District of Pennsylvania, to wit:

BE IT REMEMBERED, That on the twenty-fifth day of October, in the forty-seventh year of the Independence of the United States of America, A. D. 1822, James Webster, of the said district, hath deposited in this office the title of a book, the right whereof he claims as Proprietor, in the words following, to wit:

"A Treatise of the Materia Medica and Therapeutics. By John Eberle, M.D. Editor of the American Medical Recorder; Member of the American Philosophical Society; of the Academy of Natural Sciences of Philadelphia; Corresponding Member of the Medico-Chirurgical Society of Berlin, &c. &c. In Two Volumes. Vol. I.

In conformity to the act of the Congress of the United States, intituled, "An act for the encouragement of learning, by securing the copies of maps, charts, and books, to the authors and proprietors of such copies, during the times therein mentioned." And also to the act, entitled, "An act supplementary to an act, entitled, 'An act for the encouragement of learning, by securing the copies of maps, charts, and books, to the authors and proprietors of such copies during the times therein mentioned,' and extending the benefits thereof to the arts of designing, engraving, and etching historical and other prints."

D. CALDWELL,
Clerk of the Eastern District of Pennsylvania.

INTRODUCTION.

WE know from experience, that the acquisition of knowledge is facilitated by having its objects presented to the mind in the order of some regular arrangement. Science, indeed, cannot exist without system. It is this which gives symmetry and beauty to its temple, and without which, its most valuable materials would lie in rude and shapeless masses.

When we fix our attention upon a diversity of mixed objects, we naturally, and almost unconsciously, begin our inquiries by separating them into groups or families, according to their various analogies or resemblances. We thus obtain a general view of their common and partial relations, and are thereby not only better enabled to investigate their individual characters, but also greatly assisted in retaining what we have learned concerning them, by the influence of association. We become systematic from the very

constitution of the human mind. To classify our ideas is the first step we make towards useful knowledge; and the highest attainments of intellect are but a more extensive and intimate view of those various relations which subsist between the objects of human knowledge.

The principle of systematic arrangement being thus essentially interwoven with science, it is obvious that perfection in classification can only be attained when science itself shall have become perfect. Such an era of intellectual glory is, however, never to be expected; and we must be contented to approximate what we cannot reach.

As things are not viewed under the same aspect by every observer, and relations seen by some, which are either unimportant or unnoticed by others, it follows that arrangements founded on these views are exceedingly various and dissimilar. It is obvious, however, that the classification which includes the greatest number of the conspicuous and constant relations of objects, must best answer the purposes of such arrangement. The difficulty lies in fixing upon the strongest, most constant, and universal points of

resemblance, and to bring them together under such a scheme of arrangement as will exhibit them in the order of their most essential and conspicuous affinities. In arranging the objects of natural science, as, for instance, those of botany, zoology, or chemistry, we bring into view only those natural relations of conformation or character, which subsist among the objects themselves. In medical science, however, we are obliged to enter upon a much more extensive and perplexing range of comparison. Here we must keep in view not only the relations of external agents with each other, but also those which they bear to *living* matter,—to the effects which they produce upon the animal economy. The difficulties which arise from these complicated relations are particularly experienced in the classification of the *materia medica*; and hence the great imperfection and inadequacy of all the arrangements that have hitherto been proposed in this department of our science. Some writers have, indeed, been so strongly impressed with the insurmountable nature of these difficulties, that they have thought it best to reject all systematic arrangement, and to describe remediate substances in an alphabeti-

cal order. This simple mode of arrangement, it must be confessed, possesses some advantages which cannot be obtained by regular classification. We are particularly enabled thereby to exhibit a connected view of all the remediate qualities and therapeutic applications of each individual article, without those frequent repetitions which are unavoidable under every other known system of classification. But to counterbalance this advantage, which, in reality, is of no *essential* importance, we lose sight, by the adoption of such an arrangement, of those general physiological and therapeutic relations between the living body and remedies, which are in themselves highly interesting, and which serve to give to this department of medicine the character of a science. A few have arranged the articles of the materia medica according to their chemical analogies alone. Burdach uses this mode of classification; but his system is exceedingly complicated and imperfect. Arrangements of the materia medica founded exclusively on the physical properties of medicines are even more objectionable, in every point of view, than the alphabetical order. Without affording us the least instruction with regard to their therapeu-

tic relations, they are necessarily very complex in their structure, and often bring articles together of the most opposite remediate properties. Cullen's arrangement, which is principally founded upon the general effects of medicinal agents, and partly also, in its minor subdivisions, upon their physical relations, is still viewed by many, and I believe justly too, as the most perfect classification that has hitherto been offered upon this subject. But even this arrangement does not bring into view all those general analogies which subsist between the *effects* of medicinal substances, and which may be used with peculiar propriety as the basis of classic distinctions. Observation teaches us, for instance, that certain remedies direct their action specifically upon certain organs or structures in the animal economy. These specific affinities between external agents and the various parts of the living body are fundamental, and their notice is essential to a comprehensive and philosophical scheme of arrangement. Cullen, however, overlooked these particular views of the action of remedies, and founded his system on their ultimate medicinal effects alone. Thus the effect of opium in the living system is sleep. The

medicine is, therefore, placed in the class of *narcotics*. This is well, so far as it goes. By this arrangement we at once know the *general character* of the effect; but we are not informed as to the particular organ or structure which is principally influenced, and by the peculiar excitement of which the more manifest *effects* are produced. If, however, we place the narcotics, as a genus, under the primary class of "*medicines whose action are specifically directed to the nervous system,*" we exhibit at once, a general view both of the character of the effect, and of the organ principally concerned with the medicine in its production. Alibert, who saw the propriety of attending to this latter object, adopted a classification founded *entirely* upon the relations which remediate agents bear to particular organs or structures, or, in other words, on their specific tendencies to affect particular parts of the organization. His arrangement is, however, still more objectional than that of Cullen. It exhibits, it is true, an interesting physiological view of the connections which subsist between medicinal agents and the various subordinate systems in the living economy; but it wants those more useful *practical* distinctions derived

from the ultimate effects of remedies, and which constitute the basis of Cullen's classification.

More recently Dr. Granville, of England, has proposed a new classification of the materia medica, which combines, to a degree, the advantages both of Cullen's and Alibert's arrangements.* His primary or classic divisions are founded on the specific tendency of medicines to act upon particular organs, or systems of structure; and the old divisions of *tonics*, *cathartics*, &c. are introduced as secondary distinctions. This plan of arranging the materia medica appears to me to be superior to any that has hitherto been proposed. Dr. Granville has not, however, been altogether successful, I think, in the particular construction of his classification with regard to its minor divisions. He places stimulants, for instance, in the class of "*medicines that act specifically upon the digestive organs*," whereas this genus undoubtedly belongs to his third class, which comprises those "*medicines that act specifically on the circulating system*." It may be said, however, that remediate agents of the stimulant

* Vide London Med. and Phys. Journal, for April, 1822.

class produce their effects upon the circulatory system, by a specific action primarily exerted upon the stomach; and that the location given to these medicines by Dr. Granville is, therefore, proper. But although these remedies do certainly produce a primary excitement in the stomach, yet this primary impression is constantly and specifically directed upon the circulatory system, where alone it becomes obvious. It is this ultimate effect alone which we consider of consequence, or which can be regarded as a manifestation of the action of the stimulant. There are several other objections, of a similar character, which might be urged against the construction of this classification, although its general scheme is unquestionably very good. It forms the ground-work of the arrangement which I have adopted in this treatise, and of which, without any further comment, I subjoin the following synoptical view:

CLASSIFICATION OF THE MATERIA MEDICA.

A. Medicines that act specifically on the Intestinal Canal, or upon morbid matter lodged in it.

I. Medicines that excite discharges from the Alimentary Canal.

a. *Emetics.*

b. *Cathartics.*

II. Medicines calculated to destroy or counteract the influence of Morbific Substances lodged in the Alimentary Canal.

a. *Anthelmintics.*

b. *Antacids.*

B. Medicines whose action is principally directed to the Muscular System.

I. Medicines calculated to correct certain Morbid conditions of the System, by acting on the Tonicity of the Muscular Fibre.

Tonics.

II. Medicines calculated to correct certain Morbid States of the System, by acting on the Contractility of the Muscular Fibre.

Astringents.

C. Medicines that act specifically on the Uterine System.

I. Medicines calculated to promote the Menstrual Discharge.

Emmenagogues.

II. Medicines calculated to increase the Parturient efforts of the Womb.

Abortiva.

D. Medicines whose action is principally directed upon the Nervous System.

I. Medicines that lessen the Sensibility and Irritability of the Nervous System.

Narcotics.

II. Medicines that increase and equalize the Nervous energy.

Antispasmodics.

E. Medicines whose action is principally manifested in the Circulatory System.

I. Medicines that increase the action of the Heart and Arteries.

Stimulants.

F. Medicines acting specifically upon the Organs of Secretion.

I. Medicines that act on the Cutaneous Exhalants.

§. General.

a. *Diaphoretics.*

§. Topical.

b. *Epispastics.*

c. *Errhines.*

d. *Emollients.*

II. Medicines that increase the action of the Urinary Organs.

Diuretics.

III. Medicines that alter the state of the Urinary Secretion.

Antilithics.

IV. Medicines that promote the secretory action of the Salivary Glands.

Sialagogues.

G. Medicines that act specifically upon the Respiratory Organs.

I. Medicines calculated to increase the Mucous Secretion in the Bronchia and to promote its discharge.

a. *Expectorants.*

b. *Inhalations.*

H. Medicines whose action is purely Topical.

Escharotics.

A
TREATISE
OF
MATERIA MEDICA
AND
THERAPEUTICS.

CHAPTER I.

*Observations on the General Modus Operandi of
Medicines.*

W HATEVER be our opinion with regard to the nature of animal life, certain it is, that the living economy is under the constant influence of extraneous causes, and subjected, by them, to an infinite variety of modifications. Concerning the essential nature of their action, however, it would be in vain to inquire. All the information which seems to be attainable, in relation to their modus operandi, is, perhaps, a knowledge of the organs upon which they primarily act; the medium through which their impressions are conveyed throughout the system, and the successive order of the phenomena thence arising.

The doctrines which prevail on this subject resolve themselves into the two following positions: 1. All

medicines act primarily on the solids ; their impressions being conveyed through the system by the agency of sympathy. 2. Medicines are absorbed into the circulation, and act on the system through the medium of the blood.

That the animal body possesses the faculty of transmitting impressions from one part to another, is an indisputable fact. Such a power is, indeed, essential to the preservation of the living economy. The circle of vital actions would soon cease to revolve, were it not for some general connecting medium, by which the various organs of the body are brought into a mutual harmony and correspondence of action. The brain and its appendages—the nerves, constitute this connecting medium; for these parts alone receive and transmit impressions; and upon them, therefore, depend all those phenomena which are called *sympathetic*. This opinion has, however, been controverted on the score, as it is alleged, that sympathies exist between parts which have no direct nervous connection with each other. It is not difficult to show, however, that this objection is entirely without foundation; for it must be obvious to every one, on a moment's reflection, that the nervous system brings every sentient and irritable part, under the immediate influence of the *sensorium commune*, the brain; and that, therefore, all the parts of the body have a continuous nervous connection with each other, through the me-

dium of this common centre of feeling. That sympathetic actions are thus propagated through the system, may be inferred from the known laws of nervous excitement. An impression made on the nervous extremities of a part, is either altogether local or insulated in its effects, or it is communicated to the sensorium commune, whence it is reflected either upon the part in which the primary irritation exists, producing sensation in that part; or it is reflected upon other parts, exciting in them new motions and feelings.

The fact, therefore, of the existence of sympathetic communications, and of their agency in propagating remediate impressions throughout the system, is incontestible. It is, however, no less true, that many medicinal articles are absorbed into the circulation, and that they act on the animal economy through the medium of the blood.

This opinion having been warmly contested of late, and rejected as "a relict of the humoral pathology," it may not be improper to enter into a particular examination of the grounds upon which it is founded, and of the objections that have been urged against it.

Before I enter more directly upon the proofs of the admission of remediate substances into the circulation in an indecomposed state, I shall make a few observations concerning the so common want of success in detecting, in the blood, certain substances re-

ceived into the stomach, or otherwise subjected to the action of the absorbents. Dr. Wollaston states, that he gave a person three and a half grains of prussiate of potash repeated every hour to the third time. The urine being examined every half hour, was found, in two hours, to be tinged, and to afford a deep blue, at the end of four hours. But in the serum of the blood which was *then* drawn, no prussiate could be detected. This experiment is, however, extremely fallacious. In the first place it must be observed, that probably but a small portion of the ten and a half grains of the prussiate received into the stomach, was taken up by the lacteals. But this small portion could not have entered the circulation at once; it must have been introduced very gradually into the chyle; and as the kidneys, no doubt, commenced separating it again, as soon as any part of it was present in the circulation, it is obvious that but a very minute quantity indeed, could, at any particular time, have existed in the blood. It is, therefore, not to be wondered, that he could not detect this substance in the serum of blood drawn after the greater part of that which had been absorbed had already appeared in the urine, and consequently passed out of the circulation. For the portion of prussiate present in the blood, was not only very small, but was diffused through a mass of at least twenty-four pints of fluid. The urine, on the contrary, having gradually collected the prussiate, held in less, perhaps,

than a pint, a much greater quantity of this substance than could have been present at any one time in the whole mass of the blood. Now, from the experiments of professor MACNEVEN, it appears that it requires one-eighth of a grain to two ounces of serum before it can be detected by the most delicate tests.* It would, therefore, require more than ten grains of this substance in the blood, before it could be detected, supposing the serum to amount to about twelve pints. Hence, it is evident, that no inference can be drawn from experiments of this kind, which deserve to be regarded as militating against the opinions I am advocating. I have detected one-sixtieth of a grain of the prussiate in one ounce of urine; which accounts for the ease with which this substance is detected in this secretion, whilst in the serum it escapes our tests.

It may also be observed that the articles usually employed in experiments of this kind, have a tendency to pass off very rapidly by the kidneys. It would seem that almost as soon as some of them arrive in the circulation they are again eliminated by the emunctories; and hence, although the urine may become highly charged with such substances, yet the blood, being so soon deprived of them again, shall con-

* Experiments for ascertaining the Permanency of Chemical Compounds in their passage through the Fluids, in the New-York Medical and Physical Journal, June, 1822.

tain but a very minute portion, and this diffused through a large mass of fluid. Hence, too, we have an explanation of the fact, that certain substances, after having been received into the stomach or injected into the cavity of the abdomen, may be detected in the mesenteric veins, vena portarum, splenic veins, and thoracic duct, whilst in the blood generally no traces of their presence can be discovered. For, as many of the abdominal lymphatics open directly into the veins just mentioned, it is evident that the substances which these lymphatics absorb and convey into the veins in question, must be in a much less diluted state than they can be after being mixed with the general circulating mass. If we admit the existence of venous absorption, an opinion advocated by very high authority,* this explanation will be still more satisfactory.

Great, however, as are the difficulties which exist in experiments of this kind, we are not without many well authenticated facts which prove the admission of foreign substances into the circulation. In the chyle of the thoracic duct, Musgrave, Lister, and Blumenbach detected substances which had been thrown into the intestines of animals. But not to dwell on the testimony offered upon this subject by the older writers, we have abundant evidence of the existence

* Magendie, Emmert.

of this physiological fact in the researches of many of the most enlightened physiologists of the present day. The experiments of Mayer,* of Home,† of Magendie,‡ and the more recent and satisfactory researches of professors Tiedeman and Gmelin§ do not leave any doubt on this point. The experiments of the latter two physiologists prove, in a direct and conclusive manner, that almost all those substances which are usually found in the urine, after having been taken into the stomach, may be detected by proper management, in the serum of the blood of the *venæ portæ*, the splenic and mesenteric veins. These facts have been lately confirmed, by an extensive course of experiments on this subject by Drs. Harlan, Coates, and Lawrence, of this city. From the interesting and well digested report which these gentlemen have just published, of the results of their inquiry, it appears in positive evidence that camphor may, and does pass through the circulation. Having given a tabular view of sixteen experiments on living animals, they observe: “It is impossible to look over the above table without being struck with the obvious manner in which

* In Meckle's Archiv für die Physiologie.

† Philosoph. Trans. for 1811.

‡ Précis Elementaire de Physiologie.

§ Versuche über die wege, auf welchen substanzen aus dem magen und Darmcanal ins blut gelangen, u. s. w. Von. F. Tiedeman, M. D. und L. Gmelin, M. D. Heidelberg, 1820.

they indicate the route by which the chemical substance (prussiate of potass) experimented on entered the circulation. In nearly every instance in which *it was found in the blood*, the contents of the thoracic duct, if examined, exhibited it in a much more obvious degree.”* Still more recently, professor Macneven, in the able paper already quoted, has published the results of some experiments on the subject, which are entirely confirmatory of those I have already mentioned. “I triturated,” says he, “one drachm of chrystallized hydrocyanate of potassa with fresh butter and crumbs of bread, which being made into a bolus, the same dog swallowed and retained. Between three and four hours after, Dr. Anderson bled him largely from the jugular vein. A dose of hydrocyanic acid was then administered, of which he died without pain, and the abdomen was laid open. The lacteals and thoracic duct were seen well filled with milk-white chyle. On scratching the receptaculum, and pressing down the duct, nearly half a tea-spoonful of chyle was collected. Into this were let fall a couple of drops of the solution of permuriate of iron, and a deep blue was the immediate consequence.” In another experiment of this kind Dr. Macneven found that, “whenever the mesenteric vessels, or the external coats of the intestines were

* Philadelphia Journal of the Medical and Physical Sciences, for Feb. 1822.

lightly scratched with the scalpel and touched with the solution of permuriate of iron, a strong blue was immediately exhibited." My friend, Dr. Ducachet, obtained a similar result in an experiment which he performed on this subject.*

The facts which have already been detailed, are, I think, quite conclusive on this point. It may not, however, be uninteresting to adduce a few other observations in evidence of the admission of foreign substances into the circulation. EMMERT, an eminent German physiologist, relates an experiment,† in which he passed a ligature round the abdominal aorta of an animal, and inserted the prussic acid into its legs. The extremities became cold, but some portion of irritability and sensibility remained. In seventy hours after its application the ligature was removed, and the effects of the poison immediately showed themselves. Similar experiments were performed with the poison *woorara*, by Mr. Brodie.‡ "He exposed the sciatic nerve of a rabbit in the upper and posterior part of the thigh, and passed under it a tape half an inch wide. He then made a wound in the leg, and having introduced into it some of the *woorara* mixed with water, he tied the tape moderately tight on the forepart of the thigh. He thus inter-

* New-York Medical and Physical Journal, No. II. April, 1822.

† Archiv für die Physiologie, Von. I. F. Meckle.

‡ Philosophical Magazine, June, 1811.

rupted the communication between the wound and the other parts of the body, by means of the vessels, while that by means of the nerves still remained. After the ligature was tightened, he applied the *woorara* a second time, in another part of the leg. The rabbit was not affected, and, at the end of an hour, he removed the ligature. Being engaged in some other pursuits, he did not watch the animal so closely as he could otherwise have done, but twenty minutes after the ligature was removed, he found him lying on one side, motionless and insensible, evidently under the influence of the poison." It appears, therefore, from these experiments, that the poisons employed had no power of affecting the system until they had entered the general circulation. Brodie's researches render it, indeed, extremely probable that *woorara*, as well as several other poisons, produce their deleterious effects on the animal economy, by acting directly upon the brain, through the medium of the blood, and that they are not injurious unless they are absorbed into the blood-vessels.

Besides the evidence of direct experiment, there are many other facts mentioned in the writings of physicians, which go to prove the absorption of foreign substances into the circulation. The effects of the internal use of nitrate of silver on the skin, is a striking fact in confirmation of this opinion. A considerable number of cases have been related, on the most re-

spectable authority, in which the skin acquired a very dark, and, in some instances, quite a black colour, from the long continued use of this medicine.* It is well known, too, that medicines taken by nurses very often produce the same effects upon their suckling infants, as if these had taken the medicine directly into their stomachs. It is a fact equally well known, that the milk of cows becomes imbued with the odour and taste of the vegetables on which they feed.

I am well aware, that it is denied by some, that these facts can be regarded as evidence of the transmission of foreign substances into the circulation. It is said, for instance, that the process of assimilation completely decomposes all substances subjected to its influence; that, consequently elementary particles alone are admitted into the blood-vessels; and that these are recombined, and again rendered conspicuous when thrown into the secretions.

That substances taken into the stomach, or otherwise subjected to the action of the absorbents, are not necessarily decomposed before they are admitted into the circulation, is fully demonstrated by what has already been said.

Admitting, however, that the assimilating powers do decompose the substances subjected to their action, it does not, I think, form any valid objection to the

* Lond. Med. Reposit. vol. v. May, 1817.

doctrine which alleges, that the blood may become imbued with properties capable of producing remediate or morbidic impressions, in consequence of the admission of certain substances into the circulation. When the milk, urine, flesh, &c. become impregnated with the peculiar qualities of substances taken into the stomach, the blood, from which these secretions are formed, must have contained either the substances themselves or their elements. It is evident, however, that blood which contains such elements, contains parts which do not belong to it in its natural and healthy state. Thus, in the instance given above, in relation to the discoloration of the skin by the internal use of the nitrate of silver, if the substance were previously decomposed, and again regenerated in the skin, as has been alleged, we should then have silver, oxygen, and azote floating in a separate state in the blood, and without which no nitrate of silver could possibly be afterwards regenerated in the cutaneous vessels.

In opposition to the opinion that remediate substances enter the circulation in an active state, it is asserted in a late work on the *Materia Medica*, that "chyle, however diversified the materials may be out of which it is formed, whether animal or vegetable, has essentially an identity of nature." This assertion is, however, entirely gratuitous, and contradicted by direct experiment. Dr. MARCET found that chyle

formed from vegetable food contains nearly three times as much carbon, as that which is formed from animal food; and that the chyle from animal substances, for the most part, enters into putrefaction in three or four days, whilst that from vegetables will remain unchanged for weeks, or even months. It moreover appears from these experiments, that chyle from animal food, is milky, and that, on standing, it becomes covered with a cream-like substance; whilst that from vegetable food is, generally, transparent, resembling common serum, with a coagulum almost colourless, and does not collect a creamy substance on its surface.* There is, therefore, a very striking difference between the chyle formed from animal and vegetable substances.

It has also been objected, "that it is incompatible with animal life that such active substances should be received into the circulation, since milk and other bland fluids have been known, when injected into the vessels, to occasion immediate death." It cannot be denied that substances *forced* into the circulation by a *syringe*, and of a reduced temperature, may, and in fact generally do, occasion death. Such violent effects do not, however, always follow experiments of this kind. Drs. Smith, Wahrendorf, Borrichius, Magendie, and others, injected medicines into the veins of persons, and found them to produce the same effects as if they

* Medico-Chirurg. Transact. vol. vi. p. 630.

had been received into the stomach. Sir E. Home performed similar experiments, and demonstrated anew that remediate substances may be thus introduced into the system, not only without fatal consequences, but with the same effects as if they had been taken internally. The experiments of Dr. Smith and Sir E. Home are published in the Transactions of the Royal Society of London.

Although the introduction of foreign substances into the circulation, by means of an injecting apparatus, may often give rise to dangerous or fatal consequences, it by no means follows that the same violent effects must ensue from the introduction of the same articles into the blood, through the regular route of the absorbents. In the one case, the substance introduced is suddenly and forcibly urged into the blood-vessels; whereas in the other, it passes into the veins, drop by drop, without any unnatural impetus, enveloped in bland and congenial fluids possessing the precise temperature of the blood. In confirmation of the correctness of this view of the subject, we need only advert to the fact, that chyle itself, when *injected* into the blood-vessels, will produce the same injurious effects that follow the introduction of other articles in the same way.

It has also been said: "By the medication of the blood, were it possible, as is contended for, we must, in all instances, do harm. The whole mass of the

circulating fluids is equally charged in this case with the medicinal substance, and therefore, while an action is going on in a diseased organ which may be salutary as to it, every sound part of the system becomes subjected to a similar impression, which could not fail to disturb the order of health, and create morbid derangements." To this hypothetical objection, I will oppose the observations of one of the editors of the *New-York Medical and Physical Journal*. "That every organ in the body," says the writer, "has its peculiar and appropriate stimulus, by which it is excited into action, is so universally admitted as to require no process of reasoning to establish it. If this be so, then there can be but little difficulty, we think, in conceiving that a substance dissolved in the blood may circulate through the system, without producing any particular effects, until it reaches the organ upon which, from its peculiar properties, it is designed to operate. The reason why a medicine acts upon one organ in preference to all the other organs of the body,—why jalap, for instance, operates upon the intestines, and not upon the brain and lungs,—we can no more explain than we can the reason why the planets are kept revolving in their orbits. If we are told that the movements of the planets are the result of attraction, so we may say that the determination of medicines to certain organs is occasioned by a similar attraction. This, however, explains nothing, and we

must, after all, be content with the broad fact, that such phenomena do occur, and that they are governed by certain laws; but the *cause why* they occur, must for ever remain concealed."

I would not have thought it necessary to enter so minutely into this subject, had I not read, in a recent work of great pretensions, and which is much in the hands of medical students in this country, that "the ancient notion which would refer the operation of medicines to their entrance into the circulation, is *perfectly* gratuitous, originating at a period of darkness, and when medicine was comparatively in its infancy, and is now abandoned by every one whose intelligence has at all kept pace with the progress of our science."* This is, indeed, a very extraordinary assertion, and well calculated to deceive minds who have not yet examined for themselves. Instead of this doctrine being abandoned by every one whose intelligence "has at all kept pace with the progress of medical science," it is well known, that the contrary is the case,—that the most eminent writers and physicians of the age, believe in the admission of certain remediate substances into the circulation. If this unqualified declaration be correct, then we must admit, that Armstrong, Paris, Murray, Alibert, Home, Abernethy, Cook, Johnson, Hosack—we might mention almost every respectable medical writer of the day,

* Chapman's Elements of Materia Medica and Therapeutics.

have not kept pace with the progress of our science, but that the author of the *Elements of Therapeutics* alone possesses this enviable advantage.

From the foregoing observations, therefore, it is, I think, perfectly evident, that medicines may produce remediate impressions in both the ways mentioned in the beginning of this chapter. This, indeed, is the generally admitted doctrine on this subject, with all those who have “kept pace with the progress of medical science.”

CHAPTER II.

A. MEDICINES THAT ACT SPECIFICALLY ON THE INTESTINAL CANAL, OR UPON MORBIFIC MATTERS LODGED IN IT.

I. *Medicines that excite Discharges from the Alimentary Canal.*

EMETICS.

AN emetic is a substance which excites vomiting by a specific impression on the stomach, independent of mere distention from quantity, or of nauseous taste or smell.

With regard to the *mechanism* of vomiting, experiments, apparently equally fair and conclusive, have led to very opposite results. *Chirac*,* a French physician of the 17th century, published an account of some experiments which he had performed on living animals, with a view of ascertaining the particular process of vomiting. The conclusions which he drew from his experiments are, that in the act of vomiting

* Histoire de l'Academie Royale des Sciences, P. 12, An. 1700.

the stomach is quiescent, and that its contents are ejected solely by being forcibly compressed between the diaphragm and abdominal muscles. Magendie, without alluding to the experiments of *Chirac*, has lately arrived at the same conclusions, from a set of experiments he performed on this subject. The experiments of Haighton, on the contrary, seem to prove, very conclusively, that vomiting is chiefly, if not entirely, effected by the contraction of the muscular coat of the stomach; and this opinion is now almost universally entertained on this subject. There can, however, be but little doubt, that all the powers that have been mentioned, conspire to produce the act of vomiting. The stomach contracts, its peristaltic action is inverted, the diaphragm and abdominal muscles are brought into action, and thus, by the combined agency of all these powers, emesis is produced.

How do emetics excite these actions of the stomach and muscles concerned in vomiting? The speculations of Darwin on this subject, though, perhaps, untenable upon the whole, are not without considerable plausibility. He alleges that the excitement of the stomach is greatly diminished by the action of an emetic; in consequence of which its peristaltic motion becomes inverted. When nausea is produced, (says he,) the stomach, as well as the whole system, is in a state of temporary debility. As the nausea increases in intensity, the natural powers of the stomach are more

and more diminished, until they cease altogether, and give rise to an inverted motion of its muscular fibres. In confirmation of this view of the subject, he refers to the vomiting produced by causes manifestly debilitating, such as syncope, concussion of the brain, &c.

It is impossible to ascertain the precise nature of the changes which take place in the living system from the operation of extraneous causes. All that we can hope to arrive at in this respect, is a knowledge of the general character and order of phenomena; a point, indeed, which it is but seldom allowed us to attain. When an agent is applied to the system, a longer or shorter train of actions occurs intermediate between the application of the cause and its ultimate or characteristic effect. In proportion as we trace these successive links in the chain of actions which results from the operation of a remedy, so do we succeed in attaining a knowledge of its *modus operandi*. With regard to the operation of emetics, therefore, we may trace, I think, the following series of actions. The emetic, in the first place, makes an impression on the sentient extremities of the nerves of the stomach. This impression is immediately referred to the sensorium commune; in consequence of which its natural energies are diminished, as is evinced by the languor of both the intellectual and corporeal powers. But as the sensation of an irritated organ depends, in reality, directly on a peculiar excitement

in the sensorium commune, so we may infer, that the sensation of nausea is the immediate and necessary result of the diminished and peculiar cerebral excitement, referred to the stomach. That this is, in fact, the case, is demonstrated by the vomiting and nausea which is sometimes excited, at the sight, smell, taste, or even the thought of a disgusting object. Here, however, our progress is arrested. For we can trace no necessary connection between nausea and the mechanical process of vomiting. We know not why a certain degree of nausea produces contractions of the organs concerned in this act, any more than we know, why a certain degree of venereal excitement calls into action the muscles concerned in *ejectione seminis*. These are mysteries, locked up in the bosom of our CREATOR, and about which it would be idle to speculate.

When an emetic is taken, an uneasy sensation is first felt, which is sooner or later followed by nausea; this gradually grows stronger and stronger, while the pulse becomes feeble, frequent and irregular; the face turns pale and the skin becomes cold and shrunk; vomiting finally comes on, during which the face is red and turgid with blood. On the cessation of the vomiting the sickness goes off, leaving the system in a state of temporary languor, from which it soon recovers.

Contrary to what takes place with the operation of

other articles on the animal economy, emetics increase by repetition, the susceptibility of the stomach to their impressions. Cullen states that he knew a person so accustomed to excite vomiting in himself, that the one-twentieth of a grain of tart. antim. was sufficient to excite a convulsive action of the stomach.

The evacuation produced by an emetic, is not merely confined to the stomach, but extends occasionally also to the duodenum, and even further. During the act of vomiting, there must be a considerable pressure exerted upon the liver and gall-bladder, by the contraction of the diaphragm and abdominal muscles. In consequence of this a more copious discharge of bile into the duodenum takes place;* and this effect is facilitated by the relaxation which the previous nausea induces in the common duct. The bile, being therefore more copiously thrown into the duodenum, during the first efforts of vomiting, is readily conveyed to the stomach, both by the inverted motion of the intestine, and the pressure of the abdominal muscles. It is obvious, from this, that the first contents of the stomach may be thrown off without any admixture of bile, and yet, after one or two acts of vomiting, by which the contents of the duodenum are brought into the stomach, this fluid may be copiously discharged. When, therefore, we do not observe any bile thrown off, until several full

* Cullen's *Materia Med.*

evacuations have occurred, we may conclude that it did not previously exist in the stomach, but was brought into it by the preceding acts of vomiting.

In cholera, we generally find no bile in the discharges, until vomiting has continued for some time. In this case, the bile is undoubtedly furnished from the gall-bladder, which being compressed by the action of the diaphragm and abdominal muscles, during the acts of vomiting, pours its contents into the intestines. From this circumstance, therefore, we derive a caution against the imprudent repetition of vomits, on finding bile in each succeeding discharge, under the fallacious idea of expelling the whole of it from the primæ viæ. Besides the mere discharge of the contents of the stomach, vomits are useful by agitating and compressing the abdominal viscera; and thereby giving a more vigorous impulse to the circulation in the portal vessels. They are, on this account, advantageously employed, in diseases attended either by internal congestions, or where the circulation in the abdominal organs is morbidly sluggish. Vomits are moreover beneficial by the general shock which they give to the nervous system. It is by an influence of this kind, perhaps, that they are sometimes capable of arresting fevers, when administered in their forming stages.

It has been satisfactorily ascertained, that effused fluids are often rapidly diminished during the opera-

tion of emetics, and hence it is inferred that they *increase*, either in a direct or indirect manner, the *activity* of the absorbents. Dr. Chapman supposes that there is a kind of antagonising power between the absorbents and the blood-vessels; in consequence of which the activity of the former set of vessels, is *indirectly* increased from the operation of emetics by the reduction of the arterial action which they create. The circumstance of a more rapid disappearance of effused fluid, during the employment of emetic remedies, admits, however, of an explanation more philosophical, and, I think, satisfactory. When an effused fluid accumulates in the body, it must be owing either to too rapid an exhalation from the arteries, or too slow an absorption by the lymphatics. Whichsoever be the case, it is quite certain that if we lessen the action of the exhalent vessels, the quantity of the effused fluid must diminish, although the action of the absorbents remain unaltered. It is in this way, therefore, I presume, that emetics act when they diminish dropsical accumulations. They lessen the action of the heart and arteries, and consequently diminish exhalation. If the lymphatics, therefore, preserve but their ordinary powers, they will diminish the quantity of collected fluid, or at least greatly retard the progress of its ordinary increase. This effect, namely, diminished exhalation into the internal cavities, and consequent diminution of the fluid already collected,

may be further enhanced by the tendency which emetics have to determine the circulation from the internal to the external surface.

With regard to the influence of emetics on the brain, I have already stated, that they appear to have an immediate power of diminishing its energies. They are, therefore, useful in diseases of the mind, attended by a morbid irritability of the brain, from their immediate influence in repressing this condition. They are, however, equally useful in mental diseases of an opposite character,—where the brain is in a state of torpor, as in hypochondriasis. But, as this disease is, for the most part, attended, and greatly influenced by abdominal congestions, as well as a sluggishness of the portal circulation, emetics would seem to produce their good effects in it chiefly by the agitation which they give to the body, and the activity they thereby impart to the abdominal circulation. They, however, undoubtedly also produce a new excitement in the brain, by the more direct influence which they excite upon this organ through the medium of the gastric nerves.

In prescribing emetics, care must be taken that we do not administer them when there is much fulness of the vessels of the head, or where symptoms of general plethora exist, without premising an adequate detraction of blood, lest by the exertions during the

act of vomiting, some blood-vessel burst, and apoplexy or dangerous hæmorrhage be induced.

From the extensive influence of this class of remedies on the animal economy, it may be readily conceived, that their remediate application must be various and important. In a great number of diseases, indeed, they are indispensable, at some period or other of their progress. I shall now, therefore, proceed to give a more particular detail of their practical application.

Emetics constitute a very important class of remedies in febrile diseases. In the treatment of typhus, when exhibited in the forming stage of the disease, they often arrest its progress in a very prompt manner. "Antimonial emetics," says Dr. Armstrong, "have been very generally recommended in typhus fever, and, according to my observation, are serviceable when the fever is of the least complicated form, commonly producing an improvement in the condition of the skin, respiration, and pulse in particular; and, perhaps, it is on the power which they possess of determining the blood to the surface, and of changing the morbid states of the circulation, that their efficacy depends."*

In typhus pneumonica I have derived much advantage from emetics, in every stage of the disease. They appeared to be particularly serviceable where

* Armstrong on Typhus. Amer. edit. p. 94.

much distress and pain in the thorax, with signs of internal congestion, were present. In such cases they promoted expectoration, and tended to re-establish the equilibrium of the circulation. They, moreover, tended to render the system more susceptible to the operation of stimulants. "In the typhoid and typhus pneumonica," says professor Potter, "that occasioned such lamentable mortality, of late years, throughout the United States, emetics, judiciously employed, were more beneficial than any other remedy. It was, indeed, a novel spectacle to those who were accustomed to unsheath the lancet in almost every thoracic affection, to behold a pneumonic fever, perhaps a hemoptoe, removed by the incantation of a single emetic."

Emetics have also been recommended in the various forms of malignant fever. In the beginning of some fevers of this character, they may occasionally prove beneficial, though, as a general rule of practice, their employment is to be regarded of doubtful efficacy, even in the earlier stages of such fevers; and, in their advanced periods, for the most part, injurious.

In intermittents vomits are a very common remedy. They, indeed, not unfrequently put a stop to the disease, without the employment of any other medicine. There exists some difference of opinion with regard to the importance of exhibiting emetics, as a preparative for tonic remedies. Judging from my own experience, I am led to believe, that an emetic will, in

general, render the subsequent employment of bark more certainly successful; and this seems to be in accordance with the sentiments of many of the best writers on this subject. Independent of the general impression which emetics produce on the system, and which, of itself, must aid in breaking through the chain of morbid associations, they appear to render the stomach more sensible to the impression of other remedies, and consequently give them a greater chance of displaying their full powers.

In some of the exanthemata, emetics are often of essential service. They are especially useful in the early stage of scarlatina, both in its simple and malignant form. When aided by the warm bath, they tend to "free the system from the pressure of the plethora of the internal blood vessels, so frequently observed in the commencement of this disease, and by thus equalizing the whole circulation, to render the future case most commonly mild and manageable."*

Emetics have also been strongly recommended in some varieties of erysipelas. In the bilious erysipelas, which Desault regards as the common and genuine form of this disease, he trusted entirely to antimonial emetics. *Renauldin*, author of the article *Erysipéle*, in the *Dictionnaire des Sciences Médicales*, also adds his testimony in favour of the use of emetics in this affection.

* Armstrong on Scarlet Fever, p. 35.

In the first stages of measles and small-pox, when the chest seems to be threatened by an oppressive topical determination of blood, vomits are strongly indicated, and will, in general, afford very great relief. "In the beginning of measles," says Dr. Armstrong, "when the lungs have been exceedingly oppressed, and particularly when vomiting has been absent, I have often seen the most striking relief follow an antimonial emetic, which may fairly be ranked among the most efficacious remedies in pulmonic congestions."^{*}

Emetics constitute an important auxiliary in the treatment of many of the phlegmasiæ. In puerperal fever they were at one time in high repute. Where there is nausea and bilious vomiting in the beginning of the disease, one or two gentle emetics may be employed with advantage. They cannot, however, be relied on as a principal remedy in the cure of this dangerous affection, and may, I think, be always omitted with propriety, except under the peculiar circumstances just mentioned.

In the treatment of croup, this class of remedies is of more unquestionable advantage. They are, indeed, altogether indispensable in managing this formidable malady, and will often procure effectual relief without any other remedy. In slight attacks, emetics, assisted by the warm bath, and the application of rubefacients

* Practical Observations on Scarlet Fever, Measles, and Pulmonary Consumption, p. 130.

to the throat, will, in general, suffice to give a permanent check to the disease.

But where the febrile symptoms run high, and the breathing is very difficult, bleeding is our sheet-anchor. Whenever, therefore, vomiting and the warm bath do not afford effectual and speedy relief, immediate recourse ought to be had to the lancet. The bleeding should be carried to the extent of producing a decided impression on the system. "In all the cases of croup," says Dr. Ferriar, "which I have seen, I have found it necessary to bleed immediately, and when I have seen the patients sufficiently early to entertain hopes of saving them, I have directed the evacuation to be continued, so as nearly to produce fainting. This is the essential point of the cure, without which no relief can be effected. Even if the patient should not be seen till the day succeeding the attack, it is proper to bleed *ad deliquium*, if the subject be plethoric and the difficulty of breathing and restlessness be great."* Independent of the relaxation which a decisive bleeding produces in the glottis, and the check which it gives to the tracheal inflammation, it has also the effect of greatly facilitating the operation of emetics, by removing the cerebral congestion, and the consequent insensibility of the stomach to the action of remedies.

* Ferriar's Medical Histories and Reflections, p. 137. Philadelphia edition, 1816.

The emetics should be continued at intervals until the disease is completely subdued. In the latter stages of the complaint they are useful by assisting to discharge the viscid mucus secreted in the bronchia.

Emetics are also of great advantage in the other species of cynanche. In the commencement of cynanche maligna, an emetic will often afford evident advantage, and sometimes at once arrest the progress of the disease. By this practice "we never fail to bring off a considerable quantity of acrid matter, which, by getting into the bowels, might induce a diarrhœa; an affection to be avoided by every possible means, as always adding to debility, and endangering the life of the patient."

In cynanche laryngea, undoubtedly the most fatal variety of anginose disease, vomits have been known to afford unequivocal advantage. Dr. Armstrong, whose authority is entitled to very great respect, recommends the employment of emetics in this fatal affection, as one of the most effectual means in our power for arresting its progress. He states, that in five cases of this disease, he exhibited "tartarized antimony, sometimes combined with ipecacuanha, in repeated doses, until free and frequent vomiting took place. No circumstance of my professional life," he continues, "ever gratified me more than the great and sudden relief which the vomiting afforded; in reality it removed all the urgent symptoms at the time, and

being excited as soon as ever the slightest signs of stricture in the larynx returned, at last completed the recovery.”*

Emetics are frequently very beneficial in the treatment of peripneumonia notha, where the inflammatory condition has been in some degree subdued, or where the stage of excitement has never developed itself fully from a strong tendency to oppressive venous congestions, emetics, in repeated, but gentle doses, are more useful than any other remedies we can employ. The patient generally brings up a large quantity of slime, and finds almost immediate relief. After the operation of the emetic, suitable stimulants, such as small doses of opium and camphire, with some gentle diaphoretic drinks, should be employed.† Of course blisters to the chest are never to be neglected. They are indispensable to relieve the local pulmonary affection.

Emetics are no less useful in the treatment of pneumonia biliosa, than in the preceding variety of pulmonic inflammation. *Richter*‡ says that they will often remove the excruciating pain in the thorax, as if by enchantment. *Stoll*§ also speaks in the highest terms of the utility of emetics in this form of pleurisy. Pro-

§ Ratio Medend. vol. i.

fessor Potter, of Baltimore, in an interesting paper published in the *Medical Recorder*, adds his testimony in favour of this practice. "Experience has taught us," says he, "that they (emetics) are eminently useful after the violence of inflammatory action shall have been abated, as well as in all the milder degrees with which this disease so frequently commences."* I have never met with a case of this disease, and have, therefore, nothing to add from my own observation.

In the treatment of every variety of acute ophthalmia, vomits have been recommended as particularly serviceable.

By many very respectable writers, emetics are highly praised for their virtues in the cure of acute rheumatism. Horn† states, that he found emetics more useful in this disease than any other remedy. He repeated them every day, until from fifteen to twenty had been given. The result of this practice, he informs us, was exceedingly happy. There is a form of rheumatism, which occurs in low and marshy situations, and which Richter calls *rheumatismus acutus gastricus*, depending, according to Stoll, on an irritation from vitiated or redundant bile in the primæ viæ,‡ in which emetics are of unquestionable service.

* *Medical Recorder*, vol. iv. p. 418.

† *Über die heils. wirk. der Brechmittel in hitzigen rheumat.* D. Archiv. b. viii. st. 2.

‡ *Ratio Med.* tom. ii. p. 25.

Lentin* also speaks of rheumatism connected with a bilious form of fever, in which he found vomits to produce very beneficial effects. Haygarth informs us, that, preliminary to the use of bark, in acute rheumatism, he was in the habit, "of giving either the antimonial powder or tartarized antimony, generally the former, till the stomach and bowels were sufficiently cleansed."† Scudamore also speaks favourably of the employment of vomits in this disease. "If the patient be seized," says he "in consequence of exposure, shortly after some convivial occasion, on which he has indulged in improper diet, the present remedy should not, on any account, be neglected."‡ I have occasionally met with acute rheumatism, attended with manifest bilious symptoms, and in these cases I have employed emetics with much advantage. In the purely inflammatory form of this disease, uninfluenced by the miasmata which produce our autumnal bilious fevers, I have, however, never exhibited these remedies, and can, therefore, say nothing from my own experience of their value in such cases.

Emetics have also been strongly recommended in gout. Scudamore thinks that they should not be used, "unless an evacuation of the stomach in a full degree is obviously indicated." He mentions a case, how-

* De aere et morb. claustral. p. 30.

† Clinical History of Rheumatism, &c. part i. p.

‡ A Treatise on the Nature and Cure of Gout and Rheumatism, p. 298.

ever, in which the good effects of an emetic were strongly exemplified. Mr. Alexander Small, surgeon at Minorca, speaks in very high terms of the efficacy of tart. antim. in his own case of gout. He sometimes gave it with bark, in which combination it acted as a mild aperient.*

Mr. Saunders† was in the habit of employing tartrated antimony so as to excite nausea, or full vomiting, in acute ophthalmia, with great success. In that variety of inflammation of the eyes, called Egyptian ophthalmia, Sir W. Adams speaks of the use of emetics in the strongest terms of praise.

In gutta serena, also, emetics have been administered with very considerable advantage. Richter, who considered the cause of this disease as seated in the abdominal viscera, employed them much in conjunction with the deobstruent pills which will be hereafter mentioned, under the head of antispasmodics.‡

Of the propriety of employing emetics in hæmoptysis, I have great doubts, although there is not wanting very respectable testimony in favour of this practice. When we attend to what takes place during the operation of an emetic, it is difficult, I apprehend, to

* Observations on the Gout, by A. Small, late surgeon to the ordnance in the island of Minorca, in the Med. Observ. and Inquiries, vol. vi. p. 198.

‡ Richter's Medical and Surgical Observations, p. 254.

enter upon the employment of vomits in the cure of this variety of hæmorrhage, as recommended by Dr. Bryan Robinson, without entertaining considerable fears as to the result. During the process of vomiting there is a strong impulse given to the circulation; a full inspiration is made, by which the lungs become expanded, and a greater facility given to the escape of blood from the bleeding orifice.* Besides these effects, there is undoubtedly some impediment created to the passage of the blood through the abdominal aorta, in consequence of the action of the abdominal muscles and diaphragm; and of course there will be a greater impetus given to the blood through the superior arteries. It is true that both before and after the act of vomiting there exists a very considerable languor in the circulation, which might favour the suppression of the hæmorrhage; and if these remedies be exhibited only to the extent of inducing nausea, there can be no doubt of their being, in some degree, advantageous. The agitation and straining, however, during the efforts of vomiting, might very readily produce much more mischief, than could be compensated by any advantage that might be derived from the subsequent languor. Cullen, indeed, who tried this practice states, that in one instance it increased the hæmorrhage to a great and alarming degree.

* An Essay on the Materia Med. by J. Moore, p. 320.

In hæmorrhages from the uterus there are, I think, much better grounds for expecting useful effects from the operation of this class of remedies.

Independent of very respectable testimony in favour of the use of emetics in this variety of hæmorrhage, we have a good anatomical reason, both for the advantages of vomits in menorrhagia, and for their occasional injurious effect in hæmoptysis. During the act of vomiting, the abdominal muscles and diaphragm are thrown into a state of violent contraction. The natural consequence of this is a degree of pressure on the abdominal aorta, both where it passes through the crura of the diaphragm, by the contraction of this muscle, and in its course through the abdomen, by being compressed in common with the other contents of this cavity. Hence there will be a slight impediment to the passage of the blood to the lower portions of the body, whilst it will be more forcibly driven into the vessels which pass off from the aorta within the thorax. The reason is, therefore, obvious why vomiting will sometimes not only increase, but give rise to a hæmorrhage from the lungs; whilst, on the contrary, its effects in menorrhagia, so far as experience has taught us, are not only free from dangerous consequences, but very often of unquestionable service. The only case in which I have had recourse to this practice, was recently, in a delicate female, who, with menorrhagia, suffered under symptoms indicating the

use of a gentle emetic. I ordered her eighteen grains of ipecac. which brought on several copious bilious discharges from the stomach; and had the effect, besides, of giving a very decided check to the hæmorrhage.

In the treatment of dysentery emetics are often of very great advantage. Where there is redundant or vitiated bile present in the primæ viæ, as is frequently seen in the dysenteries of hot climates and marshy districts, vomits would seem to be indispensable. Sir John Pringle speaks very favourably of this practice; and Mr. T. Clark assures us that he derived the greatest advantage from the employment of emetics in this disease, when administered in the form of enemata.* Cleghorn, too, gives his testimony in favour of emetics in this disease. "When they begin," he says, "like simple diarrhœa, without fever or fixed pains in the belly, the first thing to be done, is to empty the intestines of their acrimonious contents, as soon as possible." For this purpose he was in the habit of giving *P. ipecacuanha*, in combination with *vitrum antimonii ceratum*, in such doses as to bring on copious emesis and catharsis.† In cases unattended with high febrile excitement, I have sometimes given an ipecacuanha puke, when first called to the patient,

* Observations on the Nature and Cure of the Diseases of the East and West Indies.

† Cleghorn's Observat. on the Epidem. of Minorca, p. 146.

and, I believe, always with advantage. It is evident, however, that where the fever runs high, emetics ought not to be used, before the arterial excitement has been adequately reduced by more energetic depletory measures. In the treatment of diarrhoea also, this class of remedies will often prove very serviceable. In this and the former intestinal disease, vomits are useful, not so much by evacuating the contents of the stomach, as by the effect they have of equalizing the circulation, and, perhaps, also by deriving the superabundant excitement of the intestines to the stomach.

In that species of mania which arises from the imtemperate use of ardent spirits, emetics possess the most decided remediate powers. This practice was introduced, a few years ago, by Dr. Joseph Klapp, of this city, who has published the result* of a very large experience on this subject, exhibiting the most indubitable evidence of the superior utility of emetics in this very singular variety of mania. The importance of this treatment in *mania a potu*, seems now to be pretty generally acknowledged by the practitioners of this city. The late Dr. Albers, of Bremen, in a letter written a short time before his death, gave me an account of three cases of this disease, in which emetics were employed with decided advantage. The result was at least so favourable, as to induce him to

* Vide. Eclect. Repertory, vol. vii. p. 251. Also Medical Recorder, vol. ii. and iii.

express a determination to adopt the treatment in future.

The stomach, in this disease, is often extremely insensible to the operation of emetics. It is, therefore, in general, necessary to employ very large doses before vomiting can be excited. Where a full emesis is produced, the mental hallucinations are commonly much corrected, and in mild cases, sometimes entirely suspended, by a single emetic. It will most frequently be necessary, however, to repeat the emetic two, three, four, or even five or six times, at such intervals as the particular circumstances of the case may require. In the course of this treatment, the bowels must be kept relaxed by the exhibition of aperients, if the emetics do not produce this effect. Dr. Klapp does not think it necessary or even proper, to employ opium along with the emetic treatment, unless, perhaps, under the particular circumstances of extreme exhaustion, or hypercatharsis induced by the emetic articles acting violently on the bowels. It has been contended that a full opiate after the operation of the vomiting will greatly facilitate the cure, by inducing sleep, and tranquilizing the general excitement. Judging from my own experience, I am not disposed to regard the employment of opium as necessary to procure these advantages. Such is the power of emetics in this disease, that they will not only allay the mental aber-

rations, but often induce sleep more readily than opium under any mode of management.

Emetics have also been much recommended in other varieties of mania, and in hypochondriasis. In this latter complaint I have employed them with evident advantage. An emetic will often rouse the hypochondriac patient from that state of mental and physical torpor with which he is pressed down, and render his system more sensible to the operation of other remedies. Emetics are particularly advantageous in this disease, when alternated with alterative doses of blue-pill, and an occasional saline purgative. Whatever be our notions concerning the pathology of hypochondriasis, observation has fully demonstrated the intimate connection of its symptoms with the particular condition of the abdominal viscera. In this disease there generally exists much congestion in the portal vessels, with torpor and functional derangement of the liver. By the employment of these remedies, therefore, we not only evacuate the alimentary canal of its vitiated contents, but also invigorate the circulation in the portal system, both by the mechanical agitation of the vomiting, and the specific influence of the mercury upon the vascular extremities of the hepatic system. In a case of puerperal mania, I derived the most decided benefit from the employment of emetics. The patient had been delivered of her first child four days, when she began to manifest symptoms of mental de-

rangement. She would neither speak nor take nourishment, unless greatly urged. After using a variety of means to induce her to speak, she replied, that she was talking to good spirits from the other world, and was determined to have nothing to do with the beings of this wicked place. She declared she was perfectly well, and stood in no need of any medicines. In this state she continued for three days, and then, all at once, became extremely loquacious. Her pulse was small and frequent, and the pupils of her eyes much contracted. Under these circumstances, I ordered her an antimonial emetic, which brought on pretty copious vomiting. She became evidently much tranquilized by its operation, and seemed, at short intervals, to be sensible of her real situation. On the evening after the vomiting, I gave her an anodyne draught, which, however, did not procure her the rest I anticipated. On the next day, therefore, I gave her another emetic, which again operated well; and from this period she rapidly recovered the full possession of her reasoning faculties.

In hysteria also, emetics are often of unequivocal advantage. They are, perhaps, to be employed usefully in every variety of this disease; but in that form which is attended with complete suspension of the animal functions, bringing on a state resembling syncope, I have found them to be particularly useful.* Dr.

* Medical Recorder, vol. iv. p. 124.

Dean, a highly respectable practitioner in the interior of this state, adds his testimony in favour of the employment of emetics in hysteric affections. His experience has led him to regard them as decidedly the most effectual remedy we possess, in the chronic form of this disease. "But it is in the chronic variety of this complaint," says Dr. Dean, "in which the common routine of what are improperly termed antispasmodic medicines, produce no other than transient relief to the patient, that I have experienced the most permanent good effects from the administration of emetics. In cases of this description, where the patients had laboured under this disease for ten years, and during that time, by the advice and direction of respectable physicians, exhausted, with at most but temporary benefit, the whole class of remedies which are usually prescribed, I have, by the continued exhibition of vomits, either entirely removed the complaint, or so far interrupted the habits of diseased action in the stomach, that antispasmodic and tonic medicines would, in general, complete the cure."* Dr. Joseph Smith, of New-York, has published some interesting observations on the employment of emetics in spasmodic diseases. "The experience I have had," says he, "of the utility of emetics in *hysteria* and epilepsy, enables me to assert, with confidence, that they are

* Medical Recorder, vol. iv. p. 259.

more efficacious than any remedy ordinarily employed.”*

In asthma emetics are of unquestionable advantage. They not only assist materially in expelling the viscid mucus from the bronchia, but operate in a direct manner in facilitating the transmission of the blood from the right to the left side of the heart, the impeded course of which forms, perhaps, the chief source of distress in this and other similar affections. That the operation of an emetic produces this effect, is evident from the circumstances which take place during the act of vomiting. During this process the diaphragm is drawn downwards, by which the thoracic cavity is enlarged, and the lungs are in a full state of inspiration, and therefore expanded to the utmost degree. The necessary consequence of this is, that the blood which had congested in the pulmonary arteries, right side of the heart, and large venous trunks, in consequence of the previous inadequate expansion of the lungs, is now, during the act of vomiting, permitted to pass on with freedom to the right side of the heart. And hence, in part, the temporary relief almost invariably obtained from full vomiting in this disease.

In the treatment of hooping-cough also, emetics, in general, afford more relief than any other remedies we possess. Where the disease is attended with much arterial excitement, emetics are, however, inadequate

* Transactions of the New-York Physico-Medical Society, vol. i.

of themselves to prevent serious consequences, and require to be assisted by prompt and decisive venesection.

Much dispute existed at one time concerning the propriety of administering emetics in apoplexy. This subject is amply and warmly discussed in the fifth and sixth volumes of the *London Medical and Physical Journal*. As the power of vomiting to propel the blood to the superior parts of the body, from the causes which I have already mentioned in this chapter, is, however, very considerable, I am entirely convinced that, as a general rule, this class of remedies cannot be safely employed in apoplexy. This disease may, however, occur under circumstances of gastric irritation, which will not only render the employment of an emetic useful, but absolutely indispensable. When, for instance, apoplexy comes on immediately after eating a very full meal, it would be exceedingly unwise, I think, to suffer the stomach to remain oppressed and over-distended by what had been eaten. But even under such circumstances, a copious abstraction of blood should, perhaps, always be premised to the emetic; for the apoplectic symptoms may as yet depend simply on a turgescence of the vessels of the brain, which, from the further impetus given to the blood by the efforts of vomiting, may become ruptured, and bring on fatal apoplexy. The occurrence of such an event will, how-

ever, be rendered much less probable, if we lessen, to a considerable degree, the general mass of the circulatory fluid previous to administering the emetic. Where there is no strong reason to suspect an irritation in the stomach, either from over-distention or from the presence of some irritating substance, I cannot conceive what advantage is to be expected from the administration of an emetic. If apoplexy be essentially connected with an engorgement of the cerebral vessels, it is obviously wrong to resort to a treatment which has a direct tendency to increase the fulness of these vessels by increasing the arterial, and retarding the venous circulation.

Of the employment of emetics in epilepsy, the records of medicine furnish us with very contradictory evidence. As in the treatment of apoplexy, so in that of epilepsy, their employment has been on the one hand as extravagantly praised, as it has been inordinately censured on the other. It may be observed, however, that, perhaps, in all cases where we have contradictory evidence, from respectable sources, in relation to the remediate powers of any remedy, it arises from its having been given either in different stages of the same complaint, or in different varieties dependent on a difference in the remote causes. We may, therefore, safely conclude, that although as a general rule emetics may not be proper in epilepsy, yet that, occasionally this disease may present itself under cir-

cumstances which will render the employment of such remedies of the greatest importance.

In the epilepsy of children, when there does not appear to be much fulness of the vessels of the head, and symptoms of gastric irritation are present, such as nausea, flatulency, disturbed sleep, and other marks of indigestion, emetics will be of essential importance. Dr. J. Clark advises, for this purpose, a solution of the sulph. zinc. in an aqueous infusion of ipecacuanha, to be repeated in six, eight, or ten days, according to circumstances. Dr. Thomas says, that when an attack of idiopathic epilepsy can be foreseen, there is, perhaps, no remedy which will be more likely to prevent the paroxysm, than an emetic administered about an hour before its accession. In a child, which had been about eighteen months affected with occasional epileptic convulsions, I succeeded in removing the disease entirely, by a long course of emetic remedies, administered every third day. The disease came on after an attack of ague, which was cured by arsenic, and was probably at last kept up from habit. I employed the pulv. ipecacuanha.

Of the utility of emetics in the early stages of indigestion there can be no doubt. In the advanced periods of this complaint, however, when the disease is no longer confined to functional derangement of the stomach, but has extended to the neighbouring viscera, they are, in general, either useless or impro-

per. In recent attacks of indigestion, attended with distressing pains of the stomach, or symptoms of an oppressed state of the brain, an emetic will often procure the most prompt relief. Dr. Revere, of Baltimore, in a most excellent paper on dyspepsia,* observes, that in persons whose digestive organs have become much debilitated, food, which in the healthy state of the stomach is perfectly innocent and nutritious, will sometimes produce "great general distress, numbness of the scalp, violent colic, acute pain in the side and bladder, vertigo, apoplexy, and convulsions." In affections of this kind, emetics are obviously the proper remedies; and Dr. Revere relates several highly interesting cases in which their efficacy was promptly and conspicuously manifested.

In the ordinary symptoms of indigestion, however, although an occasional vomit may be indispensable, yet, I think with Dr. W. Philips, that they should be cautiously repeated, and only for the removal of urgent symptoms evidently depending on the presence of some irritating matters in the *primæ viæ*.

In dropsical diseases emetics have been much employed. They have been prescribed in every variety of dropsy, but they appear to be more particularly applicable to the treatment of *anasarca* and *ascites*. It is supposed that their beneficial action on these affections depends on their power to increase the ac-

* Medical Recorder, vol. iv. p. 50.

tivity of the absorbents. I have already expressed my doubts with regard to the supposed influence of emetics on the absorbent system, and stated, what appears to me to be the correct explanation of the *modus operandi* of medicines in this respect. By the nausea they create, they lessen the momentum of the blood in the system of capillary vessels, as is clearly evinced by the paleness and shrunk appearance of the skin during this state. The momentum of blood being, therefore, diminished in the extreme vessels, it is obvious that exhalation, which depends on the activity of these vessels, must receive a simultaneous check. The absorbents, however, not being under the same influence, pursue their functions uninterruptedly, and thus gain on the antagonizing, but weakened, exhalants. Emetics may also do good by promoting the return of blood through the portal system of vessels, and thus removing a source of congestion in the capillaries of the peritoneum and lower extremities, by which an increased exhalation of serum may have been favoured.

