YORKSHIRE COLLEGE LIBRARY

Class ..... *No.* .....

BOOK OF REFERENCE.

REGISTERED STUDENTS are entitled on payment of the Entrance or Sessional Fee, to use the Library so long as they are in attendance upon Classes in the College; OCCASIONAL AND EVENING STUDENTS on payment of a Library Fee of 2s. 6d. per Session.

Books of Reference taken out of the Library by permission of a Professor or Lecturer for use in the College, must be returned before the person using them leaves the College Buildings.

This book may only be taken away from the College Buildings after 5 p.m., and must be returned before 10 on the following morning, or a fine of 2d. a day will be levied.

YORKSHIRE
COLLEGE

PREFACE.

THE design of the present work is briefly, but not completely expressed in its title page. Independently of a reliable and comprehensive collection of formulæ and processes in nearly all the industrial and useful arts, it contains a description of the leading properties and applications of the substances referred to, together with ample directions, hints, data, and allied information, calculated to facilitate the development of the practical value of the book in the shop, the laboratory, the factory, and the household. Notices of the substances embraced in the Materia Medica of our national pharmacopœias, in addition to the whole of their preparations, and numerous other animal and vegetable substances employed in medicine, as well as most of those used for food, clothing, and fuel, with their economic applications, have been included in the work. The synonymes and references are other additions which will prove invaluable to the reader. Lastly, there have been appended to all the principal articles referred to, brief, but clear directions for determining their purity and commercial value, and for detecting their presence and proportions in compounds.

The sources from which I have derived the vast mass of materials forming this volume, are such as to render it deserving the utmost confidence. I have invariably resorted to the best and latest authorities, and have consulted almost innumerable volumes, both British and foreign, during its compilation. Secondary channels of information have been scarcely ever relied on, when original authorities were within my reach. A large portion of the work has been derived from my personal experience and observations in the departments of applied chymistry and hygiène, and from the processes of various laboratories and manufactories, many of which I can the more confidently recommend, from having either inspected or witnessed their employment on an extensive scale. The indiscriminate adoption of matter, without examination, has been uniformly avoided, and in no instance has any formula or process been admitted into this work, unless it rested on some well-known fact of science, had

been sanctioned by usage, or came recommended by some respectable authority. The settlement of doubtful or disputed points has often occupied me a greater number of hours, and not unfrequently, a greater number of days, than that of the lines of letter-press which convey the results to the public. In all cases precedence has been given to the standard formulæ of our national pharmacopœias, and to those processes which long experience, or well-conducted experiments, have shown to be the most successful, profitable, and trustworthy. In general, the sources of information have been indicated, for the purpose of enabling the reader to form a better estimation of their value. Wherever this is not the case, in reference to borrowed formulæ and data, the omission has arisen from the impossibility of determining to whom the merit is justly due.

I have endeavoured, as much as possible, in the present work, to avoid confusion of the medical weights with those commonly used in trade and commerce; an attempt which, so far as I am aware, has not been successfully carried out in any other quarter. For this purpose I determined to entirely abandon the usual arbitrary signs or characters employed to represent the divisions of the apothecaries' pound, and to distinguish the two weights from each other, by simply printing, in different type, the plain English names and abbreviations representing their several denominations. The medical signs for the imperial gallon and its sub-divisions, have also been abandoned for their common English names. It would have afforded me pleasure to have reduced all the quantities to one uniform standard, had it been practicable, or, in all cases, advisable.

Under the names of most of the leading diseases that could be profitably noticed in the present work, such explanations and directions have been given as accord with the prevailing opinions and practice of the faculty at the present day. These, when judiciously applied, will prove invaluable to emigrants, travellers, voyagers, and other parties beyond the reach of legitimate medical assistance; and, under opposite circumstances, will, in general, enable those who have the care of the sick, the better to second and carry out the instructions and efforts of the physician for the benefit of their charge. Here, however, it may be useful to repeat the cautions given in other parts of this volume, as to the impropriety of unnecessarily meddling with the healing art, or neglecting a prompt application to a duly qualified practitioner, in all cases demanding either medical or surgical aid. It is an indubitable fact, that the best efforts of the inexperienced and uninitiated in the mysteries of medical science, must be always enormously behind those of parties whose whole lives and study have been devoted to the subject.

The nature of a condensed alphabetical arrangement not permitting numerous articles to come under distinct heads, or to be referred to under

all their synonymes, the casual reader may often be led to suppose that this book is most deficient where in reality it is the most copious. In general, I have attempted, as much as possible, to bring together subjects of a closely allied character, and compounds which are analogous to each other, either in constitution, or the mode of their preparation. Thus, most of the formulæ for Mixtures, Ointments, Pills, &c., follow, in alphabetical order, the general articles under these heads; whilst those for the Oxides, Salts, &c., follow the names of their respective bases. In like manner, a notice of a number of preparations will be found included in that of their principal ingredients. The names under which the leading substances appear, are generally those which are most familiar to well-informed practical men, and which have commonly reference to either their acknowledged chemical constitution, or to some long-known and easily recognised quality. The following extract conveys an important lesson on this subject, with which I perfectly agree:—"We have been unwilling to make any unnecessary changes in the nomenclature of substances whose names are sanctioned by the usage of the present day; for these names have been, for the most part, rightly assigned by our predecessors, or confirmed by lapse of time. We are indeed aware, that every improvement in the knowledge of things ought to be embodied in their names; but we must be careful, in selecting or forming these names, not to make those points appear certain and established which are as yet doubtful, for it is safer to be in the rear than in advance of natural history."*

I have exerted myself to the utmost to ensure the accuracy and completeness of this volume, but I feel conscious that after all my efforts for this purpose, some errors have crept into it, that many subjects which deserve insertion in it have been omitted, and that many others have been either imperfectly or too briefly noticed. "Yet these failures, however frequent, may," I trust, "admit of extenuation and apology. To have attempted much is always laudable, even where the enterprise is above the strength that undertakes it. To rest below his aim is incident to every one whose fancy is active, and whose views are comprehensive; nor is any man satisfied with himself because he has done much, but because he conceives little." When I commenced this work, I resolved to leave nothing within its legitimate limits unexamined or unelucidated; and I flattered myself with a prospect of the hours which I should thus "revel away" in a pursuit so congenial to my desires—"the treasures with which I expected every search into those neglected mines to reward my labour—and the triumph with which I should display my acquisitions to mankind.

* Preface to the Ph. L. 1851.

But these were the dreams of a poet, doomed at last to wake a'' Cyclopædist. The long task which I had undertaken soon exhibited its truly onerous character, and daily grew in urgency, until that which promised to be a pleasure, had been transformed into an exhausting and continuous labour. At first, a sacrifice of the hours of leisure only, seemed necessary to the undertaking,—next, those assigned to professional and business avocations were demanded, and absorbed,—but, ere long, one by one, the hours usually devoted to repose were sucked into the insatiable vortex, until the bright beams of the rising sun not unfrequently illumined the lamp-lit study or the gloomy laboratory, and surprised the author, no longer an enthusiast, at his still-enduring task. But long ere this I had learned, that to carry out my original resolutions in all their completeness and entirety was impossible, and "that to pursue perfection was, like the first inhabitants of Arcadia, to chase the sun, which, when they had reached the hill where he had seemed to rest, was still at the same distance from them." * All I can further say in reference to this point, is simply to assure the reader, that three of the elements usually deemed essential to give value to a technological work,—viz., zeal, industry, and capital, have not been wanting in the production of the present one;—the first two depending on the author, and the other chiefly on the liberality and enterprise of the publisher.

As heretofore, I beg to solicit my readers to apprise me of any inaccuracies or omissions in this volume which may come beneath their notice. I shall also thankfully receive any hints or suggestions tending to the improvement of future editions of this work. Such communications to be useful, must, however, be written on only one side of the paper. Parties who may thus kindly afford me assistance, will, in due course, have their services publicly acknowledged; and their names and addresses, unless when otherwise requested, will be published in full.

I have endeavoured to render the present volume as self-explanatory as possible, and, in general, have appended ample directions to the several formulæ and processes that seemed to me likely to cause embarrassment to those inexpert in chemical manipulation; but should any party find it otherwise, I shall be happy to reply, gratuitously, to any reasonable questions tending to elucidate the difficulty.

In conclusion, I may add that, having now for nearly a quarter of a century devoted my attention to the applications of chymistry in most of the useful arts and manufactures, both British and Foreign, and in sanitation, I am in possession of many valuable processes and formulæ, hitherto wholly unknown, or but partially developed, with various improved plans of

* Dr. Samuel Johnson's Preface to his English Dictionary.

factories, laboratories, ventilation, &c., which the limits of this work will not permit me to describe in its pages, but on which I should be happy to communicate with parties interested in the same. Persons desirous of establishing any new branch of manufacture, or of improving an existing one, or of determining the purity or value of articles of food, wines, liqueurs, medicines, &c., or of obtaining formulæ or processes which are not contained in this work, may, in like manner, have their wishes complied with, by inclosing to me samples, or the requisite information.*

ARNOLD J. COOLEY.

LONDON; *February* 1, 1856.

* Communications for the Editor, in the *first case* addressed to him through the publisher, will be duly attended to.

THE YORKSHIRE COLLEGE

ABBREVIATIONS, ETC., USED IN THIS WORK.

These, for the most part, consist of the first syllable, or the initial letter or letters of the words they stand for. As *Prep.*, preparation; *Pur.*, purity; *Purif.*, purification, &c. —*Obs.*, (in Italics,) at the commencement of a paragraph or sentence, stands for *observations;*—Obs., (in Roman letters,) following names or synonymes, means *obsolete.* —Ph., stands for *pharmacopœia;* Cod., for *codex.*—L., E., D., P., U. S., &c., associated with the last two abbreviations, are the initial letters of the cities and countries which produced the respective works; as, London, Edinburgh, Dublin, Paris, United States, &c. When no dates are given, the last editions of the pharmacopœias are referred to.

lb., oz., dr., respectively represent the *pound*, *ounce*, and *drachm* (⅛ *oz.*), AVOIRDUPOIS WEIGHT. This is the only weight employed in the new Dublin Pharmacopœia.

℔, oz., dr., and gr., refer to the *pound*, *ounce*, *drachm*, and *grain*, APOTHECARIES' or TROY WEIGHT.

The word "*drop*" in all cases indicates a measured drop or minim.

The *names of individuals* which appear in this work, are those to whom the immediately attached information or formula is usually attributed, or on whose recommendation or authority it has been selected.

ERRATUM.

Page 1029, 2d col., 17th line from the bottom, *after*—residuum tested as before, *add*—The alkaline liquid, from which the ether has been decanted, is then separated from any precipitate which may have formed, and both of these separately tested for alkaloids.

For another correction see *page* 1189, col. 2.

A

CYCLOPÆDIA OF PRACTICAL RECEIPTS

AND

COLLATERAL INFORMATION.

ABBREVIATIONS. Before the invention of printing, a great variety of abbreviations were employed, which are now disused. Those still retained in medicine, pharmacy, and chemistry, usually consist of the initial letters, or the first two or three letters of the words they stand for; but when necessary, a larger number are taken. *Ex.*—O., *octarius*, a pint; Aq., *aqua*, water; Man., *manipulus*, a handful; Coch., *cochleare*, a spoonful. Sometimes both the initial and final letters of a word are employed; as, No., *numero*, in number; āā, *ana*, of each; and in a few cases, z, is added to an initial letter to mark a contraction; as, oz., *ounce;* Zz., *zingiberis*, ginger. See *Prescriptions*, *Symbols*, *&c.*

ABERNETHY MEDICINES. These medicines originally consisted of a mercurial pill, to be taken overnight, followed by an aromatised black draught in the morning. The quantity of the first, for an adult, was about three grains and a half, increased a little in bulk by the addition of some liquorice powder; that of the last, from one ounce to one ounce and a half. As, however, when frequently taken, they sometimes occasioned salivation, which proved prejudicial to their sale, a little compound extract of colocynth (Ph. L. 1836) was introduced into their composition, by which this objection was obviated. Ultimately, their composition was settled at *three grains* of *mercurial pill*, and *two grains* of *compound extract of colocynth;* and these proportions are still followed as the best by those who prepare them. For persons who object to *black draught*, a dose of *castor oil*, or of any other mild purgative medicine that may be more agreeable to them, will be found equally efficacious. The *occasional* use of these medicines seldom fails to prove highly beneficial to the plethoric, bilious, and dyspeptic. In ordinary cases of constipation, headache, &c., arising from deranged stomach or liver, wherein the administration of mercurials is not contra-indicated, they will be found of great service. It need scarcely be added that these medicines are named after Mr. Abernethy, the celebrated surgeon, who is *said* to have frequently employed them in his practice.

ABERRATION (of mind). Mental alienation or wandering; insanity. This term is frequently applied to a mild form of incipient insanity or dementia, which is more or less occasional or continual, trifling or severe, according to circumstances. The studious, nervous, inactive, and those who are engaged in sedentary occupations and spend much of their time in ill-ventilated apartments, or who indulge in irregular or vicious habits, as well as "fast livers," are the most liable to this affection. It also frequently arises from disordered physical health. Change of scene, out-door exercise, agreeable company, pleasing and continual mental occupation, and due attention to diet, clothing, ventilation, &c., with the judicious use of some mild aperient medicine and tepid bathing, will generally alleviate, and frequently effect a cure.

ABIETIC ACID. An acid found by M. Baup in the resin of the pinus abies, or spruce fir.

Prep. Digest the *resin*, first in *dilute*, and afterwards in *strong alcohol;* mix the two liquors, filter, and evaporate; dissolve the residuum in *pure alcohol*, and again filter and evaporate. It may be purified

by re-solution, the addition of a solution of *acetate of copper* to saturation, and subsequent decomposition by *hydrochloric acid.*

Prop., &c. Square crystalline plates; soluble in alcohol; with the bases it forms salts termed *abietates.* (See *below.*)

ABIETIC ACID (of Caillot). *Prep.* Digest the *resin* of the *abies picea* or *pectinata* (Strasburg turpentine), in *absolute alcohol,* and neutralize the residuum by digestion with *carbonate of potassa,* when *abietate of potassa* will be obtained, from which the abietic acid may be separated by saturating the alkali with another acid, as before.

Neither of the above compounds deserves to be ranked as a distinct acid.

ABIETIN. A crystallizable resin found by Caillot in Strasburg turpentine, and sometimes improperly called *abietic acid.*

ABIETINE. A name often absurdly given to the finer varieties of Strasburg turpentine. When thinned with a little oil of turpentine, it is used, like Canadian balsam, for attaching microscopic objects to slips of glass.

ABLUTION. The value of frequent and copious affusions of pure water to the surface of the body is well known. During life, the skin is continually subjected to abrasion, and the processes of reproduction and decay, by which its exterior portion, or the cuticle, is being constantly thrown off as effete and useless matter, in the shape of very minute scales or dust. This, mingling with the oily and saline products of the skin, acquires sufficient adhesiveness to attach itself to the surface of the body and clothing, as well as to attract the waste particles of our dress, and the dust and soot floating in the atmosphere. In this way, if occasional ablution be not had recourse to, the channels of perspiration will become choked, and the clothing itself rendered unwholesome and unfit for use. The consequence of the pores of the skin being obstructed, is impeded transpiration, by which its functions, as a respiratory organ, are interfered with or suspended. This adhering pellicle of refuse matter also acts both as a mechanical and chemical irritant, and forms a medium favourable for the absorption and transmission into the body, of effluvia, miasmata, poisonous gases, and the infectious and contagious vapours of disease. "The greater part of (contagious) poisons are conveyed to us through the external surface of our bodies; and it is fully proved, that poison, already communicated, has been by cleanliness removed, before it could actually produce any bad effects. I here allude, in particular, to frequent washing, bathing, rinsing the mouth, combing and brushing the hair, and often changing the linen, clothing, and bedding." (Hufeland.) Such are the immediate effects of neglected ablution of the skin; the further consequences are of an equally serious character. The blood being deprived of one of its sources of oxygen, and one of the outlets for its carbon, the functions of nutrition become imperfect, and the animal temperature lessened. The matters which would be thrown out of the system in the form of perspiration are retained, and must be eliminated by other channels. The lungs, the kidneys, the liver, and the bowels, are each in their turns "taxed" to perform the functions of another organ. The oppressed viscera suffer from exhaustion and incipient disease. Their particular offices are languidly performed, the equilibrium of health is disturbed, and skin-diseases, or consumption, diarrhœa, dropsy, liver-complaints, visceral obesity, or some other serious diseases of the vital organs, ensue. What further considerations need be offered to enforce the necessity of personal cleanliness? And when it is added, that *no dirty or imperfectly-washed skin can long continue healthy,* and *ceasing to be healthy must also cease to be agreeable or beautiful,* the argument in favour of the daily use of pure water to the whole surface of the body will surely be complete. See *Baths, &c.*

ABORTION. The expulsion of the human fœtus after the sixth week, and before the sixth month of pregnancy. Prior to the sixth week it is usually called *miscarriage;* and after the sixth month, *premature labour.*

Treat., &c. Avoid exciting causes, and seek a recumbent posture, quiet, and repose. A dose of castor oil, confection of senna, or other mild aperient, will be found advantageous; and when there is much hæmorrhage, injections of cold water or black tea may be had recourse to. A cold hip or sponge bath, to which a little vinegar may be added, has been recommended. Should these measures prove ineffectual, medical assistance should be at once called in.

