A few m the telegraph, enable any person to calculate by feet and decimal parts of the foot. Example :—A box measures 2 feet 1 inch in width, 2 feet 3 inches in breadth, and 2 feet 4 inches in length, 2 feet 1 inch or 2 feet $8\frac{1}{4}$ by 2 feet $\frac{1}{2}\frac{1}{2}\frac{1}{2}$ on the stationary is the answer 11 feet. By this rule, wood, timber, and all kinds of merchandise is also measured: and this method will set the answer. easured; and this method will test the ac

is also measured; and this method will test the accuracy of the former. Amongst the thousands who have purchased the above-named work, a very large number use it to examine computations made in the ordinary manner. It is uni-versally admitted that the most perfect mathematicians find themselves sometimes in error in setting down the numbers, or in placing the fractions for addition.

To Measure Timber A stick 13½ by 15, and 32 feet long :--Set 15 at 1, and at 13.5 is 202; set this at 144, and at 32 is 45 feet. Superfield Measure. Set the whole width in inches at 12, and at the entire

Price 22s. 6d.

Exchange of the different currencies into Pounds, Shil-lings, and Pence.

lings, and Pence. EXAMPLE—If 444 cents be equal to 20s., required the value of 19s. Set 444 at 2, and at 19 is 4.22, at 18 is 3991, and at 17 is 377, and against each number of shil-lings on the stationary part is the answer. If pounds be required instead of shillings, place the 444 at the 1, and on the moveable part are the dollars equal to any num-her of pounds and parts of a pound, on the opposite side. The par value of a dollar is 4s. 6d., or £9. is equal to forty dollars. The same rule is applicable to all other coins or cur-rencies.

The same rule is appendent to 20s., how many frances for frencies. If 25 frances are equal to 20s., how many frances for 124.? Set 25 at 20, and at 12 is 15, the answer. If 25 frances are £1., how many frances for £9.? Set 25 at 1, and at 9 is 225. If 25 frances for £1. then £8, is 204 frances. If 3 guilders are equal to 5s, how many shillings for 33 guilders? Set 3 at 5, and at 33 is 55, the answer.

English and French Measures.

English and French Measures. Set the number of inches in the yard-36, against the number of inches in any French measure, and at any given number of yards English is the French. Exawriz.-Set 36 at 39.3, and at 11 French is 12 the English yard, or at 100 is 109. At 14, d. per yard, what would 32 yards cost? Set 1124 at 12, and at 32 is 3 shillings, the answer, Calculations of salaries. If £100,000, per annum, how much per hour? Set 1 at 365, and at the other 1 is £274, per day; set 274 at 24, and at 2 is the answer, 2233 the shillings per hour.

MAKING, BY UNITING THE TWO. A

COMPUTING TELEGRAPH.

BY JOHN E. FULLER.

NEW-YORK:

PRINTED FOR THE PUBLISHER 1851.

NORTHERN DISTRICT OF NEW YORK. TO WIT:

HE IT REMEMBERED, That on the eleventh day of December, Anno Demini, 1943, JOHN CUTTS SMITH, of the said District, has deposited in this Office the title of a Book, the title of which is in the words follow-

"A Key to the Endless, Self-computing Scale, showing its Application to the different Rules of Arithmetic, &c. By Aanon Palman." The right whereof he claims as proprietor. In conformity with an Act Congress entitled An Act to amend the several Acts respecting Copy

[A true copy of record.; ANSON LITTLE, Clerk of the District.

STEREOTYPED BY GEORGEA.CURTIS, NGLAND TYPE AND STEREOTYPE FOUNDRY, BOSTON.

PALMER'S

ENDLESS SELF-COMPUTING SCALE.

The proprietors of this invaluable work, beg leave to pre-tent the public with the following notice. This Scale (the result of three years' incessant labor) is designed as an assistant in all arithmetical calculations. The simplicity, rapidity, and accuracy of its results, have as-tonished our best mathematicians. It consists of a loga-rithmic combination of numbers, arranged in two or more-circles, one of which is made to revolve within the other; which process constantly changes the relation of the figures to each other, and solves an infinite variety of problems. Its advantages are,—

- 1st. A complete saving of mental labor; for, by the use of this Scale, the most intricate calculations are but a pleasurable exercise of the mind.
- 24. A great saving of time. Computations requiring from three to four days, are wrought out by this Scale in the incredible short space of one minute.
- the incredible short space of one minute.
 3d. Complete accuracy. The results of the computations on this Scale, are infallible. Errors are entirely out of the question, except through sheer carelessness.
 4th. Mental improvement. By this Scale, a knowledge of the philosophy of numbers, and their relation to each other, is soon obtained. So that, in a little time, many of the common calculations are wrought out by the mere exercise of the mind.

5

Brochport, Feb. 19, 1842 I have carefully examined "The Endless Self-Computing Scale," by Mr. Aaron Paimer; and, without hesitation, give it as my opinion, that it will be found a very useful invention. Al the problems in a sittimetic can be readily solved upon it, and most of them with great expedition, particularly the rules or computing interest for moths and days, at any per cent, the Rule of Three, and Fractions. In the apportionment of County, Town, and School Taxes, it will be found almost in valuable, as it requires to be set but once, to show each man's us. JULIUS BATES, M. A. Principal of Collegiate Institute.

Cambridge, Oct. 20, 1843. I have examined Mr. Aaron Palmer's "Endless Self-Com-pating Scale;" it is simple and most ingenious, and I cheer-fully concur in Mr. Julius Bates's judicious recommendations of its utility. BenJANIN PEIRCE, Perkins Professor of Astronomy and Mathematics in Harvard University.

Boston, October 24, 1843 Mr. Palmer's "Self-Computing Scale" is certainly a very ingenious arrangement of numbers, and it will save a great amount of time in the hands of those who have computing to perform, whatever be the subject of the computation. FREDERICK EMERSON,

-

Author of the North American Arith

I heartily concur in the above recommendation. WILLIAM B. FOWLE. Late Teacher of the Female Monitorial School, Boston

Eoston, October 23, 1843

Mr. Aaron Palmer, Sir: Your "Self-Computing Scale" appears to me an exceedingly useful invention. I shall be glad to possess one of them, as it will save me much labor, and I doubt not that many persons will find the same advantage in its use. Respectfully your servant, JOHN S. TYLER, Notary Public and Insurance Broker

6

Boston, October 24, 1843. I have examined Mr. Aaron Palmer's "Self-Computing Scale;" it strikes me as being a very convenient labor-saving machine, and that it will be highly useful in calculating interest, general average, or dividends on a bankrupt's estate, and for other similar purposes. S. E. SEWALL, Counsellor at Law

I have examined "The Endless Self-Computing Scale" of fr. Palmer, and with pleasure express my high administration of it. It is constructed on the only principle acknowledged is such purposes. Over all siding Logarithmic Scales, it privates a vast superiority, both in facility of use and ac-sured purpose. Over all siding Logarithmic Scales, it invites form. With a diameter of about eight inches, is a of the same length, making scale of four feet with its sho in the same length, making scale of four feet with its sho performably greater, as a circle can be constructed more care to use a scale. C. WHITTLOW. Professor of Mathematics and Natural Sciences in Gaussien Weitergan Seminary.

Mr. Aaron Palmer, Sr: I have taken much pleasure in testing the power of four "Self-Computing Scale," by examples from nearly af heitity and accuracy in computing interest, apportioning divi-dends, and performing proportions generally. From the best most simple and wonderful invention; and I am confident that when perfected, it will come rapidly into extensive public works and will prove of singular benefit to those having occa-ion make frequent computations in Bankrupter, Insid-neake frequent computations in Bankrupter, Bask-neake frequent computations in Bankrupter, Bask-More Marker (Baskrupter, Baskrupter, Bask-Marker (Baskrupter, Baskrupter, Baskru

4

BECOMMENDATIONS OF THE ENDLESS SELF-COMPUTING SCALL.

Rochester, Jan. 19, 1842. The "Self-Computing Scale," by A. Palmer, is a very in-genious and interesting instrument for performing most of the operations in arithmetic. The principle is very plain; and the accuracy, and certainty, and rapidity of the results are very striking. C. DEWEY, Principal of Collegiate Institute.

