BY THE AUTHOR.

INTRODUCTION.

WHEN we take a furvey of Mankind in general, and of the feveral requifites by which life is rendered comfortable and defirable, the productions of the Vegetable Kingdom are amongst the foremost; as affording the principal neceffaries, conveniencies, and luxuries of life.

It is in this view, that the Science of Botany, or that branch of natural Hiftory which teaches the right knowledge of Vegetables, and their application to the moft beneficial ufes, is an object which not only merits the attention and encouragement of every patriotic and liberal mind, but undoubtedly deferves a place amongft the first of useful pursuits. That it is an object highly deferving the attention of Mankind in general, cannot be denied; but in a particular manner of the inhabitants of this Commonwealth, the author wishes to make appear more obvious.

Thofe who are converfant in trade well know the continual enormous expence we are at in purchafing foreign Teas, Drugs, Dye-ftuffs, &c. The diminution of this, ought to be the care and concern of every friend to his Country's welfare. And we prefume it will appear evident, that the most eligible and obvious means means of obtaining this defirable object, will be by a proper attention and application to Horticulture and Botany. In this view, the following confiderations more particularly prefent themfelves.

I. The introduction and cultivation of foreign useful and valuable plants. Our extent of territory, our diversity of Climate, of Soil, and of Stuation, leaves not a doubt but that we might introduce and cultivate to advantage, many of the fame articles, whofe importation at this time, is to us, a confiderable expence. The Thea viridis & bohea, the true green and bohea Tea plant, formerly accounted different fpecies, but now known to be the fame, and one of the greatest drainers of our wealth; may be procured either from its native place of growth, or from Europe where it has become pretty common; and we have every reafon to believe, from its being the fpontaneous produce of the fame parallel of latitude, and from other confiderations refpecting its natural hiftory, that it might thrive well in our Southern States. In this fame view the Vine, the Almond Tree, Fig Tree, Liquorice, Madder and Rhubarb, defervedly require our attention. Many other* foreign useful plants might be enumerated, and the advantages that may be derived to this Commonwealth from their introduction, encrease and culture, must appear fufficiently obvious.

* See Transactions of the American Philosophical Society, Vol. I. Page 155. II. The discovering the qualities and uses of our own native Vegetable productions, and applying them to the most useful purposes. Our extent of luxuriant unexplored territory, is an object which here in a particular manner occurs replete with promising advantages. Our being able to discover a plant of equal general usage with the Potatoe, Tobacco, or Ginseng; or good fubstitutes for Tea, Coffee and Peruvian Bark; would be advantages surpassing all adequate estimation.

It is true, we may gain by tedious experience, or flumble by chance upon many ufeful difcoveries refpecting the uses and medicinal virtues of plants, but it is from our obfervations and refearches founded upon, and directed by, a knowledge of Botany, that we can alone hope for certain fuccefs. From the writings of the celebrated LINNÆUS this general rule is fufficiently eftablished; that plants of the fame habit and appearance, and those which agree in the difpolition of their flowers and fruit, have likewife fimilar virtues and properties. From this observation we deduce an obvious inference; that the more general knowledge we obtain of the characters and appearance of plants, the more likely we shall be also to encrease our knowledge of their vir-> tues, qualities and uses.

This fubject has been much urged and long dwelt upon from a conviction of its importance and promifing advantages: the author, influenced by these confiderations, and from a belief

a belief that it might contribute in some degree to render a knowledge of this fubject more familiar and eafy, has been induced to draw up this Alphabetical Catalogue of the Foreft Trees and Shrubs, natives of the American United States, as mentioned by the beft authors, or fince difcovered by ingenious travellers. In this Catalogue are contained their Linnæan Generic and trivial names, (or new formed ones where these have been wanting) together with their most common and approved English ones; the particular diffinguishing characters of each Genus; a plain and familiar defcription of the appearance, manner of growth, &c. of their feveral fpecies and varieties; and alfo, fome hints of their native foil and fituation, uses in Medicine, as Dyes and in domeftic æconomy.

As terms peculiar to the fcience frequently and unavoidably occur, it was judged neceffary, in order to render the work more ufeful and complete, to prefix a general explanation of the Linnæan fyftem of arrangement, as alfo of the ufeful and unavoidable fcientific terms; for this and other purpofes the author has availed himfelf from the beft writers, of what has been judged moft applicable and conducive to his defign. The whole forming an ufeful Vademecum Botanicum, or Botanical Companion.

In this my Countrymen are prefented at one view with a concife defcription of their own native Forest Trees and Shrubs, as far as hitherto discovered. And those whose fancy may may lead to this delightful fcience, may by a little application, from hence be enabled fcientifically to examine and arrange, not only thofe of the fhrubby, but the feveral and various fpecies of the herbaceous clafs. The *foreigner*, curious in American collections, will be hereby better enabled to make a felection fuitable to his own particular fancy. If he wifhes to cultivate timber for æconomical purpofes, he is here informed of our valuable Foreft Trees: if for adorning his plantation or garden of our different ornamental flowering fhrubs.

The author would have been happy, could he have given alfo a defcriptive Catalogue of our native herbaceous plants. At prefent, circumftances oblige him to confine himfelf to Foreft Trees and Shrubs; however he has fuch a work in contemplation fhould this meet with the encouragement of the public.

He is well aware that many improvements might have been made, with regard to the form and manner of defcription, as well as by the addition of Synonyms, Notes of reference, &c. but, upon reflecting that the generality of his Readers would have been more embarraffed and confufed than profited thereby, he was determined to ufe the moft plain and familiar method and language, in order to render the work as generally ufeful as poffible; this being the chief end and defign of the undertaking.

Ъ

A View

(ix)

A View of the Twenty-four Classes of the SEXUAL SYSTEM of LINNÆUS, with their Names and Characters; also the Number and Explanation of Orders contained in each.

Number Their Names and of the Characters. Classes.	Number of Orders in each.	Their Names, exp the Number of Parts or Styles.

Note, Palmæ, the Palms have, in late works, been added by way of appendix, and conftitutes the 25th clafs; but as thefe are not natives of thefe States, and their fructification but imperfectly known, they are omitted.

From the preceding View it appears, that the Names and Characters of the Twenty-four Claffes, are each founded on either the Number, Infertion, Equality, Connection, Situation, or Absence of the STAMINA OF MALE SEXUAL ORGANS.

On Number only, are founded the first eleven Classes, from Monandria to Dodecandria.

On Number and } Icofandria and Polyandria.

On Number and Bidynamia and Tetradynamia.

On Connection, Monadelphia, Diadelphia, Polyadelphia, and Syngenefia.

On Infertion only, Gynandria.

On Situation, Monoecia, Dioecia and Polygamia.

On Absence, Cryptogamia.

LOID OUT STOLEN OF STOLE

An Explanation of the different parts of Fructification.

F RUCTIFICATION is a temporary part of vegetables, appointed for the purpose of generation, terminating the old vegetable and beginning the new. The parts of fructification are the seven following, viz.

- 1. The Calyx, flower-cup, or empalement.
- 2. The Corolla, petals, or painted leaves of the flower.
- 3. The Stamina, threads, or chives.
- 4. The Pistilum, or pointal.
- 5. The Pericarpium, or Seed-veffel.
- 6. The Seeds.
- 7. The Receptacle, or base on which all the other parts of the fructification are connected.
- I. The calyx (which is the termination of the outer bark of the plant, prefenting itfelf in the fructification, in this form) comprehends the feven following fpecies, viz. the perianthium, the involucrum, the amentum, the fpadix, the gluma, the calyptra, and volva, of each of which in their order.
- 1. The perianthium, the flower-cup or empalement properly fo called, is the most common species of calyx, and situated close to the fructification. If it encloses the flamina and germen, it is called the perianthium of the fructification. If it encloses the Stamina and not the germen, it is the perianthium of the flower. If it includes the germem, and not the flamina, it is the perianthium of the fruit.
- 2. The involucrum or cover is fituated at the bottom of an umbel, at fome diffance from the flower. It is called an univerfal involucrum or cover, if it is fituated at the bottom of an univerfal umbel; and a partial involucrum or cover, if at the foot of a partial umbel.
- 3. The amentum or katkin is that fort of calyx, which confifts of a great number of chaffy fcales proceeding from a common receptacle or flender thread, as in hazel, alder, &c.
- 4. The *fpatha* or theath is a fort of calyx which burfts lengthways, and puts forth a ftalk fupporting the flowers; as in narciffus, fnow-drop, arum, indian turnep &c.
- 5. The gluma or chaffy hufk, is that fort of calve peculiar to graffes, composed of thin scales or valves, which are often terminated by an *arifta*, a beard, or awn.
- 6. The calyptra a veil or hood, is a fort of calyx peculiar to molles,

moffes, placed over their antheræ, and refembling a monk's cowl, or rather an extinguisher.

- The volva is a fort of calyx peculiar to the fungi or mufhroom tribe, involving or inclosing their fructification. It is membranaceous and torn quite round.
- II. The corolla, literally a wreath or garland, (ferving together with the calyx as covers to the parts they inclose) is the termination of the inner bark of the plant prefenting itfelf in this form, and confifts of the petalum and nectarium.
- 1. The petalum or petal is the corrollaceous covering of the flower. If the flower is monopetalous, *i. e.* confifts of one petal, the lower hollow part of fuch a corolla is called *tubus*, the tube, and the upper part which fpreads wider is called *limbus*, the limb or border. And from its different figure it is called either,

Bell-fbaped, without any tube below, Funnel-fbaped or conical, with a tube, Saucer or falver-fbaped, with a tube, Wheel-fbaped, without any tube below; or Gaping, lipped or mafked.

- If the corrolla be polypetalous, *i. e.* confifts of many petals, the lower part of each petal is called, the unguis, or claw. And the upper part which is wider, is called the *lamina*, or
 - thin plate.

Again this upper part or lamina, is either

Croff-fbaped, of four equal fpreading petals; or

- Butter-fly-shaped, irregular and of four petals; the upper one of which is called the *flandard*; the two fide ones wings; and the under one the keel.
- 2. The nectarium is that part of the corolla which contains the honey; having a wonderful variety both as to fhape and fituation, and is fometimes united with the petals, and fometimes feparate from them.
- III. The *flamina* are those parts of a flower appropriated to the preparation of the *pollen*, or fecundating dust, and confist of the *filamentum*, the *anthera*, and the *pollen*.
- 1. The filamentum, the filament or thread ferves to elevate the antheræ, and connect it to the flower.
- 2. The anthera, or fummit of the *flamen*, is that part which contains the *pollen* or fecundating duft, and difcharges it when ripe.
- 3. The pollen, or impregnating duft, is that fine powder contained within the antheræ, or tops of the flamina, and difperfed when ripe, upon the female.organ, for impregnating the fame.

IV. The

- IV. The piflillum, pointal, or female organ, adheres to the fruit, and is that part appropriated for the reception of the pollen, fpoken of above. It confifts of the germen, the ftylus, and the fligma.
- 1. The germen, or feed-bud, is the base or lower part of the *pistillum*, containing the rudiments of the unripe fruit, or feed, in the flowering state of the plant,
- 2. The ftylus, or ftyle, is that part of the pistillum which ftands upon the germen, and elevates the ftigma or fummit.
- 3. The *fligma*, the fummit, or top of the flyle, is that part which receives the fertilizing duft of the *antheræ*, and tranfmits its *effluvia*, through the flyle into the middle of the germen, or feed-bud.
- V. The pericarpium, or feed veffel, is that part which contains the feeds, and difcharges them when ripe. It comprehends the eight following fpecies, viz. the capfula, the filiqua, the legumen, the conceptaculum or folliculus, the drupa, the pomum, the bacca, and the ftrobilus; of each of which in their order.
- 1. The capfula, a capfule or little cafket, is a dry hollow feedveffel, that fplits or opens in fome determinate manner. Capfules, when opened or fplit, are divided outwardly into one or more pieces, called valvulæ, or valves, the parts which divide the capfules internally into cells are called diffepimenta, or partitions. And the fubftances which connect the partitions to the feeds, are called columellæ, or littlepillars. The empty fpaces for containing the feeds, are called loculamenta, or cells.
- 2. The filiqua, or pod is a feed-veffel with two valves, having the feeds fixed along the joining or edge of both valves.
- 3. The legumen, or cod, is a feed-veffel with two valves, having the feeds fixed along the edge of one of the valves only.
- 4. The conceptaculum, a receiver; or folliculus, a little bag, is a feed-veffel with one valve, fplitting length-ways from top to bottom, and has no feam for fastening the feeds within it.
- 5. The drupa, drupe, or ftone fruit, is a pulpy feed-vefiel, which has no valve, or external opening, and contains within it a ftone or nut.
- 6. The pomum, or apple, is a pulpy feed-veffel, which has no valve or external opening, and contains within it a capfule.
- 7. The bacca, or berry, is a pulpy feed veffel, which has no valve, and contains feeds which are naked, or have no other covering than the pulp.

8. The

- 8. The *firebilus*, or cone, is a feed-veffel compofed of woody fcales, laid over one another like tiles; it opens only at top, the fcales being fixed below to the center of the cone.
- VI. Semen, the feed, is a deciduous part of the plant, containing the rudiments of a new vegetable, and fertilized by the fprinkling of the male duft. Under this head are comprehended the feed properly fo called, the nut and propago. The nut is a feed covered with a hard bony fkin.
- Propago, the feed of the moffes, which has no tunic or covering.
- VII. The receptaculum, or receptacle, the feventh and laft part of the fructification on which the other fix are connected, comprehends the receptaculum proprium, the receptaculum commune, and the fpadix.
- 1. The receptaculum proprium, or proper receptacle, which belongs to the parts of a fingle fructification only. It is called the receptacle either of the *fructification*, when it is common to both flower and fruit; of the *flower*, when the parts of the flower only are fastened to it without the germen; of the *fruit* when it is a base for the fruit, and at a diflance from the receptacle of the flower; or of the *feeds*, when it is a base to which the feeds are fixed within the pericarpium or feed-veffel.
- 2. The receptaculum commune, or common receptacle, is that which connects feveral florets together; as in compound flowers; and is either paleaceum chaffy, *i. e.* with thin membranaceous chaffy plates rifing between the florets, or nudum naked, without chaffy plates.
- 3. The *fpadix* is the receptacle of the palms, and is always branched. It is alfo ufed to fignify the flower ftalk of every plant, which was originally contained within a *fpatha* or fheath; but in this laft cafe it is often fimple.

Explanation of the Modes of Flowering.

The peduncle or foot-stalk of the flower is a partial trunk, bearing the fructification only, but not the leaves.

- When branched or divided, each of the divisions is called *pedicellus*, or a little flower-flak.
- Flower-stalks are distinguished from the place of the plant where they grow, into,
- 1. The radical flower-ftalk, when they proceed immediately from the root.
- 2. The cauline flower-flak, which proceeds from the flem.

- 3. The branch peduncle, which proceeds from the branches.
- 4. The axillary, or bofom flower-flak, which comes out between the leaf and flem, or between the branch and flem.
- 5. The terminal flower-flak, which comes from the extremity of the branch or flem.
- 6. The folitary peduncle, when there is only one in the fame place.
- 7. The *fcattered* peduncles, when a great many grow together without any order.
- Flower-stalks are also diffinguished from the different modes in which flowers are borne and connected on them, into the uniflorous, biflorous, triflorous, or multiflorous peduncle, that is, which bear one, two, three, or many flowers.

Flowers are also collected or borne in the ten following modes.

- 1. The fasciculus, a bunch or bundle, when peduncles are erect, parallel, placed close to one another, and all of the fame height, as in *sweet-william*.
- 2. The capitulum, a little head, where many flowers are collected into a head, at the extremity of a peduncle, as in globe amaranthus.
- 3. The *fpike*, where the flowers fit close without foot-flaks, and are placed along a common flower-flak. A fpike is called *fecunda*, fingle ranked, when all the flowers are turned to one fide; or *diflicha*, double ranked, when the flowers look to both fides, or fland two ways.
- 4. The corymbus, where the leffer flower-ftalks of unequal lengths are produced along the common peduncle on all fides, and rife to the fame height, fo as to form a flat or even furface at top, as in *fpiræa opulifolia*.
- 5. The paniele where the fructifications are difperfed upon foot ftalks varioufly fubdivided, as in oats, &c. a paniele is faid to be diffuje when the partial foot ftalks diverge, and the fructifications hang loofe; or ftraight and narrow; when the foot-ftalks approach near to one another.
- 6. The thyr is a panicle contracted into an oval or eggfhaped-form, fomewhat refembling the cone of a pine; as in lilac, horfe chefnut, &c.
- 7. The racemus or clufter, confifts of a common peduncle, having fhort lateral branches, all nearly of equal length proceeding from it; as in the vine, currants &c. It is called racemus fecundus, or a one ranked clufter when all the foot-ftalks incline to one fide; as in the forrel-tree and most of our andromedas.

- 8. The verticillus, or whorl, where the flowers are produced in rings at each joint of the flem, with very flort footftalks; as in mint, horehound, &c.
- 9. The umbella or umbel, where a number of fmall flowerftalks rife from the fame center to an equal height and form an even furface at top. It is called a *fimple umbel*, when the flower-ftalks are fimple or undivided; and a *compound umbel*, or fometimes an *univer/al umbel*, when all the footftalks are fubdivided into fmaller umbels, commonly called *partial umbels*
- 10. The cyma, or irregular umbel, where the foot-ftalks rife from a common center, and to an equal height, as in the umbel; but the fecondary or partial foot-ftalks are irregularly difperfed, without order as in elder, viburnum &c.

The Reader is requested to observe that the names of the Species, under which the words, Bartram's Catalogue immediately occur, are not found in Linnæus's Species Plantarum, but are taken from a Sheet Catalogue published by John and William Bartram, Botanists in Kingsessing; containing the names of Forest Trees and Shrubs, growing in, or near their Garden.

TREES AND SHRUBS.

ACER.

THE MAPLE TREE.

Clafs 23, Order 1. Polyandria Monoecia. T hath Hermaphrodite and Male flowers upon the fame

In the Hermaphrodite,

The Empalement is of one leaf, five cleft, acute, coloured, plain and entire at the bafe, and permanent.

The Corolla confifts of five petals, which are ovate, broader outward, obtufe, fcarce larger than the calyx, and fpreading.

The Filaments are eight, awl-shaped and short. The Antheræ simple.

The Germen is compressed and funk in the Receptacle, which is large, convex and perforated. The Style is thread-form, encreasing in length. The Stigmas two, sharp-pointed, slender, and reflexed.

The Seed-veffels are two capfules joined at the bafe, roundifh, compreffed, and each terminating in a large membranaceous wing.

The Seeds are folitary and roundifh.

The Male are the fame in all parts except wanting the germen and ftyle.

Obj. The Afh-leaved Maple has male and female flowers on feparate trees.

The Species with us are,

1. ACER pennfylvanicum---Pennfylvanian Dwarf Mountain Maple.

This grows naturally upon the mountains in the back parts of Pennfylvania. The ftems are flender, rifing to the height of fix or eight feet, and fending off feveral oppofite branches. The leaves are threepointed, pretty much fawed on their edges, and placed oppofite upon pretty long footftalks. The flowers terminate the ftalks in a pretty long erect racemus or bunch; they are fmall, of an herbaceous colour, and in part fucceeded by fmall conjoined winged feeds.

2. ACER glaucum. The Silver-leaved Maple.

This tree grows frequently to the height of fifty or fixty feet, with many fpreading branches. The leaves are five-lobed, fomewhat toothed, or deeply and irregularly fawed on their edges: they are of a lucid green on the upper fide and a bright filver colour on their under. The flowers are produced in little umbels at the foot of the leaves; they are of a deep red colour, and are fucceeded by large winged feeds, which fall off early in the fummer. This is perhaps the Acer rubrum of Linnæus.

3. ACER Negundo. The Ash-leaved Maple.

This tree is dioecious, or having male and female flowers upon different trees; it is but of middling growth, rifing perhaps to the height of twenty or thirty feet. The leaves fomething refemble those of the Afh, but are generally trifoliate or quinquefoliate, or confisting of three or five lobes; which are oval, fomewhat pointed, and a little notched towards their extremities. The flowers of the male are produced upon upon pendulous bundles of very long fine threads or footftalks, each having a fmall flower-cup at its extremity, containing five or more ftamina. The female produces flowers at the extremity of the fmall branches, in long loofe bunches; they have long footftalks, with a fmall deciduous empalement; containing a comprefied germen, with fcarce any ftyle, but two reflexed ftigmas.

4. ACER canadenfe. American striped Maple.

This is but of middling growth. The bark, efpecially of the young fhoots, is beautifully variegated or ftriped. The leaves are divided into three very fharp pointed lobes, and very finely fawed on their edges. The flowers are produced in folitary bunches, with fhortifh footftalks; having pretty large petals and empalements, containing generally eight ftamina or filaments; and in hermaphrodite flowers two reflexed ftigmas. The flowers and feeds are of a greenifh yellow colour.

5. ACER rubrum. The Scarlet flowering Maple.

This grows to a pretty large fize in a rich foil. The leaves are three and fometimes nearly five lobed, and fawed on their edges. The flowers are produced in little umbels clofely furrounding the fmall branches, and are of a fearlet colour. The footftalks of the hermaphrodite flowers, fhoot out to a confiderable length; they are of a fearlet colour, each fuftaining two joined winged feeds, fomewhat of the fame colour. There is a variety of this with yellowifh flowers and feeds, which is, I believe, the moft common kind in Pennfylvania.

6. ACER

6. ACER faccharum. The Sugar Maple.

This grows to a large tree of two feet or more in diameter, and fifty or fixty feet high. The leaves fomething refemble the Silver-leaved Maple, but are not fo large, nor deeply lobed; or of fo fine a filver colour. It flowers in manner of the Scarlet Maple, but the flowers are of an herbaceous colour; and produces large joined winged feeds. The back inhabitants make a pretty good fugar, and in confiderable quantity, of the fap of this and the Silver-leaved Maple; and though thefe have generally been preferred, yet all our Maples yield a fap which affords a pretty good fugar.

ÆSCULUS.

THE HORSE-CHESNUT-TREE.

Class 7. Order 1. Heptandria Monogynia.

THE Empalement is of one leaf, tubulous, small and fivetoothed.

The Corolla confifts of five petals, roundifh, waved with a plaited margin, plane, fpreading, unequally coloured, and inferted by narrow claws into the calyx.

The Filaments are feven (fometimes eight) awl-fhaped, the length of the corolla, and declined. The Antheræ rifing.

The Germen is roundifh, ending in an awl-fhaped Style. The -Stigma fharp pointed.

The Seed-vellel a capfule, coriaceous, roundifh, three-cell'd and three valv'd.

The Seeds or nuts two, fomewhat globofe, often but one arriving to perfection.

1. ÆSCULUS octandra. New river Horfe Chefnut.

This often becomes a tree of pretty large fize. The branches are fmooth and of a greyish colour. The leaves are palmated, or composed of five pretty large large lobes joined at their bafe, having a pretty long common footftalk: they are fomewhat wedge fhape, or narrower towards the bafe than the point, veined with oblique parallel veins, and fawed on their edges. The flowers are produced in a loofe *thyrfus*, at the extremity of the branches, of a pale yellowifh colour; and are fucceeded by fruit near the fize of the eaftern Horfe-Chefnut.

2. ÆSCULUS Pavia. Scarlet flowering Horfe-Chefnut.

This is but of humble growth, feldom rifing to more than ten or twelve feet high; fending out feveral branches, with leaves and flowers much like the former, except the flowers being of a bright red colour: they ftand upon fhort naked footftalks, branching from the common ftem, generally five or fix together in each *thyrfus*. They are tubulous at bottom but fpread open at top, where the petals are irregular in fize and length, having fomething the appearance of a lip flower; they have feven or eight ftamina the length of the petals. When the flower fades the Germen fwells to a pear fhaped fruit, with a thick ruffet coloured covering, containing fometimes one or two nuts.

AMORPHA.

BASTARD-INDIGO.

Class 17. Order 3. Diadelphia Decandria.

THE Empalement is of one leaf, tubulous, cylindrical and top-fhaped: at the mouth creft, five-toothed, and obtufe: the two fuperior teeth largeft; permanent.

The Corolla is a fingle petal, inverse egg-fhape, concave, scarce larger than the calyx, erect, inferted in the calyx between the two largest upper teeth, and placed on the upper fide. The

- The Filament's are ten, very flightly joined at the bafe, erect, unequal in length, and longer than the corolla. The Antheræ are fimple.
- The Germen is roundifh. The Style awl-fhaped and the length of the Stamina. The Stigma is fimple.
- The Seed-veffel a Legumen or Pod, moon-fhaped, reflexed, larger than the calyx, compreffed, the top most reflexed, of one cell, and tubercled.

The Seeds are two, of an oblong kidney form.

Obf. This is fingularly diffinguishable from all the Papilionaceous tribe, in having only the vexillum or flandard, and wanting the wings and keel.

There appears to be but one Species of this Genus, viz.

AMORPHA fruticofa. Shrubby Bastard Indigo.

This grows naturally in Carolina, where it rifes with many irregular ftems, to the height of ten or twelve feet, with very long winged leaves, in fhape like those of the common Acacia. At the extremity of the fame year's fhoots, the flowers are produced in long flender fpikes, which are very fmall and of a deep purple colour. The flowers are fucceeded by moon-fhaped, reflexed, compressed pods, each containing two kidney-fhaped feeds.

ANDROMEDA.

ANDROMEDA.

Class 10. Order 1. Decandria Monogynia.

THE Empalement is five-parted, acute, very fmall, coloured, and permanent.

The Corolla confifts of one petal, bell-fhaped and five-cleft: the divisions reflexed.

The Filaments are ten, awl-fhaped, longer than and fcarcely affixed to the corolla. The Antheræ are two horned and nodding.

The Germen is roundifh. The Style cylindrical, longer than the Stamina and permanent. The Stigma is obtufe.

The Seed-veffel a capfule, roundifh, pentagonal, five-celled, five valved, and gaping at the angles.

The Seeds are many, roundifh and fhining. Obf. The Corolla in fome is ovate, in others perfectly bellfhaped.

The Species are, native with us,

I. ANDROMEDA arborea. The Sorrel Tree.

It grows naturally in Virginia, to about ten or twelve feet high. The flowers grow in long naked bunches, coming out from the fides of the branches, of an herbaceous colour, ranged on one fide of the common foot-ftalk: they are oval, pitcher-fhaped, and nodding; and are fucceeded by fmall capfules.

2. ANDROMEDA calyculata. Ever-green Dwarf Andromeda.

This is a low fhrub, growing on moffy land. The leaves are fhaped fomething like those of the Box tree, and are of the fame confistence, having many fmall punctures on them. The flowers grow in fhort racemi or bunches from the extremity of the branches, they are white and of a cylindrical pitcher-fhape.

3. ANDROMEDA paniculata. Panicled Andromeda.

This fhrub grows in boggy wet ground, rifing from two or three to fix or feven feet high, fending out feveral branches which are clothed with oblong leaves, a little notched and placed alternately. The flowers grow in long loofe panicled *racemi* or bunches, at the extremity of the branches; they are pitcher-fhaped, and fucceeded by fmall round feed-veffels, having five cells, filled with fmall round feeds. There is a variety of this of low growth, differing in having florter fhorter panicled bunches of flowers, and these coming out at the divisions, as well as at the extremities of the branches.

4. ANDROMEDA racemosa. Pennsylvanian Red-bud Andromeda.

This grows in low clayed lands, to the height of five or fix feet. The leaves are oblong and ferrated. The flowers are produced in a one fided *racemus* at the extremity of the branches, and refemble the other kinds. The long bunch of flower buds are of a beautiful red colour in the fpring, and thereby make a good appearance.

5. ANDROMEDA mariana. Maryland, or broadleaved Andromeda.

Is a fhrub of low growth, having but a fmall ftem, which is generally retroflected or bent from fide to fide. The leaves are egg-fhaped, entire, broad, and of pretty thick confiftence. The Seed-veffels are larger than the other kinds, gaping at their tops.

6. ANDROMEDA nitida. Ever-green shiningleaved Andromeda, or Carolinian Red-buds.

(Bartram's Catalogue.)

This fhrub grows naturally in Carolina and Florida, and may juftly be ranked among the most beautiful flowering.

The leaves are perennial, near three inches in length and one in breadth, of a hard and firm texture, lance-fhape, of a deep fhining, or gloffy green colour on both fides, placed by pretty long footftalks alternately upon each fide of the branches, but inclining clining to the upper fide, and standing nearly crect. The flowers are produced along the under fide of the branches, in long one rowed racemi or bunches, which as they arrive to their full growth change to a damask rose colour. The under parts of the bunches somewhat resemble the cells of a honey-comb, diffusing an agreeable fragrance, and affording a delicious harvest to the honey-bee.

7. ANDROMEDA plumata. Plumed Andromeda, or Carolinian Iron-wood Tree.

(Bartram's Catalogue.)

This is also a fouthern beautiful species of Andromeda; rising to the height of fifteen or twenty feet, and fending off towards the top, many spreading and nearly horizontal branches.

The leaves are fmall, lance-fhaped, and of a deep gloffy green, but changing in Autumn before they fall off, to yellow, red, purple, &c. giving the trees a beautiful appearance, even in their decline. The flowers are produced at the extremity of the branches, in one-rowed racemes or bunches, they are very fmall and perfectly white, fomewhat refembling a plume of delicate white feathers. This and the laft mentioned, grow naturally by the fides of ponds, and fwamps, in Carolina and Florida.

ANNONA.

PAPAW TREE, or CUSTARD APPLE.

Class 13. Order 7. Polyandria Polygynia.

THE Empalement is three leaved and finall: the leaves heartfhaped, concave, and fharp-pointed.

The Corolla is composed of fix petals, heart-shaped and seffile or squat: the three alternate interior lefs.

B

The Filaments fcarce any. The Antheræ are very numerous, fitting upon the fides of the Germen.

The Germen is fomewhat round, fitting upon a roundifh receptacle. The Styles none. The Stigmas obtufe.

