PRINTED FOR LONGMAN, HURST, REES, AND ORME, PATERNOSTER-ROW.

1810.

SURGICAL OBSERVATIONS.

On the Origin, Symptoms, and Treatment of Difeafes produced by the Abforption of morbific Animal Matter, and which in Appearance frequently refemble Syphilis.

SECT. I.

INTRODUCTORY REMARKS.

SINCE the publication of Mr. Hunter's accurate obfervations on the Venereal Difeafe, it has been generally admitted that certain modifications of animal matter, being applied to a fufceptible furface of the body, will in many inftances excite an ulcerative difeafe, in which the difeafed part fecretes matter precifely fimilar to that which had excited it. Thefe kinds of infectious matter Mr. Hunter called morbid animal poifons, in order to diftinguish them from those poisons with which fome animals are furnished for purposes connected with their economy. Mr. Hunter further shewed that the animal matter of one per-

YOL. II.

fon

2

fon might induce difeafe in another, even though the perfon from whom the matter was derived had no difeafe*. As Mr. Hunter's opinions have been confirmed by the fubfequent experience of other practitioners, and appear to have obtained pretty general affent; and as fome of the cafes which I mean to bring forward feem ftill further to confirm and illustrate thefe opinions, it does not appear neceffary for me at prefent to enlarge on thefe fubjects.

Infectious matter may be the effect of difeafe in one perfon and the caufe of it in another, and yet it would appear a folecifm were we to call the infectious matter itfelf difeafed or morbid. Befides, as fome kinds of animal matter, which are not the products of difeafe, are neverthelefs capable of exciting it, I have, in the firft edition of this book, called all kinds of infectious animal matter, morbific animal poifons, which term there appears no reafon to change.

It cannot, I think, on due confideration of the fubject, be denied, that many fores are in-

* See his cafes of difeafes induced by the transplantation of teeth, and the fucking of children, in his work on the Venereal Difeafe.

duced,

duced on the genitals, by fexual intercourfe, which are not the effects of the venereal poifon, and that many of them infect the conftitution, and produce fecondary fymptoms refembling those of that diforder. It may be afked, however, if these difeases be not venereal, what are they? As they are all the confequence of fexual intercourfe, they may, in one fense of the word, be faid to be venereal. To avoid ambiguity, therefore, I shall in these pages denominate that difease which broke out at the fiege of Naples, and which Mr. Hunter has defcribed as the venereal difeafe, by the name given to it by nofological writers, that is, Syphilis; and I shall call those diseases, which differ from it in their progress and mode of becoming well, though they strikingly refemble it in appearance, by a name importing these circumstances, that is, Pseudo-Syphilitic Difeases.

To prepare the mind of the reader to take an impartial furvey of these subjects, I think it will be useful to make a few preliminary observations relative to the probable origin of pseudo-syphilitic diseases.

B 2

Celfus

4

Celfus describes eight species of fores with which the genitals were affected in confequence of fexual intercourfe; and as this was long before Syphilis was known, it follows that there must be other caufes producing them. Some of the fores defcribed by Celfus are not unfrequently met with at prefent, and they are not fyphilitic. Sores alfo frequently form upon the genitals of females in confequence of that irritation which accompanies difeafed fecretions from the vagina. Sores, for inftance, very frequently fucceed to gonorrhæa in the lower clafs of females, who pay little attention to cleanlinefs, and do not abstain from fexual intercourfe. Sores frequently break out on the prepuce and glans of the male, in confequence of the irritation which gonorrhæa or other difeafes of the urethra produce in these parts. These fores generally heal without the use of mercury, frequently without inducing any conftitutional difease : and when they do infect the constitution, the difease occafioned by them is not fyphilitic. I merely mention these circumstances at present, to shew that it is possible for ulcers to form which may

RESEMBLING SYPHILIS.

may not be fyphilitic, and yet the difcharges from them may prove morbific, and produce difeafe in others.

Even difcharges from the genitals of one perfon, where no ulcers exift, are capable of exciting ulcers in another. I am aware that no argument can be grounded upon the obfervation of this fact in common cafes, where the parties have been promiscuous in their intercourfe with others, and their veracity cannot be relied on. But I have known both gonorrhæa and ulcers occafioned by connexion with perfons who had no fyphilitic difeafe, where the veracity of the parties might be relied on, and where no promifcuous intercourfe could be fufpected. The cafes of supposed gonorrhæa arising from sexual intercourfe with perfons who apparently have no difeafe are fo very common as to need no exemplification. I think, however, it will be proper to adduce fome inftances, in which ulcers have taken place in confequence of the application of irritating matter which was not of a fyphilitic nature, becaufe cafes which can be cited in proof of this fact must be rare

occur_

5

occurrences, and not likely to be met with except in the extensive practice of a large city.

CASE I.

A gentleman was connected with a female who was kept by another gentleman, and derived from fuch connexion feveral very irritable and foul fores, which broke out on the prepuce, but which, however, had not the fyphilitic characters. As neither the woman nor her keeper had any difeafe, he had no wifh to take mercury, nor had I, being confulted on his cafe, any defire to recommend it to him. The fores did not heal until between two and three months, though a variety of local applications were employed. He at length, however, became perfectly well, and I cautioned him not to be again connected with the fame woman. But his inclination got the better of his prudence, and another crop of fores, equally irritable, foul, and tedious, took place in confequence of a fecond connection. Thefe fores were treated in the fame manner as before and flowly healed. After fome lapfe of time, he again erred in the fame manner; and again received the fame punishment. He

RESEMBLING SYPHILIS.

He had no constitutional difease from these fores.

amendment was perceived, and the mouth

was not affected J. II BAADedicine, the patient

A gentleman had been my patient with strictures in the urethra, which were nearly, though not perfectly well. A large bougie could be paffed with facility, but it gave fome pain on paffing those parts of the urethra where the ftrictures had been, and there ftill existed a very trivial discharge from that canal. Under these circumstances he connected himfelf with a female, who, there was good reafon to believe, had had no communication with any other perfon. She, however, had in confequence of this connection, four fores which formed upon the under furface of the labia pudendi, two on each fide. Thefe fores were very irritable, and became larger than a fixpence, and of an oval form. They threw forth exuberant flesh of a livid hue, were very tender, and had a great deal of inflammation furrounding them. Various dreffings were employed without amending them, and after a month had elapfed I was induced to recommend from

B 4

10 to 15 grains of the pil. hydrarg. to be taken daily. After another fortnight, as no amendment was perceived, and the mouth was not affected by the medicine, the patient rubbedin 2 drachms, by measure, of mercurial ointment every fecond night. A fecond fortnight elapfed without any amendment in the fores, though the mouth was flightly affected. At this time, the uneafiness of the patient and her friend induced me to defire they would confult another furgeon, who thought the fores fyphilitic, and wifhed that the quantity of mercury should be increased, so as more decidedly to affect the mouth. In confequence of this confultation, the patient rubbed in the fame quantity of mercurial ointment every night, and difcontinued the internal use of the medicine. At the conclusion of another fortnight, the mercury fuddenly affected the gums, and produced a degree of ptyalism which prevented its further use. Still the fores were not amended, and on the abatement of the ptyalism, I again had recourse to local means without refuming the use of mercury, the inefficacy of which had been fully proved. The fores now healed rapidly under the

RESEMBLING SYPHILIS.

the local ufe of a folution of cupr. vitriolat. Wherever mercury has been ufed, it muft be difficult to decide whether cafes are or are not fyphilitic. I think it very clear, however, that the cafe juft defcribed was not of that nature; and, as to the fores healing fuddenly, it is a very common occurrence when no mercury is ufed. For fores which are not affected by a local application in their incipient ftate, will fometimes heal rapidly if the fame application be made to them in an advanced ftate, when the activity of the difeafe is abated, or its nature changed by its continuance.

Though no conftitutional affection fucceeded to the fores induced in the foregoing cafes, yet that the fyftem is liable to be contaminated by abforption from ulcers of this defcription will clearly appear from the cafes related in the fubfequent part of this paper : and at prefent, to corroborate this fact by the teftimony of another, I fhall relate a cafe which was communicated to me by an eminent and accurate furgeon in this town.

9

ad day in the CASE III.

chiordiviation to contract a

A gentleman lately married complained to his furgeon of a running from the urethra, which fo ftrikingly refembled a venereal gonorrhæa that the latter could not but afcribe it to infection. He had afterwards a fwelling of the prepuce, and fores on that part, which confirmed the furgeon in his opinion, and produced a kind of diffention between his patient and him, the one affirming that the difeafe was venereal, the other that it could not poffibly be fo, as his wife had no difeafe, and he had had connexion with no other woman. The effect of this litigation was, that the furgeon would not urge the taking of mercury, nor would the patient require the administration of that medicine, though a bubo, forethroat, and eruptions fucceeded, which could not be diftinguished from fimilar complaints of a fyphilitic nature, but all of which fpontaneoufly got well.

The narrative of the following cafe was lately fent to me by Mr. Watfon of Stourport. It is an inftance of the nurfe being in-4 fected

CASE

fected from the child, and fimilar inftances in this refpect are not unfrequently met with. Yet it contains fome interefting circumftances which are explanatory of my prefent fubject, and I therefore take the liberty of inferting it in this place.

CASE IV.

Mrs. F., after fuckling a nurfe child about four months, perceived a fmall ulcer on the breaft near the nipple, which fhe believed fhe caught from the child, as it had a bad nofe and fore lips. At this time the ulcer was about the fize of an almond, and of the fhape of one. As it did not heal from fimple dreffings, the furface of the fore was rubbed with argent. nitrat. and a wash of calomel in lime water was afterwards applied. Under this treatment the ulcer healed, and a gland in the axilla, which had enlarged, fubfided. This happened about three weeks after the patient had first confulted me. Two months afterwards, the patient had a fevere febrile attack, accompanied with fore throat, of which fhe foon recovered. To this, fucceeded a coppercoloured eruption which came out on all parts

parts of the body. No medicine was given at first, but as the patient became uneasy, some compound calomel pills, with fmall dofes of nitric acid were directed. She took about 12 pills and fmall dofes of the nitric acid for the fame length of time, when they were difcontinued. In about two months all the eruptions had difappeared, except fome white blifters, which had lately formed about the labia pudendi, and which gave her pain, when she walked. This complaint was removed in a few days by a folution of fulphat of zinc. About a week afterwards, her hufband fhewed me a fore on the penis, covered by a black fcab. It was about the fize of a fixpence, the furrounding skin was much inflamed, but the bafe of the fore was neither hard nor thickened. In a few days, a fecond fore appeared in the courfe of the abforbents between the first and the groin. The inguinal glands now became enlarged, and one of them fuppurated. In about three weeks from the first appearance of the fore on the penis, the patient was attacked with feverifh fymptoms, which were followed by an eruption, different from that which his wife had been affected with, but

but very fimilar to the erythema papulatum fyphiliticum, reprefented by Doctor Willan. The fores on the penis fpread rapidly for fome days, but did not penetrate deeper than the fkin, and after being twice touched with argent. nitrat. they foon healed with the ufe of calomel in lime water. The abfcefs in the groin was opened by a lancet, and the wound ulcerated confiderably, but afterwards healed by the fame means, that had been ferviceable to the other fores.

This patient never took any mercury, except once, when fome calomel was given with other aperients, as a purge.

It may be rationally fuppofed that the difcharges from fuch fores as I have defcribed, as well as the difcharges from fecreting furfaces not in a ftate of ulceration, may prove morbific and excite local difeafes, or if abforbed may contaminate the conftitution. Cafes which render thefe opinions probable, are fo frequent, that every furgeon muft, I think, have remarked them. In confequence, however, of his preconceived opinions, he might

might diftrust the veracity of his patients, and treat the difease as if it were fyphilitic, and the consequences of such conduct will be difplayed in the subsequent part of this paper.

After these preliminary observations, which are defigned to fhew how fores on the genitals may arife from fexual intercourfe at prefent, as they did even in the time of Celfus; I may further remark that from the time of the breaking out of the lues venerea, it is probable fuch fores continued to occur, and were confounded with the fores induced by that difeafe: thus we may account for the opinions delivered by old authors, of even fyphilis getting well fpontaneoufly, or by the administration of medicines of acknowledged inefficacy. Every furgeon must have seen cases of syphilis getting progreffively worfe, till corrected by mercury, and regularly yielding to the effect of that medicine, and being permanently cured by one adequate mercurial courfe; fo that his observations will induce him to admit the accuracy and justness of the description of that difease which Mr. Hunter has given,

RESEMBLING SYPHILIS.

given, in a great number of instances. Further, when from the infenfibility of the conftitution to the operation of mercury it has been difficult to excite its fpecific effect, how numerous are the cafes of chancres, ulcers in the throat, and nodes, that have remained stationary and unvarying under a long use of mercury, and yet have yielded and become perfectly well, when by more energetic measures the constitution has at length been affected by this medicine. To identify what I confider as true fyphilis, and to excite the reader's attention to that difeafe, fo that he may contrast it with those which make the fubject of the prefent publication, I fhall here infert a cafe which was related in the first edition of my furgical and physiological effays, to fhew the efficacy of mercurial fumigations in affecting the constitution, when other modes of administering mercury had failed to produce its fpecific effect *.

CASE

* It is not my intention to republish the cafes in proof of this fact, because I think that the present one is sufficient to evince its truth. It seems, however, right to mention, that my opinions on this subject are unaltered, and

CASE V.

A young man had a chancre by the fide of the frænum preputii, which had all the characters of true fyphilis. It was of a circular form, with a thickened edge and bafe; there were no granulations, and matter adhered to the furface. For this, he took mercurial pills in large quantities, which never affected his mouth, though occafionally they produced griping pains, and made him feel very unwell. He was obliged at this time to travel pretty conftantly, fo that he could not conveniently rub in mercurial ointment. When the mercurywas taken in fuch quantities as to make him feel ill, and to diforder his bowels, the fore

and to repeat, that I have found mercurial fumigations employed in the manner recommended by the Chevalier Lálonette, a phyfician in Paris in 1776, to be, in the majority of inftances, a more powerful and innocent means of producing a mercurial affection of the conftitution than in unction or the internal ufe of mercury, and equally certain of radically curing the difeafe for which it has been thus administered. The fumigating powder which I have ufed instead of Lálonette's is calomel washed in water, containing a small quantity of ammonia.

5

looked

looked red on the furface, and feemed difpofed to heal, but when he diminished the quantity of the medicine the fore affumed its former difeafed characters. After the chancre had continued for two months, a fmall bubo formed, fuppurated and burft. By perfevering in the internal ufe of mercury to the greatest extent that he could do, the chancre healed and the bubo got well about the fame time. This happened four months after the occurrence of the chancre, and fix weeks after the breaking of the bubo. As at laft having got the chancre to heal by pushing the use of mercury to an extent that made him feel very uncomfortable, and much indifposed, he left off the medicine fooner than he ought to have done. In two months more, his former occupations ceasing, he returned to London, where he afterwards remained. Shortly after his return, which was in September 1788, one of his tonfils feemed a little enlarged, indurated, and tender, so as to occasion a difficulty in deglutition. In the courfe of a week it ulcerated, and the ulcer acquired by degrees all the characters of fyphilis. It was of an oval VOL. II. form C

form, excavated, without granulations, and with matter adhering to its furface. The fame circumstances took place in the oppofite tonfil and an exactly fimilar fore formed in it. As the hiftory as well as the appearances of the primary chancre left no doubt of its nature, and as the fecondary fymptoms were equally unequivocal, he immediately began a mercurial courfe: being healthy, and his bowels not eafily difturbed, he took, on an average, from two to three grains of calcined guickfilver, or calomel joined with opium, every day for three months; and alfo used mercurial ointment during the fame period, beginning with two drachms, and gradually increasing it to an ounce daily : befides which, he had for a fhort time taken a folution of hydrargyrus muriatus. Yet all this fcarcely produced any forenefs of his gums, or caufed any visible amendment in the ulcers of his throat; the only effect it had being that of preventing them from becoming worfe. His bowels indeed were occafionally diffurbed by the medicines, but were cafily quieted by opium. To rub in the quantity of mercurial ointment used towards the latter part of the courfe,

RESEMBLING SYPHILIS.

courfe, the patient fpent nearly an hour and half every night and morning; but as he became weaker, he perfpired confiderably in confequence of this exercife, which tended to fruftrate his endeavours, by preventing, or at leaft greatly diminifhing, the abforption of the medicine.

No ground being gained by purfuing this plan, Sir Charles Blicke recommended mercurial fumigation according to Lalonette's method, which he had occafionally employed with fuccefs, and which would not only relieve the patient from the fatigue of rubbing in the ointment, but prevent any farther irritation of his bowels, by fuperfeding the internal use of mercury. The patient was accordingly exposed, for half an hour each night, to the fumes produced from half an ounce of the powder; by which means, in lefs than a fortnight, his conftitution and mouth became properly affected by the mercury; the ulcers healed foon afterwards; and in about a month he was permitted to difcontinue the remedy.

C 2

In

19

In this cafe the difeafe in all its circumftances precifely agreedwith the defcription of fyphilis given by Mr. Hunter. It was unchangeable in its characters; it regularly and progreffively got worfe when no mercury was employed, it was ftationary when oppofed by that medicine, and it was permanently cured by an adequate mercurial affection of the conftitution.

Having been educated in the old fchool, under professors who prided themselves in poffeffing the Tactus and Vifus eruditus, I was anxious to obtain that happy difcrimination of colour that fhould enable me to pronounce from the copperish tint of an eruption that it was undoubtedly venereal. But my endeavours were ineffectual; and much was I gratified by the publication of Mr. Hunter's book, which furnished me with a clue to guide me through the labyrinth in which I had been bewildered. All my obfervations, while a ftudent, corresponded with Mr. H.'s, and when I experienced as well as witneffed the perplexities of practice in these difeases, I faw nothing contrary to his defcription 8

fcription. I faw cafes of true fyphilitic difeafe, which had been regular in their progrefs and increafe, when no mercury was ufed, regularly and permanently cured by that medicine. I alfo faw difeafes refembling the venereal, which were neither regular in their progrefs nor cure. Each year additional facts prefented themfelves to eftablifh thefe opinions, and none appeared to contradict them. The following cafe in particular, of a medical ftudent of the hofpital, made a ftrong impreffion upon my mind.

CASE VI.

This gentleman thought that he had infected a flight cut on his hand (which was fituated in front and juft below the little finger) with the difcharge from a bubo in the groin that he had opened. The wound fretted out into a fore about the fize of a fixpence, which he fhewed me, and which I affirmed had not the thickened edge and bafe, and other characters of a venereal chancre. I therefore recommended him to try the effect of local means, and not to ufe mercury.

C 3

In about a month the fore, which had fpread a little, became again contracted in its dimenfions, and affumed a healing appearance. At this time pain was felt extending. up the arm, and fuddenly a confiderable tumour arofe over the abforbing veffels, which proceed along the inner edge of the biceps muscle. This tumour became nearly as big as a fmall orange. As the original fore feemed now difpofed to heal, and as there was no furrounding induration, I could not believe it fyphilitic, and therefore recommended him still to abstain from mercury, and apply leeches, and linen moiftened in the aq: litharg: acet: comp:, to the tumour formed over the inflamed abforbents.

Under this treatment the tumour was difcuffed, and the fore at the fame time healed. About three weeks afterwards the patient called on me, and faid that there were venereal ulcers in his throat; and in each tonfil there was an ulcer deeply excavated, with irregular edges, and with a furface covered by adhering matter; ulcers, in fhort, which every furgeon, who depends on his fight as his

22

RESEMBLING SYPHILIS.

his guide, would have pronounced to be fyphilitic. Shortly after alfo, fome copper-coloured eruptions appeared on his face and breaft. He fhewed his difeafes to feveral furgeons, on whofe opinion he relied, who, without hefitation, affirmed that they were fyphilitic, and that the mercurial courfe had been improperly delayed.

Whilft the patient was looking out for lodgings, in order that he might go through the mercurial process, a circumfcribed thickening and elevation of the pericranium covering the frontal bone appeared; it was of the circumference of a half-crown piece; and was, in fhort, what every furgeon, who is guided only by his fight and touch, would, without hefitation, have called a true corona veneris. I now told the patient that I was still more inclined to believe his difeafe was not fyphilitic, from the fudden and fimultaneous occurrence of this node with the fore throat. &c. Other furgeons thought differently; and I believe this very fenfible and amiable young man imagined that his health wound become a facrifice if he any longer attended to my opinion. C 4

opinion. He was preparing to fubmit to a mercurial courfe, when very important concerns called him inftantly into the country. He went with great reluctance, taking with him mercurial ointment, &c.: and after a fortnight I received a letter from him, faying that he found his complaints benefited by his journey, that bufinefs had prevented him from beginning the ufe of mercury for a few days, that he now found it was unneceffary, for his fymptoms had almost difappeared, and fhortly afterwards he became well.

At the time, and ever fince, I confidered this cafe as meriting publication, as being a moft unequivocal inftance of a difeafe occurring, which could not from appearance be diftinguifhed by furgeons of the greateft experience from fyphilis, and which, however, was undoubtedly of a different nature ; and I believe that there is no one, who would not have decided on this cafe, as those did who declared it to be fyphilitic, unless they had had an opportunity of watching its progress very attentively. This cafe probably made me more fcrupulous than I fhould other-

24

otherwife have been in admitting difeafes to be fyphilitic, till their unabating progrefs eftablifhed their nature beyond the poffibility of doubt; and from this hefitation in deciding I have been enabled to prove, that a great number of cafes, in which mercury would have been employed, have got well without the ufe of that medicine.

In the course of practice, I frequently met with cafes of a nature fimilar to the foregoing. In these, I had opportunities of tracing conftitutional fymptoms from the primary fores which had caufed them, a circumstance which cannot frequently be done in hospital practice. I faw that the primary fores had not the character of fyphilis, notwithstanding the secondary symptoms often ftrongly refembled those of that difease. As, however, I did not meet with other furgeons who thought as Mr. Hunter did on this fubject, and as my obfervations fo ftrictly coincided with his, I thought it right in the first volume of my Surgical Obfervations, published 1804, to excite the public attention to these cases by laying before it the following Effay.

Effay, but previoufly I enquired of the beft furgeons in London, whether conftitutional fymptoms of fyphilis do ever fpontaneoufly amend? To this enquiry no one decidedly replied in the affirmative, whilft all without hefitation agreed that they were generally, if not conftantly, progreffive, unlefs checked by the operation of mercury. In confequence of this opinion, fo concurrent with Mr. Hunter's defcription of the difeafe, I was induced to publifh the following cafes and remarks.

Langt Trans

SECTION II.

On Pseudo-syphilitic Diseases becoming well spontaneously.

MR. Hunter, in his excellent Treatife on the Venereal Difeafe, has related feveral cafes fuppofed to be fyphilitic, and fome of which were certainly not fo, as they got well without mercury; but in the greater number the employment of this medicine rendered their nature doubtful. Mr. Hunter alfo, who was as cautious in drawing conclufions as he was accurate in making obfervations, expresses himself in many instances fo diffidently on the fubject, as, in my opinion, not fufficiently to imprefs the minds of his readers with the certainty, importance, and frequency of fuch facts. He concludes his observations by intimating " that undescribed difeafes, refembling the venereal, are very numerous, and that what he has faid is rather to be confidered as hints for others to profecute this inquiry further, than as a complete account of the fubject." As it has occurred to me very frequently to meet with fuch cafes,

cafes, and as the neceffity for difcriminating them from fyphilitic difeafes appears to me of the higheft importance, I fhall profecute the fubject by relating fome unequivocal cafes of difeafes ftrikingly refembling fyphilis, but which, however, were diforders of a different nature, provided it be admitted that fyphilis does not fpontaneoufly get well without the aid of medicine.

The neceffity for difcrimination between these difeases will appear upon a flight confideration of the fubject. If a furgeon, who does not fee that extent of practice which occurs in a metropolis, administers mercury in one of the difeafes refembling fyphilis, he finds perhaps that the fymptoms yield flowly; and even after a confiderable and debilitating course of that medicine they may recur. They are then counteracted by a still more fevere use of mercury, till they perhaps fpontaneoufly ceafe, which may not happen till the patient's conftitution is fo enfeebled, that if it do not fall into other states of disease it very flowly regains the ftandard of health. Such cafes would induce the furgeon to confider the unportant consideration

a ab - y thinks Syphilis

" well without envicine

the venereal difeafe as peculiarly difficult of cure, and liable to recur on the remiffion of even a fevere courfe of mercury. The confequence of this opinion is, that he employs mercury to an unneceffary and injurious degree in his general practice,

- I do not mean, however, by these remarks to imply, that, in my opinion, fyphilitic difeafes are equally fusceptible of cure in every instance by mercury; nor am I an advocate for what has been termed an alterative courfe of this medicine. Cafes which frequently occur have convinced me that it requires a very confiderable mercurial effect to cure fyphilis in fome inftances; and that this effect must be continued for a confiderable time in order to infure a cure. Mr. Hunter probably wished the subject of difeases refembling fyphilis to be profecuted, in hopes that some distinctive characters might be difcovered as peculiar to them; but the following cafes fhew that these difeases enfue from primary infected fores of very diffimilar appearances, and fometimes arife without any primary fore having been obferved.