Rochester, January 19, 1842. Having particularly examined Mr. Palmer's "Self-Computing Scale," I fally concur in the above testimonials of Dr Dewey. SAMUEL LUCKEY, D. D.

Attica, March 5, 1842. From an examination of the "Self-Computing Scale," by Mr. Palmer, I can most cheerfally concur in the above recom-mendations, and hope it may be introduced into our schools and academies. E. B. WALSWORTH, Principal of Attica Academy

Buffalo, April 5, 1842. We have examined the above mentioned Scale, and concur in the certificate of Professor Dewey. in W. K. SCOTT, Civ. Eng. R. W. HASKINS, M. A.

THE TIME TELEGRAPH.

The Time Telegraph is composed of a beautiful steel plate engraving, neatly executed by G. G. Smith, of Boston, upon the surface of which is arranged in circles four lines or rows of numbers ; upon the moveable circle is placed the names of the twelve calendar months, to which is affixed the number of days in each month, 365 making the entire circle; the inner row of numbers found upon the stationary circle, running from 1 to 365, is used for calculating time to come; the outer row of numbers on the stationary circle is reversed, and is used for the purpose of calculating time past. The manner of ascertaining the number time past. The manner of ascertaining the number of days from any given day in any month, is readily found by simply turning the moveable circle unto the day of the month from which you compute is directly opposite the gauge point affixed at the figures 365 then opposite the day of the month to which you wish to reckon is found the exact number of days required. Upon the stationary circle is also found the weeks, from one to 52; to these are added divisions of 30 days, so that any portion of the year can be brought into months as readily as the fingers of the hand can be reckoned. The Time Telegraph will be found of invaluable benefit in working equation of payments, &c.

Entered according to Act of Congress, A.D. 1845, By JOHN E. FULLER.

INTRODUCTION.

THE undersigned, proprietor of the Copy Right of Palmer's Endless Self-Computing Scale, and having been engaged in introducing and selling the same for about eighteen months past, and become extensively acquainted with the wants of the community, has been induced to introduce an improvement for which he has secured a Copyright, both for the Scale anc Key, and is assured that all persons in commencing the use of the Scale will be very much assisted. The character of the Scale is too well established to need remarks. Having personally introduced it to about Four Thousand persons; by very many of whom he has had repeated assurances of their high appreciation of its value, he can with confidence refer others who may wish to possess it, to any of those who may have used it in any of the various rules of Arithmetic. His only desire is that its future patronage shall be proportionate to its true merits.

JOHN E. FULLER.

KEY TO THE SCALE.

DESCRIPTION OF THE SCALE.

THE figures on both parts of the scale, are precisely alike, and may be called whole numbers or parts of numbers, according to the nature of the problem to be solved. The large figure 1 may be called 1000, or 1000, ac., &c. If it be called 1000, or large figure 2 will be 1000, the large 3 will be 1000. and so on ; and the next sized figures between those large ones, will then be 10000, 10000, 10000, &cc.; and the still smaller ones will be 100000, &cc. If the large 1 be called 1, then 2 is 2, 3 is 3, &cc.; and the next sized figures are tenths, and the third sized ones are hundredths, &c. If the large 1 be called 10, the large 2 is 20, 3 is 30, &c. ; and the next sized figures are whole numbers-the first after the 1 is 11, the next 12, the next 13, &c. If the large 1 be

10

calle.' 100, 2 is 200, &c. ; and the next sized figures then will read 10, 20, 30, &c.; and the smallest sized figures will then be whole numbers.

N. B.-Whenever fig. 1 is referred to, it means the large fig. 1 at the diamond-unless otherwise explained.

1651

A TABLE OF GAUGE POINTS USED ON THIS SCALE.

I., at the diamond, is the gauge point for Multipli eation, Division, &c., &c. A. Area of a Circle. C. Circumference of a Circle. B. G. Beer Gallons. W. G. Wine Gallons. 15. for months, at 8 per cent. for months, at 7 per cent. 2. for months, at 6 per cent. for days, at 8 per cent. for days, at 7 per cent. for days, at 6 per cent. 107. Compound Int. for years, at 7 per cent. 106. do. do. do. 6 do. 160. for Acres. 144. for Square Timber. 9. Yds. Square. 886. Square and Circle, equal in Area. 707. Inscribed Square. 577. side of Inscribed Cube.

12

87. side of Inscribed Triangle. 589. side of Pentagon, (5 sides.) 5. side of Hexagon, (6 sides.) 437. side of Heptagon, (7 sides.) 383. side of Octagon, (8 sides.) 337. side of Nonagon, (9 sides.) 31. side of Decagon, (10 sides.) 282. side of Undecagon, (11 sides) 26. side of Dodecagon, (12 sides.) 464. diameter of 3 Inscribed Circles. 416. diameter of 4 Inscribed Circles. 785 . point for Area.

314 . point for Circumference.

To PERFORM MULTIPLICATION.

RULE .- First find the multiplier on the circular. Place it opposite 1, then opposite the multiplicand found on the fixed part, is the product on the circular.

Example .- What is the product of 4 by 2? Place 2 opposite 1: then opposite 4 is the product = 8.

N. B .- Observe, now, that all the numbers and parts of numbers on the fixed part, are multiplied by 2, and their products are directly opposite them on the circular. So of any other multiplier.

What is the product of 12 by 7?

Place 7 opposite 1: then opposite 12 is S4, the answer.

0:3 by 3?

Place 3 opposite 1: then opposite 3 is 9, the answer.

What is the product of 8 by 21 ?

Place 2.5 opposite 1: then opposite 8 is 20, the answer.

What is the product of 10 by 5?

Place 5 opposite 1: then opposite 10 is 50, the answer. Here you have to use the same figures both

14

times, calling them 1 and 5 the first time, and adding a cypher to each the next time.

What is the product of 13 by 3?

Place 3 opposite 1, then opposite 13 (found between the large 1 and 2) is 39, the answer.

What is the product of 50 by 4?

Place 4 opposite 1: now we must call the large 5 50: opposite it is 200, the answer.

What is the product of 24 by 3 ?

Place 3 opposite 1: then opposite 24 (found between the large 2 and the large 3) is 72, the answer.

What is the product of 3 multiplied by 2 (two tenths) ?

Now we must call the large 2, two tenths. Place it opposite 1: then opposite 3 is .6, (six tenths,) the answer.

DIVISION.

RULE .- Find the divisor on the circular. Place 11 opposite 1: then opposite the dividend, found also on the circular, is the quotient on the fixed part.

Example .- 2 is in S, how many times ? Place 2 opposite 1: then opposite S is 4, the

answer.

3 is in 12, how many times?

Place 3 opposite 1: then opposite 12 is 4, the answer.

How many times 4 in 14?

Place 4 opposite 1: then opposite 14 is 3 and five tenths, (3.5,) the answer.

Note.—Whenever a divisor is placed opposite 1, all the numbers and parts of numbers on the circular are divided by it. The quotients are on the fixed part. *Example.*—Place the divisor 2 opposite 1: now opposite 2 is 1, opposite 12 is 6, opposite 4 is 2, opposite 6 is 3, opposite 14 is 7, opposite 24 is 12, opposite 125 is 62.5, opposite 75 is 37.5, &c.

To MULTIPLY BY ONE NUMBER AND DIVIDE BY ANOTHER BY ONE SIMPLE PROCESS.

RULE .- Place the multiplier on the circular opposite the divisor : then, opposite the multiplicand is the result.

Example .- What is the result of 22 multiplied by 13 and divided by 14?

Place 13 opposite 14: then opposite 22 is 20.4+ the answer.

FRACTIONS.

TO CHANGE AN IMPROPER FRACTION TO A WHOLE OR MIXED NUMBER.

RULE .- Place the numerator found on the circular

16

opposite the denominator: then opposite 1 is the answer.

Example .-- A man spending 1 of a dollar per day, in S3 days would spend Ba of a dollar. How much would that be ?

Place 83 opposite 6: then opposite 1 is \$13 83, the answer.

In # of a dollar how many dollars ?