The Seed-veffel a very large berry or fruit, of an oval or oblong fhape, covered with a fmooth rind, and of one cell.

The Seeds are feveral, hard, fhining, oblong, oval, (compreffed in fome fpecies) and placed in a circle.

The Species with us are,

I. ANNONA glabra. Carolinian Smooth-barked Annona.

The bark is fmooth, the leaves broad, oval, but narrowed towards the bafe. The fruit is large, yellow and fomewhat conical. This grows naturally in Carolina.

2. ANNONA triloba. Pennfylvanian Triplefruited Papaw.

This grows common in rich bottoms and by river fides, in Pennfylvania. It rifes to the height of ten, twelve, and fometimes twenty feet, with but few branches, garnifhed with pretty long large leaves, narrowed toward the bafe and fmooth on their edges. The flowers are folitary, and of a dark purple colour; they have flort footftalks, which with the flower-cup is covered with flort brown hairs or down. The fruit is often found growing two or three together, which ioon falls off, becomes very mellow and turns of a yellow colour.

ARALIA.

THE ANGELICA TREE.

Clafs 5. Order 5. Pentandria Pentagyina. A N Involucrum, which is very fmall, to the little globular umbels.

The Empalement is five-toothed, very finall, and above.

The Corolla confifts of five petals, which are ovate, acute, feffile and reflexed.

The Filaments are five, awl-fhaped, and the length of the corolla. The Antheræ are roundifh.

The Germen is roundifh and beneath. The Styles five, very flort, and permanent. The Stigmas fimple.

The Seed-veffel a berry, roundish, striated, crowned and fivecelled.

The Seeds are folitary, hard, and oblong.

The Species with us are,

ARALIA spinosa. Virginian Angelica Tree.

This rifes with a thick woody ftem to the height of ten or twelve feet, dividing into feveral branches, which are garnifhed with ramofe divaricated leaves, placed alternately. The flowers are produced in large, loofe, compound umbels, at the extremity of the branches: they are of an herbaceous colour, and are fucceeded by roundifh berries of a purplifh colour when ripe. The ftem, branches, and footftalks of the leaves are armed with fhort ftrong fpines.

ARBUTUS.

THE STRAWBERRY TREE, OR BEAR-BERRY.

Class 10. Order 1. Decandria Monogynia.

THE Empalement is five parted, obtuse, very small and permanent.

The Corolla is one petalled, ovate, planish at the base; the border is five cleft; the divisions obtuse, revolute and small.

The Filaments are ten, awl-bellied, very flender at the bafe, half the length of the corolla, and affixed by the margin to its bafe. The Antheræ are flightly two cleft and nodding. The Germen is fomewhat globofe, fitting upon a receptacle marked with ten points. The Style is cylindrical and the length of the corolla. The Stigma is thickifh and obtufe. The Seed-veffel is a berry, roundifh and five celled. The Seeds are fmall and bony.

The Species with us are,

ARBUTUS Uva urfi. The Bear-berry.

This grows naturally in the Jerfeys. It is a low trailing fhrub, dividing into many branches, clofely fet with fmooth, thick, entire leaves, of an oval form. The flowers are produced in fmall bunches, near the ends of the branches, and are fucceeded by red berries. This has been ufed with great fuccefs in many calculous complaints.

ARISTOLOCHIA.

BIRTHWORT.

Class 20. Order 5. Gynandria Hexagynia.

THE Empalement is wanting.

The Corolla is of one petal, tubulous and irregular: the base bellied, fomewhat globular and protuberant: the tube oblong, fix cornered cylindrical: the border dilated and extended beneath in a long tongue.

The Filaments are wanting. The Antheræ are fix adjoined under the Stigmas, and four celled.

The Germen is oblong bencath and angled. The Style fcarce any. The Stigma fomewhat globular, fix parted, and concave.

The Seed-veffel is a capfule, which is large, hexagonal and fix celled.

The Seeds are many, depressed and incumbent.

Obf. The Seed-veffel varies in figure; in some species it is roundish, in others oblong.

The Species growing shrubby, with us, is one, viz.

ARISTOLOCHIA frutescens. Pennsylvanian Shrubby Birthwort.

This grows naturally near Pittfburg, in a rich foil and fhaded fituation; rifing with fhrubby cylindrical cal ftems, which twine round any neighbouring fupport, and reach fometimes to the height of thirty feet or more, fending off many long twining branches. The leaves are large, entire, and heartshaped, of eight inches or more in length, and as much in breadth, ftanding upon thick ftrong footstalks. The flowers come out fingly, or fometimes two together upon pretty long foot-stalks, which are either terminal, or arife beneath the divisions of the branches, each having a bractea or floral leaf embracing it near its bafe; they confift of a long tube which is very crooked and bellied towards the bafe, but narrower towards the extremity, and furnished with a border which at first appears three lobed and triangular (in form of a cock'd hat,) but after becomes fpreading, plain and roundifh, and together with the interior extremity of the tube, is finely variegated with fpots or streaks. The Capfules or Seed-veffels are cylindrical fix-fided, of three or four inches in length and near one in diameter, opening with fix fiffures, and having fix cells, filled with heart-fhaped compreffed feeds, with a falfe one between each. This from its twining stems and large leaves affords a fine fhady covering for an arbour.

The roots have an aromatic penetrating favour, and are fuppofed to be equal in medical virtues to the fmall Virginian Snake-root.

ASCYRUM.

ST. PETER'S WORT

Clafs 18. Order 3. Polyadelphia Polyandria. THE Empalement is of four leaves; the exterior opposite are very fmall and linear; the interior heart-fhaped, plane, large, and erect, and all permanent.

The

The Corolla is of four petals, ovate: the exterior opposite largest, the interior lefs.

The Filaments are numerous, briftly, flightly joined at the base into four parts. The Antheræ are roundish.

The Germen is oblong. The Style fcarce any. The Stigma fimple.

The Seed-veffel a Capfule, oblong, fharp pointed, and enclosed by the larger leaves of the empalement.

The Seeds are numerous, fmall and roundifh.

BOLT ICAL EIN.

The Species are,

I. ASCYRUM Hypericoides. St. Peter's Wort.

This is a fmall fhrubby plant, growing naturally in low moift ground, and rifing with a few flender ftems to the height of about eighteen inches, having fmall oppofite branches, which are fomewhat flatted. The leaves are fmall, oblong, fomewhat wedge-fhape, placed oppofite, and fitting clofe. The flowers are fparingly produced at the tops of the ftalks, and have fomewhat the appearance of those of St. John's wort.

2. ASCYRUM villofum. Villofe St. Peter's wort.

This rifes to the height of about three feet, with erect ftalks. The leaves are oblong and hairy. The flowers are produced at the tops of the ftalks, refembling those of St. John's wort, but have only four petals.

AZALEA.

UPRIGHT HONEY-SUCKLE.

Clafs 5. Order 1. Pentandria Monogynia. THE Empalement is five parted, erect, acute, fmall, coloured and permanent.

The

The Corolla is monopetalous, bell-fhaped, and half five-cleft: the fide divisions inflexed.

The Filaments are five, filiform, free, unequal in length, and inferted in the receptacle. The Anthera are fimple.

The Germen is roundifh. The Style filiform, the length of the corolla and permanent. The Stigma is obtufe.

The Seed-veffel is a Capfule, roundish, five cell'd, and five valv'd.

The Seeds are feveral, roundifh.

Obf. The figure of the petal in fome Species is funnel form, in others bell-fhaped; the ftamina in fome are also very long and declined.

The Species with us, are,

I. AZALEA nudiflora. Red-flowered Azalea.

This grows molt common upon a moift, clayey, gravelly foil, rifing from two or three, to five or fix feet in height. The leaves are produced in clufters at the extremity of the branches; they are oblong, inverfe, egg-fhaped, and a little hairy upon their edges and midribs underneath. The flowers are produced early in the fpring before the leaves are expanded, in heads or clufters at the ends of the ftalks and chief branches, of a red colour, and hairy, with very long red ftamina. There is great variety in the colour of the flowers, from red to almoft white.

2. AZALEA viscosa. White Sweet Azalea.

This grows naturally in rich rocky places, near ftreams of water; rifing to the height of five or fix feet. The leaves are much fmaller and of a paler green colour than those of the red flowered, otherwise resembling them. The flowers are produced after the leaves are fully expanded, (about harvest time;) they are white, hairy and clammy, and have the fragrance of the honey-fuckle.

3. AZALEA

3. AZALEA viscofa palustris. Swamp Azalea.

This is a variety of the white kind, growing naturally in wet low ground. It is of lower growth, with leaves rough and clammy at their first appearance. The flowers are white, but not fo fweet as the former. There is alfo fome other varieties differing fomewhat in the difposition or appearance of their flowers, &c.

BACCHARIS.

PLOWMAN'S SPIKENARD.

Clafs 19. Order 2. Syngenefia Polygamia Superflua.

THE Common Calyx is cylindrical, and imbricated: the Scales linear and acute.

The Compound Corolla, is equal with Florets Hermaphrodite and Female mixed.

The Filaments of the hermaphrodite are five, capillary and very fmall. The Antheræ cylindrical and tubulous.

The Germen of the hermaphrodite is ovate. The Style filiform and the length of the flower. The Stigma is bifid or two cleft.

Of the female very like the hermaphrodite.

The Seed-veffel none, but the calyx changed.

The Seeds of the hermaphrodite and female much alike, folitary, very fhort, and oblong. The Pappus fimple.

The Receptacle is naked.

The Species are,

BACCHARIS halimifolia. Virginian Groundsel Tree.

It rifes to the height of fix or eight feet, fending out many erect branches, garnished with leaves which which are fomewhat ovate, and a little toothed above, continuing green most of the year. The flowers are produced at the extremity of the branches, and are of a yellowish white colour.

BERBERIS.

The BARBERRY-BUSH.

Class 6. Order 1. Hexandria Monogynia.

THE Empalement is fix leaved and fpreading; the leaves ovate, narrower at the bafe, concave, the alternate lefs, coloured, and deciduous.

The Corolla is of fix petals, which are roundifh, concave, fomewhat fpreading, and fcarce larger than the calyx.

A Nettarium of two corpufies, roundifh, coloured and affixed to the bafe of each petal.

The Filaments are fix, erect, compressed and obtuse. Two Antheræ are joined to the top of each filament.

The Germen is cylindrical and the length of the flamina. The Style is wanting. The Stigma is orbiculate, broader than the germen, and furrounded by an acute margin.

The Seed-veffel is a berry, which is cylindrical, obtufe and of one cell.

The Seeds are two, oblong, cylindrical and obtufe.

The Species are,

BERBERRIS canadiensis. The Canadian Barberry.

This grows naturally in Canada, and fomewhat refembles the European Barberry, except the leaves being much fhorter and broader, and the fruit, when ripe, of a black colour. There is alfo a kind of Barberry growing upon New-River in Virginia, bearing red berries, of which I have feen one fmall plant.

(18)

BETULA.

The BIRCH-TREE.

Clafs 21. Order 4. Monoecia Tetrandria.

"THE Male flowers are difpofed in a cylindrical Katkin.

The Calyx, is a common Katkin, imbricated on all fides, loofe and cylindrical; composed of triflorous Scales, to each of which, two very minute scales are placed at the fides.

The Compound Corolla confifts of three florets, equal, and affixed to the difk of each fcale of the Katkin.

The Proper is monopetalous, four-parted, fpreading, and fmall: the divisions obtufe and egg-fhaped.

The Filaments are four, very fmall. The Antheræ are twin. * The Female flowers are difpofed in Katkins on the fame plant. The Calyx is a common Katkin, imbricated: with three fcales every where oppofed, affixed to the rachis, heart fhaped with a point, biflorous, a little divided by a pointed body in the bofom towards the top, concave, and fhort.

The Corolla none manifest.

The Germen proper, is ovate, very imall. The Styles are two, briftly, and the length of the fcales. The Stigmas fimple.

The Seed-veffel none. The Katkin embracing the feeds of two florets under each fcale.

The Seeds are folitary and ovate.

The Species with us are,

1. BETULA nigra. Black, or Sweet-Birch.

This becomes a large tree, often rifing to the height of fifty or fixty feet, and fending off many branches. The leaves are egg-fhaped and doubly or irregularly ferrated, the fmall ferratures are clofe, the larger more remote; their footftalks are villofe. The fmall branches are alfo covered with down. The natives often make their canoes of the bark of this tree.

2. BETULA

2. BETULA lenta. Red Birch.

This grows to a pretty large fize, fpreading into many flender pliable branches. The leaves are fmooth, heart-fhaped, oblong, fharp-pointed, and finely and flightly fawed on their edges.

3. BETULA papyrifera. White Paper Birch.

This is a variety of the laft, growing to a middling fize and pretty much refembling it, except in having a very white fmooth bark.

4. BETULA populifolia. Aspen-leaved Birch.

This is alfo a variety of the fecond, and grows naturally in the Jerfeys, and other eaftern ftates, becoming a pretty tall tree, and covered with a white bark. The leaves are fomewhat triangular, like those of the Aspen tree, but terminating in a long acute point; they are doubly ferrated, standing upon long slender footstalks, and are put in motion by the slightest breeze of wind.

5. BETULA humilis. Dwarf Birch.

This is also a variety of the fecond kind, of a low and dwarfish growth.

BETULA-ALNUS.

The ALDER TREE.

THE Characters are the fame of the Betula, except the Seed-veffel being a roundifh cone.

The Species are,

I. BETULA

I. BETULA-ALNUS glauca. Silver-leaved Alder.

(20)

This grows naturally in low marfhy ground, and frequently rifes to the height of ten or twelve feet.

2. BETULA-ALNUS maritima. Sea-fide Alder.

This grows to the height of the former. The leaves are long and narrow. The katkins are generally in bloom in August, at which time the female cone or feed-vessel fets, but don't grow to perfection till the next summer.

3. BETULA-ALNUS rubra. Common Alder.

This grows very common in most parts of Pennfylvania. The leaves are broader than the other kinds, and rough or wrinkled. This flowers in the fpring, and perfects its feeds in the fall.

BIGNONIA.

The TRUMPET FLOWER.

Clafs 14. Order 1. Didynamia Angiospermia.

THE Empalement is of one leaf, crect, cup form, and fivecleft.

- The Corolla is monopetalous, and bell-fhaped. The tube very fmall and the length of the calyx. The chaps very long, bellied underneath, and of an oblong bell-fhape. The border is five parted; the two fuperior divisions reflexed; the inferior fpreading.
- The Filaments are four, awl-fhaped and thorter than the corolla, of which two are longer than the reft. The Antheræ are reflexed, oblong, and as if doubled.

The Germen is oblong. The Style thread-form, of the fituation and fhape of the stamina. The Stigma is headed.

The

The Seed-veffel is a filiqua or pod, of two cells and two valves. The Seeds are pretty many, imbricated, compreffed, and having a membranaceous wing.

Obf. The Catalpa delights in only two perfect flamina, and three imperfect rudiments, with a pentaphyllous calyx.

The Species are,

I. BIGNONIA Catalpa. The Catalpa-Tres.

This rifes to the height of twelve or fifteen feet, with a ftrong ftem, dividing into feveral branches, which are garnifhed with large heart-fhaped leaves, placed oppofite at each joint. The flowers are produced in large branching panicles, at the ends of the branches; of a dirty white colour, with a few purple fpots, and faint ftripes of yellow on the infide; and waved on their edges: they are fucceeded by very long flender pods, filled with flat winged feeds, lying over each other like the fcales of a fifh.

2. BIGNONIA crucigera. Cross-vine.

This rifes with flender trailing ftalks, which muft be fupported, fo require the affiftance of a wall, and a good afpect; being impatient of much cold. The branches are clothed with oblong leaves remaining green all the year. The flowers are produced at the wings of the leaves, fhaped much like those of the Fox-glove; and are of a yellow colour.

3. BIGNONIA radicans. Climing Trumpet-Flower.

This kind, when old, hath large rough ftems, which fend out many trailing branches, putting out roots at their joints, thereby attaching themfelves to any neighbouring fupport, and rifing fometimes to the the height of forty or fifty feet. The branches are garnifhed with winged leaves placed oppofite, which are generally composed of four pair of fmall leaves, terminated by an odd one. The flowers are produced at the ends of the floots of the fame year, in large bunches; they have long fwelling tubes, flaped fomewhat like a trumpet, and are of an orange colour, inclining to red; and fucceeded by large pods full of winged feeds.

4. BIGNONIA sempervirens. Ever-green Bignonia, or Yellow Jasmine.

This kind refembles the fecond fo much as to require no further defcription.

CALLICARPA.

CALLICARPA.

Class 4. Order 1. Tetrandria Monogynia.

THE Empalement is of one leaf, bell-fhaped: at the mouth four-parted and erect.

The Corolla is of one petal, tubulous: The border four-cleft, obtufe and fpreading.

The Filaments are four, thread-form, twice the length of the corolla. The Antheræ ovate and incumbent.

The Germen is roundifh. The Style thread form, thicker above. The Stigma thickifh and obtufe.

The Seed-veffel is a berry, globofe and fmooth.

The Seeds are four, fmall, callous, oval, compreffed, fomewhat convex on one fide, but a little hallowed as if eaten on the other.

There is but one Species of this Genus, viz.

CALLICARPA americana. Carolinian Shrubby Callicarpa.

This fhrub rifes from three to five feet high, with but flender stems, fending out many branches from the the fides, which are wooly or downy when young, garnifhed with oval, fpear-fhaped leaves, placed oppofite on pretty long footftalks. The flowers come out in whorls round the ftalks, fitting very clofe; they are fmall and tubulous, cut into four obtufe fegments at the top, which expand and are of a deep purple colour; thefe are fucceeded by foft fucculent berries, which are of a deep purple colour when full ripe, each enclofing four hard feeds. This is a native of Carolina and will not endure much cold.

CALYCANTHUS.

CAROLINIAN ALLSPICE.

Class 12. Order 5. Icofandria Polygynia.

- THE Calyx is of one leaf, thickened, fquarrofe, fomewhat top-fhaped, truncated, almost closed above; and permanent.
- The Corolla is composed of many leaves, which are oblong, coloured, of thick and flefhy confistence, longer than the calyx, fomewhat foreading, but chiefly lightly incurved their whole length; inferted in the truncated margin of the calyx, disposed in feveral feries or rows circularly, of unequal length and deciduous.
- The Filaments are many, fhort, awl-fhaped and inferted in the top of the calyx; the exterior of which, have oblong furrowed Antheræ adjoined to their apex; the interior barren and clofing the calyx.
- The Germen are many, oblong, villofe, and hid within the calyx. The Styles many, joined in a medullary column and protruding in the center of the barren filaments, which ferve for its defence.
- The Seed-veffel none but the calyx, thickened, much enlarged, berry'd, and fomewhat inverse egg-fhaped.
- The Seeds are many, oval, fomewhat villofe, and furrounded longitudinally with a future.

We have but one Species of this Genus, viz.

CALYCANTHUS

CALYCANTHUS floridus. Carolinian Allspice.

This delightful fweet-scented shrub, grows naturally in Carolina, and rifes from four to fix or eight feet high, fending out many fmall branches, which are placed oppofite and garnished with oval entire leaves; which are likewife oppofite. The flowers are produced fingly, at the extremities of the fame year's shoots; they are of a fullen or dark purple colour, and when fomewhat expanded, diffufe to a confiderable distance, a very agreeable scent, scarcely distinguishable from that of ripe strawberries. It flowers in May, and by fucceffion till almost harvest. The flowers are fucceeded by large, fomewhat oval, rough, fwelling capfules, of two inches or more in length, and one in diameter, containing many oval brown feeds. meht barratet i iteri anor io ar antal

CARPINUS.

The HORNBEAM-TREE.

Clafs 21. Order 8. Monoecia Polyandria.

* THE Male Flowers are disposed in a cylindrical Katkin.

The Calyx is a common Katkin loofely imbricated on all fides: composed of fcales which are uniflorous, ovate, concave, acute, and ciliated.

The Corolla is none.

- The Filaments are for the most part ten, very small. The Anthere are twin, compressed, villose at the apex, and two valved.
- * The Female Flowers are difposed in a long Katkin, on the fame plant.

The Calyx is a common Katkin loofely imbricated, confifting of Scales which are lance-fhaped, villofe, reflexed at the apex, and one flowered.

The Corolla is cup-form, of one loaf, fix cleft, with two divifions larger.

The

The Germen are two, very fhort, each having two Styles, which are long, capillary and coloured. The Stigmas are fimple.

The Seed-veffel none. The Katkin being enlarged and containing a feed at the bafe of each fcale.

The Seed is a nut, ovate and angled.

Obf. The feeds of the Carpinus Betulus are contained within the bafe of the concave calycine fcale: but of the Offrya within the inflated fcale.

The Species are, with us,

1. CARPINUS Betulus virginiana. American Hornbeam.

This grows common by most of our river and creek fides, rifing with a ftrong, woody, fomewhat angular stem, to the height of ten or fisteen feet; spreading into many branches, with oval, pointed leaves, fawed on their edges. The flowers are produced at the ends of the young shoots, in loose, leastly katkins, and are succeeded by small, hard, angular feeds.

2. CARPINUS Oftrya. The Hop-Hornbeam.

This tree often grows larger and more upright than the former, the wood is tougher, the branches fewer and more erect. The leaves fomewhat refemble those of the Elm. The male katkins are produced at the extremity of the branches, they are fet the preceding fall, and remain all winter. The female flowers are produced in inflated chaffy katkins, much refembling a hop, from whence it acquired its name. There is a variety of this called the Virginian flowering Hop-Hornbeam, which I have not feen.

CASSINE.

CASSINE.

CASSINE, or SOUTH-SEA TEA-TREE.

Clafs 5. Order 3. Pentandria Trigynia.

THE Empalement is five-parted, beneath, very fmall, obtufe, and permanent.

The Corolla is five-parted and fpreading; the divisions are fomewhat ovate, obtufe, and larger than the calyx.

The Filaments are five, awl-fhaped and fpreading. The Anthera are fimple.

The Germen is above and conical. The Style none. The Stigmas three, reflexed and obtufe.

The Seed-ve[sel is a berry, roundifh, three-cell'd and umbilicated with the Stigmas.

The Seeds are folitary and fomewhat ovate.

The Species are,

CASSINE Paragua. Ever-green Cassine, Yapon, or South-Sea Tea-tree.

This grows naturally in Carolina and fome parts of Virginia, but chiefly near the fea; and rifes to the height of ten or twelve feet, fending out branches from the ground upward, garnifhed with Ever-green fpear-fhaped leaves, placed alternately: they are of a deep green colour, of a thick confiftence and a little notched on their edges. The flowers are produced in clofe whorls, round the branches, at the footftalks of the leaves; they are white, and are fucceeded by red berries, with three cells, each containing a fingle feed.

CEANOTHUS.

(26)

(27)

CEANOTHUS.

The NEW-JERSEY TEA-TREE.

Class 5. Order 1. Pentandria Monogynia.

THE Empalement is of one leaf, top-fhaped: the border is five-parted, acute, and incurved; and permanent.

The Corolla is composed of five petals, equal, roundifh, hookfacked, compressed, very obtuse, spreading, less than the calyx, with claws the length of the petal, rising from the incisions of the calyx.

The Filaments are five, awl-shaped, ere&, opposite to the petals, and longer than the corolla. The Antheræ are roundish.

The Germen is three cornered. The Style is cylindrical, half three-cleft, and the length of the Stamina. The Stigma obtufe.

The Seed-veffel is a berry, which is dry, three fruited, threecell'd, obtufe, and fet with tubercles.

The Seeds are folitary and ovate.

The Species with us, but one, viz.

CEANOTHUS americanus. American Ceanothus, or New-Jersey Tea-tree.

This is a low fhrub, growing common in moft parts of North America; feldom rifing above four or five feet high, and fending out branches on every fide from the ground upward, which are garnifhed with oval, pointed leaves, having three longitudinal veins, running from the foot-ftalk to the point, diverging from each other in the middle; they are placed oppofite, and are of a light green colour. The flowers are produced at the extremity of the fhoots, in a clofe kind of *Thyrfus*; they are of a white colour and when in bloom make a fine appearance. A decoction of the roots of this fhrub is efteemed a certain cure, not only in flight Gonorrhæa's,

CELASTRUS.

The STAFF-TREE.

Class 5. Order 1. Pentandria Monogynia.

THE Empalement is of one leaf, half-five cleft, plane, and very finall: the divisions are obtuse and unequal.

- The Corolla has five petals, ovate, fpreading, feffile, equal and reflexed at their margins.
- The Filaments are five, awl-thaped and the length of the corolla. The Antheræ are very fmall.
- The Germen is very fmall, immerfed in the receptacle, which is large, plane, and marked with ten ftreaks. The Style is awlfhaped and fhorter than the ftamina. The Stigma is obtufe, and three-cleft.
- The Seed-veffel is a Capfule, coloured, ovate, obtufely threecornered, gibbous, three cell'd, and three valv'd.
- The Seeds are few, ovate, coloured, fmooth, and half covered with an Arillus, four parted at the mouth, unequal and coloured.

The Species but one, with us, viz.

CELASTRUS scandens. American Climing Staff-tree.

This grows naturally in many parts of North-America, rifing with a twining woody ftem to the height of ten or fifteen feet when fupported, fending out many flender flexible branches, cloathed with oblong pointed leaves, a little fawed on their edges. The flowers come out from the fides of the branches in loofe bunches; they are of an herbaceous ous colour, and are fucceeded by roundifh threecornered capfules, of a pale, or yellowifh red colour when ripe; which fpread open in three parts, difclofing their feeds after the manner of the Spindle Tree. The feeds are hard, oval and covered with a thin red pulp. It makes a very fine appearance when covered with ripe fruit.

rinall pea, of a ye.S.I T. L. T. J. D. was built when

The NETTLE-TREE. WILL COLL

ceeded by round, hard berries, ab

Clafs 23. Order 1. Polygamia Monoecia.

* THE Hermaprodite flowers are folitary and fuperior.

The Empalement is one-leafed, and five-parted; the divifions ovate, fpreading and withering.

The Corolla is wanting.

The Filaments are five, very fhort, hid by the Antheræ, but after the difcharge of the farina, longer. The Antheræ are oblong, thickifh, quadrangular, and four-furrowed.

The Germen is ovate, fharp-pointed, and the length of calyx. The Styles are two, fpreading, varioufly inflexed, awl-fhaped,

very long, and downy on all fides. The Stigmas are fimple. The Seed-veffel is a drupe, roundifh and of one cell. The Seed is a nut, which is roundifh.

* The Male flowers and in the free alant

* The Male flowers are in the fame plant, and inferior. The Empalement is fix-parted, otherwife as the Hermaphrodite. The Corolla is wanting.

The Filaments are as in the Hermaphrodite.

The Species with us, but one, viz.

CELTIS occidentalis. American Yellow-fruited Nettle-tree.

This grows naturally in many parts of North-America. It delights in a rich, moift foil, in which it becomes a large tree, rifing with a ftraight ftem, the bark of which, in young trees, is fometimes fmooth imooth and of a dark colour, but as they advance becomes rougher and of a lighter colour. The branches are fet thick on every fide, and garnifhed with oblique oval leaves, ending in points and fawed on their edges. The flowers come out oppofite to the leaves, upon pretty long footftalks; they are fmall and make but little appearance, and are fucceeded by round, hard berries, about the fize of a fmall pea, of a yellow colour and fweet tafte when ripe. The juice of the fruit is faid to be aftringent and to give eafe in violent Dyfenteries.

CEPHALANTHUS.

The BUTTON-TREE.

Class 4. Order 1. Tetrandria Monogynia.

THE Common Empalement is none, but a globofe receptacle, collecting many florets into a little head.

The Proper Empalement is one leaved, funnel-form and angular; the border four-cleft.

The Universal Corolla is equal. The Proper of one petal, funnelform and acute.

The Filaments are four, inferted in the corolla, and thorter than the border. The Antheræ are globofe.

The Germen is beneath. The Style longer than the corolla. The Stigma globofe.

The Seedveffel none.

The Seeds are folitary, long, leffened at the bafe, pyramidal and wooly.

The Common Receptacle is round and villofe.

The Species but one, viz.

CEPHALANTHUS occidentalis. Button-tree.

This fhrub grows pretty common by creek fides and ponds, rifing to the height of fix or eight feet; growing very crooked, and fending out feveral branches, branches, which grow oppofite. The leaves are alfo placed oppofite and often, upon young fhoots, by three's; they are near three inches long and one and a quarter broad, having a ftrong vein running longitudinally through them, they are of a light green and their footftalks change to a reddifh colour next the branches. The branches are terminated with globular heads, compofed of many fmall flowers, of a whitifh colour.

CERCIS.

The JUDAS TREE.

Class 10. Order 1. Decandria Monogynia.

THE Empalement is of one leaf, very fhort, bell-fhaped, gibbous beneath, and melliferous: the mouth is five toothed, erect and obtufe.

The Corolla is ten petal'd, inferted in the calyx, and counterfeiting a papilionaceous corolla.

- The Wings, are two petals, bent back, and affixed by long claws.
- The Standard, one petal, roundifh, clawed, under and fhorter than the wings.
- The Keel, two petals, joining in a heart-fhaped figure, including the parts of fructification and affixed by claws.

The Nettarium, a gland, ftyle form, under the germen.

The Filaments are ten, diffinct, awl-fhaped, declined, of which four are longer; and covered. The Anthera are oblong, incumbent, and arifing.

The Germen is linear-lanced and pedicel'd. The Style is of the length and fituation of the stamina. The Stigma is obtuie and arifing.

The Seed-veffel is a legumen or pod, which is oblong, acute, oblique pointed, and of one cell.

The Seeds are feveral, roundifh and joined to the fuperior farture.

The Species with us, but one, viz.

CERCIS

CERCIS canadenfis. Red-bud, or Judas Tree.