ABRASION. A superficial injury of the skin, by the partial removal of the cuticle by friction. When the injured surface is large or exposed, it should be protected from dirt and further injury, by applying a piece of lint or soft linen rag, covered with

spermaceti or some other simple ointment, over which a piece of strapping, or bandage of any sort, may be placed, to keep it on. In many cases, the application of a piece of common sticking-plaster, or soft rag, will be found sufficient.

ABRUS. The seeds of the *abrus precatorius*, (Linn.) constitute the *Angola Seeds* or *Jumble Beads*, of the shops. They are innocuous, but are reputed to be nervine, ophthalmic, and cephalic. They are made into rosaries, and necklaces for children, and are used for food in Egypt.

ABSCESS. A tumour or swelling in some membranous or fleshy part of the body, containing pus or purulent matter, resulting from suppuration consequent on inflammation. Abscesses have been divided into *acute* and *chronic*.

Acute Abscess is accompanied by active inflammation rapidly terminating in the formation of pus or matter, and the increase of the tumour. The former may be felt *fluctuating* within the part, if near the surface; an uneasy sensation of weight follows; the swelling assumes a conical shape, and what is popularly termed a head, or point; the skin reddens, and gradually becomes thinner, until at last it breaks, and the imprisoned matter escapes. In favourable cases, healthy action follows, the injury is repaired, and the wound heals; in others, instead of the matter escaping, the whole of it is absorbed into the circulation, and the swelling disappears; a circumstance which it is often conceived to be prudent to prevent, by encouraging the maturation of the tumour.

Chronic Abscess, until the discharge of matter commences, presents similar symptoms to those just described, but there is less inflammation. At this point, however, the latter heightens, fever is excited, and the discharge increases, producing debility and sometimes fatal results. The healing and reparative processes are also much more tedious than in the acute variety, often *barely keeping pace* with the *injurious effects* of the ulcer, even when in an improving condition.

Treat. In the early stages, cooling applications, friction, and continued gentle pressure may be had recourse to; if ineffectual, suppuration must be promoted by warm poultices and fomentations, and a liberal diet until the rupture of the tumour. The ulcer must then be kept perfectly clean, and dressed twice a day with simple ointment; a light nutritious diet being at the same time adopted, and the bowels kept gently open with mild aperients. When the abscess is situate in any part of the body where its presence might be productive of serious injury from pressure or diffusion, it should be cautiously opened with a lancet as soon as mature.

ABSINTHATE. A salt containing absinthic acid. The *absinthates* may be procured by double decomposition, from a mixture of solutions of absinthate of ammonia and the salts of the metallic oxides.

ABSINTHIC ACID. A peculiar acid found by Braconnot in the *artemisia absinthium*, or common wormwood. It exists in the plant in the state of *absinthate of potassa*.

Prep. To a *watery infusion of the plant*, add *solution* of *acetate of lead;* wash the precipitate in pure *cold* water, suspend it in water contained in a tall, narrow glass vessel, and pass *sulphuretted hydrogen gas* through the liquid until all the lead is thrown down in the form of sulphuret; lastly, decant, filter, and evaporate.

Prop., &c. Sour, uncrystallizable, deliquescent; forming salts with the bases called *absinthates*, some of which are crystallizable. It greatly resembles impure succinic acid, and when prepared as above, appears to consist of absinthic acid and absinthin.

ABSINTHIN. Syn. *Absinthia*, *Absinthina*,—Lat. A bitter substance found by Caventou in common wormwood, and called by him its "*pure bitter principle.*"

Prep. Digest *crude absinthic acid* (procured by the above process) in a mixture of *alcohol* and *ether*, and abandon the solution to spontaneous evaporation. The brown product may be purified by re-solution in alcohol, digestion with animal charcoal, and careful evaporation.

Prop., &c. White, semi-crystalline, and very soluble in alcohol. Its physiological effects are similar to those of extract of wormwood.

Dose. ½ to 1 grain, or more; as a remedy for dyspepsia, and as a substitute for quinine in intermittents.

ABSORBED. A term in use among French connoisseurs to represent that state of a picture in which the oil has sunk into the canvas or ground, leaving the colours flat, and the touches indistinct. The remedy consists in rubbing the surface of the picture, previously well cleaned, with a soft sponge dipped in a little *drying oil*, and after some days, varnishing it, when it should be kept in a warm room until perfectly dry.

ABSORBENT GROUND. Picture grounds prepared chiefly in *distemper* or *water-colour*, in order that the redundant

oil may be immediately absorbed, for the purpose of expedition and imparting brilliancy to the colours.

ABSORBENTS. Among *chemists*, substances which possess the power of withdrawing moisture from the atmosphere, as *soils*, *argillaceous earths*, &c.; or which neutralize acids, as *chalk*, *lime*, and *magnesia*. They differ from deliquescent salts. The latter attract moisture and dissolve therein; whilst the former suck it into their pores, as a sponge does water. See *Absorption*.

ABSORBENTS. Medicines that remove acidity from the stomach and bowels. The principal absorbents are—*Magnesia* and *carbonate of magnesia*, *prepared chalk*, and the *carbonates* and *bicarbonates of soda*, *potassa*, and *ammonia*. The first three are popularly called EARTHY, and the others ALKALINE ABSORBENTS. See *Antacids*, *&c.*

ABSORPTION. The power possessed by soils of absorbing moisture. The more a soil is divided by labour and vegetation, the greater is its absorbent power, and consequently its fertility. The latter, indeed, chiefly depends on its capacity for imbibing moisture, and may be illustrated by reference to recent and disintegrated lava. (Leslie.) The finely divided state, most penetrable by the delicate fibres of plants, appears to derive its superior power of acting on atmospheric vapour from the augmentation of its surface and the multiplication of its points of contact. (Ure.) This method of increasing the fertility of a soil is well known to scientific farmers, and seldom neglected by them. (Loudon.) That soil must be regarded as the most fertile which possesses this power in the greatest degree. Garden mould has the highest absorbent power of any mineral substance. (Leslie.)

Process of ascertaining the absorbent power of soils, and other substances. Thoroughly dry the article by a moderate heat, and transfer it, whilst still warm, to a clean dry phial, furnished with a ground-glass stopper. When cold, remove it to a large wide-mouthed glass bottle, the atmosphere of which has previously been rendered as damp as possible, by suspending moistened rag or filtering paper in it. It must now be kept closed for some time. A delicate hygrometer being subsequently introduced, will indicate the degree of dryness of the enclosed air.

Obs. Experiments of this nature are only relatively correct, and must be performed under *exactly* similar circumstances, to furnish reliable comparative results. With this reserve, they will be found invaluable to the agriculturist. See *Absorbents*, *Agriculture*, *&c.*

ABSTINENCE. The advantages of *rational abstinence*, or *abstemiousness* in eating and drinking, both as regards the health and welfare of the individual, need scarcely be insisted on here. That, under certain circumstances, it conduces to longevity, there can be but little doubt. When excessive, its effects cannot fail to be prejudicial, and productive of debility, suffering, and disease. The instances of extreme abstemiousness, or abstinence, in persons who have reached a very great age, are far from few; but, on the other hand, we have no record of the number who have died from complaints thus produced, and depending on insufficient nutrition. *St. Anthony* is said to have lived to the age of 105 on twelve ounces of bread daily, and drank no other liquor than water. *James, the Hermit*, on a like diet, lived to 104; *St. Epiphanius*, to 115; *Simeon, the Stylite*, to 112; and *Kentigern*, or *St. Mungo*, to 185 years. (Spottiswood.) In opposition to this it would be useless to attempt to show the multitudes who have died from starvation, or from the use of an insufficient quantity of food; although this number would probably not equal the myriads who have expiated the follies of intemperance and gluttony by prematurely sinking into the grave. There can be no doubt that all the numerous reports of long fasting and excessive abstinence above referred to, have originated in imposture and credulity.

ACACIA. There are upwards of 300 species of acacia, many of them yielding products highly useful or agreeable to mankind; as catechu, gum arabic, perfumes, &c. The flowers of some of the species are used by the Chinese in dyeing yellow; those of the *Acacia farnesiana* (Willd.) growing in the E. and W. Indies, yield a delicious perfume, which is one of the principal ingredients in Italian perfumery.

ACACIA. The inspissated juice of the unripe fruit of the Mimosa nilotica, brought from Egypt, in roundish masses, enclosed in bladders. Astringent. The substance usually sold for it, is inspissated sloe-juice. A similar article is prepared from the Acacia Germanica, and sold in Germany under the name of *German Acacia*, or *Acacia Nostras*. They are little used.

ACARUS, (Lat.) A mite or tick. The following are well-known varieties,—*Acarus autumnalis*, the harvest bug; *Acarus domesticus*, the domestic tick; *Acarus dysenteriæ*, the dysentery tick; *Acarus*

ricinus, the dog tick; *Acarus sacchari*, the sugar mite; *Acarus scabiei*, the itch insect; *Acarus siro*, the mite. Most of these animals are either microscopic or extremely minute, and possess such tenacity of life as to resist for some time the action of boiling water, and to live with comparative impunity in alcohol. The *irritation of the skin*, caused by them, may be relieved by a lotion of equal parts of sal volatile and water; and *they may be destroyed* by tobacco water, or a lotion or ointment of stavesacre.

ACCIDENTAL COLOURS. Syn. *Complimentary Colours.* If we look for some time, with one eye, on a bright coloured object, as a wafer, placed on a piece of paper, and subsequently turn the same eye to another part of the paper, a similarly shaped spot or mark will be seen, but the colour will vary, though it will be always the same under like circumstances. Thus, if the original spot or wafer be of a red colour, the imaginary one will be green; if black, it will be white: the imaginary colour being always "complimentary" of that first gazed upon. An attention to this subject is of the utmost importance in the art of dress, as the colour should be chosen with reference to the complexion. That best adapted to the particular individual can be easily determined, on scientific principles, before making a purchase or a trial. See *Dress, &c.*

ACCIDENTS. As no situation or condition in human life is not liable to a great variety of serious accidents, against which it is impossible always to guard, even by the greatest care and foresight, it becomes of the utmost importance to remember, that one of the most powerful assistants in dangerous or trying circumstances, is *presence of mind.* A certain amount of self-possession would have saved many lives which from its absence have been lost, and would have averted the mischiefs arising from various accidents, which without it, have become irretrievable. The mind overwhelmed by fear, or astounded by alarm, is utterly incapable of deliberately guiding us in securing either our own safety, or the safety of those who happen to be dependent on us, or in the same predicament as ourselves. It is, therefore, a proof of the truest wisdom to cultivate, and endeavour to preserve as much as possible, in all extraordinary and unexpected situations of danger or calamity, those invaluable mental requisites —*coolness, judgment*, and *determination*; in short—PRESENCE OF MIND.

ACERBITY. Acidity, with bitterness and astringency. See *Malt Liquors, Wines, &c.*

ACERIC ACID. Syn. *Maple Acid; Acidum Acericum*,—Lat. An acid found by Scherer, in combination with lime, in the milky sap of the common maple.

Prep. Keep *maple juice* in a warm situation for about a fortnight, that it may undergo fermentation; then filter, add a solution of *acetate of lead* as long as a precipitate forms; collect this on a filter, and wash it with *very cold water.* Next, carefully pour on a large quantity of *boiling* water, and receive it in glass vessels. *Acerate of lead* will be deposited as the liquor cools, under the form of brilliant crystals. These must be washed in *cold* water, dried, reduced to fine powder, and decomposed by *sulphuretted hydrogen*, as directed under absinthic acid.

Prop. &c. Crystalline; soluble; its salts are termed *acerates.* It resembles malic acid, with which it is probably identical. (Gmelin.)

ACESCENCY. The souring of fermented liquors, &c., by spontaneous decomposition, or the acetic fermentation. Fermented liquids that have been badly stored or kept too long, frequently become *acescent*, or acquire acescency. See *Wine, Beer, &c.*

ACETA MEDICATA, (Lat.) Medicated vinegars. See *Vinegars.*

ACETAL. An etherial fluid discovered by Dobeireiner, and at first named *oxygen ether.* It is one of the products of the slow combustion of alcohol by spongy platinum.

Prep. (Liebig.) Pour *alcohol*, to the depth of one inch, into a tall, wide-mouthed, glass bottle, and suspend three or four watch-glasses or capsules containing the *black powder of platinum*, (previously moistened with water,) to the depth of about two lines, close to the surface of the spirit. Place the apparatus in a warm situation for some weeks. Acetal, aldehyde, acetic acid, and acetic ether will be formed. Next neutralize the liquor with *chalk*, (or carbonate of potassa,) and carefully distil, (the first fourth only being collected.) The product treated with powdered *chloride of calcium*, until the latter is no longer moistened, decanted, and (very slowly) redistilled, yields pure acetal, as soon as the boiling point reaches 202° Fahr.

Prop. &c. Liquid, colourless, inflammable; alcoholic; miscible with ether and alcohol; soluble in 18 parts of water; unchanged in the air; decomposed by strong alkalies and acids; convertible by slow combustion into acetic acid. *Sp. gr.* ·821, at 72° Fahr.; boiling point, 204° F. Its odour resembles that of Hungary wines.

ACETAMIDE. A crystallizable sub-

stance soluble in water and alcohol, obtained by treating pure *acetic ether* with *ammonia*. Alkalies and acids reconvert it into ammonia and acetic acid.

ACETATE. Syn. *Acetas*,—Lat. A salt of acetic acid. The individual acetates are noticed under the respective bases.

Prep. By direct solution of the *carbonate*, *hydrate*, or *oxide of the base* in the *dilute acid*; or from a *solution of an acetate* and of a *salt of the base*, by double decomposition.

Prop., &c. The acetates are soluble in water, several so much so as to be uncrystallizable; many dissolve in alcohol; by distillation at a moderate red heat, they yield acetone and water, or acetone and acetic acid, and leave a carbonaceous residuum. The aqueous solutions of the *alkaline acetates*, suffer decomposition and turn mouldy. No more of them should, therefore, be dissolved at once, than is required for immediate use.

Tests. The acetates are recognised by—1. Evolving fumes of acetic acid on the addition of sulphuric acid;—2. Striking a deep red colour with the sesqui-salts of iron;—3. Yielding acetone, by destructive distillation. See *Acetic Acid*.

ACETETYL. A substance formed by the action of *pentachloride* of *phosphorus* on *acetate of soda*. See *Acids*.

ACETIC ACID. Syn. *Hydrated Acetic Acid*, *Monohydrated Acetic Acid*, *Hydrated Acetylic Acid*, *Acetous Acid*, *Pyroligneous Acid* (pure); *Acidum Aceticum*,—Lat. Acetic acid, strong enough to deposit crystals on cooling, is also termed—*Glacial Acetic Acid; Acetum Glaciale*, *Acidum Aceticum Glaciale*,—Lat.; *Radical Vinegar*, *Essence of Vinegar*, *Spirit of Verdigris*, *Spiritus Veneris*, *Esprit de Venus*, —*Obs.* The well-known acid principle of vinegar. Acetic acid is peculiar to the organic kingdom. It is one of the common products of fermentation, of the oxygenation of alcohol and of the destructive distillation of wood and other vegetable matter. It has been detected in several animal fluids, as the milk, urine, and perspiration, and is frequently generated by a morbid process in the stomachs of dyspeptic patients. In the vinegars of commerce, it is found in combination with mucilage, sugar, colouring matter, vegetable extractive, and water.

Var., &c. Commercial acetic acid occurs under the forms of the *pure acid* of the chemist and pharmaceutist, (*glacial* and *dilute*,) and of *vinegar*. Of the *latter* there exist several varieties—1. *Malt vinegar*;—2. *Wine vinegar*;—3. *Sugar vinegar*;—4. *Wood vinegar*;—5. *Alcohol vinegar*. The first three are formed by the acetous fermentation, which converts the alcohol of the wine, beer, or fermented sugar into acetic acid, by the absorption of oxygen; the fourth, by the destructive distillation of wood in iron retorts; and the last by the absorption of atmospheric oxygen, by the alcohol contained in the liquor. *Distilled vinegar* is another variety, produced by the simple distillation of either of the first three above referred to.