Whilft, then, the primary fymptoms are thus variable, and fuch as may perhaps in the greater number of cafes be diftinguifhed from those of fyphilis, the secondary or conftitutional fymptoms often fo ftrikingly refemble those of that difease, as not to be difcriminated from them by fight, though in general they may be by their progress.

I have kept no particular account of the numerous cafes which I have met with, but the five following inftances happened in my own private practice within a few months, and the circumftances of them are ftill fresh in my memory. The cafes are drawn up from narratives which I requested the patients themselves to make out of their own difeases.

CASE VII.

A gentleman had a fore on the lower part of the prepuce near the frænum, which was much irritated by travelling from the country. When he came to town there was a good deal of furrounding inflammation, and a thickening adjoining the edges of the fore which

which were irregular, and feemingly difpofed to fpread. An appearance of granulations had taken place on the furface of the ulcer, which was at this time as large as a fhilling. I gave him the pilulæ hydrargyri, whilft I tried by local means to quiet the irritation of the fore, and of the furrounding parts. As the fore appeared to heal flowly, and feemingly in proportion to the quantity of mercury taken, the patient rubbed in at the fame time fome mercurial ointment, and continued to do fo till after the fore was well, which was in about a month. In three weeks after he had left off these medicines, this patient applied to me on account of an ulceration on the velum pendulum palati, and on the furface of one tonfil; and foon afterwards ulcers took place on the edges of the tongue, and on the infide of the lips and cheeks. Coppercoloured spots also came out on his arms and legs, and all over his body. They were very numerous, but none appeared on his face. By waiting and watching the progress of the difeafe, I found that fome of the ulcers amended fpontaneoufly, and that the palate got well. I therefore exhorted him to refrain

10

from

from mercurial medicine, and he went into the country. A medical gentleman, whom the patient confulted, was very anxious to try fomething to cure this difeafe, when his patient was feized with a fevere febrile complaint, during the continuance of which all thefe doubtful fymptoms difappeared, and there has not been any return of difeafe fince that time.

CASE VIII.

A gentleman had a fmall fore on the prepuce, at a little diftance behind the corona glandis, which did not appear like a venereal chancre, and therefore no mercury was ufed. After about a fortnight, during which time it could fcarcely be faid to be better or worfe, it fuddenly became confiderably indurated in its circumference, and the furrounding parts' became inflamed. The hardness was to confiderable that it refembled one of those indurated chancres which fo frequently occur; and in confequence of this ftriking refemblance, another furgeon, whom the patient confulted at this time, infifted on his confining himfelf to his chamber, and using mercury attentively.

The

The quietude of the patient, with fome little attention in regard to local applications, foon removed the inflammation and hardnefs, and the patient, who was controlled by nothing but his fears, difcontinued his medicine after thrice using fome mercurial ointment, and returned to his former mode of life.

About a month afterwards, he called on me with an ulcer in each tonfil, one of which was deeply excavated, with irregular edges, and covered by adhering matter. Shortly afterwards, copper-coloured fpots appeared on his body, but thefe difeafes all difappeared in about a month, without ufing mercury.

CASE IX.

A gentleman applied to me with a very irritable fore, or rather excoriation, extending itfelf over the left half of the corona glandis. It was unlike a fyphilitic fore, as may be fuppofed from this defcription, yet, as the patient was young and healthy, I advifed him to take fome of the pilulæ hydrargyri to guard against the possible confequences of abforption, and to bathe the parts affected with VOL. II. D the

the aq. litharg. acet. comp. c. opio, and to apply folded linen moistened with the wash round the penis. The prepuce foon became Iwoln and inflamed, fothat he was unable to retract it, and the attempt gave him great pain. He was therefore directed to cleanfe the part by injecting frequently the decoction of white poppy heads of a lukewarm temperature. After a week he tried a very weak folution of vitriolated zinc, and other metallic falts, but they all increased his pain, and he was obliged to return to the use of the anodyne wash. When he had perfevered in this courfe three weeks without any evident amendment, he confulted another furgeon, who recommended the discontinuance of the mercurial medicine, and in lieu of it, the free use of the bark. This medicine he took for a week without any amendment; he then tried the nitrous acid for ten days, and afterwards took cicuta.

In about two months he was able to retract the forefkin, and then the folution of vitriolated zinc appeared to leffen the irritability, and

and contribute to the fkinning of the fore, which was merely on the furface, not having been attended with any lofs of fubftance.

Afterwards the penis being fubjected to fome accidental irritation, the fame kind of foreness spread over the other half of the corona glandis; but this difease was not accompanied with fo much tenderness as the former one, and got well in lefs than a month. As foon as it was well, the patient had an ulceration of the velum pendulum palati, round which the cuticle affumed a whitish colour; the ulceration spread across the palate, but it was evident that the part first affected got better, whilst the ulcer became worfe in the parts last affected. Two or three ulcers took place upon each edge of the tongue, and fome on the infide of the lips. At the fame time many copper-coloured fpots appeared on the face, breaft, arms, and lower extremities; they came out in fucceffion, were of an oval fhape, about the fize of a fixpence, and had a ftrikingly fyphilitic afpect.

D 2

Believing

Believing that the primary fymptoms of this difeafe were not fyphilitic, and obferving that fome part of the ulcer on the palate healed, and that fome of the fores on the tongue and lips got better, whilft new ones broke out, I recommended the patient to ufe no mercury. He went into the country, where all thefe maladies gradually difappeared, and in about a month he was perfectly well.

CASE X.

A person, whose irregular habits of life gave reason to suspect the existence of syphilis in the conftitution, had ulceration of the tonfils, not superficial, but deep. These were accompanied with copper-coloured fpots on the face and breast, and eruptions on the head amidst the hair, accompanied with a great deal of fcurf. Thefe got well by anointing the head with ung.hydrarg.nitrat. mixed with fimple ointment, which made me doubt whether the other difeafes were really fyphilitic, and caufed me to delay the ufe of mercury. The complaints did not amend, nor did they get materially worfe. There was attending these diseases a good deal of general

general indisposition; the appetite failed, and no fleep took place till the morning.

At this time a tendernefs and thickening of the periofteum of the tibia took place. Though other medicines did not appear to be of any fervice I ftill was averfe to the ufe of mercury. Tired of delay, the patient confulted another furgeon, who declared the difeafe to be veneral, and defired that mercurial ointment might be ufed. The patient accordingly rubbed in two or three nights without feeling any effect from the medicine, and then fet off on a party of pleafure to Brighton, where all the difeafes gradually difappeared without any further ufe of mercury.

CASE XI.

A gentleman had an enlargement of a gland in the groin, probably from the abforption of fome infectious matter, though he was not confcious of having had any fore. A fecond and a third gland became enlarged, the integuments became thickened and inflamed, and a very large bubb formed. It fuppurated and burft in three places. The general tumefac- D_3 tion

38

tion fubfided, but by no means difperfed, and finufes remained where the abceffes had been. About this time I faw the patient, which was two months after the first appearance of the difease.

Shortly after this, he had an ulceration, which fpread over the velum pendulum palati, and except that it was more fuperficial, much refembled a fyphilitic ulceration. It continued fo long without amendment, that I began to think it was fyphilitic. Bark was now given plentifully, and the ulcer evidently amended. The patient went afterwards to the fea-fide, where the bubo gradually difperfed : many months however elapfed before it entirely difappeared. The ulcerations of the velum pendulum palati alfo healed flowly; and ulcers, which afterwards appeared in the back part of the pharynx, got well likewife without mercury.

These cases are not related as being rare or curious, but because they all occurred to me within the space of a few months, and because fufficient time has elapsed since their

their occurrence to fhew that there is no probability that there will be any recurrence of these or similar symptoms. It must be allowed that they are incontestable instances of difeafes getting well without mercury, which could not be diftinguished by mere infpection from fimilar difeafes truly fyphilitic. For though mercury was employed in some of the cases, it was used at such a time, or in fuch quantity, that it cannot in the least influence our decision as to this point. For instance, in the first cafe though mercury was employed for the cure of the primary ulcer, and did apparently contribute to it; yet the fecondary fymptoms got well without mercury, which, according to the opinions now prevailing among furgeons, is a proof that neither was fyphilitic. It may indeed be supposed that the syphilitic poison may be modified by certain conftitutions, and its effects spontaneously disappear; and some may question if the secondary symptoms were the confequences of the fores or abforption to which I attribute them. What I have written is, I believe, in conformity to prevailing opi-D4 nions,

nions, and I forbear to enter into uncertain discuffions.

These instances, however, though not felected for the purpofe, fhew that the primary infected fores which are capable of producing fecondary fymptoms, strikingly refembling those of fyphilis, do not themselves posses any uniform characters. In the first cafe the ulcer had no uncommon appearance; it was of the fize of a shilling, with fretful edges, and every where covered with granu-In the fecond there were no appalations. rent granulations, and a great degree of induration fuddenly furrounded it, giving it a ftriking refemblance to the indurated venereal chancre. In the third, the fore furface was extremely irritable; but though the difeafe exifted for a long time, the ulcerative procefs did not eat into the part; and at the conclusion of the cafe there was no lofs of fubstance. In the fourth and fifth cafes, the abforption of the matter, which caufed the fecondary fymptoms, either took place without any breach of furface, or the primary fores

fores were too infignificant to excite attention. I lately attended a gentleman who had an ulcerated throat, and eruptions on the head, which broke out between the fecond and third month after the appearance of a fore on the prepuce, which fore healed in a few days with no other treatment than bathing it with a folution of acetated lead, and applying to it a piece of lint moiftened with that liquor. This circumftance made him difregard the primary fore, but he was affured by a furgeon, whom he confulted,, that the fecondary fymptoms were fyphilitic; they however got well without mercury.

It is probable, that the morbific poifons which produce pfeudo-fyphilis may be abforbed without any evident ulcer, or from a trivial ulcer, which may heal fpontaneoufly, much more frequently than the fyphilitic poifon; and if the confequent conftitutional fymptoms are confidered as the effects of the latter difeafe and treated as fuch, I need not fay what confusion must be produced in the mind of the furgeon who purfues this conduct, and how bewildered his opinions must be repecting

ing venereal diseases. If, for instance, in the eleventh cafe, a furgeon had confidered the fecondary fymptoms as fyphilitic, and employed mercury fuccefsfully for their cure, he would fet this down as a cafe of syphilitic bubo occurring without a previous chancre, and be inclined in his general practice to use mercury in all cases of buboes without chancre, lest constitutional difeafes should enfue. There, however, does not appear any thing that should exempt the glands of the groin from enlargement, and difeafes to which other abforbent glands are fubject, whilft they are particularly liable to irritation and confequent difeafe from diforders of the urethra and other parts, to which they are connected by means of their veffels. The use of mercury as a specific, therefore, in enlargement of these glands, unles they have been preceded by a chancre, muft, I think, be confidered as improper.

I have met with many fimilar cafes fince those five that have been related, and of which, from their fudden and almost fimultaneous occurrence, I was induced to take a written

written account : within these two months, I, have feen two cafes of eruptions and three of fore throats. The eruptions took place particularly about the hands and feet : in one cafe, the patient has been falivated for them; the difeafe, however, recurred, and afterwards got well without the use of mercury. In the other, there were warts and fores on the prepuce, and buboes in the groin, which fuppurated and burft : the eruptions fo ftrikingly refembled those of fyphilis, that all the medical men, who accidentally faw the patient, exclaimed that they were fo, with a confidence proportioned to their professional skill and accuracy of obfervation. Indeed in this cafe, and in others, I have been almost impelled to use mercury, in confequence of the opinion and wifhes of the patient and those of his friends. The hiftory however of this difeafe did not accord with that of fyphilis; the warts had preceded the fores; fome fores healed, and others broke out; and at laft, fome of the eruptions began to get well, and the reft gradually difappeared. The third patient had a fore throat for which he had been falivated: it afterwards recurred when

when it got well without mercury. The fourth and fifth had ulcers in the throat and on the lips and tongue: they all got well without mercury. One of the patients who had the fore throat had been falivated, but the . difeafe recurred. In the other two I forbore to use mercury, and I have reason to fay they will do well without it. In one of the latter cases there were ulcers on the tongue and the infide of the lips.

If, then, the occurrence of fuch cafes be frequent, and the necessity of difcriminating them from those of fyphilis be of great importance, we may folicitoufly enquire by what circumstances we are to diffinguish between difeafes fo fimilar in appearance, but fo different in their nature. Mr. Hunter feemed to wifh the profecution of this fubject, probably from the expectation that fome characters appropriate to these difeases might be detected : I have not, however, been able to discover any; the fictitious disease in appearance fo exactly refembles fyphilis that no obfervation, however acute, feems to be capable of deciding upon its nature. Although the ulcers talas!

cers in thefe ambiguous cafes generally fpread more extensively along the furface of the part which they affect, yet this does not constantly happen, as is shewn in the eighth cafe. In this cafe, however, the induration which furrounded the chancre occurred fuddenly, and went away as rapidly. The progress therefore, of the two difeases was very diffimilar *. It must also be remarked, that

* On the fubject of induration furrounding chancres I think it may be useful to relate the following cafe, and to mention that I have known fimilar ones in a lefs degree:

A student in furgery shewed me an indurated chancre, for the cure of which he had used a great quantity of mercury, which had affected his mouth for a long time, though not feverely. The fore fo exactly refembled a bad indurated veneral chancre that I did not hefitate to recommend him to remain at home, and rub in fo as to produce a flight falivation. But as no amendment was perceived after a fortnight's confinement, and under a confiderable affection of the mouth, I was induced to enquire more ftrictly into the local treatment of the fore, which I found he was conftantly irritating by various ftimulating applications. He also affirmed that the hardness had feveral times gone away and returned again. By bathing the part with milk and water, and drefling it only night and morning with mild falve, the hardness quickly abated, and thought he defifted from the mercurial courfe it foon became perfectly well,

true fyphilitic fpots and ulcers fometimes affume the appearance of other difeafes, and do not poffefs their ordinary characteriftics.

· Since, then, our fenses fail us in our endeavours to diferiminate between these two difeafes, and fince the most important circumftance is to diffinguish whether the disease be fyphilis or not, we may enquire whether there are any circumstances in the progress of these different diseafes which will serve us in diffinguishing one from the other. It appears to me that there are; and these cafes are published not merely to shew the frequency of fuch occurrences, and the neceffity for difermination, but to engage a more general attention to the means by which fuch distinction may be made. A very simple fact has enabled me in most cases to distinguish between the two difeases; yet, simple as it is, if it be generally true it is very important; and if it were univerfally true, it would be of the highest confequence. The fact alluded to is, that the constitutional fymptoms of fyphilis are generally progreffive, and never disappear unless medicine be employed. It may be

be added too, they are as generally relieved under an adequate effect of mercury on the conftitution. An attention to fuch plain and fimple circumstances has been of great use in directing the medical treatment which I have purfued, and I am induced to folicit the public attention to them, that others may determine the value of fuch remarks.

I have asked the opinion of feveral furgeons of great practice and abilties respecting this question; Whether constitutional fymptoms of fyphilis do ever fpontaneoufly amend? and no one has decidedly replied in the affirmative, whilft all, without hefitation, agreed that they were generally progressive till checked by the effect of mercury. It feemed useless to feek further information; for what furgeon is there at prefent, if he fees difeafes that cannot be diffinguished by the fight from fyphilis, and hears that they arofe in confequence of a chancre, that would fufpend his judgment, and forbear to administer mercury? . If I have lived in the habit of fo frequently detecting the imposing appearances of the fecondary effects of these diseases, it is because I have

I have been upon the watch, and becaufe they have occurred in patients in whom I have feen the primary fores, the appearance and progrefs of which have excited my fufpicion as to their nature. I have ftated the rule as general, but not univerfal; for I could myfelf relate cafes of difeafes, in which, from the great abatement, and even difappearance of fymptoms, I have concluded the difeafe was not fyphilitic; yet, from the duration of the diforder, or from the fubfequent aggravation of its fymptoms, the patient has defired, and I have recommended the ufe of mercury, and the difeafe has been fuccesfully treated as fyphitic without its real nature being afcertained.

The rule which has been mentioned relates to the conftitutional fymptoms of the venereal difeafe, for the primary ones, chancres, do fometimes heal fpontaneoufly, generally however, though not conftantly, leaving a thickening or induration of the affected part. They may alfo be induced to heal by topical means, without mercury, with fimilar events. Some enlargements of glands in the groin will alfo in like manner fubfide.

It

It may be fairly fuppofed that if fome chancres heal fpontaneoufly, conftitutional difeafes arifing from the fame caufe, may, in like manner, fometimes get well without mercury. The queftion can only be folved by experience. Delay will I am fure frequently enable a furgeon to decide, that the difeafe is not fyphilis; but there are cafes in which no amendment takes place, and the furgeon is as it were forced, from the progrefs of the difeafe, to employ mercury, though doubtful of its nature.

In recommending prudent delay and attentive obfervation, I hope and believe that I am not recommending any thing likely to be of dangerous confequences. The venereal difeafe is generally foon checked by the ufe of mercury; and in conftitutions where much medicine is required to counteract its effects, that medicine may be given with freedom. By delay and obfervation we perhaps may perceive that eruptions and fore throats, which could not from appearance be diftinguifhed from venereal, fpontaneoufly amend : that fome eruptions fcale and become well, VOL. II.

and the probability will of courfe be that the reft will do fo likewife: or that an ulcer mends in one part though it may fpread in another, when the natural inference is, that the difeafed actions in the fore will gradually ceafe, and health return fpontaneoufly; and that what has occurred in one part of an ulcer will fucceffively take place in the others.

In recommending delay it cannot, I fuppofe, be thought that I would advife any one to wait till an ulcer deftroyed the velum pendulum palati, or did material injury to any important part. There are cafes where the progrefs of the difeafe obliges the furgeon to use mercury, even though he may be furpicious that it is not fyphilitic. The effect of exciting a mercurial affection of the conftitution, where we feel ourfelves under the neceffity of employing that medicine, in difeafes refembling fyphilis is, as far as my observation enables me to determine, very various. It fometimes cures them very fuddenly, and very differently from the gradual amendment which it produces in truly fyphilitic

litic difeafes. Sometimes, however, thefe difeafes yield more flowly to its operation, and are cured permanently. Sometimes the difeafes recur in the fame parts after a fevere courfe of mercury; fometimes mercury merely checks the difeafe, and can fcarcely be faid to cure it; in which cafe it feems important to fupport the ftrength of the conftitution, and to keep up that mercurial effect which controls the difeafe, and can be borne without material derangement of the conftitution for a great length of time. Sometimes alfo the ufe of mercury aggravates thefe difeafes.

Again, in fome conftitutions, fyphilitic difeafe may affume unufual characters, and be very difficult of cure. It must then be fcarcely possible to difcriminate between these anomalous cases of fyphilis and those of difeases refembling it, unless fome new diffinctions are difcovered.

But I fupprefs any further obfervation on the fubject, having accomplifhed the intention of this paper, which was to depict a E 2 kind

kind of cafes which very frequently occurs in this metropolis, and which is, I believe, too commonly treated as fyphilitic, but which may be diftinguished not to be fo by a little prudent delay and attentive obfervation. The frequent cafes of fuch diforders which I have recently met with has fuggested the idea that they are increasing of late; nor is it improbable, fince they are like fyphilis, propagated by promiscuous intercourse from secretions, or fores not fo readily curable by mercury as those that are fyphilitic, and some of which are not from their nature so prohibitory of that intercourse.

It is now years fince this paper was drawn out as a fubject for difcuffion at a medical fociety; and, after fuch an interval, the chance of any of the diforders which are defcribed in it returning is diminifhed almost to nothing. I have fince met with confiderable numbers of fimilar difeafes, which give confirmation to the opinion that they are frequent occurrences. In fome later cafes, when the difeafe has been long protracted, and the patient very anxious to get rid of it, I have

have given a little calomel for that purpofe, but not fo as to invalidate the opinion that the difeafe was not fyphilitic. Having waited, for instance, four months from the occurrence of a fore throat with eruptions, and being affured by the progrefs of the diforders that they were not fyphilitic, I have directed that the compound calomel pills * fhould be taken in fuch dofes as to control the difeafe without weakening the conftitution, which generally difposes the fores in the throat to heal, but I have taken care to remit the use of even this small quantity of mercury if it feemed to heal the fores too fpeedily; for it feems to me better to let the difease exhaust itself than fuddenly to cure it. as in the latter cafe it is very likely to return. In confirmation of this opinion I may mention, that, about five years ago, a gentleman applied to me to undergo a falivation for the cure of a fore throat, for which he had been falivated three times, once in each fucceeding

† The pill, as prefcribed in the pharmacopeia of St. Bartholomew's Hofpital, contains 1 grain of calomel, 1 grain of the precipitated fulphur of antimony, and 2 grains of powdered gum guaiacum.

E 3

year

year. I need fcarcely fay that it was one of those ulcerated throats which have been defcribed. All medicine was abstained from ; and in between three and four months the fores fpontaneoufly became well, and have never fince recurred. The whole of this paper has been written upon the prefumption that difeafes which fpontaneoufly get well are not fyphilitic, which is, I believe, the general opinion. It may, perhaps, be queftioned by fome, whether the difeafes here recorded may not be modifications of the venereal difeafe. The practical rules of conduct will not, however, be altered even if fuch a fuppofition were verified, fo that it does not feem neceffary to difcufs this point : it may however be right to remark, that there are cafes which would induce the belief that ulcerated fore throats, eruptions, and nodes on the bones, fimilar to those described it this paper, may occur from a general diffurbance of the constitution, without the absorption of any infectious matter.

The object of this paper being fimply to excite attention to fuch cafes as are recorded in

in it, I did not think it neceffary to enlarge much upon a circumftance which, however, is a ftrong evidence of the neceffity of difcriminating between fuch difeafes and true fyphilis. The circumftance to which I allude is, that though a courfe of mercury may at the time remove all the fymptoms for which it has been employed, yet it will not cure the conftitutional difeafe; for the fymptoms will recur when the medicine has been difcontinued after repeated and fevere courfes of mercury, as will be fully fhewn, by cafes which I fhall afterwards relate.

Having written the forgoing account, I intended here to conclude, having, in my own opinion, accomplifhed my purpofe, which was to profecute in fome degree the fubject which Mr. Hunter deemed worthy of inveftigation, and to depict the circumftances of difeafes which I believe very frequently occur, and which are often confounded with cafes of fyphilis, to the detriment of patients, and the difcredit of our profession. But having requested the opinions of two of my medical friends on the foregoing paper, one E 4 of

of them faid, that he thought the publication of it would be injurious, as it might induce the younger furgeons to abftain from the ufe of mercury, to the prejudice of their patients; the other gentleman faid, that he thought more explicit defcriptions fhould be given of the cafes in which mercury fhould be withheld or employed. In confequence of thefe opinions, I am induced to take a clofer comparative view of the difeafes that are, and of thofe that are not, fyphilitic.

I undertake the task reluctantly, because the brevity with which I must speak of these fubjects may render my opinions liable to mifapprehenfion, and becaufe I do not feel competent to its proper performance. Yet, by this means, I think I fhall do away the objection of one of my medical friends; for I believe that I am myfelf more likely to err in recommending the too free than the too fparing administration of mercury in difeases of this nature. Any furgeon who has obferved the ruinous confequences of repeated mercurial courfes in fome conftitutions would probably err in the fame manner; and his diflike astalers

diflike to diforder the conftitution by mercury would probably lead him even to use it more freely than might be abfolutely neceffary : this he would do in cafes clearly fyphilitic, in order to prevent the poffibility of the recurrence of disease, and a repetition of a mercurial courfe. In doubtful cafes, which are cured by exciting the mercurial action in the constitution, he would adopt a fimilar mode of treatment, in order to fuppress the difeafe for fo long a time as to make it lefs likely to recur; or if any fubfequent difeafe fhould take place, to render it highly probable that this was not fyphilitic, fince it had broken out after fuch a course of mercury as must be confidered to be adequate to the cure of almost any difease of that nature. By undertaking this tafk I shall perhaps comply with the wifhes of my other friends, in stating more explicitly the circumstances which should induce a furgeon immediately to use or abstain from the administration of mercury, and, at the fame time, contribute my mite of observation to those already offered on this still obscure subject of venereal diseases.

The most clearly marked fyphilitic chancre has been excellently defcribed by Mr. Hunter. The striking characters of the difease are, an ulcerating inflammation without any reparation, attended with induration of the furrounding parts. The description is, a fore of a somewhat circular form, excavated, without granulations, with matter adhering to the surface, and with a thickened base and edge.

There is another fpecies of chancre in which the difposition to ulcerate is lefs than usual, and the difposition to indurate is greater; fo that the ulcerated surface may heal, and leave an indurated knob or tubercle in the affected part.