Place 8 opposite 4: then opposite 1 is \$2, the answer.

TO REDUCE A MIXED NUMBER TO AN IMPROPER FRACTION.

RULE .- Place the mixed number opposite 1 : then opposite the denomination to which you wish it reduced is the answer.

Example .- In 1615 of a dollar, how many 12ths of a dollar?

Place 1615 opposite 1: then opposite 12 is the number of 12ths in 1612, viz., 197=197, the answer.

TO REDUCE A FRACTION TO ITS LOWEST AND ALL ITS TERMS.

RULE .- Place the numerator found on the circular opposite the denominator: then all the numbers standing directly opposite each other, are other terms of said fraction; and the lowest of said numbers are nts lowest terms.

Reduce 12 to its lowest terms. Place 12 opposite 16: now 9 is opposite 12 (12,) 6 is opposite 8 (§,) and 3 is opposite 4 (\$,) the answer.

TO DIVIDE A FRACTION BY A WHOLE NUMBER.

RULE .- Place the whole number found on the circular opposite 1: then opposite the denominator is a number, which, placed opposite the numerator, is the answer.

Example .--- If 2 yards of cloth cost 3 of a dollar, how much is that per yard?

2 is in $\frac{2}{3}$ how many times? Place 2 opposite 1: then opposite 3 is 6. Now place this opposite 2, and it will read $\frac{2}{6}$, the answer = $\frac{1}{3}$.

2 is in 7 how many times?

Place 2 opposite 1 : opposite 8 is 16. This, placed opposite 7, makes 7, the answer.

TO MULTIPLY A WHOLE NUMBER BY A FRACTION, OR A FRACTION BY A WHOLE NUMBER.

RULE .--- Place the numerator found on the circular opposite the denominator : then opposite the whole number is the answer.

N. B .- Whenever a numerator is placed opposite a denominator, all the numbers on the circular are that fractional part of the numbers opposite them.

18

Example .- Place 3 opposite 4 : this is 3. Now the 3 is 2 of 4; 6 stands opposite 8, being 2 of 8; 9 is opposite 12: 12 is opposite 16, &c., &c. Now move the circular until 3 is opposite 5: now all the numbers on the circular are 3 of those opposite them.

Nore.—Whenever a numerator is placed opposite a de-nominator, thereby forming a vulgar fraction, the decimal of said vulgar fraction is opposite 1; hence,

TO REDUCE VULGAR FRACTIONS TO DECIMAL FRACTIONS.

RULE .- Place the numerator found on the circular opposite the denominator: then opposite 1 is the decimal fraction.

Example .- What is the decimal of # ? Place 3 opposite 4: now opposite 1 is .75, the

answer.

What is the decimal of # ? Place 7 opposite S: opposite 1 is .875.

TO REDUCE DECIMAL FRACTIONS TO VULGAR FRACTIONS.

RULE .- Place the decimal found on the circular opposite 1: then any two figures standing directly opposite each other is the answer.

Example .--- What is the vulgar fraction equivalent to the decimal .5?

Place 5 opposite 1 now 1 is opposite $2=\frac{1}{2}$, the answer.

TO MULTIPLY ONE FRACTION BY ANOTHER.

RULE.—Reduce one to decimals: then place the numerator of the other opposite the denominator: then opposite the decimal is the answer in decimals, which, if desired, can be reduced to a vulgar fraction by the preceding rules.

To reduce the Different Currencies to Federal Money.

RULE.— Place the 1 on the circular, opposite the number of shillings and parts of a shilling composing a dollar of the currency to be reduced : then, opposite the given number of shillings is the answer.

Example .-- Reduce 5 shillings, New York currency, to Federal money.

Place 1 (on the circular) opposite 8: ther opposite 5 shillings, is .625, the answer.

In 15 shillings, how much?

Opposite 15 is 1.875, the answer.

In 32 shillings, English currency, how much? Place 1 (on the circular) opposite 4.5: then opposite 32, is \$7.11, the answer.

In 9 shillings, how much? Opposite 9 is \$2, the answer.

20

INTEREST.

To COMPUTE INTEREST FOR YEARS.

RULE.—Place the rate per cent. found on the cir cular, opposite 1: then opposite the principal is the interest.

Example.-What is the interest of \$50 at 7 per cent.?

Place 7 opposite 1: then opposite 50 is \$3.50, the answer.

What is the interest on \$40 at 6½ per cent.? Place 6.5 opposite 1: then opposite 40 is \$2.60, the answer.

To compute Interest for Months.

RULE.—Place the principal, (found on the circular,) opposite the gauge point for months at the given per cent.: then opposite the given number of months is the answer.

Example .- What is the interest on \$50 for three months at 7 per cent.?

Place 50, (found on the circular,) opposite 1714, (the gauge point for months at 7 per cent.,) then opposite 3 months is :875, the answer.

What is the interest on \$60. for eight months at 6 per cent ² Place 60 opposite 2, (the gauge point for months at 6 per cent.,) then opposite 8 months is \$2.40, the answer.

To COMPUTE INTEREST FOR DAYS.

RULE.—Place the principal, (found on the circular,) opposite the gauge point for days at the given per cent.: then opposite the number of days is the answer. *Example.*—What is the interest on \$55 for 15

days at 6 per cent? Place 55 opposite 600, (the gauge point for days at 6 per cent.,) then opposite 15 days is 13 3.4.

THE PRINCIPAL AND INTEREST BEING GIVEN, TO FIND THE RATE PER CENT.

RULE FOR ONE YEAR.—Place the interest opposite the principal : then opposite 1 is the rate per cent. *Example.*—Received \$7.00 for the use of \$50.00

for one year; what was the rate per cent.? Place 7 opposite 50: then opposite 1 is 14, the an-

swer, 14 per cent.

Gave \$4.00 for the use of \$80.00 one year: what was the rate per cent.?

Place 4 opposite S0: then opposite 1 is 5, the answer, 5 per cent.

22

RULE FOR MONTHS.—Place the given interest opposite the given number of months: then observe the number opposite 12. Now place this number opposite the principal: then opposite 1 is the rate per cent.

Example.—Paid 25 cents for the use of \$5.00 for 4 months: what was the rate per cent.?

Place 25 opposite 4: then opposite 12 is 75. Now place 75 opposite \$5.00: then opposite 1 is 15, (15 per cent.,) the answer.

Gave 14 cents for the use of 60.00 one month : what was the per cent.?

Place 14 opposite 1: then opposite 12 is 1.68. Now place 1.68 opposite 60: then opposite 1 is 2.8, $(2_{10}^{*}$ per cent.,) the answer.

RULE FOR DAYS.—Place the given interest opposite the given number of days: then observe the interest opposite 365 (the number of days in a year). Place this opposite the principal: then opposite 1 is the rate per cent.

Example.—Paid 14 cents for the use of \$64.00 29 days: what was the rate per cent.?

Place 14 opposite 29: now opposite 365 is \$1.76. Now place 1.76 opposite 64: then opposite 1 is 2.75 (21 per cent.,) the answer.

Paid 23 cents for the use of \$50.00, 21 days : what was the rate per cent.?

Place 23 opposite 21: now opposite 365 is 4. Place 4 opposite 50: then opposite 1 is 8 per cent. the answer.

THE RATE PER CENT. AND THE INTEREST BEIM GIVEN, TO FIND THE PRINCIPAL.

RULE FOR ONE YEAR.—Place the per cent. oppo site 1: then opposite the interest is the principal. *Example.*—At 7 per cent. I paid \$3:50 for the us

of money 1 year: what was the principal? Place 7 opposite 1: then opposite 3:50 is \$50.00

the answer.

RULE FOR MONTHS.—Place the interest opposit the given number of months : then opposite the poin of the given per cent., for months, is the answer.

Example.-Gave \$2.00 at 7 per cent. for three months: what was the principal?

Place 2 opposite 3: then opposite 1.714 is \$114.3 the answer.

RULE FOR DAYS .--- Place the given interest opposite the given number of days: then opposite the gauge point for days stands the principal.

Example.-At 7 per cent., gave 15 cents for 2 days: what was the principal?

