $\frac{1}{2}$  to the Finger  
So we are affected by the thro' percussions, I imagine the  
motion generates  $\frac{1}{2}$  in reality it will be found to be. Hence  
here as when we throw an Injection into them, the Artery  
instead of becoming shorter & contracted is lengthen'd out  
becomes <sup>less</sup> more supple & at  $\frac{1}{2}$  same time is dilated  
Next then by what power after the Arteries having given  
a stroke to the Finger do they recover their former Sit-  
uation? is it merely by their Elasticity? or that whilst  
they are elastic they are likewise muscular. Their  
Elasticity you know and the use of it is apparent, it  
is intended to prevent  $\frac{1}{2}$  whole force of the heart, from  
being spent  $\frac{1}{2}$  force is eluded by  $\frac{1}{2}$  yielding of  $\frac{1}{2}$  larger  
Branches, and  $\frac{1}{2}$  impulse is contin. instead of being  
given in one moment, nothing is lost and nothing is  
added by  $\frac{1}{2}$  Elasticity: the force is as much lost by  
 $\frac{1}{2}$  yielding as it is increased by the reaction,  $\frac{1}{2}$  force  
is the same: but divided, part of it is employ'd when  
the heart is in action & then it is contin. when  $\frac{1}{2}$  heart  
ceases but are we to join a muscular power: that the  
fibrous Coat is really muscular: Most Authors have  
done so; but Dr. Haller of late years has attempted to  
undo  $\frac{1}{2}$  notion extremely doubtful, but in every circum-  
stance is inconsistent. <sup>Et</sup> in treating of  $\frac{1}{2}$  Structure in one place  
he describes  $\frac{1}{2}$  fibrous Coat of  $\frac{1}{2}$  Arteries under  $\frac{1}{2}$  name of  
muscular, in another we observe him describing all  $\frac{1}{2}$  Coats, as  
compos'd merely of a cellular Substance condensed.

If you look into his works experiments & conclusions you  
 will find y<sup>t</sup> he allows the living power of y<sup>e</sup> large arteries  
 but denies it of smaller, y<sup>t</sup> at one place he denies y<sup>e</sup> power  
 in another admits it, & at last compromises y<sup>e</sup> matter,  
 how upon y<sup>e</sup> whole we may not w<sup>th</sup> a probability multiply  
 but with an absolute certainty conclude y<sup>t</sup> y<sup>e</sup> Arteries are  
 muscular Organs capable of irritation, of varying y<sup>e</sup> action  
 occasionally in health & disease, & I apprehend y<sup>e</sup> proof of y<sup>e</sup>  
 is full & complete: I have at diff<sup>t</sup> Times in experiments,  
 tho' not made principally w<sup>th</sup> a view to this Subject, h<sup>o</sup> occas<sup>n</sup>.  
 to observe y<sup>e</sup> Contractions of Arteries when irritated, I have  
 been sensible of their performing a motion of y<sup>e</sup> place irritat<sup>d</sup>.  
 & greater y<sup>e</sup> elsewhere, in many instances we can't shew y<sup>e</sup>  
 so clearly as we might have expected, but the same of the  
 other Organs is true; thus it has been found y<sup>t</sup> y<sup>e</sup> Arteria  
 Uterina may on certain Occasions be wounded & cut on  
 the outer surface, without suffering a contraction of its fibres  
 & many difficulties are to be had in view here, If we shew  
 a Ligature upon an artery in order to intercept y<sup>e</sup> blood  
 y<sup>t</sup> we may see what passes beyond y<sup>e</sup> Ligature, or make  
 an incision we may have compr<sup>d</sup> a divided thus very  
 nerves on w<sup>ch</sup> y<sup>e</sup> very motion of y<sup>e</sup> cut muscle depends:  
 We are next to obs<sup>r</sup> y<sup>e</sup> irritation we apply is not in the  
 natural way: it has been made upon y<sup>e</sup> outside, where  
 as if apply'd to y<sup>e</sup> inside y<sup>e</sup> effect may be very diff<sup>t</sup>.  
 Whilst the proper y<sup>e</sup> muscular power, they push at  
 the same Time the Elastice; & it is by no means impos-  
 sible y<sup>t</sup> in sw<sup>th</sup> places y<sup>e</sup> Elasticity obstructs y<sup>e</sup> Artery  
 as much as y<sup>e</sup> muscular power can do, so y<sup>t</sup> it is not  
 made smaller in Life, but a greater impulse only is

given to the blood. If these things are properly considered. 203.  
and if experiment made with accuracy or has been done  
by the chain we will be able to discover the motion of the  
muscular coat of the Arteries, let us add to such experiments  
the observ<sup>ns</sup> made by dissections or otherwise, let us consider  
if we can balance between Arteries & the Intestinal Canal, we  
see fibres in both, faster than those moving of Extremities &  
(any person judging merely from if appearance) w<sup>d</sup>. call  
these if. muscular Boats we find in certain places nerves  
sent into into it. Dr. Haller has endeavoured to prove if. they  
are without nerves & it may be impossible to say where they  
end, or where not. But the following experiment, made on  
Frogs plainly shews if. nervous power existing in them. I  
cut thro' if. Boats in a Frog, then fix'd a small pipe into it  
in doing this w<sup>d</sup>. minutes elapsed & the motion of if. blood  
had now in a great measure ceas'd. I pour'd a single drop  
of a solution of Opium in water into the Trunk of if. Boats  
we can't imagine that this way convey'd to all the most  
distant parts of the Body, yet in a few seconds if. most  
distant parts were agitated - i. e. thro' if. nerves of if. Arteries, or  
let us observe other instances, let us attend to if. appearances  
under disease, we must allow if. existence of Spasms in  
Diff. diseases; do not we see such effects in Hysterical  
persons or in if. Rheum, or if. effect of if. Passions of if. mind  
In all, or the effect of mechanical irritation upon if. glands  
not only if. quantity of if. secreted Liquors is increas'd  
but their nature is alter'd by irritation. Lastly if. effect  
of topical Stimulus w<sup>ch</sup>. has been insisted upon by Dr.  
Whytt - Dr. Haller w<sup>d</sup>. find an inconsistency in Dr. Whytt's  
acc<sup>t</sup>. of if. small vessels; but who were impartially consider

the whole will find some for Dr. Whitt speaking of it generally. (204)  
 motion of our blood, conceives it is action of small vessels  
 promotes the Circulation: Inflammation is an opening part  
 of living power of vessels. I have try'd the year ago in  
 following I had in view it follow'd part of an animal to  
 microscope. I then apply'd a substance w<sup>ch</sup> I tho<sup>t</sup> irritat<sup>d</sup>  
 it animal a weak Solution of Sp<sup>l</sup>. C. C. I co<sup>d</sup>. immediately per  
 ceiv'd it redness of the part was increas'd in a short Time  
 in many of vessels an obstruction had form'd, it circulation  
 continued tolerably free thro' some but was stopp'd in others,  
 meantime it acid parts increas'd, without howm<sup>er</sup> retaining  
 their natural Globular form a bloody water is to be seen  
 in Intestines of vessels. I next burnt holes in living  
 & allow'd it parts to heal for 2. or 3. days till it discharge of  
 of liquor from it. Edges was entirely stopp'd, Upon examin<sup>g</sup>.  
 then with it microscope: I saw plainly many vessels  
 w<sup>ch</sup> blood stagnating in it in the Intestines or before it  
 ting'd water effus'd. I ag<sup>n</sup>. touch'd it parts w<sup>th</sup> Sp<sup>l</sup>. C. C. and  
 immediately I co<sup>d</sup>. plainly perceiv'd an increas'd redness round  
 the edges in a few seconds it blood was thrown in a stream  
 from a n<sup>o</sup>. of mouths. It might suppose it depend'd upon  
 the pain given to the animal but in a n<sup>o</sup>. of experiments  
 I apply'd Sp<sup>l</sup>. C. C. to a distant part where it gave equal  
 pain but without it same effect: So it increas'd action  
 of vessels is a cause of Inflammation it being excite<sup>d</sup>.  
 by topical Stimuli, gives a proof of it living power of the  
 Intestines, I so touch'd it contractile power I was say<sup>g</sup> it  
 living power is much more active in it extremities it  
 in the beginning of it. Intestines, I co<sup>d</sup>. they be equally  
 subject to Experiment. we who find much greater changes  
 proceed.

After endeavouring to prove that the Arteries possess a liv. or muscle power, as appears from the disposition of them, the regular Course of their fibres plac'd circularly; from their being provided with nerves, as appears from the sympathy between the Arteries & other parts of the body; there are many other Circumstances which meet together in the same point; we find that after the death of Animals the Arteries are empty of their blood & the veins distended with it, and I make no doubt that it will be found to be the Case altho' the Heart were suddenly cut out of the body, the Arteries would be capable of pushing their blood forward into the Veins. Besides I avoid several Circumstances which might add somewhat to their being actuated in a different manner in different parts of the body as in the Palsy, because I have never seen an instance of the kind. I indeed met with one Case of palsy in the Arm: & when the arm was with the pulse could not be distinguished while at other times it was felt as distinct & frequent as in the sound Arm, but here I suspected a mechanical Stoppage, the palsy had been brought on by accident by a twist the patient had got in the Arm. However the Arteries have been known to beat in one frequent & in one part of the body & in another! But independent of this our proof is still ad compleat: not only possession of the mind, but topical irritation after both the quantity of kind of several Liquors, irritation produces Inflammation as if it is apply'd to the right Eye: & it is not to be explain'd by supposing the Heart is irritated & drives the blood forward as were the Case of the other Eye which is equally affected but the vessels of the part are thrown into unusual action. I mention'd one Experiment which I made to prove for the Light upon the Subject.

the vis a Tergo likewise possess a living power in Depend<sup>t</sup> 200  
Which Particity, & it was appear<sup>d</sup> y<sup>t</sup> y<sup>e</sup> smallest veins like y<sup>e</sup>  
smallest Arteries possess it in the greatest degree, nay in y<sup>e</sup>  
larger veins we perceive a greater attraction made by heat  
V. A. in a living y<sup>e</sup> in a dead body, owing to y<sup>e</sup> activity of  
their coats similar to what y<sup>e</sup> Arteries possess, especially  
if we find many of our Veins particularly y<sup>e</sup> Lactals, in w<sup>ch</sup> we  
can still left demonstrate muscular fibres, we find are cap-  
able of emptying themselves very completely, independ<sup>t</sup> of a  
mechanical extens<sup>n</sup> pressure made upon them, & y<sup>e</sup> larger  
Veins are capable of being irritated in a y<sup>e</sup> of heat. Their  
coats inflame<sup>d</sup> & thickend, & y<sup>e</sup> blood moves in the Veins  
by the Vis a tergo, y<sup>e</sup> muscular power of y<sup>e</sup> veins & y<sup>e</sup> pressure  
made upon them by y<sup>e</sup> action & swell<sup>t</sup> of our muscles, while  
the Circumstances may have a less condu<sup>t</sup> effect, the motion  
appears nearly uniform in y<sup>e</sup> veins till we come near to the  
Heart for y<sup>e</sup> motion of y<sup>e</sup> blood from y<sup>e</sup> heart is brisk, & unlik<sup>e</sup>  
in an extraordinary Situation of y<sup>e</sup> body, there is no stoppage  
because y<sup>e</sup> Muscles receive y<sup>e</sup> blood from y<sup>e</sup> Veins during y<sup>e</sup>  
contraction of y<sup>e</sup> Ventricle, & there are no Valves interpos<sup>d</sup>  
w<sup>ch</sup> can stop its course for a very moderate impulse is suff<sup>t</sup>  
to distend y<sup>e</sup> ventricle, w<sup>ch</sup> we are not to look upon as a  
Spring but as yielding to a gentle impulse w<sup>ch</sup> valves  
were unnecessary, & when y<sup>e</sup> respiration is much impeded  
if there had been valves pres<sup>d</sup> mechanically upon y<sup>e</sup> Muscles  
it might have sent y<sup>e</sup> blood backwards into y<sup>e</sup> Venae cavae  
If in y<sup>e</sup> case we do find it pres<sup>d</sup> backward & a pulsat<sup>n</sup>  
in y<sup>e</sup> branches w<sup>ch</sup> immediately terminate in the V. Cava  
When we compare y<sup>e</sup> force of y<sup>e</sup> blood in y<sup>e</sup> Art<sup>ies</sup> w<sup>th</sup> its force in  
the Veins, suppose by fixing a Tube in sm<sup>e</sup> or D. Hales did

we find  $17^{\text{th}}$   $17^{\text{th}}$  blood rises 10. times  $17^{\text{th}}$  height in the Arteries (20)  
 $17^{\text{th}}$  it does in  $17^{\text{th}}$  veins i.e. it loses  $1/10$  of its force in pass<sup>g</sup> thro<sup>g</sup>  
the Arterial System - hence one and a primary purpose of  $17^{\text{th}}$   
Heart is to renew  $17^{\text{th}}$  force of  $17^{\text{th}}$  blood, & upon  $17^{\text{th}}$  activity of the  
Heart  $17^{\text{th}}$  Circulation in a great measure depends: It is in vain  
to imagine  $17^{\text{th}}$  blood runs from  $17^{\text{th}}$  Venous System, into  $17^{\text{th}}$   
Heart w<sup>th</sup> a force suff<sup>ic</sup> to continue its motion: We sur<sup>is</sup>  
Heart & Brain by acting upon each other in a Circle have  
an Advantage over every piece of machinery in continuing  
 $17^{\text{th}}$  motion of  $17^{\text{th}}$  blood w<sup>th</sup> almost unimpair<sup>d</sup> vigor. But  
there are many other uses w<sup>ch</sup>  $17^{\text{th}}$  Circulation of  $17^{\text{th}}$  blood serves  
 $17^{\text{th}}$  The Thoracic Duct terminates in a large vein near to  $17^{\text{th}}$   
Heart, &  $17^{\text{th}}$  Heart & Lungs are perfectly well fitted to mix the  
Chyle with  $17^{\text{th}}$  mass of Blood, next we w<sup>o</sup> be led to suppose  
as our Opinion highly probable  $17^{\text{th}}$  gen<sup>l</sup> motion of  $17^{\text{th}}$  Chyle  
thro<sup>g</sup>  $17^{\text{th}}$  Heart and Arteries form<sup>s</sup> it into blood, all part con-  
tributing their share, & some more  $17^{\text{th}}$  than others, & especially  $17^{\text{th}}$   
Lungs; we find many circumstances w<sup>ch</sup> lead to suppose  
 $17^{\text{th}}$  Coagulation chiefly perform<sup>d</sup> in  $17^{\text{th}}$  Lungs  $17^{\text{th}}$   $17^{\text{th}}$  red globules  
depend more especially upon  $17^{\text{th}}$  Oxygen: whether we compare  
breathing Animals w<sup>th</sup> others or consider  $17^{\text{th}}$  effect w<sup>ch</sup> Air has  
upon  $17^{\text{th}}$  mass. next we w<sup>o</sup> say  $17^{\text{th}}$   $17^{\text{th}}$  blood that form<sup>d</sup> is  
preserv<sup>d</sup> in a proper state of fluidity &  $17^{\text{th}}$  Coagulation is  
a great measure prevented: for altho<sup>g</sup>  $17^{\text{th}}$  access of the Air  
disposes the Blood to Coagulat<sup>n</sup> thus I have seen in washed  
Ovaries a quart<sup>ty</sup> of fluid contain<sup>d</sup> in  $17^{\text{th}}$  Cavities of  $17^{\text{th}}$  Pleura  
when  $17^{\text{th}}$  body was open<sup>d</sup> thro<sup>g</sup> perfectly cold; but in a few  $17^{\text{th}}$   
after exposure to the Air it coagulated, w<sup>ch</sup> shows  $17^{\text{th}}$  effect  
of  $17^{\text{th}}$  Air in producing these Circumstances, but it does by  
no means shew  $17^{\text{th}}$  certain parts of  $17^{\text{th}}$  gen<sup>l</sup> mass cannot be  
coagulated without  $17^{\text{th}}$  or  $17^{\text{th}}$ . Contrary all Anatomists to have

found it coagulated in 1/2. container of 1/2. heart & we see it (208.)  
quickly taking place in an Arteries; & after tying a large  
vein in 2 places I have found the blood coagulated in it in  
a short time — in what upon a variety of occasions we see  
the spontaneous separation of 1/2. blood into its constituent pts.  
I find a coagulum of coagulated serum in no great length of  
time: not we may say 1/2. 1/2. convey 1/2. distribution of 1/2.  
every where & apply 1/2. nourishment repeatedly, & I shall offer  
attempt to give an absolute proof of 1/2. 1/2. nutrition in apply  
not by the Nerve but by Arteries, not we may say 1/2. 1/2. 1/2.  
of 1/2. Chyle or of 1/2. blood are truly repeatedly apply'd to their  
proper Organs in order to be separated from 1/2. mass:  
Thus 1/2. 1/2. of 1/2. milk depends upon 1/2. circumstances, &  
same quantity co. not be collected without 1/2. constant mot.  
of 1/2. blood in a Circul. & in like manner 1/2. 1/2. to the other  
Nourishment: there are other purposes w. we shall afterwards more  
clearly discover, while we consider 1/2. effect of 1/2. 1/2. in  
entire pts of 1/2. circulat. System, by w. not only a separation  
is made, but 1/2. ligures chang'd at 1/2. same time, & 1/2. differ  
between these several liquors & 1/2. and blood, or between 1/2.  
and blood & 1/2. Chyle. — We find many other circum-  
stances depend. upon 1/2. same cause. The growth of new pts  
is supply'd 1/2. in a manner 1/2. is extremely curious &  
w. is almost inexplicable. — Next let us turn our attention  
to 1/2. diseas'd parts. If we attend to 1/2. structure of 1/2. pts.  
1/2. they are compos'd of parts of various natures, we must  
suppose & we find 1/2. 1/2. 1/2. Arteries are Subject to inflam.  
& all 1/2. coming 1/2. attend 1/2. dis order in other parts: If  
Arteries are inflam'd near to the heart there may be a  
termin. of 1/2. disease in Death depend. upon 1/2. W.S.  
If 1/2. inflam. is not discur'd & 1/2. patient does not die

From 17<sup>th</sup> disease of 17<sup>th</sup> part may Gangrene; whenever 17<sup>th</sup> coats (200)  
of 17<sup>th</sup> Intestines are become very soft & tender & give way there is  
some degree of gangrene has taken place, especially if these  
Coats are press'd against firm & existing substances: such  
they are subject to Schirrus, thin Coats are thickend, & a  
matter deposited in 17<sup>th</sup> cellular substance adding to the  
thickness & bulk, and in some measure interrupting 17<sup>th</sup>  
Circulation & when 17<sup>th</sup> is carried farther an appearance is  
produc'd like bone & we may compare such a change to  
what happens in 17<sup>th</sup> glandular Organs. — Again as a  
manifestation of gangrene may happen without any previous  
appearance of a Schirrus, so as in glandular parts 17<sup>th</sup>  
Schirrus may lay 17<sup>th</sup> foundation of a Gangrene, first  
17<sup>th</sup> opaque matter is deposited, afterwards 17<sup>th</sup> Coats matify  
& give way, we find in other Cases erosions or what we  
we call suppurations, only we do not find 17<sup>th</sup> matter  
collected in considerable 17<sup>th</sup> for membranes suppurate  
with difficulty; & 17<sup>th</sup> matter is wash'd from 17<sup>th</sup> inner surface  
by the current of 17<sup>th</sup> Blood. When 17<sup>th</sup> heart is affected  
by disease consequences follow greater 17<sup>th</sup> we can explain  
from mechanism of 17<sup>th</sup> patient has anxiety & oppression  
a quick pulsing 17<sup>th</sup> convey. of irritation, but it is irregular  
& intermitting in various degrees, & we are to conceive 17<sup>th</sup>  
these changes depend upon 17<sup>th</sup> sensibility of 17<sup>th</sup> Organ & 17<sup>th</sup>  
Sympathy w. 17<sup>th</sup> body has in gen. w. it & particularly the  
N. S. is considerably irritated — To give some Idea of 17<sup>th</sup> I  
shall mention an Experiment. — After cutting 17<sup>th</sup> Dorsa in  
a Frog in w. there is only one Arterial Ventricle the  
Arts supplying the Lungs, 17<sup>th</sup> Animal is capable of  
mod. its body for 17<sup>th</sup> space of 1/2 hour but if you pour  
into 17<sup>th</sup> heart a single drop of a solution of Opium in

Water from that Instant of Heart is needed (210)  
after. Tho' the Pericardium was cut it wd. have made near Two  
hours upon the slightest irritation, but now not over  
burning it w. a hot Iron is sufficient to revive it in  
a very few minutes of power of y. whole muscle of the  
body is uniting, they become weak & affected w. humors  
So disease of y. heart may disorder y. most distant parts  
of y. System independ. of y. Circul. — The Heart maybe  
affected in y. follow. ways — There maybe a Concretion of it  
with the pericardium. — Or a Duplex within y. membrane  
going still deeper we find in other Cases of y. blood in life  
have found Vets within y. heart to w. <sup>ch. 7</sup> name of Polypus  
are given, — Partly from a Constriction al. y. <sup>ch. 7</sup> Duplex  
parts of it are very considerably dilated.

Concretion of y. heart to the pericardium without some  
previous Inflammat. either bet. upon y. heart or neigh-  
boring Organs scarcely happens; y. patient has  
felt a pain and burn. heat about y. region of y. heart  
y. Pulse by degrees becomes irreg. & intermits w. the  
usual Symptoms of Angina & Oppression; & we find the  
Arteries of y. heart nearly y. same in every part of  
y. body, & y. strokes confin'd to y. usual place; because  
y. Concretion between y. Heart & its Capsule will pro-  
bably occasion a similar Concretion of y. Capsule  
to y. inner side of y. heart: next we shall suppose  
water to be collected, in y. Case many Symptoms will  
be entirely y. same as when y. water is collected in the  
Cavity of y. pleura; a paucity of Urine: a duplicital  
habit, y. patient awake in Sleep with terror

especially in certain postures of  $\gamma^e$  body, he finds him-  
self oppress'd upon changing  $\gamma^e$  body, from  $\gamma^e$  erect to  $\gamma^e$  Horizontal:  
because in the erect  $\gamma^e$  water in  $\gamma^e$  pleura presses down the  
diaphragm & enlarges  $\gamma^e$  Cavity of  $\gamma^e$  Thorax, whereas in the  
horizontal  $\gamma^e$  weight of  $\gamma^e$  Abdominal viscera add to the dis-  
order: But if  $\gamma^e$  water is contain'd within  $\gamma^e$  pericardium  
In apprehension of  $\gamma^e$  patient will feel a still greater anxiety  
upon being laid horizontally because  $\gamma^e$  water presses  
immediately upon the Cavities of  $\gamma^e$  heart, so he is oblig'd to sleep  
with  $\gamma^e$  body rais'd, & we shall not in any situation of  $\gamma^e$   
Body be able to discover the stroke of  $\gamma^e$  heart, as  $\gamma^e$  Pills  
Next going deeper we can suppose a disorder arising from  
Polypus, not effluvia is so frequent as many seem to conceive, it is  
a rare occurrence, but it is not to be altogether deny'd; for  
the Blood does coagulate after death w<sup>th</sup> out  $\gamma^e$  access of  $\gamma^e$  Air  
so if a person from terror &c. has fainted & continues for  
some time in it, we may conceive a coagulation to have taken  
place,  $\gamma^e$  is perhaps not to be removed by  $\gamma^e$  succeeding action  
of  $\gamma^e$  heart: & where after dissection nothing is found but a  
very firm Coagulum within  $\gamma^e$  heart,  $\gamma^e$  could not have happen'd  
in Articulus Mortis, & we may conceive  $\gamma^e$  it happens here  
as in  $\gamma^e$  Case of Aneurism. We judge of  $\gamma^e$  by the Cause  
They finding  $\gamma^e$   $\gamma^e$  person in certain postures is more  
uneasy than in others; for  $\gamma^e$  polypus may be situated  
so as to cover  $\gamma^e$  mouth of  $\gamma^e$  Ventricle and may be remov'd  
by posture. The enlargem<sup>t</sup> of  $\gamma^e$  heart for  $\gamma^e$  most part  
depends upon  $\gamma^e$  ossification in  $\gamma^e$  valves, partic<sup>l</sup>r. then of  $\gamma^e$   
Aorta, this part is more subject to pressure and therefore  
to this accident for  $\gamma^e$  blood is thrown thro' a narrow pass-  
age with violence, & the Artery reaching  $\gamma^e$  valves are shut  
so  $\gamma^e$   $\gamma^e$  are subject to pressure both from  $\gamma^e$  heart & Arteries

In the perusal of this manuscript, the Reader  
may find some incoherency in the Concatenation  
as from the Original Copy several parts were  
left at my elbow and of little signification  
w. is the real foundation of it. Simplicity if any  
be found. — Edin. August Nov. 1775.

and in most people put to hard labor, we find an Efflu- 219.  
viation altho' mouth of y<sup>e</sup> Rorta, & this disease in y<sup>e</sup> human  
body is much more frequent, is commonly imagined. I have met  
w<sup>th</sup> a D. of example where I was cut off y<sup>e</sup> head. Taken place  
for such, he rose with the dead suddenly in a moment with  
being above distended y<sup>e</sup> usual 3. minutes before. The patient  
felt anxiety, oppression y<sup>e</sup> pulse is irr. qu. inter. For the  
most part weak, much heat altho' breast, and often com-  
plains of coldness in the Extremities, & making an attempt  
to walk up a hill, he is quickly oblig'd to stop very soon  
becomes extremely oppress'd, and y<sup>e</sup> pulse irreg. y<sup>e</sup> distinguish  
pathognomonic sign is y<sup>e</sup> heart striking y<sup>e</sup> side lower y<sup>e</sup>  
usual.

From y<sup>e</sup> structure of y<sup>e</sup> Arteries & Veins  
accidents from wounds of w<sup>ch</sup>. I say nothing till we come to the  
Surgery, when y<sup>e</sup> situat<sup>n</sup> of which being better understood,  
we will be better able to form an exact notion of y<sup>e</sup> appearance  
of y<sup>e</sup> blood spreading in the Cellular Substance.

Some of y<sup>e</sup> Physicians of this place were consulted concerning y<sup>e</sup>  
Case of a Gentleman in England who was supposed to have  
a large Abscess in the Abdomen, & we were desired to give  
our Advice with regard to it. But as the particular Circum-  
stances were not fully described, we tho' it necessary to  
have an acct. of the Case; but we got a very laconic  
answer, y<sup>e</sup> name of y<sup>e</sup> absent Physicians in England b<sup>e</sup>  
examined it & were of opinion, y<sup>e</sup> it was an Abscess  
I have heard however since y<sup>e</sup> it was of a very diffi-  
cult nature. I mention y<sup>e</sup> to show y<sup>e</sup> we should attend to every  
Circumstance of the disease its progress, situation y<sup>e</sup>  
appearance of y<sup>e</sup> part if it had a pulsation, from the  
beginning, if we can make it outside and find it fill  
again with a rush &c.

If a large artery is thus affected it is evident it we can only palliate it's disease by lessening it's force of it's blood, by V.S. keeping it's body cool, & it's belly open. In some cases I have seen advantage from Opium in others again it did hurt and in some cases where it's artery, tho' deep seat had work'd it's way towards it's Surface, it's patient found considerable relief by having the Tumor covered by a piece of Flannel, as in cold weather it was remarkable uneasy

### Lecture 46<sup>th</sup>

Considering the Arteries as merely serving for it's purpose of Circulation - we shall proceed to their termination & beginning of it's veins.

It is necessary to show how besides it's veins w. are universally known, another System, of valvular Lymphatic veins, as they are generally pellucid, & very white and very white crowded with valves, w. is in our Arteries have not the D. of pairs of these valves, & their Structure is exactly it's same in it's human body as it's of it's valves found in red veins, there are almost always two valves together each describing it's semicircle & filling it's vein exactly; but it is of very considerable consequence not only in physiology; but in practice to understand their Course as well as Structure - We find it's they enter into small test. glands w. have been described from their Shape under it's name of Branched glands: when they reach it's gland they divide into a very great N. of Branches w. are so minute it's difficult to force a penetrating inject. thro' 'em, when we succeed we find it's after dividing within it's gland the Extremities of it's vessels open into Cells w. are natural

to these glands and in it they chyle and lymph are  
deposited for in descending in general, it is all one whether  
we take the lymphatics or the lactals & in fine of other  
lymphatics & lactals come out from y<sup>e</sup> glands beginning  
equally small & a h<sup>t</sup> of these minute branches join together  
from y<sup>e</sup> Trunk so we may call the first of our vasa lymph-  
atica & lactalia, supposing always y<sup>e</sup> cellular matter is  
intusper<sup>d</sup>, just as when blood is shown by y<sup>e</sup> Arteries of the  
Cell. Substance of y<sup>e</sup> penis, it passes into Cells & from thence  
into the Veins, these vessels in their Course have numerous  
Anastomoses, suppose two Lactals to run a certain way  
parallel each venter of a branch, w<sup>ch</sup> are united to form a  
y<sup>e</sup> Trunk of these is again subdivided, & thus we may  
pursue y<sup>e</sup> Anastomoses a very great way, & hence no action  
can be readily obstructed, for if y<sup>e</sup> passage is deny'd to the  
right hand y<sup>e</sup> Arteries can run to the left. When y<sup>e</sup> lymph-  
atic reaches a complete gland, y<sup>e</sup> whole of it does not  
enter into the gland, but it divides upon the surface into  
diff<sup>t</sup> branches, some passing over y<sup>e</sup> gland & others entering  
it: and they communicate again on the other side of y<sup>e</sup> gland  
& therefore the y<sup>e</sup> gland sh<sup>d</sup> be obstructed by diverse with an  
obscure or rather cutaneous matter. H<sup>ow</sup> y<sup>e</sup> Lymphatic pass  
on. When we follow y<sup>e</sup> Lymphatic & Lactal we find one  
principal or gen<sup>l</sup> termination in the Thoracic Duct.  
In tracing<sup>g</sup> on from y<sup>e</sup> Testicles we find two sets, one  
accompanying y<sup>e</sup> subcutaneous veins & other y<sup>e</sup> Arteries &  
deeper vein and as they run upward y<sup>e</sup> deep plexus  
comes nearer to the superficial when we trace on near the  
groin, we find the superficial plexus, passing into the  
Inguinal glands, and from thence the Eminentia entering

The Trunk behind, is Tendon of external oblique muscle  
 while some of the deeper branches are seen entering at, side  
 of the pelvis, & situated by 2. superficial vessels, communicate  
 with those follow. 2. Artery, then within the body of 2. ante-  
 rior gland: therefore we take it for granted, 2. 2. showing  
 a conglomerate gland, is the same as showing Lymphatic  
 vessels, & if I can demonstrate these glands, I prove that  
 2. part is provided with Lymphatics running up along  
 the vein, they pass thro' the glands of 2. lower loe plexus  
 where they meet with the Lactal vessels, 2. Lactal Trunk  
 joining with the Lymphatics & running to 2. receptac.  
 Chyli, The Thoracic Duct in its Course receives 2. Lymphatics  
 of 2. Trunks, & when it makes a Turn to her into the  
 Internal jugular there enters a large Lymphatic which  
 receives which receives 2. Lymph from 2. left side of  
 head and neck. Thus we have seen 2. Thoracic Duct  
 receive the Lymph from 2. lower Extremities, from 2. Pelvis  
 and Abdomen, with the Chyle from 2. Chyliferous viscera  
 then in its passage upwards thro' the Thorax it receives the  
 Lymph from the heart & Lungs. We find the plexus from  
 the left Arm going thro' the Axilla & running towards the  
 Thoracic Duct with the Lymphatics of 2. left side of the  
 head and neck enter 2. Internal jugular vein of 2. same  
 side and right subclavian. I next shew you the mesentery  
 of a Litter, as a proof 2. Lactal vessels are found in ovipar-  
 ous Animals, you will in examining sev. 2. preparations  
 shew 2. Lymphatics are demonstrated in parties. I goant  
 attend to this 2. in many of 2. preparations the Branches  
 are so very small and all crowded with valves, 2. we neither

if we neither can suppose if injections to have been thrown  
nor pipes to have entered in the usual way, so if they  
must have been filled by an extravasation.

### Lecture 11<sup>th</sup>

Certain Arteries are large enough had not  $\frac{1}{2}$  red globules  
but there are others in the body w<sup>th</sup> exclusive  $\frac{1}{2}$  red globules &  
these we call veins or Lymphatic or veins Lymphatic or aqueous  
Arteries - now so far there can be no doubt if  $\frac{1}{2}$  red Arteries  
divide into color'd & colorless Branches, if many of  $\frac{1}{2}$  colorless  
Branches were for  $\frac{1}{2}$  purpose of Secretion or if we find  
if latent Arteries sent off, then we cannot doubt if  $\frac{1}{2}$  Lumen  
of  $\frac{1}{2}$  Vein has a Circulation thro' it nearly in  $\frac{1}{2}$  same man-  
ner as is perform'd in the Poats. That if red Arteries terminate  
in the red veins is beyond all doubt; but how are we to send  
back  $\frac{1}{2}$  Liqueur contain'd in the Lymphatic Arteries a quick  
in from the diff<sup>t</sup> Cavities: are we to suppose w<sup>th</sup> Systematic  
Arteries of  $\frac{1}{2}$  Lymphatic Arteries form  $\frac{1}{2}$  valvular Lymphatic  
Veins passing thro'  $\frac{1}{2}$  glands; & if  $\frac{1}{2}$  absorbent Veins pass  
into the red veins, or are we to conceive if  $\frac{1}{2}$  red Arteries form  
 $\frac{1}{2}$  red veins & if  $\frac{1}{2}$  Lymphatic Arteries  $\frac{1}{2}$  Lymphatic Veins, &  
if a part of  $\frac{1}{2}$  absorbents w<sup>th</sup> colorless terminate in the  
colorless veins of valvular Lymphatics - but is there  
not another System more simple viz. as we have & are of  
an Artery in its Extremities divides into red & colorless  
Branches w<sup>th</sup> we not suppose if  $\frac{1}{2}$  red veins in like man-  
ner form'd, & if  $\frac{1}{2}$  thus correspond w<sup>th</sup>  $\frac{1}{2}$  Arteries in one of  
their principal Offices of carrying on the Circulation & in  
that only whilst  $\frac{1}{2}$  valvular Lymphatic veins connect  
with 'em in so far as they perform secretion or if they

receive all the Liguors of any where effused, & so  
y. y. Circulation is carried only the red veins & taken up by  
by the valvular Lymphatics, As we observe y. blood out of  
the body to divide into a red & colorless part and as we  
find in the body color'd & colorless veins, there can be  
little doubt of each of the Veins corresponding to the part  
of y. diff. color but surely this observation teaches not  
of Origin of the veins we find there conclude nothing of  
orig. to y. from there being in the body parts of a colorless  
we may conclude of y. Arteries divide into color'd & colorless  
Branches; or we get a proof of there are more Arteries of  
we can perceive with the microscope, y. colorless Branches  
weeping us from their smallness and y. want of Globules,  
so y. we have no manner of judging: just as if water was  
running in a Glass Tube plac'd across in this Room we  
would not be able to determine whether y. water was at rest or  
not. — Puffinbater a violent vomiting was produced by  
poisoning y. Animal & a red color was found in y. Lymph  
and the red blood was found extravasated at y. roof of y.  
Stomach, now one of two things happens here from some  
sudden violence or wound y. branches of y. Lymphatics  
are lacerated, and y. blood enters in a mechanic<sup>l</sup> manner  
from y. cut arteries, or injected matter enters after Death,  
or in consequence of an Inflamm<sup>n</sup> y. red part of y. blood is effus'd  
I mention y. appearance which follows every inflammation  
a bloody matter is effus'd into y. Cellular substance &  
this Circumstance was not attended to by those who drew  
the Conclusion of y. red color when'd y. Content<sup>l</sup> of Vesicles  
& they could see this Circumstance of y. red globules break  
down into invisible parts, so are perhaps as capable

of being absorb'd by the round mouths of the Lymphatics  
as any of the other parts, may more readily perhaps  
become white if whole mass is effus'd, & red color diffus'd  
before the yellow; instead therefore of this observ<sup>n</sup>. proving  
a continuation of y<sup>e</sup>. valvula Lymphatica System per  
y<sup>e</sup>. Leticia, it rather seems to show y<sup>e</sup>. Contrary, y<sup>e</sup>. y<sup>e</sup>.  
Lymphatics begin by open mouths from the vessels into  
wh<sup>ch</sup> in the Case of Inflammation & wounds y<sup>e</sup>. red particles  
are effus'd. — We find therefore no proof of y<sup>e</sup>. colorless  
arteries terminating in the Lymphatic veins, but do we  
find any y<sup>e</sup>. y<sup>e</sup>. colorless arteries do not terminate in  
red veins? I apprehend y<sup>e</sup>. it is very much otherwise  
very Circumstances leads to y<sup>e</sup>. suppression of y<sup>e</sup>. do. —  
Let us first take y<sup>e</sup>. Analogy of y<sup>e</sup>. Leticia. In looking at  
its termination consists of color'd & colorless Branches  
why wh<sup>ch</sup> we not suppose a vein at its beginning to  
consist of y<sup>e</sup>. same? we usually admit y<sup>e</sup>. nature found  
us in one of y<sup>e</sup>. colorless part of y<sup>e</sup>. blood y<sup>e</sup>. is proper for the  
purposes of Life, for maintaining y<sup>e</sup>. diffusion & separat<sup>n</sup>.  
of y<sup>e</sup>. red globules from each other & for many uses  
otherwise; and instead therefore of imagining y<sup>e</sup>. y<sup>e</sup>. part  
is carried away from the red veins, we must suppose y<sup>e</sup>.  
after y<sup>e</sup>. colorless Leticia have made their colorless diffu-  
sion thro' a colorless Organ, they run into y<sup>e</sup>. red Veins  
Thus in the Eye of a Child we find Leticia conveying  
red blood, wh<sup>ch</sup> afterwards become too small to admit  
y<sup>e</sup>. red globules, yet the Termination of y<sup>e</sup>. Leticia must  
still be in the red veins, and when we view y<sup>e</sup>. different  
Cases of the same also in wh<sup>ch</sup> y<sup>e</sup>. Lymphatic System is found  
& where there is a greater proportion of colorless fluid, as  
in a Skate when the Flesh is of a white Color, so y<sup>e</sup>. the

219.

Arteries must exclude y<sup>e</sup>. red globules if the colourless  
veins terminated in the Lymph<sup>ic</sup>. System, we we find the  
Lymph<sup>ic</sup> of a prodigious N<sup>o</sup>. and size and the Venæ Cavae  
receiv<sup>e</sup>. only y<sup>e</sup>. red globules, very small in proportion to the  
Arts: But the preparation's are the same in man: we may  
therefore apply what we find in these parts to ourselves  
& take it for granted y<sup>e</sup>. y<sup>e</sup>. red Veins correspond to the red  
Arteries as far as concerns y<sup>e</sup>. Circulation of the blood.  
Now if we prove y<sup>e</sup>. y<sup>e</sup>. red veins receive all the circulating  
branches of the Arteries, we leave Absorption only as the  
Office of y<sup>e</sup>. Lymph<sup>ic</sup>. System, & we have direct proofs to shew  
y<sup>e</sup>. y<sup>e</sup>. valvular Lymph<sup>ic</sup>. vessels begin with open mouths  
at y<sup>e</sup>. ext<sup>er</sup>. Cavities, and suck in with their Extremities  
the Liguæ they convey. The Analogy of the Lacteal Vessels  
shew this, we find the same Structure of their Coats. w<sup>ch</sup>.  
are thin, tough & transparent, & crowded with Valves &  
we trace them both thro' glands, w<sup>ch</sup>. also agree, thus y<sup>e</sup>.  
mesenteric glands and the Conglobate glands of the  
Ovary & Uterus perfectly agree in every Circumstance; We  
find y<sup>e</sup>. vessels in a similar way passing along y<sup>e</sup>. surface  
& passing thro' them, & to carry on the Analogy, they unite  
together, so y<sup>e</sup>. Thoracic duct is y<sup>e</sup>. common Cave of both  
Systems. — In a Jaundic occasion'd by a total obstruct-  
ion of the Biliary ducts I know for certain that the  
Lymph<sup>ic</sup>. Vessels take up the Bile almost as pure &  
bitter as it is found in y<sup>e</sup>. gall bladder: I have seen myself  
y<sup>e</sup>. Lymphatics fill'd in that manner & I shew'd em to Dr.  
Young & Dr. Black who were not contented with seeing y<sup>e</sup>.  
Color, but opening the Lymphatic they tasted the Bile  
& found it to be as bitter nearly as when taken from the  
gall bladder: this is a direct proof y<sup>e</sup>. y<sup>e</sup>. Lymphatic Vessels,

in the Liver begin from  $\gamma$ . Cavities of the Biliary (220)  
ducts first perform absorption: When acid matter, whether  
of medicine, or disease is apply'd to our body externally or  
internally we find in many instances that the matter  
directly enters  $\gamma$ . Lymph. vessels & hence it returns it. In-  
fluence in  $\gamma$ . body in general produces swellings of the  
glands thro' which  $\gamma$ . Lymph. loaded w<sup>th</sup>  $\gamma$ . medicine or  
other matter naturally passes &c. It often happens  $\gamma$ .  
Blisters produce swellings in  $\gamma$ . Conglobate glands  
not in those to which the blister is apply'd, or there lying  
immediately under it but in those w<sup>ch</sup> are so situated as to receive  
 $\gamma$ . Lymph. Vessels from  $\gamma$ . part blister'd, however distant  
as in  $\gamma$ . Pexilla or inguinal glands, when  $\gamma$ . blister was  
apply'd to the hands or feet, Surgeons often find that  
Blisters on the head produce Maxillary of the neck  
their situation varying according to the place of  $\gamma$ . blister  
The same thing is observable in diseases as in the plague  
perhaps, but beyond all doubt in the measles: Cancer  
Smallpox. Scurv Venerea. So recollect what you have seen  
in the common manner in w<sup>ch</sup>  $\gamma$ . Scurv Venerea is receiv'd  
The Inguinal glands swell & constantly  $\gamma$ . Swelling is  
produc'd in the uppermost gland or glands of  $\gamma$ . Inguin-  
al plexus, & the under ones thro' equal manner, & thro' they all  
are supply'd with Vessels and nerves from the same  
Root do not swell. I have repeatedly trac'd  $\gamma$ . Lymphatic  
Vessel harden'd from the Root of the penis into  $\gamma$ . groin  
and I have trac'd a Lymphatic vessel from  $\gamma$ . under part  
of the Back behind  $\gamma$ . Scrotum  $\gamma$ . whole way into  $\gamma$ . groin  
In other Cases again as in the Cancer of the foot  $\gamma$ . lower  
glands of  $\gamma$ . Inguinal plexus swell first plainly showing

that they swell in the swell in the course of y. vesicle (221.)

and if y. venereal poison has been received any other way  
as if a Surgeon receives it from a wound in the finger, when  
a Bubo is produced in the Axilla, or if a nurse communicates  
y. Infection to a child by giving suck, the child has a  
Sore form'd in the Mouth & a Bubo is produced in the Neck  
again a diseas'd Child communicates y. Infection to  
a nurse y. Lymphatic glands are affected & y. neighbouring  
parts are free from y. Inflammation, In like manner  
many other Cases when there is a suppuration as in  
Scrophulous Cases or in common sores especially when they  
are expos'd to the Air & y. matter becomes acid, we frequently  
meet with a swelling of the glands; and it is easy to know  
how y. Galen was acquainted with these swellings &  
many others who had no particular Theory to serve and  
Galen calls Glands swell'd from sores Bubones & we  
find the matter passing to a very great distance Dr.  
Pullen lately met with an instance when a Bile had  
gather'd in the Leg & had occasion'd a swelling in the  
Inguinal glands & I have now seen so many Instances  
of this y. I think it scarce worth while to take any par-  
tic<sup>r</sup> notice of them.

I find a number of conglute  
gland immediately under the Brain in proportion  
greater than could be suppos'd unless y. Lymphatics  
of the Brain pass'd thro' them; and wounds and  
suppurations of y. Brain have bro't in swellings of the  
neck - But supposing y. y. Lymph. System does perform  
absorption does it follow y. y. Absorbents don't likewise  
terminate in red vessels, or y. Absorption is not perform'd by  
these, also: or while y. Lymph. vein about as we to  
suppose

that the red veins assist in the same office. It is  
 not consistent with y<sup>e</sup> simplicity of nature to make  
 such a supposition: to suppose one set of veins to per-  
 form the purpose of absorption singly, & y<sup>e</sup> other set  
 shall not only serve y<sup>t</sup>. but likewise the purpose of Circu-  
 lation it is more probable y<sup>t</sup>. as the two kinds of veins  
 correspond to diff. kinds of arteries y<sup>t</sup>. the correspond en-  
 tirely & y<sup>t</sup>. the one office has no connexion w<sup>th</sup> y<sup>e</sup> other, but  
 y<sup>t</sup>. the red veins serve for Circulation & y<sup>e</sup> Lymphatic for  
 Absorption. And if the Structure had been fully understood  
 understood before the other Supposition had been formed  
 we might have allowed it to have more weight, but the  
 red veins were known long before y<sup>e</sup> Lymphatic & there-  
 fore were for many ages supposed to serve every purpose  
 in the body, & even after y<sup>e</sup> discovery of the circulation they  
 took it for granted, y<sup>t</sup>. y<sup>e</sup> red veins serv'd both for motion  
 and absorption, & it was not easy for Physiologists tho'  
 they now began to treat matters more minutely, to  
 divert themselves of their prejudices, & instead of  
 producing arguments against the former opinion more  
 were advanced in favor of it: thus it has been said that  
 y<sup>e</sup> Lymphatic Vessels were wanting in a variety of Animals  
 w<sup>ch</sup>. in other respects agree with man & so that Absorp<sup>tion</sup>  
 in them must be performed by the red veins but we find  
 y<sup>t</sup>. in Viperous Animals there are Lymphatic Vessels.  
 They also alledg'd y<sup>t</sup>. want of Lymphatic Veins in certain  
 places because they have not been seen as in y<sup>e</sup> Brain  
 & Eye But I have met w<sup>th</sup> a Case w<sup>ch</sup>. clearly proves this  
 in a Cancer affecting y<sup>e</sup>. inner part of y<sup>e</sup>. Ball a very  
 large swelling was produced in y<sup>e</sup> Lymphatic

Sands in the bottom of it neck of the same side (223.)  
w<sup>ch</sup> soon broke out into Cancer - And I have obs<sup>d</sup>. where  
a N<sup>o</sup> of the Glands have been obstructed suppose y<sup>e</sup>. Billa  
y<sup>e</sup>. whole Liver has become adenomatous & yet y<sup>e</sup>. red veins  
were not affected, & if there are provided with numerous  
Arterial vessels, why do not these perform their office  
one Experiment w<sup>ch</sup>. is more decisive y<sup>e</sup>. all this is, that  
I find on tying y<sup>e</sup>. Thoracic Duct, few animals survive it  
& further I find from experiments of y<sup>e</sup>. sort y<sup>e</sup>. Thoracic  
duct more frequently y<sup>e</sup>. is suspected communicat<sup>ed</sup> w<sup>th</sup>  
other veins, as with branches of y<sup>e</sup>. Venæ Cava within the  
Abdomen, w<sup>th</sup>. y<sup>e</sup>. Azygos within the Thorax & near its usual  
Entrance it has frequently more y<sup>e</sup>. one Termination, &  
in sev<sup>l</sup>. experiments I found y<sup>e</sup>. these termin<sup>ns</sup>. had been con-  
siderably dilated & keeping y<sup>e</sup>. Animal Alive 2. or 5.  
Days I got it to take some food in w<sup>ch</sup>. Madder had been  
mix<sup>d</sup>. & it eat y<sup>e</sup>. same quantity w<sup>th</sup>. other Animals of the  
same Age in w<sup>ch</sup>. y<sup>e</sup>. duct had not been ty<sup>d</sup>; & yet y<sup>e</sup>. death  
of it was to be prevent<sup>d</sup> to have been very much owing to  
want, it had not been nourish<sup>d</sup> by it y<sup>e</sup>. bones had not rec<sup>d</sup>  
y<sup>e</sup>. smallest tinge, while in a sound animal they were  
ty<sup>d</sup> in half y<sup>e</sup>. time so y<sup>e</sup>. inter-vein<sup>ns</sup> are not cap-  
able of Absorption for nourish<sup>mt</sup>. or for colouring y<sup>e</sup>. bones  
so dont about our Aliment.