There are befides fome chancres in which the difeafed action feems to be very inert; in thefe the ulcer is fuperficial, the thickening of the furrounding parts flight, and, after fome time, the ulcerated furface acquires a flate of health, and cicatrizes, without producing any perceptible granulations. I conclude that the truly fyphilitic chancre fometimes affumes fumes the appearances just described, because I have repeatedly confidered the constitutional fymptoms which fucceeded to fuch fores as truly fyphilitic, yet I may have been deceived, for reasons which I shall afterwards explain.

But it is impoffible to depict by words the various fores, fome of which are of a very irritable nature, that are produced by sexual intercourfe, and through the medium of which the conftitution becomes contaminated; neither is it poffible to know from local circumftances whether they be fyphilitic or otherwife. It is from their effects upon the conftitution alone, that we can judge whether they were fyphilitic or not. Many we know are not fo, fince they do not produce the conftitutional effects of fyphilis. The fubject can alone be decided by future experience derived from watchful observation made by unbiaffed men. Mr. Hunter thought that fyphilitic poifon might produce a fore which might be modified by the difeafed propenfities of the conftitution and the

the part, and thus lofe its diffinctive characters.

Influenced by this belief, he fpeaks but briefly on the fubject of chancres. I have also seen cases of constitutional disease, which I confidered as fyphilis originating from primary fores which had not the ufual character of fyphilis: the more, however, that I fee of the fubject, the more I am inclined to doubt the correctness of my opinions on this point, and of this I am certain, that the greater number of the conftitutional difeafes originating from fores, which have not the fyphilitic character, differ materially in their progrefs and mode of getting well from those which are the confequences of true fyphilis, and that they require a proportionate peculiarity of treatment.

However, if, according to the opinion of Mr. Hunter, the ction of a fyphilitic chancre may be fometimes fo modified by the difeafed propenfities of the conftitution, or part, as to form an ulcer fcarcely cognizable as a fyphilitic

fyphilitic one, it follows, as a general rule of - conduct in practice, that furgeons are not to confide in their powers of difcrimination, but in all cafes of ulcers arifing from impure intercourse, to act as if the fore was syphilitic, to give fufficient mercury flightly to affect the conftitution, in order to guard against the confequences of abforption, and, by local and other general means, to cure as quickly as poffible the local difeafe, and thus remove the fource of contamination, and the neceffity for the continuance of medicine. The quantity of mercury neceffary for the cure of a fyphilitic chancre will never, I believe, be found to be fo confiderable as materially to difturb the constitution. We may therefore, without hefitation, employ it in almost all cafes of primary ulcers, and be guided as to its continuance or ceffation, its increase or diminution, by the effects which it produces in the fore or conftitution. Mercury in small dofes inclines other fores to heal, as well as those which are fyphilitic; it may therefore act beneficially when the difeafe is not fyphilis, and by contributing to the healing of the fore remove the fource of contamination

tamination and the neceffity for the continuance of medicine. It is furely an object of importance to get the local difeafe well as foon as possible, and topical applications often greatly contribute to this defirable event; yet they should not be of a very irritating nature, for fuch means frequently aggravate the difease, as may be seen in some of the cafes which are related; nor fhould our applications be of an aftringent nature, fince by . checking difcharge, they incline the difeafe to become indurated, and it requires a longer continuance of mercury to remove a fmall induration than to heal a large fore. This observation applies equally to fores of a syphilitic nature and to others. Whilft there remains an induration, we can never be fure that it may not ulcerate again, upon leaving off the use of mercury, nor can we be affured that it may not contaminate the constitution. Indeed, in the fyphilitic chancre, it feems best to use none but the fimplest drefsings; for when it heals by the effect of mercury on the constitution, we are affured of the adequateness of the quantity which is employed to the intended purpose, and we have 5

have reason to believe, that the constitutional mercurial affection which has fubverted the local actions of the difeafe, will have prevented its contamination by any matter that may have been imbibed from it. If then we may, for the reafons above stated, employ mercury without hefitation in primary infected fores, being governed with respect to the degree and duration of its use by its effects, we ought, as has been shewn in the preceding part of this chapter, to pursue the reverse conduct with respect to constitutional fymptoms. Here we are required to hefitate, that we may learn the nature of the difeafe previous to attempting its cure. It has appeared to me, that a longer and more active operation of mercury on the fystem is neceffary for the permanent cure of constitutional symptoms in true syphilis, than for that of the primary chancre. Here, if we use mercury unhefitatingly, we may employ it to an injurious degree, where it is not wanted, and we generally fail in preventing a recurrence of fymptoms. These are, I believe, the general rules of practice adopted by the best furgeons, and they appear to

to me, in the prefent state of our knowledge of these diseases, to be judicious. One advantage results from this plan of conduct, which is, that if constitutional symptoms follow from a fore treated in a manner that ought to have prevented contamination of the habit had the fore been symphilitic, our sufpicions are excited, and by attentive observation we may perhaps discover that the symptoms are of another nature.

In cafes of anomalous fores it may be enquired, if in those, where the event renders it probable that they were of a fyphilitic nature, the difeafe deviates materially from its common characters, that of an ulcerative procefs without reparation, and extending in every direction. Do these fores enlarge by floughing, or produce granulation or fungus? do they fpread otherwife than nearly equally in their whole circumference? does the ulceration extend in them only in particular directions? do they heal in one part and fpread in another? or do they fuddenly amend and become worfe without an adequate mercurial influence to produce fuch changes

Those infected fores which are not fyphilitic have fuch peculiarities, as have been shewn in the first part of this paper, and as they are fo very various, it becomes neceffary to diftinguish them from those which are fyphilitic, by accurately noting the progress of anomalous cases of the latter difease. It is extremely difficult to form any correct opinions on this fubject on account of its intricacy, and the almost impossibility of abftaining from the use of mercury; but it is a fubject highly deferving enquiry, and which never can be fairly investigated till it be known that the fecondary fymptoms arifing from fores may not be fyphilitic, though their appearances cannot be diftinguished from fuch difeafes by fight alone.

With refpect to fores that are not fyphilitic the difficulties of inveftigation are greatly multiplied. If a defcription cannot be given of fyphilitic fores, it feems almost absurd to fay any thing of those multiform fores produced by infectious matter, the qualities of which, it is probable, may be variously modified, VOL. II. F and

and the effects of which appear equally liable * to modification from peculiarities of conftitution. Yet in this intricate fubject there are certain facts which can be diffinctly observed, and deferve attention. Some of these fores fpread by ulceration, and fome by floughing, of which inftances are related in the first fection of this paper. Even Celfus has defcribed feveral species of fores which, as Dr. Adams has observed, we are acquainted with in the prefent day. I have never feen that phagedænic ulcer, which fuddenly floughs, affect the conftitution; neither do I believe that furgeons in general have remarked it; those who regard all these fores as fyphilitic attribute the absence of secondary symptoms to the chancre having been removed by the floughing of the furrounding parts. Yet in the cafe related by Mr. French in Mr. Hunter's Treatife on the Venereal Difeafe, secondary fymptoms did occur from a fore of this kind, and got well without mercury. It may therefore, perhaps, be doubted whether this difeafe be not an aggravated form of the fore which floughs more flowly, and from which the constitution

stitution is much more frequently affected. Though Dr. Adams has reftricted the term Phagedæna to one kind of deftructive fore, yet I feel more inclined to leave it as a generic term for all these destructive fores, and to divide them into fpecies according to their peculiar characters. Then we may defcribe them as ulcerating phagedænic fores, and fores which fpread by floughing. Again, the ulcerating or floughing procefs may extend not in all but in particular directions, and the floughs may take place from the edges or from the whole furface. As Dr. Adams has treated thefe fubjects at large, I refer the reader to his book; but I will take upon me to defcribe fome fpecies of fores which frequently occur, and are treated generally as fyphilitic, but which I am convinced are not fo.

The fores, in one fpecies alluded to, generally break out in fucceffion, and fometimes after confiderable intervals of time; which circumftance, if remarked, would render it improbable that they arofe from infection of the ulcerated part, fince fuch fores would probably

F 2

be

be contemporary. The ulcer is at first inflamed, and fpreads ordinarily to the fize of the finger nail : its circumference is thickened; it throws out new flefh, which rifes above the furrounding fkin; fometimes there is an appearance of feveral little cells or fpaces in the interstices of the granulations, if they may be called fo, owing to the whole ulcer not producing new flesh in an equal degree. The edges of the fore generally retain their difeafed state after the middle has become healthy; from this caufe, the healing of the fore is retarded. These fores are flow in healing under any mode of treatment, and they generally get well in the fame fucceffion as they broke out. They fometimes form in a circle round the orifice of the prepuce, and caufe a contraction in that part after they have healed. I do not mean to fay that all fores occupying this fituation are not fyphilitic, but merely to state, that fometimes after a gonorrhæa of the prepuce, either originally occurring there, or having happened by a metaftafis of difeafe from the urethra, fores do break out in this fituation at a remote period from the reception of

of the infection, which are not fyphilitic. The fores which I am endeavouring to defcribe, feem to be the confequence of an irritated ftate of the prepuce, from which there is fometimes a flight general difcharge, like that which takes place when the gonorrhæa fhifts its fituation from the mouth of the urethra, and becomes the gonorrhæa of the prepuce. The glands in the groin fometimes fwell from irritation in thefe cafes, and generally fubfide again, though I have known them fuppurate: but I never faw any fecondary fymptoms fucceed to this fpecies of ulcer.

In the earlier part of my practice, in conformity to general rules, I used to give mercury in these ulcers to secure the constitution against infection, whilst I tried to heal the fores as speedily as I could by topical applications. Slightly destroying the surface with the argentum nitratum every second day, and dreffing with the solution of zincum vitriolatum, were the local means which seemed to be most successful. An attention to the history of the disease, and frequent applications for advice from perfons who had been se-F 3 verely

verely and unavailingly falivated for the cure of this fpecies of fore, foon emboldened me to abftain from the ufe of mercury, and I have never found, though I have met with a confiderable number of inftances, that I have in this refpect acted wrong.

I shall mention the circumstances of a cafe which occurred to me no long time ago. A gentleman had a flight irritation in the urethra, and after a few days, found the prepuce a little fwollen, with a fmall difcharge from beneath it. This was checked by a weak folution of zincum vitriolatum; and afterwards three fores, fuch as I have defcribed, broke out in fucceffion, for which he used mercury fo as to affect his mouth. The fores flowly healed, but two new ones made their appearance, and the mercurial courfe was perfevered in. Thefe fores alfo healed flowly, and a running came on from the urethra, no new fores having. appeared. The mercury was left off, the gentleman came to town, and was much diftreffed to find that three other fores, exactly like VCPOIV

like the former ones, now broke out, but the discharge from the urethra had ceased. At this period he applied to me, and gave me the foregoing narrative of his diforder, with an affurance that he had exposed himself to no new rifk of infection. I employed only local means for their cure, being fatisfied by the hiftory as well as the appearance of the fores that they were not fyphilitic. Near a month elapfed before any confiderable amendment took place, when a fwelling appeared in the groin, and the fores healed fuddenly in a few days. Leaches and Goulard's wash were employed to difperfe the bubo, but in vain : it fuppurated, and formed a very unhealthy abcefs. There was a great deal of furrounding eryfipelatous inflammation, the cuticle feparated from the furface of the bubo, the skin became livid, and gave difcharge to the matter by a partly floughing and partly ulcerating procefs. This, however, proved the crifis of the complaint: the abfcefs having thus broken filled up, and healed in the course of about three weeks, fince which the patient has had no return of difease.

difeafe. This gentleman was liable to have fores break out fpontaneoufly on the prepuce: they got well readily by bathing them with a weak folution of zincum vitriolatum; and I believe that perfons who have naturally an irritable ftate of the prepuce are most obnoxious to fuch affections. We must not, however, impute the occurrence of these peculiar fores to mere irritability, but to fome fpecific contagion.

The difcharge from the urethra in fuch cafes is not confiderable, nor attended with much inflammation or chordee, nor does it increase in violence; it may therefore be eafily diftinguished from common gonorrhæa and its varieties.

Sometimes, in a common gonorrhæa, the difeafe fhifts its ground and attacks the forefkin, and fores form about the orifice of this part. Thefe are of a different nature from the fores which I have been defcribing : their furface is generally gloffy, not producing exuberant new flefh, and their colour is unhealthy.

healthy. They generally get well as the difeafe returns to its original fituation in the urethra. I merely mention thefe circumftances to induce attention, and to prevent furgeons from confounding the fores which I have been defcribing with any other fimilarly fituated, but different in their nature.

I wish also to excite attention to another fpecies of fores which I have frequently met with, and which differ confiderably in their progrefs from those truly fyphilitic. The first appearances of the fores are various, but in their progress a thickening in the furrounding parts takes place, whilft the centre is foft and lefs difeafed than the circumference. I have feen the furrounding parts much elevated, and an opening leading into a cavity in the middle. I have feen them, on the contrary, heal with a flat furface and acquire a circular hardness, the middle being quite foft, and the area of the circle gradually increase. I have known fores heal apparently well and fmoothly, and afterwards the edge has acquired a circular hardness like a ring of some firm substance.

In

In all thefe fores I have given mercury in dofes fhort of producing a tendernefs of the gums, and the difeafe has gradually but flowly got well. In the greater number of cafes no conftitutional affection has enfued. In fome, however, it has, but it has got well without mercury, or with fuch fmall dofes as would certainly not have cured fyphilis. So that thefe obfervations concur with the hiftory of the difeafe, in inducing me to believe that fores of this defcription are not fyphilitic.

Under this head of fores which occur on the genitals, and which are not fyphilitic, I may mention one fpecies that I have feveral times feen on the fide of the penis, which is herpetic, affecting new parts whilft those first affected get well; fo that the fore may exift a long time, and be very troublefome, though its fituations may have varied confiderably.

I have alfo feen a circle of fmall fores, like what takes place in tinea, occur on the outfide of the prepuce in confequence of fome acrimonious fecretions being applied to it in 2 fexual

fexual intercourfe. Some difeafes, whatever may be their primary nature, do, after a time, extend themfelves between the integuments and the fubjacent parts. I have known many difeafes which burrow in this manner treated as fyphilitic, and, as the event of the cafes has proved, improperly. Indeed, the progrefs of fuch difeafes is fo different from that of fyphilis, that it is natural to difcredit their being fo. Difeafes which proceed in this manner feem to be of an irritable nature, and to affect most those parts which have least powers of life, which appears to be the cause of their peculiar mode of extending themfelves.

To corroborate this remark, that fores which burrow are not likely to be fyphilitic, I may mention the cafe of a gentleman of the medical profession, who had a fore of this defcription, which began on the dorfum penis, near to the pubes, for which he rubbed in two months, and had his constitution confiderably affected; nevertheles, the fore fpread and burrowed under the integuments of the pubes, and the mercury was left off. The

The difeafe became communicated to a confiderable diftrict of the integuments of the bottom of the belly, and to those of the ferotum. The affected parts fometimes ulcerated, and fometimes healed. A great variety of local and general remedies were tried without benefit. No mercury was ufed except in very trivial quantity. The cavities beneath the skin were in some parts laid open, at different periods of the difease; but without much advantage. After two years and a half the difease became well, when nothing but simple dressing were applied, and when he took nothing but decoction of farsaparilla and some soft the difease.

I have in the foregoing pages endeavoured to reprefent briefly the circumftances of the primary ulcers of difeafes which are, and of thofe which are not, fyphilitic, and to ftate the general rules for the administration of mercury; and, at the fame time, I have defcribed fome fores which have not, as far as I know, been diftinguisted, and which, in my opinion, are not fyphilitic, though they are generally treated as fuch. To take a fimilar compacomparative view of constitutional difeases arifing from these various fores would render this paper too prolix. I hope it will be feen that I do not prefume, nor do I fee caufe, to deviate from the established rules of practice founded on the general experience of furgeons. It would indeed, in my opinion, be prefumptuous in an individual to form general rules drawn from his fcanty experience; I may be allowed, however, to remark, that individuals of the profession are likely to err by inferences drawn from their own practice; and it appears to me that fome professional men at prefent are inclined to believe all fores arifing from impure connexion to be fyphilitic, whilft others may be too fcrupulous in expecting all fyphilitic fores to posses their common characters. The truth probably in this, as in other cafes, lies between the extremes. Much, however, it must be acknowledged, remains to be afcertained, and I think that those furgeons would do effential fervice to fcience, who would give an accurate account of the irregularities of the venereal difeafe. But fuch an account never can be given by one, who efteems

efteems all difeafes fyphilitic, which refemble them in appearance. The foregoing cafes will, I think, at least prove this to be fact; and it was a principal incitement to their publication, that if this fact were generally admitted, it might excite that fcrupulous attention and impartial obfervation of fyphilitic difeases, which would probably lead to accurate diffinctions, and the removal of that obscurity with which they have hitherto been furrounded. I have fuppreffed many observations of my own on this fubject, from a belief that it is better to fay nothing than to offer opinions not fully confirmed by facts. The idea that fyphilis is a most variable and Proteus-like difease, has probably arifen from those irregular difeafes which I have defcribed in the first fection of this paper having been confounded with it. The opinion is however prejudicial, as it checks attentive obfervation by declaring its inutility. If it should be in our power, as I should hope it may, by directing our attention to the hiftory rather than to the appearances of these diseases, to distinguish fyphilis from other complaints, then we may alfo

79

alfo be able to defcribe the irregularities of this difeafe, and to inform others when it affumes deceptive characters, and purfues an unufual track, what difguife it puts on, and what courfes it follows.

SECTION III.

On the constitutional Origin of Pseudo-Syphilitic Diseases.

IN order further to elucidate the nature of pseudo-fyphilitic difeases, I published fome cafes in which they originated fpontaneoufly, or without there being any reasonable ground for supposing that morbific animal matter had been imbibed to contaminate the conftitution. The cafes included in this fection were first published, amongst others which were defigned to shew the importance of correcting diforders of the digestive organs in attempting to cure local difeases. A diforder of those organs constantly exists in these cases; and produces, or at least aggravates and protracts a state of weakness and irritability of conftitution; to which the origin of the difeafe must undoubtedly be referred.

CASE XII.

A gentleman refiding in the country, who had been many years married, and whofe moral

moral character prevented any fuspicion of his having exposed himself to venereal infection, had an ulcer in the right tonfil, poffeffing every character of a truly fyphilitic fore. The figure of the ulceration was oval; it had extended itself deeply, and prefented a furface covered with adhering matter, and without the least appearance of granulations. It had continued three months without amendment, although various medicines had been employed during that period. These circumstances impreffed the minds of the medical attendants with an opinion, that the difease was fyphilitic. On me they had a contrary effect. I thought that a fyphilitic ulcer would have become materially worfe in that time, as mercury had not been used to arrest its progrefs. Finding that the patient had a furred tongue, and diforder of the digestive organs, I recommended, as the first object of attention, the correction of that derangement of the stomach, from which the fore-throat had probably originated. The patient went to the fea-fide, where his throat was alternately better and worfe; but the dimensions of the ulcer were not enlarged. Three months VOL. II. elapfed G

elapfed before I faw the patient a fecond time; when I told him that my argument against the complaint being fyphilitic was greatly strengthened. It was manifest that the diforder, to which I had imputed the fore, still existed. Being unwilling however that the refponfibility should rest entirely upon myfelf, I advised him to confult another furgeon, who, judging of the nature of the fore from its appearance, (which indeed was ftrikingly characteriftical of fyphilitic difeafe,) recommended a course of mercury. The patient underwent, in confequence of this advice, a regular mercurial course; during which the fore got well. Between two and three months afterwards another fore formed in the palate, which had the characters of a fyphilitic ulcer, in a still more striking de. gree, if poffible, than the former. It was fituated just where the foft palate proceeds from the bone. It was of a circular figure, and fo deep as to expose the bone. The circumference of the ulcer was tumid and inflamed; its edges were not fmooth, but had a tendency to ulcerate. There was no appearance of granulations, and the dif-.... charge

charge adhered to the furface of the ulcer. The patient now applied to me again; when I repeated my original opinion, that thefe fores depended on the ftate of the health in general. He confulted another furgeon, who recommended the ufe of the Lifbon Diet-Drink, with the application of the oxymel æruginis to the part; under which treatment the ulcer healed; and no other complaint has fince occurred, though two years have elapfed.

CASE XIII.

A gentleman, who was habitually fubject in a great degree to diforder of the digeftive organs, had an excoriation of the prepuce, which had continued about three weeks, when copper-coloured eruptions came out all over his body, fo ftrikingly fimilar to thofe which are venereal, that fome of his medical attendants recommended the immediate ufe of mercury. It was however agreed to delay the mercurial courfe for a little time; and to give the patient half a grain of calomel, with three grains of hemlock night and morning, and a folution of magnefia vitriolata

G 2

in

in mint-water, fo as to keep the bowels freely open. The fpots began to die away almost immediately, and foon difappeared altogether. The patient then mentioned that he had feveral times had the fame kind of eruption, which had difappeared in like manner upon taking fome opening medicines.

In calling the reader's attention to those difeafes of the bones which refemble fyphilitic affections, I fhall not pretend to relate any cafe in detail; for furgeons can feldom trace the progrefs of thefe difeafes for themfelves, but are obliged to rely on the doubtful hiftory given by their patients. I fhall endeavour to fketch the principal parts of the fubject, referring to particular cafes, merely to shew that the picture is not drawn from fancy, but is copied from nature.

I have been frequently confulted on account of fuppofed venereal affections of the bones; where the periofteum has been thickened and tender, and the bone enlarged, and the concomitant pains have been fo much aggravated at night as to deprive the patient of reft. The hiftory

hiftory of the cafe has removed all fufpicion of a venereal origin ; while general indifpofition, a furred tongue, loss of appetite, and other attendant fymptoms, have clearly indicated great diforder of the chylopoietic vifcera. By attending to the ftate of the digeftive organs in these cases, the patient's health is amended ; the general rheumatic pains are diminished; sleep is procured; and the difease has receded almost entirely. After fome time has elapfed, the bone may again fwell, the fwelling may again be checked, and return no more. Perhaps fimilar difeafes may take place in other bones, at times very remote from the first occurrence of the diforder. If mercury be not employed, there are decifive circumstances in the history of the cafe, which proves that it is not fyphilitic. Sometimes suppuration takes place, and exposes the bone: this occafionally proves a kind of crifis to the difease at that part. But the circumstances of these affections are so variable as to preclude a complete enumeration of their fymptoms,

I shall briefly mention the cases of two pa-G 3 tients,

tients, by whom I was confulted about the fame time, in order to identify the difeases to which I allude. Both these gentlemen had been married for many years; and there was not the least reafon to fuppofe that any morbific poifon had been imbibed. They became generally indifposed, had reftless nights, pain in the head, and about the fhoulders; and a painful thickening of the periofteum of the tibia, with enlargement of the bone, took place. The chylopoietic vifcera were difordered in both these cases. One gentleman had used mercury repeatedly to a confiderable extent, which produced a temporary alleviation of his difease; but his fufferings feemed to be augmented upon the ceffation of the mercurial excitement. The other patient never used any mercury. They both experienced a confiderable mitigation of pain from those medicines, which corrected the state of the chylopoietic organs. Their difeafes were checked, and never became again fo bad as before attention had been paid to the state of the vifcera. Both these patients were better or worfe as the ftate of the bowels va-; bein all brieffy mention the cafe of two par-

ried; and they both gradually, but flowly, recovered.

Similar difeafes are fo common, that I believe every furgeon of experience will admit that affections of the bones, with wandering pains, often occur from general diforder of the health. I have never feen thefe cafes unaccompanied by diforder of the chylopoietic organs; and I have always found them most benefited by whatever has tended to rectify the functions of thefe organs.

e delifted

There was no reafon, in any of the cafes alluded to, to fufpect the abforption of poifon. I will add another, to corroborate this ftatement. A gentleman, who had been married about eight years, and had no venereal difeafe during that period, was feized with a violent fever. Shortly after his recovery, a thickening of the periofteum on the parietal bone took place. The fcalp was alfo much fwollen, fo as to threaten fuppuration. He was at this time in ill health, and had great derangement of the digeftive organs. By attention to this latter diforder, the fwelling fubfided, and no G A trace

trace of it remained. The patient afterwards went into the country, where his health was still more amended. In about twelve months he had feveral tumours of the fame kind in different parts of the cranium; one alone threatened to fuppurate : for thefe he underwent a mercurial courfe, which relieved them, fo as to induce him to perfevere in it to an extent, which almost constantly cures venereal difeafe. His health, during the latter part of the mercurial course, being much difordered by the medicine, his difeafes became proportionally aggravated; he therefore defifted from the use of mercury; at which time his complaints were but little better than at their commencement. Thefe difeases, however, gradually got well in the fpace of little more than a year; still the patient continued in a bad state of health, the symptoms of which were a furred tongue, indigestion, and faulty biliary fecretion,

I add another cafe, which came under the obfervation of Dr. Baillie. A ftudent of medicine, who attended the lectures in Windmillftreet, was, obferved to look very much out of health

health; and, on enquiry, it was found that he had nodes upon his fhins, which fo exactly refembled those that are venereal, that no doubt was entertained of their being of that nature. It was therefore earneftly recommended to him not to delay the mercurial courfe, which feemed requifite for the cure. He was very reluctant to comply with this advice, and declared upon his honour that he had fimilar fwellings before he had had any fexual connection. This declaration made this propofal to be laid afide; and the nodes got well by a strong decoction of farfaparilla. without a fingle grain of mercury being employed. Now, if this account be accurate, it fhews that difeases like syphilis can arise from diforder of the health, even without any fexual intercourfe.