This grows naturally in feveral parts of North-America, rifing to the height of ten or fifteen feet, with a pretty ftrong trunk covered with a darkifh coloured bark; dividing upwards into feveral irregular branches, furnifhed with heart-fhaped leaves, fmooth upon their upper furface and edges, but a little downy underneath, having pretty long footftalks. The flowers come out upon the branches upon all fides, many arifing from the fame point, with fhort footftalks; they are of a fine red colour and coming out before the leaves, make a beautiful appearance. There is faid to be a variety of this in Carolina, with fmall flowers.

CHIONANTHUS.

they have bell that there was

The SNOW-DROP, or FRINGE TREE.

Class 2. Order 1. Diandria Monogynia.

THE Empalement is of one leaf, four-parted, erect, sharppointed and permanent.

The Corolla is one petal'd and funnel-form. The tube is very fhort. fpreading, and the length of the caylx. The border with four divisions, which are linear, erect, acute, oblique, and very long.

The Filaments are two, very fhort, awl-shaped and inferted in the tube. The Antheræ are heart-shaped, and erect.

The Germen is ovate. The Style fimple and the length of the calyx. The Stigma is obtufe and three-cleft.

The seed-veffel is a drupe, roundifh or oval and of one cell. The Seed a striated nut.

Obf. The number of ftamina is often three or four.

We have but one Species in America, viz.

CHIONANTHUS

CHIONANTHUS virginica. Virginian Snow-drop Tree.

This fhrub grows naturally in feveral places in North America, in a moift foil; rifing to the height of fifteen or twenty feet, spreading into many branches, covered with a light coloured bark. The leaves are large, oblong and entire, placed nearly oppofite. The flowers are produced towards the extremity of the fhoots of the former year, upon fhort, leaffy, common footstalks; at the bosom of the leaves of which, the proper footftalks come out, and are divided for the most part into three parts, but often more; each fuftaining one fmall flower, with four very long, narrow, white petals; which, when fully grown, make a beautiful appearance: thefe are fucceeded by oval berries, of a livid blackish colour when ripe, each containing one hard, oblong, pointed feed. The bark of the root of this shrub, bruised and applied to fresh wounds, is accounted by the natives a specific, in healing them without fuppuration.

with a lower of L C L E T H R A. to a desidence a the

CLETHRA.

Class 10. Order 1. Decandria Monogynia.

THE Empalement is of one leaf, five-parted; the leaves are ovate, concave, erect and permanent.

The Corolla confifts of five petals, oblong, broader without, a little fpreading, and longer than the calyx.

The Filaments are ten, awl-shaped, and the length of the corolla. The Antheræ oblong-erect, gaping at the apex.

The Germen is roundifh. The Style is thread-form, erect, permanent, and increasing. The Stigma is three-cleft.

The Seed-veffel is a capfule, roundifh, covered with the calyx, three-cell'd and three-valv'd.

The Seeds are many and angled.

There is but one Species of this Genus, viz.

CLETHRA alnifolia. Alder leaved Clethra.

This fhrub grows common in Maryland, Virginia, and Carolina, in moift ground and by rivulets; rifing to the height of fix or eight feet, dividing into many branches, clothed with wedge-fhape, oval, veined leaves, fawed on their edges, refembling those of the Alder but longer; which are placed alternately. The flowers are produced at the extremity of the branches, in long close bunches; they are of a white colour, and when in full bloom make a very fine appearance.

CORNUS.

The CORNEL, or DOGBERRY-TREE.

Class 4. Order 1. Tetrandria Monogynia.

THE Calyx confifts of an Involucrum of four leaves, many flowered: the leaves ovate, coloured, and deciduous; the opposite interior fomewhat longer and narrower.

An Empalement, very small, four-toothed, above and deciduous.

The Corolla confifts of four petals, oblong, acute, plane, and fmaller than the Involucrum.

The Filaments are four, awl-shaped, erect, and longer than the corolla. The Antheræ are roundish and incumbent.

The Germen is roundifh and beneath. The Style filiform and the length of the corolla. The Stigma is obtufe.

The Seed-veffel is a drupe, or ftone-fruit, roundifh and umbilicated.

The Seed, a nut, heart-fhaped, or oblong, and two cell'd. Obf. The Involucrum is wanting in most of our Species.

The Species are, with us,

I. CORNUS

This grows to the height of twelve or fifteen feet, dividing upwards into many branches, which are covered with bark of a ftriated or ftreaked appearance. The fmall branches are placed alternate, bending at each divifion. The leaves are entire, oval, fharp-pointed, and much veined. The flowers are produced in clufters at the extremity of the branches, and are fucceeded by roundifh berries of a dark purple colour when ripe. The fmall branches being alternate, afford a diftinguifhing mark for this fpecies.

2. CORNUS candidiffima. Swamp American Dogwood.

This fhrub grows to the height of fix or eight feet, moftly in moift or fwampy places; and is covered with a whitifh bark. The branches are placed oppofite, and alfo the leaves, which are lance-fhaped and pointed, and of a whitifh colour. The flowers are produced at the extremity of the branches, in clufters, and are fucceeded by whitifh fucculent berries.

3. CURNUS florida. Male Virginian Dogwood.

This rifes with a ftrong ftem to the height of twelve or fifteen feet, dividing into many fpreading branches, which are fometimes placed oppofite, but often by four's, arifing from oppofite points and regularly difpofed. The leaves are oval, pointed, veined and entire. The flowers are produced at the extremity of the fmall branches, in clufters; having a common involucrum involucrum of four large white leaves, which are generally end-bitten and a little coloured at their extremities, and one opposite pair, rather longer and narrower than the other. The flowers within are fucceeded by oblong, red berries. This flowers in May and is defervedly ranked amongst the beautiful flowering shrubs. The bark of this kind has been used with some success as a substitute for the Peruvian Bark. And to its top, regular disposed shoots, our spinsters are often indebted for their distaffs.

4. CORNUS fanguinea. American Red-rod Cornus.

This grows in a moift foil, to the height of eight or ten feet, generally many ftems arifing from the fame root. The bark of the young fhoots is very fmooth, and of a beautiful dark red colour. The branches are placed oppofite, and alfo the leaves, which much refemble the first and third kinds above defcribed. The flowers are produced in clusters at the ends of the branches, of a whitifh colour; and are fucceeded by fucculent berries of a bluish colour when ripe.

CORYLUS.

The HAZEL, or NUT-TREE.

Class 21, Order 8. Monoecia Polyandria.

*THE Male flowers are difposed in a long Katkin.

The Calyx, a common Katkin, imbricated on all fides, and cylindrical; confifting of Scales, which are uniflorous, narrowed at the bafe, at the apex broader, more obtufe, inflexed and three-cleft: the middle divisions of equal length, but twice the width of and covering the reft.

The

The Corolla is wanting. and alallav-basi ve salian and thes

- The Filaments are eight, very fhort, joined to the interior fide of the calycine fcale. The Antheræ are oblong-ovate, fhorter than the calyx, and erect.
- * The Female flowers are remote from the Male in the fame plant, fitting clofe and included in a bud.
- The Empalement is of two leaves, coriaceous, torn at the margin, erect, and the length of the fruit; at the time of florefcence, fcarce manifest for its finallness.

The Corolla none.

The Germen is roundith and very imall. The Styles two, briftly, coloured, and much longer than the calyx. The Stigmas are fimple.

The Seed-veffel none.

The Seed, a nut fomewhat ovate, fhaved at the bafe, fomewhat compressed and pointed at the apex.

The Species with us are,

1. CORYLUS americana. American Hazelnut.

This grows very common in a rich, loofe, moift foil; fpreading far by its roots, and rifing at firft with a fimple, erect ftem; which, as it grows old, is divided into a few irregular branches, cloathed with oval, pointed leaves, fawed on their edges. The Male katkins are produced at the ends of the branches, and the Female parts a little beneath them, often many together, at other times fingly; and are fucceeded by feed-veffels, roundifh at the bafe, but lengthened out into a leaffy, fringed expansion, parted at the extremity; each containing one nut.

2. CORYLUS cornuta. Dwarf Filbert, or Cuckold-nut.

This kind much refembles the other, except in fize, feldom growing above three or four feet high; and alfo in having its nuts fingle upon the branches, and and their husks or feed-vessels smaller and lengthened out into a point or horn, and closely embracing its nuts.

CRATÆGUS.

The WILD SERVICE-TREE.

Class 12. Order 2. Icofandria Digynia.

THE Empalement is one leaved, concave-fpreading, five-toothed and permanent.

The Corolla is of five petals, roundish, concave, fitting close and inferted in the calyx.

The Filaments are twenty, awl-fhaped, and inferted in the calyx. The Antheræ are roundifh.

The Germen is beneath. The Styles are two, thread-form, and erect. The Stigmas are headed.

The Seed-veffel is a berry, fielby, roundifb, and umbilicated. The Seeds are two, longifb, diffinct and cartilaginous.

Botanical writers enumerate feveral Species of this Genus, native of these states; but I believe, upon more strict examination, they will chiefly be found to belong, with more propriety, to the Mespilus. See Mespilus.

CUPRESSUS.

The CYPRESS TREE.

Clafs 21. Order 9. Monoecia Monodelphia.

* THE Male flowers are collected in an ovate Katkin.

The Calyx, a common ovate Katkin, compounded with fparfed flowers, confifting of Scales which are uniflorous, roundifh, fharp-pointed on the fore part, targetted, oppofite and in number about twenty.

The Corolla none.

The Filaments are wanting; but four Antheræ are joined, in their ftead, to each fcale of the katkin.

* The Female flowers are collected in a roundifh cone, on the fame plant.

The

The Calyx, a common cone, which is compounded of from eight to ten florets, confifting of Scales, which are uniflorous, oppofite, ovate, convex beneath and gaping.

The Corolla none.

The Germen is fcarce obfervable. In the place, perhaps, of Styles, there are numerous dots within each calycine fcale, which are truncated, and concave at the apex.

The Seed-veffel, none but the globofe cone, which is fhut, but gaping with orbiculate, angled, and targetted fcales.

The Seed is a nut, which is angled, fharp-pointed, and fmall.

The Species with us, are, 20 and

1. CUPRESSUS disticha. Virginian deciduous Cypress-Tree.

This grows naturally in fwampy, low ground; and becomes a lofty tree, of feventy or eighty feet in height, and three or four feet in diameter; dividing, towards the top, into many branches, clothed with fmall linear leaves, coming out upon all fides, yet inclining to but two fides of the fmall branches; and falling off in the autumn. The cones, of this kind, are roundifh and near an inch in diameter. The timber is valuable for many ufes, affording great quantities of boards, fhingles, &c.

2. CUPRESSUS Thyoides. Maryland Blue-berried Cypress.

This, by fome means, has obtained the name of a dwarf, yet it becomes a large tree, nearly equal in height and diameter to the former. The branches are covered with fmall ever-green leaves, much refembling those of the Arbor Vitæ. The cones are about the fize of Juniper-berries, a little angular and having many cells. The timber of this is foster than the other kind and applied to more general use, being being durable and not liable to be eaten by worms; it affords excellent planks, &c. for fhip building; alfo pofts, rails, boards, fhingles, &c. &c. and to it our dairy women are indebted for tubs, pails, churns, &c.

DIOSPYROS.

The DATE PLUM, or PERSIMMON TREE.

Clafs 23. Order 2. Polygamia Dioecia.

* THE Hermaphrodite female.

The Empalement is composed of one leaf, four-cleft, large, obtuse and permanent.

The Corolla, of one petal, pitcher-fhape, larger, and four-cleft; the divisions acute and foreading.

The Filaments are eight, briffly, fhort and lightly inferted in the receptacle. The Anthere are oblong and effecte.

The Germen is roundifh. The Style one, half four-cleft, permanent and longer than the stamina. The Stigmas are obtuse and two-cleft.

The Seed-veffel is a berry, which is globous, large, eight-cell'd, and fitting on the large fpreading calyx.

The Seeds are folitary, roundifh, compreffed, and very hard. * The Male in diffinct plants.

The Empalement confifts of one leaf, four-cleft, acute, erect, and finall.

The Corolla of one petal, pitcher-shape, coriaceous, four-cornered and four cleft: the divisions are roundish and revolute.

The Filaments are eight, very fhort and inferted in the receptacle. The Anthera are double, long, and acute; the interior ihorteft.

The Pistillum, is the rudiment of a germen.

The Species with us, but one, viz.

hi and dimneter to the termer, I he handles

This, by fome means, has obtained the name of a

DIOSPYROS virginiana. Virginian Persimmon Tree.

This grows naturally in moift clayey ground, in Pennfylvania and Maryland, as well as Virginia; rifing ing to the height of twenty feet or more, fending out many fhortifh branches, garnifhed with entire, oblong, pointed leaves; the flowers are produced upon the fmall branches, making but little appearance, and are fucceeded by large, globular or oblong fruit, which when fully ripe has a fweet agreeable tafte. A full grown tree will often yield two bufhels or more of fruit, which upon diftillation will afford as many gallons of Spirits, allowed to be equal in tafte and flavour to Weft India Rum. Our countrymen have not enough attended to this, but in fome places they brew of them a very good Beer. There appears to be varieties of this, fome with early ripe large fruit, others with fmaller and late ripe.

DIRCA.

LEATHER WOOD.

Class 8. Order 1. Octandria Monogynia.

THE Empalement is wanting.

The Corolla is one petal'd and clubb'd. The tube is more bellied above. The border none, the margin unequal.

The Filaments are eight, capillary, inferted in the middle of the tube, and longer than the corolla. The Antheræ are roundifh and erect.

The Germen is ovate, with an oblique top. The Style is threadform, longer than the ftamina and curved at the top. The Stigma is fimple.

The Seed-veffel is a berry of one cell. The Seed is one.

There is but one Species of this Genus, viz.

DIRCA palustris. Virginian Marsh Leatherwood.

This is a low fhrub, growing in moift fhady places, feldom rifing more than three or four feet high, F fpreading fpreading into a head, with many fmall and very flexible branches, covered with a light coloured bark, and cloathed with oval fmooth leaves, of a pale green colour. The flowers are produced at the extreme ends of the former year's floots; they are of an herbaceous colour and make but little appearance, but are fucceeded by oval berries, changing fomewhat yellowifh when ripe.

EPIGÆA.

TRAILING ARBUTUS.

Clafs 10. Order 1. Decandria Monogynia.

THE Empalement is double, approximated, and permanent. The exterior confifts of three leaves, which are ovate-lanced, and fharp pointed; the exterior largeft.

The interior is five-parted and erect; a little longer than the exterior: the leaf-lets are lanced and tharp pointed.

- The Corolla is composed of one pitcher-form petal. The tube is cylindrical, rather longer than the calyx, and hairy within. The border is fpreading and five-parted, with ovate-oblong lobes.
- The Filaments are ten, thread-form, the length of the tube and affixed to the bafe of the corolla. The Antheræ are oblong and acute.
- The Garmen is globofe and villous. The Style is thread-form, and the length of the stamina. The Stigma is obtuse and fomewhat five-cleft.

The Seed-vessel is a capsule, fomewhat roundish, depressed, five fided, five cell'd, and five valv'd.

The Seeds are many and roundifh. The receptable large and five-parted.

There is but one Species of this Genus, viz.

EPIGRA repens. Trailing Arbutus.

This grows naturally upon northern hills, or mountains, with trailing fhrubby stalks, putting out roots at at their joints. The leaves are oblong, rough and waved on their edges. The flowers are produced at the ends of the branches, in loofe panicles, and are of a white colour, mixed with red, dividing at the top into five parts, and fpreading open in form of a ftar.

EUONYMUS.

The SPINDLE TREE.

Class 5. Order 1. Pentandria Monogynia.

THE Empalement is composed of one leaf, five-parted, and plane: the divisions are roundish and concave.

The Corolla confifts of five petals, ovate, plane, fpreading and longer than the calyx.

The Filaments are five, awl fhaped, erect, fhorter than the corolla, and placed on the germen as a receptacle. The Anthere are twin.

The Germen is fharp pointed. The Style is fort and fimple. The Stigma is obtufe.

The Seed-vessel is a capfule, fucculent, coloured, pentagonal, with five angles, five cells and five valves.

The Seeds are folitary, ovate and covered with a berry'd Arillus.

Obf. In fome fpecies one fifth part of the fructification is taken away.

The Species with us, are,

I. EUONYMUS carolinensis. Carolinian Spindle Tree.

This fhrub grows to the height of eight or ten feet, dividing into many oppofite branches, the young fhoots are fomewhat quadrangular and marked longitudinally, with green ftripes. The leaves are placed oppofite, and are oval, fharp pointed, and finely and flightly fawed on their edges, of a deep green green colour. The footftalks of the flowers come out from the bofom of the leaves of the young fhoots, and are generally divided into three parts towards their extremities, the middle divifion fuftaining one, and the two fide ones, each three flowers; having four deep purple coloured petals, expanding in form of a crofs, and four ftamina; thefe are fucceeded by angular furrowed feed veffels, of a beautiful pale red colour when ripe, making a fine appearance after the leaves are fallen off.

2. EUONYMUS latifolius. Broad-leaved Spindle Tree.

This fhrub very much refembles the former, except the leaves being broader and longer, and of a paler green colour, turning reddifh before they fall off. The feed-veffels are rather larger and rounder at the corners or angles, and of fomewhat paler colour, as are alfo the flowers.

3. EUONYMUS fempervirens. Ever-green Spindle Tree.

This is of fmaller growth than either of the former, feldom rifing above fix or feven feet, and dividing into many oppofite branches, towards the top, which are of a greener colour, and more angular than the other kinds, and garnifhed with narrower leaves, of a clofer texture. The flowers are produced in manner of the former, except each footftalk fuftaining generally but three flowers, having five petals, which are of a paler colour, and rounder than either of the former; and are fucceeded by roundifh capfules clofely fet with fmall protuberances, turning of a fine red colour when ripe, and opening into four four or five parts, difclofing its feeds hanging by fine white threads. This makes a very beautiful appearance in autumn when its fruit are ripe; and from their red appearance obtained the name of the Burning Bufh. The young plants retain their leaves all winter. All the fpecies grow naturally in moift, fhaded places.

FAGUS.

The BEECH-TREE.

Class 21. Order 8. Monoecia Polyandria.

* THE Male flowers are affixed to an Amentaceous receptacle. The Calyx is an Empalement of one leaf, bell-fhaped, and five-cleft.

The Corolla none.

The Filaments are many (about twelve) the length of the calyx, and briftly. The Antheræ are oblong.

- * The Female flowers are contained in buds upon the fame plant.
- The Calyx, an Empalement of one leaf, four-toothed, erect and acute.

The Corolla none.

- The Germen is covered by the calyx. The Styles are three, awlfhaped. The Stigmas are fimple and reflexed.
- The Seed-veffel is a capfule (formerly the calyx) which is roundifh, large, fet round with foft fpines; with one cell and four valves.
- The Seeds are two nuts, which are ovate, triangular, three valved and fharp-pointed.
- Obf. The Male flowers of the Beech are difposed in a globular form; those of the Chesnut in a cylindrical.

We have but one Species of this Genus, befides the Chefnut and Chinquepin, which are fomewhat improperly joined with it, viz.

FAGUS

FAGUS Sylvatica atro-punicea. American Beech Tree.

This grows naturally in low, bottom grounds, by river fides, rifing fometimes to the height of forty or fifty feet, and to fifteen or eighteen inches in diameter, generally fending out many long branches, garnifhed with very thin, oval, fpear-fhaped leaves, fawed on their edges, and remaining late upon the branches. The nuts are eaten by fwine. The wood is hard and clofe grained, and ufed for making lafts, joiner's tools, &c.

FAGUS-CASTANEA.

The CHESNUT TREE.

THE Characters are nearly the fame of the Beech, except the Male flowers being difpofed in cylindrical katkins. The Styles more in number and briftly. The Capfules much larger, round, and fet very thick with long prickly Spines; containing from one to four or five, but generally two or three nuts, filled with fweet kernel.

The Species of Chefnut, with us, are,

I. FAGUS-CASTANEA dentata. American Chesnut Tree.

This often becomes a large tree, growing to the height of fixty or eighty feet, and to four or five feet in diameter, fending out but few branches, garnifhed with long fpear-fhaped leaves, toothed or notched on their edges. The timber is used much for rails, fplitting free and out-lasting most of our Oaks. The kernel of the nuts are dried and used by fome as a substitute for Coffee. The wood is also burnt burnt into coals for the use of blacksmiths, &c. but not much esteemed for common fuel.

2. FAGUS-CASTANEA pumila. Dwarf Chefnut Tree, or Chinquepin.

This feldom rifes above eight, ten, or twelve feet, otherwife much refembling the Chefnut in the appearance of its branches and leaves. Its fruit capfules are finall, and generally contain but one conical fhaped nut. It grows naturally in a light gravelly foil.

FOTHERGILLA.

FOTHERGILLA.

Clafs 13. Order 2. Polyandria Digynia.

THE Empalement is of one leaf, hairy, and five-toothed at the margin.

The Corolla is wanting.

The Filaments from fixteen to eighteen, inferted in the calyx, long, incurved and leffened towards the bafe. The Antheræ are minute.

The Germen is oblong and villofe, ending in two acute Styles.

The Seed-veffel is a capfule, oblong, of two cells and covered by the calyx.

The Seeds are fingle and oblong.

The Species with us,

FOTHERGILLA Gardeni. Carolinian Fothergilla.

This finall, but beautiful flowering fhrub grows naturally in Carolina, on the borders of favannahs, or near ponds of water; fpreading much by its roots. The ftalks are flender, rifing to the height of two or or three feet, generally feveral from one root, with fmall, alternate, divaricated branches. The leaves are oval, fomewhat toothed towards the apex, and placed alternate. The flowers are produced in fpikes terminating the ftalks; they are feffile, and each furnifhed with a bractea or floral leaf, which is ovate, rough externally, longer than the empalement and fitting clofe at their bafe; they are produced early in the fpring and being thick fet, make a beautiful appearance with their long, fnowy white ftamina. The fruit or feed-veffel very much refembles that of the Hamamalis or Witch Hazel, but is much fmaller.

This, in fome late Catalogues, has been called *Youngfonia*, in honour of William Young, Botanift, of Pennfylvania; but by Dr. Linnæus, *Fothergilla* in honour of the late Dr. Fothergill of London. It was first fent to Europe, from Carolina, by John Bartram, to his friend P. Collinson, by the title of Gardenia.

FRANKLINIA.

FRANKLINIA.

Clafs 16. Order 5. Monadelphia Polyandria.

THE Emplement is of one leaf, five-cleft; the divisions roundifh.

The Corolla confifts of five petals, large, fpreading, roundifh, narrowed towards the claw, and joined at the bafe.

The Filaments are numerous, awl-fhaped, joined beneath in a cylinder, and inferted in the corolla. The Antheræ are twin. The Germen is roundifh, lightly furrowed. The Style cylindrical and longer than the ftamina. The Stigma obtufe and rayed.

The Seed-veffel, a roundifh nut with five cells. The Seeds are wedge-form, and feveral in each cell.

The

The Species one, viz.

c is has been oblerved to grow naturally. I

(49)

FRANKLINIA alatamaha. Franklinia.

(Bartram's Catalogue.)

This beautiful flowering, tree-like fhrub, rifes with an crect trunk to the height of about twenty feet; dividing into branches, alternately disposed. The leaves are oblong, narrowed towards the bafe, fawed on their edges, placed alternately, and fitting close to the branches. The flowers are produced towards the extremity of the branches, fitting close at the bosom of the leaves; they are often five inches in diameter when fully expanded; composed of five large, roundifh, spreading petals, ornamented in the center with a tuft or crown of gold coloured stamina; and poffeffed with the fragrance of a China Orange. This newly difcovered, rare, and elegant flowering fhrub, was first observed by John Bartram when on botanical refearches, on the Alatamaha river in Georgia, Anno 1760; but was not brought into Pennfylvania till about fifteen years after, when his fon William Bartram, employed in the like purfuits, revifited the place where it had been before obferved, and had the pleafing profpect of beholding it in its native foil, poffeffed with all its floral charms; and bearing ripe feeds at the fame time; fome of which he collected and brought home, and raifed feveral plants therefrom, which in four years time flowered, and in one year after perfected ripe feeds.

It feems nearly allied to the Gordonia, to which it has, in fome late Catalogues, been joined: but William Bartram, who first introduced it, believing it to be a new Genus, has chosen to honour it with the name of that patron of fciences, and truly great and and diftinguished character, Dr. Benjamin Franklin. The trivial name is added from the river, where alone it has been observed to grow naturally. It delights in a loofe, fandy and moift foil.

FRAXINUS.

This heauiful flowering, tree-like vinowit mode The ASH TREE. The Bons dairy

intan, these

Clafs 23. Order 2. Polygamia Dioecia.

THE Flowers are Hermaphrodite and Female on different trees. *The Hermaphrodite:

The Calyx none; or an Empalement of one leaf, four-parted, erect, acute, and fmall.

The Corolla none; or of four petals, linear, long, acute, and ereft.

The Filaments are two, erect and fhorter than the corolla. The Antheræ are crect, oblong, and four furrowed.

The Germen is ovate and compressed. The Style cylindrical and erect. The Stigma thickish and two cleft.

The Seed-veffel none befides the cruft of the feed.

The Seed is lanced, compressed-membranaceous and of one ricarches, on the Alatamaba rivelisin

* The Female are the fame in every part except wanting the Pennfylvania till about fifteen years after, snimefis

fon William Barten are, are Species Deen before oblerved.

i. FRAXINUS americana. Carolinian or Red bearing ripe feeds at the diffe time; foure of which

This grows to the height of twenty or thirty feet, dividing into feveral branches, the fmall ones of which are generally opposite; the leaves are composed of three or four pair of lobes, terminated by an odd one, which are egg-fhaped and pointed, their upper surface of a light green colour, their under covered with short white downy hairs. The feeds are broad and of a light colour.

2. FRAXINUS

2. FRAXINUS alba. American White Afb.

KITYS. OF MAID. MCC BCOOM SC.

This tree grows fometimes to the height of forty or fifty feet, and to eighteen inches or more in diameter. It grows much after the manner of the former, only the leaves are broader, and the feeds narrower. The timber of this is used much by Wheelwrights, Chaife-makers, &c. for making fhafts, rimming of wheels, &c.

3. FRAXINUS Nigra. Black Afb.

This kind grows in moift places, rifing to the height of thirty feet or more, covered with a rough, lightifh coloured bark, and fending out but few branches. The leaves are chiefly produced at the ends of the branches, and are generally compofed of four pair of lobes, and an odd one, which are fhaped like those of the other kinds, but are smaller and finely fawed on their edges. The feeds or keys are broad and flat, and of equal width their whole length.

4. FRAXINUS pennfylvanica. Pennfylvanian Sharp-keyed Afb.

This kind often grows to the height of thirty feet or more, and is generally thick fet with branches towards the top, having leaves much refembling the White Afh. The feeds grow in large panicles, thick fet upon the fides of the branches, near their extremities: they are longer and narrower than any of the other kinds, almost terminating in a point at their bafe. This alfo affords a valuable wood, which is ufed for the fame purpofes as that of the White Afh.

The

The infide bark and keys of Ash, are accounted good to promote urine.

GAULTHERIA.

GAULTHERIA, or MOUNTAIN TEA.

Class 10. Order 1. Decandria Monogynia.

THE Empalement is double, approximate and permanent. The exterior two leaved and fhorter: the leaves femi-

ovate, concave and obtufe.

The interior one leaved, five-cleft and bell-fhaped: the fegments femi-ovate.

The Corolla is monopetalous, ovate and half five cleft: the border finall and revolute.

A Netturium of ten corpufcules, which are awl-fhaped, erect, very fhort, and furrounding the germen within the flamina.

The Filaments are ten, awl-fhaped, incurved, fhorter than the corolla, and inferted in the receptacle. The Anthera are two horned: the horns bifid.

The Germen is roundifh and depressed. The Style cylindrical and the length of the corolla. The Stigma is obtuse.

The Seed-veffel is a capfule, roundifh, obtufe five-fided, deprefed, five cell'd, and five valv'd; covered on all fides by the interior empalement, and becoming a roundifh coloured berry, pervious at the apex.

The Seeds are many, fomewhat ovate, angled and bony.

There is but one Species of this Genus, viz.

GAULTHERIA procumbens. Canadian Gaultheria, or Mountain Tea.

This is a very fmall fhrubby plant, with flender ftems, feldom rifing above five or fix inches in height; having, at their tops, four or five oval ever-green leaves, which are marked with a few fmall points or ferratures upon their edges. The flowers come out from the bofom of the leaves, of a white colour, and and are fucceeded by fmall berries of a red colour when ripe. The leaves have been ufed as a fubftitute for Bohea Tea, whence the name of Mountain Tea.

53)

GLEDITSIA.

TRIPLE-THORNED ACACIA, or HONEY LOCUST.

Clafs 23. Order 2. Polygamia Dioecia.

THE Flowers are Male and Hermaphrodite upon the fame plant, and Female upon a different plant.

* The Male are in a long, compact, cylindrical katkin.

- The Calyx; a proper empalement of four leaves; the leaves fpreading, fmall and acute.
- The Corolla confifts of three petals, roundifh, feffile, fpreading, and cup form.
 - A Nectarium, top-shaped, to whose borders the remaining parts of fructification grow.
- The Filaments are fix, thread-form, and the length of the corolla. The Antheræ are incumbent, oblong, compreffed and twin.
- * The Hermaphrodite are in the fame katkin with the male flowers, and for the most part terminal.

The Calyx, an empalement, four leaved, as in the male. The Corolla, four petals, as in the male.

The Nectarium as in the male.

The Stamina as in the male.

The Pistillum, Seed-vessel, and Seeds as in the female.

* The Female Flowers are in a loofe katkin, in a different plant.

The Calyx; a proper empalement, as in the male, but five leaved.

The Corolla, five petals, which are long, acute, and fomewhat foreading.

The Nectaria are two, very fhort, like the filaments.

The Germen is broad, comprefied, and longer than the corolla. The Style is fhort and reflexed. The Stigma is thick and the length of the ftyle, to which it is adjoined, growing hairy above.