Emetics have also been recommended in diabetes. Richter relates several cases that were effectually cured by them. Where it is evidently connected with gastric irritation, as in the cases mentioned by Richter, vomits will, no doubt, do much good. This writer mentions an instance of this disease, where an emetic brought up a very great quantity of bilious matter; “and I can assert with truth,” says he, “that next

morning there was not a vestige of diabetes or of any other complaint present."²* We have also the testimony of Frank, in favour of the employment of this class of remedies in the present disease. Emetics are, indeed, a very common remedy in the treatment of diabetes with the German physicians; and many cases may be found in their writings illustrative of their beneficial effects.

In the treatment of jaundice emetics are often of essential service. They are particularly calculated to promote the passage of a gall-stone through the common duct. By the nausea which they create, they relax the duct, whilst the mechanical pressure and agitation caused by vomiting tend to push the calculus forward in the relaxed tube.

Emetics have often a very strong effect in reducing the inflammation and swelling of the testicles in hernia humoralis. I have, in several instances, witnessed the surprising effects of a strong antimonial vomit, in reducing these painful swellings; most generally, however, these remedies do not produce any perceptible change in these affections. Emetics have also been a good deal recommended to reduce indolent buboes; their effects in this way, do not, however, appear to be considerable.

Quite recently Dr. Hosack has published some very interesting observations on the utility of emetics in

* Medical and Surgical Observations, p. 84.

constipation. He details seven cases of this kind, from which it appears, "that in the commencement of constipation, or in its more advanced stage, when the symptoms of inflammation have been subdued by the lancet, emetics may be very advantageously exhibited, both for the purpose of removing the hepatic obstructions, and of counteracting the spasmodic constriction and pain ordinarily attendant upon this disease."*

CALLICOCCA IPECACUANHA.

THIS plant was first discovered about the middle of the seventeenth century. It is a native of South America, and has been well described by M. Brotero, professor at the University of Coimbre, in the Memoirs of the Linnean Society of London. It appears to be a species of the genus *Callicocca*, of Shreber, and is accordingly described in the books under the name of *Callicocca Ipecacuanha*. It has been ascertained that the ipecacuanha root, as it is brought to us from Brasil, is not always taken from the same plant, namely the *Callicocca Ipecacuanha*. According to Linnæus it is not unfrequently obtained from the *psycotria emetica*; and Decandolle asserts, that the ipecacuanha, as it is found in our shops, is very often

* New-York Medical and Physical Journal, vol. i. No. 1. p. 60.

a mixture of the genuine root with the roots of some species of violets, apocynæ, euphorbia, &c. It is also said to be occasionally mixed with the roots of several species of the genus *Ionidum*.* To what degree these adulterations may deteriorate the value of the ipecacuanha, I am unable to say. It is certain, however, that they must interfere with its peculiar virtues, and tend more or less to modify and render uncertain its effects.

The ipecacuanha root consists of very tortuous branches, of the thickness of a goose-quill, surrounded by numerous prominent rings, separated by deep grooves. Externally its colour is brownish or blackish grey; internally it is white or faintly yellow. It has a faint disagreeable smell, and a bitter sub-acrid taste.

Magendie and Pelletier have ascertained that ipecacuanha contains a peculiar principle, to which they have given the name of *emetin*,† and upon which the emetic properties of the root seem entirely to depend.

* Nouveaux Elémens de Thérapeutique, Par I. L. Alibert, t. i. p. 236.

† The following is the formula introduced into the new codex of Paris, for the preparation of this substance. “ Let ℥i. of the powder of ipecacuanha be macerated in ℥ii. of ether, with a gentle heat, for some hours, in a distilling apparatus; let the portion which remains be triturated and boiled with ℥iv. of alcohol, it having been previously macerated in it; filter, and let the remainder be treated with fresh portions of alcohol, as long as any thing is taken up from the root; mix these alcoholic solutions and evaporate to dryness; let this alcohol extract be macerated in cold distilled water, in order that every thing soluble in that menstruum may be dissolved; filter, and evaporate to dryness; this extract is *emetin*; in

It consists, when pure, of little transparent laminae, of a brownish red colour, possessing very little odour, and a taste resembling that of the powdered ipecacuanha. Emetin is decomposed in a heat of about 212°. Water dissolves it in every proportion, without affecting its composition in the least. It deliquesces in a moist air. Alcohol dissolves it readily, but ether has no action on it. "*Nitric acid* dissolves it, but at the same time decomposes it; *dilute sulphuric acid* has no action on it; *muriatic acid* and *phosphoric acid* dissolve it without altering its nature; *acetic acid* dissolves it with facility; *corrosive sublimate* precipitates it from its solutions; but *tartarized antimony* has no effect upon them. *Gallic acid*, the *infusion of galls*, and *acetate of lead* precipitate it."* According to the analysis of Pelletier, ipecacuanha contains: sixteen parts of *emetin*, two of oil, six of wax, ten of gum, forty of starch, and twenty of woody fibre.

Of a hundred parts of ipecacuanha, alcohol takes up about twenty-one; proof spirits somewhat more than thirty-two, and boiling water nearly forty-seven.

This substance is, undoubtedly, the most important vegetable emetic we possess, and in many instances preferable to every other article belonging to this class. It is mild in its operation, and may be safely exhibited

this state, however, it contains a small quantity of *gallic acid*, but which is too inconsiderable to affect its medicinal qualities." Paris Pharmacol.

* Paris Pharmacologia.

under circumstances of general exhaustion, or intestinal irritation, which would render the employment of antimonial emetics injurious. In all cases where the stomach is irritable or debilitated, the ipecacuanha is decidedly the best emetic. It seems to have less tendency to weaken the digestive powers of the stomach than any other article of this class; it would appear even to exert some tonic power upon this organ, when given in very minute doses, as I have more than once observed in my own person. It possesses another advantage over antimonial emetics, which in many cases is of great importance; it is much less apt to act upon the bowels, and to pass off by copious and exhausting stools, than the preparations of antimony. This is of immense consequence in many diseases; for we often find it useful to procure emesis, in cases where a rapid catharsis would prove highly injurious. It is, nevertheless, not destitute of properties capable of exciting the peristaltic action of the intestines. It will, in general, after having acted upon the stomach, prove gently aperient, and excite, moreover, in a very particular manner, the cutaneous exhalants;—circumstances which render it peculiarly adapted to the treatment of several intestinal diseases.

Its powers as an antidysenteric, was, indeed, the very first circumstance which brought this remedy into notice. Piso, as early as 1649, and before any of it had been brought to Europe, mentioned the ipe-

cacuanha as a common remedy for dysentery, in the Brasils. Its character in this respect, though not equal to what it once enjoyed, appears to be well deserved, since, by the most eminent writers who treat of this disease, it is mentioned as a principal remediate article. Ipecacuanha is given in dysentery, with a view either to its emetic or sudorific operation, though the latter is, in general, the principal intention for which it is employed. On this account, therefore, it is commonly given in combination with other substances, which have the effect of increasing its tendency to excite the cutaneous emunctories.

Moseley, who adopted the sudorific plan of treating this disease, was in the habit of giving small doses of ipecacuanha and opium, in combination, and upon which he seemed to place his chief dependence. There can be no doubt that this treatment will sometimes remove dysentery, but common experience would seem to show that it cannot be safely relied on as a principal part of the treatment of such cases. In the dysenteries of this country, at least, more promptly evacuant measures are necessary, and if ipecac. be used in the early stage, it should, perhaps, always be given in the first place to the extent of inducing full vomiting. Sir John Pringle was in the habit of giving it in small doses, and repeating it until both vomiting and purging were produced. To ensure its operation on the bowels, Cleghorn gave it in union with the

cerated glass of antimony, in such doses as to produce a full emeto-cathartic effect.

In the latter stages of the complaint, however, when the arterial excitement has been considerably subdued, there is no remedy which is so well calculated at once to mitigate the distressing tormina, and to keep up an agreeable and salutary moisture of the surface, as ipecacuanha and opium combined. If calomel be united with these two articles, we heighten, still more, the curative effects of the composition; for of all the articles in the *materia medica*, the latter substance appears to be the most powerful in equalizing the circulation.

Mr. Playfair, in a paper published in the tenth volume of the *Edinburgh Medical and Surgical Journal*, has given an account of a new mode of using ipecacuanha in this disease; and which he states to have proved exceedingly successful. He gave from half a drachm to a drachm of this article, in union with from thirty to sixty drops of laudanum, keeping the patient for some time after in a horizontal position. When the medicine was rejected, he repeated the dose. He states that this practice is applicable only to the early stage of the disease. He practised in Bengal. The ipecacuanha has also been administered in the form of an enema, in dysentery; and its effects, when thus employed, have been much praised.* For

* *Observations on Fevers and other Diseases of the Indies.* By Thomas Clark. London, 1801.

this purpose three drachms of the bruised root are to be boiled in a quart of water down to a pint. This is to be administered as an enema, all at once, to an adult. This injection is also greatly extolled for the relief it affords in internal piles. In a case of this kind I have myself had an opportunity of witnessing its good effects.

Ipecacuanha, given in small doses, so as to puke gently, has been much praised for its effects in the cure of chronic diarrhœa, and more particularly if the disease be attended with symptoms of gastric impurities. Dr. Samuel Pye, has published a number of cases illustrative of the good effects of the ipecacuanha in this disease. He administered it in small doses, sufficient, however, to produce vomiting, and repeated the medicine from day to day, with an occasional anodyne mixture, until the disease disappeared.* The same practice is recommended by Dr. Fothergill, and may, indeed, be found in perhaps every work that treats on this disease.

Much has been said of the efficacy of nauseating doses of ipecacuanha in hæmorrhages. Dr. A. N. Aasheim, a Danish physician, has published some interesting observations on the employment of this remedy in hæmoptysis. He gave one-fourth of a grain every three hours during the day, and every four hours during the night. The third dose, in general, excited

* Medical Observat. and Inquiries, vol. i. p. 240.

slight vomiting. By this treatment, Aasheim remarks, the bleeding was put a stop to; the cough became less severe, and the skin, which before was dry, was rendered moist, and soft to the feel.* There can be no doubt that this treatment will occasionally prove entirely successful, for, without ascribing to ipecacuanha any astringent or antispasmodic virtues, by which it has been supposed to arrest hæmorrhages, we have an obvious explanation of its operation in these cases, in the restraint which it exercises over the action of the heart and arteries, during the nausea which it creates. If the advantages of venesection in hæmorrhagy proceed from its diminishing the impetus of the blood, and I can see no other reason for it, certainly we may apply the same explanation to the *modus operandi* of nauseating doses of ipecacuanha in similar cases, since they have a power perhaps equal to venesection, in diminishing the force and activity of the circulation. In addition, however, to the curbing influence of this remedy on the action of the heart and arteries, something, undoubtedly, must also be ascribed to its power of equalizing the circulation and exciting the cutaneous emunctories. In uterine hæmorrhage, this article has been found still more decidedly beneficial than in the other hæmorrhages; and this may, perhaps, be accounted for in the way I have already attempted to do, when speaking of the general applica-

* Alibert *Matière Médicale*, tome i. p. 248.

tion of this class of remedies to the cure of diseases. Bergius relates a violent case of uterine hæmorrhage, which he successfully cured by giving half a grain of this remedy every half hour. I have never used the ipecacuanha in cases of this kind, but I can well conceive of the propriety of the practice.

Ipecacuanha vomits have been thought to be peculiarly serviceable in asthma. Vomiting, by whatever article excited, must of itself, simply from its mechanical operation, be useful in the asthmatic paroxysm. By the contraction of the diaphragm, it augments the cavity of the thorax, and allows the lungs to expand more fully, by which the transmission of blood through these organs is greatly facilitated, and a principal source of uneasiness in this disease temporarily removed. Besides this effect, it aids, in no inconsiderable degree, to expel the viscid mucus from the bronchia, and thereby gives a greater opportunity for the oxygenation of the blood. But independent of these general effects, ipecacuanha has been supposed to possess antispasmodic or other peculiar powers calculated to act beneficially in this disease. It appears to me, however, that in this respect it possesses no advantages over the other emetics generally employed, except in its acting more mildly, and not being apt, like the antimonial preparations, of passing off rapidly by the bowels, and debilitating the digestive organs. It must not be concealed, however, that Akenside, who

published a paper on the use of this article, in the present disease,* states, that he found it equally useful, whether given to the extent of producing vomiting or only in nauseating doses. It must, however, also be observed, that in the *paroxysm* he administered it so as to produce vomiting, whilst, after the paroxysm had passed off, he continued its use every morning in nauseating portions.

In the Memoirs of the Medical Society of Copenhagen, there are some very interesting remarks on the employment of ipecacuanha as an *anti-emetic*, by Dr. Schonheyder. He relates the history of a case of *ileus*, in which small doses of this article proved successful, after every other means of relief had been fruitlessly employed.

“ On lui avoit donné plusieurs remèdes inutilement. Son estomac ne pouvait rien retenir ; et il vomit pendant plusieurs jours des matières fécales d’une grande fétidité. La soif étoit très-incommode ; l’abdomen n’étoit ni dur, ni tendu, ni douloureux. On avoit essayé de lui donner de l’eau de sedlitz, qui avoit été rejetée. Schonheyder tenta dès-lors d’administrer l’ipécacuanha par doses prises. La seconde dose enleva toute la propension que le malade avoit à rejeter les alimens ; le malade qui étoit tourmenté par la soif, put boire considérablement. On continua ; et de jour en jour il alla mieux.”†

Burdach states, that it is very useful in habitual

* Memoirs of the London College of Physicians.

† Alibert Matière Médicale, t. i. p. 249.

vomiting from morbid irritability of the stomach. In such cases, however, it must be given in very small doses.

Alibert mentions, on the authority of J. W. Guldbrand, a Swedish physician, that ipecacuanha has been found to manifest important emmenagogue powers. He refers to two obstinate cases of amenorrhœa effectually cured by it.

Ipecacuanha has also been applied to the cure of indigestion. Daubenton gave it in doses just sufficient "to excite a slight sensation of vermicular motion of the stomach, without carrying it to the point of nausea."* I have used it in my own case, in doses of one-fourth of a grain every morning, noon, and evening, with evident advantage. In a case which I have under my care now, I give it in union with phosphate of iron, and my patient derives much advantage from this combination.

With regard to the proper dose of this article, we should find it difficult to arrive at any definite conclusion, from a reference to authorities. Dr. Pye† records upwards of one hundred and fifty cases, in all of which vomiting was produced effectually, and in by far the greatest majority repeatedly by two, three, and four grain doses. Cullen expresses his doubts with regard to the correctness of this state-

* Alibert.

† Medical Observations and Inquiries, vol. i.

ment; but we have the testimony of Chaumonton and others in confirmation of the vomitive power of small doses. Those who are in the habit of prescribing the Dover's powder, or the more simple combination of ipecac. and opium, for diaphoretic purposes, know how apt they are to excite vomiting, although the quantity of ipecacuanha be but very small. It would appear, indeed, as if the opium which enters into these compositions, enhanced the emetic properties of the ipecacuanha. The medium dose of powdered ipecacuanha, with a view to its emetic effects, is about twenty grains; although much larger doses may be given without detriment, as the greater part of it is commonly thrown up by the first discharges. I am informed by Dr. Joseph Hartshorne, of this city, that the addition of powdered gum arabic, destroys almost entirely the peculiar nauseous taste of ipecacuanha. The officinal preparations are the *pulvis ipecacuanhæ compositus*, and the *vinum ipecacuanha*. The powder becomes inert by long exposure to the air and light. All vegetable astringents, as *infusion of galls*, &c. *vegetable acids*, especially the *acetic*, weaken its power. Dr. Irvine found that gr. xxx. administered in ℥ii. of vinegar, produced only some loose stools.

LOBELIA INFLATA.

THIS is a biennial plant, and indigenous to the United States, in many parts of which it grows in great abundance. For a particular description of this species of lobelia, the reader is referred to Dr. Bigelow's American Medical Botany, and to Dr. Barton's Vegetable Materia Medica, of the United States, where accurate figures are given of the plant. The leaves and capsules of this plant are exceedingly acrid, and when "held in the mouth for some time, they produce giddiness and pain in the head, with a trembling agitation of the whole body; at length they bring on extreme nausea and vomiting. The taste resembles that of tartar emetic."*

As an emetic the lobelia inflata is extremely active, producing, in strong doses, "great relaxation, debility, and perspiration." Concomitant with its emetic operation it sometimes acts on the bowels and produces purging. Shoepf merely notices this plant as "*astrigent and used in ophthalmia*," without saying anything further concerning its medicinal powers. Our knowledge of its virtues as a medicine has been chiefly derived from the account given of its effects by the Rev. Dr. M. Cutler, whose experience with it appears to have been very considerable. He has found it par-

* Bigelow's Medical Botany, vol. i. p. 179.

ticularly serviceable in asthmas. "It has been my misfortune," says he, "to be an asthmatic for about ten years. I have made trial of a great variety of the usual remedies with very little benefit. In several paroxysms I had found immediate relief more frequently than from any thing else, from the skunk-cabbage, (*pothos fœtidum*.) The last summer I had the severest attack I ever experienced. It commenced early in August, and continued about eight weeks. Dr. Drury, of Marblehead, also an asthmatic, had made use of a tincture of the Indian tobacco (*lobelia inflata*) in a severe paroxysm, early in the spring. It gave him immediate relief, and he has been entirely free from the complaint from that time. I had a tincture made of the fresh plant, and took care to have the spirit fully saturated, which I think is important. In a paroxysm, which, perhaps, was as severe as I ever experienced, the difficulty of breathing extreme, and after it had continued for a considerable time, I took a table-spoonful. In three or four minutes my breathing was as free as it ever was. In ten minutes I took another spoonful, which occasioned sickness. After ten minutes I took the third, which produced sensible effects on the stomach, and a very little moderate puking, and a kind of prickly sensation through the whole system, even to the extremities of the fingers and toes. Since that time I have enjoyed as good

health as, perhaps, before the first attack.”* Other practitioners have employed this article with decided advantage in asthmatic affections. Dr. W. P. C. Barton mentions a case of this kind in which he exhibited a tea-spoonful of the tincture every two hours, with speedy and obvious benefit. Dr. Stewart also, as I am informed by Dr. Barton, has obtained unequivocal advantages from the employment of this remedy in a case of spasmodic asthma. Dr. Cutler has found it a very useful pectoral “in consumptive and other coughs depending on mucus accumulated in the bronchial vessels.”

From my own experience I have nothing to add, with regard to the remediate powers of this species of lobelia, in asthmatic affections. As an emetic, however, I have employed it in one case of croup, with very great benefit. I have also used it effectually instead of tobacco, in the form of an enema, to facilitate the return of a strangulated hernia.†

The plant should be collected in August, and plucked up by the roots. Every part of the plant possesses active qualities, but the roots and the inflated capsules are decidedly the most powerful. It may be given either in the form of powder or tincture. The latter is, however, the most convenient mode of exhibiting this remedy. The formula adopted in the American

* Thatcher's Dispensatory.

† Barton's Vegetable Materia Medica, vol. i. p. 197-9.

Pharmacopœia, for making the *tinctura lobeliæ*, is given below.* As an emetic, we may give from ten to twenty grains of the powdered leaves, to an adult. In smaller doses its effects are expectorant. The saturated tincture is administered in the dose of from twenty to forty drops, to children of one or two years old.

SPIRÆA TRIFOLIATA.

THIS is an icosandrous plant, and found in considerable abundance throughout almost every part of the United States. Its root is perennial, sending up annually several slender stems, to the height of several feet, branching above, and of a reddish colour. It flowers in June and July, and delights in hilly woods or on the borders of rivulets. The root, which consists of "long, brown, slender branches, radicating from a thick tuber," is the part employed for medicinal purposes. It is said that the cortical part of the root alone possesses active qualities. "The predominant soluble ingredients in this root, appear to be a bitter extractive matter and resin. When boiled in water, it imparts to it a beautiful deep red, wine colour,

* R *Lobeliæ* uncias duas.

Alcoholis diluti octantem unum.

Digere per dies decem, et per chartam cola.

and an intensely bitter taste. This decoction undergoes no change from alcohol or gelatine, though it gives a precipitate with muriate of tin. Water distilled from the root has its peculiar flavour with little of the bitterness. A large portion of resin is precipitated on the addition of water to an alcoholic tincture of the root."* From my own experience with this plant, which has not been inconsiderable, I am led to regard it as very little inferior to the officinal ipecacuanha, as an emetic. Like this latter article it is a safe and efficacious vomit. While practicing in Lancaster county, I employed this plant very frequently as an emetic, in the treatment of intermittent and bilious fevers, and it very seldom disappointed me of the desired effect. Dr. Bigelow, however, observes, that from his own experience with this remedy, he was led to regard it as an emetic of very uncertain operation.

Given with opium I have found it particularly serviceable as a sudorific in dysenteric affections; and from what I have observed of its effects in other cases, it appears to me that the opinion entertained by the late Dr. Barton, of its possessing tonic properties, is not without foundation. In small doses, from two to four grains, I have taken it myself, when suffering from dyspepsia, and generally with evident advantage.

As an emetic it should be given in the dose of about

* Dr. Bigelow's American Medical Botany, vol. iii. p. 14.

thirty grains of the powdered root. It should be collected in September. Accurate figures of this plant are given in the first volume of Barton's Vegetable Materia Medica of the United States; and in the third volume of Bigelow's American Medical Botany.

EUPHORBIA IPECACUANHA.

THIS plant is found no where except in the United States. The root is perennial, long, tuberculated, from half an inch to an inch in diameter, and of a yellowish colour. It is light and brittle when dried, and has a sweetish and not very disagreeable taste. Dr. Bigelow subjected this root to chemical examination, from which it appears that;—"sulphuric ether digested on the powdered root dissolved a part of it; and this ethereal solution gives a precipitate if alcohol is added to it. Alcohol alone takes up another portion of the root, and assumes a pearly turbidness after water is added. Both the ethereal and alcoholic solutions, evaporated to dryness, leave a residuum which is fusible and inflammable. The decoction gives no precipitate with gelatin or sulphate of iron. With alcohol it gave out a white precipitate, which rendered the solution turbid, and subsided in flocks. The cold infusion exhibited the same phenomenon in a smaller

degree. From these experiments we may infer that the root contains caoutchouc, resin, mucus, and probably fecula." For a good description and figure of this plant the reader is referred to Dr. Barton's *Vegetable Materia Medica*, vol. i. p. 213, and to Dr. Bigelow's *American Medical Botany*, vol. iii. p. 111.

The emetic virtues of this plant had been but little noticed until they were more particularly investigated by Dr. Barton, the present professor of botany in the University of Pennsylvania. In his excellent work, to which we have just referred, he observes: "That the *Euphorbia Ipecacuanha* is possessed of virtues entitling it to supersede the use of the imported ipecacuanha, my own extensive experience with it, corroborated by the numerous trials of the medicine by professor Hewson; my brother, Dr. J. R. Barton, of the Pennsylvania hospital, and others, all embolden me to declare." Dr. Bigelow states, that in the trials which he has made with it, he has found it, in the majority of instances, to operate with as much ease as the other emetics. In large doses, however, "it excites active and long continued vomiting, attended with a sense of heat, vertigo, indistinct vision, and prostration of strength."* From what I have myself seen of this remedy, I am satisfied that it is well worthy the attention of the profession. Given in the dose of from fifteen to twenty grains, the powdered root of

* *American Medical Botany*, vol. iii. p. 112.

this plant acts as a safe and efficacious emetic. It seems to have a greater tendency to act on the bowels than ipecacuanha, as I have known it to produce very considerable purging. In the dose of twenty-five grains, Dr. Barton has found it to produce hypercatharsis, which continued for fourteen hours. It may be advantageously substituted for ipecacuanha, in the various "combinations into which this latter substance enters as a part." As the officinal ipecacuanha is but seldom very good, or perhaps, unadulterated, it is a matter of very considerable importance to attend to such native articles as promise to become adequate substitutes in its place. In this respect there is, perhaps, no indigenous vegetable known, which deserves greater attention from the profession than the *euphorbia ipecacuanha*.

SCILLA MARITIMA.

THE squill belongs to the liliaceous plants. It is a maritime plant, and found in very great abundance on the sandy coasts of Portugal, Spain, Sicily, &c. The root, which is the only part employed in medicine, consists of a large bulb, composed of fleshy scales, which overlap each other and give it a pyriform shape. It has no odour, but is bitter, nauseous, and acrid to

the taste. The recent root will inflame the skin if kept in contact with it for any considerable time. According to the analysis of Vogel it contains six parts of gum, twenty-four of tannin, six of sugar, thirty-five of bitter principle, (*Scillitin*, which is white, transparent, and breaks with a resinous fracture,) and thirty of woody fibre.*

The squill, when taken in very large doses, acts with great and dangerous violence on the animal economy. It has been known to produce excessive tormina, colic, and even convulsions. Alibert asserts that he has performed many experiments on animals with this substance, and that the result confirmed what had been said of its effects in this respect.

It is chiefly employed as a diuretic and expectorant; for both of which purposes it is, indeed, one of our most valuable remedies. It is but little used as an emetic. In the pectoral diseases of very young children, however, it may often be resorted to with peculiar advantage. I have been a good deal in the habit of prescribing the syrup of squills, so as to produce vomiting, in the catarrhal affections of infants; and it has appeared to me to be followed by greater relief than usually attends the operation of other articles of this class.

The active principle of this root is readily and perfectly extracted by any of the usual menstrua. The

* Paris' Pharmacologia.

officinal preparations are, *Acetum scillæ*, *Pil. scillæ*. *composit.* *Pulv. scill.* *Syrup. scillæ.* *matim.* *Tinct. scill.*

To procure an emetic effect, the fluid preparations must be given in the dose of an ounce or more to an adult. A tea-spoonful of the syrup is generally sufficient to puke a child under a year old.

Alkalies diminish both the bitterness and acrimony of this root. Vegetable acids do not materially affect either of these qualities, but are supposed to increase its expectorant powers.

ANTIMONY.

ANTIMONY is a hard and brittle mettle, of a bluish white colour, resembling tin in its lustre. It is of a lamellated texture, and when handled imparts a peculiar smell to the fingers. It enters into fusion at a degree of heat a little above red, and when suffered to cool presents a stellated appearance on the surface.

This substance was known to the ancients under the name of *stibium*, but was not employed as an internal remedy until about the middle of the sixteenth century. About this period Basil Valentine published his *Currus Triumphalis*, in which we find various preparations of this metal mentioned, and their internal employment enthusiastically recommended.

Paracelsus became its warm advocate, and announced it as a powerful and efficacious remedy in plague. In the plague which ravaged Bohemia, in 1562, antimony was extensively employed. But as its virtues were imperfectly understood, it was frequently administered improperly, and occasionally attended with violent and dangerous consequences.* It was, therefore, soon denounced by the Medical Faculty of Paris, as a fatal poison; in consequence of which the French parliament issued a severe decree against its internal employment, in 1566. In 1603, the celebrated Theodore Turquet de Mayerne, was prosecuted for having sold antimonial preparations, contrary to the decree of parliament; and Besnir, an eminent physician of that time, was expelled the Medical Faculty of Paris, for having given this proscribed remedy. After this decree had been suffered to stand for more than half a century, it was at last repealed, and antimony soon became one of the most boasted and popular articles of the materia medica.

In pursuit of an universal remedy, the alchemists of the sixteenth and seventeenth centuries subjected this metal to an infinite variety of chemical processes, from which has resulted an astonishing number of preparations, differing, however, more in the degree than in the quality of their remediate powers.

The pure metallic antimony is entirely insoluble in

* Matthiol. Comment. in Dioscorid. lib. v. c. 59. p. 838.

water and alcohol. Vegetable acids, however, act upon it, though but feebly; and hence cups of this metal were formerly employed to impart an emetic quality to wine.

Crude Antimony.—*Sulphuret of Antimony.*—In this state of combination antimony is at present not frequently employed in medicine, and never as an emetic. As an alterative, however, it has been much praised by many writers of eminence; and it is not improbable that, in many cutaneous, and other chronic disorders, its powers are too much neglected. In the Transactions of the Society of Copenhagen, Dr. J. W. Guldbrand has published an elaborate and interesting paper on the anti-arthritic virtues of crude antimony. He declares it to be a most valuable remedy in the treatment of chronic rheumatism. Quarin gave it in this disease, in combination with three parts of sulphur; and Stoll, who speaks highly of its employment in affections of this kind, recommends it to be used in union with myrrh. The general operation of antimonial remedies, when given in minute doses, appears to be, an excitation of the capillary vessels throughout the whole system, but more especially those of the cutaneous surface. Such an operation has a direct tendency, not only to equalize the general circulation, and thereby to remove chronic inflammations wherever they exist, but also to excite a new action in the extreme vessels of the skin, and consequently to re-

lieve those disorders of the cutaneous surface which depend on deranged functions of its vessels. Antimony is, indeed, one of the most important remedies we possess, in the treatment of many of the diseases of the skin. In its crude state it has been much employed for this purpose, both by itself and in union with other substances, such as cicuta, guaiac, dulcamara, &c. It is, however, undoubtedly inferior in this respect to many of the more active preparations of this metal. In the treatment of *plica polonica*, Lafontaine regards it as almost an infallible remedy.*

In the cure of scrofulous affections the sulphuret of antimony is much extolled by some writers. It appears to be particularly applicable to those cases that are connected with cutaneous eruptions, or ulcerations. Kotrum recommends it in union with equal portions of burned sponge, sulphur, cicutæ and pulverized oyster-shell, as a valuable remedy for goitre. Richter states that he cured scrofulous fistula lachrymalia by means of the internal employment of the black sulphuret of antimony.

This substance is given in powder, in the dose of from ten to thirty grains. If it act as an emetic in consequence of meeting with an acid in the stomach, it ought to be given in combination with an alkali or absorbent.

Antimonii Sulphuretum Præcipitatum.—This is a

* Burdach's Mat. Med. vol. ii. p. 376.

bright orange-coloured, styptic, but inodorous powder. It is composed of about thirty parts of sulphur, fifty-five of sub-oxide of antimony, and fifteen of sulphureted hydrogen. It is entirely insoluble in water. This preparation is diaphoretic, cathartic, or emetic, according to the dose in which it is exhibited. In the cure of cutaneous diseases this medicine has been more generally recommended than any of the other antimonial preparations. It has unquestionably considerable claims to attention for its powers in this respect; although it is, upon the whole, perhaps, less efficacious in these affections than the black sulphuret of antimony already noticed. In eruptions depending on a syphilitic taint, it is very advantageously employed in combination with mercury. For this purpose I have been much in the habit of prescribing Plummer's pill,* which is, indeed, a very useful remedy in almost every variety of chronic disease of the skin.

The precipitated sulphuret of antimony has been recommended as peculiarly serviceable in the cure of chronic rheumatism. In this disease it is given in union with camphor, opium, or guaiac.†

† Burdach's Mat. Med. vol. ii. p. 407. Phil. Conrad. Fabricius, Diss. de sulphuris antimonii aurant: eximio usu in arthritide. Helmot, 1759.

The dose of this preparation is from two to six grains, three or four times daily. It is to be gradually augmented until it excites slight nausea; and ought never to be given with acids or acidulous salts, if it be employed with a view to its alterative effects, as these substances have the power of very considerably increasing its emetic properties. Where there is reason to suspect the existence of an acid in the primæ viæ, it ought to be admitted in union with soap, magnesia, or aromatic confection.*

Antimonii Tartarizatum.—This is by far the most important antimonial preparation, whether we consider it in relation to its powers as an emetic, or its more imperceptible operation on the animal economy. With regard to its chemical composition, opinion is as yet unsettled. By some it is considered as a triple salt, consisting of tartaric acid, oxide of antimony, and potass. Others hold it to be a bi-tartrate of antimony.

There exists also much difference of opinion in relation to its degree of solubility. According to Dr. Duncan, it is soluble in three times its weight of water, at 212°, and in fifteen at 60°.

Mineral acids, alkalies, and their carbonates, and many of the metals, soaps, hydro-sulphurets, and many infusions and decoctions of bitter and astringent vegetables, decompose this salt, and render it inert, or at least destroy its peculiar powers. “One ounce of the

* Paris' Pharmacologia.

decoction of yellow bark is capable of completely decomposing Di. of this salt.”* Rhubarb also destroys its powers; it is said, that the infusions of gentian or wormwood do not decompose it. The alkaline sulphates, if perfectly neutral, do not affect this salt. When, however, “there is an excess of acid, as in alum and bi-sulphate of potass, &c. then its decomposition is effected, and a white insoluble sulphate of antimony is precipitated.” “It appears, therefore,” adds Dr. Paris, “that the famous ‘emeto-purgative’ of the French school, consisting of sulphate of soda and tartrized antimony, in solution, is by no means the un-chemical mixture which some have considered it to be, and that it really produces its effects from the operation of its original ingredients, and not from that of the compounds (*sulphate of antimony, tartrate of soda, and sulphate of potass*) which have been erroneously supposed to result.”

Its effects on the living economy are various, according to the dose administered. Given in very minute doses, as one-sixteenth or one-twelfth of a grain, it increases pulmonary secretion, and promotes expectoration. Exhibited in the dose of one-quarter or one-third of a grain, it augments the cutaneous transpiration, as well as the secretion of urine. In the dose of one-half to one grain, it increases the secre-

* Paris' Pharmacologia: from which work chiefly I have taken the chemical and pharmaceutical character of this salt.

tion of the saliva, the gastric and intestinal mucus, and occasions nausea, and alvine discharges. In a still stronger dose, from two to four grains, it speedily excites nausea, and full and perfect emesis. If it be given in an over-dose, it produces inflammation of the stomach and bowels. Magendie states that he found the mucous coat of the digestive and pulmonary organs of those who had died of excessive doses of this substance, to exhibit marks of inflammation.* It also affects the nervous system, producing vertigo, anxiety, insensibility and delirium. Brodie thinks that tart. antimony acts directly on the brain; in some experiments which he performed with this substance he saw paralysis, insensibility, and torpor produced, unattended by any other effects to which these symptoms could be ascribed as secondary results.† Its most important operation, however, independent of its emetic effects, is to diminish the force and frequency of the pulse. Its control over the action of the heart is sometimes so great as to produce syncope. Brodie,

* *De l'Influence de l'Emetique sur l'Homme et les Animaux.* A Paris, 1815, 8vo.

† Orfila gives the following general symptoms of poisoning by tartar emetic. "Rough metallic taste, nausea, copious vomitings, frequent hiccup, cardialgia, burning heat in the epigastrium, pains of the stomach, abdominal colic, inflation, copious stools, syncope, small contracted and accelerated pulse, skin cold, sometimes intense heat, breathing difficult, vertigoes, loss of sense, convulsive movements, very painful cramps in the legs, prostration of strength, death." To these symptoms difficulty of swallowing is sometimes joined.

after having given large doses of this salt to animals, found, on opening them, that the heart beat with great feebleness, and, although artificial respiration was kept up, it soon ceased to act altogether.

As a vomit, tart. emetic is, perhaps, the most important article we possess. Its effects are certain, prompt, and energetic. It occasions a more complete agitation and impression upon the whole nervous system, than ipecacuanha; nor is it apt, like this latter substance, to leave the bowels in a constipated state. It acts also with greater certainty on the skin, producing diaphoresis; and finally, it acts in smaller doses, and is less disagreeable to the taste.

I will now proceed to consider its therapeutic application, in which, however, I shall confine myself to its more important and peculiar remediate effects.

Tartarized antimony, either with a view to its emetic effects, or as a means to curb the action of the heart and arteries, and to induce diaphoresis, is now one of the most common remedies in all febrile diseases. Cullen, who was particularly fond of prescribing this remedy in fevers, thought that its good effects were immediately connected with the *nausea* which it produces when given in certain doses. This opinion is, however, controverted by Fordyce, and more recently by Balfour, Lenthois, and others. It is contended by these writers, that this medicine is much more efficacious in fevers, when it produces little or no sensible

effects on the stomach, than when it excites nausea. The two latter writers especially, bring forward strong proofs of its possessing sedative powers, independent of its diaphoretic or nauseating effects. The experiments of Brodie, already mentioned, are also in evidence of the correctness of this opinion. From my own experience, I am entirely persuaded, that this substance has the power of diminishing inflammatory or arterial action, independent of any of the effects just stated. I have a patient now under my care, who is using very minute doses of this medicine in incipient phthisis, according to the directions of Lenthois, and he is sensible of very great relief; all the hectic symptoms are manifestly mitigated; he has never taken the medicine to the extent of producing nausea.

Upon this subject Dr. Chapman gives us some "curious" speculations. "Medicines," says he, "seem to do good in the cure of fever by exciting their *own* specific or peculiar action, and when they disorder the stomach by sickness, they depart from this, and, if they do not act as poisons, always become *nugatory*, or more or less *mischievous*."

That tartar emetic has a tendency to lessen febrile excitement, independent of its nauseating effect, appears to be beyond a doubt; yet the declaration that the *nausea* which it creates, renders its anti-febrile effects "nugatory or mischievous," is wholly gratuitous,

and unsupported by experience. All that can be correctly said upon this point is, that the good effects of this remedy in acute diseases are not confined to *nauseating doses*; just as the anti-syphilitic powers of mercury are not confined to its salivating effects.

The idea that tartar emetic “departs from its specific or peculiar action when it creates *nausea*,” is to me altogether incomprehensible. *Nausea* is but an intermediate link in the chain of effects produced by this remedy; and to say that its peculiar operation ceases when this effect supervenes, appears to me to carry with it its own contradiction, and certainly is without the shadow of a proof. We might, with just as much propriety, assert that when mercury produces ptyalism, it departs from its peculiar or specific action, and becomes “nugatory or mischievous.”

Dr. Chapman seems to think that he explains the febrifuge operation of antimonials, by asserting that, “like mercury, lead, arsenic, bark, &c. they operate by virtue of a peculiar power.” This, it must be confessed, is not very edifying; since, to say that an agent produces its effects “by virtue of a peculiar power,” is, indeed, to utter what no one will deny, but what cannot convey the least information concerning the nature or character of its operation.

It appears to be ascertained beyond a doubt, that tartar emetic has a specific power of moderating the action of the heart and arteries; and upon this power,

there is much reason to believe, its good effects in acute diseases mainly depend. Although this effect of the remedy, namely, the reduction of arterial excitement, unquestionably takes place, independent of *nausea*, yet there are no facts which can lead us to believe that it *ceases* when the nausea comes on. Every thing, on the contrary, clearly demonstrates, that when nausea does supervene, the action of the sanguiferous system is still more prostrated. It is not reasonable, therefore, to say, that nausea renders the febrifuge operation of this substance “nugatory;” an assertion which is indeed contradicted by universal experience. From what I have observed of the operation of antimonials in the cure of fevers, I am of opinion that its good effects will be most decidedly manifested, when it is given in doses just sufficient to create and sustain very *slight* nausea. Much of the advantage of this, as perhaps of all other remedies, depends, I conceive, on keeping up an equable impression upon the system. If the degree of the action be greatly varied, irregular and fluctuating determinations must take place in the body. For it must be observed, that, in proportion as the action of a remedy rises in degree, so does it successively bring under its more especial influence particular organs of the system; and hence, if its impressions fluctuate in intensity, there will be a corresponding fluctuation in the action of the organs upon which the peculiar powers of the remedy determines it to

act. Thus a dose of tartarized antimony first acts upon the nerves and brain, whose influence, according to the experiments of Brodie, it diminishes. As a necessary consequence of this, the capillaries, being more immediately under the nervous influence, fall into a corresponding state of relaxation, and give rise not only to a determination of blood from the central to the exterior vessels, but also to a freer separation of the perspiratory fluid. If the action of the remedy rise still higher in intensity, it brings under its influence the stomach, giving rise to the sensation of *nausea*; this effect being the result of a greater degree of sedative operation than the preceding ones, it is, of course, attended with an augmented relaxation of the cutaneous capillaries, and consequently with a more profuse discharge of perspiration. A still higher degree of the influence of the remedy directs its action more especially upon the muscular fibres of the stomach, diaphragm, and upon the abdominal muscles, all of which it brings into violent and simultaneous contraction. From all this it is evident that, by frequently varying the degree of action of our remedy, we keep up an irregular fluctuation of the excitement of the organs which it affects, a circumstance which I conceive must interfere very considerably with its salutary operation.

It is upon this principle, therefore, that I would object to the employment of *nauseating* doses of antimo-

nial remedies, and not upon the supposition that their febrifuge effects are incompatible with their nauseating operation, as is imagined by Dr. Chapman. In order to obtain the full advantages of these remedies, their action must be kept up for a considerable time. But it is often extremely difficult to keep up a *nausea* for any length of time, in consequence of its distressing effects upon the patient. It is, therefore, not often sustained with uniformity, and generally very frequently interrupted. Hence we have its chief action at one time concentrated upon the stomach and cutaneous capillaries, and again suddenly withdrawn from these, to be directed exclusively upon other parts. These disadvantages are, however, wholly avoided by exhibiting the remedy in doses insufficient to excite nausea; since, in such under-doses, its effects are confined exclusively to the nervous and sanguiferous systems; whose actions it moderates without producing any fluctuations in the excitement of particular organs. If, in prescribing antimonials, we can keep up a continued and uninterrupted nausea, for an adequate length of time, we shall, I am persuaded, obtain the full advantages of the remedy. But as there is a difficulty in effecting this, it will, I think, be best either never to carry it to the point of producing nausea, or perhaps, as I have already said, just far enough to excite this sensation in a very slight degree. This may

be further illustrated by the effects which mercury produces on the system. Thus, while we keep up a uniform ptyalism, we fully obtain the peculiar sanative effects of this substance, in, perhaps, as short a period as is possible. If, however, it becomes frequently interrupted, and again renewed, we derive much less benefit from it than we do either from a course of continued salivation, or from one in which the mercury is never carried to the extent of producing this effect.

I conceive, therefore, that the antiphlogistic operation of the antimonial preparations depend upon *their sedative effects*; first on the nervous system, and consecutively on the heart and arteries; and that these effects will be the more advantageous as they are more equably diffused throughout the whole system.

Dr. Balfour, in a late work on the sedative effects of tartar emetic, speaks in the highest terms of small doses of this remedy in febrile affections. "Tartar emetic," he says, "is eminently efficacious in chronic as well as acute disorders; in topical affections as well as in general derangement; and its efficacy in either case is not confined to *nauseating* doses. From its natural and powerful tendency to equalize the nervous power, it cannot fail, even where blood-letting is necessary in the first instance, to supersede the necessity of recurring to it so often, and carrying it to that degree which is found necessary when the lancet alone

is trusted to, for the removal of inflammatory complaints.”*

Mr. Lenthois, of Montpelier, has lately published a work, in which he adduces strong testimony in favour of the salutary operation of very minute doses of this remedy in phthisis pulmonalis. This mode of employing it is as follows: a grain of tart. emetic is to be dissolved in eight table-spoonfuls of distilled water. This is to be mixed with six or eight pints of water, but never more than twelve, nor less than six. “This is to be used for drink, either alone or with other drink, at meals, or with wine at all seasons and hours, and without any limited time, it being attended with no inconveniency.”

If these views of the operation of tartar emetic be correct; that is, if, independently of its nauseating effects, it possesses the power of moderating the action of the heart and arteries, then there can be no doubt of its better adaptation to the cure of hæmorrhages than any of the other articles of this class. In slight, but protracted hæmorrhagy, attended with an irritated state of the arterial system, small and frequently repeated doses of this remedy have been known to produce decided advantages. From my own experience I can say nothing of this practice.

I have already mentioned the employment of eme-

* Observations Illustrative of the Sedative Effects of Emetic Tartar, p. 3—12.

tics in hernia humoralis. In this affection the tart. antimony is decidedly more efficacious than the other emetics. It should, however, always be given so as to produce full vomiting; or, at least, to excite strong nausea.

James' powder, a preparation which approaches very nearly to the character of tartar emetic, is said to be highly useful in hydrocephalic affections. Dr. William Stoker, of Dublin, who speaks particularly in favour of the employment of this remedy in these affections of the head, has also published some very favourable results of its use in apoplectic cases. He states that it has an obvious tendency to diminish the determination of the blood to the head; and that a continued use of it, in small doses, has the effect of removing the disposition to apoplexy.*

Tartar emetic is sometimes employed, in nauseating doses, to bring on relaxation of the muscles, in order to facilitate the reduction of dislocated joints. Dr. Chapman says, that he has known it to be advantageously administered in the form of an enema, for the purpose of evacuating the stomach, in order "to remove poison which had been swallowed." He has also used the remedy in this way, in a case of tetanus, "with such complete success" that he entertains "the hope that, under this treatment, the disease may here-

* Dublin Medical Essays, anno 1806. See also vol. ii. p. 43, of the "Transactions of the King and Queen's College of Physicians, Ireland."

after be divested of some portion of its terrors and mortality." This practice has, I believe, never been resorted to by any other physician.

Dr. Witzman, a Russian physician, has lately recommended the employment of tartar emetic for removing opacity of the cornea. The remedy is to be applied in the form of an ointment, composed of fresh butter and castor oil $\text{āā } 3i.$ tart. antim. gr. iv. and afterwards gradually increased to twenty grains. A small portion of this ointment is to be put into the eye every morning and evening; and a warm compress applied pretty firmly to it, for two or three hours after the introduction of the ointment, in order to allay the pain which it sometimes creates.*

Tartar emetic, as has already been stated, is capable of acting with great violence, and when the quantity taken is enormous, its effects are eminently deleterious. If it excites great vomiting, with cramp in the stomach, the patient should be directed to take copious draughts of sugar and water. "If the vomiting do not cease after the tartar emetic may be supposed to have been ejected, and the pain is augmented, a grain of opium may be given, and repeated at an interval of a quarter of an hour, for two or three times, if the symptoms be not calmed." When the symptoms continue still to increase, leeches should be applied to the abdomen and throat. If the individual

* Russian Physico-Medical Repository, &c. edited by E. Martini.

who has taken the antimonial preparation does not vomit, and yet suffers from the other symptoms, several glasses of sugar and water should be taken; if, in spite of this, vomiting do not occur, the following should be given at repeated doses: "put four or five gall-nuts into two quarts of water, let them be boiled together for ten minutes and then strained. Experience has proved that gall-nuts are to be preferred to any other astringent; but, in default of them, two ounces of Peruvian bark, or the bark of oak or willow may be employed."* If, notwithstanding these applications, the symptoms continue, we must resort to general and local depletions, blisters or fomentations to the region of the abdomen, together with copious draughts of mucilaginous drinks, warm bath, &c.

SULPHAS ZINCI.—WHITE VITRIOL.

WHITE vitriol has a styptic, metallic, and somewhat acidulous taste. "It is composed of one proportional of oxide, and one proportional of acid;" its crystals, which are four-sided prisms, terminated by four-sided pyramids, "contain seven proportionals of water. It

* Orfila's Directions for the treatment of persons who have taken poisons, page 60.

is dissolved by 2.5 times its weight of water at the temperature of 60°. Alcohol has no action on it. The alkalies, earths, hydro-sulphurets, astringent vegetable infusions, and milk, destroy or weaken its powers.”*

Its remediate effects vary according to the dose in which it is administered. Given in a small dose, from one-half to two grains, it acts as an astringent tonic. In larger doses, from ten grains to ʒss, it is strongly emetic.

Sulphate of zinc is, perhaps, the most prompt emetic with which we are acquainted; and hence it is peculiarly applicable to cases where poison has been swallowed, and where, of course, it is of the utmost consequence to procure speedy and effectual vomiting. Previous to the discovery of tartarized antimony and ipecacuanha, this preparation of zinc was very commonly employed as an emetic in all cases where emesis was desired. At present, however, its use as an emetic, is almost entirely restricted to the purposes for which I have just mentioned its peculiar applicability. The objection alleged against its employment in this way by Cullen, namely, “that it is apt, if not thrown up again immediately, to continue a disagreeable nausea, or even vomiting longer than is necessary,” does not appear to be well founded. Moseley, indeed, gives quite a contrary character to this re-

* Paris’ Pharmacologia.

medy. His experience with it was very extensive, and his opinion upon this point is, therefore, entitled to much respect. He affirms, "that the patient is not harassed with its operation; that it is never violent as antimonials are, and generally instantaneous and suddenly over, always leaving the stomach strongly invigorated. Neither does it cause spasms in the viscera, nor any nervous affections, mischiefs often produced by the antimonials."

I have exhibited this substance, with a view to its emetic operation, in a very considerable number of instances, and sometimes to the extent of thirty grains, without ever noticing any of the disagreeable consequences mentioned by Cullen. It does not appear, indeed, that its effects on the system, even when taken in excessive quantities, are eminently deleterious. Orfila mentions the case of a young lady, who, by mistake, took a solution of two ounces of white vitriol. On his arrival "he found the lady in a dreadful situation; her countenance was pale and sunk; the extremities cold, the eyes dim, and the pulse convulsive." Vomiting, however, soon came on, which was promoted by draughts of warm water. After the greater portion of vitriol had been evacuated "he set about decomposing the rest by means of the fixed alkali, diluted with sugar-water." The vomiting now ceased instantaneously, and in less than two hours she was free from every painful or alarming sensation.

Moseley speaks highly of this remedy in the treatment of dysentery. "I give it," says he, "at first without alum, in sufficient doses to cause evacuations, and afterwards with the alum, in nauseating doses, and frequently with opiates at night."* I have used this preparation in the dysentery of children, after it had assumed a chronic character, and generally with considerable advantage. I have always, however, confined myself, in these cases, to the employment of nauseating doses; and it should never, I think, be used, until the inflammatory symptoms have been moderated by depletory measures, and the bowels frequently evacuated by suitable laxatives. In referring to the testimony of Moseley, in favour of this practice, it must be recollected that he employed it in *tropical* dysenteries; a circumstance which may, perhaps, account for its less favourable results in the treatment of more northern climates. Mr. Bampfield, who has published an excellent book on tropical dysentery, makes the following observations, in relation to Moseley's zinc mixture in dysentery. "The mixture of sulphas zinci and alum, recommended by Dr. Moseley, has nearly the same effects on the intestines, as the infusion of simarouba, if there be an excess of alum. It is extremely

* The following is his formula, for exhibiting the white vitriol with alum. Sulp. zinci ℥iii. sulp. alum. ℥i. pulv. coccinel. gr. iii. aqua bulientis ℔i. Mix these in a mortar, until the solution is cold and the sediment deposited, then pour it off. Dose, a table-spoonful for an adult.

difficult to adapt the proper quantity of alum to the astringent effect required; when it produces constipation, the morbid secretions, tormina, &c. are increased, and sometimes induce an actual relapse, and when the excess of sulphas zinci maintains a free discharge of natural fæces, the morbid secretions are diminished.”*

In the treatment of diarrhœa, this remedy appears to be more decidedly advantageous, and is certainly less hazardous than in dysentery.

Dr. Moseley speaks also highly in favour of the employment of the zinc solution, in colica pictonum. After the bowels are evacuated by suitable purgatives, a table-spoonful of the solution is to be taken every five or six hours, until the pain ceases. Of this practice I can say nothing from my own experience, nor does it appear to have gained much credit with the profession.

To relieve whooping-cough, the sulphate of zinc is, undoubtedly, a remedy of very considerable powers. For this purpose I have prescribed it with unequivocal advantage. I think it decidedly superior to antimonial emetics, in cases where there is much pulmonic oppression, with difficult respiration. The only objection to its use is its very disagreeable taste, a circumstance, indeed, which renders its employment by

* Practical Treatise on Tropical and Scorbutic Dysentery, p. 193. London, 1819.

children, extremely difficult, and often altogether impracticable.

As an expectorant, in chronic catarrhal affections, attended with oppressed breathing and a tough mucous expectoration, the same writer who I have already so often mentioned, speaks in exalted terms of his "vitriolic solution." He directs it to be taken in slightly nauseating doses, three or four times a day. In phthisis, attended with bloody expectoration, he declares this remedy to be often of signal service. In all these affections I have occasionally employed it, but never with any decided advantage. Dr. Paris, however, adds his testimony in favour of the use of this remedy in pectoral complaints. "In affections of the chest," says he, "attended with inordinate secretion, I have witnessed much benefit from its exhibition, particularly when presented in the form of lozenge."

Under the head of astringents this remedy will be again noticed, to which the reader is referred for an account of the various other uses to which it has been applied in medical practice. "The white vitriol of commerce," says Dr. Paris, "ought never to be used in medicine, since it generally contains the sulphates of copper and iron."

SULPHAS CUPRI.—SULPHATE OF COPPER.—BLUE
VITRIOL.—BLUE COPPERAS.

THIS salt occurs in the form of rhomboidal prisms of a deep blue colour, having an exceedingly harsh and stiptic taste. It consists of one portion of peroxide, with two portions of sulphuric acid, constituting, therefore, an *oxy-sulphate*. It dissolves in four parts of water, at the temperature of 60°, and in less than two, at the boiling point. It is not soluble in alcohol.

The operation of blue vitriol, as an emetic, is exceedingly prompt, but its impressions upon the general system appear to be much less powerful and extensive than those of the other articles of this class. When taken into the stomach it very speedily excites strong efforts at vomiting; and though the agitation of the body which it creates is very considerable, yet its impressions seem to be a good deal confined to the stomach, since, neither during the operation, nor after it is over, does the patient experience that distressing relaxation, and general prostration of the system which is occasioned by the other emetics.

As an emetic, this remedy has been very little employed, except in the cure of phthisis pulmonalis. Dr. Marryatt* appears to have been the first who employed the sulphate of copper in this way. He re-

* Therapeutics; or, the Art of Healing, 21st edition, 1806.

commends it to be given with tart. emetic, in doses of little more than two grains of each, two or three times a week. Nothing is to be drank during its operation, and hence he calls it the dry vomit. When diarrhoea attends, he gives one grain of the sulphate of copper with five grains of ipecacuanha.

In the first volume of the Transactions of the College of Physicians of Philadelphia, there is a paper by Dr. Senter, on phthisis pulmonalis, in which he declares that he "has restored more persons labouring under hectic fever from glandular suppuration, by vomiting every second or third day with the sulphate of copper, and giving in the intervals as much as the stomach would bear of Dr. Griffith's myrrh mixture, than by all other methods he has ever tried." He considers this preparation of copper, when united with ipecacuanha, as one of the safest and most efficacious emetics we possess. Dr. Thomas,* also adds his testimony in favour of the good effects of this practice. He says that he has adopted it in the treatment of many cases of incipient phthisis "with infinite advantage." Dr. Samuel Fort Simmons,† likewise speaks very favourably of this remedy in consumption.

When this preparation is taken into the stomach in

* Modern Practice.

† Practical Observations on the Treatment of Consumption. London, 1780.

excessive doses, it acts as a strong poison, producing pain in the throat, stomach, and intestines, accompanied with violent vomitings. "To these alarming symptoms are joined frequent and foetid eructations; hiccup, difficulty of respiration, and almost suffocation; the pulse becomes small, hard, and accelerated, and in certain cases it may be said to vibrate under the finger like catgut. An inextinguishable thirst, difficulty of making water, cramps, the extremities of an icy coldness, horrible convulsions, general decay of strength, the features of the face changed, delirium—death." To counteract these effects it has been found that the white of eggs, beat up with water, is the best remedy we possess. Sugar is also useful, and by many has been highly praised as an antidote to this poison. Orfila admits the propriety of its employment, but he says it is not a counter poison. "Liver of sulphur, the alkalies, gall-nuts, Peruvian bark, charcoal, &c. considered as counter poisons, are useless, often dangerous, and ought, therefore, to be banished."*

The alkalies and their carbonates, sub-borate of soda, acetate of ammonia, tartrate of potass, muriate of lime, nitrate of silver, sub-acetate and acetate of lead, oxymuriate of mercury, all astringent vegetable infusions and tinctures, decompose it and alter or destroy its effects.†

* Orfila.

† Paris' Pharmacologia.

In the dose of from two grains to fifteen, this article acts as a prompt emetic; from one-eighth to one-fourth of a grain, it operates as a tonic.

MERCURIAL PREPARATIONS.

THE subsulphas hydrargyri flavus, or turpith mineral, is the most active and prompt emetic of the mercurial preparations. It was, at one time, a good deal employed for this purpose, but it is now almost entirely neglected, on account of the violence of its operation, and its aptness sometimes to excite salivation. It has been recommended for the cure of virulent gonorrhœa, and hernia humoralis, in which affections it has been said to act beneficially, both as a mercurial and an emetic. In leprous diseases, it has also been employed with advantage, particularly when it affects robust constitutions. It has likewise been administered with good effects in putrid sore-throat, croup, and in peripneumony.

It is given in the dose of from two grains to six or eight. Given in smaller doses, it acts as an alterative and diaphoretic. Dr. Hope, senior, states that it forms an excellent errhine by mixing it with powdered liquorice-root.

The *corrosive sublimate* has also been employed with a view to its emetic effects. Its use, however, for this purpose, has been properly abandoned, as violent and dangerous.

CHAPTER III.

Cathartics.

CATHARTICS are medicines which evacuate the contents of the intestines downwards, or which, when given in proper doses, produce purging.

As, in many parts of the intestinal tube, its contents are carried forwards in a direction contrary to their gravity, a very considerable force, it is evident, must be pretty constantly exerted from above downwards, in order that the alvine evacuations may be regularly effected. This force consists in the peristaltic action of the intestines:—that is, in a regular series of contractions of the muscular fibres of this organ, from above downwards. Constipation, therefore, depends either upon a cessation, or an inadequate force of this peristaltic action, or upon some mechanical resistance to its natural propulsive power, or upon both these causes combined.

Whatever, therefore, increases the alvine discharges, acts either by increasing the peristaltic action of the bowels; or, by removing the impediments to its regular powers; or, finally, by producing both these effects.

It is in this latter way that cathartics produce their evacuant effects. For, while they excite the peristaltic or propulsive action of the intestinal canal, they also augment the effusion of its natural secretions, and thus at once increase the force of the propelling power, and diminish the resistance of the substances propelled, by lubricating the internal surface of the bowels and attenuating their contents.

Independent of the different degrees of evacuant powers which these remedies possess, they also differ essentially from each other in relation to the particular parts of the intestinal tube upon which they more immediately exert their actions, as well as in the nature and appearances of the discharges which they produce. Thus, gamboge, calomel, and a few others, act more particularly upon the upper portion of the intestines; castor oil, colocynth, &c. possess a more extensive range of operation; while aloes acts almost entirely upon the lower portion of the bowels. With regard to the particular character of the evacuations, produced by the articles of this class, the diversity is equally remarkable.—We find, for instance, that jalap and the saline purgatives produce copious *watery* discharges; castor oil, rhubarb, &c. merely evacuate the contents of the bowels; while others, like calomel, increase the secretion of bile, and carry off this fluid in augmented quantities. It is not improbable, as Dr. Paris observes, that the diversity which exists in relation to the part

of the intestinal tube upon which different purgatives act, is owing to the different degrees of "the solubility of the active elements" of these remedies. "It is, for instance, easy to conceive," says this writer, "that a medicine may act more immediately and especially upon the stomach, small or large intestines, according to the relative facility with which its principles of activity enter into solution; that those which are dissolved before they pass the pylorus are quick and violent in their effects, and liable to affect the stomach, as is exemplified by the action of *gamboge*, &c. whilst some resinous purgatives, on the other hand, as they contain principles less soluble, seldom act until they have reached the colon. *Colocynth* has a wider range of operation, since its principles of activity reside both in soluble and insoluble elements. *Aloes* again, being still further insoluble, pass through the whole alimentary canal before they are sufficiently dissolved, and act, therefore, more particularly upon the rectum." A knowledge of these circumstances is of very great consequence, both in a therapeutic and pharmaceutical point of view. For it will not only enable the practitioner to modify the peculiar action of these remedies, by changing the degree of their solubility, but also to select those articles which are peculiarly adapted to the particular circumstances of the diseases for which they are prescribed. Thus, for instance, in *ascites*, we would be naturally led to employ those pur-

gatives that have a tendency to evacuate much serum from the intestines, such as the saline cathartics; whilst in cases attended with redundancy or vitiated bile, we would resort to such as act especially upon the upper portion of the bowels, and at the same time influence the functions of the biliary system. Again, if, in addition to the mere effect of unloading the contents of the bowels, we wish to produce a determination to the pelvic viscera, as, for instance, to the uterus, in amenorrhœa, we select *aloës* as the appropriate purgative, in consequence of its more particular action on the rectum.