All furgeons of experience will, I believe, admit that difeafes refembling fyphilis occur from diforder of the health in general. In all the cafes which I have inftanced, there was not the leaft reafon to fuppofe that any morbific poifon had been imbibed to produce the difeafes which exifted. I wifh much to have this

this point afcertained or refuted by the general experience of furgeons. The cafes, which would tend to establish it, must be of rareoccurrence. Most of the instances, to which I have alluded, occurred in men who had been long married, and on whofe veracity I could rely. There is alfo, in my opinion, fufficient intrinfic evidence in each cafe to prove that the difeafe was not venereal. It was this kind of cafes which I had in view in my last publication, in difcuffing the queftion whether those difeafes, which may be denominated pfeudo-fyphilitic, arife from fome modification of the venereal poifon, or from a peculiarity of conflitution in the patients, who are exposed to the action of truly fyphilitic virus. I have there faid, that "it deferves to be observed that difeafes refembling fyphilis do occur, without any reason to suppose that any morbific poison has been admitted into the fystem." I have been induced to dwell upon this fubject, which may perhaps be confidered more fpeculative than useful, because if the opinion were verified, it would explain the occurrence of pseudo-syphilitic diseases in a very ftriking and fatisfactory manner. If local difeafes 4

difeafes refembling fyphilis may take place in the throat, skin, and bones, from a certain state of weakness, and irritability of constitution, then various modifications of animal matter being abforbed may fo diforder the general health as to induce fuch a state of weakness and irritation, as is likely to produce those fymptoms, and fuch fymptoms are rather to be regarded as arifing from the propenfities of the constitution, than from the peculiar properties of the matter which has been imbibed. It is fhewn in my former publication, that the poison which produces pleudo-fyphilitic fymptoms is fometimes abforbed without an evident breach of furface in the fkin; fometimes from a trivial fore which foon heals; whilft, in other cafes, it produces local fores of various and diffimilar characters.

SECTION IV.

On the Effects of Mercury in Pseudo-Syphilitic Diseases.

HAVING thus by the publication of the cafes related in the two preceding fections, endeavoured to excite a general inveftigation of a fubject which I think every one will admit to be highly important, I proceed to relate fome additional cafes of difeafes which I confider as pfeudo-fyphilitic, and in which mercury was employed for their cure, in order to thew the effects refulting from its use. I was necessarily precluded from bringing forward fuch cafes in my first attempt to elucidate this fubject, becaufe my object at that time was merely to fhew, that difeafes, which could not by fight be diftinguished from syphilis, yet differed from it in the primary fores from which they originated, and also in their progress; for they got well without the administration of mercury, and generally recurred after the feverest course of that medicine. The latter

Dala walt an

ter fact will, indeed, be more ftrikingly manifested by the fucceeding cafes. I was also prevented from relating cafes of this defcription, because the administration of mercury may be supposed to render the nature of the fubsequent fymptoms ambiguous; fince they may be confidered as the effect of that diforder of the conftitution, which the poifon and the antidote have conjointly produced.

As the tide of public opinion feemed at that time to run strongly against me, I mentioned, that any experienced furgeon, who regarded the cafes in question as anomalous cafes of fyphilis, would do a most effential fervice to fociety, if he would lay down practical rules for the treatment of fuch difeafes. As no one has undertaken this tafk, I fhall endeavour to accomplish it; for I think, that the cafes which I shall relate will at leaft fhew what mercury will do, and what it will not do, in these diseases. An attempt to establish rules for the treatment of these difeafes appears to me of great importance; because discordance of opinion is both difcreditable

creditable to the profession, and injurious to patients.

Before, however, I relate the facts from which I mean to deduce the practical rules of treating these diseases, I wish briefly to recapitulate the reafons which induce me to think that they are not fyphilitic; and alfo to advert to the arguments which I have heard brought forward, by those who entertain a contrary opinion. I wifh, alfo, to confider the effects likely to be produced on the conftitution at large, by the abforption of morbific animal poifons; and to difcufs the probable effects of mercury, administered in different degrees; because I think it neceffary, that all thefe circumftances fhould be borne in mind, whilft the reader perufes the cafes, in order that he may form a proper judgment of the nature and treatment of these perplexing difeases.

I concur, then, with Mr. Hunter in opinion, that these difeases are the effects of kinds of animal poison different from that which

which produces fyphilis, first, because they may be contracted from parties who have no fyphilitic difeafe; and that I perceive how they may be contracted at prefent, as they were in Rome, during the time of Celfus *. Secondly, becaufe I fee fuch difeafes occurring in perfons whole constitution is difordered, but where there is no reafon to fuppofe that any poifon has been imbibed +. Thirdly, becaufe thefe difeafes differ from fyphilis, in often getting well without mercury, and in recurring after the fevereft courfes of that medicine ‡. Yet I wifh, as a comment on the latter claufe, to obferve, that though it may be regarded as a general rule, it is not abfolutely without exceptions. We have fometimes recourse to the use of mercury, on account of the destructive progrefs of difeafes, which we have the ftrongest reasons to believe, are not syphilitic; and mercury fometimes cures thefe difeafes, without relapse. It is indeed not improbable,

* See the cafes related in the preliminary remarks.

- + See the cafes related in the 3d fection.
- ‡ See the cafes related in the 2d fection.

that

that the alteration, which mercury produces in the ftate of the conftitution, may occafionally cure a diforder which is not fyphilitic. Formerly, when I met with a cafe in which the conftitutional fymptoms were regularly progreffive till mercury was employed; if they yielded, and were cured by an adequate courfe of this medicine, I concluded that the difeafe was fyphilitic, and I regarded, therefore, any deviations which I might have obferved in the progrefs of the primary fore, as the effect of fome peculiarity in the patient's conftitution. Of late, however, I have thought this inference to be erroneous.

I fhall next advert to the arguments of thofe who think differently. Firft, it is faid, that the fpontaneous cure of thefe difeafes is no proof that they are not fyphilitic. Secondly, the peculiarity of the difeafe is accounted for by peculiarity of the patient's conftitution, whith may not only contribute to modify the difeafe, but alfo to prevent its ordinary cure by mercury; becaufe the conftitution may be incapable of bearing at once once, fo much mercury, as is necessary for its cure. Cases, however, stand in direct opposition to these opinions. For these difeases may be contracted by persons of very healthy conftitutions; and I have known patients, who have contracted pfeudo-fyphilitic difeases, contract also real fyphilis, both a fhort time before and after the pfeudofyphilitic affection. Further, in many perfons, who are the fubjects of pfeudo-fyphilitic difeases, the difease recurs, without the intervention of any new exciting caufe, even though a mercurial courfe has been fubmitted to, greater in degree and longer in duration than is necessary for the cure of true fyphilis, even though the mercury has alfo acted on the patient's conftitution, in the most regular and complete manner. It is indeed, highly probable, and accordant to general obfervation, that these difeases will be greater and more obstinate in weak and irritable conftitutions, than in those that are healthy, and this circumstance has probably given rife to the preceding fuppositions.

H

VOL. II.

I with

I wifh alfo to confider the probable effects which would be produced on the conftitution from the admiffion of morbific animal matter into the circulation. Such infectious matter is likely to produce irritability or weaknefs of the nervous fyftem, and confequent general diforder. The nervous diforder is likely, more efpecially, to difturb the functions of the digeftive organs, and by their re-action to become prolonged and aggravated. In almost every case of pseudofyphilis a diforder of the digestive organs is manifest, and in many, most evident benefit is derived from correcting this, as far as we are able.

It is probable, that the diforder of the nervous fyftem, and conflictution in general, will be more transient in fome conflictutions than in others; and is likely to be prolonged by every thing that induces debility, and irritability. Indeed, if we have no fpecific remedy, or means of counteracting the effects which the poifon has produced; the rational indications of treatment would be to tranquillize and ftrengthen the fyftem, in

in the expectation, that the effects refulting from the action of the poifon, will gradually fubfide. Analogy would lead us to expect, that the diforder of the nervous fyftem, induced by the operation of the poifon, would, as it declined, become intermittent, and recur in paroxyfms. I have premifed these observations, that the reader may bear them in his mind, during the perusal of the cases, affuring him at the fame time, that they are the result of practical remarks.

I wifh, alfo, to explain my ideas refpecting the operation of mercury. First, finall dofes of that medicine do not feem to affect the constitution in general, but merely to act upon the digestive organs; yet, by this operation they are often productive of the most important benefit, as has been shewn by cafes recorded in the first volume of these observations. As in difeases produced by the absorption of morbific poisons, the digestive organs are difordered, in consequence of nervous irritation, and in some patients, in a most remarkable degree, owing probably

to

H 2

to a pre-difposition to diforder in them, fo an attention to keep thefe organs in as correctly natural a state as possible, is an object of primary importance. Secondly, mercury exhibited in larger doses, exerts an influence on the conftitution in general, though fcarcely perceptible by its effect upon the pulse or fecretions; but by affecting the nervous fyftem, in a peculiar manner, and by inducing a specific state of constitution, it counteracts that morbid irritation which has before prevailed, and is the effect of the poi-Thus mercury relieves many other fon. diforders, as well as those which are fyphilitic. The dofe which is neceffary to produce fuch effects, must vary in different perfons. Such a state of mercurial excitement, or action, as is necessary to produce these effects, may also be kept up without inducing debility; - on the contrary, patients frequently become ftronger and more /healthy under its influence, becaufe it controlls the irritation attendant on difeafe. Thirdly, a greater mercurial effect upon the constitution produces an acceleration of the pulse, renders the constitution in general irritable

100

irritable and weak, and produces a more evident and confiderable diforder of particular organs. Such an affection cures completely and radically fyphilitic difeafes; whilft others, which had been checked and cured by a flight mercurial affection, often increafe and break out again, under that which is greater in degree. This violent action of mercury never fails to weaken and diforder the conftitution in general; and thus, with its powers impaired, and its functions deranged, it has ftill to endure the continuance of the difeafe.

The cafes, which I fhall now bring forward, are felected, becaufe I think they fhew as great a variety of circumftances incidental to thefe difeafes, as could be difplayed in an equal number of examples. I could have crowded the book with inftances, tending more directly to illuftrate and confirm the opinions delivered in it. My object has, however, been, not to reprefent the fubject as more clear than it will appear in practice,

H 3

CASE

CASE XIV.

A medical student, had, without any previous chancre, an indolent bubo, which had increased in the course of two months, to the fize of a fmall egg, at which time I first faw him. After about three weeks, it inflamed and fuppurated. The inflammation was of an unhealthy nature, and the bubo ulcerated, forming a foul ulcer, about three inches and a half in length, and two and a half in breadth. During this process, he was much ditordered in his health, and he confined himfelf to his bed. Lint, moiftened with a watery folution of opium, was applied to the fore; it was covered by a dreffing of fpermaceti cerate, and linen moistened in fome wash was applied over all, to regulate the temperature of the part. Under this treatment the fore granulated, cicatrized, and had contracted into a fmall compass, when the patient's health again became difordered, and an ulcer formed, on the upper furface of the velum pendulum palati. He fnuffled in fpeaking, and blew from one nostril thick mucus, some matter, and occasionally blood. Pain extended in the courfe

course of the eustachian trumpet towards the ear. circale. Dut after forme line

His diforder was to troublefome at night as to preclude fleep, and his fituation was altogether fo uncomfortable as to induce him to have recourse to mercury. He accordingly rubbed in two drachms of mercurial ointment, for ten successive nights. In this time the mercury produced a flight effect upon the gums, and relieved him fo much, that he determined, notwithstanding my remonstrances, to discontinue it, feeling himfelf perfectly well. In about fix weeks fubfequent to this, he had a painful affection of the upper part of the tibia, attended with a collection of fluid under the fascia. He was feverish at night, and had but little fleep; his ftomach and bowels were, during the whole of the diforder, affected in the manner I have defcribed in the first paper; he had no appetite, and when he was most indisposed, his tongue was extremely furred. He again used mercury, but after having rubbed in about fix times he difcontinued it, as he found himfelf worfe, which he attributed to the use of the mercury.

14

103

cury. The diforder of his leg did not increase, but after some little time diminished; still, however, it prevented him from walking about, and he had occasionally fits of pain in it, which, after continuing for a few days, abated, fo as to leave him comparatively eafy. Thus his leg continued, from about February to June, when he took lodgings in the country. He had, about a month after the affection of his leg, a fimilar attack in the elbow, the progress of which was also fimilar. His health was improved by his refidence in the country, and he was foon able to walk about, which contributed to his recovery. He for a few days, took a little hydrarg: muriat: in decoct: farfæ, but left it off by my defire, as I was convinced that his difeafe was not fyphilis; and as the fymptoms were declining fpontaneoufly. He was once or twice induced to befmear the skin with mercurial ointment; but excepting this, he used no mercury, and by the autumn of the year, all local difeafe had left him. His health, however, was not correctly right, his tongue remaining furred; and his bowels irregular. He paffed through 8

104

through the winter without any relapfe. In about a year afterwards he had fome rheumatic complaints, from which he foon recovered, and has continued well fince, except that he has been fubject to occafional returns of rheumatifm *.

CASE XV.

A gentleman about thirty years of age, of a healthy robuft habit, had a fore behind the corona glandis, which I faw on the third or fourth day after its appearance. It was then nearly as large as the nail of the finger, and fo deep as to defeend to the ligamentous fubftance of the corpus cavernofum penis. It was indurated in its circum-

* The chief, circumftances, which feem to me to deferve attention in this cafe, are, that probably infectious matter was abforbed, without any evident breach of furface or primary fore; that the conflictutional fymptoms were at first fuddenly cured by a fmall quantity of mercury; that afterwards the use of mercury rather aggravated them, in confequence of which it was difcontinued; that the diforder of the conflictution afterwards gradually fubfided; and that the whole of the mercury employed feems quite infufficient for the cure of fyphilis.

ference,

ference, and there was no appearance of any new growth from its furface. This ulcer appeared to me to have been too rapid in its, progrefs to be fyphilitic ; however, as it had most of the characters of fores of that nature, I recommended the patient to take fifteen grains of the pilul: hydrargyr. daily, to bathe with milk and water, to be very gentle in the application of mild dreffings, and to keep the penis furrounded by fome linen, moiftened with a cooling lotion. After a fortnight had elapsed, an enlargement of the glands in the right groin took place; and as the fore had not fpread, I recommended him to rub two drachms, by meafure, of mercurial ointment, into the right thigh every night, withing to produce an evident mercurial affection of the constitution, with a view to difcover what effect it would have on the fore. In about a week, the conftitution was affected by the mercury, and the gums were flightly tender and fwollen; the fore was, however, rendered worfe; it became enlarged, and inflammation took place round it. The inunction was therefore omitted, but the pills were continued. As the

106

-

the mercurial irritation fubfided, the fore became tranquil, and the bubo ftationary. In about five or fix weeks from the beginning, granulations appeared, and the fore began to heal, fo that by the feventh week it was quite well. In healing, that edge which was next the body got well first, while the other rather fpread, fo as to encroach a little on the back edge of the corona glandis. The bubo gradually fubfided. When the fore was healed, (the patient still continuing the mercurial pills,) he was feized with difficulty of fwallowing, and uneafy fenfations on the upper part of the foft palate, caufing him to fnuffle in fpeaking, and to blow his nofe frequently. I advifed him to defift wholly from the use of mercury, that thefe conftitutional fymptoms might go on unchecked by that medicine, obferving at the fame time, that if they were fyphilitic, and required the use of mercury, it might be used with more freedom, and perhaps effect, in confequence of this fufpenfion. The diforder rapidly increased, and it was much worfe in the night, when the fenfations were fo diffurbing, that the patient could obtain

obtain no reft. The pain extended to the ear, and matter and blood were fometimes blown from the nofe.

The health of the patient was much difordered; and, as he faid that no courfe of mercury could harafs and weaken him fo much as the continuance of this difeafe, it was agreed in confultation, that he fhould begin a mercurial courfe, and that the difeafe should be treated as syphilitic. The patient confined himfelf to his chamber, and rubbed in two drachms, by meafure, of mercurial ointment every night. In the courfe of a week the difeafe was much mitigated; in a fortnight, at which time the gums were fwollen and tender, it was well. The mercury was continued (fo as to keep the gums as fore as they could be, without producing that ftate of difeafe which would have obliged us to defift from the use of it) for three weeks more, when a new occurrence took place. The left tonfil became fomewhat enlarged, and an ulcer was formed upon its furface. This, another furgeon who was confulted, attributed to mercurial irritation,

108

irritation, whilst I, on the contrary, felt affured that it was the effect of the difeafe breaking out anew under the full effect of mercury. As the course of mercury was deemed perfectly adequate to the cure of fyphilis, it was now difcontinued. The ulcer however continued to fpread, nor did it ceafe till it had entirely deftroyed the tonfil, when it healed. About three weeks afterwards, and fix weeks after the difuse of mercury, a fimilar ulcer formed on the oppofite tonfil, which purfued exactly the fame courfe, and ended in the fame manner. After about three weeks more an ulcer appeared to have formed upon the upper furface of the velum pendulum palati, in a fituation corresponding to the first, but on the opposite fide. It was attended with the fame difficulty of deglutition, alteration in the voice, occafional discharge of pus and blood from the nofe, and tormenting pain, extending to the euftachian trumpet. It feemed in vain to use mercury, and I felt great apprehension that this ulcer might destroy the foft palate. It fortunately happened otherwise; for (after continuing for about

about a fortnight to fpread, fo that its edge could be diffinctly feen on the margin of the velum palati, and left fide of the uvula), it healed, leaving no greater imperfection than what was produced by an adhesion of the left fide of the uvula to the foft palate, which took place during the healing of the ulcer. After this complaint was well, various eruptions appeared on different parts of the body, many took place on the head, forming fores which were flow in healing, and many fores, which were formed in like manner on the trunk of the body, became herpetic, healing in one part and fpreading in another. An inflammation and induration of the coverings of the lower part of the right tibia alfo took place, which fubfided, fo as to leave but little appearance of any diforder having exifted. During these occurrences the patient took the decoct. farfæ. and Lifbon diet-drink, nitric acid, cicuta and bitters, and was as attentive as poffible to keep his bowels regular, which was difficult, as his digestive organs were throughout the whole of the complaint difordered. He had also lived a good deal in the 6

the country, and made occasional excursions to the fea-fide, and used the tepid falt-water bath. Upon his return from one of thefe, about fix months after the difcontinuance of mercury, he felt himfelf fo perfectly well, that he indulged himfelf in dining with his friends, and undertook a journey into the country on business. The exertion attending this undertaking feemed to have operated in re-inducing difeafe, for he was foon laid up with a rheumatic affection of the right foot, and one of the testes became enlarged to a confiderable degree, but it was indolent. Nodes also appeared on the middle of either tibia, which regularly increafed. The enlargement of the teftis fubfided, when the other became affected in the fame manner. For between two and three months after the patient's return to town he confulted various furgeons, who knew nothing of the hiftory of his cafe, and they fo uniformly concurred in affirming it to be fyphilitic, that the patient was even anxious to use mercury again. As the nodes did not abate as the other fymptoms had, and as they did not yield to the application of leeches, evaporating lotions

tions, or bandages, I thought an alterative course of mercury at this period even advifable, to fee if it would controll this local affection. The nodes were not like venereal nodes. They were elevated and bony, and there was a small quantity of fluid beneath the periofteum. I would have divided the periofteum at first, but I was restrained by the apprehension of the wounds becoming fores, and of exfoliation taking place and augmenting the patient's already distrefsful fituation. He now rubbed in fmall quantities of mercurial ointment, without confining himfelf. This courfe was attended with manifest benefit; infomuch as to imprefs his mind with an opinion that a more liberal use of mercury would now cure him. In this opinion he was confirmed by fome furgeons whom he had confulted, and he therefore refolved to ftay at home, and rub in every night till his constitution was affected by mercury. By the accomplishment of this object, however, he was made materially worfe. His pains were tormenting, the nodes inflamed, and threatened to ulcerate. The mercury was left off, and I divided the periofteum to the extent

extent of an inch and a half on the furface of one node, and let out fome ferum mixed with pus. The knife in paffing down garted against different portions of bone, which were heaped up to a confiderable height above the level of the tibia. The node was no longer painful. The wound healed, and pain occurred again in a flight degree and gradually increafed. The fame treatment was purfued with refpect to the node on the other fhin, and the confequences were the fame. After the wounds had healed the pain gradually returned, and in about a month he found himfelf nearly in the fame state as before his confinement. Under these circumstances he again began to take diet drink, with fome mild mercurial pills, which never perceptibly affected his conftitution, and under the ufe of which he became muscular and fat, and by this treatment the pains left him, and in the courfe of three months he was well*.

CASE

The principal circumftances worthy of remark in this cafe are, that the primary fore though refembling fyphilis in many refpects differed in others. It was aggravated by the free use of mercury, and it healed on one fide VOL. II.

CASE XVI.

A gentleman between twenty and thirty years of age, refiding in the country, had an ulcer in the prepuce, which, to ufe the words of his furgeon, had more the appearance of excoriation than chancre; it was fucceeded by a bubo and ulcerated throat. For each of these difeases he used mercury so freely as to convince fome of his medical attendants that the difease could not be fyphilitic; his surgeon faid enough to cure twenty sphilitic patients. The ulcers in his

whilft it fpread on the other. The conftitutional fymptoms were fpeedily cured by a flight mercurial affection, but they broke out again under a fevere courfe of mercury. Many conftitutional fymptoms got well without the ufe of mercury, and when at laft it was employed again on account of the flubborn nature of the nodes, thefe difeafes yielded to a flight, and were aggravated by a fevere courfe of mercury. The difeafe laftly yielded to an alterative course of mercury, fo flight as not manifeftly to affect the conftitution, and during which, the patient got muscular, fat, and healthy. The subject of this cafe was a remarkable healthy man, and had before contracted fyphilitic difeafes, which were regular in in their progrefs and cure. Mercury also affected his conftitution in the mode which is confidered most defirable for the cure of fyphilis. ule of m

throat

throat were fometimes better and fometimes worse, both during the continuance and after the ceffation of the mercurial courfe. After about a year and a half from the commencement of the difeafe I first faw the patient, and informed his furgeon, that in my opinion pseudo-fyphilitic difeases generally gave way to an alterative course of medicine, conjoined to decoction of farsaparilla.

About nine months afterwards the patient came again to town; his throat was not ulcerated, but his nofe was greatly difeafed. Some affection of that part had taken place when I first faw him, which had encreased to fuch a degree, that he was almost constantly blowing from his nose tough mucus and pus, mixed with blood. The skin covering the the offa nasi was also very red, so as to threaten the giving way of the arch of nose. He was much emaciated and seeble, and had a chlorotic appearance.

Under these circumstances, I defired him to drink a pint of decoction of sarsaparilla daily, to keep his bowels strictly regular, and to take I 2 five

five grains of the pilul: hydrarg: every night, defiring to fee him at the expiration of a week. After that time, when he called on me, he faid he could perceive no difference whatever in his difeafe. Thinking that perhaps in another week the mercurial effect would be increafed, fo as to affect the conftitution and controll the difease, I made no alteration in the quantity of the medicine; but when at the expiration of that time, I found the disease undiminished, I recommended him to take five grains of the pilul: hydrarg: night and morning. After the expiration of another week, when he called upon me, he faid that the difeafe of his nofe feemed gone, though when he blew it some purulent discharge still took place. The mercury had no effect upon his gums, and he looked more healthy and felt ftronger than he had done before he began the mercurial courfe. Finding the diforder fo completely fubdued by this quantity of mercury, and wifhing above all other confiderations, that the patient should acquire some muscular strength and vigour of constitution, I advised to take but one pill daily for the future, and to observe whether the fymptoms II avit

toms fubfided or increafed under its ufe. In one week more there was no difcharge from his nofe, even when the air was forcibly driven through it. And after three weeks had elapfed, or at the end of fix weeks, he had become fo mufcular, fat, and healthy looking, as to produce the greateft aftonifhment in all who had feen him before, and faw him after that fhort interval of time.