The Seed-veffel is a legumen or pod, very large, broad, and much comprefied, with many transverse partitions: with ifthmuses filled with pulp.

The Seeds are folitary, roundifh, hard and mining.

The Species with, us are,

I. GLEDITSIA fpinofa. Triple-thorned Acacia, or Honey Locust.

This tree grows naturally in a rich foil, rifing to the height of thirty or forty feet, dividing into many branches, which, together with the trunk, are armed with long pithy fpines of five or fix inches in length, fending off laternal ones, fome of which are nearly the fame length, and generally triple thorned. The branches are garnished with winged leaves, composed of ten, or more pair of fmall lobes, fitting close to the midrib, of a lucid green colour. The flowers come out from the fides of the young branches in form of katkins, of an herbaceous colour, and are fucceeded by crooked, compreffed pods, from nine or ten to fixteen or eighteen inches in length, and about an inch and a half or two inches in breadth, of which near one half is filled with a fweet pulp, the other containing many feeds in feparate cells. The pods, from the fweetnefs of their pulp, are used to brew in beer.

2. GLEDITSIA aquatica. Water Acacia.

This fort grows naturally in Carolina, and hath much the appearance of the first, but hath fewer spines, which are very short. The leaves are also fmaller and the pods oval, containing but one feed.

GLYCINE.

PERENNIAL KIDNEY BEAN.

Clafs 17. Order 3. Diadelphia Decandria. THE Empalement is of one leaf, compressed and two lipped: the upper lip emarginate and obtuse: the lower, longer, acute, and three-cleft; the middle division longest.

The

(54)

The Corolla papilionaceous, or butterfly fhaped.

- The Standard inverse heart-shaped, the fides deflexed, the back gibbous, the apex emarginate, straight and bent from the keel.
- The Wings oblong, ovate towards the top, fmall and bent downwards.
- The Keel linear, hooked, broader and obtufe towards the point, and bent upwards, preffing against the standard.
- The Filaments are diadelphous, or one fingle, and nine conjoined; a little dividing at the top, and revolute. The Antheræ are fimple.
- The Germen is oblong. The Style cylindrical, bending back in a spire. The Stigma obtuse.
- The Seed-veffel an oblong legumen or pod.

The Seeds kidney form.

HALESIA.

Obf. Glycine frutefcens has legumens or pods of two cells.

The shrubby Species with us, is one, viz.

GLYCINE frutescens. Carolinian Shrubby Kidney Bean.

This grows naturally in Carolina, rifing with twining fhrubby ftems, when fupported, to the height of ten or fifteen feet. The keaves are winged, and composed of about five pair of fmall, oval, pointed pinnæ or lobes, fmooth and of a pale green on their upper furface, but lighter underneath, having their edges a little reflexed and hairy. The flowers terminate the branches in a close, erect racemus or bunch; they are of a purplish blue colour, and are fucceeded by long cylindrical pods of two cells, fhaped like those of the fcarlet Kidney Bean.

tree, where it is faid to grow pleaty, and is called

GUILANDINA.

(56)

GUILANDINA.

The BONDUC, or NICKAR TREE.

Clafs 10. Order 1. Decandria Monogynia.

THE Empalement is one leaved, bell-shape: the border five parted, equal, and spreading.

The Corolla confifts of five petals, lanced, concave, fquat, equal, fomewhat larger than the calyx and inferted in its chaps.

The Filaments are ten, awl-shaped, erect, inferted in, and shorter than the calyx: the alternate less. The Antheræ are obtuse and incumbent.

The Germen is oblong. The Style is thread-form and the length of the flamina. The Stigma is fimple.

The Seed-ve[sel is a legumen or pod, which is rhomboid, convex on the upper future, bellied-compressed, of one cell, diffinct, with transverse partitions.

The Seeds are bony, globofe-compressed, and folitary between the partitions.

Obf. A species of this genus is dioecious.

The Species with us,

GUILANDINA dioica. Canadian dioiceous Bonduc, or Nickar Tree.

This tree is faid to rife, with an erect ftem, to the height of thirty feet or more, dividing into many branches, covered with a bluifh afh-coloured, fmooth bark, garnifhed with large winged leaves, the lobes of which are ranged alternately, and are oval fhaped, very fmooth and entire. I have lately received feveral feeds from Kentucky, fuppofed to be of this tree, where it is faid to grow plenty, and is called the Coffee or Mahogany tree.

HALESIA.

(57)

HALESIA.

HALESIA, or SILVER-BELL TREE.

Class 10. Order 1. Decandria Monogynia.

THE Empalement is one leaved, very fmall, above, fourtoothed, and permanent.

The Corolla is of one petal, bell'd and bellied: with the mouth four-lobed, obtufe and fpreading.

The Filaments are twelve (rarely fixteen) awl-fhaped, erect and fomewhat fhorter than the corolla. The Antheræ are oblong, obtuie and erect.

The Germen is oblong and beneath. The Style is thread-form and longer than the corolla. The Stigma is fimple.

The Seed-vessel is a nut which is barked, oblong, narrow towards each end, four cornered with membranaceous angles, and two cell'd.

The Seeds are folitary.

The Species are,

1. HALESIA diptera. Two-winged fruited Halefia.

This grows naturally in Carolina, to the height of twelve or fifteen feet. The bark is beautifully variegated or ftreaked, much like the ftriped Maple. The leaves are large and egg-fhaped, having fmooth footftalks. The fruit is fharp-pointed, having two oppofite, large wings, and two very fmall.

2. HALESIA tetraptera. Four-winged fruited Halesia.

This likewife grows in Carolina, and has much the appearance of the former, except the leaves are much smaller, a little fawed on their edges and downy downy underneath, with glandular footflalks. The flowers are produced upon the fmall branches, fometimes fingly, but often three or four together, upon pretty long footflalks; they are bell-fhaped and pendulous, of a white colour, and are fucceeded by fharp-pointed fruit, having four wings.

HAMAMELIS.

WITCH HAZEL.

Class 4. Order 2. Tetrandria Digynia.

THE Calyx confifts of an Involucrum, three-leaved, and three flowered: the two interior leaves are roundifh, lefs, and obtufe; the third outer one is larger and lance fhaped.

- A double Empalement: the exterior two leaved, lefs and roundifh; the interior four leaved and erect; the leaves oblong, obtufe, and equal.
- The Corolla has four petals, which are linear, equal, very long, obtufe, and reflexed.

And a Nectarium, of four leaf-lets, truncated, and adjoined to the corolla.

- The Filaments are four, linear, and fhorter than the calyx. The Antheræ two horned and reflexed.
- The Germen is ovate and villofe, ending in two Styles, the length of the Stamina. The Stigmas are headed.

The Seed-veffel none.

The Seed, a nut which is ovate, half covered with the calyx, obtufe and furrowed on each fide at the apex with fmall horizontal two horned horns; with two cells and two valves.

We have but one Species of this Genus, viz.

HAMAMELIS virginiana. Virginian Witch Hazel.

This fhrub grows naturally in many parts of North America. It hath fpreading roots, generally fending up feveral stalks or stems to the height of eight or or ten feet, dividing into feveral branches, furnished with oval leaves irregularly notched on their edges, and smooth on their upper fides, but downy underneath. The footstalks of the flowers come out singly upon the small branches, each generally supporting three flowers, of an herbaceous colour, and making but little appearance, but remarkable for being in bloom late in the sall after the leaves drop off.

SEA BUCKTHORN, or SALLOW-THORN.

Clafs az. A R A D A H Tetrandria.

Class 5. Order 1. Pentandria Monogynia.

THE B Rawers ate Mat. YndV el to on different plants

THE Calyx confifts of an Involucrum of a fimple umbel, very fmall and many toothed.

And an *Empalement* very finall, five toothed and furrounding the germen.

The Gorolla has five petals, oblong and fpreading, with incurved tops.

The Filaments are five, awl-fhaped, erect and the length of the corolla. The Antheræ are bifid at the base, and incumbent.

The Germen is top thaped, furrounded by the receptacle. The Style is fimple and very thort. The Stigma is fimple.

The Seed-veffel is a globofe berry of one cell.

The Seeds are five, large, on one fide gibbous, on the other angled.

We have but one Species Native of America, viz.

HEDERA quinquefolia. American Ivy, or Virginian Creeper.

This hath a climing stem, attaching itself to any neighbouring support, and rising often to the height of thirty, forty or fifty feet, sending off branches, furnished with leaves composed of sive lobes joined at at their bafe, which are egg-fhaped and fawed on their edges, having a pretty long common footftalk. This has been ufed to plant againft walls and houfes to cover them, but the leaves falling off in winter, the plants make but a poor appearance at that time.

HIPPOPHAË.

SEA BUCK-THORN, or SALLOW-THORN.

Class 22. Order 4. Dioecia Tetrandria.

THE flowers are Male and Female on different plants. *The Male.

The Empalement is one leaved, biparted, bivalve, entire at the bottom: the divisions are roundifh, obtufe, concave and erect, meeting with their tops, but gaping at their fides. The Corolla is wanting.

The Filaments are four, very thort. The Anthere are oblong,

angled, and almost the length of the calyx.

* The Female.

The Empalement is one leaved, oblong-ovate, tubulous, clubbed, with a two cleft mouth, and deciduous.

The Corolla none.

The Germen is roundifh, and fmall. The Style is fimple and very fhort. The Stigma thickifh, oblong, erect, and double the length of the calyx.

The Seed-veffel is a globole berry of one cell. The Seed one, roundifh.

There is but one Species, with us, viz.

Ніррорнаё canadienfis. Canadian Sea-Buck-Thorn.

This rifes with fhrubby ftalks to the height of eight or ten feet, fending out many irregular branches, having a brown bark, filvered over, and garnifhed with very narrow fpear-fhaped leaves, of a dark green on their upper fide, but hoary underneath, and reflexed

reflexed on their edges like the Rofemary. The flowers come out from the fides of the young branches, fitting very clofe; the male growing in fmall clusters, but the female coming out fingly; thefe open in July and make but little appearance; they are fucceeded by roundifh berries, which ripen in autumn, and are faid to be purgative.

HYDRANGEA. TTTTE E Bagaismene is five pareod: the dividions are fontewinds

Clais is owner a Polyadomaia Polyandria,

Builderand HANDRANGEA.

Class 10. Order 2. Decandria Digynia.

THE Empalement is one leaved, five toothed, permanent, and fmall.

The Corolla confifts of five petals, equal, roundifh, and larger

than the calyx. The Filaments are ten, longer than the corolla, the alternate of which are longer. The Antheræ are roundifh and twin.

The Germen is roundifh and beneath. The Styles are two, fhort, and diffant. The Stigmas are obtufe and permanent.

The Seed-veffel is a capfule, roundifh, twin, two beaked with the double flyle, angled with many nerves, crowned with the calyx, two cell'd, with a transverse partition, and gaping with a paffage between the horns. 132 MODIATTIC

The Seeds are numerous, angled, tharp pointed, and very fmall.

There is but one Species of this Genus, viz. with thrubby Italks to the beight of three or tour

HYDRANGEA frutefcens. Virginian Shrubby o visitable i o alon Hydrangea. I has debosil ous

This hath a fpreading woody root, from which are produced, generally feveral foft, pithy, ligneous stalks, rifing to the height of about three feet, garnished at each joint with two oblong, heart-shaped, pointed leaves, fawed on their edges, and having many veins. The flowers are produced in form of a coa corymbus, at the tops of the stalks, they are of a white colour, and are succeeded by small capfules.

survey, and are faid to be purgalite

Clafs 18. Order 3. Polyadelphia Polyandria.

THE Empalement is five parted: the divisions are fomewhat ovate, convex, and permanent.

The Corolla has five petals, oblong-ovate, obtufe, fpreading, and marked according to the motion of the fun.

The Filaments are numerous, capillary, joined at the bafe into five or three parts or bodies. The Antheræ are fmall.

The Germen is roundifh. The Styles are three (fometimes one, two, and five) fimple, diftant, and the length of the ftamina. The Stigmas are fimple.

The Seed-veffel is a roundifh capfule; with cells according to the number of the Styles.

The Seeds are many and oblong.

The Species growing shrubby, with us,

HYPERICUM kalmianum. Virginian Shrubby

This grows naturally in low wet places, rifing with thrubby ftalks to the height of three or four feet, with oppofite angular branches. The leaves are fmooth and thaped like those of Rosemary or Lavender. The flowers terminate the branches in fmall divided clufters of three or feven flowers; they have each five very flender ftyles, and are fucceeded by oval, pointed capfules, filled with fmall feeds.

The HOLLY - TREE.

Clafs 4. Order 3. Tetrandria Tetragynia.

THE Empalement is four toothed, very fmall and permanent. The Corolla confifts of one petal, four-parted and plane: the divisions are roundifh, concave, fpreading, pretty

large, and cohering by claws.

The Filaments are four, awl-fhaped, and fhorter than the corolla. The Antheræ are fmall.

The Germen is roundifh. The Style none. The Stigmas are four and obtufe.

The Seed-veffel is a berry, roundish and four cell'd.

The Seeds are folitary, bony, oblong, obtufe, gibbous on one fide and angled on the other.

Obf. The flowers are in fome fpecies male upon one plant, and female and hermaphrodite upon a different plant.

The Species with us, are,

I. ILEX Aquifolium. American Common Holly.

This grows in Maryland, New Jerfey, &c. generally in moift ground, rifing to the height of fifteen or twenty feet, with an erect ftem, covered with a greyifh coloured fmooth bark, and furnifhed with pretty many branches, which are garnifhed with thick, hard, ever-green leaves, waved on their edges and indented, each point terminating in a ftiff prickly fpine. The flowers are produced upon pretty long footftalks, often three parted from the fides of the branches, of a white colour, having often five or fix ftamina, and the corolla divided into as many parts, and are fucceeded by roundifh berries, which when full ripe are red. Of the bark of common Holly is made Birdlime, which is better than that made of Mifletoe.

2. ILEX

2. ILEX Caffine. Daboon, or Carolinian Holly.

(64)

This grows naturally in Carolina, rifing with an upright branching ftem to the height of eighteen or twenty feet. The bark of the ftem is of a brown colour, but that of the branches and young fhoots green and fmooth. The leaves are fpear-fhaped, above four inches long and one and a quarter broad toward the bafe, of a light green colour and thick confiftence, with their upper parts fawed on the edges, each ferrature ending in a fmall fharp fpine. The flowers come out in thick clufters from the fides of the branches, they are white and like those of the common Holly, but fmaller, and are fucceeded by fmall roundifh red berries.

3. ILEX canadenfis. Canadian, or Hedge-bog Holly.

The leaves of this kind are not fo long as those of the Common Holly, but are armed with ftronger fpines ftanding closer together, their upper furfaces are alfo fet very close with fhort prickles, from whence it obtained the name of Hedge-hog Holly. It grows naturally in Canada. There are faid to be two varieties of this with variegated leaves, one of which is yellow, the other white.

ITEA.

ITEA.

Class 5. Order 1. Pentandria Monogynia.

THE Empalement is one leaved, five cleft, erect, tharp pointed, very fmall, and permanent: the divisions are acute and coloured.

The

- The Corolla has five petals, lance-fhaped, long and inferted in the calyx.
- The Filaments are five, awl-fhaped, erect, the length of the corolla, and inferted into the calyx. The Antheræ are roundisfh and incumbent.
- The Germen is ovate. The Style is cylindrical, permanent, and the length of the Stamina. The Stigma is obtuse.
- The Seed-ve[[el is a capfule. ovate, much longer than the calyx, pointed with the flyle, with one cell and two valves, of two joined together, gaping at the top.

The Seeds are numerous, very fmall, oblong, and fhining.

There is but one Species of this Genus, viz.

ITEA virginica. Virginian Itea.

This fhrub grows naturally in Maryland, Virginia, &c. near ftreams of water, or in moift places; rifing to the height of eight or ten feet, and dividing into feveral branches, which are garnifhed with fpear fhaped leaves, placed alternately, flightly fawed on their edges, and of a light green colour. The flowers are produced at the extremity of the fame year's fhoots, in erect fpikes of three or four inches in length; they are white, and make a fine appearance when in bloom, which is a little before harveft time.

JUGLANS.

The WALNUT - TREE.

Clafs 21. Order 8. Monoecia Polyandria.

THE Male and Female Flowers are feparate upon the fame tree.

- * The Male, are difpofed in an oblong katkin.
- The Calyx is a common katkin, on all fides imbricate-fparfed, and cylindrical; confifting of fcales which are uniflorous, fingly affixed in the exterior center to each corolla, and turned outward.

The

- The Corolla is fix-parted, elliptic, equal, and plane: the divifions are fomewhat erect and concave, pedicell'd and inferted in the interior center of the corolla, and rachis.
- The Filaments are many, (eighteen) very fhort. The Anthera are creft, fharp pointed and the length of the calyx.
- * The Female are without a katkin, two or three together, and fitting clofe, in the fame plant.
- The Empalement is four cleft, erect, very fhort, crowning the germen, and vanishing.
- The Corolla is four parted, acute, erect, and a little larger than the calyx.
- The Germen is oval, large, and beneath. The Styles are two, very fhort. The Stigmas are very large, clubbed, reflexed, and torn above.
- The Seed-veffel is a drupe, or capfule, dry, oval, large and one cell'd.

The Seed is a nut very large, roundifh, netted with furrows, and half four cell'd. The Kernel is four lobed and varioufly furrowed.

The Species (or chiefly Varieties according to Weston) with us, are,

1. JUGLANS nigra. Round black Virginian Walnut.

This tree often rifes to the height of fifty or fixty feet, and to three feet or more in diameter, covered with a dark furrowed bark, and dividing into many branches, furnished with winged leaves, composed of ten or twelve pair of lobes, and an odd one; these are smooth, oblong, sharp pointed and fawed on their edges; and upon being bruised emit a strong aromatic flavour, as doth also the external covering of the fruit. The fruit are round, their covering pretty smooth, and softish when fully ripe. The nuts themselves are hard, netted and furrowed, containing sweet oily kernel.

2. JUGLANS

2. JUGLANS nigra oblonga. Black oblong fruited Walnut.

This tree refembles the former fo as fcarcely to be diffinguished from it, except by its fruit, which is oblong or oval; the shells or coverings are rougher, harder, and of a deeper green colour. The timber of both forts is much used by Joiners, &c. in making tables, drawers, book and clock-cases, &c. Coffins are also generally made of it. The bark, and outer coverings of the nuts, are used in dying wool, cloth, &c.

There are perhaps fome other varieties of thefe.

3. JUGLANS oblonga alba. Butter-nut, or White Walnut.

This often grows to the height of twenty or thirty feet and to eighteen inches or more in diameter, with a fmooth light coloured bark. The branches are garnished with leaves composed generally of eight or nine pair of lobes and an odd one, which are villofe, oblong egg-fhaped, fharp pointed, flightly ferrated, and larger than those of the other kinds. The fruit, when ripe, is villous and covered with a vifcid clammy fubstance, by which it almost flicks to the fingers when handled. It is long and fomewhat pointed at the ends, and freed of its hull, or covering, is very rough and deeply furrowed, containing a foft, oily, fweet kernel. An extract of the bark of this tree affords a mild and fate cathartic. The bark and shells of the nuts dye a good brown colour, fcarcely ever fading.

4. JUGLANS

4. JUGLANS alba acuminata. Long, Sharp-fruited Hickery Tree.

This tree grows to the height of forty or fifty feet, and to eighteen inches or two feet in diameter. The leaves are generally composed of three or four pair of lobes and an odd one. The nuts with their covers are about two inches in length and above one in diameter. The covers, or hulls, generally open into four parts, difclofing their nuts, which are white, hard and thick thell'd, having feams oppofite the divisions of their hulls. The kernel is fmall and not very fweet.

5. JUGLANS alba minima. White, or Pig-nut Hickery,

This generally grows pretty large, fometimes to the height of eighty feet or more, and above two feet in diameter. The bark of young trees is fmooth, but when older becomes rough and furrowed. The leaves are generally composed of five pair of lobes and an odd one, which are mostly narrower than those of many other kinds. The fruit is small and roundish, and covered with a very thin husk or covering, opening in divisions. The shell of the nut is also very thin, and easily cracked with the teeth; the kernel plump and full but very bitter. The timber of this is not much esteemed.

6. JUGLANS alba odorata. Balfam Hickery.

This tree grows as large as the Pig-nut Hickery, and much like it in appearance. The nuts are fmall, round, and thin fhell'd, the kernel fweet. The branches are flender and flexible. There is, I think, a variety of this, with a rougher furrowed bark, bearing broader leaves and larger nuts, having thicker thicker outer covers, as well as inward fhells, with the kernel generally fmall and fhrivelled. The timber of both kinds is hard and tough, and used for axle-trees of carriages, &c. mill coggs and rounds, and also for handles, &c. for most implements of husbandry.

7. JUGLANS alba ovata. Shell-barked Hickery.

This tree delights in a rich moift foil, generally growing by creeks and rivers, often to the height of feventy or eighty feet, and above two feet in diameter. The bark is rough and fhelly or fealy. The leaves are generally composed of two pair of lobes and an odd one, they are narrowed towards the base, oval, and pointed at the extremity, and fawed on their edges. The fruit is roundish, but rather flatted and indented at the ends. The outer cover very thick and dividing into four parts, difclosing its nut, which is not very thick shell'd, containing sweet kernel, preferable to the other kinds. There are sour common Walnuts.

8. JUGLANS pecan. The Pecan, or Illinois Hickery.

This tree is faid to grow plenty in the neighbourhood of the Illinois river, and other parts to the weftward. The young plants raifed from these nuts, much refemble our young Pig-nut Hickerys. The nuts are small and thin shelled.

JUNIPERUS.

(70)

JUNIPERÚS.

The JUNIPER TREE.

Class 22. Order 12. Dioecia Monodelphia.

THE Flowers are Male and Female on different plants. *The Male.

The Calyx is a conical katkin, confifting of a common rachis or ftring, to which three flowers are placed in triple opposition, the katkin terminating with the tenth: each flower has for its bafe a Scale which is broad, fhort, incumbent and affixed to the column by a little footftalk.

The Corolla none.

The Filaments (in the terminal floret) are three, awl-fhaped, and joined beneath in one body; (in the lateral florets fcarce manifest.) The Antheræ are three, diffinct in the terminal floret, but in the lateral joined to the fcales

* The Female.

The Empalement is three parted, very fmall, adjoining to the germen, and permanent.

The Corolla has three petals, permanent, rigid and acute.

- The Germen is beneath. The Styles are three, fimple. The Stigmas are fimple.
- The Seed-veffel is a berry, flefhy, roundifh, the under part marked with three obfolete opposite tubercles, grown from the calyx, the top umbilicated with three fmall teeth (formerly petals.)

The Seeds are three, fmall, oblong, and bony, convex on one fide, and angled on the other.

The Species, with us, are,

1. JUNIPERUS virginiana. Red Cedar-Tree.

This tree often grows to the height of fifteen or twenty feet, fending off many diverging branches, covered with leaves fomething like the Juniper, but much fmaller, fhorter, and lying clofer to the branches. The berries are fmaller than those of the Juniper, Juniper, and covered with a whitish substance, eafily rubbing off.

2. JUNIPERUS caroliniana. Red Carolinian Cedar.

This tree much refembles the former in fize and fhape, but the under leaves have fomewhat the appearance of Juniper, the upper, of Cyprefs or Savin. There are faid to be other varieties, but their difference in appearance is fcarcely obfervable. The timber affords very good durable pofts for fencing, &c.

KALMIA.

KALMIA, or AMERICAN LAUREL.

Class 10. Order 1. Decandria Monogynia.

THE Empalement is five parted, fmall, and permanent: the fegments are fomewhat ovate, and acute.

The Corolla is of one petal, pitcher-funnel form. The tube is cylindrical and longer than the calyx. The border with a plane difk, and erect half five cleft circumference; there are ten fmall nectariferous horns, prominent without, and placed round the corolla from where the border is raifed.

The Filaments are ten, awl-fhaped, fomewhat fpreading, a little fhorter than the corolla, and inferted into its bafe. The Antheræ are fimple.

The Germen is roundifh. The Style is thread form, longer than the corolla, and declined. The Stigma is obtufe.

The Seed-veffel is roundifh, depressed, five cell'd and five valv'd. The Seeds are numerous.

The Species are,

I. KALMIA

1. KALMIA angustifolia. Narrow leaved Kalmia.

(72)

This kind delights in moift or fwampy places, and rifes to the height of two feet or more. The leaves are of a light green colour, and fometimes grow to the fize of an inch and a half in length and half an inch in breadth, of an oval fhape, and entire. The flowers come out in clufters on every fide of the ftalks, towards their extremities, and are of a beautiful red colour. This has been called Glaucous leaved Kalmia.

2. KALMIA latifolia. Broad leaved Kalmia.

This beautiful flowering fhrub rifes often to the height of fix or eight feet and fometimes to ten or twelve, covered with a lightifh coloured rough bark, and generally growing crooked. The leaves are of a dark green colour, thick confiftence, lance-fhaped and entire, in general about three inches in length and one in breadth. The flowers are produced in clufters at the ends of the branches and are variegated with red when first opening, but change to a whiter colour when expanded. There are very few flowering fhrubs comparable to this when in bloom. The leaves are noxious to oxen and fheep, yet the deer eat them with impunity.

LAURUS.

The BAY-TREE.

Clafs 9. Order 1. Enneandria Monogynia.

THE Empalement is wanting.

- The Corolla has fix petals, ovate, fharp pointed, concave, and erect: the alternate exterior.

And

And a Nectarium, confifting of three tubercles, fharp pointed, coloured, and ending in two briftles, ftanding round the germen.

The Filaments are nine, fhorter than the corolla, comprefied, obtufe and three-fold in each order. The Antheræ are adjoined on each fide to the margin of the filaments.

There are two roundilh finall Glands affixed by very fhort footftalks, to each filament of the inward order, near the bafe.

The Germen is fomewhat ovate. The Style is fimple, equal and the length of the ftamina. The Stigma is obtufe and oblique.

The Seed-velfel is a drupe, oval, tharp pointed, and one cell'd, contained in the calyx.

The Seed is a nut of a tharp pointed egg-fhape, with a kernel of the fame form.

Obf. The flowers are fometimes male and female upon different trees.

The Species, with us, are,

1. LAURUS Benzoin. The Benjamin-Tree, or Spice-Wood.

This fhrub grows naturally in moift places, and rifes often to the height of eight or ten feet, dividing into feveral branches. The leaves are annual, oval fhaped and entire. The flowers are produced from the fides of the branches upon fhort footftalks, often dividing and fuftaining from one, to four or five flowers, of a greenifh yellow colour; which are fucceeded by oval, oblong berries, of a red colour when ripe, but changing to black. The bark, berries, &c. have a ftrong aromatic fmell, much like that of Benzoin, and indeed, by fome, is allowed to be the tree, from whence it is produced.

2. LAURUS Borbonia. Red-stalked Carolinian Bay-Tree.

This grows naturally in Carolina, and rifes with a ftraight trunk to a confiderable height, especially K near the fea-coaft. The leaves are fharp pointed and much longer than those of the European Bay; a little wooly underneath, veined transversely, and somewhat reflexed on their edges. The male trees produce their flowers in long bunches from the wings of the leaves; the temale, in loose bunches, standing upon long red footstalks, and are succeeded by blue berries fitting in red cups.

The wood is of a very fine grain, proper for cabinet making and other ornamental furniture. It alfo dies a beautiful black colour.

3. LAURUS geniculata. Carolinian Spice Wood Tree.

This kind fo much refembles the Benzoin as to require no further defcription, except in having berries not of fo red a colour.

4. LAURUS Saffafras. The Saffafras-Tree.

This tree rifes fometimes to the height of twenty or thirty feet, and to twelve or fifteen inches in diameter, but is commonly of much lower growth. The bark of the young fhoots is fmooth and green, but of the old trunks rough, furrowed and of a lightifh colour. It is divided towards the top into many branches, generally crooked, furnished with leaves different in form and fize, fome being oval and entire, others two or three lobed and of five or fix inches in length, and nearly as much in width; of a light green colour and placed alternately upon pretty long footftalks. The flowers are produced at the extremity of the former year's fhoots upon long panicled footftalks, and are generally male and female upon different trees. The female are fucceeded by oblong, oval berries, of a bluish colour when

when ripe, fitting in red cups, having red footftalks. The roots and wood have been long ufed as a fudorific, but the bark of the root is by much the ftrongeft, yielding a confiderable quantity of hot, aromatic oil; and when powdered and joined with other febrifuges, has been given with fuccefs in intermittents, &c. Alfo ufed as a tea, is faid to promote obftructed menfes; but has been blamed for occafioning the head-ach.

LEDUM.

MARSH CISTUS, or WILD ROSEMARY.

Class 10. Order 1. Decandria Monogynia.

THE Empalement is of one leaf, very fmall, and five-toothed.

The Corolla confifts of five petals, ovate, concave, and fpreading.

The Filaments are ten, thread-form, fpreading and the length of the corolla. The Antheræ are oblong.

The Germen is roundifh. The Style thread-form and the length of the ftamina. The Stigma is obtufe.

The Seed-vessel is a capfule, roundish, five-cell'd and gaping in five parts at the top.

The Seeds are numerous, oblong, narrow, acute each way and very flender.

The Species with us, but one, viz.

LEDUM thymifolium. Thyme leaved Marsh Cistus.

This grows naturally in the Jerfeys, in low, moift places. It is a fmall ever-green fhrub, fcarcely rifing above eighteen inches or two feet in height and divided into feveral branches. The leaves are very fmall, entire, of an oblong oval fhape, and thick confiftence, confiftence, placed clofe, alternately, and thick upon the branches. The flowers terminate the ftalks in fhort leaffy bunches, coming out fingly at the bofom of the leaves upon pretty long footftalks; they are fmall and white but make a fine appearance when in bloom. This has generally been called Thyme-leaved Kalmia.

LIQUIDAMBAR.

LIQUIDAMBAR, or SWEET GUM-TREE.

