[illegible] appropriate conditions, give rise to peculiar ripple marks.

It may not be thought out of place if I mention an exceedingly beautiful movement of water which I used to admire every morning when the sun is shining, before entering my bath, which is about 110 Fahr, & to the depth of a foot. The bath is prepared with hot water of about 60° in a second. I get it from by turning a cock above the foot, which is towards the bottom, letting in water of

The colder water produces a most curious & complicated system of wrinkles, which creep along the bottom of the bath at the rate of about one inch per second. They overlap and intertwine, and they occupy an annulus round the head of the bath. I can compare the appearance of the surface to a mass of animated vermicelli, the thickness of each wrinkle being hardly one eighth of an inch. They are clearly vortex rings of remarkable tenacity, and of at least 5 feet in their longest diameter. They ought to be found wherever a [illegible] water [illegible] drops into a [illegible] glacier-chilled [illegible] There ought to be no difficulty in demonstrating these [illegible] a tranquil scale in a laboratory by photographing the surface ripples, checked by such a plate of glass [illegible] overflow.

Veuillez agréer, Monsieur, l'assurance de f1v
ma considération la plus parfaite.

The Pathology of Snoring

Married ladies that have [illegible] that husbands past the age of 50 or 60 are apt to snore.

I have [illegible] reason to believe in the correctness of this generalisation to assume it to be true & to ask the reason of it. What is the cause of snoring? I have not found this interesting & [illegible] domestically important topic treated anywhere in a scientific manner. [illegible] I have on my own [illegible] & investigation thrown myself to elicit those of others.

First I have been surprised at the total lack of men in Germany [illegible] & their breathing [illegible] of whom I have had many months experience in hospital, was inaudible. Conversely hot [illegible] stimulate snoring more accompanied by [illegible] Obstruction to the fallen jaw of death. Lastly the mucus in the throat becomes more [illegible] & tenacious, as life advances, & [illegible] bronchitis then [illegible] becomes [illegible] dangerous

I believe that snoring is [illegible] due to two causes: 1. the drooping of the soft palate with consequent [illegible] of the tongue & 2. the mucus in old age drooping in hot [illegible] also in deep sleep.

~~Nature Having observed, I find the [illegible] formed to what be considered the most appropriate [illegible] Francis Galton (Dec. 1875)~~

Arrangement of trees in an Orchard

f15

Having noticed that trees are usually planted in orchards in parallel rows, separated by the same distances that trees in the same row are separated from one another, I have asked whether the economy of space was recognised if planting them hexagonally. It appears to be imperfectly appreciated, that it may be proper, even for myself who am no agriculturist, to call attention to the geometry of the case. The solution I send is based on the supposition that each tree requires a free circular area of some appropriate diameter, to avoid crowding and being crowded by its neighbours with roots and branches, and that unused corners around this space are wasted land. The problem then comes to the same thing as the economy of space in arranging flower pots of the same size, in parallel rows as above described, or in the compactest manner possible. In the former case each pot occupies the middle of an imaginary square and touches four neighbours, in the latter case it occupies the middle of an imaginary hexagon and touches six neighbours. It may be easily proved that between 115 & 116 flower pots can be arranged by the hexagonal system upon the same area that will only contain 100 pots on the square system. Simple mathematics show that the area of a square circumscribed round a circle whose radius is 1, is equal to 4 square units, & that the area of a hexagon round the same circle is $6 \times \tan 30$, or 3.46 square units. The number of hexagons required to fill a given field of given area, to that of the squares, is the inverse ratio of this, namely as 400 to 346, which is that of between 115 and 116 to 100. It follows that if the preliminary supposition be strictly correct, a profit of between 15 and 16 per cent would be made by planting orchard trees on the hexagonal, instead of on the square system.

TELEGRAMS, NORTH COKER.

COKER COURT,
YEOVIL.

Dec 1.

My dear Gallon

I came here
today. My wife having
come back this afternoon.
Mr. E. Hall took into
his bathroom yesterday,
not coming out, they
finally broke the door
& found him in apoplexy

He never regained
consciousness & died
about 8 oclock.
They telegraphed for my
wife but of course Mrs Hall is
crushed by the sudden-
ness of the blow.
I am thankful to say
I am not sick.
I must stay here

till after the funeral
on Tuesday.
His terribly sudden.
I wrote to Charles
about your affairs.
He took great interest,
& I enclose his suggestion
When I spoke of a
Key, he thought I
meant a Key to tune

a lyre, and a key
to play on. I did
not care to bother
him again.

Yrs very truly
Robert Heath