This furprizing recovery muft be afcribed to the youth and ftrength of his conftitution relieved from diforder. I mention it particularly, to fhew that the quantity of mercury that controlled the difeafe did not weaken the conftitution. When the patient returned into the country, I recommended the continuance of the pills every other night for fome time, to prevent any relapfe; but I was informed that he foon left them off, and has fince had no diforder *.

CASE

* When a difeafe refembling fyphilis attacks the noftrils, we are almost compelled to use mercury, fince we cannot fee the character, extent, and progress of the ulcer; yet extensive experience demonstrates in a manner horrible to observe, how many such difeases pursue a most destructive course uncontrouled, nay, often aggraused

CASE XVII.

A gentleman had a trivial fore upon the prepuce, and being engaged to marry in the course of a few months, he underwent what was confidered as a more than adequate course of mercury, for the cure of the disease. After he had married, however, his throat ulcerated. His furgeon hefitated in pronuncing it to be fyphilitic, and its progrefs contra-indicated that fuppofition, for one fore healed and another broke out, or ulceration again enfued in the fame place. One of the teftes afterwards became confiderably enlarged without pain, and fores broke out upon the fcrotum, which was much thickened, and in the perinæum. Six or more months paffed during the progrefs of the difeafe to this ftate, when I was first confulted on the cafe. It was in the fpring of the year, and we agreed

vated by the most powerful effects of mercury. The cafes above recited, I therefore deem worthy attention, as they shew that difeases refembling syphilis may occur in the nose as well as elsewhere; and that our practice should be regulated by the same principles in treating these, as in other symptoms of venereal difeases.

that he fhould fpend the fummer at the feafide. During this fummer the fores on the fcrotum healed, and it regained its natural state. The fwelling of the testis fublided. His throat occafionally ulcerated and healed; but a kind of difeafe feemed to fpread along the alveolary process from behind, for the teeth loofened and came out, and in fome parts the gums ulcerated. This happened on the left fide of the mouth, and it advanced as far forwards as the first fmall grinder, which still remained firm. In November he remarked, that whenever his ftomach and bowels were difordered, his complaints were aggravated; and by the means which were fuggested for regulating those organs, he paffed through the winter without any increase of diforder. In the fucceeding fummer fores broke out again on the perinæum, and by the fide of the rectum, which healed under dreffings of red præcipitate ointment. He had also a flight enlargement of the teftis, which foon got well. In the fucceeding autumn the difeafe in the alveolary proceffes feemed to trouble him, and there was a flight difcharge from the being I 4 n ofe

nofe. I had recommended him to abstain from the use of mercury, while his diforders were stationary; but fearing that there might be an increase of difease in this part, I advised him to to take the compound decoction of sarsaparilla and one of Plummer's pills night and morning. Under this treatment he soon recovered, without any perceptible effect of mercury on his constitution, and has remained well fince.

Though I feel pretty confident, for the reafons stated in the preliminary observations, as well as those contained in the third fection. that many difeases which refemble fyphilis, do not originate from that poifon, I am by no means equally certain, that none of the cafes which I am now promifcuoufly relating, might not have arifen from that fource. Such an affertion would be to deny the poffibility of the effects of fyphilitic poifon being modified by the difeafed propenfities of the conftitution. It would be alfo to affirm that there is only one kind of fyphilitic chancre, and one kind of conftitutional fyphilitic difease, which is far from being being my intention. I merely ftate, that when the primary fores differ materially from the ordinary characters and progrefs of fyphilitic chancres, that they may fairly be fufpected to be of a different nature; and that in general the conftitutional fymptoms will be found equally to deviate from the progrefs of fyphilis, and confequently to require a different mode of treatment.

I proceed to relate fome cafes of this defcription, and to give an account of the conftitutional fymptoms fubfequent to these kinds of fores, in a few cafes, that the reader may judge of them for himself.

CASE XVIII.

On burrowing Sores.

A gentleman forty years of age, who had lived very freely, in the month of July 1806; contracted a fore between the prepuce and glans penis, near the frænum, which he believed to have originated from fome acrimony in the fecretions. This probably was the opinion of his furgeon, as he merely recommended cleanlinefs, and a poultice, until the fpreading of the fore induced him to ufe mercury.

mercury. A confiderable fwelling of the prepuce was occafioned by the irritability of the fore, which continued to fpread by ulceration forwards, fo as to extend over the whole of the lower half of the glans, to within the eighth of an inch of the urethra, and backwards between the integuments and lower half of the body of the penis for more than half way to the fcrotum. It did not prevent him from denuding the glans, and cleanfing away the difcharge in fome degree, but the extent of the fore backwards could not be feen. It had continued to fpread gradually for more than two months, although the mouth was affected by the ufe of a great deal of mercury. His constitution was much enfeebled, in a great measure owing to the mercury he had used. In this state he came to London, and confulted me. Fearing that the fore might continue to fpread if the mercury was laid afide, I defired him to rub in every fecond night, fo as still to keep his constitution under the influence of that medicine, while I endeavoured to correct the fore by local means. Various washes were tried, for instance, weak folutions

tions of fulphate of zinc, and nitrate of filver, calomel, and muriate of mercury in lime water. In lefs than a month the fore was nearly healed, except in that part which covered the urethra about half-way below the penis; and here the ulceration feemed kept up by the efcape of fome urine from the canal, and he had at this time a frequent propenfity to void his urine. It appeared probable, that the urethra had not been in a found state prior to his contracting this complaint, and that it had derived additional irritation from the proximity of the fore to the mouth of the canal, as well as from that part where its ulceration had occafioned an opening. At this time an indolent enlargement of the right teftis took place, and fo large a hydrocele was formed, that I was much inclined to puncture it, to relieve him from the inconvenience occafioned by its weight. The patient, however, was anxious to return into the country, where he was directed to continue the fame mild mercurial courfe. In January, 1807, he returned to town, and during the interval, the hydrocele difappeared, though some enlargement of the testis still conti-

continued. The aperture of the urethra had inflamed and ulcerated, leaving an external fore. The other part of the penis which had been ulcerated, continued firmly healed. His health, however, was much difordered. He had a rheumatic fwelling of the finger, and a node upon one shin, with rheumatic pains in various parts of his body. Finding conftitutional fymptoms apparently originating from a fore, for which from its commencement mercury had been ufed unremittingly, I advised him to difcontinue rubbing in, and he went to Bath in purfuance of the recommendations of fome of his friends. I previoufly, however, introduced a bougie, and found feveral strictures in the urethra, which had probably exifted before he had contracted the other complaint. As a bougie of a moderate fize paffed through the urethra, I merely advifed local warm bathing. During a month's refidence at Bath, he fuffered much from pains in the tibia, but the nodes had not increafed during that period. An ulcer larger than the furface of a shilling, with thickened inflamed and fpreading edges, deep in the

124

the middle, and without granulations, had formed near the outer angle of the orbit of the eye. Some fores of the fame nature, but less in degree, took place also on the arms. Wishing to know if these fymptoms were truly fyphilitic, I determined to try if they would get well without mercury. A poultice of bread and water was applied to the fore on the face at night, and a dreffing of fimple cerate in the day. The edges of it were occafionally touched with argent. nitrat. to controul their fretful difposition, and under this treatment the ulcer healed. The patient was anxious to return into the country; and as I thought his health might be better than in town, he returned to his own house with an injunction not to use mercury if it could be avoided, and there his pains in a measure subsided. After some time, however, the nodes on the shin became more prominent, though lefs painful. The noftrils also became very much affected by the difease. He blew from them pus in a fluid form, and concrete lumps refembling (to his own words) " the internal parts of the nostrils, but this" he continues, "gradually went

went off, leaving the noftrils as clear as before. My general health now improved, and encouraged by this circumstance, I was induced to make a journey to London in the month of June, where I lived more freely than before and took fresh cold. Upon my return home, I had a recurrence of the pain and fwelling in my fhin bones, and the pain of the legs to fo great a degree, that it was effeemed prudent to confult a phyfician, who recommended nitrous acid, two mercurial and an opiate pill at night. Milk diet was also recommended, which conftituted my principal food. The acid was continued a fortnight, the pills about a month, but little relief from pain was experienced. The nodes gradually leffened, but the pains were unabated, and occupied my knees and ancles as well as fhins; they continued during the night, and remitted in the morning." On the weather becoming very cold, he was recommended to pass the winter in fome warmer place than the fituation in which he refided. He came to town and confulted Dr. Baillie as well as me. He was advifed to take the decoction of farfaparilla I

126

parilla, with a small quantity of hydrarg: muriat: and to controul the night pains with extract of henbane. This plan anfwered very well, and he returned into the country, where he faid his ftomach was fo much naufeated by the medicine, that he was obliged to leave it off. He came to town again in the beginning of January, 1808, in a very emaciated and crippled ftate, owing to rheumatism. His nights were passed in great pain, and this terminated in profuse perspiration in the morning, fo that he feldom rofe till past noon on the following day. He was fcarcely able to walk, and dreaded the leaft exposure to air, which confiderably aggravated his pains. Some fores had again broken out upon his face, and one of the largeft was fituated on the front of the ear, extending over the tragus, the discharge from which generally filled the concha, and this obstruction together with the irritation, made him very deaf. I had often expressed to the patient my conviction that an alterative and undebilitating mercurial courfe would temporarily cure his difease, but wished to see him when that medicine was employed, that shupp I might

I might observe its effects. He now took a pint of decoction of farfap: daily, and five grains of the pil: hydrarg: every night, and in about a fortnight he was fo much recovered that he was able to ride out, which he did as often as the weather permitted. At the end of the third week, he went into the country, a fhort diftance from town, to fpend a week, from whence he rode at the expiration of that time, eighteen miles without stopping. His rheumatic pains had nearly left him, and the fores on his face were healed. In fhort the ceffation of the difeafe was as ftriking and as rapid as in almost any cafe, that I had feen, but he was not reftored to perfect health. Though comparatively mufcular and ftrong, he did not acquire that ftrength which he had poffeffed prior to the occurrence of the difeafe, nor did he look healthy. He continued in town, taking the fame medicine a fortnight longer, during which time he committed, in confequence of the liberty he had acquired, fome little irregularities, fuch as fitting up late, and eating and drinking too much. The effect of this alterative courfe

course of mercury, which did not produce any evident mercurial action in the conftitution, and under which the patient acquired a furprizing degree of ftrength and and apparent health, fully equalled and even furpaffed my expectation. Inferring the probability of a relapfe, and that half the dofe of the medicine was not likely to be in any degree prejudicial to the conftitution, I recom. mended him to return into the country, and to continue the fame medicines, taking the mercurial pill every fecond night only. The patient, however, did not profecute the plan laid down, and his health has continued. greatly difordered ever fince this period. He has been fubject to various local difeafes, but their nature was fuch, that I believe no unprejudiced perfon could confider them as fyphilitic. He has had fevere rheumatifm, but it never produced a local attack on a bone, fo as to refemble a fyphilitic node. He has had gout to which he had formerly been fubject.

He had a great degree of inflammation and induration of both his legs. He had violent vol. 11. K pain

pain about the first joint of the great toe, and matter feemed to have formed beneath the periosteum, for, upon the abcess breaking, the bone was denuded. He has a redness, thickening, and tendency to ulceration, of the integuments of the alæ nasi.

The patient had formerly lived very freely, and the alteration in his ordinary modes of life, with the effect of mercury on his conftitution when employed freely, at first, for the cure of the primary fore, feem conjointly to have produced this deplorable derangement of his constitution.

Under these circumstances, he fometimes took the compound calomel pill in the dose of one grain of calomel each night, and it generally appeared to be of fervice to him. Sometimes he took no mercury. His local diseases did not seem to be much affected either by the use of mercury in this degree, or by its discontinuance.

When once, without my knowledge, he took the compound calomel pill more freely, it

130

it evidently was injurious both to his health in general, and to his local difeafes.

CASE XIX.

A gentleman had a fore between the prepuce and corona glandis, which was treated as a fyphilitic chancre. After a time it began to fpread in the cellular fubstance, between the integuments and body of the penis towards the pubes. In proportion as the fore became worfe, the quantity of the mercury administered for its cure was increafed; fo that he had gone through a very confiderable courfe of mercury, which had made his mouth very fore, and had greatly impaired his ftrength. The fore, however, was not amended, but when I first faw him was extending itfelf still nearer to the pubes and more round the penis. I directed him to clean away the difcharge by frequently injecting a warm decoction of poppy heads, and to keep a bread and water poultice round the penis. After fome time the skin of the dorfum penis ulcerated, and gave an outlet to the discharge in this direction. K 2

rection. The degree of difeafe which took place feemed to have been prejudicial to the front of the prepuce, for it became very œdematous, and the ulceration fpread rapidly forwards fo as to divide it, leaving the glans and body of the penis projecting above the feparated and tumid fides of the prepuce. The fore gradually got well without any other medical treatment than what appeared neceffary to regulate the actions of the bowels. He took indeed occafionally fome decoction of farfaparilla and fome nitric acid. The patient had no fubfequent conftitutional difeafe.

Refpecting these fores, which I have called burrowing fores, I may observe, that only a few of them begin to burrow in the first instance. It is generally an after process, and may be confidered in the greater number of cases as the effect of a new action taking place in the fore. It is, however, fo difcordant to the progress of true fyphilis, that I cannot believe it to be an effect of that difease. If we have any doubt we must look to the constitutional fymptoms which fucceed ceed to them, and thefe we find to partake more of the nature of pfeudo-fyphilis than of true fyphilis. Some burrowing fores do not fo affect the conftitution as to produce fecondary difeases, whilst others do. I have recorded a specimen of each, and think it unneceffary to cite more; though I could bring forward a confiderable number. The fecondary fymptoms in the first cafe were very obstinate, and those surgeons, who are inclined to believe all these difeases syphilitic, may probably think the fymptoms in this inftance were fo. To me, however, it appears that the most potent mercurial courfe was inadequate to the cure of the primary fymptoms, and would have been fo to those of a secondary nature, while the latter were readily controulable by an alterative courfe, and in fome inftances got well fpontaneoufly. It is alfo my opinion, that their continuance depended much upon the difordered state of the constitution produced by former irregularities of living, by the irritation of difeafe, and the debilitating effects of the too free use of mercury for the cure of the primary fore. I could produce many instances K 3

inftances in which the fecondary fymptoms were more flight and more clearly pfeudo-fyphilitic, than in the one which has been related. The prefent cafe I brought forward, becaufe it made a ftronger impreffion on my mind, than thofe which were lefs vexatious, and becaufe I do not wifh to reprefent the fubject of the fecondary difeafes in pfeudo-fyphilis, as lefs obftinate and fevere than they will often be found to be.

CASE XX.

On floughing Sores.

A gentleman about thirty years of age applied to me on account of a floughing fore about the fize of a fhilling on the dorfum penis. I defired him to drefs it with a watery folution of opium, covered with fpermaceti cerate fpread on linen, and to furround the penis with linen kept conftantly wet with water. His bowels were obftinately coffive, his tongue much furred, and he had fo much fever and head-ache, that the ufe of mercury feemed to be prohibited by the difordered ftate of his conftitution. The fore fpread fo

as

134

as nearly to encircle the penis, and to occupy its whole length. Various dreffings were employed until the furface of the fore was no longer floughy, but the edges were thickened and very fretful. These were touched every day with argent: nitrat: which feemed to counteract their fretful state : they afterwards became healthy, and the fore healed in the fpace of two months from its commencement. Before the fore healed, fymptoms of constitutional diforder appeared. The throat became fore, but did not ulcerate in any material degree. Spots came out on the skin and breast. He had afterwards a rheumatic affection of the knee and foot. All these fymptoms disappeared fucceffively without the use of mercury, to which medicine he had fo ftrong an averfion, that it would have been difficult to perfuade him to take it : he foon recovered from the effect of his diforder, and felt as well as before he had contracted it. The medicines which were taken in this cafe, were farfaparilla, nitric acid, bark, and aperients. Secondary fymptoms do not fucceed to every floughing fore, and these symptoms occasionally approach K 4 more

more to the nature of fyphilis than in the preceding cafe; yet I have known no inftance in which, either from the irregularity of the progrefs of the fymptoms, and their infufceptibility of cure by the powerful action of mercury, they could not be diftinctly recognifed as pfeudo-fyphilitic.

CASE XXI.

A gentleman had a floughing fore, which fpread round the prepuce, without extending backwards to the integuments covering the body of the penis, yet its breadth was fo confiderable as to involve the whole of the prepuce, which it eventually deftroyed. The furgeon who first faw the patient had given him mercury, but, doubting the propriety of its continuance, I was confulted, and immediately opposed its further use. Fumigations with cinnabar were found to be more efficacious than any other applications which were tried to this fore; these quickly arrested the floughing process, but an ulcerative one continued till the prepuce was eaten away. After two months from the commencement

mencement of the fore, when it was nearly healed, the constitution of the patient became much difturbed, and fecondary fymp toms appeared. These were spots and blotches of rather a livid afpect, the latter of which in many parts of the body fpread out into extensive fores which had a floughing appearance. One on the outfide of one foot and ancle was as large as the palm of the hand. The original fore was also irritated by the diffurbance of the conftitution, and began to ulcerate again very rapidly, infomuch that the glans penis, and a confiderable part of the corpora cavernofa, were deftroyed. Neither fumigations nor any other of a great variety of applications appeared to retard the deftructive progress of this fore, and mercury was employed. The patient was ordered to rub in two drachms by meafure of mercurial ointment every night for five weeks, when his gums became tender and fwollen, and his conftitution confiderably influenced by the mercury, yet no material alteration took place in the difeafe. The unavailing effect of mercury being proved, the patient went into the country, where all thefe

these complaints gradually disappeared. His health, however, was still difordered, and new fymptoms came on. His nofe became flightly affected, and he had pains in his bones. He now removed to the fea-fide, and after continuing there for a confiderable time, he wrote to me, faying, that ulceration had taken place in his nofe, which had deftroyed the septum narium, and that the integuments, covering a kind of node on one thin, had formed into a foul and fretful fore. I now recommended an alterative mercurial courfe. He took five grains of pil: hydrarg: at night, and a pint of the decoct: farfæ daily, and in the course of four or five weeks he was apparently well, having acquired health and ftrength at the fame time. . In a fecond letter he expressed his great furprize at his amendment, and wifhed for my further directions. I then defired he would take the pil: hydrarg: every fecond night, if the state of the biliary fecretion required it; but as that was not the cafe he took no more of that medicine, and has fince remained perfectly well.

138

CASE

CASE XXII.

A gentleman had a very irritable fore on the prepuce, just behind the corona glandis, which was covered with flough ; this having been thrown off was fucceeded by another flough, and the fore fpread laterally to the right and left ; but it neither extended backwards fo as to affect the fkin covering the body of the penis, nor forwards fo as to touch the glans; neither did it eat deeply into the part fo as to affect the corpus cavernofum. I tried various dreffings, but none feemed to do much good. I touched the furface of the fore with argentum nitratum, but that did harm. I therefore was obliged to foothe this fore, fince I could not correct it. A falve made of fpermaceti cerate, with as much aq: litharg: acet: and tinct: opii as could be incorporated with it, feemed to anfwer best; and the parts were kept cool by enveloping them in linen moiftened with the decoction of poppies. The most perfect quietude was enjoined, and the part laid upon a pillow with the extremity rather raifed above a horizontal line. I had given the patient some pilulæ hydrargyri in the first inftance,

stance, but his constitution was fo deranged by the irritation of the fore that it would have been abfurd to perfevere in the ufe of mercury. The fore continued to flough, and to extend in a circular direction nearly all round the prepuce, the lower part of which became extremely fwoln. This took up nearly two months : about five weeks after the commencement of the difeafe, a fpot appeared more than an inch from the corner of the mouth. It was foon covered over with a fcab, which role far above the furface. It had increafed to the fize of a fixpence, when I thought right to drefs it, that I might diftinguish the furface of the fore. I found that the ulcer was very deep, but I could not fee the furface for a very vifcid difcharge, which adhered to it like mucus. Poultices and various dreffings were employed, but the appearance of the fore was unchanged, and it gradually became of the fize of a shilling. At length a kind of fungus fhot from that edge of the fore farthest from the mouth. A fimilar fpot had made its appearance on the ear, and was also increasing. The activity in the difeafe of the prepuce had gradually declined,

clined, and I began again to try fome medicated applications :--- the fore feemed much benefited by touching it daily with argentum nitratum; but when this was omitted the floughy appearance of the fore again took place, and it increased in dimensions. It was now agreed at a confultation that this patient should use mercury, and he rubbed in two drachms, by measure, every night for fix weeks. As the mercury took effect it feemed to operate beneficially on the fpot on the ear, which gradually died away; and on the fore of the penis, which also gradually acquired a, healthy appearance, and the parts became found, except at one part where the prepuce was not quite destroyed, and which still retained an unhealthy appearance. The mercury, however, did not affect the fore on the cheek; the fungus which I mentioned feemed to increafe, and, after a time, skin formed over it fo that the fore healed in an unhealthy manner at the edge farthest from the mouth. But it still spread in the other direction till it reached the angle of the mouth, and it afterwards extended itfelf along each lip. On the upper lip it had fpread to the extent of one third

14E

third of an inch, and ftill retained the fame difeafed appearance which characterized it at the beginning. It was deep, and its furface could not well be feen on account of a vifcid matter which adhered to it. It was now agreed in confultation to leave off mercury, left the irritated ftate of the mouth fhould increafe the deftruction which the ulcer was committing on the lips. The fore now no longer fpread; it very flowly loft its difeafed ftate, and healed. This alfo happened in the remaining difeafed part of the fore on the prepuce.

CASE XXIII.

Of Sores which become indurated in their Circumference.

A medical man contracted a fore on the prepuce, which, while it was healing, became indurated in its circumference, and when healed, it became foft and apparently healthy in the middle. The patient had taken and rubbed in mercury from the commencement of the complaint; in fhort he treated it ftrictly as fyphilitic. When it affumed the appear-

142

appearance and character which I have defcribed, he shewed it to me. I advised him to continue the mercury, in fuch fmall quantity as not to affect his health, until the induration fubfided, left from want of this precaution it should fret into a fore. Under this plan of treatment, however, conftitutional fymptoms occurred. The throat became ulcerated, and numerous fmall fpots came out all over the body. . His health was alfo much difordered, and he could only take fuch fmall quantities of mercury, as could have no influence on true fyphilis. He took at the fame time the decoct : farfæ. All the fymptoms gradually difappeared, and he got perfectly well in the course of a few months.

CASE XXIV.

A gentleman who had juft left London on a vifit to fome friends in the country, perceived a fore on the prepuce, which he undertook to manage for himfelf. He dreffed it fimply, and took from ten to fifteen grains of the pil: hydrarg: daily. After a month he came to town with the fore much enlarged, having difeafed indurated edges, but with a 9 healthy

healthy furface. As his mouth was affected I defired him to continue the mercury in lefs quantity, fo as not materially to difturb his conftitution. The fore healed under this treatment, in the course of another month, but it exhibited the appearances which characterize those ulcers of which I am now fpeaking. It was foft in the middle, but had a circular hard rim, of the extent of a shilling. At this time his health was much. difordered, and his throat ulcerated. Deep and foul ulcers alfo took place in his cheeks opposite to the grinding teeth, and some fores appeared on his tongue. His gums were fpongy, and loofened from his teeth, like those of a perfon having fcurvy. I now recommended him entirely to difcontinue the mercury, and to take the nitric acid, which he did, in the dofe of from 60 to 90 drops daily. Under this treatment, both the conftitutional fymptoms, and the remaining induration of the primary fore got well in the courfe of fix weeks. Nearly a year afterwards, he had a fevere and intractable ophthalmy, attended with nervous fymptoms, and diforder of his conftitution. After a time.

144

time, fpots again appeared on his fkin, and he then applied again to me. By taking decoction of farfaparilla daily, and five grains of pil: hydrarg: every fecond night, at the fame time paying attention to keeping his bowels regular, his health was reftored, and all thefe complaints totally difappeared in about five weeks.

These circumstances occurred in the fpring of the year, and in the autumn the pituitary membrane of his nofe began to ulcerate, and it continued to do fo more or lefs during the whole winter, and even fome discharge continued for the space of a year. The ulceration deftroyed a great part of the cartilaginous part of the feptum narium, fo that the alæ nafi being lefs fupported funk a little, and made the termination of the bones apparent beneath the fkin. The deformity was, however, too trivial to attract the notice of an indifferent or inattentive spectator. For this difease the alterative plan of treatment which had been fo fuccefsful on the former occafion was again instituted, though with little advantage. At first, when the patient's apprehenfions VOL. II. L

henfions were confiderable, as the alterative courfe of mercury failed to do good, the dofe was increased even so as to affect the mouth, but the difease was so evidently aggravated by it, that the medicine was for a time left off and with manifest advantage. In the autumn of the fucceeding year a new difease occurred. A large deep ulcer formed in the throat, which had all the characters of fyphilis. It, however, very fuddenly acquired its largest dimensions, being about an inch in length and half an inch in breadth. It was ituated obliquely between the top of the tonfil and the front of the velum palati. It was very deep. As fo little fuccefs had attended the alterative courfe of mercury in the ulcerative difease of the nose, and as the progrefs of the prefent ulcer could be noted, no mercury was employed, and in about a month this ulcer was well, and the patient has not fince had any relapfe; and, from the length of time which has fince elapfed, it is highly probable that he never will have any.