Prep. Pure Acetic Acid is principally obtained from the *acetates*, either by the *action of a strong acid*, which seizes on the base, setting the acid free; or, by *dry distillation*, in which the high degree of heat employed separates the acetic acid from the base in the form of vapour. The following are the principal processes at present adopted for the purpose:—

1. (Liebig.) Take of *pure acetate of soda*, (thoroughly dried and finely powdered,) 3 parts; *pure sulphuric acid*, 9·7 parts. Pour the *acid* on the *acetate*, previously placed in a capacious retort. One-eighth of the acetic acid will then pass over by the heat developed by the reaction of the ingredients. The retort may next be placed in a sand-bath, until its contents become quite liquid. The product, carefully rectified, yields two parts of pure acid, containing only 20 per cent. of water. By exposing the latter portion which comes over in a closed vessel to a temperature below 40° Fahr., crystals of hydrated acetic acid will be deposited. The weaker, or liquid portion, being poured off, the crystals may be again melted and re-crystallized by cooling. The crystals of the last operation, separated from the liquid, are perfectly pure.

(*Obs.*) A good process for producing perfectly pure hydrated acetic acid.

2. (Mollerat.—*Without distillation.*) Take of *acetate of soda*, (pure commercial, powdered,) 100 *parts*; *concentrated sulphuric acid*, 35 or 36 *parts*; *acetate of lime*, q. s. Pour the *acid* gradually and cautiously on the *acetate of soda*, previously placed in a hard glazed stoneware or glass pan or receiver, so that the acid may flow *under* the powder, and little heat be generated by the operation. The whole must then be allowed to remain in contact (covered) for some hours, when crystalline grains of sulphate of soda will be found covering the bottom and sides of the vessel, and hydrated acetic acid, partly liquid and partly in crystals, the upper portion. The temperature being now slightly raised to a point barely sufficient to cause the liquefaction of the crystals of acetic acid, the fluid

is poured off, and a very small quantity of pure acetate of lime added to it gradually, until it yields no trace of free sulphuric acid on evaporation. After sufficient repose it may be decanted for use.

Obs. An excellent *commercial* glacial acetic acid is thus obtained *without distillation*, owing to the insolubility of sulphate of soda in acetic acid. If, however, the process is badly managed, or the proportions of the ingredients are not carefully observed, the product is contaminated with either a little sulphuric acid or saline matter. It is also important to success that it should be performed in a cool apartment, and in well-cooled vessels.

3. (Ph. Hann. 1831.) Take *acetate of soda*, (as last), 12 oz.; *strong sulphuric acid*, 9 oz.; *peroxide of manganese*, 2 oz. Mix, and distil as before. Rectify the product with *peroxide of manganese*, and *dried acetate of soda*, of each, 1 oz. Superior to the last, but more expensive.

4. (*Acidum Aceticum*,—Ph. L. 1836; *A. A. Fortius*,—Ph. L. 1824.) *Prep.* (Ph. L. 1836.) Take of *acetate of soda*, 2 lbs.; *sulphuric acid*, 9 oz.; *distilled water*, 9 fl. oz. Mix the *acid* with the *water*, and proceed as before.

Obs. The product is 165½ parts of liquid acid of the sp. gr. 1·048, containing 30·8% of real acetic acid for every equivalent, or 137 parts of crystallized acetate of soda employed, being within 1½% of the estimated product. 100 gr. of this acid saturate exactly 87 gr. of crystallized carbonate of soda. 15 parts added to 85 parts of distilled water is equal in strength to the distilled vinegar of the London Pharmacopœia. 1 part of acid to 6 parts of water are the proportions commonly employed in trade for this purpose. It is not strong enough to dissolve camphor, resin, or essential oils, in any quantity.

5. (*Acidum Aceticum*,—Ph. L. 1851.) This acid is now placed in the materia medica; the *same strength* being ordered as in Ph. L. of 1836.

6. (Ph. Bor. 1847.) Take of *crude sulphate or bisulphate of potassa*, 13 oz.; *sulphuric acid*, 7½ oz.; thoroughly dried *acetate of soda*, 12 oz. Mix the *first two*, and cautiously evaporate to dryness; cool, powder, mix with the *acetate*, and distil 7 oz., as before.

Obs. Sp. gr. of product, "1·068 to 1·070." "It contains from 84 to 85% of real acetic acid." (Redwood.)

7. (Lowitz' *Acetic Acid.*) Take of *sulphate of potassa*, 12 oz.; *sulphuric acid*, 6 oz.; *water*, 18 oz.; *acetate of soda*, (as last) 9 oz.; *oxide of manganese*, ½ oz. Mix the *sulphate*, *acid*, and *water*, evaporate, powder, mix with the other ingredients, and proceed as before. Resembles the last.

8. (Ph. D. 1826.) Take of *acetate of potassa*, 100 parts; *sulphuric acid*, 52 parts. Mix, and distil to dryness. *Prod.* 50 to 51 parts of liquid acetic acid, sp. gr. about 1·074, containing about 65·6% of real acetic acid.

9. (Ure.) Take of *acetate of potassa*, (fused and powdered), 2 parts; *strongest sulphuric acid*, 1 part; *dried acetate of lead*, q. s. Mix the *first two*, distil to dryness, and rectify, adding a little of the dried acetate of lead.

Obs. Stronger than the last, from the acetate being fused.

10. (*Acidum Aceticum*,—Ph. E. 1841.) Take of *acetate of lead* (prepared as under,) 6 oz.; *pure strong sulphuric acid*, 9½ fl. dr.; *red oxide of lead*, a few grs. The *acetate of lead*, previously dried and powdered, is to be heated to 320°, in a porcelain basin, placed in a bath of oil or fusible metal, and constantly stirred, until the powder ceases to concrete; it must then be weighed, mixed with the acid, and distilled to dryness, at a heat of 320°. The product is agitated with a few grains of red oxide of lead, the clear portion decanted, and redistilled.

Obs. Sp. gr. 1·063 to 1·065; but must not exceed 1·0685. It contains about 80·5% of real acetic acid. "20 per cent. of water added to it should increase its density. 100 minims neutralize at least 216 grains of carbonate of soda." It crystallizes when cooled to about 50° Fahr.

11. (Ure.) Take of *dried acetate of lead*, 4 parts; *strong oil of vitriol*, 1 part. Distil slowly to dryness. Nearly equal to the last.

12. (Baup.) As the last, putting a little peroxide of manganese into the retort before distillation.

13. (Liebig.) *Acetate of lead*, 3 parts; *sulphuric acid*, 8 parts.

14. (Fresenius.) Take of *crystallized neutral acetate of lead*, 10 parts; *effloresced sulphate of soda*, 3 parts; *sulphuric acid* and *water*, of each 2½ parts. Mix the *acid* and *water*, and when cold, pour the mixture on the *acetate* and *sulphate*, previously triturated together, and placed in a retort, and distil to dryness in a sand bath. Very pure; used as a test-acid in chemical analysis.

15. (Dollfuss' *Concentrated Acetic Acid.*) Take of *dried acetate of lead*, 12 oz.; *sulphuric acid*, 6 oz.; distil 7 oz.

16. (*Acidum Aceticum Glaciale, Glacial Acetic Acid,*—Ph. D. 1851.) *Prep.* Expose *finely powdered acetate of lead* (previously dried at a temperature of about 300° Fahr. until it ceases to lose weight) to an atmosphere of *dry hydrochloric acid* in a flask or retort, until "nearly the whole of it exhibits a damped appearance." Then connect it with a Liebig's condenser, and apply heat by means of a chloride of zinc bath, until "the whole of the acid shall have distilled over."

Obs. The hydrochloric acid may be prepared in the usual way, (See *Hydrochloric Acid,*) but must be dried before being used, by causing it first to bubble through a vessel containing *oil of vitriol*, and then to pass through a long tube containing small fragments of *fused chloride of calcium.* The sp. gr. of this acid is 1·065. It contains about 98% of hydrated acetic acid. The process, though apparently complicated, is not at all difficult to manage.

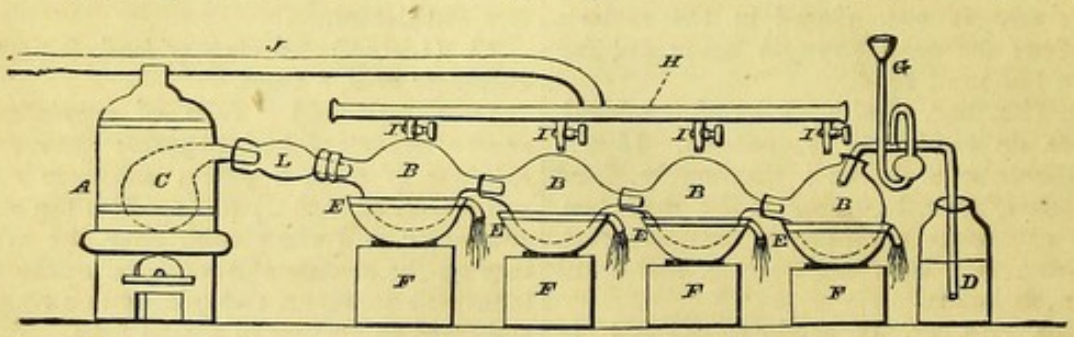
17. (*Acidum Aceticum Forte, Strong Acetic Acid,*—Ph. D. 1851.) *Prep.* Take of *glacial acetic acid*, (Ph. D.) 6 fl. oz.; *distilled water*, 4 fl. oz.; mix.

Obs. Sp. gr. 1·066. It contains about 59% of the hydrated or glacial acid.

18. (Christl.) From *commercial acetate* or *pyrolignate of lead*, in the same way as from pyrolignate of lime, using equivalent proportions, (See below.) The product in the retort is *muriate of lead* or *patent yellow.*

19. (Ure.) Take of *sulphate of iron* (gently calcined), 2 parts; *acetate of lead* (dried), 5 parts; mix, and carefully distil into a well-cooled receiver. An economical process under certain circumstances.

20. (Bardollier's *Strong Acetous Acid.*) *Dried acetate of lead*, 10 oz.; *calcined green vitriol*, 12 oz.; mix and distil as last.



21. By using *acetate* or *binacetate of copper* (instead of sugar of lead), and *sulphate of iron*, as in the last two.

22. (Christl.) Take of *raw acetate* or *pyrolignate of lime*, (prepared by Völckel's process,) 100*lb.*; *hydrochloric acid*, (20° Baumé, or sp. gr. 1·1515), 120*lb.* Mix, and after 12 hours, distil in a copper vessel, with a gradually applied heat.

Obs. The product is 100*lb.* of acetic acid, of 8° Baumé, or sp. gr. 1·0556, containing about 47% of hydrated acid, only slightly coloured and empyreumatic, fit for many manufacturing purposes. By rectification from a little fresh-burnt wood charcoal and *pure* acetate of lime or soda, and dividing the products, an acid of any degree of purity and concentration may be obtained. The advantage of this process is the present low price of muriatic acid, and the product not being contaminated with sulphuric acid. It will be found that pyrolignate of lime generally contains 90% of neutral acetate, but should it contain either more or less, a proportionate quantity must be employed. If the hydrochloric acid used has the sp. gr. 1·16, a less quantity being employed, the product will have the sp. gr. of 1·058 to 1·061. The resin sometimes found floating on the mixed ingredients, should be removed by skimming, before distillation.

23. (Völckel.) Take of *acetate of lime*, (as last), 100 parts; *hydrochloric acid*, (sp. gr. 1·16), 90 to 95 parts; *water*, 25 parts; mix, and proceed as before. *Prod.* 96 to 98 parts of an excellent acetic acid (sp. gr. about 1·050,) well adapted to trading purposes.

24. Syn. *Radical Vinegar, Aromatic Vinegar, Spirit of Verdigris, Spiritus Veneris,*—*Obs. Esprit de Venus,*—Fr. *Acidum Aceticum,*—Ph. L. 1787. Carefully dry *crystallized verdigris* or *binacetate of copper* by a very gentle heat, and introduce it into a large stoneware retort, (See *Engraving,*)

A, Furnace.
B B B B, Glass receivers.
C, Stoneware retort.
D, Bottle containing vinegar.
E E E E, Basins containing water.
F F F F, Supports for basins.
G, Welter safety-tube.
H, Supply-pipe of cold water.
I I I I, Cocks to supply water to the basins.
J, Water main.
L, Adopter connecting retort and globes.

the bottom of which has been previously coated with a mixture of clay and horse-dung to render it more capable of standing the fire. Next place it in a suitable furnace, and connect it, by an adopter tube, with 3 or 4 double tubulated globes, the last of which must be furnished with a vertical tubulature, to which a double Welter's safety tube should be adapted, the other end being immersed in a basin half-filled with distilled vinegar or water, while the funnel portion communicates with the atmosphere. Then place each globe in a basin of water, kept cool by a stream constantly passing through it; and cover the upper portion with cloths, kept continually wetted with cold water. After 15 or 20 hours, fire may be applied, and must be so regulated that the drops follow each other with considerable rapidity from the end of the adopter tube, whilst the bubbles of air cause no inconvenience at the other end of the apparatus. If otherwise, the fire must be damped. The operation should be continued, and the fire gradually increased, until vapour ceases to come over, known by the globes gradually cooling, notwithstanding the heat of the furnace. The operation is now concluded, and the whole may be allowed to cool, and the acid collected, ready for being rectified for sale. The rectification may take place in a similar apparatus to the above, but it must be wholly of glass, and the retort should not be much more than half-filled. The operation must now be very carefully conducted, and discontinued before *barely* the whole of the acid has distilled over, as the last portion is apt to injure the flavour and colour of the rest. The first portions which come over are very weak, and should be kept separate, until the sp. gr. reaches 1·072, when the receiver should be changed, and the product may be collected in separate portions, as noticed below.

Obs. Good binacetate of copper yields, by careful management, at a temperature of 400° to 560° Fahr., about one-half its weight, of a greenish coloured acid, of the sp. gr. of about 1·061, containing about 50% of hydrated acetic acid. 20*lb.* of the ordinary acetate yields 9¾*lb.* of this rough acid, leaving a residuum of about 6½*lb.* of metallic copper mixed with a little charcoal, in the retort, the remainder (nearly $\frac{3}{10}$ths of the acid in the acetate,) being decomposed by the heat and loss. This 9¾*lb.* of crude acid yields by rectification, and dividing the products, ½*lb.* of acid of the sp. gr. 1·023; 3*lb.* of the sp. gr. 1·042; and 6*lb.* of the sp. gr. 1·065; exclusive of a little acetone which comes over with it. The strongest acid is found in the third receiver, and the weakest in the first. The acid obtained in this way contains a little fragrant pyroacetic spirit; which renders it preferable for aromatic vinegar and perfumery. It dissolves camphor, resins, and essential oils with facility. Well-dried *acetate of lead*, as well as several other acetates, may be substituted for acetate of copper in the above process; but are less economical and convenient. In all cases, great care must be taken to avoid over-firing, as thereby the quantity obtained is lessened, and the quality injured. The residuum of the distillation is pyrophoric, and frequently inflames spontaneously, on exposure to the air. Due caution must be therefore observed regarding it.

25. (Döbereiner.) Syn. *Alcohol Vinegar*, *German Acetic Acid.* In a bell glass or oblong glass case, arrange shelves, a few inches apart, one above another, on which place small flat dishes of earthenware or wood; fill these dishes with *spirit of wine* or *dilute alcohol*, and suspend over each, in small trays or capsules, a portion of the *black powder of platinum;* and hang strips of porous paper in the case, with their bottom edges immersed in the spirit to promote evaporation. Set the apparatus, loosely covered, in a light place at a temperature of from 70° to 90° Fahr.,—the sunshine, when convenient. In a short time the formation of acetic acid will commence, and the condensed vapours will be seen trickling down the sides of the glass and collecting at the bottom, whence it may be removed once or twice a day.

Obs. A case of 12 cubic feet content, with 7 or 8 oz. of platinum powder, is capable of producing, if well managed, nearly 1½*lb.* of absolute acetic acid from 1*lb.* of absolute alcohol daily; 25*lb.* of platinum powder and 300*lb.* of alcohol in like manner will give daily nearly 350*lb.* of *pure acid*, and of other strengths in proportion. Theoretically, the product should be 110·6 of anhydrous, or 130 parts of hydrated acetic acid for every 100 parts of alcohol consumed; but this cannot be quite obtained in practice, as a small portion of the alcohol mixes with the newly-formed acid, and escapes decomposition. The platinum powder does not *waste*, and the most *inferior* spirit may be employed. By the above elegant and economical process, perfectly pure acetic acid of considerable strength may be produced from pure alcohol, but it is impossible in this way to obtain a concentrated acid, without a subsequent opera-

tion. Unfortunately the revenue laws of this country forbid the adoption of this beautiful process, but there is no statute that prevents any individual employing it on the small scale for private consumption. In Germany, and the United States of America, vinegar is manufactured on this plan, and from the low price of crude alcohol there, it will no doubt prove ultimately to be the *cheapest source of both pure acetic acid* and culinary vinegars; more particularly of the latter.

26. *An excellent acetic acid* of considerable strength may be made by soaking fresh burnt and perfectly *dry charcoal* in *common vinegar*, and then subjecting it to distillation. The water comes over first, and on increasing the heat, the acid follows. Vinegar-bottoms and waste vinegar may be used.

