Column chromatography for P-esters

Rev. 1

Column made up from:

El form
marked by E. C. Baker.
Packed in Nylit 2.5 cm longer than one of 6 ft. order.
Leave 3 days; water flowing from side funnel, about
6" pressure. Bed vol = 5 ml.

34 loops = 1 in. Apply 6 ft. water pressure. Flow = 16 drops/min

Wash. ~ 40 ml. 3 M. Na formate. Effluent ~ 8 ft. x 8 in., even
to end of tank. Flow rate reduced to 9 drops/sec.
Wash. ~ 40 ml. 6 N HCl + 0.8 M. Na formate. Effluent ~ finally no Cl⁻.
Reduced pressure to ~ 6 drops/min. & wash overnight in water.

14-8 5:30pm Add sample 5 ml unchlorinated water. Wash in 5 2 2.5 ml portions
water. Apply 4 N-HClO₄ & start collecting 100 loops samples
7.5 loops/min.

20-2 11 am. 90 fractions collected. Stop machine.

Make dilution 0.5 ml F5 ml record at 260 + 275

Cystosfific & adenylic came through together because of wrong
strength 4 N-NaCO₃H instead of gradient from water.

Columns

Run 2 26x Col. from run ① washed w/ 8 N. H form., 88% H form., & copious water. Let some air in for top 2.5 cm., but bubbles seemed to disappear after.

Add 5 ml nucleotide mix + force in at ~ 6 drops/min. Wash in w/ 2.5 ml copious water.

Apply gradient solution: uricase: 250 ml water in 500 ml flask, monos: 250 ml 4 N-H2SO4. However, due to pressure changes, about 100 ml acid went into uricase before filling column.

5.4. 1:55 pm. Plate at 6 drops/min., collecting 100 drops fractions.

10:30 pm. 37 tubes collected. Reduce pressure! Leave overnight.

27-x. 10 am. 56 tubes. Plate for reading 0.4 & 4 ml. 2 water.

Porton - F0+1 → brown after over incubation. Heat over burner → clear. Some heat by sputter from F1.

Repeat F0+1 : 0.05 ml sample.

iP + labile (R+P) : 0.1 ml → 2.6 Y, 2.6 Y, but mixture is turbid.

Total P: 0.01 ml → 2.6 Y, 2.6 Y
0.02 ml → 5.5 Y, 5.2 Y
(turbid)Total applied to column: iP: $\frac{19.1 \times 2.6}{0.1} = 0.69$ mg $\frac{19.1 \times 2.6}{0.1} \times \frac{100}{6.08} \times 1.05 = 347$ Total P: $\frac{19.1 \times 2.6}{0.01} = 4.96$ mg $\frac{19.1 \times 2.6}{0.01} \times \frac{100}{6.08} \times 1.05 = 23.0$

$$\frac{\text{applied P}}{\text{Total P}}: \frac{3.5 \times 13.1}{10.9 \times 13.1} = 0.46 \text{ mg. (or 0.69 applied)}$$

$$\text{Total P: } \frac{10.9 \times 13.1}{0.1} = 1.140$$

$$9.2 \times 13.1 / 0.1 = 1.20$$