Clafs 21, Order 8. Monoecia Polyandria.

* THE Male Flowers are numerous in a conical, long, loofe katkin.

The Calyx is a common Involucrum of four leaves; which are ovate, concave, and falling; the alternate thorter.

The Corolla none.

The Filaments are numerous, and very fhort, in a body, plane on one fide and convex on the other. The Antheræ are crect; twin, four furrowed, and two cell'd.

* The Female flowers are collected in a globe at the bafe of the male fpikes.

The Calyx is an Involucrum as in the male, but double.

The Proper Empalement is bell-fhape, angled, warty, and many joined together.

The Corolla none.

The Germen is oblong and adjoined to the empalement. The Styles are two, awl-fhaped. The Stigmas joined to thefe are the length of the ftyle, recurved and downy.

The Seed-veffel confifts of as many capfules as empalements, which are ovate, oblong, fharp pointed, with one cell and two valves at top; joined in a ligneous globe.

The Seeds are few, (one or two) oblong, pointed and fhining; mixed with many branny corpufcles.

The Species with us, are,

I. LIQUIDAMBAR

1. LIQUIDAMBAR Styraciflua. Maple-leaved Liquidambar-Tree, or Sweet Gum.

This tree grows naturally in low clayey ground, rifing with a ftraight trunk to the height of forty feet or more, fending off many branches, forming a pyramidal head. The leaves are angular, fomewhat refembling those of Maple, having five and often seven, pointed, ferrated, spreading lobes; and are of a dark green colour. They have a strong, sweet, glutinous substance, exuding through their pores in warm weather, rendering them clammy to the touch. The flowers are produced early in the spring, and are succeeded by globular feed-vesses, composed of many capfules joined at the base, but terminating in long fostish spines or points, and containing each one or two oblong compressed, winged feeds, with a great number of furfuraceous particles.

2. LIQUIDAMBAR afplenifolia. Spleen-wort-leaved Gale, or Shrubby Sweet Fern.

This is a fmall fhrub, growing naturally upon dry flaty ridges, and feldom rifing above three feet high, dividing into feveral branches, furnished with many oblong leaves, alternately fituated, refembling those of Spleen Wort; of a dark green colour, hairy underneath and fitting close to the stalks. The male katkins are produced lying close to the small branches near their ends. The female flowers are in small heads a little beneath them, becoming small burs, generally containing two or more oblong smooth feeds. An infusion of the leaves has been used as an aftringent in Diarrhæas, &c.

LIRIODENDRUM.

(78)

LIRIODENDRUM.

The TULIP-TREE.

Clafs 13. Order 7. Polyandria Polygynia.

THE Calyx confifts of a proper Involucrum of two leaves; which are triangular, plane and deciduous.

And an *Empalement* of three leaves; oblong, concave, fpreading, petal-form, and deciduous.

The Corolla has fix (often more) petals, bell'd: the petals are fpatuled, oblong, obtufe and variegated.

The Filaments are numerous, fhorter than the corolla, linear, and inferted in the receptacle. The Antheræ are linear, and adjoined longitudinally to the fides of the filaments.

The Germen are numerous, placed in a cone. The Style none. The Stigmas globofe.

- The Seed-ve []el none. The feeds are imbricated in a cone like body.
- The Seeds are numerous, ending in a lanced fcale; near the bafe of the fcale, fending off from the interior fide, an acute angle, compressed at the bafe and acute, by which they are joined to the fpindle fhaped receptacle.

The Species with us, are,

LIRIODENDRUM Tulipifera. Virginian Tulip-Tree.

This often grows to the fize of a large tree, of feventy or eighty feet in height and above four feet in diameter. The bark of young trees is fmooth, but as they grow old it becomes furrowed, their lower branches alfo falling off. The young trees fend off many branches, almost from the ground upward, garnished with broad fmooth leaves, heartstremity, having two or three pointed lobes, on each fide the midrib; of a dark green colour on the upper fide, fide, but lighter and veined underneath; with pretty long footftalks. The flowers are produced at the extremity of the branches in form of a Tulip, compoled of fix or feven petals, or fometimes more, greenish coloured towards the tops, but marked transversely with red, towards the claws; which are glandular and honey-bearing. The young trees make a beautiful appearance, efpecially when in flower. We have two kinds of Tulip trees, viz. Yellow and White, their difference eafily diffinguishable by the wood or timber, but perhaps not otherwife. The Yellow is foft and brittle, and much used for boards, heels for fhoes, &c. alfo turned into bowls, trenchers, &c. The white is heavy, tough, and hard, and likewife fawed into joifts, boards, &c. for building. The bark of the root is used as an ingredient in bitters, &c.

LONICERA.

HONEYSUCKLE, or WOODBINE.

Clafs 5. Order 1. Pentandria Monogynia.

HE Empalement is five parted, above and fmall.

The Corolla is of one petal and tubulous. The tube oblong and gibbofe. The border five-parted: the divifions revolute, and one deeper feparated than the reft. The Filaments are five, awl-fhaped and nearly the length of the corolla. The Antheræ are oblong.

The Germen is roundifh and beneath. The Style is thread-form and the length of the corolla. The Stigma is obtufe-headed. The Seed-veffel is a berry, umbilicated and two cell'd. The Seeds are roundifh and compreffed.

The Species, with us, (according to Linnæus's arrangement) are divided as follows, into

* Honeyfuckles

(80)

* Honeyfuckles with a trailing stalk.

I. LONICERA caroliniana. Carolinian scarlet Trumpet-flowered Honeysuckle.

This is a variety of the following, only differing in having fmaller leaves and flowers.

2. LONICERA virginiana. Virginian Scarlet Honey-Suckle.

This hath a fhrubby trailing ftalk, which requires fupport, and appears much like the common Honeyfuckle, but the fhoots are weaker. The inferior leaves are inverfe egg-fhaped, of a deep green colour on their upper fides, but whitifh underneath, fitting clofe to the branches; but thofe near the ends of the branches, are joined, forming fometimes a large fomewhat quadrangular leaf, but moftly a fmaller concave oval one. The flowers are produced in whorls upon a long naked ftalk terminating the branches, having long fearlet tubes with fhort borders. The lower leaves in warm fituations are evergreen.

3. LONICERA fempervirens. Ever-green Honeyfuckle.

This is faid to grow in Virginia, with ftrong branches, covered with a purple bark, and garnifhed with lucid green leaves, continuing their verdure all the year. The flowers are produced in manner of the former, of a bright red on their outfides and yellow within, and continuing in fucceffion from June till autumn.

* Dwarf

(81)

** Dwarf Cherries with biflorous footstalks. 4. LONICERA canadenfis. Canadian dwarf-cherry Honeysuckle.

(Bartram's Catalogue.)

This is a native of Canada, rifing with an erect fhrubby ftalk to the height of about five feet. The leaves are oval fhaped, entire, of a very thin texture and lucid green colour. The flowers terminate the branches, fitting two upon each footftalk, of a pale yellow colour, fireaked with purple, and appearing pretty early in the fpring.

*** With an erect stalk, and multiflorous footsalks.

5. LONICERA Diervilla. Yellow flowering Diervilla.

This hath flender fhrubby ftalks, feldom rifing above two feet and a half high, and generally leaning; furnifhed with fomewhat heart-fhaped, oblong, fharp-pointed leaves, flightly fawed on their edges, placed oppofite, and fitting clofe to the ftalks. The flowers are produced at the extremity and fometimes from the fides of the branches, generally two 'or three together, upon fhort footftalks; they are of a cream colour, the inferior fegment of the flower fomewhat larger and yellower than the others; they are fucceeded by oblong capfules, containing fmall feeds. This grows moft natural upon mountains, and fpreads much by its creeping roots.

6. LONICERA marylandica. Maryland scarlet Lonicera.

This, it is faid, grows in Maryland with an upright stalk, furnished with ovate, oblong, sharp-L pointed pointed leaves, which are diffinct and fit close to the stalks. The flowers are produced in erect spikes of a fearlet colour.

7. LONICERA Symphoricarpos. Indian Currants, or St. Peter's Wort.

This hath a fhrubby ftalk, which rifes from four to five feet high and fpreads into many flender branches, garnished with oval entire leaves, somewhat hairy and placed opposite upon short footstallks. The flowers are fmall and of an herbaceous colour, and are produced upon fhort, common peduncles, or footftalks, which are placed oppofite a conderable diftance along, and terminating the branches; upon which they are fet very clofe in whorls, or rather in two opposite rows. A few of these are succeeded by reddifh, depreffed, hollow and fpongy berries; ripening very late, and each generally containing two fmall round compressed feeds. This often fends off a few weak trailing branches lying upon the ground and taking root, by which it may be eafily propagated.

MAGNOLIA.

The LAUREL-LEAVED TULIP-TREE.

Clafs 13. Order 7. Polyandria Polygynia.

THE Empalement is three leaved: the leaves ovate, concave, petal form and deciduous.

The Corolla has nine petals, oblong, concave, obtufe, and narrower at the bafe.

The Filaments are numerous, fhort, fharp pointed, and compreffed; inferted beneath the germen in the common receptacle of the ftyles. The Antheræ are linear and adjoined on each fide to the margin of the filaments.

The

- The Germen are numerous, ovate-oblong, covering the clubbed receptacle. The Styles are recurved, contorted and very fhort. The Stigmas are from one end of the ftyle to the other, and villofe.
- The Seed-veffel is an ovate cone, covered with capfules, which are compressed, roundish, fcarce imbricated, crowded, acute, one cell'd, two valv'd, feffile, gaping outward and permanent.
- The Seeds are folitary, roundifh, berried, and hanging by a thread from the bofom of each fcale of the cone.

The Species are,

1. MAGNOLIA acuminata. Long leaved Mountain Magnolia, or Cucumber Tree.

This tree grows fometimes to the height of thirty or forty feet, and to eighteen inches or more in diameter; dividing into feveral branches towards the top, garnifhed with large, oblong, fharp-pointed leaves. The flowers come out early in the fpring and are composed of twelve large bluifh coloured petals. The feed-veffels are about three inches long, fomewhat refembling a fmall Cucumber; from whence the inhabitants where it grows natural, call it the Cucumber-tree.

2. MAGNOLIA glauca. Small Magnolia, or Swamp Saffafras.

This grows naturally in low, moift, or fwampy ground, often to the height of fifteen or twenty feet; covered with a whitifh fmooth bark, and dividing into feveral branches; furnished with entire, oblong, oval leaves, of a dark green on their upper furface, but whitish and a little hairy underneath. The flowers are produced at the ends of the branches, composed of fix concave, white petals, of an agreeable fmell; and are fucceeded by oval, or fomewhat what conical feed-veffels, of an inch or more in length and three fourths of an inch in diameter; composed of many capfules, which open and discharge their feeds when ripe, hanging by flender white threads, of a red colour, and near the fize of a small bean. The feeds and bark have been used with some succefs in the cure of Rheumatism, &c.

3. MAGNOLIA grandiflora. Ever-green Laurel-leaved Tulip-Tree.

This grows naturally in Florida and South Carolina, fometimes to the height of eighty feet or more, with a straight trunk of two feet or more in diameter; having a regular head. The leaves are evergreen, of a thick confiftence, pretty large, oblong, pointed, and entire: cf a lucid green on the upper fide, and fometimes of a ruffet, or buff colour on the under. The flowers are produced at the ends of the branches; they are very large, and composed of eight or ten oblong white petals, narrowed towards the bafe, but broad, rounded, and a little waved at their extremities. They are fucceeded by oblong, conical feed-veffels, difclofing their feeds after the manner of the other species. This is allowed to be one of the most beautiful ever-green trees yet known, but is impatient of cold.

4. MAGNOLIA tripetala. The Umbrella Tree.

This grows pretty frequent in Carolina, and fome parts of Pennfylvania; ufually to the height of fixteen or twenty feet, with a flender trunk, covered with a fmooth bark, and dividing into feveral branches. The leaves are very large and entire, often from twelve to fifteen inches or more in length, and five or fix in width, narrowing to a point at each extremity, placed placed at the ends of the branches in a circular manner, fomewhat refembling an umbrella; from whence it obtained its name. The flowers are composed of ten, or eleven, large, oblong, white petals, the exterior ones hanging down; and are fucceeded by oblong, conical feed-veffels, between three and four inches in length, and about one and a half in diameter, growing reddifh and difclofing their feeds, when ripe, after the fame manner of the others. There are faid to be two other fpecies in the fouthern ftates.

MENISPERMUM.

MOONSEED.

Class 22. Order 10. Dioecia Decandria.

THE Flowers are Male and Female upon feparate plants. * The Male.

The Emplement is two leaved: the leaves are linear and thort. The Corolla has four exterior petals, which are ovate, fpreading

and equal. And eight interior leffer ones, ovate and concave. The Filaments are fixteen (or more) cylindrical and rather long-

er than the corolla. The Anthera are terminal, very thort, and obtufe four lobed.

* The Female, on a different plant.

The Empalement as in the Male.

The Corolla as the Male.

The Filaments eight, like the male. The Antheræ are pellucid and barren.

The Germen are two, ovate, incurved, winking and pedicell'd. The Styles are folitary, very fhort and recurved. The Stigmas are bifid and obtufe.

The Seed-vessels are two berries, roundifh-kidney form and one cell'd.

The Seeds are folitary, large, and kidney form, or fomewhat orbicular and comprefied.

Obf. The Canadian has an Empalement and Corolla of fix leaves, alfo fix framina and three flyles.

The

The Species with us, are,

I. MENISPERMUM canadenfe. Canadian Moon-Jeed.

This hath a thick, ligneous root, fending up many twining ftalks, twifting themfelves round the neighbouring trees for fupport, becoming woody, and rifing to the height of ten or fifteen feet. Thefe are furnished with large, smooth, roundish, angled leaves, having pretty long footstalks placed on their under fides, making a hollow, or appearance of a navel on the upper fide. The flowers come out in loofe bunches from the fides of the stalks; they are fmall, of an herbaceous colour, and composed of fix oblong petals, fix short stamina, and three styles arising from as many germen; which become three channelled berries, each containing one fomewhat circular compressed.

2. MENISPERMUM carolinum. Carolinian Moonseed.

This is much fmaller and weaker than the other, fcarcely becoming fhrubby. The leaves are fmaller, entire, heart-fhaped, and villous underneath.

3. MENISPERMUM virginicum. Virginian Moonsfeed.

This much refembles the Canadian kind, the leaves are target-form, heart-fhaped and lobed.

MESPILUS.

(87)

MESPILUS.

The MEDLAR-TREE.

Class 12. Order 4. Icosandria Pentagynia.

THE Empalement is one leaved, concave-fpreading, five toothed, and permanent.

The Corolla has five petals, roundifh, concave, and inferted in the calyx.

The Filaments are twenty, awl shaped and inferted in the calyx. The Antheræ are simple.

The Germen is beneath. The Styles are five, (often lefs) fimple and erect. The Stigmas are headed.

The Seed-veffel is a berry, globofe, umbilicated, and covered with the calyx, but fomewhat perforated at the apex.

The Seeds are five, bony and gibbous.

The Species, with us, are,

* Armed with Thorns

I. MESPILUS coccinea. Cock/pur-Hawtborn.

This rifes generally to the height of ten or twelve feet, with a pretty ftrong ftem, dividing into feveral branches, which are armed with ftrong thorns, bent downwards like a cock's fpur. The leaves are fomewhat oval, but fpreading into angles, fawed on their edges, and fmooth. The flowers come out at the extremities and fides of the branches in umbels; they are pretty large and are fucceeded by fruit nearly as large as a fmall cherry and of a fine red colour when ripe.

There is a variety of this without thorns, with leaves deeper fawed on their edges, and not fo deeply veined, otherwife of the fame growth and appearance.

2. MESPILUS

2. MESPILUS Crus galli. Pear leaved Thorn.

This rifes with a ftrong ftem to the height of fifteen or twenty feet, fending off many long (and often nearly horizontal) branches, armed with long, fharp thorns. The leaves are of an oblong, oval fhape, or often narrowed towards the bafe, fawed on their edges, fmooth, and of a deep, fhining green colour, and thick confiftence. The flowers come out late, and are produced in fmall clufters at the ends of the branches. The fruit are of a middling fize and of a dark or dirty reddifh colour.

Obf. The flowers have frequently but one ftyle.

3. MESPILUS cuneiformis. Wedge leaved Mefpilus.

This grows often to the height of twenty feet or more, with a ftrong ftem of five or fix inches in diameter, covered with a dark rough bark, dividing into many branches, and armed with long fharp thorns. The leaves are funooth, wedge, or inverfeegg-fhaped, and pointed; flightly and fomewhat doubly ferrated towards their extremities, of a fhining green colour on their upper furface and veined with oblique parallel veins. The flowers are produced in fmall clufters at the ends of the branches and are fucceeded by middle fized reddifh fruit.

4. MESPILUS Azarolus major. Great Azarole, or Hawthorn.

This kind frequently rifes to the height of twelve or fifteen feet, with a ftrong ftem covered with a lightifh rough bark, dividing into many branches, and armed with many long thorns. The leaves are larger larger than those of the other kinds, somewhat eggfhaped, but toothed or angled, fawed on their edges, and much veined. The flowers are produced in umbels at the extremity of the branches and are fucceeded by large fruit, of a dark red colour.

5. MESPILUS Azarolus minor. Smaller Azarole, or Hawthorn.

This has much the appearance of the last, but is fmaller in growth, leaves and fruit.

6. MESPILUS Oxyacantha aurea. Yellow berried Hawthorn.

This rifes to the height of fix or eight feet, dividing into feveral branches and armed with fharp thorns. The leaves are fomewhat egg-fhaped, but acutely toothed and fawed on their edges. The flowers are produced as in the other kinds and are fucceeded by middling fized fruit, of a greenish yellow colour when ripe.

7. MESPILUS apiifolia. Virginian Parfley leaved Mespilus.

This is generally of low growth, rifing perhaps to the height of five or fix feet, and armed with a few tharp thorns. The leaves are fmall, thining and much cut or divided on their edges. The fruit are fmall and red coloured.

> Without ** Without spirite coloar when right

ric produced at the extremity of the branches in

arge that the of the other states for the what egge

and much veined. The flowers are produced in

(90))

8. MESPILUS nivea. Early ripe, Esculent fruited Medlar, or wild Service.

This rifes frequently to the height of fifteen or twenty feet, dividing into feveral branches, which are without thorns, and covered with a fmooth, whitish, spotted bark. The leaves are of an oblong oval; pointed, flightly and acutely ferrated, hairy and whitish at their first appearance, but becoming fmooth and of a dark green, especially upon their upper fides. The flowers are produced from the fides of the fmall branches in loofe bunches or panicles, of a fnowy white colour, and are fucceeded by fruit near the fize of a Goole-berry, which are foft, fucculent, fweet tafted, and purplish coloured when ripe. The flowers of this come out before the leaves are expanded, perfectly white, and thick fet upon the branches, making a fine appearance. The fruit is ripe in June, pretty large and of an agreeable tafte. There is a variety of this of fmaller growth, but of the fame appearance.

9. MESPILUS prunifolia. Plumb leaved Medlar.

Vorminian Pression jacons

This grows naturally in moift places rifing with flender ftems to the height of fix or eight feet, dividing into but few branches and without thorns. The leaves are inverse egg-fhaped, pointed, flightly ferrated, of a dark green on their upper furface, but lighter and downy underneath. The flowers are produced at the extremity of the branches in clusters, and are fucceeded by fmall fruit of a dark purplish colour when ripe.

There

There is a variety of this, generally rifing but to the height of two or three feet. The fruit are fomewhat larger and of the fame colour, but otherwife much refembling the other.

10. MESPILUS canadenfis. Dwarf red fruited Medlar.

This rifes to the height of four or five feet, with flender fmooth ftems, much refembling the last defcribed, except in having fruit of a red colour when ripe. There is also a variety of this of fmaller growth, which produces fruit of a beautiful red colour.

Ob/. The characters of the Cratægus and Mefpilus differ fo immaterially that, I fhould fuppofe, they might be reduced to one Genus, with much greater propriety than the Beech and Chefnut. They are Genera in which much confusion prevails amongst Botanical writers, fome claffing most of the Species under the Cratægus, others the fame Species under the Mefpilus; neither is it eafy to determine to which they, with most propriety, belong. I have frequently observed in some Species from one to three styles, in others from three to five, but not having observed any to be conftant with two, agreeably to the character of the Cratægus, have ranged none under that Genus. We have, native of these states, several Species of Mefpilus, and a great number of Varieties, which, until better difcriminated and afcertained, can never be described with any degree of accuracy.

MITCHELLA.

(92)

IC IS CALLER ALLER

MITCHELLA.

MITCHELLA.

Class 4. Order 1. Tetrandria Monogynia.

THE Flowers are twin, or two fitting upon the fame bud; and each having an *Empalement*, four parted, erect, permanent and above.

A Corolla of one petal, funnel form. The tube cylindrical; the border four-parted, fpreading and hairy within.

And four Filaments, thread-form, erect, and within the bofom of the corolla. With Antheræ oblong, and acute.

The Germen is twin, orbiculate, common to both, and beneath. The Styles are one in each flower, thread-form and the length

of the corolla. The Stigmas are four, oblong.

The Seed-veffel is a berry, two parted and globofe. The Seeds are four, comprefied and callous.

There is but one Species of this Genus, viz.

MITCHELLA repens. Creeping evergreen Mitchella.

This is a fmall plant, growing upon moffy, northern, fhaded banks, with flender fhrubby ftalks, lying clofe to the ground, and putting out roots at the joints. The leaves are ever-green, of a thick confiftence, obtufely egg-fhaped, and entire; they are placed oppofite and thick upon the branches, with fhort footftalks, and are often marked longitudinally with a whitifh vein. The flowers are produced at the bofom of the leaves, they are double, or two arifing from one bud, of a white colour, and are fucceeded by fmall roundifh red berries.

MORUS,

(93)

MORUS. cq eldente

The MULBERRY-TREE.

Class 21. Order 4. Monoecia Tetrandria.

* THE Male Flowers are difposed in Katkins.

The Empalement is four parted; the leaves ovate and concave.

The Corolla none.

The Filaments are four, awl-fhaped, erect, longer than the calyx, and one within each leaf of the flower cup. The Antheræ are fimple.

* The Female Flowers are collected, either in the fame, or a different plant from the male.

The Empalement is four leaved : the leaves are roundifh, obtufe, permanent; the two opposite exterior incumbent.

The Corolla none.

The Germen is heart fhaped. The Styles are two, awl-ihaped, long, reflexed, and rough. The Stigmas are fimple.

The Seed-veffel none. The Empalements becoming fleihy fucculent berries, jointly forming an oblong rough fruit. The Seeds, one in each berry, ovate acute.

We have but one Species, native with us, viz.

MORUS rubra. Large-leaved Virginian Mulberry Tree.

This grows common in many parts of North-America, to the height of twenty or thirty feet, and with a trunk from twelve to eighteen inches or more in diameter; dividing into many branches, which are garnifhed with large, rough, heart-fhaped, oblong, pointed leaves; fawed on their edges, and fometimes with others largely and deeply divided into two, three, or more pointed lobes. The leaves of male trees are generally largeft. The fruit is large, of a dark purplifh colour when ripe, very fucculent culent and of an agreeable tafte. The timber affords very durable pofts, for fencing, &c. As our Mulberry has been found, upon trial, to anfwer well for the purpofe of raifing filk worms, and growing fpontaneoufly and plentifully in many parts of thefe ftates; it is prefumed, many of our countrymen might profitably apply their attention to the culture of filk.

MYRICA.

CANDLEBERRY MYRTLE.

Class 22. Order 5. Dioecia Tetrandria.

THE Flowers are Male and Female on different plants. * The Male.

The Calyx is a Katkin ovate-oblong, loofe, imbricated on all fides, and confifting of Scales, which are one flowered, moon-fhape, obtufely pointed, and concave.

The Corolla none.

The Filaments are four, (rarely fix) thread-form, fhort, and erect. The Antheræ are large and twin, with two-cleft lobes. *The Female.

The Calyx and Corolla as in the male.

The Germen is fomewhat ovate. The Styles are two, threadform and longer than the calyx. The Stigmas are fimple. The Seed-veffel is a berry, of one cell.

The Seed is one.

Obf. The Gale has four framina: the Berry compressed at the apex, and three lobed: the cerifera has fix framina: the berry fucculent and roundifh.

The Species with us, are,

1. MYRICA cerifera. Candleberry Myrtle.

This grows naturally upon low boggy lands, rifing with many ftrong fhrubby ftalks, to the height of fix or eight feet; fending out feveral branches, which which are furnished with stiff spear-shaped leaves, a little fawed towards their extremities, of a yellowish lucid green on their upper sides but paler underneath, having very short footstalks, and of a grateful odour when bruised. The katkins come out on different plants from the berries, and are about an inch long, standing erect. The female flowers come out on the sides of the branches in long bunches, and are succeeded by small roundiss berries, covered with a mealy substance, and affording a kind of green wax, which is sometimes used in making candles.

2. MYRICA cerifera humilis. Dwarf Candleberry Myrtle.

This is a variety of the former kind, differing from it in being of a lower growth, the branches not fo ftrong, and covered with a greyish bark. The leaves are also shorter and broader, and more fawed on their edges. The berries afford a wax like the others.

3. MYRICA Gale. American Bog Gale.

This alfo grows naturally in bogs and fwamps, rifing with fhrubby ftalks to the height of two or three feet, garnifhed with lance-fhaped leaves, fmooth and a little fawed towards their points. The berries are dry, comprefied at the apex and three lobed.

NYSSA.

The TUPELO-TREE.

Class 23. Order 1. Polygamia Dioecia.

THE Flowers are Male and Hermaphrodite, (in fome Species Male and Female) upon different plants.

* The

* The Mate.

The Empalement is five-parted and fpreading, with a plane bottom.

The Corolla none.

The Filaments are ten, awl-fhaped and fhorter than the calyx. The Antheræ are twin and the length of the filaments.

* The Hermaphrodite.

The Empalement as in the male, fitting upon the germen.

The Corolla none.

The Filaments are five, awl-fhaped, and crect. The Anthera are fimple.

The Germen is ovate and beneath. The Style is awl-fhaped, incurved, and longer than the flamina. The Stigma is acute.

The Seed-veffel is a drupe, ovate and one cell'd.

The Seed is a nut, oval, acute, hollowed with longitudinal furrows, angled, and irregular.

Obf. The Nyssa fylvatica is Male and Female on different trees.

The Species are,

1. NYSSA aquatica. Virginian Water Tupelo-Tree.

This grows naturally in wet fwamps, or near large rivers, in Carolina and Florida; rifing with a ftrong upright trunk to the height of eighty or an hundred feet, dividing into many branches towards the top. The leaves are pretty large, of an oval, fpear-fhaped form, generally entire, but sometimes somewhat toothed, and covered underneath with a whitish down: they are joined to long, flender footftalks, and affixed to the branches in fomewhat of a verticillate order, prefenting a beautiful varied foliage. The berries are near the fize and fhape of fmall olives, and are preferved in like manner by the French inhabitants upon the Miffifippi, where it greatly abounds, and is called the Olive tree. The timber is white and foft when unfeasoned, but light and and compact when dry, which renders it very proper for making trays, bowls, &c.

2. NYSSA Ogeche. The Ogeche Lime Tree.

(Bartram's Catalogue.)

This is a tree of great fingularity and beauty; growing naturally in water, in the fouthern ftates, and rifing to the height of about thirty feet. The leaves are oblong, of a deep fhining green on their upper fides, and lightly hoary underneath. The flowers are male and female upon different trees, and are produced upon divided, or many flowered footftalks. The fruit is nearly oval, of a deep red colour, of the fize of a Damascene Plumb, and of an agreeable acid tafte; from which it is called the Limetree. Perhaps this is the *multiflora* of Weston.

3. NYSSA fylvatica. Upland Tupelo-Tree, or Sour Gum.

This grows naturally in Pennfylvania and perhaps elfewhere, rifing with a ftrong upright trunk to the height of thirty or forty feet, and fometimes of near two feet in diameter; fending off many horizontal, and often depending branches; garnished with oval, or rather inverse egg-shaped leaves, a little pointed, entire, of a dark green and shining upper furface, but lighter and a little hairy underneath: those of male trees are often narrower and fometimes lancefhaped. The flowers are produced upon pretty long common footstalks, arising from the base of the young fhoots, and dividing irregularly into feveral parts, generally from fix to ten; each fupporting a finall flower, having an empalement of fix or feven linear, unequal leaves, and from fix to eight awlfhaped fhaped fpreading ftamina, fupporting fhort four lobed Antheræ. The female trees have fewer flowers produced upon much longer, fimple, cylindrical footftalks, thickened at the extremity, and fupporting generally three flowers, fitting clofe and having a fmall involucrum. They are composed of five fmall oval leaves, and in the center an awl-fhaped incurved ftyle, arifing from the oblong germen, which is beneath, and becomes an oval oblong berry, of a dark purplifh colour when ripe. The timber of this tree is clofe grained and curled fo as not to be fplit or parted; and therefore much used for hubs of wheels for waggons, carriages, &c.

OLEA.

The OLIVE. TREE.

Class 2. Order 1. Diandria Monogynia.

THE Empalement is of one leaf, tubular, and fmall: the border four-toothed, erect and deciduous.

The Corolla is one petal'd, funnel-form. The tube cylindrical, the length of the empalement. The border four-parted and plain: the divisions femi-ovate.

The Filaments two, oppofite, awl-fhaped and fhort. The Antheræ erect.

The Germen is roundifh. The Style fimple, very flort. The Stigmas two-cleft, thickened, the divisions end-nicked.

The Seed-veffel a drupe, fomewhat ovate, fmooth, and one cell'd. The Seed ovate-oblong, and wrinkled,

The Species with us,

OLEA americana. American Olive Tree.

This grows naturally in Carolina and Florida, and is a beautiful ever-green tree. The leaves are nearly ovate, or fomewhat oblong, perennial, of a fhining, full full green, on their upper furface, and of a folid confiftence. The fruit or berries are nearly oval, of the fize of a fparrow's egg, of a beautiful bluissue of a former of a nebula or gloom.