Besides the more immediate operation of evacuating the contents of the bowels, cathartics produce other effects on the animal economy, to which no small part of their remediate powers may, with reason, be ascribed.

1. They diminish the action of the heart and arteries, and consequently act with more or less advantage in all diseases of a sthenic character. This effect they produce, not only by evacuating the bowels of vitiated or accumulated contents, and thereby removing a source of general irritation, but also, by abstracting from the contents of the blood-vessels themselves, by augmenting the secretion of serous fluid from the exhalants of the alimentary canal. In this respect the operation of these remedies resembles, in some degree, those of blisters; which, though acting pri-

marily as stimulants upon the sanguiferous system, reduce its action as a secondary effect, by the effusion of the serum which they occasion.

2. They promote the absorption of fluids, from the internal cavities. This effect they produce by a two-fold operation; namely, by depriving the blood-vessels of a considerable portion of their serous contents, and by augmenting, as a consequence of this, the reabsorption of serum, from those cavities, in which it may exist in a state of morbid accumulation. To render this explanation intelligible, it will be necessary to enter into a more particular exposition of the grounds upon which it rests. It appears to be conclusively established, both by direct experiment* and pathological observations, that absorption is accelerated in proportion as the quantity of fluid circulating in the blood-vessels is diminished. It would appear too, that there is a constant effort in the system to preserve the regular proportion of serum in the blood, and that its inordinate loss by one emunctory, is counterbalanced either by a greater absorption from some of the internal cavities, in which it may be accumulated, or by the diminished action of one or more of the other serous emunctories. Thus when the exhalants of the peritoneum effuse a preternatural portion of serum into the cavity of the abdomen, producing ascites, the mor-

* Journal of Experimental Physiology, by M. Magendie, 1821.

bid diminution of this fluid in the blood-vessels is, in some degree, counteracted by the *diminished* action of the cutaneous exhalants, and of the kidneys. The moment, however, that the kidneys are excited into a more perfect performance of their functions, then (this check to the morbid diminution of the serum of the blood being removed) some new supplying power is requisite to keep up the necessary proportion of serous fluid in the blood-vessels; hence the absorbents are called into action, and the dropsical fluid is reabsorbed into the circulation, and thence eliminated by the regular emunctories. From these facts, therefore, we readily perceive the manner in which active cathartics promote the absorption of dropsical effusions. By irritating the exhalants of the internal surface of the intestines, a very greatly increased secretion of serum is suddenly produced by the action of these remedies. As a consequence of this, not only is the further effusion of dropsical fluid diminished by deriving the blood from the exhalants of the cavities to those of the intestines, but its existing bulk is also directly lessened, by the absorbents assuming a more vigorous action, in order to supply the deficiency which the purging has suddenly induced in the serous portion of the blood. This view of the subject will aid us, I think, in accounting for the fact mentioned by Dr. Paris and others, that cathartics often increase the effects of diuretics. If, for instance, we give a diuretic to a drop-

sical patient, a slight, but insufficient increase of urinary secretion, for the most part, follows; the absorption is, of course, proportionally small. Let a cathartic be now administered. This will excite a sudden and considerable increase of serous evacuation by the bowels; hence, an unusual demand for a restitution of this constituent portion of the blood is created; and, by consequence, a new impulse given to the supplying or absorbing vessels; which, continuing *after* the operation of the cathartic has ceased, will have the effect of supplying the kidneys with a larger portion of the elements of their secretion, and, therefore, enable those medicaments which are calculated to increase their action, to operate more effectually.

3. Cathartics have a tendency to remove the torpor which sometimes prevails in the portal circulation, and thereby to promote the biliary secretion. This they do by exciting "a brisk peristaltic motion of the intestines, whereby the blood which is accumulated, and, as it were stagnated in the portal circle, is propelled forwards."*

4. They produce a powerful derivation of the circulation from the superior to the inferior parts of the body, on the principle of *ubi irritatio ibi fluxus*; and hence their utility in cephalic diseases.

It may be observed, that, under particular circumstances, bleeding has a decided effect in increasing the

* Johnson on the Diseases of Tropical Climates.

susceptibility of the intestinal canal to the operation of cathartic medicines. "I have often noticed this fact," says Dr. Paris, "in contending with a plethoric diathesis; whenever the bleeding preceded the purgative, the effects of the latter have been uniformly more speedy and considerable; in obstinate constipation the same fact has been observed, and mild remedies have been known to act more powerfully, when preceded by blood-letting, than potent ones have when exhibited antecedent to it."

Having premised these general observations, I shall now pass on to a more particular account of the practical application of this class of remedies. There is no class of articles belonging to the *materia medica*, whose application is more extensive, or whose aid is more essential to the medical practitioner, than this one. In almost every variety of febrile disease, cathartics are among the most indispensable and important curative means we possess. The alimentary canal has been, not unaptly, called the "store-house of diseases." Whatever may be the original febrile cause; whether seated in the bowels or elsewhere, it is certain that the secretions which are poured into the alimentary canal are, perhaps in almost every instance of fever, changed from their natural or healthy condition, to a state which renders them additional causes of irritation, to the already preternaturally excited system. Hence, simply with a view to remove

these additional supporters of febrile action, cathartics are important and indispensable throughout the whole course of nearly all acute diseases. But they are beneficial not merely by evacuating the vitiated and irritating contents of the bowels, but also on account of their direct depletory effects on the sanguiferous system, and their consequent power of reducing arterial excitement.

In fevers of high vascular excitement, or in the first stage of all febrile diseases, we should, therefore, always select such cathartics as are calculated at once to evacuate completely the contents of the bowels, and to occasion an abundant effusion of serous fluid from the intestinal exhalants. Hence, saline cathartics, in the ordinary synochous fevers, are decidedly the most advantageous. If, however, the disease be attended by an obvious functional derangement of the biliary system, as is generally the case in remittent and intermittent fevers, then it will be necessary to employ such cathartics as have a tendency, in addition to the effects just mentioned, to correct the disordered hepatic secretions. For this purpose we unite calomel with other appropriate cathartics. But, upon this point, I shall speak more particularly when I come to the consideration of the particular articles of this class of remedies.

Typhus fever, having been long considered as essentially characterized, *ab initio*, by debility, cathar-

tics were, of course, almost universally held as improper in its treatment, until Dr. Hamilton, of Edinburgh, pointed out their utility, in his inestimable work on purgatives. That they are, in fact, not only safe, but eminently useful, in the management of this form of fever, is now sufficiently established by the concurrent testimony of the ablest practical writers of the present day. Dr. Rush has, long since, observed, that purgatives are often found to remove, in a sudden and remarkable manner, the *apparent* debility which frequently exists in the latter stages of acute diseases. In the yellow fever he often saw the prostrated strength of a patient suddenly renovated by the operation of a single purgative. That debility is conspicuously produced by the impression of irritating matters on the intestinal nerves, is a fact too frequently witnessed to admit of a moment's doubt. Who has not seen the impression of indigestible food, in persons of debilitated digestive organs, bring on the most alarming prostration of the vital powers? Why do we so strenuously restrict our debilitated convalescents from taking food, which, in health, would be deemed altogether insufficient to sustain the natural powers? It is because we fear, and justly too, lest it either prostrate the already debilitated vital energies, or raise a tumult in the system dangerous to life. If the natural ingesta are thus able to affect the animal economy, when not fortified by strong digestive powers, is it not reasonable to expect

similar pernicious consequences from the retention and *irritation* of the vitiated matters, on the intestinal nerves of the debilitated typhous patient? That the contents of the intestines must necessarily be more or less vitiated in all febrile diseases, but especially in the low typhus fever, is rendered certain, I think, not only from the actual appearance of the discharges themselves, but also from the necessary results of the suspended digestion and morbid intestinal secretions which occur in these fevers. From this view of the subject, therefore, we can readily perceive the utility of employing mild purgatives in the latter stage of typhus fevers; since we thereby free the system from a powerful cause of irritation, and at once renovate the vital powers, and enable the intestinal emunctories to recover their natural functions. "I have directed a strict attention," says Dr. Hamilton, "to this practice for a long time, and I am now thoroughly persuaded that the full and regular evacuation of the bowels relieves the oppression of the stomach, cleans the loaded and parched tongue, and mitigates thirst, restlessness, and heat of surface; and that thus the latter and more formidable impression on the nervous system is prevented; recovery more certainly and speedily promoted, and the danger of relapsing into the fever much diminished."* These observations apply particularly to the latter stages of typhus, for, in the commence-

* Hamilton on Purgatives.

ment of this disease, when vascular excitement is pretty active, brisk purgatives will be beneficial, not only by unloading the bowels of their irritating contents, but also by their direct depletory effects on the blood-vessels. Upon the *modus operandi* of purgatives in typhus, Dr. Armstrong* makes the following remarks, which, though correct, do not, as this respectable writer would seem to think, invalidate the foregoing remarks concerning the mode in which these medicines produce their good effects in typhus. "Purgatives seem beneficial by unloading the intestines of fæces and excrementitious matters, which, when retained, excite and keep up much general irritation. But is it not exceedingly probable, that they have another *and far more salutary effect, in restoring healthy secretion, and in removing irregular distributions of blood from the head, liver, and other parts?* The full operation of aperients sometimes reduces the morbid heat of the skin and the morbid force of the pulse, almost as effectually as the affusion of cold water or venesection; consequences which surely indicate, that their action extends further than the mere removal of fecal matter from the intestinal canal." It cannot, indeed, be denied, that the consequences here mentioned do sometimes follow the operation of cathartics; but when we reflect that the very circumstances of a hot and dry skin, an irritated pulse, mor-

* Treatise on Typhus Fever, p. 102. Am. edit.

bid function of the intestinal exhalants, and irregular distributions to the head, liver, and other vital parts, are, in reality, often produced by irritating matters lodged in the intestines; it will appear evident, that these symptoms will be mitigated by purgatives, not by any operation independent of their mere evacuant effects, but solely, perhaps, by removing those irritating matters from the bowels, by which the morbid phenomena are aggravated, or produced.

Dr. Armstrong makes, however, another observation on this subject, to the reasonableness of which I readily subscribe. "I believe," says he, "that purgatives are also beneficial by preventing, through their operation, the absorption of the morbid secretions and excrementitious matter of the intestines; for when these have been allowed to be retained in typhus, I have generally observed a considerable increase of irritation, with an offensive odour from the lungs and from the skin; and, on the contrary, when the morbid secretions and excrementitious matter have been regularly evacuated, there has mostly been a diminution of irritation, with an absence of this peculiar odour."

I have already said that some purgatives excite the intestinal exhalants to a copious evacuation of serous fluid, and thereby occasion a very considerable reduction of vascular action, whilst others appear to do little more than merely evacuate the contents of the bowels. This circumstance should be always kept in mind

when prescribing purgative remedies in typhus. For while cathartics of the former kind are best adapted to the first stage of the disease, when it may be necessary to reduce the general excitement, they are, undoubtedly, less proper in its advanced stages than purgatives of a milder character, when our object is, in general, merely to unload the irritating contents of the bowels, with as little reduction of the vital powers as is possible.

In all the exanthematous fevers cathartics are very important remedies. Their beneficial operation in these diseases would seem, I think, to depend chiefly on their power of determining the circulation from the cutaneous to the intestinal capillaries. That the exanthemata are peculiarly characterized by strong morbid excitement in the cutaneous vessels, is perfectly obvious from the manifest character of these diseases themselves. It would, therefore, appear reasonable, *a priori*, to suppose that whatever is calculated to moderate the action of the vessels of the surface, is, by this effect, equally calculated to moderate the characteristic symptoms of these diseases. It is upon this principle that cold air and tepid ablutions act so beneficially in affections of this kind. Experience has taught us the fact, that an increased action of the vessels of the intestines, or an afflux of blood to these organs, is almost invariably attended by a simultaneous diminution in the action of the extreme vessels of the

cuticular surface, or, in other words, by a partial desertion of the blood from these vessels, and *vice versa*. Hence, sudorifics are useful in checking intestinal fluxes; and hence too, cathartics, by exciting intestinal exhalation, act beneficially in the exanthematous fevers. Undoubtedly, however, something is also to be ascribed to the mere removal of the irritating contents of the intestines, and to the *general* reduction of arterial excitement, which these remedies occasion.

In the early stage of scarlatina simplex and anginosa, purgatives are of essential service. Their utility in this disease has been particularly dwelt on by Dr. Hamilton, in his work on purgatives; and Dr. Armstrong adds his testimony in favour of this practice—a practice which is, indeed, pretty universally recommended at the present day. In order to derive the full advantages of purgatives, it is necessary to produce *brisk* and copious evacuations. For, if the views just given of the *modus operandi* of purgatives, in affections of this kind, be correct, it is evident that such cathartics as act *briskly* upon the bowels, must be most efficacious in this disease. Dr. Armstrong recommends the employment of sulphate of magnesia with tartrate of antimony, so as to excite rapid purging and vomiting. The same observations apply to the use of purgatives in erysipelas.

In no disease are cathartics more decidedly beneficial than in dysentery. Such is the tenderness of the

inflamed intestinal canal in this disease, that even its ordinary contents become a source of great and painful irritation. One of the first steps, therefore, in its treatment, is to remove these irritating matters by the employment of such purgatives as produce a speedy and full action on the bowels; and, as the secretions which are poured into them are, perhaps, in all instances in a vitiated state, these remedies must be occasionally employed throughout the whole disease. As our principal object is, however, to remove those substances from the bowels which have a tendency to irritate, it is obvious that our purpose will be best answered by such means, as will evacuate them with the least possible irritation. It is, therefore, of considerable consequence to select such cathartics as are least harsh in their operation, though sufficiently active to induce copious evacuations.

Cathartics are exceedingly useful in puerperal fever and peritonitis. Active purging in the onset of these diseases, is, indeed, often sufficient effectually to arrest their future progress. Used in conjunction with decisive venesection, cathartics constitute, in fact, the only remediate measures upon which any reliance deserves to be placed. There is generally much difficulty in moving the bowels in these affections, and we must, therefore, employ strong doses of the most active of these remedies. I am decidedly of opinion, both from theoretical considerations and practical

observation, that the benefits of purgatives in these diseases will, in general, be proportionate to the activity of their operation. Drs. Abercrombie* and Broussais, however, are of opinion that purgative medicines are injurious in peritoneal inflammations. The latter writer observes, that these remedies are hurtful, "because the vermicular contractions which they excite in the intestines, must increase the morbid sensibility of the peritoneum." The following observations of Dr. James Johnson upon this subject, appear to me to be highly judicious. "In abdominal inflammation, provided the *mucous* tissues are not inflamed, purgative medicines excite the secreting vessels, not only of the whole internal surface of the intestines themselves, but of the glandular organs whose excretory ducts open into the *primæ viæ*, and thus powerfully deplete *locally* the vascular system of the abdominal viscera. When the portion of peritoneum reflected over the intestines is inflamed, but where the villous coat is unaffected, I hesitate not to assert, from personal experience, that constipation of the bowels will, in nine cases out of ten, be a feature of the disease; and in such cases we maintain that to excite the natural action of the mucous membrane, immediately after proper vascular depletion, is a powerful mean of checking the peritoneal inflammation; in the same way that a

* Researches on the Pathology of the Intestinal Canal; in the sixty-third number of the Edinburgh Medical and Surgical Journal.

free expectoration from the mucous membrane of the lungs, relieves the vascular turgescence and inflammation of the parenchymatous structure or pleural covering of the same organ.”*

Dr. Marshall Hall, gives an account of a disease peculiar to puerperal women, resembling very closely genuine puerperal fever, in which purgative medicines would appear to be the only remedies offering any prospect of success; and in which bleeding, according to his experience, is almost certainly fatal. Dr. Hall's description of this disease, as distinguishable from puerperal fever, properly so called, is, however, by no means satisfactory. He has pointed out no marks by which it may be discriminated from this latter disease; there can, however, be no doubt, that great prostration of the vital powers, pain and arterial excitement, may sometimes arise from intestinal irritation in puerperal women, without the existence of any local abdominal inflammation; and under such circumstances we can readily perceive, that bleeding, especially if copious, would be improper, since it would create additional debility without removing the cause of irritation, which would, indeed, by this very practice, become more pernicious in its effects.

From the general antiphlogistic operation of cathartics, it is evident that they are not inapplicable in the treatment of acute rheumatism. They are, in fact,

* Medico-Chirurgical Review, No. 2, Analytical Series.

much recommended in this disease by writers of great respectability. "The advantage," says Dr. Scudamore, "of making a detraction from the general circulation by the channel of the alimentary canal, is no less remarkable in rheumatism, than in every other inflammatory disease. In proportion as we pursue this practice upon a continued principle from day to day, do we obtain its good effects in acute rheumatism; the circulation becomes moderated; the inflammatory diathesis subdued, and the absorbent system is excited to increased action. Hence, we powerfully promote the removal of those excessive secretions of the synovial membranes, which have been already described as causing the distention and impeding the motion of the affected parts. A saline purgative, administered in small doses, and at repeated intervals, is the most advantageous."* Drastic purges are, however, as a general rule, not to be employed in the treatment of this disease. These are, in some degree, incompatible with that regular action of the cutaneous exhalants which seems to be indispensable in the removal of this painful affection. Laxatives, on the contrary, are of unquestionable service; they remove the sources of intestinal irritation; tend gently to equalize the circulation, and lessen the action of the heart and arteries, by their evacuant effects upon the extreme vessels of the intestines. As an auxiliary to other antiphlogistic measures, they can seldom be

* A Treatise on the Nature and Cure of Gout and Rheumatism, p. 299.

neglected with propriety in the cure of acute rheumatism. Nearly the same thing may be said in relation to the use of cathartics in the treatment of gout. Whatever be the real nature of this disease, it seems certain that there is, perhaps, always functional derangement of the secretory organs of the alimentary canal, and especially of the liver and portal system of vessels.* There is no difficulty, therefore, in accounting for the beneficial operation of purgatives in gout; since they not only remove the vitiated and irritating contents of the bowels, but tend also to correct the action of those glands whose products are poured into the alimentary canal, and, by detracting from the general circulation, to moderate the febrile excitement, and especially to promote and invigorate the portal circulation, which, according to Scudamore, is in a morbidly engorged condition.† Dr. Sutton, in his *Tracts on Gout, &c.* speaks strongly in favour of the employment of cathartics in this disease. Dr. Scudamore states, that “he has invariably employed, with the greatest advantage, purgative and diuretic medicines conjointly, so that the exhalant vessels of the alimentary canal, and the secreting function of the kidneys are stimulated to increased action at the same time.” Such a union of purgatives and diuretics is particularly serviceable in those cases that are attended with dropsical effusions in the extremities.

* Dr. Scudamore on Gout, p. 74.

† Ibid. p. 100.

There is no acute disease in which purgative medicines are more indispensable than in hydrocephalus internus. The pathology of this disease has, of late years, been much elucidated. It appears to be now pretty generally admitted, that hydrocephalus is very often dependent on gastric irritation. The alvine discharges, in this disease, afford unequivocal proof of great functional disorder of the liver. They very commonly consist of large quantities of black, or green and glary bile, and are seldom, if ever, found to exhibit the appearance of natural and healthy evacuations. In post mortem examinations of hydrocephalic children, Dr. Cheyne "found in the liver the remains of great inflammatory action, and also proofs that undue irritation had existed in the alimentary canal."* And Mr. Abernethy† states, that on dissecting the body of a child that had died of "unequivocal symptoms of hydrocephalus," he found the brain perfectly healthy, *the only diseased appearance being in the bowels*. Dr. Cheyne also mentions the case of a girl, who, complaining in the evening of headach, was put to bed by her mother, and soon fell asleep; next day, at noon, she was still sleeping profoundly, respiring fully and slowly, with now and then a heavy sigh; the eyes were fixed, the pupils large and immovable. She had been very costive for some days previous, and

* Cheyne on Hydrocephalus.

† Surgical Observations, part ii. p. 190.

was languid; she was ordered an enema, and this roused her so far as to swallow a bolus of jalap and calomel. This operated powerfully; and brought away "two chamber-potfuls of the most extraordinary collection of fæces" the doctor ever saw. The patient recovered immediately. This case shows, in a striking manner, the powerful influence which intestinal irritation, from the presence of acrid or vitiated matters, may have upon the brain. We have a further confirmation of the correctness of this pathology of hydrocephalus, in the fact, that cholera infantum very often terminates in unequivocal symptoms of hydrocephalus. Nor is it an uncommon thing to see children who have long been harassed with indigestion and diarrhœa, die with symptoms of hydrocephalus acutus. Indeed, proofs of the morbid influence of visceral irritations on the brain are so various and palpable, that the most careless observer must have often noticed them.*

But, whether the disease be an idiopathic, or only a secondary affection of the encephalon, purgative medicines are amongst the most important of our remediate resources. It is evident, however, that where the disease is dependent on a primary irritation in the bowels, cathartics are more especially indicat-

* This pathology of hydrocephalus is particularly advocated by Drs. Cheyne and Yates. Spurzheim thinks that it is sometimes dependent on primary gastric irritation, but generally, an idiopathic cerebral affection.

ed, since they tend, at once, to remove the remote cause of the disease, and, by determining an afflux to the intestines, to lessen the flow of blood to the brain. The bowels should, therefore, be actively moved, in every instance where hydrocephalic symptoms supervene, whatever other measures be adopted. They have a more powerful effect in lessening the action of the circulation in the head, than any other internal remedies we can employ. "Should we ascertain," says Dr. Cheyne, "that the alimentary canal is torpid, and imperfectly performing its functions, admitting an accumulation of feculent matter, or that the secretions flowing into it are vitiated or diminished in quantity, which we discover by the peculiarity in the appearance, or the pungent fœtor of the stools, we must, by steadily pursuing the purgative plan, endeavour to effect a change; for while this is produced in the appearance of the stools, by the stimulating quality of our medicines, we are effecting a most important change in the hepatic system, alimentary canal, and all the parts, including every organ essential to life, which is connected with them."*

For the same reason that cathartics are prescribed in hydrocephalus; namely, to determine the circulation from the head, and to remove the causes of intestinal irritation, are they useful in apoplexy. Whatever be the speculative notions entertained in relation

* Essays on the Diseases of Children, by John Cheyne, M. D.

to the pathological character of this disease, all experience would seem to testify in favour of the employment of active cathartics in its cure. As the advantages derived from these remedies, in the present disease, arise probably more from the strong tendency they have to diminish the afflux of blood to the encephalon, and directing it upon the intestines and other gastric viscera, it is evident that the more rapidly they purge the more beneficial will be their operation.

Hypochondriasis is, in general, obviously the result of a deranged state of the chylopoietic viscera. We may frequently trace the successive grades of dyspepsia up to the full formation of this deeply distressing complaint. It is almost invariably preceded by disorder of the digestive organs. The appetite is either morbidly increased, or depressed; a distressing sense of fulness is experienced in the stomach, and there are foetid eructations, with a white tongue, obstinate constipation, and headach. Yet in this disease *active* purging does not appear to be proper; for, as the gastric symptoms just mentioned, and upon which those of the mental affection would seem to depend, arise from a *debility* of the digestive organs, it is easy to understand why drastic purgatives rather do harm than good. For, although they might effectually remove the vitiated contents of the intestines, yet, as their operation would have a tendency to weaken still more the already debilitated chylopoietic organs, it is evident that they

cannot be employed with propriety in this affection. The same objection does not, however, stand against the use of *laxatives* in this disease. These, on the contrary, are indispensable auxiliaries in its treatment. By gently exciting the action of the bowels, they tend to restore the natural intestinal and hepatic secretions, and to remove the torpor which, in this disease, prevails in the portal circulation. Purgatives ought to be united with mild bitter tonics, and given in such a way as to procure one, or at most but two good evacuations every twenty-four hours. There is often an amazing quantity of faecal matter impacted in the lower bowels of hypochondriacs, which has a strong influence in keeping up the disease, and which it is almost impossible to remove by purgatives. When there is reason to suspect the presence of such accumulated contents, there is no way by which we can so conveniently, and at the same time so effectually and beneficially remove them, as by the daily employment of mild and copious laxative injections. These, indeed, should never be neglected in the treatment of this and other chronic diseases, dependent on gastric derangement and accompanied with intestinal torpor.

Hysteria is a disease closely allied to the preceding; and its intimate connection with disorder of the digestive viscera, is demonstrated by the symptoms of wandering pains in the abdomen, flatulence, acid and foetid eructations and constipation, which characterize

the hysteric constitution.* “In my opinion,” says Dr. Hamilton, “these symptoms afford conclusive evidence, that this gastric affection is primary, and that the other multifarious symptoms of hysteria depend on it. I have, therefore, thought it reasonable to attend particularly to the state of the stomach and intestines, and to employ, in the first place, purgative medicines, to remove the constipation of the body which most commonly prevails in hysteria.” I have been much in the habit of employing purgative medicines in hysteria. In some cases I have succeeded in putting a stop to the paroxysm by means of a brisk cathartic, after all the ordinary remedies for cases of this kind had been tried with little or no advantage. Purgatives will, however, produce very little benefit in this disease, unless they be administered in doses sufficient to occasion full and active purging. They may be very advantageously united with the foetid gums, particularly asafœtida. Dr. Hamilton observes, what, indeed, I have myself repeatedly noticed, that “the first purgatives seem, on some occasions, to aggravate the symptoms; but the practice must not be deserted on this account. The additional irritation which purgatives may give in the first instance, soon passes away; and perseverance in the use of them removes that irritation which gave rise to the disease, which, of course, disappears in proportion as the bowels are

* Dr. Hamilton.

relieved of the oppressive mass of accumulated fæces." It is evident, however, that in a disease, which, like this one, is so intimately connected with disordered digestive powers, the employment of tonic and gently stimulating remedies will often be found necessary along with purgatives.

Chorea is another of the neuroses in which the employment of purgatives has been especially recommended. That it is often dependent on gastric irritation, and connected with great fæcal accumulations in the lower intestines, I have not the least doubt; and that, in such cases, purgatives must be peculiarly applicable, is at once obvious. Dr. Hamilton is the first who directed the attention of the profession to the purgative plan of treating this disease. It appears, however, as is stated by this writer, that the exhibition of purgatives in the present disease, is countenanced by the practice of Sydenham, De Haen, and Dr. Stoll.

"Chorea," says Dr. Hamilton, "consists of two stages. In the first, while the intestines yet retain their sensibility, and before the accumulation of fæces is great, *gentle* purgatives, repeated as occasion may require, will readily effect a cure, or rather prevent the full formation of the disease. In the confirmed stage, more sedulous attention is necessary. Powerful purgatives must be given, in successive doses, in such a manner that the latter doses may support the effect of the former, till the movement and expulsion

of the accumulated matter are effected." It is absolutely indispensable to pursue this treatment in a firm and decided way, in order to derive permanent advantages from its employment. "Half measures, in instances of this kind, will prove unsuccessful."

It must be confessed, however, that, although chorea may frequently, perhaps generally, have its origin in the alimentary canal, yet we sometimes meet with cases which do not seem to depend upon causes seated in the abdominal viscera, or which, at least, do not yield to the most complete and efficient course of purgative remedies. I have seen two cases in which purging was practised copiously and regularly for a reasonable length of time, with no alleviation, but, on the contrary, with a manifest aggravation of the convulsive motions of the patients. One of these patients was finally cured by tonics and antispasmodics; the other did not recover. I have, however, seen five other cases, two in my own practice and three in the practice of other physicians, which were effectually cured on the plan recommended by Dr. Hamilton. I am, therefore, fully persuaded, that, although this mode of treating the disease will not always succeed, it holds out a more certain and rational prospect of success than any other treatment with which we are at present acquainted.

Respecting the employment of purgatives in the

treatment of tetanus, no very satisfactory recommendations have been advanced.

When this disease arises from general causes, or, more properly speaking, perhaps, when it does not depend on any local mechanical injury, it would seem, from the reports of Drs. Hamilton and Burns, to be occasionally remediable by the vigorous employment of purgative remedies. In the treatment of *trismus nascentium*, or the locked-jaw of infants, also, purging has been successfully employed. Dr. Chalmers says, "I have cured one case of the jaw-falling of infants, by purging with an infusion of rhubarb, to which a few grains of musk and a little *ol. tart. per. deliq.* were added."* When once formed, however, this disease of infants is but very rarely cured. I know of no authority for the assertion made by Dr. Chapman, that "the utility of purging is indisputably established in *trismus nascentium*." A very few solitary cases appear on record, in which these remedies were employed with seeming success; but their utility is far, I am sorry to say, very far, from being "indisputably established," in this fatal variety of spasmodic disease.†

* London Medical Observat. and Inquiries, vol. i. p. 109.

† The following observations on spasmodic diseases are quoted by Dr. Hamilton from Camper's *Anatomico-Pathological Demonstrations*.

"Nervis descriptis ad symptomata accedo, quæ ex eorum unionibus facile explanatur; Ordiar autem a pedum tremor, qui hystericis familiaris est. In antecessam vere monere debeo, omnia terribilia hystERICA symp-

In the treatment of marasmus, a disease unequivocally and essentially connected with morbid derangement of the digestive organs, purgatives constitute our most important remediate resources.

In the first stage of this disease, which, according to Hamilton, extends from its commencement to the accession of the febrile symptoms, and in which "the bowels are not altogether torpid, neither are they overloaded with accumulated fæces, *mild* purgatives will, in general, effect a cure." When, however, the disease has advanced into the second, or febrile stage, more *active* aperients must be regularly and perseveringly employed. For this purpose, Dr. Hamilton recommends the exhibition of small, but frequently repeated doses of the purgative medicines; "so that the latter dose may support the effects of the preceding

tomata, quæ tum in singulis, tum in universi corporis locis quotidie videmus, ab acrimonia putrida primas vias occupante omnino dependere; excrementorum enim fætor intolerabilis, fauces, et alia qua præter naturam sunt, rigorum et convulsionum accessum annuntiant. Res igitur ita se habere videtur; plexu mesenterico inferiori affecto, nervi omnes cum eo conjuncti, lumbales scilicet, et proinde crurales, atque obturatores nervi afficiuntur. Si acrimonia tanta est ut etiam rectum intestinum irritare queat, nervi Ischadici in concensum trahentur, rigebitque pes integer, concucietur, et per vices quiescet, donec animi deliquium tumultum sedet.

"Infantum inferiorum extremorum convulsiones, ex ascaridibus rectum intestinum occupantibus, hanc theoriam confirmant.

"Purgantia, etiam drastica licet imprudentur adhibita, propterea forsan, epilepsia spurias, choream sancti viti, aliosque spasmodicos sanarunt morbos qui desperati a medicis habebantur."

ones. When the bowels are once opened, stronger purgatives, given at longer intervals, will accomplish the cure." In my own practice I have obtained the happiest results from the continued employment of purgatives, together with a light but nourishing food, in the treatment of this disease.

Dr. Hamilton speaks favourably of the use of purgatives in the treatment of chlorosis. "The slightest attention to the history of the disease," says he, "evinces that costiveness precedes and accompanies the other symptoms. Costiveness induces the feculent odour of the breath, disordered stomach, depraved appetite, and impaired digestion. These preclude a sufficient supply of nourishment, at a period of growth, when it is most wanted; hence paleness, laxity, flaccidity, the nervous symptoms, wasting of the muscular flesh, languor, debility, the retention of the menses, the suspension of other excretions, serous effusions, dropsy, and death." He accordingly recommends purgative medicines, until the bowels are well emptied, after which he has recourse to tonics. I have never used purgatives in this disease, nor should I be disposed to employ them to the extent recommended by Dr. Hamilton. The costiveness, as well as the amenorrhœa, is, I think, in some instances at least, the consequence and not the cause of the general debility and torpor of the system. There can be no doubt, however, that these effects may, of themselves, con-

tribute to keep up that state of the general system which in the first place produced them. And hence, although purgatives will be proper, to remove at least one of these symptoms, namely, constipation, still, our main dependence ought to be placed on the employment of tonics, nourishing diet, and exercise. The same author speaks in very high terms of the employment of purgative medicines, in that variety of vomiting of blood which "attacks females who are from eighteen to thirty years of age." The attack of this variety of hæmorrhagy "is preceded by great languor and oppression, both about the chest and the præcordia; and by a sense of fulness of the præcordia; by cough, dyspnœa, and sometimes by pain of the breast; by loss of appetite, headach, vertigo, and disturbed sleep; the eye is dull, the countenance is expressive of much distress, the pulse is feeble, and the bowels are constipated." "In this state of impaired health, a particular fit of sickness and nausea is the immediate forerunner of the attack of the vomiting of blood." I have never had a case of this kind to treat, and can, therefore, say nothing in relation to the utility of purging in its treatment. Dr. Hamilton, however, speaks strongly in favour of this practice. "My success," says he, "has been so uniform, that I now lay it down as a certain position, that the proper exhibition of purgative remedies affords sure and effec-

tual means of removing the vomiting of blood which I speak of.”

Cathartics have long been considered as important remedies in the cure of dropsies. As I shall, however, have occasion to speak more particularly on this subject when I come to treat of cremor tartar and elaterium, it will be unnecessary to dwell particularly on this point in the present place.

I shall now, therefore, proceed to an account of the particular articles belonging to this class of remedies,

Of the Particular Cathartics.

RADIX JALAPÆ.—JALAP.

JALAP is the root of the *Convolvulus Jalapa*, a perennial plant, indigenous to the southern parts of the United States, Mexico, and some of the West India islands. It is brought to us, either in transverse slices or in pieces of a pyriform shape; these are compact, solid and heavy; rugous and blackish externally, and of an obscure grey colour internally.* When powdered, it has a peculiar and somewhat nauseous odour, and a slightly acrid and sweetish taste. It contains a large proportion of resin, upon which its purgative powers seem entirely to depend. It contains also a gum, which, though almost wholly destitute of laxative properties, is extremely active as a diuretic, and some extractive matter, with fecula and salts, enter into its composition. It appears that a combination of the resinous, gummy, and extractive principles of this root, “is requisite for the production of its *full*

* Jalap is sometimes mixed with *briony root*; but this may be readily distinguished from jalap by its pale colour, its spongy texture, and its greater lightness and bitterness, and by its not burning so readily when held to the flame of a candle.—BURDACH.

cathartic effect;” and hence, proof spirit is its proper menstruum.* The officinal preparations of this substance are: The, *pulvis jalapæ compositus*; *extract jalapæ*; *tinctura jalapæ*; *tinctura sennæ composita*. The Prussian Pharmacopœia contains a formula for preparing the *sapo jalapinus*, which is said to operate mildly and promptly.†

The resin acts powerfully, but is apt to produce violent griping pains. Its dose is from gr. x. to ℥i. It should be well rubbed up with sugar or vitriolated tartar, in order to obviate its griping effects.

Jalap is commonly given in the form of powder. From twenty to forty grains may be given at a dose, according to circumstances. In combination with calomel it forms one of the mildest and most effective purges with which we are acquainted. This combination is particularly applicable, when we wish to emulge the biliary organs, to excite the healthy functions of the liver, and to produce prompt and copious alvine evacuations. Hence calomel and jalap are very generally preferred to the other purgatives in the treatment of bilious fevers, jaundice, hepatitis, &c. The proportion in which these two substances may be combined varies considerably. About ten grains

* Paris.

† This is made by taking equal parts of castile soap and of resin of jalap, and digesting them in a sufficient quantity of alcohol, with a moderate degree of heat, and evaporating to the consistence of a conserve.

of the former with fifteen of the latter, forms a very suitable mixture.

A combination of jalap and cremor tartar, in the proportion of about twenty-five grains of the former, with forty to sixty of the latter, forms an exceedingly useful cathartic in dropsical cases. It powerfully excites the intestinal exhalants, causing them to pour out large quantities of serous fluid, in consequence of which it produces very copious watery evacuations. It is on this account too, that this combination forms a peculiarly efficacious cathartic for reducing local inflammations; such as that of the hip disease, ophthalmia, &c.; for it not only abstracts copiously from the general circulation, but also excites a strong afflux to the intestinal exhalants, and thereby diminishes the determination of the circulation to the parts affected.

Dr. Aiken asserts that "fifteen grains of jalap, with two or three grains of ipecacuanha, purge more than twice the quantity of jalap by itself."

RADIX RHEI.—RHUBARB.

THERE are two sorts of rhubarb met with in the shops; the *rheum palmatum*, and the *rheum undulatum*. The former is brought from Russia and Turkey, and is considered the better sort. It consists of round

rather compact and heavy pieces, with perforations through the middle. Externally it is of a yellow colour, and, on being cut, exhibits a variegated appearance, from a number of reddish or white streaks which pass through it. Its taste is slightly styptic, subacrid and bitterish. That which is imported from China consists of long and somewhat flat pieces. It is heavier and more compact than the Turkey rhubarb, and is seldom perforated with holes. It is also more nauseous to the taste, and its powder has a deeper shade of red than the other sort.

Rhubarb contains "gum, resin, extractive, tannin, gallic acid, and a peculiar colouring matter, with traces of alumina and silex." The white or reddish streaks which run through it, consist almost entirely of sulphate and oxalate of lime. It was supposed to contain a peculiar acid, to which the name of *rheumic acid* was given, but it has been satisfactorily ascertained, that this supposed new acid is nothing more than the oxalic acid. The Chinese rhubarb contains less tannin, resin, and oxalate of lime, but a greater proportion of extractive and gallic acid, than that which comes from Turkey. Out of sixty parts of Turkey rhubarb, twenty-four are taken up by water at the temperature of 212° . By long boiling it loses its cathartic properties, but becomes more astringent and bitter. Alcohol extracts 2.7 parts out of ten. That which comes from China is, however, more soluble.

One half of its weight is taken up by boiling water; and alcohol extracts four out of ten parts. "Its habits with acids, alkalies, and neutral salts differ likewise from those of the Russian variety."*

With its cathartic properties rhubarb possesses a very considerable degree of astringency. Given in small doses, as from four to ten grains, it acts as a stomachic, and gentle tonic. In the dose of from twenty to forty grains, it operates as a mild and pretty active cathartic; but, from its astringency, it is apt to leave the bowels in a costive condition after its operation. From this union of properties, it is evident that it is not well suited to the treatment of inflammatory diseases, nor, indeed, to that of any other complaint in which we wish at once to evacuate the contents of the bowels, and to abstract from the general circulation by means of the intestinal exhalants. It has been much recommended in dysentery, and there can be no doubt of its peculiar utility in the advanced stages of this complaint; but in the commencement of the disease, before the inflammation has been considerably moderated by more decisive antiphlogistic measures, rhubarb is unquestionably an improper cathartic.

On the contrary, however, the very astringency which rhubarb possesses in common with its cathartic properties, renders it particularly useful in the treat-

* Paris' Pharmacologia.

ment of diarrhœa, and other diseases connected with a laxity or debility of the intestinal canal. It is evident, that much advantage is to be derived in affections of this kind, from a remedy, which, like the present one, at once evacuates the bowels of their vitiated contents, and acts upon them as a gentle tonic.

In the treatment of indigestion, rhubarb is decidedly the most useful purgative we possess. Where, from debility of the digestive organs, much acid is generated in the primæ viæ, rhubarb may be very advantageously exhibited in union with magnesia. In the diseases of infants this medicine has been long regarded as peculiarly beneficial. It is especially useful, when combined with magnesia, in the griping bowel complaints of very young infants. From one to two grains of rhubarb with three or four grains of magnesia, rubbed up with a little cinnamon water and sugar, forms a most excellent medicine in cases of this kind.

United with aromatics, rhubarb forms a highly useful aperient in atonic gout, attended with uneasy sensation and debility of the stomach. For this purpose it is generally admitted that Warner's cordial is an exceedingly useful preparation.*

Externally the powdered rhubarb is sometimes employed as an application to ulcers, for the purpose of

* Rhubarb bruised ℥i. senna ℥ss. saffron ℥i. powdered liquorice ℥iv. raisins pounded ℔i. brandy ℔iii. Digest for a week and strain.

promoting granulations. When taken internally its colouring matter passes rapidly through the circulation, and is soon conspicuously manifested in the urine. Its purgative effects are considerably enhanced by uniting it with neutral salts; “the super-sulphate of potass forms a very useful adjunct, and its acidulous taste completely covers that of the rhubarb.*

FOLIA SENNÆ.—SENNÆ LEAVES.

THE senna of the shops, according to the observations of Nectoux, is furnished by three different plants: the *cassia senna*, the *cassia lanceolata*, and the *cynanchum oleacefolium*. The leaflets of the *cassia senna* (known in Egypt by the name of senna bellidy,) are obtuse, oval, unequal at the base, somewhat thick, and supported on footstalks destitute of glands. The pods of this species are compressed oval, *sickle-shaped*, and marked on each side with small longitudinal elevations, corresponding in situation with the seeds they contain. The leaflets of the *senna lanceolata* of Lamarck, which is known to the inhabitants of Egypt by

* *Incompatible substances.* “The stronger acids; the sulphates of iron and zinc; nitrate of silver; tartarized antimony; acetate of lead; oxy-muriate of mercury; and the infusions of cusparia; cinchona, catechu, galls, and of some other astringent vegetables; the alkalies deepen the colour, but produce no decomposition.”

the name of *senna quebelly*, may be distinguished from those of the former by being more acuminate, or lance-shaped, and having a small elevation or gland at the base of the footstalk. The pod of this species is very flat, oval, oblong, and *not curved*. The leaves of *cynanchum oleæfolium*, (arguel,) known in commerce by the name of *senna Mekki*, are very often found mixed with those of the two species of *senna* just described. They may, however, be detected by their greater length, and especially by being covered with a long down.* Of these the *cassia lanceolata*, or, as it is commonly called, the Alexandrian senna, is regarded as the most valuable. It does not appear, however, that the leaves of the *cynanchum oleæfolium*, are in any degree inferior as a cathartic to the best senna. Mr. Nectoux observes that the *arguel* (*cynanchum oleæfol.*) possesses properties equal to those of good senna; he even holds it as being preferable to either of the species of *cassia*; an opinion which he predicates upon the experiments made with it by Dr. Pugnet, as well as upon the testimony of the inhabitants of those parts of Egypt from which it is brought.

According to an interesting analysis of senna, made by M. Bouillon Lagrange, it appears: 1. that the watery extract of senna is almost entirely soluble in

* The senna of the shops is sometimes adulterated by the leaves of *coluta arborescens*. These are, however, easily distinguished by being conspicuously cordate, and notched at the points.

alcohol, and that the part thus soluble is not a resin, as has been supposed, but a substance which requires simply the addition of a certain portion of oxygen to convert it into a matter which has all the characteristics of resin. 2. That the part soluble in water contains sulphate of potass, potass, carbonate of lime, magnesia, silex, &c. together with that substance, which, I have just said, is connected with a matter possessing the character of resin by uniting with a portion of oxygen, and to which senna seems to owe its purgative qualities. It appears also that this peculiar substance has a very strong affinity for oxygen; and hence we see the propriety of the caution given by Dr. Paris, that the infusion of senna should never be suffered to stand long before it is taken, "since, by simple exposure to the air, for only a few hours, in consequence of the powerful affinity of its extractive matter for oxygen, a yellow precipitate takes place, and the infusion loses its purgative quality." "In preparing it, therefore," he adds, "we see the necessity of conducting the process in *covered* vessels, and of making only such a portion as may be required for immediate use."

Senna is hardly ever employed as a cathartic, except in the form of an infusion. In order to divest it of its griping quality, which it possesses to a very considerable degree, it is commonly mixed with other substances, such as manna, coriander, fennel or anise

seeds. For this purpose, however, the best adjuncts are soluble tartar and alkaline salts, which have the power “of increasing the solubility of its oxidized extractive.” A decoction of guaicum is said to increase its powers and to render its operation milder.*†

It is observed by Alibert, on the authority of M. Bouillon Lagrange, that the powdered senna is very apt to undergo alteration or decomposition, from being suffered to remain exposed to a humid atmosphere. In such a situation it becomes covered with a kind of pellicle, or mouldiness, which contains a small portion of potass. The powder, however, is but very seldom employed, except in the form of an electuary in combination with other purgatives. “The infusion is disturbed by *strong acids, lime water*, nitrate of silver, oxymuriate of mercury, acetate of lead, tartarized antimony, and by the infusion of yellow cinchona.”

* Paris' Pharmacologia.

† The *infusum sennæ limoniatum*, is a very convenient mode of exhibiting this medicine to children. It is made by pouring six ounces of boiling water upon ℥ss. of fol. senna, ℥ii. lemon peel, and ℥ii. lemon juice.

The *infusum laxativum viennense*, is also an excellent preparation. It is made thus: folior. sennæ ℥ii. cremor tart. ℥iss. pulv. rhei. ℥i. sem. coriander ℥iss. mannæ ℥i. aquæ ferventis ℥vi. Digere per 4^h horas.

Selway's prepared essence of senna.—“This is a concentrated infusion of senna in combination with an alkali. It is admirably adapted for domestic use.”—PARIS.

CASSIA MARILANDICA.

THIS species of cassia is exceedingly abundant in many parts of the United States. Its leaves differ but little in appearance and properties from the senna of the shops. The predominant constituents of the leaves of this plant are resin and a volatile substance. "The tincture is of a dark brown colour, and is rendered extremely turbid by water."* I have very frequently employed it instead of the officinal senna, and have always found it a certain and safe purgative. It seems to be more apt to gripe than the common senna, "a quality which may, however, in a great measure, be corrected, by infusing with the leaves a small quantity of the root of glycyrrhiza, or anise, and employing a large quantity of water." The cassia marilandica is not so powerful as the senna of the shops. It requires about one third more than the latter to produce an ordinary cathartic effect. For a particular description, and very accurate figures of this plant, the reader is referred to Dr. Barton's Vegetable Materia Medica of the United States, vol. i. and to Dr. Bigelow's American Medical Botany, vol. ii.

* Bigelow's American Medical Botany, vol. ii. p. 168.

PODOPHYLLUM PELTATUM.—MAY APPLE.

THIS is an exceedingly common plant in the United States; and every where well known, on account of its esculent, and, to some, delicious yellow fruit. Its root possesses valuable cathartic properties; but the *turiones*, or young shoots of this plant are said to be highly poisonous. Dr. Barton, the present professor of botany in the University of Pennsylvania, has shown me a letter from the Rev. F. Heckewelder, of Bethlehem, in which it is stated, that the Indians of this country have been known to use these shoots as a poison, to destroy themselves. According to Dr. Bigelow, the root contains a resin, a bitter extract, *fæcula*, and a small proportion of gum. As a cathartic, the powdered root is pretty extensively employed in some parts of this country. I have myself given it very frequently instead of jalap, and have always found it active and safe in its operation. It is, however, more drastic and apt to gripe than jalap; nor does it appear to be so prompt in its effects as this cathartic. "Its operation," says Dr. Burgon, "in all cases in which I have administered it, is slower than that of jalap, but it leaves the bowels longer in a lax and soluble condition. I once took twenty grains at four o'clock P. M. which gave me no disturbance till the next morning, when its operation commenced, and

produced continual motions all that day and part of the next night, together with severe tormina; this was the first dose of podophyllum I had ever administered; and its effects being so decided, I have since prescribed it in a multitude of cases, and, for the most part, with similar results. It is more disagreeable to the stomach than common purgatives, and will often occasion emesis.”*

Calomel renders its operation milder. In combination with crem. tart. it forms an exceedingly good cathartic for the cure of anasarca and ascites. It has also been particularly recommended in bilious fevers. It certainly is entitled to considerable attention from the American practitioner, as a useful indigenous cathartic. “The medical properties of the podophyllum pelatum,” says Dr. Bigelow, “are those of a sure and active cathartic, in which character it deserves a high rank among our indigenous productions. We have hardly any native plant which answers better the common purpose of jalap, aloes and rhubarb.”

The best time for taking up the root is in autumn, when the leaves are turning yellow. The extract of it is said to operate mildly and freely. For excellent figures of this plant see Bigelow’s American Medical Botany, vol. ii. and Barton’s Vegetable Materia Medica of the United States, vol. i.

* American Medical Recorder, vol. iii. p. 332.

JUGLANS CATHARTICA.—WHITE WALNUT.—BUTTERNUT.

THE white walnut grows in considerable abundance throughout the United States, and furnishes us with decidedly the most important of our indigenous cathartics. During the American revolution, it was pretty extensively employed in our military hospitals, and was esteemed, as it undoubtedly deserves to be, a most excellent substitute for the ordinary officinal cathartics.

The extract made from the inner bark of this tree is alone employed for medicinal purposes. Given in doses of from fifteen to thirty grains, it operates as an active cathartic, without "occasioning heat or irritation, and is, therefore, greatly commended in dysentery." It is thought to be particularly applicable as an aperient in habitual costiveness, as it is less apt, than most other cathartics, to leave the bowels in a state of languor or costiveness. Calomel increases its activity, and, combined in this way, it has been recommended as especially useful in bilious fevers. Dr. Thatcher says, "a decoction of the inner bark is advantageously employed as a cathartic in the disease of horses called the *yellow water*." The bark of the root will blister the skin. "The extract should be made from the bark in the month of May or June."

CAMBOGIA.—GAMBOGE.

THIS gummy-resinous substance is furnished by the *stalagmitis cambogioides*, a tree of middling size, growing spontaneously in the kingdom of Siam and Ceylon. It consists of small, irregular, solid lumps, of saffron yellow colour, and breaking with a shining or vitreous fracture. When moistened it assumes a beautiful bright yellow colour. It is destitute of odour, but is slightly acrid to the taste. It consists of one portion of gum, and four of a very brittle resinous matter.

Gamboge acts very powerfully both as a cathartic and an emetic, and is, in consequence, condemned by some, as apt to excite violent and dangerous hypercatharsis and vomiting. Others, on the contrary, speak strongly in its favour, and represent it as a mild, certain, and safe cathartic. Dr. Ferriar, especially, recommends it as one of the gentlest and most certain of our purgative remedies. "After a long and extensive experience," says he, "of the qualities of gamboge, I can recommend it as one of the gentlest, most certain, and least nauseous laxatives in the materia medica. Being nearly free from either smell or taste, it is particularly well adapted to the management of children, with whom its anthelmintic power is likewise valuable.*

* Medical Histories, p. 270. Philad. edit. 1816.

It seems, however, to be very generally allowed, that its action is too powerful for the ordinary purposes of purgative remedies; and, unless as an adjunct to other substances of this class, it is, at present, but seldom employed in practice.

Gamboge has been a good deal employed in dropsy; and, by proper management, it is undoubtedly a medicine of considerable value in this disease. For this purpose it is commonly given in union with cremor tartar, in the proportion of about two grains of the former to half an ounce of the latter for a dose. Large watery stools and an increase of urine are generally produced by the operation of such a dose. Dr. Ferriar relates several remarkable instances of the efficacy of gamboge in dropsy, given in union with the nitrous or vitriolic æther. He directed five grains of gamboge with two drachms of spiritus ætheris vitriolici, in a draught two or three times a week. This composition acted as a gentle purgative, and considerably increased the urine. "When there is imminent danger of suffocation," says Dr. Ferriar, "from the quantity of water effused, in hydrothorax, I have frequently given immediate relief, by the following purgative draught.* A draught of this kind may be given twice

or thrice a week, in such cases, while the crem. tar-tar and diuretic drops* are employed in the intermediate days."

Gamboge has also been frequently employed with advantage for the expulsion of intestinal worms. It has been especially recommended against the tapeworm; and as an active cathartic, either after the exhibition of more direct anthelmintics, or independent of such remedies, there can be no doubt of its occasional beneficial operation in such cases.

Given in minute doses, such as do not produce either vomiting or purging, this remedy is said to be serviceable, as a stimulant, in chronic rheumatism, asthma, and particularly in exciting the activity of the portal circulation.†

Its great solubility increases its tendency to act upon the stomach and to excite vomiting. This effect is accordingly much diminished by giving it in combination with other substances, which lessen its solubility, and hence, the addition of a portion of aloes to it (as in the *pil. cambogiæ compos.*) renders it a very mild and unirritating purgative.

† Burdach's *Arzneymittellehre*, band. iii. s. 66.

To obviate its tendency to produce vomiting, Dr. Cullen prescribed it in small doses, and repeated at short intervals until purging was produced. Dr. Ferriar, in his Medical Histories, says: "a very commodious form for exhibiting gamboge, is a solution in distilled water, in the proportion of half a grain to half an ounce of water. A table-spoonful may be given to an adult, every hour, till it operates. A tea-spoonful of this solution, given in the same way, is a dose for a child under twelve years of age. When given in this manner, doses of seven or eight grains have been found necessary to move the bowels, and it has proved strongly diuretic."

ALOES EXTRACTUM.—ALOES.

WE meet with three varieties of aloes in the shops. 1. The aloes spictata, or socotorina. 2. aloes vulgaris, or hepatica. 3. aloes caballina, or horse aloes. The aloes socotorina is imported in small pieces from the island of Socotora, in the Indian ocean, and is much purer than the other two varieties. It is of a reddish brown colour, with a faint purple cast; and when pulverized becomes of a lively yellow colour. The hepatic, or Barbadoes aloes, is the product of the *aloe vulgaris*, a plant, which, Dr. Sibthorpe states, in

his *Flora Græca*, "to be the true *aloe* described by Dioscorides." This variety of aloes is brought from the East Indies, but chiefly from Barbadoes. It comes in large lumps, of a brighter brown colour, and a much stronger and more disagreeable odour than the former variety. Its taste, too, is almost entirely destitute of the aromatic flavour which accompanies the bitterness of the socotorine aloes. The caballine or horse aloes, is the most impure of the three species, and may be easily distinguished by its peculiar rank smell. In other respects, however, it differs but little from the hepatic aloes.

According to the analysis of Tromsdorff, socotorine aloes consists of twenty-five parts of resin and seventy-five of a saponaceous extractive matter, soluble both in alcohol and in water; a slight trace of gallic acid may also be detected in it. This saponaceous extract is intensely bitter, and possesses a faint odour resembling, in some degree, that of saffron. The resinous matter is not very bitter, and possesses but feeble powers as a purgative. Mr. Braconnot, "conceives aloes to be a substance *sui generis*," which he terms, "*bitter resin*."

Aloes is but very slowly and sparingly dissolved by cold water. Boiling water dissolves it readily, "but, on cooling, a precipitation ensues." Long boiling deprives it entirely of its purgative properties. Its appropriate solvent is proof spirit. The solubility of

aloes is increased "by alkaline salts and soaps, but by such a combination aloes undergoes a material change in its medicinal properties; the bitterness is diminished, its purgative effects impaired, and it ceases to operate specifically upon the large intestines, a fact so far valuable as it enables us in certain cases to obviate its irritating action upon the rectum."^{*}

Aloes is a slow, stimulating cathartic, exciting a sensation of warmth in the stomach and bowels, and directing its operation more especially upon the lower portion of the intestinal canal. This latter circumstance is, no doubt, owing to its great insolubility, in consequence of which it passes through the stomach and small intestines before it has had time to dissolve, and, therefore, to act upon them. Being, however, at last dissolved in its progress through the large intestines, it acts upon them with considerable force, and produces free evacuations. Dr. Cullen observes, that aloes evacuates the bowels simply by exciting the peristaltic action of the intestines, without increasing materially the intestinal secretions, as is evident from the state of the evacuations, which are hardly ever thin or liquid.

In consequence of its tendency to act more particularly on the rectum, and thereby to create an afflux of the circulation to the pelvic viscera, aloes is a good

* Paris' Pharmacologia.

deal employed to promote the secretion of the menses; for which, indeed, it seems to be well adapted in cold, phlegmatic and costive habits. This very tendency, however, renders aloes an improper aperient in persons subject to hæmorrhoidal tumours, or affected with any other disease of the rectum.

From its acting in small doses as a slow aperient, it is well suited to obviate habitual costiveness. When employed with this intention, it is necessary to avoid a strong operation, as it is apt, when it acts fully, to leave the bowels in a dry and costive condition. Given in small doses, as from two to four grains, it seems, like bile, to keep up the regular peristaltic action of the intestines, and it is only when it produces this slow but natural action of the bowels, that it can be employed with propriety in constitutional costiveness. Its aperient operation is not proportionate to the size of the dose given; four or five grains will produce nearly the same opening effect that ten or fifteen grains will do. In an uncombined state, indeed, it hardly ever produces large evacuations, whether it be given in a small or large dose. In union with other articles, however, it furnishes us with several very useful preparations.* Viz. pulv. aloes compos. L. pil.

SCAMMONIA.—SCAMMONY.

THIS substance is the inspissated juice of the root of the *convolvulus scammonia*, a perennial plant, growing abundantly in the mountainous parts of western Asia. It comes to us from Smyrna and Aleppo, in blackish grey cakes. That which is imported from the latter place, is purer and better than the Smyrna scammony. It has a bitter, subacrid taste, and a peculiar disagreeable odour. “When rubbed with water, the surface lathers or lactifies.” Aleppo scammony, according to the analysis of Buillon La Grange, contains sixty parts of resin, two of extractive, three of gum, and thirty-five of insoluble matter. That which comes from Smyrna contains less resin but more gum

rosarum rubrarum, āā ℥ii. syrupi de absinthio q. s. ut fiat massa; the mass is to be divided into pills of three grains each. The operation of this pill is to produce a copious and bulky evacuation, and in this respect experience has fully established its value.—PARIS' *Pharmacologia*.

and extractive. Proof spirits is its best menstruum; it dissolves all except its impurities. Water takes up about one-fourth and alcohol two-thirds.

Scammony was one of the purgatives employed by the ancients. A decoction of the root of the plant which yields it was used by Hippocrates; and it is said to be an exceedingly good purgative when given in this way, procuring free evacuations, "without occasioning any gripes, sickness, or any manner of uneasiness."*

Scammony is a powerful stimulating purgative. The accounts which are given of its effects by different writers, are, however, very discrepant; some representing it as mild and perfectly safe, and others as a violent and dangerous cathartic.

Orfila found ulcers in the stomachs of animals that had been killed by scammony. These differences in the action of this remedy, are, however, supposed "to be entirely owing to the different circumstances of the patient, and not to any hurtful quality, or irregularity of operation of the medicine; where the intestines are lined with an excessive load of mucus the scammony passes through without acting upon them; but where the natural mucus is deficient, a small dose of this or any other resinous cathartic, irritates and inflames."†

* Dr. Alexander Russel, in a letter to Dr. Fothergill. See *Medical Observations and Inquiries*, vol. i. p. 13.

† Dr. Andrew Duncan's *Dispensatory*.

Scammony enters into the composition of many of the purgative remedies that have been recommended against worms. It enters also into several useful official preparations; such as the *confect. scammon.* L. D. pulv. scammon. comp. L. E. extract colocynth. com. L. pulv. sennæ comp. L.

The best mode, perhaps, of exhibiting scammony, is to triturate it with sulphate of potass, sugar, or almonds. Given in this way, it operates mildly and with considerable promptness. An excellent form for exhibiting this medicine, is a solution of it in a strong infusion of liquorice, and poured off from the fæces. The dose is from three to fifteen grains.* Much was formerly said of a preparation into which scammony enters as a chief ingredient, and known by the name of *Count Warwick's powder*, or pulv. detritus. It consists of a mixture of sulphuretted scammony, diaphoretic antimony, and cremor tartar. Ramazzini, Baglivi, Van Swieten, Werlhoff, recommend it as a peculiarly efficacious purgative in intermittent fevers.

* Dr. Paris says, that "there is a compound bearing the name of scammony to be met with in the market which is altogether factitious, consisting of jalap, senna, manna, gamboge, and ivory-black. Good scammony ought to be friable, and when wetted with the finger, it should lactify or become milky; and the powder should manifest its characteristic odour, which has been compared to that of old ewe milk cheese.—*Pharmacologia*.

COLOCYNTHIDIS PULPA.

THIS is the medullary or pulpy part of the fruit of the *cucumis colocynthis*, an annual cucurbitaceous plant, growing in abundance in Syria, Arabia, and also in some parts of Spain. It is intensely bitter, and contains a saponaceous extractive, a bitter resin, gum, and vegetable fibrous matter.

This is one of the most ancient purgatives employed in medicine. The Greek and Arabian physicians mention it in their writings as a powerful and valuable cathartic.

At the present day it is but seldom administered in an uncombined form, on account of the great violence of its operation. As a hydragogue, however, it is still occasionally employed in dropsical cases; in one instance of which, I have myself prescribed it with great advantage. Bang recommends a decoction of it as an exceedingly good remedy in dropsy; and Hufeland considers it as the most effectual diuretic we possess, in persons of a cold and sluggish habit of body. His mode of prescribing it for this purpose is, to boil two drachms of the colocynth, in a quart of beer, down to a pint, of which one or two table-spoonfuls are to be taken every day.