Place 15 opposite 20: then opposite 521 (il gauge point for days at 7 per cent.) is \$39.00. il answer.

24

The Rate per cent., Interest, and Princ pal bein given, to find the Time.

RULE.—Place the interest of the given princip for one year opposite 12: then opposite the given in terest will be the answer in months and decimals a month. Or, place the interest of the given princip pal for one year opposite 365: then opposite the given interest will be the time in days.

Example.—Gave S7,5 cents at 7 per cent. [\$50.00: how long did I have it?

The interest of \$50.00 for one year, is \$3.5 Place 3.50 opposite 12: then opposite \$75 is thanswer, 3 months.

Gave 24 cents at 7 per cent. for the use of \$50 how long did I have it ?

Place \$3.50 opposite 365: then opposite 24 is t answer, 25 days.

COMPOUND INTEREST.

RULE.—Place the principal opposite fig. 1: the opposite the rate per cent. added to 100, on the fix part, is the amount for one year. Place this amoun opposite fig. 1: then opposite the same point is the amount for two years. Place this last amount opp site 1: then opposite the same point is the amount for 3 years, &c.

Example .- What is the compound interest on \$5.00 for 5 years at 6 per cent ?

Place 5 opposite 1: then opposite 106, (the per cent. added to 100,) is \$5.30, the amount for 1 year. Now place \$5.30 opposite 1: then opposite 106 is \$5.62, the amount for 2 years. Now place \$5.62 opposite fig. 1: then opposite 106 is \$5.95. the amount for 3 years. Now place \$5.95 opposite fig. 1: then opposite 106 is \$6.31, the amount for 4 ycars. Now place \$6.31 opposite fig. 1 : then opposite 106 is \$6.69, the amount for 5 years.

LOSS AND GAIN.

Bought a hogshead of molasses for \$60: for how much must I sell it to gain 20 per cent.?

RULE .- Place 20 opposite 1: then opposite 60 is what must be added to the original cost to gain said per cent., viz.. 12: which added to 60=72.

Bought cloth at \$2:50 per yard; but, being damaged, I am willing to sell it so as to lose 12 per cent. How must I sell at per yard?

Place 12 opposite 1: then opposite \$2.50 is .30, the amount to be deducted from \$2.50, which will leave 2.20, the answer.

Bought cloth at 50 cents per yard : sold it for 10 cents advance from cost. What per cent. did I make ? 3

26

Place 10 opposite 50: then opposite 1 is 20 per cent., the answer.

ANOTHER METHOD .- Place the original cost opposite 1: then opposite the rate per cent. added to 100, is the answer.

Example .- Bought corn at 50 cents per bushel: at how much must I sell it to gain 20 per cent.?

Place 50 opposite 1: then opposite 120, is 60 cents, the answer,

Bought cloth at \$2 per yard, and sold it at \$3 per yard : what per cent. did I make ?

Place 2 opposite 1: then opposite 3 is 150, 50 per cent., answer.

RULE OF THREE, OR PROPORTION.

RULE .- Place the second term opposite the first . then opposite the third term, is the answer.

Example .--- If 2 yards of cloth cost \$4.00, what cost 8 yards ?

Place 4 opposite 2: then opposite 8 is 16.

Nore.-All numbers of yards at that rate, are now on e scale, and may be determined without moving the the scale circular.

At I of a dollar per yard, what cost 4 yards? Place 7 opposite 8: then opposite the given number of yards, is the answer.

If 1 ton of hay cost \$S.00, what cost 900 pounds? Place S opposite 2000, (the number of lbs. in a ton:) then opposite 900 is the answer; and so of any other number of pounds.

FELLOWSHIP.

RULE .- Place the whole gain or loss opposite the whole stock : then opposite each man's share of the stock is his share of the gain or loss.

Example .--- A invested \$30, B invested \$20, and they gained in trade \$12: what is each one's share of the gain ?

Place 12 (the whole gain) opposite 50 (the whole stock): then opposite 20 (A's stock) is \$4.80; and opposite 30 (B's stock) is \$7.20.

EVOLUTION.

TO EXTRACT THE SQUARE ROOT.

RULE .- Move the given number around until it is opposite the same number which is opposite 1; and that number is the answer sought.

Example .- What is the square root of 42?

Move 42 on the circular around until it comes opposite 6.48. Now 6.48 is opposite 1: hence that s the square root of 42.

TO EXTRACT THE CUBE ROOT.

RULE .- Move the given number around until it

28

comes opposite a number, the square of which at the same time is opposite 1; and that number is the root sought.

Example .- What is the cube root of 27?

Move 27 around until it comes opposite 3: at that time 9 is opposite 1: hence 3 is the answer.

TO APPORTION TAXES.

RULE .- Place the whole tax to be raised, found on the circular, opposite the whole valuation : then opposite each man's valuation, is his tax.

Example .- A tax of \$1.500.00 is levied on a valuation of \$200.000 00 : what is a man's tax whose valuation is \$700.00?

Place 1500 opposite 200.000 : then opposite 700 is \$5.25, the answer.

SCHOOL TAX.

1550 days have been sent, and \$33.20 tax is to be raised : how much is each man's tax ?

Place 33.20 opposite 1550: then opposite the days each man has sent is his tax.

A has sent 28 days : his tax is 60 cents.

Opposite 70, the number of days B has sent, is his tax, \$1.50; and so of every other man's tax, without moving the scale.

TO COMPUTE TOLL.

29

What is the toll on 6000 pounds, for 289 miles, at 4 mills per mile per 1000 pounds?

Place the 4 opposite 1000 : opposite 6 is 024 (two cents four mills). Now place this opposite 1: then opposite 289 is \$6.936, the answer.

TO MEASURE SUPERFICES.

RULE 1 .- Place the width in inches opposite 12 : then opposite the feet in length, is the answer in feet and tenths of a foot.

Example .-- Give the contents of a board 6 inches wide, 14 feet long.

Place 6 opposite 12 : then opposite 14 (the length), is the answer, 7 feet.

RULE 2 .- Place the width in feet opposite 1: then opposite the length in feet, is the answer in feet.

How many square feet in a floor 20 by 20 ? $20 \times 20 = 400$, the answer.

> How many square feet in a garden 96 by 54 feet?

96×54=5184 feet, answer.

Note.-If one side be inches and the other feet, place the given number of inches opposite the number of inches 3#

30

in a foot, viz. 12: then opposite the length in feet, will be the answer in feet. If one side be feet and the other rods, the answer will be in rods by placing the feet opposite the number of feet in a rod; &c., &c.

In a lot of land 120 rods long and 60 rods wide, how many acres?

Place 60 opposite 160 (the number of rods in an acre): then opposite 120, is 45 acres, the answer.

If a board be S inches wide, how much in length will make a square foot ?

Place the width, S inches, opposite 1: then opposite 144 (the number of square inches in a foot) is the answer, 18 inches.

If a piece of land be 5 rods wide, how many rods in length will make an acre?

Place 5 opposite 1: then opposite 160 (the num ber of rods in an acre) is the answer, 32 rods.

SQUARE YARDS.

How many square yards of carpeting will it require to cover a floor 20 feet long and 14 feet wide ?

Place 20 found on the circular opposite 9 (the gauge point for yards square): then opposite 14 on the fixed part is 31 yards, the answer.

THE WIDTH AND CONTENTS GIVEN, TO FIND THE LENGTH.

RULE .- Place the contents on the circular opposite

the width in feet: then opposite 9, on the fixed part, is the length in feet.

Example.—I have a room containing 20 square yards: I wish to cover it with a piece of carpeting 21 feet wide: how many feet in length will it require?

Place 20 on the circular opposite 2.5 (21): then opposite 9, on the fixed part, is 72 feet, the answer.

TO MEASURE LAND IN CHAINS AND LINES.

RULE.—Place one of the sides in chains and links, opposite 1: then opposite the other side, in chains and links, are the number of acres and parts of an acre.

Example.-To find the acres in 7 chains and 50 links by 6 chains and 40 links.

Place 750 opposite 1: then opposite 640 is 4.80 (4^{so}_{100}) acres, the answer.

To find the acres in 7 chains and 75 links by 9 chains and 64 links.