### Lecture 48.

In our last Lecture I mention<sup>d</sup> a variety of Arguments  
to show y<sup>e</sup>. valvular Lymph. veins are abortives, upon  
the whole we concluded so, from y<sup>e</sup>. Analogy of y<sup>e</sup>. duct. vessels  
from attending to the Structure, to their appearance in living  
Animals, their continuing to be fill<sup>d</sup> w<sup>th</sup>. liquor after the

*[Faint, illegible handwriting covering the page]*

*Bulls In the ...*

*[Faint signature or date]*

circulation ceas'd, from the colour of their contents par-  
ticularly the green color of those coming from the Liver, To en-  
dow'd w<sup>th</sup> effect w<sup>th</sup> acid matter with whether of medicine or  
disease has in producing swellings of y<sup>e</sup> Lymphatic glands  
of an interpos'd between the part irritated & y<sup>e</sup> heart, And  
where a disease affects y<sup>e</sup> body in many cases; s<sup>th</sup> an ulcer  
is produc'd, but in other y<sup>e</sup> acid matter enters without an  
ulceration, & sometimes the seldom y<sup>e</sup> happens in y<sup>e</sup> Liver  
Venous, I have examin'd patients without finding  
Chanere or Gonorrhoea but where a Bubo had form'd; & I  
find in Fallopius an abs<sup>ss</sup> of the same kind when y<sup>e</sup> disease  
produc'd more violent Effects than it does now: & in y<sup>e</sup>  
plague we find Bubo's arising in these parts of y<sup>e</sup> body  
expos'd to y<sup>e</sup> external Air, and in y<sup>e</sup> small pox more espe-  
cially in the Highlands, in S<sup>t</sup>. Milda we are told by Mr.  
Kennedy y<sup>t</sup> it is customary to inoculate Children by  
rubbing matter upon y<sup>e</sup> wrist & the abscess y<sup>e</sup> in many  
cases swellings were found under y<sup>e</sup> Rumpit, tho' he did  
not know the Cause & he mentions an Instance where  
from rubbing y<sup>e</sup> matter upon y<sup>e</sup> Axilla, y<sup>e</sup> Axillary glands  
only were swell'd; After y<sup>e</sup> reasoning from the Arguments  
y<sup>e</sup> nature of y<sup>e</sup> Lymph Absorbent vessels. For I avoid some  
few descriptions y<sup>t</sup> may seem still more direct and  
decisive because I know they are erroneous, Dr. Mickle  
does not scruple to tell us y<sup>t</sup> y<sup>e</sup> beginning of y<sup>e</sup> Lymphatic  
vessels may be discover'd by y<sup>e</sup> naked Eye, as from the  
Spermatic duct: but he is deceiv'd by a particular vessel  
w<sup>ch</sup> is very diff<sup>erent</sup> it is a Duct conveying the Semen. Another  
cut is given lately in y<sup>e</sup> Philosophical Transactions by  
Mr. Watson of London, where with the naked Eye are pointed  
out to us y<sup>e</sup> beginning of y<sup>e</sup> Lymphatics of y<sup>e</sup> Uterus &

225.  
several years before I have seen what I apprehend has  
misled him, they are nothing more than mucous ducts which  
are very tender, & if a injection of mercury is pushed a little  
it bursts them and gets into the cellular substance of  
the skin and very short and without entering any vessel it  
seems to represent a lymphatic vein; In other cases I  
have seen of lymphatic vessels & branches of red veins  
by a laceration of a branch, at which we make an extra-  
vagation. So there are really seen but they are the ends of  
mucous ducts, not the beginning of lymphatic vessels; I  
will admit that the mouths of lymphatic vessels can be seen  
for an Anatomist has accurately & clearly demonstrated  
the mouths of lacteals, & also the mouths of the gross  
arteries, whose mouths are probably larger than the mouths of  
the system above; I do not know if any person has made  
an attempt to show the manner in which lacteals arise, they are  
too small to be seen, and were it otherwise their mouths  
are larger than their terminations of the circulating system  
& could not pass this; I then reject all attempts to describe  
the first beginnings of the Lymphatic System.  
After endeavouring to show that lymphatic vessels are absorbed  
I mentioned a list of circumstances which determine us to reject  
a common Opinion of the branches of the red veins as first in  
absorption. I also say that lymphatics are distributed in the human  
body universally, they are found in all the large Cavities.  
When we inject into a vein we fill a cavity, but without being  
able to show that the Injection has not passed into an Artery;  
and recurring to experiment we do not find colored substances  
penetrate into lacteal vessels into red veins: When we  
tie an Artery we produce an Oedema of part, but it is  
because of quantity of liquor exhaling is increased by the  
resistance made to the freedom of circulation, & such is

increased upon the esophagus w<sup>ch</sup> accounts for y<sup>e</sup> swell. (296.)  
very fully & this is often a Cause of dropping in our  
body: if the Liver grows retinuous it acts like a Ligature  
upon the returning veins w<sup>ch</sup> a greater discharge is made  
from the Arteries, and when the Thoracic duct is ty'd, so  
far as the experiments I have yet made, y<sup>e</sup> Animal can't  
be vivisect'd, or a colour communicated to its liver.  
Perhaps before I entirely quit this Subject it may be  
expected y<sup>e</sup> Expts. take notice of a late work of Dr. Meckle  
who endeavours to prove y<sup>e</sup> Branches of y<sup>e</sup> veins per-  
form absorption, & y<sup>e</sup> in many instances more y<sup>e</sup> the  
Lymphatics. But I do it with reluctance because I  
see many instances in it inconsistent, his Experiments  
are inconsistent & I happen to be before him in every  
instance but one, with regard to the Venulae Seminales  
Others admit of a quite diff. explain<sup>tn</sup>. As when he injects  
the Biliary duct he fills the vein, now I have done so  
repeatedly, but most readily when y<sup>e</sup> Injection was pushed  
with sudden violence so as to lacerate & rupture the  
Branches terminating in the Cava, y<sup>e</sup> Cats are torn by  
the injection, & it passes from one large vessel into  
another, w<sup>ch</sup> course I can sometimes follow w<sup>th</sup> y<sup>e</sup> Knife  
into y<sup>e</sup> Vera Cava. In like manner when we blow Air  
into y<sup>e</sup> Uterus the Veins are filled, or when we take wax  
& then cutting open the Kidney we shall not find an  
Uterine duct filled, & we find a great deal in y<sup>e</sup>  
side of y<sup>e</sup> pelvis, and taking y<sup>e</sup> injections of the ducts  
of y<sup>e</sup> mamma & y<sup>e</sup> matter had made its way from the  
Lactiferous ducts into the Cellular Substance, But he  
he alleges y<sup>t</sup> it must first have entered y<sup>e</sup> veins, but  
to show y<sup>t</sup> these Experiments have not been made with

proper accuracy Dr. Meckel is to this day unacquainted with y<sup>e</sup> real structure he knows nothing of y<sup>e</sup> follicles of y<sup>e</sup> mammæ he has not been able to fill the follicles & yet he pretends to fill y<sup>e</sup> veins abstracting from their termination now we shall fill y<sup>e</sup> follicles & not a single branch fill'd. may he perform'd his experiment upon a conglomerate gland diseas'd with Schinour, where there is a destruction of parts, & yet y<sup>e</sup> is brought as a proof their view. as abstractants. — Having then endeavoured to determine y<sup>e</sup> nature of y<sup>e</sup> absorbent veins, let us not consider y<sup>e</sup> way in w<sup>ch</sup> we are to conceive liquor to move in a vessel y<sup>e</sup> wants y<sup>e</sup> vis a tergo, y<sup>t</sup> is not continued from an artery I draw y<sup>e</sup> mouth of a lymphatic w<sup>ch</sup> is provided with valves from its very first beginning: It often mistakes in y<sup>e</sup> supposing y<sup>t</sup> is. Lacteals only receive Valves when they reach y<sup>e</sup> Invening, but they begin to be crowded w<sup>th</sup> valves on y<sup>e</sup> other side of y<sup>e</sup> villous Coat: I have introduced pipes but have not been able to force y<sup>e</sup> valves backwards in order to discover y<sup>e</sup> appearance of y<sup>e</sup> orifice of y<sup>e</sup> Lacteals I must draw a portion of our Intestines but we are not to fancy y<sup>t</sup> y<sup>e</sup> contraction of y<sup>e</sup> Intestines, or y<sup>e</sup> pressure from y<sup>e</sup> muscles & diaphragm presseth y<sup>e</sup> blood into our Lacteals: in proof of y<sup>e</sup> contrary we can't after death inject y<sup>e</sup> Lacteals from y<sup>e</sup> guts, they therefore suck it in, or draw it in, in y<sup>e</sup> manner w<sup>ch</sup> y<sup>e</sup> vessels of vegetables probably do, or in y<sup>e</sup> manner in w<sup>ch</sup> very small Tubes draw water from a Cistern. Thus suppose I have a Cistern fill'd w<sup>th</sup> water to a cert<sup>n</sup> height & I dip a small pipe into it suppose of Glass, y<sup>f</sup> we may see what happens & w<sup>ch</sup> from its smallness resembling a hair is call'd capillary, y<sup>e</sup> water rises to a certain

height within the Tube, higher  $\frac{1}{2}$  of surface of  $\frac{1}{2}$  Water 226  
and the Height is proportion'd to the smallness of  $\frac{1}{2}$  Tube,  
rising highest in  $\frac{1}{2}$  smallest Tube and therefore we may suppose  
this to take place in our Lactals, w<sup>ch</sup> are so exceedingly minute  
as to be insensible, suppose then  $\frac{1}{2}$   $\frac{1}{2}$  Liguor in our Lactal  
rises to this height, it only enters at all if  $\frac{1}{2}$  Liguor be of a  
mild nature. Hence next we learn from Lactals possess a  
rising power  $\frac{1}{2}$  they shut their mouths against acid matters  
so possess motion & Contraction to such a degree as to exclude  
a very thin substance altogether, providing it is extremely  
acid. This helps us to explain  $\frac{1}{2}$  progress of  $\frac{1}{2}$  Liguor, for  
altho'  $\frac{1}{2}$  water will ascend in  $\frac{1}{2}$  Tube a certain way yet at  
length it stops, so  $\frac{1}{2}$  attraction of Capillary Tubes only begins  
a motion, but is not able to continue it rising to a certain  
height and  $\frac{1}{2}$  stagnating; to push it on a rising power is  
necessary, & is beyond all doubt is intr. in  $\frac{1}{2}$  Lactals or  
Lymphatics from its own Coat & as a further proof of its  
being muscular, after  $\frac{1}{2}$  death of an Animal when  $\frac{1}{2}$  Lactal  
vessels are full after cutting of  $\frac{1}{2}$  head or heart, they empty  
themselves completely & push on all their contents into the  
Thoracic duct, so  $\frac{1}{2}$  is seldom if we can give a demonstration  
of  $\frac{1}{2}$  Lactal Vessels from  $\frac{1}{2}$  Color of their Contents, & hence  
in  $\frac{1}{2}$  Intestines it is beyond all doubt  $\frac{1}{2}$  muscular Coat  
of  $\frac{1}{2}$  Intestines alternately contracting & pushing on the  
same affects  $\frac{1}{2}$  beginning of  $\frac{1}{2}$  Lactal Vessels & when the  
Lactal itself contracts  $\frac{1}{2}$  valves hinder  $\frac{1}{2}$  Liguor from  
being push'd outwards, so  $\frac{1}{2}$  very profuse determine  $\frac{1}{2}$   
fluid to  $\frac{1}{2}$  h. of the pulsation of  $\frac{1}{2}$  Arteries, &  $\frac{1}{2}$  action of the  
muscles, thus when a vein is open'd by acting w<sup>th</sup>  $\frac{1}{2}$  muscles  
of  $\frac{1}{2}$  Arm we accelerate  $\frac{1}{2}$  flow of  $\frac{1}{2}$  blood and we would do  
so if there were no more vein in the Member &  $\frac{1}{2}$  Lymph.

appear to be purposely oppos'd to the Action of *Arteries* 224  
I was swelling of *v. common red veins*, while from their being  
crowded w<sup>th</sup> valves *v.* are fitted for taking advantage of every *v.*  
slightest profusion, and *v.* principal trunk of all runs up the  
Thorax parallel to *v. Aorta* so *v.* every stroke of *v.* heart affects  
it & pushes forward *v.* Chyle w<sup>th</sup> considerable violence so we  
can readily understand *v.* manner in w<sup>ch</sup> *v.* liquor enters *v.*  
absorbent System and is convey'd to the heart. Next to deter-  
mine *v.* principal Offices of the absorbent Veins or *v.* gen<sup>l</sup>  
purpose of *v.* System seems in our body, & *v.* very first use  
*v.* occur to us respects *v.* Lacteal Vessels *v.* They seem for  
taking in our nourishment & I shall give reasons for thinking  
*v.* whilst we throw out a poisonous matter from the lungs  
we at the same Time take in something useful from *v.* Liver  
w<sup>ch</sup> has been of late doubted of. - We find *v.* *v.* Bile in *v.* Gall  
bladder is much thicker & materially diff<sup>t</sup> from *v.* Bile f<sup>r</sup>  
in the Hepatic duct so has undergone a preparation, partic-  
ularly *v.* absorption of the thinner parts, In like manner  
*v.* fat is separated from the exhalant vessels out of *v.* same  
Involvement as it is found in *v.* adipose Pleura, a watery  
fluid much have convey'd it thence, w<sup>ch</sup> is afterwards reasum'd  
so *v.* in the mucous *v.* is expos'd to the Air, we find a subac-  
eous matter or mucous in *v.* follicles or bags of *v.* Trachea  
&c. surely *v.* mucous has been chang'd by absorption, perhaps  
we may push this one step farther, *v.* *v.* Absorbent Vess<sup>ls</sup>  
do not merely serve for the preparation of *v.* vented liquor  
but *v.* a somewhat *v.* is useful to the Economy in at *v.* same  
time taken away & return'd to the mass of blood i.e. that  
by *v.* Secretion such changes are produc'd upon *v.* liquor  
*v.* when these are reasum'd they have diff<sup>t</sup> effects upon  
the body from *v.* effects of *v.* principles of *v.* blood, that it  
can be render'd probable *v.* *v.* Jaundies, *v.* yellowness, is

not owing to the want of  $\dot{y}$ . separation of  $\dot{y}$ . bile but 230.  
to its being return'd to the blood, & if we can prevent the  
return we can prevent  $\dot{y}$ . disease, take an other example in  
 $\dot{y}$ . Semen we certainly do observe  $\dot{y}$ . the whole Constitution  
is affected by that if this was owing to a want of separation  
 $\dot{y}$ . fater etc. in  $\dot{y}$ . flesh of Bulls we know remarkably in  
 $\dot{y}$ . flesh of Oxen. May perhaps somewhat useful is taken in  
from  $\dot{y}$ . most excrementitious Liquors, as  $\dot{y}$ . Urine, for in  
fishes there is a vesica urinaria, & if all the parts were  
well it might be discharged from  $\dot{y}$ . body by  $\dot{y}$ . Urine, w<sup>th</sup>  
out any inconvenience to the Animal, & so in the last  
place of  $\dot{y}$ . Lymphatic System is connected with  $\dot{y}$ . Lactal  
or rather  $\dot{y}$ . vessels desc'd under two names makes one  
System and  $\dot{y}$ . Lymph mix'd with  $\dot{y}$ . Chyle must be of  
singular use for filling the blood to receive  $\dot{y}$ . chyle, &  
without  $\dot{y}$ . dilution and separation  $\dot{y}$ . mixture w<sup>th</sup>  $\dot{y}$ . mass  
might have prov'd hurtful, & in proof of this observation if  
a small quantity of milk be inject'd into the Veins it is  
in danger of producing Convulsions. — Our views are en-  
larg'd by considering  $\dot{y}$ . blood vessels as valvular  
for we see more distinctly,  $\dot{y}$ . benefit in health and in disease  
arising from friction & Exercise, whilst we consider the  
Branches of the art veins to perform  $\dot{y}$ . office this was be-  
vident. But from  $\dot{y}$ . number of Valves we accelerate in a  
remarkable degree  $\dot{y}$ . flow of the Lymph &  $\dot{y}$ . will lead to  
 $\dot{y}$ . use of this in a variety of diseases, as in the Dropsy: we  
are very apt to err in recommending rest & a horizontal  
posture w<sup>th</sup> less care  $\dot{y}$ . swelling of  $\dot{y}$ . feet, because  $\dot{y}$ . erect  
posture increases  $\dot{y}$ . exhalation and makes  $\dot{y}$ . return  
more diff. But exercise & friction are of particular use

We must perceive from know. of division of Lactials  
 in glands of reason why sometimes after breaking of  
 Bubo or Scrophulous tumour, there is a conside. discharge  
 of watery matter Physicians are apt to consider it as owing  
 to a laxity of ruptur'd vessels but from understand. of cause  
 it is chiefly owing to flow of Lymph into gland w.  
 in these Cases does not readily enter vasa efferentia  
 Next we have found of Lymph. & Lactial vessels very  
 when Anatomise, small branches continually receive  
 an addition from neighbouring; & whilst many pass  
 thro' gland others pass upon the surface & therefore an  
 obstruction may happen in first Lymphatic glands  
 w. a poisonous matter touches upon but altho' same poi-  
 son be convey'd further glands nearer heart are not  
 affected: Thus with ref. to the Bubo a consug. of Lues Ven.  
 in the groin I have often observed formation of a similit.  
 bubo within body, & yet I have not met with a single  
 Dow tumor of it, or reason but to have heard of one, it is  
 prevented not merely from warmth of part, but espe-  
 cially from poison being diluted by joining of the  
 Lymph. branches from inferior Extremities before the  
 poison reaches next glands. Keeping of same in  
 view we must learn reason why a Staphy. in a single  
 gland does not produce an edema in vessels from w.  
 it is originally deriv'd a number of vessels passing over  
 gland & carrying on absorb'd fluid towards heart  
 Next by attending to the Cause of swelling of these glands  
 we are in many instances directed in the Law, as by know.  
 Cause of venereal bubo it depends upon ven.  
 poison directly convey'd into gland, if we suppose that

Mercury acts topically applied, healing venereal  
 Ulcers more readily if a common Ointment, and if experience  
 may be proved easily made as supposing there is a venereal  
 Ulcer on y. outside of y. throat on both sides, we may dress y.  
 one w<sup>th</sup> mercurial Oint. applying any common dressing to y.  
 other, we endeavour to direct the mercury into the gland  
 by applying it as near as possible into the part receiving  
 the contagion. We must learn y. state of hard Tumors, we  
 judge whether asbestos has degenerated into a Cancer  
 & concerning this there are numberless mistakes daily com-  
 mitted; as in the case we have from Hark & Van Swieten  
 under y. name of Schismus, w<sup>ch</sup> were cured by licuta, more  
 y. one half of an ankerone, so y. if any of such could be  
 made it is still more powerful y. is imagined: But I must  
 y. to show y. inattention & want of due explan<sup>n</sup> of y. appear-  
 ances of swellings in y. longitate glands. If a woman  
 has a hard Lump in y. breast, & upon y. same side we  
 perceive one of the Axillary glands swelled, we may conclude  
 certainly y. y. Tumor has begun to change into a Cancer  
 & y. matter is already form<sup>d</sup> within it so if an Operation  
 is to be done y. Surg<sup>n</sup> ought to take out y. Tumor in the  
 Axilla, otherwise y. will contaminate the blood, not y. the  
 taking it off will entirely prevent this, for a part may  
 have pass<sup>d</sup> or into y. blood; but if we leave y. gland the  
 Insulation of y. mass is certain, & y. disappearing of y.  
 Tumor is occasion<sup>d</sup> by its being no longer fed & emptied y.  
 Cancerous matter into y. mass of blood, Another way of  
 judging where y. glands are not swelled is from ab-  
 sence of some degree of Oedema, I have seen instances when we  
 rub with the finger detecting with any swelling of y. Axillary  
 glands, & yet they were affected but it was concealed by

The Oedema w. ch. had found. Sometimes this is w. (288.)  
Send to the breast only, but in other Cases y. whole Arm is  
affected, these glands being also swell'd into w. y. Lymph  
from y. Arm terminates & in such Cases if y. Skin is open'd  
into y. Axilla y. glands will be found swell'd, next by att-  
ending to y. manner in w. ch. y. glands are affected, we in  
some measure learn to prevent diseas'd matter from aff-  
ecting y. Constitution if you attend to y. description given  
of y. Rubor y. occur in the plague you'll find y. the happen  
in these places y. are expos'd to the Air, so I presume y.  
y. pustulent bubbles indicate y. y. matter is only entering y.  
body & therefore y. best means of preventing the disease  
will be to extirpate y. bubbles as soon as it appears, & per-  
haps from y. we may draw another inference y. we may pre-  
vent y. entrance of y. plague in a certain degree by  
properly covering y. whole body excepting only what is  
necessary for respiration: they occur more freq. about the  
parotid glands, or rather y. Lymph. over y. parotid &  
maxillary glands & more frequently in y. Axillary g. &  
y. in the Inguinal. the hands being more expos'd y. y. feet  
We are apt to entertain wrong notions of disease, thus  
it is y. Opinion of sev. eminent Physicians y. y. scroph-  
ula is a disease proper to y. Lymph. Glands Ruboritis  
far from being a just notion because when I come to the  
diseases of y. bones, I shall shew Instances of Spina  
Ventosa, or Scrophulous Caries of y. bones, y. disease  
first beginning there & only afterwards occasioning the  
swelling's in y. Lymph. glands, & therefore y. Scrophula  
is to be considered as a disease of the System, more  
readily appearing in the Lymph. glands, from this office  
y. diseas'd matter being convey'd thro' these to the Heart

So some conceive *yt. y. Gonorrhoea & Lux Venerea* are two  
 distinct diseases, *yt. y. Chancre* is produced by a diff. cause  
 from *yt. w. ch.* produces Gonorrhoea, but it is easy to shew *yt. y. y.*  
 are nearly *yt. y. y.* same, Bubo's are *yt. y. y.* produced in the same manner  
 by both. From considering *yt. y. y.* matter enters *yt. y. y.* body & affects  
 these glands I have hinted at *yt. y. y.* inefficiency of extirpating  
 a fistulous Bubo I perhaps likewise saw from a farrow  
 as suppose *yt. y. y.* a Surgeon in extirpating a Chancre wounds his  
 finger *yt. y. y.* matter gets in & causes a swelling in *yt. y. y.* Axillary  
 glands he ought to extirpate *yt. y. y.* gland at *yt. y. y.* same time  
 destroying *yt. y. y.* wounded part by cauterizing or Caustic. He sees  
 an evident danger that attends *yt. y. y.* disease whether *yt. y. y.* disease  
 forms in *yt. y. y.* outer parts suppose in *yt. y. y.* Lungs System or in  
*yt. y. y.* pulmonary, for all abroad matter passes to *yt. y. y.* right side  
 of *yt. y. y.* heart suppose from the hand or lower Extremities &  
 it immediately enters *yt. y. y.* pulmonary System, so it may im-  
 mediately receive the Taint. Where *yt. y. y.* disease originally begins in  
 the Lungs *yt. y. y.* abroad matter passes thro' *yt. y. y.* Bronchial  
 Glands, & im- returns to them, so passes in a circle, *yt. y. y.*  
 danger with more difficulty get rid of *yt. y. y.* taint, & from compare  
 the Course of *yt. y. y.* Lymph. veins vessels in *yt. y. y.* Lungs and  
 pulmonary System, we perceive an advantage attending  
 insensibility for the small part, when *yt. y. y.* disease is rec-  
 from *yt. y. y.* Lungs it is partic. drawn into *yt. y. y.* Cells of *yt. y. y.* Bronchial  
 & is in danger of irritating these, for the poison of diseases  
 affects *yt. y. y.* part of the System, w. it touches more *yt. y. y.* rest  
 thro' *yt. y. y.* poison abroad passes into *yt. y. y.* Bronchial glands  
 w. is in danger of producing Inflammation & Obstructions  
 there. Whereas if we inoculate *yt. y. y.* infection does not immedi-  
 fall upon Capere *yt. y. y.* air of the utmost importance to life

in its concentrated state it is diluted with y. blood  
 profuse to the skin and suppurates, & from y. same cause  
 condition I have been led to propose y. inoculation for the  
 Malaria when y. affection of the Lungs is a brachygonia  
 sine signis; w. might be attended with similar advantage  
 w. not so readily irritate the Lungs; & since y. some  
 Dr. Hume has made some experiments with reg. to this  
 But as yet we can draw no certain Conclusion from

D  
 Section 19<sup>th</sup>

Of y. Temporal Artery is composed of y. Circulation  
 interrupted, it is carried on by y. frontal or occipital of  
 the same side, or y. temporal of y. opposite, It is of consequence  
 to attend to these Dissections for if an Artery is wounded  
 in the head it is sometimes not sufficient to make a  
 Ligature or compression on y. side next y. heart: and we  
 see the benefit of opening any of y. Branches in case of  
 an affection in the neighbouring Part when y. ocular Artery  
 is affected we obtain great relief from drawing blood from y.  
 Temporal & by lessening y. momentum of y. blood in a pt.  
 w. there is no near a Communication. Next we find  
 numerous nerves supplying y. tegum. & these of very con-  
 siderable Size; & as y. wounding a Nerve in other places is  
 attended w. y. most dangerous symptoms, y. same may  
 happen from wounds of y. Subcutaneous nerve of y. head  
 when y. Skin happens to be lacerated; & from an extremely  
 slight wound I have seen instances of a lock'd Jaw and  
 swellings resembling Dysipelas; and in such Cases y.  
 patient may be much relieved by dilating y. wound and  
 thereby dividing y. nerve w. we suppose wounded in fact

or lacinated or branched: And we wd. avoid the larger (286) the  
 Branches of y. nerves in letting blood. The frontal Artery is  
 small w. y. stroke of it are not to be distinguished, & it is  
 accompanied with a very large nerve we wd. therefore avoid it,  
 for y. same reason, its being accompanied w. a nerve of great  
 size we wd. avoid y. Occipital Artery & it is difficult to find  
 it from y. thickness of y. teguments, w. the presents the  
 Artery from being readily compressed & we cannot with y. finger  
 distinguish y. stroke, even when it is large. y. The branches of  
 of the Temporal from w. we let blood; whenever we find the  
 stroke of this distinct we may venture to open it, because  
 if a gentle pressure is not sufficient we may venture to apply  
 a greater but it will be suff. to draw the blood from the  
 anterior branch tho' it is no larger because we distinguish  
 it easier from the thickness of the teguments & there is no  
 consid. nerve near it.

Lecture 50.

Considering y. Appearance of y. Internal Carotid & Verte-  
 bral we must be sensible y. a greater y. y. common pro-  
 portion of blood is circulated here than comparing the  
 Brain & Cerebellum w. the y. them, upon w. we find only  
 we find y. Arillary Artery & sent, each of y. Internal  
 Carotids are nearly as large & the two Vertebrals join'd  
 together are larger. Haller compares y. Carotid & Verteb.  
 with the Trunk of y. Aorta, instead of comparing it with  
 similar branches, if we are to suppose y. y. quantity is to  
 be judgd of nearly 1/10. or 1/12. of y. which is circulated upon  
 the Surface of y. Brain & Cerebellum but we are oblig'd  
 to make a deduction, from this proportion because y. force  
 of y. blood within y. head is broke by a number of circum-  
 stances, y. momentum in singular manner is diminish'd

1. we must make allowance for  $\frac{1}{2}$  blood rising 237 the  
 contrary to its weight, & this has greater effect  $\frac{1}{2}$  is commonly  
 imagined. In a person disposed to the Dropsy, it generally appears  
 first in the feet, from the descent of  $\frac{1}{2}$  blood & exhalation  
 is greater as well as  $\frac{1}{2}$  absorption more difficult; & a  
 change of posture in Inflammatory Cases is sometimes  
 attended with particular Advantage, so in Rheumatism  
 a person will find pain in his Limbs when he only sits  
 up in Bed; and in an inflam<sup>n</sup> of  $\frac{1}{2}$  Testicles a horizontal  
 posture is of  $\frac{1}{2}$  greatest consequence, & in general wounds  
 of  $\frac{1}{2}$  lower extremities are more disposed to inflame  $\frac{1}{2}$   
 than in the other parts of  $\frac{1}{2}$  body, and if w<sup>th</sup> regard to the  
 Brain itself if a person from a languid Circulation  
 is disposed to faint we will prevent by raising his body  
 horizontally; or if we sleep with  $\frac{1}{2}$  head low we find  
 unusual drowziness: & Dr. Sydenham recommends  $\frac{1}{2}$  to  
 taking patients labouring under Phrenitis out of Bed  
 & shewing  $\frac{1}{2}$  body is not only more cool, but we must at-  
 tend something to the change of posture, & in Apoplexy  
 $\frac{1}{2}$  patient is relieved by raising the head to above than  
 common height with pillows, further when we attend to  $\frac{1}{2}$   
 coats of  $\frac{1}{2}$  Int<sup>er</sup>. They are very thin within  $\frac{1}{2}$  head, & even  
 without  $\frac{1}{2}$  head they are thinner in  $\frac{1}{2}$  extremities, & more  
 so in  $\frac{1}{2}$  superior extrem<sup>s</sup>.  $\frac{1}{2}$   $\frac{1}{2}$  lower tho' both equally affected de-  
 ly  $\frac{1}{2}$  action of  $\frac{1}{2}$  muscles, &  $\frac{1}{2}$  momentum is greatly diminished  
 raised by the ascent of  $\frac{1}{2}$  blood; & it is lessened also by  
 the thinness of  $\frac{1}{2}$  Coats, for  $\frac{1}{2}$  living power of  $\frac{1}{2}$  Arteries  
 contribute to carry on the circulation: When we pursue  $\frac{1}{2}$   
 Arteries further we perceive  $\frac{1}{2}$   $\frac{1}{2}$  branches bear a  $\frac{1}{2}$  proport<sup>n</sup>.  
 to the Trunks, we can't make an exact comparison w<sup>th</sup>  $\frac{1}{2}$   
 the Arteries, but we can readily perceive  $\frac{1}{2}$  they are

sumous, & of surface of y<sup>e</sup> pia mater is vastly increased (238) the  
by the doublings in y<sup>e</sup> Convolutions of y<sup>e</sup> Brain & cerebellum  
But notwithstanding these v<sup>e</sup>l. Circumstances of diminished  
y<sup>e</sup> force of y<sup>e</sup> blood we are by no means to conceive, as v<sup>e</sup>l. eyes  
of late have done, y<sup>e</sup> v<sup>e</sup>l. Ducts of y<sup>e</sup> Brain want pulsat<sup>n</sup>.  
y<sup>e</sup> y<sup>e</sup> blood moves in them nearly in y<sup>e</sup> same manner  
as it moves thro' immovable Tubes, therefore they  
give us by no means conclusive, as y<sup>e</sup> y<sup>e</sup> Cardiac Duct.  
proves thro' a hole in the Cranium, that its sides  
glide to the hole. I grant that y<sup>e</sup> Coats have no motion  
in the Oesophagus but it does not prevent y<sup>e</sup> impulse  
of y<sup>e</sup> Heart, for y<sup>e</sup> pulsation remains in an artery  
after you have cut it in the middle, & joined the ends by  
a Tube, now if you can suppose y<sup>e</sup> all y<sup>e</sup> veins y<sup>e</sup> cut out  
the blood an accurately ty'd up after y<sup>e</sup> Artery is full  
stretched, it can't be emptied. But supposing y<sup>e</sup> Artery  
and vein run parallel y<sup>e</sup> heart gives a stroke, this is  
attended, & pushing upon the Brain pushes y<sup>e</sup> blood down  
to the heart, & now y<sup>e</sup> Coats contracting push y<sup>e</sup> blood  
forward & forward into the Brain so y<sup>e</sup> blood moves in  
the same manner in y<sup>e</sup> inner part of y<sup>e</sup> head as in the rest  
of the body by y<sup>e</sup> alternate dilatation & contraction of  
the Arteries. We next have seen y<sup>e</sup> obstruction in any ad-  
vanc'd part is guarded against by y<sup>e</sup> unusual joining into  
and Anatomies of y<sup>e</sup> principal trunks. The 2. Vertebral and  
into into y<sup>e</sup> Basilian Ar. so y<sup>e</sup> alicul. is found around  
& Vella Turcica, & therefore from accid. or disease, as per-  
haps y<sup>e</sup> motion of y<sup>e</sup> head & any of y<sup>e</sup> 4. principal Ar-  
teries are stopp'd, y<sup>e</sup> blood can pass to every minute

as we can empty  $\gamma$ . vessels of other parts Thus If I draw  $\gamma$ .  
a pound of blood from  $\gamma$ . Arm, I empty  $\gamma$ . vessels & lessen the  
Bulk of many parts of  $\gamma$ . Lim. the veins subside & become  
smaller, but this can't happen in the Brain w<sup>ch</sup> constantly  
contains nearly  $\gamma$ . same quantity of blood. From  $\gamma$ . danger  
arising from a stoppage of  $\gamma$ . blood within  $\gamma$ . head it has  
been imagin'd, if when  $\gamma$ . man is killed by hanging it must  
be owing to  $\gamma$ . stoppage of the blood within the head, But  
the blood continues to find its way, there may be a kind  
of stoppage & Oppression from  $\gamma$ . pressure upon  $\gamma$ . vessels  
but upon opening the Trachea Arteria of a Dog it was kept  
hanging  $\gamma$ . of an hour with. him, killed; but upon putting  
the Pipe upon the whole it was found irrecoverably dead  
after  $\gamma$ . minutes; so  $\gamma$ . Death is chiefly ow. to  $\gamma$ . asphyxiation

### Lecture 51.

We shall take a view of  $\gamma$ . first pair of nerves with the  
corresponding Arteries; & then of the Nerves & blood vessels  
w<sup>ch</sup> supply the Eye. — The Arteries of  $\gamma$ . Eye are not from  
 $\gamma$ . external Carotid according to Winslow; but  $\gamma$ . muscles &  
Coats are supply'd by  $\gamma$ . internal & Winslow committes w<sup>ch</sup>.  
mistakes here, the principal Arteries go in at  $\gamma$ . middle of  $\gamma$ .  
muscles of  $\gamma$ . Eye, as in  $\gamma$ . Case in other parts of  $\gamma$ . body,  $\gamma$ .  
reason we shall shew hereafter. The nose too receives blood from  
 $\gamma$ . internal Carotids, Inhund<sup>d</sup> you see several Branches of  
Arteries going into  $\gamma$ . Glands Dr. Haller w<sup>ch</sup>. perswade  
us  $\gamma$ . the part over  $\gamma$ . gland but he was led into  $\gamma$ . mistake  
from  $\gamma$ . opinion  $\gamma$ .  $\gamma$ . glands have little sensibility, and  
we shall have occasion to shew many others terminating  
in Glands.

Act. 52<sup>nd</sup>

241

The front part of y<sup>e</sup> Eye is rounder y<sup>e</sup> the rest, or y<sup>e</sup> Cornea is a portion of a smaller Circle above y<sup>e</sup> formed by the Tunica Sclerotica, which makes a portion of a larger Circle, & y<sup>e</sup> Optic Nerve enters y<sup>e</sup> Eye towards one side, namely y<sup>e</sup> inner side, the Lens is flatter upon the fore y<sup>e</sup> the Back part, and the Dilatory Muscles are connected to the Edge of y<sup>e</sup> Crystalline Lens &c. as I shew you in this horizontal Section of y<sup>e</sup> Eye w<sup>ch</sup> I am draw<sup>n</sup> w<sup>th</sup> Chalk upon a Black Board. It will be seen y<sup>e</sup> it is not w<sup>th</sup> y<sup>e</sup> bottom of an Eye be made more sensible y<sup>e</sup> y<sup>e</sup> rest of y<sup>e</sup> Body in order to perceive y<sup>e</sup> impression of Light, but it is also necessary y<sup>e</sup> Light be collected, or y<sup>e</sup> rays of the Sun are collected w<sup>th</sup> a burning glass, by w<sup>ch</sup> means y<sup>e</sup> rays make a sharper white upon y<sup>e</sup> Putina. The humours of y<sup>e</sup> Eye are perfectly fit for defending y<sup>e</sup> sensible bottom & for collecting y<sup>e</sup> rays, By their pellucidity y<sup>e</sup> allows them to pass thro, by their softness they defend y<sup>e</sup> parts & by their shape they collect y<sup>e</sup> rays w<sup>ch</sup> I am a picture of y<sup>e</sup> Object at y<sup>e</sup> bottom of y<sup>e</sup> Eye, just as y<sup>e</sup> burning glass we see upon the Floor an Image of y<sup>e</sup> window in this Room. — Of y<sup>e</sup> humour y<sup>e</sup> Crystalline is y<sup>e</sup> principal, for with it when out of the body, I can form a picture as I do with a Burning glass so y<sup>e</sup> it is calculated to collect y<sup>e</sup> rays upon y<sup>e</sup> bottom of the Eye & it can do y<sup>e</sup> independant of assistance from y<sup>e</sup> other parts tho' they cooperate. You will collect y<sup>e</sup> structure of y<sup>e</sup> Lens y<sup>e</sup> it is a firm substance inclin<sup>d</sup> in a Capsule & which gradually grows softer towards the Paper. This leads to the opinion y<sup>e</sup> a fluid is interpos<sup>d</sup> between y<sup>e</sup> Capsule & Lens. But when we examine a recent Subject there is only a solid, and y<sup>e</sup> reason of y<sup>e</sup> softness is y<sup>e</sup> in all such

substances of rays are collected in an unequal manner  
of edges drawing on to a point sooner of middle; hence  
there is no perfect focus made by Ret, but here in converg:  
of rays softness of light is less gathered at edges, so all  
of rays unite at bottom of Eye. There are vessels of con-  
siderable size of are seen upon Capsule in Child, & after  
afterwards exclude of and globules but continue to circulate  
of other parts of the blood, this seems to prevent of tender  
Eye of Child from being injured by of light & there is a  
want of clearness in their Vision. & this Circul<sup>n</sup> seems to  
show of of Capsule is provided w<sup>th</sup> Vessels so of inest.  
Cover of membrane may be thickened by Inflamm<sup>n</sup>. & be a  
Cause of Opacity, so of altho' in of Cataract of Opacity  
is chiefly seated in of body of of lens, it may be confin<sup>d</sup>  
to the Capsule; or after of body of of lens has been ex-  
tracted it sometimes becomes opaque, from of wound &  
admission of of Air becoming thicker and darker.

The Vitreous Humour is plac<sup>d</sup> betw<sup>n</sup> of Lens & bottom of of  
Eye it appears like of glass of an Egg, but we have reason  
to believe of it is confin<sup>d</sup> in a Capsule, tho' it is not so  
wid<sup>th</sup> its principal use is to support of Lens at of proper  
distance from of bottom of of Eye as on a cushion, & by it  
being thinner of of lens it also assists in collecting of  
Rays, & if it had not interpos<sup>d</sup> of picture w<sup>d</sup> have form<sup>d</sup>  
behind of Retina. The aqueous humour is plac<sup>d</sup> betw<sup>n</sup>  
of lens and Cornea in w<sup>ch</sup> of Iris is plac<sup>d</sup>, so of it is  
partly lodg<sup>d</sup> on of outside, & partly on the other side of of  
Iris, a substance what are call<sup>d</sup> of anterior & posterior  
Chambers of anterior is larger, on an uncertain whence it  
is deriv<sup>d</sup>, whether from of Cornea or Iris, but I suspect  
of it is from of latter, as of vessels I find upon of Iris seem

243.  
better fitted for providing their business, w<sup>ch</sup> is regenerated  
in the space of 24 hours; & I have seen an Injection w<sup>ch</sup> is  
rising from y<sup>e</sup> Iris this y<sup>e</sup> aqueous humour probably imitating  
y<sup>e</sup> natural Secretion. The aqueous humour allows y<sup>e</sup> motion of  
y<sup>e</sup> Curtain of y<sup>e</sup> Iris to regulate y<sup>e</sup> Light pass<sup>ing</sup>. This y<sup>e</sup> Eye-  
wider y<sup>e</sup> Crystalline is much better remov<sup>ed</sup> from danger as  
from Blow &c. a slight rub might have disorder<sup>d</sup> y<sup>e</sup> d<sup>ist</sup> &  
its vessel & Cap<sup>it</sup>le, & there is reason to imagin<sup>e</sup> y<sup>e</sup> it helps  
to keep the Cornea transparent for it is naturally interpos<sup>d</sup>  
between y<sup>e</sup> Layer & Paper this there; & after death the Crystalline  
its shape this humour exuding this y<sup>e</sup> Cornea. With ref<sup>er</sup> to the  
v<sup>er</sup> Coat beginning w<sup>ch</sup> y<sup>e</sup> innermost, The Retina is y<sup>e</sup> last  
of y<sup>e</sup> Optic Nerve & there takes their rise from y<sup>e</sup> Thalami  
Nervum opticum, from a certain Tubercle from y<sup>e</sup> bottom of  
y<sup>e</sup> lateral Ventricle & y<sup>e</sup> side of y<sup>e</sup> 3<sup>d</sup> Ventricle, & hence we  
understand, why in y<sup>e</sup> internal Hydrocephalus, y<sup>e</sup> Eye comes  
to be affected; there y<sup>e</sup> Thalami are squeezed on Two sides above  
by y<sup>e</sup> water in y<sup>e</sup> lateral Ventricle & within by y<sup>e</sup> in y<sup>e</sup> 3<sup>d</sup>  
y<sup>e</sup> Ventricle all communicating, w<sup>ch</sup> y<sup>e</sup> affection of y<sup>e</sup> Eye  
points out y<sup>e</sup> collection within y<sup>e</sup> head, when we trace these  
nerves from y<sup>e</sup> Thalami we find y<sup>e</sup> they are united Hall<sup>s</sup>. & then  
conceive y<sup>e</sup> y<sup>e</sup> Nerve is made by a cellular Substance, but  
we can in y<sup>e</sup> way give no ration<sup>al</sup> acc<sup>ount</sup> of y<sup>e</sup> Union, & I was led  
to consider y<sup>e</sup> matter more partic<sup>ular</sup>ly. I find y<sup>e</sup> there is a real  
Intermixture & Dissipation of Fibres in y<sup>e</sup> right Optic Nerve  
for instance is found from both y<sup>e</sup> Thalami & nearly equally  
and we see the Advantage of y<sup>e</sup> y<sup>e</sup> it is better that y<sup>e</sup> half of y<sup>e</sup>  
Sensibility of both sh<sup>ould</sup> be provided y<sup>e</sup> y<sup>e</sup> y<sup>e</sup> sensibility of one  
sh<sup>ould</sup> be lost altogether. We derive many advantages from 2  
Eyes, & from y<sup>e</sup> uniform motion we judge better of distances &  
accidents are better guarded ag<sup>ainst</sup> sup<sup>posed</sup> a disease in y<sup>e</sup> right  
Eye, y<sup>e</sup> half of the Sensibility in both may remain & sup<sup>posing</sup>

a blow given to the left afterwards we still retain an  
much sight as is necessary in the common office of life, so  
we must admit of a mixture of  $\gamma^d$  optic nerves where they  
adhere. — We next follow the nerve into the Eye, we find it  
is crook'd a little between  $\gamma^d$  foramen Opticum & Ball of  $\gamma^d$ .  
Eye, to allow  $\gamma^d$  free motion by the Ciliary muscles, we then find  
it enter thro' not directly optically into the pupil, but at the  
Innervide, now what reason do we assign for this? An Expt.  
shew  $\gamma^d$  use of this in the clearest manner, it was made  
in the last Century by Hauette. if you bring  $\gamma^d$  picture  
to fall upon  $\gamma^d$  entrance of  $\gamma^d$  optic nerve you see  $\gamma^d$  Object  
at the other side if what one Eye look at  $\gamma^d$  piece of Chalk  
before me; & I see it from  $\gamma^d$  Image falling on  $\gamma^d$  outside  
but turning my Eye so far I have lost  $\gamma^d$  Chalk: I might  
suppose  $\gamma^d$  was owing to the Obliquity, but following it  
a little further I again wait & making  $\gamma^d$  Experiment  
w<sup>th</sup> accuracy I find  $\gamma^d$  we see the object when diameter  
is equal to  $\frac{1}{19}$  of  $\gamma^d$  distance so 9. feet distant from  $\gamma^d$   
Eye you will see a circle one foot in Diameter. It is matter  
to attend to this, because many have imagin'd  $\gamma^d$  sensibilit  
ity to be owing to the small Artery entering w<sup>th</sup> the nerve, but  
I find on making a calcul<sup>n</sup>  $\gamma^d$  whole medullary Substance  
a entrance of  $\gamma^d$  nerve is insensible,  $\gamma^d$  nerve not being spread  
into parts fine enough to receive  $\gamma^d$  impress<sup>n</sup> or where a  
nerve is spread upon  $\gamma^d$  Tongue or nose,  $\gamma^d$  nerve is not fitted  
to receive the Impression. The nerve enters toward  $\gamma^d$  innervide  
& we find from attend<sup>n</sup> to  $\gamma^d$  length,  $\gamma^d$  Eye looks w<sup>th</sup>  $\gamma^d$  Object  
 $\gamma^d$  entrance is somewhat more  $\gamma^d$   $\frac{1}{16}$  of an Inch,  $\gamma^d$  is  
the place where  $\gamma^d$  optic nerve enters, the reason at its entrance  
at the innervide is evident, if  $\gamma^d$  nerve had enter'd at the  
outervide, picture of a single object, w<sup>o</sup> have form'd at the

at y<sup>e</sup> same instant in both Eyes, but the Rays fall  
upon y<sup>e</sup> outerside of the left when on the innerside of the right.  
we find y<sup>e</sup> same forming y<sup>e</sup> Retina, w<sup>ch</sup> is the expansion of y<sup>e</sup>  
medullary substance, y<sup>e</sup> same is improper, for it is an uni-  
form membrane & no Network w<sup>ch</sup> wd. have bet parts of y<sup>e</sup>  
object's, it is proper nothing more y<sup>e</sup> a Web extendd uniformly  
upon y<sup>e</sup> innerside covering y<sup>e</sup> vitreous humor. Dr. Haller and  
some of y<sup>e</sup> French Doctors describe it as going to y<sup>e</sup> edge of  
the Crystalline Lens & some of y<sup>e</sup> Titius passing over it  
But it is unnecessary y<sup>e</sup> they sh<sup>d</sup>. extend over y<sup>e</sup> lens it wd.  
have disturb'd y<sup>e</sup> vision upon y<sup>e</sup> posterior part & I find y<sup>e</sup> it  
terminates like y<sup>e</sup> edge of a Tacep behind y<sup>e</sup> lens, & y<sup>e</sup> same  
acct is given of it by Dr. Linn to whom I refer you for an  
accurate figure of the Eye, there may be some fibres perhaps  
going forwards to the Crystalline Lens, it may receive a  
new one fibre from y<sup>e</sup> Retina, tho' it seems to receive it rather  
along w<sup>th</sup> y<sup>e</sup> vessels. It is cover'd by the Choroid Coat  
y<sup>e</sup> innerside of w<sup>ch</sup> is enervat'd with a black paint form  
y<sup>e</sup> appearance of a Membrane, that serves y<sup>e</sup> very opposite  
purpose of quicksilen on y<sup>e</sup> back of a Mirror, it prevents  
y<sup>e</sup> reflection of y<sup>e</sup> Light, w<sup>ch</sup> being thrown back again  
so as to make a 2<sup>d</sup>. impression, it suffocates y<sup>e</sup> rays.  
From y<sup>e</sup> Experiment y<sup>e</sup> y<sup>e</sup> Optic Nerve on y<sup>e</sup> entrance of it  
is invisible, Maistie & others concluded y<sup>e</sup> y<sup>e</sup> Coat was  
y<sup>e</sup> Organ on w<sup>ch</sup> y<sup>e</sup> picture made its impression. But we  
also y<sup>e</sup> blindness is occasion'd by a Disease of the Chalami-  
ous. stitue. by pressure upon them; or what is y<sup>e</sup> use of the  
Retina, why we find a web is it only a sort of Cover to the  
Choroid? Next pursuing y<sup>e</sup> Choroid as a Web of fine Sub. as  
we find it makes a turn, & is connect'd to y<sup>e</sup> Cryst. lens  
by w<sup>ch</sup> has been nam'd Ciliary Processes, w<sup>ch</sup> are only termin.

