	18 r															
F	F -															
G	G p-															
	G q-															
	G r															

NOTE: A shaded area indicates that one patient (at least) is known to have the deletion and to be heterozygous at that locus. Due to individual variation in the extent of deletions, it is possible that a locus could be included in a large deletion and excluded in a small one.

MAPIN

Map interval estimation program- Card input

(All fields are right adjusted unless otherwise stated.)

Card or Group	Col	Description
1	1-2	KC- Number of chromosomes. This number is usually 22 or 1 depending whether the interval is being estimated on the autosomes or a particular chromosome such as the X.
	3-10	CL- The total length of the chromosome or chromosomes referred to by KC.
	11-12	NL- Number of loci. (3 or 4)
	13-14	NW- Number of points on each likelihood curve. All likelihood curves for each interval must have as input the lods for the same points.
2	10 fields of 8	W- Map values. (max ¹⁵ 21) Additional cards are used when the number of map values exceeds 8 10.
3a	8 <i>1207</i>	Map interval identification number. This will be a number 1 to 6 as defined by the interval diagram below. NEVER 3 FOR 3-LOCUS MAP.
	9 fields of 8 starting in col 9	Log likelihood values corresponding to the map lods values. When there are more than 9 values they are continued on cards with format 3b.
3b	10 fields of 8	This is a continuation of card 3a when there are more than 9 log likelihood values. (There may be 1 to 6 sets of number 3 cards. They need not be in any order and cards for a particular interval may be omitted when there is no information.)
4	8	This must be punched with a 9.

7

Prior distributions of map intervals, between 2 of n loci.

n=1 Assume n+1 events on a circle, 1 being the opening-up event.

$p(w) \propto 1/L$ (i.e. distance from locus to end is uniformly distributed at density $1/L$.)

n=2 Imagine an extra event on this circle.

$p(w) \propto (1/L) \frac{(L-w)}{L}$ where w is the distance from end and does not contain the third locus. However, owing to symmetry of 3 events on a circle, this end interval is distributed exactly as the interval between any two neighbouring events out of 3.

$p(w \text{ inner}) \propto (L-w)/L^2$ i.e. interval between loci or interval to near end.

$p(w \text{ outer}) \propto w/L^2$ i.e. from locus to distant end.

n=3 As for n=2 but combined with probability of extra event falling outside the interval.

Prior prob of a particular sequence is $1/3$. Given a specific sequence, $w_1 + w_2 = w_3$

$p(w_1 \text{ inner}) \propto (L-w_1)^2/L^3$

$p(w_3 \text{ outer}) \propto w(L-w_3)/L^3$

$$a > b > c$$

$$\frac{L}{2} + \frac{\Delta}{2} = \frac{L'}{2} + \frac{\Delta'}{2}$$

locus in a, $p(\omega) = \frac{2(L+\Delta)-4\omega}{T(L+\Delta)}$ or $\frac{2(L'+\Delta')-4\omega}{T(L'+\Delta')}$

locus in b,

$$p(\omega) = \frac{2\omega}{T(L+\Delta)}$$

$$\omega < \frac{L}{2} - \frac{\Delta}{2}$$

$$p(\omega) = \frac{(L-\Delta)}{T(L+\Delta)}$$

$$\frac{L}{2} - \frac{\Delta}{2} < \omega < \frac{L}{2} + \frac{\Delta}{2}$$

$$p(\omega) = \frac{2(L-\omega)}{T(L+\Delta)}$$

$$\frac{L}{2} + \frac{\Delta}{2} < \omega < L$$

0 elsewhere

locus in c

$$p(\omega) = \frac{2\omega}{T(L+\Delta)}$$

$$\omega < \frac{L'}{2} - \frac{\Delta'}{2}$$

$$p(\omega) = \frac{L' - \Delta'}{T(L+\Delta)}$$

$$\frac{L'}{2} - \frac{\Delta'}{2} < \omega < \frac{L'}{2} + \frac{\Delta'}{2}$$

$$p(\omega) = \frac{2(L' - \omega)}{T(L+\Delta)}$$

$$\frac{L'}{2} + \frac{\Delta'}{2} < \omega < L'$$

0 elsewhere

$$\sum \text{ at } 0 = \frac{2}{T}$$

$$\text{at } c = \frac{2(L'+\Delta') - 2(L'-\Delta') + 2(L'-\Delta')}{T(L+\Delta)}$$

$$= \frac{2}{T}$$

$$\text{at } b =$$

$$\sum_{ab} 0 \quad p(w) = \frac{2}{L}$$

$$\frac{L-\Delta}{2}$$

$$T =$$

$$L + \Delta = L' + \Delta'$$

$$T = L + L' - \frac{L}{4} - \frac{\Delta}{4} - \frac{L'}{4} - \frac{\Delta'}{4} = \frac{1}{4} [3L + 3L' - \Delta - \Delta']$$

$$= \frac{1}{4} [2L + 2L' + 2(L$$

$$T = \frac{1}{2} (L + L' + (b+c))$$

$$a_c + a_s = t_c + t_s = \Sigma$$

~~$$a_c - t_c = t_s - a_s$$~~

$$t_c - a_c = a_s - t_s$$

$$t_c = a_s + a_c - t_s$$

$$t_c = \Sigma - t_s$$

$$a_s + a_c = a_s + a_c + t_s$$

① 0-S.

② From $\frac{A}{2} - 2s - d$ to $\frac{A}{2} - s - d$

A

let A = sum of all 4 arm-lengths
 s : shortest of all 4 arm-lengths.
 δ = change in length due to translocation

Limits of break-point are

1. On shortest arm

2. On other chromosome arm $\left(\frac{\Sigma}{2} - 2s - \delta\right)$ to $\left(\frac{\Sigma}{2} - s - \delta\right)$