PHILADELPHUS.

SYRINGA, or MOCK-ORANGE.

Class 12. Order 1. Icosandria Monogynia.

THE Empalement is one leaved, four parted, fharp pointed, and permanent.

The Corolla has four petals, roundifh, plane, large and fpreading.

The Filaments are twenty, awl-shaped and the length of the calyx. The Antheræ are creft and four furrowed.

The Germen is beneath. The Style is thread form and fourparted. The Stigmas are fimple.

The Seed-veffel is a capfule, oval, fharp-pointed, part furrounded by the calyx, with four cells, and four valves. The Seeds are numerous, oblong and fmall.

We have, with us, but one Species, viz.

PHILADELPHUS inodorus. Carolinian Scentle/s Syringa.

This is faid to grow naturally in Carolina; rifing with a fhrubby ftalk to the height of twelve or fifteen feet, fending out oppofite branches, furnished with fmooth, entire leaves, shaped like those of the Pear tree, but standing opposite upon pretty long footstalks. The flowers are pretty large and have large empalements of four acute-pointed leaves, and four white, oval, spreading petals, and a great number of stamina with yellow summits. This is impatient of much cold.

PINUS.

(100)

ton a to bat of the U N N I I P are nearly over

The PINE - TREE

Clafs 21. Order 9. Monoecia Polyandria.

* THE Male Flowers are disposed in Racemi or bunches.

• The Calyx none but the fcales of the bud, gaping. The Corolla none.

The Filaments are numerous and joined beneath in an erect column, divided at top. The Anthera are erect.

* The Female Flowers are in the fame plant.

The Calyx is a common, fomewhat ovate cone, confifting of Scales, which are two flowered, oblong, imbricated, rigid, and permanent.

The Corolia none.

The Germen is very finall. The Style is awl-shaped. The Stigma fimple.

The Seed-ve[[el none, but the fcales of the cone.

The Seed is a nut, increased with a membranaceous wing, which is larger than the feed, but smaller than the scale of the cone, oblong, straight on one fide and gibbous on the other.

The Species, with us, are,

I. PINUS echinata. Three leaved prickly-coned Bastard Pine.

This grows naturally in Virginia. The leaves are long and narrow, fometimes three, at other times but two in each fheath. The cones are long and flender, their fcales terminating in fharp points.

2. PINUS palustris. Longest three leaved Marsh Pine.

This grows naturally in South Carolina, and is of a middling growth. The leaves are produced by threes in a fheath and are often ten or twelve inches in in length. The cones are long and large, opening and dropping their feeds in the fall. It is accounted equal to any for yielding tar, &c.

3. PINUS rigida. Common three leaved Virginian Pine.

This grows common in many places throughout these states, rising often to the height of sixty or seventy feet, with a large erect trunk, dividing into branches towards the top, and furnished with pretty long leaves growing by threes in a sheath. The cones are often produced in clusters round the branches, they are about three inches long and have rigid scales. There are whole Forests of many hundred acres of these trees in some back parts of the country, of which great quantities of Boards are saved and floated down some of our long rivers.

4. PINUS Strobus. New-England, or White Pine,

This is allowed to out top in growth moft of our other trees, rifing with a large erect trunk, to the height of an hundred feet or more, covered with a fmooth bark and fending off many long branches. The leaves are long and flender, growing by fives in a fheath, and fet thick on the branches. The cones are often fix or feven inches in length, and generally befmeared with turpentine, with which thefe trees much abound. The cones generally open about the first of September, foon after which the feeds drop out. This alfo grows in great plenty towards the heads of fome of our rivers, from whence great quantities are rafted down, affording excellent masts, yards, fpars, &c. &c. for ship building.

· ECHERY'S SE

5. PINUS

5. PINUS Täda. Virginian Swamp, or Frankincence Pine.

This grows to a pretty large fize, the leaves are very long and narrow and are produced by threes in a fheath. The cones are pretty long and large. This is useful for boards, and for producing turpentine and tar, as are the other kinds.

6. PINUS virginiana. Two-leaved Virginian, r dische or Jerfey Pine.

This is generally of but low growth, but divided into many branches. The leaves are broader and fhorter than the other kinds, and of a deeper green colour; they are produced by twos in each fheath. The cones are fmall, each fcale terminating with a prickly point. This is called, in fome places, Spruce Pine.

PINUS-ABIES.

This is allowed to out top in growth mold of our other the FIR - TR E E. . To the

1. PINUS-ABIES Balfamea. Balm of Gilead

The leaves are long ... First Tree, on of the south of I

rate and for thick on the branches. The cones

This tree grows to the height of thirty or forty feet, fending off many branches, which are thick fet chiefly upon two fides, with ftiff linear leaves, refembling those of the Yew. The furface of the trunk is almost covered with small bladders, or rifings in the cuticle of the bark, which are filled with a clear balfam or turpentine. The cones are pretty large, and fall to pieces in the autumn.

2. PINUS-

S. PINDS

2. PINUS-ABIES canadenfis. Newfoundland Spruce.

There are faid to be three varieties of this, diftinguifhed by the colour of their cones, into white, red and black; fome of which, fometimes become pretty large trees. The leaves are ftiff and linear, and flightly channelled on both fides, fmaller than those of the Balm of Gilead, and fet equally upon all fides of the branches. The trees make a very good appearance, and of these the famous Sprucebeer is brewed.

3. PINUS-ABIES americana. Hemlock Spruce Fir-Tree.

This rifes up with but a flender trunk, fometimes to a great height, and is generally thick fet with fomewhat horizontal branches. The leaves are fhaped much like those of the Yew and are ranged upon two fides of the branches, fo appearing flat, like those of the European Silver Firs, but are of a pale green on both fides. The cones are very small, loofe, and of an oval oblong form. The bark is faid to be good for tanning leather; and with it, our natives dye their soft for bases of a red colour.

PINUS-LARIX.

The LARCH-TREE.

I. PINUS-LARIX rubra. Red American Larch-Tree.

This fhoots up to a confiderable height with a flender erect trunk, fending off many flender branches. The The leaves are pretty long, linear and foft, coming out in fafciculi, or fmall bundles fpreading like a painter's brufh, and are fet pretty thick round the branches. They are of a light green colour and deciduous. The cones are of a fine red colour at their first appearance; they are fmall, perhaps three-fourths of an inch long, and half an inch thick, the fcales fmooth, opening early in the fall and dropping their feeds, which are very fmall and winged.

2. PINUS-LARIX alba. White American Larch-Tree.

This a variety of the other, differing very little, except in the cones, being of a greenish white colour.

3. PINUS-LARIX nigra. Black American Larch-Tree.

This is alfo a variety differing in having dark cotoured cones.

PLATANUS.

The PLANE-TREE.

Clafs 21. Order 8. Monoecia Polyandria.

THE Flowers are Male and Female upon the fame plant. * The Male Flowers are difposed in a globose katkin. The Calyx confists of some very small segments. The Corolla is scarce manifest.

The Filaments are oblong, thicker above, and coloured. The Antheræ are four cornered, moving round the filaments to the inferior fide.

*The Female Flowers are difpofed in a globe.

The Calyx confifts of many fmall fcales.

The Corolla of many petals, concave, oblong and clubbed.

The

The Germen are many, difposed in a globe and ending in awlshaped Styles, with recurved Stigmas.

The Seed-veffel none. But a globofe receptacle.

The Seeds are oblong, angular and clubbed, crowned by the permanent flyle, and with a capillary pappus adhering at the bafe,

Obf. I am in doubt with regard to the petals.

We have, with us, but one Species, viz.

PLATANUS occidentalis. American Plane-Tree, or Large Button Wood.

This grows common by creeks and river fides in many parts of America. It is of quick growth, and often becomes a large tree of fixty or feventy feet in height and above three feet in diameter, fending off but few long, diverging branches, which together with the upper part of the trunk, are generally covered with a fmoothifh bark, annually, or often renewed, and falling off in thin plates or fcales. The leaves are broad, and cut into angles, or lobed; having feveral acute indentures on their borders, of a light green on their upper fide, but paler, and a little wooly underneath; with long footstalks, and placed alternately. The flowers are produced in round pendulous balls, of near an inch in diameter, upon very long footstalks. This is fometimes fawed into boards, and has been much uled of late by our card-makers, for card-boards or backs.

POPULUS.

The POPLAR-TREE,

0

Class 22. Order 7. Dioecia Octandria. THE Flowers are Male and Female on different Plants. *The Male.

The

The Calyx is a common katkin, oblong, loofely imbricated, and cylindrical; composed of Scales which are one flowered, oblong, and plane, with the margin torn.

The Corolla none, but

A Nectarium of one leaf, top fhaped and tubulous beneath, but oblique and terminating in an oval border above.

The Filaments are eight, very fhort. The Antheræ are fourcornered and large.

* he Female.

The Katkin, Scales, and Nettaria, are like the Male.

The Germen is ovate-fharp pointed. The Style is fcarce manifeft The Stigma is four cleft.

The Seed-vessels are ovate capfules, two cell'd and two valv'd: the valves reflexed.

The Seeds are numerous and ovate, with a volatile capillary pappus.

The Species, with us, are,

1. POPULUS deltoide. White Poplar, or Cotton Tree of Carolina.

(Bartram's Catalogue.)

Laver are broad and cut into anyless or lobed 1

This becomes a tall tree, with a large creft trunk, covered with a white, fmoothifh bark, refembling that of the Afpen tree. The leaves are large, generally nearly triangular, toothed or indented with fharp and deep ferratures, of a fhining full green on their upper furface, but fomewhat lighter or hoary underneath; ftanding upon long flender footftalks, and generally reftkefs or in motion. The timber is white, firm, and elaftic, principally ufed for fence rails. It grows naturally upon rich low lands, on the banks of large rivers in Carolina and Florida.

2. Populus

2. POPULUS heterophylla. Virginian Poplar-Tree.

This becomes a pretty large tree, the branches of which are nerved, appearing as if quadrangular. The leaves are large and variously shaped, fome roundish, others heart-form, slightly fawed on their edges and downy at their first appearance.

3. POPULUS nigra. Black Poplar.

This is not of very large growth, but covered with a darkifh rough bark. The leaves are fomewhat triangular, pretty long pointed, flightly and obtufely fawed on their edges, ftanding upon pretty long footftalks, finooth and of a bright green on their upper furface, but lighter and a little downy underneath.

4. POPULUS tremula. American Aspen-Tree.

This grows frequently to the height of about thirty feet, covered with a fmooth whitifh bark. The leaves are fmall, fmooth on both fides, of a dark green colour above, but lighter underneath; roundifh, and a little pointed, or forming nearly an equilateral fpherical triangle; flighty crenated, a little waved on their edges, and trimmed with a very narrow hairy border. Their footftalks are pretty long, roundifh at the bafe, but comprefied on their fides towards the bafe of the leaves. The katkins are large appearing early in the fpring.

5. POPULUS balsamifera. Balsam, or Tacamahac-Tree.

This is a tree of but middling growth, covered with a light brown bark. The leaves are large, fomewhat fomewhat heart-fhaped, lightly toothed, or crenated on their edges, of a dark green on their upper furface but lighter underneath. The buds abound with a glutinous refin, which is the tacamahacca of the fhops.

6. POPULUS balfamifera lanceolata. Lance-leaved Balfam Tree.

This is a variety of the laft kind, of a fmall and very flow growth. The leaves are fpear-fhape, of a bright green above, but whitifh and variegated with brownifh veins beneath, with a few, fcarce obfervable, ferratures on their edges, and joined to fhort, channelled, and often fomewhat reddifh footftalks.

POTENTILLA.

SHRUB CINQUEFOIL.

Clafs 12. Order 5. Icofandria Polygynia.

THE Empalement is of one leaf, planish, and half five cleft: the alternate divisions are less and reflexed.

The Corolla has five petals, roundifh, fpreading, and inferted by claws in the calyx.

The Filaments are twenty, awl-fhaped, fhorter than the corolla, and inferted in the calyx. The Antheræ are elongate-moonfhaped.

The Germen are numerous, very fmall and collected in a little head. The Styles are thread-form, the length of the ftamina, and inferted in the fides of the germen. The Stigmas are obtufe.

The Seed-ve[sel none, but a common receptacle, which is roundifh, juicelefs, very fmall, permanent, covered with feeds and included in the calyx.

The Seeds are numerous and fharp pointed.

We have but one Species, viz.

POTEN-

POTENTILLA fruticosa americana. American schrubby Cinquefoil.

This is a fmall fhrub, feldom rifing above two feet high, and fpreading into many branches. The leaves are fmall and thick fet upon the branches, they are winged, and composed, generally, of five fmall, oblong hairy lobes, reflexed on their edges and ftanding together. The flowers are produced pretty thick on the branches, of a yellow colour, and are fucceeded by fmall heads of pointed feeds.

PRINOS.

The WINTER-BERRY.

Class 6. Order 1. Hexandria Monogynia.

THE Empalement is one leaved, plane, half-fix-cleft, very finall, and permanent.

The Corolla has one petal, wheel-fhaped. The tube none. The border is fix parted and plane: the divisions ovate.

The Filaments are fix, awl-fhaped, erect and fhorter than the corolla. The Antheræ are oblong and obtufe.

The Germen is ovate, ending in a Style florter than the flamina, with an obtufe Stigma.

The Seed-veffel is a roundifh berry, with fix cells; and far larger than the calyx.

The Seeds are folitary, bony, obtufe, convex on one fide and angled on the other.

Obf. Sometimes a fixth part of the number is excluded.

There are two Species of this Shrub, viz.

1. PRINOS glaber. Evergreen Winter-Berry.

This grows in feveral parts of North America, rifing up with flender fhrubby flalks to the height of fix or eight feet, dividing into branches, which are garnifhed garnished with small, evergreen, oblong, smooth leaves, of a thick confistence, with a few flight ferratures towards their points, and placed alternate, upon shortish footstalks. The flowers are produced from the bosom of the leaves upon short footstalks;

(110)

and are fucceeded by fmall roundifh berries, of a black colour when ripe.

2. PRINOS verticillatus. Virginian Winter-Berry.

This grows naturally in moift places, by ftreams of water; generally fending up feveral flender ftalks to the height of eight or ten teet, dividing into a few branches towards the top. The leaves are lancefhaped, fharp pointed, and acutely fawed on their edges; having fhort flender footftalks, and placed alternately. The flowers come out at the bofom of the leaves in fmall Corymbi or Clufters; of an herbaceous colour. They are fucceeded by roundifh berries of a red colour when ripe, and remaining long on the branches, almoft furrounding them in places and fomewhat refembling a whorl.

Note, The inner bark of this fhrub is very good to make poultices of for ripening tumors.

PRUNUS.

The PLUMB-TREE.

Class 12. Order 1. Icosandria Monogynia.

THE Empalement is one leaved, bell-fhaped, five cleft, and deciduous; the divisions are obtuse and concave.

The Corolla has five petals, roundifh, concave, large, fpreading, and inferted by claws in the calyx.

The Filaments are from twenty to thirty, awl-fhaped, near the length of the corolla, and inferted in the calyx, The Antheræ are twin and fhort.

The

The Germen is roundifh. The Style is thread-form and the length of the flamina. The Stigma is orbiculate. The Seed-veffel is a roundifh drupe. The Seed is a nut, roundifh and compreffed.

The Species, with us, are,

I. PRUNUS americana. Large Yellow Sweet Plumb.

This generally rifes to the height of twelve or fifteen feet, fpreading into many ftiff branches. The leaves are oblong, oval, acute pointed, fharply fawed on their edges and much veined. The flowers generally come out very thick round the branches, often upon thick fhort fpurs; and are fucceeded by large oval fruit, with a fweet fucculent pulp. We have a great variety of thefe, growing naturally in a good, moift foil, with reddifh and yellowifh fruit, but differing much in fize, tafte, and confiftence.

2. PRUNUS angustifolia. Chicafaw Plumb.

This is fcarcely of fo large a growth as the former, but rifing with a ftiff fhrubby ftalk, dividing into many branches, which are garnifhed with fmooth lance-fhaped leaves, much fmaller and narrower than the firft kind; a little waved on their edges, marked with very fine, flight, coloured ferratures, and of an equal, fhining green colour, on both fides. The bloffoms generally come out very thick, and are fucceeded by oval, or often fomewhat egg-fhaped fruit, with a very thin fkin, and foft fweet pulp. There are varieties of this with yellow and crimfon coloured fruit. Thefe being natives of the fouthern ftates, are fomewhat impatient of much cold.

3. PRUNUS

(112)

3. PRUNUS missifippi. Crimfon Plumb.

This grows naturally upon the Miffiffippi, and is of larger fize than most of the other kinds. The fruit are crimfon coloured, and fomewhat acid.

4. PRUNUS maritima. Sea side Plumb.

This grows naturally towards the fea coaft, rifing to the height of eight or ten feet, often leaning, and fpreading into many branches. The leaves are oblong, rather fmaller and not fo pointed as those of the common plumb; fmooth and of a fhining green on the upper fide, but fomething lighter underneath, and flightly fawed on the edges. This is generally well filled with flowers, a few of which are fucceeded by fmall, roundifh fruit.

5. PRUNUS declinata. Dwarf Plumb.

This is of a fmall dwarfifh growth, feldom rifing above four or five feet high, but frequently bearing fruit at the height of two or three; which is fmall, and almost black when ripe.

To this Genus alfo belongs

the state of the second document document of the second se

The CHERRY-TREE.

Of which our Species are,

1. PRUNUS-CERASUS Virginiana. Virginian Bird-Cherry-Tree.

This grows naturally in a rich moift foil, often to the height of forty feet or more, with a trunk of eighteen eighteen or twenty inches in diameter, generally retaining its thicknefs a confiderable height, and branching out towards the top. The leaves are lance-fhaped, or long, narrow, pointed, and fawed on their edges. The flowers are produced in bunches, generally pretty thick fet on the branches; they are of a white colour, and are fucceeded by fmall fruit, of a purplifh colour when ripe, and of a difagreeable, bitter tafte, but greedily devoured by the birds.

The timber is of a reddifh ftreaked colour, capable of receiving a fine polifh; and is frequently fawed into boards, and ufed by joiners, cabinent-makers, &c. for many purpofes.

2. PRUNUS-CERASUS canadenfis. Canadian, or Dwarf Bird-Cherry-Tree.

This is a fmall kind, growing to the height of fix or eight feet, and dividing into branches, which are furnished with broader and shorter leaves, somewhat refembling those of the Apple, or Crab-tree, but smaller. The flowers are produced in a racemus, or bunch, composed of more footstalks than the Virginian kind; and are succeeded by fruit of near the fame colour and fize, not of so bitter a taste, but greatly corrugating the mouth and throat, so as to obtain the name of Choak-Cherry.

3. PRUNUS-CERASUS montana. Mountain Bird-Cherry-Tree.

This grows naturally upon the mountains in the back parts of Pennfylvania; rifing up with a flender ftem to the height of twelve or fifteen feet, and dividing into a few very flender branches, furnished with leaves refembling the first, or Virginian kind. P The fruit is likewife produced in the fame manner, but is fmaller, of a red colour, and an extremely acid tafte.

And also to the Genus Prunus, belongs,

LAURO-CERASUS.

The LAUREL-TREE.

Of which we have but one Species, viz.

PRUNUS-LAURO-CERASUS ferratifolia. Carolinian Evergreen Bay-tree.

This is a beautiful evergreen fhrub, but of fmall growth; fpreading with lateral branches, on every fide and covered with a brown bark. The leaves are fpear-fhaped, above two inches long and three quarters of an inch or more in breadth, with a few fharp ferratures on their edges, ftanding alternately on very fhort footftalks, of a thick confiftence, and fhining green colour, continuing their verdure all the year. The flowers are generally very numerous, perfectly white, and are fucceeded by roundifh fruit of the fize of a middling cherry, of a black colour when ripe. This is a native of South Carolina, and other fouthern States.

PTELEA.

PTELEA.

Clafs 4. Order 1. Tetrandria Monogynia.

THE Empalement is five-parted, acute, and fmall. The Corolla has four petals, ovate-lanced, plane, fpreading, larger than the calyx, and coriaceous.

The

(114)

The Filaments are four, awl-fhaped. The Antheræ are roundifh. The Germen is orbiculate and compressed. The Style is fhort. The Stigmas are two, a little obtuse.

The Seed-veffel is a roundish, perpendicular membrane, in the center two cell'd.

The Seed is one, obtufe, and leffened at the bafe.

Obf. The Petals and stamina, also the divisions of the calyx, have often one added to their number.

We have, with us, but one Species, viz.

PTELEA trifoliata. Carolinian Shrub-Trefoil.

This rifes with an upright woody ftem, to the height of ten or twelve feet, dividing into many branches, covered with a fmooth greyifh bark. The leaves are trifoliate, or composed of three oval, fpear-fhaped lobes, of a bright green on their upper fide, but paler underneath, and inferted together at the end of a pretty long footftalk. The flowers terminate the branches in a kind of umbel, or large branching heads, of a whitifh herbaceous colour; and are fucceeded by roundifh, flat, bordered capfules, fomewhat refembling those of the Elm, each containing two feeds.

PYROLA.

WINTER.GREEN.

Clafs 10. Order 1. Decandria Monogynia.

THE Empalement is five-parted, finall, and permanent.

L The Corolla is composed of five petals, which are roundish, concave, and spreading.

The Filaments are ten, awl-fhaped, fhorter than the corolla. The Antheræ are nodding, large, and two-horned upward. The Pistillum has a roundish, angular Germen; a filiform, permanent Style, longer than the stamina; and a thickish Stigma. The

P YPOLA

The Pericarpium, or Seed-vessel, is a roundifh, depressed, pentagonal Capsule, with five cells, gaping at the angles. The Seeds are numerous and chaffy.

Obf. The Stamina and ftyle differ fometimes in fituation.

The Species, with us, are,

1. PYROLA maculata. Spotted Pyrola.

This is a fmall plant, feldom rifing above four or five inches high, with flender ligneous stalks. The leaves are ever-green, oblong and pointed, of a thick confiftence, with a few fharp ferratures on their edges; fmooth and of a dark green on their upper fides, but marked with a broad, branching, longitudinal vein or ftreak, of a whitifh or paler colour; and fomewhat reddifh underneath. There are generally three or four of these placed at the top of the ftem fomewhat horizontally, and fometimes fmaller ones beneath, fet by threes, The flowers are likewife produced at the top upon a pretty long, (nodding at first, but afterwards erect) divided footstalk, often fuftaining two or three white flowers, which are fucceeded by roundifh, depreffed capfules, filled with fmall feeds.

2. PYROLA rotundifolia. Round leaved Pyrola.

This is of fmaller growth than the former, having about three or four roundifh leaves, rifing from the root, with pretty long three fided footftalks, channelled above. Thefe often become pretty large and a little waved on their edges, they are of a light green, and fcarcely perennial. The flowers are produced upon a radical triangular footftalk, of four or five inches in length, in form of a racemus or bunch, fupporting five or fix white flowers, which are fucceeded by fmall, round, depreffed capfules.

3. PYROLA

3. PYROLA umbellata. Umbellated Pyrola.

This grows commonly to the height of five or fix inches, generally fet pretty thick with leaves, which are wedge-fhaped or narroweft towards the bafe, fmooth, of a fhining green, and fharply fawed on their edges. The flowers terminate the ftalks on a pretty long divided footftalk, in a kind of little umbel, which is nodding at first but becomes erect, fupporting five or fix round, pentagonal, depreffed capfules, filled with fmall feeds.

A decoction or infufion of this, has been used with confiderable fuccess as a substitute for the Peruvian bark. The roots are faid to give ease in the tooth ach. This kind is called by the Indians *Phipfefawa*.

PYRUS.

The PEAR-TREE.

Class 12. Order 4. Icosandria Pentagynia.

THE Empalement is of one leaf, concave, half five-cleft, and permanent; the fegments fpreading.

The Corolla has five roundifh, concave, large petals, inferted in the empalement.

The Filaments are twenty, awl-fhaped, fhorter than the corolla, and inferted in the empalement. The Antheræ fimple.

The Germen is beneath. The Styles five, thread-form, the length of the stamina. The Stigmas simple.

The Seed-ve[fel a pome, roundifh, umbilicated and flefhy, with five membranaceous cells.

The Seeds a few, oblong, obtufe, fharpened at the bafe, conyex on one fide and plane on the other.

To this Genus belongs

MALUS.

(118)

MALUS.

The APPLE - TREE.

Of which we have one Species, viz.

PYRUS-MALUS coronaria. Virginian sweet-scented Crab-Tree.

This often grows to the height of twelve or fifteen feet, dividing into many ftiff branches, fet pretty thick with fhort ftiff fpurs. The leaves are fomewhat like those of the Apple-tree, but often toothed, or largely and irregularly fawed on their edges. The flowers generally come out thick upon the branches, upon pretty long dividing footftalks; they are pretty large, of a beautiful blush colour, and fragrant odour at their first appearance. The fruit is small, hard, roundish, umbilicated, and extremely acid. It is frequently used for conferves, &c. There is faid to be a variety of this in Carolina with evergeen leaves, though I have never feen it.

QUERCUS.

The OAK-TREE.

Class 21, Order 8. Monoecia Polyandria.

* THE Male Flowers are difpofed in a loofe katkin.

The Empalement is of one leaf, four or five-parted; the divisions are acute and often bifid.

They have no Corolla.

The Filaments are feveral, very fhort. The Antheræ large and double.

* The Female are in close buds, on the fame plant with the Male.

The Perianthium is of one leaf, coriaceous, hemifpherical, rough, and entire, fcarce manifest in the flower.

There

There is no Corolla.

The Germen is egg-fhaped and finall. The Style fimple, fivecleft and longer than the empalement. The Stigmas are fimple and permanent.

There is no Seed-veffel, but an oval, columnar, fmooth nut, fhaved at the bafe and affixed in the flort calyx.

The Species and Varieties with us, are many, which, I think, may be divided in the following manner, into

* Quercus alba. White Oak.

1. QUERCUS alba. Common American White Oak.

This grows very common, and with age arrives to the fize of a large tree of feventy or eighty feet in height, and of three, four, five, or more feet in diameter; dividing into many large branches, and covered with a whitish fealy bark. The leaves are narrowed towards the bafe, but fpreading and deeply finuated obliquely, towards the ends; the finuses obtufe, the angles, or productions unequal in length, entire and obtufe. They are of a glaucous, or light green underneath and have very fhort footftalks. The acorns are middling fized, fitting in fmall fhallow cups. There are fome varieties of this, differing in the hardness and toughness of the timber, and fomewhat in their acorns or fruit. It affords a hard, tough, useful and valuable timber, which is hewed into beams, &c. for frame buildings; fawed into plank, &c. for fhip building; and applied to various other useful purposes. Our fwine are often wholly fatted upon the feveral kinds of acorns, but for thefe and Chefnut Oak they feek most diligently.

2. QUERCUS

2. QUERCUS alba minor. Barren White Oak.

This grows generally upon poor, barren, or wafte land, rifing perhaps to the height of thirty or forty feet, covered with fealy greyifh bark. The leaves are fomewhat rough, but of a fhining green above, fomewhat paler underneath; they are finuated deeply, most obtufely, and irregularly; the lobes or productions (if I may be allowed the expression) are obtufe, often fomewhat angular, and very irregular. The acorns are small and striped. The timber is accounted very durable for posts, to fet in the earth; otherwise not much esteemed unless for fuel.

3. QUERCUS alba paluftris. Swamp White Oak.

This becomes a pretty large fpreading tree, of two or three feet in diameter and of proportionable height. The bark is often rougher or more furrowed than the other kinds, and greyifh coloured. The leaves are fomewhat wedge-fhaped or narrowed towards the bafe, and toothed on their edges and extremities. The acorns are larger and rounder than those of the common White Oak, and have larger and thicker cups, fupported often by pairs upon a long, ftrong footftalk.

** Quercus nigra. Black Oak.

Della Richt

4. QUERCUS nigra. Common Pennfylvanian Black Oak.

This grows to the height of fixty or feventy feet, and to three or four feet in diameter, with large fpreading branches. The leaves are large, fpreading, and fomewhat woolly; their footftalks longer than those of the White Oak. They are irregularly ly and fometimes pretty deeply finuated, the angles or productions unequal, generally obtufe, yet with their veins extending in a briftly point. The acorns are roundifh and not large, fitting in thick fealy cups. There is, I think, a variety of this of much finaller growth, with larger leaves and differing fomewhat in the fruit. Our common Black Oak is ufed much (where Cedar is fearce) for making fhingles, and alfo for rails, &c.

5. QUERCUS nigra digitata. Finger-leaved Black Oak.

This grows naturally in low lands, rifing to the height of thirty or forty feet, with a trunk of confiderable thicknefs, covered with a rough blackifh bark. The leaves are finuated, or divided towards their extremities into two or three pretty long, fomewhat finger-fhaped lobes, of unequal length, with others fhorter, fometimes at the fides; all of which end in a briftly point. The acorns are fmall, but the cups pretty large.

6. QUERCUS nigra trifida. Maryland Black Oak.

This grows naturally in Maryland, and other low lands, with a trunk of eighteen inches or two feet in diameter, and thirty or forty feet in height. The leaves are wedge-fhaped, or narrowed towards the bafe, and three-pointed, with briftly terminations. The acorns and cups refemble the laft mentioned.

7. QUERCUS nigra integrifolia. Entire-leaved Black Oak.

This grows about the fize of the other low-land Black Oak, and is of the fame appearance, except Q the the leaves being fomewhat inverse egg-shaped, and often a little notched or indented on each fide towards the extremity.

8. QUERCUS nigra pumila. Dwarf Black Oak.

This grows naturally upon poor barren ridges, rifing to the height of five or fix feet, with a crooked, branching ftem. The leaves are about three pointed, much refembling those of the Maryland Black Oak. The acorns are small, and stand in small shallow cups. This, I believe, is of little use or beauty.

* * * Quercus rubra. Red Oak.