But it separates them and serves to support  $\gamma^2$  Chryst  
Lene in its place, w<sup>ch</sup> rests upon  $\gamma^2$  vitreous humour as  
upon a Cushion, & is supported at  $\gamma^2$  edges by  $\gamma^2$  Continuat.  
of  $\gamma^2$  Chryst Coat.

of this Coat contracted into a narrower Circle just as  
The Glass of a Shurt is found into a N<sup>o</sup>. of doubling at the  
Orbit, so there is no space for Light to pass but the Light  
pursues and is done, as is supposed by some, & other say  
if there was y<sup>e</sup>. aqueous humor w<sup>o</sup>. mix w<sup>th</sup>. y<sup>e</sup>. vitreous, this  
Opinion has led to very wrong Ideas of y<sup>e</sup>. parts affected in  
diseases of y<sup>e</sup>. Eye, all the rays of Light y<sup>e</sup>. Strike y<sup>e</sup>. Retina  
have before y<sup>e</sup>. part of y<sup>e</sup>. Chrysolite, & if a Cataract is  
incommodious opaque from y<sup>e</sup>. want of sensibility to Light  
we are not immediately to infer y<sup>e</sup>. y<sup>e</sup>. Retina is in a diseas<sup>d</sup>  
State unless we find other circumstances y<sup>e</sup>. may lead us to  
suspect this — Let us next consider y<sup>e</sup>. Iris y<sup>e</sup>. has been dis-  
cuss<sup>d</sup> before Tim<sup>o</sup>. as y<sup>e</sup>. Contin<sup>o</sup>. of y<sup>e</sup>. Choroid Coat on y<sup>e</sup>. of  
it being supposed to form y<sup>e</sup>. Ciliary process, & y<sup>e</sup>. other  
y<sup>e</sup>. Iris but in she now y<sup>e</sup>. y<sup>e</sup>. Iris is to tally distinct  
from y<sup>e</sup>. Choroid, & is nearly connect<sup>d</sup> to it by y<sup>e</sup>. Ciliary  
Circle, as they are join<sup>d</sup> by a Coll. Subst<sup>o</sup>. w<sup>ch</sup>. also connect<sup>s</sup>  
y<sup>e</sup>. Iris to y<sup>e</sup>. Sclerotic Coat, & y<sup>e</sup>. y<sup>e</sup>. watery humor is present  
by y<sup>e</sup>. Ciliary process Circle from entering betw<sup>o</sup>. the  
Sclerotic Coat & y<sup>e</sup>. Choroid, & thus makes a white opaque  
sub<sup>o</sup>. forming a Ciliary Membr<sup>e</sup>. at y<sup>e</sup>. root of the Iris  
The Iris has an Arteries in y<sup>e</sup>. middle w<sup>ch</sup>. are call<sup>d</sup> y<sup>e</sup>. pupil of  
the Eye. When we follow y<sup>e</sup>. vessels of y<sup>e</sup>. Iris in an injected  
prepar<sup>o</sup>. there are chiefly deriv<sup>d</sup> from y<sup>e</sup>. Choroid Coat, & we  
find none entering in connect<sup>o</sup>. N<sup>o</sup>. near y<sup>e</sup>. root of y<sup>e</sup>. Iris  
there is a circular Arter<sup>o</sup>. or at its root all y<sup>e</sup>. vessels communicate  
we then trace em to y<sup>e</sup>. edge of y<sup>e</sup>. Iris, & follow them all y<sup>e</sup>. course  
w<sup>th</sup>. y<sup>e</sup>. naked Eye, & yet Haller & others in a vein of red blood  
enters y<sup>e</sup>. Iris, & y<sup>e</sup>. its vessels convey estate<sup>d</sup> humor only; but  
besides y<sup>e</sup>. evidence from y<sup>e</sup>. appearance of the Vessels from  
accidents we know y<sup>e</sup>. the Iris circulates a consid<sup>o</sup>. quantity

Quantity of red blood, w<sup>ch</sup> I have seen mix'd with the (247)  
Aqueous humor, this in a Case I met w<sup>th</sup>. Some time ago a young  
patient attiring his head suddenly a cloud or film appear'd  
within y<sup>e</sup>. P<sup>er</sup>icornea, & upon holding his head steady the cloud  
went off. & upon examining y<sup>e</sup>. circumstances I found y<sup>e</sup>. it  
was owing to red blood mix'd w<sup>th</sup>. y<sup>e</sup>. aqueous hum<sup>or</sup>. When y<sup>e</sup>.  
head was held in our position y<sup>e</sup>. blood set to y<sup>e</sup>. bottom of  
humour, & y<sup>e</sup>. Iris is not connected where y<sup>e</sup>. Sclerotic Coat joins  
y<sup>e</sup>. P<sup>er</sup>icornea but behind y<sup>e</sup>. joining, & y<sup>e</sup>. it fell lower than y<sup>e</sup>.  
edge of y<sup>e</sup>. P<sup>er</sup>icornea and went entirely out of sight, And in  
attempting to extract y<sup>e</sup>. Crystalline lens, if y<sup>e</sup>. Iris is  
wounded red blood comes from it, & there is great redness &  
inflammation of y<sup>e</sup>. part, & we may be certain y<sup>e</sup>. there Diff<sup>er</sup>.  
convey y<sup>e</sup>. red blood in diff<sup>er</sup>, but y<sup>e</sup>. red color of y<sup>e</sup>. Vapels is  
conceal'd from us by y<sup>e</sup>. faint or colour w<sup>ch</sup> is laid over them  
& y<sup>e</sup>. Aqueous humor is probably excreted from y<sup>e</sup>. Vapels of y<sup>e</sup>.  
Iris. The principal use of y<sup>e</sup>. Coat is to exclude a superfluous  
quantity, & to allow as much as is usefull to reach y<sup>e</sup>. P<sup>er</sup>icornea,  
& hence when y<sup>e</sup>. is turn'd towards y<sup>e</sup>. light the pupil is small  
& when it is turn'd from y<sup>e</sup>. light it becomes larger, & adapt  
itself to y<sup>e</sup>. quant<sup>ty</sup> of light: But there is something more y<sup>e</sup>.  
happens, it is not merely affected by the gen<sup>er</sup>. quant<sup>ty</sup> of light  
but it is contracted or widened whenver Objects become indist-  
inct, by being plac'd too near the Eye thus turn<sup>ing</sup> y<sup>e</sup>. Eye  
downward y<sup>e</sup>. pupil gets a certain diameter, but if I next  
mean to examine y<sup>e</sup>. point of a small pin b<sup>u</sup>. near the Eye  
the Iris tho' not mov'd sollicitly by more light contracts a  
little more y<sup>e</sup>. before to see it distinctly, this was alleg'dly  
the late D<sup>r</sup>. White: and I have severall times made a small hole  
in a bit of paper & put a small printed book w<sup>ch</sup> appear'd  
confus'd, & viewing it thro' the hole it appear'd more distinct  
& y<sup>e</sup>. experiment enable us more readily to receive the

fact, is in distinguishing of motion of Iris in viewing near objects. — This circumstance respecting of pupil is of utmost consequence to attend to in judging of diseases, w<sup>ch</sup> the Eye is insensible to the Light there is a very small degree of motion in the Iris, & it is of no use whether the Eye be less sensibly impressed by Light being interrupted as in Catarrh or in both Cases of pupil becomes larger, some have supposed that of motion of Eye was owing to the Light striking the Iris & affecting it. But it evidently depends upon the manner in w<sup>ch</sup> the Iris is affected, for of pupil loses its motion nearly as much in Cataract as in the Gutta Serena. In the Eye sympathize, suppose one Eye is diseas'd & the other pupil is little affected by irritating it, yet upon opening the sound Eye of irritation upon one affects of pupil of other so of motion depends upon of affection of the Iris itself. But we wd. say farther of of circumstances of Eye adapting itself to the confusion of Objects shows an instinctive power w<sup>ch</sup> is more extensive of we are commonly aware of: we not merely contract of pupil & allow it to relax itself by its natural tone, as Dr. White supposed, but we possess a muscular structure not only of I can show by dissection I can't show a sphincter for contraction or fibres for dilatation, but we possess of power of contracting or dilating of Iris beyond its tone; the contraction is known by of common effect of Light, but when w<sup>ch</sup> the Iris is uncommonly insensible by disease, the pupil is widened, for beyond its natural tone, & in persons dying I have seen of pupil much larger of it was 5. minutes after death w<sup>ch</sup> bring it nearly to the same size as when the Eye is not turn'd to a very clear Light, nor in too great Obscurity. But in of Hydrocephalus or Anasarca it is

greatly dilated: I think when <sup>the</sup> patient was (254)  
was it by giving him Tract from deep. <sup>the</sup> pupil was  
was very much dilated: & when <sup>the</sup> stimulus was made by  
light by bringing a Candle near <sup>the</sup> Eye <sup>the</sup> pupil opened  
wide <sup>the</sup> colour of <sup>the</sup> Iris was scarcely to be distinguished  
White account for it from mechanical irritation, but when  
<sup>the</sup> patient is moved there is an effect made to vary <sup>the</sup> quantity  
of Light is not sufficient to make an impression, therefore  
an Instinct of Nature there is an effort to enlarge <sup>the</sup> pupil  
immediately after death it contracts to a much smaller size  
in these circumstances. — I remain to consider the external  
Coat of <sup>the</sup> Cornea & Sclerotia which is intended for a defence; whilst  
whilst <sup>the</sup> Cornea serves <sup>the</sup> same purpose by its pellucidity  
it transmits & by its curvature it collects <sup>the</sup> Light, for  
Light is in a great measure collected before it reaches <sup>the</sup> lens  
it may be accurately regulated by a smaller motion, <sup>the</sup>  
Light is broken into a very small pencil of rays, & by  
a very small motion exactly regulated what is necessary.  
The Eye is supported in its place by <sup>the</sup> Tunica Membrana conjunctiva  
conjunctiva which is produced from <sup>the</sup> Epithelium double & we trace  
it over <sup>the</sup> Eye, when making a part of <sup>the</sup> outer Layer of the  
Cornea, tho' it is not separable by dissection, but it is said  
more loosely over <sup>the</sup> Sclerotic Coat, & many vessels run here  
it is subject to Inflammation. I have seen cover <sup>the</sup> whole Eye,  
and <sup>the</sup> whole Cornea covered with vessels, which is contrary to what  
Haller alleges is a very sensible substance, & we often find  
spots produced upon it; when these vessels are very deep there  
may be a dilatation of <sup>the</sup> natural vessels, but in <sup>the</sup> case of  
10. They are a new growth beginning in <sup>the</sup> Sclerotic Coat &  
gradually extending over <sup>the</sup> Cornea, as in <sup>the</sup> case of a loss of  
substance or wound; and we may have them with <sup>the</sup> Eye over  
Coat, & then arteries must <sup>the</sup> veins to return to the blood.

single thread; but if probability is of a N<sup>o</sup> of threads are (259)  
affected by every picture at the same time: we see therefore that there  
may be numerous nerves distributed to parts, tho' we are not able  
to trace them. — The 3<sup>d</sup> pair of nerves is called Oculi motor sup:  
plying many of the muscles of the Eye, we find likewise produced  
from it. Several small threads w<sup>ch</sup> join to supply the Iris. —

The next pair of N<sup>o</sup>s is singular in every Circumstance, in its Origin  
w<sup>ch</sup> is very distant from the eye & from its Origin of the 3<sup>d</sup> pair, it is  
in a nerve of the brain & of the Cerebellum. It terminates  
in a single muscle of the Trochlearis, some think it is a chief  
Instrument of the pup<sup>a</sup>. The passions of the Eye, so receive a thread  
undivided but obs. only is the distribution of the 3<sup>d</sup> pair we find a  
muscle cooperating supplied by a common root, & the 3<sup>d</sup> supplies  
the attollens & depressor oculi w<sup>ch</sup> are Antagonists, so I would  
leave it as a Circumstance of it we cannot explain; when nature  
is uniform the distribution is intended for some wise purpose  
but in the present instance it lies concealed.

The 5<sup>th</sup> is the largest Nerve of the Cranium, it is soon spread out into  
a considerable branch, w<sup>ch</sup> is divided into 3 branches, 1<sup>st</sup> & 2<sup>d</sup>  
send some branches into the nose, & other branches supply muscles  
so it serves both for motion, & likewise for sensation, & the third  
branch serves not only for sensation on the point of the Tongue  
but taking its course towards the point it supplies the muscles  
of the Organ, & branches are sent to the maxillary & subling-  
ual glands, to regulate the Secretion of the Saliva, now the entire  
Nerve, at the Mastoid and Ophthalmic, have a greater whiteness  
if we obs. in the other Nerves, yet in the 5<sup>th</sup> pair of branched sup-  
plying the nerves Senses have the same colour as those destined  
for motion and hence we conclude that all its offices are performed  
by the same medium; & we will be able to give a reason for the  
whiter Colour of the optic nerve, tho' intended for more distant  
parts are exposed to Injury & receive perhaps an addition of  
nervous influence from the coats of the cover the proper Nerve.

When we now look back to 4<sup>th</sup> origin of 5<sup>th</sup> first pair, we find 1<sup>st</sup>, 2<sup>nd</sup>, 3<sup>rd</sup> pair a nerve of the Brain, whereas 4<sup>th</sup> & 5<sup>th</sup> are almost entirely derived from 4<sup>th</sup>. Cerebellum, yet some of its offices are done by both, 4<sup>th</sup> & 5<sup>th</sup> are organs of Sense the 3<sup>rd</sup> of Motion, 4<sup>th</sup> of Motion, 5<sup>th</sup> of Sense, Motion, & of assisting in regulating 4<sup>th</sup> Secretions, so there is no reason for imagining 4<sup>th</sup> offices of 4<sup>th</sup> Brain Cerebellum are so very diff. as some Physiologists have imagin'd. — The 5<sup>th</sup> we have seen joining the 3<sup>rd</sup> forming a small ganglion, 4<sup>th</sup> only remain. I wd. make here is 4<sup>th</sup> we see ganglions in these parts w<sup>ch</sup> serve the most material purposes &c. — The 6<sup>th</sup> pair is spent upon the abductors muscles, for a reason, I do not pretend to understand; why 4<sup>th</sup> 3<sup>rd</sup> might not have furnished 4<sup>th</sup> Abductors as well as the other acts. — In its course we perceive a connexion made by two distinct threads w<sup>ch</sup> form the beginning of 4<sup>th</sup> Intercostal, for it is absurd, 4<sup>th</sup> disjunct w<sup>ch</sup> 4<sup>th</sup> course of an whether it is upwards or downwards, whether they come from from up to this nerve. If they come from 4<sup>th</sup> Intercostal we have no origin to that nerve: besides I constantly obs. 4<sup>th</sup> the 6<sup>th</sup> pair becomes smaller between 4<sup>th</sup> place & 4<sup>th</sup> Eye; so there w<sup>ch</sup> 4<sup>th</sup> Branches from 4<sup>th</sup> 5<sup>th</sup> pair are 4<sup>th</sup> highest origins of the Intercostal or Sympathetic Nerves. — The 7<sup>th</sup> is divided into 2. portions, one of w<sup>ch</sup> is without a covering because it is in no danger of being tore, & is call'd 4<sup>th</sup> portio mollis of 4<sup>th</sup> Auditory nerve; but 4<sup>th</sup> other branch running outwards receives 4<sup>th</sup> covering from 4<sup>th</sup> dura mater & is call'd 4<sup>th</sup> portio dura, & as we have found more 4<sup>th</sup> one Nerve supplying material Organs, 4<sup>th</sup> portio dura is join'd by a branch from 4<sup>th</sup> 2<sup>nd</sup> of 4<sup>th</sup> 5<sup>th</sup>. I find a nerve connecting it to 4<sup>th</sup> 3<sup>rd</sup> branch of the 5<sup>th</sup> & I have no doubt w<sup>ch</sup> 4<sup>th</sup> 4<sup>th</sup> to 4<sup>th</sup> Chorda tympani 4<sup>th</sup> they are from 4<sup>th</sup> portio dura & 4<sup>th</sup> 4<sup>th</sup> point of the Tongue is supplied by 4<sup>th</sup> 3<sup>rd</sup> in two places join'd to 4<sup>th</sup> 7<sup>th</sup>. So 4<sup>th</sup> can be taken if we may not want 4<sup>th</sup> Sensation from 4<sup>th</sup> Tongue. — Pursuing 4<sup>th</sup> portio dura we find a very great n<sup>o</sup>. of branches spent upon 4<sup>th</sup> side of 4<sup>th</sup> face we may venture to alledge 4<sup>th</sup> 4<sup>th</sup> n<sup>o</sup>. is greater here in proportion

than what is spent upon the other muscles because if other 254.  
 muscles of the face perform a double office, they not only serve for  
 motion of the lips but for expressing our passions & our sense  
 are large in proportion to the exercise of the motion of the Organ  
 in which they terminate: the pericardium is joined to other nerves,  
 but the branches instead of forming continued canals, we find  
 they pass each other, & when a muscle is supplied it receives  
 a thread from each of the nerves, so we find a great care  
 taken to prevent there from being their power than most of  
 the other muscles, because of the importance of their office, thus  
 if we can open & shut the mouth with half the natural force it is  
 better than we could open and shut it. — The next pair going  
 very far downwards is named per vagum, it supplies the Larynx  
 & is the function of the Organ an material to Life so every  
 precaution is taken to guard against accidents, so there is a  
 superior Ganglion & recurrent vent back in a very particular  
 manner; & in endeavouring to determine the final Cause, I find  
 the voice will not be lost by cutting one of the nerves, & recur-  
 rent, tho' the tone & the general strength of the voice is diminished  
 it is by no means lost. — The 9th pair like the 5th supplies  
 the muscles of the Organ of sense & likewise the external,  
 for from the surface of the Tongue there is a considerable quantity of mus-  
 cles. — All the last mentioned enter the medullary substance  
 of the Brain with the 4th of the Cerebellum, so are divided from both,  
 & these 9th branches we in vision went from the 8th pair to the heart  
 as by no means to be considered as belonging to the Cerebellum;  
 for I deny the vital functions are performed by the Influence  
 of the nerves of the Cerebellum, tho' we must admit the  
 Cerebellum to have its share in these functions. So far we  
 have remarked the nerves. — Next with respect to the Blood vessels  
 tracing there outwards from the heart, we have seen the Arch of the  
 Aorta send off 3 principal branches; the first branch supplies

As the Carotid Communis runs upwards parallel to  
 Trachea a very consid. way, it is very convenient for various Experi<sup>ts</sup>  
 that I have seen in it y<sup>e</sup> dilatation of Arteries in diff. Animals,  
 & I have seen a degree of y<sup>e</sup> living or contractile power, tho' that  
 was less evident y<sup>t</sup>. I expected after making every allowance;  
 we find too by tying y<sup>e</sup> Carotid in two places, y<sup>e</sup> a consid. deg<sup>ty</sup>  
 of the entire into y<sup>e</sup> composition of y<sup>e</sup> blood, & we obs<sup>rv</sup>. y<sup>t</sup> without  
 y<sup>e</sup> assistance of y<sup>e</sup> Arteries it coagulats; We find y<sup>e</sup> Carotid divides  
 into y<sup>e</sup> external & internal Carotides, & y<sup>e</sup> last such communicates  
 with the Vertebral v<sup>oy</sup>. There is little danger of a too large of  
 Blood in any part of the Brain or Cerebellum, & we have seen  
 numerous examples of the anastomosis between y<sup>e</sup> Inter. & Extern.  
 Arteries, & hence after tying y<sup>e</sup> Carotid Communis: I found y<sup>t</sup> not  
 only y<sup>e</sup> functions of y<sup>e</sup> Brain continued but also those of the  
 external parts, y<sup>e</sup> blood getting thro' y<sup>e</sup> Vertebral to y<sup>e</sup> Internal  
 Carotid, & from there into y<sup>e</sup> external, whilst another portion  
 arose from y<sup>e</sup> Subclavian artery by y<sup>e</sup> inferior Larynxia and  
 Thorical, & y<sup>e</sup> in a few minutes y<sup>e</sup> whole external branches of y<sup>e</sup>  
 Carotides came to be filled with it, & y<sup>e</sup> v<sup>oy</sup>. communications  
 soon became enlarg'd. Dr. Comart has published an acc<sup>t</sup>. of this  
 exper<sup>t</sup>. & when y<sup>e</sup> head seems to be oppress'd w<sup>th</sup> too great quant<sup>y</sup>  
 of Blood, w<sup>ch</sup> is frequently a cause of Apoplexy, perhaps also  
 of the Epilepsy, he proposes loosening y<sup>e</sup> quantity by tying on  
 of the Carotides. Now altho' from y<sup>e</sup> vicinity of y<sup>e</sup> nerves, of y<sup>e</sup>  
 Pain & Intercostal, y<sup>e</sup> experim<sup>t</sup>. is attended w<sup>th</sup> a consid. degree  
 of danger, in de<sup>sp</sup>. of y<sup>t</sup> from tying y<sup>e</sup> Artery, yet surely y<sup>e</sup> Idea  
 is worth pursuing in other Animals; so in y<sup>e</sup> Staggers or Epilepsy  
 in a Horse, we might try one of y<sup>e</sup> Carotides to see the effect.  
 Next attending to y<sup>e</sup> situation of y<sup>e</sup> Carotides w<sup>ch</sup> are just beneath  
 other, y<sup>e</sup> internal is sent off at an angle, & y<sup>e</sup> external is y<sup>e</sup> more  
 direct contin<sup>g</sup>. of y<sup>e</sup> Trunk, & y<sup>e</sup> Vertebral Arteries arise at a right  
 Angle of from y<sup>e</sup> Subclavian. We find y<sup>t</sup> both y<sup>e</sup> Arteries which

supply of. Encephalon come off in an unfavorable manner 256.

Quantity of blood is circulat. here. It is of use to attend to it.  
size in cut. Operation part. in Barototomy, when we  
must gen. cut this it. gland, & if it. is done it. blood getting  
into it. Trachea may cause a convulsive Cough, w. is attend.  
it. real danger, now considering it. Operat. we may reflect  
on it. way of gaining advantage in cut. Cases of Inflamm.  
& of avoiding it. danger of blood falling into the Lung.  
Lig. of it. we see a consid. Branch, the Lingual, pass  
above it. Cornua of it. Os hyoides. attending to it. size of  
join'd to its fellow it conveys a very large proportion of blood  
It is of use to judge of its situat. in Surgical Operations;  
when tumour press in here, we do not know readily its course  
by the Finger because it is supported chiefly by Tissues, so  
it is scarcely distinguish'd its pulsation. The next being the  
Facial, supplying it. inferior maxillary & sublingual glands  
the branches are sent off at right Angles, as those of it. Temporal  
Artery it. supplies it. Temporal glands, so there is not man  
part. it. settles to receive it. very active mercury, & it. effect of  
it. Artery in throwing out it. mercury is not to be ascribed to  
its passing off at a right Angle but to the structure of the  
ultimate branches, w. of it. gland, & it. greater sensibility of it.  
part: going still higher we find it. Facial Artery pass. over  
it. lower Jaw, ab. an Inch from its Angle & called Arteria  
Angularis, there we can distinguish it. pulsation & can  
open it on certain occasions, & in some Operations we allow

The parts to bleed freely, & it may be of advantage  
 to empty all v<sup>o</sup> vessels very fully: but in many other cases  
 we wish to stop v<sup>o</sup> bleeding, as in v<sup>o</sup> ap<sup>o</sup> at<sup>o</sup> for v<sup>o</sup> haemip<sup>o</sup>  
 in the Case of Stomach &c. And Surgeons gen<sup>l</sup> use pressure  
 upon v<sup>o</sup> extremity of v<sup>o</sup> bleeding artery or take it up w<sup>th</sup> the  
 Needle, But applying two fingers upon v<sup>o</sup> root of v<sup>o</sup> Facial  
 artery will assist very considerably not but if blood is  
 found in in small qu<sup>ty</sup> from v<sup>o</sup> neighbour<sup>g</sup> branches, but if v<sup>o</sup>  
 principal source is interrupted v<sup>o</sup> will be found to cease.  
 Pursuing v<sup>o</sup> facial art. higher on v<sup>o</sup> face we find it supply  
 v<sup>o</sup> small glands of v<sup>o</sup> Lips, & v<sup>o</sup> suspens<sup>o</sup> turns it takes  
 over a double purpose, allowing an extension of v<sup>o</sup> mouth  
 v<sup>o</sup> artery coming near to v<sup>o</sup> Knight Line, but the turns and  
 still greater v<sup>o</sup> what is necessary for v<sup>o</sup> purpose, & considering  
 v<sup>o</sup> situation of v<sup>o</sup> vessels within v<sup>o</sup> muscles, we may conceive  
 v<sup>o</sup> from v<sup>o</sup> situat<sup>o</sup> & course v<sup>o</sup> Spittle is better prepared, & the  
 Scentim increased by v<sup>o</sup> motion as well as v<sup>o</sup> ventilation, at v<sup>o</sup>  
 top of v<sup>o</sup> face we find v<sup>o</sup> artery communicating w<sup>th</sup> v<sup>o</sup> ocul<sup>o</sup> &  
 frontal, or communications between v<sup>o</sup> internal & external  
 Arteries. Hence v<sup>o</sup> room for Dr. Blain's proposing to open v<sup>o</sup>  
 frontal artery in disease of v<sup>o</sup> Encephalon; but I have men-  
 tioned v<sup>o</sup> reasons for avoiding v<sup>o</sup> operation, from its being  
 turned over a bend it is impossible to relax it &c.  
 Follow<sup>g</sup> v<sup>o</sup> artery still higher we find v<sup>o</sup> occipital vent  
 backwards &c. From v<sup>o</sup> root of the Temporal artery the  
 Trunk of v<sup>o</sup> Artery is turned upwards & v<sup>o</sup> it gets v<sup>o</sup> name  
 of internal maxillary, splitting into a very great number  
 of Branches supplying v<sup>o</sup> muscles, v<sup>o</sup> substance of v<sup>o</sup> face  
 the roof of v<sup>o</sup> mouth, & there is a branch going into v<sup>o</sup> dura ma-  
 ter. The v<sup>o</sup> artery terminat<sup>o</sup> in v<sup>o</sup> sides of v<sup>o</sup> nose is a contin<sup>o</sup>  
 of v<sup>o</sup> external Artery. And the three res<sup>o</sup> branches now fall  
 in the way of a subj<sup>o</sup>. yet it is of use to know from what source

each may receive its blood & the knowledge of 258.  
Their connexion & vicinity may be of advantage in certain  
dangerous diseases to liften  $\frac{1}{2}$  force very considerably, thus  
if  $\frac{1}{2}$  dura mater is inflam'd to a  $\frac{1}{2}$  degree, or in case of thick-  
ning in  $\frac{1}{2}$  skull.  $\frac{1}{2}$  force of  $\frac{1}{2}$  blood may be more lifed by  
open'g  $\frac{1}{2}$  temporal Artery in  $\frac{1}{2}$  neighbourhood, than by  
opening vessels  $\frac{1}{2}$  as more distant. We are to consider at  
same time  $\frac{1}{2}$  nerves, almost every principal branch of  $\frac{1}{2}$   
Artery is closely accompany'd by a nerve, w<sup>ch</sup> it is of use for  
 $\frac{1}{2}$  purpose of Surgery to know in  $\frac{1}{2}$  most accurate manner.  
Corresponding to  $\frac{1}{2}$  Arteries there are two sets of veins, viz.  $\frac{1}{2}$   
inter. & jugular attending  $\frac{1}{2}$ . Carotio communis, & 2. external  
jugulars, so  $\frac{1}{2}$  ven in this part of the body, where  $\frac{1}{2}$  blood  
returns  $\frac{1}{2}$  most readily to  $\frac{1}{2}$  heart in  $\frac{1}{2}$  erect posture, we have  
seen under under our muscular Capax,  $\frac{1}{2}$  veins running in very  
diff<sup>t</sup> directions; & one set may. outside of  $\frac{1}{2}$  muscles, see from  
 $\frac{1}{2}$  action & freely communicating. In  $\frac{1}{2}$  external jugular  
veins I shew'd valves, w<sup>ch</sup> are im<sup>pr</sup>oof  $\frac{1}{2}$ . They are chiefly in-  
tended to prevent  $\frac{1}{2}$  blood from being driven backwards to  
 $\frac{1}{2}$  small branches. From the face communication w<sup>ch</sup> the  
external Jugulars have w<sup>ch</sup> the internal you must be consider'd  $\frac{1}{2}$   
drawing of blood from  $\frac{1}{2}$  in diseases of  $\frac{1}{2}$  Encephalon may be attend'  
w<sup>ch</sup> parts benefit;  $\frac{1}{2}$  only danger attending of  $\frac{1}{2}$  arises from certain  
small nerves, branches of  $\frac{1}{2}$ . Cervicobas. Has. I shew'd many of  $\frac{1}{2}$  princi-  
pal Vessels of  $\frac{1}{2}$  body,  $\frac{1}{2}$  may be a proper occasion for explaining the  
effect of opening Arteries and veins, w<sup>ch</sup> sh<sup>d</sup> determine us in our presen-  
t.  $\frac{1}{2}$  whether we are to prefer  $\frac{1}{2}$  open'g of an Artery to  $\frac{1}{2}$  open'g a vein, or w<sup>ch</sup>  
we are to dopt, whether to be done in  $\frac{1}{2}$  neighbourhood of the place  
of ulc<sup>r</sup> or at a distance? And I imagine these depend upon the same  
principles, so  $\frac{1}{2}$  in determining  $\frac{1}{2}$  one Circumstance, we in  $\frac{1}{2}$  det-  
ermine  $\frac{1}{2}$  other. I avoid saying anything w<sup>ch</sup> regard to  $\frac{1}{2}$  degree of  
danger, or the cause of this, it will be better consider'd in  $\frac{1}{2}$  surgical

part of the Course; only at present, I suppose it is opening an  
 Artery is a more dangerous operation than opening a vein of the same size  
 blood being thrown out from yr. Artery w<sup>th</sup> much greater violence,  
 Now to determine yr. whole question I wd. venture to appeal to one or 2  
 observations, yr. Ex<sup>o</sup> made when I am injecting a dead body: If any  
 one Artery happens to burst, I constantly observe yr. yr. Arteries in yr.  
 neighbourhood are not so well injected, as yr. Arteries are at a very con-  
 siderable distance. Thus suppose yr. internal Arteries burst, I don't  
 find yr. external Arteries of yr. side is so well injected, as yr. Bronchial  
 Arteries, suppose yr. pipe be<sup>d</sup> in the common root, for the force of yr.  
 injection in yr. internal Arteries is much less'd, by yr. ready outlet  
 from yr. internal, & it is therefore perfectly evident to me yr. if I open  
 yr. Artery of blood in any part, & if any part is affected with an  
 Inflammation, & if the disease is general we ought to take  
 away the blood in yr. safest manner, but supposing yr. question  
 to turn upon Topical Complaints, yr. means yr. opening is made  
 to the heart directly, so much the better: In one case we prefer the  
 Artery, in another the vein, as we can draw the blood more immedi-  
 ately from yr. part, always preferring near vessels to distant  
 ones: So suppose an Inflamm<sup>n</sup> to occupy yr. outer side of yr. head  
 or Ear, surely yr. proper way of giving relief wd. be opening yr.  
 Temporal Artery; perhaps by stopping yr. Artery yr. Artery might  
 be less'd, & a sufficient quantity could still be apply'd for  
 carrying on Life, or if we want to make an open it wd. be of this  
 Trunk; but supposing yr. patient will not agree yr. Ar-  
 tery sh<sup>d</sup> be open'd, I wd. surely prefer yr. drawing the blood  
 from the Top of yr. Jugular, or Temporal vein. Now is an ob-  
 jection of Haller any objection to this, yr. when a Vein  
 was open'd, yr. flow of blood is accelerated in yr. vein, & the  
 force quicker in the Artery, but the force is not increased, only  
 yr. flow is accelerated because this is like assistance: to  
 show yr. we are apt to mix apply common principles with  
 regard to the quantity & velocity without regarding the  
 assistance: You'll observe yr. force of the blood w<sup>th</sup> in yr. Artery  
 is greater yr. in yr. pulmon. Artery, but yr. velocity is entirely  
 yr. same, we are to attend, not only, to yr. velocity w<sup>th</sup> w<sup>th</sup> the  
 Blood we cure, But yr. with w<sup>th</sup> it tends to move: and the

existence there is to this notion instead of being an argument. (260.)  
 to deter us from opening a neighbouring vein will lead us to do so  
 suppose of <sup>the</sup> Eyes affected when we can't open of <sup>the</sup> coat of <sup>the</sup> Ocular  
 Artery, here a question arises, whether we are to take a neighbour-  
 ing or a corresponding vein? perhaps we wd. prefer a neighbour-  
 ing, for we wd. lessen of force more, suppose by opening of <sup>the</sup> Temporal  
 Artery, of <sup>the</sup> blood wd. not be determined w<sup>th</sup> an equal force into the  
 Ocular Artery: But now supposing of <sup>the</sup> patient won't submit  
 to have an Artery opened, we wd. prefer opening of <sup>the</sup> Jugular vein to  
 of <sup>the</sup> of <sup>the</sup> foramen: and whenever we want to lessen Inflammation  
 tis all together clear & confirmed by practice: of <sup>the</sup> of <sup>the</sup> drawing of  
 blood quickly is an advantage: we lessen of force more in of  
 diseas'd vessels: and give 'em time to recover themselves, &  
 whilst we weaken of <sup>the</sup> patient, he grows fainter, but that is  
 momentary & we save his Constitution: so of <sup>the</sup> by making  
 a large orifice, w<sup>ch</sup> produces a faint & apprehension w<sup>ch</sup> still  
 more lessens the Disease.

Lecture 55.

I shew you of <sup>the</sup> foramen incisum, w<sup>ch</sup> is not only open in the  
 Skeleton, but in the natural state of of <sup>the</sup> body, tho' in many  
 subjects it seems to be entirely shut, I was first of <sup>the</sup> this  
 conveys the Tears from of <sup>the</sup> nose into of <sup>the</sup> mouth, for I find  
 that of <sup>the</sup> Tears dropping from of <sup>the</sup> lachrymal duct, when the  
 head is erect fall into this Canal at of <sup>the</sup> same time in my  
 self I can't find of <sup>the</sup> I can make colour'd fluids, as milk  
 or Ink pass into it. — I shew you an insect resembling  
 a Leech of <sup>the</sup> was found in the nose, w<sup>ch</sup> exactly resembles  
 some others I shew you, of <sup>the</sup> was fresh & lay stool: & this  
 Species of Insect is not described by Linnæus: Now after  
 shewing of <sup>the</sup> structure, let us consider of <sup>the</sup> use of the parts,  
 or the reason of the structure, I will begin with of <sup>the</sup> sense  
 w<sup>ch</sup> is exercised in of <sup>the</sup> most simple manner the Taste. —  
 We have seen very large arteries & nerves vent to of <sup>the</sup> Tongue

You readily find a reason for this, we consider the Tongue  
 as an organ of very consid<sup>d</sup>. motion as exercising it<sup>s</sup>. sense of  
 Taste, & besides it<sup>s</sup>. from its surface there is a very consid<sup>d</sup>.  
 secretion, for it<sup>s</sup>. part purpose, a great quantity of blood is  
 likewise constantly found circulating in organs it<sup>s</sup>. perform  
 a large suction motion, & still more in organs of sense: it<sup>s</sup>.  
 reason of this at first sight, is not so certainly wid<sup>d</sup>. but if  
 apprehend it<sup>s</sup>. we shall find reason to believe, it<sup>s</sup>. as it<sup>s</sup>. part &  
 brain act upon each other in a Circle, so it<sup>s</sup>. we find ourselves  
 at a loss to distinguish Cause from effect: in like manner the  
 Arteries and nerves in their progress, act upon each other, & I  
 shall give reason for believing, it<sup>s</sup>. in a manner I don't pretend  
 fully to understand: it<sup>s</sup>. Arteries turn it<sup>s</sup>. nerves for receiving the  
 impression, & conveying it<sup>s</sup>. distinctly: when we compare it<sup>s</sup>. Tongue  
 w<sup>th</sup>. it<sup>s</sup>. nose, we see this in a clear point of view, in it<sup>s</sup>. membrane  
 of it<sup>s</sup>. nose, there are such a vast number of vessels it<sup>s</sup>. circulate  
 red blood, it<sup>s</sup>. we wd. be apt to imagine it<sup>s</sup>. we wd. prevent it<sup>s</sup>. distinct  
 impression of it<sup>s</sup>. nerves, but on it<sup>s</sup>. contrary they contribute to in-  
 crease it<sup>s</sup>. distinctness of it. It is making experiments w<sup>th</sup>. medicines, to  
 know for they act, by immediately influencing it<sup>s</sup>. nerves: I find  
 it<sup>s</sup>. after it<sup>s</sup>. circulation is interrupted in it<sup>s</sup>. course of the nerves:  
 as it<sup>s</sup>. vocalic, tho' it<sup>s</sup>. Organ is quite entire, medicines cannot  
 influence it<sup>s</sup>. system thro' the single branch, after it<sup>s</sup>. circulation  
 has ceas'd tho' they produce it<sup>s</sup>. most violent symptoms when  
 apply'd to it<sup>s</sup>. corresponding nerve when it<sup>s</sup>. Circul<sup>n</sup>. is carried on:  
 So that it<sup>s</sup>. Arteries actuate it<sup>s</sup>. nerves in their progress something  
 more it<sup>s</sup>. merely giving them a certain degree of Tension, and in  
 like manner as we find it<sup>s</sup>. Arteries assist it<sup>s</sup>. nerves in their  
 Office of sense and motion: we find it<sup>s</sup>. it<sup>s</sup>. nerves assist it<sup>s</sup>. Arteries,  
 performing their functions, so we may call it<sup>s</sup>. it<sup>s</sup>. numerous  
 mass of the Tongue not only an <sup>intended</sup> for it<sup>s</sup>. motion & sense,  
 but for circulating it<sup>s</sup>. secretions made from it<sup>s</sup>. extremities of it<sup>s</sup>.  
 Arteries. — We know it<sup>s</sup>. general manner in w<sup>ch</sup>. it<sup>s</sup>. sense of  
 Taste is exercis'd: we apply saline Substances w<sup>ch</sup>. are dispos'd  
 upon it<sup>s</sup>. surface of the Tongue, & if we don't perceive it<sup>s</sup>. Impression

examine it with the Light of a Candle, but turning it. (26)  
patients had towards the Sun, you can see to the most  
distant parts of it.

Lecture 56<sup>th</sup>

You all know Gentlemen y<sup>e</sup> y<sup>e</sup> skin of y<sup>e</sup> external Ear is sup-  
ported by Cartilage: & besides y<sup>e</sup> muscles connected w<sup>th</sup> the  
head, y<sup>e</sup> superior addens acuminat there are a few very short  
pale colored fibres w<sup>th</sup> are muscular they begin and end in the  
external ear: from it there is a passage inwards y<sup>e</sup> outer  
half of w<sup>ch</sup> is compos'd of y<sup>e</sup> same materials as y<sup>e</sup> external  
Ear: but the inner half in an adult is opaque: In a Child the  
whole passage is soft & cartilaginous: At the bottom of the ex-  
ternal passage w<sup>ch</sup> is lined by a fine membrane, we find way  
a bitter Substance like Bile inspissated: It w<sup>ch</sup> is separated  
from minute glands: This membrane is transparent &  
looks like a bit of y<sup>e</sup> pleura or peritoneum when wetted w<sup>th</sup> water  
Now this membrane has no hole in it: we find a large ir-  
regular shaped Cavity, w<sup>ch</sup> Cavity is compar'd to y<sup>e</sup> Cavity of a  
Drum, therefore the membrane w<sup>ch</sup> is found covering it is  
compar'd to the parchment of a Drum, or is nam'd membrane  
Tympani; therefore upon inspecting we find no passage for  
Air in y<sup>e</sup> Cavity of an Tympanum, but we find a direct  
passage into it, leading from the Throat, nam'd the  
Eustachian Tube & tis of y<sup>e</sup> shape of a Trumpet w<sup>th</sup> y<sup>e</sup> small  
end towards the Ear, a connexion is made between y<sup>e</sup> and the  
membrane of the Drum, by a curious chain of bones & in y<sup>e</sup>  
The Cochlea a curious Organ is turn'd round a gland and has  
its name from its resemblance to a shell of a snail: the  
chain of bones w<sup>ch</sup> play upon one another is not merely  
form'd by membranes but muscles are likewise connect'd

to be: I never could find *any* external muscle w<sup>ch</sup> has been (265)  
mentioned as at *any* bottom of the meatus: but there are three  
others: one of *them* is deny'd. by Haller: but it follows *in* course  
of the Eustachian Tube, & is connected by *any* malleus, w<sup>ch</sup> is drawn  
out a little: it lies parallel w<sup>th</sup> a nerve, *any* branch of *which* was seen  
at the root of the Lingual branch of *any* 5<sup>th</sup> pair, & it passes  
thru' *any* cavity of *any* Tympanum like a stretched cord, and is  
call'd *any* Corda Tympani.

### Lecture 5<sup>th</sup>

Let us now consider *any* use of *any* *any* parts & their manner  
of opening, & first we sh<sup>ll</sup> *any* danger is guarded against, pointed  
Instruments are hinder'd, from entering *any* external Cavities,  
to the membrane, partly by *any* protection w<sup>ch</sup> *any* prominent  
nasal Tragus gives to the passage, and partly by *any* irregu-  
larity of *any* passage, but we can lay pulling backwards the  
Cartilaginous part be able to see the bottom of *any* passage, &  
w<sup>th</sup> *any* light of the sun be able to distinguish *any* membrane  
of *any* drum: Insects are hinder'd from readily entering from  
*any* narrow hairs, by *any* sides of it, & *any* very viscid wax, w<sup>ch</sup>  
is *any* principal purpose of *any* Ceramen. - In like manner the  
internal passage to *any* Eustachian Tube is guarded, there is  
little fear of our food or drink being squeez'd into it by deglutition  
for *any* mouth is plac'd higher *any* *any* Vel. pendic. palati and tis  
accurately shut by *any* elevator palati, & *any* superior constrictor  
of the pharynx: next with regard to the partic<sup>l</sup> parts of the  
Organ, beginning with the external: The Cartilage under the  
Skin seems to enlarge the Tube in w<sup>ch</sup> *any* Tremor of the air is  
made: we find other Contrivances equally good, & we observe a  
great variety w<sup>th</sup> respect to shape in diff<sup>t</sup> Animals, some of  
w<sup>ch</sup> hear on an acuity of *any* we do: but by attending to *any* shape  
& winding of *any* passage, we also *any* *any* sound reverberates  
as tis thrown into the meatus: and a N<sup>o</sup> of animals assist  
their hearing by pointing the ear towards *any* & enormous body:  
whence we are convinc'd of necessity of moving the whole head: &  
The direct I<sup>o</sup> superior is made upon one ear only, & there is

no communication between the Ears as in a Bird which receives it, direct impulsion upon both Ears at the same instant a Canal leading from the one to the other. The small muscles upon the Cartilage seem also to give a greater tension, & to throw of the sound with an additional force, & within it, the *Quadratus externus* of sound is collected & is contracted, & the winding passage, instead of lessening, increases it, just as a sound appears louder in a crooked passage made by walls of it, if it's passage is altogether straight: perhaps of sound is thrown by it, sides of it, passage towards middle of it, Cavities, to the very place where the Bones are connected to it, membrane; The third of chain of sound is communicated to it, membrane of it, oval hole or visible when at first sight we see in the shape of this Cavity, & the communication it has with the Cells of it, matrix proceeds; we sh. suppose it, purpose of collecting the sound was contracted, by its being diffused in a cavity of it, extent. But it, sides of it are made of hard bone fitted for Tumor, & it, outlet is small, & we find a striking analogy, between the Ear and it, common Instrument of membrane resembling it, parchment of a Drum, it, Cavity w. in it, Eustachian Tube, the Cavity and hole in it, side, or collecting it, sinuses what was said of them communicating with the nose, it, they increase it, voice & render it more melodious, & Dr. Sney tells me of a Dove he met with, where a wound in it, Anterior maxillary produced a very considerable alteration in the voice Another manner of communication has been supposed, it, it, Tumor has been communicated to it, parts within, by it, means of the directly thro' the Eustachian Tube, & every it, same gen. purpose with the external, & we are apt to admit such a supposition: may to form further Theories; As it, from the commun. a person as it, utates his voice better: his own voice making a direct impulsion upon his own Ear: Valsalva has an observ. it, it, certain Case where it, mouth of the Eustachian Tube was ulcerated, & he introduced a small tent to prevent it, concussion of the Sides, it, patient lost his hearing: but I can't help

calling it "obscure" into question, & denying any kind of  
 truth in it. & supposition: For if you make a simple experiment  
 shut up the external Ear, open the mouth, let the breath enter thro  
 the nose, & place a Bell before you w<sup>ch</sup> sound's loud, you are  
 scarcely sensible of the sound, If I put my watch in my mouth  
 I am scarcely able to distinguish it. w<sup>ch</sup> sound of it: w<sup>ch</sup> I suppose  
 therefore is so inconsiderable in speaking of it. w<sup>ch</sup> we call it  
 To gain it may be altogether overlooked, & Valvula is widely  
 mistaken, for the ulcer was on ~~one~~ <sup>one</sup> side only, & why sh<sup>d</sup> the  
 patient have lost his hearing from it. Stopping of one of the  
 Eustachian Tubes: then are besides two chief ways in w<sup>ch</sup> we  
 receive the Impression of sound, one thro' the chain of bones,  
 the other thro' the membrane of the Tympanum, & the Air in the  
 Cavity: There is another way w<sup>ch</sup> has no general effect, it is  
 the Tremor of the bones of the head, & of the whole body: So in some  
 persons in whom the external ear is corroded, & the whole chain  
 of Bones perhaps destroy'd: distinguish sounds very loud in  
 this way: so if applying any tumultuous substance to the  
 Jaw Bones: as striking it with grains of a fork, you hear as  
 it were a very loud sound: the common acc. is in the nerves  
 are connected here, so the Tremor passes from one nerve to an-  
 other: but you'll obs. that the sound is m<sup>ch</sup> more distinct, when  
 the Tremor is communicated to the teeth of the upper Jaw, tho'  
 tho' the nerves of the under are chiefly connected a branch of  
 the 5<sup>th</sup> pair being connected to the 7<sup>th</sup> & that above may be  
 apply'd to practice w<sup>th</sup> considerable relief: thus if you want con-  
 vince w<sup>th</sup> a person dull of hearing, you take a piece of very  
 hard wood w<sup>ch</sup> can have a Tremor easily communicated tho'  
 you apply one end to his four teeth of the upper Jaw, & you  
 take the other end into your mouth & speak: and he will  
 apprehend what you are saying, tho' he is not able to  
 hear a single Letter if the Bit of wood be remov'd so it is  
 communicated thro' the bones w<sup>ch</sup> impress the nerves of the  
 Ear as they receive the impression from the Tremor apply'd

in the other two ways: By receiving an impression in diff: ways (268.  
perhaps we judge better of a sound if the Tremor is convey'd  
in one way only. — As I have deny'd of the Eustachian Tube con-  
vey's of Tremor of Air, we must confine its use to one purpose  
chiefly to supply the cavity of the Tympanum, & elastic Air: The only  
wound before it reaches of very tender parts, of internal ear: —  
Another purpose of it is perhaps to convey moisture or odour collect'd  
by the secretion within the cavity of the Tympanum, & may be more  
necessary here, when the Air is admitted, for as it is subst. floating  
in the atmosphere are convey'd into it; & we again have a per-  
for outlet, the only thing remaining is to determine the way in  
which the impression is convey'd from the membrane of the oval hole  
Toward once to the parts mollis of the auditory nerve; for after  
bringing the nerve to receive the Tremor, we can give no further acct.  
why we judge so accurately of sound any more if we can explain  
the effect of the objects of sight have upon the retina: The question  
of occurrence, is this, whether as we to say of the Tremor is commu-  
nicated thro' the air filling the Cavities of the vestibule, semicircular  
Canals &c. or as they are filled with water. Upon the whole,  
I am inclin'd to believe of the Tremor is communicated to water  
& thro' the water to the nerves. — H. H. I proceed to examine  
the nerves of the spinal marrow, & the structure of it has been  
sufficiently explain'd. — We have seen of the spinal marrow  
is chiefly to be consider'd as of production or lengthning out  
of the medullary substance of the Brain. Humboldt, but  
upon cutting it transversely, a small proportion of cortical  
or Givertious substance may be observ'd resembling of the  
brain. — Next we have seen sent of every where of whole length  
of the spinal marrow nerves in pairs and these are crown'd  
when they are about to go thro' the holes of the substance by the  
Dura mater, & at the place there this is an enlargement: a  
Ganglion, or knot bigger than the thread of the nerve, and we  
shall find of the nerves spread into anterior & posterior  
branches the anterior are the largest, and all of them com-  
municate to the nerves above and below.

Lecture 58<sup>th</sup>

We proceed to pursue the Subclavian branches from the  
Arts with the accompanying veins

Lecture 59<sup>th</sup>

And Nerves.