This substance has also been recommended in small doses, as very useful in paralysis of the lower extremities and in herpetic eruptions. Heim, a German wri-

ter, speaks a great deal in favour of the *tincture of colocynth*, in union with *tinctura antimonii saponata*, in the proportion of twenty drops of the former to sixty of the latter every three hours, in cutaneous affections of this kind.*

Colocynth has been a good deal employed in coma and apoplexy; and, as the beneficial effects of cathartics in these diseases depend, perhaps, entirely on the afflux which they occasion from the head to the intestinal canal, there can be no doubt that a remedy which produces such prompt and strong impressions on the bowels, and which, therefore, procures such copious watery evacuations as the present one, is well calculated to prove beneficial in affections of this kind.

The compound extract of colocynth is an exceedingly useful preparation. In combination with calomel this extract forms one of the most effectual, and at the same time, mild purgatives with which I am acquainted. In cases where we wish at once to evacuate the bowels gently, but copiously, and to correct the functions of the biliary organs, I have found the pill recommended by Dr. James Johnson,† a most valuable medicine.

* Kölpin über die Wirkung der Tinctura Colocynthidis.—

The dose of the compound extract of colocynth is from ten to fifteen grains. The colocynth, in substance, is given in doses of from five to ten grains.

The subacetate and acetate of lead, the nitrate of silver, sulphate of iron, and the fixed alkalies, disturb its infusion.*

ELATERIUM.

THIS substance is obtained from the fruit of the *momordica elaterium*, a cucurbitaceous plant, growing wild in the southern parts of Europe. The fruit of this plant bears a very strong resemblance to the common garden cucumber; “differing from it merely in point of size. When full grown it is from an inch to an inch and a half in length, and of proportionate thickness. The seeds, which, when fully ripe are of a *black* colour, are lodged in a light green pulp, the interstices of which contain from half a drachm to a drachm of nearly limpid fluid.” This juice, when first collected, is perfectly limpid. On standing for a few hours, however, it first becomes turbid, and then gradually lets fall a sediment, which, when slowly dried, without being exposed to a strong light, has a

* Dr. Paris observes, that “when the fruit is larger than a St. Michael’s orange, and has black, acute pointed seeds, it is not good.”

yellowish white colour, with a faint shade of green. This is the pure *elaterium*; a substance which is decidedly the most powerful cathartic we possess.

Its taste is acrid and slightly bitter. It appears to be entirely insoluble in water, whether hot or cold. That which is obtained from the spontaneous deposition of the juice, is almost wholly soluble in alcohol; whilst, of that which is commonly met with in the shops, not more than one half, and sometimes not above a fourth part is dissolved by alcohol. That part of it which is left undissolved, appears to possess no powers whatever as a medicine. According to the experiments of Dr. Paris, *elaterium* consists of water .4, extractive, 2.6, fecula 2.8, gluten .5, woody matter 2.5, *elatin* and bitter principle 1.2.

It appears from the experiments of Dr. Clutterbuck, that *elaterium* is almost entirely, if not wholly confined to the limpid fluid contained in the centre of the cucumber, since no other part of the plant seems to possess any active properties. It is evident, therefore, that the common mode of preparing this substance, namely, by pressing the fruit and collecting its ordinary juice together with that which is lodged in the centre, and afterwards evaporating it, must yield an article of inferior and uncertain powers. Dr. Clutterbuck recommends the following method for preparing this medicine, and there can be no doubt of its superiority over the modes usually adopted.

“The cucumbers should be gathered when as nearly ripe as possible, and without violence, that might endanger their *bursting*. They should then be wetted by the affusion of cold water, that less of the juice, when they are cut, may adhere to the external surface. In this state they should be cut through longitudinally, and the juice allowed to strain through a fine sieve placed in a large earthen vessel. The seeds and surrounding pulp should be scooped out upon the sieve, and washed with repeated affusions of cold water, by which they will be freed from all adhering juice. Something will be saved also by afterwards rinsing the split cucumbers themselves in cold water, from which a portion of elaterium may be collected. After standing a few hours a sediment is formed, from which the clear liquor is to be poured off; it is then to be thinly spread on fine linen, and exposed to the air to dry; a gentle warmth may be employed without injury; but the access of sunshine destroys the fine green colour which the substance otherwise acquires.”*

Elaterium is a very ancient remedy, and was, for a long time, much esteemed as a hydragogue in hydropic diseases. In modern times it had, however, almost sunk into entire neglect, in consequence of its occasional harsh and violent operation, until it was again brought into notice as a remedy for dropsy, by Dr. Ferriar, of

* London Medical and Physical Journal, July, 1819.

Manchester. It must be confessed, indeed, that it is a medicine of exceedingly active powers, and may readily do great mischief if improperly administered. Elaterium, says Dr. Clutterbuck, is, with the exception of arsenic, perhaps, and the hydro-cyanic acid, the most active article of the materia medica; and Dr. Ferriar observes, that "on its first exhibition to a patient, it is nearly as active and as dangerous, if incautiously given, as arsenic." It appears, however, susceptible of such management in its administration as to render it not only a safe, but a most important remedy. "Its powers," says this latter writer, "in removing serous accumulations in the cavities of the human body, surpass those of any other medicine; and the astonishing relief which it affords in the dyspnœa occasioned by hydrothorax or ascites, even in persons of the most advanced age, must place it in the first class of hydragogues." Dr. Clutterbuck also, speaks in the highest terms of the utility of this remedy. "I know of no medicine," says he, "from which I have derived greater benefit, on various occasions, nor one in which greater confidence may be placed. Whatever can be accomplished in the cure of diseases, by active purging, may be effected certainly by this medicine."

The sensible effects of this substance are, excessive nausea, copious and frequent watery stools; and if the dose be very large, vomiting, violent pains in the

stomach and bowels, inflammation of these organs, spasms, and death. Along with its cathartic effects, it excites the action of the heart and arteries, even when given in moderate doses.

When prepared according to the method of Clut-terbuck, one-eighth of a grain will be sufficient to produce violent purging. As it is met with in the shops, its dose is from one to two grains. It should, however, always be commenced with in a small dose, as, for instance, half a grain, and repeated every hour until the desired effects be produced. Dr. Ferriar states, that he generally gave it in union with some diuretic, when employed in dropsy, and commencing with a very small dose, sometimes carried to the extent of six grains a day.*

HELLEBORUS NIGER.—BLACK HELLEBORE.

THIS article will be particularly described under the head of Emmenagogues, and I shall, therefore, in this place, speak of it only in relation to its purgative properties.

* He usually gave it in the following prescription :

℞ Extract. elaterii gr. i. sp. æther. nitros ℥ii. tinct. scill. oxymel colchic. sing. ℥ss. syrup rhamni ℥i. M. ft. solutio. cap. ℥i. ex equæ pauxillo ter, quater-ve in die.

Of all the articles of the *materia medica*, this has held the greatest reputation among the ancients for its remediate powers, and especially for its virtues as a cathartic. It was particularly esteemed in the treatment of mania, melancholia, and gout. For the cure of this latter disease it is mentioned, by Aretæus, as superior to every other remedy then known.

Black hellebore is an exceedingly active cathartic, and, when given in an over-dose, is apt to produce the most alarming effects. It occasions very copious watery evacuations, and hence it has been a good deal employed in dropsical affections. Dr. Ferriar reports several cases of this kind, in which the good effects of this remedy were conspicuously evinced. He prescribed it in the form of Bacher's tonic pills;* a preparation which, on various accounts, deserves much more attention than it appears to receive from the profession of the present day. "When the tonic pills have succeeded with me," says Dr. Ferriar, "they have operated early, by producing copious watery stools. Their action is easy, but in cases of long standing, contrary to Mr. Bacher's assertion, they evidently weaken the patient, however cautiously given."† From two to six of these pills may be given three times every day, according to the effects they produce.

* The formula for preparing these pills is given under the article *helleborus niger*, in the class of Emmenagogues.

† Medical Histories, vol. i. p. 46.

The black hellebore is now but seldom, if ever employed by itself, or in substance, with a view to its cathartic effects. From twenty to thirty grains of the powdered root are said to be a proper dose for this purpose.

CALOMEL, OR SUBMURIATE OF MERCURY.

OF all the articles of the *materia medica*, calomel is undoubtedly the most important, whether we consider it in relation to its purgative operation, or to its more extensive and specific influence upon the animal economy. Under the head of mercury, I shall consider the remediate powers of this article, so far as they depend on its constitutional or specific effects, and confine myself, in this place, merely to a consideration of its virtues as a purgative.

Given in proper doses, either by itself or in combination with other articles of this class, it produces copious evacuations, without evincing any harsh or drastic effects. Along with its cathartic effects, calomel has the peculiar power of exciting the biliary organs, and it is, therefore, particularly adapted as a purgative to all diseases attended with functional derangement of the hepatic system. A combination of calomel and jalap, forms one of our most useful and

common purgatives in bilious diseases, as well as for the ordinary purposes to which remedies of this kind are usually applied. Where we wish to procure easy, but copious alvine evacuations, we will, in general, find our intentions fully answered by giving three or four grains of calomel in the evening, and exhibiting on the following morning an ordinary dose of any of the milder cathartics.

Calomel, from its possessing very little taste, is well suited as a cathartic for children. In my own practice I seldom employ any other purgative in the diseases of children. It evacuates more freely, and, at the same time, more mildly, than, perhaps, any other article of this class, the intestinal mucus which is often morbidly accumulated in the bowels of children. Of late it has been much recommended as a cathartic in dysentery. Dr. James Johnson speaks strongly in favour of large and frequently repeated doses of calomel in this disease, *as it occurs in tropical climates*.—He gave *scruple* doses three or four times a day, and he affirms that it was generally followed by great alleviation of all the distressing symptoms which attend this complaint.

When calomel is given in very minute doses it has a direct anti-cathartic effect, by lessening the morbid irritability of the intestinal canal. It is, indeed, one of our most valuable remedies for excessive purging. Dr. Ayre, of Hull, in his very valuable work on bilious

affections, adduces satisfactory testimony of the utility of small doses of this remedy in cholera, diarrhœa, &c. From an eighth to one-fourth of a grain, given every half hour or hour, will very often put a speedy stop to the most violent vomiting and purging. I have employed it in this way with much advantage in cholera infantum, and especially in chronic diarrhœa, in which latter affection I regard it as decidedly the most important remedy we possess. In affections of this kind it is, perhaps, most effectually administered in union with prepared chalk; or, as I have sometimes given it, with small doses of some astringent vegetable powder, as, for instance, the powdered root of *geranium maculatum*.

Calomel is also frequently employed as a vermifuge; but as I shall have occasion to mention it again in relation to its powers in this way, in the chapter on Anthelmintics, I shall dispense with any further remarks on it in this place.

The usual dose of calomel, as a cathartic, is from eight to twenty grains; ten grains may be considered as a medium dose. If given in too large a dose it is apt to excite vomiting.

OLEUM RICINI.—CASTOR OIL.

THIS oil is obtained by expression, or decoction, from the seeds of the *ricinus communis*, a plant which grows wild in the East and West Indies, and in some parts of South America, and which is now cultivated in this country.

It is a yellowish or colourless oil, possessing a faint peculiar sweetish taste, and scarcely any odour. On being swallowed it excites an unpleasant acrid burning in the throat and fauces, which, however, is but very slight when the oil is fresh and entirely free from rancidity. It is wholly soluble in alcohol and sulphuric æther; and mixes more readily with caustic ley than any other oil. These circumstances distinguish it from the other fat oils, and enable us without difficulty to detect its adulterations.

Castor oil is a very mild, unirritating, but certain and prompt cathartic, procuring copious fæcal evacuations, without appearing to excite the intestinal emunctories, since it hardly ever occasions any very liquid or watery discharges. Where we wish simply to evacuate the contents of the bowels, or avoid costiveness, there is no article belonging to this class of remedies, so well adapted as castor oil to answer our intentions. Independent of the mildness and completeness of its operation, it is less apt than any other ca-

thartic to leave the bowels in a dry or costive condition.

In cases of obstinate constipation, castor oil, though often insufficient, by itself, to procure adequate evacuations, acts, in general, with much advantage when given some hours after the exhibition of a full dose of calomel, or calomel and jalap.

No laxative is more commonly employed in the treatment of dysentery than this one; and when the stomach can bear it, it is, without doubt, a very important remedy. "Oleum ricini," says Dr. Bampfield, "is, perhaps, better calculated to afford relief in dysentery than any other aperient or cathartic; for its action is not only mild and generally effectual, but I have observed, that some of it passes undecomposed, in its oily form, through the intestines, and appears on the surface of the excrement, and hence may serve as a sort of sheather or defence to the diseased intestines, from the stimulus of fæces and morbid secretions."

A common mode of prescribing it in this disease, when there is much tenesmus and griping, is in union with a full dose of laudanum. Given in this way it is much less apt to be rejected by the stomach, and it moreover mitigates directly the sufferings of the patient, and loses but very little of its aperient effects.*

* The following is an excellent mode of exhibiting castor oil in cases of this kind: Ol. ricini ℥i. vitelli ovi q. s. tere simul et

Castor oil has also been much recommended in the treatment of colica pictonum. It is particularly useful in this disease to put the bowels in motion, after large doses of calomel and opium have been administered.

In the form of an emulsion* it is a very excellent aperient for children.

Castor oil has also been highly recommended as a remedy for the expulsion of the tape worm. Dr. Odier, of Geneva, and Dunant, employed it with much success in expelling the *unarmed tænia*,† and Brera states that “it sometimes serves wonderfully well to expel also the armed tænia.”‡ After having previously administered three drachms of powdered *male fern*, Odier gave the ol. ricini, by table-spoonfuls every half hour until full purging is induced. Brera, however, recommends it to be given to the extent of three ounces for a dose. “In my journal,” says he, “I have two cases of armed tæniæ expelled by three ounces of this oil, taken by a patient during three suc-

adde syrupi papaveris ℥ii. tinct. opii g^{ss} x. aquæ distillatæ ℥iiss; fiat haustus.

* R Ol. ricini ℥i. sacch. alb. ℥i. album. ovi. q. s. tere simul et adde, gradatim aq. menthæ ℥ss. aq. fontanæ ℥ii. Dose for a child one year old, a tea-spoonful every hour.

† Manuel de Medicine-Pratique, par L. Odier, p. 225.

‡ A Treatise on Verminous Diseases, by V. L. Brera, professor of clinical medicine at Pavia, p. 234.

cessive days, and by another taken twice a day for a week."

The celebrated S. G. Vogel* has introduced a composition which strongly resembles castor oil, and which forms an excellent substitute for it when it is rancid. It consists of nine grains of resin of jalap, three grains of venetian soap, to be triturated in a mortar with an ounce and a half of oil of olives. The dose is a table-spoonful. Dr. Schmidtman speaks very highly of this mixture in dysentery. He says it always allays the pain and severe excitement of the intestines, but at the same time gently and completely evacuates their contents.

OLEUM OLIVÆ.—OLIVE OIL.

OLIVE oil is of a pale yellowish colour, without odour, and of a pleasant bland taste. When perfectly pure it congeals at a temperature of 38° of Fahrenheit. With the exception of the oil of almonds, it is the lightest of the fat oils, having a specific gravity of no more than 0.915. It is composed of forty-nine parts of carbon, thirty oxygen, and twenty-one hydrogen. It possesses less activity as a laxative than the oleum ricini; it is, nevertheless, in many cases, a very useful

* Summa Observationum Medicarum, &c.

aperient, and is much employed for this and other purposes, in medicine.

This oil was very extensively used by the Roman physicians as an external application in the cure of diseases. Celsus, Galen, and Aetius were much in the habit of employing oily frictions; and have left us some excellent observations in relation to the cases in which they are applicable.

A good deal has been said of the utility of frictions with this oil in dropsy. Cases of ascites are said to have been cured, by such frictions assiduously applied to the abdomen.* Dr. Donald Monro informs us that, although unsuccessful in his attempts to cure ascites in this way, he found it effectual in some cases of anasarca.†

It is probable, however, that very little, if any thing, is to be ascribed to the oil in such cases. It is well known that frictions, whether with or without any intermediate substance, have a very considerable tendency to excite the activity of the absorbents; and it is not unlikely that all the good that has ever been done in this disease by oily frictions might have been obtained by frictions with the dry and bare hand.

This oil has also been much recommended, both as an internal and an external remedy against the ef-

* Oliver, Stork, Burdach, &c.

† Alibert. *Nouveaux Elémens de Thérapeutique*, vol. ii. p. 252.

fects of the bites of venomous snakes and insects.* It does not, however, appear to be entitled to any attention for its supposed remediate virtues in cases of this kind.

The external application of warm olive oil has been much employed as a remedy against the plague. Baldwin especially speaks in the highest terms of this practice. According to this writer the patient is to be briskly rubbed all over with the warm oil, which is to be repeated every day, and assisted by warm drinks and the heat of a bed, until a copious perspiration is excited. This practice is only effectual when early employed.†

To blunt the activity of certain poisonous substances brought into the stomach, olive oil is of unquestionable utility. Its powers, in common with other oily or fat substances, to prevent the deleterious effects of lead upon the system are well known to those who are much exposed to the influence of this poison, it being a common practice among such persons to fortify themselves against its effects, by the daily use of olive oil, or some other fat or oily substance.

* Abr. Vater diss. de antidoto novo adversus viperarum morsum præstantissimo. Viteb 1736. Ejusdem. Progr. pro olei olivarum efficaciam et virtutem adversus morsum animalium venenatorum confirmat. 1751.

† Osservazioni circa un nuovo specifico, contra la peste, ritrovato e fatto sperimentare, da G. Baldwin. 1800.

Burdach says,* that it should never be given where narcotic poisons have been swallowed, since, as he observes, it is not only useless but absolutely injurious in cases of this kind.

Olive oil may be advantageously employed as an aperient in cases of habitual costiveness, and in colica pictonum. It operates, commonly, with considerable promptness and certainty, and may be conveniently exhibited with other articles of this class, as manna, the resin of jalap, &c.

In ileus it is said to be an exceedingly good remedy given either alone or in combination with opiates. Gallesky recommends it to be given in the dose of a table-spoonful every hour until the bowels are moved and the pains abate.

Malacarne† has published a memoir on the internal employment of olive oil in wandering arthritic pains. He gave from one to two pounds of the oil, having previously added a portion of culinary salt to it, in the course of two or three days. He speaks very favourably of this practice.

This oil has also been recommended as a vermifuge; its powers in this way are, however, of no consequence.

Olive oil is often adulterated by the oil of poppy seeds. This fraud may be readily detected "by ex-

* *Arzneymittellehre*, B. ii. S. 118.

† *Samlung Auserlesener Alhandl.* Bd. xii. St. iv. S. 579.

posing the oil to a freezing temperature; when the olive oil will congeal, while that of poppies will remain fluid; and since those oils which freeze with most difficulty are most susceptible of rancidity, the admixture of poppy oil must be regarded as injurious; it also deserves notice, that the peculiar habitudes of *oil of olives* with *per-nitrate of mercury*, offer a distinguishing character, by which the adulteration of the oil may be satisfactorily detected; for if the *per-nitrate* (made by dissolving six parts of the metal in 7.5 of nitric acid of sp. grav. 1.36, at a common temperature,) be mixed with olive oil, the mixture, if kept cold, will, in the course of a few hours, become solid, whereas if it has any admixture of the oil of grains, it will not undergo such a change. The contamination derived from lead, which is frequently immersed in the oil for the purpose of removing its rancidity, may be detected by shaking one part of the suspected sample with three parts of water, impregnated with sulphuretted hydrogen, in a stopped vial.*

SULPHUR SUBLIMATUM.

THE sulphur of commerce is extracted from pyrites by sublimation. In volcanic districts, it is occasion-

* Paris' Pharmacologia.

ally found in a perfectly pure and crystallized state; and it exists in a combined state in some animal and vegetable substances. It is insoluble in water and alcohol, but perfectly soluble in both the essential and fixed oils. Linseed oil is one of its most powerful solvents.

Sulphur was much esteemed for its remediate powers by the ancients, and continues to this day to hold a very important rank among the articles of the *materia medica*. When taken in the dose of from one to two drachms, it acts as a mild and pretty certain laxative, producing one or two copious evacuations, without either heating the system or griping the bowels. "These circumstances," says Dr. Cullen, "render it a most proper and convenient laxative; and were it not for the fœtor that sometimes attends its operation, and is ready to be diffused in the air around, sulphur would be one of the most agreeable laxatives that could be employed."

It appears to pass with facility into the circulation, as is evinced by the sulphureous odour which the breath and cutaneous exhalation of those who take sulphur soon acquire; and also by the black colour which polished metals carried in the pockets of such persons often contract.

It seems to direct its action more especially upon the lower portion of the bowels, and to excite the ac-

tivity of the circulation in the portal system of vessels. It has been accordingly much recommended in hæmorrhoidal affections, more, however, with a view of obviating, than of removing them when they already exist.

The most important medicinal powers of this substance are, however, those which it possesses against various obstinate diseases of the skin. Alibert considers it as the most efficacious article we possess in affections of this kind. "I have used sulphur a great deal in my practice," says he, "and have removed cutaneous eruptions with it, that had resisted all the other means known." It is observed by the same author, that persons whose employment exposes them much to the fumes of sulphur, are never affected with chronic cutaneous eruptions. He considers it as particularly efficacious in the cure of herpetic diseases. For the cure of tinea capitis, too, he thinks that there is no remedy superior to the unguentum sulphuris. I have, however, employed the kali sulphuratum, according to the prescription of Barlow,* with much better effect than the simple sulphur ointment.

For the cure of psora, it is a very common remedy. I have found Jasser's ointment, as it is altered in the

* R Kali sulph. (recens peperat.) ℥iii. sapo Hispan. ℥i. aq. calc. ℥viii. spir. vin. rect. ℥ii. M. fiat lotio. Wash the head morning and evening.

Prussian Pharmacopœia, an exceedingly useful remedy in this disagreeable affection.*

For the cure of psora in children, Dr. Clark, of Dublin, recommends a lotion, made by pouring a quart of boiling water on an ounce of broken sulphur, and suffering it to infuse for twelve hours. "In this process," says Dr. Paris, "the water probably takes up a small portion of sulphurous acid."

Sulphur has also been much praised as a remedy in gout and rheumatism. Barthez, in particular, commends its powers in the former of these diseases; in the chronic form of the latter, I have, in several instances, derived great advantage from the employment of sulphur, in combination with guaiacum. Its beneficial operation in these diseases is, no doubt, mainly dependent on its tendency to excite the cutaneous exhalants, and to equalize the general circulation.

Wedekind, a German physician of celebrity, speaks very favourably of the employment of sulphur, in the dose of twenty grains, with double the portion of gum arabic, in the cure of dysentery. "The bloody discharges," he says, "together with tormina and tenesmus, often cease as soon as a few doses of this medicine have been administered."†

Werlhof recommends the internal employment of

* R Flor. sulph. ℥ii. sulp. zinci ℥ii. ol. lauri. auxung. porcin. q. s. ut fiat unguent.

† Burdach, *Arzneymittellehre*, Band ii. S. 14.

sulphur as a valuable remedy for the anasarca, which is sometimes the consequence of scarlet fever.

Sulphur is, by many, supposed to have the property of diminishing the salivant effects of mercury, and it is accordingly a good deal prescribed for the purpose of moderating ptyalism. I do not believe, from what I have observed in my own practice, that it possesses any virtues in this respect beyond what may be ascribed to its diaphoretic operation.

MAGNESIA.

NATURE no where presents us with this substance in a pure state. It is commonly found in combination with sulphuric acid, from which it is separated by precipitating it from its solution by potash.

Magnesia is a white and very light earthy substance, having a specific gravity of 2.3. It converts very delicate blue vegetable colours to a green; is very sparingly soluble, requiring two thousand times its weight of water to hold it in solution. The solutions of alkaline carbonates dissolve it; but those of the caustic alkalies have no action on it. It increases the solubility of camphor, opium, and resins, in water.* It combines with sulphur.

* Paris' Pharmacologia.

This substance was, for a long time, sold in Italy as a secret remedy, under the name of *magnesia alba*, or *Count Palma's powder*. It was not until about the middle of the last century that it was introduced into practice as a regular remedy. At present it is much employed as a mild aperient, both in its pure state and in that of a carbonate.

As a laxative it is particularly serviceable where an acid exists in the *primæ viæ*. It unites with the acid, and, acquiring thus the character of a neutral salt, acts with greater energy as a purgative. If the carbonate of *magnesia* be employed under such circumstances, the acid in the stomach, uniting with the *magnesia*, evolves a considerable portion of carbonic gas, and may thus create painful flatulent distentions. This effect is obviated by using the pure *magnesia*, instead of the carbonate.

Magnesia has been much commended for its good effects in gout. Dr. Scudamore,* however, states his conviction, "that its only useful agency, in this disease, has been in its conjoint action as an antacid and a purgative; and that in no other way than by such influence on the stomach and alimentary canal can he consider it as having any claims to our regard."†

* Treatise on the Nature and Cure of Gout, &c. p. 278.

† In conjunction with laxatives, the same respectable writer states, that he obtained the most remarkable success in gout "from a draught composed of *magnesia*, gr. xv. ad xx. *magnes*.

In cases of dyspepsia, attended with an acid in the stomach, magnesia may be advantageously united with aromatics and some of the milder tonics. In this way we not only remove the morbid contents of the stomach, but at the same time also, invigorate this organ, and thereby counteract the new formation of the acid.

Used simply as an absorbent or neutralizer, magnesia is highly useful in all affections attended with morbid acidity of the stomach. In the griping bowel complaints of children, attended with green or sour stools, magnesia is a great deal employed, and is, indeed, one of its most useful remedies. For this purpose, the prescription given below is a very convenient form of exhibiting it.*

Magnesia has, of late, been recommended as a very useful remedy to prevent the too copious secretion of uric acid by the kidneys, and consequently to obviate the formation of those urinary calculi that are chiefly or wholly composed of this acid.†

Mr. Brande has published some very interesting experiments and observations on the comparative

sulphat. \mathfrak{z} i. ad \mathfrak{z} ii. aceti colchici \mathfrak{z} i. ad \mathfrak{z} ii. with a sufficient quantity of sweetened water. It should be repeated every four, six, or eight hours.

† Brande, on Calculous Disorders, in the Philos. Trans. 1810, P. i.

value of magnesia and alkalies in calculous affections. Sir E. Home had suggested the superiority of the former over the latter remedy, on the ground of its possessing less solubility, and, therefore, more apt to remain longest on the stomach, and to counteract the formation of uric acid. The correctness of this suggestion, so far as regards the fact, was confirmed by the experiments of Mr. Brande. Dr. Scudamore admits the fact of its superiority over the alkalies; but he ascribes it chiefly to its purgative qualities, by which the acid of the stomach is not only neutralized, but also carried out of the body.

Magnesia may be conveniently given in union with other purgatives. It is frequently united with lac sulphuris; in which combination it is said to be particularly useful in bilious complaints. The dose of the carbonate, for an adult, is from twenty to sixty grains. Infants may take from two to five grains.

It ought to be observed, that from a considerable number of authentic cases reported in the journals within the last ten or twelve years, it would appear that the long use of magnesia results sometimes in enormous and dangerous accumulations of this substance in the large intestines.

In the *Journal of Science and the Arts*, No. xi. Mr. Brande has given an account of two cases, "in which the long continued use of magnesia was productive of a concretion of this earth in the bowels, in an im-

mense quantity," and which "gave rise to many of the worst symptoms attendant on an obstruction of the intestinal canal." In the second case, it is stated that "not only large quantities of a concretion of a similar description were voided, but upon examination after death, which took place perhaps six months after any magnesia had been taken, a collection, supposed to be from four to six pounds, was found imbedded in the head of the colon, which was, of course, much distended." Cases similar to these have since been published by other physicians.

Carbonate of magnesia has been much recommended by some late writers as an antidote. Mr. Marshal* mentions this article as one of the most valuable remedies, in cases of poisoning from arsenic. Mr. Hume also† speaks highly of its effects in this way. He relates a case of poisoning by arsenic, of a very hopeless character, which was cured by the composition given below.‡

* Remarks on Arsenic.

Neutral Salts.

SULPHAS SODÆ.—GLAUBER'S SALTS.

THIS salt is one of the most common and useful purgatives we possess. It consists of 24.64 parts of sulphuric acid, 19.36 of soda, and 56 of water. It crystallizes in transparent six-sided prisms, terminated by dihedral summits. When exposed to the air it effloresces. It possesses a saline and disagreeable bitter taste. One ounce of water at 60° dissolves ℥iiss. of the salt; boiling water dissolves it in much greater proportion; in alcohol it is quite insoluble. It is decomposed by the *murates of ammonia, baryta, and lime; nitrate of silver; sub-acetate and acetate of lead.*

The dose is from ℥ss. to ℥ii; when administered in lemonade, or with the addition of a small portion of cremor tartar, it is much less disagreeable to the taste.

SULPHAS MAGNESIÆ.—EPSOM SALTS.

THIS is also a very common and useful purgative. It consists of small, needle-like, tetrahedral prisms;

possesses a bitter taste, and is soluble in its own weight of water at 60°. When pure, it effloresces on being exposed to the open air. It is decomposed by “baryta, strontia, the alkalies, and all the salts formed by these salifiable bases, excepting the alkaline muriates; and by the nitrate, muriate, and carbonate of lime.” The addition of a little common salt is said to increase its purgative powers, and a small portion of tart. antimony quickens its operation. The dose is from $\mathfrak{z}\text{ss.}$ to $\mathfrak{z}\text{ii.}$ The sulphates of magnesia and soda differ but little in their effects. Being less apt to heat the system than the other active articles of this class, they are more particularly applicable to the treatment of febrile diseases. Given with a minute portion of antimony, according to the directions of Sir Gilbert Blane and Dr. Chisholm, they are exceedingly useful in the beginning of bilious fevers. A solution of $\mathfrak{z}\text{ii.}$ of either of these salts, with gr. ii. of tart. antimony, in a pint of water may be very usefully given in the beginning of such fevers, in doses of a wine-glass full every hour, until vomiting and full purging is produced.

The sulphate of magnesia is, in general, less apt to be rejected by the stomach than the sulphate of soda, and it is on this account best suited to cases attended with morbid irritability of the stomach. It has been said that epsom salt has a peculiar power of moderating gastric pain, independent of its cathartic effects. Exhibited in small and frequently repeated doses its

effects have been particularly extolled in ileus and colica pictonum. A solution of this salt in lemonade is a very convenient and efficacious laxative in the diseases of very young children.

SULPHAS POTASSÆ.—VITRIOLATED TARTAR.

THIS salt crystallizes in small transparent, hard six-sided prisms, terminated by six-sided pyramids. It is bitter, and dissolves slowly in water, requiring $\mathfrak{z}\text{i}$. of water at 60° to dissolve twenty-four grains of the salt; in alcohol it is quite insoluble. It consists of 32.8 acid, 67.2 of potass and water. The barytic salts, the nitrates and muriates of strontia, and lime decompose this salt; it is *partially* decomposed by the tartrates and the salts of mercury, silver, and lead.

Sulphate of potass acts as a gentle aperient, when given in doses of about twenty or thirty grains. In the dose of from $\mathfrak{z}\text{v}$. to $\mathfrak{z}\text{vi}$. it acts as a mild cathartic, though, on account of its difficulty of solution it acts much slower than the preceding two salts. It is, however, very rarely employed with a view to its purgative effects. "It forms a component part of the pulvis ipecac. compositus."

SUPER-TARTRAS POTASSÆ.—CREMOR TARTAR.

THIS is a bi-tartrate, having two proportionals of acid and one proportional of potass. It is but sparingly soluble, requiring for its solution one hundred and twenty parts of water at 60° and thirty parts at 212°. By long keeping the watery solution of cremor tartar undergoes decomposition, depositing a mucous matter, and leaving “a solution of carbonate of potass, coloured with a little oil.”* The solubility of cremor tartar is greatly increased, “by combining it with boracic acid.”† The alkalies, alkaline earths, and mineral acids decompose it.

Cremor tartar is, for many purposes, an exceedingly useful purgative. It is a mild, cooling, and certain laxative, exciting the intestinal exhalants, to a copious effusion of serous fluid, and producing at the same time pretty strong diuretic effects. From these

* Paris' Pharmacologia.

† “The following formula is introduced into the Codex Medicamentarius of Paris, for preparing a ‘*tartarus acidulus potassæ solubilis admixto acido Boracico?*’ Let thirty parts of boracic acid and twenty parts of distilled water be heated together in a silver dish; as soon as this has been effected, add in divided portions one hundred and twenty parts of super-tartrate of potass, taking care to shake the mixture continually, the whole will soon liquefy, and by continuing the heat a pulverulent mass will result.”

properties it is manifestly a very appropriate remedy in dropsy, a disease in which, indeed, it has been much employed, and very frequently with the happiest effects. Dr. Ferriar gives an account of forty-three cases of dropsy treated by cream of tartar, of which thirty-three were effectually cured. He says: "I think we may fairly rank this medicine in the first class of hydragogues."* Dr. Home also, speaks much in favour of its effects in dropsical diseases.† In my own practice, I have often derived the most decided advantage from this remedy in the treatment of ascites. It may be very advantageously united with gamboge, and digitalis. In several cases of this disease, I derived very great benefit from the prescription given below.‡

Cream of tartar has been a good deal extolled for its powers in removing obstinate constipation. In union with jalap, it will often excite the action of the intestines, after the most powerful cathartics have been given in vain.

In the dose of $\mathfrak{z}\text{iv}$. or $\mathfrak{z}\text{vi}$. it acts as a hydragogue cathartic; in smaller doses it produces diuretic effects. A very pleasant aperient beverage may be made by

* Medical Histories and Reflections, p. 46.

† Clinical Observ. Exper. &c. p. 349.

‡ R Crem. tart. $\mathfrak{z}\text{iss}$. sulph. potassæ $\mathfrak{z}\text{ss}$. pulv. scillæ $\mathfrak{z}\text{ii}$. tart. antimonii grs. ii. M. Dose, four or five tea-spoonfuls every day.

dissolving about ʒi. of this salt in a pint of hot water, and flavouring it with lemon peel and sugar.

TARTRAS POTASSÆ.—SOLUBLE TARTAR.

THIS salt consists of one atom of acid and one of potass. It is soluble in its own weight of water when in a crystallized state; but when it is in the form of small grains, as it is commonly met with in the shops, it requires four times its weight of water for its solution. Alcohol dissolves it very readily. It is decomposed by magnesia, baryta, lime, and strontia; the sulphates of potass, soda, and magnesia, and the muriate of ammonia decompose it partially. It is also entirely or partially decomposed by all acid; “and hence it is improper to join it with tamarinds or other acid fruits, as is too often done in the extemporaneous practice of those physicians who are fond of mixing different cathartics together, and know little of chemistry.”*

Soluble tartar, given in the dose of from thirty to sixty grains, acts as a mild and unirritating aperient. In the dose of ʒvi. or ʒvii. it acts pretty strongly as a cathartic. It is commonly employed in conjunction with senna or the other resinous cathartics, with a

* Dr. A. Duncan.

view of correcting their griping qualities. Soluble tartar has been much recommended as an aperient in maniacal affections. It has also been recommended in dropsy and jaundice.

CHAPTER IV.

II. MEDICINES CALCULATED TO DESTROY OR COUNTER- ACT THE INFLUENCE OF MORBIFIC SUBSTANCES LODGED IN THE ALIMENTARY CANAL.

Anthelmintics.

ANTHELMINTICS are such medicines as have the power of dislodging and expelling worms situated in the intestinal canal. The operation of these remedies is not difficult to understand. Some of them act in the manner of a poison on these animals; others destroy them by a mechanical action on them; others again simply expel them from the bowels, by producing strong purging; and some increase the tone of the digestive organs, and thereby obviate that condition of the stomach and bowels which appears to favour the generation and nourishment of these animals.

There are four species of worms generated in the human intestinal canal. The *tænia*, the *tricocephalus* or *trichuris*, the *ascaris vermicularis*, and the *lumbri-
coides*.

The *tænia*, or tape-worm, is a long tape-like worm,
“formed of a chain of flat articulations, united to-

gether by means of a border or edge varying in breadth and thickness." These links or articulations are possessed of independent vitality, and capable of becoming distinct worms, when left in the intestinal canal.

The *tænia* occasionally grows to an amazing length. Brera speaks of one, preserved in the cabinet of the university of Pavia, which exceeds two hundred and thirty feet. There are two species of *tænia*: the *tænia curcubitina*, or *armed* tape-worm, and the *tænia lata*, or unarmed tape-worm. The former of these species is found exclusively in the human subject. It is exceedingly difficult to dislodge it from the bowels, in consequence of the power it has of insinuating itself into the mucous membrane of the intestines, by means of two small fangs or crotchets with which its head is armed, and from which it derives its specific name. This species of *tænia* is rarely discharged entire; it usually comes away in small pieces, or in single joints, resembling the seeds of the gourd. The *tænia lata* is not furnished with the fangs which characterize the other species, and is, therefore, much more easily expelled from the bowels than the armed one.

The *trichocephalus* or *trichuris*.—This worm is but very seldom found in the human intestines. It was first described by Dr. Wagler, a German writer, about the middle of the last century, who found it in the *cæcum* of some French soldiers who had died of a

contagious epidemic at Göttingen.* It is a very thin spiral worm, from an inch and a quarter to two inches in length. The external surface is marked by a great number of transverse lines, like rings. "One part of the body terminates in a filamentous elongation, as fine as a hair, and coiled round in a very surprising manner; the other part, turning in a spiral form, most commonly terminates in a hook, broad and obtuse, and similar to the pistil of the liliaceous flowers. From this extremity the worm can put forth a sort of tube enveloped in a sheath." It is commonly found in the cæcum or ileum.

The *ascaris vermicularis*, or ascarides, are an exceedingly common worm, and are often discharged in astonishing numbers. They are round, thread-like, very slender, and not more than from a quarter of an inch to an inch in length. They skip and move with very great vivacity, and when touched contract to nearly half their length. The ascarides reside in the large intestines, and are commonly most abundant in the rectum, just within the anus. They are also occasionally discharged from the stomach. Brera states that he found several masses of ascarides in the œsophagus of a woman who had died of a nervous fever. He states too, that this worm is frequently found in the vagina of women. "The ascarides live longer than any other, in the human body. It can exist an

* Brera's Treatise on Verminous Diseases, p. 44.

almost incredible space of time. The nature of the aliment which supports this worm has been the subject of various opinion. But it has at length been observed that the mucous matter which lubricates the intestines and the vagina of women, is the substance for which it has the strongest predilection. Agreeably to this, it is not wonderful that we find the *ascaris vermicularis* in other parts of the body, in which the mucous fluid abounds, as those of the bladder, stomach, œsophagus, &c.”*

The *lumbricoides* bear a strong resemblance in shape to the common earth worm, and were, by Linnæus, regarded as belonging to the same species. This worm is white, sometimes of a flesh colour, and commonly about the thickness of a goose-quill, and perfectly round. “The canal which passes through the abdomen of the worm is yellow and transparent,” which some regard as a characteristic sign of this species. Its length is from four to twelve inches. They are generally situated in the small intestines, but not unfrequently in the stomach, and occasionally in the colon and rectum. “When they have once passed the valve of Bauhin,” says Brera, “we may consider them as destroyed.” They are generally soon evacuated after having passed into the lower intestines. Children are particularly subject to the *lumbricoides*; and they are often discharged, even by very young sub-

* Brera's Treatise on Verminous Diseases, p. 50.

jects, in great numbers. They are sometimes discharged collected together into round balls.

Worms are capable of producing great disturbances in the system. Not only do they aggravate ordinary diseases when they are present, but they also give rise to a great variety of very alarming and anomalous affections. The whole train of spasmodic and convulsive diseases may proceed from the irritation of worms in the alimentary canal. Chorea, epilepsy, catalepsy, tetanus, paralysis, mania, convulsions, as well as a variety of other nervous and convulsive affections, are not unfrequently the immediate effects of this cause. Besides these diseases, worms have also been known to produce pleuritic and rheumatic pains, dysentery, remitting fever, hydrocephalus, consumption, chronic and spasmodic cough, &c. &c. But I must refer the reader to the works on practice, and particularly to Brera's excellent treatise on verminous diseases, for a full account of the morbid effects of intestinal worms.

Although we have no unequivocal signs of the presence of intestinal worms, except their actual discharge either from the bowels or stomach; yet there are certain symptoms which enable us to pronounce, with tolerable assurance, on their presence in the alimentary canal. Among these symptoms the following are the most common and striking: a pale, leaden coloured and occasionally flushed countenance; a bluish streak

under the eyes; these are dull and heavy; the pupils are dilated, or very much contracted; the lower eyelids and upper lip tumefy, especially during the night while sleeping; great itching in the nostrils, which causes the patient to pick his nose; foetid breath; disturbed sleep, during which the patient grinds his teeth, is apt to lie on his belly, to scream out and start up suddenly, as if frightened; tingling in the ears, giddiness; interrupted speech; palpitation of the heart, muscular debility and flaccidity; pulse frequent, corded, and often intermittent; a dry and spasmodic cough; irregular and depraved appetite, being sometimes entirely suppressed, and at others exceedingly voracious; abdomen swelled and hard; diarrhoea or costiveness; unnatural, slimy, and foetid stools; pricking and tearing pains in the bowels; emaciation; convulsions, paralysis, &c.

The above symptoms may be considered as common to all the species of worms that have been mentioned. There are others, however, which are peculiar to some of these species separately, and which it will be proper to advert to in this place.

A pricking and rending pain in the umbilical region; colic, with a rumbling noise in the belly, may be considered as symptoms peculiar to the lumbricoides. This worm is capable of perforating the intestines with the sharp cutting point of its head; and its efforts

to insinuate itself into the mucous coat of the intestines are supposed to cause the pains just mentioned.

The symptoms which are peculiar to the ascarides are: an irritation and intolerable itching and pricking pain in the extremity of the rectum. These worms are usually found in conglobated masses, and although near the extremity of the large intestines, they are exceedingly difficult to remove entirely from their place of lodgment. They sometimes produce inflammation of the rectum, with bloody stools and tenesmus. Swelling and pain of the anus is also occasionally observed as the effects of ascarides.

The symptoms of *tænia*, besides those which have already been mentioned as common to the intestinal worms, are: a sense of weight and pain in the abdomen, accompanied with a burning motion of something alive in the bowels. "Occasional prickings, or rather bitings, are felt in the region of the stomach, the abdomen swells at intervals, and then subsides almost by undulation; a sense of cold from time to time pervades the abdominal viscera. The appetite is usually uncommonly great; his complexion is livid, and he is frequently faint; the pupils are unusually dilated; vertigo confuses the head of the patient and excites vomiting; the legs vacillate, and sometimes the whole body seems to be affected with convulsive trembling. Often small substances resembling the seeds of the lemon or gourd are evacuated with the

fæces of the patient, which are portions of the marginal papillæ of these worms.” It is stated also, by authors, that persons affected with tænia become uneasy and ill whenever they hear music, particularly the music of an organ at church.*

* Brera's Treatise on Verminous Diseases, p. 147.

Particular Anthelmintics.

SPIGELIA MARYLANDICA.—PINK-ROOT.

THIS plant is indigenous to the southern parts of the United States, where it is found in great abundance. It has a perennial root, consisting of numerous fibrous branches, of a yellowish colour when first dug out of the earth, but becoming black on being dried and long kept. The stalk is herbaceous, and grows to the height of from six inches to two feet. *Spigelia* possesses a bland but somewhat nauseous taste. It contains a considerable portion of mucilage, which is precipitated from its decoction by the addition of alcohol. It does not appear to contain any resin. Water extracts its active principles.*

The pink-root is esteemed as a very valuable vermifuge. It was first introduced into regular practice by Drs. Lining,† Garden, and Chalmers, of South Carolina, and it is now more frequently prescribed in this country, for the expulsion of the round worm, than any other anthelmintic we possess. The whole

* Bigelow's Medical Botany, vol. i. p. 144.

† Essays and Observations of Physic and Literature, vol. iii. p. 151.

plant possesses anthelmintic properties; the root, however, is by far the most powerful portion of it.

Dr. Garden states, that the *spigelia* is much more active in its recent state than when old; by very long keeping it loses nearly all its active qualities.

Dr. Thompson* took large doses of this root, and found it to produce acceleration of the pulse, flushed face, drowsiness, and a sensation of stiffness of the eyelids. It is now ascertained beyond a doubt, that this plant possesses narcotic powers, capable of producing unpleasant and even alarming symptoms, when taken in very large doses. I once had a little patient, in the commencement of my practice, to whom I administered this medicine in very large and frequent doses, and the effects were such as clearly demonstrated its narcotic powers. The child, a boy about six years old, after having taken three or four gills of a strong decoction of the root, was suddenly affected with complete mental derangement. The derangement was precisely of that kind which is sometimes produced by the seeds of *stramonium*, and of which I have seen an example. He distorted his countenance into a variety of shapes; was affected by alternate fits of laughing and crying, and run and skipt about the room incessantly. The pupils of his eyes were greatly

* An Inaugural Dissertation on the *Spigelia Marilandica*, by Hodge Thompson. Philadelphia, 1802.

dilated, and his talk was wild and incoherent. These symptoms went off in the course of about twenty-four hours, and left him quite as well as he had been before he took the pink-root. I have, however, since, prescribed this medicine in a great number of instances, and have not, except in one case, seen any ill effects from it, and in this instance it only produced slight giddiness, with dimness of sight, and dilatation of the pupils.

The pink-root may be given either in powder, or in decoction. The latter mode of using it is, however, the preferable one, as the medicine is much more rapidly and equably diffused through the intestinal canal when in a liquid form than when given in a powder. The powder is given to children in doses of from ten to twenty grains. A pint of the decoction made from an ounce of the root should be given in the course of four, five, or six hours. It is usual to combine senná with the pink-root in order to procure the expulsion of the worms as soon as they have been destroyed or weakened by this anthelmintic. It is better, however, to give the spigelia by itself, and to exhibit a strong mercurial purge immediately after the medicine is taken. Given in this way it will seldom fail to bring away worms, if there are any present. The pink-root possesses purgative properties; but these are both uncertain and feeble. It is said to be most active when recently dried, and that its efficacy

is always impaired by keeping longer than six months.* The root possesses more activity than the other parts of the plant.

MELIA AZEDARACK.—THE PRIDE OF CHINA.

THIS beautiful and stately tree was originally brought from Japan, and is now naturalized to most of the countries of Europe, and to the southern parts of the United States.

It appears from the testimony of some of our southern physicians, that the fresh bark of the root of this tree possesses very active anthelmintic properties. Dr. L. Kollock, vice-president of the Georgia Medical Society, speaking of the vermifuge powers of this tree, says: "It is a vermifuge of efficacy. Its use is in some measure general among the planters, and with many supersedes the use of all others. I have given it with success where all others in common use have failed of relieving. But when given in the months of March and April, while the sap is mounting into the tree, it has sometimes been followed by stupor, dilatation of pupil, stertorous breathing, subsultus, &c. But these symptoms, like those sometimes produced by spigelia, pass off without any perceptible injury to the

* Bigelow's Amer. Med. Bot. p. 146.

system. This article, like the spigelia, is also a useful febrifuge medicine, in those affections usually denominated verminous fevers, but where no worms are voided. The common form is that of decoction. A large handful, say about four ounces, of the bark of the fresh root, is boiled in a quart of water, till it acquire the colour of strong coffee, i. e. to about a pint, of which from half an ounce to an ounce may be given every two or three hours till it operates. Given in this manner its operation is powerful, sometimes producing both vomiting and purging." The late professor Barton had a very high opinion of the vermifuge powers of this tree. He considered it as the most valuable anthelmintic with which we are acquainted.* The berries have also been employed with success as an anthelmintic. Children are suffered to eat them, "without any particular regard to the dose," and it is stated by some, that they are quite as efficacious as the bark of the root. The pulp of the fruit made into an ointment with lard, has been employed with success in tinea capitis.†

* Collections for an Essay towards a Materia Medica of the United States, P. ii. p. 53.

† Thatcher's Dispensatory, p. 283.

CHENOPODIUM ANTHELMINTICUM.—JERUSALEM OAK.

THIS is a native of Buenos Ayres, and of different parts of the United States. It has been much praised for its anthelmintic powers, and from no inconsiderable experience with it myself, I am fully satisfied that it is worthy of very considerable attention as a vermifuge. The leaves and stalks are bitter, and possess “a good deal of aromatic acrimony.” Every part of the plant is endued with active properties, but the seeds are decidedly the most powerful. The juice of the fresh leaves are occasionally employed in the dose of a table-spoonful two or three times a day, for children under five years old. Given in this way, however, it is exceedingly unpleasant, and very few children can be induced to take it. I have employed the juice in a few instances with much advantage. The best, and, indeed, usual form for giving this remedy, is the powdered seeds, made into an electuary, with syrup. From twenty to forty grains of the seeds may be thus taken two or three times a day, by a child four or five years old. It is usually directed to be given early in the morning, before eating, and again in the evening, some hours after supper.

The seeds of the chenopodium contain an essential oil, which has been lately much recommended in cases of worms. It is, indeed, an exceedingly active ver-

mifuge; I have, in many instances, succeeded in expelling numbers of lumbrici with it, after various other anthelmintics had been repeatedly tried in vain. A child two or three years old may take from three to eight drops twice a day, mixed with a good deal of sugar or mucilage. After it has been given for three or four days, some brisk purgative medicine should be administered. The oil, like the expressed juice, is very offensive both to the taste and smell, and this forms a very great obstacle to its employment with children. Where it can be regularly given, however, it is unquestionably one of the best anthelmintics of which we have any knowledge.

GEOFFRÆA INERMIS.—CABBAGE-TREE.

THE bark of this tree, a native of Jamaica and other West India islands, has been lately introduced into notice, as a vermifuge of very great powers. It is of a grey colour externally, and of a dark brown or black and furrowed appearance on the inside. It has a sweetish and mucilaginous taste, and a pretty strong unpleasant smell.

This article is prescribed either in the form of powder, or decoction, or of extract. The decoction is, however, most commonly employed. It is made by

boiling one ounce of the bark in a quart of water, till it acquires the colour of Madeira wine. Brera states, that it is more efficacious when it is combined with valerian. He says that he has employed it with great efficacy against lumbricoides and the ascarides.

When given in full doses, it often produces nausea and occasionally vomiting. If the dose is too large its effects are sometimes very violent, producing strong vomiting and purging, delirium and fever. It should, therefore, always be commenced with in small doses; and when carefully administered, it is said by those who have tried it, to be a very powerful vermifuge. It is more particularly useful for the expulsion of the lumbrici. Of the decoction two table-spoonfuls may be given to an adult two or three times a day; the powdered bark is given in doses of about half a drachm; of the extract, from three to four grains are considered a full dose. It is said by some that cold water, drank during the employment of this remedy, is apt to occasion very alarming effects. When fever, delirium, or other disagreeable effects arise from its use, relief may be obtained by drinking warm water, vinegar, or castor oil.

DOLICHOS PRURIENS.—COWHAGE.

THIS plant grows in considerable abundance in the East and West Indies. It bears pods, thickly beset on the outside with stiff hairs, which, when applied to the skin, occasion a most intolerable itching. These hairs, by their mechanical action on worms, are a safe and effectual anthelmintic. It appears that this article is equally useful against every species of intestinal worm. When used for the expulsion of the tapeworm, it ought, however, to be given in at least double the quantity which is usually directed in cases of lumbricoides. In cases of ascarides, I have, in some instances, employed this article with much benefit. Against whatever species of worm it be employed, however, it should always be preceded by one or two cathartics, as its efficacy is commonly much increased by this practice, probably by exposing the worms more to the action of this substance. The proper mode of giving the cowhage is, to mix it with molasses or syrup, into a thick electuary. Of this a tea-spoonful may be given to a child two or three years old, and repeated in the morning and evening for three or four successive days. The dose for an adult is a table-spoonful of the electuary. It appears to be quite a safe remedy, and I am persuaded from my own experience, that it is often very effectual. Mr. Chamberlain says, that

one of his children about five years old, "took, by stealth, three or four ounces of the syrup of cowhage, without any other inconvenience than a diarrhœa, which did her more good than harm."*

The root of this plant is said to possess very valuable diuretic properties; and a vinous infusion of the pods (12 to a quart) is stated to be a certain remedy for the dropsy.† Dr. Collier, of London, in a late number of the London Medical and Physical Journal, proposes scattering some of the *pubes dolichi prurientis* over the body, for the purpose of rousing the system in cases of poisoning by narcotics. The effects are said to be sudden and powerful.

ARTEMISIA SANTONICA.

THE seeds of this plant, are an excellent anthelmintic. They have a bitter and subacid taste, and a moderately strong and disagreeable odour. They contain a large portion of an essential oil, upon which their activity appears entirely to depend.

* Coffin's translation of Brera's work on Verminous Diseases, p. 301. See also Chamberlain's Practical Treatise on the efficacy of Cowhage, &c. 1785.

† Thatcher's Dispensatory.

They are prescribed in substance, in infusion, in the form of an electuary, and in that of an extract. The dose for children under five years, is from four to eight grains, and for adults from two scruples to a drachm, two or three times a day. The following is an excellent formula for giving these seeds. "Take an ounce of pulverized semen santonicum, and of black sulphur of mercury, resin of jalap, and of powdered cinnamon bark, three scruples, white sugar seven ounces; dissolve these in water and boil to a consistence, mix the whole, and form the mass into boluses. The dose for a child is from one to two drachms."

POLYPODIUM FELIX MAS.—MALE FERN.

THE roots of this fern has been long celebrated as an efficacious anthelmintic. Pliny,* Theophrastus, and Galen,† prescribed it against tæniæ, and lumbricoides; and it is still considered by many practitioners as a remedy of very important vermifuge powers. Its employment is, however, at present almost exclusively confined to cases of tænia; and there is much testimony extant of its efficacy against this species of worm.

* De Simplici Medicina, lib. viii.

† Opera, lib. xxviii.

The powder of this root forms the basis of the celebrated specific of Madame Nouffer.*

When administered in substance it is given in doses of from one to three drachms, followed by a full dose of some active cathartic. In this way I have employed it in four or five instances, but never with any advantage. I have, however, known it to be used with perfect success in the practice of other physicians. The French commissioners who were appointed to examine the remedy of Madame Nouffer, assert that it will not destroy the armed *tænia*. Brera and others, however, contradict this statement. "I have had several patients attacked by armed *tænia*," says Brera, "who were happily cured by this remedy." He states, in a note, that he cured seven patients affected with armed *tænia* by Nouffer's method. Herenschwand, a German physician, had employed the male

* The secret of this remedy was purchased by Lewis XV. of France. The following are the directions given for using it : Take three drachms of the root of the *felix mas*, reduced to a powder, mixed with four or six ounces of water. The whole is to be swallowed by the patient, in the morning, on an empty stomach. For children the dose is lessened to one drachm of the powder. If this produces nausea, the patient must inhale the odour of strong vinegar. Two hours after the powder is taken the patient is to swallow the following bolus : take submuriate of mercury, and dry resin of scammony, of each twelve grains, and five grains of gamboge ; let them be finely powdered and formed into a bolus, and taken at one dose.

fern before Madam Nouffer's secret was known, in a way very similar to her method. His mode of using this remedy, is to administer two drachms of the male fern root two successive mornings and evenings, and on the third day a cathartic composed of "twelve grains of gamboge, thirty of carbonate of potass, and two grains of turpentine soap, dissolved together in a cup of water." Three hours after an ounce of ol. ricini is to be given and repeated in an hour; if the worm does not come away, another dose of the castor oil must be given in two hours after. "But, if the worm be still not discharged, a clyster of equal parts of milk and water, and three ounces of oleum ricini must be injected towards evening, by which means the worm will come away entire and with ease." This plan of treatment has been found very efficacious by some physicians.

CAMPHORA.—CAMPHOR.

CAMPHOR has been a good deal prescribed as an anthelmintic. Brera and others extol it very highly. "Of all the remedies for the expulsion of the lumbricoides," says Brera, "there is no one, according to my observations, which is more active or more certain than camphor. This substance, administered

according to rule, expels lumbricoides with facility and promptitude, and at the same time strengthens the intestinal tube and the whole body.”* Pringle states that he found this remedy exceedingly efficacious in verminous diseases; and Moscate, as we are informed by Brera, generally preferred camphor to other anthelmintics in cases of lumbricoides. “The employment of camphor,” says Brera, “is also attended with this precious advantage, that it counteracts the predisposition to the further development of verminous seeds. I have always used it with great success, and I cannot too strongly recommend its use to physicians, in worm complaints.”† Camphor has also been used with success against tænia. Vogel expelled one of these worms, of great length, by administering camphor in the form of pills and enemata.

Camphor is most conveniently given in an emulsion with gum arabic and sugar. By triturating camphor with carbonate of magnesia, we greatly increase its solubility in water. Two or three grains may be thus dissolved in an ounce of water, and if sugar be added to this solution it forms an elegant and efficacious medicine in the worm affections of children. It is sometimes given in combination with asafœtida, semen santonica, valerian, &c.

* Treatise on Verminous Diseases, p. 299.

† Ibid. p. 199.

The dose of camphor varies from one grain to thirty, according to the age and strength of the patient.

OLEUM TEREBINTHINÆ.

A GREAT deal has lately been said concerning the vermifuge powers of the spirits of turpentine. Its efficacy in the expulsion of *tænia* has been so frequently attested, that we can no longer doubt of its excellence in this respect.

On the continent of Europe, the spirit of turpentine has been for many years prescribed in verminous affections. In England and in this country, however, its introduction into practice as a vermifuge, is of recent date. It was first noticed in England as a remedy against *tænia*, in a letter from Dr. John R. Fenwick, of Durham, to Dr. M. Bailie, and published in the *Medico-Chirurgical Transactions* for 1811. Three cases are mentioned by Dr. Fenwick, in which the turpentine was successfully administered. Many other cases have since been related in the periodical journals, which demonstrate the powers of this remedy against *tænia*. When employed for the expulsion of this worm it should be given in large doses. From one to three ounces are commonly administered at once. Before the turpentine is taken the bowels

should be freely evacuated by some active purgative medicine. "Whatever quantity it may be thought proper to give at one trial of the remedy should usually be given in one dose. Three ounces of the spirit of turpentine taken at once will be more likely to destroy the worm or worms, than the same quantity taken one third at once repeated after an interval of one, two, or three hours, and will be much less tedious to the patient."* When given in large doses it generally passes through the bowels in a short time, and is consequently less apt to be absorbed, and to affect the urinary organs than when employed in small doses. If it does not move the bowels in three hours after it is taken, a large dose of castor oil should be given. Dr. Coffin says, that as soon as it begins to be discharged per anum, "whether the worm appear or not, the patient should be permitted to drink freely of any bland suitable liquid." The turpentine is also an active remedy against the lumbricoides. When employed for the destruction of these worms, however, it may be given in much smaller doses than is necessary for the expulsion of tænia.

Dr. Klapp, of this city, in a paper on worms in the stomach, adduces a number of examples of the value of this remedy as a vermifuge. He gave it in doses of from twelve to fifteen drops every four, five, or six

* Coffin's translation of Brera's Treatise on Verminous Diseases, p. 250.

hours, occasionally interposing a mercurial cathartic.* It acts with peculiar advantage when the worms are situated in the stomach. In several instances of verminous affections, attended with a soreness in the epigastric region, sickness of the stomach after eating, vertigo, a dry short cough, foul breath, and an occasional choking sensation in the throat, I have administered turpentine in doses of from fifteen to twenty drops, and continued for three or four days with the most complete success. The worms are usually discharged in a dissolved state. Under the head of Stimulants I shall again have occasion to speak of this article.

Many other vegetable substances have been recommended for their vermifuge powers. Of these the following are the principal: *allium cepa*, *angelica*, *asafoetida*, *juglans regia*, *tanacetum vulgare*, *valeriana officinalis*, *veratrum sabadilla*, *caria papaya*, *pomegranate*.

According to Schmucker, the *veratrum sabadilla* is a very powerful vermifuge; it is, however, apt to produce violent symptoms, and ought, therefore, to be employed with great caution. Garlic also possesses strong anthelmintic properties. Taken on an empty stomach, in the morning, in the form of decoction, it seldom fails to expel lumbrici, if any be present.