27. By exposing vinegar or dilute acetic acid to the air in very cold weather, or to freezing mixtures, the water separates in the form of ice, and the strong acetic acid may be obtained by draining it into suitable glass vessels, observing to do so at a temperature sufficiently low to keep the water solid. Adapted to cold climates.

28. Acid containing 20% of water may be deprived of a good deal of its superfluous water by standing over dry sulphate of soda. (Liebig.) It may then be used either with or without distillation.

29. Acetic acid of ordinary strength, may be concentrated to any degree, by rectification once or oftener from dry acetate of potassa or soda, rejecting the first and last portions. The same acetate may be used repeatedly. The heat must not exceed from 500° to 570° Fahr.

Prop. Pure hydrated acetic acid is liquid above 62° Fahr.; at 50° to 55° it crystallizes in brilliant, colourless, transparent needles and plates; at 40° it is a crystalline solid. *Sp. gr.* 1·063, (Mollerat;) 1·0629, (Brande;) 1·062, (Ure.) *Sp. gr.* of *crystals*, 1·135 at 55° Fahr. (Ure.) *Odour*, grateful, fragrant, pungent, and refreshing; *taste*, intensely sour and acrid; volatile; colourless; inflammable, burning with a white flame; oxidizes iron, zinc, copper, nickel, and tin; dissolves camphor, resins, gum resins, volatile oils, gliadine, and albumen; miscible with alcohol, ether, and water in all proportions; combines with the bases forming salts called *acetates;* boils at 230°, (Ure;) 240°, (Fownes;) and is decomposed at a red heat.

Tests, &c. When free, it reddens litmus paper, and may be readily recognised by its odour and volatility. For its detection when combined, see *Acetate.* A very delicate test is to separate and neutralize the suspected acid with *carbonate of potassa*, and to distil the acetate thus formed along with a little *arsenious acid*, in the dry way, when Cadet's fuming liquor (*alkarsine*) will be driven over, the horrible odour of which cannot be mistaken for anything else. For the determination of the quantity of pure acetic acid in commercial samples of liquid acid, see *Acetimetry.* Organic mixtures that cannot be thus tested, or from which the acid cannot be obtained by simple distillation, may be neutralized, if acid, with *carbonate of lime*, boiled for a few minutes, cooled, filtered, the lime precipitated with *dilute sulphuric acid*, and the whole submitted to distillation, when the acid content may be estimated as above.

Pur. "By heat, it escapes (entirely) in vapour; nothing is precipitated on the addition of either nitrate of silver or chloride of barium. When a thin plate of silver is digested in it, and hydrochloric acid subsequently dropped in, no precipitate is formed. Its colour is unchanged by the addition of hydrosulphuric acid, or ammonia, or by ferrocyanide of potassium, added after the ammonia." (Ph. L.) Sometimes it is accidentally contaminated with a little sulphurous acid, which may be recognised by carefully inhaling the fumes, and by a white precipitate being formed on the addition of a little peroxide of lead.

Adult. The acetic acid of the shops is chiefly adulterated with water. The vinegars of commerce are scarcely met with pure. See *Acetimetry* and *Vinegar.*

Uses. Acetic acid is largely used by the chemist and pharmaceutist, for the manufacture of various preparations, and in analysis; by the perfumer, for the production of several of our most refreshing and choicest scents; and in medicine, as an antiseptic, stimulant, rubefacient, alterative, refrigerant, and escharotic. The acetic acid (Ph. L.) applied by means of a piece of rag tied to the end of a small stick, is said to be a certain cure for ringworm or scaldhead—one or two applications generally effect a cure; as a caustic, it removes warts and corns; a piece of lint or blotting-paper wetted with it and applied to the skin, (evaporation being prevented,) forms an extemporaneous blister; it was once employed as a disinfectant, but is now only used as a fumigation, to remove the unpleasant smell of the sick room or crowded assemblies. It is a popular refreshing scent in faintings, asphyxia, and nervous headache; and is a valuable rubefacient, astringent, and local stimulant. It is also

used as a rubefacient and caustic in *veterinary practice*. In its stronger forms it acts as a corrosive poison. The *antidotes* and *treatment* are similar to those directed for poisoning by the other acids.

In the *dilute state*, (vinegar,) a little added to water forms a useful drink in fever, scurvy, and phthisis. Added to clysters, it is useful in obstinate constipation; mixed with honey it forms a common gargle in ulcerated sore-throat; a few drops mixed with water make an excellent collyrium for chronic ophthalmia, and for removing lime-dust from the eye; in sprains and bruises it forms a valuable fomentation.

In the arts, it is used by the engraver to etch his plates; as an antiseptic in pickling and preserving animal and vegetable food, and anatomical preparations; in dyeing and calico printing; and in the manufacture of medicated vinegars and other pharmaceutical preparations.

As a *condiment*, vinegar promotes the appetite and assists digestion, but its habitual or excessive use is said to produce emaciation.

Dose, &c. Water soured with acetic acid or vinegar may be taken ad libitum as a refrigerant beverage. In *enemas*, 1 to 2 oz. of distilled vinegar is the proper quantity; for a *lotion*, 3 oz. of the latter to 5 or 6 oz. of water; and for a *collyrium*, 1 oz. to about a pint of distilled water.

Concluding Remarks. Acetic acid, *on the large scale*, is principally prepared from *acetate of soda*, which yields a sufficiently strong and pure acid for commercial purposes, without the trouble of rectification. In this process shallow vessels of wood, or of copper formed without rivets or solder in those parts exposed to the action of the acid, are employed for the purpose of the distillation. A coil of *drawn* copper pipe, heated by steam, having a pressure of 30 to 40*lb.* to the inch, traverses the bottom of the apparatus. The refrigeratory consists of well-cooled earthenware, Berlin ware, or glass vessels, and the adopter pipe is also of the same materials. *Stills* of earthenware are also frequently employed; and even worms and condensers of silver, or silvered copper, are sometimes used. The crystallized acetate of soda is placed in the still, and 35 to 36% of strong oil of vitriol is added; the whole stirred together with a wooden spatula, the head luted on, and the distillation soon afterwards commenced. The product has the sp. gr. of about 1·050, and after being agitated with a little animal charcoal, and passed through a prepared calico filter, is fit for sale. A little acetic ether is added by some manufacturers. In this way 4*lb.* of acid of the above strength is obtained for every 3*lb.* of the acetate of soda employed. Should rectification be had recourse to, the addition of about 2 or 3 per cent. of *bichromate of potassa, peroxide of manganese*, or *red oxide of lead*, will prove useful in removing empyreuma, if present. In distilling the weaker acids and vinegars, it is found useful to add from 25 to 30% of chloride of sodium, which, by raising the boiling point of the liquid, allows the acid the more freely to pass over, (Stein;) but this addition proves disadvantageous if any sulphuric acid be present, in which case sulphate of soda may be employed instead.

On the *small scale*, glass retorts are usually directed to be used, but glass alembics are more convenient and safe, as the product is less likely to be contaminated by the spirting of the ingredients over the brim of the vessel. In preparing the pure acid, care should be taken that the acetate of soda does not contain common salt, as the carbonate of soda, prepared by calcination, and frequently used to form the acetate, is generally contaminated with it, and yields up its muriatic acid during the process of distillation, thus vitiating the product. In all the methods given, the product becomes more concentrated in proportion to the dryness of the acetate and the strength of the oil of vitriol. By using the one *dry*, and the other *concentrated*, glacial acid may always be obtained by *collecting separately* the last two fifths that come over. The crystallized acetate loses about $\frac{3}{5}$ths of its weight by being thoroughly dried. See *Acetimetry*, *Vinegar*, *&c.*

ACETIC ACID (Anhydrous). Syn. *Dry Acetic Acid*, *Gerhardt's Acetic Acid*, *Acetylic Acid*, *Acetate of Acetetyle*. This is the preceding acid free from water, as it exists in the dry acetates.

Prep. 1. Mix, in a glass retort, well-fused *acetate of potassa*, with half its weight of *chloride of benzoyle*, apply a gentle heat, collect the liquid that distils over, and submit it to careful rectification.

2. Add *oxychloride of phosphorus* to a considerable excess of *acetate of soda*, agitate, and proceed as before. The product is *chloride of acetyle*, and *dry acetic acid*.

Prop., &c. A limpid, colourless, oily liquid; smelling of acetic acid and hawthorn; sp. gr. 1·073; boils at 278½° Fahr.; hot water resolves it into hydrated acetic acid. See *Acids*.

ACETIC ACID (Aromatic). Syn. *Aro-*

matic Vinegar; Acidum Aceticum Aromaticum,—Lat. *Prep.* (Ph. E. 1839.) *Dried rosemary* and *origanum*, of each, 1 oz.; *lavender flowers*, ½ oz.; *bruised cloves*, ½ dr.; *acetic acid*, (sp. gr., 1·068,) 1½ pint; macerate 7 days, express, and filter. A fragrant and refreshing perfume.

2. (Ph. E. 1817.) As above, using distilled vinegar instead of the strong acid of the Pharmacopœia. Inferior.

3. (Ph. Bor. 1847; Cod. Med. Hamb. 1845.) *Prep. Oil of cloves*, 1 dr.; *oils of lavender* and *citron*, of each 2 scrup.; *oils* of *bergamot and thyme*, of each 1 scrup.; *oil of cinnamon*, 10 drops; *strongest acetic acid*, 1 oz.; mix. Limpid; yellow-brown; highly fragrant and refreshing. See *Camphorated Acetic Acid* and *Aromatic Vinegar*.

ACETIC ACID (Camphorated). Syn. *Acidum Aceticum Camphoratum*,—Ph. E. & D. *Prep.* 1. (Ph. E.) *Camphor*, ½ oz.; pulverize by means of a few drops of *spirit of wine*, and dissolve in *acetic acid*, (Ph. E.), 6½ fl. oz.

2. (Ph. D.) *Camphor*, 1 *oz.*; *rectified spirit*, 1 *fl. dr.*; pulverize, and dissolve in *strong acetic acid*, (Acid. Acet. Forte—Ph. D.), 10 *fl. oz.*—*Obs.* Fragrant and refreshing; useful as an embrocation in rheumatism and neuralgia; and as a fumigation in fevers, &c.

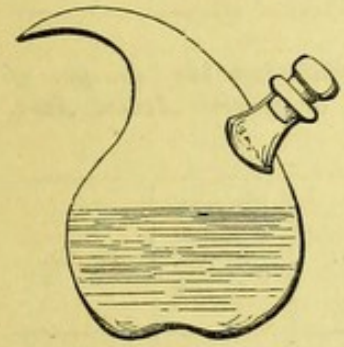
ACETIC ACID (Dilute). Syn. *Acidum Aceticum Dilutum*,—Ph. L. & D. *Prep.* 1. (Ph. L.) *Acetic acid*, (Ph. L.), 23 fl. dr.; *distilled water*, q. s. to make the whole accurately measure 1 pint. Sp. gr. 1·008. "One fluid ounce is saturated by 57 grains of the crystals of carbonate of soda." It contains about 6% of hydrated acetic acid.

2. (Ph. D.) *Acetic acid of commerce*, (sp. gr. 1·044), 1 pint; *distilled water*, 7 pints; mix. Sp. gr. 1·006. It contains about 4% of the hydrated acid.

ACETIC ACID (Strong). Syn. *Acidum Aceticum Forte*,—Ph. D. *Prep.* 1. (Ph. D.) *Glacial acetic acid*, (Ph. D), 6 fl. oz.; *distilled water*, 4 fl. oz.; mix. Sp. gr. 1·066. It contains 59% of the hydrated acid.

2. *Acidum Aceticum Fortius*,—Ph. L. 1824. See *Acidum Aceticum*,—Ph. L. 1836.

ACETIC ACID (from wood). Syn. *Acidum Aceticum e Ligno Venale*,—Ph. E. & D. The acetic acid of commerce; purified pyroligneous acid; sp. gr. 1·044.



ACETIFICATION. The oxygenation of alcohol in the process of making vinegar. To be capable of acetification or conversion into vinegar, it is necessary that the liquid should contain alcohol in some state or other, or some substance, as sugar, which, by the process of fermentation, is capable of producing alcohol. The presence of a ferment or nitrogenous vegetable matter, and a temperature between 70° and 100° Fahr., facilitates the operation. In the conversion of wines, beer, wort, &c., into vinegar, the sugar is first transformed by fermentation into alcohol, and in this state becomes oxygenized or acidified, by the absorption of atmospheric oxygen. This transmutation is operated by a species of catalytic action, which the researches of chemists have as yet left unexplained. Manufacturers should always remember that such is the true nature of this process. See *Fermentation*, and *Vinegar*.

ACETIMETRY. The art of determining the strength of acetic acid and vinegar. Several methods are employed for the purpose, based on the—*saturating power of the acid*; the—*specific gravity after the liquid has been neutralized with hydrate of lime*; and the—*simple specific gravity*.

Proc. 1. Take of *pure crystallized bicarbonate of potassa*, 196½ grs.; dissolve in *a little water*, and then add *water* to make up *exactly* 1000 parts by measure; as, for instance, 1000 minims, or the 100 divisions of an acetimeter, or graduated glass tube. A solution is thus formed, which, when cautiously added to *one hundred minims* or *measures* of acetic acid or vinegar, until the latter is *exactly* saturated, indicates the exact amount of acid present in the sample. The quantity of test liquor employed may be read off from the scale of the acetimeter, every division of which represents 1% of dry acetic acid. If the sample under inspection be the stronger acid, it will be found convenient, previously to testing it, to dilute it with 2 to 8 times its weight of distilled water, according to its degree of concentration. The dilute acid and vinegars require no such addition. Care must be taken to avoid the effervescence following each addition of the bicarbonate, vitiating the result. By using only 98¼ grains of the *bicarbonate of potassa*, we obtain a test liquid of still greater susceptibility. Every acetimeter division will then represent only half a grain of real acetic acid. The acetimeter employed is commonly one or other of those represented in the engraving.

2. *Crystallized bicarbonate of potassa*, 196½ grs.; *distilled water*, q. s. Dissolve in a suitably shaped bottle, previously carefully weighed, and see that the solution is *exactly* equal to 1000 grs. This test liquor is used like the last, but in this case the quantity tested must be 100 grs. instead of 100 measures. Every grain of the test liquor indicates $\frac{1}{10}$th of a grain of real acetic acid, and every ten grs. are equal to 1%. A convenient bottle for the purpose is Schuster's Alkalimeter. (See *engr.*) The weight of the bottle and solution, after the process, deducted from their previous weight, gives the exact weight of the test liquor consumed, and by dividing this number by 10, the quantity of acetic acid per cent. in the sample is immediately found. This method admits of great accuracy.

3. To 100 or 1000 parts of the sample under inspection, cautiously add from a *weighed* quantity of powdered *pure dry bicarbonate of potassa*, sufficient to produce exact neutralization, as before; and carefully re-weigh the bicarbonate unconsumed. Double the loss in grains will indicate the quantity of acid in the liquid tested.—Less accurate than the last, but more convenient, particularly to the traveller and man of business.

4. (Ure.) To 100 grains of the sample (as above), very slightly reddened with *neutral* (blue) *tincture of litmus*, add, cautiously, *liquor of ammonia* (ammonia water), sp. gr. 0·992, (from an acetimeter holding 1000 water-grains measure, divided into 100 divisions,) until precise neutralization be effected, indicated by the neutral or blue colour of the litmus being restored. The number of the acetimeter divisions of the test liquor expended, multiplied by 51 or 60, and the first two right-hand figures of the product cut off as decimals, will give a number which will represent respectively the exact quantity of *dry* and *hydrated* acetic acid in the sample.—*Ex.* I find a sample of vinegar takes 10 divisions of test liquor for complete neutralization; then $10 \times 51 = 5{\cdot}10$, or $5\frac{1}{10}$% of dry acid; or, $10 \times 60 = 6{\cdot}00$, or 6% of hydrated acetic acid. If the number of grain-measures be employed as the multiplier instead of the divisions of the acetimeter, then the first three right-hand figures must be pointed off. Thus, 175 grain-measures of test liquor being used, it would be, $175 \times 51 = 8{\cdot}925$, or nearly 9% of real acid; $175 \times 60 = 10{\cdot}500$, or $10\frac{1}{2}$% of glacial acetic acid. In practice, it is found more convenient to keep the ammonia water ready tinged with litmus, in which case it is added to the acid until it ceases to change colour, from blue to red. Great care must also be taken to have the ammonia water of the proper specific gravity. With care, this method gives very accurate results, and is easily applied.

5. Instead of bicarbonate of potassa, directed above, 104 grs. of *dry*, or, 281 grs. of *crystallized carbonate of soda*, or, 135 grs. of *dry carbonate of potassa*, may be employed, the usual precautions as to their purity being observed.