Lecture 60<sup>th</sup>

We shall now consider *g.* applic<sup>n</sup> of what we have seen to  
 practice & follow *g.* order of *g.* demonstration; we first trace  
*g.* blood vessels from *g.* origin: You have seen 3 branches  
 sent off from *g.* arch of *g.* Aorta, *g.* first branch supplying *g.*  
 right Arm, & right side of *g.* head, *g.* second *g.* left side of *g.*  
 head: *g.* 3<sup>d</sup> *g.* left arm, & at *g.* same time *g.* principal branch  
 is more directly oppos'd to *g.* mouth of *g.* ventricle of *g.* heart  
 coming of from the Aorta where tis about to make *g.* turn  
 then as *g.* force of *g.* blood is broke by *g.* turn before *g.* other  
 branches come off: — you all know *g.* mankind in general  
 prefer *g.* right arm; now are we to find a connexion between  
 or facts? are we to consid<sup>r</sup> *g.* as cause an Effect? This  
 Circumstance is a very curious one, was so far as I know  
 suggested by my father? & *g.* now I've considered *g.* fact, the  
 more I am perswaded it is founded: for I've repeatedly  
 compar'd *g.* nerves of both arms, they are of *g.* same size,  
 exactly connected in *g.* same manner: the only final cause  
 of *g.* preference is perfectly void: *g.* by exercising on an  
 more frequently we acquire m<sup>ch</sup> more dexterity: but we must find  
 an effectual cause: we must endeavour to find somewhat *g.*  
 wh<sup>ch</sup> determin<sup>s</sup> us to use *g.* one and not *g.* other, or *g.* one or  
 originally in preference to *g.* other, for *g.* *g.* we proceed not  
 from a cause, Child<sup>n</sup> give the same preference: Motion  
 is not properly depend<sup>t</sup> on the blood vessels, but it does so  
 in a secondary degree, I've had occasion to obs<sup>r</sup> *g.* *g.* nerves

of ut their Energy more powerfully by a quantity of Blood (270.  
dispersed along them: I will see many more vessels in the  
Organ of Trunk of we can well find use for, now of Trunk receiving  
of blood with greater force, & in greater quantity, & taking its  
rise in a common Trunk, of assistance is much less, without  
at all alleging of of right subclavian is occasionally con-  
tracted larger of of left: The Trunk Blood runs thro' of common  
Trunk with greater ease of this of 2<sup>d</sup> and 3<sup>d</sup> branches: then in  
life assistance made by of sides of of vessels: & to compare of  
with the Case of other animals, of notwithstanding of necessity  
They are under in walking to use of 2<sup>d</sup> anterior extremities  
in exactly of same manner, yet in them there is a preference of  
to a very difficult matter to force a Horse to walk with his  
left shoulder foremost, he naturally prefers of right fore  
extremity; & to carry it a step further: in examining Birds  
when a preference will have been hurtful & will have led on to of  
ground just as of cutting of smallest Bit of of wing: so that  
great care to suppose of of distribution of of Vents, as allowing  
of blood to enter more freely to of right arm, & perhaps to  
return more readily from of arm gives of preference, & of the  
stronger & therefore originally preferred, when we follow the  
Artery of the Arm which at last ends in of arm: we find small  
branches sent off to the Thorax, upper part of of shoulder and  
lower of of neck, after which of artery passes under of Basilic, & is  
properly nam'd Subclavian, passing between of Basilic & first  
Rib, & we can at of place readily distinguish of pulsation, so  
I've the of making an experiment of may be useful in a variety  
of cases to stop of blood in of subclavian Artery by a very  
slight pressure; I tried it on myself as well as on others  
If I put my thumb upon it, above of middle of of Basilic &  
press downwards on of of first rib of pulse ceases immedi-  
Now suppose an accidental wound in any of of large branches  
coming of near of Axilla or in of internal Thoracic Arteries & the

Surgeon is not provided with Instruments to take up the  
 Bleeding vessels, or an impossibility of applying of Tourniquet  
 in of ordinary way, or if we are taking of of superior extremity  
 at of joining of of humerus w<sup>th</sup> of scapula &c. by making a  
 incision here we prevent of great loss of blood, and all we find  
 necessary is of profuse of of them l. - Following of of artery a  
 little further we find it get into of Axilla & there tis protected by  
 by of pectoral muscle & latissimus Dorsi stretch'd across from of  
 Trunk: to of body of of humerus, when of of artery receives conve<sup>nt</sup>  
 protection & of vein is m<sup>uch</sup> less wasted in persons of wear<sup>th</sup> shells.  
 lower we find of Axillary glands connect'd to the Artery by cell<sup>ular</sup>  
 Substance & when these are enlarg'd in a diseas'd state of must  
 be cut w<sup>th</sup> of utmost Caution in attempting to separate from  
 of Artery & of Surgeon is under a necessity of tearing 'em away w<sup>th</sup>  
 of fingers, instead of using a Knife, lower again of of artery runs  
 parallel with of of humeri therefore is now nam'd humeral  
 Artery. - & after it has run ab<sup>out</sup> 1/2 Inch under of binding of the  
 Elbow it divides it into of ulnae & radial branches. I have  
 made sev<sup>er</sup>al experiments w<sup>th</sup> regard to these Arteries, I have tied  
 the Trunk of of humeral Artery in 2 places & cut between them  
 Supper ab<sup>out</sup> of middle: I then fix'd an injecting pipe higher of  
 of place cut: In quisting in water, Air, or milk I fill'd all the  
 inferior Branches, w<sup>ch</sup> is done on on the Elbow, may be practis'd  
 any where in of upper part of the humerus w<sup>th</sup> nearly the same  
 Success only a greater portion of of membrane needs to be remov'd  
 & I can occid of prove it in of most absolute manner  
 It occid to my Father when an Arterial Sack had occ<sup>ur</sup>  
 - casion'd a corruption of the Side of of Artery of of humerus  
 near to the Axilla, of effect is the same as of of of Ligature:  
 So if of Ligature had been made in of Patients life: he might  
 have been sav'd: I don't mean to say of of Surgeon ought to  
 have perform'd of operation, perhaps of dilatation might  
 have been very deep, but it might have been ty'd above the

274

ruptured place, even from this case it does not follow, if  
any arm might have been saved w<sup>th</sup> absolute certainty, tho' in  
the humoral history is tied to the height, w<sup>ch</sup> concussions must  
have been gradual according to w<sup>ch</sup> disposition of w<sup>ch</sup> Arterio-  
-mal Tumor, so the lateral branches w<sup>ill</sup> dilate by degrees  
but in Case of a wound w<sup>ch</sup> branches might not be sufficient  
to convey w<sup>ch</sup> necessary quantity of blood, but instead of imm-  
-ediately proceeding to Amputation we sh<sup>ould</sup> attempt to save  
the Arm - Next tis of use to observe w<sup>ch</sup> Lusus nature which  
are more frequently observed w<sup>ch</sup> Anatomists are aware of. Haller  
obs. that they have not been so frequently observed as they are  
would now instead of w<sup>ch</sup>. I happen to have 7. or 8. instances  
of w<sup>ch</sup> kind and several more which have been left or neglected to  
be kept. A Surgeon cut to look for it, as in performing the  
Operation of the Arteriom, especially w<sup>ch</sup> the two branches  
may closely accompany each other, & so both may be taken  
up, but if the Surgeon is afraid of this the 2. branches may be  
separated with the greatest Care & w<sup>ch</sup> success of the Operation w<sup>ill</sup>  
be assured, tho' the supply is the same as when one of the  
Arteries happen to be wounded: In some Cases they are after-  
-wards united by a cross Canal: but we are to take it for  
granted w<sup>ch</sup> the supply is made thro' w<sup>ch</sup> small anastomosis  
as arch in w<sup>ch</sup> ball of w<sup>ch</sup> hand, & w<sup>ch</sup> necessity of large Arteriom.  
is w<sup>ch</sup> in the Ball of w<sup>ch</sup> hand w<sup>ch</sup> part being more exposed to  
compression: & w<sup>ch</sup> Stagnation of the Blood in the vessels: -  
One further Arterio nature ought to be observed w<sup>ch</sup> sometimes  
happens when the Arterio division is made w<sup>ch</sup> Arteries inst-  
-ead of remaining contiguous to each other, separate some of them  
is w<sup>ch</sup> cutaneous: therefore there may be a danger of opening  
An Artery instead of a vein, particularly we ought to be

arteries, when we are abt. to open the branches in the course  
 of the Basilic Vein. — All the considerable arteries are accom-  
 panied by corresponding veins: these are more numerous  
 than the arteries: taken together are larger: but taken singly  
 are smaller: for I don't find any vein as large as the humeral  
 artery; for ordinary they are accompanying it 2. or more veins  
 & these frequently joined together & whole crowded w<sup>th</sup> valves  
 Next beside the accompanying veins, you have seen a set of  
 subcutaneous veins, w<sup>ch</sup> are upon the whole larger & deeper  
 veins & these likewise crowded w<sup>th</sup> valves: not withstanding  
 they run upon the muscles; I have seen numerous anastomosis  
 between the deep & subcutaneous Vessels: All of Circumstances  
 clearly confirming us w<sup>th</sup> reg. to the use of valves & they  
 serve to determine the blood to the heart: the moderate  
 action of the Arteries & Muscles promotes the flow of blood  
 in the veins; yet if the action is greater, we stop the flow almost  
 entirely, when we act with the muscles, the subcutaneous  
 muscle veins immediately swell, & the blood being no longer  
 able to get along the internal veins w<sup>th</sup> freedom, hence in U.S.  
 Surgeons direct the patient to move the fingers & if he makes  
 slow motions, we see the blood sometimes flowing into the  
 subcutaneous Veins; & I have known Surgeons abate the pain  
 if they had opened an artery: So the use of valves is perfectly evident.  
 The blood from the subcutaneous veins is not only from their  
 Situation but size; I mean the flow because the skin is thinner  
 there is at the outside of the Cephalic Vein, upon the inside  
 of the branch forming the Basilic Vein: & between these the  
 median Cephalic & median Basilic: Now if we regard the  
 situation of the arteries, along w<sup>th</sup> reg. to the veins, & the Tendons,  
 & muscles. The Tendons are very sensible w<sup>ch</sup> the blood in  
 the Cephalic & median Cephalic veins more readily: But if  
 it shall appear that the Tendons have very little Sensibility

274  
That of danger of wounds; independ<sup>t</sup>. of of. Artery depends  
arises from punctures of of. Subcutaneous nerves, we perform in  
of bleeding most frequently in of. median Basilic, & of. vein is  
of consid<sup>l</sup>. length thro' it crosses of. Artery, you will always find  
room for opening of. vein with<sup>o</sup>. making of. Orifice immediately  
of. Artery, it does not run so much longitudinally but we  
may keep at the of an Inch distant. — If of. V. S. is done with a  
Blunt Canut from the force necessarily us<sup>d</sup>, we are in danger  
of wounding the Artery: I let us now consider in what manner  
it may be wounded, & the general effects of it, of. wounds made  
sometimes by the Surgeons missing of. vein and cutting  
the Aponeurosis from of. Biceps and the Artery: but for the  
most part he wounds the Artery thro' the vein, he first goes  
thro' of. side of of. vein w<sup>ch</sup>. an thin and transparent, thro' thro'  
the Aponeurosis of the Biceps I next thro' the Coat of the  
Artery: we need not say whether all or part of of. Coats are  
wounded: but suppose it penetrates into the Cavity of  
the Artery & that the wound is free, of. blood is discharg<sup>d</sup>  
in a gush, If we suspect this, we make a pressure on the  
Vein with the Thumb, & at the same time make a mod<sup>er</sup>  
erate pressure above the Orifice, because a vein sometimes  
bleeds downwards between its valves; we therefore apply  
the point of the forefinger above the Orifice, & if the opening  
is only into the vein we stop the effusion of the blood, but  
if it is from the Artery, it bleeds more violently, because  
the return of the blood in the vein being hinder<sup>d</sup>, tis thrown  
with more force thro' the wound. — But supposing  
the wound in the Skin not opposite of. Blood will run  
under the Skin & be diffus<sup>d</sup> in the Cellular Substance & it  
may extend of. whole length of the Arm, but for the most  
part it happens of. the Artery receives but a slight hurt.

the very point of the Lancet, & the blood is confin'd partly  
 by the Cellular Substance, but in a great number of places  
 by the Aponeurosis of the Biceps w<sup>ch</sup> is wounded, as in y.  
 Quantity is discharg'd, this soon coagulates, & the blood is  
 confin'd, & we find a circumscrit<sup>d</sup> Aneurism arteri<sup>all</sup>,  
 but tis a dilatation merely of the Cellular substance in-  
 creasing till the Tumor resemble the real Aneurism, giving it  
 somewhat of the same circumscrit<sup>d</sup> shape, & the contents  
 receive the Impulso from the blood, There is another way  
 still of which I've had two or three Instances, you'll  
 see an Instance in the Essay published at London and one  
 occur'd in our Dispensary, when the blood gets from the  
 Artery into the wounded vein: the Basilic vein was first  
 struck thro', then the Artery which occasion'd an uncom-  
 mon varix, the vein being dilated to considerable length,  
 and putting on the appearance which veins generally do  
 in a various state, In one Case of this kind there is  
 mention made of a canal joining the Artery and vein  
 at a distance, & the blood is supposed to run between  
 them in the Cellular Substance: But if ever the  
 Blood gets into the Cellular Substance: so as to run at  
 a distance, it will not readily enter the vein, but when  
 the vein comes that attends the humoral Artery is  
 wounded along with the Artery, the blood gets into the  
 Vein, comes from thence into the Basilic, dilating all  
 the neighbouring veins from the Communications—  
 So I make no doubt but if every Gentleman in the least  
 acquainted with Anatomical Knowledge will always be  
 extremely wary in y<sup>e</sup> common application of the Lancet in  
 Venesection.

276.

Lecture 61. —

At our last meeting Gentlemen we considered fully the distribution of the blood vessels, let us now turn our attention to the nerves. You recollect that the Brachial & in general spinal nerves which take rise from the spinal marrow, at the begin by two distinct bundles of fibres an anterior and a posterior bundle. These come to be joined together & are covered by the dura mater; but further where they meet there is a knot, an enlargement or a substance which Anatomists call ganglion, the nature of it not certainly understood, I at present avoid offering any conjectures concerning it. From the ganglion you have seen the branches vent off, & all the anterior branches are connected by arches which represent the Anastomosis of blood vessels but are perhaps very essentially different from these, are bundles of nerves tied together in one sheath. — Besides the common or cervical spinal nerves have by their anterior branches a nerve called accessory which runs upwards into the head, comes out with the 8th pair is again connected with the other cervical Nerves, & at last all the cervical nerves are joined to the great Sympathetic or intestinal. The general purpose is to prevent the nervous Energy from being intercepted, From the Axillary plexus a N<sup>o</sup>. of Branches are vent off which are distinct & constant in their distribution: The large & deep nerves accompany the arteries so exactly that in demonstrating the Nerves, changing the word Artery for nerve and we find that the superficial & subcutaneous in a great measure accompany the veins one evident reason is of nature and reason to guard against accident by lodging both in the safest place, but in every part of the body, where they are equally protected in every part of the Organ, they run close to the arteries, so that if one vein be receive somewhat of its energy from the other. The use of knowing their particular situation is evident as in treating various cases of Convulsion & Paralysis & in performing surgical Operations, if we may add them because they are never wounded or punctured without evident danger, & in proof of it we need only attend to the bad consequences from wounds of the small branches, & particularly the following

Operation performed about the Elbow, you have all seen or  
 of instances, where patients from y. operation have received immoderate  
 pain, y. part swelled, y. swelling spread sometimes to a great ex-  
 tent; y. skin & parts under it become hard, discolored, y. pulse become  
 quick, y. patient delirious, wanted rest, spoke incoherently, & in sev-  
 eral instances y. part after an appearance of Erysipelas, mortified, &  
 in some Cases the Event proved fatal, you see 3. of y. kind is I  
 have met with before you. The gen. history of y. fist is this a  
 Gentleman and Ser. fell from a Horse but was not sensible of hav-  
 received any injury, found y. rupture of both his Limbs, and  
 soon, However he was persuaded to let a little blood, & so far  
 from being sick w. he did y. ordinary business of the Family  
 & 4. or 5. days after rode out to a review; But he felt an uneasy  
 & stiffness about the Limb. — In y. 2. Case, y. patient bled  
 on acct. of a bad Cold & found himself easier sev. days after till abt.  
 the 5. or 6. Day. — In the 3. Case y. danger was more certainly  
 owing to the bleeding y. in the two former: I shall first read the  
 acct. given by Dr. Robertson, & then subjoin an Extract from y.  
 Clerk of the Infirmary — “The man I mentioned was d. w. y. years  
 about a year and a half he was bled wantonly on acct. of 2. or 3.  
 pimples on his face his Arm was swelled considerably, & some of  
 his arteries possibly affected, y. abt. y. year before he was bled  
 in the same Arm, it became painful swelled, & was attended w.  
 a dangerous fever so widely the bad consequences proceeded from the  
 bleeding, & not of any disease in consiq. of which y. blood was drawn  
 The common & unisonal opinion of Surgeons is y. all y. bad symptoms  
 proceed from wounding y. Tendon of y. Biceps, or of its tendinous  
 Aponeurosis. Now instead of y. we have perhaps find y. they proceed  
 from y. wound of the Subcutaneous nerve plac’d between the Skin  
 & the Aponeurosis. Now it is of consequence to determine this point  
 because if it who. proceed from y. wound of y. Aponeurosis, y. Surg. no  
 may almost avoid wounding the Aponeurosis by using a blunt

pointed Lancet, & not striking that to any considerable depth (278.)  
Again if the bad Symptoms depend upon a wound of a subcutaneous  
nerve, it may be impossible for the Surg<sup>t</sup>. absolutely to avoid bad  
consequences, because the Situations vary in diff<sup>t</sup>. persons, & they cannot  
be distinguished by the touch but they will happen less frequently  
by the Surg<sup>t</sup>. avoiding a place where the largest nerve runs, and  
instead thereof in order to avoid a Tendon of the Biceps, letting  
Blood in the Cephalic Vein, he will look upon it as a most danger-  
ous matter let blood in one of these nearest a middle part in a Median  
Basilic avoiding a place of the Ulnar. Dr. Waller & many other accurate  
Anatomists & Surg<sup>ns</sup>. whom he quotes have repeatedly wounded the  
Tendon of Biceps of living Animals, not only without any bad conse-  
quence but the wounds & punctures made in it readily heal'd up again  
And in consulting a<sup>l</sup>. writings of many Surgeons when they treat in  
general of a<sup>l</sup>. manner of managing Tendons if an cut and wounded, it  
does not to be sew'd together, now it is generally unnecessary, but nothing  
more clearly shews the Inconvenience of Surgeons; this is a proof  
they have been try'd & sew'd together without any bad consequences  
& I have had repeated occasion to see wounds made in various  
Tendons of a<sup>l</sup>. body, and could I see to make without any bad Symptoms  
being produc'd, I have touch'd them with a probe tho' in an inflam'd  
State, because the Skin afterwards heal'd over it, I have cut, scratch'd  
& made large incisions into it, in the case of matter being collect'd,  
without a<sup>l</sup>. part. complain. The same is done in every case of Abscession  
near the Anus, or happens without a puncture of a<sup>l</sup>. Aponeurosis of  
the Biceps, & we make the Cure by enlarging the Incision.  
On the other hand we have examples where similar Symptoms happen  
at a distance from Tendons, or when Tendons have not been at all  
injur'd, but where nerves nearly of the same size run under the Skin  
I know examples of this sort in almost every part of a<sup>l</sup>. body, as  
at the side of the finger when a light puncture has produc'd a<sup>l</sup>.  
same dangerous effects. I met w<sup>th</sup>. a case of a<sup>l</sup>. kind some years ago, a  
Gentleman in Town punctur'd a<sup>l</sup>. side of his thumb by an extremely

small Splinters of a broken Wine glass,  $\frac{1}{2}$ . wound was not larger (2<sup>nd</sup> 1/2).  
than to admit of  $\frac{1}{2}$ . point of a common small probe & the whole  
was swell'd to the Shoulder, &  $\frac{1}{2}$ . as well as the Arm was swell'd  
only by a great suppurative found up as high as the Elbow, & in  $\frac{1}{2}$ .  
Case I caus'd an Incision to be made thro' the Aponeurosis into  
the Intertices of the Muscles. — In a publication by O'Hallerin I  
find manifestations ensuing bleeding in the neck or near it, & in  
 $\frac{1}{2}$ . work on Amputation I find sev. examples of it, in one Case  $\frac{1}{2}$ . whole  
of the foot swell'd, two of the Toes mortify'd and in another  $\frac{1}{2}$ . whole  
foot mortify'd & dropt off, & in bleeding in the Jugular Vein trouble  
some consequences may in like manner follow, I met w<sup>th</sup>. a Case  
where a person had wound'd  $\frac{1}{2}$ . back of his Leg by a pike on the  
Broad behind a Chair, it had been only a little thro' the Skin, &  
when there was no tendinous Aponeurosis or round Tendon, by the  
Time I saw him he had a lock'd Jaw, & contractions of  $\frac{1}{2}$ . muscles  
in various parts of the body, & thro' the Symptoms were far advanc'd.  
I propos'd  $\frac{1}{2}$ . an Incision thro' to be made thro' the Skin as deep as  $\frac{1}{2}$ .  
Belly of the Muscles, but that was not agreed to & he did not  
Survive: I mention'd my notion of the Case  $\frac{1}{2}$ . a new had been  
perforat'd, & upon examining  $\frac{1}{2}$ . part found  $\frac{1}{2}$ . nerve swell'd and  
discolor'd at the very place  $\frac{1}{2}$ . pike had enter'd. Let us now more  
partic<sup>ly</sup>. consider the Case before us, & to these I can now add a great  
No. of others. — I have seen 7. or 8. of these Cases w<sup>th</sup>. in so many years  
when the patients were in the utmost danger of losing their Lives  
and in 2. 3. of em  $\frac{1}{2}$ . bleeding was perform'd in  $\frac{1}{2}$ . Cephalic Vein, at least  
 $\frac{1}{2}$ . Inch distant from the Tendon of the Biceps: In every one of  $\frac{1}{2}$ . Cases  
 $\frac{1}{2}$ . blood ran freely from the Vein in  $\frac{1}{2}$ . Cases before us  $\frac{1}{2}$ . vein was  
not wound'd on the back part and  $\frac{1}{2}$ . Tendon of the Biceps was not any way  
thickn'd or swell'd, but the swelling was confin'd to  $\frac{1}{2}$ . cellular Substance  
& Nerve. — In 2. Cases of  $\frac{1}{2}$ . kind occurring in the Infirmary, I found the  
Tendon of the Biceps playing behind the Tumor on bending  $\frac{1}{2}$ . Arm  
The Surg<sup>ns</sup>. were all convinc'd of  $\frac{1}{2}$ . W. Chamber who imagin'd  $\frac{1}{2}$ . Danger  
arose from  $\frac{1}{2}$ . affection of the Biceps Tendon in such Cases, gave me  
leave to mention his Change of Opinion, & allow'd  $\frac{1}{2}$ . Tendon of the  
Biceps was in no way affect'd. — In all these 3. Cases I perforat'd

The subcutaneous nerves w<sup>ch</sup> were w<sup>ch</sup> in the manner you see  
 & veins were very considerably thickend, but the deeper parts were not  
 affected. In all of these Cases y<sup>e</sup> patient died without any manifest  
 coming on the part, they grew restless, y<sup>e</sup> pulse scarcely exceeded the 100  
 in a minute they became delirious at Times, but when rouz'd  
 spoke distinctly & answer'd any question; they complain'd of pain  
 abt. y<sup>e</sup> part, & of an odd sensation running up the Arm: I have myself  
 some kind of Idea of y<sup>e</sup> Sensation from being bled in the Arm, some  
 years ago, & I found for 3. or 4. weeks a very odd numbness & pain  
 mix'd together. But in some other Cases y<sup>e</sup> part mortify'd, in one case  
 I was made acquainted y<sup>e</sup> y<sup>e</sup> mortification was so great y<sup>e</sup> Surgeon  
 did not choose to make the dissection. In w<sup>ch</sup> of the Cases y<sup>e</sup> patient  
 complain'd of pain in the very time of the Operation, & was convinc'd  
 y<sup>e</sup> y<sup>e</sup> Lancet had broke & y<sup>e</sup> point remain'd in the Arm, but this is  
 by no means constantly y<sup>e</sup> Case, for in other Cases y<sup>e</sup> patient had little  
 more pain y<sup>e</sup> is common but not to a very great degree, nay in every one  
 of the Cases before us there was not a principal trunk passing over  
 passing over the Osifice, only a small branch end'd about y<sup>e</sup> vein, &  
 it was not to impossible to trace it very exactly into the Osifice  
 because it came to be compound'd w<sup>th</sup> y<sup>e</sup> subcutaneous cellul. Subst<sup>ce</sup>  
 by y<sup>e</sup> hardness and inflam<sup>n</sup>. So it is beyond all doubt certain y<sup>t</sup> a  
 wound of y<sup>e</sup> Subcutaneous vein can produce these Symptoms. —  
 There is no one case choosing y<sup>t</sup> it proceeds from the Tendon we  
 scarcely can imagine a Case y<sup>t</sup> occurs y<sup>t</sup> will prove it, It is not  
 enough y<sup>t</sup> it happens by opening y<sup>e</sup> median Basilic Vein over the  
 Tendon: for if we find the same Symptoms from wounds made at a  
 distance, is it not probable y<sup>t</sup> y<sup>e</sup> others may proceed from y<sup>e</sup> same  
 Cause, or what proof can we give y<sup>t</sup> we have not wounded a subcut-  
 aneous nerve in y<sup>e</sup> passage into the Tendon, & in two cases, where  
 y<sup>e</sup> dangerous Symptoms arose from a wound of y<sup>e</sup> median Basilic  
 there was no puncture made in the Sphenosivis. — Now after  
 determining y<sup>e</sup> place affect'd let us see what application  
 in practice it admits of.

1<sup>st</sup> thought to avoid the large & subclavian cutaneous nerves  
 to draw the blood from y<sup>e</sup> median basilic w<sup>ch</sup> is only accompany'd by  
 small branches of nerves, and in these Cases when y<sup>e</sup> wounding or  
 small nerves was attended w<sup>th</sup> large swelling & supp<sup>r</sup>. if y<sup>e</sup> puncture  
 had been in the Cephalic Vein, and large nerve affected like these  
 smaller probably the consequences w<sup>d</sup>. have been more material.  
 When we recommend y<sup>e</sup> median Basilic another difficulty presents it-  
 self from the artery, but we can always find a place in that Vein  
 sufficiently distant, it is 1/2 Inch in length, so we can always find  
 a place where the artery may be divided avoided. Next suppose y<sup>e</sup> a  
 patient is struck w<sup>th</sup> a very sharp pain in letting blood, we must allow  
 y<sup>e</sup> him to bleed w<sup>th</sup> freedom to prevent Inflammation next we keep it  
 properly bent & supported, for the motion contributes much to the bad  
 symptom. Next we watch y<sup>e</sup> appearance, if y<sup>e</sup> pain continues & the  
 part begins to swell, we w<sup>d</sup>. enlarge the Incision & cut y<sup>e</sup> subcutaneous  
 nerve across, y<sup>e</sup> y<sup>e</sup> Tension being taken off y<sup>e</sup> Inflamm<sup>n</sup> may in a y<sup>e</sup> measure  
 be prevented & from amputation we see y<sup>e</sup> y<sup>e</sup> division of a large nerve is  
 less material y<sup>e</sup> y<sup>e</sup> puncture of a small one. Or suppose y<sup>e</sup> pain not  
 acute but y<sup>e</sup> y<sup>e</sup> swelling comes on afterwards & more especially if there  
 is an appearance of a delirium, unless the patient is in a fever, where  
 y<sup>e</sup> delirium is a natural conseq. of the disease: I w<sup>d</sup>. propose y<sup>e</sup> y<sup>e</sup> Incision  
 sh<sup>d</sup>. be made in the nerve a little higher y<sup>e</sup> y<sup>e</sup> part inflam'd; If y<sup>e</sup> is later  
 being done we are not to imagine y<sup>e</sup> y<sup>e</sup> bad symptoms can be taken off  
 by the Incision, but they will not be increased I have made y<sup>e</sup> y<sup>e</sup> Experiment  
 twice & in both cases the patient surriv'd, while in other Cases where it  
 was not done even when the swelling was less considerable, y<sup>e</sup> Patients  
 dy'd, so probably y<sup>e</sup> y<sup>e</sup> symptoms are alleviated by their means. But  
 when the parts are thickn'd & the neighbouring branches become to  
 be swell'd & sympathize, besides y<sup>e</sup> inexplicable sympathy y<sup>e</sup> all  
 the parts of the nervous System have with one another we are by  
 no means to suppose y<sup>e</sup> the swelling or danger may be altogether  
 remov'd. With regard to applic<sup>ns</sup> we doubt but pastures & rest are  
 especially proper, but it may be question'd whether digested Spirit of  
 Turpentine & such very irritating substances, or Emollients are the best  
 I think y<sup>e</sup> Emollients are most proper, but in the Tooth act, instead of

warm water, we relieve it. Pain by touching it. nerve with an  
ardent Spirit, perhaps the best way is to make the trepan immediately  
to the wound, but over the rest of the Skin to lay on an Emollient poultice  
or a discharging one, as of Sacchar. Saturni besides letting blood and  
exhibiting opium & Opium, w. <sup>ch</sup> may have their use, From the Success  
of w. <sup>ch</sup> Saturnus is treated w. Mercury if a suff. quantity be thrown  
in it may be of use, but Opium on the first of Internal  
remedies if we wd. have recourse to.

### Lecture 62<sup>nd</sup>

We proceed to consider it. distribution of it. nerves & Vessels on the  
containing part of the Uterus. — And to make a few remarks  
upon these Vessels, you have seen them coming in diff. directions  
in the containing parts, the Epigastric communicates freely with  
the Mammary &c. — The Arteries is intended to guard against  
Obstructions, but more material consequences have been supposed  
to attend it. Communication, & partic. of it. Epigastric with the  
Internal Mammary Dr. Boerhaave & Dr. Whitt suppose it. flow  
of Milk after delivery depends upon it. communicat. They tell us  
it. im. <sup>ly</sup> after delivery there is a great discharge from it. uterus &  
in consequence of it. mouth of its Vessels being so freely open'd  
the push is lifed into all the other Vessels, so it is sev. days before  
the Milk appears: But as soon as it. contraction of the Uterus &  
the blood coagulating in the mouth of the Vessels, a small Quant.  
is circulated thro' the body of the Uterus, there is an increase of the  
Momentum of the blood in the Epigastric Artery so a great Qu. <sup>ty</sup>  
is sent thro' the Epigastric Artery to the Mammary w. occasion  
the flow of Milk: Now I apprehend it. is absolutely inconsist.  
w. the Anatomical facts, & it. we can't reconcile it. Thoy w. <sup>th</sup> known  
& gen. Laws of it. Circulation of it. blood. For if it. flow of Milk  
depended upon it. partic. lower of the Epigastric Ar. <sup>ty</sup> it. <sup>ty</sup> <sup>ty</sup> <sup>ty</sup>  
of the Arter. was increas'd in this instead of finding it. it only  
communicates w. the small branches w. <sup>th</sup> it. Internal mammary  
Artery w. <sup>th</sup> we have found it to terminate immediately upon the

is a mistake of a single drop of y<sup>e</sup> Epigastric Blood we reaches y<sup>e</sup> Mamma; it is inconsistent w<sup>th</sup> the Lawe of y<sup>e</sup> Circulat<sup>n</sup> to suppose it, as we to imagine y<sup>e</sup> the blood runs from y<sup>e</sup> smaller Branches of y<sup>e</sup> Artery into its Trunk. This never happens, unless when the Mammary Art<sup>y</sup> is taken up w<sup>th</sup> a Ligature & this is onely of y<sup>e</sup> joining, y<sup>e</sup> in case of an obstruct<sup>n</sup> in the Mammary Artery there may be a supply. But in the ordinary course of y<sup>e</sup> Circulat<sup>n</sup> it is absurd to suppose that any blood enters y<sup>e</sup> breast y<sup>e</sup> way. The only effect is, admitting y<sup>e</sup> left passage thro' the Uterus & y<sup>e</sup> now enters y<sup>e</sup> Epigastric Art<sup>y</sup>. y<sup>e</sup> blood will not pass down wards by y<sup>e</sup> small Branches of y<sup>e</sup> Mammary Art<sup>y</sup> as before. But it is to be doubted if y<sup>e</sup> Communica<sup>n</sup> can have such an effect for before delivery y<sup>e</sup> uterus pressing strongly upon y<sup>e</sup> descending Artery, & upon the containing parts of y<sup>e</sup> Abdomen w<sup>ch</sup> make a great resistance to y<sup>e</sup> descent of y<sup>e</sup> blood, by y<sup>e</sup> Branches of y<sup>e</sup> Mammary Art<sup>y</sup>. Then the increased momentum of y<sup>e</sup> blood in y<sup>e</sup> Epigastric can do; so y<sup>e</sup> force of the Circulat<sup>n</sup> in y<sup>e</sup> internal Mammary Art<sup>y</sup> is the same before delivery as after: nay the matter may be bro<sup>gt</sup> to the decision of an Experi<sup>mt</sup>. I will venture to alludge y<sup>e</sup> if we were to cut thro' y<sup>e</sup> uterus muscle & divide all y<sup>e</sup> communicating Branches, we w<sup>ch</sup> still find y<sup>e</sup> flow to the breast take place in the usual manner, therefore y<sup>e</sup> Theory must be laid aside as altogether insufficient for y<sup>e</sup> purpose & we must have recourse to an explanation w<sup>ch</sup> depends upon very diff<sup>er</sup> principles. Whatsoever Ideas we entertain of y<sup>e</sup> cause of y<sup>e</sup> menst<sup>r</sup>ual flux whether we suppose it to depend upon ager<sup>e</sup> or a partial plethora at delivery y<sup>e</sup> constitution has been in the habit of preparing blood both for y<sup>e</sup> Mother & Child, & y<sup>e</sup> habit continues the same for a certain length of Time, for the 8<sup>th</sup> days after delivery there is ager<sup>e</sup> debility from y<sup>e</sup> opening of the Vessels of y<sup>e</sup> Uterus & y<sup>e</sup> great discharge of blood but after y<sup>e</sup> is stopped by the blood coagulating in their offices, y<sup>e</sup> uterus greatly contracted, & y<sup>e</sup> vessels of y<sup>e</sup> body have accommodated themselves to y<sup>e</sup> state of

figures they contain and as may Woman w<sup>th</sup> Child has the  
 vessels immediately distended there is still remaining a considerable degree  
 of fulness, and unless some outlet is given by the breast, by suck-  
 nature water an outlet some other way, w<sup>ch</sup> woman sweats very pro-  
 fusely & is in danger of falling into some disease, as a fever &c  
 we can conceive w<sup>ch</sup> necessity of w<sup>ch</sup> separation of w<sup>ch</sup> Milk. But for this  
 we might a priori conclude w<sup>ch</sup> nature nourishes w<sup>ch</sup> Child before deliv-  
 ery & after it nearly in the same manner, they figure nearly of w<sup>ch</sup>  
 same nature, w<sup>ch</sup> there is a Section in w<sup>ch</sup> Uterus resembling that  
 made in the breast; and when w<sup>ch</sup> nourishing vessels are collected  
 into glandular masses, as in Cow & Sheep we find a Figure in  
 Color and Taste resembling milk. In the human body, w<sup>ch</sup> vessels are  
 not so collected but by their division upon the Uterus a simil<sup>r</sup> secretion  
 is made & when that Section comes to be interrupted w<sup>ch</sup> vessels recover  
 their Tone, now the flow is to the Breasts just as when w<sup>ch</sup> respiration  
 is stopped there is a flow towards the Stomach, w<sup>ch</sup> Organ is swelled  
 w<sup>ch</sup> w<sup>ch</sup> marred & if the Child is applied, by the sucking w<sup>ch</sup> flow is  
 better determined, & w<sup>ch</sup> independent of other Causes, & w<sup>ch</sup> in Animals  
 w<sup>ch</sup> formerly had young will bring again the Milk: we conclude  
 therefore w<sup>ch</sup> w<sup>ch</sup> vessels of w<sup>ch</sup> mother had been in w<sup>ch</sup> habit of pre-  
 paring more nourishment w<sup>ch</sup> was necessary for herself during the  
 9 Months of pregnancy, w<sup>ch</sup> this constitution for a certain time  
 remains, & as w<sup>ch</sup> Section made in w<sup>ch</sup> Uterus resembles w<sup>ch</sup> made  
 in w<sup>ch</sup> mammæ when there is an interruption of w<sup>ch</sup> own Section  
 there is an increased secretion in w<sup>ch</sup> other glandular Organs.

Lecture 63.

With w<sup>ch</sup> the vessels w<sup>ch</sup> may be considered as w<sup>ch</sup> ground work of w<sup>ch</sup>  
 Lung's - the Trachea is composed of membranes w<sup>ch</sup> muscular  
 fibres & rings of Cartilage, w<sup>ch</sup> an imperfect behind; this allows  
 w<sup>ch</sup> food to descend in w<sup>ch</sup> Oesophagus, & w<sup>ch</sup> Circle not being com-  
 plete, w<sup>ch</sup> Trachea in w<sup>ch</sup> respiration. & formation of w<sup>ch</sup> voice allow its  
 length & distension more readily; when we follow w<sup>ch</sup> Trachea  
 to its division into Branches a similar Structure takes place

great way thro' it. Substances of it. Lungs but as now there is  
 no reason why the defect sh<sup>d</sup>. be only in the posterior part, it is  
 a few perfect portions of a Circle in the whole circumference till it  
 like become membranous & there terminated in Cells of a similar  
 texture so far as we may judge by the Eye: these ultimate branches  
 of the Trachea are not so small as Dr. Hall's. suppose but can be seen  
 with the naked Eye: the minute cells are found to communicate freely  
 the one another, so if we blow Air into it, small branches a m<sup>ch</sup> greater  
 portion of it. Lungs is inflated, & from a single lobule we can fill it whole  
 the so I apprehend it every cell of the lungs has not its corresponding  
 vessel but are more numerous, & the Cells are so extremely minute it  
 been entering into a calculation we are surpris'd w<sup>th</sup> the vast extent of  
 surface w<sup>ch</sup> may be nearly equal to it. Surface of it. walls of it. have we  
 are now in, & it. pulmonary Artery has a very minute division every where  
 being address to it. Sides of the Cells. The Air in the Cells is confin'd  
 a membrane proper to it. Lungs & it. membrane is more extensive of  
 only from viewing it. Lungs in it. concave, for it. division into Lobules  
 is to a great depth; & there divisions of it. Lungs into Lobules  
 low'd in to accommodate ourselves to it. Size of the Thorax, & allows way  
 it to be expanded in the most equable manner, & it. their play upon  
 it other way be the easier & they may the more readily retract: you  
 we even it. a Cell. Membrane enter between the Lobules; & it. whole  
 cover'd over w<sup>th</sup> the pleura with any Communication. It is strange to  
 observe w<sup>th</sup> Dr. Hall's it. it. Cells communicate w<sup>th</sup> it. common Cell. membrane  
 convey<sup>ce</sup> of it. must be the diffusion of the Air in it. interlobular  
 Cell. membrane, & from it. over it. whole body, & we w<sup>o</sup>. be of force to  
 emphysema & it. increased in the Lungs it. water making it way  
 to their Cavity: when the Lungs are taken out round we can indeed  
 see blowing in Air make it go into it. Interlobular. Subst. Cellula  
 Membrane, & we are apt to imagine it. when we do this by it. force of  
 breath it. same violence is done to our own Lungs, but our Lungs  
 are prevented from over distension by the containing sp. of it. Thorax, so  
 we can burst Lungs it. in Air were stronger of our own, before  
 using it. Thorax I have not been able to make injections pass into  
 a Cellular Membrane: so we may compare it. Membrane as proper

the fat & extravasated Liguor, & allowing & allowing it.  
 The Lungs are on purely vascular, & blood is still & sent upon a  
 lid of weight 15 times or more, & when vessels are numerous  
 in proportion to weight may find it in equal portions is  
 greater for & find upon injecting fluids it they pass more readily  
 from pulmonary artery into vein than in other places of  
 body: This generally supposed of veins are not in such proportion to  
 the arteries in Lungs as elsewhere, but there is no such diff. as is  
 generally supposed, in the arterial system many veins run under  
 muscles & hence there are Lungs; & of course is larger in proportion  
 of pulmonary veins: there is likewise an inequality in size of  
 the sides of heart, right is originally larger is the diff. &  
 perhaps is diff. in course w. use or wear, because of unequal  
 steps in expiration, & blood passing w. more diff. thro' Lungs  
 in state of expiration in Inspiration when vessels are drawn  
 out into straight lines, & of passage of air within Lungs  
 taken off for air does not so readily enter by narrow  
 passage of glottis as to make same passage in Inspiration  
 & takes place in expiration when the sides of Thorax are drawn  
 in, & passage of air being difficult thro' glottis, the  
 pulmonary vessels come to be compressed. There is a minute division  
 of blood vessels upon cells of Lungs w. appear very  
 when red upon vessels being injected but there is no appearance  
 of glands for mucous & yet a secretion is made from  
 the minute of pulmonary vessels of a matter is pernicious to  
 animals; we are constantly throwing out a quant. of effluvia  
 which is mixed w. & carried off by the air we breathe: Besides  
 pulmonary vessels, we find other small, but constant arteries  
 derived from the Aorta, & Bronchial, & N. saying in diff.  
 subjects; & they make a very intimate division thro' the  
 Lungs at first we might imagine it they were accidental  
 Luxus Naturae from the Aorta scattering itself on all sides  
 but we cannot doubt of material purposes are served by the

288.

Vessels tho' it is diff: to say what they may be, In like  
manner 12. Coronary Arteries of the heart are divid'd from 12. Aorta  
only, & tracing these back 12. veins terminate on 12. right side,  
tho' we wd. have imagin'd 12. they wd. have gone into 12. left Auricle  
with 12. pulmonary, & in the Liver where we find a vast Quant:  
furnish'd by veins & forming a Vena porta, we shall find a  
branch constantly from 12. Aorta, wch. it wd. appear 12. there  
as purposes necessary to be done in 12. various Organs wch. the  
whole mass of blood, or vessels carrying it thro' these Organs  
are not fitted to execute; or 12. greater change is produc'd by  
a single circulat: 12. at first sight we are awar of: it is gen:  
suppos'd 12. 12. Bronchial Vessels were for the nourish: of the  
Lungs; but tho' I shall prove 12. 12. nutrition depends upon  
12. bloodvessels, yet I cannot wth a certainty affirm 12. to be 12  
purpose they were, nor till life 12. it is 12. only purpose. —  
You have seen a N: of minute glands on the back of 12. Trachea  
12. make Ridges in the Rings of the Trachea & wch. evidently  
pour out mucus we can wth 12. Knife trace these glands in 12.  
larger Branches of the Trachea & we are to apply what we  
see there to 12. most minute branches, as they must have a  
very extensive distribution here as in other places, whenever  
12. air has access or acid Oligum are apply'd & wch. require 12.  
separation of a mucous or viscidous matter. — In some few  
diseases there is an appearance wch. is suppos'd to be owing  
to an increas'd quantity of mucus, & 12. dry'd upon 12. Trachea  
& wch. appears in the form of a membran:; but we may doubt  
whether it is owing to mucus, or if we are to consider it as a  
Crust form'd by an inflammatory exudation, just as if I cut  
into 12. peritonaeum or pleura there is discharg'd a liquor wch.  
gradually inspissates & forms a Crust of 12. Lymph: & p: of the  
Blood & upon exposing the Crust in the Trachea to acid Sp:  
it gets a consid: degree of hardness while we don't obs: wch.  
great change produc'd upon mucus by such an addition

In some of these diseases a few Authors have considered  
 it as the Cause of it, but I do rather view it as  
 the effect; & tho' we could remove it by a wish, I doubt if we  
 could cure the patient, or if the danger depends upon the Inflammation: I  
 have had repeated occasions of Children dying of the Croup, & I found  
 it in passage for the Air was not intercepted by the Membrane. -  
 These membranes may separate from the Trachea & be a cause of  
 Suffocation great in infants, & it may happen it collecting it  
 shall stick in the Larynx & suffocate the patient but they  
 are no more the cause of the disease, if a fixed Tongue in a fever  
 is to be considered as the cause of the Fever.

Observe of all the matter absorbed from the Lungs passes to the  
 right side of the heart, so of changes made upon it, blood from  
 it before circulation don't depend upon a difference of mixture  
 of parts, but upon the effect of the Lungs compressing & agit-  
 ating it, & a somewhat discharg'd from it, & excretion  
 of it, pulmonary Artery, & the Colon of it, matter in the  
 Bronchial glands, in a young Subject we observe nothing of  
 it, Black matter: in an adult it color of the Lungs gradu-  
 ally changes from a brown to a black color; & it is some useful  
 it by separating a certain substance gives it black color to  
 it, solid part of the Lungs, by making a similar secretion  
 into it, Cravity of the Trachea may give it same color to the  
 mucous or it, excretion of it, pulmonary Artery discharge  
 by their exhalent terminations it, black color, & the bronch-  
 ial glands giving passage to it, about it, vessels, receive  
 it, black tinge from it, Lungs, & Trachea raising it, color  
 first & communicating it to the bronchial glands, & as all  
 it, solid parts of our body are constantly undergoing a change  
 the solid mass of it, Lungs & vessels will be in course gradu-  
 ally reasum'd by new about it, Vessels & it, color will also  
 be communicated in it, way; & it, color of the Lungs & of the

as always comes, and, so y<sup>e</sup>. Bronchial glands (203.)  
owe a ring to purpose, y<sup>e</sup>. of absorption and receive their  
Color from the Lungs.

### Lecture 24.

Yesterday we considered the Lungs with y<sup>e</sup>. glands, y<sup>e</sup>. divisions  
of y<sup>e</sup>. Trachea & its termination in the Cells of the Lungs, y<sup>e</sup>. the  
Cells seem'd to communicate freely w<sup>th</sup>. each other upon y<sup>e</sup>. surface  
as well as deeper in y<sup>e</sup>. Lungs, y<sup>e</sup>. Clusters of Cells form the  
lobules & those y<sup>e</sup>. greater Lobes, & y<sup>e</sup>. y<sup>e</sup>. proper Cells are covered by  
a Membrane w<sup>ch</sup>. is a continuation of y<sup>e</sup>. pleura, that y<sup>e</sup>. Cells of the  
Lungs are not to be supposed capable of contraction & a cause of  
the difficulty of breathing in an Asthma, but y<sup>e</sup>. we are to refer y<sup>e</sup>.  
to the spasmodic affection of y<sup>e</sup>. Blood vessels & to y<sup>e</sup>. contraction of  
the Cells, & supposing y<sup>e</sup>. Larynx & nerves were divided, this a great  
Oppression & Anxiety w<sup>ch</sup>. remain y<sup>e</sup>. Asthma w<sup>ch</sup>. not be violent.  
After observing y<sup>e</sup>. gen<sup>l</sup>. distribution of y<sup>e</sup>. vessels & turning our  
attention to y<sup>e</sup>. glandular structure we observ'd y<sup>e</sup>. without a glandular  
Apparatus a secretion of a hucifal nature is evidently made  
or y<sup>e</sup>. a quant<sup>y</sup>. of fixed or sulphuric Air makes a p<sup>t</sup>. of expiration  
Dr. Black shew'd y<sup>e</sup>. nature of this by y<sup>e</sup>. follow<sup>g</sup>. Experiment,  
he took a bent glass Tube or Syphon pour'd some Lime Water  
into it & drew y<sup>e</sup>. breath thro' the water w<sup>ch</sup>. produc'd no change  
upon it but upon breathing thro' it again, grains of Lime app<sup>r</sup>.  
or what the Lime had lost in the fire is hereby recover'd; and  
what is remarkable, y<sup>e</sup>. that Organ w<sup>ch</sup>. is intended to make y<sup>e</sup>.  
discharge is most affected by it when it is apply'd to it, we  
receive y<sup>e</sup>. Air into y<sup>e</sup>. Stomach with Impunity but it returns  
upon y<sup>e</sup>. Lungs not without danger. I w<sup>ch</sup>. observ'd y<sup>e</sup>. Lungs were  
some way or other not only to intimately mix, but to act too by  
Blood as something useless, so I think it pretty cert<sup>n</sup>. y<sup>e</sup>. whilst  
we throw out somewhat highly dangerous w<sup>ch</sup>. at y<sup>e</sup>. same Time

take in a somewhat of it is useful: I wd. suspect if our  
 old supposition from the Analogy of other Animals; if we throw a fish  
 into water from the <sup>st.</sup> <sup>of</sup> this has been extracted it dies in a short Time  
 and surely water alone is equally fitted for making an Impression  
 upon the quills, or for washing of any thing hurtful mix'd w<sup>th</sup> blood  
 I therefore suppose if there is a vivifying Spirit or somewhat useful to  
 Life rec. from the external Air in Inspiration whilst by expiration we  
 make a discharge of somewhat hurtfull. We next proceed to trace  
 the Course of the Thoracic Organs & the Diaphragm or pleuriticum  
 w<sup>ch</sup> is a fit subject for experiments from the length of its Nerves  
 We find if the heart receive its supply from 13. Nerves at least  
 may be divid'd into 2. courses of 7. descend, we are not certain but there may  
 be others of 6. ascend and enter into the substance of the heart, & upon  
 the whole we can do. if nature carefully guards ag<sup>t</sup> want of a  
 proper Energy, we suppose from any Accident or Disease a part of it  
 force sh<sup>d</sup>. be lost, it is better if the larger & more any one part  
 sh<sup>d</sup>. be render'd Paralytic; since if the heart derive its Nerves from  
 a No. of Organs & these are intimid'd by the intervention of  
 Gargles, a further Energy proceeding perhaps from these. From  
 the Consider<sup>n</sup> of the importance of the Organs upon w<sup>ch</sup> these Nerves  
 are spent, the danger of wounds in the Nerve of the neck is perfectly evi-  
 dent, if a wound be made in the preparation of an animal soon die;  
 & independant of the danger w<sup>ch</sup> attends the ligation or division of one  
 Nerve, we have reason to believe if there is a trust danger to be  
 apprehended where the 8<sup>th</sup> pair of Intercostal run, upon their being  
 expos'd to the Air, & an inflammation taking place, it alone will be  
 found after fatal: so we are not rashly to undertake Operations  
 here, or for the Ancurism in the Costal Artery, supposing it small,  
 For it is in the Surgeons power to tie the Artery in 2. places. I have ty'd  
 the Artery communis & the Arteria Curv'd, but when any gre-  
 ater Injury was done the Animal died, & I found these Nerves were  
 in an inflam'd state & glued to the neighbouring Organs.  
 It is a point allow'd in practice if what is call'd the pleurisy, the  
 Inflamm<sup>n</sup> of the Side, of the contour of the Thorax, is attend'd w<sup>th</sup> more pain

and a harder pulse, &c. &c. true peripneumony when of Inflamm. (209.)  
is in the substance of the Lungs, now we may in some measure explain  
these w. c. circumstances no doubt come, but without taking into Acc.  
of difficulty arising from of Inflamm. w. w. c. blood proper from the  
right Side of the heart to the left to affect the pulse we feel, we use.  
we w. say of from of greater number of nerves sent to the Side, its  
Sensibility is greater, &c. &c. System is more irritated, & perhaps fur-  
ther one thing may have effect, of of proper Dorsal Nerves are intim-  
ately connected to the Nerve w. supply of heart, & this we dont say  
of of Sympathy depends upon the Connexion of the Nerve in their  
progress, yet an inflamm. find upon a branch more readily affects  
of neighbouring branches of the distant nerves of the body. So I  
say of the hardness of of pulse, of quick jerk is owing very much  
to sensibility of from these large nerves, w. too is of Cause of the  
pain. — So far we determine in gen. but a question remains w.  
has been much agitated, whether or w. to obtain of common name of ple-  
urisy, supposing of of pain, of of dangerous & often fatal Symptoms  
depend upon of Inflamm. of of pleura lining of ribs, or are w. to im-  
agine of of pain & danger depends upon of Inflamm. of of Intercostal  
Muscles, & to say of of inflammation of of pleura alone can produce  
all these Symptoms? I apprehend of of last opinion will be found  
the most just, & I shall observe of there is an w. oversight com-  
mitted by of practical Writers. You find of some persons exaggerat-  
ing of Symptoms, of the suppose to depend on an affection of of pleura  
or of part of of membrane lining of ribs; & diminishing of effect of it  
when it lines of diaphragm, since of pleura is common to both, how do we  
explain of diff. w. they themselves pretend to find between an inflam.  
erated in the one, or of other end of of parietal membrane? surely it is sim-  
ilar in its nature this out; We find of speak of of danger from the  
Affection of of nerves entering of pleura, as if they were consid.  
whereas it is impossible to demonstrate nerves enter. the pleura; &  
we observe of of whole substance of of Lungs does not receive a nerve  
larger of one of the proper Dorsal nerves, of divisions of it therefore  
must be exceedingly minute; & of nerves of the pleura very small

And it was to be suspected from considering it's use of *pleura* (P. 13.)  
w<sup>th</sup> respect to the Lungs is to give a strength to em, to confine the  
Air & prevent rupture; another use is of *Lungs* in resp<sup>n</sup> may  
play upon the ribs, *pleura* is int<sup>r</sup>posed to lessen it's attraction; now  
do we perceive either from it's one use or other any necessity for sensi-  
bility? a highly sensible membrane cannot be int<sup>r</sup>posed for either  
purpose. — I am ready to admit if the *pleura* has nerves, because  
it has vessels w<sup>th</sup> an actual life, the nerves, yet these are small &  
inconsiderable in n<sup>o</sup>. yet it is capable of Inflamm<sup>n</sup> & of concretions, w<sup>ch</sup>  
may be the source of many diseases; but we are not to believe if  
merely if inflammation of *pleura* is capable of occasioning fatal  
Symptoms, & if we depend chiefly almost entirely upon it's affection  
of the Nerves of the side w<sup>th</sup> are large & numerous, & w<sup>ch</sup> it is not in our  
power to relax, & w<sup>ch</sup> we cannot altogether refrain from using: &  
where the pain is seated entirely in the Lungs, I w<sup>ch</sup> allged of it's  
patient will suffer it's highest degree of danger when it's Inflamm<sup>n</sup> oc-  
cupies it's deepest part of the Lungs, both on acc<sup>t</sup> of it's Sensibility of  
the Trachea & of it's distribution of it's nerves from it's 8<sup>th</sup> pair, Thus  
if *Tubercle Scidula* is chiefly seated in the Trachea & if patient is  
most in danger when it's inflamm<sup>n</sup> is it's deepest within the Lung.  
From considering it's Structure of *Lungs* we can understand the  
reasons why it's Organ more of others is it's subject of disease: Oestry  
when diseases happen w<sup>ch</sup> here is rather difficult: they are continu-  
ally dead, in w<sup>ch</sup> the Air Substances hurtful to Life w<sup>ch</sup> pass deep  
into Cells of it's are very minute & communicate w<sup>th</sup> one another, by such  
winding passages if it's noxious substance is thrown back w<sup>th</sup> difficulty  
& suppose nothing may be convey'd w<sup>th</sup> it's Air if it is hurtful, if State of  
the Air may be such if it does not readily carry off the poison we  
are continually discharging from it's Lungs, & if I am hurt by it's  
in the condensed breath of other animals into my Lungs, an injury  
must arise if it's Substance is not sufficiently carried off by my own  
& I make no doubt if it's State of it's Air may be such as shall not  
sufficiently convey it's purbative Air & other poisonous matter from  
our Lungs & if it's in Time may lay it's foundation of disease.  
Their continual expansion & contraction in respiration & it's violent

Chylipactia

...ditions to w<sup>ch</sup> they are subject, & w<sup>ch</sup> we can have the (29th)  
immediate effect of throwing out the blood may lay w<sup>ch</sup> foundation  
of disease. — The acid Element is immedi<sup>tly</sup> blended w<sup>th</sup> blood  
on the right side of the heart & first undergoes a Circul<sup>n</sup> in w<sup>ch</sup> Lungs  
& it is vain to pretend w<sup>ch</sup> Chyle enters drop by drop & is suffic<sup>tly</sup>  
diluted & mixed before it begins to be circulated for in w<sup>ch</sup> blood  
from Animals after they have taken food I have observ<sup>d</sup> w<sup>ch</sup> Chyle  
swimming on w<sup>ch</sup> mafs, so w<sup>ch</sup> it does not enter in w<sup>ch</sup> gradual a way  
& they may often suffer by w<sup>ch</sup> Circumstance: And all absorb<sup>d</sup> mat<sup>r</sup>  
is too useful & hurtful from w<sup>ch</sup> Symp<sup>tomatic</sup> cramp w<sup>ch</sup> Lungs before  
the rest of the body — We must also take into acct. w<sup>ch</sup> velocity of  
the blood in the Lungs, w<sup>ch</sup> is w<sup>ch</sup> same quantity passes thro<sup>ugh</sup> in  
this the rest of w<sup>ch</sup> body, so w<sup>ch</sup> it must pass w<sup>ch</sup> greater violence, w<sup>ch</sup>  
must make us more subject to disease: we likewise see w<sup>ch</sup> difficulty  
of making a Cure when a disease has begun, from w<sup>ch</sup> Spongy & tender  
nature of the Lungs they are easily corroded & destroy<sup>d</sup> & even w<sup>ch</sup> out  
Bovum in matter readily passes by the communic<sup>n</sup> of the Cells, from a  
small part of the Lungs to a large: & in case of an ulcer the con-  
tinual Pace of Alternate motion must tear the sides of it w<sup>ch</sup> extend  
whereas nothing contributes so much to the healing of such ulcers as  
rest: & farther w<sup>ch</sup> discharge is made in the most disagreeable  
manner upwards. — The Velocity too of the blood being  
greater in the Extremities of w<sup>ch</sup> Vessels of the Lungs must render  
w<sup>ch</sup> Cure more difficult; just as ulcers in the Legs heal with  
difficulty & in case of w<sup>ch</sup> Curley posture And here w<sup>ch</sup> noxious  
matter is pour<sup>d</sup> in from other Vessels upon the diseas<sup>d</sup> organ, & we  
must take into acct. a Circumstance w<sup>ch</sup> has often effect, that  
whatever absorb<sup>d</sup> matter is taken in from the Lungs is im<sup>mediately</sup> return<sup>d</sup>  
upon w<sup>ch</sup> before there is any chance of an cure —

### Lecture 35.

Having consider<sup>d</sup> w<sup>ch</sup> Structure of the Thoracic Viscera we proceed  
the descending Aorta w<sup>ch</sup> the accompanying Nerves & we begin with  
the Splenoportic Viscera or bowels w<sup>ch</sup> receive, contain, or in any

have seen for  $\frac{1}{2}$  part of  $\frac{1}{2}$  Chyle or Aliment we find 276  
 the  $\frac{1}{2}$  Diaphragm is suppl<sup>d</sup> in the usual manner by branches  
 from  $\frac{1}{2}$  Aorta &  $\frac{1}{2}$  return of blood back again to  $\frac{1}{2}$  heart in  $\frac{1}{2}$  3.  
 my principal Arteries sent off from  $\frac{1}{2}$  fore part of the Aorta:  $\frac{1}{2}$  4.  
 Esophae, whose large branches suppl<sup>y</sup>  $\frac{1}{2}$  Nostrils or Stomach, the  
 other two run along  $\frac{1}{2}$  membrane of  $\frac{1}{2}$  Intestine. Canals & are  
 therefore named Mesenteric; & they are distinguished by the one  
 rising higher  $\frac{1}{2}$   $\frac{1}{2}$  other into  $\frac{1}{2}$  superior & inferior mesenteric Ar<sup>teries</sup>.  
 they likewise send branches to the pancreas, omentum, & Spleen  
 & Liver. — The branches sent to the Liver return w<sup>th</sup> blood in the  
 common way back to the Heart by the Vena Cava. But all the other  
 branches, instead of returning  $\frac{1}{2}$  blood as usual, unite  $\frac{1}{2}$  form  
 one great Trunk or Vein w<sup>ch</sup> enters  $\frac{1}{2}$  Liver at  $\frac{1}{2}$  porta, & is  
 called Vena portarum. As soon as it gets into the Liver it sp<sup>lts</sup>  
 like an Artery thro' the coats & is not of the thicknes, as in the  
 of an Artery  $\frac{1}{2}$  distribution is altogether Arterious dividing  
 into minute branches w<sup>ch</sup> we can't perceive by dissection, &  
 from their Extremities  $\frac{1}{2}$  blood returns by other veins the  
 Vena Cava & hepatica. — We proceed to demonstrate  
 these Vessels.