For the expulsion of ascarides, anthelmintics ought

* American Medical Recorder, vol. iii. p. 155.

to be administered both by the mouth and in the form of injections. Clysters are, indeed, indispensable in cases of this kind. Aloes dissolved in water and thrown into the rectum, is an excellent remedy against these worms. The infusion of semen santonici, is also highly recommended for this purpose. Mr. C. M. Clark says, "a strong decoction of the sem. santon. is the most efficacious of all the injections in use."*

A very effectual mode of destroying these worms is to introduce a large bougie or tent into the rectum, smeared with mercurial ointment. Dr. Coffin says, that a friend of his who suffered violent irritation in the rectum from these worms, obtained complete relief by introducing a bougie, covered with whale oil, into the rectum.

STANNUM.—TIN.

TIN is a remedy of very considerable powers as an anthelmintic. Of its efficacy against tænia as well as against the lumbricoides, there is abundant evidence extant. Alston, a Scotch physician, was the first who prescribed it for the expulsion of tænia.† Dr. J.

* Diseases of Females, p. 109.

† Medical Essays and Observations, by a society at Edinburgh, vol. v. p. 87.

Fothergill also, speaks in high terms of its powers against this worm. He recommends an ounce of the filings to be given for six days in succession, and a purgative to be taken on the seventh.* Dr. Brera observes, that in cases of old, large armed *tænia*, he has known the method of Nouffer to be ineffectual, and that in these instances the filings of tin regularly administered, produced the desired effect with promptness. Tin appears to be most efficacious when given in the form of filings. These are given in doses of from half a scruple to an ounce, formed into an electuary with honey or syrup. It should be continued for several days, and occasionally suspended for the purpose of interposing a purgative. Brera says, that he has used this metal in the form of Guy's powder of Ethiopia, with great success.† He observes

* Med. Obs. & Inq. vol. vi. p. 71.

† The following are the directions given for making this powder: "Take seven ounces of pure rasped tin, an ounce of mercury, a drachm of sublimed sulphur, triturate the whole thoroughly in a mortar to a very fine powder. The dose is from twenty to thirty grains twice a day." Tin forms a principal part of the vermifuge of Mathieu. This man received the title of counsellor of the court as well as a large pension for life, from the king of Prussia, for making known his method of expelling *tæniæ* from the bowels. This remedy consists of two electuaries; the first marked A. the second B

"*The First Electuary, A.* Take an ounce of very fine English tin filings, six drachms of the root of the polypodium filix

also: "The aurum musivum, is one of the most efficacious remedies employed against tæniæ, particularly

mas, half an ounce of semen santonicum, a drachm of the resinous root of jalap, and of sulphate of potass, and of honey sufficient to make an electuary.

Second Electuary, B. Take two scruples of the pulverized resinous root of jalap, and of sulphate of potass, one scruple of scammony from Aleppo, ten grains of gamboge, and of honey sufficient to form an electuary.

Those who may be inclined to adopt this method to expel tæniæ, must observe the four following rules:

1. For some days previous, the patient is to be confined to a suitable diet, that is, he is to eat salted substances,—for example, herrings, light porridges and broths, and leguminous articles.

2. The treatment is begun by administering to the patient, every two hours, a tea-spoonful of the electuary A. This course to be continued two or three days, till the worm is perceived to be in the intestines, and then,

3. The patient is to take electuary B, and of this he also takes, every two hours, a tea-spoonful, till the worm is expelled.

The discharge of the worm is facilitated by taking some spoonfuls of fresh oleum ricini, or by some clysters of the same oil.

4. The age, sex, and temperament of the patient may require a considerable modification of the dose of these remedies; for this reason the treatment ought to be directed and modified by a well informed physician.

Finally, it is to be borne in mind that the virtue of the electuary A. depends in great part on the root of the polypodium filix mas; hence this root should be fresh, and its internal hard part only should be reduced to powder.

This powder will have a reddish colour; *see Hartenkiel, Medicinisch-chirurgische, Zeitung, 1800, 2 Band, p. 293."*

the armed *tænia*. This preparation, more active than the powder of Guy, ought to be thus compounded. Melt twelve ounces of very pure tin, and add to it three ounces of mercury; let the mixture cool, triturate it in a mortar to a very fine powder; while triturating the mixture, add seven ounces of sublimed sulphur and three ounces of muriate of ammonia. The dose is ten grains twice a day.*

HYDRARGYRUS.

MERCURY possesses the power of destroying intestinal worms, and has been much employed by physicians for this purpose. Formerly water boiled on mercury was recommended as a remedy against lumbricoides. Many reports have been made in favour of its vermifuge powers when administered in this way; but as mercury seems to be entirely insoluble in water, the decoction is now universally neglected as an inert remedy. Calomel, however, is certainly a very useful anthelmintic.† Given in minute and re-

* Treatise on Verminous Diseases, p. 344.

† "Many of the nostrums advertised for the cure of worms, contain calomel as their principal ingredient, combined with scammony, jalap, gamboge, or some other purgative; they are uncertain and dangerous medicines; the method of exhibiting

peated doses, it seldom fails to destroy the lumbrici. Were it not for its tendency to affect the mouth, it would be a very important vermifuge in children, as it may be more conveniently administered than any other medicine.

To children, from one fourth to half a grain may be given night and morning, for three or four days, and a purgative given when the medicine is discontinued. The corrosive sublimate has also been pre-

pared in the form of lozenges (*worm cakes*;) is also attended with inconvenience, for the sugar and the gum generating an acid, by being kept in damp places, may considerably increase the acrimony of the mercury; besides which, the calomel is frequently diffused very unequally through the mass, one lozenge may therefore contain a poisonous dose, whilst others may scarcely possess any active matter.

Ching's Worm Lozenges.—These consist of *yellow* and *brown* lozenges, the former are taken in the evening, the latter the succeeding morning.

The Yellow Lozenges.—Saffron \mathfrak{z} ss, of water oj. boil, and strain; add of white panacea of mercury (calomel washed in spirit of wine) \mathfrak{l} bi. white sugar, 28lb. mucilage of tragacanth as much as may be sufficient to make a mass, which roll out of an exact thickness, so that each lozenge may contain one grain of panacea.

The Brown Lozenges.—Panacea \mathfrak{z} vii. resin of jalap \mathfrak{l} biiss. white sugar \mathfrak{l} bix. mucilage of tragacanth q. s. each lozenge should contain gr. $\frac{1}{2}$ of panacea.

Story's Worm Cakes.—Calomel and jalap made into cakes and coloured by cinnabar."—*Paris' Pharmacol.*

scribed as a vermifuge; but its extremely unpleasant taste renders it difficult to give to young patients. The ammoniacal muriate is said to be a very efficacious form for giving this remedy. The sulphate and sulphur of mercury have also been recommended as useful against worms. The mercurial preparations are frequently given in combination with other vermifuges.

There are many other mineral substances recommended in books, as possessing useful anthelmintic powers. The principal of these are, arsenic, sulphur, iron, muriate of barytes, muriate of ammonia, and muriate of soda.

CHAPTER V.

Antacids.

ANTACIDS are substances which obviate acidity in the alimentary canal. The action of these remedies is purely chemical, "as they merely combine with the acid present, and neutralize it."*

In a perfectly healthy state of the digestive organs, no acid is, perhaps, ever generated in the alimentary canal. As it, however, frequently happens even in the most temperate, that digestion is retarded or enfeebled, the aliment taken in is often subjected to chemical changes, producing acidity and flatulencies. While these changes go on in a moderate degree only, the system does not, in general, experience any particular inconveniences from them. When, however, the evolution of acid is great, or has become habitual, a train of various and distressing symptoms generally ensue.

Acid does not, however, always depend on a chemi-

* Murray's Mat. Med.

cal change in the substances received into the stomach. It has, in fact, been well ascertained that this acid is usually different from that which is formed by vegetable fermentation. It appears to be of a peculiar character, depending often on a morbid secretion in the stomach. Still, however, as the generation of acid in the primæ viæ is very often accompanied by the evolution of large quantities of air, it would appear to be pretty certain that fermentation does take place in the stomach and bowels, and that the acid depends on this cause. "Acid," says Richter, "in the primæ viæ, is certainly of two kinds, arising from two different causes. It is sometimes plainly the consequence of a *corruptio spontaneæ*, of acids taken by the mouth, or of meat and drink which have become sour; and in this case it only incommodes the patient when he has taken such meat or drink; it is easily and constantly blunted by alkaline or absorbent medicines, and keeps away as long as the patient carefully uses *diæta antacida*. Medicines which strengthen the system, with an antacid diet, generally cure the patient of this acid. But sometimes the patient is incessantly tormented with acid, eat what he will, even though he only takes animal food. None of the medicines which blunt acidity are of any service, or they only procure him a short mitigation. And in this case the acid is not the produce of a *corruptio spontaneæ*, but a *secretio perversa*

liquorum menstruorum. The patient, as Kæmpf says, has a brewery of vinegar in his stomach.”*

The secretion of uric acid by the kidneys, is much influenced by the presence or absence of acidity in the stomach. An accumulation of acid in the primæ viæ is almost invariably attended with an abundant secretion of the uric acid; and hence, we find alkaline remedies among the most useful for counteracting the lithic acid diathesis.

The existence of acid in the stomach, produces, in some, a very troublesome itching in the skin. I have seen several persons who always experienced such an itching in the skin, whenever they were troubled with acid in the stomach; and who invariably obtained relief from a dose or two of magnesia.

The connection between acidity in the stomach and gout, has often been observed. “Acid,” says Dr. Scudamore, “when much accumulated in the primæ viæ, will always powerfully concur with the other causes to excite a fit, and will sometimes prove alone sufficient. I have met with several instances, in which the discharge of acrid fluid from the stomach has produced immediate and very sensible relief.”†

In children, acidity in the bowels is very often the cause of much uneasiness and distress. Whenever

* Medical and Surgical Observations, p. 190. See also the article *Asafœtida*, in this work.

† Scudamore on Gout, p. 57. Philad. edit.

we discover the stools to be of a grass-green colour, we may be assured of the existence of acid in the primæ viæ. The bile, in its natural state, is not green, but pale yellow. The green colour which we often observe it to possess in the discharges of infants, depends on the action of the gastric acid upon it. The efficacy of the common practice of giving cretaceous powders, when the stools have this grass-green appearance, depends on their property of obviating acidity.

LAPIDES CALCARIÆ, ET TESTACEA.

CALCAREOUS substances are among the most useful articles of this class of remedies. Of these there are a great number, the most important of which are the following:

Creta præparata.—This is a very useful antacid, and much employed in diseases of children depending on acidity and relaxation of the alimentary canal. It is, indeed, particularly serviceable in the chronic bowel complaints of infants, whether acid or not be present. The usual mode of prescribing it is in union with gum arabic, opium, cinnamon, catechu, &c.*

* This is a very useful formula for checking diarrhœa depending on acidity.—℞ pulv. cretæ. co. cum opio. ℥i. pulv. catechu extract gr. xv. Sit pulvis, post singulas sedes liquidas sumendus.

Testæ Ostrearum.—Pulverized oyster-shells are an excellent antacid and absorbent. They are given with bitter or aromatic articles, in debility of the digestive organs, attended with sour eructations and other gastric affections arising from acidity. De Haen states that he cured rachitis, by giving twice a day twenty grains of powdered oyster-shells. This article has also been recommended as very beneficial in the debility and dyspepsia, which arises from excessive onanism.* It may be given in doses of from ten grains to two drachms.

Oculi Cancrorum.—These are small hemispherical calcareous bodies, found on each side of the stomach of the *cancer astacus*, during the month of August. They consist of carbonate of lime and animal gelatine. They are slowly soluble in vinegar. This article has been much used in affections arising from acidity of the first passages. It has been recommended as particularly serviceable in disorders of the urinary organs, depending on this cause. I presume, however, that it is not superior, in this respect, to any of the other calcareous articles of this class. Gaubius and others, recommended it as useful in leucorrhœa, especially when this complaint is accompanied with acid in the primæ viæ.† It has been stated by some German

* Burdach, *Arznei. m. l. vol. ii. p. 504.*

† Shippers, *über eine besondere wirkung der krepsaugen beym weisen flusse*—in *Sammlg. auserl. Abhh. xviii. B. I. 471.*

writers, to be apt to excite hæmorrhages, and we are, therefore, cautioned against employing it where there is much disposition to hæmorrhage. I have no idea, however, that there is any foundation for this opinion. This substance is given in doses of from twenty grains to a drachm.

Aqua calcis.—Lime water is an efficacious corrective of acidity in the first passages. In dyspepsia, attended with acid eructations, and in chronic diarrhœa, this article is often of great service. It is usually given with milk, in doses of from two to four ounces, three or four times a day. Of the various remediate powers of this preparation, and especially of its utility in counteracting the lithic acid diatheses, I shall have occasion to speak when I come to treat of Antilithics.

MAGNESIA ALBA.

MAGNESIA unites readily with the acid generated in the stomach, and is especially serviceable in all cases of acidity attended with a torpid state of the bowels. Where, however, diarrhœa, and a very irritable state of the intestinal canal exists, it is much less useful than the calcareous antacids already mentioned, since it acquires pretty active purgative qualities when united with an acid. In the bowel complaints of infants, at-

tended with green and griping stools, magnesia combined with rhubarb, has long been a favourite remedy with practitioners.

CARBONAS POTASSÆ ET SODÆ.

THE fixed alkaline salts are the most perfect neutralizers of acids. They have accordingly been much prescribed in affections attended with accumulations of acid in the stomach and bowels; as they are, however, much less pleasant and not more efficacious than magnesia, in the diseases which depend on this cause, a preference is generally given to this latter substance. In dysentery, attended with acid eructations, or other symptoms denoting acidity in the alimentary canal, the carbonate of potass has been particularly recommended by Causland and Rademayer. Dr. Mitchill, of New-York, also speaks highly of the alkaline medicines in this disease. The dose of these carbonates is from five to twenty grains.

CHAPTER VI.

B. MEDICINES WHOSE ACTION IS PRINCIPALLY DIRECTED TO THE MUSCULAR SYSTEM.

I. Medicines calculated to correct certain morbid conditions of the system, by acting on the tonicity of the muscular fibre.

TONICS.

THESE are medicines which impart vigour and tone to the system, without materially increasing either the heat of the body or the frequency of the pulse.

Cullen thought that the tonic power of substances is specifically the same principle which gives them their bitter taste. That this opinion is, however, without foundation, is at once evident from the fact, that some intensely bitter substances do not possess the least tonic virtues, whilst, on the other hand, some very valuable tonics are entirely destitute of bitterness. Thus opium and digitalis, though very bitter, have no tonic properties; and some of the metallic preparations are tonic, though void of bitterness.

The action of tonics, unless taken in very large doses, is not manifested by any immediate and obvious excitement. The vigour which they impart to the system, is the result of a slow operation on the animal economy, and altogether different in its character from that temporary augmentation of force which is the immediate consequence of the operation of stimulants, properly so called.

When tonic remedies are employed in a debilitated state of the system, their operation is evinced by a gradual and permanent increase of the force of the circulation; an invigoration of the digestive powers, and of the general energies of the animal economy.

There are three ways in which these remedies may produce their tonic effects on the system. 1. They may increase the strength of the system, by improving digestion, and thereby giving rise to a more abundant and healthy formation of chyle. That debility and disease may arise from an imperfection of the chyle, there cannot be the least doubt. Out of this fluid every other fluid and solid part of the system is ultimately formed; and we may, therefore, conclude that any deviation from its healthy state, must interfere with the regular operations of the animal economy. It is evident, therefore, that whatever substance has the power of restoring the digestive energies of the stomach, and thereby the healthy condition of the chyle, will, by this effect alone, give health and vigour to the

body. 2. Tonics may also impart tone to the system, by exciting a peculiar action in the part to which they are immediately applied, and thence propagating a similar action to the other parts of the body, through the medium of the nervous system. The effects of impressions on the stomach are often manifested in other parts of the body in an exceedingly violent and sudden manner. Debility, syncope, and even death are sometimes suddenly produced, simply by the action of indigestible food on a weak stomach. Seeing, therefore, such violent affections excited by articles that suddenly resist or prostrate the energies of the stomach, there is reason to believe, on the contrary, that whatever has a tendency to give vigour to this organ, will communicate a corresponding vigour to the general system.* 3. Finally, tonics may strengthen by being absorbed into the circulation, and by thus acting directly on the whole organization, through the medium of the blood. That remediate substances are carried into the circulation, is a fact which is, I trust, established by what has already been said on this head in the first chapter; and there can be no reason why a tonic substance absorbed into the circulation, should

* Qui stomachum regem totius corporis esse
 Contendunt, vera niti ratione videntur.
 Hujus enim validus firmat tenor omnia membra:—
 At contra ejusdem franguntur cuncta dolore.

Serenus Samonicus, De Med. Precept.

not produce the same invigorating impressions on the parts with which it comes in contact whilst circulating in the blood, as when applied to the surface of the stomach, the rectum, or skin. That they do in fact operate in this way, is further rendered probable by the new qualities which some of these substances impart to the urine and the other excretions.

The remediate effects of these medicines are, however, not to be exclusively referred to any one of these modes of influencing the animal economy. Tonics, no doubt, generally act, at once, in all these ways.

Although tonics do not produce any very evident excitement in the system, yet they have an obvious tendency to increase the inflammatory diathesis, and they are, therefore, as a general rule, inadmissible wherever there is any tendency to inflammatory action in the system. It is, indeed, at once obvious, from the general effects of these remedies, that the diseases of debility alone are those in which they may be employed with advantage or propriety. As a general axiom this undoubtedly holds good; yet experience has demonstrated that tonics may sometimes be used beneficially in cases attended with an evident phlogistic condition of the system, as in the declining stage of gout and rheumatism.

As I shall have occasion to speak fully of the therapeutic application of tonics when treating of the particular articles of this class, I will not pursue this

subject any further, but proceed at once to the consideration of the individual tonics.

CINCHONA.

THE cinchona is unquestionably the most important tonic we possess, and justly ranks among the most useful and indispensable articles of the *materia medica*.

Its introduction into regular practice is said to have occurred in the following manner. In 1640, the lady of the *Count of Cinchon*, viceroy of Peru, was affected with a tertian intermittent, which resisted every mode of treatment that her physicians could devise. Being, at length, nearly exhausted by the disease, she was advised by the governor of Loxa, who had been made acquainted with the febrifuge virtues of this bark by an Indian, to use it as a remedy for her disease. She took it, and the complaint very soon disappeared. The event of this case spread its reputation rapidly throughout Spain, whence it was carried into Italy by the Jesuits, where it was gratuitously distributed among the poor sick at Rome, by cardinal de Lugo, and his physician Sebastian Baldo. This latter person has the credit of having written the first work on this valuable remedy.* Its fame now rapidly

* Alibert.

extended itself through France, Germany, England, &c. and, although much opposed on all sides, the value of its powers was finally established on the testimony of almost universal experience. The name *Cinchona* was given to this substance by Linnæus, in commemoration of the incident mentioned above. It was also long known by the name of Jesuits' powder, in consequence of its having been first brought into Europe and extensively employed by the Jesuits.

The genus *cinchona* is a very extensive and remarkable family of trees, of the natural order *rubaceæ*; and of the class pentandria, order monogynia, of Linnæus. It grows on mountains, and is never found in the plains. Until of late a great deal of confusion and uncertainty existed with regard to the natural history of this family of trees; and, indeed, there still exists no inconsiderable perplexity on this subject.

The different varieties of bark, as they occur in commerce, appear to be made up of a considerable number of distinct species, and are assorted into the *pale*, the *red*, and the *yellow*.

The *pale* or grey bark of the shops, is principally derived from the *cinchona condaminea* of Humboldt and Bonpland. This is the *cinchona officinalis* of Linnæus, and the *cinchona lancifolia* of Mutis, which latter is the name adopted in the London pharmacopœia. This species of *cinchona* is found in abundance in the province of Loxa, and in the neighbourhood of

Guancabamba and Ayavaca, in Peru. Bonpland asserts that this is by far the most valuable species of bark, and from its acknowledged superiority the Spaniards have given it the name of *cascarilla fina*.

The *cinchona condaminea* consists of very slender, doubly rolled pieces, not more than a line in thickness, of a brown colour externally, and of a cinnamon colour internally. The epidermis is marked by fine transverse cracks, and readily scales off in small laminae, and is of a much deeper brown than the parts beneath, which are of an orange yellow. Its fracture, when good, is not fibrous or powdery, but even and somewhat shining. It has a faint aromatic odour, and when chewed becomes very bitter and astringent. Besides this species, there are others which frequently go to make up the *pale* bark of commerce. Bonpland and Humboldt inform us that the *cinchona scrobiculata*, a species found very abundantly in the province of Jean de Bracomoras, forms a very great portion of the pale bark. There is another species, the *cinchona nitida*, which is occasionally mixed with the *c. condaminea*. The *c. nitida* is considered as the most valuable of the pale barks, and is now but seldom met with. Indeed, we are informed that the *condaminea* is daily becoming scarcer, and it would appear from the account given by Humboldt and Bonpland, that the greater part of the *pale* bark, consists now principally of the *c. scrobiculata*.

Yellow bark.—This is the *cinchona cordifolia* of Mutis; the *pubescens* of Vahl, and the *ovalifolia* of Humboldt. This species grows in cold mountainous regions, and is particularly abundant in the provinces of Loxa and Cuenca.

This bark comes to us in pieces of about six inches in length, not so much rolled up nor so thin as the preceding kind. Its internal surface is straw-coloured, becoming of deeper yellow when dipt in water; it is not so heavy and less compact than the pale bark. When chewed it is very bitter, possessing considerable astringency, with little or no odour. “Its decoction, when hot, is redder, but when cold, paler. Its solution strikes a deeper colour with sulphate of iron. It contains more of the active constituents than either of the others, but less gum than the preceding species; according to Mutis, it is the only one which is directly febrifuge, and we are informed by Humboldt, it is that which is most esteemed at Loxa.”

Red bark.—This is the *cinchona magnifolia* of Ruiz and Pavon, and the *c. oblongifolia* of Mutis. It is found in considerable abundance in Peru, and at Santa-Fe de Bogata. It is commonly imported in larger, thicker, and flatter pieces than the other two kinds. It is compact, friable, and heavy; breaks with a smooth fracture; externally it is rough, and of a reddish brown colour; the internal surface is redder, of a fibrous woody texture; the central part is resinous,

brittle, of a darker red, and compact. This species is more bitter and astringent than the pale bark, and by some is considered the best of the barks in use. Mutis, however, observes, that its febrifuge powers are not equal to those of the yellow bark. It is very frequently found in an adulterated state, being either nothing but pale bark coloured with some other substance, or the red bark mixed with other powders resembling it in colour, &c.

Cinchona Caribæa.—This is a native of the Caribæan islands, and was first brought to the notice of the profession by Dr. Wright, in an excellent account of it published in the Philosophical Transactions of London. This bark is imported in pieces from four to six inches in length, rolled into a cylinder, and from a line to two in thickness. Its external surface is brown, and covered with small white lichens. Under the epidermis or thin external covering there is a dark brown and fibrous substance. Its taste is at first sweetish, but on being chewed it becomes bitter and somewhat acrid, not unlike the taste of horseradish. Dr. Wright found it to answer every purpose for which the Peruvian bark is considered useful. This species is not unfrequently confounded with the *cinchona floribunda*, which is brought from St. Domingo, and which was first described by Badier, in 1777. This may be distinguished by its grey epidermis, which covers a fibrous parenchyma of a pale brown colour.

It is very bitter, and it is said to possess considerable emetic properties.

There is, perhaps, no article of the *materia medica* which has been so frequently the subject of analysis as the cinchona bark. The results, however, have been very various, and in some respects quite contradictory; so that on this subject there still exists much confusion and perplexity. The cause of this diversity exists, no doubt, in the confusion and uncertainty which has hitherto existed with regard to the different species of the cinchona, and their consequent liability of being mistaken one for the other.*

It would be useless and quite uninteresting to give a detailed account of the analyses that have been made of the bark; it will be sufficient to state the most important results upon this subject.

Mr. Deschamps, of Lyons, ascertained the existence of *lime* in cinchona, which he considers as arising from the decomposition of a particular salt residing essentially in the bark. Mr. Vauquelin, who has examined this salt very attentively, thinks that the acid which is united with the lime is a peculiar one, and has, therefore, proposed to call it kinic acid. This acid crystallizes in thin lamina, unites with earths and alkalies, forming soluble and crystallizable salts, and forms no precipitates with the nitrates of silver, mercury, or lead.

* Dr. Duncan's Dispensatory.

According to the very minute analysis of yellow bark, by Marabelli, chemist of Pavia, it appears to contain citric acid, galic acid, muriate of lime, muriate of magnesia, nitrate of potass, sulphate of potass, a resinous extract, a mucous extract, mucus, gum, gluten, a pure resin, and woody fibre. Distilled with water on a sand bath a lymph passes over, containing a small portion of acid, some ammoniacal salt, and a volatile oil. Marabelli observes that the bark should not be given with any of the martial salts, on account of the decomposition that would take place in consequence of the galic acid of the cinchona. Alibert and Cabal detected a small portion of iron in cinchona. They digested the ashes of the bark in nitric acid and obtained a fine prussian blue, by the addition of some prussiate of potass.*

Various opinions have been published in relation to the particular principle of bark in which its tonic virtues are supposed to reside. Sequin thought he had demonstrated the existence of gelatine in cinchona, and ascribed its febrifuge powers to this principle. In consequence of this supposed discovery some of the French and Italian physicians employed glue in intermittents, and, according to the reports that have been published, with very considerable success. Mr. Westring, a Swedish physician of great eminence, was led to conclude from his obser-

* Alibert, *Mat. Med. et Therap.* vol. i. p. 48.

vations and experiments, that the febrifuge power of bark resided wholly in the tannin which it contains. "Experience, however, demonstrates, that the virtues of bark must depend upon the combination of all its principles, for no preparation, however carefully made or scientifically combined, will equal in efficacy, bark in the state of powder."*

M. Vauquelin, in a second course of experiments on the cinchona, has shown that there are three classes of this bark, differing considerably from each other in their chemical composition. "The first class precipitate astringents, but not gelatine. The second precipitate gelatine, but not astringents. The third precipitate both astringents and gelatine. And lastly, some barks confounded with these, precipitate neither astringents nor gelatine; but these, Vauquelin, viewing the genus chemically, does not consider as cinchonas."

Although chemistry may not have afforded us any correct information with regard to the nature of the principle upon which the febrifuge powers of cinchona depend, it nevertheless furnishes us with pretty accurate criteria for ascertaining the relative powers of the different species of barks. M. Sequin gives the following directions for this purpose:

"1. *Good* cinchona precipitates the solution of tannin, but those of sulphate of iron and gelatine are not precipitated by it.

* Paris' Pharmacologia.

“ 2. The precipitate which the febrifuge principle forms with the solution of tan, is reddish, slightly flocculent and heavy. If the precipitate be considerable, and sink quickly, it is a proof that the febrifuge principle is abundant and of good quality. If it be not very decided, and remain suspended in the liquor, only disturbing its transparency, it is a proof that it is scanty and of bad quality.

“ 3. If it does not precipitate the solution of tannin, it is a proof that it does not contain any febrifuge principle.

“ 4. If it only precipitate the solutions of tannin and of sulphate of iron, it is a proof that it contains an astringent substance not capable of tanning, which is foreign to it.

“ 5. If it precipitates solutions of tannin, sulphate of iron, and gelatine, it is a proof that it contains an astringent substance analogous to that of the oak.”

Following these principles, M. Sequin makes six classes of cinchona.

“ Class 1. Precipitate neither tannin nor gelatine, but form, with sulphate of iron, a precipitate soluble in acids, and insoluble in alkalies; properties common to astringents. This class has no febrifuge property.

“ Class 2. Precipitate neither tan, gelatine, nor sulphate of iron.

“ Class 3. Precipitate neither gelatine nor sulphate

of iron, but act slightly on solution of tan. These act only in large and inconvenient doses.

“ Class 4. Precipitate neither gelatine nor sulphate of iron, but solution of tan abundantly. The best cinchona of commerce are of this class.

“ Class 5. Precipitate solutions of tan and sulphate of iron, but not gelatine. The chalybeate precipitate was ferruginous, yellow, and abundant, and soluble in alkalies.” He found these properties to belong to a specimen of a bark sold as *Angustura*.

“ Class 6. Precipitate tannin and gelatine, but not sulphate of iron.” M. Sequin rarely met with this kind of bark, but he thinks favourably of it.

Water extracts the virtues of bark; but the infusion very soon undergoes decomposition and loses its medical properties. Wine and alcohol also extract the virtues of bark. The decoction of it undergoes important chemical changes, if the boiling be protracted beyond ten or twelve minutes; “it combines with oxygen, becomes insoluble, and medicinally considered, it is rendered inert; on this account the extract is necessarily a very inefficient preparation; if we attempt to redissolve it, not more than one half is soluble in water.”

It is sometimes infused in lime water, and by many this preparation is particularly recommended for children. In the American Pharmacopœia there is a formula for an infusion of cinchona, in which it is

directed to triturate the bark with magnesia, previous to infusing it. When prepared in this way it is much stronger than when infused without the magnesia. This substance possesses the remarkable property of increasing, to a very considerable degree, the solubility of resins, balsams, camphor, and oils; and, as it appears from the experiments of Pelletier and Caventou, that the active principle of cinchona resides chiefly in its resinoid part, it is upon this principle, no doubt, that the magnesia acts in increasing the strength of the aqueous infusion.

A very important paper on the principal pharmaceutical preparations of bark has lately been published by MM. Pelletier and Caventou, of which I extract the following well condensed account from the twenty-first number of the *London Medical Intelligencer*.

“ It having been demonstrated that the active principle of cinchona resides in the alkaline bases which it contains; and recent observations having shown that in these alkaline bases consist the febrifuge properties of bark, it must naturally follow, that those preparations of bark will be best adapted for medicinal purposes, in which the active principle has not only been concentrated, but freed from the admixture of heterogeneous matter, so as to render it more susceptible of absorption by the organs on which it is destined to act.

“ The first and most simple preparation of bark is

its *powder*. Directions are given in this case to throw away the first coarse powder, and to preserve the second.

“The second preparation of bark is its decoction. When bark is subjected for any length of time to the action of boiling water, the cinchonine combined with the kinic acid is dissolved; though not alone, for several other substances are dissolved along with it; such as gum, starch, and yellow colouring matter, the kinate of lime, tannin, and a portion of the red matter. With these substances also a portion of fatty matter is generally mingled; and we see, in fact, that on cooling a common decoction of bark, however well filtered, it soon becomes opaque, in consequence of the tannin combining with the starch, and forming a compound, insoluble in cold water; while, at the same time, a part of the red and fatty matter is precipitated, carrying along with it a portion of the active principle or cinchonine, which is thus wasted. In order to obviate, in some degree, these circumstances, MM. Pelletier and Caventou, recommend the employment of a much larger quantity of water than usual, in making the decoction, so as to keep the whole of the cinchonine in solution; to filter the liquid when cold, and to concentrate the decoction by a gentle evaporation. By these means the preparation will be clearer, less unpleasant to the taste, and endowed with its full febrifuge efficacy.

“ With regard to the *extract* of the bark, MM. Pelletier and Caventou observe, that the one which is obtained from the decoction, is liable to all the objections of the latter preparation; so that, in order to obviate these, it will be necessary to prepare the decoction itself in the manner already directed. Of the extract prepared by cold infusion, the authors speak very unfavourably, as containing scarcely any part of the cinchonine.

“ All the alcoholic preparations of bark contain the largest proportion of cinchonine. Physicians, therefore, observe the authors, may place their full confidence in the different tinctures of cinchona, as very energetic preparations. The strongest alcohol should be employed in such cases.

“ An alkali has occasionally been prescribed in combination with the tincture of bark. In such cases the combination of the kinic acid and cinchonine is torn asunder, and the acid unites to the alkali employed. There can, however, be no objection to the practice, as cinchonine is fully soluble in alcohol. Not so in regard to the *aqueous* decoction; for here, the presence of an alkali would infallibly precipitate the febrifuge principle, and if the liquid be filtered afterwards, a most inert preparation would be obtained. In this respect, therefore, the formulæ ninety-six and ninety-seven, in Dr. Paris' Pharmacologia, must be considered as unchemical preparations of bark.

“The addition of an acid to the decoction of bark is, on the contrary, a proper one.

“Tartar emetic in union with bark does not produce vomiting. This is explained on the principle that the tannin combines with the oxide of antimony, and modifies the action of the latter on the stomach, while the active principle of cinchona is set free.

“The tartaric acid weakens the power of bark, by forming an insoluble salt with its cinchonine.”

The salts of iron, sulphate of zinc, nitrate of silver, oxymuriate of mercury, tartarized antimony, solutions of arsenic, form precipitates with the solutions of bark.

Mr. Alibert justly observes, that the history of cinchona is very intimately associated with that of intermittent fever, both from the circumstances which attended its introduction into regular practice, and the high character which it has long held and still sustains, as a remedy in this disease. Of its very superior efficacy in intermittents, it would now, indeed, be altogether useless to adduce any evidence. Upon this subject the profession may be considered as unanimous. The only difference of opinion which yet prevails, in relation to the employment of cinchona in these fevers, relates to the mode of administering it; the periods of the intermission, in which it should be given; the proper doses; and the utility or inutility of a previous resort to evacuant remedies.

With regard to the propriety of evacuating the contents of the stomach and bowels previous to administering the bark, although doubted by some, yet general experience is decidedly in favour of the practice. There can be no doubt that many cases of intermittent fever may be effectually removed by bark given without any previous evacuations whatever. This is more especially the case in those instances which occur in spring or winter, in subjects who have had the disease during the preceding autumn; and which may, therefore, be considered as relapses of the former attacks. In intermittents occurring, however, in summer and autumn, in miasmatic districts, and where the biliary secretions are much affected, an emetic, followed by a dose of calomel and jalap, is in general a very useful measure previous to giving the bark. There is too, sometimes, a phlogistic tendency in the system which is unfavourable to the febrifuge operation of the bark, and in such cases cathartics will act beneficially, by reducing the general excitement of the system.

Bleeding is also an essential preliminary in some cases of intermittents, before using the bark. I have had many examples of this kind in my own practice. The tendency to inflammatory action in the system is sometimes so great, that the fever has not power to develop itself in its genuine character; the intermission is incomplete, attended with restlessness, and an

irritated state of the pulse, the cold stage is not marked by strong rigors, but only by creeping and protracted chills; and the hot stage does not go off by a profuse and universal perspiration. In such cases the bark can seldom be employed with any decided advantage, unless it be preceded by venesection, and other evacuations. By one good bleeding and cathartic, in instances of this kind, the fever will commonly assume its genuine character; the rigors will be strong; the perspiration which concludes the hot stage copious and general, and the intermission perfect. The bark will now act beneficially, however ineffectually it may have been previously employed.

Considerable diversity of opinion has been expressed in relation to the proper time of exhibiting bark in intermittents. Dr. Home gave it at the commencement of the hot stage. Heberden gave as much as four ounces immediately before the accession of the paroxysm; and Drs. Clark, Balfour, and others, recommended it to be given in the hot stage. The proper stage of this disease for administering bark is, however, undoubtedly during the intermission. Upon this point the profession are now, I believe, unanimous.

Cinchona should always be given in as large doses as the stomach will bear. In general from one to two drachms of the powder may be taken every hour. Some delicate stomachs will reject the bark when administered even in the smallest quantities. When this

is the case, it may be given in the form of decoction or infusion, or administered as a clyster. "With children who cannot be prevailed on to take the bark, we may administer it with much efficacy in this way, repeating the clyster every four hours." It has also been used effectually in children, by applying it externally, quilted into a shirt or waistcoat.

When the bark occasions purging, it must be given with the addition of small doses of opium. This is, indeed, frequently a very important addition to the cinchona. It not only prevents the bark from acting on the bowels, but enables the stomach to bear much larger doses of it, and adds, moreover, in many instances, considerably to its good effects. The snake-root may also sometimes be very usefully combined with the bark. Dr. Thomas says, that this combination is particularly useful in intermittents of long continuance, affecting old debilitated persons, living in a damp situation, or when the season is rainy. I have myself occasionally given a combination of bark, opium, and snake-root, in cases of this kind, and the effects have, in general, been very favourable.

Bergius speaks very highly of a combination of bark and mustard in this disease. The late professor Barton recommended a mixture of cinchona and black pepper as an exceedingly efficacious remedy in intermittents. The black pepper, indeed, appears to be a remedy of great powers in this disease, if we are to

credit the account given of its effects by Dr. L. Frank. This physician cured intermittents readily, by giving his patients from five to eight grains of pepper twice a day. Dr. Ghigini confirms this statement.*

Dr. Alibert, who has published a highly interesting work on *malignant intermittents*,† observes that the bark is our only remedy when the disease assumes this character, and that he has known this inestimable remedy arrest, as if by magic, the delirium, convulsions, colliquative sweats, suffocating dyspnœa, lethargy, and excruciating pains in the head, which attends this variety of the disease. This writer also observes, that the epidemic constitution of the atmosphere occasionally impresses such a peculiar character on intermittent fevers, as to render them incapable of being cured by the bark. “En parlant des fievres intermittentes, il importe de faire voir que le genie epidemique leur imprime, dans quelques occasions, un tel caractere, qu’elles resistent a l’administration du quinquina.”‡ Hillary speaks of an epidemic intermittent at Barbadoes, in which the bark was of no avail, unless combined with saline remedies or some of the tonic bitters. M. Boulou, also, mentions an epidemic intermittent, in which the cinchona was found ineffectual.

* Journal Complementary du Dictionnaire des Sciences Médicales.

† Traité sur le Fievrès Pernicieuses Intermittentes.

‡ Elemens de Therapeutique, vol. i. p. 51.

When visceral obstructions accompany intermittents, the bark is a remedy of doubtful efficacy. This is more especially the case where the diathesis is considerably inflammatory. When the obstructions occur in weak and phlegmatic habits, I have, however, seldom found any very particular obstacles to the successful operation of the bark. In cases of this kind, a gentle mercurial impression will, in general, either remove the disease, or render it more manageable by the bark. "Bark, combined with mercury in a small proportion, is one of the best medicines for removing the swelling of the spleen, which so often occurs after intermittent fevers."*

In remittents, after the inflammatory excitement has been somewhat moderated, by antiphlogistic measures, bark given during the remission has been recommended by some writers, as not only a safe but a highly useful remedy. Judging from my own experience, however, I am decidedly of opinion, that the practice is, in general, not a safe one, except it be resorted to in the decline of the disease, when the exacerbations are not marked by strong vascular action, and the remissions attended with a cool and moist skin, and a small compressible pulse. It has already been stated, that where the pulse remains irritated and tense, and other symptoms of an inflammatory tendency in the system be present, in intermittents,

* M. S. notes of Dr. B. S. Barton's Lectures on the Mat. Med.

the cinchona will not only frequently fail to remove the disease, but aggravate its symptoms. If this be the case, of which, indeed, there can be no doubt, we can hardly presume that the bark would be often useful in remittents, in which there is always some febrile action present, however complete the remission may be.

When the patient has been worn down by the long continuance of the disease, and proper evacuations have been premised, bark may undoubtedly be employed with much advantage in this form of fever.

In certain stages of typhus fever, bark is a remedy of considerable utility. During the stage of excitement, it is, however, wholly inadmissible. When the disease is somewhat advanced, and the powers of the system begin to sink, bark, in conjunction with stimulants, given in moderate quantities, will, in general, produce salutary effects. Bergius says, that a combination of bark with mustard, in the proportion of ℥ii. of the former to gr. viii. of the latter, is peculiarly beneficial in the latter stages of typhus. Where, in the latter stages of the complaint, the tongue and skin are dry, and delirium or coma, with convulsive twitches, attend, the bark is by no means a proper remedy. Here opium is, perhaps, our most valuable remedy. It is in the state of convalescence, that the cinchona displays its salutary powers; but, in every other period of the disease, where the powers of the system require

support, it is decidedly inferior to some of the more diffusible stimulants, such as wine, volatile alkali, opium, musk, &c.

The bark has also been highly recommended by some writers, in acute rheumatism and gout. In the former of these diseases, its powers have been particularly extolled by Morton, Fothergill, Saunders, and Haygarth. This latter writer, referring to his experience with the cinchona in this disease, observes: "After the stomach and bowels have been sufficiently cleansed by antimony, I have, for many years, begun to order the powder of Peruvian bark, in doses of grs. v. x. or xv. every two, three, or four hours; and if this quantity had a salutary effect, it was gradually increased to grs. xx. xxx. xl. with sedulous attention never to add more than what perfectly agrees." He states, that under this treatment, in the great majority of cases, "the pains, swellings, sweats, and other symptoms of inflammaory fever manifestly and speedily cease, till health is perfectly restored."

Of the propriety of this practice, however, there is great reason to entertain much doubt. From my own experience I can say nothing either for or against it, having never employed it in this disease; but from the known properties of the bark, we may infer, a priori, that it is a medicine which can be seldom employed in the acute rheumatism, whilst the inflammatory fever continues, without doing injury. After the sympa-

thetic fever has been reduced by proper evacuants, and other antiphlogistic measures, the bark may, no doubt, be resorted to with advantage. "I should venture to state," says Dr. Scudamore, "from such experience as I have had, that the Peruvian bark, either administered as Dr. Haygarth directs, or in decoction with tincture and sulphuric acid, is often a very suitable and valuable medicine to be employed when the convalescence begins; namely, when the fur of the tongue is fast contracting its edges, and has an appearance of detaching itself; when the urine is of a light specific gravity; the state of the bowels is natural; the skin is relaxed, and simple debility prevails; but that, under the opposite circumstances, it will, I fear, disappoint our hopes of its asserted specific powers."*

Acute rheumatism, occurring in autumn, or in miasmatic districts, sometimes assumes a remittent, and even an intermittent type; and when this is the case, the bark may be employed with much advantage, after the alimentary canal has been well evacuated, by emetics and mercurial purges. Torti, indeed, says that the bark may be usefully given in every form of inflammatory fever, where the disease assumes the form of an intermittent.

Dr. Tavares,† a Portuguese physician, speaks very

* Scudamore on Gout and Rheumatism, p. 302.

† Observationes et Epicrisis de Corticis Peruviani salutari et

highly of the remediate powers of bark in gout. He says, in the words of Dr. Held, whom he quotes in favour of this remedy: "*Uno verbo, cortex peruvianus in podagra divinum est remedium.*" It is also recommended by Drs. Small and Saunders, as decidedly useful when "freely administered in the intermissions of pain and fever, and when the local inflammation has abated."*

It does not appear, however, that this practice has ever been much pursued, and very few, I presume, would now be willing to adopt it. In the irregular form of this disease, where great debility attends, bark may be employed with advantage; but in the majority of cases of regular gout, it cannot be resorted to with safety. The late Dr. Barton used to state, in his lectures, that he had observed the bark to be particularly pernicious in gout, when it evinced a tendency to shift its situation to the stomach, lungs, or brain.

According to some British writers the bark is a remedy of very considerable efficacy in erysipelas. Fordyce gave it in drachm doses every hour, and, as he informs us, with the most decided advantage. It does not appear, however, that this practice has ever obtained many advocates; nor does it appear to me at

proficus usu in Podagra. See Scudamore on Gout, p. 121. Philad. edition.

* Scudamore.

all calculated to do good in the disease as it occurs among us, it being, so far as I have observed, always attended with much general inflammatory excitement. After the local inflammation has nearly subsided, and the patient is left in a state of considerable debility, there can be no doubt of the usefulness of this remedy. In a late work there is a form of erysipelas described under the name of *erysipelas phlegmonodes*, which is said to be very prevalent in the British navy, and in which bark with mineral acids may be given with much benefit, when it occurs in persons advanced in life, or of a weak habit, and assumes a typhoid character.*

The bark was formerly a good deal employed in measles. Dr. Percival describes an epidemic measles of the regular kind, in which, however, it was not usual for violent pulmonic symptoms to occur until five, six, or eight days after the eruption had disappeared. Speaking of this epidemic, he says, "I prescribed the bark with great success to many of my patients under the measles, combining it with demulcents and the saline mixture; and premising venesection when the signs of inflammation were urgent." He ascribes the first employment of this remedy in measles to Dr. Cameron, "a very eminent physician at Worcester," and extols the practice very much. "My experience,"

* Surgical Observations by Mr. Copeland Hutcheson.

he says, "has afforded me the fullest conviction of its safety and efficacy in all ordinary cases."*

In the putrid measles described by Dr. William Watson,† the bark is said to have afforded great relief in the second stage, when great debility was present. He observes, however, that where there was much cough and difficulty of breathing, the bark generally acted perniciously, however great the debility of the patient. Notwithstanding these favourable reports of the effects of bark in measles, the present sentiment of the profession appears to be entirely against the practice. In this country, at least, the measles are always too strongly marked by inflammatory symptoms to admit of this remedy. Venesection, cold and tepid affusions, purgatives and diaphoretics, are the remedies now generally trusted to, both in Europe and in this country.

In the scarlatina anginosa, the bark has been much recommended by some writers. In the last stage of this complaint, where there is great prostration of strength, with symptoms of malignancy and putrescence, and a tendency to gangrene in the throat, the bark is undoubtedly a medicine calculated to do good. In the simple form of scarlatina, however, the bark is inadmissible, except, perhaps, as a tonic during the state of convalescence; and even here it will seldom

* Medical Observations and Inquiries, vol. v. p. 284.

† Ibid. vol. iv. p. 136.

be necessary or very useful. Bleeding, purging, emetics, cold and warm affusions, are the remedies to be relied on during the stage of excitement, in both the simple and malignant forms of the disease.

In the ordinary cases of dysentery, Peruvian bark can, perhaps, never be employed with propriety. It sometimes, however, assumes the form of an intermittent, and when this is the case, the bark may generally be given with advantage. This medicine has also been prescribed with success in chronic diarrhoea. In these diseases it is best given in combination with opium.

Not much can be said in favour of bark in the cure of epilepsy and tetanus. In the former of these complaints it was once a good deal prescribed, but it does not appear to be entitled to any particular attention for its powers in this way. In tetanus, it was employed by Dr. Rush, and he speaks favourably of its effects. Dr. Morrison, in his excellent work on tetanus, observes, what indeed will readily be assented to, "that, when the disease is conquered, the patient should take wine and bark for many weeks." I have, however, never heard of any case in which the bark effected a cure; in the cases in which it appeared to do good, it was given in conjunction with the free use of wine, to which latter, we may, I think, fairly attribute the benefit which may have been derived from such a combination.

Of the use of bark in chorea, Dr. Cullen entertained

a very favourable opinion. I have seen one case effectually cured by the bark, together with a few purges. The patient was a very delicate girl, about twelve years old, very debilitated before the disease came on, and of a strumous habit. She took the bark in forty grain doses, four times a day, having previously evacuated the contents of the bowels by purgatives, and was cured in about three weeks. In general, however, I should not be inclined to use the bark in this disease except in the state of convalescence, at which time it is of unquestionable service. I am fully satisfied from what I have seen, that the purgative plan of treatment recommended by Hamilton, with the occasional employment of gentle tonics or antispasmodics, will, in the majority of cases, be more effectual than any other plan of treatment with which we are at present acquainted.

Pertussis is another of the spasmodic diseases in which the Peruvian bark has been particularly recommended. Dr. Morris appears to have been the first who employed the bark in this disease, and his report of its effects are very favourable. He gave it with castor.* Cullen observes, that in the advancement of the disease, when the cough is kept up by habit, and no pulmonary congestions are present, the bark may put an end to the disease. Many of the German writers speak particularly in favour of the bark in this

* Medical Observations and Inquiries, vol. iii. p. 281.

disease. In this country it is, I believe, very seldom, if ever, given; and except under the circumstances mentioned by Cullen, it does not, I am inclined to believe, deserve much attention.

Bark has been also much prescribed in asthma. In the paroxysm it can be of no service; but, where the disease is connected with a cachectic state of the system, attended with indigestion, this, in common with other tonics, may be employed with advantage.

In pulmonary consumption, the bark has been recommended by some writers, as a useful remedy. Observing that this disease is marked by periodical paroxysms, with pretty regular cold fits, followed by heat, and at last copious sweats, succeeded by a temporary abatement of all the symptoms, physicians were led to suppose, that as the bark is so valuable a remedy in intermittents, which are characterized by a similar train of symptoms, it might be employed with advantage in phthisis. Experience, however, has proved that it is not only of no value in this disease, but uniformly pernicious in its operation. "I have seen the bark given," says Dr. Fothergill, "in almost every state of the phthisis pulmonalis, even in the first commencement, whilst the breast was in pain, the cough dry and harsh, the pulse quick and hard, and the heat considerable. What was the consequence? Frequently an hæmoptysis, and all its worst attendants; ulcerated lungs, purulent spitting, colliquation, and death."*

* London Medical. Observ. and Inquir. vol. v. p. 347.

This writer states, that symptoms resembling those of genuine phthisis, are sometimes produced by delicate mothers suckling their children longer than is consistent with their ability. "Here," he observes, "the bark given early, in moderate doses, and merely as a tonic remedy, is often of excellent use. Many, I am satisfied, it has retrieved from deplorable situations; and under such circumstances a prudent trial of the remedy may safely be made."

Where symptoms of consumption supervene, in consequence of copious discharges from abscesses, fluor albus, or other similar debilitating evacuations, the bark is a useful remedy, provided the lungs be not yet inflamed. If, however, the breathing is oppressed, the cough dry, the pulse quick and hard, with shooting pains through the chest, the bark will inevitably increase the disease.*

There is another variety of consumption, in which the bark may sometimes be beneficially employed. It is that species of the disease which has been lately described under the name of *dyspeptic phthisis*. In the early stages of this complaint, whilst the affection of the lungs is as yet sympathetic, the moderate employment of bark, with laxatives, is often followed by very beneficial results. It is, however, decidedly pernicious whenever the pulmonary organs become the seat of inflammation, or organic alterations.

* Dr. Fothergill.

Of the use of bark in dyspepsia, I have no very favourable opinion, when the disease is once completely formed, and the lungs or liver are brought into a morbid condition. In mere weakness of the stomach, giving rise to flatulence and acidity, the bark, either by itself or in combination with iron, may be used with advantage; but in that fixed form of the disease in which the mind and body are equally unfitted, both for the enjoyments and duties of life, the bark, and, indeed, all tonics, must be administered with the greatest circumspection.

In scrophulous complaints the bark is a remedy of very considerable powers, and deserves to be placed among our most useful medicines in this disease. Dr. Fordyce observes, that "in tumefied glands, where the habit happens to be feeble, and the circulation weak, from constitution or accident, bark is a most efficacious remedy; and, what is remarkable, acts as a resolvent and discutient."* He observes also, that much may be done with this remedy in scrophulous ulcerations, or in "gleety phagedenic and semigan-grenous sores." In debilitated persons of a strumous habit, the bark, with cold bathing and iron, is a very valuable remedy. Barks, in combination with the mineral alkali, has been known to remove scrophulous

* An Account of some Virtues of the Peruvian Bark, not generally known nor described, particularly in Scrophulous Cases, by John Fordyce, in *Med. Observ. and Inquir.* vol. i.

swellings, when no other form of this medicine would have the least effect.* In a few cases of scrophulous ulcerations, I obtained much advantage from the bark given conjointly with cicuta and minute portions of corrosive sublimate. In this stage of the complaint, however, we can very seldom procure complete relief by any mode of treatment which has hitherto been devised.

The bark has also been recommended as very serviceable in certain varieties of dropsy. Where, for instance, anasaruous swellings depend on mere debility, and no visceral obstructions exist, the bark, as a general roborant, is a remedy of excellent powers. In combination with cream of tartar, it is said to be peculiarly efficacious in the dropsies which succeed intermittents. I should doubt, however, its general applicability in cases of this kind, since dropsies from this cause are very commonly connected with visceral indurations; a circumstance which experience shows to be especially unfavourable to the salutary operation of this remedy.

In hemicrania, when, like an intermittent, it returns at regular periods, the bark is the best remedy with which we are acquainted. I have usually combined it with valerian, and administered it in large doses. It is always useful to evacuate the stomach and bowels previously to employing this remedy.

* M. S. Lectures of the late professor Barton.

The Peruvian bark is also very commonly prescribed in gangrene. When the gangrene depends on deficiency of action, this remedy is of unquestionable utility. Where it depends on increased action or inflammation, the bark is always injurious if it be given before the general inflammatory excitement has subsided. To promote the separation and sloughing of dead parts, however, and support the sinking powers of the system during this process, after the general inflammatory action has disappeared, the bark may be very advantageously resorted to. It is usually given in combination with opium, volatile alkali, or wine, and its powers are much assisted by these articles. †

Having now given an account of the therapeutic application of the bark, it remains for me to say something concerning its mode of exhibition.

The best form for exhibiting the bark is, undoubtedly, in substance. The stomach, however, will sometimes reject it when taken in this way, and in this case it should be given in the form of an infusion, conjointly with the tincture. When thus administered, it will, in general, remain very easy on the stomach. By giving the infusion and tincture together, we obtain all the power of the bark residing both in its gummy and resinous principles; an advantage which cannot be so completely had by using these preparations separately. From the experiments of Pelletier and

Caventou, it appears that the extract of bark is a preparation of no great powers; being liable to all the objections that have already been mentioned in the former part of this chapter, as lying against the decoction or infusion.

If the bark disagrees with the stomach in whatever shape it be taken, it may be beneficially employed in the form of a clyster. Administered in this way it is particularly applicable to the diseases of children, where it may be necessary to employ this remedy. The bark may also be advantageously used as an external application, either in the form of powder, quilted into a waistcoat, or of decoction, as a bath. Dr. Alexander states, that he cured intermittents by immersing the lower extremities in a decoction of bark, when the stomach rejected the medicine.

ARISTOLOGIA SERPENTARIA.—VIRGINIA SNAKEROOT.

THIS plant is found exclusively in the United States, and was introduced to the notice of the profession as a remedy for the bites of venomous serpents. The root, which is the only part employed in medicine, is perennial, consisting of very numerous fibres, matted together, proceeding from a common head or caudex.

The fibres are of a yellow ochre colour externally, and of a pale yellow within. The central or knotty part of the root is of a dark brown colour. It has an agreeable aromatic smell, resembling that of valerian; its taste is warm, pungent, and bitterish, not unlike that of camphor or of the *pinus canadensis*. Subjected to the action of alcohol, "it affords a bright green tincture, which is rendered turbid by water; by filtration a small portion of a green matter is separated, but its transparency is not restored. It neither precipitates tannin or gelatine, nor affects the salts of iron or tincture of turnsole. When the diluted tincture is distilled, the spirits and tincture pass over milky, strongly impregnated with its peculiar odour." Lewis states that the spirituous extract is more powerful than the watery, "not so much from its having lost less in evaporation, as from its containing the active parts of the root concentrated into a smaller volume; its quantity amounting only to about one half of that of the other."

The snakeroot was first brought into notice as a remedy for the bite of venomous serpents; and although soon found to be destitute of antidotal powers, experience showed it to be a remedy of very considerable value in a variety of circumstances.

When taken into the stomach, it increases the force and frequency of the pulse, excites a glow of heat throughout the system, and produces pretty copious

diaphoresis. It is not, however, simply stimulant and diaphoretic in its effects, for along with these qualities it possesses very important *tonic* powers.

Possessing, along with its tonic, pretty powerful stimulant properties, the snakeroot is peculiarly suited to fevers of a low grade of excitement; on the other hand, however, it can never be employed without danger, wherever blood-letting is indicated.

In every variety of fever, however, when the inflammatory excitement has been reduced, or the system is sinking into a typhoid state, the snakeroot is a remedy of unquestionable utility. It is especially serviceable in the latter stages of febrile diseases, when the skin and tongue remain dry and hot, and the pulse is feeble, frequent, and corded. When given in this state, it commonly excites a general diaphoresis; the tongue becomes moist, and the pulse and general powers of the system become invigorated.

A good deal has been said in favour of the powers of the serpentaria in putrid fevers, and, from the general properties of this remedy, there can be little doubt of its applicability to the treatment of fevers of this kind.

The snakeroot was formerly a good deal employed in intermittents. Of its efficacy, however, in the cure of this disease, when administered by itself, not a great deal can be said. I have employed it in a considerable number of instances, but always without success,

and I am inclined to believe that it is not often capable of arresting this disease. When united, however, with bark, or some of the bitter tonics, it seems to increase their efficacy, and it is in this way, that it is now commonly employed in intermittent and remittent fevers. It is particularly useful when given with Peruvian bark, in those intermittents whose paroxysms terminate by an imperfect sweat, leaving the skin hot and dry during the intermission.

During the prevalence of the late epidemic pneumonia typhoides, in this country, the serpentaria was much prescribed by some physicians. Being at once stimulant, diaphoretic, and roborant, it was peculiarly calculated to produce beneficial effects in this disease, by equalizing the circulation, and imparting vigour to the vital powers. Dr. Dyckman states, that he has prescribed the snakeroot in combination with seneka, with marked advantages, in this disease. It may also be employed with advantage in the latter stages of pneumonia, and bronchial affections; being useful not only by its tonic operation, but chiefly, perhaps, by exciting the cutaneous emunctories, and thereby relieving the pulmonic system.

The late professor Barton used to dwell particularly, in his lectures, on the utility of this remedy in bilious pleurisy. This disease occurs in miasmatic districts, and is generally most prevalent in the winter and spring, after an autumn in which bilious diseases were

common. "The pulse is often full, strong, and bounding, and would seem to require the lancet, but in general the loss of the smallest quantity of blood is productive of the greatest debility. In this complaint I am acquainted with nothing so valuable as the serpentaria."* In this disease the liver is uncommonly active, giving rise to an excessive quantity of bile, as is evinced by the bilious vomitings which frequently accompany the first stage of the complaint. Before exhibiting stimulants of any kind, therefore, the intestinal canal should be well evacuated by an emetic, followed by mercurial purges. When this is effected, we may employ the serpentaria freely, in conjunction with minute doses of calomel, in order to correct the functional disorder of the biliary organs.

In some of the exanthematous fevers, of a low typhoid character, the infusion of serpentaria has been recommended as of much service, in keeping up the action of the cutaneous vessels, and preventing the retrocession of the eruption.

The snakeroot has also been found highly useful in restraining bilious vomiting; and in removing that irritability of the stomach which is often so troublesome in bilious diseases.

The snakeroot has often been recommended for its effects in dyspepsia. I do not doubt that it may often be useful in the last periods of this complaint,

* Barton's M. S. lectures on the Mat. Med.

when the stomach is as yet the only organ particularly affected. After some of the neighbouring organs have, however, become involved in the disease, especially if the secondary affections are of an inflammatory character, I have reason, from experience, to regard it as injurious.

The infusion of snakeroot may be used with advantage, as a gargle, in ill-conditioned ulcers of the throat.

The dose, in powder, is from twenty to thirty grains, It is usually given in infusion, of which a wine-glassful may be taken every half hour or hour. By boiling, its powers are entirely destroyed.

PRUNUS VIRGINIANUS.—WILD-CHERRY.

THIS is a large and handsome tree, indigenous to the United States, in many parts of which it is found in considerable abundance. The bark of the tree, which is the part employed in medicine, has a bitter, astringent, and slightly aromatic taste. Its smell resembles that of those substances which contain prussic acid, particularly the peach kernel. This bark, indeed, contains a very considerable portion of the prussic acid, a circumstance upon which I am inclined to believe its remediate powers mainly depend.

When taken into the system, it produces a slight increase of the action of the heart and arteries, and induces, in some individuals, considerable drowsiness. When continued for some time, and not in very large doses, it gives tone to the stomach, and, by this effect, vigour to the general system. When, however, it is taken in *large* quantities, and frequently repeated, it weakens the digestive organs, and produces an effect upon the action of the heart and arteries, the very reverse of a stimulant. In my own person I have several times reduced my pulse from seventy-five to fifty strokes in a minute, by copious draughts of the cold infusion, taken several times during the day, and continued for twelve or fourteen days. This effect has not, I believe, been noticed before, but from much experience with it I am strongly inclined to believe that we may control the action of the heart and arteries to a considerable extent, by the use of this substance.

The wild-cherry bark has been highly recommended in the cure of intermittents. I have myself employed it a good deal, while residing in the country, and in the majority of cases, with success. It has appeared to me most useful in those cases in which the bark did not produce its usual beneficial effects; and in one instance, where the bark, arsenic, and mercury, had all been tried ineffectually, the patient was finally cured by the use of the wild-cherry bark infusion.