I have already faid, that fores which indurate in their circumference do not in every

2

every inftance produce conflitutional fymptoms. Apprized of their nature I generally order for the patients that dofe of mercury, which may be taken without affecting the conflitution, as a difcutient of the hardnefs, and I have known nearly fix months elapfe before it has been completely difperfed. This kind of partial induration is fo different from the progrefs of true fyphilis, that I think it must be readily granted not to be of that nature. It must however be alfo remembered, that fores which indurate in all parts are not always fyphilitic. As I have already related two inftances I think it unneceffary to add more.

Having thus endeavoured to reprefent the conftitutional effects refulting from fores, which differ materially in their characters and progrefs from fyphilitic chancres, I wifh to fubjoin another cafe, though I am doubtful whether the difeafe originated from infection, or was the product of conftitutional diforder. I think it deferves to be recorded on account of its duration.

L 2

147

In

In the year 1793, a gentleman aged twenty-fix, who had been married two years, had a paralytic affection of the whole of the left fide, from which he gradually but not completely recovered in about nine months, the latter of which he fpent in the country, and he attributed much benefit to the country air. About four months from the commencement of the paralyfis, he had an indolent enlargement of the teftis as big as a large fift, which did not fubfide, but in 1796 fuppurated, broke, and very flowly got well. In 1797, he had an ulcerated fore throat, for which he went through a very regular and fevere courfe of mercury. He was confined from July to November, and the mouth was in a greater or lefs degree affected during the greater part of that time. The throat foon got well. The year 1798 he fpent in the country, and regained his health and strength in a very confiderable degree. In 1802, a node appeared about the middle of the right thin, which was removed by a blifter kept open for fome time. He had at the fame time a pimple on the nofe which formed a fcabby ulcer, but flowly got well from from the application of a folution of the hydrarg: muriat: He had fubfequently feveral eruptions, forming fcabs upon the trunk of the body and arms which did not ulcerate, and got well without medicine. In 1804, there was a thickening about the os calcis and tendo achillis, which threatened to fuppurate. In 1805, I first faw the patient; his tongue was furred, the fecretion of bile irregular, with a great degree of nervous irritation. He was also subject to rheumatic pains which particularly affected his knee. I recommended a strict attention to the state of the bowels, and foothing applications, with preffure to the heel. Under this treatment the heel gradually got well and the fpots difappeared. In the fpring of 1806 fome nodes appeared on different parts of the skull, when I told the patient to profecute the fame plan of treatment, and if they got better to difregard them, but if worfe, to let me see them. In the autumn of this year, he called upon me with the nodes on his head confiderably augmented; one on the right fide of the forehead was as big as a large walnut, and threatening to break, and two on

L 3

on the left parietal bone, but of lefs fize, had broken and healed. There was alfo a very confiderable node near the top of the left tibia, which had been opened by cauftic, and had left a foul ulcer. I then recommended the decoct: farfæ with a compound calomel pill, night and morning. This plan was continued from November to the end of May, when the decoction was left off, though the pill was continued in a fmaller dofe for fome time longer. Under this courfe, which never produced the flightest mercurial effect on the constitution, all these complaints got well, and the patient became healthy and fat, and, as he fays, better than he has been from the commencement of his diforders which is fourteen years ago.

This cafe appears to me to be very fimilar to that related at page 87. In neither do I believe that the fymptoms were the effects of poifon imbibed, but on the contrary, of a difordered ftate of health.

Whilft I was attending this patient, his wife's throat ulcerated to a confiderable degree.

degree. Both tonfils were ulcerated, and the ulcer continued from one along the edge of the velum palati to the extremity of the uvula. The ulcers were hollowed, covered by vifcid matter, and furrounded by inflammation. I should without hesitation have pronounced thefe fores fyphilitic had they fucceeded to a chancre. Another furgeon had no doubt of their nature. The patient's bowels were difordered, and fhe felt generally unwell. I directed her to take fome decoction of farfaparilla, and fmall dofes of rhubarb, whilft I attentively watched the progress of the ulcer. In the course of a week it was fo decidedly amended, that I had no doubt of its not being fyphilitic. Where it ran down the fide of the uvula, it had granulated, and was in a great meafure healed. As the difcharges from the bowels were blackish, I directed five grains of the pilul: hydrarg: to be taken every night for a fortnight, which gradually corrected the biliary fecretion, and in that time the ulcers were perfectly healed. The patient took the pills every fecond night for another fortnight when the bowels L 4. being

being in all refpects right, and the conftitution in general relieved from all diforder, they were difcontinued.

About fix months afterwards, this patient being in the country, thought fhe had caught a cold in her head, as fhe had frequent occafion to blow her nofe, and as fhe fnuffled in fpeaking; this complaint gradually increased, and after a fortnight had elapfed, fhe perceived a difficulty of deglutition, which alarmed her, because it reminded her of her former indifpolition. She was at this time also very unwell, and felt in the fame manner as when her throat had ulcerated. These fymptoms gradually increasing, after another fortnight fhe came to town. There was no doubt but in this fecond attack ulceration had taken place in the upper furface of the velum palati, for the ulcer had eaten through the foft palate at a small distance from the termination of the bone, there prefenting a circular aperture, about as large in circumference as a pea. This complaint was made perfectly well in three weeks, by the fame treatment as was instituted in the former. The health in

152

in general, and the digeftive organs particularly, were difordered in the fecond attack as they were in the former one, and both were fet right by the measures that were purfued.

I have known many ulcerated throats, which could not, by infpection, be diftinguifhed from fyphilitic difeafes, and which were even fuppofed to be fo on account of the difficulty of curing them, arife from an irritable ftate of the ftomach, and they have readily got well by the treatment above defcribed.

The foregoing cafe might have been one of this defcription. Might it not, however, have arifen from contagion, and have been caught from her hufband? I have recorded it chiefly on this account; for I am defirous of mentioning, that I have feen feveral inftances of pfeudo-fyphilitic difeafes communicated from hufbands to wives, where there were no fores, nor apparently any morbid difcharges from the genitals. If this fuppofition be true, it would probably be confidered as a very curious fact, and I mention it to excite I general

general obfervation, by which alone it can be confirmed or confuted. I shall briefly relate another case, suggesting the same opinion.

A gentleman had been my patient on account of a chancre, for which he regularly took mercury fo as flightly to affect his mouth. He had afterwards an ulcerated throat, which got well without the use of any medicine. Shortly afterwards he married a very healthy woman, who in about three months became very unwell, and had pfeudo-fyphilitic difeases, for which a mercurial courfe was instituted without benefit. As I had attended the hufband, I was once confulted on her cafe. She had then a deep and foul ulcer between the ala nafi and upper lip. Her difeafes afterwards got flowly well under a plan of treatment calculated to reftore her general health.

I am aware that the cafes which I have related by no means reprefent all that deferves to be difplayed, in order to convey to the reader

154

reader that extensive knowledge of the fubject which a furgeon living in this metropolis may and ought to poffers.

For example, I have not related any cafer to shew that the primary fores, in many instances, are subject to paroxysms of diforder; that they will amend and feem inclined to heal, and when, from their appearance, the greateft hopes are entertained, on a fudden, a renovation of diforder takes place and more parts become difeased or destroyed. This circumstance happens whether mercury be employed or not, and under an equal operation of mercury on the patient's conftitution. Alfo in fyphilitic and pfeudofyphilitic affections, fometimes difeafes occur which are the effect of derangement of the conftitution at large, fuch as unhealthy abceffes and fores; and whilft mercury, if employed, acts beneficially on the fymptoms for which it was administered, it often has a prejudicial effect on these accessory diseases.

I have now lying before me the written records of many cafes fimilar to the foregoing, each

each of which exhibits fome interesting variety observable in these diseases. I forbear, however, to adduce more instances, from a conviction that recorded cases will never make a forcible impression on the minds of practitioners, and that they merely serve to induce attention to the occurrences which are met with in practice, so as to lead each person by observing circumstances to which he had perhaps before been too little attentive to acquire practical information and knowledge from his own experience,

cury be employed or not, and under an equal operation of mercury on the patient's conditiution. Allo in typhilitic and pleudodyphilitic affections; formating s diffectos accur which are the effection derangement of the conditiution at large (nob as unleaded) she ethics and fores that will servery, if canployed, acts becendably on the fymproms for which it was relatively on the fymproms for official effect on the or could be defended.

I have now lying before ute the written re-

150

SECTION V.

On the Treatment of Pseudo-Syphilitic Diseases.

THE impropriety of putting patients under a full mercurial courfe, fuch as is neceffary for the cure of fyphilis, without taking into confideration the nature of the primary fore, or watching, even for a fhort time, the progrefs of the constitutional fymptoms, must I think, be to every one fufficiently evident. If the conftitutional fymptoms proceed in the manner detailed in the fecond fection, and get well fpontaneoufly, it would be abfurd to use mercury; but if they are progreffive, and threaten to deftroy parts of importance, even though we may have great reafon to believe that they are not truly fyphilitic, an alterative course of mercury, with the addition of decoction of farfaparilla, feems to be, in general, the most efficacious means of effecting a temporary cure.

In the fecond fection, I stated, that after having waited till I was affured that the constitutional

stitutional fymptoms were not truly fyphilitic, and confequently, did not require for their cure a strong mercurial course, I generally gave the compound calome! pill with a view to fhorten the duration of those fymptoms. This practice has been faid to be ridiculous. I only with to fhew that in general, it is the most fuccessful that can be purfued. The cafes which have been related atteft, that an alterative course of mercury will cure difeafes which a potent one will aggravate; and that neither courfe can be confidered only as producing the temporary effect of curing the prefent fymptoms without eradicating the conftitutional difeafe. In proof of this point, I could adduce the most abundant and clearest evidence. I take the liberty to mention, that fome eminent furgeons of this metropolis, who concur with me in opinion respecting the nature of these diseases, are averse to employing mercury for their cure; and as fuch fentiments and practice may become very general amongst those who clearly perceive that the most powerful mercurial courfes will not radically cure these diseases, and

and that they will get well without that medicine, I feel it neceffary to difcufs the fubject a little more at large.

I have found a compound calomel pill or five grains of the pilul: hydrarg: taken every fecond night, fufficient in many cafes to heal fores more rapidly than I wifhed, while in others, the fame pill taken every night has been infufficient, and the difeafe has been controlled and cured when the pill was taken night and morning. The dofe which has been most fuccefsful, has been one that has not perceptibly affected the mouth nor weakened the constitution; during its ufe, on the contrary, patients have acquired muscular strength and increase of bulk.

The conftitutional fymptoms in these cases frequently occur when the patient's health is much difordered, and it may be feared that any course of mercury, however trivial, may increase the weakness and irritability of the constitution. However, it will be found, on the contrary, that an alterative course

courfe of mercury, by controlling the difeafe, will produce a diminution of irritability, and increase the strength of the patient. All perfons who are not familiarly acquainted with the fact are extremely furprifed at the wonderful acquifition of bodily ftrength and vigour obtained by the patient during the ufe of a medicine which they have always confidered as likely to debilitate. The difficulty is to afcertain the precife dofe that thall cure the local difeafes, without apparently producing any mercurial effect on the conftitution in general. This dofe must necessarily be various, as the fusceptibility of being acted on by mercury varies greatly in different perfons.

Refpecting doubtful cafes, and of this defcription muft many be, which are prefented to the notice of a furgeon who has had no opportunity of obferving the characters of the primary fore, &cc. I wifh to afk the following queftion. If a difeafe that may be fufpected to be fyphilitic gets well, when the patient takes only five grains of the pilul: hydrarg: each night, (taking alfo the decoction

d

be

m

Rec

tion of farfaparilla in the day) without the mercury apparently disturbing his constitution, but, on the contrary, contributing to the increase of his strength, ought such a difease to be regarded as fyphilitic, and requiring a perfevering courfe of mercury for its cure? Were I to answer this question agreeably to the dictates of my own experience, I should reply in the negative, becaufe I have feen many fuch instances, wherein it was evident that the difease was of the kind which I have termed pseudo-fyphilitic. Within these few months three cafes have come under my obfervation, in which the throat was deeply and very badly ulcerated, and the general health greatly impaired; and yet all the patients got well in about a month by fuch a course of medicine as I have defcribed, increasing in health as the local difeafe amended, and without any mercurial effect on their constitution being manifest.

This is a point of practical conduct, much deferving of confideration, and requiring to be eftablished. It would appear wrong to use more force for effecting a purpose than is requisite. In syphilis the cure of the diseases vol. II. M for

for which mercury is administered is a proof of the fufficiency of the mercurial courfe. Syphilitic fymptoms will not, however, as far as my experience enables me to determine, give way to fo trivial a quantity of mercury. Therefore the mode of cure of these difeases may ferve as a test of their nature, and as a guide for our conduct on a recurrence of fymptoms, in cases where no other evidence can be obtained.

Were this question determined, were it decided, that truly fyphilitic fymptoms would not yield to an alterative course of mercury, which produced no apparently mercurial effect on the patient's conftitution, but under which it acquired a natural degree both of tranquillity and ftrength, another enquiry would yet remain. Are we warranted in continuing or augmenting the mercurial course, in order to prevent a return of the fame or fimilar fymptoms? Were my own experience to direct me in my reply to this question also, I should again answer in the negative; becaufe I have frequently, in such dubious cases, put patients under a full mercurial course, in order to prove, that if

any relapse should occur, the difease could not be fyphilitic, or curable by fuch a courfe of mercury. The cafes to which I allude were those of officers and perfons of frong constitutions, in which it feemed necessary to establish this fact, with a view to the subsequent treatment of any fymptoms that might occur. Yet in these cases new fymptoms were manifested. I have also been frequently confulted with refpect to the degree to which a mercurial courfe should be carried, and the time it fhould be continued, that had been instituted for thecure of pfeudo-fyphilitic fymptoms, which had been mistaken for those of true fyphilis; and I have recommended that it fhould be continued to that degree and for that duration, that should render a repetition of it unneceffary, by proving it to be unavailing, should a recurrence of fymptoms enfue. Yet in these cafes alfo, either the fame fymptoms returned or fimilar difeafes took place, and in most instances these returning symptoms have got well without the use of mercury. The cafes allo, which I have detailed, fhew how unavailing the most potent courses of mercury are, in effecting the radical cure of these

163

diforders.

diforders. It feems therefore better to defift from the use of medicine, when the local difeafes are well; and, fhould they recur, to cure them again by an alterative courfe of mercury, which appears, from its effects, to be not only innocent, but even falutary. In fome cafes which I have attended, after having cured the local fymptoms by an alterative course of mercury, with the addition of the decoction of farfaparilla, without producing the flighteft apparent mercurial effect on the patient's constitution, I have recommended the continuance of half this innocent quantity of mercury for a confiderable time, in order to prevent a relapse, and in many instances, this plan of treatment has feemed to fucceed, whilst in others it has failed.

In fome cafes of pfeudo-fyphilis, one fet of fymptoms will difappear without the ufe of mercury, yet new fymptoms occurring, they will be progreffive and deftructive fo as to require mercury for their cure. The reverfe of this alfo happens: one fet of fymptoms feemed to require, and to have been cured by an alterative courfe of mercury; yet others, fubfequently arifing, may difappear without its adminiftration.

164

the restart

nistration. Even an innocent and alterative courfe of mercury should not, in my opinion, be hastily reforted to. The object which we are to keep in view, throughout the whole treatment of the difeafe, is to tranquillize and invigorate the constitution, and only to check or cure destructive or very diffreffing fymptoms by an adequate quantity of mercury. Though an alterative courfe of mercury is fo generally beneficial, yet in fome inftances it aggravates thefe difeafes. There are perfons of fo peculiar a conftitution, that the fmalleft dofes of mercury cannot be given without producing irritation and diforder. Mercury also may fail to be beneficial, when administered at one period of these difeases, and yet have the most defirable effect at another. It may for instance fail to do good at an early period of the difeafe, when it is in a state of confiderable activity, and yet may counteract and fubdue it, when its vigour is on the decline. The cafes furnish examples of these facts.

Though in general the decoction of farfaparilla appears to be the beft medicine that can be given in addition to alterative dofes

M 3

of mercury; yet, when the conftitution of the patient is weak, it is useful to give medicines of a tonic and cordial kind. This practice is peculiarly proper, when it requires a more powerful operation of mercury than I have in general described, to control and cure urgent fymptoms*.

Such is the refult of the observations I have made on the treatment of these most

* It may be thought by fome, that I have relied too much in the treatment of the foregoing difeafes, upon the internal administration of mercury, and have not fufficiently tried its effects by inunction. I therefore think it right to explain, that it feems to me immaterial, whether a mild oxyd of mercury, fuch as should be contained in mercurial ointment, and quickfilver pills, is abforbed from the skin or the alimentary canal. I generally find that as much of the quickfilver pill can be taken internally as is necessary to produce the degree of mercurial affection of the system, which is requisite for the cure of pseudo-syphilitic symptoms, without in the least difordering the functions of the digestive organs; but on the contrary, with evident benefit by exciting and maintaining the natural and healthy actions of those organs.

It is right, however, to add, that the pilul: hydrarg: which I have always employed, has been procured from the Apothecaries' Hall; and that when it has been obtained from other places, its effects have by no means corresponded to what I have represented of them, either in this, or the preceding volume.

0

Of

vexatious difeafes ;- difeafes which must, I believe, perplex all furgeons, whatever opinions they may entertain refpecting them, and whatever conduct they may purfue with a view to their cure. They, who believe them all to be fyphilitic, and regard mercury as the only remedy, must be perplexed by difcerning its inefficacy. They who abstain from it must be perplexed by observing the pertinacious nature of the difeafe, and the frequent recurrence of new and diftreffing fymptoms. They who fteer a middle courfe, as I have done, will not avoid difficulties. Without any particular investigation of the nature of venereal difeafes, two different modes of treatment feem to have been adopted by the profession. One party has used mercury liberally for evident reasons. It feemed neceffary for the cure of fyphilis, and it has been fuccessful in cases of that difeafe. Believing all venereal difeafes to be of that nature, and further incited by frequent recurrence of fymptoms, one party of professional men has used mercury, as I believe, in a most injurious degree : whilst others, from witneffing the beneficial effects of an alterative course of mercury in pleudofyphilitic M 4

fyphilitic difeases, have confidered such a course to be all that was necessary in every instance.

No improvement in practice could poffibly take place, whilft former opinions prevailed; whilft furgeons regarded every conftitutional difeafe that had the appearance of fyphilis to be really of that nature, and treated it accordingly. This was done, whatever might have been the characters and progrefs of the primary fore from which it originated; and even when it was preceded by no fore, it was confidered as an inftance of fyphilis long lurking in the conftitution. Even Mr. Hunter, who fo accurately obferved difeafes, and fo clearly diftinguished, that there were many difeafes refembling fyphilis which were not of that nature, must have been exceedingly perplexed in his opinions and practice. As he believed chancres might be modified by the difeafed propenfities of the conftitution, when he met with ulcers in the throat, eruptions, and nodes confequent to fuch chancres, which, not even his accurate obfervation could, I will venture to affirm, in many cafes diftinguith, from those of fyphilis, he must, I think, have deemed it right to treat them

them as if they were fyphilitic. The cafes, to which I now allude, are recorded in the fecond fection.

But in these cases, the symptoms will recur in general after the feverest course of mercury. That he met with fuch cafes, and was perplexed by them, may be inferred from his opinions, he having accounted for fuch failures by faying, that mercury will cure the difease, when in an active state, but will not cure the difposition to difeased actions, which certain parts may have affumed. I believe, however, it will be found that mercury cures both the actions and difpofitions to act in true fyphilis, and that the perplexing cafes were of a different nature to that difeafe. How far the difeafed actions incited by fyphilitic poifon admit of confiderable modifications from peculiarity of constitution in the primary fores or chancres, we have, I believe, yet to learn. There are, however, good reafons for fuppofing that when a poifon is abforbed without inducing a fore, and when that fore is of a nature very discordant to those of fyphilis, that the constitutional symptoms will be found equally to differ

differ from those of fyphilis in their nacure, and require a different mode of treatment.

Having been instructed by Mr. Hunter to believe, that there were difeafes refembling the venereal difease, which were different in their origin and progrefs, having perceived nothing to contradict, but on the contrary, every thing to confirm that proposition, I have in this publication, avowed my opinion of their existence to a far greater extent than Mr. Hunter fuppofed. Knowing how much opinions influence our judgment and conduct respecting facts which come under our obfervation, I have even wished that these opinions, if they be correct, might become general and confirmed. Being confcious that they have not been haftily adopted; and that in furveying the facts upon which they are founded, I have endeavoured to keep my mind as unprejudiced as poffible, I fhould think myfelf guilty of a culpable timidity, were I not to avow them. If the opinions be correct, it must indeed be acknowledged, that cafes of true fyphilis are much lefs frequent now than formerly, and for this I have endeavoured to affign a reason in the second section. Well aware how

how liable an individual is to err, in forming general conclusions from his own limited experience, and confcious that the opinions which I entertained refpecting these difeases were different from those of a great number of eminent furgeons, I at first published my observations on the subject in portions; and the fame apprehenfion as to the poffibility of error has now induced me to republish them in a less methodical manner than I could have wifhed. I thought this mode would fhew better the rife and progrefs of those opinions which I cannot but entertain; inafmuch, as they appear legitimately to be deduced from facts. Had I published all I knew and thought, relative to thefe fubjects under another title, had I called the book additional obfervations on venereal difeafes, or on progreffive and remittent fyphilis, it might have been better received, because it might have been more accordant to the notions of others. Yet in whatever way I might have represented the subject the the difference would only have been in the manner of difplaying it; there would have been none in the matter to which it related, as that confifts of actual occurrences in practice.

(172)

On Difeases of the Urethra; particularly of that part, which is surrounded by the prostate Gland.

SECTION I.

EVERY furgeon will, I believe, acknowledge that an obfcurity hangs over the fubject of strictures of the urethra, which prevents us from perceiving the caufe of many circumstances, which occur in daily practice. Contractions of this canal are fometimes readily enlarged to their natural diameter by th introduction of common bougies, and the cure thus effected is permanent. In other cafes it is difficult to procure even a temporary enlargement of the contracted part; and the ftricture returns, when the means by which it was relieved are difcontinued. This variety in the even't of different cafes may, in fome instances, depend on the kind and duration of the difease in the strictures themselves; yet, in many others, I am convinced that it is owing to other circumstances, which it is my defign

DISEASES OF THE URETHRA, &c. 173

defign to confider in the prefent paper. Before my obfervation had been directed to these circumstances, I was much puzzled to account for the discordance in the result of cases apparently similar. I was equally unable to understand some occurrences, like those which are represented in the following case.

CASE I.

A gentleman, whofe life was made uncomfortable by a very frequent and very urgent propenfity to void his urine, applied to me for advice. Two strictures were difcovered in the further part of the urethra, which did not oppose the passage of a bougie as large as a goofe-quill. Some difficulty was experienced when the bougie entered that part of the urethra, which paffes through the proftate gland; and the patient complained of pain, which was confiderably increased at the orifice of the bladder. The inftrument, however, entered the bladder, though with difficulty; and it feemed to be grafped by the fphincter. The proftate was enlarged to twice its natural fize ; which circumstance seemed

to

to me, to explain the caufe of the flight impediment which occurred to the paffage of the inftrument through it. The urethra was unufually long in this patient; and though bougies had been frequently introduced, I fuspect that they had never been passed into the bladder. The patient was of this opinion, from the peculiar fenfations which he experienced, and which he had never felt before. He called upon me four days afterwards, faid that he was much relieved, and requefted to have the operation repeated. The fame bougie which had been used before now passed with much greater facility. The patient still felt peculiar fenfations, though much diminished in degree, as the inftrument went through the It entered the bladder without difprostate. ficulty, and without appearing to be grafped. I now introduced a larger bougie, which went through the strictures with less difficulty than the smaller one had done on its first introduction. This produced the fame uneafy fenfation on entering the proftate; it was retarded for a moment at the orifice of the bladder, and was flightly grafped at its entrance. All the fymptoms were still more relieved

lieved by this fecond introduction. The fame operation was repeated a few times ; at first every fourth day, and afterwards once a week, till a bougie of the largest fize could be passed without occasioning any uneasines. The patient, during the latter part of the time, did not require to void his urine more frequently than is common. He was relieved from a great trouble; and though many years have elapsed, he has not experienced fimilar inconvenience.

Such cafes as the preceding induced me to fufpect that a ftricture might exift in the orifice of the bladder. The following cafe gave me new, and, as I think, just ideas relative to this fubject. Whether the opinions be correct or not, the cafes, it must be admitted, deferve attention.

CASE II.