### Lecture 66. (D)

We find  $\frac{1}{2}$   $\frac{1}{2}$  Two Nerves emerging  $\frac{1}{2}$   $\frac{1}{2}$  pair, after supplying  
 $\frac{1}{2}$  Lungs run upon  $\frac{1}{2}$  Oesophagus in this Course downwards  
 they split into branches, & from  $\frac{1}{2}$  opposite sides  $\frac{1}{2}$  branches are  
 united,  $\frac{1}{2}$  branching & joining is a  $\frac{1}{2}$  time before we get down  
 to the Stomach, & we find an anterior & posterior plexus, but we are  
 only to understand  $\frac{1}{2}$  w<sup>ch</sup> nerves are included in the same sheath  
 but without knots or ganglia being found, the remainder of  $\frac{1}{2}$   $\frac{1}{2}$   
 pair pass from  $\frac{1}{2}$  back part of  $\frac{1}{2}$  Stomach to  $\frac{1}{2}$  Aorta & join  
 it as soon as possible about  $\frac{1}{2}$  root of the Celiac Artery. These  
 shall quit  $\frac{1}{2}$   $\frac{1}{2}$  pair & trace  $\frac{1}{2}$  great & sympathetic: That then  
 run down the Thorax, & is join'd to the super. intercostal nerves  
 abt  $\frac{1}{2}$  middle of the Thorax we find branches sent off w<sup>ch</sup> unite  
 from a common nerve  $\frac{1}{2}$  is spent almost entirely upon the

terminal bowels, we name by the letter  $\gamma$ .  $\gamma$  ramus of lanchu (276)  
we,  $\gamma$  rami of lanchu: take  $\gamma$ .  $\gamma$  rami direct<sup>ly</sup> w<sup>th</sup>  $\gamma$ . posterior br.  
of  $\gamma$ .  $\gamma$  pair, & they are joind to each other across  $\gamma$ . Aorta Sat  $\gamma$ .  
some time they receive  $\gamma$ .  $\gamma$  pair: w<sup>ch</sup>  $\gamma$ .  $\gamma$  rami must about  $\gamma$ .  
Pulver history and at  $\gamma$ . meeting we find a prodigious enlargem<sup>t</sup>.  
w<sup>ch</sup>  $\gamma$ . w<sup>ch</sup>  $\gamma$ .  $\gamma$  rami we w<sup>ch</sup> suppose  $\gamma$ . it is a cluster of small  
lobulate glands, & we find Ganglia, & sumits appearance it  
is call'd  $\gamma$ .  $\gamma$  similina. gland ganglion from  $\gamma$ . rami are sent  
off to all the Chylopoetic Viscera, & as these scatter a  $\gamma$ . proceed  
towards the diff<sup>t</sup>. bowels, there are others w<sup>ch</sup> call  $\gamma$ . Subst.  
plexus Solaris, like  $\gamma$ .  $\gamma$  rami sending out radii to all sides.  $\gamma$ .  
rami from it proceed along  $\gamma$ .  $\gamma$  rami, are conducted by  
a network  $\gamma$ .  $\gamma$  rami. take for Cell. Subst. I have their name  
from  $\gamma$ .  $\gamma$  rami they accompany a  $\gamma$ . plexus coliacus recent  
visus &c.

### Lecture 27.

We find  $\gamma$ .  $\gamma$ . plexus nam'd  $\gamma$ . similina in w<sup>ch</sup>  $\gamma$ .  $\gamma$ . rami are united  
is vastly larger  $\gamma$ .  $\gamma$  rami might have expected for  $\gamma$ . something more  
is done here  $\gamma$ . in w<sup>ch</sup>  $\gamma$ . other plexus where we can trace the fibres  
distinctly, whereas here we have  $\gamma$ .  $\gamma$  rami. I w<sup>ch</sup>  $\gamma$ .  $\gamma$  rami  
be somewhat added to  $\gamma$ . rami Energy in  $\gamma$ . part or  $\gamma$ . some part  
more is w<sup>ch</sup> diff<sup>t</sup>. from what  $\gamma$ . Brain itself supplies, we find here  
an intimate mixture & in cooperation of all  $\gamma$ . branches running  
downwards nature guarding a  $\gamma$ . total interruption of  $\gamma$ . rami  
Energy in organs  $\gamma$ . an necessary to life: Thus it is better to lose  
 $\gamma$ .  $\gamma$ . part of  $\gamma$ . rami Energy of  $\gamma$ . alimentary Canals,  $\gamma$ .  $\gamma$  rami  
total power of  $\gamma$ .  $\gamma$ . part of  $\gamma$ . length of it, for  $\gamma$ . a paralysis  
of a single part of it take place, there w<sup>ch</sup> be an interruption to  
 $\gamma$ . discharge of  $\gamma$ . aliment  $\gamma$ . action of  $\gamma$ . muscular Coat of  $\gamma$ .  
Aliment<sup>al</sup> Canals contributing in a very principal way to  $\gamma$ .  
So we at present say  $\gamma$ . in  $\gamma$ .  $\gamma$ . similina ganglion there is an  
intimate mixture of  $\gamma$ .  $\gamma$ . rami & we may consid<sup>r</sup>. then rami

297.

is deriv'd from a number of sources from 1. intercostal con-  
ducts w. the all the nerves of the Spinal Marrow, Arter. from 2. head  
rest w. the 3. to 4. blood vessels, 5. vena porta in its divisions are  
conduits in 6. and 7. it requires greater pains to push an In-  
jection thro' them, 8. to push an injection from 9. pulmonary Arter.  
into the 10. Arteries - This Vessel is form'd from Veins so is said  
a vein but it performs 11. office of an Artery, 12. bile is chiefly  
separated by it, 13. like 14. Arteries in other places 15. Dig. is separated  
from branches &c. From 16. singular Arteries w. 17. blood takes two  
18. force w. regard to its circulat<sup>n</sup> must be very consid<sup>r</sup>. thro' it is  
twice push'd from 19. heart, & twice attempts to return before it  
reaches it. we find 20. in 21. first circulat<sup>n</sup> 22. strokes of 23. heart to  
the Eye is beat, & there is no pulsation seen in the Veins of 24. Ali-  
mentary Canal more 25. in 26. other Veins & Arter. 27. Boats of the  
Vena porta are as thin after they enter 28. Liver, as when they come  
from 29. Stomach, so we need make no doubt, but these Boats possess  
a living power & muscular as well as 30. Arterial System: But  
state of motion is languid, thence we are expos'd in 31. part of 32. body  
more to stagnation & obstructions of various kinds 33. in any other  
I can understand how people fall into complaints from w.  
of exercise, & if there is a disposition to Dropsy from 34. laxity of  
35. valves & thinness of the fluids it will more readily shew itself  
in 36. Syst. of 37. Vena porta & in fact 38. ascites is more frequent  
39. any other species of Dropsy incipit. - Suppose 40. a Schinus  
affects 41. Liver in a great part or in 42. whole of it, we see a doubt-  
less Cause of Dropsy tho' difficultly w. 43. blood passes thro' 44. Liver  
has 45. same effect as a Ligature upon all 46. vessels composing  
47. Vena porta: so a ligature upon 48. Arm brings on a Dropsy of 49.  
whole Arm: and any hard Tumor encompassing 50. veins of 51. Liver  
may have 52. effect with<sup>o</sup> suppressing 53. 54. veins as 55. about the  
liver increas'd 56. resistance to 57. Arteries, when more liquor is thro'  
out & in many instances 58. Liver from its weight & bulk may  
press upon 59. Thoracic Duct, & so, whilst 60. exhalat<sup>n</sup> from 61.  
Arteries is increas'd 62. inhalat<sup>n</sup> by 63. Lymphatics may be

...in which at 12. & sometimes. — In 12. alimentary canal (209) 00  
...in 12. receives 12. Aliment or food 12. blood vessels on 12. Stomach  
Intestines everywhere be as tomorrow, becoming more & more  
...with 12. assistance of Glands they escape us altogether  
...we can only obs. an uniform red color. — Dr. Young has Dis-  
...in 12. fetuses, 12. new tart. Smith, 12. liquor of thin Stomach  
...power of coagulating milk as a pupa. for Digestion, &  
...food we take in is dissolved as by a menstruum some way  
...change therefore is made in its passage that 12. vessels  
...parts, we find Anatomies in every where as in 12. veins  
...these various humors in 12. blood vessels may be in  
...some measure fitted for performing 12. secretion, we may conjecture  
...12. blood is rendered more fit for 12. excretion of the Bile in the  
...liver, for instance, for comprising some of 12. Arteries of 12. glands  
...one of make time & have Anatomies, &c. with a proper  
...with a purpose must seem unnecessary. But 12. chief & most evident  
...tion is to guard agt. 12. danger of obstruction, from change of  
...in 12. diff. portions of 12. body & under 12. degree of  
...intention to suppress an art. in which 12. extremities have 12. blood  
...and into one by 12. natural branches. — But we must attend to the  
...and effects of disease: & almost all 12. cause of disease that  
...Anatomists discover by dissection arises, at least 12. quarters. No  
...12. 12. most frequently occur — 12. w. 12. v. 12. concretion 12. we must  
...with him, & w. 12. are by no means a rare occurrence, most of em have  
...nuclei, & we may suppose em in others where they seem to be wanting  
...so we can imagine a clot of blood to seem as a nucleus w. may  
...afterwards shrink so 12. we can scarcely perceive it on cutting open  
...12. Bile. In order to give some Idea of one way in w. such walls  
...may be found I have shown you a ball taken from 12. Stomach of  
...a Cow, 12. are plainly composed of hairs 12. an always of 12. same  
...color as those of 12. Surface, & these are found by 12. Animal  
...biting itself, 12. hairs are determined to 12. What by 12. right of 12.  
...mouth &c. so some to be collected in 12. Stomach. In like manner  
...we may imagine concretion found within ourselves, but we

not to imagine it is indigested & fibrous substance (209, 300)  
14. Aliment alone forms these concretions there may be such  
attraction of it nucleus to parts of it aliment as takes  
place in it, vis. in urina. So within our alimentary canal  
when you see <sup>the</sup> concreted ends of Gooseberries, & such concretions  
of all stones, suppose one to form in it stomach they  
nearly stop thro' till they come very low, & are met frequently  
found in it great intestines <sup>partly</sup> in the beginning of it Colon  
in it Caput Coli more especially, or in it Caput Secundi Coli  
there they are very much out of it. Circul. of it food, & it Caput  
Coli is somewhat tonic found at it. same time of very consid.  
size. — We wd. judge of it disease if a person with seeming to have  
any very great weakness in it stomach, being subject to nervous  
complaints has a frequent pain, if it is situated in one part  
part of it Intestines & remains there for a consid. time, if it comes  
in an uncertain manner, with it patient being able to find a cause  
it no error is committed in diet; at some time perhaps it part. has  
a loose belly, at another time there is a total stoppage, & it made  
mechanically by it ball blocking up it passage, soon after it is  
it perhaps a great discharge of it sweat, & it not without a great  
deal of pain, & part. we distinguish a ball of it kind by it part.  
feeling a pain upon pressing upon it part, & we can discover a  
remarkable hardness: if we find it has very much chang. its place  
or is situated where no solid bowel is to be found; were it under the  
left ribs we might apprehend it was at it point of it Pleura in  
a Scirrhus state, whereas if we find it at it side of it umbilicus  
we wd. conclude it to be owing to one of these concretions; under such  
such a suspicion it. gen. manner of treatment is obvious, we wd.  
attempt to discharge it. concretion by purgatives & under the  
Intestines slipping by oily medicines give injections &c. but sup. and  
if we see means to fail we may ob. one or two things.  
1<sup>st</sup> there is a possibility in certain situations of getting it out  
from it body with. opening it. Cavity of it Abdomen: I mean whether  
it is situated in it beginning of it Colon, in it Caput Coli, or

The most usual place where these Concretions lodge is in another  
 place where they very often stop, according to some way, is Concretion de  
 oribus of great black of je. Colon, but is apt to stop on je. left side: now  
 the Colon is only covered on the anterior part by je. peritonium, & we may  
 cut into it without cutting je. Cavity of je. peritonium, & admitting air  
 into je. Abdomen, w<sup>ch</sup> is attended w<sup>th</sup> the greatest danger, merely by its ad-  
 mission: next when a ball of je. kind has stop'd long in one place, by  
 inflammation & irritation of Coats of je. Gut on the kind, & je. same  
 cause acting, je. gut is constricted, & tho' the diameter of je. ball is not  
 at first greater w<sup>th</sup> je. of je. gut, in conseq. of je. constriction in it, it comes  
 to be impossible for je. ball to pass; & then comes to be an adhesion  
 to the contiguous parts of the Belly, so if it is attended w<sup>th</sup> pain  
 we may cut upon it without opening je. Cavity of je. Abdomen  
 and je. liver of some persons say je. Operation may be w<sup>ch</sup> done  
 one patient I had of je. kind of complaint had labored for some  
 years, was mistaken for a scirrhus of je. spleen & was treated at  
 London w<sup>th</sup> mercury & iuncta, from je. great hardness, je. pain  
 Situation & Size I was certain of a Concretion within je. Intestines  
 so gave only purgatives & Injections repeatedly, je. Stone was bro<sup>gt</sup>  
 down into je. Sigmoid flexure of the Colon & remain'd there 3. or 4  
 Months & all attempts to remove it from thence prov'd in vain.  
 These innumerable Seeds of goose berries were evacuated by a good  
 the history of the Case is je. The complaint of a violent pain &  
 sickness at Stomach, je. pain was seated at je. place of je. gas-  
 bladder. In Je. hours there was a deep yellow color in je. Eye  
 & all the marks of Jaundice; & I had no doubt w<sup>th</sup> it was  
 owing to a bilious Calculus in je. Guts. So I directed to examine  
 je. Stools to discover je. Calculus & je. led to je. discovery of these  
 Concretions w<sup>ch</sup> we found to the N<sup>o</sup>. of 3. or 4000. & je. reason of  
 casting goose berries was over w<sup>ch</sup> w<sup>ch</sup> had collected into  
 a Ball at je. turn of je. Duodenum, by their bulk, pressure and  
 Irritation had occasion'd je. common Symptoms of je. Jaundice  
 whenever we meet with such Symptoms, we sh<sup>d</sup>. at least en-  
 deavour to prevent any substance from lodging long in the  
 Intestines by giving laxatives. - Next we meet w<sup>th</sup> diff<sup>ty</sup>.

kinds of worms, the Tape worm and of girdling worm  
 it has been imagin'd of. <sup>2</sup> Tapeworm was a Grain of Animals  
 totally distinct from each other, of good some suppose con-  
 nected by Tenacula, but by injecting <sup>2</sup> Tapeworm I find that  
 there is a real communic<sup>2</sup> between its joints, <sup>2</sup> while  
 joints make but one animal, but every joint is at <sup>2</sup> same  
 time capable of living as being provided with a mouth. It has  
 been imagin'd of it is in a continual state of growth by fresh ad-  
 ditions to <sup>2</sup> number of Joints but we have no proof of this. —  
 Lumbricus are essentially & totally diff<sup>2</sup> from <sup>2</sup> earth worm  
 This is more easily expelled, but is more dangerous <sup>2</sup> of <sup>2</sup> former as  
 preyed only upon <sup>2</sup> Contents, but on <sup>2</sup> Coats of <sup>2</sup> Intestines  
 eating great portions of <sup>2</sup> Villous Coat has indeed it grow<sup>2</sup> stops  
<sup>2</sup> other Parts arising from their greater hardness, but in some  
 Cases there too are found eroded & perforated, & we are not to  
 conceive of <sup>2</sup> happens after death when <sup>2</sup> animal is uncom-  
 & wants to awake, & we have instances when <sup>2</sup> worm had m<sup>2</sup>  
 its way thro' Abscesses. — Next <sup>2</sup> Ricinus w<sup>2</sup> I suppose is  
 only a young Lumbricus & not a distinct species, it has been  
 represented as having two heads as it buds from <sup>2</sup> Cornut  
 ion occasion'd by its being kept in spirits, but in shape it near-  
 ly resembles <sup>2</sup> Lumbricus & I have s<sup>2</sup> seen existing at the same Time  
 Physicians have thought to kill these Worms by means of oils &  
 other medicines of <sup>2</sup> w<sup>2</sup> stop their Breathing power: but I've never such  
 w<sup>2</sup> the we could fill <sup>2</sup> whole intestinal Canal with oil it w<sup>2</sup>  
 not kill 'em; Oily Injections have bro<sup>2</sup> away a vast quant<sup>2</sup> of  
 Ricinus but they were all living. In <sup>2</sup> Case of Insects of <sup>2</sup> have  
 Breathing power <sup>2</sup> oil is an effectual remedy, thus upon touch<sup>2</sup>  
<sup>2</sup> Breathing holes of an Animal taken from <sup>2</sup> nose upon one side  
 it was made paralytic, & on touching these on <sup>2</sup> other side also  
 it soon died incessantly; & in <sup>2</sup> way we effectually kill a common  
 Flea. — With reg<sup>2</sup> to <sup>2</sup> yubs they may be twisted from a  
 sudden motion independ<sup>2</sup> of <sup>2</sup> momentum. I have met w<sup>2</sup> a Case  
 of this kind w<sup>2</sup> that of <sup>2</sup> today's illness w<sup>2</sup> all the common signs  
 of Pleur<sup>2</sup>: Upon opening <sup>2</sup> Body, ab<sup>2</sup> a foot or more of the  
 Intestine. Pleur<sup>2</sup> was found of a black color & lying at <sup>2</sup> right

side & I found y<sup>e</sup> appendix vermiformis had passed  
 over y<sup>e</sup> root of y<sup>e</sup> mesenterij & was entangled in y<sup>e</sup> mesenterij on  
 y<sup>e</sup> under side, & y<sup>e</sup> was y<sup>e</sup> cause of y<sup>e</sup> matif<sup>n</sup>: below w<sup>ch</sup> was con-  
 sidered to y<sup>e</sup> place, & y<sup>e</sup> appendix was thickend & enlarged, & stuffed  
 with mucus. now it is diff<sup>c</sup> to conceive how y<sup>e</sup> c<sup>o</sup>l<sup>o</sup> takes place & a  
 continues but I am certain of y<sup>e</sup> fact: — When y<sup>e</sup> intestines  
 rupted happens it is w<sup>th</sup> y<sup>e</sup> rupture & removal of y<sup>e</sup> intestine  
 must be greatly affected & one part falling double within the  
 other y<sup>e</sup> space pass w<sup>th</sup> difficulty, & y<sup>e</sup> same difficulty occurs  
 in y<sup>e</sup> circul<sup>n</sup> of y<sup>e</sup> blood, & on y<sup>e</sup> acc<sup>t</sup>. when it happens in ch<sup>o</sup>.  
 it is by no means to be consid<sup>d</sup>. as a thing w<sup>th</sup> danger. —  
 Next I shew you a case when a large piece of y<sup>e</sup> gut was pass<sup>d</sup>  
 by stool w<sup>th</sup> all its coats & y<sup>e</sup> patient surviv<sup>d</sup> w<sup>o</sup>ut more  
 there was evidently a breaking ab<sup>t</sup>. y<sup>e</sup> middle of y<sup>e</sup> small In-  
 testine, & if a portion falls double within another; is thickend  
 & stuffed, a total matification may be produced in y<sup>e</sup> portion  
 of falls there within, & thus it is discharg<sup>d</sup>, while a contraction  
 of y<sup>e</sup> extremities of y<sup>e</sup> gut takes place, so y<sup>e</sup> y<sup>e</sup> reparation  
 is evidently of advantage to y<sup>e</sup> part. y<sup>e</sup> mechanism of straitening  
 being taken away

Lecture 38.

We may judge of Constrictions of y<sup>e</sup> Intestines but without  
 being able to determine w<sup>th</sup> absolute certainty ab<sup>t</sup>. them. If a  
 patient has for a length of time complain<sup>d</sup> of unmovings in  
 a certain part of y<sup>e</sup> Abdomen w<sup>ch</sup> he is able to point out accura-  
 tely; if he is costive: & afterw<sup>ds</sup> discharges a y<sup>e</sup> g<sup>l</sup> of faeces  
 y<sup>e</sup> are gen<sup>lly</sup> liquid, because when a constriction forms y<sup>e</sup> p<sup>ts</sup>.  
 above is unobscurely dilated & so there is less absorption &  
 hence y<sup>e</sup> faeces remain in a liquid state, or if they are found  
 we find y<sup>e</sup> they are smaller y<sup>e</sup> in a person in health, & from  
 y<sup>e</sup> circumstances we may judge with probability. If y<sup>e</sup> pat<sup>t</sup>.  
 labours under a constriction of y<sup>e</sup> pylorus, he gen<sup>lly</sup> feels  
 an unmovings near y<sup>e</sup> part, a degree of fulness, & gen<sup>lly</sup> an  
 such persons as w<sup>ch</sup> are aciated, it can be distinguished w<sup>th</sup>  
 y<sup>e</sup> hand. If any valid reason is taken it lives from the  
 Stomach like a load, & it is gen<sup>lly</sup> vomited again, & y<sup>e</sup> most

cold & sub. In can be as jelly from a Gall-head, when  
 the constriction is in y<sup>e</sup>. descending part of the Colon on y<sup>e</sup>. left  
 side we may discover it from an obstinate constipation, occurring  
 Now all the Causes are Constrictions, humid, Intus Susceptiles,  
 constriction may occasion mechanically y<sup>e</sup>. Ileus, pain in  
 y<sup>e</sup>. Abdomen, a distention of it, an obstinate constipation, w<sup>th</sup>.  
 vomiting of Pauculent matter. — When a Cancer happens or an  
 Inflamm<sup>n</sup> in a violent degree, we find y<sup>e</sup>. guts glued to each  
 other & y<sup>e</sup>. neighbouring parts & sometimes y<sup>e</sup>. patient  
 survives for a great length of time, till y<sup>e</sup>. Coats of y<sup>e</sup>. Intestines  
 are consumed. — If an ulcer happens to be situated w<sup>ch</sup>. y<sup>e</sup>. the  
 Coats of y<sup>e</sup>. Intestines give way a communication is made w<sup>th</sup>. y<sup>e</sup>.  
 Cavity of y<sup>e</sup>. Abdomen, of w<sup>ch</sup>. I have seen one instance, the Air  
 generally escapes first & gives y<sup>e</sup>. appearance of a real  
 Tympanites, & in some Cases y<sup>e</sup>. swelling is prodigious &  
 affects y<sup>e</sup>. diaphragm to such a degree y<sup>e</sup>. patient can  
 hardly inspire. In such Cases y<sup>e</sup>. guts are found squeezed  
 against y<sup>e</sup>. back bone & y<sup>e</sup>. pulsions upon y<sup>e</sup>. Intestines seem  
 as a valve the return is prevented. — We must proceed to  
 y<sup>e</sup>. Chylipotic Viscera or those w<sup>ch</sup>. auger<sup>t</sup>. reckon<sup>d</sup> such  
 We begin with y<sup>e</sup>. Omentum. — It does not reach so low in  
 Man as in Quadrapeds. — It extends an oil y<sup>e</sup>. is directly  
 intersped between y<sup>e</sup>. sub. portions of y<sup>e</sup>. bowels & in y<sup>e</sup>. sub.  
 posture distills from y<sup>e</sup>. end of y<sup>e</sup>. Omentum to y<sup>e</sup>. bottom of y<sup>e</sup>.  
 Cavity, & had it extended farther y<sup>e</sup>. inferior part w<sup>d</sup>. have been  
 more y<sup>e</sup>. sufficiently supply<sup>d</sup>, so one primary purpose of it is  
 to prevent constrictions, & to allow our Bowels to slide & play  
 with ease & safety in our motions, But as we to say with  
 Bouhaave, Haller & others following them y<sup>e</sup>. oil of the  
 Omentum is taken in by it. veins & convey<sup>d</sup> to y<sup>e</sup>. Liver to  
 make a principal share in y<sup>e</sup>. formation of y<sup>e</sup>. Bile. I app-  
 rehend y<sup>e</sup>. opinion is to be altogether w<sup>th</sup> aside, here we find  
 conglutinated, & then give a suff. part y<sup>e</sup>. it is provided  
 w<sup>th</sup>. valvular absorbents, so y<sup>e</sup>. effused liquor are convey<sup>d</sup> to  
 the mesic duct & not to the Liver: as y<sup>e</sup>. Omentum is supply<sup>d</sup>  
 with its blood by small blood vessels only, a Surgeon may

cut off a portion of it in *Henric* without m<sup>o</sup>. danger  
 & there is little necessity for tying up the part before the  
 Incision w<sup>ch</sup> might destroy *q<sup>d</sup> Omentum* by drawing the  
 parts too close together, & yet the neighbouring vessels  
 We find *q<sup>d</sup> Omentum* subject to nearly *q<sup>d</sup> same kind of*  
*disorders*, as *q<sup>d</sup> Subcutaneous cellular membrane is*, &  
 particularly to *Stomat*; I shew'd you one *q<sup>d</sup> affected* *q<sup>d</sup> whole*  
*extent*, & *q<sup>d</sup> growth* was so prodigious as to be attended w<sup>th</sup>  
*q<sup>d</sup> disturbing* *q<sup>d</sup> functions of* *q<sup>d</sup> Abdominal viscera*, & at last  
 to prove fatal; but when it is confin'd to a particular place  
 it may be carried a *l<sup>t</sup>* for a great number of years, I may  
 distinguish it w<sup>th</sup> an almost absolute certainty, we can per-  
 ceive *q<sup>d</sup> Tumor* to slide, & play within *q<sup>d</sup> abdominal*  
*Muscles* & upon *q<sup>d</sup> surface of* *q<sup>d</sup> Intestines* - with *q<sup>d</sup> ag<sup>t</sup>*  
 Structure of *q<sup>d</sup> PANCREAS*, *q<sup>d</sup> most common opinion* *q<sup>d</sup>*  
 it is *q<sup>d</sup> principal Salivary gland* in just, there is a some-  
 what of color, a similar division into *q<sup>d</sup> other*, *q<sup>d</sup> coats of*  
 ducts thin & transparent, very much resembling *q<sup>d</sup> coats of*  
*q<sup>d</sup> inferior maxillary gland*, for instance, & sometimes  
 concretions form within *q<sup>d</sup> ducts* resembling *q<sup>d</sup> other saliv*  
*ary glands*; *q<sup>d</sup> agree* perfectly in color & consistence, may  
 I further apprehend a resemblance may be pointed out, *q<sup>d</sup>*  
 Mercury affects these glands, in like manner as *q<sup>d</sup> salivary*  
 glands are affected, & I have cured *q<sup>d</sup> Diarrhoea* w<sup>ch</sup>  
 mercury produces is very much owing to an increased disch<sup>g</sup>  
 from *q<sup>d</sup> Pancreas* & when a pipe was fix'd into *q<sup>d</sup> duct of*  
 pancreas by *De Graaf*, a liquor resembling *q<sup>d</sup> Saliva*  
 was discharged from it. Tracing *q<sup>d</sup> Arteries of* *q<sup>d</sup> Pancreas*  
 then come from *q<sup>d</sup> Splenic Artery* nearly at right angles  
 & it happens *q<sup>d</sup> all salivary glands* are supplied w<sup>th</sup> *q<sup>d</sup> Arteries*  
 much in *q<sup>d</sup> same manner*, so *q<sup>d</sup> q<sup>d</sup> direction* noway corres-  
 ponds to *q<sup>d</sup> effect of mercury* upon *q<sup>d</sup> m<sup>o</sup>*, w<sup>ch</sup> was supposed to be  
 thrown into *q<sup>d</sup> duct of* *q<sup>d</sup> Aorta* towards the head, and to be  
 determin'd into these glands by *q<sup>d</sup> direction of* *q<sup>d</sup> Arteries*, &  
*q<sup>d</sup> pancreas* was overlooked; but it is w<sup>th</sup> *q<sup>d</sup> m<sup>o</sup>* *q<sup>d</sup> effect of*

Mercury here is to be explain'd upon the very same principle (305.  
 as the secretion of Saliva. — we are next led to the  
 Spleen, w<sup>ch</sup> appears like a clot of blood inclos'd in a membrane  
 of no great thickness or toughness; we find Arteries in great  
 numbers conveying a great proportion of blood into the substance of the  
 Spleen & these divided into very minute branches of veins join  
 together to form larger veins forming a Trunk & terminating  
 in the vena porta. We can form no prevailing Idea of the Spleen  
 if it is subservient to the Liver, it had been a general notion  
 of the Spleen gave to the blood its red color but it is evident it does  
 not for we observ. red blood passing into the Spleen, & it had been  
 cut from Animals w<sup>ch</sup> have surviv'd Days, months & years  
 after. if blood always retaining its red colour: but further  
 if the Spleen was intended for the formation of red blood why  
 is the blood sent from it into the Liver & why after performing  
 its office, does it return in its channel & ad into the Veins?  
 We may say the Spleen is thrown in to break the force of  
 blood, as it is in the circulation of bile is best form'd  
 but in herbivorous Animals, where the tract is longer &  
 more blood dispos'd upon the aliment. Canal, we still find  
 a Spleen, w<sup>ch</sup> it w<sup>ch</sup> appears of some change w<sup>ch</sup> we perhaps  
 shall never be able absolutely to ascertain is produc'd on the  
 blood in its passage thro' the Spleen, such as fits it for the  
 separation of the Bile: or there is some other reason to believe  
 if it is subservient to the Liver, the w<sup>ch</sup> way to it we  
 shall perhaps never fully understand.

Lecture 13.

We are now to consider the Structure, office & some of the  
 principal affections of the Liver, you know the purpose  
 of it is to prepare & separate the Bile for the use of digestion  
 w<sup>ch</sup> I avoid at present entering upon particularly. If we are to make  
 any remarks it w<sup>ch</sup> be, if whilst the bile promotes the  
 digestion of food, it irritates at the same time the

great difference in many Animals in this Concerned & (307)  
Respect, as in Birds, where y<sup>e</sup> of the Liver has a sweet taste  
while y<sup>e</sup> in the Bladder is intensely bitter, so y<sup>e</sup>. This seems  
some very essential difference, The farther found y<sup>e</sup>. is. Cystic &  
Hepatic ducts run parallel to each other, & open separately into  
y<sup>e</sup>. Cavity of y<sup>e</sup>. Intestines w<sup>ch</sup> is likewise a fact, without any  
communication in this Course downwards, y<sup>e</sup>. led him back to  
the proof in y<sup>e</sup>. human body & cover are described when y<sup>e</sup>. Cystic  
duct was found distended obstructed by Calculi & y<sup>e</sup>. a consi-  
derable q<sup>ty</sup> of bile was found distending y<sup>e</sup>. gall bladder —  
Now to shew y<sup>e</sup>. with all these appearances of probability this  
notion is destitute of foundation: I wo<sup>ld</sup>. obs<sup>erve</sup>. y<sup>e</sup>. These follicles  
are indeed in the gall bladder but they are also every where in  
the other ducts, & they are partic<sup>ularly</sup> numerous in y<sup>e</sup>. Duct. comun  
& when we examine y<sup>e</sup>. Contents we find a clear mucous mat-  
ter within the follicle, so y<sup>e</sup>. they are merely intended for a  
defence against an acid matter, just as the bladder is covered  
with a q<sup>ty</sup> of slime, w<sup>ch</sup> in some diseases is discharged in  
great quantity. — With reg<sup>ard</sup> to the Taste, they agree in color they  
insipidating the hepatic bile, we imitate y<sup>e</sup>. Cystic, so y<sup>e</sup>. all y<sup>e</sup>.  
changes may be accounted for from y<sup>e</sup>. effect of Stagnation and  
Absorption. When y<sup>e</sup>. gall bladder has been distended with  
bile & yet a stone found y<sup>e</sup>. Stone has been moveable & y<sup>e</sup>.  
Bile passed the sides of the Stone, & y<sup>e</sup>. Stone being pushed down  
into y<sup>e</sup>. duct acts as a valve just as a cork within a Bottl<sup>e</sup>.  
stops y<sup>e</sup>. liquor before it is poured out of it: & we can point  
to vast n<sup>o</sup>. of Cases when y<sup>e</sup>. Cystic duct being totally obstruct-  
ed by a stone impacted into it, y<sup>e</sup>. gall bladder was found  
empty, y<sup>e</sup>. sides almost contiguous & quite flaccid, & a single  
instance of this kind is decisive, similar Argum<sup>ts</sup>. shew the  
fallacy of comparing Birds to Men. — And we may further consid-  
er as a point established in physiology y<sup>e</sup>. bile descends  
from y<sup>e</sup>. Liver by the hepatic duct, & passes by the Cystic into  
y<sup>e</sup>. gall bladder & returns again this y<sup>e</sup>. same duct, & there  
is no improbability in the flow being diff<sup>erent</sup> at diff<sup>erent</sup> times, we obs<sup>erve</sup>.

... moves in the very same way, & there is a comp. at analogy between ... two digons - We see for us examples most of em from the Liver of vessels found in large vessels, & within each of em larger we find smaller now this appearance, tho' it occurs most frequently in the Liver, yet is to be observ'd in various other places, but especially in ... Abdominal viscera: Dr Pallas a late ingenious naturalist conceives of these as animated bodies, w<sup>ch</sup> opinion was first hinted by Dr Sydenham in the last Century; & I am persuaded upon a whole of this Idea is just, tho' in w<sup>ch</sup> respects he errs, as in calling em Tenia Hydatides, he supposes of it is an animal somewhat like to ... Intestines & of it produces Hydatides but I never observ'd any connexion & I have ventured to doubt of it. Opinion, of ... is constantly sending of new joints or adding to its No. w<sup>ch</sup> is a very discouraging opinion for after we have separated hundreds of joints it may still form new ones, but by killing ... joints we kill a part of the Animal, & there is no growth again, we find clusters of round bodies within each other ad-hering to ... outer skin, w<sup>ch</sup> I take to be ... parts of ... young growing & ... when they have acquired a certain bulk ... separate ... having ... same construction as ... first contains them & we see an infirmity, & it only remains to prove of they are living animals, of we distinguish their motions; and are sup-posed to exist by fluids pour'd in from the Luteal System We find also other worms in ... liver w<sup>ch</sup> we can at little explain there is a pair of worms found in ... die of the rest, & I have a strong suspicion of it is the cause of the rest, as in many other grounds ... disease is more common. We find within ... gall ducts a worm of a partic<sup>r</sup> kind w<sup>ch</sup> feeds on Bile: from its mouth branches are dispers'd like ... branches of an Artery, & are all fill'd with bile, w<sup>ch</sup> of ... mouth of ... animal is its Rota, & its branches are propagat'd to ... distant parts When ... liver is in a scirrus totate it is sometimes lif'd in its bulk Dr Haen gives an instance of a scirrus dis- not bigger ... fist but for ... most part it is bigger &

in the intestines of the vessels we find deposited a  
 obnoxious like matter & knots scattered unequally thro'  
 it & we can generally distinguish the Schinours by laying the hand  
 on the edge of the Thorax, & about the middle as we can  
 generally first feel it under the Cartilage Eniformis, & size  
 is sometimes very great descending the way to the umbilicus, and  
 the way between the umbilicus & the pubis & yet without  
 droping - Tho' a suppuration happens in the Liver & conveyance of  
 inflammation, we ought to attend to all the possible ways in  
 which the pus can be discharged. In a sound person the Liver is covered  
 in its under part by the peritonaeum, upon which the bowels play  
 freely, & it only adheres to the containing parts by its Ligaments,  
 but in inflammation adheres in its neighbourhood; by the  
 suppuration of the Liver is enlarged, descends under the edge of the  
 Thorax, & the Abscesses frequently adhere to the peritonaeum lining  
 the muscles, so if an opening is made under the edge of the Thorax  
 we get into the cavity of the Abscess without opening the cavity  
 of the Abdomen: but if the Abscess is within the edge of the Thorax  
 it may make its way thro' the diaphragm, & as it is almost  
 contiguous to the pleura, it being thickened & inflamed may  
 come to adhere to the vice, & the matter eroding it may make  
 its way outwards, or into the lungs. We have many examples  
 in practice when abscesses of the Liver were freely discharged  
 by vomiting & stool, the matter may get into the Pleura, & pass  
 by the erosion of the biliary duct, likewise into the gall bladder  
 which has been found distended with purulent matter, or suppurated  
 the Abscess to burst into the cavity of the Belly, the matter may  
 fall down into the pelvis & resting in the os cutis may inflame  
 & erode it, & so get out of the body.