In phthisis, also, this bark has been employed with decided benefit. I have prescribed it often in hectic fever, and in some instances with unequivocal advantage. There is, indeed, no difficulty in perceiving how this bark may produce beneficial effects in cases of this kind. It is well known now, that the prussic acid, when judiciously administered, is capable of moderating, nay, even of removing, all the symptoms attending the early stage of pulmonary consumption. The testimony we have is too respectable and numerous to admit of any reasonable doubt as to its powers in this way. Now, the wild-cherry tree bark contains no inconsiderable portion of this acid, and it is obvious, therefore, that by using the infusion of it, we employ a medicine which contains prussic acid, together with a bitter and an astringent principle, dissolved in a considerable portion of water. These ingredients would appear, I think, particularly calculated to produce good effects in pulmonary consumption, by at once lessening the irritability of the system, which the prussic acid does in an eminent degree, and supporting the strength of the patient by the tonic principles which it contains. I have already stated the power which this remedy possesses, when taken in very large doses, of diminishing the action of the heart and arteries, and it is, doubtless, by its controlling influence in this way, in consequence, perhaps, of the prussic acid which it contains, that its

action has been found so useful in diseases attended with an irritated or hectic state of the circulation. Whether it is ever capable of giving perfect relief in phthisis, is extremely doubtful, but of this I am satisfied from repeated experience, that it is one of our most valuable palliatives, and well deserving of attention in the present disease. Its effects, indeed, upon phthisical patients, are very similar to those of the prussic acid. It lessens the frequency, tension, and irritated state of the pulse; moderates the cough, and profuse nocturnal perspirations; checks the diarrhœa, and sustains the general strength of the system.

In chronic hysteria, I have, in several instances, prescribed this remedy, with great relief to the patients. I have found it equally useful in wandering rheumatic pains and swellings, attended with a small, corded, and frequent pulse, and general debility of the system.

The wild-cherry bark has also been recommended as a very useful remedy in asthma. Of its powers in this complaint I can say nothing from my own experience. It is to be given during the intervals of the fits, and in large doses.

When given in moderate doses, it often produces excellent effects in dyspepsia. I have, however, found that large and frequent doses of this remedy, have a tendency rather to weaken than to invigorate

the digestive powers of the stomach. This I have particularly observed in my own case.

Very excellent effects are said to have been produced by washing irritable and fungous ulcers with a decoction of this bark.*

The bark of the root is stronger than that of the trunk. To certain animals the leaves of the tree are said to be poisonous. The cherries have been advantageously used, as a domestic remedy, in scurvy and dysentery.

The dose of the powdered bark is from ʒss. to ʒii. The decoction does not appear to possess much strength. The prussic acid, which appears to be its most important part, is driven off by boiling. The cold infusion, however, is an excellent preparation. An ounce of the bark is to be infused in a pint of cold water, for twenty-four hours. Dose, a wine-glass full every four hours.

CORNUS FLORIDA.—DOGWOOD.

THIS is a common and well known tree throughout the United States. It appears from the experiments of Dr. John M. Walker,† that the bark of this tree

* Thatcher's Dispensatory.

† Inaugural Dissertation. Philadelphia, 1797.

differs but very little in chemical composition from the Peruvian bark, and experience has fully demonstrated that, in their operation on the system, these two articles possess a very close resemblance. In its sensible qualities too, the dogwood bark is very much like the cinchona; it has a bitter, astringent, and slightly aromatic taste. Its astringency is, however, stronger than that of the Peruvian bark.

In the cure of intermittents, the dogwood bark has been a good deal used in some parts of this country, and from the concurrent testimony of those who have employed it, as well as from my own experience, I am persuaded that, of all our indigenous tonics, this bark is the most useful in the present disease. The late professor Barton observes, "I believe we may, with entire safety, assert, that as yet we have not discovered within the limits of the United States, any vegetables which have been found so effectually to answer the purpose of the Peruvian bark, in the management of intermittent fevers, as the *cornus florida*."

When employed in a recent state it is said to be apt to disagree with the stomach, and to produce pains in the bowels. To obviate this, it is only necessary to give it in conjunction with a few drops of laudanum; or to employ the bark after it has been collected for some time. Thirty-five grains of the dogwood bark, is about equal to thirty of cinchona. An infusion of

the flowers has been used with advantage in flatulent colic. “A decoction of the small branches and buds agrees well with weak stomachs, and is, perhaps, the most eligible form of exhibiting this medicine.”*

The *cornus sericea*, or swamp dogwood, another American species of this genus, possesses powers in every respect equal to those of the *c. florida*. It forms a beautiful tincture with proof spirit. It is given in the same dose as the *c. florida*.

Both these species of *cornus* may be advantageously given with aromatics and other tonics. An excellent mode of prescribing them in intermittents, is in union with Virginia snakeroot.

CHIRONIA ANGULARIS.—CENTAURY.

THIS is a beautiful plant, and exceedingly abundant in some parts of the United States. The root, which is annual, consists of yellowish fibres; the stem is erect, from one to two feet high, herbaceous, smooth, and four-sided; the branches are opposite and axillary; the leaves opposite, ovate, amplexicaule, and three nerved. The flowers, which are numerous, grow at the extremities of the branches, and are of a beautiful rose colour above, but pale, and in many specimens

* Collections, &c.

nearly white in the centre underneath. The calix is much shorter than the corolla; its segments are very acute. "In the centre of the corolla there is a defined pentangular star, of a rich yellow colour, bordered with green. The petals are obovate, and vary in being narrower, sometimes nearly lanceolate-obtuse."*

This plant is one of the most useful and agreeable of our indigenous vegetable bitters; and is decidedly more valuable than the centaury (*chironia centaurium*) of Europe. It is a pure bitter, possessing a slight aromatic flavour, and by no means offensive to the stomach. Both alcohol and water extract its active principles. It does not appear to possess any astringency. In domestic practice it is much used as a stomachic, for weakness of the digestive organs; and I know of no bitter which is more grateful and effectual in cases of this kind, than this one. It has also been a good deal used in some parts of the country in intermittents. I have myself employed it in some instances, but I do not remember any case in my practice which was cured by it. I knew a country practitioner, however, who was in the habit of giving this remedy conjointly with *calamus aromaticus*, in intermittents, and with very considerable success.

It is commonly given in the form of strong infusion. Of this, from a half to a whole gill may be taken

* Barton's Medical Botany, vol. ii. 257.

frequently during the day. The dose of the powder is from twenty to thirty grains.

There is an excellent figure of this plant in Dr. Barton's Vegetable Materia Medica of the United States, vol. ii.

LIRIODENDRON TULIPIFERA.

THIS is one of the largest and most beautiful of American forest trees. It rises to the height of eighty, ninety, and even one hundred and forty feet, putting forth, about the middle of May, an abundance of superb flowers, marked with green, yellow, and red streaks, which, together with its beautiful foliage, give to the tree a very magnificent appearance. The bark, which is the part employed in medicine, is of a strongly bitter, and slightly aromatic taste. According to the analysis of Dr. Rogers,* it contains gum, resin, muriatic acid, iron, calcareous salt, gum mucous, and fecula. This bark has been long employed, both in domestic and regular practice in the United States, and it appears from the testimony which has been published in favour of it, to be well entitled to the attention of the profession.

This bark possesses considerable stimulant proper-

* Inaugural Dissertation. Philad. 1802.

ties, but it is chiefly on account of its tonic effects that it deserves notice. It acts also occasionally as a diuretic, and in general, it produces very conspicuous diaphoretic effects when largely administered. The bark of the root appears, however, to be less stimulant and more purely tonic, than that of the trunk or smaller branches.

Given in union with dogwood, and the *prinus verticillatus*, it has been employed with much success in the cure of intermittents. The late Dr. Rush employed it, as he states, "with as much satisfaction as any of the common bitters of the shops."*

Dr. J. T. Young, in a letter to governor Clayton, of Delaware, says, "I have prescribed the poplar bark in a variety of cases of the intermittent fever; and can declare from experience that it is equally efficacious with the Peruvian bark, if properly administered."† As this bark is, however, considerably stimulant, it should never be given where the intermission is marked by symptoms denoting a phlogistic tendency in the system. Bleeding and purging are necessary preliminaries to the employment of this remedy where the habit is inflammatory.

It has also been much recommended in chronic rheumatism and in gout,‡ and from its manifest ten-

* Transactions of the College of Physicians of Philad. 1793.

† Carey's American Museum, vol. xii.

‡ Barton's Collections.

dency to produce diaphoresis, together with its tonic operation, there can be little doubt of its occasional usefulness in affections of this kind. From these combined properties it also often acts with great advantage in the advanced stage of dysentery.* In this disease I have repeatedly employed it in conjunction with the *ulmus aspera*, in the form of decoction, and in general the effects were very satisfactory.

Dr. J. T. Young, whom I have already quoted, speaks in very high terms of this remedy in the cure of hysteria. "I can assert from experience," says he, "there is not in all the *materia medica* a more certain, speedy, and effectual remedy in the hysteria, than the poplar bark, combined with a small quantity of *laudanum*."

Dr. Young also states, that he has used this bark with much advantage as an anthelmintic. "I have never known it to fail," he observes, "in a single case of worms which has come under my observation." I have given it for this purpose in several instances, without deriving any good effects from it.

In a debilitated state of the stomach, the powdered bark of this tree, in union with steel dust, has been prescribed with very great advantage.† The bark may be given in substance, tincture, infusion, or decoction. In substance, however, it acts with most

* Thatcher's Dispensatory.

† Ibid.

power. The dose of the powdered bark, for an adult, is from thirty to one hundred and twenty grains. If it produces purging and griping, a few drops of laudanum should be added to it.

BONPLANDIA TRIFOLIATA, (CUSPARIA FEBRIFUGA.)—
ANGUSTURA BARK.

It is not a great while since this bark has been known to the profession; but it would appear, from the experience of those who have given an account of its remediate powers, to be entitled to very considerable attention. The Angustura bark is obtained from a large and beautiful forest tree, growing in abundance in the woods near Carouy and Alta Gracia. It is also found in the valley of Santa Fe, between Cumana and New Barcelona,* and particularly in the woods near Carouy and Alta Gracia. The botanical character of this tree was not known until it was described by Humboldt and Bonpland. Willdenow, to whom specimens were sent by these enterprising and intelligent travellers, constituted it into a new genus, to which he gave the name Bonplandia. It is said to approach very nearly in its botanical character to quassia, but to be, nevertheless, sufficiently

* Alibert.

discrepant from this to require for its classification a separate genus.

The bark of this tree comes to us in small, slightly convex, wrinkled, and externally whitish pieces, of about four or five inches in length. It has a very bitter and slightly aromatic taste—its odour is peculiar and nauseous. When pulverized it becomes of a bright yellow colour.

According to M. Vauquelin, this bark does not precipitate animal gelatine, but it forms a copious precipitate with tartar emetic, iron, copper, lead, and tan. One of its principal chemical peculiarities, therefore, is, that it does not precipitate animal gelatine. M. Vauquelin thinks, too, that the principle which gives to this bark the power of precipitating metallic solutions, is not the same as that which gives a similar property to the Peruvian bark.* From the analysis of other chemists, however, it appears that the Angustura bark contains *cinchonin*, besides resin, extractive, carbonate of ammonia, and an essential oil. Its active principle is readily extracted by cold and hot water, and it does not appear that long boiling injures its powers.†

The Angustura bark is a stimulant tonic of very considerable powers; and is much less apt to nauseate or oppress the stomach than the cinchona bark. When

* Alibert, Mat. Med. tom. i. p. 78.

† Paris' Pharmacologia.

first introduced into notice it was highly extolled as a remedy in intermittent fevers; and although it has now lost much of its former reputation, there are still some highly respectable physicians who regard it as a remedy of very great power in the cure of intermittents.

It has also been recommended as particularly useful in chlorosis. I have lately prescribed it in a case of this complaint, in combination with iron, and the effect was very beneficial. In this case, however, the iron may have been the most efficacious of the two articles in combination.

In dyspepsia, while the disease is yet entirely confined to the digestive organs, the Angustura bark may be beneficially given. I have used it in my own case, and obtained considerable relief from it. It is also said to be a very effectual remedy in diarrhœa, depending on a weakness of the bowels, and in dysentery. In these affections I have never administered it, but I can readily believe, that in the former disease, and in the chronic form of the latter, it may be employed with advantage.

In powder it is given in the dose of from six to thirty grains. The dose of the decoction or infusion is from ʒi. to ʒii. When given in very large doses it has a tendency to produce nausea. The incompatible substances are: sulphate of iron, sulphate of copper,

oxymuriate of mercury, nitrate of silver, tartarized antimony, subacetate and acetate of lead, potass.*

“There is found in the market,” says Dr. Paris, “a particular bark, which has been called *fine Angustura*, but which is of a different species, and is a very energetic poison. This bark is characterized by having its epidermis covered with a matter which has the appearance of rust of iron, and which, moreover, possesses certain chemical properties of this metal, for if water acidulated with muriatic acid, be agitated in contact with its powder, it assumes a beautiful green colour, and affords, with an alkaline prussiate, a prussian blue precipitate. Late researches have detected the presence of an alkaline element in this bark, to which the name of *Brucine* has been bestowed. When this alkali is dissolved in boiling alkohol, and crystallized by spontaneous evaporation, it yields colourless and transparent crystals, in the form of oblique quadrangular prisms.”

COLUMBO.

THIS is the root of the *menispermum columbo*, a native of Ceylon, and is brought to us from Columbo, the capital of this island. The botanical character

* Paris' Pharmacologia.

of this plant was entirely unknown until Mr. Fortin, in 1805, discovered it near Mosambique, whence it was carried into Portugal, and ascertained to belong to the genus *menispermum*. The root, which alone is employed in medicine, is imported in transverse slices, from an eighth to a quarter of an inch in thickness. The bark of the root is rugous, thick, and of a greenish, verging to an obscure brown colour. The internal, or parenchymatous part of the root is yellowish. In general there are three distinct parts composing this root, the bark, the woody part, and medullary portion.* It has a faint aromatic odour, and is intensely bitter and slightly acrid in taste. According to an elaborate analysis made of this root by M. Planche, it contains a kind of animal matter, which exists in it in very great proportion, and a yellow substance of an intensely bitter taste, which readily dissolves in water and in alkohol. It also contains a very large portion of starch. By repeated distillation a volatile oil may be obtained from it; and it appears to contain malate of lime, and sulphate of lime.† It also contains cinchonin. About one-third of its weight is dissolved by boiling water; its best menstruum, however, is proof spirit, with which it forms a very beautiful and active tincture.

This is one of the purest and least stimulating bit-

* Alibert, Mat. Med. tom. i. p. 96.

† Ibid. tom. i. p. 97.

ters we possess. It has been prescribed in intermittents, but it does not appear to be particularly efficacious in this disease. It has also been recommended in phthisis; but, from what I have seen of its effects in this disease, I am not induced to believe that it is often useful, or even proper, in this hopeless malady.

The columbo has also been recommended in dysentery and diarrhœa, but I suspect its powers in these complaints are of no great value, unless, indeed, as a tonic, in the declining stage, or state of convalescence from these diseases. In the cholera morbus of the East Indies, this remedy is said to be of very considerable value. In the cholera infantum, when it assumes a chronic form, the columbo may be advantageously given.

The disease, however, in which it seems most decidedly beneficial, is indigestion. In this complaint it is one of the best tonics we can employ.

The dose of the powder is from gr. xv. to ʒss.; that of the infusion from ʒiss. to ʒii. It may be given in combination with iron, rhubarb, or saline purgatives. The incompatible substances are, infusion of galls and yellow cinchona bark, subacetate and acetate of lead, corrosive sublimate and lime-water. The nitrate of silver, muriate of mercury or tart. antim. do not affect it.

GENTIANA LUTEA.—GENTIAN.

THIS is a perennial plant, indigenous to the mountainous parts of Germany, France, &c. The root, which is the only part employed in medicine, is long, slender, branched, externally of a brown colour, and of a yellowish colour within. Its taste is intensely bitter, but it has no particular smell. Chemical analysis shows it to contain resin, some oil, bitter extractive, a portion of tannin, and mucilage. Both water and alcohol extract its active principles, but proof spirit appears to be its best menstruum.

Of all the tonic bitters the gentian is the most frequently employed as a remedy. It contains no astringency, but is considerably more stimulant than the colombo.

The gentian has been successfully employed in combination with astringents in the cure of intermittents. Cullen says that he never knew it to fail in curing intermittent fever, when given with galls or tormental. When given alone, however, its powers are much less certain and useful. Lind, also, commends it as an efficacious remedy in this disease. At present, however, it is very seldom used for this purpose, nor does it appear to be entitled to much credit for its virtues in this complaint.

As a tonic, in general debility, or in a weak state

of the stomach and bowels, the gentian is an excellent remedy. It is particularly beneficial as a stomachic; and, in indigestion, it is, perhaps, the most useful of the bitter tonics. It has also been recommended in gout, particularly in the convalescent state, when much debility of the stomach is present. Gentian is an article in the composition of the famous Portland powder, which appears to have been employed with great advantage in preventing the paroxysms of gout.

The dose of the powdered root is from gr. x. to ʒi. It is also given in the forms of an extract, infusion, or tincture, all of which are excellent preparations.* In a large dose it is apt to purge.

QUASSIA EXCELSA.—QUASSIA.

THE quassia excelsa, is a large tree growing spontaneously in Surinam, from which its wood was first brought into Europe in the year 1761.

The wood of this tree, and more especially that of

* “*Brodum’s Nervous Cordial* consists of the tincture of gentian, columbo, cardamon, and bark, with the compound spirit of lavender, and wine of iron.

Staughton’s Elixir is a tincture of gentian with the addition of serpentaria, orange peel, cardamus, and some other aromatics.”—PARIS’ *Pharmacologia*.

the root, is of a pure and intense bitter taste, which, according to Thomson, depends on a peculiar bitter principle to which the name of *quassin* has been given. According to Crell and Tromsdorff, the *quassia* contains a greater proportion of gummy matter than of resinous, and hence they infer that the infusion of it in cold water is its best preparation.

The *quassia* is a very excellent tonic, and may be very usefully employed in all cases where remedies of this kind are indicated. It possesses scarcely any stimulating or heating properties, and is, therefore, peculiarly calculated to improve the digestive powers of the stomach in weak and very irritable subjects. It was at one time a good deal employed in the cure of intermittents. It has, however, not sustained its reputation in this disease, and is now but very seldom employed in its cure. It is said to be very efficacious in suppressing bilious vomitings, attending bilious and putrid fevers. Alibert states, that he succeeded in curing a female, by this remedy, of habitual vomiting, which had prevented her for a long time retaining any nourishment on her stomach. He also says, that he has used the *quassia* with much success in cases of dyspepsia. In the depraved appetite in chlorosis, particularly when there is a disposition to eating dirt, chalk, &c. the *quassia* is said to be a very efficacious remedy.*

* Barton's M. S. Lectures on Mat. Med.

As a stomachic, it is, indeed, one of our best remedies; it is said to be especially useful in indigestion arising from intoxication. When administered in combination with some absorbent, it acts with much advantage in the weakness and languor attending chronic hysteria.*

In diarrhoea from a want of tone in the bowels and stomach, the quassia is an excellent remedy. It has also been recommended in leucorrhœa, gout, cachexy; and Alibert says that it ought to be employed as a prophylactic, by persons who are subject to intestinal worms. It is usually given in infusion. The infusion made in the proportion of three or four drachms of the wood to twelve ounces of water, may be taken in doses of one, two, or three, table-spoonfuls.

QUASSIA SIMAROUNBA.—SIMAROUNBA.

THIS species of quassia is brought from St. Domingo, Jamaica, &c. and is also found growing spontaneously in southern parts of the United States. The bark, and not the wood of this species of quassia is used in medicine. It is inodorous, and exceedingly bitter, without any perceptible astringency. It is of a tough and fibrous texture, of a pale yellowish colour,

* Thatcher's Dispensatory.

and rough on the external surface. It furnishes a very abundant watery extract, but contains very little resin. It does not, like the quassia, strike a black colour with the sulphate of iron.*

The simarouba has been highly spoken of as a remedy in dysentery and diarrhœa. It has been particularly recommended for its efficacy in the former of these complaints, by Pringle, Lind, Stoll, Zimmerman, Blane, Tissot, Bampffield, &c. The latter writer, in his work on scorbutic dysentery, observes: "The infusion of simarouba, or a decoction of it, has been recommended generally in the obstinate chronic stages of dysentery. (*See Blane on Diseases of Seamen, &c.*) In my practice it has shown great powers, but these were of uncertain benefit. It was too apt to produce constipation, and its painful and disordered consequences." I have myself employed it in this disease, after it had assumed a chronic form, and repeated evacuations had been premised, and the effects have frequently been very beneficial. Alibert says that this remedy has been used with much advantage at the hospital St. Louis, in diarrhœas, following scurvy and intermittent fevers.

It has also been much recommended in dyspepsia and intermittent fevers; experience, however, has not established its efficacy in these diseases, and it is certainly inferior in this respect to several other articles

* Alibert, Mat. Med.

of this class of remedies. In powder it is given in doses of half a drachm. The decoction, however, is the most convenient form, and it possesses all the powers of the substance.

CROTON ELEUTHERIA.—CASCARILLA.

THIS is a small shrubby tree, indigenous to Jamaica, Eleuthera, Carolina, Florida, and various parts of South America. The bark of this shrub, which is the only part used as a medicine, comes to us in the shape of round tubes, the external surface of which is ash-coloured; internally it is of a brownish colour. Its taste is very bitter, and it has a strong aromatic odour, which becomes particularly manifest when burned. It contains a very large proportion of resin, and hence alcohol is its most appropriate menstruum. According to the analysis of Tromsdorff, it contains also, besides resin, a small portion of mucilage, a bitter principle, and a very volatile essential oil.

As a remediate article, this bark was first brought into notice in the year 1692, in a dissertation attributed to a Spaniard of the name of Vincent Garcias Salat. It soon afterwards attracted the attention of many of the most celebrated physicians of Germany,*

* Alibert, Mat. Med.

and was highly praised for its febrifuge powers; which, by some, were affirmed to be superior even to those of the Peruvian bark. Stahl and his followers contributed greatly to its reputation as a remedy in intermittent fevers; and Junker and Alberti spoke in the highest terms of its powers in this disease. It has been particularly recommended for its usefulness in what have been called putrid or malignant intermittents. The very strong and respectable testimony which we have in the writings of physicians in favour of the febrifuge virtues of the cascarilla bark, do not permit us to doubt of its usefulness in this way. Without pretending to say that it is equal to the bark, it is quite certain, I think, that it merits much more attention than appears to be given to it at present.

This bark is a very active and useful remedy in weakness of the stomach, giving rise to frequent vomiting and symptoms of indigestion. Cullen, however, speaks but lightly of this medicine, but I feel persuaded that his estimate of its powers falls considerably short of its real merits. I have given it in intermittents, and have taken it myself, for indigestion, and with decided advantage.

It has also been employed in dysentery, diarrhœa, flatulent colic, and internal hæmorrhages. From my own experience, however, I can say nothing of its powers in these complaints; but I do not presume, that in this respect it is entitled to much attention.

It is given in powder, from twelve to thirty grains. Its tincture is an active preparation, but the decoction or infusion possesses no great powers.

ANTHEMIS NOBILIS.

CHAMOMILE is one of the most ancient articles of the materia medica. It was employed by the Egyptians as an external application, in the cure of fevers; and it appears from the Greek writers, that it was held in very great estimation by them.*

It does not appear that chamomile flowers have as yet been subjected to any very particular analysis. They have been ascertained, however, to contain a considerable portion of bitter extractive, and an essential oil of a beautiful sapphire blue, or of a greenish brown colour. By being exposed to the light and air, this oil is liable to undergo changes.

Chamomile flowers were, at one time, much prescribed for the cure of intermittents, and much respectable testimony is extant in favour of their powers in this complaint. We are informed by Dr. Cullen that Dr. Pitcairn thought them quite equal in this respect to the Peruvian bark, and Hoffman considered them very efficacious. Cullen, also, employed

* Alibert.

them with success in this disease. He states, however, that their employment is frequently attended with the inconvenience of readily running off by stool, to obviate which he usually gave them with an opiate or some astringent.

As a stomachic bitter, chamomile flowers are much employed, and their effects in this way are commonly decidedly beneficial. They are also an excellent remedy in spasmodic and flatulent colics; in hysteria, attended with habitual weakness of the digestive organs, and in restraining violent bilious vomitings. When employed for restraining vomiting, a *weak* infusion must be employed; a strong one having the property rather of exciting than allaying vomiting. The infusion is much employed to promote the operation of emetics, but for this purpose it ought to be used strong.

Chamomile flowers are often employed in colds and catarrhs, as a gentle diaphoretic, and they, indeed, seldom fail in producing this effect. The essential oil is used as a carminative, and cordial diaphoretic. The leaves and flowers of chamomile have sometimes been used as an external discutient application; and the infusion of them is said to be very beneficial when used in the form of a clyster, in dysentery and colic. The incompatible substances are, the soluble preparations of iron, nitrate of silver, oxymuriate of mer-

cury, acetate and subacetate of lead, solutions of isinglass, infusion of yellow Peruvian bark.*

In substance these flowers may be given in the dose of a drachm or more; but they are usually prescribed in the form of an infusion. They give out their virtues both to water and rectified spirit.

HUMULUS LUPULUS.

THIS is a native both of Europe and America, and has for a long time held its station among the articles of our materia medica, although its principal importance depends on its economical uses, and particularly on the use which is made of it in brewing malt liquors.

Cold water extracts but little of the bitter principle of the hop. In boiling water, however, it is entirely soluble. Alcohol also, is a good menstruum of its bitter extractive. The aqueous infusion becomes black on adding to it some solution of sulphat of iron.

The hop is a very excellent stomachic, and has been for a long time valued for its usefulness in dyspepsia and other diseases depending on a loss of tone in the stomach. The summits of this plant, also, in which the bitter and aromatic principles are combined,

* Paris' Pharmacologia.

are said to be exceedingly useful in weakness of the digestive organs. They have been particularly recommended in scrophulous diseases, and in rachitis.*

The use of the infusion of the hop, has been supposed to be capable, when long continued, of dissolving a urinary calculus while yet in the bladder. Its lithontriptic powers are not only exceedingly questionable, but it is even asserted on very high authority, that its effects in this way are injurious. The late Dr. Barton found, in his own case, that the use of malt liquors subjected him to more frequent and severe nephritic attacks.

The infusion is taken in doses of about two ounces every two or three hours, to the extent of a pint in twenty-four hours.

In another place I shall speak of its anodyne or narcotic properties. Every one knows the effects of the hop pillow in procuring sleep.

FERRUM.—IRON.

AMONG the mineral tonics, iron, undoubtedly, holds the first rank, whether we consider the importance of its general tonic effects, or the extent and variety of its remediate applications.

* Alibert, Mat. Med. tom. i. p. 146.

Cullen thought that iron is totally inactive in its metallic state, except it meet with an acid in the stomach, to corrode and render it soluble.

This idea is, however, without foundation, as it is now sufficiently ascertained that the gastric juice readily dissolves iron in its metallic state, "without the intervention or aid of the acetous, or any other acid present in the stomach."*

The effects of iron on the system, are those of a slow but permanent tonic, increasing the fulness and frequency of the pulse, rendering the blood more florid, and imparting permanent vigour and tone to the general system.

It is, therefore, obvious from these effects, that this metal is peculiarly calculated to act beneficially in cases of debility attended with a weak and sluggish pulse, and a pale, cold, and relaxed state of the body.

One of its earliest remediate applications was for the purpose of restraining hæmorrhages; and in these cases it may be injurious or beneficial, according to the particular state of the system attending the complaint. In what are called active hæmorrhages, this remedy could hardly fail to act perniciously, unless, indeed, some of its astringent preparations be employed. In those chronic hæmorrhages, however, which depend on a laxity of the animal fibre, and are accompanied with a pale and cachectic state of the

* Dr. Barton, in a note to Cullen's Mat. Med.

body, iron, either in its metallic form, or in that of its milder preparations, is a remedy of unquestionable benefit. It is peculiarly advantageous in those cases of chronic uterine hæmorrhages which occur in females somewhat advanced in life, and of a relaxed and debilitated habit of the system. In cases of this kind I have done much good by exhibiting small doses of iron and Peruvian bark, and interposing occasionally some active astringent, when the discharge became alarming. M. Alibert says, that he has employed this remedy with much success in the hæmorrhages which accompany scurvy.*

In general, iron is a very important remedy in all diseases attended with a feeble and cachectic state of the system. In chlorosis, it is justly considered as one of our most useful remediate means. In this affection there is always a great want of tone and activity in every part of the system; every thing indicates languor and relaxation of the vital energies. The pale and leaden hue of the countenance, the flaccidity of the skin and muscles, the swellings of the feet, the anorexia or depraved appetite, the indisposition to active exercises; all these symptoms point out the necessity of invigorating measures, and none appears to be so generally useful as iron, aided by the gentle exercise of gestation.

Iron is also much prescribed as an emmenagogue;

* Alibert, *Elémens de Thérapeutique*, tom. i. p. 180.

and it is, in fact, often the most effectual remedy we can employ. It must be observed, however, that it is only in those cases of amenorrhœa which depend on debility and relaxation, that it can be employed with advantage. Where the complaint is attended with an opposite state of the system, this remedy is not only useless, but absolutely pernicious. The emmenagogue effects of iron appear, therefore, to depend on its powers as a general tonic; and it is only in proportion as its general roborant effects are produced, that it acts beneficially in restoring the suppressed menses in cases of this kind.

Iron has been highly recommended in scrophulous affections. Alibert says, "there are few remedies more useful in scrophulous complaints than iron."^{*}

Other practitioners have added their testimony in favour of its remediate power in affections of this kind.

Of late it has also been particularly recommended in the cure of cancerous ulcerations. Dr. Carmichael, of Dublin, has written a work[†] expressly on the use of iron in the cure of cancerous affections. Respectable as is the testimony of Dr. Carmichael, more extensive and diversified experience is still wanting, before we can pronounce on the real value of this practice. It is not, however, just to oppose specu-

* *Elémens de Thérapeutiques, &c.* tom. i. p. 181.

† *An Essay on the effects of the Carbonate and other preparations of Iron in Cancer.* 1809.

lative doubts to the facts of direct experiment, and we have, therefore, no right to invalidate the large body of evidence offered by Dr. Carmichael in favour of this remedy in cancer, until ample and diversified experience shall have shown it to be inefficacious. Dr. C. recommends the iron to be given in very large doses, and to be continued for a long time; the ulcers are to be sprinkled with the powdered carbonate of this metal, or touched with the muriated tincture.

In atony of the stomach and bowels, chalybeates are often exceedingly useful, when given in combination with bitters. This remedy has also been commended for its effects in dropsy. Sydenham proposed its employment in the commencement of this disease, on the supposition that it depends essentially on a weak and watery state of the blood. "Steel," he says, "is the chief corroborative in the beginning of dropsy, for it heats and invigorates the blood." It is, however, well known now, that this disease is very generally connected with a phlogistic condition of the system, and where this is the case the use of iron must be obviously improper. In anasarcaous swellings, from general debility, we can readily perceive that this remedy may produce excellent effects. Alibert* mentions the case of a weak and delicate female, labouring under anasarca, who was constantly much relieved by the *sulphuret* of iron; and Dr. Robert Archer has

* *Elémens de Thérapeutique*, tom. i. p. 180.

reported a case of general dropsy, in a soldier, which was effectually cured by this remedy.*

Mr. Halle describes a singular affection under the name of *anæmia*, (privation of blood,) which, in the year 1804, attacked all the workmen in a mine of *anthracite*, near Valencines, and which is represented as offering symptoms very analogous to those of chlorosis. In this malady he administered iron filings, in combination with Peruvian bark, with the happiest effects. Other physicians employed iron with equal success in this disease. M. Leblen, physician of the hospital at Dunkirk, to which some of the sick were taken, administered the red oxyde of iron with perfect success.†

In another place I shall speak of the anthelmintic powers of this remedy.

The filings of iron may be taken from twenty grains to a drachm. It is generally joined with some aromatic substance, and may be very conveniently given in the form of an electuary. Care should be taken that the filings be well purified by a magnet, as they are apt, when procured from work shops, to be mixed with the filings of other metals, particularly copper. "For pharmaceutical purposes, iron wire should be

* American Medical Recorder, vol. ii.

† Bibliothèque Médicale, tom. vi. p. 195 et 342, et tom. viii. p. 297. Vide Traité de Mat. Med. par C. J. A. Schwilgué, tom. i. p. 310.

preferred, as being the most pure, since the softest iron only can be drawn; and Mr. Philips has shown us, in experiments upon the '*ferrum tartarizatum*,' that soft iron is more easily acted on by tartar.*

The preparations of this metal are very various; of these I shall, however, mention only such as are considered the most important, and fully capable of affording all the advantages which can be derived from chalybeate remedies.

Ferri sub-carbonas.—*Carbonate of iron.*—*Rubigo ferri.*—This is a dark brown powder, destitute of odour, and has a slightly stiptic taste. It consists of a mixture of peroxide, protoxide, and subcarbonate of protoxide of iron, in proportions subject to variation, according to the temperature at which the preparation is made. Acids act upon it and dissolve it with effervescence; in water, however, it is wholly insoluble.

This is, perhaps, the best preparation of iron, in the majority of cases for which martial remedies may be thought necessary. It is by no means unpleasant to take, and sits easily on the stomach. In certain cases, however, where a costive habit of body exists, this preparation is apt to increase the confined state of the bowels, and when this is the case, we ought to employ the filings instead of the rust.

The carbonate of iron has lately been recommended

* Paris' Pharmacologia.

as a very efficacious medicine in tic douloureux. Mr. B. Hutchinson has published a pamphlet in which he adduces many examples of the efficacy of this remedy in this disease. Mr. Richmond, also, has lately reported a case which was promptly relieved by the carbonate of iron, after a great variety of remedies had been ineffectually tried. He prescribed it in drachm doses three times a day.*

It may be given in the form of pills, or powder, combined with aromatics, in doses of from gr. vi. to lx.

Ferri sulphas.—*Green vitriol.*—*Copperas.*—The sulphate of iron consists of green coloured, transparent, rhomboidal chrystals. When exposed to the air they effloresce, and when subjected to a high temperature, they are deprived of their acid, leaving a peroxide of iron, which constitutes the *colcothar* of vitriol. The sulphate of iron dissolves in two parts of water at 60°, and in three-fourths at 212°. In alkohol it is insoluble, unless the iron be further oxidized when it undergoes solution in this menstruum.†

This preparation possesses all the powers of iron, and may be employed with advantage wherever a chalybeate is wanted. Its employment requires, however, much more caution than the preceding preparation; for, when given in large doses, it is apt to

* Med. and Phys. Journal, No. 271, p. 271, for Sept. 1821.

† Paris' Pharmacologia.

produce pains in the stomach and bowels, and may excite very alarming symptoms.

Besides its tonic properties, it is, also, powerfully astringent, and answers very well in solution as a wash for indolent and fungous ulcers. It is also a good application to herpetic eruptions.

It is given in the dose of gr. i. to v. in combination with rhubarb, myrrh, &c.

The incompatible substances are, "salts whose base forms an insoluble compound with sulphuric acid; the earths, the alkalies, and their carbonates; borate of soda, nitrate of potass, muriate of ammonia, tartrate of potass and soda, acetate of ammonia, nitrate of silver, subacetate and acetate of lead, and soaps."

Ferrum ammoniatum.—*Flores martialis.*—This salt is obtained in the form of small granular crystals, which deliquesce on being exposed to the air. It is of an orange yellow colour, of a styptic taste, and of an odour similar to that of saffron. The chemical composition of this salt appears to vary considerably with regard to the proportion of the substances that enter into it, according "to the degree of heat and time employed for its preparation." It would appear to consist of submuriate of ammonia and submuriate of iron, with the iron in a state of red oxide. Four drachms of this substance are dissolved in one ounce of water. Alcohol dissolves it readily.*

* Paris' Pharmacologia.

This preparation possesses the tonic virtues common to the other martial remedies. In some instances, however, where we wish to avoid constipation, it is preferable to the rust; for although it does not act sensibly as an aperient, it has, nevertheless, no constringing powers, and, therefore, does not interfere with the regular action of the bowels, as is sometimes the case with the rust.

The dose is from two to ten or twelve grains, in the form of a bolus.

Ferrum tartarizatum.—This preparation consists of brownish green coloured powder, having no odour, and a taste slightly styptic. It dissolves with great ease in water, the solution remaining a long time without undergoing any changes.*

This is an excellent preparation of iron. A watery solution of it is recommended by Dr. Bateman as a chalybeate peculiarly suited, from its tasteless quality, to the palates of children, and as being more efficacious than the vinum ferri. Its qualities have also been particularly commended in a communication from Dr. Birbeck, published in the London Medical Review.†

The incompatible substances are, “a strong acid, lime-water, hydro-sulphuret of potass, astringent vegetables. The fixed alkalies and their carbonates de-

* Paris' Pharmacologia.

† No. xix. July, 1819.

compose the solution very slowly unless heated; but ammonia and its subcarbonate produce upon it no effect, whether it be hot or cold." Dose, from gr. x. to ʒss.

Phosphas ferri.—*Phosphate of Iron.*—The phosphate of iron is a preparation, which, like the preceding one, has been but lately introduced as a remediate article. It consists of a powder, either of a blue or yellow colour, according to the mode in which it is prepared. It has no odour, and little or no taste. The blue phosphate is considerably stronger than the yellow. The latter may be given in doses of from twenty to sixty grains, three or four times a day; but the former cannot be administered beyond eight or ten grains, without being apt to excite nausea and vomiting.

The phosphate of iron is considered by those who have employed it an excellent chalybeate. It is said to be particularly serviceable in amenorrhœa attended with weak digestive powers. It has also been administered with very favourable results in obstinate cutaneous eruptions, chronic rheumatism, and scrophula. This is the preparation chiefly recommended by Dr. Carmichael for the cure of cancer.

CUPRUM.—COPPER.

COPPER has a slightly styptic taste, and a peculiar faint, nauseous smell. It is said by some writers that this metal is perfectly inert when received into the stomach in its metallic state. Mr. Drouard convinced himself of its innocence by administering the filings to dogs, in no instance of which did it produce any injurious consequences. Indeed we often see children who have swallowed copper coins without any perceptible effects on the system. In those cases, where it proved deleterious, it is probable that an acid existed in the stomach, by which the metal is converted into a soluble salt, and thus rendered active. It is, however, asserted by others, that it acts as a poison in its metallic state. It is said to be acted on by the gastric liquor, and rendered active. This, indeed, may be the case, but it is extremely probable that the copper is not dissolved in its metallic state, but in that of an oxide, to which it is previously converted by the fluids in the stomach.*

* Dr. Paris mentions a striking instance in proof of the inertness of copper when taken into the system in its metallic state. "A young woman," says he, "swallowed six copper penny pieces, with a view of destroying herself; she was attended by Dr. Maton and myself, in the Westminster hospital, for two years, for a disease which we considered visceral, but which

In its metallic state copper was formerly employed as a remedy in rheumatism; and Cothenius recommends its filings in the cure of hydrophobia. At present it is, however, never prescribed in the metallic state. It is susceptible of a variety of chemical preparations, some of which are remedies of undoubted utility.

Cupri sulphas.—*Blue vitriol.*—Having already noticed this article as an emetic, I shall here speak only of its remediate powers as a tonic and alterative. As such it has been particularly recommended in the cure of intermittents, by Dr. Donald Monro, and others; and in several obstinate cases of this disease, I have myself employed it with perfect success. It is to be given in doses just sufficient to excite slight nausea.* In the cure of epilepsy this remedy was, at one time, a good deal prescribed. Dr. Cullen, before he became acquainted with the cuprum ammoniacum, gave it in this disease and in hysteria, and he states that its effects were often highly beneficial. This salt has also been commended for its effects in resolv-

was evidently the effect of *mechanical* obstruction occasioned by the coin. After a lapse of five years she voided them, and then confessed the cause of her protracted disease, during the whole course of which no symptom arose which could in any way be attributed to the poisonous influence of copper.

* Dr. Monro prescribed it in the following formula: R vitriol cærul. gr. iv. extract cort. peruv. gr. xxxii. syrup. q. s. divide in pil. xvi. One to be taken four times a day for two weeks.

ing scrophulous swellings. Dr. Parsons speaks highly of it in this respect. Chalmers prescribed it with success in colica pictonum, and Adair gave it with advantage in other varieties of colic and in dysentery. As an external application to chancre, and other venereal ulcerations, it often produces excellent effects. For this purpose it is best employed in solution in the proportion of about five grains to one ounce of water. When we wish to use it for the purpose of destroying the surface of a chancre, it may be applied in substance, like caustic. It also forms an excellent injection for gleet and leucorrhœal discharges. Dr. J. Foot, of London, in his late work on the venereal disease, recommends, in the strongest terms, the following injection in gonorrhœa, after the inflammation has been reduced. Dissolve blue vitriol in a sufficient quantity of water, precipitate the solution with lixivium of tartar. Suffer it to separate, then pour off the clear liquor; wash the precipitate until it becomes insipid; make a saturated aqueous solution of sal. volat. ammon.; mix as much of this precipitate with the filtered solution of the volatile salt as it will dissolve, which reserve for use. Mix of this six drops to every ounce of water for an injection.

Cuprum ammoniacum.—*Ammoniated copper.*—This preparation consists of a triple salt, a subsulphate of oxide of copper and ammonia. It has a metal-line and exceedingly styptic taste, and an ammoniacal

odour. It is soluble in the proportion of ℥i. to an ounce of water. This preparation has been much employed in nervous and convulsive diseases, and from the testimony which has been published in favour of it by Michaelis, Cullen, Gregory, Tissot, Odier, Duncan, Bland, and many other physicians of the first respectability, we have no grounds to doubt its usefulness in this respect. Dr. Batt, a physician of great celebrity, has more recently published an account of the extraordinary effects of this remedy in the cure epilepsy. He administered it in combination with valerian, to three persons, the father and two daughters, affected with this disease, and all were effectually cured by it.

In hysteric affections, attended with great irritability, anxiety, cramps, and feebleness, the cuprum ammoniacum is a remedy of very useful powers.

In the cure of obstinate intermittents this remedy is highly spoken of by Brera; he thinks it quite equal to arsenic in this disease, especially where there is much irritability of the general system, and the intestinal canal is in a state of debility.*

A solution of this preparation is an excellent application to old and ill-conditioned ulcers; and has also been applied with much advantage to the removal of opacity of the cornea.

We may commence with it in the dose of half a

* Burdach's *Arzneymittellehre*, B. ii. p. 184.

grain twice a day, gradually increasing the quantity as far as the stomach will bear it. It is best given in the form of pills. It is sometimes given with sugar; but if it be true that this vegetable substance counteracts the operation of copper, such a combination would appear to be improper.

Thuessink, a German physician, has published some very interesting observations on the powers of this remedy in hysteria. He considers it particularly useful in those chronic cases which depend, or at least are accompanied with, debility and relaxation, and a very irritable state of the system.* In my own practice I have made considerable use of this remedy both in epilepsy and in hysterical complaints. I have never been successful in a case of epilepsy, but in the chronic form of hysteria I have given it with the most decided benefit.

This preparation has also been advantageously used in other spasmodic affections. B. Bell gave it with complete success in a case of spasmodic cough, attended with great irritability of the nervous system; and Walker† states, that he cured many cases of chorea with this remedy. He observes that he found it particularly successful where the disease was ac-

* In Samml. auerles. Abhandlungen für practische Aerzte, vol. xvii. p. 266.

† A Treatise on Nervous Diseases.

accompanied with much relaxation and debility. Willan, also, cured a case of chorea with this medicine.

OXYDUM ZINCI.—FLOWERS OF ZINC.

THIS preparation of zinc has been much extolled for its antispasmodic and tonic powers. In small doses, it excites and invigorates the energies of the system, though by a very slow and imperceptible operation. When given in very large doses its action is more violent, producing vomiting, spasms of the stomach, constipation or diarrhoea, inflammation of the bowels, convulsions, and paralysis. These effects are, however, never observed unless it be taken in enormous quantities, and we have, therefore, nothing to apprehend from its regular and proper administration. It was introduced into practice as a remedy in spasmodic diseases, by Gaubius, who reported strongly in favour of its powers in affections of this kind. He gave it in chorea and epilepsy, and in some instances with perfect success. The occasional efficacy of this practice has since been abundantly confirmed by the testimony of many very eminent physicians. Goodsir, Percival, Beireis, Crell, Hufeland, and many other physicians, have reported cases demonstrating the powers of this medicine in epilepsy. Hufeland gave

it in combination with cuprum ammoniacum, extract of hyoscyamus, and valerian. It appears to be more particularly useful in this disease when it affects children. Burdach observes, that it probably does more good in children by neutralizing acid in the stomach and destroying worms.

In a case of this disease in a child, I gave this remedy in large and frequent doses, and in the course of two months succeeded in putting a permanent stop to the disease. Dr. Rush, also, states that he cured a case of ten years standing with the flowers of zinci.

It has also been employed against hooping cough. Hager and Loeffler recommend it highly in this singular disease.

The flowers of zinc is a remedy of considerable value in hysteric affections, connected with much relaxation and weakness. In cases of this kind I have sometimes employed it with Peruvian bark, and in several instances with very considerable advantage.

This remedy has likewise been employed with very good effects in spasmodic diseases arising from suppression of chronic cutaneous eruptions. Robœl used it in children affected with symptoms of chorea in consequence of the suppression of eruptions on the head, and he states that the result was entirely favourable; the eruption returned after using the remedy for some days, and the disease disappeared.*

* Burdach, *Arzneymittellehre*, vol. ii. p. 197.

In the form of an ointment the flowers of zinci admit of various useful applications. The ointment is recommended as an excellent application to herpetic ulcerations. It is also used in chronic inflammation of the eyes, in scrophulous subjects. For this purpose the ointment should be made by mixing two parts of the flowers of zinc with three of lard.

It is given to children in doses of from one to six grains, three or four times a day. Adults may take from six to twenty grains.*

Sulphas zinci.—*White vitriol.*—The sulphate of zinc, is a remedy of very considerable powers, and has been much employed in spasmodic and other diseases. Under the head of Emetics, I have already spoken of the remediate application of this substance, so far as its emetic properties are concerned, and it remains for me, therefore, in this place, only to notice its virtues as a tonic.

In the cure of epilepsy, many practitioners have thought it preferable to the preceding preparation, and I am inclined to believe that this opinion is well founded. Cullen gave it in this disease with advantage,

*“Dr. Roloff, of Magdeburgh, has lately discovered the casual presence of arsenic in the oxide of zinc; by boiling the substance in distilled water and assaying the solution with ammoniac-nitrate of silver, its presence may be instantly recognized; chalk may be detected by sulphuric acid, exciting an effervescence; and white lead, by its forming an insoluble sulphate of lead. It ought to be volatile.”—PARIS’ *Pharmacologia*.

and Johnston* states that he cured several cases with it.

In hysteria Dr. Lettsom employed this article in conjunction with quassia, and the result from his account appears to have been favourable. Ideler, a German writer of considerable note, states, that he gave the white vitriol in spasmodic asthma with the happiest effect. In another part of this work we have spoken of Moseley's vitriolic solution.

Dr. Hewson, of this city, has lately informed me that he has been particularly successful in curing intermittents with this remedy. Dr. S. Ffirth, in a letter to Dr. S. Mitchell, dated Calcutta, 1805, speaks in very high terms of this practice. "The sulphate of zinc," says he, "is a remedy which I have been in the habit of prescribing in several diseases as a tonic, and am of opinion, that when combined with a narcotic anodyne, it may be substituted very advantageously for the cinchona officinalis. I have often done this in practice, and was seldom disappointed in its good effects."

"In remittent fevers it is a useful and valuable remedy, and can be given when the bark is inadmissible, especially if combined with the extract of hyoscyamus niger. In the remittent form of the malignant fever of Asia, I have given it to the extent of three grains of the hyoscyamus niger, and four of vitriolum album,

* Medical Essays and Observations.

every hour and a half. I formerly used this remedy with much success," he continues, "in a number of cases of intermittent fever, in Pennsylvania; when I resided at the Philadelphia Dispensary, I had frequently an opportunity of comparing its virtues in the cure of intermittent fevers, with bark and arsenic; the result of my experience was, that in many cases it cured where the bark failed; but I found, also, that the bark succeeded in as many cases where the vit. alb. had disappointed me."

The dose of this medicine, when employed as a tonic, is from one grain to two or three. It is most conveniently given in the form of pills.

OXIDUM BISMUTHI.—MAGISTERY OF BISMUTH.

It is not more than twenty-eight years since this remedy was introduced into practice by Dr. Odier,* of Geneva, and *De la Roche*, of Paris. Its remediate virtues had, however, been particularly noticed by Jacobi,† nearly a century before Dr. Odier published his observations on its employment; but it does not appear that it had attracted the attention of the profession anterior to the publication of Dr. Odier's paper.

* Journal de Medicine, 1786, tom. lxviii. p. 49.

† L. F. Jacobi de Bismutho. Erford, 1697, 4 Burdach.

The diseases in which it has been particularly recommended, are, gastrodynia, spasms of the stomach, hysteric colics, pyrosis, and other dyspeptic complaints.

The testimony of Dr. Marcet, Dr. Bardsley, and Clark, in England; of Hufeland, Reil, Krysig, Belsen, &c. in Germany, and of Dr. Hosack, and Moore, in this country, are strongly in favour of the remediate powers of this article, in the above disease.

Its employment is, however, now chiefly confined to the cure of gastrodynia, pyrosis, and cardialgia. In these affections it seems to be pretty generally admitted to be a medicine of considerable value. Dr. Marcet, whose testimony deserves great respect, in a paper read in 1801, before the London Medical Society, says, "I have since had frequent opportunities, at Guy's hospital, of trying the oxyde of bismuth in spasmodic affections of the stomach, and those trials have fully confirmed the opinion which I formerly gave, of the utility of this medicine." Dr. Samuel W. Moore, of New-York, in his excellent dissertation on the medical virtues of the white oxide of bismuth, relates three cases of painful affections of the stomach, in which this remedy was employed with much success. I have employed it in a few cases of spasmodic pain of the stomach, and in one its effects were decidedly beneficial; though in the other, which appeared to me a perfect case of gastrodynia, it had not the slightest effect whatever. Upon the

whole, however, the evidence we have in favour of the powers of this remedy, in the diseases mentioned, entitles it to much attention from the profession.

This medicine may be given in the dose of from three grains to ten, three or four times a day. Hufeland says, that its virtues are increased by being given in combination with the extract of hyoscyamus and ol. cajeput. Odier gave it a quarter of an hour before eating, and to the extent of twelve grains for a dose.

NITRAS ARGENTI.—LUNAR CAUSTIC.

THE nitrate of silver, when fused and cast into small cylindrical pieces, forms the lunar caustic of the shops. These pieces are of a dark grey colour, and break with a shining crystalline fracture. The lunar caustic possesses no odour, but it has an exceedingly austere bitter, and metalline taste. It is soluble in an equal weight of water at 60°; it also dissolves in alcohol.

In another place I shall have occasion to speak of the employment of this substance as an escarotic; in the present place, therefore, I have only to notice its remediate powers as a tonic.

The internal employment of the nitrate of silver has been particularly recommended in the cure of epilepsy. Dr. Simms, of London, relates several cases in

which this remedy was successfully employed. Dr. Cappe,* also, speaks in very high terms of the efficacy of this medicine in epilepsy. Nord, a German writer, gives an account of a case of epilepsy complicated with mania, in which the nitrate of silver was employed with complete success.† It has also been successfully used in the disease by Dr. Gough,‡ Sir Henry Hallford,§ and Dr. Roget.|| Sementini, an Italian physician, says it is more efficacious in this disease than any other remedy we possess. It ought to be given in combination with a vegetable extract. He states, also, that he found it successful in paralysis.¶ This writer states that a cutaneous eruption, of a pustular kind, frequently appears in those who are taking this remedy; when this takes place we may be assured of the beneficial influence of the medicine. Many other names might be added in testimony of the efficacy of this medicine in epileptic complaints. Other practitioners, however, who have prescribed this remedy, in the present disease, have been entirely disappointed of any beneficial results. I must confess that, in my own practice, it has not produced any ad-

|| Ibid. vol. vii.

¶ Giornale di Fisica, tom. xi. p. 355.

vantages, although I have given it largely and perseveringly in several instances.

The nitrate of silver has, also, been used with advantage in other convulsive affections. Wollf speaks of it in the most exalted terms as a remedy for tremours of the heart.* And Dr. Powel, of London, has published cases of its successful use in chorea.

This remedy has likewise been employed with success in angina pectoris, dropsy, and leucorrhœa. "In several instances of leucorrhœa," says Dr. Thatcher, "the nitrate of silver has been employed in doses of one twelfth of a grain three times a day, with complete success." Bayle and Geoffroy speak favourably of its effects in dropsy.

In combination with cicuta, I have, in a few instances, prescribed this remedy with excellent effect in scrophulous ulcerations. In old constitutional ulcers, the nitrate of silver, administered in doses of from gr. i. to vi. three times a day, has been known to prove highly beneficial. I once prescribed it with complete success in an alarming case of ulceration of the gums and jaws, from the imprudent use of mercury. A part of the palate and upper jaw, with the two middle incisors, had already come away, and the ulceration was spreading rapidly. I administered four grains of the nitrate of silver, three times a day, and by this remedy alone, succeeded without difficulty in

* Burdach, *Arzneymittellehre*, B. ii. p. 173.

arresting the disease. This preparation is, indeed, highly recommended by Hahnemann, in the treatment of mercurial diseases. Dr. Roberts, an English writer, employed it with much benefit in counteracting the deleterious effects of lead.

The nitrate of silver may be given from one-fourth of a grain to six grains; gradually increasing the dose. Nord began with half a grain and gradually augmented the dose to fifteen grains three times a day. I have frequently given it to the extent of six grains.

It is now ascertained beyond a doubt, that the long continued use of nitrate of silver is capable of giving a permanent black colour to the skin. The late Dr. Albers, of Bremen, relates several cases of this kind.* A case, also, is reported by Dr. F. Harrold, of England, in which the skin became nearly black in consequence of the internal use of this remedy;† and Sir H. Hallford gives an account of a person who took it for a year and a half, and whose skin, at last, assumed a permanent dark hue.‡

The incompatible substances are, “fixed alkalies and alkaline earths, the muriatic, sulphuric, and tartaric acids, and all the salts which contain them; soaps, arsenic, hydro-sulphurets, astringent vegetable infusions, undistilled waters.” It does not deliquesce when free from copper.

AURUM.—GOLD.

DURING the ages of alchemy, gold enjoyed considerable reputation as a medicine. It had, however, sunk into entire neglect, when Dr. Chrestien,* in 1811, published his observations concerning its remediate powers, and again brought it to the attention of the profession. This writer adduces a number of facts illustrative of its efficacy in syphilitic and scrophulous cases; and asserts that the employment of gold is not liable to the same inconvenience which occasionally attends the use of mercury. It cures the disease without exciting ptyalism; and, unless given in too large doses, produces no sensible disturbance in the system. No particular care as to regimen is required during its employment, and the patient, we are told, may go about his ordinary business; nay, it is even stated, that the remediate employment of gold admits of a generous diet and the moderate enjoyment of wine. The preparations which he used are: metallic gold, in the state of minute division; oxide of gold, precipitated by potash; the oxide precipitated by tin; and the triple muriate of gold and soda. Of these preparations the muriates are vastly more powerful

* Observations sur un Nouveau Remède dans le Traitement des Maladies Veneriennes et Lymphatic, par A. Chrestien, à Paris, 1811.

than the oxides and divided gold. The latter is the weakest of them all. Orfila ranks the muriate of gold among the poisonous substances; and Chrestien asserts that it is incomparably stronger than corrosive sublimate. He administered it in doses, at first no larger than one-fifteenth of a grain, and if pushed beyond one-tenth of a grain, it never failed to excite fever and inflammatory symptoms. The oxide he gave in doses of from half a grain to two grains, and the metallic gold, to the extent of three grains daily.

Duportal, who, in conjunction with Pelletier, published a very interesting memoir on the preparations of gold, adds his testimony in favour of the efficacy of this remedy in syphilitic complaints. He relates a remarkable instance of the good effects of these preparations in a cancerous ulcer, "that had destroyed the upper lip, attacked the soft parts of the nose and left cheek, destroyed the square bones, and rendered the maxillary bone carious." Notwithstanding the very high terms in which the auriferous preparations have been spoken of by Drs. Chrestien, Duportal, Plenciz, and others, it does not appear that they are much attended to at present in the treatment of any diseases. Pontin, however, and several other Swedish physicians, who have tried this remedy, state that they never obtained any real advantages from its use.

In this country the reports of several eminent practitioners have not been very favourable in relation to

the power of this remedy in scrophulous and syphilitic diseases. Dr. Hosack and Dr. Francis saw several cases in which the syphilitic symptoms returned after they had disappeared under the use of the gold. It ought to be observed, however, that this is not unfrequently the case even with the acknowledged specific, mercury, when too soon discontinued or improperly used. It would appear, also, from the experience of these and other physicians, that the muriate of gold is of doubtful efficacy in the secondary symptoms of this disease.* To this, however, we may oppose the evidence of Dr. Saml. L. Mitchill, who, in a communication to Dr. Dyckman, says, "The efficacy of this medicine has been tried year after year in the New-York hospital. My practice with it there has been witnessed by all the attendants of the wards. It possesses admirable virtues against syphilis. Without presuming to affirm that it is capable of eradicating the distemper in every instance, my opinion, upon the whole, is, that the muriate of gold will effect all that is achieved by muriate of quicksilver, with incomparably less inconvenience to the patient. He gets well under the operation of the former without the hazard of a sore mouth or a salivation, and with very little wear and tear of constitution. I consider the introduction of this preparation into common use as one of the greatest improvements in modern medicine;

* Dyckman's Dispensatory, p. 201.

and I wish it were already as universal as the malady it is intended to remove. The muriate of gold is found to increase the quantity of urine, in many instances, to such a degree, that it ought to be ranked among the diuretics of the *materia medica*.”*

I have employed the gold in two cases of secondary syphilitic ulcers of long standing: in one of these there was an evident amendment in the appearance of the ulcers, but I could not succeed in curing them by this remedy; the other case yielded to its powers, and the patient has since remained perfectly well. In both these cases I had previously employed mercury for a long time, but without any good effects whatever. I have also administered it in a case of scrophulous ulcerations, and succeeded very soon in healing up the sores. The cure was not, however, permanent. In a recent memoir on the remediate properties of gold, by Dr. J. C. Niel, a French physician, it is asserted, “that the aurific preparations are exceedingly efficacious in tinea, elephantiasis, and scrophula. This writer states, that the preparations of gold sometimes excite salivation; which, however, is not attended by the unpleasant effects that arise from a mercurial salivation. It seldom produces much inflammation of the mouth, and does not affect the teeth, nor is it attended with a foetid breath.”†

* Dyckman's Dispensatory, p. 201.

† London Med. and Phys. Jour. vol. xlvii. p. 248.

From what has already been published in relation to this remedy, it is sufficiently evident that it possesses very important powers. We, however, want much more ample experience upon this subject, before we can decide upon its real merits, and the particular cases to which it may be especially adapted.

Dr. Chrestien administered the different preparations of this metal by friction on the gums. It may, however, be more efficaciously used internally, either enveloped in some mucilaginous liquid, or in the form of pills. The pure muriate cannot be well given in this latter way, as it is much too caustic and deliquescent. For this purpose the triple muriate of gold and soda, must be employed. This may be given from one-fifteenth to one-eighth of a grain, gradually increasing the dose. According to M. Figuer, the pure muriate may be conveniently given in the following mode: dissolve sixteen grains of the salt in one ounce of water; preserve this solution in a vial, well closed, and seclude it from the light. A half a drachm of this may be made into pills, with starch or the crumbs of bread, or by being mixed with a sufficient quantity of some mucilaginous fluid to obtund its acrimony, it may be taken in a liquid form. The oxide is given in much larger doses. Dr. Chrestien gave it from a half a grain to two grains. Other practitioners have, however, given it to a much greater extent. Van Mons administered from twenty to twenty-

five grains. The report of this physician is much in favour of the efficacy of this preparation. He found it particularly efficacious in curing chancre.*

ARSENICUM.—ARSENIC.