A gentleman, more than feventy years of age, had experienced for about fix years a difficulty in voiding his urine, which gradually increased, till the stream became very small. This was attended with a frequent propenstream fity

fity to discharge the urine, which disturbed him every fecond or third hour during the night. At last a complete retention took place when he was in the country; and a furgeon attempted to introduce a small catheter, which however was prevented, by a stricture, from paffing farther than fix inches. The patient immediately came to London, when I directed him to take fome caftor oil, and to bathe the perinæum and adjacent parts frequently with warm water. After fome time the urine flowed again, and he was relieved from the prefent urgent fymptoms. In two days I examined the urethra, and found a ftricture at fix inches, through which I could not pafs even a very fmall bougie. I touched this with the argentum nitratum; but the application did not produce any alteration in the circumstances of the difease. On the third day the bougie passed on to a stricture, at feven inches, which was also touched with cauftic; and the fame treatment was repeated with another stricture, at the distance of half an inch from this. The bougie now paffed through all the ftrictures, and entered the prostate, when I was obliged to withdraw it imme-

immediately, from a sudden attack of pain and faintness. No enlargement of the prostate was discovered by an examination per anum; nor was it tender when compressed. I told the patient that I confidered it very defirable to introduce a tubular inftrument into the bladder, but that the minuteness of the stream of urine rendered it doubtful whether this could be accomplished. I requested him to call in another furgeon, that the attempt might be made by us conjointly. A flexible varnished catheter, containing a strong wire, was readily paffed into the proftate, but could not be made to enter the bladder. The attempt was not long perfevered in, from an apprehension of doing injury, if the instrument were not guided in the right track. No blood flowed upon withdrawing the catheter. A flight retention of urine followed this attempt; but, after a few days, the patient was in the fame state as before. On examining the urethra four days afterwards, I found that the fmallest bougie would not pass farther than ; fix inches; so that the contraction of the first fricture had been re-excited by the irritation occasioned by our late attempt. As the application of the argentum nitratum had fo fud-VOL. II. N denly

denly and completely relieved this stricture in the first instance, I now repeated this application, although I knew that the stricture was merely spasmodic. In the course of a few days a fmall bougie was introduced into the prostate, and afterwards a larger one. I now wifhed to afcertain whether I could pais the bougie into the bladder, or learn, by means of that instrument, the cause of the obstruction. As the patient found that he could void his urine most easily when lying on the left fide, it feemed probable that the orifice of the urethra might be found in that direction. I therefore depressed the point of the instrument, and carried the other extremity towards the right groin, when most unexpectedly it went forwards into the bladder. When the bougie was withdrawn, a confiderable quantity of clotted blood and mucus, with fome matter, oozed out of the urethra; and the patient afterwardsvoided in a large stream about eight ounces of turbid and fætid urine mixed with mucus; after which he felt as if his bladder were completely emptied. From this time he had no occasion to void his urine more frequently than is natural, and he expelled it in as large a ftream, and with as much

much facility, as he had ever done at any period of his life. The bougie was for fome time introduced every third day, and afterwards once a week. It paffed eafily not only through the urethra, but into the bladder, when guided in the direction which has been mentioned. At first the point was foiled with blood and matter, but afterwards these appearances were no longer observable, which led me to conclude that the circumference of the ulcerated orifice of the bladder had completely healed. Two years afterwards this gentleman experienced a recurrence of his former complaints; a finall bougie only could now be introduced into the bladder. A larger bougie was paffed through the urethra on the next attempt; but was not carried forwards into the bladder, from an apprehension of irritating the prostate. After a few days the larger bougie was introduced into the bladder, and met with a little refiftance at its orifice. From this time it paffed with the fame facility as when I difcontinued my former attendance, and the patient found himfelf equally well. Two years have now elapsed, without any necessity for repeating these operations.

TOOT

In

In this cafe a difeafe took place in the prostate gland, without producing any evident enlargement or tendernefs of its fubftance, though it had proceeded to a ftate of ulceration. The difease feems to have operated on the continuous parts in two directions; backwards upon the bladder, rendering that organ irritable; and forwards upon the urethra, caufing strictures, which were in fome degree organic, though chiefly of a spafmodic nature. It must be allowed, however, that the obstruction of the aperture into the bladder by the difcharges from the ulcerated furface contributed in a great degree to maintain the irritability of the organ, by impeding the discharge of the urine. This disease was also of a nature that admitted of relief, and the passage of a bougie feemed to effect its cure. It had, however, a tendency to recur, and the use of the bougie leffened the irritability of the part, and arrefted the progress of the difeafe.

The circumstances of this cafe do not indeed unfold the cause and precise nature of the diforder, which, however, will in my opinion be elucidated by those which follow. They

OF THE URETHRA, &c.

They induced me to fuppose that those instances, which I had formerly met with, and which appeared fo unintelligible, were of a fimilar nature; and they made me particularly attentive to the state of the urethra, where it paffes through the proftate gland, as I faw the poffibility of this canal being difeafed, without the proftate being materially implicated in the diforder. The following cafe occurred foon afterwards.

CASE III.

than every fecond or thi

riere lels :

A gentleman, between fifty and fixty years of age, had for twenty years been subject to occafional fits of dyfury. I was defired to fee him in one of thefe, which had been very fevere and long continued. He was obliged to void the urine at leaft every hour. The calls were fudden and urgent, and the pain continued for a confiderable time after the urine had been discharged. He had some fever, which fuch irritation would naturally produce. A moderate fized bougie stopped at two strictures, but passed through them without much difficulty : when it entered the prostate, the patient complained of burning pain

pain; of a ftrong irritation to make water; and grew fo faint that I had merely time, by a gentle preffure, to afcertain that the bougie would pafs into the bladder : when I withdrew it, the point was covered with blood. The patient was directed to bathe the perinæum with warm water frequently, if the dyfury was urgent. He was much relieved by the introduction of the bougie, and did not want afterwards to void his urine oftener than every fecond or third hour. The calls were lefs urgent, and the fubfequent uneafinefs lefs in feverity and duration. After two days, a bougie of the fame fize was introduced to the extent of eight inches, and withdrawn; no blood adhered to its furface. A fmaller bougie, much curved, was now paffed into the bladder; the patient complained of the fame uneafy fenfation as before, when it entered the proftate; but he did not grow faint. The point was bloody for three quarters of an inch, but lefs fo than on its first introduction. More relief was experienced this time. The urine was now voided only every fourth hour. Two days afterwards the bougie was again introduced into the bladder 71123

bladder, confiderably curved, and with the point carried along the upper furface of the urethra, where it passes through the proftate gland. The point was foiled with a yellowith fluid, flightly tinged with blood. As the patient was getting much better, the operation was not repeated till after four days, and then after the interval of a week; at which time the blood and the yellow fluid had entirely disappeared. The urine was not voided more frequently than natural, nor was its expulsion attended or fucceeded by any painful fenfation. The frictures in this cafe felt firm, and not eafily dilatable : I thought it necessary to relieve them, left they should contribute to re-induce the irritation in the proftate; but the patient felt himfelf fo well, that he was averfe to any thing which might renew his former fufferings, and he has had no fymptoms of dyfury fince that period. The proftate in this patient was not enlarged nor tender. Conclusions fimilar to those, which were deduced from the former cafe, may be more fairly drawn from this; viz. that a difeafe may occur in the membrane of the urethra where

ON DISEASES TO

where it paffes through the proftate, and that it may render the bladder irritable, and produce ftrictures in the urethra; for in this cafe there was no mechanical obftruction to the expulsion of the urine to produce irritation in the bladder. It also appears, that the difeafe admitted of relief by the introduction of a bougie.

which dimonthe blood and the yellow fluid

I have lately met with another cafe in a younger man, who is between twenty and thirty years of age, and who was afflicted with fimilar fits of dyfury, the caufe of which could not be afcertained. I paffed a bougie for him a few times, but found no ftricture in the urethra. The fame painful fenfations were produced in the proftate, as in the preceding cafes. The bougie did not appear at the time to relieve the dyfury; but the complaint gradually ceafed, and the patient left town. He has been much better fince this time, and attributes his relief to the paffage of the bougie.

deducted from the former cafe or synthe more fairly drawn from this private the la difeste RAD occur in the mebd concord who or other, where CASE IV,

of tender. The

A gentleman, about fixty years of age, was affected with dyfury, which increased with violence, though various means were employed during two years for his relief. He voided his urine every fecond hour, or oftener, with great pain and fevere irritation; which continued for fome time after its expulsion. He had fuch a fenfation of heat and uneafinefs in the perinæum, that he could not bear to bring his thighs together; and he was obliged to use a cushion, with a vacancy in the middle, when he fat down. He could not ride in a carriage, or even walk out, although his general health was good. A moderate fized bougie halted a little at two frictures, and when it arrived at the proftate produced a violent burning fenfation, a vehement propenfity to void the urine, and extreme pain at about two inches from the orifice of the urethra; which part was always particularly painful during the time of voiding the urine, and after its expulsion. On withdrawing the bougie, which had entered the bladder, its point was found to be covered with blood. The

The prostate being examined, felt rather broader than usual, but was not tender. The patient was relieved by the introduction of the bougie, which was repeated on the third day : it went more freely through the ftrictures, and the fenfations, caufed by its paffage through the proftate, were diminished. The point of the bougie was bloody. I afcertained that the blood came from that part of the urethra which is fituated in the proftate, by introducing a large bougie to the distance of eight inches, and then withdrawing it : the point was not in the leaft foiled with blood. The fecond introduction of the bougie, produced confiderable relief, The urine was retained longer, the uneafy fenfation in the perinæum was diminished, and the patient could walk or fit down more comfortably. The bougie was used every third or fourth day for three weeks; and then once a week for a month longer, its fize being gradually increafed. The appearance of blood on the point gradually ceafed : it was afterwards foiled with a purulent and then with a mucous fluid, which appearances also gradually ceafed. The water was now voided only The

only at intervals of four hours, the fubfequent pain being either trivial or entirely wanting; the uneafinefs in the perinæum was fo inconfiderable, that the patient could walk for feveral hours, and fit down without pain. The feminal difcharges had been attended with extreme pain, fo great as almost to produce fainting, before the state of the prostate had been relieved: they afterwards took place without any unufual fensation.

These cases shew that the urethra may become irritable and difeafed, where it paffes through the proftate gland, without any material diforder of the contiguous parts. They induced me to pay particular attention to the ftate of that part of the urethra; which attention will, in my opinion, be found of great confequence in directing our treatment of these diforders. As it would render this paper extremely voluminous to detail the particular cafes which I have met with, I shall merely relate the observations which I have made, and the inferences which I have drawn from them; that the profession in general may inveftigate the fubject, and determine how far these observations and opinions are correct. Firft,

First, then, it has appeared to me that a state of inflammation and irritation may take place in the remote part of the urethra to a greater or lefs extent. It may produce in the proftate that peculiar fenfibility of the part which I have defcribed; and in the perinæum it may cause contractions of different parts of the canal. Either of these affections may be more permanent than the other, even where each part has been equally affected in the beginning. This state of inflammation and irritation is frequently produced by gonorrheea, though it may occur from other caufes. If a bougie be introduced injudicioufly, when this diforder first occurs in a gonorrhœa, numerous spasmodic strictures * are met with; the patient becomes alarmed by the difficulty of paffing the inftrument, and by the name of strictures, and confults a more experienced furgeon, who directs local warm bathing, and the application of leeches to the perinæum.

* I have used the term spasmodic strictures in the indiferiminate manner in which it is generally employed, though I am aware that it is objectionable : a stricture from spasm is not a stricture ; and a stricture may be irritable or spasmodical, or otherwise.

rvations and opinions are correct.

The

The diforder is cured; the patient expects that strictures remain ; a full-fized bougie is introduced to fatisfy him, which paffes without the least difficulty. I am unable to determine, whether in fuch cafes the urethra is affected in the first instance in that part which passes through the proftate, as I never made any examination under these circumstances, though I think it very probable that it is fo. When a gleet becomes unufually protracted, it is frequently owing to the effects of this diforder in the remote part of the urethra, maintaining a degree of irritation in the front. Under these circumstances, it is allowable to introduce a bougie, when strictures will frequently be found in the perinæum; and inmany cafes, the patients whom I have attended have experienced those sensations, which are characteristic of tenderness in the membrane of the urethra, where it passes through the prostate. If, therefore, we look to the origin of those cases, which we are called upon to attend in their advanced stages, we might expect to find the diforder of the urethra various with respect to the kind and extent of the disease. That it will be found so in practice I do

I do not hefitate to affirm, from the obfervations which I have already made relative to this fubject. In fome cafes, strictures in that part of the canal, which is fubject to fuch contractions, will be the fole difeafe. In others, an uneafinefs, and fuch fenfations as I have defcribed, will be complained of as the bougie paffes through the last inch of the urethra, which is contained in the proftate gland. In fome cafes alfo, the ftrictures will be the lefs degree of the difeafe, and the irritation in the proftate the greater; and in fome cafes it will be found that nothing is difcoverable which can fairly be denominated a stricture, and yet the tendernefs which I have defcribed exifts in a moft painful degree.

A ftudent of the hofpital who had a flight gleet, but of long continuance, having alfo fome pain and irritation after voiding his urine, though without any frequent defire to void it, paffed a bougie, which arrived at the proftatic part of the urethra without impediment, or caufing him to feel any particular uneafinefs; but when it glided on through the proftate, it occafioned, he faid, a burna burning pain and irritation, fo peculiar, as not to admit of defcription, and fo fevere, that he could not have believed it, but on the evidence of his own fenfes.

fame cofes, the enlargencess of the aries mes

My obfervations have alfo led me to believe, that the inflammation of the teftis, which is fo frequent an attendant on gonorrhœa, is excited by inflammation of this part of the urethra, and not by a fympathy between that gland and the urethra in general.

after having been under the care of other fur-

In deducing these diseases from the inflammation which gonorrhœa excites, I mean only to trace them from a very common origin. The same disorders frequently take place without having been preceded by that complaint. An attention to the circumftances, which have been mentioned, seems to me to explain the contradictory events which happen, when a similar plan of treatment is pursued for the cure of diseases of the urethra. When strictures are the fole disease, they are often readily, and generally permanently, cured. When an irritation, such as I have described, exists in the prostate,

prostate, it is difficult to enlarge the contracted portions of the canal; and, when that is acomplifhed, the ftrictures recur, as a caufe of irritation to the urethra still continues. In fome cafes, the enlargement of the ftrictures fails to mitigate the dyfury, and in others it is augmented by the measures which have been employed to cure the ftrictures, when the state of irritation at the neck of the bladder has been unadverted to. Many patients have applied to me under these circumstances, after having been under the care of other furgeons. They have ftated, that fmall bougies only could be pafied in the first instance, and that though the largeft could now be introduced, the complaint was no better; nay, fome have thought themfelves materially worfe. A bougie has paffed in these cases eight inches, without meeting any confiderable obstruction, or exciting much fenfation; but, after this point, it caufed a most acute and burning pain, with vehement defire to make water. Some have enquired if I was withdrawing the bougie, whilst it was flowly proceeding, and fome have complained of great pain in the front of the uretha. Similar cafes have occurred

curred in my own practice. I have relieved ftrictures, without materially benefitting my patients; of late years, I may venture to fay, without making them worfe; becaufe I have been cautious not to hurt the canal, where it paffes through the proftate.

Some cafes of diforders of the urinary organs are made worfe by the attempt to cure ftrictures : and I think I deliver an important admonition, to the younger part of the profeffion, when I caution them to beware, in their attempts to cure ftrictures, that they do not irritate nor injure the laft inch of that canal, where there are no ftrictures, but in which confiderable diforder may neverthelefs exift.

In fome cafes of difeafed urethra, which I have not unfrequently met with, ftrictures are found, through which a fmall bougie paffes with difficulty; and it produces those fenfations, in passing through the prostate, which I have described, as peculiar to that part of the canal when in a difeased state. The patient, however, experiences relief from the vol. II.

introduction of the bougie; and if it be paffed again on the third day, it will meet with no obstruction from the strictures, and cause less uneafinefs in paffing through the proftate. I have then taken a bougie of a larger fize, fuch as it would have been impoffible to introduce in the first instance, and this has paffed through the ftrictures to the diftance of eight inches; but I have forborne to carry it any farther, left I should irritate the urethra near the neck of the bladder. It appears therefore to me, that you may relieve or aggravate strictures in fuch cafes in proportion as you diminish or augment the morbid fensibility of the remote part of the urethra; and an attention to the state of this part is on this account of the greatest importance.

Having thus adverted to the probable origin of the difeafe, which I am endeavouring to defcribe, and its connection with ftrictures, I proceed to obferve, that fuch a ftate of morbid fenfibility in that portion of the urethra, which paffes through the proftate, may perhaps exift as a fymptom of an irritable bladder. If the lining of the bladder be inflamed

OF THE URETHRA, &c.

flamed and irritable, it is probable that the diforder will extend into the urethra for fome small distance. In the fourth case, I believe that the difease in question was complicated with an irritable state of the bladder; but whether it was to be confidered as an adjunct circumstance, or in the relation of caufe or effect, cannot be determined. The irritability of the bladder was diminished, but not cured, by the treatment which leffened this difeafe. In one gentleman, who apparently died of an irritable bladder, and who complained of the fenfations, which I have defcribed, in an acute degree, on the bougie paffing through the proftate, the difeafed parts were examined, but very trivial morbid appearances were difcovered. The lining of the bladder was not perfectly natural, and was inflamed; yet the difeafed appearances were not ftriking; and in the urethra the deviation from the healthy structure was still less observable.

It is not improbable, however, that fuch a morbid fenfibility of the proftatic urethra may arife from an irritable bladder. Perhaps, 02 alfo

alfo, it may occafionally arife from the irritation of the last stricture. Many patients with strictures, who complained much of the fenfations at the neck of the bladder, at the commencement of the treatment of their complaint, have afferted, that they felt no unufual fenfations when the bougie paffed through the proftate, after the ftrictures had been cured. Yet, though I would admit that a tenderness of the canal of the urethra in the proftate may fometimes arife from its proximity and continuity with the lining of the bladder, or with the last stricture, I think it more frequently exifts as an original and independent disease. It has been shewn, that it may render the bladder irritable, and excite contractions in the urethra. Some cafes have been adduced, which fhew that this state may exist, and yet the bladder may not be conftantly irritable, but that it may be affected by fits. I have also met with a case where this fenfibility exifted in an extreme degree, and yet it feemed to have very little influence on the bladder. I have likewife known this irritable state of the urethra complicated with enlargement of the proftate.

196

I pro-

I proceed, in the next place, to relate what I have observed respecting the treatment of the difeafe, which I have been defcribing. The three first cafes shew, in a striking manner, the advantage derived from the introduction of bougies; and I have feen many fimilar ones, though I fcarcely think fo demonstrative of the utility of this mode of treatment. I know fome patients with occafional attacks of dysury, and who have this tendernefs of the remote part of the urethra, in whom the paffage of a bougie, together with warm bathing of the perinæum and adjacent parts, very speedily relieves a difease, which had proved very tedious and diffreffing, before these measures were adopted. If a bougie be introduced, for the first time, in a cafe of this defcription, fevere pain is felt, and faintnefs is occafioned : if this operation be repeated three days afterwards, the pain perhaps is much lefs fevere, and it may diminish at each succeeding introduction of the instrument. Should this be found to be the cafe, furely nothing need be farther faid in commendation of this mode of treatment. The morbid fenfibility of parts is diminifhed 0 3

nished by it. This happened in the three first cafes in' a remarkable degree, and I have known it take place in many others. Nor is there any thing in this event that should excite furprife: every furgeon is familiar with the fame circumstance, with relation to ftrictures in the urethra. The first introductions of a bougie are very painful; the fubfequent ones become to be even difregarded. Still, however, I think it may be useful to dwell a little on this fubject, and to confider the probable caufes of these effects, as it may tend to establish rules for our conduct in practice. It appears to me, that we diminish the morbid as · well as the natural fenfibility of parts by doing them a degree of violence, fhort of that which produces a kind of re-action in them, by which their fenfibility is heightened. This is, indeed, the confideration which guides my practice in these and in many other cafes. If, even in ftrictures of the urethra, the fenfibility of the canal becomes increafed by the introduction of bougies, or, in other words, if inflammation is excited, furely it is wrong to profecute fuch measures at this juncture. If the morbid fenfibility be diminished, we may

may use more freedom in the profecution of our measures. In passing the bougie, in the cafes now under confideration, it ought at first, I think, to be fo fmall as not at all to diftend the irritable urethra. I have always curved it confiderably, and kept the point in contact with the upper furface of the urethra, as it paffes through the gland. I recommend warm bathing to the perinæum, with a view to obviate or diminish irritation. If I find, on the fecond introduction of the bougie, the fenfibility of the parts diminished, it induces me afterwards to proceed more freely; but at all times with a caution excited and regulated by the confideration which I have mentioned. Now, though fuch conduct has been fuccefsful in many inftances, I am concerned to state, that it has failed in fome others; and, when I clearly afcertain that I am not likely to fucceed, I ceafe to make farther attempts by the introduction of bougies, and purfue only general methods, fuch as warm bathing, bleeding by leeches, &c. When there are strictures, which it is right to enlarge, and when the irritation of the prostatic part of the urethra is not relieved

04

by

by the measures which have been suggested, I pass the bougie through the last stricture, without carrying it on, fo as to irritate the tender part of the urethra, which lies behind it. A knowledge of the nature of difeafes cannot but be defirable, even though it does not enable us to cure them all. If ftrictures are removed, and dyfury remains, I believe it is common to confider it as arifing from an irritable bladder: now, though this may be generally true, there are many exceptions. I do not find that attention is paid to that defcription of cafes, which makes the fubject of the prefent paper : I was unacquainted with them till I met with the cafes which I first mentioned : the knowledge which I have thus obtained, has enabled me to afford relief in many cafes, and has prevented me from error in others.

OF THE URETHRA, &c.

SECTION II.

On the constitutional Origin and Treatment of Diseases of the Urethra.

HAVING in the preceding fection, pointed out one caufe which renders ftrictures and other difeases of the urethra difficult of cure, in this, I shall advert to another; I mean a state of irritability and diforder of that canal, produced or maintained by conftitutional causes. To explain my ideas on this fubject, I wish, in the first place to excite the attention of the profession to the constitutional origin of diforders of the urinary organs. That they are very liable to be difordered by the state of the health in general, is very apparent. Indigeftion becomes a caufe of foul and unhealthy urine, in confequence of much unaffimilated matter being conveyed into the blood with the chyle. Nervous irritation affects the kidney and impairs its functions, fo that whilft under its influence, fcarcely any thing but water is feparated by that organ from the blood. The nervous irritation at the fame time operates

on

on the bladder, and creates a frequent and fometimes urgent defire to void this unftimulating urine. Many perfons during the day, or until they have dined, are greatly incommoded by this circumftance; whilft on the contrary, after dinner, nervous irritation ceafing, and the urine becoming in confequence loaded with falts and animal matter, the bladder will retain the acrid urine, even in a large quantity, for a great number of hours.

In other cafes, nervous irritation takes place, and limpid urine is frequently voided after dinner; which I merely mention, becaufe it may tend to throw light on the caufe and nature of the nervous irritation. If the kidneys and bladder can thus be operated upon by nervous irritation, it is reafonable to fuppofe, that the urethra will participate

* The qualities of the urine are fometimes the only circumftances by which we can difcover that there is general irritation of the nervous fystem; they also denote imperfect digestion; they may further indicate the state of the blood; and for all these reasons they deferve particular attention and invostigation.

in the affection; and I am convinced by numerous observations, that many diseases of the urethra, in both fexes, originate from a continuance of this kind of conftitutional dyfury. The cafes of fuch difeafes occurring in females who have paffed the middle period of life, will probably be confidered as affording the most unequivocal proofs of the correctness of these opinions. Under fuch circumstances, I have known in different instances, strictures in the urethra, induration and tendernefs of the whole tube, and even ulceration of its orifice to enfue. Though I have feen relief obtained in cafes of this description by bougies and local remedies, yet I believe the treatment of fuch difeafes ought to be conftitutional, and that fuch treatment will fucceed in curing the difease without local remedies. I know one instance in which the dyfury had been very fevere, and two confiderable strictures had formed in the urethra; there was also a thickening accompanied with whitenefs and hardnefs of the membrane of the vagina, caufing a contraction in the orifice of that canal; yet all dyfury ceafed, and no inconvenience was experienced upon the

the patient's acquiring better health; which change was effected partly by medicine, and partly by removal into the country. Women will fuffer a great deal from thefe diforders before they reveal their diftrefs; and when from the urgency of the fymptoms, and the belief that they have a ftone in the bladder, they are willing to fubmit to examination, the diforder may be fpeedily and completely relieved and cured by means which have the effect of tranquillizing nervous irritation. It may be ufeful to relate a cafe in proof of this affertion.

CASE V.