Obs. A matter essential to success in testing acetic acid or vinegar, in the way directed above, is hitting the exact point of neutralization; neither adding too little nor too much of the given test, from both of which inaccurate results must alike be obtained. It will be found greatly to simplify the operation to tint with litmus, either the sample under examination, or the test liquor, in the manner suggested above. Towards the end of the experiment, a gentle heat may be applied to the sample, in order to expel the free carbonic acid in the liquor, which of itself possesses the property of reddening litmus. A glass, with a rounded bottom inside, will be found most convenient to hold the sample, and a *glass* or *wooden* rod only should be used as a stirrer.

6. (*Revenue System.*) *Common hydrate of lime*, (powdered fresh-slaked lime,) is added gradually to the sample until it is saturated, when the sp. gr. of the resulting clear solution of acetate of lime is taken by the acetimeter of the Messrs. Taylor. This instrument resembles the common hydrometer in form, and stands at the mark on the stem called proof, in a solution containing 5% of real acid (No. 24 vinegar), 100 grs. of which are saturated by 14½ grs. of crystallized carbonate of soda. For vinegars stronger than proof, small weights are provided, each of which indicates an additional 5% up to 35%, the greatest strength at which the duty is levied by the gallon. To ascertain the per-centage of real acid, 5% must therefore be added to the acetimeter number. Thus: without being loaded, the instrument, on floating to the proof mark, indicates a vinegar of 5%; with *one* weight, a vinegar of 10%; with *two* weights, 15%; &c.: the starting-point, or proof, being an acid of 5%. According to this system of notation, which is now generally adopted in

trade, each 5% is called a vinegar. An acid of 10% is said to contain *two* vinegars; one of 15%, *three* vinegars, &c. It is also common to speak of the degrees of the acetimeter as *proof* or *overproof*. Thus: No. 24 vinegar is said to be proof; one of 5 acetimeter degrees—5 overproof; one of 10 degrees—10 o. p., &c. For malt and wine vinegars, which contain gluten and mucilage, this method is not strictly accurate, as these substances alter the specific gravity. A small weight marked, M, is therefore supplied by Mr. Bate with the acetimeters made by him for trying such vinegars.

7. By carefully ascertaining the *specific gravity* by any of the usual methods, and then seeking for the corresponding number in one of the following tables. This method furnishes reliable results when the liquid does not contain above 50% of glacial acid, or has a higher sp. gr. than about 1·060. By carefully diluting a strong acid with two, three, or four times its weight of water, and allowing it again to acquire its normal temperature, the sp. gr. may be taken as a guide; in which case, all that is necessary, is to multiply the indication furnished in the tables by 2, 3, or 4, as the case may be.

Concluding Remarks. Before applying any of the above processes, account should be taken of any mineral acid, which may have been added, (as is common with vinegars,) to impart artificial strength; and in those depending on the sp. gr., gum, gluten, &c. must also be allowed for. The methods depending on the saturating power of the acid will be found appropriate to acetic acid of all strengths, when unadulterated with the mineral acids; the *revenue system* is well adapted to commercial vinegars and all crude samples of acetic acid, within the limit of its scale, (40% of dry acid,) whether they be adulterated with oil of vitriol or not; as if the latter be present, it is precipitated, as sulphate of lime, by the hydrate of lime employed in the process. The method based on the sp. gr. is also very convenient, and is sufficiently accurate for distilled vinegars and pure acids of moderate strength.

It is found that the decimal fraction of the sp. gr. of pure or nearly pure vinegar, is doubled by its conversion into acetate of lime. Thus: 1·0085 in vinegar becomes 1·0170 when converted into a solution of acetate of lime. In malt vinegar, however, 0·005 may be deducted from the sp. gr. for mucilage and gluten. The quantity of foreign matter present in vinegar may therefore be approximatively ascertained, by deducting the decimal of the sp. gr. of the solution of acetate of lime from double that of the decimal part of the sp. gr. of the vinegar. Thus:—the sp. gr. of a sample of vinegar being 1·014, and after saturation with hydrate of lime 1·023, the sp. gr. of the *pure* vinegar would be 1·009, and that due to foreign matter ·005.

As both *dry* and *glacial* acetic acid are unavoidably referred to in speaking of strengths, it may be convenient to know that 51 parts of the *former* are equal to 60 parts of the *latter*; or, what is the same thing, the weight of *glacial* or *hydrated acetic acid*, multiplied by ·8512, gives the weight of the DRY or ANHYDROUS ACID which it contains; and that of the *anhydrous acid*, multiplied by 1·1748, gives a number representing an equivalent weight of GLACIAL ACID, (nearly.) See *Acidimetry* and *Vinegar*.

ACETO-BENZOIC ACID. See *Organic Acids*.

ACETO-CINNAMIC ACID—

ACETO-CUMINIC ACID. Both these compounds for the most part resemble aceto-benzoic acid, and are obtained in a similar manner.

ACETOMETRY. See *Acetimetry*.

ACETONE. Syn. *Pyroacetic Spirit, Pyroacetic Ether; Spiritus Pyroaceticus*,—Lat. *Acétone, Esprit Pyro-acétique*,—Fr. An ethereal liquid, chiefly obtained by the dry distillation of the acetates, the bases of which retain carbonic acid at a red heat.

Prep. Submit the *acetate*, placed in very shallow retorts, or other suitable vessels, to dry distillation, at as low a temperature as possible, compatible with its decomposition; slowly and cautiously increasing the heat, until no more spirit comes over. The product, after repose and separation from the empyreumatic oil with which it is mixed, must be rectified over carbonate of potassa, or chloride of calcium, or better still, over quick lime, to which some animal charcoal may be added, and the process repeated until the liquid be sufficiently pure, and its boiling point constant. The *product* is about 2 to 2¼ gallons of pyroacetic spirit for every cwt. of acetate of baryta or lime employed. Theoretically, the product should be about 20%, but such a quantity is unattainable in practice, owing to the decomposition of a portion of the newly formed acetone during the process. The *acetates* of *baryta, lime, potassa*, and *soda*, are the only ones adapted for the purpose; the preference being given to them in the order in which their names appear above. It may also be obtained in large quantities from *beech-tar*, and by distilling the *tarry deposit of crude pyroligneous acid*.

Prop. Limpid, colourless; miscible with water, alcohol, and ether, in all proportions; taste, pungent and acrid at first, afterwards cooling, somewhat like that of peppermint; odour, penetrating, aromatic, and slightly empyreumatic; sp. gr. 0·7922; boils at 132°;

very inflammable, giving a brilliant flame without smoke; dissolves resins and essential oils.

Uses. It is burnt in lamps, for which it is as good as spirit of wine, but requires more care; and is used to dissolve resins (gums) by the hatters, but for this purpose it is now almost superseded by wood-naphtha.

ACETONITRILE. A colourless, aromatic, volatile, liquid, obtained by distilling acetate of ammonia with anhydrous phosphoric acid.

ACETOUS ACID. It was formerly supposed there were two vinegar acids, containing different proportions of oxygen, which were accordingly named the *acetous* and *acetic;* the salts of the former being termed *acetites*, those of the latter, *acetates*. Modern research has shown their identity.

ACETOUS FERMENTATION. See *Acetification* and *Fermentation.*

ACETYLE. Syn. *Acetyl*, *Acetule*. The hypothetical radical of the acetic compounds. Neither acetyle nor its oxide has, as yet, been obtained alone. The *hydrated oxide of acetyle* is *aldehyde*. *Chloride of acetyle* is formed by the lengthened exposure of *chloride of ethyle* to the action of *chlorine* and *light*, and also in the process of making anhydrous acetic acid. It is a heavy, colourless, fuming liquid, decomposed by water, yielding acetic and hydrochloric acid. *Oxychloride of acetyle*, is prepared by saturating *anhydrous ether* with perfectly *dry chlorine gas*, exposure to external cold, and afterwards to a gentle heat. These are transparent colourless fluids. *Sub-oxychloride of acetyle* is a gas formed by heating the last article in contact with *potassium*. *Oxysulphuret of acetyle* is made by passing *sulphuretted hydrogen* through the *oxychloride*, until an oily liquid forms, which by exposure becomes semi-crystalline. This is dissolved in hot alcohol, and separates in crystals on cooling.

ACETYLIC ACID. Anhydrous acetic acid; so called on the presumption that it is a compound of acetyle and oxygen.

ACHILLEINE. A peculiar bitter principle obtained from the achillea millefolia, or common milfoil. See *Alkaloids.*

ACID. Syn. *Acidum*,—Lat. *Acide*,—Fr. In *familiar language*, any substance possessing sourness or acidity; in *chemistry*, an electro-negative compound, capable of uniting in definite proportions with bases, forming salts, and which, when either liquid or in solution, possesses a sour taste, and reddens litmus.

Class, &c. The acids have been variously classed by writers into *animal*, *vegetable*, and *mineral; organic* and *inorganic; metallic* and *non-metallic; oxygen acids*,(oxacids,) *hydrogen acids*, (hydracids,) and *acids destitute of either of these elements*, the names being applied according to the kingdom of nature, or class of bodies, to which the "radical" belongs, or after the "element' which was presumed to be the acidifying principle. The only useful general classification of these compounds is into *organic* and *inorganic* acids.

Gen. Prop., &c. Forms, various;—*gaseous*, as carbonic acid; *liquid*, as nitric and acetic acid; and *solid*, as citric and oxalic acid. Some under peculiar conditions assume more than one of these forms. Those which are soluble or liquid, taste sour, are corrosive when concentrated, change vegetable blues to red, and restore the original colours to vegetable blues turned green, or yellows turned brown, by an alkali. Most of the acids are soluble in water in all proportions, and some of them (as the sulphuric) have so strong an affinity for it, as to absorb it from the atmosphere. They neutralize the alkalies, effervesce with the carbonates, and combine with the bases generally, forming compounds termed *salts*. Most of the acids are either volatilized or decomposed by a moderate degree of heat, but some resist a considerable temperature.

Tests, &c. The method of testing for the individual acids will be found under their respective names. In most cases the mere presence of an acid may be known by the sourness of the compound, by its reddening blue litmus paper, and exhibiting the other general properties of acids already described. The *organic acids* are decomposed upon ignition, carbonized, and destroyed; their salts (particularly those with the alkalies and earths) also suffer carbonization, and are mostly resolved into carbonates of the respective bases. The *inorganic acids* deport themselves in a different manner when thus treated. Hence these two great classes of acids are readily distinguished from each other.

Ant., &c. All the stronger acids act as poisons, and some are very poisonous even when considerably diluted with water. The following is the treatment usually recommended when they have been swallowed. —Administer tepid water or other diluents (milk, broth, &c.) abundantly, mixed with chalk, magnesia, carbonate of magnesia, or the carbonates or bicarbonates of potassa (except for oxalic acid) and soda. Salad oil, oil of almonds, &c., may also be

given, followed by a strong emetic; and subsequently by emollients, warm baths, and, (to allay nervous excitability,) small doses of morphia or opium. The diet during convalescence should be light and digestible. When the poison is *oxalic acid*, chalk or magnesia should *alone* be used, as this acid forms a *poisonous* salt with the alkalies. See *Oxalic Acid* and *Hydrocyanic Acid.*

Uses. The acids are employed as escharotics, anti-alkalines, astringents, styptics, lithontriptics, tonics, refrigerants, &c. Water rendered slightly acidulous with them, is drank to lessen the perspiration and tendency to putrescence in fevers, and to allay the irritation in prurigo and other skin-diseases; and combined with bark, quinine, and bitters, as an alterative and tonic in the depraved condition of the body occurring in scurvy, secondary syphilis, mercurial disease, &c. The acids are also extensively employed in *veterinary practice.* In the *arts*, in *pharmacy*, *chemistry*, and *domestic economy*, the uses of the acids are numerous, various, and important.

Concluding Remarks. From the corrosive nature of all the strong liquid and soluble acids, they should be kept in glass bottles, furnished with perfectly tight ground-glass stoppers; glass vessels should be used in measuring them, and they should be dispensed in stoppered phials, whenever the compound containing them is more than very weakly acidulous. Too much care, also, cannot be observed in their administration, to prevent mere local action on the tissues before their secondary effects can occur. This is best prevented by the plentiful addition of pure water. For measuring the doses, glass or silver should alone be used, and it will be found advantageous either to take them from a "medical spoon," or to suck them up through a small glass or silver tube. The mouth should then be immediately rinsed with water, (especially after the mineral acids,) to prevent erosion of the teeth, which, when these acids are long taken, is often of a very extensive and serious description. See *Acidimetry.*

ACIDS (Anhydrous). Acid compounds free from combined water. See *Organic Acids.*

ACIDS (Mineral). Acids derived chiefly or wholly from the mineral kingdom. The sulphuric, muriatic, and nitric acids are commonly so called.

ACIDS (Organic). Those which are formed by or derived from organic substances, in opposition to those which originate from inorganic matter. The organic acids have recently been obtained by Gerhardt in the dry or anhydrous state. His process consists in adding *oxychloride of phosphorus* to an excess of a *soda salt* of the given acid, when the anhydrous acid may be separated by distillation, crystallization, or decantation, as the case may be.

The hydrous organic acids exhibit little disposition to combine with each other. In the anhydrous state the reverse is the case. Thus, chloride of acetyle and benzoate of soda, yield *aceto-benzoic acid;* and chloride of benzoyl and cinnamate of soda, *benzo-cinnamic acid.* Several other double organic acids may be obtained in the same way. Most of the above compounds, when treated with the alkalies or hot water, are reduced to the hydrated form, and several cannot be volatilized without suffering decomposition.

ACIDS (Oxygenised). Acids to which an apparent surcharge of oxygen is given by means of deutoxide of barium.

Prep. (M. Thènard.) Perfectly pure and freshly prepared *deutoxide of barium* is moistened with *water*, and after it has fallen to powder, (which it does without much increase of temperature,) it is mixed with seven or eight times its weight of *water*, and the *given acid*, in a dilute state, poured in, until the liquid becomes neutral, and neither acts on litmus nor turmeric paper, the solution during the whole time being promoted by constant agitation. The liquor, after being filtered or decanted, consists of pure water, holding in solution the oxygenized acid, or deutoxide of hydrogen combined with the acid operated on.

Obs. For the success of this process it is absolutely necessary that the deutoxide of barium be free from manganese and iron. The presence of a little silica and alumina, which usually occurs in the deutoxide prepared by decomposing the nitrate, is not material. See *Deutoxide of Barium.*

ACIDIMETRY. The estimation of the quantity of an acid contained in any given sample. *Acidimetrical processes* are founded chiefly on the capacity of the acids to saturate the bases; and in some of the liquid acids, on the specific gravity.

1. The *sample for examination*, (one hundred grains, or any convenient aliquot part thereof,) is placed in a suitable glass or tube, (*acidimeter*,) and if one of the stronger acids, diluted with six or eight times its weight of water, or if solid, (as oxalic, or citric acid,) dissolved in a like quantity. The liquid is then *exactly* neutralized with an alkali. The quantity of

the latter consumed for this purpose, represents an equivalent quantity of acid, from which the acid content of the sample is readily ascertained. The common practice is to dissolve *one equivalent* of the *alkaline test* in *water*, and to make up the solution to either *exactly* 1000 parts by measure, or 1000 grs., (100 acidimetrical divisions.) The equivalent value of the test liquid is then=100; and hence the *quantity* of the *sample tested* will bear the same proportion to the *equivalent number* of the *acid* under examination, that the *acidimeter divisions consumed*, bear to the *per-centage of acid sought*. Thus:—suppose 50 grs. of a sample of sulphuric acid, take 30 acidimeter divisions, (300 parts or grains) of the test-liquid, what is its content of real acid?—The equivalent of dry sulphuric acid is 40, therefore by the rule of proportion—

50 : 40 :: 30 : 24

It therefore contains 24 per cent. of dry sulphuric acid. If the 1000 parts or grs., instead of the number of the acidimeter divisions, be taken for the calculation, it will of course be necessary to point off the first right-hand figure of the result as a decimal. If 100 grs., instead of the *equivalent* weights of the given tests, be employed in making the solutions, *each grain*, or 1000th part, will then represent $\frac{1}{10}$th, and *each acidimeter degree*, 1 grain of the alkali or carbonate employed, when a similar proportion will obtain.

The following table represents the quantities of *ammonia*, of the *carbonates* and *bicarbonates of soda* and *potassa*, and of *carbonic acid*, equivalent to the given weights of the principal acids, (omitting fractions.)

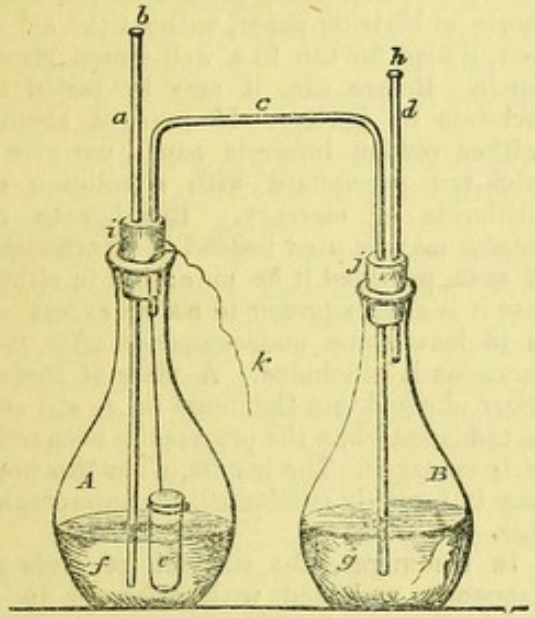
Table.