Place 775 opposite 1: then opposite 964 is $7\frac{47}{100}$ acres, the answer.

To find the amount of land in 1 chain and 80 links by 2 chains and 50 links.

Place 180 opposite 1: then opposite 250 is $\cdot 45$ $\left(\frac{1}{100}\right)$ of an acre, the answer.

32

TO MEASURE SQUARE TIMBER.

RULE.—Place the product of the width by the thickness, opposite 144: then opposite the length is the answer in feet and tenths.

Example.-What is the solid contents of a stick 4 inches by 7, and 20 feet long ?

 $4 \times 7 = 28$. Place 28 opposite 144: then opposite the length, 20 feet, is 3.9 feet, the answer, $= 3\frac{9}{10}$ feet.

What is the solid contents of a stick of timber 18 inches by 18 inches, and 13 feet long ?

The product of 18 by 18, is 324. Now place 324 opposite 144: then opposite 13 (the length) is 29.3, $(29_{10},)$ the answer.

N. B.--If it be desired to have the answer in inches, instead of placing the product of the width by the thickness, opposite 144, place it opposite 1: then opposite the length in inches, will be the solid contents in inches.

Note.-Any bale, box, or chest may be measured by the preceding rule.

TO MEASURE A HYPOTENUSE.

AB hypotenuse, no perpendicular, ao base.

RULE .- Square each of the sides and add their

products together, the square root of which is the answer.

Example.—What is the hypotenuse of a rightangled triangle, one side of which is 3 feet, the other 4 feet?

 $3 \times 3 = 9$ and $4 \times 4 = 16$: these two added together, make 25, the square root of which is 5 feet, the answer.

To MEASURE A TRIANGLE.

Place half the base opposite 1: then opposite the perpendicular height, is the area.

Example.—What is the area of a triangle whose base is 32 inches, and perpendicular height 14 inches?

Place 16 ($\frac{1}{2}$ of 32) opposite 1: then opposite 14 is 224 square inches, the answer.

To find the Solid Contents of a Pyramid.

RULE.—Multiply the area of the base uy square, triangular, or circular pyramid.

Example.—What is the solid contents of a pyramid whose base is 4 feet square, and perpendicular height 9 feet?

 $4 \times 4 = 16$, the base. Place this opposite 1. Now $\frac{1}{3}$ of 9 is 3. Opposite 3 is the solid contents, 48 feet.

34

There is a cone whose height is 27 feet, and whose base is 7 feet in diameter · what are its contents ?

Place the square of 7 (49) opposite 1: then opposite Λ is the area of the base.

 $\frac{1}{3}$ of 27 is 9. Place 9 opposite 1: then opposite the area (38.6) is the answer, $346\frac{1}{2}$ solid feet.

To find the Solid Contents of a Frustrum of a Pyramid.

RULE.—To the product of one end by the other, add the sum of the squares of each end. Place this opposite 144. Then opposite $\frac{1}{3}$ of the length, is the answer.

Example.—What are the contents of a stick of timber whose larger end is 12, whose smaller end is 8 inches, and whose length is 30 feet ?

The product of one end by the other is 96, the square of 12 is 144, the square of 8 is 64. These, all added, make 96

	144
	64
-	~~
13	1000

304. Place this opposite 144. then opposite 10 (1 of the length) is the answer, 211 feet. TO FIND THE SOLID CONTENTS OF A FRUSTRUM OF A CONE.

35

RULE.—Multiply each diameter by itself separately, multiply one diameter by the other, add these three products together. Now place the length opposite 3S2 : then opposite the products thus added, is the answer.

To find the Circumference of a Circle from its Diameter, or its Diameter from its Circumfer ence.

RULE.—Place letter c, (found on the circular,) opposite fig. 1: then the figures on the fixed part are diameters, and those on the circle are circumferences. Opposite each diameter is its circumference. *Example.*—What is the circumference of a circle

whose diameter is 9 inches ?

Place c opposite fig. 1: then opposite 9 is 28.2, (28 inches and 2 tenths,) the answer.

To find the Area of a Circle.

RULE.—Place the square of the diameter opposite 1: then opposite the letter a is the area.

Example.—What is the area of a circular garden whose diameter is 11 rods?

Place 121 (the square of 11) opposite 1: then opposite letter Λ is 95.03 rods, the answer.

36

To find the side of a Square equal in area to any given Circle.

RULE.—Place '886, found on the circular, opposite fig. 1: then opposite any diameter of a circle upon the fixed part, is the side of a square equal in area, on the circular.

Example.-What is the side of a square equal in area to a circle 4 feet in diameter?

Place '886 opposite fig. 1: then opposite 4 is 3:55 feet, the answer.

To find the side of the greatest Square that can be inscribed in any give 'rcle.

RULE.—Place '707, found on the circular, opposite fig. 1: then opposite any diameter of a circle (found on the fixed part,) is the side of its inscribed square.

Example.—What is the side of an inscribed square equal in area to a circle 45 rods in diameter ?

Place '707 opposite fig. 1: then opposite 45, on the fixed part, is 31.8 rods, the answer.

To find the length of one side of the greatest Cube that can be taken from a Globe of a given diameter.

RULE.—Place 577, found on the circular, opposite fig. 1: then opposite any diameter, on the fixed part, is the length of one side of the greatest cube.

Example. What is the length of the side of the greatest cube that can be taken from a globe 82 inches in diameter ?

Place 577 (the gauge point for the side of an inscribed cube) opposite fig. 1: then opposite S2, on the fixed part, is 47.3 (4773) inches, the answer.

To find the length of the side of the greatest equilateral triangle that can be inscribed in a given circle.

RULE .- Place S7, found on the circular, opposite fig. 1: then opposite any diameter on the fixed part, is the length of the side of an inscribed triangle And opposite the length of the side of any triangle on the circular, is the diameter required to inscribe it in.

Example .- What is the length of one side of the greatest equilateral triangle that can be inscribed in a circle 62 inches in diameter?

Place S7 opposite fig. 1: then opposite 62, on the tixed part, is 54 inches, the answer.

What is the least diameter of a circle in which a triangle may be inscribed whose side is 6.5 inches (61)?

Place S7 opposite fig. 1 : then opposite 6.5, on the circular, is 7.48 (748 (748) inches, the answer.

38

To find the length of the side of the greatest figure that can be inscribed in a given circle.

	Ru	LE for	a	
Pentagon	(5 :	ides)	Place	589.
Hexagon	6	44	66	5.
Heptagon	7		66	437.
Octagon	8	**	**	3.83
Nonagon	9	**	66	337
Decagon	10	**	**	31
Undecagon	11	44	64	282
Dadecagon	12	55		26

opposite fig. 1: then opposite any given diameter on the fixed part, is the length of the side of the greatest figure that can be inscribed in it.

Example 1 .- What is the length of one side of the greatest pentagon, or five-sided figure, that can be inscribed in a circle whose diameter is 51 inches ? Place 589 opposite 1: then opposite 51, on the fixed part, is 30 inches, the answer.

Example 2 .- What is the length of one side of the greatest nonagon (nine-sided figure) that can be inscribed in a circle S2 feet in diameter ?

Place 337 opposite fig. 1: then opposite 82, found on the fixed part, is 27.6 (27 10) feet, the answer.

Example 3 .- What is the least diameter of a circle

in which may be inscribed an undecagon (elevensided figure.) one side of which is 13 inches long? Place 282 opposite fig. 1: then opposite 13 inches,

found on the circular, is 46.1 inches, the answer.

To find the greatest diameter of each of three equal circles that can be inscribed within a circle of a given diameter.

RULE .- Place, 464 opposite fig. 1 : then opposite any diameter on the fixed part, is the diameter of one of the three inscribed circles.

Example .- What is the greatest diameter of each of three circles, that can be inscribed within a circle 25 inches in diameter ?

Place 464 opposite fig. 1: then opposite 25 on the fixed part, is 11.6 inches, the answer.

To find the greatest diameter of four equal circles that can be inscribed within another circle of a given diameter.

RULE .- Place 416 opposite fig. 1: then opposite any given diameter on the fixed part, is the diameter of each of the four inscribed circles.