9. QUERCUS rubra maxima. Largest Red Oak.

This often becomes a large tree, of the height of feventy or eighty feet and of four, five, or fometimes fix feet in diameter; retaining its thicknefs to a confiderable height, and without lateral branches, but fpreading at the top. The leaves are large, obtufely and but lightly finuated, the angles acute, each often terminating with feveral acute, briftly points. The acorns are large and fomewhat conical, fitting in broad fhallow cups. The timber is ufed for flaves, fhingles, rails, &c.

10. QUERCUS rubra ramofifima. Water Red Oak.

This grows most naturally by creek fides, or in low wet places, rifing to the height of a pretty large tree; generally thick fet with flender lateral branches, and covered with fomewhat fmooth, greyish coloured bark. The leaves are finall, obtufely and deeply ly finuated, pretty uniformly, almost to the midrib; the angles or lobes are narrow, acute, and unequal, each terminating with feveral briftly points. The acorns and cups are fmall. This is generally known by the name of Water or Low Land Spanish Oak. The buts of these trees are often used for rimming of carriage wheels, &c.

11. QUERCUS rubra montana. Upland Red Oak.

This grows naturally upon higher and poorer land than the others, often attaining to fifty or fixty feet in height. The bark is fomewhat rough and lightifh coloured. The leaves are deeply and obtufely finuated, fomewhat regularly; the angles fomewhat bitrifid, or ending in feveral acute, briftly points; their footftalks are pretty long. The acorns and cups are middling fized. The timber is generally worm eaten, or rotten at heart, therefore of little efteem. It is likewife commonly known by the name of Spanifh Oak; and, I think, has fome varieties differing in the fize of their fruit and leaves.

12. QUERCUS rubra nana. Dwarf Barren Oak.

This grows naturally upon dry barren ridges, and is found from five to ten feet high, generally growing very crooked. The leaves are fmaller, but fomewhat refemble those last defcribed. The acorns and cups are fmall, the acorns red at the base and striped when taken first from their cups. It is called barren from its place of growth, but is generally almost covered with fruit, fitting very close on all fides of the branches.

**** Quercus

(124)

**** Quercus Phellos. Willow-leaved Oak.

13. QUERCUS Phellos angustifolia. Narrow Willow-leaved Oak.

This grows naturally in low lands, and to the height of fifty or fixty feet, with a trunk of confiderable fize. The leaves are entire, fmooth, oblong, and lance-fhaped, of about three inches in length and half an inch in breadth, and have very fhort footftalks. The acorns and cups are fmall. The timber is found and good.

14. QUERCUS Phellos latifolia. Broad Willowleaved Oak.

This tree very much refembles the other in every refpect, except in having leaves of about double the width; and broader but perhaps florter cups and acorns.

15. QUERCUS Phellos fempervirens. Evergreen Willow-leaved Oak.

This grows naturally in Carolina, becoming a pretty large tree, of the height of forty feet or more. The leaves are perennial, entire, fomewhat oval, fpear-fhaped, of a dark green colour and thick confiftence. The acorns are fmall, oblong, fitting in fhort cups, and containing a very fweet kernel. The timber is hard, tough and coarfe grained.

***** Quercus

***** Quercus Prinus. Chefnut-leaved Oak.

16. QUERCUS Prinus. Chefnut-leaved Oak.

This grows naturally upon a light gravelly foil, frequently to forty feet or more in height, and above two feet in diameter; covered with a furrowed, lightifh coloured bark. The leaves are fomewhat oval and uniformly crenated on their edges, or rather fometimes obtufely toothed. The acorns are fmooth and large, greenifh coloured and fitting in fhallow fpreading cups. The timber fomewhat approaches towards that of Chefnut in appearance, but affords very good fuel, rails, &c.

17. QUERCUS Prinus humilis. Dwarf Chefnut or Chinquepin Oak.

This generally rifes with feveral fhrubby, fpreading ftalks, to the height of two or three feet. The leaves are fomewhat wedge-fhaped and toothed, or flightly and obliquely finuated. The acorns and cups pretty much refemble those of the large kind, but are confiderably fmaller.

It may not be improper here to make fome remarks with refpect to cutting, or felling of timber. Long experience, I think, hath fufficiently afcertained, that timber cut down in the fpring of the year, when full of fap, and the leaves fully expanded; and alfo in the third or laft quarter of the moon's age; is much more durable than when cut at any other time. Timber when full of fap and vigour, in all probability, contains alfo more oily particles, which, in proportion as they abound, are known to add to its durability. With regard to the influence of the moon, it may probably be accounted a fuperfitious

flitious or whimfical fancy, but that it materially affects timber is a fact well known to those who strip, or peel bark for the ufe of tanners; and when accounted for in one cafe, may probably throw fome light upon the other. But further, it is also a fact well known, that timber, whole bark has been fufficiently separated and peeled round at the but, in order for deading, as it is termed; if done in the decreafe of the moon, retains its greenness often a confiderable time; but if in the increase, withers in a much fhorter time. From hence, I think, we may conclude, that the fap or juice of trees, has a kind of monthly circulation, or revolution; afcending in the moon's decreafe, but descending in the increase. However, be this as it may, the falling of timber in the different phasis of the moon, is confidently afferted, from experience, to materially affect its durability.

RHODODENDRUM.

DWARF ROSE-BAY.

Clafs 10. Order 1. Decandria Monogynia.

THE Empalement is of one leaf, five parted and permanent. The Corolla of one leaf, wheel-funnelled : the border spread-

ing: the divisions rounded.

The Filaments ten, thread-form, almost the length of the corolla, and declined. The Antheræ oval.

The Germen five cornered, retufe. The Style thread-form, the length of the corolla. The Stigma obtufe.

The Seed-veffel ovate, angled, five cell'd. The Seeds numerous and fmall.

We have, with us, but one Species, viz.

RHODO-

RHODODENDRUM maximum. Pennfylvanian Mountain Laurel.

This grows to the height of about fix or eight feet, often with feveral ftems from the fame root. The leaves are oblong and entire, generally about four or five inches in length and one and a half or near two in breadth : of a thick confiftence, and fhining dark green on the upper fide but lighter underneath, continuing their verdure all the year. The flowers are pretty large and of a pale rofe colour, ftudded with fpots of a deeper red, having their tubes a little bent. They are produced at the extremity of the former year's fhoots, in roundifh clufters, making a beautiful appearance. This is much and defervedly efteemed as a very beautiful, evergreen, flowering fhrub.

RHUS.

SUMACH.

Class 5. Order 3. Pentandria Trigynia.

THE Empalement is five-parted, beneath, crect, and permanent.

The Corolla of five petals, ovate and a little fpreading.

The Filaments are five, very fhort. The Antheræ finall, fhorter than the corolla.

The Germen above, roundifh, and the fize of the corolla. The Styles fcarce any. The Stigmas three, hearted, finall.

The Seed-vellel a berry, roundith, and of one cell.

The Seed one, roundifh, bony.

Obf. The Toxicodendron has fmooth, ftriated berries: the kernel compressed and furrowed.

The Vernix is male and female upon different plants.

The Glabrum (and perhaps fome others) is female and hermaphrodite on different plants.

The

The Species with us, are,

I. RHUS Copallinum. Lentifcus-leaved Sumach.

This grows to the height of fix, eight, or fometimes ten feet, dividing into flender branches, and covered with fpeckled bark. The leaves are winged, and composed of four or five pair of narrow, entire lobes, terminated by an odd one; joined to a common footstalk; with decurrent, leastly expansions between each pair of lobes. The flowers are produced in loose, compound panicles, of an herbaceous colour, and are fucceeded by reddifh feeds, fprinkled with a greyish pounce. This grows naturally in a flaty, gravelly foil. The berries are very acid. There are fome varieties of this, much refembling it but of fmaller growth, and with redder berries.

2. RHUS glabrum. Smooth Pennsylvanian Sumach.

This grows naturally in feveral of the northern States, rifing to the height of fix or eight feet, dividing in a few thick, pithy and fomewhat angled branches; covered with a fmooth bark. The leaves are large and winged, composed of eight, nine, or ten pair of lobes, and an odd one; oblong, pointed and fawed on their edges; of a pretty deep green on their upper fides, but much lighter underneath and changing reddifh in autumn. The flowers are hermaphrodite and female on feparate plants, and are produced in large, erect, compounded panicles, or thyrfi, terminating the branches; of an herbaceous colour; the hermaphrodite of which are largeft and barren, but the female are fucceeded by feeds with a red meally covering, of an acid tafte.

RHUS

(128)

This is a variety of the last described, but differing in having scarlet flowers.

Rнus glabrum canadense. Canadian Red-flowering Sumach.

This is also a variety of the fame, growing naturally in Canada, with red flowers.

3. RHUS typhinum. Stag's-born Sumach.

This grows naturally in Virginia and Pennfylvania, often rifing to the height of twelve or fifteen feet, with a trunk of fix or eight inches in diameter; dividing at the top into feveral branches; which, when young, are covered with a foft, velvet-like down, refembling that of a young ftag's horn, both in colour and texture. The leaves are composed of fix or feven pair of oblong lobes, terminated by an odd one, ending in acute points, and together with the midrib, a little hairy underneath. The flowers are produced in a close, erect panicle or thyrfus, terminating the branches; they are of an herbaceous colour and are fucceeded by feeds enclosed in a purple, woolly, fucculent covering; making a fine appearance in the autumn.

4. RHUS canadense. Canadian trifoliate Sumach.

This grows naturally in Canada, and perhaps the northern parts of Pennfylvania. The stems are stender, rising to the height of fix or eight feet, and covered with a brown bark. The leaves are com-R posed posed of three lobes, somewhat egg-shaped and joined to a common footstalk. The flowers are male and female on different plants.

To this Genus is also added,

TOXICODENDRON.

The POISON - TREE.

Of which we have,

1. RHUS-TOXICODENDRON Vernix. Varnish-Tree, or Poison Ash.

This rifes with a pretty ftrong, erect ftem, to the height of twelve or fourteen feet; dividing towards the top into feveral branches. The leaves are winged, and composed of three or four pair of lobes, terminated by an odd one; which are for the moft part oval, spear-shaped, smooth, and of a lucid green on their upper fide, but paler and a little hairy underneath; their footftalks changing of a purple colour in autumn. The male and female flowers are produced upon different trees, and are difpofed in loofe panicles, coming out from the bofom of the leaves; of an herbaceous colour. The female are fucceeded by fmall, roundifh feeds, of a lightifh colour when ripe. This is allowed to be the fame with the true Varnish-tree of Japan; where it is collected in great quantities, by making incifions in the trees and placing veffels underneath to receive the milky juice, which harden's and becomes the true varnish; much used in various kinds of curious workmanship. This, in all probability, might be collected here equal in quality with that of Japan and to confiderable advantage. This tree ought to be

2. RHUS-TOXICODENDRON toxicodendrum. Poison-Oak.

This has a low, fhrubby ftalk, feldom rifing above three or four feet. The leaves are trifoliate, with pretty long footftalks, the lobes are entire, fmooth and fomewhat heart-fhaped. The flowers come out from the fides of the ftalks, in loofe panicles of an herbaceous colour; fmall, and not always hermaphrodite. They are fucceeded by roundifh, channelled, fmooth berries, of a yellowifh grey colour when ripe.

3. RHUS-TOXICODENDRON radicans. Poison-Vine.

This rifes with many fhrubby climing ftems, attaching themfelves to every neighbouring fupport; and often rifing to the height of twenty or thirty feet, with a ftem of two or three inches in diameter; fending off many branches. The leaves are trifoliate, and have pretty long footftalks: the lobes are fomewhat oval and pointed, often fomewhat toothed. The flowers are produced in fhort panicles from the fides of the branches, and are fucceeded by roundifh berries, of a brownifh colour when ripe.

RIBES.

The CURRANT-BUSH.

Class 5. Order 1. Pentandria Monogynia.

THE Emplement is of one leaf, part five-cleft and bellied: the divisions oblong, concave, coloured, reflexed and permanent. The The Corolla is of five petals, fmall, obtuse and creft, adjoined to the margin of the empalement.

The Filaments are five, awl-fhaped, erect and inferted in the calyx. The Antheræ are incumbent, compressed, and gaping at the margin.

The Germen roundifh and beneath. The Style bifid. The Stigmas obtufe.

The Seed veffel a berry, globous, umbilicated and of one cell, with two receptacles, lateral, opposite and longitudinal.

The Seeds many, roundish, and somewhat compressed.

The Species, with us, are,

* Ribefia inermia. Currant-Trees.

I. RIBES nigrum pennfylvanicum. Penn/ylvanian Black Currants.

This grows to the height of the common cultivated Currant, but the ftalks are generally more flender and covered with a darkifh, fmooth bark. The leaves have the fame refemblance but are fmaller. The flowers grow in loofe bunches, and are fucceeded by oblong, black fruit when ripe.

** Groffulariæ aculeatæ. Goofe-berries.

2. RIBES oxycanthoides. Mountain Wild Goofeberry.

These grow to the fize of the common Goose berry, but have smaller stems and not branching so much; but near the earth are often prickly on all sides. The leaves are smaller but have the same appearance. The fruit is also much smaller but of an agreeable taste when ripe. This either by a little culture becomes smooth, otherwise we have a different kind, not more prickly than the common.

3. RIBES

3. RIBES cynosbati. Prickly fruited Wild Goose-berry.

This grows naturally in Canada and the upper parts of Pennfylvania; and much refembles the other, except in having its fruit covered on all fides with foftifh prickles.

ROBINIA.

ROBINIA, or FALSE-ACACIA.

Clafs 17. Order 3. Diadelphia Decandria.

THE Empalement is of one leaf, fmall, bell-fhaped, and fourtoothed: the three inferior flender; the fuperior fourth of double the width, and flightly emarginated; all equal in length.

The Corolla Butterfly-fhaped.

The Standard roundifh, large, fpreading and obtufe.

The Wings oblong, ovate, free: with very fhort, obtufe appendages.

The Keel almost femi-orbiculate, compressed, obtuse, and the length of the wings.

The Stamina are Filaments in two fets, or bodies; (one fimple, the other nine-cleft) rifing above. The Anthera roundifh.

The Germen cylindrical, oblong. The Style thread-form, bent upward. The Stigma villous before. at the apex of the ftyle. The Seed-ve(fel large, compressed, gibbous, and long. The Seeds few, kidney-form.

The Species with us, are,

1. ROBINIA Pfeud-Acacia. White flowering Robinia, or Locust-Tree.

This grows naturally in feveral of thefe States; rifing to the height of forty or fifty feet, with a trunk of eighteen or twenty inches in diameter, dividing

viding into many branches which are armed with fhort, ftrong fpines. The bark is darkish coloured and rough. The leaves are winged and generally composed of eight or ten pair of small, oval lobes, terminated by an odd one; entire, of a bright green and fitting close to the midrib. The flowers are produced from the fides of the branches in long pendulous bunches, each having a feparate footftalk; they are white, of a butterfly fhape and fweet fmelling; and are fucceeded by comprefied pods, of three or four inches in length and half an inch in width, containing feveral hard, kidney-fhaped feeds. The timber is very durable, and used for posts to set in the earth, and other purpofes; therefore, the propagation of it might be well worthy of attention. Its natural place of growth is in a rich moift foil.

2. ROBINIA rofea. Rose coloured Robinia.

This fpreads much from its running roots, fending up weak branching stalks, to the height of fix or eight feet, but often flowering much fmaller. The whole plant, with the footflalks of the leaves and flowers, are clofely armed with foft, purplish spines. The leaves are winged and composed of five or fix pair of oval, concave lobes, terminated by an odd one, with their midribs protruding in fhort briftly points. The flowers are larger than those of the other kind and of a Peach bloffom colour, with their ftamina diffinctly in two bodies; whereas those of the other are frequently all joined at the bafe. This is a beautiful flowering fhrub, fometimes flowering twice or more in a feafon, but feldom producing feeds. There are feveral other varieties differing fomewhat in their pods or colour of their flowers.

R O S A.

(135)

The ROSE-BUSH.

Clafs 12. Order 5. Icofandria Polygynia.

THE Empalement is of one leaf. The tube bellied; narrowed at the neck; the border spreading, five parted and globous: the divisions long, narrow and pointed.

The Corolla is composed of five petals, heart-fhaped, the length of the empalement, and inferted in its neck.

The Stamina are very many, capillary, very flort, and inferted in the neck of the empalement. The Stigmas obtufe.

The Seed-veffel is flefhy, top-ihaped, coloured, and of one cell.

The Seeds numerous, oblong, hairy, and joined within on all fides of the Seed-veffel.

The Species, native with us, are,

1. RosA carolinenfis. Wild Virginian Rose.

This rifes with feveral stalks to the height of five or fix feet, somewhat prickly, as are also the footstalks of the leaves and flowers. The leaves are composed of four or five pair of lobes terminated with an odd one, which are somewhat spear-shaped and sawed on their edges. The flowers are fingle, of a red colour and late coming.

2. Rosa palustris. Swamp Pennsylvanian Rose.

This grows generally in fwamps; rifing to the height of four or five feet, with erect, and very prickly ftems, branching out at top in a regular head. The leaves are composed of three pair of lobes, terminated by an odd one, of an oblong, oval fhape fhape and flightly ferrated, joined to a common footftalk with a few fpines underneath. The flowers are fingle and of a damafk colour; the hips or feedveffels are of a dark red, roundifh, depreffed, prickly or briftly, and very clammy to the touch.

3. Rosa humilis. Dwarf Pennfylvanian Rofe.

This rifes with feveral flender ftems to the height of two or three feet; covered with a brownifh green bark, and armed with a few fharp fpines. The leaves are composed of three or four pair of lobes, and an odd one, of an oblong egg-fhape and fharply fawed on their edges. The leaves of the flower cup have often linear, leaffy elongations. The flowers are fingle and of a pale reddifh colour.

4. Rosa pennfylvanica plena. Double Pennsylvanian Rose.

This very much refembles the last described in growth and appearance, except in having a double flower.

RUBUS.

The RASPBERRY BUSH and BRAMBLE.

Clafs 12. Order 5. Icofandria Polygynia.

THE Empalement is of one leaf, five-parted: the divisions oblong, fpreading and permanent.

The Corolla is of five petals, roundish, fomewhat spreading, of the length of the Empalement and inferted into it,

The Filaments are numerous, thorter than the petals, and inferted in the Empalement. The Antheræ are roundish and compressed.

The Germen are numerous. The Styles fmall, capillary, and arifing from the fides of the germen. The Stigmas fimple and permanent. The The Seed-veffel a compound berry: the acimi roundifh, collected in a convex head, concave beneath; and each with one cell.

(137)

The Seeds folitary and oblong; their receptacle conical.

The Species, with us, are,

1. RUBUS fruticofus. Common Blackberry Bush.

This rifes generally (with feveral ftalks from the fame root) to the height of four or five feet, but fometimes to eight or ten: which are fomewhat angled, and pretty thick fet with fharp prickles. The leaves are composed of three lobes, the fide ones of which are often divided; mostly egg-fhaped, pointed, acutely and unequally fawed on their edges, a little hairy underneath, and joined to a pretty long prickly footstalk, the middle one extending fome little distance from the others. This is generally well furnished with flowers, which often stand upon panicled, or divided footstalks, and are fucceeded by black fruit when ripe.

2. RUBUS hispidus. American Dewberry Bush.

This is much fmaller than the other, having feveral flender weak ftems, which often trail on the ground to a confiderable diftance. The leaves very much refemble those of the Blackberry, but are generally fmaller. The fruit is also fmaller, rounder and blacker; and supported upon long, simple, prickly footstalks.

3. RUBUS

3. RUBUS canadenfis. Smooth stalked Canadian Bramble.

This is faid to grow in Canada with purplish stalks without prickles. The leaves are fingered; composed of ten, five, and three lobes, which are very flender, lance-shaped, and sharply ferrated.

4. RUBUS occidentalis. American Raspberry.

This rifes with a round prickly ftalk, of feven or eight feet in length, which often defcends again to the earth in a femi-circular manner, fometimes taking root. The ftalks are covered with a thin bluifh fcum or mift, and furnifhed with trifoliate leaves. The lobes are fomewhat heart, or egg-fhaped; cut and fawed on their edges, whitifh and downy underneath, the lateral ones fometimes divided, the common footftalk pretty long, and the middle or terminal lobe a little fubtended. The flowers are produced at the extremity of the branches in a kind of racemus or bunch, and are fucceeded by finall fruit of a reddifh black colour when ripe; the *acini* of which are joined, parting entire from the conical receptacle.

5. RUBUS odoratus. Virginian Rose-flowering Raspberry.

This rifes with upright woody ftalks, without prickles, to the height of three or four feet, covered with a brown fcaly bark. The leaves are fingle, large, palmated or divided into five or more pointed lobes, fharply fawed on their edges, a little hairy, and joined to pretty long, hairy footftalks. The flowers are produced in a kind of panicle at the extremity of the branches, of a curdled reddifh colour; refembling refembling a fmall fingle Rofe, both in their petals, and divisions of their flower cups which are villous, and terminate in leaffy elongations. This grows naturally on rocky mountains in Pennfylvania and Virginia, and makes an agreeable appearance by a long fucceffion of rofe-fhaped flowers.

SALIX.

The WILLOW-TREE.

Class 22. Order 2. Dioecia Diandria.

THE Male Flowers are difpofed in a common, oblong, imbricated katkin; with an involucrum formed of the bud. The Scales are one-flowered, oblong, plain, and fpreading.

It hath no petals; but a very fmall, cylindrical, truncated, honcy-bearing Gland, or Nectarium, in the center of the flower.

The Filaments are two, ftraight, and thread form. The Antheræ are twin, and four-cell'd.

* The Female have a katkin and fcales as the male.

The Petals none.

- The Germen ovate, and leffened into a Style fcarce diffinct, fomewhat longer than the Scales of the flower-cup. The Stigmas two, bifid and erect.
- The Seed-veffel a capfule, ovate-awl-fhaped, of one cell and two valves: the valves revolute.

The Seeds are numerous, ovate, very fmall, and crowned with a fimple hairy Pappus.

The Species, native with us, are,

* With smooth servated leaves.

1. SALIX nigra. Rough American Willow.

This rifes often with a leaning or crooked trunk to the height of about twenty feet, covered with a dark dark coloured, rough bark. The leaves are fmooth and of equal colour on both fides; narrow, lancefhaped, and very flightly ferrated. The katkins are long and flender.

** With ferrated villofe leaves.

2. SALIX fericea. Ozier, or Silky leaved Willow.

This rifes generally to the height of eight or ten feet, with many fhrubby ftalks, covered with pretty fmooth, dark, greenifh bark. The leaves are fhorter and fomewhat broader than the other kind, lancefhaped, filky underneath, and very flightly ferrated on the edges.

*** With entire villofe leaves.

3. SALIX humilis. Dwarf Willow.

This feldom rifes above three or four feet, with greenifh, fomewhat downy stalks. The leaves are larger than the other kinds, entire, oblong, fomewhat oval, and glaucous or whitish underneath. There are fome varieties of larger growth, belonging either to this or the last mentioned kind.

SAMBUCUS.

The ELDER - TREE.

Clafs 5. Order 3. Pentandria Trigynia.

THE Empalement is of one leaf, above, very fmall, five-parted, and permanent.

The Corolla is of one petal, concave wheel-fhaped, part fivecleft, obtufe, the divisions reflexed.

The Filaments five, awl-shaped, the length of the corolla. The Antheræ roundish.

The Germen beneath, ovate, obtufe. The Style none, but in its place a bellied Gland. The Stigmas three, obtufe. The Seed-ve [sel a roundifh berry of one cell.

The Seeds three, angular on one fide and convex on the other.

The Species, with us, are,

1. SAMBUCUS nigra. American Black-berried Elder.

This rifes generally to the height of fix or eight feet, with a ftem fometimes of two or three inches in diameter. The leaves are generally composed of three pair of lobes and an odd one, which are fomewhat oval, pointed, fharply fawed on their edges, a little hairy on both fides, light coloured underneath and joined to pretty large, channelled footftalks, placed opposite. The flowers are produced at the extremities of the fame year's floots in a kind of umbel, of five principal parts, again divided : they are white and are fucceeded by berries which are blackifh when ripe. An infusion of the inner bark is purgative. From the berries may be prepared a fpirit, a wine, and an oil, which promote urine, perfpiration and fweat.

2. SAMBUCUS canadenfis. Canadian Red-berried Elder.

This grows naturally upon Mountain fides, or moift, rich, fhaded places, in the back parts of Pennfylvania. It has much the appearance of the other kind, but produces red berries, which are ripe the latter end of June, at the time the other is in flower.

SMILAX.

(142)

SMILAX.

ROUGH BINDWEED, or GREEN BRIAR.

Class 22. Order 6. Dioecia Hexandria.

*THE Male have Empalements of fix leaves, of a fpreading bell-shape; the leaves are oblong, joined at the base, spreading and reflexed at the apex.

The Corolla none.

The second and the second and and

The Filaments are fix, fimple. The Antheræ oblong.

* The Female have Empalements as the male, deciduous. The Corolla none.

The Germen ovate. The Styles three, very fmall. The Stigmas oblong, reflexed, downy.

The Seed-ve[sel a globofe berry, of three cells. The Seeds two, globofe.

The Species, with us, are,

* With a square prickly stem.

1. SMILAX Sarfaparilla. Ivy leaved rough Bindweed, or Sarfaparilla.

This grows naturally in Virginia and to the fouthward, rifing up with prickly, angular ftalks. The leaves are without prickles, oval fhaped, pointed, and three nerved.

2. SMILAX virginiana. Lanceolate-leaved rough Bindweed.

The stalks of this are slender, angular and prickly. The leaves are without spines, spear-shaped and pointed; their bases not eared.

** With

(143)

** With a round prickly stem.

3. SMILAX rotundifolia. Canadian round leaved Smilax.

The stalks of this are round and winding, with a few straight spines. The leaves are heart-shaped, without spines, five-nerved, having short sootstalks with two slender classes.

4. SMILAX laurifolia. Bay leaved rough Bindweed.

This hath a round ftalk, armed with prickles or fpines. The leaves are of an oval lance-fhape, without fpines, and of thicker confiftence than those of the other species. The flowers are small and whitiss black when ripe.

5. SMILAX tamnoides. Bryony leaved rough Bindweed.

The stems of this are armed with prickles and round; climing upon the neighbouring trees for support. The leaves are without spines, of an oblong heart-shape and five nerved. The berries are black.

6. SMILAX caduca. Three-nerved-leaved rough Bindweed.

This rifes with round, naked, winding ftalks, armed with many flraight, black pointed fpines and covered with a green bark. The leaves are ovate, pointed, three nerved and annual. The berries black.

*** With

(144)

*** With a square smooth stem.

7. SMILAX bona nox. Carolinian prickly leaved Smilax.

The stalks of this are angular and without spines. The leaves are broad, and ciliated or set upon the margin with spines. There is also a variety with narrow rough leaves, eared at the base and angular.

**** With a smooth round stem.

8. SMILAX lanceolata. Red berried Virginian Smilax.

The stalks of this are smooth and round. The leaves are without spines and lance-shaped. The berries red coloured.

9. SMILAX Pfeudo China. Bastard China.

This hath fmooth round stalks. The leaves are without spines, those on the stalks heart-shaped, but on the branches lance-shaped. The berries are black and supported on very long footstalks.

SORBUS.

The SERVICE TREE, QUICKBEAM, or MOUNTAIN ASH.

Clafs 12. Order 3. Icofandria Trigynia.

THE Empalement is of one leaf, concave-fpreading, fiveparted and permanent.

The Corolla is of five petals, roundifh, concave and inferted in the Empalement.

The Filaments twenty, awl-shaped, and inferted in the Empalement. The Antheræ roundish.

The Germen beneath. The Styles three, thread-form, and erect. The Stigmas headed.

The Seed-veffel a berry, foft, globofe, and umbilicated. The Seeds three, fomewhat oblong, diffinct, and cartilaginous.

The Species, with us, but one, viz.

SORBUS americana. American Service Tree.

This grows naturally upon the mountains towards Canada; rifing to the height of about fifteen or eighteen feet, with an erect ftem dividing into feveral branches. The leaves are winged, composed of eight or nine pair of lobes, terminated by an odd one; which are narrow and fawed on their edges. The flowers are produced at the extremity of the branches in form of an umbel, and are fucceeded by roundifh berries of a red colour when ripe.

SPIRÆA.

SPIRÆA.

Clafs 12. Order 4. Icofandria Pentagynia.

THE Empalement is of one leaf, half five-cleft, and plane at the bafe: the divisions acute; permanent.

The Corolla of five petals, oblong-rounded, and inferted in the calyx. VO RECEIVIOS

The Filaments above twenty, thread-form, thorter than the corolla, and inferted in the calyx. The Antheræ roundifh.

The Germen five or more. The Styles as many, thread-form, and the length of the Stamina. The Stigmas headed. The Seed-veffels capfules, oblong, fharp-pointed, compressed

and two valved.

The Seeds few, tharp-pointed and fmall. Obf. S. opulifolia has three Styles.

The

The Species, with us, are,

1. SPIRÆA hypericifolia. Canadian Spiræa, or Hypericum-frutex.

This rifes generally to the height of four or five feet, dividing into many flender branches, and covered with a dark brown bark. The leaves are oblong, entire, and fmooth, refembling those of St. John's-wort, and placed opposite. The flowers are yellow, and disposed in fmall umbels, fitting close to the stalks, each having a long, flender footstalk; and are succeeded by oblong, pointed capfules, filled with small feeds. This makes a very good appearance when in flower.

2. SPIRÆA opulifolia. Guelder Rose-leaved Spiræa, or Nine-Bark.

This rifes with many fhrubby branching ftalks, covered with a brown fcaly bark, to the height of five or fix feet. The leaves are fomewhat three parted, the two fide divifions or lobes fmall, obtufe and near the bafe; the middle one large and pointed; they are alfo flightly crenated and fawed on their edges. The flowers are produced at the extremity of the branches, in form of a corymbus or clufter: they are white with fome fpots of pale red, and are fucceeded by clufters of greenifh, inflated capfules.