17 grs.	of pure ammonia, (*a.*)
53 „	dry carbonate of soda, (*a a.*)
143 „	crystallized ditto, (*b.*)
84 „	crystallized bicarbonate of ditto, (*c.*)
69 „	dry carbonate of potassa, (*a a.*)
100 „	crystallized bicarbonate of ditto, (*d.*)
44 „	dry carbonic acid (when the bicarbonate of potassa or soda is used for testing in the process of Fresenius & Will).
22 „	„ „ (when a carbonate is used).

Grains.	are equivalent to
51	Acetic acid (anhydrous).
60	„ „ (crystallized or glacial).
113	Benzoic acid (dry).
122	„ „ (crystallized).
35	Boracic acid (dry).
62	„ „ (crystallized).
22	Carbonic acid (dry).
58	Citric acid (dry).
67	„ „ (crystallized).
36½	Hydrochloric acid (dry).
109	„ „ (liquid, sp. gr. 1·16).
58	Malic acid (dry).
54	Nitric acid (dry).
67	„ „ (liquid, sp. gr. 1·5).
90	„ „ (sp. gr. 1·42).
36	Oxalic acid (dry).
63	„ „ (crystallized).
40	Sulphuric acid (dry).
49	„ „ (liquid, sp. gr. 1·845).
66	Tartaric acid (dry).
75	„ „ (crystallized).

(*a.*) 1000 grains measure of pure water of ammonia, sp. gr. 0·992, contain exactly 17 grs., or one equivalent of pure gaseous ammonia.

(*a a.*) Prepared by gradually heating the crystallized carbonate to redness.



(*b.*) The crystals must be free from attached water, but not the least effloresced.

(*c.*) The salt must be perfectly pure for this purpose.

(*d.*) Ditto.

2. (Fresenius and Will.) This method depends on the quantity of carbonic acid gas which a given weight of acid is capable of expelling from an alkaline bicarbonate, which is estimated by the loss of weight in the apparatus, after the gas, rendered perfectly dry by passing through sulphuric acid, has escaped into the air. The sample of *acid* is accurately weighed into the flask *A* (*see* Engr.), and if concentrated or solid, mixed with or dissolved in 6 or 8 times its weight of water. The little glass tube (*e*) is then nearly filled to the brim with *pure bicarbonate of soda* in powder, and a fine silken thread is tied round the neck of the tube, by means of which it is lowered down into the flask (*A*), so as to remain perpendicularly suspended when the cork is placed in the latter, the cord being held between the cork and the mouth of the flask. The flask (*B*) is next about half filled with *oil of vitriol*, and the tubes being arranged in their places, as represented in the engraving, the whole apparatus is accurately weighed, time having been allowed for the mixture of acid and water to *cool completely*, should it have become hot by mixing. The cork in the flask (*A*) is then slightly loosened, so as to allow the little tube containing the bicarbonate of soda to fall into the acid, and is again immediately fixed *air-tight* in its place. The evolution of carbonic acid now commences, and continues until the acid in the flask (*A*) is

neutralized. When this takes place, which is easily seen by no bubbles being emitted on shaking the apparatus, the flask *A* is put into hot water, (120° to 130° Fahr.) and kept there with occasional agitation until the renewed evolution of gas has completely ceased. The little wax stopper is

(*A.*) A wide-mouthed flask, capable of holding 2½ to 3 oz., containing sample for trial, (*f.*)
(*B.*) Ditto, capable of holding 1½ to 2 oz., partly filled with oil of vitriol, (*g.*)
(*a, c, d.*) Tubes fitting air-tight in the flasks by means of the corks (*i*) and (*j.*)
(*b.*) Piece of wax fitting air-tight on the end of (*a.*)
(*e.*) Small tube capable of holding about 1 drachm of powdered bicarbonate of potassa.
(*h.*) Open end of the tube (*d.*)
(*k.*) Silk cord fastened to the tube (*e.*)

then taken off the tube *a*, the apparatus taken out of the hot water, wiped dry, and suction applied by means of the mouth to the end of the tube (*d*,) until the sucked air no longer tastes of carbonic acid. The whole is then allowed to become *quite cold*, when it is replaced in the balance, (the other scale still containing the original weights,) and weights added to restore the equilibrium. The loss of weight represents the exact quantity of dry carbonic acid gas that has been expelled from the bicarbonate of soda, by the action of the acid in the sample examined. The quantity of *real acid* it contained may then be deduced by the following calculation:—*Two equivalents of carbonic acid gas* (= 44), bear the same proportion to *one equivalent of the acid* in question, as the amount of the *carbonic acid expelled*, does to the amount of the *acid* sought. Thus, suppose a dilute sulphuric acid gives 3 grs. of carbonic acid, the arrangement would be 44 : 40 :: 3 : 2·727, or, 2·73 grs. (nearly) of dry sulphuric acid. By multiplying the weight of the carbonic acid lost by the corresponding number in the *following* table, the *per-centage* strength of the sample will be at once obtained, provided 100 grs. have been examined. When only 50, 25, 20, or 10 grs. have been tested, this number must, of course, be doubled, quadrupled, &c., as the case may be.

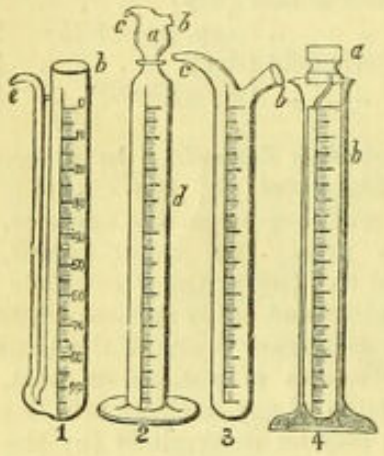


Table.

Acetic acid (dry)	1·159
„ „ (hydrated) . . .	1·364
Citric acid (crystallized) . .	1·523
Hydrochloric acid (dry) . .	·829
„ „ (sp. gr. 1·16)	2·478
Nitric acid (dry)	1·227
„ „ (sp. gr. 1·5) .	1·523
„ „ (sp. gr. 1·42) .	2·045
Oxalic acid (crystallized) .	1·432
Sulphuric acid (dry) . . .	·909
„ „ (sp. gr. 1·825)	1·114
Tartaric acid (dry) . . .	1·500
„ „ (crystallized) .	1·705

Concluding Remarks. In proceeding as described under (1,) the choice of the re-agent must depend on the operator. Some parties prefer the ammonia-test, before alluded to, (Ure,) which certainly is very convenient and easily applied; whilst others give a preference to one of the bicarbonates or carbonates of potassa or soda. "The proportion of any one free acid in any substance may be determined (by the ammonia-test) with precision, or to 1-50th of a grain, in five minutes." (Ure.) Whichever re-agent is adopted, care must be taken that it be perfectly pure, so far as the points already mentioned are concerned. A test solution once carefully prepared of the proper strength may be kept unharmed for any length of time, in a stoppered bottle, and will be always ready for application wherever a good pair of scales or a graduated tube is to be found. The only danger to be dreaded is over-saturation. Great care must be taken not to exceed the precise point of neutralization of the acid. After adding each portion, the solution should be well stirred up, and as soon as the effervescence becomes languid, the greatest caution must be observed in adding more. The proper point is arrived at when the liquid, after being slightly heated, ceases to *redden litmus*, and does not *alter the colour* of *turmeric paper*; if it turns the latter *brown*, too much of the test-liquid has been added, and the operation becomes useless. A good method is to tint either the acid sample or the test-liquid with a few drops of litmus, as before

recommended, when the reddish shade will gradually deepen into purple as the point of saturation is approached, and the blue colour be restored as soon as this point is reached.

The common forms of acidimeters have been already figured under *Acetimetry*. In using them the operator must be careful to pour the test-liquid out in drops, as occasion may require, without allowing the smallest portion to be wasted, by running over the outside. For this purpose the lip of the tube may be smeared with tallow. In practice, the simplest forms of acidimeters are the best, and have the advantage of being *less* costly and *more* durable than the others. When extreme accuracy is desired, or if the operator is inexpert at chemical manipulations, one or other of those figured in the margin may be used.

The ingenious and elegant method (2) is admirable in the hands of persons accustomed to chemical manipulations, and, though *apparently* complicated, is, in reality, very simple and easy to perform, when once well understood. The application of heat after the completion of the operation is indispensable, as if it were neglected, from 0·3 to 0·4 of a grain of carbonic acid would be retained in the liquid. The bicarbonate of soda must be *perfectly pure*, and *free* from any neutral carbonate or sesquicarbonate of soda. To ensure this, the bicarbonate of commerce is directed to be reduced to an uniform powder, put into a glass jar, and covered with its own weight of *cold* distilled or rain water, and allowed to stand for twenty-four hours, with frequent stirring. It is then placed upon a funnel, the tube of which is stopped with loose cotton, so as to allow the ley to drain off. It is next washed several times with small quantities of *cold* distilled or rain water, and after being dried between some sheets of blotting-paper, without the aid of heat, is kept for use in a well-closed glass-bottle. Before use, it may be tested to ascertain its purity. If pure, it should neither redden turmeric paper, nor give a brick-red precipitate with a solution of bichloride of mercury. Bicarbonate of potassa may be used instead of bicarbonate of soda, provided it be pure; but in either case it is always proper to use an excess, so as to leave some undecomposed after the operation is concluded. A piece of litmus paper plunged into the liquid in *A*, will not be reddened when the process has been properly managed. The results, when this process is properly conducted, are unimpeachable.

In commerce, the strength of acids is frequently reckoned with reference to a standard, termed 100 acidimetric degrees. This is taken from the circumstance that 91 grs. of commercial oil of vitriol, of a sp. gr. of 1·845, exactly saturate 100 grs. of dried carbonate of soda. An acid requiring only 35, 50, or any other number of grains of the carbonate to saturate it, is in like manner termed of so many degrees strong, the number of grains representing in each case an equal number of degrees. This method originated with the French chemists, and though only conventional, and principally confined to commercial purposes, is especially adapted to practical men.

The strength of all the liquid acids may be estimated, with more or less accuracy, from their specific gravity. Where this plan is applicable, it will be described under the respective acids. See *Acetimetry* and *Alkalimetry*.

ACIDITY (of Stomach). A common symptom of weak or disordered digestion.

Treat. Small doses of the carbonates or bicarbonates of potassa, soda, or ammonia, or of sal volatile, or ammonia water, three or four times daily, to which some tonic bitter may be added. Diet light and nutritious, and as much out-of-door exercise as possible. The bowels should be kept regular by the occasional use of some mild aperient. See *Dyspepsia, &c.*

ACNE. An eruption of distinct, hard, inflamed tubercles (or pimples), which are sometimes permanent for a considerable

length of time, and sometimes suppurate very slowly and partially. (Bateman.) This affection generally appears on the forehead or the chin, and less frequently on the other parts of the face. Occasionally it attacks the neck, shoulders, and breast, but seldom extends lower down the trunk. This disease is generally of a local character, and is commonly excited by heat, violent exercise, excessive indulgence, &c. It has been regarded by some as symptomatic of a failing constitution.

Treat., &c. There are four varieties of this affection mentioned by nosologists:—*Acne simplex*, *punctata*, *indurata*, and *rosacea*. The first three merely require cooling laxatives, a light diet, and stimulating lotions or ointments to the parts. For this purpose, a lotion of benzoin, sulphate of zinc, or bichloride of mercury, may be used; or the ointment of sub-acetate of lead, when there is much inflammation. An appropriate purgative is the compound powder of sulphur. *Acne rosacea* is of a more serious character, frequently attacking the nose and cheeks, producing tubercles, enlargement, and ulceration, which sometimes permanently disfigure the features. Occasionally the whole nose, and even a portion of the adjacent face, is covered by it, and marked by large veins, which spread out their branches like the tributary streams of a large river. When the circulation is active, the diseased surface is fully distended and brightly red. In cold weather, it becomes bluish, and even assumes a livid hue. This variety of acne is a frequent consequence of hard drinking, and is hence sometimes called "*acne bacchia*," but it often arises from other causes. Extreme temperance and an unstimulating diet must here be adopted, together with some weak cooling lotion (as that of Goulard water) to the inflamed parts. It sometimes becomes necessary to press out the contents of the pustules, which often resemble small grubs in appearance; or to apply small poultices to promote suppuration.

ACONITE. Syn. *Wolfsbane*, *Monkshood*; *Aconitum*,—Lat. The whole of this plant possesses deleterious properties, and acts as an acrid drastic purgative, even in small quantities. The leaves are the portion commonly employed in medicine.

Pois., Ant., &c. Antimonial emetic, and a purgative glyster; followed by decoction of galls or cinchona bark, or even of oak bark; afterwards, vinegar-and-water, and mucilaginous drinks. If the poison arises from a wounded surface, dry cupping or ligatures may be had recourse to at once. If in the early period cerebral congestion threatens, blood should be taken.

ACONITIC ACID. Syn. *Equisetic Acid*; *Acidum Aconiticum*,—Lat. An acid existing in the juice of the aconite, combined chiefly with lime.

Prep. It is obtained from the filtered *expressed juice of aconitum napellus*, in the way described under absinthic acid, page 3. It may be purified by solution in ether, and careful evaporation.

Prop. A white, odourless, semi-crystalline mass; soluble in alcohol, ether, and water; with the alkalis it forms soluble *aconitates*, and with the metallic oxides, salts that are wholly or nearly insoluble in water. It appears to be identical with the pyrocitric acid.

ACONITINA. Syn. *Aconitin*, *Aconitine*; *Aconita*, *Aconitia*,—Lat. An alkaloid discovered in 1833, by Gieger and Hesse, in the aconite, in combination with aconitic acid.

Prep. 1. (Ph. L. 1836.) Take of the *root of aconite* (aconitum napellus), dried and pounded, 2 lb; *rectified spirit*, 3 gals.; *dilute sulphuric acid*, *solution of ammonia*, purified *animal charcoal*, of each q. s. Boil the aconite with a gallon of the spirit for an hour in a retort to which a receiver is annexed; decant; and again boil with another gallon of the spirit and the recently distilled spirit. Let the same be done a third time. Then express the aconite; and the liquors being mixed and strained, let the spirit distil; and evaporate what remains to the consistence of an extract. Dissolve in water, filter, and again evaporate by a gentle heat to the consistence of a syrup; and to this add of the sulphuric acid mixed with water, q. s., to dissolve the aconitine. Next precipitate with the ammonia, and dissolve the precipitated aconitine in the acid, mixed with water as before. Then add the animal charcoal, agitate every quarter of an hour; strain, again precipitate with the ammonia, and wash and dry the precipitated aconitine.

2. (M. Hesse.) By adding *hydrate of magnesia* to the decoction of the *dried leaves of the aconitum napellus*, washing the precipitate with water, drying and then treating it with *boiling alcohol*, which dissolves out the aconitina and deposits the greater part of it again on cooling, and the remainder by gentle evaporation.

3. (Headland.) Evaporate *a tincture*, prepared with *rectified spirit* from the *root of the aconitum ferox* to the consistence of a syrup; dilute with twice its volume of water, *acidulate* with *dilute sulphuric acid*,

filter, and again evaporate to the consistence of a syrup by the heat of a water-bath; place the residuum in a stoppered bottle, add *strong liquor of ammonia* in excess; agitate, and to the white mass add *an equal bulk* of *ether;* place the bottle in a damp cloth, and agitate briskly for several minutes; and after repose, decant the ether. Repeat the agitation with *fresh ether*, a *second* and a *third time;* lastly, let the clear decanted ether evaporate spontaneously in an open basin. The residuum is perfectly pure aconitina.

Prop., &c. A white odourless powder, or semi-transparent, glassy mass, soluble in 150 parts of water at 60°, and in 50 parts at 212° Fahr. Freely soluble in hot alcohol and ether, and in the dilute acids forming salts. When quite pure, it may be obtained in crystals from its alcoholic solution, but much of the alkaloid is lost in the mother liquid. It is "largely soluble in sulphuric ether, less so in alcohol, and nearly insoluble in water. It is *totally* destroyed by heat, leaving *no salt of lime.*" (Ph. L. 1836.) The foreign aconitina, which sells about threepence per grain, is a spurious article. Mr. Morson is the only English manufacturer. His article fetches an extremely high price, (3*s.* 6*d.* a grain.) The "$\frac{1}{30}$th of a grain of Mr. Morson's aconitina killed a moderate-sized dog, whereas 1 or 2 grs. of the spurious alkaloid only produced slight sickness." (Garrod.) This small quantity has even endangered the life of an individual. (Pereira.) The pharmaceutical chemist cannot, therefore, be too careful in dispensing this article. It was formerly recommended by Dr. Turnbull, in very minute doses, in neuralgic affections, but is now only used externally, made into an embrocation and an ointment.