### Lecture 70.

We shall next proceed to give some acct. of the Jaundice, -  
 This disease is generally first seen in the Eye, namely on acct. of  
 its whiteness, but in its progress it affects the whole surface  
 tinged with urine; & I have found on dissecting Animals of the  
 fat of the body, whether of the oily part or membranous containing

... or both; I am somewhat uncertain but from the colour of 310.  
... we readily distinguish it from y<sup>e</sup> disease, may y<sup>e</sup> ting  
... communicated to the Bones deprived of their membranes, or y<sup>e</sup>  
... is mixed w<sup>th</sup> y<sup>e</sup> earth of y<sup>e</sup> Bones. Diversity of cause produce  
... appearance. Sometimes it happens y<sup>e</sup> y<sup>e</sup> Bile becomes very  
... in y<sup>e</sup> gall bladder so as to pass thro' y<sup>e</sup> ducts w<sup>th</sup> difficulty  
... persons have laboured under what paucy some of Jaun  
... & discharg'd Bile y<sup>e</sup> was very thick resembling y<sup>e</sup> yolk of an  
... & from y<sup>e</sup> discharge witht any thing further being obs<sup>d</sup> in y<sup>e</sup>  
... disease has gone off. & after getting into y<sup>e</sup> common duct  
... it may stop in y<sup>e</sup> passage thro' y<sup>e</sup> Gate to y<sup>e</sup> Intestines, but espe  
... ally at its orifice, the pressure however sufficient to push y<sup>e</sup>  
... Bile thro' y<sup>e</sup> Cystic duct will in no long time carry it thro' y<sup>e</sup>  
... common duct, so y<sup>e</sup> a Jaundice from y<sup>e</sup> cause cannot be very  
... lasting. — Next Calculi, as a freq<sup>t</sup> cause of y<sup>e</sup> Obstr<sup>ct</sup> of y<sup>e</sup> is  
... of from y<sup>e</sup> disease coming and going in an irreg<sup>r</sup> manner  
... attended w<sup>th</sup> sharp pain, & y<sup>e</sup> is a more freq<sup>t</sup> cause of y<sup>e</sup> disease  
... is commonly imagin'd, & may take place w<sup>th</sup> when scales  
... have been found even upon y<sup>e</sup> most narrow inspection of y<sup>e</sup>  
... Cases & when it may be thought owing to spasm. — For if the  
... Stone is of an irregular shape, in one position, y<sup>e</sup> Bile may pass  
... & in another it may be stopp'd y<sup>e</sup> Stone acting like a valve. —  
... say it is possible y<sup>e</sup> a soft Stone may pass thro' y<sup>e</sup> ducts: oc  
... causing Jaundice & may be melted in passing thro' y<sup>e</sup> Intest.  
... tho' in general they are very diff<sup>t</sup> of Solution & passage, so  
... some Stone may occasion repeated paucy, & a further  
... Circumstance is worthy of notice is y<sup>e</sup> y<sup>e</sup> Stones sometimes  
... increase very much in y<sup>e</sup> intestinal Canal, & we may suppose  
... to cause disorder there. — Next we find y<sup>e</sup> flow stopp'd by  
... swelling of neighbouring parts, as from a swelling in y<sup>e</sup>  
... head of y<sup>e</sup> pancreas, or of y<sup>e</sup> Lymph<sup>tic</sup> glands in y<sup>e</sup> Capsule  
... of Glyceron, & others connected w<sup>th</sup> them at y<sup>e</sup> pancreas, tho'  
... part will seldom occasion Jaundice as y<sup>e</sup> duct runs in  
... hollow between y<sup>e</sup> swell'd glands, now after seeing the  
... Jaundice from pressure by neighbouring Organs in a Schirrus

state we can conceive it to happen from a retention of 311.  
the liver pressing upon y<sup>e</sup>. ducts in their passage, sup-  
pressing y<sup>e</sup>. whole or a larger branch of y<sup>e</sup>. hepatic duct com-  
munic'd by it & whatever stops y<sup>e</sup>. extremity of y<sup>e</sup>. ducts com-  
munic'd will have the same effect, therefore a distention of  
y<sup>e</sup>. duodenum may produce it, merely wind pent up here may  
produce it, & still more readily any solid substance as comes  
time similar to these I shou'd you from y<sup>e</sup>. seeds of Goose ber.  
now these are the ordinary causes undiscov'd from dissection  
but physicians add Spasme, they suppose y<sup>e</sup>. biliary  
ducts can be contracted from their muscular nature by y<sup>e</sup>. slow  
y<sup>e</sup>. bile stop'd, & in proof of this they obs. y<sup>e</sup>. Jaundice happens  
after y<sup>e</sup>. bite of a serpent or viper, or in y<sup>e</sup>. yellow fever of y<sup>e</sup>. west  
Indies or it comes on from violent emotions of y<sup>e</sup>. mind, now I  
am not fully doubting whether Jaundice can arise from such a  
cause, at least there is no room for supposing y<sup>e</sup>. arising in  
y<sup>e</sup>. manner it will be permanent; I once or twice have seen y<sup>e</sup>.  
limbs of persons bit w<sup>th</sup>. a Viper, & then was a yellowness but  
it continued at y<sup>e</sup>. part & was plainly owing to y<sup>e</sup>. Serum of y<sup>e</sup>.  
Blood, & I do not find any clear proof y<sup>e</sup>. a bite of a Viper has  
such a diff. effect; y<sup>e</sup>. yellowness may extend further, but  
if it is first confin'd to one part, tho' it spread over y<sup>e</sup>. whole  
body it must still depend upon the same cause - Next the  
Jaundice has follow'd violent fits of anger is beyond doubt, but de-  
pauis may have been lodg'd in y<sup>e</sup>. gall bladder, & by y<sup>e</sup>. exertion  
attending y<sup>e</sup>. passion been thrust down into y<sup>e</sup>. duct, & in the  
yellow fever we find by no means a stoppage of y<sup>e</sup>. bile in its  
course, y<sup>e</sup>. persons not only vomit & purge bile, but a g<sup>t</sup>.  
found in y<sup>e</sup>. duodenum & stomach, y<sup>e</sup>. flow is greater in  
y<sup>e</sup>. case, & y<sup>e</sup>. disease attacks y<sup>e</sup>. liver more readily y<sup>e</sup>. other  
organs y<sup>e</sup>. secretion is increased; & in preparation to y<sup>e</sup>. there is  
an increased return, not from any Spasme, but there is a  
greater absorption, & we never obs. y<sup>e</sup>. smallest degree

of contraction in the gall bladder or Biliary ducts when  
 are irritated, nor can we discover of muscular power by dissection  
 So I doubt if they possess so much of muscular power as to  
 force the flow of bile in vom, & consider the stomach have been  
 found in the gall bladder striking in the neck, &c.  
 I think probable not altogether certain of it. I am inclin'd to see  
 not depend upon it. Secretions being interrupted may it if we  
 interrupt of secretion all together a person we not labor under  
 Jaundice. - But of bile is first separated & afterwards taken  
 up into the blood, I am at first led to judge so from y. reason  
 of things - When can we suppose these bitter particles proper  
 to the Bile to be found in what part of y. body is y. blood  
 so changed as y. its parts become bitter? We do not find y. bitter  
 parts in y. Chyle; & why shd. we suppose y. y. Chyle by y.  
 gen. Circulat. acquires y. property, rather y. y. it gets it in  
 an organ contriv'd for forming it, or at least for collecting it?  
 Why would y. change to y. gen. System & not to y. Liver  
 surely no good reason can be given: or, if by y. gen. Circulat.  
 y. Chyle can be converted into red blood, & I have no doubt y.  
 y. various parts of Circulat. contribute their share to this  
 perhaps chiefly y. lungs. If y. great a change may be that  
 process can be produc'd upon it, some further change must  
 happen to it in passing thro' y. Liver; or y. y. blood is chang'd  
 into bile in y. Liver, y. y. is y. proper Office of y. Liver to make  
 the change as well as of excretion - There is one thing further  
 of Jaundice can't be occasion'd if y. return of fluids from y.  
 Liver can be prevented: tho' a stoppage to y. excretion be made  
 by tying y. Duct. Commun. Cholid. if afterwards we can cut  
 of y. natural Commun. between y. Duct. Com. & circulating  
 System y. Jaundice will not be produc'd: so I shall conclude  
 for a moment of y. Jaundice depends upon a stoppage of y.  
 Excretion, & to a return of y. bile from y. Biliary ducts into y.  
 Circulating System, & y. want of y. excretion can't occasion  
 it. It only remains to determine y. passage by w. it can  
 return to y. vessels now to be more clearly understood I shall

draw of following and sketch. The V. Porta of princip.  
 receiving Artery dividing into many branches some of w<sup>ch</sup>  
 intended for circulation others performing secretion. so I draw  
 of red parts passing on this v. vena Cava, & v. V. Cava hepatic  
 going into it, small branches excluding v. and gl. bodies  
 perform of secretion of v. bil. & pass on upon v. glands of v.  
 Liver, these continued from v. hepatic duct, from v. there are  
 no doubt abs about vessels, these are common & some of em at  
 least are lymphatic, running to the thoracic duct. Now so  
 far if we were to delineate no other vessels we wd. suppose either  
 of v. bil. was pushed back again, forced in a retrograde way  
 into v. V. portarum, or v. v. bil. returned to the heart by the  
 Lymphatic vessels. But the most common opinion is totally  
 diff. from either of these, that it is pushed back into v. Vena  
 Cava hepatic by branches of v. vein supposed to communicate  
 w<sup>th</sup> v. Biliary ducts, in consequence of v. distention of one duct  
 from a pressure upon them. Now I shall attempt to prove v. it  
 returns entirely thro' v. lymph. vessels, i.e. by absorption only,  
 & I shall endeavour to state v. Arguments for v. contrary Opinion  
 in their full force. We are told of v. lymph. Vessels w<sup>ch</sup> not  
 convey all v. bil. in so short a time: I wd. only obs. that v.  
 lymph. of v. liver are very numerous, I wd. only compare  
 what may be supposed to happen in v. Jaundice w<sup>th</sup> what hap-  
 pens in v. Scurvy vessels, of a great many Pt. of fluid taken  
 into our stomachs & gut's enter v. blood very quickly. But what  
 kind of vessels are these, or what purpose do they serve in a  
 sound Animal? They can only say v. they are v. abso<sup>l</sup>.  
 branches of v. red veins, & if we have understood v. doctrine in-  
 probable in gen<sup>l</sup>. we must doubt of it in v. single instances  
 But granting v. they are natural abso<sup>l</sup>. vessels, we cannot  
 inject these by filling v. ducts, as we can inject v. mouth  
 of abso<sup>l</sup>. vessels elsewhere, or if it is admitted v. lymph.  
 vessels do abs about we must admit at least v. it may  
 be forced back thro' v. lymphatic as well as v. veins; may

it is more reasonable to ascribe it to y<sup>e</sup>. Lymphatics as  
 well as the veins and y<sup>e</sup>. only reason to y<sup>e</sup>. contrary in an exper<sup>t</sup>  
 repeated by Waller, y<sup>e</sup>. when we inject into y<sup>e</sup>. hepatic duct, a  
 colored matter. & y<sup>e</sup>. more milk y<sup>e</sup>. injection goes into y<sup>e</sup>. V. Cava  
 hepatic, we fill y<sup>e</sup>. venae cavae. Now I admit y<sup>e</sup>. part but know  
 y<sup>e</sup>. explanation of it; y<sup>e</sup>. injection first passes into y<sup>e</sup>. V. Port. &  
 it is more easy to make y<sup>e</sup>. Injection from y<sup>e</sup>. V. Port. into y<sup>e</sup>.  
 hepatic duct & we more readily fill y<sup>e</sup>. Lymphatics y<sup>e</sup>. V. Ven.  
 Cav. hepatic. now let us attend to what y<sup>e</sup>. Lymphatic perform  
 in every part of y<sup>e</sup>. body; are we to believe y<sup>e</sup>. Lymph. take  
 off y<sup>e</sup>. watery parts, because y<sup>e</sup>. bile is thicker in y<sup>e</sup>. Gall blad?  
 This proves nothing more y<sup>e</sup>. y<sup>e</sup>. thin parts are m<sup>o</sup>. readily  
 absorbed; but was not y<sup>e</sup>. whole blood taken in by absorption  
 every part y<sup>e</sup>. constitutes y<sup>e</sup>. bile; & every part of y<sup>e</sup>. red blood  
 when extravasated can be reabsorbed, why not y<sup>e</sup>. Bile? This  
 also grows lean by exercise; we see y<sup>e</sup>. whole gland call'd Thyroid  
 obliterated in old people we see a continual change of y<sup>e</sup>. bones &c.  
 But to reduce y<sup>e</sup>. matter to a plain exper<sup>t</sup>. I y<sup>e</sup>. mentions I have  
 after tying y<sup>e</sup>. duct. com. chol. & producing Jaundice. I found  
 y<sup>e</sup>. Lymph. to contain all y<sup>e</sup>. parts of y<sup>e</sup>. bile. Last Summer I  
 shew'd y<sup>e</sup>. Lymph. vessels upon y<sup>e</sup>. Liver tying it w<sup>th</sup>. bile to Dr.  
 Young & Dr. Black who had y<sup>e</sup>. curiosity to taste y<sup>e</sup>. by nor I  
 in any respect appear'd perfect bile: & to prevent y<sup>e</sup>. evaporation  
 of any exsudation I open'd y<sup>e</sup>. body while it was still warm  
 But I conceive y<sup>e</sup>. we may bring y<sup>e</sup>. matter to the decision of our  
 Exper<sup>t</sup>. If we tie y<sup>e</sup>. hepatic duct & Duct. com. chol. & also y<sup>e</sup>.  
 end of y<sup>e</sup>. thoracic duct there will be no Jaundice, whereas  
 without tying y<sup>e</sup>. thoracic duct in a few hours y<sup>e</sup>. whole may be  
 ting'd, & y<sup>e</sup>. Exper<sup>t</sup>. does not always succeed is owing to y<sup>e</sup>. Duct  
 having various turns in. as I mentioned before in order to lessen y<sup>e</sup>.  
 chance of y<sup>e</sup>. coarctation. I have open'd y<sup>e</sup>. receptacle of y<sup>e</sup>. Chyle, & in all  
 y<sup>e</sup>. dogs and pigs y<sup>e</sup>. liv'd any time there was no Jaundice & I am  
 inclin'd to believe y<sup>e</sup>. y<sup>e</sup>. disease depends upon y<sup>e</sup>. return of y<sup>e</sup>.  
 Bile to y<sup>e</sup>. mass of blood by y<sup>e</sup>. Lymph. Return.

(316.)

## Lecture 7<sup>th</sup>.

Having examined of Chyliferous Vena we proceed to y<sup>e</sup> organs of urine & generation in y<sup>e</sup> male. — Dr. Haller thinks the Uterus has little sensibility, & allows sensibility to y<sup>e</sup> uterus conceiving it to be y<sup>e</sup> continent of y<sup>e</sup> Lutea vera, inserted to y<sup>e</sup> organs of gener<sup>e</sup> upwards thro' the Uterus & backwards into y<sup>e</sup> kidney. But y<sup>e</sup> proportion of nerves sent to y<sup>e</sup> kidney is surely y<sup>e</sup> same as to y<sup>e</sup> other solid viscera & y<sup>e</sup> uterus seems to be of a muscular nature, & possess a fibrous coat & in moulting animals I have repeatedly excited an unwill<sup>d</sup> contraction of it upon irritating it w<sup>th</sup> a knife, & I shew'd y<sup>e</sup> to Dr. Vuccher who was accustomed to such experiments, when he drew the finger along it, it mov'd as distinctly as an Earthworm makes its motions from y<sup>e</sup> upper to y<sup>e</sup> lower end. — In y<sup>e</sup> pelvis of y<sup>e</sup> kidney give uneasiness, w<sup>ch</sup> is increased by their descent into the Uterus, & if other instances can be shewn where y<sup>e</sup> stone gave no uneasiness, this is nothing more y<sup>e</sup> what occurs in highly sensible Organs, as y<sup>e</sup> bladder of urine & gall — In y<sup>e</sup> pelvis of y<sup>e</sup> kidney they are more fix'd & when they have remain'd for a length of time the Membrane grows thick & in some measure callous, w<sup>ch</sup> is a resource of nature to rid herself of an ail w<sup>ch</sup> she can't otherwise get free from — next attend to the vascular structure of y<sup>e</sup> bladder of urine, from y<sup>e</sup> vast quantity of urine secreted some have conceiv'd passage from the Stomach to y<sup>e</sup> bladder of urine but consider y<sup>e</sup> number of Bowels, y<sup>e</sup> density of membranes: y<sup>e</sup> we are subject to Excites, w<sup>ch</sup> does not drain off; y<sup>e</sup> in quadrupeds y<sup>e</sup> bladder is higher y<sup>e</sup> y<sup>e</sup> Stomach: & Cestachius found y<sup>e</sup> on tying y<sup>e</sup> Ureters y<sup>e</sup> bladder after some time was not more fill'd y<sup>e</sup> when y<sup>e</sup> experiment was made: all y<sup>e</sup> urine descends from y<sup>e</sup> kidney into y<sup>e</sup> bladder & from y<sup>e</sup> size of y<sup>e</sup> vessels we can acc<sup>tly</sup> judge. The Renal Artery's compar'd w<sup>th</sup> y<sup>e</sup> primary Arteries from y<sup>e</sup> Aorta will be found to cont<sup>n</sup> a 15<sup>th</sup> or 16<sup>th</sup> of y<sup>e</sup> whole mass, or y<sup>e</sup> in the space of a single hour a y<sup>e</sup> N<sup>o</sup> of 18<sup>th</sup> of blood passes thro' y<sup>e</sup> kidney, suppose at every stroke of y<sup>e</sup> heart 3j. of blood is thrown into y<sup>e</sup> Aorta, & y<sup>e</sup> then an 18<sup>th</sup> such pulsations in a minute, 18j. will pass thro' y<sup>e</sup> kidney in a minute or 115. in y<sup>e</sup> hour; so we can readily explain y<sup>e</sup> plentiful secretion of urine y<sup>e</sup> takes place when the blood is load'd with water. —

310

Having of. Arteries within of. Kidney we obs. a sudden division  
into branches, few of w<sup>ch</sup> communicate w<sup>th</sup> each other: An artery sees be.  
little necessary here is an Organ secured in its place, & not subject  
to muscular action. — In of. small branches we find an appearance  
y<sup>t</sup> is singular, & y<sup>t</sup> was first described by D. Nido, what he calls  
lobuli arteriarum termini; I find it lately alludg<sup>d</sup>, y<sup>t</sup> these are a  
bundle of minute vessels but there is an enlargement of y<sup>e</sup> branches  
of of. Artery: but there are not they arteriar. termini; there is another  
division of of. Artery before it ends in the Vein, y<sup>e</sup> globuli is in of.  
course of of. Artery & is better injected from of. Artery y<sup>e</sup> from of. vein  
but I have I think seen in this of. Kidney, we find y<sup>e</sup> y<sup>e</sup> there is a  
further division of of. at length the uriniferous ducts begin, w<sup>ch</sup> join in  
of. common way to form larger ducts, & in of. Tubuli we see orifices  
w<sup>ch</sup> are y<sup>e</sup> mouths of of. trunks of these ducts, of. Tubuli terminat-  
ing in such a manner as to supply of. office of a valve, so y<sup>t</sup> Injections  
are generally stopp'd at of. termination of of. Tubuli: From y<sup>e</sup> great  
size of of. branches compar'd with of. Artery, where a calculus forms  
it is apt to appear in the pelvis, & to increase to such a size y<sup>t</sup> it  
can't descend, so y<sup>t</sup> an operation has been propos'd for extracting it  
But this can't be done with<sup>o</sup> dividing of. large branches of of. renal  
vessels, & adding to this of. depth of the part, an operation is by no  
means to be advis'd. In some few cases the Stone has work'd its  
way outwards, matter has been found, & the Opening of an abscess  
has been mistak'n for y<sup>e</sup> operation of Nephrotomy. — It is right  
of. we sh<sup>d</sup>. be aware of of. leucous nature: thus if we find a stone stopp-  
ing the Uterus, & yet of. function of of. part preserv'd it may be owing  
to the Uterus being double: With regard to of. morbid appearance,  
we observe of. where of. Kidney does not mortify in consequence of an  
Inflam<sup>n</sup>. Suppurations form: we wo<sup>d</sup>. conclude of. of. patient would  
run life danger from of. disease of. where matter found in the  
other viscera because it gets a ready outlet: but of. ulcer is con-  
stantly irritated by of. urine w<sup>ch</sup> is plainly one cause why ulcers  
heal here very difficultly — Next it is subject to Schismus where  
of. occurs in of. whole of of. Kidney it must be attended w<sup>th</sup> of. very  
wors<sup>t</sup> species of dropsy: If of. Disease occurs from a Schismus of  
of. Liver it is found of. milder parts of of. blood & of. water is  
exagulable by heat: But when of. matter passing by the Urine is

is extravasated into y<sup>e</sup>. Cavities of y<sup>e</sup>. body most readily  
 yielding to it & even in y<sup>e</sup>. ventricles of y<sup>e</sup>. brain, w<sup>ch</sup>. frequently is  
 the Case it must be attended w<sup>th</sup>. y<sup>e</sup>. worst consequences, & where  
 y<sup>e</sup>. obstruction is lower, y<sup>e</sup>. effects are nearly y<sup>e</sup>. same as when  
 it is in y<sup>e</sup>. Kidney itself. — As a Calculus forming here is a  
 frequent cause of Inflamm<sup>n</sup>. in the Kidney I have a strong  
 suspicion y<sup>t</sup>. an inflamm<sup>n</sup>. here Disposes to the growth of Calculi  
 w<sup>ch</sup>. circumstances lead to y<sup>t</sup>. notion, some persons are more  
 subject to Calc<sup>n</sup>. Concretions y<sup>e</sup>. than, & there is no doubt a  
 Constitution that disposes to it & this is chiefly in the Kidney  
 & a marked change may be made by inflamm<sup>n</sup>. w<sup>ch</sup>. gives that  
 Disposition: It begins to be found long before the Urine is  
 extravasated: I have observ'd small particles of Calculi  
 within y<sup>e</sup>. Tubuli & as y<sup>e</sup>. inflamm<sup>n</sup>. is often evidently brought  
 on by Calculi, so if they get cold, or are affected by intem-  
 perance there is an increase of y<sup>e</sup>. Kidney & a discharge  
 of Sand, where y<sup>e</sup>. pain of y<sup>e</sup>. Kidney seems to be y<sup>e</sup>. consequence  
 of this want of secretion, so if we find persons affected  
 w<sup>th</sup>. pains after y<sup>e</sup>. Inflammatory circumstances are gone off  
 it may be proper to wash y<sup>e</sup>. Kidney by a course of diluent  
 Medicines.

Lecture 72<sup>nd</sup>

We shall now attend to y<sup>e</sup>. situation of y<sup>e</sup>. Testis within y<sup>e</sup>. body  
 with a view of judging of y<sup>e</sup>. use of the Spermatic Ducty un-  
 der as before it terminates on the Testicle, some of late  
 w<sup>ch</sup>. persuade us y<sup>t</sup>. there is nothing singular in y<sup>e</sup>. length  
 of y<sup>e</sup>. Spermatic Ducty, y<sup>t</sup>. it takes its rise from the place  
 nearest to the Testicle of y<sup>e</sup>. Satus, & is afterwards drawn out  
 from necessity: now I apprehend y<sup>e</sup>. notion is to be rejected, for  
 here I shew you the Spermatic Ducty of a Ram, now obs. y<sup>e</sup>.  
 vast number of Convolutions w<sup>ch</sup>. y<sup>e</sup>. makes in its descent  
 to the Testicle: I find by a calculation y<sup>t</sup>. if it was drawn  
 out to a straight line it w<sup>o</sup>. measure about 20. feet I w<sup>o</sup>. find  
 y<sup>e</sup>. Ducty is larger at the Testicle y<sup>t</sup>. at its origin notwithstanding  
 it gives off a number of branches, w<sup>ch</sup>. we cant

suppose this to be made in vain we must conceive a change is made necessary for the pupar<sup>ty</sup> of the Semen, <sup>of</sup> <sup>the</sup> <sup>length</sup> of <sup>the</sup> <sup>artery</sup> is of use in a manner <sup>if</sup> we can't specify how often seeing <sup>it</sup> in other animals we are tempted to draw a similar conclusion w<sup>th</sup> <sup>reg<sup>d</sup></sup> to it in man, where we wo<sup>d</sup> have expected to find it taking its origin halfway between its original place in <sup>the</sup> <sup>abdomen</sup> & its after place in <sup>the</sup> <sup>scrotum</sup>, i.e. abt<sup>y</sup> <sup>the</sup> <sup>bottom</sup> of <sup>the</sup> <sup>urethra</sup>. *Placa communis*, & <sup>if</sup> some change is made in it, descent in the blood depending upon <sup>the</sup> <sup>usual</sup> length & therefore we may admit a name apply'd chiefly by <sup>the</sup> <sup>ancients</sup> to the veins, calling <sup>em</sup> <sup>Vena</sup> <sup>puparata</sup>. — You have not seen <sup>the</sup> <sup>vein</sup> have an uncommon proportion to the artery, perhaps some further use is to be deriv'd from <sup>the</sup> <sup>numerous</sup> large veins favouring <sup>the</sup> <sup>return</sup> of <sup>the</sup> <sup>blood</sup> to the heart, & we obs<sup>rve</sup> from exper<sup>ce</sup> <sup>the</sup> <sup>vein</sup> is more apt to grow varicose <sup>than</sup> almost any other in <sup>the</sup> <sup>body</sup> I have seen a great N<sup>o</sup> of instances of varix in it: In some few one it is swell'd to such a bulk as to stretch <sup>the</sup> <sup>skin</sup> of <sup>the</sup> <sup>scrotum</sup> so may be mistakn for a rupture or other Complaint but if we apply <sup>the</sup> <sup>hand</sup> to the scrotum <sup>the</sup> <sup>swelling</sup> is unequal & it gives a full diff<sup>er</sup> from <sup>the</sup> <sup>various</sup> vessels: or one fill'd w<sup>th</sup> water: Dr. Bouhaave supposed <sup>the</sup> <sup>artery</sup> & <sup>blood</sup> did not enter the body of the Testicle but we can give a general redness to <sup>the</sup> <sup>ducts</sup> within <sup>the</sup> <sup>Testicle</sup>, & we find consid<sup>er</sup>able Arteries dividing minutely upon <sup>the</sup> <sup>seminal</sup> ducts. — Next with regard to <sup>the</sup> <sup>seminal</sup> ducts. — You see <sup>the</sup> <sup>bulk</sup> of <sup>the</sup> <sup>Testicle</sup> is very much owing to a N<sup>o</sup> of Threads convoluted: w<sup>ch</sup> from injection we find to be hollow tubes, measuring <sup>the</sup> <sup>size</sup> of these & examin<sup>g</sup> <sup>the</sup> <sup>gen<sup>l</sup></sup> Bulk of the Testicle: I find <sup>if</sup> <sup>the</sup> <sup>whole</sup> <sup>Testicle</sup> were suppos'd to be compos'd of such Tubes the length wo<sup>d</sup> be nearly equal to 500 feet near to a mile in length: now we can't accurately determine how m<sup>ch</sup> <sup>the</sup> <sup>real</sup> Bulk of it depends upon <sup>the</sup> <sup>red</sup> <sup>blood</sup> circulating in <sup>the</sup> <sup>vessels</sup>, but it is evident <sup>it</sup> m<sup>ch</sup> more <sup>is</sup> on half of <sup>the</sup> <sup>bulk</sup> is owing to <sup>the</sup> <sup>seminal</sup> Ducts, & <sup>the</sup> <sup>length</sup> of these is not less <sup>than</sup> 3000 feet in each Testicle. — The next point is <sup>the</sup> <sup>N<sup>o</sup></sup> ducts enter<sup>g</sup> into <sup>the</sup> <sup>Testicle</sup> w<sup>ch</sup> is not so very difficult

to be determin'd as might be imagin'd: because in the [ 319.  
Testicles there is a structure of it is altogether irreg<sup>r</sup>. we find a N<sup>o</sup>  
of small ducts joining into larger ones, in other places, & there  
for it is duct continually increasing but here it is ducts run par-  
allel to each other without any loss at tumours or any division  
or any gland or knot from w<sup>ch</sup> they are deriv'd, so we need only  
attend to it and w<sup>ch</sup> communicat<sup>ion</sup> w<sup>th</sup> it. Epidydyms, & Epidydy-  
m. on carbon distinctly 150. diff. ducts: & supposing it is  
mercury has not fill'd more, than an 300. south tubes  
composing each of it. Testicles may be abt. 10. feet in  
length. There are every where convoluted in ducts or enanous of  
we trace it with difficulty; & the blood vessels divide  
upon it surface & perform it's function in a partic<sup>ular</sup> manner. I  
have seen a colour matter pass from it. Ptery into it. Tubes  
but I am not certain but some small arteries might have  
burst & given it tinge, & we fill 'em with it. & it is difficult  
The division of these convoluted & Superficial Tubes, is not  
only form'd by blood vessels according to D<sup>r</sup>. Albinus but  
there are three Layers of it. Tunica propria or Albuginea which  
slide in between dividing one bundle from another tho' not in a  
regular manner as an orange is divided by septula, when one  
Tube run to it. septa and back part of it. Testicle they become  
straight: we find vasa aucta of it come out from 'em, & there they  
communicate, or there is at Haller first accurately explain'd a rete  
Testis. i.e. - of it. w<sup>ch</sup> ducts of it. Testicle communicate, just w<sup>th</sup> in  
it. Tunica Albuginea, just adhering to it, & we find a number  
of vasa aucta coming out & conveying it. Semen into it. Epidydy-  
m. so call'd by Haller vasa efferentia, of it. N<sup>o</sup> from 12. to 15. or 18. after  
running a little way become convoluted for it's description of these  
we are much indebted to Haller. Now these Coni vasculosi run  
to form the beginning of it. Epidydy. & after some time they  
all unite into a single Tube, for upon fixing a Tube w<sup>th</sup> mus-  
-cley into it. vasa deferentia, & cutting it. Epidydy. transversely  
beyond it. middle: I find it. of it. Injections come out from one  
orificia only & upon separating it. Coni Vasculosi I find it.  
they all unite into one Duct: this at first is not larger

has a single hair from a horse tail but gradually (320.)  
becomes wider as we come nearer to it. I have observed that  
this describes Twenty feet at least before it  
terminates in the Vas deferens.

### Lecture 73.

After the Semen is separated from the Testis it acquires  
its properties, in a great in a great measure by stagnation  
and Absorption in passing thro' y<sup>e</sup>. Seminal Tubes I was  
obs. an uncommon N<sup>o</sup>. of Lymph<sup>ic</sup>. Vessels arising from the  
Testicles. — One wd. be surpris'd to conceive by what power y<sup>e</sup>.  
Semen can describe so long & intricate a course, I wd. most  
willingly have Tules perhaps a truly muscular or living  
power, we can't obs. y<sup>e</sup>. contractions or see y<sup>e</sup>. fibres, but the  
reason of the thing I y<sup>e</sup>. observe. y<sup>e</sup>. papillae have been found  
to occasion swelling in the Seminal ducts had to y<sup>e</sup>. suppos  
it in the Dog kind y<sup>e</sup>. Copulation is tedious because y<sup>e</sup>. semin  
Seminolis are wanting so the Semen is but round in y<sup>e</sup>. Time  
in the Testicles, it must pass quicker y<sup>e</sup>. at other Times  
I there must be a living power to convey it, y<sup>e</sup>. vis a Tergo  
spitting in some measure. — By attending to y<sup>e</sup>. Epididym.  
we distinguish a swelling in the ducts, from one in the  
Testicle or Cord: The principal part of the Cord enters  
upon the inner side of the Epididym. is longer y<sup>e</sup>. the Testicle  
so y<sup>e</sup>. the bottom of it can be distinctly felt. we likewise  
see y<sup>e</sup>. slightest wound of y<sup>e</sup>. Epididym. beyond its middle  
may be interrupt the Course of the Semen so y<sup>e</sup>. a Surgeon  
ought to be cautious not to puncture it in the smallest  
degree, & some time ago a Soldier was treated in y<sup>e</sup>. Infir  
mary, who had a small hole in the Scrotum y<sup>e</sup>. scarcely  
admitted y<sup>e</sup>. head of a pin from w<sup>ch</sup>. there was discharged  
a liquor w<sup>ch</sup>. was undoubtedly y<sup>e</sup>. seminal liquor, &  
if any swelling found y<sup>e</sup>. can press upon a single turn  
of y<sup>e</sup>. duct y<sup>e</sup>. whole organ above will be affected, & if it  
begins at y<sup>e</sup>. lower end of the Epididym. unless it is speedily

through the whole Epidyde. & Testicles will be affected. — ( 321.

Thus an also vascular Canals unusually situated, w<sup>ch</sup> instead of coming out from the other usual end comes out from y<sup>e</sup> other  
log. is. structure after y<sup>e</sup> Epidyde. has been divided may prevent  
an irreparable Stoppage of y<sup>e</sup> Semen, w<sup>ch</sup> may still pass on the  
vas deferens: & it takes place perhaps in one person out of  
3. or 10. the vas deferens runs down ab<sup>o</sup> y<sup>e</sup> back of the Bladder then  
and in the Vesiculae Seminales w<sup>ch</sup> were first well explained by  
D<sup>r</sup>. Haller. — It is thus supposed y<sup>e</sup> Intestinum Caecum, is. N<sup>o</sup>.  
of it press<sup>d</sup> against each other, & y<sup>e</sup> vas deferens coming down  
against it approaches near to the Vesicula seminal. & is men-  
tioned: & add to y<sup>e</sup> Intestin. cae. a N<sup>o</sup>. of Intestinalia Caeca  
w<sup>ch</sup> packs containing y<sup>e</sup> semen, & add to the wall to the  
vas deferens the surface is greatly increas<sup>d</sup> with a view of  
adding to the quantity of the Semen. — perhaps y<sup>e</sup> prostate G.  
mixes its liquor with the Semen within y<sup>e</sup> penis; but y<sup>e</sup> is not so  
essential as y<sup>e</sup> liquor in the Testes, for in some classes of anim<sup>ls</sup>  
as in Birds it is wanting yet y<sup>e</sup> structure of the Testicles is y<sup>e</sup>  
same as in man, so it is only of secondary use — there is a g<sup>ty</sup>  
of mucus discharg<sup>d</sup> for a defence against y<sup>e</sup> urine.

The only thing y<sup>e</sup> remains in y<sup>e</sup> erection of y<sup>e</sup> Penis, some as D<sup>r</sup>.  
Whitl. have conceiv<sup>d</sup> y<sup>t</sup> it depends upon an unusual flow of  
blood made from the Arteries from their Oscillations being  
increas<sup>d</sup>. — The common opinion is y<sup>t</sup> it depends upon a diff<sup>n</sup>  
tion of y<sup>e</sup> blood thro' y<sup>e</sup> veins, & if y<sup>e</sup> veins are ty<sup>d</sup> up y<sup>e</sup> penis  
is in a certain degree distend<sup>d</sup>. — The only difficulty is to  
determine y<sup>e</sup> means by w<sup>ch</sup> y<sup>e</sup> Stoppage is made, for y<sup>e</sup> has  
been improperly explain<sup>d</sup> by Louper who has been chiefly  
follow<sup>d</sup>, that y<sup>e</sup> Vena interna penis runs on y<sup>e</sup> penis &  
y<sup>e</sup> muscle press<sup>s</sup> it; but they rather draw down the  
penis & make a pressure against the Corpora Caverosa.  
The Ven. Pen. possess a muscular or contractile power  
as it is add<sup>d</sup> & thick<sup>n</sup> y<sup>e</sup> the other veins; & y<sup>e</sup> principal  
plexus pass<sup>s</sup> away from the Testes in a very unusual

anner within the Levator Ani, & is opposed to the action  
These muscles w<sup>ch</sup> are in action at the time; & some degree  
of contraction in y<sup>e</sup>. Ducts of y<sup>e</sup>. seminal Seminales may assist  
in emptying em and merely y<sup>e</sup>. weight of y<sup>e</sup>. urine may dispose  
to the Erection of the penis, & the blood being effus'd into y<sup>e</sup>.  
Ducts may cause or really do the distention.

A Demonstration of y<sup>e</sup>. Structure of y<sup>e</sup>. Female organs fully  
explain'd concludes the Lecture. — Alex. Monro.

### Lecture 7<sup>th</sup>.

After what we have formally remark'd upon this Subject it  
only remains to trace y<sup>e</sup>. changes produc'd by conception  
to increase. To explain y<sup>e</sup>. manner in w<sup>ch</sup>. y<sup>e</sup>. fetus is nourish'd.  
The rudiments of y<sup>e</sup>. fetus is deriv'd from y<sup>e</sup>. ovarium & in  
proof of this a number of circumstances occur.

1<sup>st</sup> The Analogy of oviparous animals, you have observ'd  
y<sup>e</sup>. bed of yolke adhering to the back of a hen, y<sup>e</sup>. fetus is  
connected w<sup>th</sup>. y<sup>e</sup>. yolke & is convey'd into y<sup>e</sup>. uterus by a Tube  
resembling exactly y<sup>e</sup>. Fallopian.

2<sup>d</sup> It has repeatedly been found y<sup>e</sup>. if y<sup>e</sup>. ovaria are extirpat'd  
y<sup>e</sup>. animal is incapable of generating, may we observe  
there is no conception if from a faulty Structure or from  
injury of y<sup>e</sup>. uterine Tube comes to be stopp'd.

3<sup>d</sup> The fetus has been found w<sup>th</sup>. in y<sup>e</sup>. Ovarium lodg'd in y<sup>e</sup>. Fal-  
lopian Tube.

4<sup>th</sup> We can always demonstrate a change in y<sup>e</sup>. ovarium  
following conception, we find at first a hole in it of thousands  
of circataries upon the surface & on cutting into y<sup>e</sup>. substance  
we appear a totally different from what is found elsewhere  
that is call'd Corpus luteum y<sup>e</sup>. name borrow'd from Lud  
spudo when it is more remarkable, it is a yellow coloured  
substance, with a cavity within, & having vessels entering it in  
great number y<sup>e</sup>. N<sup>o</sup>. of holes & circataries, is fully equal always  
to y<sup>e</sup>. N<sup>o</sup>. of Fetuses in the Case of Twins we find two Corpora  
lutea, & in y<sup>e</sup>. multiparous Animals full as many as y<sup>e</sup>. N<sup>o</sup>. of

... sometimes more, some having passed as abortions 323.  
... died within the uterus, so without corruption of change  
... not made in the Ovarium. I never could find an appearance  
... of Corpora lutea in the Ovaria of prostitutes, beyond all doubt  
... at the time of corruption or immediately after the Fallop. Tube is apply'd  
... to the Ovarium, grasps it by means of fine bris: for however  
... inactive there may be appear beyond all doubt of end of the  
... Fallop. Tube is thrown like a net upon the ovarium. - In Birds  
... the end of y. Tube is large enough to take in y. Yolk, and we  
... supposed y. we cannot conceive any thing muscular in it; but  
... it is certain y. it does grasp y. ovarium, I have been found  
... apply'd to it in Animals after death. - In consequence of y.  
... application a change seems to be produced in y. ovar. at least  
... it is more probable to imagine this, y. to suppose first a change  
... in y. Ovar. I am after apply'd of y. Tube & y. change does not  
... happen when y. uterine Tube is exact. - Now we proceed  
... so with absolute certainty, y. something comes from y. Ovar.  
... Dis convey'd by y. Tube into the uterus, but y. nature of it, some  
... what is by no means ascertain'd: whether an entire vesicle  
... separates, assembling y. fatos w<sup>th</sup> its membranes, & containing  
... all y. is necessary, y. y. rudiment of y. fatos is perfectly  
... entire in y. female. Dis exclud'd by y. male, or if y. female furnish  
... so much y. receptacle of y. fatos, experiments are still want.  
... to determine this, whether from y. Ovarium a solid visible outlet  
... is discharg'd or if it merely furnishes a liquor: y. one of y.  
... vesicles burst, & y. liquor mix'd w<sup>th</sup> y. male Semen forms the  
... fatos, we need further experiments to determine y. point.  
... Next suppose y. y. fatos is within y. uterus, when it acquires  
... its Bulk, before we explain y. manner of y. corruption, we  
... shew y. necessity of y. Circulation being diff<sup>r</sup> from what it is  
... in the Adult on Two principal accounts.

1<sup>st</sup> The want of respiration from y. collapsed state of the Lungs  
y. whole blood cannot pass through em.  
2<sup>nd</sup> Vesels are necessary for the nutrition, for making y. connexion  
between the fatos & y. mother. Now first let us attend more

32th.

particularly to  $\dot{y}$ . vessels proper to  $\dot{y}$ . fetus for these are  
 $\dot{y}$ . things respecting them  $\dot{y}$ . require an explanation an appo-  
 sition we readily conceive  $\dot{y}$ . reason of a  $\dot{p}$ . of passage from the  
 $\dot{y}$ . right side of the heart to the left: but why might not  
 one passage have been sufficient? why do we find a commun-  
 ication between  $\dot{y}$ . auricles, & another between  $\dot{y}$ . arteries. a very  
 little reflexion will explain  $\dot{y}$ . suppose one communication  
 only, & obs.  $\dot{y}$ . consequences, suppose it between  $\dot{y}$ . auricles  
 in  $\dot{y}$ . case  $\dot{y}$ . left ventricle of the heart & left auricle wd. in  $\dot{y}$ .  
 fetus have circulated more  $\dot{y}$ . the right for taking any proportion  
 suppose  $\dot{y}$ .  $\dot{y}$ . foramen ovale had transmitted  $\dot{y}$ . of  $\dot{y}$ . whole mass  
 then remained  $\dot{y}$ . to enter  $\dot{y}$ . right ventricle, but  $\dot{y}$ . left ventricle  
 wd. have recd.  $\dot{y}$ . whole  $\dot{y}$ . from  $\dot{y}$ . lungs &  $\dot{y}$ . from  $\dot{y}$ . foramen  
 ovale: Hence  $\dot{y}$ . quantity in these wd. must be perfectly equal  
 after birth tho. have been very unequal. — Again suppose  
 $\dot{y}$ . foramen ovale wanting &  $\dot{y}$ . commun. only between  $\dot{y}$ .  
 pulmonary artery & Port.  $\dot{y}$ . whole wd. have entered the  
 right, but a considerable portion wd. have passed by  $\dot{y}$ . left:  
 when as supposing  $\dot{y}$ .  $\dot{y}$ . foramen ovale is nearly equal  
 in size to  $\dot{y}$ . Canalis Ductus; &  $\dot{y}$ . nearly equal to  $\dot{y}$ . two  
 branches of  $\dot{y}$ . pulmonary artery, we perceive  $\dot{y}$ . both ventricles  
 in  $\dot{y}$ . same space of Time circulate  $\dot{y}$ . same quantity of blood  
 &  $\dot{y}$ . same applies to  $\dot{y}$ . Auricles Hence is just proportion  
 is preserved between them. For of  $\dot{y}$ . whole mass ascending  
 thro'  $\dot{y}$ . vena Cava one third goes off, & two thirds remains, for  
 $\dot{y}$ . right ventricle: the left auricle again receives from  $\dot{y}$ . lungs  
 what entered  $\dot{y}$ . pulmonary branches, & had passed through the  
 foramen ovale i.e.  $\dot{y}$ . hence each of  $\dot{y}$ . ventricles circulates  
 $\dot{y}$ . of  $\dot{y}$ . mass. — For  $\dot{y}$ . purpose of communication we have  
 seen two umbilical arteries,  $\dot{y}$ . continuation of the internal  
 Iliacs, & these are again joined together carefully to guard  
 against obstruction: when they reach  $\dot{y}$ . placenta they con-  
 stantly meet & cross: from  $\dot{y}$ . placenta a single vein returns  
 to  $\dot{y}$ . vena portae. From  $\dot{y}$ . canal leads to  $\dot{y}$ . vena Cava: but  
 $\dot{y}$ . Canal tho' call'd venous as coming from  $\dot{y}$ . veins, is much  
 smaller  $\dot{y}$ .  $\dot{y}$ . umbilical vein, & supposing it proportion'd to the  
 size we wd. say  $\dot{y}$ .  $\dot{y}$ . whole blood returning does not enter the  
 Vena Cava but a consid. portion of it afterwards passes

325.  
This of Liver: There is some difficulty in giving a reason for  
the joining of  $\gamma$ . umbilical vein, with  $\gamma$ . vena porta &  $\gamma$ . again  
with  $\gamma$ . vena Cava: I do not find a satisfying an<sup>r</sup> of it, I see  
only way in general  $\gamma$ . it is necessary  $\gamma$ . some more blood should  
enter  $\gamma$ . vena porta. before birth  $\gamma$ . it is merely furnished by the  
Stomach and Aliment. Canal  $\gamma$ . in an inert state; hence a  
portion is sent from  $\gamma$ . placenta into it, &  $\gamma$ . rest into  $\gamma$ . vena  
Cava by  $\gamma$ . Canalis venosus: But I suspect there is one further  
reason: after birth these Canals are stop<sup>d</sup>; now without any  
tying of  $\gamma$ . umbilical Chord  $\gamma$ . blood coagulates in it; but how  
comes it  $\gamma$ .  $\gamma$ . Canalis venosus is shut, as also  $\gamma$ . foramen  
ovale &  $\gamma$ . Canalis lateralis, these are points w<sup>ch</sup> no physi-  
cists have yet explain'd in a satisfying way because or mat-  
erial Circumstances is constantly omitted. — Begin w<sup>th</sup>  $\gamma$ . Canalis  
Venosus. — We are told  $\gamma$ . after birth  $\gamma$ . circulation is more  
rapid in  $\gamma$ . vena Cava  $\gamma$ . before, hence  $\gamma$ . blood can't enter from the  
Ven. port. into it. But is not the rapidity equally increas'd in  $\gamma$ .  
Ven. porta & how comes it  $\gamma$ .  $\gamma$ . blood does not pass from  $\gamma$ . vena  
Cava in  $\gamma$ . port. neither can we avail  $\gamma$ . stoppage entirely by  $\gamma$ .  
action of  $\gamma$ . diaphragm, tho' by its descent, pressure is made upon  
 $\gamma$ . Canal: but further  $\gamma$ . Can. Ven. takes its rise from  $\gamma$ . Ven. port.  
in an oblique manner, so  $\gamma$ . force increas'd in  $\gamma$ . ven. port. seems to  
compress  $\gamma$ . sides of  $\gamma$ . beginning of  $\gamma$ . Canal, whilst the descent of  
the diaphragm changes  $\gamma$ . direction a little, & at  $\gamma$ . same time  
adds to  $\gamma$ . pressure. & further an ob.  $\gamma$ . nature disposes  $\gamma$ . Canal  
when there is no further occasion for it: to contract at its origin.  
With reg<sup>d</sup> to  $\gamma$ . stoppage of other two passages, beyond doubt the  
blood runs thro'  $\gamma$ . lungs w<sup>th</sup> much greater velocity,  $\gamma$ . thro'  $\gamma$ . rest  
of the System:  $\gamma$ . force of  $\gamma$ . left Auricle exceeding  $\gamma$ . of  $\gamma$ . right  
as much as  $\gamma$ . of  $\gamma$ . one ventricle exceeds  $\gamma$ . of  $\gamma$ . other, & w<sup>ch</sup>  $\gamma$ . numb<sup>r</sup>  
cause of  $\gamma$ . Osal hole, w<sup>ch</sup> is dispos'd as a valve by  $\gamma$ . repeated  
Contractions of  $\gamma$ . left auricle is raised & remains contiguous to  
 $\gamma$ . sides of  $\gamma$ . foramen they adhere, & with regard to the  
shutting of  $\gamma$ . Canalis lateralis it enters  $\gamma$ . descending Aorta  
in an oblique manner, &  $\gamma$ . force of  $\gamma$ . blood being much increas'd  
thro'  $\gamma$ . sides of  $\gamma$ . Canal are press'd together, & this I find is  $\gamma$ . first  
place  $\gamma$ . shuts & its disposition to contract we can assign no  
distinct reason for, further than that it is useful & therefore  
happens. — Further with regard to  $\gamma$ . fetters we find  $\gamma$ . it is w<sup>ch</sup>

in water y<sup>e</sup> pressure in all parts may be equal & its ( 326.  
organs grows equally: at y<sup>e</sup> same Time it is less injurious to  
Uterus: y<sup>e</sup> weight of y<sup>e</sup> fetus within y<sup>e</sup> uterus is next to  
nothing, while at y<sup>e</sup> same time external accidents are guarded  
against. Next it is supposed by a chord & whilst y<sup>e</sup> chief  
purpose of this is to make y<sup>e</sup> communication, it answers other  
very material purposes. It is generally tyed to y<sup>e</sup> Top of y<sup>e</sup> Uterus  
preventing y<sup>e</sup> fetus y<sup>e</sup> Bottom of the uterus, whilst it is in any  
tender state; & it determines y<sup>e</sup> head downwards, because the  
Chord is tyed not to the very middle of y<sup>e</sup> body but by on<sup>e</sup> the  
greatest weight is towards y<sup>e</sup> Head, so at all times y<sup>e</sup> head of  
the Fetus is downwards, whilst by means of the water & length  
of y<sup>e</sup> Chord y<sup>e</sup> fetus can especially in y<sup>e</sup> after m<sup>o</sup> capacity  
change its place; & the communication is gen<sup>ly</sup> made by  
Top of the uterus, because there y<sup>e</sup> weight of y<sup>e</sup> fetus & of the  
water presses less against y<sup>e</sup> principal vessels destined  
for its nourishment: with regard to y<sup>e</sup> vessels of y<sup>e</sup> mother,  
we have seen the Placenta arising as in the Male, having the  
Spermatie Part. We find it joined w<sup>th</sup> y<sup>e</sup> Hypogastrium, and  
numerous Anastomoses repeated upon y<sup>e</sup> substance of y<sup>e</sup>  
uterus; & that they run in a Serpentine way w<sup>ch</sup> is not on  
account of y<sup>e</sup> dilatation of y<sup>e</sup> uterus, y<sup>e</sup> N<sup>o</sup> of times being  
nearly as great in the last month as in y<sup>e</sup> first; but y<sup>e</sup> Anast.  
-omoses serve to prevent obstruction, & perhaps y<sup>e</sup> different  
Purposes meeting serve to prepare y<sup>e</sup> blood for y<sup>e</sup> Uterus of y<sup>e</sup>  
uterus are most unnecessarily convoluted, without supposing  
some such purpose. Next it is said y<sup>e</sup> in delivery a N<sup>o</sup> of  
these Serpentine Arteries are torn, & y<sup>e</sup> y<sup>e</sup> open mouths there-  
of are remain within y<sup>e</sup> cavity of y<sup>e</sup> uterus, as from attending to  
this we conceive y<sup>e</sup> natural & original structure: that the  
Arteries terminate by open mouths within y<sup>e</sup> cavity of y<sup>e</sup> uterus  
and y<sup>e</sup> termination of y<sup>e</sup> arteries is y<sup>e</sup> same as of y<sup>e</sup> veins.  
I dont know how y<sup>e</sup> Uterus has kept in y<sup>e</sup> y<sup>e</sup> menstrual flux  
is venous, & y<sup>e</sup> y<sup>e</sup> veins are more remarkable after delivery  
than y<sup>e</sup> Arteries. But I see a sufficient N<sup>o</sup> of Arteries to

to discharge of blood, & it is readily made at y<sup>e</sup> same [327]  
origin where y<sup>e</sup> fetus is attached, & y<sup>e</sup> both are answer'd by  
one structure: when we attend to the placenta we find Retinix  
passing passing upon y<sup>e</sup> spongy chorion covering it: farther  
is fix'd a sack or pellucid bag, call'd amnion containing  
y<sup>e</sup> liquor Amnii in w<sup>ch</sup> y<sup>e</sup> fetus swims next to that and slightly  
connect'd with it we find y<sup>e</sup> clear or pellucid chorion & this is  
cover'd by a soft spongy opaque membrane call'd y<sup>e</sup> spongy  
chorion: & between y<sup>e</sup> pellucid & spongy chorion we find the  
placenta taken in. but at first there is no appearance of  
placenta, we find only a vast number of vessels upon y<sup>e</sup> clear  
chorion: we are therefore dispos'd to imagine y<sup>e</sup> y<sup>e</sup> placenta  
is form'd by somewhat particular in y<sup>e</sup> structure of y<sup>e</sup> uterus  
& that it is not an original pt. In y<sup>e</sup> inner side of the  
uterus of a calf or of a lamb, we find a N<sup>o</sup> of glands or knots  
into w<sup>ch</sup> many vessels enter; & these are plac'd at reg<sup>l</sup> distances  
from each other & in find a N<sup>o</sup> of placuntula answering to y<sup>e</sup>  
N<sup>o</sup> of these glandule: In a cow perhaps to y<sup>e</sup> N<sup>o</sup> of y<sup>e</sup> D. now we  
cant imagine y<sup>e</sup> there were 70. original placuntula but rather  
y<sup>e</sup> y<sup>e</sup> structure of y<sup>e</sup> uterus gave occasion to this formation &  
in a human fetus of 2. Mo<sup>th</sup> old or somewhat later we find  
no appearance of a cake, but y<sup>e</sup> y<sup>e</sup> bottom of y<sup>e</sup> uterus has  
many more vessels y<sup>e</sup> any other part of it, & gen<sup>l</sup> y<sup>e</sup> placenta  
is connect'd to y<sup>e</sup> part: so y<sup>e</sup> uterus at its fundus is better  
fitted for forming y<sup>e</sup> placenta y<sup>e</sup> in any other part the there  
are instances of its being found at y<sup>e</sup> or interior & other  
parts, & when then happen to be twin contain'd in dis-  
tinct membranes we almost alway find y<sup>e</sup> placenta  
contiguous: & we cant imagine y<sup>e</sup> two ova to meet by  
accident, so y<sup>e</sup> part touching y<sup>e</sup> fundus is chang'd onto  
placenta, whilst y<sup>e</sup> vascular structure of y<sup>e</sup> uterine skin ke.  
The spongy chorion seems also to be deriv'd chiefly from the  
uterus, & when y<sup>e</sup> fetus is young it adheres firmly to it  
We are not however to imagine y<sup>e</sup> regularly at certain periods  
a membrane is detach'd from y<sup>e</sup> uterus as Anim<sup>als</sup> also cast  
their skins at different seasons; this separation is only

the work of Conception, & only takes place after  $\dot{y}$ . Ovaum (328.  
has grown to a certain Bulk,  $\dot{y}$ . connexion between  $\dot{y}$ . being  
naturally  $\dot{y}$ . Bond. — With reg. to  $\dot{y}$ . nourishment of the  
Fetus whether it receives it by absorption, or if there is a  
Circul. between it & the Mother. For as to a separate question  
whether it is nourish'd by what it receives thro'  $\dot{y}$ . umbilic.  
For as by swallowing  $\dot{y}$ . Liquor Amnii, these entering into  
 $\dot{y}$ . substance seem to have conceiv'd  $\dot{y}$ .  $\dot{y}$ . animal can live  
altho'  $\dot{y}$ . connexion between  $\dot{y}$ . by means of  $\dot{y}$ . Cord were  
wanting,  $\dot{y}$ . is  $\dot{y}$ .  $\dot{y}$ . Liquor Amnii is deriv'd from  $\dot{y}$ . vessels of  
the Mother. But in  $\dot{y}$ . Quadruped we can shew  $\dot{y}$ . the  
membranes of  $\dot{y}$ . Fetus are supply'd by  $\dot{y}$ . vessels from  $\dot{y}$ .  
Fetus  $\dot{y}$ .  $\dot{y}$ . Amnii is full of vessels w<sup>ch</sup>. are from  $\dot{y}$ . umbilical  
Arteries &  $\dot{y}$ . The liquor Amnii is a secretion from  $\dot{y}$ . Fetus.  
It has been alledg'd  $\dot{y}$ . hairs were found in  $\dot{y}$ . Intestines of  
Fetus of  $\dot{y}$ . same color w<sup>ch</sup>. these are  $\dot{y}$ . skin w<sup>ch</sup>. w<sup>d</sup>. shew  $\dot{y}$ .  
 $\dot{y}$ . Liquor Amnii is swallow'd but from  $\dot{y}$ . improbability  
of  $\dot{y}$ . thing, it w<sup>d</sup>. require some very clear exper<sup>ts</sup>. to prove the  
fact, & perhaps it was only some fibrous substance  $\dot{y}$ .  
was mistaken for hair. — It only remains therefore to enq<sup>ire</sup>  
whether there is a Circul. between  $\dot{y}$ . mother & Ch<sup>ld</sup>. or if  $\dot{y}$ .  
Ch<sup>ld</sup> receives its nourishment by absorption. — The latter is  $\dot{y}$ .  
most gen<sup>l</sup>. but by no means  $\dot{y}$ . most just opinion. I am  
dispos'd to believe  $\dot{y}$ . there is a Circul. between  $\dot{y}$ . mother &  
Ch<sup>ld</sup>. tho' I can by no means give a clear proof of it. There  
is nothing of Circul. ab.  $\dot{y}$ . viviparous animal as nourish'd  
by absorption w<sup>ch</sup>. is true; but then it is absolutely necessary  
that the nourish<sup>t</sup>. is prepar'd before hand; & therefore w<sup>d</sup>. say  
 $\dot{y}$ . as there is no such receptacle of prepar'd matter for aliment  
in the viviparous animals a Circul. is necessary. Thus say  
Father  $\dot{y}$ . it is altogether inconceivable  $\dot{y}$ .  $\dot{y}$ . vessels of  $\dot{y}$ . Fetus  
& those of  $\dot{y}$ . Mother, w<sup>ch</sup>. beyond doubt are originally detach'd  
wh<sup>ch</sup>. must be as to form continued Canals. But we obs<sup>rv</sup>.  $\dot{y}$ . in  
fact takes place in wounds  $\dot{y}$ . vessels of  $\dot{y}$ . healing unite  
or communicate from opposite sides; &  $\dot{y}$ . same may happen  
in the Utterus. — In Quadrupeds they tell us there is no

continuation of Canals for we perceive y<sup>e</sup> glands of  
 appearing of a white colour containing milk, whereas y<sup>e</sup>  
 contains red blood, Upon this using in an Injection, we put  
 away the pleasure. But too much dependance is had to  
 the success of Injections, it is difficult to imitate every  
 common circuit as in y<sup>e</sup> Brain or Spleen, to make an injec-  
 ion pass from y<sup>e</sup> Artery into the vein: we do not make an  
 injection pass from y<sup>e</sup> Artery into y<sup>e</sup> vein, nor can we make  
 it follow y<sup>e</sup> Circulation when y<sup>e</sup> vessels are extremely tender  
 Besides how do we know y<sup>e</sup> colorless vessels are not con-  
 nected, & supposing in y<sup>e</sup> Quadruped there is no circuit we  
 can't apply y<sup>e</sup> to y<sup>e</sup> human structure w<sup>ch</sup> is very different.  
 In the Quadruped we find glands before Reception of an in-  
 stant to prepare a liquor of a milky nature, & whether circu-  
 lated or abraded is capable of supplying the fetus in the  
 human body there is no such structure, & some points are  
 from imagination; but we find only arteries divided and  
 far from having come to the Extremities.  
 So upon the whole we must conclude y<sup>e</sup> most reasonable  
 & just opinion is y<sup>t</sup> there is a circulation between the  
 Mother and fetus.