ARSENIC is a hard grey-coloured metal, of a granular texture, and great brittleness. In its metallic state it does not affect the animal economy. Combined, however, with a certain portion of oxygen, it forms the white oxide of arsenic of the shops—the most active mineral poison with which we are acquainted. The oxide of arsenic is generally found in the form of white semivitreous lumps, exhibiting, when pulverized, the appearance of white sugar. When exposed to a heat of about 383° of Fahrenheit, it rapidly volatilizes in white *inodorous* fumes. The alliaceous or garlic-like smell does not belong to the oxide of arsenic in a state of vapour, but is wholly confined to the fumes of metallic arsenic. When the oxide of this metal, or the common arsenic of the shops, is thrown upon hot charcoal, the garlic smell of the fumes is quite perceptible. But, in this instance, the oxide is decomposed, the oxygen uniting to the charcoal, and the

* Burdach, *Arzneymittellehre*, vol. ii. p. 208.

metal escaping in the form of fumes, having a garlic odour.

“ It is stated by Orfila and other chemists,” says Dr. Paris, “ that if it be projected upon heated copper, the alliaceous odour is evolved. This, however, takes place only when the copper is in a state of ignition, at which temperature its affinity for oxygen enables it to reduce the arsenious acid; for I find, by experiment, that if a few grains of this substance be heated on a plate of copper, by means of a spirit-lamp or blow-pipe, no odour is perceptible, for the whole of the acid is dissipated before the copper can acquire a sufficiently exalted temperature to deoxidize it. If the arsenious acid be heated on a plate of zinc, the smell is not evolved until the metal is in a state of fusion; if, instead of these metals, we employ, in our experiments those of gold, silver, and platina, no alliaceous smell whatever is produced at any temperature.” The knowledge of this fact is of considerable importance in employing this experiment as a test for arsenic; for it is evident, that if the substance suspected to contain the white arsenic be subjected to heat, without being in contact with any substance capable of depriving it of its oxygen, no alliaceous odour will be evolved.

The oxide of arsenic combines with potash, soda, and liquid ammonia to saturation, forming soluble arsenites, and possessing, therefore, some of the essential properties of acids.

According to the accurate experiments of Klaproth, it takes four hundred parts of water at 60° , to dissolve one part of the oxide of arsenic, and only thirty parts at 212° . If it be boiled in water, and the solution be suffered to cool, it will retain thirty parts of it to one thousand of water, and deposit the superfluous part in the form of tetrahedral crystals. "This fact," observes Dr. Paris, "shows the importance of employing boiling water in every chemical examination of substances supposed to contain arsenious acid." The oxide of arsenic is also soluble in alcohol and oils.

The oxide of arsenic acts with great violence when taken internally, and commonly destroys life in a very short time. When taken in too large a dose, as for instance, one-fourth of a grain, it excites nausea, and slight chills. By continuing it in such doses, it destroys the appetite, excites vomiting, pains in the stomach and bowels, painful diarrhoea, great anxiety, and oppression in the breast, debility and emaciation, numbness of the hands and feet, dropsical swellings, tremors, and paralysis. In doses above a grain, it destroys life, with symptoms denoting inflammation of the alimentary canal. It is generally believed to produce its deleterious effects, by acting directly on the villous coats of the stomach and bowels, producing inflammation and ulceration of these parts. This idea is certainly countenanced both by the appearances on dissection, and by the corrosive quality of

this substance. Mr. Brodie, however, rejects this explanation of its *modus operandi*, and thinks himself warranted to conclude, from several experiments which he performed on this subject, that arsenic enters into the circulation, and that it produces its effects by acting at once upon the nervous system, the organs of the circulation, and the alimentary canal; and that death depends immediately on a suspension of the functions of the brain and heart.* This opinion is also entertained by Orfila. Dr. George F. Jaeger, of Stutgard, in a very elaborate and interesting dissertation on the effects of arsenic on various organized bodies, adduces a number of strong arguments to prove that arsenic does not produce its deleterious effects by a local action on the stomach and bowels, "nor in the manner of the acrid poisons, nor upon the nervous system; but is analogous to the poison of the viper and ticunas, which act primarily upon the blood."† It appears from the experiments of Jaeger, that arsenic is entirely inert when applied directly to a nerve. That death from arsenic does not depend on the inflammation or local lesion which it produces in the part to which it is applied, is rendered certain by the fact, that it has been known to

* Philosophical Transactions for the year 1812.

† Edinburgh Med. and Surgical Journal, January, 1811. *Dissertatio Inauguralis de Effectibus Arsenici in Varios Organismos, &c.* Auctor. G. F. Jaeger. 1808, Tubengæ.

destroy animals in a short time on being applied to wounds. Sprægel states that he sprinkled a drachm of arsenious acid into a recent wound on a dog's back, and that the death of the animal took place at the end of five hours.* It is a remarkable fact, also, that when arsenic destroys life on being applied to a wound, it often produces nearly the same organic effects on the membranes of the alimentary canal, as when taken internally. In the experiment just mentioned from Sprægel, "the stomach and intestines were greatly inflamed, both on their exterior and interior surface; coagulated blood was effused into their cavities, and had insinuated itself between their coats. The pleura, pericardium, and lungs appeared very inflamed." Hunter, Home, and Brodie have made the same observations. Arsenic has even been known to destroy life, when taken internally, without leaving any very manifest traces of inflammation on the stomach and bowels. There can be no doubt, however, that the extensive disorganization which this mineral commonly produces in the coats of the alimentary canal is sufficient, independent of any other effects, to destroy life; and it is, probably, in this way that it is most frequently fatal when received into the stomach. Arsenic is not only destructive of animal, but also of vegetable life. From M. Jaeger's observations, it ap-

* Orfila's Toxicology, vol. i. p. 114. Sprægel *Experimenta circa varia Venena*. Disp. Med. Goet. 1753.

pears that the death of vegetables is induced by arsenic by the gradual absorption and distribution of the poison by the vessels and cellular membrane, so that the parts die in succession as the particles of the arsenic reach them." Paris states that the influence of arsenical vapours, near the copper smelting works of Cornwall and Wales, "is very apparent in the condition both of the animals and vegetables in the vicinity."

Arsenic, like most other powerful substances, may be applied to very important remediate purposes. It was employed as an external remedy, both by the Greek and Arabian physicians. Dioscorides recommends its use in this way; and Athenæus speaks of some arsenical preparation as very beneficial in the form of a clyster in dysentery. It is only in modern times, however, that the medicinal powers of arsenic have been particularly noticed as an internal remedy. Nearly a century ago it was recommended in the cure of intermittent fevers by Jacobi;* and the observations of Brera and Fowler have since brought it into general notice as a remedy in this disease. By many physicians it has, indeed, been very highly extolled, and its reputation as an efficacious medicine, is now well established. It is not, however, to be employed with equal advantage, or even with safety, in all cases of this disease.

* Burdach, *Arzneymittellehre*, vol. ii. p. 475. Jacobi de *Arsenici Sale alcalico domiti usu interno salutari*, (*Acta Academ. Elect. Mogunt. tom. i. p. 116.*)

In patients of debilitated and cachectic habits of body, especially where a scorbutic tendency, or a disposition to passive hæmorrhage exists, this remedy is apt to produce dropsical swellings, great debility, and symptoms of general depravation. It is, also, said to act perniciously in phthisical persons, or where there is a strong inflammatory diathesis present.

Examples of this kind, I have occasionally observed in my own practice, and I feel entirely satisfied, that, although a very powerful remedy in the majority of cases, it cannot be indiscriminately employed without running the risk of doing injury. The state of the system in which arsenic appears to be peculiarly calculated to do good in this disease, is the very opposite of that which I have just mentioned as inimical to its remediate powers. In cases attended with considerable fulness of habit, not very irritable or debilitated, with a moderately full, soft, and regular pulse during the intermission, and unaccompanied by any local congestions, or organic affections of internal parts, the arsenic will, in general, act as a very efficacious and safe remedy.*

Dr. Thomas D. Mitchell, a very intellegent physi-

* "It is a very extraordinary fact," says Dr. Paris, "that previous to the establishment of the copper works in Cornwall, the marshes in their vicinity were continually exciting intermittent fever, whereas, since that period, a case of ague has not occurred in the neighbourhood."—*Pharmacologia*, p. 282.

cian of this city, states, that while practicing at Norristown, in 1820, where he had an opportunity of seeing many cases of intermittent fever, he found the bark ineffectual in the majority of instances, whilst arsenic, in the form of Fowler's solution, given from fifteen to twenty drops, almost uniformly proved successful. He never observed any injurious effects to follow its exhibition. Before giving such large doses, he had tried the ordinary ones, as from eight to ten drops, but his patients derived no advantage from the medicine when given in this way. It appears, therefore, from the statement of this physician, that where arsenic is indicated, it ought to be given in as large doses as the stomach will bear, it being much more promptly efficacious, and not more detrimental to the general habit, when thus administered, than when given in smaller doses. To children from two to five years old, he gave from one to six drops of the solution three times a day.

Mr. Gasc, a French physician of eminence, has lately published the result of his experience with this remedy, in the cure of intermittents. His observations were made at the hospitals of Dantzick. "The number of patients, with this fever, was so great in the hospital," says this physician, "and the disease had been so rebellious to the ordinary modes of treatment, that I determined to have recourse to the use of arsenic. My first trials with it were so satisfactory, and the

successful results so numerous, that I did not hesitate to extend the use of it to almost all the cases of fever of that species in the hospital, without regard to particular complications of disease, provided they were not of a nature to contraindicate it in a positive manner." The result, he states, was highly satisfactory.*

I have myself been a good deal in the habit of employing arsenic in the cure of this disease; and have occasionally found it successful where I could do nothing with the cinchona. These two remedies are, indeed, adapted to very different states of the system. The cinchona is most efficacious in a relaxed and exhausted state of the system, and will often disappoint our expectations in persons of a full and robust habit of body. In intermittents, attended with a phlogistic habit, the bark is always more effectual after the general powers of the system have been somewhat reduced by evacuants.

On the contrary, however, the arsenic, as has already been stated, would seem to be best suited to the cure of this disease in persons of a firm and healthy constitution, and often to act injuriously when given in a debilitated, cachectic, and irritable state of the system.

I have hardly ever employed arsenic in this disease without giving it in conjunction with opium. I have usually given the laudanum and arsenic separately;

* London Med. and Phys. Jour. Feb. 1817.

the former in the dose of from ten to fifteen drops, about half an hour after a dose of the latter. By this plan we avoid the disagreeable sickness which effectual doses of the arsenic are apt to create, and it does not appear that its powers are lessened by this mode of exhibition. This remedy has, also, been prescribed in combination with bark. These two substances are, however, chemically incompatible, the arsenical solutions forming precipitates with the bark,—a circumstance which renders this combination of doubtful propriety.

Dr. Ferriar speaks very favourably of the use of arsenic in the last stage of typhus, when the tongue is covered with a thick black crust, and the ordinary tonics and stimulants do not produce any beneficial effects. By the use of arsenic the tongue very generally becomes clean.*

Arsenic has, also, been recommended as a useful remedy in rheumatism. In the chronic variety of this complaint, I have, in a few instances, employed it with remarkable advantage. But the powers of this remedy are more decidedly evinced in syphilitic rheumatism, and in that variety which is sometimes the consequence of the imprudent use of mercury. In rheumatic pains from this latter cause, I know, indeed, no remedy which is so effectual as the present one. Among the writers who speak more particularly in

* Medical Histories, vol. i. p. 84.

favour of the remediate powers of arsenic in chronic rheumatism, may be mentioned Kellie, Hardman, and Jenkinson.

Favourable reports have, also, been published of the effects of arsenic in epilepsy. Drs. Duncan and Alexander give examples of its successful employment in this disease.

Dr. Ferriar speaks in very high terms of the powers of arsenic in hooping-cough, after the inflammatory symptoms have been subdued by antiphlogistic remedies. "In the beginning of this disease," says he, "when it is accompanied by symptoms of fever and inflammation, bleeding is sometimes necessary. Blisters are more frequently necessary, and Dr. Armstrong's plan of exhibiting tartarized antimony, in doses which prove gently emetic, is, undoubtedly, very useful; chiefly, perhaps, by supplying the means of expectoration to very young children. But, after these preliminary steps are taken, I believe that the only remedy which promises to shorten the disorder effectually, is the solution of white arsenic." He gave it, at first, in the dose of one drop, for an infant; and to children under seven years, he gave two drops, daily. Dr. Klapp, of this city, has informed me, that he has found the arsenic decidedly beneficial in the present disease. I have given it in some cases, in a few of which its good effects were conspicuous.

Arsenic has also been prescribed with success in

spasmodic asthma. Dr. Alexander mentions its successful employment in this way. Of its powers in this disease I know nothing from my own experience.

Some accounts have, also, been published of the successful employment of this remedy in tic douloureux. Dr. M'Kechnie, surgeon at Paisly, relates a case which was cured by arsenic, after various modes of practice had been tried ineffectually.* Hardman and Jenkinson, also, commend its powers in this painful affection.

Arsenic has recently been employed with much success in chorea. In the fourth volume of the *Medico-Chirurgical Transactions*, a case of this disease is related, which yielded without difficulty to this remedy. Mr. Salter, also, has given an account of four cases of chorea successfully treated with this medicine.†

Mr. Hill, in an excellent paper published in the *Edinburgh Medical Journal*, recommends arsenic as a highly useful remedy in hemicrania. I found it promptly successful in a case of this kind which lately came under my care, and I know of other practitioners who place great reliance on its powers in this complaint.

In that species of cephalalgia which is commonly called sick headach, arsenic has been known to afford

* *Edinburgh Medical and Surgical Journal*. July, 1811.

† *Medico-Chirurgical Transactions*, vol. x. Part i. p. 218.

permanent relief. To Dr. Mease, of this city, we are indebted for the first account of its efficacy in this painful and troublesome affection. Several cases are related by this respectable physician, in which this remedy was used with perfect success. In one case I have known it to be employed with great advantage; the disease was greatly mitigated, but not completely overcome. Dr. Otto, also, employed it with success in a case of this kind.

In old and obstinate syphilitic ulcers, much benefit has been derived from the employment of this remedy. It is particularly recommended in such cases by Remer, Hagstrom, and Horn.* I have known it to be used with complete success in a case of venereal ulcerations of the septum of the nose, under the care Dr. M'Clellan, of this city.

In the treatment of venereal nodes, arsenic is an exceedingly useful remedy. Dr. Calhoun, of this city, was, I believe, the first who published any account of its efficacy in these affections. His experience with this remedy, as published in the third volume of the *American Medical Recorder*, is directly in favour of its powers in this way; and Dr. M'Clellan, one of the

* Burdach's *Arzneymittellehre*, vol. ii. p. 469. Horn's *versuche mit gebrauch des Arsenicks in veralterter Syphilis*, in his *Archives of Medical Experience*, vol. iv. No. 257. See, also, Remer's *Observations* in the same work, vol. i. No. 9. 1812.

surgeons of the Philadelphia Alms-house Infirmary, informs me that he has used it with success in several cases of this kind, and particularly in swellings of the periosteum. A remarkable case of the efficacy of arsenic in venereal nodes, is reported by Dr. M. S. Baer, of Baltimore;* and my experience enables me to speak with much confidence of the utility of this practice.

Charles Lane, esquire, gives a very interesting account of the successful employment of arsenic in an ill-conditioned ulcer of the tongue. The ulcer extended through the substance of the tongue, and passed through its root into the throat. "The general appearance," says he, "was most alarming, bearing a very strong character of carcinoma." By one month's use of this remedy the ulcer appeared perfectly healed; it, however, broke out again, and was again cured by the same means, and finally got perfectly well under its use.†

Arsenic is a very useful remedy in certain obstinate cutaneous affections. It has been particularly recommended in leprosy, and ichthyosis. "In the lepra vulgaris," observes Dr. Bateman, "the arsenical solution recommended by Dr. Fowler, is often extremely beneficial, in doses of four or five drops, which may be slowly increased to eight, and persevered in for a

* Medical Recorder, vol. iv. p. 461.

† Medico-Chirurgical Transactions, vol. viii. p. 201.

month and more.”* In a mild case of ichthyosis, the same writer states that, “this medicine produced a complete change of the condition of the cuticle, which acquired its natural texture.”† It has, also, been used with advantage in elephantiasis, and other chronic affections of the cuticle.

Arsenic has been employed both internally and externally in the cure of cancer. It is said to allay the pain, in the ulcerated stage of this affection, without producing either stupor or disposition to sleep. It has, however, been chiefly extolled in cancer as an escarotic, destroying the diseased parts without affecting the sound ones, and thus enables the surgeon, in some instances, to remove the whole of the diseased parts. Richter speaks very favourably of its use in cancerous ulcers. “I have employed arsenic,” says he, “in cancerous ulcers of the face, with much advantage, and without any bad or remarkable effect. I have generally used Bernard’s mixture.‡ I lay it

* Practical Synopsis of Cutaneous Diseases, p. 33. Philadelphia edition.

‡ This mixture consists of factitious cinnabar \mathfrak{z} ii. ashes of burnt shoe soles gr. viii. dragon’s blood gr. xii. white arsenic gr. xl. Reduce them all to a fine powder and mix them intimately. “When it is used some of it is mixed with so much water as to form a thin paste, which, by the means of a small hair-pencil, is applied to the whole surface of the ulcer.” Richter

on about the thickness of the back of a knife. The pain which it occasions is, for the most part, inconsiderable.”* He mentions several cases in which this mixture was applied with the most remarkable success. I have known the arsenical solution, weakened by water, to be injected into the vagina in cancer of the uterus, with evident advantage. It has, also, been applied to cancers in the form of an ointment. Plunkett’s ointment† had, at one time, very considerable celebrity in this affection.

Arsenic is now usually prescribed in the form of Fowler’s solution. The dose, for an adult, of this, is from eight to fourteen drops. It may, also, be given in the form of pills, with opium or some of the other narcotic extracts, in the dose of one-fourteenth to one-eighth of a grain.

Antidotes.—Sugar and water, or a decoction of linseed and mallows, drank in large quantities, are said to be our best means for counteracting this poison. By taking copious draughts of any of these, vomiting is excited and the arsenic ejected. Lime-water with sugar has, also, been highly recommended. Orfila states, that “theriac, oil, gall-nuts, the bark of the

calls this Bernard’s preparation, but it was first employed and published by the celebrated lithotomist Frère Cosme.

* Medical and Surgical Observations, p. 47.

pine, liver of sulphur, vinegar, suggested by some, ought not to be used, because they are not only useless but often injurious." In addition to these remedies, warm fomentations and leeches must be applied to the abdomen; general bleeding, promptly and largely employed. When the fever abates the patient should be directed to take veal or chicken broth; and when convalescent, rice-milk, gruel, &c. Wine, spirits, and solid food must be avoided. "Wine, regarded by many persons as proper to restore action, is, in this case, a new poison, which acts precisely as that, the effects of which we have combated. It is only after three or four days that solid food is to be taken, in small quantities, and such as is of easy digestion."*

* Orfila.

CHAPTER VII.

II. Medicines calculated to correct certain morbid states of the System, by acting on the Contractility of the Muscular Fibre.

ASTRINGENTS.

ASTRINGENTS are such substances as produce constriction or condensation in the living animal fibre. Of the *modus operandi* of these remedies we know exceedingly little. It is certain, at least, that it cannot be explained, as Cullen supposed, on the principle of their action in the process of tanning. It is by producing a *peculiar* excitement in the *living* system, directed upon the contractile and irritable fibre, that these substances produce their effects. Further than this general and vague fact, I fear, we shall never be able to go in our inquiries upon this point.

Various opinions have been entertained relative to the particular principle which gives to substances their astringency. By some it has been supposed to be the gallic acid; others have considered it as constituted by an union of this acid with an earthy base; and

others again have regarded *tannin* as the astringent principle. That none of these hypotheses are entitled to any credit, is evident from the fact, that some of the most astringent substances known, contain neither tannin nor gallic acid. The truth is, that the proximate principle of remedies is just as inscrutable as the *essential* character of the impressions which they produce on the living system. These are objects which the human mind cannot reach, and about which all our most ingenious speculations are worth nothing.

Astringent substances are applicable to a great variety of remediate purposes. In the treatment of excessive evacuations, especially of hæmorrhages, they have been recommended in all ages. In hæmorrhagy from the nose, lungs, stomach, bowels, and uterus, these remedies are, indeed, often of decided utility. They are not, however, to be employed without reference to the state of the general circulation. In what is called active hæmorrhage, where there is tension and force in the pulse, astringents, except, perhaps, the sugar of lead, should never be employed without previous depletion.

In the treatment of dysentery, astringents were formerly much employed. At present, however, their use in the early stages of this disease is very justly considered as highly pernicious. Cullen was one of the first who spoke decidedly against their employment in this complaint. Although his objections to

their use are unquestionably correct, they were not predicated upon just views concerning the nature of dysentery. He supposed that this disease depends on an "increased constriction of a considerable portion of the intestinal canal," and concluded, therefore, that astringents must do harm by increasing still more this constricted state of the bowels. The pathology of this complaint is, however, better understood at present, it being well established that it is essentially connected with a phlogistic state of the intestinal canal, as well as of the general system. It is on this account that astringents act perniciously in the early stages of this disease. They not only tend to increase the general inflammatory excitement of the system, but their direct action upon the tender and irritated surface of the bowels, is calculated to do much mischief, by increasing the local intestinal inflammation. They are further injurious by confining the vitiated and irritating contents of the bowels. After the inflammatory symptoms have been subdued, and proper evacuations made from the bowels, the employment of mild astringents, may sometimes be resorted to with benefit. As a general rule, however, they are to be regarded as improper, especially in the dysenteries of this climate. In tropical dysentery, as it has been called, astringents are more frequently useful. But even here they require a cautious employment.

In the treatment of diarrhoea, astringents are more

generally useful. They are not, however, to be employed even in this complaint without some risk of doing harm, when febrile symptoms accompany the discharge, or when administered without having previously unloaded the bowels of their vitiated contents, by proper purgatives. When given without these precautions, they are apt to give rise to colic, headach, and other unfavourable symptoms. When the disease is protracted, and no signs of a phlogistic tendency be present, we may, in general, use astringents with advantage. In cases of this kind I have found very minute doses of calomel, given in union with some vegetable astringent, exceedingly useful.

Astringents are, also, much employed in leucorrhœa. In that form of the disease which Dr. Darwin calls the *fluor albus frigidus*, these remedies are commonly very beneficial. When there is much febrile action connected with the complaint, they are, however, universally injurious. The usual and best way of employing astringents in this disease, is in the form of injection. They are not unfrequently, also, given internally; but it does not appear that they are capable of doing much good when thus employed. In using astringent injections in this complaint, we should take care that we adapt the strength of the injection to the degree of sensibility and irritation in the affected parts. Where there is considerable *ardor urinæ*, with other marks of a phlogistic state of

the internal surface of the vagina, the astringency of the injections should be very weak, and employed for the purpose rather of washing away the irritating secretions, than with a view to arrest the discharge by an impression made on the parts affected.

The employment of astringent injections in gonorrhœa, is exceedingly common. Many writers, however, reprobate their indiscriminate use in this complaint, and there can be little doubt that much mischief is often done by their employment. During the early or more inflammatory stage of the complaint, they can never be useful, and will seldom fail to do harm. The consequences which result from their imprudent use are, cordee, hernia humoralis, stricture, violent inflammation in the urethra and neck of the bladder, phymosis, &c. After the discharge has continued for some time, and the general as well as local inflammatory action has been reduced by antiphlogistic measures, mild astringent or stimulating injections are of unquestionable utility. Too little attention is, however, commonly paid to general remedies in this affection. Bleeding, saline purgatives, and a low diet, are of essential service in the early stage of the majority of cases of this kind. By these measures, and the liberal employment of balsam copaiva, we may, for the most part, cure the disease speedily and safely.

Astringents are, also, much used as external applications to inflamed parts. In ophthalmia they may

often be employed with great advantage. In this, however, as in the former complaint, they may, also, produce much mischief by being applied during the early or active stage of the inflammation. When the local and general inflammatory action has been reduced by proper antiphlogistic means, moderately astringent collyria are generally very serviceable. In aphthous ulcerations of the mouth and throat, or in inflammation or relaxation of the palate and tonsils, astringent gargles are much employed. In prolapsed parts, as of the uterus and anus, astringent injections are, also, often of great service.

Some writers have supposed that astringents possess the property of relieving the symptoms of urinary calculi. This opinion is certainly countenanced by the beneficial effects which *uva ursi* produces in affections of this kind. But it would appear that the antilithic powers of this substance do not reside in its astringency, since we know of no other astringent that possesses any obvious powers in this way.

The class of astringent substances is very numerous. The property of astringency is especially common in the barks and roots of vegetables. The mineral astringents are, generally, much more powerful than those which are obtained from the vegetable kingdom. The majority of the latter are connected with other active properties; the former are, for the most part, purely astringent, or astringent and tonic.

CORTEX QUERCI.

THE genus *quercus* is a very extensive one, and the barks of all its different species possess more or less astringency. That which is employed in medicine is chiefly obtained from the black oak, (*quercus tinctoria* Mich.) although some of the other species of this family furnish us with barks, equally, if not more astringent. The late professor Barton was of opinion that the chesnut and spanish oak barks (*q. monticola*, *q. falcata*,) are preferable, in most cases, to the black oak bark; he asserted that they possess all the useful properties of the *tinctoriæ* in a superior degree, without partaking of the purgative quality of the latter.*

Oak bark contains a very large proportion of *tannin*, which is readily extracted by infusion. It appears from the experiments of Mr. Davy, that the proportion of tannin varies according to the age of the tree from which the bark is taken; the younger containing more of this principle than the older bark.

The oak bark was very early employed in medicine. Galen recommended a decoction of the leaves and outer bark of the oak in dysentery, uterine and pulmonary hæmorrhages, and in fluxus cœliacus.† It is undoubtedly one of the most powerful vegetable

* M. S. Lectures on Mat. Med.

† Alibert, Nouv. Elém. de Therap. vol. i. p. 93.

astringents we possess; and capable, as such, of being applied to very useful purposes in medicine. In the treatment of intermittent fevers it has been recommended as a remedy of very considerable efficacy.* I have known it to be given in this disease with prompt success; it is, however, exceedingly disgusting to the taste, and few patients can be induced to take it. In the intermittents of very young children, I have, in a few instances, used the oak bark decoction as a bath with benefit. There are other indigenous barks, however, of superior efficacy in this respect, and they do not, like this one, give so disagreeable a dye to the skin. In chronic diarrhœa this bark has been found very serviceable. Its employment in dysentery is, however, very objectionable, except, perhaps, in the last stage of very protracted cases. As an injection in leucorrhœa, the infusion of oak bark has been much recommended by some writers, and I have myself employed it in this way with very good effects. It is, also, a useful application in inflammation and swelling of the fauces, prolapsus uvulæ, and cynanche tonsillaris. "In many cases," says Dr. Cullen, "this decoction, early applied, has appeared useful in preventing those disorders. I have, indeed, almost constantly joined a portion of alum to these decoctions; but, I have frequently found that a solution of alum

* Dr. Rousseau, Philad. Med. Museum, vol. ii.

alone, of the strength it could be conveniently employed in, did not prove so effectual."

Bathing in a decoction of black oak bark has, also, been recommended as an efficacious remedy in *tabes mesenterica*. Dr. J. Fletcher, of Virginia, has reported four cases of this disease which yielded readily to purgatives together with bathing twice a day in a strong decoction of this bark.* The inhalation of the finely powdered oak bark has been known to produce very excellent effects in pulmonary consumption. An instance of this kind was communicated to me some years ago by Mr. William Webb, of Lancaster county. He informed me that a man who had laboured under the usual symptoms of confirmed phthisis, was advised to employ himself in grinding bark for a tanner in his neighbourhood. He was extremely weak and emaciated when he went into the bark mill; in a short time, however, the cough, night sweats, and other hectic symptoms began to abate sensibly, and in less than three months he was perfectly restored to health.

The powdered oak bark, in the form of a poultice, is an excellent application to mortified or gangrenous parts. Dr. Barton employed it both internally and externally with great success, in a case of gangrene of the foot.†

For internal use an ounce of the powdered bark is

* Am. Med. Recorder, vol. iii. p. 363.

† Collections towards a Mat. Med. of the U. States, p. 11.

to be boiled in two pints of water down to one pint. The dose of this is from one to two ounces.

The leaves and cups of the acorns differ very little in astringency from the bark. The acorns possess more of the bitter principle, and on being roasted, evolve a considerable portion of an empyreumatic oil. These have been highly recommended in *tabes mesenterica*.* They are, also, said to be very serviceable in spasmodic cough, asthma, chronic hysteria, amenorrhœa,† diarrhœa, and rheumatism. They are given to the extent of from one to two ounces daily. They are used, by some, as a beverage instead of coffee.

GALLÆ.

THE gall-nuts of commerce are obtained from the *quercus cerris*, a species of oak indigenous to Asia Minor, “from the Bosphorus to Syria, and from the shore of the Archipelago to the frontiers of Persia.” It is also found growing in the southern countries of Europe. The galls are excrescences from the young shoots of this tree, and are produced by the puncture

* Kaiser von dem Nutzen der Eicheln in der dörrsucht der kinder. Frankfurt, 1784, 8.

† Marx, Geschichte der Eicheln, &c. Burdach's Arzneymittellehre, tom. iii. p. 564.

of an insect (*diplolepis gallæ tinctoriæ*) to deposit an egg. They are nearly round, and studded with a number of rough watery tuberosities. They are hard, and when broke exhibit a smooth or flinty fracture. They have no odour, but they are extremely astringent, and bitter to the taste. Both water and alcohol extract their active principles. According to Neumann's experiments, water extracts seven-eighths of their substance, and alcohol a little more than six-eighths.* The chemical composition of galls does not appear to be as yet perfectly ascertained. Sir H. Davy obtained from five hundred grains of Aleppo galls, one hundred and thirty grains of tannin, twelve of mucilage and matter rendered insoluble by evaporation, thirty-one of gallic acid, and a little extractive matter, and twelve of calcareous earth and saline matter.

Besides these component parts, it appears, from the experiments of M. Braconnot, that the gall-nut contains a peculiar acid, distinct from the gallic acid, and to which he has given the name of *ellagic acid*.† The infusion and tincture of galls strike a black precipitate with iron. The precipitate formed by the acetate and subacetate of lead is greyish; that by tartarized antimony, yellowish; by sulphate of copper, brown; sulphate of zinc, reddish-black; nitrate of silver, deep olive;

* *Chemia Medica*, vol. ii. p. 2.

† *Annales de Chimie*, vol. ix. p. 187, new series.

and nitrate of mercury, bright yellow.* Concentrated sulphuric acid produces a copious milk-white curdy precipitate, which soon becomes brown, and assumes the appearance of a resinous substance. This precipitate is soluble in alcohol and boiling water. It consists of tannin and extractive matter, and is powerfully astringent. Nitric acid destroys the astringency of the infusion, but does not produce any precipitate; muriatic acid forms a white flaky precipitate. The carbonate of potass produces a similar white precipitate, which consists of tannin, lime, and potass, and is destitute of astringency. It is but very sparingly soluble in water and alcohol. Lime-water occasions a precipitate of a dark green colour. Animal jellies and starch precipitate the tannin from the infusion.

Galls are a very powerful astringent, and may be usefully employed in cases where such remedies are indicated. They were at one time a good deal prescribed in the cure of intermittents, but it does not appear that they possess sufficient febrifuge powers to entitle them to much attention in this respect. M. Poupart has made a favourable report on this subject in the memoirs of the French academy for the year 1702; but, according to Bergius, galls are very pernicious when employed in this disease. Cullen states

* Paris' Pharmacologia.

that they produce no bad consequences when given with gentian or other bitters.*

The infusion of galls has been recommended as a very useful injection in leucorrhœa and in gleet. In chronic diarrhœa, also, we may often derive much advantage from this remedy when prudently administered. In ulcers, or inflammation of the palate, tonsils, or gums, and in relaxation of the uvula, the infusion forms an excellent astringent gargle.

An ointment made of one part of finely powdered galls to eight of lard, forms a very useful application in hæmorrhoidal affections. In internal piles the decoction has been injected into the rectum. Such a practice is, however, not to be rashly imitated. The sudden suppression of hæmorrhoidal discharges, by applications of this kind, has been often productive of very serious consequences; epilepsy, apoplexy, phthisis, and other dangerous affections have been induced in this way. Where the discharge has not as yet become habitual, and is very profuse, the employment of astringent injections may often be resorted to with advantage. As a general rule, however, the practice is not to be recommended. In prolapsus ani and uteri, injections of the infusion of galls are generally very useful.

* Mat. Med. vol. ii. p. 34.

GERANIUM MACULATUM.

THE geranium maculatum, or spotted cranesbill, grows abundantly in almost every section of the United States. The root, which is the only part used for medicinal purposes, is thick, rough, and knobby. Externally the dried root is of a dark brown, and internally of a pale flesh-colour. It is one of the most powerful and pure vegetable astringents with which we are acquainted. According to professor Bigelow's experiments, it contains a considerable proportion of tannin, and some gallic acid. "The gallic acid is indicated by the dark precipitate remaining in solution. It differs, however, from the acid of oak galls in not reddening vegetable blues, and not passing over in distillation."^{*} Its active principles are readily extracted both by alcohol and proof spirits. The tincture is strongly astringent.

This root is the most agreeable astringent we possess. Its astringency is not associated with bitterness or any other unpleasant taste. In the diseases of children, where astringents are indicated, a decoction of it in milk, is a very convenient and efficacious remedy. In this form it has been a good deal used in cholera infantum, and I have myself repeatedly prescribed it, in protracted cases, with great benefit. I

* Bigelow's American Medical Botany, vol. i. p. 89.

have, also, very frequently administered the powdered root in union with calomel, in the proportion of gr. vi. of the former to one-sixth of a grain of the latter, with much advantage in this affection. In the advanced stages of diarrhœa and dysentery, after proper evacuations have been made, it has proved very beneficial. In my own practice I have occasionally given it in cases of this kind with very good effects. I have, also, used the watery infusion as an injection in gonorrhœa, but not with any decided benefit. In aphthous affections of the mouth this remedy is frequently very useful. In a chronic and very obstinate case of ulceration of the mouth the patient was perfectly relieved by the use of gargles made of this root, after a great variety of other substances had been tried unsuccessfully by myself and others. Dr. Mease recommends it as very efficacious in restraining internal hæmorrhages; and Dr. Thatcher says, that he has known the infusion to restrain hæmorrhage from the lungs in a very prompt manner. It is said that the western Indians consider the geranium as the most effectual remedy they have for the venereal disease.

From considerable experience with this medicine, as well as from the testimony of many other physicians, I am entirely satisfied that it is one of the most useful vegetable astringents we possess. The saturated tincture may be given in doses of from one to two drachms.

In substance it may be given to the extent of thirty or forty grains.

OROBANCHE VIRGINIANA.

THE *orobanche virginiana*, or beech drop, is a parasitic plant, growing almost exclusively on the roots of the beech tree. It is herbaceous, from six inches to a foot in height, and commonly of a pale yellow colour. The root is tuberous, clay-coloured, and covered on its lower part with a number of small fibres. The stem is erect and furnished "with short ovate scales instead of leaves, of which it is entirely destitute."

The root of this plant is powerfully astringent, and has been frequently employed as such in the practice of some of our physicians. It entered as an ingredient into the famous cancer powder of Dr. Martin; and Dr. Barton observes, that "it has been of great service, externally applied, to obstinate ulcers, some of which had resisted the applications that are commonly made use of in such cases." In aphthous ulcerations of the mouth I have known it to be highly beneficial. I have, also, used a strong decoction of this root as a wash in an obstinate cutaneous affection of the herpetic kind, with complete success. Internally I have never employed it; I do not doubt, however, of its applicability

to all the purposes for which vegetable astringents may be useful. In some parts of this country it is a common remedy for diarrhœa and dysentery.

QUASSIA SIMAROUBA.

THIS tree grows abundantly in St. Domingo and Jamaica, and is found, also, in the southern parts of the United States. The bark of the root is the only part of the tree employed in medicine. It is brought to us in pieces of some feet in length, and folded together lengthwise. It is generally of a very fibrous and tenacious texture, of a pale yellowish colour on the inside, and beset with a number of little rough points on its external surface. It has a very bitter taste, but little or no sensible astringency. It furnishes a large portion of a watery extract, but contains very little resin.

This bark was introduced into practice as a remedy in dysentery and diarrhœa, above a hundred years ago; and it has been much commended for its efficacy in affections of this kind by some of the most celebrated physicians of the last century. Pringle, Lind, Werlhoff, Stoll, Zimmermann, Tissot, Pinel, &c. have spoken very favourably of its virtues in this respect. If we are to pay any deference to the authority of these

names, we can hardly doubt of its usefulness in these diseases, when cautiously and judiciously administered.* It must, however, always be kept in mind, that, in recommending astringent remedies in dysenteric complaints, reference is made to the advanced periods of the disease, in which stage alone can they ever be employed with any prospect of doing good. Blane speaks very highly of the *infusum simaroubæ* in obstinate chronic cases of this kind. Bampfield, however, reports less favourably of its powers. "In my practice," says he, "it has shown great powers of action, but these were of uncertain benefit. It was apt to produce constipation and its painful and disordered consequences. Its constipating effects appeared to be more disadvantageous to the patient, than its astringent powers on the morbidly secreting vessels were beneficial. I attempted to avail myself of its powers by making it weaker or stronger, according to circumstances, but found that, if too weak, it had no effect; and, if strong, it always occasioned constipation."†

This remedy has, also, been recommended in dyspepsia and intermittent fevers; but it does not appear to be entitled to any particular attention for its powers in this respect. The dose of the powdered bark is from a half to a whole drachm. It is, however, usually given in infusion or decoction. The cold infusion is

* Alibert. Elem. de Therap.

† Bampfield on Tropical Dysentery, p. 197.

stronger to the taste than the decoction. The latter becomes turbid and reddish brown on cooling.

HÆMATOXYLON CAMPECHIANUM.

THIS tree, which furnishes the logwood of commerce, is a native of South America, and is particularly abundant in the province of Honduras, whence it was brought into Jamaica, where it now grows very plentifully. The wood is compact and heavy, and of a deep red colour internally. When split open it has a peculiar sweetish odour. Its taste is sweet, followed by a slightly bitter astringency. The colouring matter of logwood may be obtained in a separate state, in the form of small brilliant crystals of a reddish white colour, and of a sub-astringent, bitter, and acrid flavour. This crystalline substance has recently received the name of *hematin*. The infusion of logwood is of a deep blood red colour. By adding to it the sulphate of iron it becomes black; the solution of sulphate of alumine changes it to a purple colour, which by the admixture of some potass assumes a fine violet hue.* The oxydulated sulphate and nitrate of iron change the blood red decoction to a very beauti-

* Dissertatio de Hæmatoxylo Campechino. Vide Pfaffs' System der Mat. Med. T. ii. p. 213.

ful dark blue. Carbonate of iron strikes a dull black precipitate, leaving a brown supernatant fluid. Muriate of tin forms a light and loose red precipitate with both the decoction and infusion, leaving the fluid as clear and colourless as water. Phosphate of lime renders the colour somewhat more light, and forms, after some time, a dark brown precipitate. The alcoholic tincture is of a dark yellowish red colour, possessing the same chemical habitudes as the watery infusion. Water distilled from logwood remains perfectly clear, but acquires the peculiar odour of the wood.

When the decoction is taken internally it very soon gives a deep red colour to the urine. By some practitioners it has been recommended as a very efficacious remedy in dysentery and diarrhœa. Dr. John Hunter states that he found the extract of logwood very serviceable in cases of dysentery where the discharges were frequent and copious, and not attended with much tormina.† It has, also, been used with advantage in the chronic form of cholera infantum;‡ and I have known it to be given with excellent effects in a case of diabetes.

The best form for exhibiting this remedy is an infusion. A cup full of this may be taken every three

† Treatise on the Diseases of Jamaica, p. 186.

‡ Dr. Chapman's Mat. Med. vol. ii. p. 270.

or four hours. The extract is, also, frequently employed.

RUBUS VILLOSUS.

THE bark of the blackberry root is a pure and powerful astringent, and is now a good deal employed as such both in popular and in domestic practice. The sulphate of iron changes the colour of both the infusion and decoction into a beautiful dark purple, and occasions a copious precipitate. Gelatin, also, produces a copious white and opaque precipitate. The alcoholic solution undergoes a partial decomposition on adding water to it. The precipitate thus formed is of a flocculent appearance, and when dry "exhibits the common resinous properties on exposure to heat."*

This root has been much extolled by some late American writers for its efficacy in the cure of chronic dysentery, diarrhœa, and cholera infantum. I have myself employed it with advantage in the latter complaint. I prefer, however, using the *geranium maculatum*, as being much more pleasant to the taste. I have seen an infusion of the blackberry root used in a case of hæmatemesis with apparent advantage. I

* Bigelow's American Medical Botany, vol. ii. p. 163.

have, also, known it to be used with very good effects as an application in the form of a cold poultice, in hæmorrhoidal tumours. As an astringent, this article may, no doubt, be usefully employed, wherever such remedies are indicated.

The berries of this bramble have also been used in medicine. Dr. Mease says, "a jelly made of blackberries when on the turn from red to black, is much used in the United States for gravel." It has been said that a decoction of the root of this plant is very useful in gravelly complaints. I am not aware, however, that there is any foundation for this opinion.

KINO.

THIS is an inspissated vegetable juice, possessing very great astringency. The natural history of the trees from which it is obtained is, as yet, but imperfectly known. The kino of commerce consists of three distinct kinds: "The first is in very small jet-black fragments, perfectly opaque, without smell, crackling under the teeth when chewed, not colouring the saliva, after some time imparting only a slight astringent taste, not fusible, and difficultly reduced to powder." There is another kind which consists of large pieces, of a very dark brown colour, resinous,

appearance, and interspersed with little air cells; very thin pieces of it are translucent, and of a ruby red colour; when chewed it crackles under the teeth; its taste is at first slightly acid, which soon changes to a very bitter and astringent one, "succeeded by a peculiar sweetness. It is infusible, and forms a reddish brown powder." This variety of kino is obtained from the juice of the *coccoloba uvifera*. There is a third variety of this substance which consists of dark brown pieces of different sizes. It is generally covered with a reddish brown powder, has a resinous and unequal fracture, and is often mixed with bits of leaves, twigs, &c. Very thin pieces are transparent; it crackles but slightly under the teeth, and its taste is astringent, followed by sweetness. This variety is obtained from the *eucalyptus resinifera*, a tree indigenous to New South Wales.* "The London college," says Dr. Duncan, "have indicated the *butea frondosa* as the source of kino, but certainly erroneously. It, however, produces, in large quantities, a red juice very analogous to kino, and which may unquestionably be used as a substitute for it. The production of these substances from so many different trees in Africa, America, Asia, and New Holland, show that kino is to be considered as a genus of which these are species."

Kino contains a very large proportion of tannin, and does not possess any of the characteristic habi-

* Dr. Duncan's Dispensatory.

tudes of the resins or gum-resins. According to Vauquelin's Analysis, one hundred parts of kino consist of seventy-five of tannin, twenty-four of red mucilage, and one of fibrous matter.* Cold water dissolves about four-fifths of its substance; but in hot water it is much more soluble; and hence the decoction, on cooling, lets fall a copious reddish brown sediment, and becomes turbid. Alcohol dissolves the whole of this substance except its impurities. "It is remarkable," says Dr. Duncan, "that alcohol dissolves kino entirely, but does not dissolve the residuum of the decoction." The solutions of kino form a greyish yellow precipitate with acetate of lead,—a reddish yellow one with nitrate of silver,—a yellowish white one with tart. antimon.—and a green one with sulphate of iron. Gelatine, also, precipitates the solutions of kino.† By exposure to heat kino becomes soft, and if the heat is very considerable, it slowly enters into fusion.

This substance was first introduced to the notice of the profession as a useful remediate article, by Dr. John Fothergill, about eighty years ago.‡ It has been recommended as an efficacious remedy in intermittent

* Ann. de Chimie. tom. xlvi. p. 321-332.

† Pfaff's Mat. Med. tom. ii. p. 200.

‡ A letter from Dr. John Fothergill to the Medical Society, concerning an astringent gum brought from Africa. See Med. Observ. and Inquir. vol. i. p. 358.

fevers, given either by itself or in conjunction with some of the bitter tonics. In the advanced stages of diarrhœa, and in chronic dysentery, it is very frequently employed; and I do not doubt that it will generally answer all the useful purposes in these complaints, that can be obtained from astringents. In the bowel complaints of children, especially, it may often be very advantageously given in union with chalk and small portions of laudanum. The aqueous solution of kino has been highly recommended as an injection in the cure of fluor albus and gonorrhœa. In the former of these complaints a solution of this substance in lime-water, is said to be particularly useful. Its use in this way is objectionable, however, on account of its staining every thing with which it comes in contact, of a blood red colour. It has, also, been employed with good effects in diabetes; and Pemberton speaks very favourably of its virtues in pyrosis. Some practitioners have found it to produce excellent effects in certain varieties of hæmorrhage, more especially in protracted menorrhagia from laxity of the solids. Gillespi recommends a solution of kino in red French wine, as an excellent application to foul scorbutic ulcers.*

Kino is given in substance, in doses of from ten to thirty grains. It is, also, very frequently given in the

* Lond. Med. Jour. vol. iv. p. 373.

form of tincture; from twenty to forty drops of which may be administered for a dose.

CATECHU EXTRACTUM.

THE tree, *mimosa catechu*, which furnishes this extract, is a native of Hindostan, and is said to be particularly abundant on the uncultivated mountains of Rotas and Pallamou, in the province of Bahar, westward of Bengal.* Catechu is, however, also obtained from other species of *mimosa*; and at Bombay it is principally prepared from the nuts of the areca catechu. The catechu obtained from the *mimosæ*, is prepared from the internal part of the wood by decoction, and evaporation in the sun.

This substance comes to us in compact, hard, brittle, flat pieces, of a dark brown colour; and, when broken, exhibiting light and dark brown streaks. It possesses a powerfully astringent taste, succeeded by a slight sensation of sweetness in the mouth. It has no odour. Its specific gravity varies from 1.28 to 1.39. Formerly it was thought to be a mineral product, and was, therefore, described under the impro-

* For a good account of the tree producing the catechu, and of the mode of preparing this substance, see Med. Obs. and Inquir. vol. v. p. 148.

per name of *terra japonica*. Hagedorn and Boulduc,* were among the first who opposed this error, and who established the fact of its vegetable origin. According to Mr. Davy's analysis two hundred grains of Bombay catechu contains one hundred and nine grains of tannin, sixty-eight of a peculiar extractive matter, thirteen of mucilage, and ten of residual matter. Bostock found traces of gallic acid in catechu. That which is brought from Bengal contains less tannin. It is almost wholly dissolved both by water and proof spirits. The oxysulphate of iron produces a beautiful green precipitate with the aqueous solution of this substance, which changes to an olive green, with a faint shade of brown by the further addition of some muriate or nitrate of iron. Lime, barytes, and strontian produce copious light brown, and the preparations of copper dark brown precipitates. It also forms a copious precipitate with gelatine. The concentrated muriatic and sulphuric acids produce pale precipitates, and the fuming nitrous acid destroys its property of precipitating the solutions of lime and iron.

The catechu was formerly much employed by physicians, and it is unquestionably an article of strong and useful astringent powers. In diarrhœa and the advanced periods of dysentery, it is equal if not superior to any of the vegetable astringents we possess. It is also said to be a very valuable remedy in fluor

* Mém. de l'Acad. des Sciences de Paris, A. 1709, p. 228.

albus, when employed in the form of an injection. Combined with gentian it has been used with success in obstinate intermittents.* In relaxation of the uvula, and ulcers of the mouth and fauces, it has been known to produce very excellent effects. It has, also, been prescribed with much advantage in general relaxation of the system with debility of the digestive organs.

Clysters of a solution of catechu have been recommended as highly useful in restoring tone and energy to the bowels in cases of colica pictonum.† Mr. James Kerr states, that this substance forms a principal ingredient in an ointment of great repute among the Hindoos, composed of sulphate of copper $\mathfrak{z}\text{iv}$. catechu $\mathfrak{z}\text{iv}$. alum $\mathfrak{z}\text{ix}$. white resin $\mathfrak{z}\text{iv}$. reduced to powder and mixed with olive oil and water sufficient to bring the mass to the consistence of an ointment. This ointment they use in all kinds of ulcers. "A gentleman," says Mr. Kerr, "of great practice, told me he used this ointment with success beyond expectation."

The catechu is administered both in the form of a powder and of tincture. The former is given in doses of from grs. x. to $\mathfrak{v}\text{i}$. The latter from thirty to sixty

† Chirurg. Arzneymittellehre, Von C. L. Römer, B. i. s. 119.

‡ Medical Obs. and Inq. vol. v. p. 158.

drops. It is, also, occasionally prescribed in the form of an electuary and in lozenges. The latter by gradually dissolving in the mouth, may be very conveniently and beneficially used in relaxation of the palate and fauces.

SUPERACETAS PLUMBI.

THE acetate or sugar of lead consists of irregular masses resembling lumps of white sugar, "being an aggregation of acicular four-sided prisms, terminated by dihedral summits." Its taste is sweet and styptic. When exposed to the air it slightly effloresces; and it is decomposed by heat and light. It is soluble in twenty-five parts of water, and also in alcohol. The aqueous solution is turbid and of a milky colour, but becomes transparent on adding a small portion of acetic acid to it. It is decomposed by the "alkalies, alkaline earths and their carbonates, most of the acids, alum, borax the sulphates and muriates, soaps, all sulphurets, ammoniated and tartarized iron, tartarized antimony, undistilled water."

When taken internally the sugar of lead produces a sensation of constriction on the fauces and along the whole course of the œsophagus. It accelerates the

frequency of the pulse, but does not augment its strength or volume.*

The effects of the continued influence of lead on the animal body, are of a nature so distressing and dangerous, that it was long before physicians would venture on the internal employment of the saturnine preparations. We find, however, that the sugar of lead was occasionally used as an internal remedy as early as the days of Paracelsus. This eccentric genius extolled it as a remedy of great powers in diseases of the thoracic viscera, all of which he included under the general name of asthma.† Its internal use was, also, strongly recommended in all species of dropsies, by Goulard; and Wuerz and Gramannus, of the sixteenth, and Libavius, Raumer, and others, of the seventeenth centuries, employed it freely as an internal medicine. The use of lead in this way, was, however, strongly opposed by Stahl, Hoffmann, Boerhaave, and subsequently by Sir G. Baker,‡ and the authority of these names proscribed almost wholly, for a time, its internal employment. But the apprehensions of the profession, in this respect, gradually gave place to the accumulating testimony of experience in favour of

* Semmes' Inaugural Thesis, on the effects of lead, &c. Philad. 1801.

† Paracelsi Opera Omnia, vol. ii.

‡ Medical Transactions of the London College of Physicians, vols. i. and ii. 1772.

its general inoffensiveness; and it is now pretty commonly admitted, that, although not destitute of deleterious properties, the sugar of lead may be exhibited internally in a variety of affections with great benefit and without the least injury, if managed with prudence and judgment. It must be confessed, however, that this remedy has been known to produce injurious effects even under the most judicious administration; and we are, therefore, not to resort to it with an entire assurance of its being uniformly innoxious. Like all our heroic remedies, it is capable of doing a great deal of good, and, also, under unfavourable circumstances of administration and constitutional predisposition, much harm.

The sugar of lead was very early recommended as a useful medicine in phthisis pulmonalis. The *Pharmacopœia Bateana* contains the formula of a *tinctura anti-phthisica*,* into which sugar of lead enters as a principal ingredient, and which is stated to be "truly a good medicament in those consumptions which proceed from ulcers of the lungs."† *Ettmuller*, also, employed the sugar of lead internally in this disease.

Dose, from twenty to forty drops.

† *Pharmacopœia Bateana*, or *Bates' Dispensatory*, fourth edition, by *William Salmon*, M. D. 1693.

More recently this remedy has been particularly recommended in this affection by Horn,* Amelang,† Remer, Kopp,‡ Hildenbrand,§ Jahn,|| and others. I have myself, in a few instances, given it in this disease, and its effects were always manifestly beneficial. It generally lessens both the night sweats and expectoration, and often very considerably relieves the cough. It is especially useful as a palliative in the advanced stage of the complaint, when the patient is harassed by frequent colliquative discharges from the bowels.

To check internal hæmorrhages the sugar of lead is, undoubtedly, the most efficacious remedy we possess. It was occasionally resorted to in cases of this kind by the older physicians, but its virtues in this respect have only become duly appreciated during the last twenty or thirty years. The efficacy and safety of the sugar of lead in hæmorrhages, rests now upon the evidence of a very extensive experience. Monro, Hill, Reynolds, Barton, Amelang, Williamson, Jahn, Richter, Heberden, and many others have written in favour of its employment in such affections. It ap-

* Horn's Archiv für Medicinische Erfahrung. 1812, tom. i.

† Hufeland's Journal of Præctischen Heilkunde, tom. xxii. p. 3.

‡ Ibid. tom. xi. p. 62.

§ Ibid. tom. viii. No. 4, p. 3.

|| Materia Medica, p. 2.

pears to be equally applicable to the treatment both of active and passive hæmorrhages. When, however, the pulse is full and hard, bleeding is obviously an essential preliminary to the use of the lead. The late Dr. Barton was in the habit of prescribing this remedy in combination with small portions of opium or ipecacuanha. "Seldom," says he, "have I been disappointed in my expectations of benefit from this medicine, which, of all the articles of the materia medica, seems to me to possess the greatest command over the movements of the arterial system."* From my own experience with this remedy, in hæmorrhagy, I am induced to entertain a very high opinion of its powers. In a single instance only have I known its use to be followed by symptoms of colic, and these readily yielded to a few doses of castor oil and opium.

The sugar of lead has also been recommended in the cure of dysentery and diarrhœa. To this purpose it appears to have been very early applied, as we find it mentioned by several of the older writers,—particularly by Ettmuller and Adair, who speak highly of its remediate powers in dysentery. Drs. Moseley and Jackson have also added their testimony in favour of its usefulness, under certain circumstances, in this disease. "In chronic dysentery," says Dr. Jackson, "a solution of sugar of lead, viz. ten grains of the acetate to one drachm of the chrystals of tartar

* Cullen's Mat. Med. vol. ii. p. 21, in a note.

and two parts of boiling water, given every three or four hours, to the quantity of two ounces for a dose, gives evident relief on many occasions, and in no instance within my knowledge has any inconvenience arisen from the supposed deleterious effects of the lead.* Moseley employed this substance in the form of enemata, where the tenesmus was inveterate and harassing, attended with frequent discharges of bloody mucus, or purulent matter, and great soreness about the anus.† Dr. Bampffield, another late writer on tropical diseases, states that Dr. Ainslie, at the artillery hospital at the mount of Madras, showed him cases “where this medicine was said to be strikingly useful.” He does not, however, add much in favour of this remedy from his own experience. He says, that during its exhibition animal food should be abstained from.‡ Quite recently, Dr. Harlan, of this city, has published cases illustrative of the efficacy of this medicine in dysentery,§ and he seems to entertain a very high opinion of its powers as well as an entire conviction of its safety. My own limited experience with this article, in dysentery, has by no means been satisfactory. I have found it in a few instances to produce

* Jackson on Febrile Diseases, vol. ii. p. 61.

† Moseley on Tropical Diseases, p. 404, fourth edition.

‡ Practical Treatise on Tropical Dysentery, p. 198. London, 1818.

§ American Medical Recorder, vol. v.

constipation with a distressing pressing down of the bowels, without affording any relief to the tormina. I have no doubt, however, that cases may occasionally occur in which the sugar of lead will be found advantageous. But, as a general practice, I am not disposed to think favourably of the remedy.

Of the employment of sugar of lead in intermittents I know nothing from my own experience. Some writers of the last century have spoken well of it in this disease, but I suspect that its powers in this respect are not entitled to much attention. In some of the neuroses this article has been found decidedly beneficial. Saxtorph,* Richter,† Ossan,‡ and others employed it with success in epilepsy and hysteria. Dr. Rush,§ also, cured a case of epilepsy with this remedy; and in the *New-York Medical Repository*,|| I have reported a remarkable case of this disease, in which the sugar of lead proved completely successful. In this case the fits returned regularly about the periods of full moon. I prescribed three grains of the sugar of lead to be taken mornings and evenings, commencing three or four days before the expected return of

* Act. Reg. Soc. Med. Hafniensis, vol. iii. 1792.

† *Specielle Therapie*, vol. vii. p. 266.

|| Vol. ii. No. 1. *New Series*. 1813.

the paroxysms, and continued it for five days at each period. The medicine was thus taken at five successive periods of full moon, and the patient, who had been affected with the disease upwards of eight years, was permanently cured thereby.

The sugar of lead has also been prescribed in other spasmodic diseases. Kramp, a German writer, cured a case of spasmodic dysphagia by it, and Ettmuller employed it in melancholia, in which he says "it is esteemed a specific."* It is said, also, to have been given with advantage in tetanus.† Lately this remedy has been highly spoken of in the cure of whooping-cough. I have used it in five or six cases of this disease, and in a few instances it appeared to do some good. Its efficacy in this respect is, however, not sufficiently great to entitle it to much attention, and more especially as its employment can certainly not be said to be without some risk of unpleasant consequences.

The sugar of lead is one of the most useful remedies we possess for the reduction of external phlegmonous inflammation. In ophthalmia it has long been an exceedingly common remedy; and, although applications of this kind are by far too indiscriminately made, it may often be resorted to with great benefit. When the inflammation does not depend on a consti-

* Allen's Synopsis Medicinæ, vol. i. s. 437.

† Burdach, Arzneymittellehre, vol. ii. p. 241.

tutional cause, and is unaccompanied by much excitement of the general circulation, saturnine collyria will, in general, prove very serviceable. Under opposite circumstances, however, such applications will not only do no good, but almost invariably produce mischief. The use of this remedy has been no less common, as an injection, in gonorrhœa, than in ophthalmia; and it certainly is very often adequate to the removal of the disease.

The solution of sugar of lead, made into a cold poultice with the crumbs of bread, is also an excellent application in phymosis, hernia humoralis, and swelled inguinal glands. Applied in the same way, it frequently affords great relief in inflamed hæmorrhoidal tumours. This remedy has also been much praised by some writers for its effects in erysipelatous inflammation arising from external causes. By others, however, its use in this affection has been condemned; and my own experience has furnished me with no evidence of its usefulness in this respect.

The sugar of lead may be given in doses of from half a grain to six grains, according to the nature and urgency of the symptoms for which it is administered. It is frequently given in the form of pills, in combination with opium. In administering this preparation of lead, care must be taken that the patient do not at the same time receive other substances into the stomach which have the power of decomposing it. The sulphates of

magnesia and alum, for instance, would decompose the acetate and produce a sulphate of lead, which is entirely insoluble, and consequently inert.* Dr. Paris advises, that in taking the sugar of lead the patient should abstain “from all potation except cold water or draughts composed of diluted acetic acid, for at least an hour after the ingestion of the medicine.”

The immediate effects of an enormous dose of sugar of lead are, a sweet astringent taste, with a sense of constriction in the throat, pains in the stomach, with retching, or vomiting of bloody mucus, bowels constipated or relaxed, with bloody evacuations, fœtid eructations, hiccup, a sense of constriction in the thorax, with difficulty of respiration, great thirst, painful micturition, cramps of the extremities, cold sweats, convulsions, general sinking of the vital powers, and death. To counteract these effects, experience proves that much advantage may be derived from the early use of solutions of Glauber's salts, Epsom salts, and hard water. Orfila says that the liver of sulphur, which has been recommended by some, is pernicious. If the symptoms be not early subdued by these measures, and signs of gastric inflammation come on, the warm bath, fomentations and leeches to the abdomen, with copious draughts of infusions of linseed or mallows, or of water sweetened with sugar, should be resorted to.†

* Paris' Pharmacologia.

† Orfila's System of Toxicology, vol. i. p. 484.

SULPHAS ZINCI.

THE emetic and tonic properties of this article have already been noticed; and to complete its remediate history, it remains, therefore, only to speak of its virtues as an astringent.

In chronic ophthalmia, a weak solution of the sulphate of zinc often produces excellent effects. It is certainly preferable, in such cases, to the acetate of lead, as having, besides its constringing, a greater roborant effect upon the dilated and debilitated capillaries of the inflamed part. As an astringent injection in gonorrhœa, its employment is very common. Its indiscriminate and unguarded use in this disease is, however, by no means to be approbated. It is much too harsh and irritating, and frequently gives rise to injurious consequences, when employed in the acute stage of the affection. When the discharge has assumed the character of gleet, it may generally be used with advantage. In injections for this complaint it is usually united with sugar of lead, to which some mucilage and a small portion of laudanum is commonly added. Used in this way, it also forms an excellent application in fluor albus.