ACORN. Syn. *Okecorn: Glans Quercus.* In the early ages of the world, acorns formed one of the principal articles of the food of man. (Ovid, Virgil.) In modern times, during periods of scarcity they have been consumed as food on the Continent. We are told that the first settlers of Boston were reduced to the necessity of eating clams, muscles, ground nuts, and *acorns.* (Trumbull.) Husked, dried, and roasted, they have been used as a substitute for coffee.

ACORUS CALAMUS. Syn. *Sweet Flag, Sweet Rush, Sedge; Calamus Aromaticus,*—Ph. E. *Calamus Acorus, A. Verus, A. Asiaticus, A. Calamus,*—Lat. var. This plant is abundant in the marshy counties of England, and flowers in May and June. The root (rhizome) is officinal in the Edinburgh Pharmacopœia. It possesses a fragrant, warm, bitterish, aromatic taste, and an odour resembling that of a mixture of cinnamon and allspice, depending on the presence of a fragrant essential oil, and an aromatic bitter principle. Part of its aroma is lost by desiccation. Though now seldom employed in medicine, it might frequently be substituted for other and more costly aromatics, (Pereira;) especially in cases of dyspepsia, and as an adjunct to tonics and purgatives. (Lindley.) It is generally taken in the form of *infusion or powder.* The former is made by digesting 1 oz. of the *bruised root* in 1 *pint* of *boiling water* for an hour, in a covered vessel. The dose is a teacupful. *The powder* is given in doses of 10 grs. to 1 dr. once or twice a day. The root and its *essential oil* are used in perfumery and for flavouring spirit. 14 ℔ of the dried rhizomes yield 22 drs. of volatile oil. (Volter and Dann.) The oil is sometimes given in stomach complaints: 1 drop on a piece of sugar. A *fragrant water*, also used for similar purposes to the infusion and oil, is made by distilling 1 ℔ of the root along with 2 gallons of water, drawing over only 1 gallon. In Constantinople the rhizomes are made into a species of candy or confection, which is held in great repute as a pectoral and stomachic. In England it is chiefly used by the perfumers to scent hair-powder, and the composition for their scent-bags, (*sachets;*) and by the brewers, as a substitute for hops in the manufacture of bitter beer and ale. The London druggists are chiefly supplied from Norfolk, which produces an article fully equal in quality to that imported from the Levant.

ACROLEINE. When the fat oils are exposed to a heat sufficient to produce ebullition, acroleine, mixed with carburetted hydrogen, is given off. By passing the vapour through a series of well-cooled bottles, partly filled with water, and by re-distilling the contents of the second and third bottles, this substance is obtained in the form of an oily liquid, possessing a very disagreeable odour. It is best prepared by distilling *glycerine* with *bisulphate of potassa*, and purifying the product; but the process is attended with great difficulty.

Prop., &c. Pure acroleine is a thin, colourless, volatile liquid, lighter than water, boiling at 126° Fahr.; soluble in alcohol and ether, and sparingly so in water. Its vapour is irritating beyond description. It is decomposed by exposure to the air, contact with alkalies, &c.

ACRYLIC ACID. An acid formed by

the long exposure of acroleine to air, or by mixing it with oxide of silver. It greatly resembles the acetic and propionic acids.

ADEPS. Fat. The *adeps* ordered in the London Pharmacopœia is hog's-lard. "That which has been cured by chloride of sodium (common salt) is not to be employed." (Ph. L. 1851.) "It is not to be used without being carefully washed with water." (Ph. L. 1836.)

ADEPS (Magnetic). See *Magnetic Adeps.*

ADIPIC ACID. Syn. *Acidum Adipicum*,—Lat. A new acid discovered by Laurent, among the products of the oxidation of oleic acid.

Prep. Gently evaporate the *mother liquor, left from the process of preparing pimelic acid*, set it aside for some days, and then collect the crystals deposited; repeat this operation until the liquor ceases to yield crystals. Then dissolve them in *hot water*, skim off the oil, filter, evaporate, and crystallize. Dissolve in *ether*, and evaporate to one half; collect the crystals and repeat the process a second time; next dissolve the two crops of crystals separately in alcohol, when ADIPIC ACID, *in roundish crystalline grains*, and LIPIC ACID, *in plates*, will be obtained.

Prop. Colour, brown; soluble in hot water, volatile above 266°. Its salts are called *adipates.*

ADIPOCERE. Syn. *Grave Wax; Adipocera*,—Lat. *Adipocire*,—Fr. A substance resembling a mixture of fat and wax, resulting from the exposure of the flesh of animals in moist situations, or under water. It was proposed by Lavoisier to produce this substance artificially, for the purposes of the arts. Attempts have since been made to convert the dead bodies of cattle (carrion) into adipocere, for the purposes of the candle-maker and the soap-boiler, but without success. Besides, dead animal matter can be worked up more profitably than in making artificial adipocere.

ADRAGANTHINE. A name given by Bucholz to the pure mucilage of gum tragacanth. See *Tragacanthine.*

ADULTERATION. In proportion to the rapid strides made in every department of science and productive industry during the last half-century, has been the progress of the arts of sophistication and adulteration. The poor man's necessities and the rich man's luxuries—every article of food, medicine, and clothing, of trade, commerce, and manufactures, are now more or less mixed, adulterated, falsified, or drugged. The time has arrived when purity and wholesomeness can no longer be ensured by the payment of the fair price for a commodity, or by its purchase of a large and apparently respectable dealer. The revelations recently made on this subject in some of the medical journals, are sufficient to show the public, that the only safeguard against fraud and deception remains with themselves. There are laws in this country to punish those who adulterate what they sell, but except with respect to a few exciseable articles, the authorities are supine, and the laws almost useless. The only remedy left to the public is to take no man's word, but to examine what they buy. They must abandon the struggle between quality and low prices, often falsely called cheapness, and at once cease dealing with those men who sell them adulterated or inferior articles for pure or good ones. The knowledge necessary for such an examination is very easily acquired, and its application is not merely simple, but is capable of yielding a fund of rational amusement and useful occupation, which is almost inexhaustible. Easy means of detecting the adulterations commonly met with in trade, will be found explained, under all the more important articles noticed in this work.

ÆGYPTIACUM. Syn. *Ægyption; Unguentum Ægyptiacum*,—Lat. An old name for various detergent and corrosive liniments, principally composed of verdigris, vinegar, and honey. See *Oxymels.*

ÆSCULINE. A white crystalline powder obtained from the bark of the horse-chestnut tree (æsculus hippocastinum). When dissolved in water it possesses the property of communicating a bluish opalescence to a large quantity of that fluid. It is said to consist principally of extractive matter and lime.

ÆTHOGEN. A compound of nitrogen with boron, remarkable for the intense luminosity which it exhibits in the oxidating flame of the blowpipe.

Prep. (Balmain.) Take of *powdered anhydrous boracic acid*, seven parts; *melon*, nine parts; place the mixture in a crucible lined with *charcoal*, and apply heat, then transfer the product into a well-stopped phial.

Prop. A light powder, resembling magnesia, infusible, and nearly insoluble in water. Its compounds with the metals are called *æthonides.*

ÆTHONIDES. These may be prepared by either exposing a mixture of the metal and *æthogen* to heat, or a mixture of the *cyanide of the metal* with *boracic acid.*

AFFINITY. Syn. *Elective Attraction*,

Chemical Attraction. The peculiar power by which new substances or compounds are generated by the chemical union of dissimilar bodies. The result of its operation is *chemical combination.*

The following tables of chemical affinity exhibit the order of precedence in attractive force of the various substances for each other, for the circumstances under which the experiments on which they were founded were made, and subject to the various conditions which modify elective attraction. An intimate acquaintance with the order in which decompositions take place among compounds, is of vast importance to the chemical manufacturer, and, in fact, forms the ground-work of operative chemistry. The tyro in this art is therefore recommended to pay especial attention to the subject.

I. *Table of Simple Affinity, drawn up from the researches of Geoffrey, Bergman, Vauque'in, Fourcroy, Berthollet, and others, and arranged in alphabetical order expressly for this work.*

Obs. The substance, the attractions of which are to be shown, is placed at the commencement of each paragraph, and the substances to which it has an attraction, follow in the order of the forces of that attraction.

Acetic Acid. Baryta; Potassa; Soda; Strontia; Lime; Magnesia; Ammonia; Metallic oxides; Glucina; Alumina; Zirconia.

Alcohol. Water; Ether; Volatile oils; Alkaline sulphurets.

Alumina. *Acids*—Sulphuric, Nitric, Hydrochloric, Oxalic, Arsenic, Fluoric, Tartaric, Succinic, Mucic, Citric, Phosphoric, Lactic, Benzoic, Acetic, Boracic, Sulphurous, Nitrous, Carbonic, Hydrocyanic.

Ammonia. *Acids*—Sulphuric, Nitric, Hydrochloric, Phosphoric, Fluoric, Oxalic, Tartaric, Arsenic, Succinic, Citric, Lactic, Benzoic, Sulphurous, Acetic, Mucic, Boracic, Nitrous, Carbonic, Hydrocyanic; Oil; Water; Sulphur.

Arsenic Acid. The same as Fluoric acid, omitting Silica.

Baryta. *Acids*—Sulphuric, Oxalic, Succinic, Fluoric, Phosphoric, Mucic, Nitric, Hydrochloric, Suberic, Citric, Tartaric, Arsenic, Lactic, Benzoic, Acetic, Boracic, Sulphurous, Nitrous, Carbonic, Hydrocyanic; Sulphur; Phosphorus; Water; Fixed oils.

Benzoic Acid. White oxide of arsenic; Potassa; Soda; Ammonia; Baryta; Lime; Magnesia; Alumina.

Boracic Acid. The same as Fluoric acid, omitting Silica, and adding Water and Alcohol.

Camphoric Acid. Lime; Potassa; Soda; Baryta; Ammonia; Alumina; Magnesia.

Carbon. Oxygen; Iron; Hydrogen.

Carbonic Acid. Baryta; Strontia; Lime; Potassa; Soda; Magnesia; Ammonia; Glucina; Zirconia; Metallic oxides.

Citric Acid. Same as Oxalic acid, excepting that Zirconia should be inserted after Alumina.

Fixed Oils. Lime; Baryta; Potassa; Soda; Magnesia; Oxide of Mercury; Metallic oxides; Alumina.

Fluoric Acid. Lime; Baryta; Strontia; Magnesia; Potassa; Soda; Ammonia; Glucina; Alumina; Zirconia; Silica.

Hydrochloric Acid. The same as Nitric acid, excepting that Ammonia should stand above Magnesia.

Hydrocyanic Acid. Baryta; Strontia; Potassa; Soda; Lime; Magnesia; Ammonia.

Hydrogen. Oxygen; Sulphur; Carbon; Phosphorus; Nitrogen.

Lactic Acid. The same as Acetic acid.

Lime. *Acids*—Oxalic, Sulphuric, Tartaric, Succinic, Phosphoric, Mucic, Nitric, Hydrochloric, Suberic, Fluoric, Arsenic, Lactic, Citric, Malic, Benzoic, Acetic, Boracic, Sulphurous, Nitrous, Carbonic, Hydrocyanic; Sulphur; Phosphorus; Water; Fixed oils.

Magnesia. *Acids*—Oxalic, Phosphoric, Sulphuric, Fluoric, Arsenic, Mucic, Succinic, Nitric, Hydrochloric, Tartaric, Citric, Malic, Lactic, Benzoic, Acetic, Boracic, Sulphurous, Nitrous, Carbonic, Hydrocyanic; Sulphur.

Nitric Acid. Baryta; Potassa; Soda; Strontia; Lime; Magnesia; Ammonia; Glucina; Alumina; Zirconia; Metallic oxides.

Nitrogen. Oxygen; Sulphur; Phosphorus; Hydrogen.

Oxalic Acid. Lime; Baryta; Strontia; Magnesia; Potassa; Soda; Ammonia; Alumina; Metallic oxides; Water; Alcohol.

Oxide of Antimony. *Acids*—Gallic,

Hydrochloric, Benzoic, Oxalic, Sulphuric, Nitric, Tartaric, Mucic, Phosphoric, Citric, Succinic, Fluoric, Arsenic, Lactic, Acetic, Boracic, Hydrocyanic; Fixed alkalies; Ammonia.

OXIDE OF ARSENIC. *Acids*—Gallic, Hydrochloric, Oxalic, Sulphuric, Nitric, Tartaric, Phosphoric, Fluoric, Succinic, Citric, Acetic, Hydrocyanic; Fixed alkalies; Ammonia; Fixed oils; Water.

OXIDE OF COPPER. *Acids*—Gallic, Oxalic, Tartaric, Hydrochloric, Sulphuric, Mucic, Nitric, Arsenic, Phosphoric, Succinic, Fluoric, Citric, Lactic, Acetic, Boracic, Hydrocyanic, Carbonic; Fixed alkalies; Ammonia; Fixed oils.

OXIDE OF GOLD. *Acids*—Gallic, Hydrochloric, Nitric, Sulphuric, Arsenic, Fluoric, Tartaric, Phosphoric, Acetic, Hydrocyanic; Ammonia; Sulphuretted hydrogen.

OXIDE OF IRON. *Acids*—Gallic, Oxalic, Tartaric, Camphoric, Sulphuric, Mucic, Hydrochloric, Nitric, Phosphoric, Arsenic, Fluoric, Succinic, Citric, Lactic, Acetic, Boracic, Hydrocyanic, Carbonic.

OXIDE OF LEAD. *Acids*—Gallic, Sulphuric, Mucic, Oxalic, Arsenic, Tartaric, Phosphoric, Hydrochloric, Sulphurous, Suberic, Nitric, Fluoric, Citric, Malic, Succinic, Lactic, Acetic, Benzoic, Boracic, Hydrocyanic, Carbonic; Fixed oils; Ammonia.

OXIDE OF MERCURY. *Acids*—Gallic, Hydrochloric, Oxalic, Succinic, Arsenic, Phosphoric, Sulphuric, Mucic, Tartaric, Citric, Malic, Sulphurous, Nitric, Fluoric, Acetic, Benzoic, Boracic, Hydrocyanic, Carbonic.

OXIDE OF PLATINUM. *Acids*—Gallic, Hydrochloric, Nitric, Sulphuric, Arsenic, Fluoric, Tartaric, Phosphoric, Oxalic, Citric, Acetic, Succinic, Hydrocyanic, Carbonic; Ammonia.

OXIDE OF SILVER. *Acids*—Gallic, Hydrochloric, Oxalic, Sulphuric, Mucic, Phosphoric, Sulphurous, Nitric, Arsenic, Fluoric, Tartaric, Citric, Lactic, Succinic, Acetic, Hydrocyanic, Carbonic; Ammonia.

OXIDE OF TIN. *Acids*—Gallic, Hydrochloric, Sulphuric, Oxalic, Tartaric, Arsenic, Phosphoric, Nitric, Succinic, Fluoric, Mucic, Citric, Lactic, Acetic, Boracic, Hydrocyanic; Ammonia.

OXIDE OF ZINC. *Acids*—Gallic, Oxalic, Sulphuric, Hydrochloric, Mucic, Nitric, Tartaric, Phosphoric, Citric, Succinic, Fluoric, Arsenic, Lactic, Acetic, Boracic, Hydrocyanic, Carbonic; Fixed alkalies; Ammonia.

OXYGEN:—1. Carbon; Charcoal; Manganese; Zinc; Iron; Tin; Antimony; Hydrogen; Phosphorus; Sulphur; Arsenic; Nitrogen; Nickel; Cobalt; Copper; Bismuth; Mercury; Silver; Arsenious acid; Nitric oxide; Gold; Platinum; Carbonic oxide; Hydrochloric acid; White oxide of manganese; White oxide of lead.

2. (Vauquelin's table of the affinity of the metals or oxygen, according to the difficulty with which their oxides are decomposed by heat.)—Titanium; Manganese; Zinc; Iron; Tin; Uranium; Molybdenum; Tungsten; Cobalt; Antimony; Nickel; Arsenic, Chrome; Bismuth; Lead; Copper; Tellurium; Platinum; Mercury; Silver; Gold.

PHOSPHORIC ACID. Baryta; Strontia; Lime; Potassa; Soda; Ammonia; Magnesia; Glucina; Alumina; Zirconia; Metallic oxides; Silica.

PHOSPHOROUS ACID. Lime; Baryta; Strontia; Potassa; Soda; Ammonia; Glucina; Alumina; Zirconia; Metallic oxides.

PHOSPHORUS. The same as Sulphur.

POTASSA. The same as Ammonia.

SILICA. Fluoric acid; Potassa.

SODA. The same as Ammonia.

STRONTIA. *Acids*—Sulphuric, Phosphoric, Oxalic, Tartaric, Fluoric, Nitric, Hydrochloric, Succinic, Acetic, Arsenic, Boracic, Carbonic; Water.