Lecture 75.

We shall now proceed to give some acct. of y<sup>e</sup> Venereal Disease  
 You all know y<sup>t</sup> y<sup>e</sup> venereal poison is not convey'd by the Air, but  
 enters us only when it is directly apply'd to y<sup>e</sup> Surface of y<sup>e</sup> body;  
 may we say it from being contagious y<sup>t</sup> it runs & carries to hunt  
 us thro' apply'd to y<sup>e</sup> sound skin of y<sup>e</sup> common hardness, when  
 it is apply'd to y<sup>e</sup> softer parts as the Glans penis, the Lips  
 the papilla of y<sup>e</sup> Breast, it then has its effects. It generally  
 occasions an Inflammation of y<sup>e</sup> part before it enters the In-  
 stitution, but it may enter y<sup>e</sup> thinner & tender parts of the skin  
 so as to taint y<sup>e</sup> mass without occasioning Inflammation or ulceration  
 where y<sup>e</sup> poison affects supposing y<sup>e</sup> outer surface of y<sup>e</sup> Glans  
 Penis there is an inflam<sup>n</sup> generally attended with swelling &  
 pustule forms than an Ulcer, & from this a Rubeo is afterwards  
 produced, or the other Symptoms of the disease.  
 Next we attempt to prevent the Chance making further

390.  
progress & producing Bubo. — You know y<sup>e</sup> y<sup>e</sup> poison in  
such cases is convey'd from the Chancre by y<sup>e</sup> Lymph: & is  
usually into the Bubo, y<sup>e</sup> there is a translocation of y<sup>e</sup> y<sup>e</sup> poison  
The hands & ulcers y<sup>e</sup> part affected & the heart, & in y<sup>e</sup> y<sup>e</sup> poison  
y<sup>e</sup> upper stands of the Inguinal Cluster alone swell, sometimes  
there is a fulness produced at the Top, producing an Oedema  
down the thigh, & even remarkable in y<sup>e</sup> whole system. —  
Now if we w<sup>d</sup>. reason abstractly upon y<sup>e</sup> cure of a Bubo we  
w<sup>d</sup>. say y<sup>e</sup> y<sup>e</sup> bringing it to a suppuration is y<sup>e</sup> safest course  
because we discharge y<sup>e</sup> poison already lodg'd in y<sup>e</sup> gland,  
& in some measure prevent y<sup>e</sup> further intercourse between y<sup>e</sup>  
Chancre & y<sup>e</sup> system y<sup>e</sup> matter being discharge'd a y<sup>e</sup> opening  
But in this method Bubbles are cur'd not w<sup>d</sup>. heat m<sup>d</sup>. pain  
Hope of time therefore y<sup>e</sup> best way is discovering it, & the  
most effectual way is by giving the patient mercury in  
such doses as to touch y<sup>e</sup> mouth w<sup>d</sup>. of all other medicines  
most readily discovers y<sup>e</sup> Bubo & instead of anubling y<sup>e</sup> part  
with Ungt. Mercurial, at y<sup>e</sup> same time apply y<sup>e</sup> Sacchar:  
Saturn. poultice. — In treating Bubbles where they come  
forward, a small incision made at y<sup>e</sup> bottom of y<sup>e</sup> sack  
containing y<sup>e</sup> matter is sufficient: & after y<sup>e</sup> incision we  
continue y<sup>e</sup> Sacch. Saturn. poultice as before: After y<sup>e</sup> poison  
has by passing upwards into y<sup>e</sup> thoracic duct, & so into  
the adveins been mix'd w<sup>d</sup>. y<sup>e</sup> mass of blood it lies quiet  
for some time without producing any disorder, but the  
consequences are felt some weeks or more generally month,  
thereafter y<sup>e</sup> matter is evidently multiply'd before we feel  
y<sup>e</sup> effect of it; & by mercury we can prevent the physical de-  
termination of y<sup>e</sup> disease, w<sup>d</sup>. proves y<sup>e</sup> mercury operates  
upon y<sup>e</sup> general mass. — The poison after floating in the  
mass for a certain time generally first appears about y<sup>e</sup>  
Amyg<sup>d</sup> of the throat, if nothing is done to cure it next  
it readily affects y<sup>e</sup> skin, & generally in y<sup>e</sup> part place we  
observe y<sup>e</sup> bones come to be affected &c. & y<sup>e</sup> y<sup>e</sup> y<sup>e</sup> y<sup>e</sup> y<sup>e</sup>  
y<sup>e</sup> bones first suffer & afterwards y<sup>e</sup> bones come to be affected

generally upon the Surface of the hard bones or the hardest parts of the soft bones most readily suffer & in some Cases we find y<sup>t</sup>. the Joints are liable to suffer. In improper methods of treatment I have frequently found ulcers appearing in the Throat and swellings produced in the side of the neck, but sometimes the y<sup>t</sup>. disease is neglected such swellings of y<sup>t</sup>. Glandular duct appear. We may also further y<sup>t</sup>. There is no Case of Lues venerea curable by mercury, w<sup>ch</sup>. cannot be cur'd by it in its most simple form i.e. made into an Ointment. Cou'd it into y<sup>t</sup>. lozge or made into pills & taken inwardly & y<sup>t</sup>. all the usual preparations may be laid aside entirely & y<sup>t</sup>. want of a cure is for a want of sufficient time y<sup>t</sup>. most simple of all forms is the killing y<sup>t</sup>. mercury w<sup>ch</sup>. Honey & then beating it into a paste with bread: three grains of mercury are sufficient for many or from y<sup>t</sup>. to seize, in y<sup>t</sup>. Ob. Lewis: & in a recent Case 2.5. or 6. weeks will be sufficient & in a very inveterate case double the Time: and it is never to be pushed further y<sup>t</sup>. to produce a slight soreness in the Mouth: whether y<sup>t</sup>. medicine acts by a discharge or without it is not certainly known, but we may say a great deal on both Sides.

Let us next attend to y<sup>t</sup>. effects of y<sup>t</sup>. poison when y<sup>t</sup>. Methra suffers or when the GONORRHOEA. as it is improperly call'd is produced. — You are all without doubt assent to the opinion y<sup>t</sup>. y<sup>t</sup>. Gonorrhoea & Lues Venerea are both different symptoms of the same disease or affection, occasion'd by the same poison — But how are we to imagine y<sup>t</sup>. poison is convey'd into y<sup>t</sup>. Methra? There is more difficulty in y<sup>t</sup>. might be imagin'd, & it has produc'd various opinions, Some suppose y<sup>t</sup>. the Lymphatic vessels or absorbent veins conveying the poison from y<sup>t</sup>. Surface of the Glands into y<sup>t</sup>. membranous part of y<sup>t</sup>. Methra: others conceive pores upon the Glands like Sponges sucking it in, whilst the most common and just opinion is y<sup>t</sup>. it enters at y<sup>t</sup>. extremity of the Methra so the Course of the absorbent vessels is not inwards for

for from a chancre  $\gamma$ . poison is carried outwards to  
 the Inguinal Glands. — So we must suppose  $\gamma$ . it enters  
 at the Extremity of the Uthra, but without having a  
 very distinct motion about it: I can't satisfy myself  
 whether it enters like water & oil between two glass plates  
 or rather  $\gamma$ .  $\gamma$ . mucous of  $\gamma$ . uthra whilst  $\gamma$ . Cells of the  
 penis are distended with blood, is press'd out at its ex-  
 tremity: & when the penis is detumescit  $\gamma$ . viscid mucus  
 remaining  $\gamma$ .  $\gamma$ . poison entangled with it, fall back w<sup>th</sup> in  
 the passage. In infants have been found in the nose & the  
 Mother did not enter to deposit her ova: but there were  
 deposited upon  $\gamma$ . mucus hanging upon the nose w<sup>ch</sup> by  
 an effort of expiration was drawn up again: In some  
 such way it enters  $\gamma$ . uthra. — Next let us consider  $\gamma$ .  
 effect it has upon  $\gamma$ . membrane of  $\gamma$ . uthra.  
 Dr. Saphirband  $\gamma$ .  $\gamma$ . mucus views as a defence against  
 $\gamma$ . venereal poison & I doubt very much whether we suffer  
 more from the disease by mucus of glands pouring out  
 matter into  $\gamma$ . uthra, or less: I apprehend less: The mucus  
 perhaps conveys  $\gamma$ . poison into the Uthra: but if we were  
 to suppose these glands wanting  $\gamma$ .  $\gamma$ . poison apply'd to  
 the Uthra, we sh<sup>d</sup>. have suffer'd more from the disease  
 than we do, as in the measles, w<sup>ch</sup> disease is said to have  
 a determination to the mucous glands: I w<sup>d</sup>. rather say  $\gamma$ . it  
 has a determination to  $\gamma$ . skin parts of excretorious  
 matters, but  $\gamma$ .  $\gamma$ . parts,  $\gamma$ . nose &  $\gamma$ . suffer less  $\gamma$ . they w<sup>d</sup>.  
 do without  $\gamma$ . Mucus. — So the very tender & sensible  
 Membrane w<sup>d</sup>. have been more injur'd without  $\gamma$ . mucus  
 Next with respect to the mucous organs as composing a  
 part of the Uthra. — We find in every part of the body  
 how irritation  $\gamma$ . liquor is increased, as  $\gamma$ . Tears, Saliva  
 $\gamma$ . mucus; &  $\gamma$ . venereal poison may have  $\gamma$ . same effect:  
 so we explain the first effect,  $\gamma$ . increase of mucus from  
 irritation. Afterwards it comes to be discolour'd from  $\gamma$ . degree  
 of Inflamm<sup>n</sup>. &  $\gamma$ . putting a Bougie into a wound person will

occasion a similar effect Discharge when y<sup>e</sup> irrit<sup>ed</sup>  
 has continued longer there is a yellow & greenish matter  
 mixed with the clear mucus, Upon examining y<sup>e</sup> Liqueur  
 w<sup>th</sup> y<sup>e</sup> microscope you will see a vast number of globules  
 But we are not to imagine y<sup>t</sup> we see any thing of y<sup>e</sup> Ven<sup>er</sup>  
 Disease for y<sup>e</sup> same proceeds from a mixed matter from  
 irritation & I have seen this appearance in a Gleet: after  
 y<sup>e</sup> person left off y<sup>e</sup> use of medicines & cured without  
 any bad consequences so it is only y<sup>e</sup> effect of y<sup>e</sup> inflam<sup>ed</sup>  
 and irritation. — With time y<sup>e</sup> poison is multiply'd in  
 the Uthra in a manner w<sup>ch</sup> it is by no means easy to account  
 for whether y<sup>e</sup> change be owing to y<sup>e</sup> glands irritated in a  
 certain manner & in consequence of a certain kind of ir-  
 itation producing venereal poison; or whether y<sup>e</sup> there is  
 some chemical process, or some degree of fermentation  
 it is not to impossible to say: if the mamma is baw'd  
 & inflam'd we find a cancerous poison produced, tho' there  
 is no original leaven: whether the like happens in the  
 Uthra, or y<sup>e</sup> there is a chemical process is not easy to be  
 determin'd: but y<sup>e</sup> only useful fact is, y<sup>t</sup> it is multiply'd,  
 w<sup>ch</sup> every one knows, y<sup>t</sup> it is a natural progress of the  
 Disease, to affect y<sup>e</sup> Uthra farther & farther backwards to  
 its beginning, so y<sup>t</sup> tho' it is first seat'd over the frum  
 yet by degrees & in a manner I do not pretend to explain  
 depending upon the same principal as y<sup>e</sup> origin<sup>al</sup> affection  
 it goes deeper towards y<sup>e</sup> vesica urinaria: and the Uthra &  
 Uthra & Sphincter of the Bladder. — We find chiefly partic<sup>ular</sup>  
 Spots of the Uthra accidentally affect'd: we find Bores  
 in several places, w<sup>ch</sup> are an obliteration of certain of y<sup>e</sup> mucus  
 ducts: The patient in making water finds a pain more in  
 one place than another, or throwing injections backwards  
 it hurts at that particular place, or introducing a Bougie  
 has the same effect: or when a fissure fistula form'd, so we  
 are not to compare y<sup>e</sup> affection of the membrane of the

rather to the effects produced on the mucous glands  
 in common. — In y. Cure of the gonorrhoea mercury is m.  
 certainly one of y. most powerful Antiphlogistics, & the  
 the fever is quicken'd by its use, yet y. Inflammation is  
 diminish'd & in case of a Bubo or Chancre when there is  
 an Inflamm<sup>n</sup> we can't discuss y. Bubo more readily y. by  
 giving mercury. — generally as soon as y. mercury is  
 felt in the mouth the Inflamm<sup>n</sup> subides in y. the thro' &  
 the Cure is complicated worse. — The last affection  
 in consequence of Gonorrhoea is producing a Swelling of the  
 Testicle. — The Testicle is swell'd or affect'd from y. Inflamm<sup>n</sup>.  
 in the Uthra & y. in five ways. — First the swelling of  
 the Uthra falls upon the mouth of the Seminal Duct.  
 prevents y. discharge of the Semen. — Next y. Irritation  
 is communic'd from the mouth of its duct, just as  
 when an irritating Substance is put into y. mouth or  
 blown into the Eye, there is a discharge made from the  
 Salivary or Lachrymal glands: & in Confirmation of this  
 as the Gonorrhoea naturally attacks y. anterior part of  
 the Uthra first: & only by degrees going deeper, I seldom  
 see the swelling of the Testicle produced by y. most violent  
 Gonorrhoea when recent: It is only when it has crept back  
 to the mouth of the Seminal duct. And I have seen it  
 occasion'd from ulcers of the Bladder from stone & in coming  
 of y. Patial Operation of y. men Inflamm<sup>n</sup> occasioning it. &  
 it is y. beginning of y. sea disease from y. Epidyd. y. as  
 first swell'd & y. swelling is gradually communicating  
 backwards thro' y. Epidyd. & the Testicle new. swell'd till  
 y. whole of the Epidyd. is affect'd: & when the swell'd. subides  
 I find y. it first falls in the end of y. Epidyd. next the  
 War disease, and gradually backwards to the body of  
 the Testicle: y. affection evidently preceding in y. manner.  
 Now from this view we are led evidently to the Cure —  
 Mercury is not more necessary in the Gonorrhoea y. here

But a greater attention is necessary to y. Antiphlegm. the Cause, on account of the delicacy of the Testicle & violence of the Inflamm. w. has now reach'd vasa into the Urethra & sometimes there is a degree of venereal strangury w. it endeavours to prove the same thing. — The method of cure is plainly this w. as soon as the swelling is abated, let out to be bled the quantity to be determin'd by y. Constitution or Age: After drawing it safely from the Arm, if the Inflamm. continues & the letting a greater quantity judg'd improper recourse may be had to topical bleeding, & we ought to apply Leeches, not to the Scrotum in the beginning, we shall succeed better if we apply the Leeches to the root of the penis. & if we apply a poultice w. may be made of Saub. Saturn. ℞. Aqua P.P. with Rind of some oil, instead of confining it entirely to the Testicle let it also cover the penis. & we may say the warm Bath & Foment. The patient is also to be laid horizontally, as the raising the Body will bring on considerable pain. — After the Swell. has subsided, let us begin to give mercury in a small quantity as there is possibility of y. matter pass. back into the blood notwithstanding we have not observed the Intervention of a Subs.

Lecture 7<sup>th</sup>.

A Demonstration of the Glands & their Structure. — We have now seen gentlemen y. vascular Structure of all the Glands & glandular viscera: It remains y. we explain y. beginning of the several ducts & endeavour to determine whether y. Ducts communicate with them exactly in the same manner y. the communicate w. y. circulating veins & y. their ducts only differ from veins in this y. they end of the duct does not terminate in the heart, & y. liquor differs from the general mass: or whether a receptacle, bag, or follicle

be interposed. — We are to imagine of a Branch which includes [336]  
and globules takes its rise from of Arteries & Seminales in an ex-  
cretory duct, or of there is a bag or follicle interposed, into which  
Arteries pour the Liquor: we shall now review what has been  
shown or mentioned with regard to our glandular Organs: Begin-  
ning with of fatty bags, we observe w<sup>th</sup> of microscope of of whole fat of  
Animals, not only of marrow w<sup>ch</sup> was supposed to consist of  
round bags, but the fat is all divided into bags of a minute  
shape, pointed with vessels, so of bags or follicles in of glandular  
Organs are perfectly indisputable: And the whole of of Tongue  
is made all w<sup>th</sup> an injection of of bags of follicles gives it of  
colour, numerous Arteries running upon of: Next in of organs  
of generation particularly in of Ovarium we perceive round  
Vesicles fill'd w<sup>th</sup> a Liquor, no doubt of of highest importance  
These vesicles open at the Time of Conception & it is pointed w<sup>th</sup>  
Vessels — & we find in the Male long tubes forming of Testicles  
of of Semen is deposited into these, & of communication of the  
Arteries w<sup>th</sup> of tubes of the Seminal ducts may be compar'd  
to of communication between of Arteries & ducts of of Intestines  
With regard to the Liver of divisions are so minute in this  
Organ of it is not to impossible to determine of of beginning  
of the Biliary ducts because of lobules are very much in-  
termed. But as we have it in our power to dilate the ducts  
we see of of biliary ducts begin likewise from very minute  
Bags, such as the naked Eye does no way's take in

### Lecture 11<sup>th</sup>

In our discourse on the glands a disquisition still remains  
& I am afraid may in understanding of changes made in  
our blood by of glands — And we can trace of and globules  
in their whole course & yet we cant see how these are form'd  
from the food; it is efful'd by of general Circulation, but w<sup>th</sup>  
regard to of particular manner we certainly dont compre-  
hend it — In speaking of excretion we must include a  
variety of Circumstances; & perhaps after enumerating all

all of us, others still remain the effects of us. (33)  
escape us. We see the Arteries of glands applied in very different  
situations, w<sup>ch</sup> respect to distance from the heart & direction  
varies greatly, some going off at acute Angles, others at right  
angles, next there is a great disproportion in the size of the  
Arteries compar'd w<sup>th</sup> the Organs on w<sup>ch</sup> they terminate; in the  
Lungs &c. we can't but suppose that these various circum-  
stances have great effect on the coats of the Arteries are  
of different thickness. In the Liver the secretion is made from  
from blood w<sup>ch</sup> has undergone a circulation, & w<sup>ch</sup> force of  
which is more brisk than in any other part of our body  
So that long before the Blood comes near to the glands or to  
the ultimate termination a proper preparation is made for  
the secretion: and we are not to imagine chiefly w<sup>th</sup> Arteries  
that the Glands represent Sieves, w<sup>ch</sup> the secretion and  
changes depend upon the ultimate terminations of the  
Vessels &c.

### Lecture 78<sup>th</sup>

Having finished the structure of the Chyliferous Viscera  
and those of their generation. It remains that we  
examine some posterior Branches of the Aorta dis-  
persed on the Trunk of the body, next we follow w<sup>ch</sup> Aorta  
divided above the pelvis, dispersed to the Muscles, &  
pursue the Vessels to the Superior Extremities following  
the external femoral Artery with the accompanying  
Vein.

A Demonstration of the Nervous System.

888.

## Lecture 79. <sup>th</sup>

You have seen that the Trunk of the Uterus within y<sup>e</sup>. Abdomen is close to the Spine, hence y<sup>e</sup>. swelling & stroke of it are entirely outwards so y<sup>e</sup>. in many persons, y<sup>e</sup>. containing parts of y<sup>e</sup>. Uterus being press'd backwards, we can distinguish y<sup>e</sup>. stroke; and sometimes persons have been supposed to labour under Convulsion of the Uterus from this Circumstance. — All y<sup>e</sup>. from the Lumbar Vertebra it divides into two equal branches as thin is nothing found in y<sup>e</sup>. distribution of y<sup>e</sup>. vessels, w<sup>ch</sup>. sh<sup>d</sup>. determine us to prefer one Extremity to the other & in fact if by any accident the right Arm comes to be disabled persons, very readily learn to give y<sup>e</sup>. left leg y<sup>e</sup>. preference in performing the motions; & this may seem to confirm y<sup>e</sup>. reason of y<sup>e</sup>. preference mankind in general give to right Arm, y<sup>e</sup>. y<sup>e</sup>. particular division of y<sup>e</sup>. Uterus has a sensible effect. — The Uterus runs outwards not in a direct line to the Thigh, but in order to avoid y<sup>e</sup>. Cavities of the pelvis a considerable Angle is form'd, & y<sup>e</sup>. blood rushes against the division with considerable force & y<sup>e</sup>. may explain what we find y<sup>e</sup>. just after the beginning of the Uterus from y<sup>e</sup>. heart y<sup>e</sup>. Division of it at the Os Sacrum, is most subject to diseases as Spasmodic &c. The principal Artery of y<sup>e</sup>. Uterus is y<sup>e</sup>. Hypogastric Artery & from its situation an Experiment has been propos'd to make pressure on y<sup>e</sup>. top of the Femoral Artery in order to promote y<sup>e</sup>. menstrual flux & I have recommended it to be done, but without being satisfy'd of the effect, as either missing y<sup>e</sup>. Artery or not applying the proper pressure. But it is well y<sup>e</sup>. y<sup>e</sup>. pressure upon this Artery must increase y<sup>e</sup>. momentum of y<sup>e</sup>. blood in the Uterus, & in many Cases at least promote y<sup>e</sup>. discharge. If by any accident y<sup>e</sup>. femoral Artery sh<sup>d</sup>. be wounded, we may not only save the life, but the Limb, I am not to think of amputating at the Top of the Thigh, w<sup>ch</sup>. from y<sup>e</sup>. Quantity of blood lost, y<sup>e</sup>. number of nerves &c. is attended w<sup>th</sup>. y<sup>e</sup>. utmost danger, so must attempt to tie y<sup>e</sup>. Artery in y<sup>e</sup>. space of y<sup>e</sup>. branches many convey as much blood as is necessary & going lower y<sup>e</sup>. prospect of success continually increases because of the more numerous Arteries.

These few years we have two or three Cases of y. kind  
 when a Ligament proves successful, wive on in y. London  
 medical Essays, & 2<sup>nd</sup>. in y. medical Commentaries & one  
 quoted & told in an imperfect way by Hunter. As the Artery  
 passes downwards to y. ham it lies near to the Bone so  
 can stop y. blood by a Tourniquet by pressing y. femoral  
 Artery against the Bone - We attend to y. exact Situation  
 of y. Arteries in order to find 'em after Amputation: There  
 is no difficulty in finding y. Trunk of y. femoral in the  
 Thigh: But in the leg two of the Arteries are now connected  
 to membranes; y. Anterior Tibial is connected to y. inter-  
 osseous membrane in such a manner y. it requires atten-  
 tion to detach it: y. difficulty of raising this is such y.  
 y. Surgeon sometimes ties the Thread round y. bone; but  
 y. includes y. periosteum, & w<sup>th</sup>. Threads of y. muscles  
 & of y. nerves an divided here very minutely some of y.  
 Membrane may be taken in. - Then we trace back the  
 blood from y. foot, we see y. same gen<sup>l</sup>. Structure as in  
 the Arm only y. deep seated Veins are larger & y. outer  
 of course smaller, from the great activity of y. superior  
 extremity performing more varied motions, so y. blood is  
 more in danger of being stop'd: & y. deep veins don't  
 divide into so many branches, but they are larger &  
 therefore a Surgeon in performing Amputation will be  
 under a necessity of tying y. veins as well as the Arteries  
 The nerves of y. inferior Extremities are every like those  
 of y. Superior y. I need not make many remarks upon 'em  
 In y. bending of the body forwards when a Stone descends  
 thro' y. ureter has been explain'd from y. Ureter crossing  
 obliquely y. Anterior branches of y. nerves in the Groin  
 & y. y. y. Cremaster muscle is thrown into Action, &  
 drawn upwards: we are not to suppose y. y. Ureter  
 can make any such mechanical pressure upon these  
 Nerves. But first an irritation is communicated to the  
 neighbouring head, an Inflammation is excited; I suppose y.  
 Hydraulic System detach'd from y. nerves we sh. not

shows any contraction of *ij.* Remotior, it is from  
 an inflam.<sup>n</sup> spreading more readily to *ij.* neighbouring  
 Pagans & this situation in an inflam.<sup>n</sup> of *ij.* psoas muscle  
 chiefly proceeds from *ij.* cause *ij.* patient finds in that  
 posture, by the parts being relax'd & not *ij.* muscle is  
 in a spasmodic & convulsive action; for the patient can  
 not with pain extend *ij.* body behind *ij.* psoas.

I need scarcely obs. *ij.* in all operations wants avoid  
 of course of these nerves, as much as possible & the  
 Surgeon is with *ij.* utmost care to detach *ij.* nerve from *ij.*  
 artery. - I met with a curious case of an injured nerve.

An Officer was bound upon the outside of *ij.* fibula, the  
 shoe buckle was drove in upon the place; from the time  
 of the accident he co. extend the foot fully, but it was not  
 in his power to bend it again, - again he could extend the  
 toes but co. not extend them again, It immediately  
 occur'd to me *ij.* it was occasion'd by the trunk of *ij.* nerve  
 being lacerat'd against the bone; by drawing blood from  
 the part with Leeches and scarifying *ij.* part from time  
 to time & applying blisters he came to be reliev'd. -

Going lower to these small nerves: I need not warn you to  
 avoid carefully those that run upon the sides of *ij.* sheath  
 of the Tendons. - In practice Surgeons commonly commit  
 an error as when they treat *ij.* paronychia, because *ij.* Tendon  
 runs in *ij.* middle of *ij.* Incisions are made in *ij.* sides of *ij.* finger  
 now other things being equal let *ij.* Incision be made exactly  
 in *ij.* middle for at *ij.* side we are in danger of puncturing the  
 Nerve w<sup>ch</sup> is as large as those near to the Bone, & where it is  
 next to impossible to relax the nerve, next w<sup>ch</sup> eq. to *ij.* nerves *ij.*  
 accompany the Veins we can have no doubt *ij.* nerves equally  
 large; wounded in *ij.* inferior Extremities will produce symptoms  
 equally dangerous as in the Superior. -

## Lecture 20. *ij.*

I find it necessary to give you some Idea of *ij.* manner  
 in w<sup>ch</sup> some of *ij.* more powerful Medicines act upon the

Body of Animals viz. whether they affect on this, [31st.]  
nerves only of y<sup>e</sup> part to w<sup>ch</sup> y<sup>e</sup> medicine is apply'd; or  
whether they operate by entering first y<sup>e</sup> above ment of y<sup>e</sup> system.  
The Circulating System - and as y<sup>e</sup> Experiments made have  
been done upon Frogs, I shall give some notion of y<sup>e</sup> Structure  
of that Animal. - In y<sup>e</sup> head we find one Arterie only  
& one Venetie; because y<sup>e</sup> Lungs & air vessels are sup-  
ply'd from a Branch of the Arteria, ab<sup>o</sup> 1/3. of y<sup>e</sup> mass of  
blood passing thro' the Lungs. The Lungs are situated  
not within a partic<sup>l</sup> Cavity, but are within y<sup>e</sup> Abdomen  
only there is a passage leading from the Throat thro' the  
Diaphragm into y<sup>e</sup> Abdomen & Air vessels. In other respects  
the Frog agrees with Man in general Structure, y<sup>e</sup> Brain  
& Cerebellum & Spinal marrow & nerves sent off and  
dispers'd in a similar way. The Arteria divides into two  
branches, within y<sup>e</sup> Abdomen again they are united, but y<sup>e</sup>  
does not alter the general Course. - It may be proper to  
mention farther, that this Animal, w<sup>ch</sup> is very tenacious  
of Life, after the Circulation is stopp'd by cutting out y<sup>e</sup> head  
can move its body, walk on y<sup>e</sup> floor for an hour and  
upwards, if y<sup>e</sup> blood be stopp'd in a single member suppose  
y<sup>e</sup> Femoral Arterie cut. It can move y<sup>e</sup> Leg for 1/2. hour  
& the Sensibility remains in the Leg after y<sup>e</sup> Circulation  
has ceas'd for 3. or 4. hours. When we cut y<sup>e</sup> nerves of any  
part as of the Inferior Extremitie, altho' by doing so you  
render y<sup>e</sup> part immediately motionless & insensible, so y<sup>e</sup>  
the Animal is not capable of drawing into it, nor when  
y<sup>e</sup> Leg is injur'd in y<sup>e</sup> most violent degree as by burning the  
Foot, it does not express any marks of pain by making  
a motion of y<sup>e</sup> anterior part of the body, yet y<sup>e</sup> Circulation  
is seen in y<sup>e</sup> member for upward of a year, by y<sup>e</sup> microscope  
we see it to be free and rapid in y<sup>e</sup> or more vessels, & yet  
there is no recovery of either Sense or Motion. Now let us

see in what manner we may try the effect of remedies,  
 I endeavoured to ascertain in what way, some medicine, suppose  
 Opium, acts on the body in a sound state, I poured it into  
 the Stomach, injected it into the Chestum, & apply'd it to the  
 Surface: It is in all these ways provided we allow it  
 to remain long enough; the Animal is violently affected & at  
 last killed by the external applic<sup>n</sup>. as certainly as by the  
 internal: if we pour the medicine into a deep Cavity of the body  
 as within the peritonaeum, or under the skin by making a hole in  
 it, the effects are much more violent & sudden, the Animal is  
 killed in a short space of Time. Now after observing the effects of these  
 several ways, the Circulation & nervous power remaining entire  
 I after wards attempted to ascertain: how far the effects depend  
 upon the nerves alone or vessels alone & First upon the nerves  
 I cut out the heart of the Animal, & apply'd it in the way in which the  
 Animal can be most violently affected, by pouring it into  
 the Cavity of the Abdomen: I found in a very short space of  
 Time the muscles of the most distant extremities of the body  
 were rendered useless, a degree of motion remain'd but it was  
 convulsive & the Animal was so weak that it was not able to  
 crawl from its place where it was laid; So it appears evidently  
 that all the nerves of the body may suffer by an applic<sup>n</sup>. to a few  
 of them, that there is such a connexion among, or somewhere  
 or other that a single nerve injur'd brings all the others to suffer  
 in the most violent manner, or that there is a sympathy  
 among the nerves. — But on pouring the Opium under the skin  
 of the leg, in which the Circulation was stopp'd contrary to expect<sup>n</sup>.  
 I did not find that I could communicate the Injury to any part  
 of the System: the nerves in that part were insensibly tinged, as  
 soon as the Opium reach'd the muscles, all motion was at an  
 End, yet the Injury was not communicated to any part of the  
 of the N. S. This opens a view into the accompanying vessels  
 in a manner we don't understand altogether if the nerves  
 for conveying their impressions as it is not possible for the  
 remain free at the beginning of the nerves there is more than

This is it. *y.* *y.* nerve depends upon *y.* artery at the  
 beginning alone. I next cut *y.* nerve of a parrot. part had.  
*y.* Blood vessels see *U.B.* *y.* Sciatic nerve issuing from the  
 end of the spinal marrow; To make our work I divided  
 every thing but the bottom of the Aorta, *y.* vena Cava and  
 probably *y.* Lymph. vessels running on their coats; yet  
 Opium apply'd to the hind extremities of *y.* Animal influ-  
 -ued *y.* whole body: & in no very great length of Time in a  
 not much longer *y.* when *y.* animal was altogether sound  
 Opium affects *y.* body not merely by touching *y.* nerves:  
 e.g. Taking Opium into our Stomach we are by no means  
 to conceive *y.* *y.* sole influence depends upon *y.* nerves of *y.*  
 Stomach & *y.* other sympathize; but we may be affected  
 by opium entering the Lactals & convey'd into *y.* mass of  
 blood, not *y.* in a mechanical way influences *y.* Hydraulic  
 System, but the nerves of *y.* Circulat. vessels are affected: & *y.*  
 this' thro' all *y.* other nerves: To shew in some measure the  
 possibility of *y.* I next open'd a vessel near to *y.* heart and  
 pour'd into it a small drop of *y.* solution of Opium: as soon  
 as it touch'd *y.* heart, *y.* Organ ceas'd from motion: or I  
 cut this *y.* Aorta, or open'd it, to prevent *y.* commun. between  
*y.* heart & *y.* rest of the body, then dropt in *y.* liquor Opium  
 few seconds *y.* most distant parts were bet. to syncha-  
 -rize, so *y.* *y.* nerves are affected in *y.* most distant parts  
 by *y.* affection of *y.* nerves of *y.* heart, so *y.* Opium intro-  
 -duc'd by absorption in a great measure in *y.* like manner  
 On to shew more clearly again *y.* one nerve influences *y.* most  
 distant parts with. conveyance by *y.* Circulat. System I  
 may add another Experiment. - Laying bare *y.* Sciatic nerve  
 of a Frog, & touching it with *y.* most minute drop of *N. B.* *y.*  
*y.* instantly depriv'd *y.* nerve of its power: & I constantly  
 found *y.* this' *y.* Animal be thrown into water & the nerve  
 was'd yet in a day or two thereafter it dies, & not of *y.* new  
 injury done to the Sciatic nerve, for when we burn it with a  
 hot Iron, or cut it this' *y.* parts of *y.* nerve are ever reunited

we can scarcely know the place: but y<sup>e</sup> poison  
 goes deeper into y<sup>e</sup> N<sup>r</sup>. S<sup>r</sup>. whole N<sup>r</sup>. comes to be injured this  
 this nerve, now after considering these effects of opium I  
 need scarcely insist on y<sup>e</sup> effects of ardent Spirits, or of safe  
 essential Oils, or Camphor, only from the nature of y<sup>e</sup> Part,  
 we can obs. y<sup>e</sup> smell is communicated to y<sup>e</sup> most distant  
 Organ unchanged, & these organs put into water give y<sup>e</sup>  
 taste to y<sup>e</sup> water: so y<sup>e</sup> animal is killed in consequence of  
 absorption of these medicines, as well as by their direct  
 operation upon the nerves: or upon the whole we are very con-  
 siously affected by medicines, or by y<sup>e</sup> matter of disease  
 acting upon our body; for besides topical medicines w<sup>ch</sup>  
 scarcely affect y<sup>e</sup> parts at a distance, medicines by resting  
 merely upon a single nerve, this y<sup>e</sup> nerve alone can affect  
 y<sup>e</sup> whole System; or from being circulated thus may have  
 y<sup>e</sup> effect, & chiefly upon y<sup>e</sup> nerves of y<sup>e</sup> circulating System  
 for we find y<sup>e</sup> some medicines have a topical determin<sup>n</sup>.  
 on organ is more affected by it than another, all y<sup>e</sup> rest  
 of the System however tho' not primarily, comes to be affected  
 in a secondary way, y<sup>e</sup> part<sup>r</sup>. Organ primarily affected  
 acting on y<sup>e</sup> rest: Thus suppose mercury to enter the N<sup>r</sup>.  
 & vessels, there feel its influence, y<sup>e</sup> pulse is affected, before  
 it fixes on any organ, & y<sup>e</sup> venereal poison is killed flat<sup>r</sup>.  
 on the general mass: but in consequence of its attacking  
 a part<sup>r</sup>. Organ all the rest may come to sympathize. —  
 So y<sup>e</sup> operation of medicines ferment<sup>r</sup>. & multiplying in  
 y<sup>e</sup> mass may be more complex y<sup>e</sup> is generally apprehended.  
 Now after premising these facts we are better enabled to judge  
 of y<sup>e</sup> nature of the nerves w<sup>ch</sup> we proceed more directly to con-  
 sider — you know y<sup>e</sup> origin & y<sup>e</sup> manner of their Course  
 That a nerve do y<sup>e</sup> production of y<sup>e</sup> medullary substance  
 of y<sup>e</sup> Brain consist nearly w<sup>th</sup> y<sup>e</sup> same Part as y<sup>e</sup> Brain  
 an inner vascular, assembl<sup>g</sup> y<sup>e</sup> pia mater: & an outer  
 sheath, either y<sup>e</sup> same altogether or very like to y<sup>e</sup> D. Mater  
 And we have seen y<sup>e</sup> in almost every part without y<sup>e</sup> head;

with 1/2000000 of an Inch, 1/2000000 of an Inch, 1/2000000 of an Inch  
 are said parallel to each other; we have seen with diffraction  
 a very minute division of 1/2000000 of an Inch; but apply  
 1/2000000 of an Inch microscope, we see 1/2000000 of an Inch division carry'd on as far as our  
 senses go, especially if we trust to 1/2000000 of an Inch of Leuwenhook  
 almost ad infinitum. — Now first we consider here, whether  
 1/2000000 of an Inch nerves are to be look'd on as solid cords, like wires, act'  
 by Tension; or are we to suppose 1/2000000 of an Inch they are hollow Tubes  
 conveying a fluid within them? or are we to imagine, perhaps  
 1/2000000 of an Inch whilst they convey a fluid within, they in some other  
 manner convey some how or other, conduct some other fluid 1/2000000 of an Inch is still  
 more subtle? Now with 1/2000000 of an Inch perhaps to do our 1/2000000 of an Inch points, we  
 can only form some very gen<sup>l</sup>. Conjectures with<sup>o</sup> being at all  
 able to determine ourselves: 1/2000000 of an Inch most common opinion rejects  
 1/2000000 of an Inch Idea of solid cords, acting merely by vibration, and  
 there are many circumstances w<sup>ch</sup> concern 1/2000000 of an Inch motion: You  
 have seen 1/2000000 of an Inch nerves are extremely soft at their origin: if  
 they appear hard in their progress 1/2000000 of an Inch depends evidently upon  
 their Tents; again when they come to operate as in 1/2000000 of an Inch Eye  
 or Ear we perceive 1/2000000 of an Inch the Tents are laid aside; nay if 1/2000000 of an Inch nerves  
 is not to be subject to motion or pressure, as 1/2000000 of an Inch ported matter  
 of 1/2000000 of an Inch Auditory nerve is: firm Tents are altogether wanting:  
 And we find so many nerves includ'd in 1/2000000 of an Inch same bundle, 1/2000000 of an Inch  
 we can scarcely have any Idea of tension communic'd to one  
 without communicating it to others; we find no determin'd  
 proportional length & tension: on 1/2000000 of an Inch contrary tension is  
 avoided, branches are ty'd down presenting 1/2000000 of an Inch Tension,  
 And what is stranger 1/2000000 of an Inch all 1/2000000 of an Inch, such an Idea is repugnant  
 to 1/2000000 of an Inch gen<sup>l</sup>. analogy of animal bodies: whenever we perceive  
 fluids circulat'd, & cords went out, these are tubular, & we  
 obs. 1/2000000 of an Inch most minute thread, 1/2000000 of an Inch smallest nerve taken from  
 one Animal ty'd around 1/2000000 of an Inch nerve of another so as to compress  
 it, altogether interrupts its influence, so there is little  
 probability 1/2000000 of an Inch nerves if solid cords, operate by Tension  
 On the contrary there seems to be 1/2000000 of an Inch degree of probability

310. 94  
but no absolute certainty if they convey a fluid. We can determine nothing from looking at a cut nerve: we can give no credit to those who pretend to have seen a fluid distilling from a nerve; nor are we to reject it as an Idea because it cannot be seen, since if nerves divide into parts so minute & colorless if they contain a fluid we could not see it as an object of sense: we might as well deny fluids to be in the body of a mite because before a microscope we dont see its motions of these; and the nerves of the Eye for instance divide into parts exceedingly minute, far beyond what we wd. conceive till we made a calculation w<sup>ch</sup> we can make w<sup>th</sup> tolerable accuracy. — If I can distinguish w<sup>th</sup> the head of a pin at the distance of 12. feet, w<sup>ch</sup> diameter of a ligament upon the artery is as much smaller w<sup>th</sup> the head of a pin any distance from the pin to the Lens, is greater w<sup>th</sup> the distance of the Lens from the bottom of the Eye: Entering into a Calculation in this way it is easy to prove w<sup>ch</sup> pictures are sometimes found w<sup>ch</sup> diameter of w<sup>ch</sup> does not exceed w<sup>ch</sup> 20.000. part of an Inch; Probably w<sup>ch</sup> picture influences w<sup>ch</sup> nerves: because we can judge of its parts, w<sup>ch</sup> one part is more round w<sup>th</sup> another, we perhaps in the Optic w<sup>ch</sup> nerves are not w<sup>ch</sup> 50. or 100. part of an Inch in their diameter so that it is impossible to perceive their Cavities or w<sup>ch</sup> fluid w<sup>ch</sup> convey, we are to judge from probability, or by reason upon it: by comparing w<sup>ch</sup> Codon with other parts, or attending to w<sup>ch</sup> phenomena of w<sup>ch</sup> nerves. — The Brain resembles some of our glandular Organs in its appearance we may compare it with w<sup>ch</sup> kidney, there is a vascular & cortical Substance within w<sup>ch</sup> within w<sup>ch</sup> Brain what is call'd medullary substance; & w<sup>ch</sup> same name has been apply'd to w<sup>ch</sup> tubular uniferous part of w<sup>ch</sup> kidney: & perhaps w<sup>ch</sup> nerves may be compar'd to w<sup>ch</sup> Tubuli uniferi; or at least there is a distant resemblance betw<sup>en</sup> these Organs: & all other Organs w<sup>ch</sup> have w<sup>ch</sup> appearance of blood distributed upon w<sup>ch</sup> w<sup>ch</sup> send out hollow Tubules or ducts. Further we observe w<sup>ch</sup> profuse upon the Brain tho' not so much as to destroy its Substance: has been

mind to bring on convulsions of y. muscles. —  
 that however is really a probable argument. y. something is  
 squeezed out: but it may be occasion'd many ways, as in  
 from irritation to a certain degree. But we know that  
 moderate pressure upon a nerve stops its influence,  
 as when we sit upon the edge of a seat y. whole leg  
 sleeps, & we remove the pressure we feel a somewhat  
 get into y. member, not without pain: we are almost  
 as if to rise off the seat, as if something had been  
 accumul'd, & im. descended into y. nerve, w. the more  
 than common violence. Or if I lay bare a muscle and  
 y. nerve running thro it then cut y. nerve across; y. muscle  
 becomes inactive, but may be bring'd into action by punc-  
 turing it: but there is an other way by moderate pressure  
 upon the Nerve, if we press it in y. most gentle manner, and  
 without stretching it, we are sensible of motion instantly  
 following, as if we had determin'd somewhat from the  
 nerve down into y. muscle. So the most probable opinion  
 is y. y. nerves convey a fluid. Still however we are very  
 far from being certain of this, because every circumstance  
 may admit of some other explanation. & I only mention  
 it as more probable than any other opinion yet  
 form'd. — How far we are to add to this, that whilst y.  
 nerves convey within them a fluid, they are likewise  
 charg'd with some other without them or in their coats  
 w. I shall consider afterwards. — Next we proceed  
 to their particular Offices. —

They seem as has been shew'd in general for sense  
 for motion & they are said likewise to serve for nutrition.  
 That the two offices are most justly assign'd to 'em is  
 beyond all reasonable doubt, for y. most simple Ar-  
 guments y. I have mention'd once, & again prove it. —  
 When we cut a nerve y. Animal suffers no injury, no  
 pain, from irritating y. member beyond the incision. —  
 In like manner y. member loses y. living principle

of the Animal, it has all further power over the member 94  
of animal has it not in its power to perform any motion  
with the muscles of the part, supposing it's Circulation to  
continue much as before. — But as we likewise to suppose  
that the nerves properly serve for the nutrition of it's Blood  
body - i. e. that it's food we take in first enters it's Absorbent  
System; after the circulating System, from it's passage into  
the nerves, & from the nervous system nourishes the several  
parts, gives to 'em their bulk, repairs their waste: Is this  
to be our opinion? or are we to conceive it's nourishment  
after being convey'd by it's absorbent System into the cir-  
-culating, is immediately apply'd for it's growth of it's parts  
by our Arteries? I apprehend this Part, is <sup>it's</sup> evidently  
most simple Idea: will be found to be the just one, and  
that the other is altogether to be rejected. I imagine we  
find the clearest & most decisive arguments to prove this.  
Let us examine the Arguments of those who imagine it's  
nerves directly nourish it's parts; & let us first be warn'd  
that the Arguments employ'd by many injurious men  
in favor of this Opinion are to be us'd with Caution, because  
they have it in view to substitute a particular System  
regard to the nature of it's Energy, by <sup>it's</sup> sense & motion as  
perform'd. They must join in allowing a probability of  
the Brain performs a secretion, therefore it's nerves con-  
-vey a secreted Liquor. But supposing it's <sup>it's</sup> is not suff.  
for sense & motion, they wish to get rid of it & therefore  
suppose that it's <sup>it's</sup> is it's use of it's secreted Liquor from it's Brain.  
I shall now state the Arguments fully. — First they  
observe it's the Brain in very young animals is remark-  
-ably large. That beyond all doubt is true, it's Brain &  
Nervous System bear a large proportion to it's whole in a foetus  
than in an Adult: But not contented with this they proceed  
one step further & assert; that it's Brain exists before it's heart  
therefore it's Brain may nourish, or it's certainly does

nowish from y<sup>e</sup>. appearance of its own size. Now I w<sup>d</sup>. 314.  
be very sorry to trust any opinion entertain'd & propos'd  
by men of great eminency otherwise, as an absurd one; but  
we can't consider this argument in any other view. It will  
be found merely an instance of a want of attention, & for this  
plain reason, without any appeal to y<sup>e</sup>. very accurate facts  
show'd by Dr. Haller upon y<sup>e</sup>. growth of the Fetus, y<sup>e</sup>. most com-  
-plete performance on y<sup>e</sup>. Subject y<sup>e</sup>. has been appeal'd, in w<sup>ch</sup>.  
affirms y<sup>e</sup>. all y<sup>e</sup>. parts are original, & y<sup>e</sup>. there is merely an  
evolution of size; without observing y<sup>e</sup>. other parts to bear a  
large proportion in y<sup>e</sup>. Fetus, y<sup>e</sup>. Liver, Thymus &c. Haller's fact  
shows y<sup>e</sup>. y<sup>e</sup>. several parts, the Liver, Lungs &c. were invis-  
-ible in the first days, as well as the heart, but when they  
became visible they were at once of a large size, &  
were only invisible from their pellucidity, & that y<sup>e</sup>. heart  
was seen at y<sup>e</sup>. end of the second day, when it once appear'd  
say. Let us think to what strange opinions this w<sup>d</sup>.  
lead us. All the parts at first are invisible from their extr<sup>a</sup>.  
smallness, now I w<sup>d</sup>. desire to know how they ever come to  
be visible, and whence does the Brain accumulate its Bulk  
Are there any other sources by w<sup>ch</sup>. nourishment can reach y<sup>e</sup>.  
Brain, but by y<sup>e</sup>. vessels leading from the heart? how does  
it nourish its self? not to enquire how it nourishes other  
parts. Or, what is Brain? does it only consist of medulla  
thruads; or are we to conceive it as consisting also of a  
Cortical part & that vascular, with Membranes &c. If  
of the former, we only say a part of the Brain pre-exists; how  
is the rest afterwards added? I w<sup>d</sup>. find vessels commun-  
-icating thro' y<sup>e</sup>. medullary substance. Surely we are led into an  
absurdity in imagining that the Brain can grow, with-  
-out a source of growth. Beyond all doubt then y<sup>e</sup>. heart  
exists as soon as the Animal exists, & nothing can grow  
without it, because all liquors are convey'd first to it.  
It is next alleg'd y<sup>e</sup>. a pale y<sup>e</sup>. number shrinks in its  
Bulk from y<sup>e</sup>. nutrition not being properly convey'd into it  
but its nerves now this fact is much exaggerat'd, for

making a deduction for the adematous swelling, supposing (350.  
it still smaller if it appears, yet if disproportion is by no means  
so great as has been alledg'd. I have kept Dogs 15. & 16. months  
after I have divided of nerves of of. & the result of there was no  
very great shrinking of the member, & what shrinking does  
actually happen may be account'd from of. want of motion,  
from the member being kept long in one situation: In luxation  
fractures, &c. where the member is long without motion there is  
a considerable degree of shrinking. & this will much more readily  
happen, if to the want of general motion, of flexion & extension  
there is wanting that particular motion w. of. <sup>ch. 7</sup> max. minute  
tortery of the member subsides, or taking it in another view the  
scurving torteries of the part want the nervous Energy properly  
applied. If we cut the nerves of the Salivary gland there  
don't perform the Secretions properly, of quant. of secreted  
Liquor is very much diminished. We imagine that if the  
Arteries possess the power of secreting the nourishment of of.  
power will in like manner be impaired by the weakness of of.  
nerves. So we may mistake a secondary for a primary effect  
that they do not immediately convey the nourishment but must  
assist the Arteries in making the secretion of of. nourishing  
matter, as they assist in making of. Secretion of other Liquors

### Lecture 81.

We had begun more particularly to determine of. office of the  
Nerves. I shew'd to you that many eminent Physiologists  
following Boerhaave and others had supposed of. our nerves  
primarily serv'd for nutrition. And of. in proof of this they put  
of. the Brain exists before the heart. This we found not only  
contradicted by the late experiments of Dr. Haller, who endeavour'd  
to shew of. there is a mere evolution of the several Organs: but  
of. of. Idea when fully conceived, is repugnant to reason.  
We farther shew'd with arg. to another argument they adduc'd  
the shrinking of paralytic members, of. of. is not greater than  
might be suppos'd, when we admit of. the nerves actuated the  
Arteries: that in this case the want of a due nervous energy  
operates in a secondary way only. We now proceed to facts of

are more decisive; and altho' as two theories are proposed, 351.