Example .- What is the greatest diameter of each of four equal circles that can be inscribed in another circle 22 inches in diameter ?

Place 416 opposite fig. 1: then opposite 22, on the fixed part, is $9.15 (9_{100}^{15})$ inches, the answer.

40

"o find the Solidity of a Cylinder, or to measure Round Timber.

RULE .- First find the area of the base by the rule for finding the area of a circle, place that area opposite 144, then opposite the length in feet, is the answer in feet and decimals of a foot.

Note .--- If the diameter be given in feet, place the area opposite 1, instead of placing it opposite 144.

Example .- What are the solid contents of a cylinder 5 inches in diameter, and 13 feet long?

Place 25 (the square of 5) opposite 1 : then oppo-site A is 1.965. Now place 1.965 opposite 144. then opposite 13 (the length) is 1.77 feet, the answer.

How many solid feet in a round log 15 inches in diameter, and 14 feet long?

Place 225 (the square of 15) opposite 1: then opposite A is 1.77 the area. Now place 1.77 opposite 144: then opposite 14 is 17.2 feet, the answer.

In a log 12 feet long, 14 inches diameter? Answer, 12.8 feet.

In a log 16 feet long, 11 inches in diameter? Answer, 10.5 feet.

In a log 7 inches diameter, 15 feet long ? Answer 4 180 feet.

Norg .--- If the diameter and length are both given in inches, place the square of the diameter opposite 1728 : then opposite the inches in length, is the answer in feet.

Note .- A cylinder that is 12 inches in diameter and 12 inches long, and a globe that is 12 inches in diameter, and a cone that is 12 inches high and 12 inches diameter at its base, bear a proportion to each other as 3, 2 and 1. Therefore if you place the contents of any cylinder on the circular opposite to 3 on the fixed part, then opposite 2 on the fixed part is the contents of an inscribed globe, and opposite fig. 1 is the contents of an inscribed cone.

To find how many Solid Feet a Round Stick of Timber will contain, when hewn Square.

RULE .--- Place double the square of half the diameter opposite 144: then opposite the length is the answer.

Example .--- In a log 28 feet long, 22 inches diameter, half the diameter is 11, the square of which is 121. This doubled, is 242. Now place 242 opposite 144: then opposite 28 (the length) is 47 + the answer.

To find how many feet of Boards can be sawn from a Log of given Diameter.

RULE -Find the solid contents of the log when

42

made square, then place 12 opposite the thickness of the board (including the saw-calf:) then opposite the solid contents is the answer in feet.

To find the Area of a Globe or Ball.

then opposite the circumference is the answer. Example .-- How many square inches of leather will cover a ball 31 inches in diameter ?

Place 31 opposite 1: then opposite D. is 11, the circumference. Opposite 11 is the area, 381 inches.

How many square feet on the surface of a globe 4 feet in diameter ?

Place 4 opposite 1: then opposite p. is 12:55 feet, the circumference. Opposite 12.55 is 50.4, the answer.

To find the Solid Contents of a Globe or Ball.

RULE .- First find its area by the preceding rules: then multiply its area by # of its diameter.

Example .- What are the solid contents of a ball 14 inches in diameter?

Place 14 opposite 1 : then opposite p. is 44 inches, the circumference. Opposite 44 is 617, the area. 1 of the diameter, is 2.331. Place this opposite 1 : then opposite 617 (the area) is 1437 inches, the solid contents.

What are the solid contents of a ball 5 inches in diameter ?

Place 5 opposite 1 : then opposite D. is 15.7 inches, the circumference. Also, opposite 15.7 inches is 78.4 inches, the area. t of 5 is 835. Place this opposite 1: then opposite 78.4 inches (the area) is 654 inches, the solid contents.

There is a ball 20 inches in circumference : what are its solid contents?

Place 20 opposite letter D. Opposite 20 is 127, the area. 1 of the diameter is 1.06. Place this opposite 1: then opposite 127 is 1350 inches, the solid contents.

To find the Area of an Ellipse.

RULE .--- Place the product of the transverse diameter multiplied by the conjugate diameter opposite 1: then opposite letter A is the answer.

Example .- What is the area of an ellipse whose transverse diameter is 12 inches, and conjugate diameter 10 inches?

10 × 12=120. Place 120 opposite 1: then opposite letter A is 94.25, the area.

44

GAUGING CASES.

To find the Mean Diameter of a Cask.

RULE .- Add 3 of the difference between the head and bung diameter to the head diameter. This reduces the cask to a cylinder. Then multiply the square of the mean diameter by the length. Place the product opposite 1: then opposite BG is the number of beer gallons, and under wo is the number of wine galions.

Example .- There is a cask whose head diameter is 25 inches, bung diameter 31 inches, and whose length is 36 inches: how many beer gallons and how many wine gallons does it contain ?

6 is the difference between 25 and 31. 3 of 6 is 4. This, added to 25, makes 29 inches, the mean diameter. The square of 29 is 841. Place this opposite 1: then opposite 36 is 302+. Place this last opposite 1: then opposite BG is 85 gallons, and opposite we is 103 gallons, the answer.

To find the Weight of an Iron Ball, from its Diameter.

RULE.-Place the cube of the diameter opposite 1 : then opposite 14 is the weight.

Example .- What is the weight of an iron ball 6.7 inches in diameter ?

45

6.7×6.7=45, and 45×6.7=301.5. Place 301.5 opposite 1: then opposite 14 is 42.29 pounds, the answer.

A ball 5.54 inches diameter ? Answer, 24 pounds nearly.

A ball 32 inches circumference?

Place 32 opposite D: then opposite 1 is the diameter. Now cube the diameter, and place that cube opposite 1: then opposite 14 is 148 pounds, the answer.

To find the Weight of a Leaden Ball from its Diameter or Circumference.

RULE .- Place the cube of the diameter opposite 1 : then opposite 21.5 is the weight.

A ball is 6.6 inches in diameter: what is its weight ?

Answer, 61.6 pounds.

A ball 5.3 inches in diameter?

Answer, 32 pounds nearly.

To find the Diameter of an Iron Ball from its Weight.

RULE .- Place the weight opposite 1: then opposite 7.11 is a product, the cube root of which is its diameter

46

What is the diameter of a 24 pound ball ? Answer, 5.54 inches.

To find the Diameter of a Leaden Ball from its Weight.

RULE .- Place 14 opposite 3: then opposite the weight is a product, the cube root of which is the answer.

A ball 8 pounds in weight is 3.34 inches in diameter.

47 Specific Gravity and Weight of Bodies.

Note.—The several sorts of wood are supposed to be dry. Also, as a cubic foot of water weighs just 1000 ounces, the numbers in this table express, not only the specific gravities of the several bodies, but also the weight of a cubic foot of each, in avoirdupois ounces; and there-fore the weight of any other quantity, or the quantity of any other weight, may be found, as in the next two proposi-tions

48

To find the Magnitude of any Body from its Weight.

RULE .- Place the weight of the material in ounces under its specific gravity : then opposite 1728 is its magnitude in cubic inches; and opposite 1 is the answer in cubic feet.

Example .- How many cubic inches of gunpowder are there in one pound weight, shaken close ?

Place 16 (the number of ounces in a pound) opposite 937 : then opposite 1728 is its content or magnitude, 291 inches.

How many cubic inches are there in 3 pounds of cast brass ?

Place 48 (the number of ounces in 3 pounds) opposite S000: then opposite 1728 is the answer, 103.5.

To find the Weight of a Body from its Magnitude.

RULE .- Place the contents of the body opposite 1728: then opposite its specific gravity is its weight in ounces.

How many ounces avoirdupois in 864 cubic inches of sand ?

Place 864 opposite 1728 : then opposite 1520 (the specific gravity of sand) is 760 ounces, the answer.

Measure, &c.

49

5.280 feet in a mile. 63,360 inches in a mile. 190,0S0 barley-corns in a mile. 32,000 ounces make one ton. 43,560 square feet in an acre. 4,840 square yards in an acre. 32 gills in one wine-gallon. 7.22 cubic inches in a gill. 28.875 cubic inches in a pint. 57.75 cubic inches in a quart. 2,150.4+ cubic inches in a bushel. 1-2444 cubic feet in a bushel. 3,600 seconds in an hour. S6,400 seconds in a day of twenty-four hours 31,557,600 seconds in a year. 1,728 cubic inches in a foot. 12S feet make one cord of wood.