A lady, between thirty and forty years of age, who had long fuffered very confiderably from dyfury, agreed to permit an examination to be made of the nature of a difeafe, which, from the feverity of its effects, fhe could but believe to be of a very ferious and alarming nature.

On enquiry, I found, that though fhe voided her urine frequently, and with great pain

OF THE URETHRA, &c.

pain, yet it flowed freely, and that fhe did not fuffer that extreme and continued pain afterwards, which is generally the confequence of the ftone.

I found alfo, by enquiry, that her bowels were not in a proper flate, and her tongue was much furr'd. Supposing that a flate of nervous irritation might be caufed or aggravated by diforder of the digeflive organs, I objected to making any examination of the flate of the urethra, &c. till the functions of those organs were put right by medicine, because I was aware that nothing but a conviction of the indispensable necessfity of examination would have induced her to fubmit to it. In a very short time, the flate of the primæ viæ being corrected, and her health in general amended, all dysury completely ceased.

Dyfury of this defcription is liable to occur in paroxyfins. I have known it alternate with diforders of the bowels, and with rheumatic affection, which I think, fhews that there is a common conftitutional origin, producing

ducing fuch various complaints; and I repeat, that I have known fuch dyfury lead to actual difeafe of the affected organs. It is very common for men, who have been married many years, and who perhaps never had gonorrhœa, (or if they had in their youth, it is probable that it had left no diforder in the canal of the urethra,) to gradually acquire, as they advance in life, difeafes of the urinary organs. Surely, then, the origin of fuch difeafes muft be regarded as fpontaneous, and likely to be induced and maintained by whatever occafions irritation in the affected organs.

There is, however, no period of life exempt from this kind of dyfury. Children are frequently much affected by it, and at that age when the bodily powers are generally in the greateft vigour, if they become difordered, dyfury occurs in common with other difeafes. I have mentioned in the first part of these observations, in speaking of the constitutional origin of local difeases, that I have known dyfury of this description.

206

I fub-

OF THE URETHRA, &C.

I fubjoin another striking cafe of constitutional dyfury, occurring in a child.

CASE VI.

A child, about two years of age, became affected with dyfury, for the relief of which, various means were tried without benefit : on the contrary, the fymptoms increafed, and ftrikingly refembled those occasioned by a stone in the bladder. The calls to void the urine were frequent and urgent, and the pain afterwards very fevere. There was an elongation and stricture of the orifice of the prepuce, which induced a furgeon who attended the child, to divide that part, as he thought it might contribute to the difficulty experienced in expelling the urine. Under thefe circumstances, the child was examined by a furgeon of great professional eminence, who had no doubt that the fymptoms were caufed by a ftone, which he thought he felt; yet recommended that no operation should be attempted till it had increased in fize. The child continued to fuffer in the fame manner for two years, when I was defired to examine

examine him. I could not, however, discover any stone, and upon enquiry, I found that the child complained of confiderable pains in his loins, and that his digeftive organs were greatly difordered in the manner that I have defcribed in the first volume of these obfervations. Unirritating and undebilitating dofes of the pilul; hydrarg: were given every fecond night, and ftrict attention was paid to keep the bowels clear, without inducing what is ordinarily called purging. The effect of this treatment was furprifing, all the fymptoms were immediately relieved, and they completely ceafed in a month, at which time the functions and fecretions of the digestive organs appeared to be fo correctly healthy, that all medicine was difcontinued. After some months, a slight relapse of dyfury took place, which immediately ceased, upon refuming for a short time the fame plan of treatment; and the boy has fince remained perfectly well, though feveral years have elapfed.

If, then, irritation of the urinary organs, even to a degree productive of local difeafes in

in them may occur from constitutional causes, and more apparently from a diforder of the digeftive organs, I need not then urge the propriety of our endeavouring to keep the latter organs, as nearly as possible, in a state of health, whilft we are endeavouring to relieve the difeases of the former by local measures. Of the beneficial effects of fuch conduct, I could relate many instances, but it does not feem necessary to detail cafes in proof of fo felf-evident a proposition. I have explained in the first volume, my ideas of the mode by which relieving diforders of the digeftive organs, relieves and cures local difeafes; and in local difeases of the pelvic viscera another reafon may be fuggested for the benefit which is obtained. It has been obferved, that in diforders of the digeftive organs, the lower part of the inteftinal canal is frequently most affected. Irritation in the rectum must affect the plexus of nerves, from which not only that inteftine, but the pelvic vifcera in common derive their energies; and thus it may lead to a fimilar participation of difeafe.

VOL. II.

P

SECTION III.

On some Effects of Diseases of the Urethra.

I SHALL take the prefent opportunity of exciting the attention of the profession to fome effects of diforders of the urethra, which have not hitherto received in my opinion a fufficient share of attention. If a violent affection of this canal can produce a correfponding degree of inflammation of the teftis, as it frequently does in gonorrhœa, it may reasonably be expected, that a lefs degree of diforder in the urethra may produce a milder irritation of the teftis, which may terminate in a flow difease of that gland. Indeed it has appeared to me that there are two circumstances caufing irritation and confequent difease of the testis: one is, diforder of the urethra; and the other, that derangement of the conftitution at large, which I have defcribed in the first part of these observations. I need not point out how inefficacious any local treatment of an irritated or difeafed gland must be, whilst we leave the causes which

OF THE URETHRA, &C.

which produced it still to operate in full force for its continuance. I proceed to relate a few cases, in which irritation originating in the urethra first caused, and subfequently maintained, disease of the testis.

CASE.

A gentleman who had been confined with a chronic difeafe of the left teftis, which had proved very refractory and irreducible by various means employed for its cure, applied to me when the gland was four times its natural fize, and very hard. I recommended the application of three or four leeches once a week, a bread and water poultice at night, and aq: ammon: acetat: during the day.

This treatment was purfued for fix weeks with very little benefit. I then changed the poultice to one made of linfeed, over which mercurial ointment was fpread. The ointment was alfo rubbed upon the fcrotum in the morning, and a foft rag applied over it. The patient likewife took a compound calomel pill every night.

P 2

This

This treatment was also perfevered in for about fix weeks, but with no manifest advantage. I then put two fetons * through the fcrotum, and continued the poultice at night and a dreffing of spermaceti cerate during the day. Under this treatment the teftis diminished very confiderably in fize, but at the end of two months, the fetons had gradually come out, in confequence of the ulceration which they occafioned. Shortly afterwards, the teftis became painful, and it enlarged to its former dimensions, fo that no advantage was obtained from all these endeavours to reduce the difeafe. I had frequently enquired of this patient respecting the state of his urethra, and been as often told that he was not confcious of any diforder exifting in that canal. Now, however, on repeating my enquiries, he faid, that he had

* Setons may be conveniently made and worn in the fcrotum. I first employed them in conformity to those general principles which regulate our conduct in the treatment of local difeases; and I have known feveral instances of difeased testis, which resulted various local modes of cure, and even confiderable courses of mercury yield, and get well when setons were employed.

remarked

OF THE URETHRA, &c.

remarked the stream of urine to be small, and that the calls to void it were more urgent than formerly. On paffing abougie, I found two strictures confiderably contracted and a tender state of the urethra where it paffes through the prostate. These difeafes being relieved, all irritation in the teftis ceafed, and the enlargement rapidly fubfided ; fo that in two months it was fcarcely larger than the other, and all difeafe had ceafed. This happened without any other local application than a poultice at night, and fupport by a bandage. Even the poultice at night was foon difcontinued. This patient has had no return of difeafe of the teftis, and many years have elapfed fince the occurrences which I have been relating.

The following cafe was drawn up by a medical man, of confiderable information and talents, who was himfelf the fubject of it, and who was convinced with respect to his own cafe, of the truth of those opinions which I am now offering to the public.

CASE

CASE.

-, ætat. thirty, about four years fince had an uneafy fenfation in both tefticles, which, however, occurred fo feldom, and was fo triffing, that he paid little attention to it; about a twelvemonth after, he found the left tefticle harder than natural, but not enlarged; for fome time previous to this, he had been obliged to void his urine very early in the morning from great irritation to do fo; but not too frequently during the day; and occafionally had a tightnefs and fenfe of constriction in the perinæum, with frequent aching pain in the glans penis. The tefticle remained in the above-mentioned state (without pain or increafe) till March 1806, when he received a blow from an accident on horfeback; no violent pain was immediately felt, nor did any apparent alteration take place till about a fortnight after, when he perceived the tefticle larger and much harder than it had hitherto been; and it gradually though flowly increased till the end of August, when he faw Mr. Abernethy. The teftis was at this time of twice its natural fize, hard and painful

ful to the touch. Leeches were applied once a week, and the tefticle was kept fufpended, and wrapped during the day in a cloth dipped in tinct: opii: and water, and an evaporating poultice was applied at night. By this treatment it gradually became lefs, but the hardness still continued. He faw Mr. A. again in September, and was then defired to rub camphorated mercurial ointment upon the tefticle, and cover it with a foap plafter. The tefticle still kept decreasing, but remained equally indurated till the twentieth of November, when it fwelled with confiderable pain and irritation, and began to adhere to the fcrotum *. He again faw Mr. Abernethy, who introduced a fmall bougie, and found a stricture about fix inches from the orifice of the urethra, and a fecond the eighth of an inch from the former. The bougie passed without much pain or difficulty through the strictures, till it came to the prostate when much pain and fensation

* The teftis was now about three times its natural fize, and at the upper part of the epidydimis, the forotum had adhered to the fubjacent part, and was fo inflamed as to indicate the probability of the formation of an abfords.

P 4

of heat, irritation, and a strong inclination to make water were felt ; the bougie, however, paffed into the bladder, and was clofely held by the sphincter. The perinæum was then ordered to be bathed night and morning with warm water, and a bread and water poultice to be applied to the tefticle, which were done, and at the end of the week, the pain and irritation in the tefficle were greatly relieved ; the fame bougie was then paffed, but with greater eafe, and the painful fenfations which had before been felt on its entering the proftate were much diminished. The warm bathing and poultices were continued, and the fame bougie paffed at the end of the following week with still greater eafe and flighter fenfations. At the end of the third week the ftrictures were touched with kali pur: which produced little irritation; and on the week following a much larger bougie paffed with eafe; the warm bathing and poultices being continued in the interval. During the three following weeks the large bougie paffed with great eafe; no irritation was felt after it, and the fenfations, whilft it was going through the proftate, were flighter each fucceffive time.

The

The tefficle at the end of this time, (feven weeks) was reduced to its natural fize, and was become nearly undiftinguishable from one that had never been difeased.

Shortly after the first introduction of the bougie, all the shooting pains and occasional uneasiness of the testis ceased, and it so rapidly and regularly declined as the state of the urethra amended, as to leave no doubt but that the amendment of the testis is to be ascribed to the relief of diforder in the urinary canal.

CASE.

A gentleman between twenty and thirty years of age, confulted me on account of an hydrocele, from which I difcharged about fix ounces of fluid. The tefticle did not appear enlarged, but both it and the bag of the tunica vaginalis feemed very tender to the touch. I recommended that the parts fhould be fupported, and that Goulard's wafh, fhould be applied. In about fix months the the tunica vaginalis was more diftended than at firft, and as the part was troublefome from its

its fize and fenfations, it was again punctured; and the fame circumstances were noted upon the evacuation of the water. The hydrocele again collected, and when it was full, which happened in about fix months, the patient was defirous of having the tunica vaginalis injected, in order that he might be made radically well. As there was nothing prohibitory except the tendernefs, I confented to his defire ; but when the fluid was difcharged this time, he complained of greater pain than formerly, and could fcarcely bear me to touch the tefticle, which made me diflike to perform the operation, and it was therefore postponed till the next time that the hydrocele should become full. I thought it right, however, to direct the application of leeches, once a week, and of linen kept damp with Goulard's wash*. Under this treatment the

* I have known many cafes of hydrocele, the confequence of irritation and inflammation, cured by evaporating wafhes: and it would be right to diftinguish the kind of hydrocele, upon which fuch treatment may be expected to have beneficial effect. Without fuch difcrimination, a furgeon, feeing a hydrocele cured by these means, would profecute the

the hydrocele filled very flowly. After four months had elapfed, the patient confulted me relative to fores which frequently broke out upon the prepuce ; fome of which were very tardy in healing. He alfo was fubject to a confiderable collection of that fubftance which is fecreted to moiften and lubricate the prepuce. I told him that these fymptoms were the effects of irritation of the prepuce, and was led to enquire more particularly into the state of the urethra than I had done before, becaufe I thought both the diforder of the teftis and the prepuce might originate in the fame caufe, that is, difeafe in the urethra. On examining that canal with a bougie, I found strictures, and a tender state of it where it paffes through the profrate. By local warm bathing, and the occafional and gentle ufe of bougies, the morbid fenfibility of the canal

the fame meafures in an indolent, and, as I may call it, dropfical hydrocele; or finding the means fail in many cafes from their indifcriminate ufe, he may be induced to confider the treatment upon the whole as inefficacious; and thus neglect it in cafes, in which it is likely to be beneficial.

was

was diminished. The strictures were touched with kali purum, and in conclusion, I could pass a large-fized bougie without occasioning any particular uneasines in one part more than in another.

The effect of this treatment was, that the remaining fluid of the hydrocele was foon difperfed, and the teftis was no longer irritable or painful when compreffed, fo that even the fufpenfory bandage was laid afide, nor has any inconvenience been experienced fince that time, which is more than four years ago.

The fores alfo on the prepuce healed, and that part was much lefs irritable, but it ftill remains fo in fome degree; indeed, fores have been fince contracted from fexual intercourfe, which circumftance may perhaps have contributed to prolong the diforders of that part. I alfo fufpect that the urethra mayagain have become in fome degree irritable.

In the foregoing cafe, it is faid, that the habitual occurrence of fores on the prepuce, led

A Carlo and

led me to fufpect diforders of the urethra; and this is an effect of fuch diforders, which I think has been but little adverted to, and which is neverthelefs deferving of particular attention. That diforders of the urethra do, in many cafes, caufe temporary or continual irritation in the external parts which are continued from its orifices, I fhall prove by the recital of a few cafes.

CASE.

A gentleman between forty and fifty years of age, had for fifteen years been fubject to fores about the prepuce and glans, fo as to oblige him to pay conftant attention to prevent and control them. He had confulted many eminent furgeons, who recommended various washes and modes of treatment. A - new application had generally the effect of healing the fores, but when perfifted in for fome time, gradually loft its effect. When the patient confulted me, the whole of the fkin covering the glans, and lining the prepuce, was thickened and white, and the prepuce was fo thickened, that though it was naturally large and loofe, it was difficult to unfold

unfold it. There were numerous fores of an oblong form in the transverse direction, appearing like chops, covered by adhering pus. I told the patient that it was necessary to enquire whether there were any cause maintaining this irritable state of the prepuce, and mentioned that I had observed it very frequently to depend upon strictures of the urethra.

The patient had no fufpicion that he had fuch diforder, for he voided his urine readily, and not much more frequently than is common. Upon examining with a bougie, however, feveral much contracted and very firm ftrictures were difcovered; and thefe being relieved, the fores on the prepuce healed without any further attention, than what cleanlinefs required. The forefkin became foft and pliant, as did alfo the fkin which lined it, and is extended over the glans. This cafe occurred many years ago; and as I have not feen the patient fince, I conclude that the relief which he thus obtained was permanent.

To fhew that ftrictures may exift in the urethra, and may perhaps prove the caufe of more vexatious diforders, though the original exciting caufe efcapes obfervation, I may mention an inftance which occurred to a medical man.

CASE.

This gentleman had been fubject to fores which frequently broke out on the prepuce without any evident caufe. There was not, however, any ftriking evidence of general irritation in that part, as in the former instance. Sometimes the fores which occurred, put on the appearance of chancres; and in confequence of the advice of his friends, he underwent a falivation. The fores for which the mercury was employed, healed under the use of that medicine, but broke out upon its difcontinuance. He then confulted me, and upon my mentioning my fuspicions of strictures exifting in the urethra, he finiled at the opinion, and faid that it might be given to patients in general, but not to those of the medical profession. I told him that nothing would convince me that I was in error, but his

his permitting me to examine by means of a bougie. Two confiderable ftrictures were found, and thefe being relieved, the fores healed under fimple dreffings. The gentleman, however, did not refide in London, and I know not the further hiftory of the cafe, which I mention merely for the purpofes that have been ftated in the beginning.

I have alfo feen a very troublefome phymofis, in which the prepuce could not be retracted without great difficulty and pain, depending upon the fame caufe, in a cafe in which the patient had been long accuftomed to the daily ufe of bougies *; but after the ftrictures

* As ftrictures of the urethra depend on a difordered ftate of parts of the canal, fo when the introduction of fimple bougies fails to cure them, the too frequent ufe of those inftruments fometimes keeps up and aggravates an irritation, which might otherwise, perhaps, fubfide. This is a fubject foreign to my present purpose; but I mention it, to introduce the following case, which deserves publication.

A gentleman more than fifty years of age, had for more than twenty years been in the habit of introducing bougies for himfelf, which he generally kept in for an hour daily.

OF THE URETHRA, &C.

strictures had been touched with kali, and the constant use of bougies defisted from, the phymofis relaxed, and the prepuce could be

At length his urethra became fo irritable, that he could fcarcely void his urine, which he was frequently called upon to attempt. Apprehensive of caustic bougies being employed, he confulted me, and I found I could introduce a fmall bougie without much difficulty ; it halted at feveral strictures, but with very gentle preffure it paffed through them. I recommended him to bathe the perinæum and contiguous parts with warm water, by means of a fponge, night and morning, and told him, I wifhed to introduce the bougie again after three days had elapfed. He was extremely apprehensive that the passage would completely clofe during the interval, and ftrongly remonftrated against fuch inefficient practice. On the third day he acknowledged that he paffed his urine more freely, and the bougie which I had first introduced went through the urethra without impediment. I took one of a little larger fize, and paffed it with the fame fort of refiftance which the first had met with. The warm bathing was continued, and by purfuing these measures for three weeks, I paffed a bougie one-third larger than he had been able at the best of times to do for many years.

The patient now voided his urine in a large ftream, and not more frequently than is common; in fhort he felt himfelf perfectly well. Since that time, no bougie has been introduced, except once, annually by myfelf, that he might be affured that the ftrictures had in no degree contracted.

VOL. II.

retracted

retracted without the least difficulty or uneafiness.

These cases are related to shew, that irritation and diseases may be induced in parts, which have a sympathetic connection with the urethra, even where the original affection may have been too trivial to attract attention. It appears to me to be of the utmost importance to investigate, as far as possible, the causes of diseases; for how can we expect to cure the effect, while the producing cause continues to operate? The secondary disease may also become even of an established or malignant nature, if there be diseased propensities in the constitution or affected part.

Difeafes in the canal of the urethra may not only caufe fuch effects as I have reprefented, by producing a ftate of irritation on the continued furface of the glans and prepuce, but they may alfo caufe fores contracted from fexual intercourfe to be very irritable, peculiar, and flow in getting well. I have feen many fuch inftances, but none in o which

OF THE URETHRA, &C.

which the fact was more ftrikingly apparent than in the following cafe.

CASE.

A gentleman, who had juft arrived in this country, had connection with a female, which was followed by general irritation of the prepuce, and furface of the glans. Shortly afterwards fix fores formed, three of which became of confiderable fize. I defired him to wafh the parts three times a day with the poppy-fomentation, and to encircle the penis by linen kept damp with it, in order to leffen the heat of the part. He at the fame time took five grains of the quickfilver pill night and morning.

After fome days, he could no longer retract the prepuce, fo that he was obliged to cleanfe the part by means of a fyringe. After a little time, a weak folution of zincum vitriolatum was tried, but the pain it occafioned was too fevere to permit its continuance. It was therefore left off, but after four days tried a fecond time, when the pain which it occafioned was very tolerable, and

as it diminished daily, it allowed us to increase the strength of the wash.

After a few days he was able to retract the fore-fkin, when the fmaller fores were healed and the principal ones had granulated, for that a fungus bulged forth above their furface; they appeared of a tawny colour, and their edges were flightly thickened. I flightly touched these fores every third day with argentum nitratum, which appeared to do them much good. The vitriolic wash was continued. In about five weeks from the commencement of the diforder, the patient was quite well. The mercury had occafionally affected the bowels, which obliged the patient frequently to omit his pill in the morning. It never affected the gums, nor did I urge the continuance of it, after his fores were healed, becaufe I did not believe them to be fyphilitic.

About three weeks afterwards, being in company with fome diffolute females, he had his paffions much excited, and one of them forcibly compressed the penis with her hand.

OF THE URETHRA, &c.

hand. The irritable ftate of the forefkin again took place, and a great number of fores broke out, particularly behind the glans, which appeared like chops, being long and not wide, and the matter, which they difcharged, adhered to the furface.

After a few days he could not retract the prepuce, fo that I can give no diftinct account of these numerous fores. It appeared that they were very fretful, for the external skin became inflamed opposite to them; and they gave much pain when pressure was made on the inflamed part.

The external inflammation and tendernefs on preffure changed their fituation, fhewing, that a fore which was most fretful at one time, became lefs fo at another.

The fores were, however, fo painful as to prevent the patient from fleeping; and as no amendment of the complaint took place in three weeks, though various local meafures were employed during that period, the patient wifhed to use mercury, and I ac-Q3 quiefced

quiesced in his defire. As this medicine formerly affected the bowels, I defired him to rub in two drachms by measure every night, which was done for one week, without any amendment in the fores, or indeed any perceptible effect on the constitution. The patient now complained of a pain in the perinæum, when he voided his urine ; and I directed him to bathe that and the contiguous parts for feven or eight minutes, with comfortably warm water by means of a large fponge, three times a day. This produced a most evident diminution in the irritability. of the fores, and convinced me that there was a stricture; I therefore introduced a bougie, and found two ftrictures, the front one of which was fo tight and tough, as to admit but a fmall bougie to pafs through it, which it grafped and indented. The warm bathing was continued. I touched the ftricture with kali, as Mr. Whately has recommended. From the time that the ftricture became an an object of attention, the fores had fo rapidly amended, that in a few days the patient was enabled to retract the prepuce; when it was found, that though the fores had been numerous

OF THE URETHRA, &c.

numerous and extensive, they had been merely superficial, and had not deftroyed any part. From the time that I first passed the bougie and ascertained a stricture, the mercury was discontinued, nevertheles the stress healed fo rapidly, that in ten days they were perfectly well.

After the fenfibility of the ftricture had been heightened by the touch of the kali, the patient complained of acute pain in the fores when he made water; and once, when I touched fome of the fores with argentum nitratum, he complained of equally fharp pain in the perinæum.

I lately attended a married man, who had been for many years tormented by occafional fores forming about the prepuce, which were fo irritable, as to be prohibitory of fexual intercourfe. In the laft attack they were confidered by feveral furgeons as fyphilitic, but as they had not the characters of that difeafe, I diffuaded the patient from the ufe of mercury otherwife than as an alterative. This patient upon taking food had the pain and inflam-

inflammation of his fores fo aggravated, that he was obliged to rife from table, and bathe the affected parts with warm water. These fores immediately loft their irritability, and even rapidly got well, upon a stricture in the urethra being relieved by local warm bathing and the use of bougies.

I have ftill further to obferve, with refpect to the occafional confequences of difeafes of the urethra, that many difeafes of the glands in the groin originate from them. I fhall not, however, detail any cafes in evidence of this fact. It will be fufficient to fay, that I have feen feveral cafes of enlarged inguinal glands difperfed by relieving diforders in the urethra; and I have feen inftances of foul and irritable fores, lofing their difeafed characters, and healing from the fame caufe. The latter event is not, indeed, likely to be a frequent occurrence.

In a gonorrhœa, the glands in the groin are commonly irritated, and fometimes flightly fwollen; the fwelling rarely increases and fuppurates, except in cases where there is

is a predifposition to disease in those glands. If then, irritation in the urethra, occurring from gonorrhea, can thus affect the inguinal glands, it may be rationally inferred, that other causes of irritation of the urethra may produce fimilar confequences. Nocturnal emiffions are also commonly the effect of morbid irritability or difease of the urethra; and it feems therefore irrational to attempt to cure them by tonic medicines or fedatives, without adverting to the state of the urethra. Indeed in many of the perfons who are fubject to these discharges, the morbid sensibility of the urethra is connected with a difordered condition of the digeftive organs; which is of itself a sufficient cause of great weakness and hypocondriac feelings. After thus adverting to fuch caufes, we cannot wonder at the terrors felt and defcribed in cafes of tabes dorsalis. That diseases of the urethra may exist without producing the confequent difeafes which I have been defcribing is very manifest; that such diseases may arise, independently of the caufes to which I have attributed them, is also evident. My object therefore is merely to announce, that I have

233

very

ON DISEASES, &c.

very frequently obferved the difeafes, which make the fubject of this fection, to arife from a difordered ftate of the urethra, leaving it to the experience of the public to determine, how far fuch cafes may be regarded as frequent occurrences in general practice.