One that the nourishment is from the nerves. The other that it is from the Arteries. It might be sufficient to establish y. one in order to reject the other, yet I find room for shewing first, that the nerves do not primarily supply nourishment except it is of the Arteries do. — First we find y. nourishment is convey'd by y. absent into the circulating system. Now do we observe any peculiar determination of it from the heart to the Brain? certainly not. But next do we find any agreement in the fine vessels of the nervous fluid, w. is such y. we are far from being able to prove its existence, and the grossness of y. Arterial fluid? Do not we observe y. the food by repeated Circulations undergoes various changes, is converted into red blood, and into many other exceeding Liguors, y. require considerable Alterations, in order to fit them for the several purposes they serve; so we imagine that a sufficient change may be made without the intervention of the nerves. — Next let us attempt to say down some notion of what is meant by nutrition. — In many Instances we can't separate the notion of nutrition from Secretion perform'd by the Arteries. The humour of the Eye is supply'd by the Arteries, and y. supply convey'd to us y. Idea of y. nourishment of the Eye. — In like manner don't we consider a person who grows lean, is wast'd as having been depriv'd by nutritious parts? If again he grows fat we conceive new nourishment added, we can't separate the Idea of nutrition and of Secretion into y. adipose follicles. — Or if we perceive a young animal grows rapidly, y. bones outgrow, we conceive an addition of earth, a new nourishment added to the bones. — And so various are y. parts of the human Body y. we must suppose the apparatus varied; and we find the variety in other respects effectu'd by the Arteries, the Saliva is separat'd in one Organ, the Bile in another, so we may suppose that one organ separates oil, another Earth, another Water. — applies to it  
But the uniform texture of the nerves, contradicts to it  
y. w. c.

12. 11. 35

This Idea, we can't suppose, if such a change is produced (35)  
in the Brain, or if some more convey'd fat, another Earth, or 3. water  
is establish'd. Idea of a variety of fluids convey'd thro' our  
nerves. - But do we not observe, if a pair of the waste have  
a proportion to the Brain? In man it is larger, in other an-  
imals, but the repair of the waste in others is much quicker,  
may, we find fetuses without the Brain, & several of these  
parts of the Body have been of the usual size and firmness;  
or take if they in its sound state, do we find if the parts,  
grow in proportion to the n. of nerves? many of the most in-  
-vulnerable Organs grow quicker than the sensible: Thus if growth  
the quick, in the Placenta, where no Anatomist can observe or  
nerves, or make experiments upon the nerves, cut the nerves  
deprive of animal of its motion, if it neither possess sense  
or motion in its member, yet the part is tolerably nourish'd,  
there is no remarkable shrinking, &c. w<sup>o</sup>. happen if nourish-  
-ment were deriv'd only thro' the nerves. And what is more  
I find if whilst if limb remains motionless & insensible  
the Circulation goes on free, there is a repair of waste, or a  
supply of any part cut away. if I break if bone I find a  
luxuriant Callus produced, & an Argumentum Cuius  
I have given a deep colour to the Bones of Animals by feeding  
them with madder, without observing if if smallest Vessel  
was communicat'd to the medullary substance of if Brain  
So the nourishment of the Bones, is not convey'd by if medium  
And the shewing if the nerves do not nourish furnishes  
many arguments if the Arteries do. - I repeat that the  
nourishment is mix'd with the Arterial blood, is dispers'd  
uniformly by the Arteries & Pulmonary Systems to all parts;  
we find changes made on the food, Arteries capable of  
varying & altering the fluids, and of performing all other  
Secretions: why make if Section of the nourishment an  
exception to the general rule? the same operation if applies  
water into the Cavity of the pleura, suppose exhalents, &c.  
between the fibres of the Body, will apply it to if vessels.

358.  
of the body, we are readily convince that the  
whatants do the one, as the other. Can further show is the body  
wasted? By the absorption of the veins: The veins take in  
all the waste. Do not the Arteries correspond w. the veins  
in any other Circumstance? so as we find it absorbents  
taking away the waste, are we not to believe it. They  
corresponding recurring branches of the Arteries supply it.  
We can't bring an experiment so decisive for it. Nutrition  
of the Arteries; I mean of tying a large Artery & seeing the  
effect. Because if the Blood is totally intercepted it part  
nourishes; if there are lateral Branches these secondarily  
But after the humoral Artery is ty'd the member for a  
considerable time shrinks, I we obs. in the case of drains  
or Issues it. there is a shrinking in the neighbourhood.  
But we can in another way shew it. The Arteries primarily  
supply what is necessary. - After the nerves are divided:  
Gallus, the Life of flesh, of Skin, is supply'd by it. Arteries  
I we can trace the new Arteries into the new formed sub-  
stance; the Arteries are numerous in Diastasis of every  
kind. Or we shew to say it. an Artery can supply 2. or 3.  
Inches of it. Tube, but it afterwards it is not able to repair  
the waste of it, so it is beyond all doubt it. the nerves do  
not primarily convey the nourishment, but that this is  
done by the Arteries. - After what I have mention'd I  
think it unnecessary to enter upon any other Argument  
made use of by those who are of a contrary opinion. They  
tell us that a secreted Liquor in the Brain is not fine  
enough for sense and motion, it must serve then for  
nutrition. - I wd. observe upon this it. perhaps it is taken  
for granted rather than prov'd; & it is to be consider'd how  
far a secreted Liquor is fit for sense and motion: But  
granting it. it wd. not perform sense and motion. I wd.  
venture to alledge it. the person who shall prove, it. will  
prove at the same Time, it. they don't convey a secreted

fluid. We are not to conclude therefore, it serves (354)  
for nutrition, but only of the Brain does not separate  
a fluid convey'd to it by nerves. — It remains of, we confine  
the office of the nerves without the head, for sense and for  
motion only, so far as we yet know, now let us consider  
each of these offices more particularly. Physiologists in general  
use an improper term, speaking of nerves they call 'em of  
only sensible parts that is, nerves only possess sense. —  
But meaning to define with precision, we say only, that  
of nerves are so dispos'd in the body of an animal as to  
give it the sense of Injury done to the body, just as a blind  
man judges of objects by a staff; we are not to imagine of  
we feel pain, of the principle within us, & in all animals  
of possess of Brain, that they feel pain in the nerves, of  
nerves only gives the Idea; or indeed of mind of of animal,  
situated near its origin, sensible of the Injury. It is material  
to attend to this because we perceive of from want of att-  
ention, some appearances surprize us w<sup>ch</sup> admit of a  
ready explanation. — If a person has had a Leg amputated  
and you irritate of end of the stump, of end of of Sciatic  
nerves, he feels pain but not in the thigh or stump, but in  
the Toes, in of part w<sup>ch</sup> of nerves naturally terminates in.  
And I apprehend of in doing this he follows not merely a  
habit, but that such feelings are inherent in our very  
nature; & if the same experiment was perform'd in the  
Toes, it wd. be attended with the same effect, So Physiologists  
have us'd a term of Sensorium Commune, some part all  
of Origin of the nerves in w<sup>ch</sup> feeling is exercised. Next of  
nerves enable us to act w<sup>th</sup> our muscles I apprehend of.  
By their Influence alone we possess of power, and as to  
reject of notion of Haller, I apprehend it will be found of  
muscles have no vis insitita. Haller supposes the muscles  
capable of contracting itself independant of the nerves. The  
Heart of a Frog beats an hour & more separate from of body  
And we can have no Idea of of nerves Energy pass'd from

the nerve into the muscle. But perhaps we ought to explain  
 this in a different way. Do we better understand how the vis insita  
 is excited than we do how the nervous energy is excited? We  
 understand neither, but both equally well. — Next let us observe  
 the plain experiments, do not we find if whatsoever substance, ap-  
 plied to the nerves of Brain diminishes their Energy, or deprives  
 of it, has of same effect upon the muscles, e.g. Opium de-  
 prives all of muscles of their power, apply it to of most distant  
 nerves: & this same medicine bro<sup>d</sup> into contact w<sup>th</sup> of muscles  
 soon with the heart, deprives it instantly of its power, if a  
 single drop be pour<sup>d</sup> into of ventricle of the heart, it is not capable  
 of of smallest contraction, & such substances as imitate the  
 nerves, excite their power, never fail to excite of muscles, add  
 to this a further observation of when we cut a nerve we should  
 deprive of muscle of of intercourse w<sup>th</sup> of living principle;  
 but if it possesses a vis insita independ<sup>t</sup> of of nerve it should  
 remain in full vigour for ever. But after I have destroy<sup>d</sup> of  
 Sciatic nerve, & kept of animal a consid<sup>l</sup> Time of muscles of  
 the mem<sup>b</sup> were so inactive, of I co<sup>u</sup> not be sensible of of small  
 est Vibration when irritated: and after all we are led by Haller  
 into of strangest supposition, if we admit a vis insita, an  
 independant power, not capable of receiving its direction from  
 the nerve: & a somewhat sent from of brain by of nerve into of  
 muscle, giving of direction &c. And I wo<sup>u</sup> deny of of muscles  
 are form<sup>d</sup> from of nerves, or of we are to call in of moving  
 & sensitive of of masses following Bouhaave, there is no  
 foundation for this. We must perplex of science w<sup>th</sup> new Terms  
 which if of have new Terms any meaning, lead evidently to  
 an erroneous one, For compare a muscle to nerve together we  
 observe of muscles of of human body in all Den<sup>r</sup> also are  
 of a considerable degree of hardness, of firmness from their  
 Office possessing toughness & strength, but the faculty  
 nervous matter is very, & to all appearance inactive, I have  
 cut of Coat of of Sciatic nerve with a Lancet, & of fibres  
 remain<sup>d</sup> without the smallest appearance of motion. —

just compar<sup>g</sup>. size of a muscl<sup>d</sup> of a muscle, shall we im-  
 agine <sup>g</sup>. beefs muscle for instance, form'd by a nerve  
 like a pack thread: & shall we grant that they divide into br-  
 anches <sup>g</sup>. sum of w<sup>ch</sup> is larger than the trunk; but that one thread  
 is parallel to another: If this is the case <sup>g</sup>. supposition of  
<sup>g</sup>. an expanded into such a volume is inadmissile. And as  
 an Argument. Quæris we wd. say, If <sup>g</sup>. nerve be cut: <sup>g</sup>. muscle  
 be the continuation of it, <sup>g</sup>. muscle sh<sup>d</sup>. shrink immensely  
 afterwards; but muscles after a long time, depriv'd of the  
 nervous Energy, remain nearly of the same bulk, so we are to con-  
 sider <sup>g</sup>. muscles as machines, only influenc'd by the nerves,  
<sup>g</sup>. mechanism of which, we are perhaps very much ignorant  
 of: or to give some Idea of what I now mean w<sup>th</sup> regard to our ig-  
 norance of a muscle, & of its nature, & this Ignorance obliges me  
 to use a gross comparison; but we may compare a muscle to a  
 dry'd aspe, we throw water upon it & make it shorter, in like  
 manner our muscles are capable of contraction, of being acted  
 upon by the nervous energy; but are incapable of action without  
 it; & we are by no means to fancy <sup>g</sup>. <sup>g</sup>. nerves from their very  
 fibres. — The great difficulty is to be able to acquire an Idea of  
 the manner in w<sup>ch</sup> <sup>g</sup>. nervous energy can produce its effect. An, that  
 leads us next to say somewhat of the nature of this Energy.  
 And particularly whether we are to imagine <sup>g</sup>. it is deriv'd in the  
 manner of a venter from the vessels of <sup>g</sup>. Brain, or, as Bellini  
 or, <sup>g</sup>. it is of a very different nature, similar to the electrical  
 fluid, or, to the fluid nam'd by Si. Isaac Newton Other; or, <sup>g</sup>.  
 it is some fluid very different from this, <sup>g</sup>. properties of which  
 we are perfectly unacquaint'd with? Of late years many In-  
 genious Physiologists, from not being able to conceive the  
 manner in w<sup>ch</sup> it is vented, call it a watery fluid, sh<sup>d</sup>. perform  
 sense and motion; have adopt'd the Idea of an Etherial matter,  
 or electrical fluid acting along our nerves. But perhaps a mis-  
 apprehension has been the chief circumstance <sup>g</sup>. has led many  
 to such an error, or supposition. or: an Haller's great work you  
 will see <sup>g</sup>. it has led him into such a supposition. — The first  
 shows the frequency with w<sup>ch</sup> our muscles vibrate, many times

in a minute; then our muscles resemble each other what we ( 357.  
know of one we may apply to another, so suppose we act with a  
muscle in our foot, as of the great Toe, Haller calculates 7. distance  
of the Brain from 7. muscle, call it 6 feet, the fluid in a minute  
a great number of vibrations performed by this muscle, hence  
he concludes 7. 7. nervous matter must pass with an almost  
infinite velocity. Now if Haller had only proved one circum-  
stance more: his Calculation might have been very proper:  
viz. That when 7. muscle vibrates 7. Energy, the fluid, call it  
of whatever nature, comes from the Brain into the muscle:  
But he overlooks a Circumstance, viz. we may suppose, that  
does take place, that the nerve is full of its energy from end to  
the beginning: so 7. 7. velocity may be very inconsiderable  
instead of being great according to his Calculation: or to show  
7. the Calcul. is by no means properly grounded, suppose I  
open the water pipe behind us, it comes at 7. distance of 1/2. miles  
and I might hear 7. stopcock a number of times in a minute  
Am I to multiply these and determine 7. velocity of the water?  
I tell he and others show 7. 7. nervous energy comes from its  
first source in every motion, these Calculations prove nothing.  
If any injury is done to the Toe, 7. moment it is communicated  
now if the Energy is not in the nerve how is it communicated?  
It only passes upwards because it is full of it in its whole  
extent; or cut out the muscle with its nerve, and we find a  
vast number of Contractions are repeated; and as we have en-  
deavour'd to show 7. there is no vis invita, it follows that a very  
minute portion of 7. influence is sufficient for the purpose.  
So we have no proof from such arguments of any great veloc-  
ity of the nervous fluid: & we find nothing which secreted  
fluids are incapable of performing. — But next let us attend  
to further views, or facts. If our nerves of power and motion  
operate by means of an electrical, or Aethereal fluid, what is  
the use of 7. Brain & Cerebellum? If we admit the other Idea  
of secretion of 7. use is obvious. Do we to compare the Brain to  
an Electrical Globe exciting this fluid? It is surely by a gross

comparision, How not does this matter pass along of nerves (358.)  
how is it prevented from communicating its influence from one  
thread to another? Why does it not escape from the nerves as if  
electrical fluid passes thro' of body? so far as they are loaded  
with a watery fluid, we do not find if they are more capable of  
conducting such a matter, than any other part of the body equally  
wet. If the Brain somehow or other excites the fluid by the blood  
moving thro' it, the more a person exercises himself, if less he  
who is fatigued, more of this Energy being excited & collected, or  
how does a slight pressure upon the nerve stop of energy?  
who I make if pressure with any kind of substance, as with  
a nerve taken from another Animal, it is'd round so as not to  
injure its texture, and the Energy totally ceases, or cutting it  
thro' altogether and replacing it, being of parts in con-  
tact, all influence ceases, or separating a member, and  
allowing time for the excreting of such a fluid, we still  
find if energy remains. Instead therefore of solving the old  
difficulties we seem to be adding to 'em. And thro' I am far  
from conceiving how any watery or viscid fluid performs  
the Office of the nerves; yet I conceive it as well as when we  
substitute some other very penetrating & elastic fluid: Do  
we conceive better of the Action of if muscle from a deluge of  
Electrical fluid rushing upon it; or some other viscid matter?  
Or do not we suppose we if changes equally wonderful are  
produced by viscid fluids; if body it is formed; if generation  
of animals depends upon it; we understand not how but we  
can't deny if fact tho' upon the whole, all we can say is this.  
That it is the most probable opinion, thro' far from being a  
probability next to certainty, if there is a fluid in the nerves,  
how can we form if most distant Idea of if nature of  
if fluid, or of the manner in w<sup>ch</sup> if mind of Animals oper-  
ates upon it, nor is it reasonable to expect if nature of it  
shall ever be understood: if it seems to connect if material  
& immaterial parts together, as we are ignorant of if nature  
of the mind, we shall be for ever ignorant of if chain by  
which mind and body are said together. Having now of the

The chief office of the nerves, & so far as experiment  
 will allow, of the nature of the nervous energy. For it  
 is as much a point of sound philosophy to know when to  
 stop as to know when to proceed. Let us next trace  $\gamma$ . nerves  
 from their beginning to their termination observing  $\gamma$ . use  
 of every part. — We begin then with the Origin of the  
 Nerves. The dura mater defends the Brain; & where the  
 Nerves are sent off gives a covering to  $\gamma$ . is produced with  
 out the head with  $\gamma$ . or somewhat of  $\gamma$ . same general  
 nature with the Dura mater accompanies them in their  
 progress, and this is evidently for their defence, that the  
 dura mater in the Nervous  $\gamma$ . same office to the nerve,  
 as to the Brain within the head. We need no other proof of  $\gamma$ .  
 than  $\gamma$ . comparing  $\gamma$ . first pair with the second,  $\gamma$ . of  $\gamma$ .  
 entering this hole in the nose needs no sheath, but  $\gamma$ . second  
 pair passing to the bottom of the Eye, & exposed to the action of  
 the muscles of  $\gamma$ . organ needs the sheath. So with regard to the  
 $\gamma$ . pair consisting of two branches, the portio mollis within  
 the Os petrosum wants the sheath, whilst the other portion  
 without it receives the dura mater, entering a nerve to its  
 termination as  $\gamma$ . Optic nerve into  $\gamma$ . Retina,  $\gamma$ . dura mater  
 is again laid aside. So we are never to connect  $\gamma$ . office of  
 the nerve with that of this coat. — Next we must with a  
 Coat of more consequence  $\gamma$ . pia mater w. covers  $\gamma$ . whole sur-  
 face of the Brain entering into all its convolutions, & from  
 from  $\gamma$ . membrane there are branches plunging into the  
 Cortical Substance &  $\gamma$ . is connected to the medullary, so  $\gamma$ .  
 we have no instance of a Cortical matter  $\gamma$ . does not produce  
 medullary; or we find no medullary substance  $\gamma$ . can't be  
 traced back to the Cortical. So we perceive  $\gamma$ . the Pia mater is  
 a membrane of the utmost consequence to the Brain; & yet  
 I do not know how it has happened, but no Author applies  
 what he observes with regard to the Brain to the nerves in  
 their progress, now it wd. appear  $\gamma$ .  $\gamma$ . pia mater in  $\gamma$ . whole  
 extent of the nervous system furnishes to the nerves in their  
 progress what it does to the Brain at their Origin: For  $\gamma$ .

We shew in the Spinal Marrow a Cortical Substance (360)

a circuitous matter, now wouldly  $\dot{\gamma}$ . Spinal marrow very much resembles any of its branches dividing farther; now may look upon it as the principal nerve of the body;  $\dot{\gamma}$ . whilst  $\dot{\gamma}$ . chief part is the production of the Brain & cerebellum, an addition is made of the nervous Energy or matter, and we have reason to believe  $\dot{\gamma}$ .  $\dot{\gamma}$ . case is the same with every other nerve,  $\dot{\gamma}$ . or  $\dot{\gamma}$ . surface of  $\dot{\gamma}$ . Spinal marrow over  $\dot{\gamma}$ . medullary part is Cortical, so  $\dot{\gamma}$ . every nerve is Cortical. Compare  $\dot{\gamma}$ . white mass of  $\dot{\gamma}$ . medullary Substance with  $\dot{\gamma}$ . threads of  $\dot{\gamma}$ . nerves after they have left the Brain, they are of a brown ashy colour, the threads lose their whiteness, & appear to do so after we have operated, as much as can be done  $\dot{\gamma}$ . piamater from  $\dot{\gamma}$ . Next let us remark  $\dot{\gamma}$ . want of Brain in many Animals being natural; and that in the human body when the Brain has been wanting,  $\dot{\gamma}$ . various kind of Coats of  $\dot{\gamma}$ . nerves have been found, & not very much smaller  $\dot{\gamma}$ . if  $\dot{\gamma}$ . Brain had existed; I say this gives some notion that,  $\dot{\gamma}$ . power we ascribe to  $\dot{\gamma}$ . Brain, may be in part supply'd by  $\dot{\gamma}$ . nerves, we feel only by a somewhat about  $\dot{\gamma}$ . origin of  $\dot{\gamma}$ . Nerve, but a nervous Energy, send in  $\dot{\gamma}$ . nerves can articulate a muscle; or let us attend to  $\dot{\gamma}$ . effect w<sup>ch</sup>. stopping  $\dot{\gamma}$ . Circulation in  $\dot{\gamma}$ . vessels  $\dot{\gamma}$ . accompany  $\dot{\gamma}$ . nerves has. According to  $\dot{\gamma}$ . common Idea of the nerves being deriv'd from  $\dot{\gamma}$ . Brain,  $\dot{\gamma}$ . stopping the Circulation shou'd by no means have the great effect I observ'd of preventing the nerves from communicating its influence backwards, to the rest of  $\dot{\gamma}$ . System: if the Femoral Artery is tied, tho' we apply Opium to  $\dot{\gamma}$ . inferior Extremities so as to bring on the want of motion, it is not communicated thro'  $\dot{\gamma}$ . nerves, unless the Circulation is free along w<sup>th</sup>. it, so we shall be tempted to imagine  $\dot{\gamma}$ .  $\dot{\gamma}$ . use of  $\dot{\gamma}$ . Pia Mater is much more extensive  $\dot{\gamma}$ . is supposed, &  $\dot{\gamma}$ .  $\dot{\gamma}$ . vascular Coat nerves more important improves  $\dot{\gamma}$ .  $\dot{\gamma}$ . merely conveying a nourishment to their Coats; so  $\dot{\gamma}$ . disease

of  $\gamma$ . nerves may depend more upon topical causes, & be more remedied by medicines confin'd to the part than we are taught to believe. In most affections of  $\gamma$ . nerves  $\gamma$ . Disease can be trac'd to the head; but we may suppose considerable diseases to take place from  $\gamma$ . want of a due circulation along  $\gamma$ . nerves in their Course or progress: Next going deeper we find  $\gamma$ . medullary part of  $\gamma$ . Brain very & more intimately connected with the Cortical. We find again  $\gamma$ .  $\gamma$ . nerves coming from  $\gamma$ . medullary part an evidently  $\gamma$ . continuation of its fibres. We can trace  $\gamma$ . Threads of a nerve a certain way into  $\gamma$ . medullary substance of  $\gamma$ . Brain. But I suspect  $\gamma$ . we are by no means to conceive  $\gamma$ .  $\gamma$ . Brain serves only to form nerves for sense & motion; there are other latent and important Functions perform'd, we wd. be inclin'd to think so from observing  $\gamma$ . various directions of the Threads in the medullary substance, from  $\gamma$ . much greater Bulk of  $\gamma$ . Brain than all the nerves; we find many Bundles of medullary fibres directed to opposite sides of the Brain & not to  $\gamma$ . beginning of  $\gamma$ . nerves, or comparing different Animals together, we find upon  $\gamma$ . whole  $\gamma$ .  $\gamma$ . Brain &  $\gamma$ . degree of Sagacity vary in some kind of regular proportion. In man we find by much  $\gamma$ . largest Brain proportion'd to  $\gamma$ . size of the body or  $\gamma$ . Quadruped  $\gamma$ . Brain is larger  $\gamma$ . in the Bird; in  $\gamma$ . Bird it is larger  $\gamma$ . in Fishes, therefore functions of which we are no ways acquainted I can give no expl<sup>n</sup>. an better of mind by a certain modification of  $\gamma$ . brain, or  $\gamma$ . powers of  $\gamma$ . mind by  $\gamma$ . certain modification of it seem to be explain'd: we can't help draw<sup>g</sup>. a Conclusion of this sort from merely considering  $\gamma$ . more obvious Circumstances.

Lecture 82<sup>nd</sup>

I have endeavour'd to prove  $\gamma$ . the Arteries, not the Nerves, owe prim<sup>ly</sup> for nutrition: I therefore confin'd the office of Nerve; to two chief purposes, viz. to render us

362.  
sensible of injury done to the body, or of impulsion made  
upon it; or to enable us to act with our muscles: But if within  
of head we are to view of medullary fibres of the Brain as  
of. Further purpose of a medium between mind and body.  
We now proceed to trace of nerves from their Origin, to their ter-  
mination & to observe the effect of connexion among them  
whether within or without the head. First there appears  
to be no room for imagining of office of Brain and  
Ponsbellum are essentially different, of nerves for the  
Animal, the other for the vital functions. For we find of  
1<sup>st</sup> 2<sup>nd</sup> & 3<sup>rd</sup> pairs are deriv'd from of brain; of 4<sup>th</sup> 5<sup>th</sup> from the  
Ponsbellum; but of 6<sup>th</sup> the others are deriv'd from of medullary  
substance of both intimately united. Next let us confine our  
view to of origin of a single nerve; in a few places we can perceive  
of nerves are united to both sides of of brain. I remark this  
more particularly of of optic nerves, of in man as well as in  
other animals we can trace in to both sides, But if we are to  
judge from of disposition of most of the others we wd. suppose  
of they take their rise from one side only; yet plain ob-  
servations seem to prove of almost all our nerves have a double  
Origin. For if of right side of the Brain be injur'd, from  
Hippocrates down to the present Time, it has been observ'd  
of both sides of the body are affected, & it is difficult to deter-  
mine w<sup>ch</sup> side suffers the most, or taking of in a general  
way, we find of origin of our nerves to be more extended  
of at first sight we are apt to suspect. - Next pursuing  
them from the head and spine, in many places they are con-  
nected; & upon the whole of connexions are of 3. diff. kinds.  
To begin with of most simple in of Ossillary Plexus, or in the  
nerves of are to supply the inferior extremities, there is a join-  
ing of two or more nerves into one bundle, of cord of composed  
equall in size to those w<sup>ch</sup> enter into it; after they have run  
some way they are again separated, or worse new cords  
form'd. Suppose next of a couple of muscles are to be voluntarily

with nerves, we find a division & it is in this way of each. (363.)  
muscle receives branches from each of  $\dot{y}$ . nerves, or  $\dot{y}$ . The first  
nervus supplies  $\dot{y}$ .  $\dot{y}$ . Likewise  $\dot{y}$ . second muscle and the  
second does the same. — Another kind of connexion appears,  
for example in the face, we see nerves coming out of holes at  
a great distance from each other, and after spreading into  
threads these are connected together in a way, representing  
 $\dot{y}$ . Anastomoses of  $\dot{y}$ . blood-vessels: opening of  $\dot{y}$ . sheath of  
some things seem to happen as in  $\dot{y}$ . former anatomies,  
at least so far as we can judge of minute nerves, there is  
a crossing of threads, & no interruption of  $\dot{y}$ . threads at their  
union. The intention of  $\dot{y}$ . is,  $\dot{y}$ . if by any accident a nerve  
in its progress happens to be cut or compressed, all  $\dot{y}$ . muscles  
in w<sup>ch</sup>  $\dot{y}$ . nerve terminates may still preserve some share  
of  $\dot{y}$ . power. — But a third kind of connexion is by means of  
Ganglia. We find a number of nerves, as those between  $\dot{y}$ .  
Outlets, running together, & when they meet a ga<sup>n</sup>. in case  
of bulk or knot is produced: From  $\dot{y}$ . opposite side of that  
we find distinct threads again sent off, in some instances  
nearly of  $\dot{y}$ . same size; but in others larger  $\dot{y}$ . the threads w<sup>ch</sup>.  
enter, & more numerous in their appearance. And tracing  $\dot{y}$ .  
threads thro' the change their color & appearance in every  
aspect. The ganglia are redder  $\dot{y}$ .  $\dot{y}$ . nerves, resembling the  
colour of a Lymphatic Gland, & it is as difficult to know threads  
running parallel to each other thro' a Ganglion as to know  
threads in a Globular gland,  $\dot{y}$ . substance appears com-  
-pact: So we are much at a loss to determine  $\dot{y}$ . nature and  
use of Ganglia. — I am inclin'd to believe  $\dot{y}$ . the threads  
of  $\dot{y}$ . several nerves are here more intimately intermix'd,  $\dot{y}$ . in  
the former connexions; & there may be other latent purposes  
w<sup>ch</sup> they serve, such as have neither been prov'd or conjectur-  
-ed: for the various opinions look into Haller's  $\dot{y}$ . Work:  
Some Authors consider  $\dot{y}$ . Gangl. as muscular Organs  
serving to push on the nervous fluid, whilst others consider

them as forming an additional nervous influence; others (364)  
again suppose *q.* a more intimate communication is made here,  
*q.* *q.* fluid is pour'd out into certain receptacles, and again  
convey'd to all *q.* branches: and of late years Dr. Johnstone  
has at a great length endeavour'd to persuade us *q.* the  
Ganglia are interpos'd to intercept *q.* power of our will, &  
therefore to render certain motions of the body involuntary;  
such as that of the heart; because it is evidently unsafe to  
trust *q.* management of *q.* Organ to our discretion: But tho'  
this opinion is supported with Ingenuity, yet I find many  
reasons for rejecting it. He tells us *q.* *q.* Ganglia inter-  
cept *q.* power of *q.* will; & *q.* altho' *q.* Brain of an animal  
be wounded, *q.* heart exercises its functions, & performs its  
pulsations as before. Now the stakes remain for a consid-  
-erable length of Time, yet if *q.* Brain is destroy'd, tho' they  
frequently continue for a certain space of Time, *q.* force is  
instantaneously so much diminish'd *q.* *q.* *q.* ceases  
in *q.* extremities of *q.* vessels, plainly proving *q.* immediate  
Influence of *q.* Brain on *q.* Organ. But *q.* distinction made  
of our actions into voluntary & involuntary is by no means  
proper. The action of *q.* muscles are involuntary, we direct  
our arm to a certain object; but we have not *q.* direction of  
of *q.* muscles employ'd for *q.* purpose. Next *q.* Ganglia are  
not confin'd to muscular organs; we have seen 'em in many  
of *q.* Glands and in many of *q.* muscles, w<sup>ch</sup> Dr. Johnstone  
allows to be voluntary: and what overturns his System  
is, *q.* way one of *q.* muscles of the Extremities, & trunk of *q.*  
body are supplied with nerves *q.* pass thro' Ganglia; tho' being  
immediately observ'd in Anatomical Enquiries he has over-  
-look'd this, *q.* all the spinal nerves, before they come to the  
Pyramidal Plexus pass thro' Ganglia. But this leads me to  
a more general point, to determine *q.* Cause of Sympathy  
as it is call'd among our several nerves; & *q.* reason and  
variety in w<sup>ch</sup> muscular motion is perform'd; whether it

365.

depends merely on mechanism, or is directed by a wise agent  
Now let us consider Sympathy in the literal sense, if an injury  
is transferred from one part of the nervous system to another  
or to the whole system. — First we perceive if any organ of  
the body is violently irritated and inflam'd, if irritation  
spreads more readily to the neighbourhood of it, to distant  
Organs, owing to the Connexion w<sup>ch</sup> the Hydraulic System  
has with the nervous, if one acting and reacting upon the  
other: But next we must likewise admit if a Branch  
of a nerve be violently irritated if irritation or inflam<sup>n</sup> will  
more disorder others confin'd in the same sheath than the  
distant nerves of the body, & sometimes we must w<sup>th</sup> plain  
examples of if kind tho' not very frequently; So if a Tooth  
beacious if irritation extends along if several nerves: in-  
clud'd in the same sheath, with if. If we find suppose if. if.  
irritation is in the incisives of if. right side if. if. side will  
more readily suffer pain & inflam<sup>n</sup> than the  
opposite side, nay it is evident if. there is some latent  
Connexion in a mechanical way of if. nerves of one side of if.  
body with each other producing remarkable effects: we see  
frequent examples of Hemiplegia, when one side of if. body  
is affected with palsy, whilst in the other if. muscular  
power is preserv'd, w<sup>ch</sup> must be owing to some immediate  
Connexion of if. nerves of one side have about the Origin, or  
in their progress. — Again we obs. a general Connexion of  
all parts of nervous system with each other so when we  
touch the Sciatic nerve with a drop of Spirits of Hartshorn  
burning the nerve will not kill the animal: but if. slightest  
applic<sup>n</sup> of this will. So in the Case of a Bite of a Rattle-  
snake from if. connexion of if. nervous System all if. parts  
sympathize. But does it follow if. if. variety of angular  
motions of our body depend upon mechanism, whether from  
if. Connexion of the nerves in their progress or origin? or to  
explain the Question let us suppose an irritation apply'd  
to a particular Organ, suppose if. if. nose is irritated by

by an acid Matter we squeeze in consequence of it. now how are we to account for this action, w<sup>ch</sup> is abundantly complex? As we do way as generally has been done, y<sup>t</sup> we can trace y<sup>e</sup> connexion from the nerves of the nose to those y<sup>e</sup> regulate y<sup>e</sup> motions of the Diaphragm & abdominal muscles, & from y<sup>e</sup> connexion we to explain y<sup>e</sup> action following y<sup>e</sup> irritation. Thus y<sup>e</sup> 1<sup>st</sup> branch of y<sup>e</sup> 5<sup>th</sup> pair sends y<sup>e</sup> nasal twig to the Nose; the 2<sup>d</sup> branch of the same nerve supplies y<sup>e</sup> beginning of the great Sympathetic or intercostal nerve; or running down from the head is connected to the sev<sup>d</sup>. Dorsal nerve, in its passage along the neck to the Phrenic, w<sup>ch</sup> regulates the Diaphragm &c. &c.

But many arguments occur against such an explanation. We have a wound of Injury before an action ensues, or if we are to consider this opinion in a general way, we find many objections arise against it, w<sup>ch</sup> I think it unnecessary to insist upon now, as such opinions are daily losing ground; and since I gave a Lecture upon that Subject D<sup>r</sup> White has published what may serve as a sufficient confutation of the common opinion. Let us take the arguments in a gen<sup>l</sup>. view and instead of tracing 'em ab capite ad Calcem, a few gen<sup>l</sup>. objections will suffice. — If a nerve when irritated immediately throws into action all others connected with it: when we irritate a nerve of y<sup>e</sup> face for instance, saying y<sup>e</sup> nerve bare y<sup>e</sup> it may act more readily it sh<sup>d</sup>. draw y<sup>e</sup> muscles inward: but we act w<sup>th</sup> different muscles, pulling y<sup>e</sup> skin away, or how comes it y<sup>t</sup> the intermediate muscles, w<sup>ch</sup> w<sup>ch</sup> the nerve in question is perhaps more connected are free from action? Why dont the several muscles of the face and neck act as evidently of those of the Diaphragm & abdominal muscles or whence the irregularity of their action? or why does not an irritation apply'd to other Nerves, as a wound of the neck immediately produce squeezing, in like manner as y<sup>e</sup> irritation

of  $\gamma$ . nerve within  $\gamma$ . mass? may not we trace  $\gamma$ . Sympathy (36 $\gamma$ )  
in  $\gamma$ . various way? why does not  $\gamma$ . farther and equally influence  
 $\gamma$ . beginning? or  $\gamma$ . tracing  $\gamma$ . intercostal nerve thro'  $\gamma$ . body,  
 $\gamma$ . motions are varied according to  $\gamma$ . place; if the nose is  
irritated we sneeze; if  $\gamma$ . throat we vomit; if  $\gamma$ . irritation  
is within  $\gamma$ . breast we vomit, or within  $\gamma$ . breast, or if  
there is a want of something necessary to Life, as in thin &  
and overrated air, our breathing is affected; but when with  
 $\gamma$ . air an irritating substance is conveyed into  $\gamma$ . Trachea,  
we cough, so a similar irritation apply'd to same place  
produces a diff<sup>t</sup>. action, so with regard to  $\gamma$ . irritations th<sup>t</sup>. in  
 $\gamma$ . abdomen, if it is in  $\gamma$ . Stomach we vomit, if in  $\gamma$ . Guts  
purging is excited; if in  $\gamma$ . uterus, there is a certain effort; if  
it is in  $\gamma$ . action & via mirabilia, there is an effect of a  
different nature; & surely  $\gamma$ . variety can't proceed from  
mechanical principles. — On the other hand  $\gamma$ . some  
regular motion follows, when we can trace no connexion  
Do not we act with the Iris thro'  $\gamma$ . irritation is apply'd to  
the second pair at  $\gamma$ . bottom of  $\gamma$ . Eye: may  $\gamma$ . I. Indeed  
sympathize, the Two Eyes move in an uniform manner  
w<sup>ch</sup>. if not from any connexion with  $\gamma$ . Optic Nerve. And  
we are all sensible  $\gamma$ . almost every action or impulsion first  
influences our mind,  $\gamma$ . living principle is rous'd & the  
action follows it. or  $\gamma$ . imagin<sup>n</sup>. in Time of sleep, performs  
a similar operations when  $\gamma$ . Stimulus is absent, therefore  
it is evid<sup>t</sup>.  $\gamma$ . we can't ascribe these regular motions, to  
mechanism & must give some different interpretations of  
the matter; Or let us only review  $\gamma$ . principal actions in a  
very gen<sup>l</sup>. way, & obs.  $\gamma$ . reason of  $\gamma$ . effects — Let us begin w<sup>th</sup>.  
those when  $\gamma$ . irritation is at a distance from  $\gamma$ . act<sup>g</sup>. organ.  
If an Animal hears a confus'd sound, he expands  $\gamma$ . Ear  
& directs it to  $\gamma$ . sonorous substance, &  $\gamma$ . motions of  $\gamma$ . deep  
parts must follow those of  $\gamma$ . external; or we obs.  $\gamma$ . accuracy  
with w<sup>ch</sup>. the Eye adapts itself; or with w<sup>ch</sup>.  $\gamma$ . two Eyes meet  
to examine  $\gamma$ . same object, Or in sneezing, Coughing. &c.

we perceive the motion varied according to y<sup>e</sup> kind of irrit<sup>n</sup>; (368.)  
and effect w<sup>ch</sup> y<sup>e</sup> motion may have in removing it: If a quantity  
of Blood rushes into my Lungs, no action is so fit for allow-  
ing it to pass as expiration, or if we have too small a quantity  
of y<sup>e</sup> living principle from y<sup>e</sup> air, or y<sup>e</sup> air is too light, we  
inspire more frequently. If an irritating substance be con-  
fined within y<sup>e</sup> Trachea, we cough, w<sup>ch</sup> is a very complex  
action, but y<sup>e</sup> most effectual for throwing out y<sup>e</sup> offending  
Cause; if y<sup>e</sup> stomach is affected & it is uncap<sup>able</sup> of y<sup>e</sup> irritating  
substance w<sup>ch</sup> pass downwards, it is thrown back by vomit-  
ing, & y<sup>e</sup> likewise is a very complex action, performed by  
means of nerves deriv<sup>d</sup> from very different sources, or if y<sup>e</sup>  
acid substance gets into y<sup>e</sup> Intestinal Canal, y<sup>e</sup> inward  
action of y<sup>e</sup> is excited. If y<sup>e</sup> irritation is in y<sup>e</sup> bottom of the  
Canal, besides y<sup>e</sup> inward action of y<sup>e</sup> Coats of y<sup>e</sup> Intestines,  
we bring into play y<sup>e</sup> pressure of y<sup>e</sup> Diaphragm & Abdomin<sup>al</sup>  
muscles in a regular manner, pushing steadily and with  
considerable force. The same thing happens in delivery, and  
in assisting y<sup>e</sup> bladder of urine to throw out y<sup>e</sup> contents, & to  
open its mouth. - If y<sup>e</sup> bladder is irritated y<sup>e</sup> motion produc-  
ed is a gradual Contraction, diff<sup>erent</sup> from y<sup>e</sup> contraction of y<sup>e</sup>  
Intestinal Canal, w<sup>ch</sup> play's backwards & forwards  
pushing down y<sup>e</sup> food, bringing it back again, applying it  
to the recurring vessels and Absorbents. We have y<sup>e</sup> power  
over y<sup>e</sup> the bladder is supply'd with nerves through  
Ganglia, we can stop y<sup>e</sup> action of y<sup>e</sup> bladder and increase it  
at pleasure. - If we next apply stimulus to the muscles  
of our Extremities, the muscles are thrown into action, while  
the Arm is kept fast, and y<sup>e</sup> Injury kept apply'd, y<sup>e</sup> muscle  
vibrates, as the only way it can free itself: and this has  
led Physiologists to talk of muscles being dispos'd to con-  
traction & relaxation; they are in no shape dispos'd  
to that state. Don't we see y<sup>e</sup> contrary in the Bladder of

of mine? They only perform that action w<sup>ch</sup> is most fit. (369)  
We see the heart regulated to an alternate contraction and  
and relaxation, as that kind of motion is most fit: the  
heart throws itself into its utmost action in an instant;  
because an action approaching to it. via percussione is  
necessary to drive of blood thro' the v<sup>l</sup>. vessels, & y<sup>e</sup>. same contract  
ions in the bladder w<sup>d</sup>. have been hurtful without with-  
out any purpose being serv<sup>d</sup> by 'em: so these actions are  
regulated by a wise Agent and it only remains that we  
determine the Agent. In y<sup>e</sup>. Discourse of Auth.  
we fail, their views are greatly too limited. - Stahl w<sup>d</sup>.  
persuade us y<sup>t</sup>. our mind reason upon all it's actions,  
& after holding consultation with herself, determine y<sup>e</sup>.  
manner in w<sup>ch</sup>. they ought to be perform<sup>d</sup>: whilst other  
later Writers treating of y<sup>e</sup>. vital & involuntary motions  
w<sup>d</sup>. persuade us y<sup>t</sup>. these actions are dependant upon  
our mind, but from a necessity not from a choice, y<sup>e</sup>. y<sup>e</sup>.  
heart is stimulated, and the mind forced to interpose, otherwise  
the heart w<sup>d</sup>. be burst thro' upon every y<sup>e</sup>. stimulus and contract.  
Now I think it perfectly clear y<sup>t</sup>. we can't reason upon v<sup>l</sup>. actions  
because we want data, we are ignorant of the facts, upon w<sup>ch</sup>.  
reasoning cou<sup>d</sup>. proceed: we are not born conscious of our  
structure; & we can't be said to do anything from necessity  
w<sup>ch</sup>. is beyond our power. Let us only take in a few actions,  
when y<sup>e</sup>. operation will be allow<sup>d</sup> to depend upon some other  
principle. An Infant y<sup>e</sup>. moment it is born breathes as reg-  
ularly & in as proper a manner as an Adult, It suck and  
swallows regularly what it receives from its mouth, and all  
this upon y<sup>e</sup>. first trial, as well as upon the last: By what  
power can y<sup>e</sup>. be done? surely we w<sup>d</sup>. say by instinct, Altho' this  
we understand a power exist<sup>d</sup> before we exist<sup>d</sup>: Can we say y<sup>e</sup>.  
our mind, y<sup>t</sup>. we ourselves possess a voluntary power over our  
muscles, & yet are never conscious of y<sup>e</sup>. N<sup>o</sup>. on situation of  
of these: if we were Anatomy w<sup>d</sup>. have been an useless study:  
but we know nothing of our muscles, we have no voluntary

power over *it*. muscles; all our power is: *it*. we wish to (310)  
move a member in a certain manner, to lay hold of something  
suppose; I see an *it*. conscious of *it*. action I do it readily but we  
know nothing of *it*. regulation of *it*. muscles about it, it is done  
for us: so all muscular action is involuntary. Nay show any  
muscle in our body to *it*. most able Physiologist: desire him  
to act with it; he can't do it; unless you tell him *it*. motion;  
then he wishes to perform *it*. motion, & *it*. action of *it*. muscle  
follows the wish. — So the more we consider the actions of  
Animals, we find *it*. greater reason to conclude *it*. Author  
of nature who made & created them continues w<sup>th</sup> his unceas-  
ing Influence to operate upon 'em; not by partic<sup>l</sup>. but gen<sup>l</sup>.  
Laws, in such a way as is most fit to maintain them —  
Thus I have, you such an account of *it*. Nervous System: &  
the Effects of it: and the<sup>l</sup>. facts led us to, I might admit of  
useful application in Practice.

### Lecture 83.

We have fully consider'd the gener<sup>l</sup>. Partic<sup>l</sup>. Structure of all *it*. parts  
of the human body, excepting its basis, viz. *it*. bones & parts con-  
-nected with them, & Teeth: & from *it*. partic<sup>l</sup>. Structure of one they make  
a detach'd enquiry: We are now therefore sufficiently prepar'd to  
proceed to the operations of Surgery. — Intreating these I shall  
not think sufficient merely to show *it*. Instaur<sup>l</sup>. propos'd by  
others or *it*. method of using 'em but I shall further endeavor  
to explain, *it*. changes produc'd by *it*. disease, when an operation  
can be of use, with *it*. Symptoms & manner of Distinguishing  
it: then I shall give *it*. various Instruments & method's of  
others: & endeavor to point out *it*. method w<sup>ch</sup>. is the fittest:  
for as I have said, an Operation of Surgery being nothing more  
*it*. a piece of dissection perform'd on a living person; we are at  
Liberty to reduce Surgery to Anatomical Rules: & from several

371.  
Considerations to correct y<sup>e</sup> practice of it: The operations are  
so various y<sup>t</sup> it wd. be difficult to reduce em to distinct Gen<sup>er</sup>  
Species: nor perhaps wd. such an attempt be very useful  
at the same time it is very eas<sup>y</sup>. y<sup>t</sup> we may avoid much the  
tediousness of repetition, y<sup>t</sup> is to be found in superficial writ-  
ings: It is not necessary first to treat of all y<sup>e</sup> diseases of y<sup>e</sup>  
Head; then of these of the Trunk: Tho' finish w<sup>th</sup> y<sup>e</sup> Extremities  
is: since many diseases are common to all parts, look into  
Histories, & you find y<sup>e</sup> manner of perform<sup>ing</sup> amputation in  
different parts, not connected together but detached in like  
manner tumors are treated: The diff<sup>er</sup> operations for Drop<sup>ical</sup> y<sup>e</sup>  
manner of letting blood from y<sup>e</sup> vessels, whether y<sup>e</sup> veins or  
Arteries &c. Now surely it is better y<sup>t</sup> we consider at once all y<sup>e</sup>  
diff<sup>er</sup> kinds of Amputation: The Operations in consequence of  
Tumors when we treat, &c. dividing these into Species.  
The partic<sup>ular</sup> place of the body when we sh<sup>ould</sup> begin is by means  
material. It signifies little whether we begin w<sup>th</sup> the head: pro-  
ceed to the thorax, & finish w<sup>th</sup> the extremities; or whether we  
begin w<sup>th</sup> the extremities, imitating y<sup>e</sup> Demonstrations of y<sup>e</sup> Subject  
we begin with y<sup>e</sup> most putrescent parts first, w<sup>th</sup> y<sup>e</sup> Abdomen  
proceed to the Thorax, then to y<sup>e</sup> head: & finish w<sup>th</sup> y<sup>e</sup> extremities  
upon, y<sup>e</sup> whole, following y<sup>e</sup> method y<sup>e</sup> Anatomist did in the  
Anatomy, I shall first endeavour to explain y<sup>e</sup> operations  
in the part of the body w<sup>ch</sup> is y<sup>e</sup> most apt to be chang<sup>d</sup> by  
some length of Time so shall begin w<sup>th</sup> y<sup>e</sup> Cataract: then I shall  
follow y<sup>e</sup> most common and convenient plan, beginning w<sup>th</sup>  
y<sup>e</sup> Abdomen, proceed to y<sup>e</sup> Thorax, y<sup>e</sup> to y<sup>e</sup> head: & finishing  
w<sup>th</sup> y<sup>e</sup> Extremities; but always taking in one general view  
these Operations which are clearly concluded by Cataract

Young