5

Comparative Value and Weight of Different Kinds of Fire Wood, assuming as a standard the Shell Bark Hickory.

	Lbs, in a Cord.	Compar. Val.	R cts.
Shell-Bark Hickory	4469	100	7 46
Button Wood	2391	52	3 85
Maple	2668	54	4 00

TABLES OF SQUARES AND CUBES.

53

54

THE STEAM-ENGINE.

The power of the steam-engine is measured by that of the horse. A horse-power, as fixed by Watt, is equal to 33,000 lb. avoirdupois, raised one foot high per minute; and one day's work of a horse, is this power, acting through eight hours. The pressure of our atmosphere is reckoned as equal to that of thirty perpendicular inches of mercury; or 14.70lb. per square inch, or 11.55 lb. per circular inch.

To find the Horse's power of an Engine, according to the Rule given by Mr. Watt.

From the Diameter of the cylinder in inches, subtract 1, square the remainder, multiply the square by the velocity of the piston in feet per minute, and divide the product by 5640. The quotient will be the number required.

CONDENSING ENGINES.

Proportion of the Cylinder.—The best proportion is when the length is twice the diameter; because the cooling surface is then least, in proportion to the content of steam.

Proportion of the Air-Pump and Condenser.—In double condensing engines, these are made, by Boul ton and Watt's rule, each to measure one eighth the content of the cylinder. Velocity of the Piston to produce the best effect.—In engines working the steam expansively, 100 times the square root of the length of the stroke in feet, is the best velocity in feet per minute.

In engines not working expansively, 103 times the souare root of the length of the stroke in feet, is the best velocity in feet per minute.

To find the quantity of Water required for Steam and Injection.—Multiply the area of the cylinder in feet, by half the velocity in feet for single, and by the whole velocity in feet for double engines. Add 1-10th for cooling and waste; and this, divided by 1497 (at the common pressure on the valve of 2lb. per circular inch), wil give the quantity of water required for steam per minute.

The quantity of water for injection should be 24 times that required for steam.

The diameter of the injection-pipe should be 1-36th part of that of the cylinder.

The valves should be as large as practicable.

The boiler should be capable of evaporating abou 12 gallons per hour for each horse power.

NON-CONDENSING, OR HIGH PRESSURE ENGINES.

The length of the cylinder should be at least twice its diameter.

The velocity of the piston, in feet per minute, should be 103 times the square root of the length of the stroke

56

in feet; or 100 times, if the steam is worked expansively.

The area of the cylinder should be, to the area of the steam-passages, as 4800 is to the velocity of the piston, found as above.

Form and Direction of Steam-pipes.—Enlargements in steam-pipes succeeded by contractions, always retard the velocity of the steam—more or less according to the nature of the contraction—and the like effect is produced by bends and angles in the pipes. These should therefore be made as straight, and their internal surface as uniform and free from inequalities as may be practicable. The following proportions of velocity, from Mr. Tredgold, will exemplify this :—

The velocity of motion that would result

from the direct unretarded action of

the column of fluid which produces it,

being unity - - - 1000 or 8 The velocity through an aperture in a

thin plate by the same pressure is .625 or 5 Through a tube from two to three diame-

ters in length, projecting outwards .813 or 6.5

Through a tube of the same length, projecting inwards - - .681 or 5.45

Through a conical tube, or mouth-piece, of the form of the contracted vein .983 or 7.9

57

MARINE ENGINES.

The construction and arrangement of the Marine Steam Engine necessarily differ from that of the ordinary condensing Engine, on account of the peculiar form of the floating structure in which it is placed, and of the absence of that solid support which can be obtained for Engines on land. The importance of ef fecting economy of room and weight on board a steamvessel, has led to the adoption of various methods of communicating motion to the paddle wheels; and vertical, oscillating, and other varieties of Engine have been introduced, with more or less success; but the more general form is that of the beam or lever Engine, the position of the beam being reversed on being placed on each side of the bottom of the cylinder. The arrangement of the condenser, air-pump, &c., is also necessarily accommodated to the space in which the machinery is required to be fixed.

The following Dimensions are given by Mr. Russell, for the Cylinders of Marine Engines of various power:

For 10 horse power, 20 inches diameter, 2 ft. 0 in. stroke.

Economy of Steam-jackets.

The following Table presents the results of three experiments made in France to ascertain the economy of steam-jackets to the cylinders of Engines, in the consumption of fuel. In the 1st, the steam first entered the jacket round the cylinder, and passed from thence into the cylinder. In the 2nd, the steam entered the cylinder directly, without passing into the jacket. In the 3rd, the steam entered both the cylinder and jacket directly, by means of separate communications between them and the boiler. The result shows an increase in the consumption of fuel of nearly fivesevenths, in the second experiment, over that in the **first**.

Friction of Steam-engines.

The difference in loss of power by friction, between beam and direct action engines is found by experiment to be so trilling, as to be unnecessary to be taken into account in estimating their relative advantages. The amount of pressure upon the piston, expended in each kind of engine in overcoming friction appears, on an average, to be not more than about 1 lb. to the square inch, in well-constructed engines.

Steam-engines for Cotton and Paper Mills.

For Cotton Mills.—The best steam-engines for cotton-mills are the double-acting, working the steam expansively. The most advantageous mean pressure on the piston with low pressure steam is 51b per circutar inch, and each circular inch will suffice to drive three spindles of cotton yarn twist with the machinery.

For mule yarn, add 15 to the number of the yarn, and multiply the sum by 26; the product will be the number of spindles for each circular inch of piston.

Or, one horse-power will drive 100 spindles with cotton yarn, and machinery. And for mule yarn, add

60

15 to the number of the yarn, and multiply by 8; the product will be the number of spindles for each horse-power. One horse-power will work 12 power-looms, with the preparatory machinery.—Brunton.

For Paper Mills.—A beating machine requires about 7 horse-power. The new paper machines require from 2 to 2 1.2 horse-power ; 3 1.2 horse-power will prepare 1 ton old rope per week, working ten hours per lay.—Fenwick.

Steam-power required to drive various kinds of Ma. chinery.

A series of experiments instituted by Mr. Davison, at Messrs. Truman and Co.'s Brewery, to ascertain the power required to drive various kinds of machinery, gave the following results :

1st. That an engine which indicated 50 horses power wnen fully loaded, showed, after the load and the whole of the machinery were thrown off, 5 horses, or onetenth of the whole power.

2nd. 190 feet of horizontal, and 180 feet of upright shafting, with 34 bearings, whose superficial area was 3300 square inches, together with 11 pair of spur and bevel wheels, varying from 2 feet to 9 feet in diameter, required a power equal to 7.65 horses.

3rd. A set of three-throw pumps, 6 inches in diameter, pumping 120 barrels per hour, o a height of 165 feet,=4.7 horses.

By the usual mode of calculation (viz., 33,000 lbs. lifted one foot high per minute), it would appear that there was, in this case. friction to the extent of 13 per cent.

4th. A similar set of three-throw pumps, 6 inches in diameter, pumping 160 barrels per hour, to a height of 140 feet,=6.2 horses.

By the same mode of calculation as before, there was here friction to the amount of 15 per cent.

5th. A set of three-throw pumps, 5 inches in diameter, raising 80 barrels per hour, to a height of 54 feet .== 1 horse.

By calculation as before, the friction amounted to 12 1-2 per cent.

6th. A set of three-throw "starting" pumps, pumping 250 barrels of beer per hour, to a height of 48 feet, =4.87 horses.

By calculation as before, the friction amounted to 15 1.2 per cent.

7th. Two pair of iron rollers and an elevator, grinding and raising 40 quarters of malt per hour=8.5 horses.

Sth. An ale-mashing machine, made by Haigh, of Dublin ; mashing at the time, 100 quarters of malt,= 5.68 horses.