The sulphate of zinc has been employed with much benefit against opacities of the cornea, and in pterygium or thickening of the conjunctiva. Himly used it

with success in tumours of the sclerotica and cornea, applied in the form of powder mixed with sugar. It has also been successfully used as an escarotic in polypus of the nose; and in fungous tumours in the external meatus of the ear. A solution of it forms a very excellent gargle in aphthous affections of the mouth, for which purpose it is highly recommended by Selle, Armstrong, Hertz, and others. The sulphate of zinc is a remedy of very considerable powers in chronic cutaneous eruptions. The famous ointment of Jasser consists principally of this article. I have frequently employed it in the form of a lotion in scabies with perfect success. Of its use in bowel complaints I have already spoken under the head of Emetics.

SULPHAS ALUMINA.

ALUM is an earthy salt, consisting of sulphuric acid and alumina, with a portion of potass, or ammonia, or sometimes of both. "It crystallizes in regular octohedrons, whose sides are equilateral triangles." Its taste is sweetish, rough, and exceedingly astringent. It dissolves in fifteen times its weight of water at 60°, and in three-fourths of its weight at 212°. It is also soluble in alcohol. When exposed to the air it slightly effloresces. "By the action of heat it first undergoes

the watery fusion, then loses its water of crystallization, and lastly a great part of its acid," assuming a white, spongy appearance, friable and very light. It is decomposed by the alkalies and alkaline salt, carbonate and muriate of ammonia, carbonate of magnesia, tartrate of potass, lime-water, superacetate of lead, the mercurial salts, "as well as by many vegetable and animal substances, especially galls and kino."* Hence, as Dr. Paris observes, the addition of alum to vegetable astringents is very injudicious.

Alum was well known to the ancients, but it does not appear to have been used by them as an internal remedy. Dioscorides and Hippocrates praised its effects as a lotion, in various kinds of ulcers, and particularly in sores of the mouth, and in spongy, swelled gums. Van-Helmont, Helvetius, Mead, and Thompson, were among the first who brought its internal use into particular notice.

Lind speaks very highly of the powers of alum given with nutmeg in intermittent fever. He declares that, except the Peruvian bark, it proved more successful in his practice than any other remedy he ever used. Cullen speaks less favourably of it. During the present season, I have prescribed it in four cases combined with nutmeg and serpentaria. One of the patients was cured after using the remedy four or five days. According to Dr. Darwin, alum is particularly

* Paris' Pharmacologia.

suited to the cure of fevers attended with disease of the bowels.

Alum is said to be one of the most effectual remedies we possess in colica pictonum. Grashues was the first who used it in this disease. Richter speaks in the most exalted terms of its effects in this painful and often intractable complaint. The testimony of a great many other eminent writers might be adduced in favour of its virtues in this respect.* Fifteen grains of the powdered alum is to be given every two or three hours, either by itself or in combination with opium.†

In chronic discharges from the bowels, alum, either alone or in combination with other articles, has been frequently employed with considerable advantage. The alum whey forms an excellent remedy in such cases. I have known the use of powders composed of ten grains of alum, fifteen of calamus aromaticus, and one fourth of a grain of opium, to arrest a chronic diarrhœa of long standing very promptly, without any disagreeable consequences. Alum has also been successfully employed in internal hæmorrhage. Van-Helmont gave it with much success in uterine hæ-

* Sommer, in Hufeland's Journal d. pract. Heilk. B. vii. st. 1, p. 73. Gebel, ibid. B. viii. st. 2, p. 195. Percival, Observ. and Experiments on the Poison of Lead, p. 71. Lentin Memorial. circa aerem, vetæ genus, sanitat, et morbos claustraliens, p. 115.

† Richter's Specielle Therapie, B. iv. p. 201.

morrhages; and Cullen states that he found it serviceable in bleedings from the uterus, but not in those from the lungs. This, he thinks, was owing to the latter variety of hæmorrhage being almost invariably of the active kind. In protracted sanguineous discharges from the uterus, connected with great relaxation of the solids, alum is undoubtedly a very valuable remedy. In cases of this kind it is very advantageously administered in combination with Peruvian bark. Where the pulse is active it ought not to be given without previous depletion. Leake used a solution of this substance in the form of an injection in this variety of hæmorrhage. Alum has also been much extolled for its remediate powers in leucorrhœa; and, employed as an injection in this disease, it is certainly capable of doing considerable good. I have prescribed it occasionally in this way, though never with any decided advantage. Where this disease is attended with great relaxation of the general system, or with that habit of body which has been denominated leucophlegmatic, alum combined with the rust of iron, is said to be peculiarly beneficial.

Diabetes is another disease in which alum has been successfully used. Its employment in this complaint was particularly recommended by the celebrated Dr. Mead, and by Dover. Selle, also, states that he cured an obstinate case by giving the patient thirty grains of

alum three times daily.* The majority, however, of those who have tried the alum in this disease, do not speak favourably of its powers; and it does not, at present, enjoy any particular reputation in this respect. Used as an auxiliary to other measures, the alum whey may, no doubt, often be serviceable. As a principal remedy, however, it is certainly not to be relied on. The alum has also been recommended in flatulent colic, gastric debility, and in colliquative sweats, &c.

As an external application, alum may be advantageously employed in a variety of complaints. In relaxations of the uvula and cynanche tonsillaris much benefit may often be derived from the use of gargles containing alum. "In many persons," says Dr. Cullen, "who are liable to be affected with swellings of the tonsils, we have known the disease prevented, or soon removed by a decoction of oak bark, to a pound of which a half a drachm of alum and two ounces of brandy were added."†

In ophthalmia, after the inflammation has been somewhat subdued by local and general depletory measures, or in the chronic form of the complaint, the alum curd,‡ as it is called, will, in general, prove very

* Beitræge zur Natur and Arznei. &c. B. i.

† Mat. Med. vol. ii. p. 12.

‡ This is made by rubbing a piece of alum with the white of eggs in a plate until a coagulum is formed. It is applied to the eye between two pieces of fine linen.

serviceable. Cullen states, that he has found the solution of alum, in the proportion of five grains to the ounce of water, still more effectual than the coagulum aluminosum. In the beginning of acute ophthalmia, these applications will very generally prove hurtful. Alum has also been used as an injection in gonorrhœa. In gleet it may be useful, but in recent gonorrhœa it is much too harsh and irritating, and ought never to be employed.

CALX.

As a mild astringent, lime-water is a remedy of very considerable utility. In the advanced periods of dysentery, in diarrhœa, and in cholera infantum, it often produces excellent effects. In the chronic form of the latter disease I have been in the habit of prescribing it in union with a weak infusion of cinchona, and it has very generally appeared to me to be of service. Where there is acidity in the primæ viæ, attended with vomiting or diarrhœa, the lime-water is doubly indicated. In such cases it at once corrects the vitiated contents, and allays the morbid irritability of the stomach and bowels. It is, indeed, one of our most useful remedies to check inordinate vomiting. For this purpose it is usually administered with milk,

given in doses of a table-spoonful of each, every twenty or thirty minutes. Under the head of Antacids I have already noticed its utility in dyspeptic cases attended with acidity of the *primæ viæ*.

Hoffman asserts that lime-water is the most effectual remedy we possess in scurvy arising from the continued use of salted provisions. This, however, is not confirmed by the experience of others.*

As an external remedy, lime-water may often be advantageously used in old fungous ulcers, attended with inordinate discharges of a serous matter. It has also been recommended as affording great relief from the pain and fetor of malignant ulcers. It is even asserted to have been used with success in genuine cancer. Baumbach, a German writer, relates two cases of cancerous ulcerations of the lips and breast, which, he says, were effectually cured by the internal and external use of lime-water.† In the cure of *porrigo larvalis*, or *crusta lactea*, lime-water, used both externally and internally, is recommended by Barlow, Dreiszig, and Wichmann,‡ as an efficacious remedy. Hufeland recommends a liniment made of equal parts of lime-water and sweet oil, as one of the most

* Burdach, *Arzneymittellehre*, B. iii. p. 500.

† Vogel, resp. Baumbach. *Diss de curatione cancri occulte et aperti per aquam calcis vivae potam præstita*.

‡ *Ideen Von Diagnostick*, B. i. p. 50.

effectual applications on herpes.* This liniment, with the addition of a portion of laudanum, is also a very excellent application in burns and scalds. I have repeatedly seen its virtues in this respect exemplified.

Much was said a few years ago of the efficacy of the muriate of lime in scrophulous complaints. Fourcroy, Beddoes, and Hufeland have published very favourable accounts of its effects in this disease. I have known it to be employed in several instances of external scrophulous ulcerations, but, although it was given in large doses, and continued for a considerable time, it did not evince any beneficial operation. It is certain that it has not answered the expectations that were at first excited by the accounts given of its effects by Beddoes and Hufeland. The mode of giving it is, to dissolve one drachm of it in two ounces of water, of which thirty or forty drops are to be given every three or four hours.

BARYTES.

THE only preparation of barytes employed in medicine is the muriate. This salt has a bitter and pungent saline taste. Given in a moderate dose, it does not manifest any sensible operation. An inordinate

* Journal der Practischen Heilkunde, B. xxiii. st. 3, p. 209.

dose, however, excites nausea, vomiting, and sometimes anxiety, palpitation and vertigo. Hufeland states, that he has known this medicine to produce a continued feeling of distressful anxiety for several days without any other obvious effect. It often occasions, when first used, and especially in patients who have worms, slight griping pains, with diarrhœa. It generally keeps the bowels somewhat relaxed. It has no perceptible effect upon the pulse. Hufeland says, that it appeared to him rather to retard than accelerate it. The excretory organs are more obviously influenced by this remedy. It generally augments the urine and cutaneous exhalation. Applied to the skin, it produces a smarting, burning pain, and when concentrated it proves escarotic.*

The muriate of barytes, or, as it was formerly called, terra ponderosa, was first introduced to the notice of the profession by Dr. Crawford,† of England as a remedy of great powers in scrophulous affections. This writer assures us that he has found it successful in many of the most confirmed cases of scrophula. Mr. Pearson and Drs. Clark and Hamilton, have published observations confirming Dr. Crawford's statements upon this subject. In Germany and France this remedy has found a number of able advocates.

* Hufeland, Darstellung der Medicinischen Kräfte der Salzsäuren Schwererde, p. 15.

† Duncan's Medical Commentaries, vol. iv. Dec. 2, p. 433.

Goerling, Fourcroy, J. A. Schmidt, Petermann, and especially Hufeland, have published statements illustrative of its beneficial effects in affections of this kind. It can, indeed, not be doubted that it has been found useful in this disease; but later experiments with it in this country, as well as in Europe, do not justify the high praises that have been bestowed on it. Ferriar, Kretschmar, Fleisch, Henke, Richter, &c. employed it in large and continued doses, without deriving the least advantage from it.* Some writers, amongst which are Girtanner and Arnemann, have represented it as frequently productive of highly injurious and even poisonous effects.

In a single instance of violent and obstinate scrophulous ophthalmia in a child, I prescribed the solution of this substance, and had the satisfaction to see my patient get well under its use. In employing this medicine, it is necessary to continue its use for a long time. In very tedious cases, Hufeland observes, its use should be interrupted every eight or fourteen days, and a purgative interposed. This remedy is said to be most useful when there is an inflammatory and very irritated condition of the lymphatic system present, or where the bowels are loaded with irritating and bilious matters. It is especially efficacious when the disease appears in the form of cutaneous eruptions. In cases attended with great relaxation and weakness, or

* Richter's *Specielle Therapie*, vol. v. p. 623.

where symptoms of hectic are present, it seldom does any good, and often harm. Nor can it be used with benefit in cases complicated with scorbutic affections.*

The muriate of barytes has also been used with advantage in herpetic eruptions, scabies, porrigo, scirrhous, amenorrhœa, and mania; successful examples of all of which are mentioned by Hufeland and others.

The dose of this remedy is from ten to fifty drops every three hours, of a solution of one drachm in an ounce of distilled water. It should always be commenced with in a small dose, and gradually augmented.

The sulphuric and nitric acids, the alkalies, magnesia, tartarized antimony, burned sponge, and flowers of sulphur decompose it. Antimonial wine renders it slightly turbid, but does not entirely decompose it. It may be given with vegetable extracts and syrups, and decoctions, alcohol, corrosive sublimate, arsenic, without having its composition affected.

ACIDUM NITRICUM.

THE nitric acid has, within the last twenty or thirty years, become an article of very considerable importance in therapeutics. M. Alyon, a French physician, introduced it to the notice of the profession as an

* Hufeland, op: citat.

exceedingly valuable remedy in syphilis. He published a number of cases illustrative of its efficacy in this disease; and it was soon afterwards tried by several eminent English physicians, whose reports on its effects were very favourable. Cruickshank, Scott, Sandford, and Hammick, published observations tending to confirm its character as an efficacious anti-syphilitic remedy. But no one was more extravagant in its praise than Beddoes.* As is usual, however, with new remedies, it did not long sustain the reputation it at first acquired. The result of the experience of the profession on this subject is,—that in old cases of syphilis, connected with a cachectic condition of the system, the nitric acid is capable of mitigating the disease, but is inadequate to a perfect cure. In cases of this kind, and especially when symptoms of scurvy are complicated with it, much benefit may commonly be derived from the alternate employment of the acid, and mercurial remedies. Where mercury fails to remove the symptoms entirely, and rheumatic pains, nodes, ulcers, &c. remain, the acid will sometimes prove highly serviceable. It is seldom sufficient to prevent the occurrence of secondary symptoms; though it will often remove them after they have made their appearance.

The nitric acid has been recommended as a very useful medicine in chronic hepatitis, as well as in

* On the effects of Nitrous Acid, &c. 1797.

scrophulous ulcerations. I have used it in some cases of the former disease with advantage; but I have not known it to perform a perfect cure. This acid has also been recommended in dysentery and diarrhœa, but its use in this way does not appear to merit much consideration.

This acid may also be beneficially used as an external application to syphilitic ulcers,* and in certain chronic cutaneous eruptions.† Plenck recommends an ointment made of nitric acid and ung. althaeæ, of each half an ounce, and two drachms of ung. juniperi, applied twice a day, as highly efficacious in tinea capitis. The nitric acid may be taken from one to two drachms daily, diluted in a quart of water, to which six or seven ounces of syrup is added. Its use increases the appetite, accelerates the pulse, augments the secretion of urine and saliva, and when long continued, produces a tenderness of the gums.‡

The nitro-muriatic acid has lately attracted very considerable attention, both as an external and an internal remedy. Dr. N. Scott was the first who noticed the superior remediate powers of this mixed acid.§

* This is said to be an excellent ointment for purposes of this kind. R Acid nitric. concentr. ℥i. pingued. vacc. ℥i. misce int. sub leni igne et adde, opii. puriss ℥i. fiat unguentum.

† Alyon, Essai sur les propriétés medicinales d'oxygene, 1798.

‡ Richter's Specielle Therapie, vol. v. p. 321.

§ Beddoes' Contributions.

It appears to have a very particular tendency to act upon the glandular system, and especially to excite the secretory action of the liver and cutaneous exhalants. "As a very general rule for its employment," says Dr. Scott, "it may be observed, that whenever the mercurial preparations are indicated, the nitro-muriatic acid will be found useful, with this difference, that in cases where mercury is highly injurious from delicacy or peculiarity of constitution, or from other causes, the nitro-muriatic acid may be employed with safety and advantage." It is inadmissible in acute diseases. It is especially recommended in chronic hepatitis and in functional disorders of the liver. In these diseases Dr. Scott considers it as the most effectual and the safest remedy. It is said, likewise, to be very efficacious in syphilitic and pseudo-syphilitic affections. Dr. James Johnson, who appears to place considerable reliance on the nitro-muriatic bath, in the treatment of chronic hepatitis, gives the following directions for preparing and using it: "Into a glass vessel capable of holding a pint or more of fluid, put eight ounces of water, and then pour in four ounces of the nitric acid of the London Pharmacopœia, and four ounces of muriatic acid. One ounce of this mixture to a gallon of warm water, will form a bath of medium strength, and such as Mr. Astley Cooper commonly prescribes. The proportion may be increased to one ounce and a half, or diminished to half an ounce of the solution to

the gallon of water, according to the age, strength, delicacy, or other peculiarity of the patient. The feet and legs of the patient ought to be immersed in this bath at a comfortable warm temperature, say 96°, and kept there twenty minutes or half an hour, just before going to bed. This may be done every night, or every second night, and the same bath will remain good for five or six nights.”*

It is proper to observe, however, that several very respectable physicians, who have published the result of their experience with the nitro-muriatic acid bath, have not found it to answer the expectations which were excited by the publications of Dr. Scott and others. Mr. Guthrie, deputy inspector of military hospitals, states, as the result of his experience with this remedy, that it is of very uncertain operation, and that no dependence can be placed on it. He does not, however, contend that the remedy is entirely destitute of useful powers. “It seems often,” he says, “not to produce any effects whatever, however extensive its application; and yet the complaint for which it has been used shall slowly subside or disappear, whilst in other instances it remains stationary or gets worse.”† From my own experience I know very little of this remedy. I have employed it in a few instances of functional derangement of the liver; but as it was

* On the Influence of Tropical Climates.

† Medico-Chirurgical Transactions, vol viii. for 1817.

alternated with mercurial remedies, I am not able to say how much of the beneficial result is to be ascribed to its operation. It appears to be beyond a doubt, however, that it is possessed of very useful remediate powers. But no one will now pretend to say that it approaches mercury in any of the diseases in which it has been recommended. It may, nevertheless, be sometimes usefully substituted for mercury, where this article cannot be given on account of idiosyncrasy, debility, or other causes. It may even occasionally happen to prove effectual where mercury has done no good, or has been hurtful. This has been observed of a variety of articles whose remediate powers are in no respect equal to this metal.

ACIDUM SULPHURICUM.

THE sulphuric acid is a medicinal agent of very considerable importance. By the German physicians this acid is very frequently prescribed in hæmorrhagies; and some of the older English writers recommend it very highly for its powers in such cases. Sydenham especially considered it as a remedy of great use in hæmorrhagy. At present it is only prescribed as an auxiliary, after the immediate violence of the discharge has been restrained by more active

measures. In spitting of blood, and in slight but protracted bleedings from the uterus, it often answers very good purposes. As a tonic this acid is very frequently administered. It seems to be particularly adapted to invigorate the digestive organs during convalescence from febrile diseases. Sometimes, however, it will produce unpleasant affections of the stomach, such as pains and nausea. When this occurs it must, of course, be at once discontinued.

The sulphuric acid is a very efficacious remedy in certain chronic eruptive diseases. The use of it in this way originated, I believe, in Germany. Dr. Cothenius, principal physician of the Prussian army, employed it for the cure of the itch, in 1756. It has, since that time, been employed and commended by many of the most eminent physicians of Europe. Crollius, Tissot, Baldinger, Hafenreffer, Gahn, Richter, and a number of other writers have mentioned its virtues in this respect. Richter observes, that the external application of this acid, diluted with water, is, perhaps, the most useful of all our remedies in itch complicated with a scorbutic habit of body.* Dr. Kinglake, also, has found this acid very effectual in cases of this kind.† Dr. Fosbroke, of Berkeley, in England, has recently published a paper on the use of dilute sulphuric acid in cutaneous affections, in

* *Specielle Therapie*, tom. vi. p. 179.

† *London Med. and Phys. Jour.* 1801, p. 614.

which he relates several very striking examples of its efficacy. He prescribed it in an obstinate case of lichen agrius, with prompt success. It was taken in a decoction of elm bark and of the wood of *solanum dulcamara*, "using, at the same time, as a wash, a decoction of the deadly nightshade.* It should be taken in as large doses as the stomach will bear; from one to four drachms, properly diluted, may be taken in twenty-four hours. It is usually employed in the form of the *acidum sulphurum aromaticum*, or elixir of vitriol. Made into an ointment with lard, it forms a very efficacious application in diseases of this kind. In this way I have repeatedly employed it with prompt success in the itch. I have also cured a distressing case of *prurigo formicans*, by the external and internal use of this remedy alone. The ointment is made by simply incorporating the acid with lard, in the proportion of about thirty drops to an ounce of the latter.

Quite recently I have been informed by Dr. J. R. Lucas, of Brunswick, Virginia, that the sulphuric acid, properly diluted, forms an exceedingly efficacious injection in gonorrhœa.† I have tried it in one instance with success. About eight drops of the acid should be mixed with eight ounces of water, when used for this purpose.

† American Medical Recorder, for October, 1822.

CHAPTER VIII.

MEDICINES WHOSE ACTION IS PRINCIPALLY DIRECTED TO THE UTERINE SYSTEM.

I. Medicines that promote the Menstrual Discharge.

EMMENAGOGUES.

UNDER this class are arranged such remedies as are supposed to be capable of promoting the menstrual discharge. It is very doubtful, however, whether any of the articles which have hitherto been employed for this purpose, possess any direct influence over the uterine secretions. We know, at least, that their emmenagogue effects are very uncertain; and that remedies of the most opposite character do occasionally, under peculiar circumstances, produce such effects.

That the menstrual discharge is a secretion, and not a mere effusion of blood from the extremities of the uterine vessels, is an opinion now pretty generally entertained. This opinion is distinctly expressed by Allen, in a quotation from an author whom he does

not mention. "I dare assert," says he, "that the menses proceed entirely from the superfluous chyle concocted into a viscid humour, which by degrees mixes with the mass of blood, and, as is well known of all the several other secretions, is separated *by the glands situated there for that very purpose*, as manifestly appears on the dissection of those parts. The menses are considerably more viscid and thick than the rest of the blood, and have generally an ungrateful and unusual smell, very different from what is drawn off by bleeding, or flows from an hæmorrhage."* Bordeu, too, in his invaluable Treatise on the Glands† advances the same opinion.

Whatever opinion we may adopt in relation to the nature of this evacuation, certain it is, that whenever it becomes irregular or suppressed, the health always suffers more or less disturbance. Even the peculiar destiny of the sex,—the noble prerogative of becoming mothers, is destroyed, and with it, often, the tenderest hope of the female.

I have already said that it does not appear probable that any of our emmenagogues exert any direct action upon the uterus. If this were the case, we might, I think, calculate with much more certainty, on the operation of these remedies, than experience teaches us to do. If we attend particularly to the effects of these

* Synopsis Medicinæ, vol. ii. p. 232.

† Traite des Glandes.

articles, we discover that many of them have a decided tendency to increase the flow of blood to the pelvic viscera generally. This is also the case with some other means occasionally resorted to for the restoration of obstructed catamenia, and which cannot be properly placed under the head of emmenagogues. Thus ligatures on the thighs, the semicupium, and fomentations to the external parts of generation, can only act by creating a local plethora in the vessels of the pelvic viscera, and consequently of the uterus. I have known the extirpation of large hæmorrhoidal tumours to restore suppressed catamenia, by which the local drain of blood from these parts was removed, and the ordinary fulness of the uterine vessels re-established. It is not necessary that we should regard the menstrual discharge as a mere effusion of blood, arising from local uterine plethora, in order to admit this explanation of the *modus operandi* of emmenagogues. The phenomena are perfectly compatible with our notions of the secreted nature of the menstrual discharge. There is an intimate relation between the degree of exaltation in the vital properties of a part, and the quantity of blood circulating through it. We find, accordingly, that whatever increases the flow of blood to a gland, increases also its secretion. It is in this way, perhaps, that all irritations increase the peculiar secretions of the organs to which they are applied. They produce an immediate flow of blood to the organs irritated, the

vital properties of which are thereby elevated, and a larger secretion of their peculiar fluid takes place.

We can, therefore, readily understand how an increased determination of blood to the pelvic viscera may very often remove torpor in the uterine vessels, and thus restore the suppressed catamenia. Although emmenagogues are a class of remedies expressly set apart as means for removing catamenial obstruction, they yet, in reality, constitute but a small portion of our remediate resources in such cases. In a very great number of instances we find it necessary to have recourse to general remedies, to the exclusion of such articles as are technically denominated emmenagogues. If, for example, the catamenia cease to flow in consequence of a general relaxation or debility of the system, our best curative means, of course, are such as invigorate the vital powers. Hence, tonics, exercise, the cold bath, an invigorating diet, &c. do occasionally produce the best effects in cases of obstructed menstruation. A suppression of the menses is also frequently attended by a state of the system directly the reverse of that of debility and relaxation. There is a rigidity of fibre unfavourable to the regular performance of some of the organic functions; the habit is full and inflammatory, and though apparently vigorous, easily subdued by any unusual exertion. In cases of this kind, all the stimulating emmenagogues would, without the use of previous depletory mea-

tures, not only be ineffectual, but injurious. Bleeding, a temperate diet, tepid bath, &c. are here the proper remedies; and they often restore the regular evacuation of the catamenia, in a prompt and effectual manner.

In prescribing, therefore, for suppression of the menses, it is of the utmost consequence that we attend to the general state of the system. Without such attention, indeed, our success must not only be extremely precarious, but our remedies very often increase the mischief we are called upon to remedy.

Alibert justly observes, that there are few disorders which depend on such a variety of causes, or are connected with such different conditions of the general system, as obstructed catamenia. Hence, its remedies are so various, and often of such contrary character; and hence, too, the great uncertainty of all our remediate measures in such cases.

RADIX HELLEBORI NIGRI.

THE plant which furnishes this article is indigenous to the Austrian Alps, the Appenines, and the Pyrenees. The root, which is the only part employed in medicine, consists of numerous black fibres, springing from knotty branches, which issue out of a central

radical tuber. Its taste is acrid, bitter, and nauseous, and, when chewed, it imparts a benumbed feeling to the tongue.*

Water and alcohol draw from it a bitter and acrid extract. According to the analysis of Vauquelin, its constituent principles are, a very acrid essential oil, a small portion of extractive matter, fæcula, a vegeto-animal substance, and salts.

Geise considered the acrid oleo-ætherial fluid as a peculiar principle, to which he gave the name of *helleborinum*. According to Pfaff, however, this sub-

* The root of black hellebore is not unfrequently adulterated by other roots, some of which are powerfully poisonous. The roots of the *adonis vernalis*, *trollius europæus*, *actæa spicata*, *astrantia major*, *helleborus fœditus*, *veratrum album*, and *aconitum neomontanum*, are occasionally mixed with or entirely substituted for it. The root of the *adonis vernalis* may be distinguished from that of the black hellebore by the fibres not issuing from branches, but immediately springing from a central tuber: they are also more numerous and more fleshy, externally darker and internally whiter, than those of the hellebore. The principal root of *helleborus fœditus* is thin, not knotty, nearly straight, with fewer fibres, which are short, very black, and much more acrid than those of *helleborus niger*. The root of *actæa spicata* is spindle-shaped, jointed, yellow within, with woody fibres. *Trollius europæus* has a very short radical tuber with branched fibres, which have neither taste nor smell when dry. The root of *astrantia major* is articulated, spindle-formed, and slightly acrid. That of *aconitum napellus* is roundish, spindle-shaped.

stance approaches more to the character of a resin than to an essential oil. It is best extracted by alcohol, and is distinguished by its leaving an exceedingly acrid taste in the back part of the mouth and fauces, when chewed.*

The root loses its active properties by age. Its fibrous are much more powerful than its knotty or tuberos parts.

This is one of the most ancient articles of the *materia medica*. Ctesias, who lived in the time of Plato, and anterior to Hippocrates, speaks of it as a medicine of important virtues. It was particularly celebrated with the Greek and Roman physicians as a remedy in mania. The extraordinary cures performed at the island of Anticyrus, famous for its hellebore, are celebrated by the poets and historians of antiquity. The doses which the ancients employed were, however, much larger than we would venture upon at the present day, and its effects accordingly were often excessively violent. It appears, indeed, by the accounts which have reached us of the employment of this article among the ancients, that they never expected to cure, without producing with it symptoms of a very violent character. Hence Oribasius, in his treatise on the use of hellebore, has two chapters, entitled "*Quæ faciendum sit quum strangulatio occupat eos*

* Pfaff's *Mat. Med.* tom. iii. p. 253.

qui Elleborum sumpserunt," and "Quæ faciendum sit ubi vox et sensus amittitur."^{*}

When given to animals in large doses, hellebore produces the following effects: slow and difficult respiration; slowness and sometimes irregularity of pulse; vomiting of mucous and bilious matter; an increased flow of saliva; trembling and unsteadiness; vertigo; convulsions followed by tetanus, and diminution of heat. The animal finally becomes cold, respire after long intervals, and dies.[†] From a variety of experiments performed by M. Orfila on dogs, he concludes, 1. That powdered hellebore, applied to the cellular texture, is rapidly absorbed into the circulation; 2. That its local effects are confined to the production of slight inflammation; 3. That "the part which is soluble in water is that in which the poisonous property of the hellebore resides;" 4. That the alkaline extract of black hellebore, which forms part of Bacher's tonic pills, is also extremely active.[‡]

When taken into the human stomach it manifestly increases the force and rapidity of the circulation, and excites a sensation of warmth throughout the whole

^{*} Medical Sketches, by G. Kerr, p. 22.

[†] A Memoir upon the effects of Helleborus Niger and Albus, by M. Schabel, of Weissenburg, read in Sept. 1818, to the Society of Emulation, of Paris.

[‡] System of Toxicology, by M. P. Orfila, M. D. translated by J. G. Nancrede, p. 208.

body. When taken in large and repeated doses, its effects are often, as I have already stated, very violent. Independent of the powerful vomiting and purging which this article is known sometimes to produce, its long use occasions a singular feeling of coldness in the abdomen, muscular debility, anxiety about the heart, slow and small pulse, headach, stiffness of the muscles of the neck, pain in the glands about the throat, slimy whitish mucous discharges from the bowels, spasms, delirium, hæmorrhages, &c.*

The emmenagogue virtues of this article remained unnoticed until the celebrated Mead announced them to the public. As is usual with those who introduce new remedies, he lavished the most extravagant encomiums on the emmenagogue powers of this substance. On the continent of Europe, especially with the Germans, this remedy stands in no small repute. But in England, as well as in this country, the authority of Cullen, who regarded it as nearly inert in this way, has thrown it into unmerited neglect.

It seems to me quite certain, however, that both Mead and Cullen were wrong in their estimates of the powers of this medicine, and that it is entitled neither to the extravagant praises of the one, nor the unqualified condemnation of the other. Indeed, within a few

* Büchner de salutarii et noxio Ellebori Nigri usu. Halæ, 1748. Burdach's System der Arzneymittellehre, vol. iii. p. 124. Hartman de virtute Hellebori Nigri.

years past, its reputation as an article of the *materia medica* seems to be again advancing.

Hellebore appears to possess a very considerable tendency to determine the circulation to the hypogastric and pelvic viscera. This is evinced by the sense of weight and pain which patients generally experience after having taken it for some days; I have known this determination to be so great as to produce a profuse hæmorrhagy from the uterus.

From its stimulant properties, one would be led to regard it as inapplicable to cases where there is a fullness of habit, or in a sanguine constitution. Yet Mead, Lewis, and other eminent writers say, that it is precisely in such cases that its emmenagogue virtues are most conspicuous. Burdach, however, in his excellent work on the *materia medica*, asserts that it is particularly valuable in cases of torpor, where the face is pale and leucophlegmatic, and the pulse soft. To this latter opinion I am inclined myself; at least, my own experience goes directly in favour of it, independently of the theoretical considerations which point that way.

In a recent work on the *materia medica** it is stated that it is especially useful as an emmenagogue when it purges, in cases attended with torpor and constipation of the bowels, and "perhaps with a degree of insensibility of the uterus." My own experience,

* Elements of Therapeutics, &c. by Dr. N. Chapman.

however, leads me to a contrary conclusion. It does not appear to me that its cathartic effects are, under any circumstances, necessary, or even accessory to the attainment of its emmenagogue results. I have been much in the habit of employing this article in amenorrhœa, and it has always appeared to me, that, whenever it purged freely, as it generally does if it purges at all, it was less apt to evince the desired effects. If, indeed, its emmenagogue powers depend upon its tendency to produce a local plethora in the uterine system, we can easily imagine how an active catharsis should lessen these effects.

It may be exhibited in substance, or in the form of extract, infusion, or tincture. The extract is given in the dose of from six to ten grains. The tincture is most commonly employed; its dose is from twenty to forty drops, two or three times a day, in a cup of some aromatic tea, such as rosemary, pennyroyal, &c. Bacher's pills answer extremely well. They are composed of equal parts of the extract of hellebore, myrrh, with a small portion of powdered carduus benedictus.*

Given as an hydrogogue, these pills have been taken to the extent of thirty a day, in three doses of ten

Pulv. card. bened. - - ℥iii.

M. ft.

In pilulas divid. āā gr. i. pondere.

each, at the distance of an hour between every dose. Taken in this way they produce very copious evacuations by stool and urine. “During their use the patients must be enjoined to drink plentifully of mild liquids. Upon a due attention to this circumstance, viz. dilution, the success of the remedy as a hydragogue in a great measure depends.”*

JUNIPERUS SABINÆ.

SAVIN is a small evergreen tree, of the cedar species, indigenous to Italy, Portugal, and Switzerland, where it grows in elevated situations in considerable abundance. It is cultivated, with us, in gardens, and is, perhaps, of all other articles of this class, the most commonly known for its emmenagogue virtues.

Its leaves contain a large portion of a very pungent essential oil, to which the medicinal virtues of the plant may be fairly ascribed.†

When taken internally it powerfully excites the vascular system. It produces a manifest flow of blood to the uterine system; and, when taken in large doses, occasions great heat, agitation, hæmorrhage, and inflammation of the bowels.

* Thesaurus Medicaminum, p. 62.

† Cullen.

The testimony of Dr. Home, of Edinburgh, is strong in favour of the emmenagogue powers of this plant; and until the time of Cullen, it was very generally regarded as one of the most potent articles of this class of remedies. By this writer, however, whose authority, though great on all subjects, has, perhaps, often been too implicitly received, the reputed emmenagogue virtues of this substance were considered as unimportant. It, therefore, soon fell into general disrepute both in England and in this country.

When amenorrhœa depends on a relaxed state of the general system, or on an inactive and torpid condition of the uterine system, the savin may be often very advantageously employed.* It need hardly be observed, that its great stimulant properties render it inapplicable in cases attended with a high degree of phlogistic diathesis.

Wedekind,† a German writer of great respectability, says, that this article may be applied with very great advantage in the treatment of that atonic, or relaxed state of the uterus, attended with an unnatural secretion and soft swelling of this organ, which is sometimes met with in women of advanced age, who have suffered much from repeated child-bearing or abor-

* Bayler über die heilkraft der sabina. Burdach's Arzneymittellehre, vol. iii. p. 300.

† Wedekind über die anwendung der sabinæ by frauenzimmerkrankheiten. In Hufeland's Journal, vi. Bd. 1 st. nr. 3.

tions, and which is generally attended with a train of hysteric disturbances.

I have occasionally employed this article in cases of amenorrhœa, in females of a relaxed habit of body; and, though sometimes without success, I have had sufficient evidence of its powers in this way to establish, in my opinion, its just claims to our attention.

Savin has been employed in various other affections, in some of which its remediate powers seem to be very considerable. Rave, a German writer of respectability, speaks in the highest terms of its use in chronic rheumatism.* I have employed this remedy for more than ten years past, in this disease, and I can truly say that its good effects have, in my practice, often been surprisingly prompt and decisive.

Savin, according to some writers, possesses active anthelmintic powers.† From my own experience I can say nothing of its virtues in this respect.

Werlhof speaks well of this article in caries of the bones. It has also been much extolled, by some German writers, for its remediate powers when applied to old and obstinate ulcers, either in the form of decoction or of poultice. As an escharotic application to venereal warts and other fungous excrescences the powdered savin is not unfrequently employed. And an ointment made of it is one of the most excellent

* *Ueber die anwendung der Sabina by der gicht, &c.* 1794.

† Alibert. *Burdach.*

applications we possess for keeping up a discharge from a blistered surface.

It is given in substance in the dose of from one to two scruples three or four times a day. It is almost impossible to pulverize it without previously drying it in a high degree of heat; and, as the active part is an essential oil, very readily volatilized by heat, the powder is always an improper form for exhibiting it. The best way is to beat it up with honey or with any kind of syrup, into the consistence of a conserve. A decoction of one ounce of the leaves to one pint of water, boiled down to half a pint, with the addition of two ounces of syrup, may be conveniently given in the dose of a large wine-glass full every two or three hours. The oil is given in doses of from one to six drops. Hartman gives the following prescription, into which savin enters as a most powerful emmenagogue:

R Pulv. hellebor. nig. ℥iv.

Pulv. G. myrrh.

Ferr. ammoniat.

Extract sabinæ. āā ℥ss.

Syrup. croc. q. s. ut, fiant pilulæ ponder. āā gran. unæ.
Three to be taken three or four times a day.*

The compound tinct. of savin, L. Ph. is given in the dose of a drachm twice a day.

* Thesaurus Medicaminum, p. 145.

MENTHA PULEGIUM.—PENNYROYAL.

THE plant which goes by the name of pennyroyal in this country, is the *cunila pulegoides*, and not the *mentha pulegium*, as is commonly thought by those who are not acquainted with botanical distinctions. These two plants are, however, so nearly allied to each other, both in botanical character and in their sensible properties, that we would be led, *a priori*, to expect, which in fact appears to be the case, an entire similarity in their medicinal powers.

As a popular remedy for suppressed menstruation there is, perhaps, no other article so generally employed. Its emmenagogue virtues are, however, extremely problematical. Cullen considered it as perfectly useless in this respect, although he thinks it of service in "the dyspeptic and spasmodic symptoms of the stomach," which some females experience about the period of menstruation. From my own experience I can say nothing in favour of this article, although I have prescribed it very frequently. As a vehicle for the exhibition of other emmenagogue remedies, an infusion of the pennyroyal is much in use in some parts of Europe, and in the interior of our own country.

ROSMARINUS OFFICINALIS.

THE rosemary is a plant well known in this country as a common garden shrub. It is indigenous to Spain, Italy, and the south of France. Water draws from it a bitter extractive matter. A very odorous, resinous principle is extracted from it by alcohol. It also yields a very pungent essential oil by distillation. Proust has discovered a sixteenth part of camphor in this oil. M. Margueron has found that oil of rosemary decomposes the nitrate of mercury, the oxymuriate of mercury, the yellow sulphate of mercury, and the caustic muriate of antimony.* It is much in use as a domestic remedy for obstructed catamenia, and it would appear from the testimony of several respectable writers, that its powers as an emmenagogue are not inconsiderable. Cullen, however, attributes to it no virtues in this way. Dr. Chapman, on the contrary, gives it a better character, and alleges that he has used it in several cases "with unequivocal success." Murray does not mention it as an emmenagogue. I have employed it in but a very few cases, and can therefore say but very little of it from my own experience.

As a warm, aromatic stimulant, it may often be given with much advantage in nervous disorders, such

* Alibert, Matière Med. vol. ii. p. 127.

as vertigo, palsy, and spasmodic pains of the stomach. It has also been extolled in the treatment of glandular swellings in infants.* But its usefulness, says M. Alibert,† is particularly conspicuous in chlorosis, a disease which is very generally complicated with a weakness of the abdominal viscera, or an aberration of their sensibility. The same author states, that a vinous infusion of this plant is an excellent remedy in chronic diarrhœa.

It is generally used in the form of an aqueous or vinous infusion. The essential oil is given from two to ten drops, on sugar. Rosemary is a principal ingredient of the preparation known under the name of Hungary water.

RUBIA TINCTORUM.—MADDER.

THIS is a perennial plant, and cultivated as an article of commerce in different parts of Europe. The root, which is the only part of the plant employed, is long, slender, of a red colour, and succulent, with a white ligneous pith in the centre. Its taste is slightly

* J. C. Speis, Rosmarini Historia Medica. Helm, 1818.

† Nouveaux Elémens de Thérapeutique et de Matière Médicale, vol. ii. p. 128.

bitter and somewhat austere, and imparts both its taste and colouring principle to water.

When given to animals with their food it soon gives a red tinge to the bones and the urine. Mr. Gibson,* of Manchester, has experimented largely with this article, in relation to its effects upon the bones and secretions of animals, and he has established the fact, that its colouring principle is manifested only where it meets with phosphate of lime, which acts as a mordant in fixing and evolving it.

It is chiefly upon the evidence of Dr. Home in favour of its emmenagogue virtues, that its claims to notice are founded. By this eminent physician it was regarded as the safest and most powerful emmenagogue known. He asserts, that out of nineteen cases treated with this remedy fourteen were cured. By the late Dr. Barton also, it was thought to possess no inconsiderable powers in this way. Respectable as these testimonies are, it is still very doubtful whether this article possesses any such powers. Very few physicians employ it at the present day; and whatever may be its virtues, it does not possess the confidence of the profession as a remediate article. I have employed it frequently, but never derived the slightest advantage from it. It appears, indeed, to have very little influence of any kind upon the functions of the

* Transactions of the Manchester Literary and Philosophical Society.

animal economy; nor has Cullen's suspicion with regard to its supposed deleterious qualities ever been confirmed. It is given in substance, in the dose of from $\mathfrak{D}i.$ to $\mathfrak{Z}ii.$ *

POLYGALA SENECA.

THIS plant, indigenous to the United States, is entitled to very great attention for its various and important medicinal virtues, whatever we may think of its powers as an emmenagogue.

Dr. Hartshorne, of this city, appears to have been the first who noticed the emmenagogue virtues of this article. Dr. Chapman speaks of it in the highest terms of praise. "Of all the emmenagogues which I have tried," says he, "this is the most efficacious, and will be found useful in all forms of amenorrhœa." And again: "I have used it with sufficient success to warrant me in recommending it as one of the most active, certain, and valuable of the emmenagogues." From my own experience, however, as well as from

* Dr. McClellan informs me that he saw a case of amenorrhœa, in the Pennsylvania Hospital, in which $\mathfrak{Z}ss.$ was given, by mistake, instead of $\mathfrak{Z}ss.$ It produced a slight discharge of blood from the uterus. The medicine may, therefore, be usually given in too small a dose.

that of some of the most respectable physicians of this city, I am led to a very different estimate of the powers of this remedy as a promoter of the menstrual discharge. I have tried it repeatedly, but hitherto uniformly without success. I am not, however, disposed to regard it as wholly inert in this respect. The testimony in favour of it is too respectable to allow me to doubt its occasionally manifesting such powers. I am nevertheless entirely convinced that Dr. Chapman has expressed an opinion much too favourable of its efficacy as an emmenagogue.

It is best given in the form of decoction. An ounce of the bruised root to a pint of boiling water, and boiled down one-third, will make it sufficiently strong. Three or four ounces of this decoction must be given during the day. It should be commenced six or eight days previous to the regular period of menstruation, and gradually increased to as much as the stomach will bear.*

CANTHARIDES.

AGREEABLY to the ideas given in the commencement of this chapter, concerning the *modus operandi* of emmenagogues, we should be led, *a priori*, to ex-

* Chapman's *Materia Medica*.

pect such virtues in cantharides: for they have undoubtedly a very considerable tendency to determine the circulation to the pelvic viscera.

The emmenagogue properties of cantharides have been noticed by Allen,* Adair,† and Burdach.‡ The latter writer says: "In obstructions of the catamenia, arising from debility and torpor of the uterine system, fly plasters laid on the lower part of the abdomen, or on the sacrum, have been known to do good; or the tincture of cantharides may be given internally, in combination with tincture of aloes." Adair recommends this latter combination as very useful in amenorrhœa. Allen, in enumerating a variety of emmenagogues, mentions cantharides in union with camphor, but makes no further observations as to the powers of this mixture. Within a few years past Dr. Joseph Klapp, of this city, has directed his attention particularly to the emmenagogue virtues of this article, and has published the result of his experience upon this subject, furnishing thereby much interesting evidence in favour of the existence of such properties in cantharides.§

In my own practice I have found this article to dis-

* Synopsis Medicinæ, vol. ii. p. 235.

† Essays on Fashionable Diseases, &c.

‡ System der Arzneymittellehre, B. iii. s. 107.

§ Medical Recorder.

play very decided emmenagogue virtues in several instances. In the majority of cases, however, I have found it to fail in common with other articles of this class.* In exhibiting this remedy, it is necessary to attend to the state of the general system. When the habit of body is full and inflammatory, venesection ought always to be premised to the exhibition of this medicine. In cold and phlegmatic temperaments, its action in this way, would seem to be most conspicuous. It seems to be peculiarly adapted to those cases of amenorrhœa which are attended with fluor albus. In this affection it appears to do good by exciting the mucous membrane of the uterus and vagina to a new train of actions, independently of its powers to increase the determination of blood to these parts.

Twenty drops of the tincture is to be given three times a day, and gradually increased until symptoms of strangury supervene.

* I was directed to the employment of cantharides, as an emmenagogue, by Dr. Klapp's publication, prior to which I was not aware that this article had ever been used for such purposes.

ALOEES EXTRACTUM.

THE natural history of this article has already been given under the head of Cathartics. Agreeably to the opinion expressed in the beginning of this chapter, relative to the *modus operandi* of emmenagogues, there is no difficulty in perceiving how aloes should prove emmenagogue independent of any specific virtue in this way. When speaking of this article before, its peculiar tendency to act upon and stimulate the rectum were particularly pointed out. The effect of such an irritation, by a well known law of the animal economy—*ubi irritatio ibi fluxus*—is, an afflux of blood to the rectum and neighbouring organs. Hence the pernicious consequences of aloetic purges in persons labouring under hæmorrhoidal affections. In cases of this kind it is exceedingly apt to bring on bleeding from the tumours in the rectum, or, at least, to render them turgid and inflamed. In males a long course of aloetic medicines seldom fails to bring on piles. In females, on the contrary, where there is no strong tendency to hæmorrhoides, it more commonly brings on copious discharges of blood from the uterus, or in amenorrhœa, re-establishes the regular flow of the catamenia. In patients of a delicate and relaxed habit of body, with a constipated condition of the bowels, we may often derive very great advantage

from a combination of aloes, steel, and myrrh.* Where amenorrhœa is connected with hæmorrhoids, which is not unfrequently the case, aloes is an improper remedy. Instead of re-establishing the menstrual discharge, it is apt to increase still further the hæmorrhoidal affection; and by thus establishing a more copious discharge from the vessels of the rectum, a derivation from the uterine vessels, and with it a diminution of the menstrual effort takes place. In chlorotic females small doses of aloes and iron will sometimes produce very happy effects. I have known it to be prescribed with prompt success in a case of amenorrhœa, in combination with pulv. ipecacuanha, in the proportion of ten grains of aloes to one grain of ipecacuanha, every morning, noon, and evening. The semicupium is an excellent auxiliary to this, as, indeed, it is to all the other articles of this class. It does not appear that the emmenagogue effects of aloes is proportionate to its cathartic operation. Small doses, just sufficient to unload the bowels, will, in general, do better than such as are large and more active in their purgative effects.

Sodæ sub-carbonatis. ʒi.

M. Divide massam in pilulas xxx. Dose, two, twice a day.

II. Medicines that increase the Parturient Action of the Uterus.

ABORTIVA.

As yet we know of but one article which has any decided tendency to excite the propulsive efforts of the gravid uterus, and this is the *secale cornutum*, or ergot.

This article is a parasitic fungus, occupying the glumes of the rye, (*tritium secale*,) of the genus sclerotium, and natural order fungi. For an interesting account of its natural history the reader is referred to a paper by Dr. William Tully, published in Silliman's Journal of Science and the Arts, vol. ii. p. 48.

There is no article of the materia medica more eminently calculated to excite our admiration of that wonderful and mysterious connection of the various organs of the animal economy, by which a slight impression upon one part is instantly propagated to another, and there manifested often by the most vehement actions.

Taken internally in a large dose, it excites nausea and vomiting, attended sometimes with vertigo, pain in the head, and increased excitement of the vascular system. Its power, however, of increasing the parturient efforts of the womb, is by far its most prominent

and important character. As a *partus accelerator*, it stands alone in the materia medica, and is capable, by its prompt and certain operation, of affording the most happy results, in the hands of a cautious and judicious practitioner.

When labour is protracted in consequence of feeble or irregular contractions of the uterus, this medicine, administered under due precautions, hardly ever fails to excite vigorous and effectual contractions. In a large majority of cases the ergot may, indeed, be regarded as a very fit substitute for the forceps and vectis. When once the uterus is under its influence, the parturient efforts generally continue uninterruptedly; the contractions of the womb never totally cease, but keep up a constant propulsive effort. It commonly manifests its operation in twenty or thirty minutes after its exhibition. Sometimes, however, the effects do not show themselves until a much longer time has elapsed. The force of the contractions are often surprisingly vehement; and it is, therefore, obvious that this medicine cannot be given indiscriminately, or without a proper regard to circumstances. Should it be improperly given, before the os uteri is soft and in a state to dilate, or has already considerably dilated, rupture of the womb might ensue.

If the mouth of the uterus is considerably dilated, and no particular rigidity of the external parts present,

it may be given with perfect safety and with almost a certainty of success.

By some physicians it is supposed that this article exerts a deleterious influence on the foetus: the life of which, they assert, it not unfrequently destroys. If this be true, it forms, indeed, a very serious objection to its employment. My own experience with this article has not been sufficient to enable me to speak with confidence upon this point; I suspect, however, from what I have myself seen, and from the detailed experience of others, that there is no good foundation for this opinion, and that the cases which have been recorded by some practitioners, as demonstrative of its injurious effects,* are to be considered in the light of accidental coincidences, rather than the positive results of the medicine.†

* Vide Dr. Chatart's paper in the Med. Repos. for 1820.

† Dr. Hosack, speaking of this article, says: "The ergot has been called, in some of the books, from its effects in hastening labour, the *pulvis ad partum*; as it regards the child it may, with almost equal truth, be denominated the *pulvis ad mortem*—for I believe its operation, when sufficient to expel the child, in cases where nature is alone unequal to the task, is to produce so violent a contraction of the womb, and consequent convulsion and compression of the uterine vessels as very much to impede, if not totally to interrupt the circulation between the mother and child."

New-York Med. & Phys. Jour. vol. i. p. 206.

The cases to which it seems particularly applicable are:

1. Where abortion becomes inevitable in the early part of pregnancy, and the contractions are feeble with considerable hæmorrhage. In such cases the exhibition of this article will not only shorten the sufferings of the patient, but in a great degree remove the danger.

2. In cases of alarming hæmorrhage near the close of utero-gestation, not occasioned by attachment of the placenta over the os uteri, and not accompanied by efficient contractions.

3. In puerperal convulsions in which a speedy delivery becomes necessary.

4. In lingering labour, the os uteri being sufficiently dilated, and the parts properly relaxed.

5. In retention of the placenta from a want of contraction of the uterus.

6. "In subjects liable to hæmorrhage after delivery from laxity and deficiency of contraction."* In such cases the hæmorrhagy may be entirely prevented by the exhibition of a proper dose of ergot fifteen or thirty minutes previous to the time when labour would otherwise be expected to terminate.

7. To restrain hæmorrhagy after delivery.

Ergot has been recommended as an emmenagogue, but I believe upon a very slender foundation. I have

* Dr. E. A. Atlee. Vide Med. Recorder, vol. iv. p. 141.

prescribed it in four cases, with a view to its emmenagogue effects, but without the least advantage. It seems, indeed, to exert very little influence on the vascular system; and when we consider, that as an *uteri contractor*, it must tend rather to diminish than to increase the quantity of blood in the vessels of the womb, its emmenagogue powers will at once appear very doubtful.

This article was used, out of the profession, as a promoter of parturition, more than a century ago. In regular practice, however, it was not known until Dr. Stearns, of Albany, brought its virtues before the public; and to him, therefore, belongs the merit of having first directed the attention of medical men to the extraordinary powers of this article.

In Europe it was at one time regarded as a powerful and extensive cause of disease. Epidemics of a very fatal character were ascribed to the effects of the ergot, mixed with the rye which was ground up for bread stuff. What foundation there is for this opinion I cannot undertake to say. It appears to me unphilosophical, however, to account for epidemics by ascribing them to a cause which must be always, in a degree, present.

APPENDIX.

The following articles, which appear to be worthy of notice in a work of this kind, were omitted through mistake, in their proper places.

SANGUINARIA CANADENSIS.

THIS plant is generally known by the name of Paccoon, or blood-root, and grows abundantly throughout every section of the United States. It is among the earliest of our spring plants, shooting up its humble but beautiful white flowers, as soon as the frost leaves the earth. The root, which is the only part employed as a medicine, is red, horizontal and tuberous; its taste is acrid, leaving an impression in the fauces some time after it is chewed. According to the very accurate and minute analysis of this root by Dr. Fitzgerald Bird, it appears to contain cinchonin, extractive matter, a gummy matter, a resin, and gallic acid, in a state of combination.* The colouring principle of this root resides chiefly in its resinous parts, the alcoholic solution being always more than twice as highly coloured as the aqueous.†

The medicinal properties of the sanguinaria, have been very variously represented, and its powers do not appear to be, as yet, well understood. Dr. Bigelow considers this root as an acrid narcotic. Dr. Bird says that "its medicinal properties are *in every respect* similar to those which characterize the cin-

* An Inaugural Dissertation on the Sanguinaria Canadensis, by Fitzgerald Bird, of Georgia. New-York, 1822.

† Bigelow's Medical Botany, vol. i. p. 79.

polypus very considerably for a time, I could not succeed in obtaining any permanent advantage by its use.

Dr. Francis very judiciously observes, that in cases of high general excitement, or in active local inflammation, its employment cannot but prove injurious; for, whatever may be its ulterior effects, it is always actively stimulant in its primary operation.

Two ounces of the powdered root to a pint of diluted alcohol, are recommended as proper proportions of making its tincture.

CROTON TIGLIUM.

THE oil which is obtained from the seeds of this plant, has been recently introduced to the notice of the profession, as one of the most active purgatives known. It is generally supposed to be a *new* remedy, but this is a mistake; both the seeds and oil were very early noticed and employed in medicine. Serapion, the younger, mentions this plant and its seeds. (De Simplicibus, c. 261.) M. Pomet, chief druggist to Louis XIV. in his General History of Drugs, speaking of the seeds of Tiglium, says, "the use of these kernels is to purge, and it is indeed one of the greatest purgatives we have." M. Lemary speaks of the oil of these seeds "as being capable of exciting purging, simply by rubbing the stomach and belly with it."* Rumphius, also, speaking of this plant says, "Olim grana (Tigilii) per totam Indiam Orientalem crebro in usu fuerat ad lympham hydropicum per alvum præprimis eliminandam, in iis vero, quorum ventriculus debilis simul emesis subsequuta. Fortioribus bina grana sufficerunt, aliis granum unum cum semisse. Variis aliis in morbis in quibus purgantia fortiora opportuna

* Vide Mr. Iliff's Paper, in the 97th No. of the London Med. Repos.

videntur, ista in India adhibent. Et hanc quidem acrimoniam oles ipsi seminis inesse, tam ex dictis quam inde apparet, quod olei ex siccis granis expressi *gutta una* cum canariensi vino capta vulgare apud chirurgos in India degentes purgans constituerit.”* The seeds are also mentioned by Dr. Flemming in the 11th vol. of the Asiatic Researches, as having been formerly well known and employed in Europe as hydragogue purgatives. Bergius, Lour, Linnæus, and Burdach speak of the *grana Tiglii* as powerfully purgative.

According to the experiments of Dr. Nimmo, alcohol of sp. gr. 825, dissolves only a portion of the oil. The part which remains undissolved, is destitute of the characteristic acrimony of the oil, “this property being entirely transferred to the alcoholic solution, which answers the medicinal properties of the entire oil in a more certain manner, and unattended by several inconveniences formerly experienced from its use.” The oil contains forty-five parts of acrid principle, and fifty-five of *fixed* oil. The acrid principle is united with a resinous substance, which is dissolved by alcohol, sulphuric æther, volatile and fixed oils.† The oil itself is converted into a saponaceous mass by means of an alkali.

This oil is powerfully purgative. Given in the dose of from one-half to one drop, it produces copious evacuations, and generally with very little or no griping or other inconvenience. Mr. Iliff, apothecary to the South London Dispensary, whose experience with this remedy has been very extensive, thinks, however, that it produces nausea and griping more frequently than has been supposed; nor does it appear to be uniformly certain in its operation. Mr. Iliff states that he gave nine drops in a case of apoplexy, in three drop-doses, without any operation

* Vide Medico-Chirurgical Review for Sept. 1821. Rumphius Herb Amboininu, tom. iv. p. 98.

† London Medical Repository, vol. xvii.

whatever; whereas ten grains of calomel, which was afterwards resorted to, acted briskly.*

We have also the testimony of Dr. Carter, one of the physicians of the Kent and Canterbury Hospital, in favour of the employment of this article as an active purgative. He says that he employed it in seventeen cases, in one of which only did it fail to operate. Croton oil has been successfully used in maniacal cases. Sir George Tuthill, one of the physicians to Bethlem Hospital, has found it beneficial in affections of this kind. It has also been used with advantage by Dr. Pearson;† and it is said to be an excellent hydragogue, and to have proved very serviceable in hydropic cases. Professor Francis of New-York states in a letter to me, that “he is induced to pronounce the oil of croton a powerful and certain and speedy purgative, and free in its action from griping. In a case of most obstinate and very long continued costiveness, he says it effected what neither the elaterium, nor the other vegetable drastics, nor mercury could accomplish.” He thinks it will be found peculiarly serviceable in habitual torpor of the intestinal canal.

This oil appears to make a very powerful and prompt impression on the nerves. The editor of the London Medico-Chirurgical Review‡ says, that “cases of tic douloureux have been lately relieved, and even removed, by a drop or two of oil of croton applied to the tongue. The effect on the nerve was almost instantaneous.” Mr. Frost says that he has seen instances in which the application of this oil to the tips of the fingers “produced a sense of numbness in the fingers, hand, and arm, (but no local inflammation) dryness in the throat and headach, which continued for several hours.” It generally, however,

produces a very considerable degree of local inflammation when applied externally.

It may be conveniently given in the form of pills, made with the oil and crumbs of bread.

The violence of the action of this oil may be lessened by giving it in union with some aromatic, and particularly with any of the volatile oils: viz oleum, caryophyllorum, cinnamoni, &c. Roasting, or baking the seeds, previous to extracting the oil, is said also to lessen the violence of its action. The vegetable acids are likewise said to moderate its action.* Dr. Frost recommends the following formula for exhibiting this oil.†

PUNICA GRANATORUM.

THE bark of the pomegranate tree has been recently introduced to the notice of the profession, as a very efficacious remedy for the removal of the tape worm. It was first noticed, I believe, as a powerful vermifuge, in Dr. Fleming's catalogue of Indian Medicinal Plants and Drugs, published in 1810. Dr. Pollock afterwards published a case of tænia in an infant, in which this article was employed with complete success.‡ Quite recently, the favourable accounts which had been published of this remedy in tænia, have been amply confirmed by P. Breton, Esq. surgeon to the Rhamgur battalion in the East Indies. He relates eight cases which were promptly and completely relieved by this medicine. In almost every instance the tænia was expelled,

entire and alive, in the course of from three to six hours after first taking the remedy. He employed it both in the form of decoction and of powder. The former he made by boiling two ounces of the bark in a pint and a half of water down to three-fourths of a pint. Of this he gave a wine-glass full every half hour, until four or five doses were taken. Of the powdered bark, he gave twenty grains every hour four or five times repeated. The remedy is apt to occasion nausea, and occasionally also, when taken in strong doses, giddiness and faintness. When these effects ensue, the use of the medicine should be suspended for a time. "The temporary suspension and renewal of the medicine," says Mr. Breton, "may be successfully adopted under such circumstances."*

PRUSSATE OF IRON.

THE prussiate of iron has been lately employed with much success in the treatment of intermittent fevers. Dr. Zollickoffer of Baltimore was the first who noticed its powers in this way. He relates a number of cases in which it was successfully used.† He gave it in doses of from four to six grains every four hours. During the present season, I have known this remedy to be employed with considerable success by several practitioners of this city. I have prescribed it in five or six cases, in three of which, it removed the disease very promptly. In cases of children, it is a very convenient medicine, being destitute of taste or smell, and the dose forming but a very small bulk. It sets easily on the stomach, and may be administered in every stage of the disease.