SPIRÆA caroliniana. Carolinian Guelder Rofe-leaved Spiræa.

This is a variety of the former, and refembles it much in growth and appearance.

3. SPIREA

(146)

3. SPIRÆA tomentofa. Scarlet flowered Philadelphian Spiræa.

This grows naturally in Pennfylvania; rifing with flender, branching ftalks to the height of three or four feet, having a purple bark, covered with a grey meally down. The leaves are fmall, fpearfhaped, unequally fawed on their edges, of a bright green on their upper fides, but downy and veined underneath. The flowers terminate the branches in form of a racemus or bunch; they are fmall and of a beautiful red colour.

4. SPIRÆA tomentofa alba. White flowered Philadelphian Spiræa.

This is a variety of the former; rifing with flender stalks to the height of four or five feet. The leaves are small and of thin texture, of an oblong oval, or somewhat wedge shape, slightly and sharply fawed on their edges, and a little downy on both sides. The flowers are produced in manner of the former, of a beautiful white, making a pretty appearance. This is called Indian Pipe Shank, from the pithy stems being used by the natives for that purpose.

STAPHYLEA.

BLADDER - NUT - TREE.

Class 5. Order 3. Pentandria Trigynia.

THE Empalement is five-parted, concave, roundifh, coloured, and almost the fize of the corolla.

The Corolla is five petal'd, oblong, erect, and like the calyx. The Nectarium concave and pitcher-thape in the bottom of the flower.

The Stamina are five, oblong, creft, and the length of the calyx. The Antheræ fimple.

The Germen thickifh, three-parted. The Styles three, fimple and a little longer than the stamina. The Stigmas obtuse and contiguous.

The Seed-veffel three Capfules, inflated, flaccid, joined by longitudinal futures; and with pointed tops gaping inwardly.

The Seeds are few, hard, and roundifh, joined to the interior futures.

The Species, with us, but one, viz.

STAPHYLÆA trifoliata. Three-leaved Bladder-nut-Tree.

This rifes generally to the height of eight or ten feet, dividing into many branches, placed oppofite. The bark of the ftem and old branches are of a greyifh colour, but of the young fhoots of a light green. The leaves are trifoliate, the middle lobe having a footftalk; the lobes are oval, lance-fhaped, flightly and fharply fawed on their edges, and joined to pretty long common footftalks, placed oppofite. The flowers are produced upon pretty long, panicled footftalks; they are white and are fucceeded by pretty large, three-fided bladders or capfules, enclofing a few roundifh, hard feeds.

STEWARTIA.

STEWARTIA.

Clafs 16. Order 5. Monadelphia Polyandria.

T HE Empalement is of one leaf, five parted and fpreading; the divisions ovate, concave, and permanent. The Corolla confifts of five petals, inverse-ovate, fpreading, equal and large.

The Filaments are numerous, filiform, fhorter than the corolla, joined in a cylinder below, and to the petals at the bafe. The Antheræ are roundifh and incumbent.

The Germen roundifh and hairy. The Style iliform, the length of the Stamina. The Stigma five cleft.

The Seed-veffel a juiceless pome, five lobed, and five cell'd. The Seeds are folitary, ovate and compressed.

The Species but one, viz.

STEWARTIA Malacodendron. Virginian Stewartia.

This grows naturally in Virginia; rifing with ftrong ftems to the height of ten or twelve feet, and covered with a brown bark. The leaves are oval and fomewhat fpear-fhaped, most flightly ferrated and villofe underneath. The flowers are large and white, produced fingly, and fitting close upon the fmall branches. The feed-veffels are dry, fomewhat conical, ligneous capfules, having five fharp angles, and five cells, each containing one oblong fmooth feed. This makes a beautiful appearance when well filled with its large white flowers.

STYRAX,

The STORAX-TREE.

Class 11. Order 1. Dodecandria Monogynia.

THE Empalement is of one leaf, cylindrical, crect, fhort and five-toothed.

The Corolla is of one petal, funnel-form. The tube is fhort, cylindrical, and the length of the calys. The border fiveparted, large and fpreading: the divisions lance-shaped and obtuse.

The Filaments are erect, placed in a circle, more than twelve, fcarce joined at the bafe, awl-fhaped and inferted in the corolla. The Antheræ are oblong and ftraight.

The Germen beneath. The Style fimple, the length of the ftamina. The Stigma lopped.

The Seed-veffel a drupe, roundifh and of one cell.

The Seeds two nuts, roundifh, pointed, convex on one fide and plane on the other.

The Species, with us, but one, viz.

STYRAX americana. Carolinian Storax-Tree.

This grows naturally in Carolina; rifing with a pretty frong ftem to the height of ten or twelve feet, covered with a fmooth brownifh bark, and dividing into many flender branches. The leaves are pretty large, oval shaped, a little pointed, fcarce observably toothed, of a deep green, and a little downy on the upper furface, but lighter and much more downy underneath; having fhort footstalks, which together with the young fhoots, are also woolly or downy. The flowers are produced upon the fmall branches. in a kind of racemus or bunch; supporting a few fcattered flowers, which are white, pendulous, and have each ten stamina and somewhat the fragrance of an Orange flower. They are fucceeded by roundifh feed-veffels, each containing two roundifh, pointed nuts or feeds.

TAXUS.

The YEW. TREE.

Class 22. Order 12. Dioecia Monadelphia.

*THE Male Flowers have no Empalements, but a bud of four leaves fomewhat like one. They have no Corolla.

The Filaments are numerous, joined beneath in a column, and longer than the bud. The Antheræ are depressed, obtuse at the margin, eight-cleft, gaping on every fide at the base (and (and having caft their farina) plane, targetted, and remarkable for their eight-cleft margin.

* The Female Empalements are as in the Male.

They have no Corolla.

The Germen is ovate and pointed. The Style none. The Stigma obtufe.

The Seed-veffel is formed of the lengthened receptacle, into a globofe, fucculent, coloured covering or berry, open at top. The Seed one, oblong-ovate, the apex protruding out of the berry.

We have, native but one Species, viz.

TAXUS canadenfis. Canadian Yew-Tree.

This fhrub is of low growth, but divided into many branches fpreading on every fide. The leaves are narrow, ftiff, linear, pointed, and evergreen; thick fet upon all fides of the branches, but inclining upwards. The flowers come out thick upon the fides of the branches and are fucceeded by oval, red, fucculent berries, open at top, and enclofing an oval brown feed. This is a beautiful evergreen fhrub, capable of being formed into any fhape.

THUYA.

ARBOR VITÆ, or TREE OF LIFE.

Class 21. Order 9. Monoecia Monodelphia.

THE Male Flowers are difpofed in oval katkins, and are placed upon a common footftalk in triple opposition; each one having for its base

A Scale fomewhat ovate, concave and obtufe. No Corolla, but

Four Filaments in each flower, fcarce manifest, and as many Antheræ, adjoined to the base of the scaly cup.

* The Female flowers are upon the fame plant, in fomewhat ovate Cones, composed of opposite Scales, which are two flowered, ovate and convex.

No

feeds'

INTER A VADIERILA.

No Corolla.

- The Germen is very fmall. The Style awl-fhaped. The Stigma fimple.
- The Seed-veffel a Cone, oblong-ovate, obtufe, and gaping longitudinally; the Scales are oblong, nearly equal, convex outwardly and obtufe.

The Seeds are oblong, begirt longitudinally with a membranaceous, end-bitten wing.

The Species, with us, but one, viz.

THUYA occidentalis. American Arbor Vite.

Siv and the Streetes. VIS

This grows naturally in Canada, and other northern parts of America; rifing to the height of thirty or forty feet, with a pretty ftrong ftem, fending off many branches, which are produced irregularly and ftand almost horizontally. The bark of young trees is of a dark brown and fmooth, but afterward becomes cracked and lefs fmooth. The young branches are flat, and covered with very finall leaves, lying over each other like fcales of fifh. The cones are fmall and loofe, containing but few oblong, winged feeds.

THUYA variegata. Striped leaved Arbor Vite.

This is a variety of the first, differing in having striped or variegated leaves.

THUYA odorata. American Sweet-scented Arbor Vita.

This is alfo a variety of the fame, agreeing with it in growth and appearance; but differing in its leaves or fmall branches, being of an agreeable, or fweet fcent, when bruifed.

TILIA.

(153)

T I I LO A about A A I I I I

The LIME, or LINDEN-TREE.

Class 13. Order 6. Polyandria Hexagynia.

THE Empalement is five parted, concave, coloured, almost the length of the corolla, and deciduous. The Corolla is of five petals, oblong, obtuse and notched at the end.

The Filaments are many, (thirty and upwards) awl-fhaped, and the length of the corolla. The Antheræ are fimple.

The Germen roundifh. The Style filiform, the length of the ftamina. The Stigma obtufely five-fided.

The Seed-veffel a Capfule, coriaceous, globofe, five-cell'd, fivevalved, and gaping at the bafe.

The Seed folitary and roundifh.

Obf. The Capfule appears to have but one cell and one feed, the other four being abortive.

The American Tilia has five Scales placed round the bud and joined to the claws of the corolla.

The Species with us, are,

1. TILIA americana. American black Lime, or Linden-Tree.

This often becomes a tree of a large fize, covered with a dark brown bark, and dividing into many branches. The leaves are large, heart-fhaped, pointed, and fawed on their edges, of a deep green on their upper fides, but paler and a little hairy underneath; and ftanding on long footftalks. The flowers are produced upon the finall branches, and are remarkable for having an oblong bractea or floral leaf upon each footftalk; they are of an herbaceous colour, having narrow petals furnifhed with nectaries at the bafe. The capfules are round, a little hairy

(154)

hairy and about the fize of a fmall pea, having each one roundifh feed.

2. TILIA caroliniana. Carolinian oblique-leaved Lime-Tree.

This is of fmaller growth than the former, rifing commonly to the height of about forty feet, with a trunk of eighteen inches or more in diameter: covered with a lightifh and fomewhat furrowed bark, and fending off many branches. The leaves are fmaller and fmoother than those of the other kind, fomewhat heart-fhaped, ending in long points, unequal at the bafe, or larger on one fide of the midrib than the other, and flightly fawed on their edges. The bunches of flowers ftand upon long flender footstalks, furnished with floral leaves. The flowers are fmall, and have narrow, pointed petals, furnished with nectaries or scales at the base; they diffuse a fragrant odour, and are continually haunted by bees during their continuance. An infusion of the flowers of Lime-tree has been used with fuccefs in an Epilepfy. The timber is too foft for any ftrong purposes, therefore, chiefly used by turners, carvers, &c. alfo, by architects in framing models of buildings, &cc. yown hark, and dividing into many

TILLANDSIA.

TILLANDSIA.

Clafs 6. Order 1. Hexandria Monogynia.

THE Empalement is of one leaf, three-parted, oblong and permament: the divisions oblong-lanced, and tharppointed.

The Corolla tubulous and of one petal. The tube long and bellied. The border three-cleft, obtufe, erect and fmall.

The Filaments are fix, as long as the tube of the corolla. The Antheræ acute, and incumbent in the neck of the corolla.

The Germen is oblong, and pointed on every fide. The Style filiform, and the length of the stamina. The Stigma threecleft and obtufe.

The Seed-veffel a Capfule, which is long, obtufely three-fided, pointed with about one cell and three valves.

The Seeds are many, joined to a very long, capillary pappus or down.

The Species, with us, but one, viz.

TILLANDSIA usneoides. Carolinian Tillandfia.

This is a parafite plant; or growing upon the branches of trees and hanging down with very flender, rough, branching threads or stalks, in manner of moss. The leaves are whitish and hoary.

ULMUS.

The ELM-TREE.

Class 5. Order 2. Pentrandria Digynia.

THE Empalement is of one leaf, top-fhaped, and wrinkled. The border five parted, erect, coloured within, and permanent.

The Corolla none.

The Filaments five, awl-fhaped, and twice the length of the calyx. The Antheræ four-furrowed, erect and fhort.

The Germen orbicular and creft. The Styles two, fhorter than the ftamina and reflexed. The Stigmas downy.

The Seed-veffel a drupe, oval compressed, membranaceous and juiceles.

The Seed one, roundish and lightly compressed.

The Species, with us, are,

I. ULMUS

1. ULMUS americana. American rough leaved Elm-Tree.

service of the can offer The

This rifes to the height of about thirty feet, with a pretty ftrong trunk; dividing into many branches, and covered with a lightifh coloured rough bark. The leaves are oblong, oval and fharp-pointed, fomewhat unequally fawed on their edges, unequal at the bafe, very rough on their upper furface and hairy underneath. The flowers are produced thick upon the branches, upon fhort, collected footftalks; and are fucceeded by oval, compreffed, membranaceous feed-veffels, with entire margins; containing each one oval, compreffed feed.

2. ULMUS mollifolia. American fost-leaved Elm.

This grows to the fame fize, or perhaps larger than the first kind. The leaves are of an oblong oval, sharp-pointed, unequal at the base, doubly ferrated on their edges and hairy underneath : but smooth on the upper surface, of thinner texture and foster than those of the first kind. The seed-vessels are also confiderably smaller, end nicked or cleft, and ciliated or fringed on the margin.

VACCINIUM.

firmed, and trace the

WHORTLE-BERRY.

Class 8. Order 1. Octandria Monogynia.

THE Empalement is very small, above, and permanent.

The Corolla is of one petal, bell-fhaped, and four-cleft: the divisions turning back.

The Filaments are eight, fimple. The Antheræ two-horned, furnished on the back with two spreading awns, and gaping at the tops.

The

The German is beneath. The Style fimple, longer than the ftamina. The Stigma obtufe. The Seed-veffel a berry, globofe, umbilicated and four cell'd. The Seeds folitary and fmall.

Obf. The number of ftamina are ten, in many of the species.

The Species, with us, are,

* With annual deciduous leaves.

1. VACCINIUM arboreum. Winter, or Tree Whortle-Berry.

This grows naturally in Carolina; rifing to the height of ten or fifteen feet, with a pretty ftrong ftem, dividing towards the top into many branches. The fruit is fmall, ripening late in autumn.

2. VACCINIUM album. Pennfylvanian White Whortle-berry.

This is a fmall fhrub, rifing to the height of about two feet. The leaves are entire, egg-fhaped and downy underneath. The flowers are produced at the ends of the branches, ftanding two or three together upon very fhort, naked footftalks. The fruit is fmall and whitifh.

3. VACCINIUM corymbosum. Cluster-flowered Vaccinium.

This grows naturally in fwampy or moift places, rifing to the height of five or fix feet. The leaves are entire, oblong, oval, and fomewhat downy underneath. The flowers are produced in clufters or rather one rowed, fhort, roundifh bunches; fet pretty clofe on the fmall branches. The fruit is of a dark purplifh colour when ripe, and of an agreeable acid tafte.

There

There are fome varieties, I think, of this growing upon higher ground, and of much fmaller growth; the leaves of fome of which are most flightly and fharply ferrated.

4. VACCINIUM frondofum. Leafy Vaccinium, or Indian Goofeberry.

This grows naturally upon Whortle-berry ground; rifing to the height of three or four feet, generally with a leaning, crooked, branching ftem. The leaves are entire and of an oval lance fhape. The flowers are produced in frondofe racemi or bunches, fet with fmall oblong leaves, at the bofom of which the flowers come out, upon pretty long, fimple, flender footftalks; they are fomewhat bell-fhaped, the antheræ are very long, two horned : the horns two cleft. The fruit or berries are oval, and of the fize of a fmall Goofeberry; reddifh coloured, foft, fucculent, and of a difagreeable tafte.

5. VACCINIUM ligustrinum. Privet-leaved Whortleberry.

This rifes to the height of about two or three feet, dividing into fmall branches. The leaves are fmall and oblong. The flowers are produced in fhort racemi, or bunches, which come out alternately, and thick upon the branches; and are naked, or without floral leaves. The berries are round, black and of an agreeable tafte.

6. VACCINIUM stamineum. Long-leaved Vaccinium.

This is alfo of fmall growth. The leaves are oblong and very entire. The flowers come out at the bofom of the leaves, upon folitary, flender footftalks, cach each fupporting one flower, which is of a fpreading bell-fhape and five cleft at the border.

** With evergreen leaves.

7. VACCINIUM hispidulum. Marsh Vaccinium, or Cranberry.

This grows naturally in moffy fwamps, with flender, creeping stalks, covered with bristly scales. The leaves are oval, or fomewhat oblong and shining. The fruit or berries are large and reddish coloured; and of a bitterish acid taste.

8. VACCINIUM pennfylvanicum. Myrtle leaved Vaccinium, or Cranberry.

EU DY IOMEWLLE OVE

The leaves of this are oval and fharp pointed. The flowers are white and nodding, produced from the bofom of the leaves. The berries are red and fmall,

VIRBURNUM.

PLIANT MEALLY, or WAY-FARING-TREE.

Clafs 5. Order 3. Pentandria Trigynia.

THE Empalement is four toothed, above, very fmall and permanent.

The Corolla is of one petal, bell-shaped, half five-cleft: the divisions obtuse and reflexed.

- The Filaments are five, awl-fhaped and the length of the corolla. The Antheræ roundifh.
- The Germen beneath, roundifh. The Style none, but in its place a top-fhaped Gland. The Stigmas three.
- The Seed-veffel, a fomewhat oval, compressed berry, of one cell.

The Seed one, hard, and of the fame form.

The

(160)

The Species, with us, are,

1. VIBURNUM accrifolium. Maple-leaved Viburnum.

This rifes generally to the height of four or five feet, with an erect, flender ftem, fending off a few oppofite branches. The leaves are fomewhat three lobed, toothed, or pretty largely fawed on their edges; a little hairy underneath, and joined to round footftalks, placed oppofite. The flowers terminate the ftalks and branches in *cymæ* (about feven parted) or kind of umbels; they are white and are fucceeded by fomewhat oval, comprefied, black berries when ripe.

2. VIBURNUM dentatum. Toothed-leaved Viburnum, or Arrow Wood.

This grows naturally in moift places, rifing up with feveral ftraight ftems, to the height of ten or twelve feet, fending off feveral flender, oppofite branches. The leaves are roundifh or oval, pointed, and toothed on their edges, much veined and placed oppofite, upon round, downy footftalks. The flowers are produced at the tops of the ftalks and branches, in cymæ or kind of umbels, about feven parted, in manner of those of the Elder but much smaller; they are white and are succeeded by dark bluish coloured, oblong berries. The young shoots of this tree are generally used by the natives for arrows; whence it is known by the name of Arrow-wood.

3. VIBURNUM prunifolium. Black Haw.

This I take to be our common, fmall black Haw; which rifes with a ftiff ftem to the height of about ten or fifteen feet, dividing into many branches, which which are generally fet pretty thick with fhort, ftrong, horizontal fpurs or fhort branches, ftanding oppofite. The bark of the trunk or ftem is dark and rough, but of the young branches finooth. The leaves are of an oblong oval, fmooth, finely and flightly ferrated, and placed oppofite upon channelled footftalks. The flowers terminate the branches in four parted cyma; they are white and make a pretty good appearance. The berries are oblong, oval, comprefied and black when ripe.

4. VIBURNUM nudum. Tinus leaved, or Swamp Viburnum.

This grows naturally in moift or fwampy places, rifing to the height of ten or twelve feet. The bark is fmooth and of the young fhoots purplifh. The leaves are oval, lance-fhaped, of a thick confiftence and hucid green colour: often flightly ferrated, and ftanding oppofite. The flowers are produced in manner of the other kinds and are fucceeded by berries of nearly the fame fize and fhape, changing black when ripe.

5. VIBURNUM Lentago. Canadian Viburnum.

This rifes to the height of about ten or twelve feet, covered with a brown bark, and divided into many branches, which, when young, are covered with a fmooth purplifh bark. The leaves are fmooth, oval, flightly fawed on their edges, and ftand generally oppofite upon fhort flender footftalks. The flowers are produced in manner of the other kinds and are fucceeded by berries of the fame fhape, and black. when ripe.

X

6. VIBUR-

6. VIBURNUM alnifolium. Alder-leaved Viburnum.

This grows naturally in Carolina and other parts of America; rifing with a fhrubby ftalk to the height of eight or ten feet, covered with a fmooth purplifh bark, and divided into feveral branches. The leaves are heart-fhaped, oval, fharp-pointed, deeply fawed on their edges, ftrongly veined, and placed oppofite upon long flender footftalks. The flowers are collected in large cymes or umbels at the ends of the branches, thofe ranged on the border are male, but the center is filled with hermaphrodite flowers, which are fucceeded by pretty large, oval berries, red coloured when ripe.

7. VIBURNUM triloba. Mountain Viburnum.

This grows naturally upon montains in the interior parts of Pennfylvania; rifing with flender ftems to the height of eight or ten feet. The leaves are fomewhat like those of the Guelder Rose or Snow-ball tree; they are narrow at the base, but spreading and divided into three sharp-pointed lobes, the middle one largest, longest, and sometimes slightly toothed. The flowers are produced in form of the others, and are succeeded by berries of the same share, of a pretty large size and red colour when ripe.

VISCUM.

MISSELTOE.

Clafs 22. Order 4. Dioecia Tetrandria. *THE Male Flowers have their Empalements, five-parted; the leaves oval and equal. They have no petals.

The Filaments or rather Antheræ are four, oblong and pointed, joined to the leaves of the calyx.

The

* The Female have Empalements, four leaved: the leaves oval, finall, fitting clofe, deciduous and placed upon the germen. They have no petals.

The Germen are oblong, three-fided, their margins crowned, obfolete, four-cleft, and beneath. The Styles none. The Stigmas obtufe.

The Seed-veffels berries, which are globofe, fmooth, and of of one cell.

The Seeds fingle, fomewhat heart-fhaped, compressed and fleshy.

The Species, with us, are,

I. VISCUM rubrum. Red berried Miffeltoe.

This grows upon the branches of trees and is not found growing in the earth as other plants. It rifes with flender woody ftalks, feveral inches in height, fpreading and forming a tuft or bufh. The leaves are lance-fhaped and obtufe. The flowers are produced in fpikes from the fides of the ftalks, and thofe of the female are fucceeded by roundifh red berries, containing each one heart-fhaped, comprefied feed, furrounded by a tough vifcid fubftance.

2. VISCUM purpureum. Purple-berried Miffeltoe.

This alfo rifes up from the branches of trees like the other. The leaves are inverfe-egg-fhaped, or oval and narrowed towards the bafe. The flowers come out in *racemi* or bunches from the fides of the ftalks; the female of which are fucceeded by berries of a purple colour when ripe.

There is a variety of this with yellow leaves, refembling those of the box; the berries are also produced in bunches and are of a fnowy white when ripe.

Miffeltoe is most frequently found growing upon the Nyffa Sylvatica or Sour Gum, in the middle States, but to the fouthward upon oaks. It is propagated by birds feeding upon the berries, the feeds of of which, fometimes by their glutinofity adhere to the outfide of their beaks, and are thus transported to neighbouring trees, and being wiped off upon their branches, frick fast, and germinate, producing new plants. From the berries of Misseltoe, Birdlime was formerly made; but for this purpose those of the common Holly are faid to be better. This plant hath been much recommended for the cure of Epilepsies.

VITIS.

The VINE.

Clafs 5. Order 1. Pentandria Monogynia.

THE Empalement is five toothed and very finall.

The Petals are five, rude, fmall, and falling off.

The Filaments are five, awl-fhaped, a little fpreading, and falling off. The Antheræ are fimple.

The Germen ovate. The Style none. The Stigma obtufe headed.

The Seed-veffel a berry, roundifh, large, and of one cell. The Seeds are five, hard, end-bitten at one end, and contracted at the other.

The Species, with us, are,

1. VITIS arborea. Carolinian Vine, or Pepper-Tree.

This grows naturally in Carolina, rifing with flender, ligneous, climbing ftalks, and faftening themfelves by tendrils to any neighbouring fupport. The leaves are branching and winged, composed generally of two fide branches of five leaves each, two of three leaves, and terminating with three; which are fmall and fomewhat toothed. The flowers are produced in loofe clufters from the wings of the ftalks; they they are fmall and white, and are fucceeded by fmall berries of a purplish colour when ripe.

2. VITIS vinifera americana. American Grape Vine.

There are many varieties of this, which generally rife up with ftrong ftems, climbing by tendrils or clafpers upon neighbouring trees for fupport, often to the height of thirty or forty feet, and of two, three or four inches in diameter; covered with a dark, rough, loofe bark. The leaves are generally heart-fhaped and fomewhat three lobed; fawed on their edges, and downy or hairy underneath. The grapes are produced in bunches, in form of the European kinds, generally between the fize of a Currant and Goofeberry: darkifh coloured, or with a light bluifh caft, and for the most part of an acid agreeable tafte.

3. VITIS vulpina. Fox-Grape Vine.

This in manner of growth hath much the appearance of the other kinds. The leaves are generally larger, and fmooth, but whitifh underneath. The fruit or grapes are about the fize of a common cherry and have a ftrong fcent, a little approaching to that of a Fox, whence the name of Fox-grape. There are alfo varieties of this, fome with whitifh or reddifh fruit which is generally most effeemed, and others with black, of which are our largest grapes.

4. VITIS Labrusca. Wild American Vine.

The stems of this have the appearance of our other kinds. The leaves are generally less and of a thinner thinner texture. The berries or grapes are produced in loofe bunches; they are fmall, and are of feveral kinds, fome reddifh, others of a fhining black, and fome of a bluifh colour; all of an acerb difagreeable tafte.

5. VITIS laciniofa. Canadian Parsley-leaved Vine.

The stalks and branches of this refemble the others. The leaves are cut into many flender fegments, fomewhat in manner of a Parsley-leaf. The grapes are round and white, and are produced in loofe bunches; they are late ripe and not very well flavoured.

XANTHOXYLUM.

The TOOTH-ACH TREE.

Class 22. Order 5. Dioecia Pentandria.

*THE Male Flowers have Empalements four-parted; the leaves oval, erect and coloured.

They have no Petals.

The Filaments in each are generally five, awl-shaped, erect and longer than the calyx. The Antheræ are twin, roundish and furrowed.

* The Female have Emplements as the male.

They have no Petals.

The Germen in each are generally five, often lefs, with fhort footftalks, oval and ending in as many awl-fhaped Styles. The Stigmas are obtufe.

The Seed-veffels are Capfules, of the fame number with the germen, oblong, of one cell and two valves.

The Seeds are fingle, roundifh and fmooth.

(167)

The Species, with us,

XANTHOXYLUM fraxinifolium. Ash-leaved Toothach Tree.

This grows naturally in Pennfylvania and Maryland; rifing with a pretty ftrong ftem to the height of ten or twelve feet; and dividing in many branches, which are covered with a purplish bark, and armed at each bud with two ftrong, fharp fpines. The leaves are composed of four or five pair of lobes, terminated by an odd one; which are entire and of an oblong egg-fhape, placed oppofite and fitting close to the common footftalk, which is also fet with a few fpines underneath. The flowers are produced along the branches, upon fhort collected footftalks; and those of the female are each fucceeded, for the most part, with five distinct, oval capfules, joined by fort footftalks to the common receptacle, and fpreading above; each containing one roundifh, fmooth feed.

There is faid to be another Species, or perhaps Variety, of this in South Carolina, differing in having the lobes of their leaves lance-fhaped, fawed on their edges and having footftalks. The bark and capfules are of a hot acrid tafte, and are used for easing the tooth-ach, from whence it obtained the name of Tooth-ach Tree: a tincture of them are also much commended for the cure of the Rheumatifm.

XANTHORHIZA.

SHRUB YELLOW ROOT.

Clafs 5. Order 6. Pentandria Polygynia. THE Empalement none. The Corolla is of five petals, lance-fhaped, pointed and fpreading. The Nectarium crowning the corolla, of five fmall leaves, fomewhat two-lobed: the lobes very fmall, roundifh, or rather runcinate, and inferted by flender claws in the common receptacle, alternating with the petals.

The Filaments five, thort and thread-form. The Anthera roundish.

- The Germen feveral, most frequently from feven to eleven, fmall and ending in as many awl-fhaped, fhort, incurved Styles. The Stigmas acute.
- The Seed-veffels as many Capfules; which are finall, fomewhat oval, comprefied, oblique pointed, of one cell and two valves, joined at their bafe to the common receptacle, and fpreading above.
- The Seeds are fingle in each cell, fmall, fomewhat ovate and lightly compressed
- Obf. The petals are fometimes fix in number. The number of Stamina are also fometimes increased.

The Species but one, viz.

XANTHORHIZA fimpliciffima. Shurb Yellow Root.

This is a fmall fhrub, growing naturally in Carolina. The roots are flender and cylindrical, but fending off fide fhoots by which it fpreads much; the wood of which, together with that of the stems, are of a bright yellow colour. The stems are slender, rifing to the height of two feet or more, generally fimple, or without branches, and covered with a lightifh brown bark. The leaves are compound, confifting of two pair of oppofite lobes, terminated by an odd one; the lobes are much and deeply cut or cleft on their edges, (fomewhat in form of Garden Lovage) and joined to very long, common footstalks, coming out from the tops of the stems. The flowers are produced at the top of the former year's growth, in a compound or panicled racemus; having their partial footflalks generally three flowered; they are

are fmall and purplifh coloured, and are fucceeded by little heads of fmall, compreffed capfules, each enclofing one fmall feed. The flowers on the partial or fmall footftalks, are not produced at once, thofe that are middle-most or terminal come out first and are hermaphrodite, and generally barren; those on the fides come out later, but one of which is generally fruitful; from whence, I had fuppofed, fome of the flowers were female, and to the contrary of which I am not yet fully convinced.

This fhrub, from the yellownefs of its roots and ftems, it is highly probable, might be employed to good purpofe in dying cloaths, &c. It has hitherto been undefcribed by Botanical writers, though named in fome late Catalogues in honour of M. Marbois; but having impofed the former name, before I had heard of this, have chofe to retain it as being exprefive of its qualities and appearance.