9th. Two porter-mashing machines, made by Moreland, mashing at the time, 250 quarters of malt,=10.8 horses.

62

10th. 95 feet of horizontal Archimedes screw, 15 inches diameter, and an elevator, conveying 40 quarters of malt per hour, to a height of 65 feet,=3.13 horses

Pressure and Density of Steam.

The following formula has been given by Mr. Wm. Pole for calculating the pressure and density of steam for engines working expansively, which is stated to produce a very near approximation to the truth; the mean error being only .0062 lb. per square inch :

Let P be the total pressure of the steam in lbs. per square inch, and V its relative volume, compared with that of its constituent water.

Then
$$P = \frac{24250}{V-65}$$
, or $V = \frac{24250}{P}$ flux 65.

64

This formula is applicable, with little risk of error, to engines working with from 5 lbs. to 65 lbs. per square inch. TABLE Of the Pressure on a square and circular Inch, respec-tively, excited by the elastic force of Steam at various degrees of Temperature with the Height of the col-

degrees of Temperature, with the Height of the col-umn of Mercury it will support.

65

To prevent Incrustation in boilers .- The introduction of potatoes and other vegetable substances will, in a great degree, prevent incrustation on the bottom and sides of a steam boiler, and animal substances, such as refuse skins, will accomplish it still more effectnally

Iron Cement for joining the Flanches of Iron Pipes, &c .- Take of Sal Ammoniac, 2 ounces; Flowers of Sulphur, 1 ounce; clean cast-iron Borings or Filings, 16 ounces : mix them well in a mortar, and keep them dry. When required for use, take one part of this powder, and twenty parts of clean iron borings or filings, mix them thoroughly in a mortar, make the mixture into a stiff paste with a little water, and apply it between the joints, and screw them together. A little fine grindstone sand added, improves the cement. A mixture of white paint with red lead, spread on canvas or woollen, and placed between the joints, is best adapted for joints that require to be often separated.

For Copper, a cement is used, composed of powdered quick lime, mixed to a proper consistence with serum of blood, or white of egg-and used immediate ly it is made.

THE MECHANICAL POWERS.

Power is compounded of the weight and expansive force of a moving body multiplied into its velocity.

The power of a body which weighs 40 lbs., and

66

moves with the velocity of 50 feet in a second, is the same as that of another body which weighs 80 lbs., and moves with the velocity of 25 feet in a second ; for the products of the respective weights and velocities are the same.

40 multiplied by 50-200 ; and 80 by 25-2000

Power cannot be increased by mechanical means.

Power is applied to mechanical purposes by the lever, wheel and axle, pulley, inclined plane, wedge, and the screw, which are the simple elements of all machines.

The whole theory of these elements consists simply, in causing the weight which is to be raised, to pass through a greater or a less space than the power which raises it; for, as power is compounded of the weight or mass of a moving body multiplied into its velocity, a weight passing through a certain space may be made to raise, through a less space, a weight heavier than itself.

Power is gained at the expense of space, by the lever, the wheel and axle, the pulley, the inclined plane, the wedge, and the screw.

LEVER.

Case 1 .- When the fulcrum of the lever is between the power and the weight.

RULE .- Divide the weight to be raised by the power to be applied ; the quotient will give the difference

of leverage necessary to support the weight in equilibrio. Hence, a small addition either of leverage or weight will cause the power to preponderate.

EXAMPLE 1.—A ball weighing 3 tons, is to be raised by 4 men, who can exert a force of 12 cwt., required the proportionate length of lever ?

$$3 \text{ tons} = 60 \text{ cwt.}; \text{ and} \frac{60}{-12} = 5.$$

In this example, the proportionate lengths of the lever to maintain the weight in equilibrio, are as 5 to 1. If, therefore, an additional pound be added to the power, the power side of the lever will preponderate, and the weight will be raised. But, although the ball is raised by a force of only one-fifth of its weight, no power is gained, for the weight passes through only one-fifth of the space. The products, therefore, arising from the multiplication of the respective weights and velocities are the same.

EXAMPLE 2.—A weight of 1 ton is to be raised with a lever 8 feet in length, by a man who can exert, for a short time, a force of rather more than 4 cwt.: required at what part of the lever the fulcrum must be placed ?

= 5; that is, the weight is to the power as 5 A cwt. [to 1: therefore,

20 cwt.

= 1 foot and a third from the weight.

68

EXAMPLE 3.—A weight of 40 pounds is placed one foot from the fulcrum of a lever; required the power to raise the same when the length of the lever on the other side of the fulcrum is five feet?

Ans

$$\frac{40 \text{ multiplied by 1}}{5} = 8 \text{ lbs.},$$

Case 2.—When the fulcrum is at one extremity o, the lever, and the power at the other.

RULE.—As the distance between the power and the fulorum is to the distance between the weight and the fulorum, so is the effect to the power.

EXAMPLE 1.—Required the power necessary to raise 120 lbs., when the weight is placed six feet from the power, and two feet from the fulcrum?

As 8 : 2 :: 120 : 30 lbs., Ans.

EXAMPLE 2.—A beam, 20 feet in length, and supported at both ends, bears a weight of two tons at the distance of eight feet from one end: required the weight on each support?

40 cwt. multiplied by 8 ft.

20 feet == 16 cwt. on the suppor

40 multiplied by 12

furthest from the weight; and 20 feet cwt. on the support nearest to the weight.

WHEEL AND AXLE.

RULE.—As the radius of the wheel is to the radius of the axle, so is the effect to the power.

EXAMPLE.—A weight of 50 lbs. is exerted on the periphery of a wheel whose radius is 10 feet; required the weight raised at the extremity of a cord wound round the axle, the radius being 20 inches. 50 lbs. multiplied by 10 ft.; by 12 inches.

= 300 lbs. 20 inches. [Ans.

PULLEY.

RULE.—Divide the weight to be raised by twice the number of pulleys in the lower block; the quotient will give the power necessary to raise the weight.

EXAMPLE.—What power is required to raise 600 lbs., when the lower block contains six pulleys?

 $\frac{1}{6 \text{ multiplied by 2}} = 50 \text{ lbs., Ans.}$

600

INCLINED PLANE.

RULE.—As the length of the plane is to its height, so is the weight to the power.

70

EXAMPLE.—Required the power necessary to raise 540 lbs. up an inclined plane, five feet long and two feet high.

As 5: 2:: 540 : 216 lbs., Ans.

WEDGE.

Case 1.—When two bodies are forced from one another by means of a wedge, in a direction parallel to its back.

RULE.—As the length of the wedge is to half its back or head, so is the resistance to the power.

EXAMPLE.—The breadth of the back or head of the wedge being three inches, and the length of either of its inclined sides 10 inches, required the power necessary to separate two substances with a force of 150 lbs.

As 10 : 1 1-2 :: 150 : 22 1-2 lbs., Ans.

Case 2.- When only one of the bodies is moveable. RULE.- As the length of the wedge is to its back or head, so is the resistance to the power.

EXAMPLE.-The breadth, length, and force, the same as in the last example.

As 10 : 3 :: 150 : 45 lbs., Ans.

SCREW.

The screw is an inclined plane, and we may suppose it to be generated by wrapping a triangle, or an inclined plane, round the circumference of a cylinder.

The base of the triangle is the circumference of the cylinder; its height, the distance between two consecutive cords or threads; and the hypothenuse forms the spiral cord or inclined plane.

RULE.—To the square of the circumference of the screw, add the square of the distance between two threads; and extract the square root of the sum. This will give the length of the inclined plane; its height is the distance between two consecutive cords or threads.

When a winch or lever is applied to turn the screw, the power of the screw is as the circle described by the handle of the winch, or lever, to the interval or distance between the spirals.

Velocity is gained at the expense of power by the lever, and the wheel and axle.

LEVER. Case.—When the weight to be raised is at one end of the lever, the fulcrum at the other, and the power is applied between them.

RULE.—As the distance between the power and the fulcrum is to the length of the lever, so is the weight to the power.

EXAMPLE.—The length of the lever being eight feet, and the weight at its extremity 60 lbs., required the power to be applied six feet from the fulcrum to raise it?

As 6:8::60:80 lbs., Ans.

72