SUBERIC ACID. Baryta; Potassa; Soda; Lime; Ammonia; Magnesia; Alumina.

SUCCINIC ACID. Baryta; Lime; Potassa; Soda; Ammonia; Magnesia; Alumina; Metallic oxides.

SULPHUR. Potassa; Soda; Iron; Copper; Tin; Lead; Silver; Bismuth; Antimony; Mercury; Arsenic; Molybdenum.

SULPHURETTED HYDROGEN. Baryta; Potassa; Soda; Lime; Ammonia; Magnesia; Zirconia.

SULPHURIC ACID. Baryta; Strontia; Potassa; Soda; Lime; Magnesia; Ammonia; Glucina; Yttria; Alumina; Zirconia; Metallic oxides.

SULPHUROUS ACID. Baryta; Lime; Potassa; Soda; Strontia; Magnesia; Ammonia; Glucina; Alumina; Zirconia; Metallic oxides.

TARTARIC ACID. Same as Oxalic acid.

TUNGSTIC ACID. The same as Fluoric acid.

II. *Table of the Sequences of the Bases with the principal Acids, by* Dr. YOUNG.

Obs. In all mixtures of the aqueous solutions of two salts, each acid remains united to the base which stands nearest to it in this table.

SULPHURIC ACID.

* Ammonia stands above magnesia when cold.
† A triple salt is formed.
‡ Perhaps magnesia ought to stand lower.
§ A compound salt is formed, and when hot, magnesia stands above ammonia.
‖ Fourcroy says, that sulphate of strontia is decomposed by borate of ammonia.
¶ With heat, ammonia stands below lime and magnesia.

AFFUSION. The affusion of cold water has been successfully employed in the treatment of the early symptoms of low contagious fever, during the state of the greatest heat and exacerbation, even when the heat of the body reached 102° to 105° Fahr., and general restlessness increasing to delirium was present. Sponging the body may be adopted instead of affusion. The water may be medicated by the addition of a little vinegar, and employed tepid, if preferred. A shower bath is of a similar character, applicable during either health or disease. In certain stages of scarlatina and low typhus, and in inflammation of the brain, affusions have been found particularly serviceable. They should not be employed during either the cold or sweating stage of fever, nor in the hot stage when the heat does not much exceed the natural standard. The affusion should be continued until the patient feels cold and shivers, when the skin should be well dried, and the recumbent posture again resumed. A little warm wine-and-water may be administered to aid reaction and the consequent perspiration. Evening is the best time for the operation. See *Baths*, *&c.*

AFTER-PAINS. These distressing annoyances are, perhaps, best met by time and patience. They may be sometimes alleviated by small doses of morphia or opium.

AGATE. A semi-pellucid uncrystallized variety of quartz, remarkable for its hardness, variety of colour, and susceptibility of receiving a high polish. It is an aggregate of various siliceous minerals, of which chalcedony appears generally to be the base. Carnelian, jasper, amethyst, and other similar minerals, often enter into its composition. The colours are often delicately arranged in stripes, bands, or clouds. Those which take an angular form, as the *Scotch pebble*, are called *fortification agates*. The agate is the least valuable of the precious stones, and is chiefly made into rings, seals, beads, burnishers, &c., on account of its hardness.

AGRICULTURE. The origin and progress of agriculture, as well as the description of the mechanical operations of the agriculturist, do not properly come within the province of this work. Our remarks will therefore be confined chiefly to a few points which depend upon principles which may be accounted for by chemistry or its allied sciences.

The principles of agriculture are derived from a knowledge of the nature of plants and animals, of soils and manures, in their several relations with chemistry and physiology, and as influenced by climate, the seasons, and the weather. *Plants* are organised beings, which take up their food by means of roots, from the interior of the

soil, and by means of their leaves from the atmosphere; *animals* are organized beings, which select their food from vegetables growing on the surface of the soil, or from other animals, their food being prepared before being absorbed into their system, by means of a stomach. The nature of these elementary principles being understood, even though imperfectly, improvements may be effected by art, which will greatly conduce to the increase of the agricultural produce obtained from any given surface of land. Among these principles, none are more important than those which relate to the *amelioration of the soil*, and maintaining it in a high state of fertility.

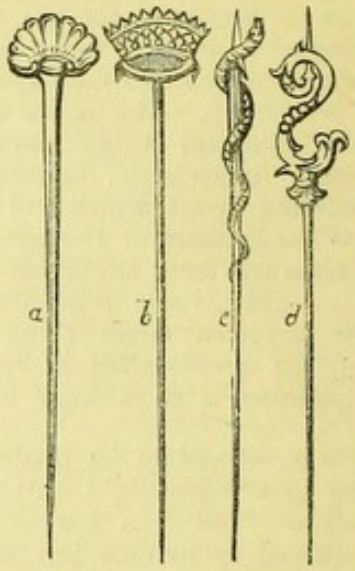
All soils are found to be productive in proportion to the organized matter which they contain. This is a law of nature, which, followed up by man, has led to the use of manures; as the fact everywhere observed, that no plant can live without water, has led to irrigation; and, as the observation, that the excess of water is injurious, has led to surface and under-draining. *Manures* are composed of either animal or vegetable matter; which may be either applied separately or together, and in a fresh state or in a state of decay. Their action is, however, much more effective after they have undergone the putrefactive fermentation. In employing manures, the great object of the cultivator is to apply *enough for the ensuing crop, and as little more as possible;* as all that is applied and not immediately used, is liable, to a certain extent, to have its particles carried off by evaporation (volatilization) into the atmosphere, or by rain into rivers or the sea. But even if this were not the case, to manure a soil which would not immediately yield a crop, would be an expenditure of capital without interest.

The improvement of the soil, considered as a mixture of different earths, mainly consists in rendering it more or less retentive of water, by the addition of clay in some cases, and of sand in others; and by the addition of such earthy, mineral, or saline matter, as may be present in too small quantities, or absent altogether. Experience shows, that those soils which are composed of *several* primitive earths are naturally more productive than those that consist of only *one* earth, other circumstances being the same; and that no soil will maintain its fertility for any length of time, that does not contain a very large proportion of calcareous earth (lime) in its composition. Hence, the addition of lime, and the admixture of soils with other soils of an opposite description.

The *rotation*, or *succession of crops*, may also be considered as connected with the fertility of soils, and the application of manures. To maintain a soil in a fertile state, it is not only necessary to supply it with manure, in proportion to the crops which have been carried from it, but to *vary* the crops which it is made to produce. It is found that plants belonging to the *same natural family, do not succeed so well after each other*, as when crops *of a different family* are made to intervene. Thus, the several grasses alternate better with root or herbage crops, than with one another; or, one of those grasses of which the *seed is ripened* will alternate better with another in which the *herbage* only constitutes the crop, than with one of the same kind as itself. Something analogous also takes place with regard to the pasturage of animals. Cattle flourish better in a field that has been grazed by horses, than *horses* after *horses*, or *cattle* after *cattle*. (Loudon.) The succession of crops becomes necessary, from the fact that certain mineral or saline matters enter into the composition of one class of plants, which are not required by another; at the same time that the other matters present in the soil accumulate ready to be appropriated by those plants into the constitution of which they enter. The necessity for the rotation of crops can only be obviated by supplying such plants with a proper quantity of the substances which enter into their composition, in the shape of manure. This practice requires a thorough knowledge of the chemical constitution of both the plants and soil; besides which, the expense of so doing so greatly exceeds that of the ordinary method of manuring with the proper rotation of crops, as to preclude its introduction on the large scale. Crops should therefore always succeed each other in such a way that the soil may not be exhausted of any one particular kind of nutriment.

AGUE. A species of fever which comes on only at stated intervals, (hence called *intermittent fever*,) leaving the patient, between the periods of attack, free from febrile symptoms, but generally in a state of languor and inaptitude, or disinclination to physical exertion. The attacks of this disease usually return with great regularity, and have, in consequence, been distinguished by names having reference to the periods of their visits; as—*Quotidian*, returning every second day;—*Tertian*, every

third day;—*Quartan*, every fourth day; and so on, until the interval extends to nine or ten days.



Symp.—1. The *cold stage*, marked by debility, paleness, coldness, drowsiness, and general rigors throughout the body, impaired respiration, nausea, vomiting, &c.—2. The *hot stage*, distinguished by the usual marks of fever, and, in some cases, delirium, &c.—3. The *sweating stage*, marked by a copious perspiration, and a gradual return of most of the functions of the body to their ordinary state. In many cases, the symptoms and the succession and duration of the stages vary.

Treat., &c.—1. (*Palliative.*) An emetic or a full dose of opium or laudanum has been recommended at the commencement of the fit, followed by a warm foot, hip, or full bath. Stimulants, as ether, spirits, &c., are also used, but, when they fail to relieve, they tend to aggravate the distemper.—2. (*Curative.*) This consists in the administration of febrifuge medicines during the intermission of the paroxysms. The principal of these are *bark and its preparations* and *liquor of arsenic*. Two or three doses of purgative medicine may be given, after which 2 to 5 grs. of the disulphate of quinine (in solution) may be taken three or four times daily; or, when this cannot be obtained, 1 to 2 dr. of powdered cinchona bark. When the stomach rejects the powder, the infusion, decoction, or extract of bark may be employed. Quinine, properly administered, generally cures ague. The solution of arsenite of potassa (liquor arsenicalis, Ph. L.) is also a valuable medicine in ague, but its use requires care and attention. Under the name of "tasteless ague drop," it has cured thousands. *Dose*, at first, 5 drops twice a day, gradually raised to 20 drops. This is the common ague medicine in the fen counties of England. Warm clothing and a light nutritious diet should be adopted during the curative course; and if the patient reside in a swampy or marshy district, he should remove as quickly as possible to one of a drier and opposite description.

AGUE DROP. Solution of arsenite of potassa.

AGUSTINE. A name given by Tromsdorff to a supposed new earth found by him in the Saxon beryl. It is merely phosphate of lime.

AIGUILLETTE. A term applied to several small dishes, from the articles of which they consist being mounted on silver needles or skewers with ornamental handles or tops. They form one of the varieties of the hors-d'œuvres of Soyer, or dishes to be handed round the table.

Attelettes from Soyer.

AIGUILLETTES (de Ris de Veau). Syn. *A. of the Sweetbread of Veal. Prep.* (Soyer.) Take *throat sweetbreads*, three in number; boil in *water* ten minutes, pour off the liquor, add *one onion, one carrot, one turnip, two bay-leaves*, and a *pint* of *white broth;* simmer twenty minutes, cut them into round pieces about the size of a shilling, and season with *salt* and *pepper;* next put them into a stew-pan, with butter, 1 *oz.*; dress them quite white; then dip each piece with a fork into a mixture of *white sauce*, 10 tablespoonfuls; *light stock*, eight ditto; *yelks* of *two eggs;* and the juice of *half a lemon;* previously brought to a proper consistence without quite boiling. When cold, run the skewers through the pieces, putting two or three on each skewer; dip them into *four eggs*, well beaten, then into bread crumbs, and fry in hot lard. Serve on a napkin.—*Aiguillettes aux Huitres*, (oysters);—*Aiguillettes de Homard*, (lobsters);—*Aiguillettes de Filets de Sole*, (soles);—*Aiguillettes de Langue de Bœuf*, (ox-tongue);—*Aiguillettes de Volaille à la Jolie Fille*, (fowl); are prepared in a similar manner to those before described, merely varying the sauces, &c., to suit the article and palate.

AIR. The fluid we breathe. This term was formerly applied to any aeriform body or gas, but is now usually confined to the gaseous matter forming our atmosphere. This compound consists of a mixture of *nitrogen* and *oxygen*, together with a small quantity of *aqueous vapour* and *carbonic acid*. It may be described as an inodorous, invisible, insipid, colourless, elastic fluid

or gas, possessing gravity, and easily moved, rarefied, and condensed. See *Atmosphere*, *Ventilation*, *&c.*

ALABASTER. There are several varieties of alabaster, known in the arts, all of which may be ranged under two heads:

1. *Calcareous* or *Oriental alabaster*, is a sub-variety of carbonate of lime, formed by the deposition of calcareous particles in the caverns of limestone rocks. It has a foliated, fibrous, or granular structure, a pure, soft, rich, semi-translucent whiteness, generally agreeably variegated with undulating zones or stripes of various shades of yellow, red, or brown. This variety is that most esteemed by sculptors, and for the manufacture of alabaster ornaments.

2. *Gypseous* or *common alabaster*, is a natural hydrous sulphate of lime, containing a little carbonate of lime. That from the quarries of the Paris basin contains 12% of the latter substance. When calcined or roasted at a heat of about 400 Fahr., (for which purpose that of a baker's oven will do,) it loses its combined water, and when powdered, forms the substance known under the name of *Plaster of Paris*. In this state, when mixed with water to the consistence of cream, and poured into moulds, it rapidly hardens, receiving a sharp and faithful impression of even the finest lines with which it comes in contact. It is thus employed by the manufacturers of stucco ornaments, and affords to the poor Italian artist the means of producing copies and imitations of the works of the great masters, at a rate sufficiently low to place them within the reach of almost every class of society. The more compact, fine-grained specimens of this variety of alabaster, are, like the preceding one, sculptured into almost numberless articles of ornament and utility, such as vases, clock-stands, statuettes, &c. The inferior kinds are manufactured into the plaster of Paris of the shops.

Alabaster is bronzed by simply covering the surface (previously prepared with one or two coats of *size*) with a *bronze-green-coloured paint;* and when this is nearly dry, dabbing on the prominent parts, with a wad of soft cotton, a little *bronze powder*, such as is sold by artist's colourmen. On the taste exercised in this part of the operation depends the beauty of the work. A good paint for the purpose is made of *verdigris* and *ochre*, tempered to the desired tint with *Prussian blue*. The addition of a little *bronze-powder* or *Dutch leaf*, to this paint, improves it.

Alabaster is cleaned with a brush and warm *soap-and-water;* afterwards well rinsing it in *clean water*. If necessary, the surface must be re-polished. *Grease spots* may be removed with a little clean *oil of turpentine*.

Alabaster is engraved or *etched* by covering every part of the surface of the subject or cast, except that to be etched, with a solution of *white wax* in *oil of turpentine* (1 to 4,) thickened with a little finely powdered *white lead*, and subsequent immersion in *water* for 20 to 50 hours, according to the effect desired. The varnish is washed off with *oil of turpentine*, and the etched parts carefully brushed over with *powdered gypsum*. The effect is produced by the solvent action of water on gypsum. This does not succeed with calcareous alabaster.

Alabaster is hardened,—1. By exposing the unpolished articles for 12 to 24 hours, to *a heat about equal to that of a baker's oven*, and when they are withdrawn and considerably cooled, *immersing* them for the space of 2 to 5 minutes in *pure river water*. The operation is sometimes repeated a second time, and 3 or 4 days are allowed to elapse before polishing them.

2. As the last, but employing *a weak solution of alum*, (alum-water,) instead of river water.

3. Dip the cast or model, previously warmed, and suspended by a fine silken cord or wire, into the *purest white wax*, melted in a suitable vessel. The operation should be repeated until the liquid wax begins to rest unabsorbed on the surface of the plaster, when the article must be placed aside (suspended) until the next day, and then polished with a brush.—*Obs.* The itinerant image vendor of London imitates this process by brushing over the surface of his wares, previously warmed, melted tallow, suet, or stearine. These substances, however, not only injure the colour of the plaster, but render it more attractive of dust and dirt.

4. Suspend the article, as last, in a wooden trough or any suitable vessel of glass or earthenware; cover it with a *strong* and *perfectly clear solution of alum*, and let it remain until a sufficient quantity of the salt has crystallized on the surface. It should be afterwards polished with a wet cloth.

5. Mix up the plaster of Paris with *weak alum-water*, instead of common water; but otherwise proceed in the usual way.

6. Mix up the plaster with *a weak solution of gum Arabic*, (1½ or 2 *oz.* to the pint

of water,) or, for rough purposes, with a *weak solution of size.*

Obs. Beautiful imitations of marble may be produced by each of the above processes; but some care and address is necessary to ensure success. They refer to gypseous alabaster only.

Alabaster is joined by means of a little *white of egg*, thickened with *finely powdered quicklime*, or by a paste of newly-baked and *finely powdered plaster of Paris*, mixed up with the least possible quantity of water.

Alabaster is polished, first with *pumice stone*, and then with a paste or pap made of *whiting*, *soap*, and *milk* or *water;* and lastly with *dry flannel.* A better method is said to be to take the article in the rough state from the hands of the sculptor or turner, and to rub it with *dried shave-grass* (equisetum), and afterwards, with *finely powdered* and *sifted slaked lime* formed into a paste with *water.* The resulting rough polish is then brought up and finished off by friction with finely-powdered *talc*, or *French chalk*, until a satiny lustre is produced.

Alabaster is stained or *coloured* by mixing with the water used in working up the plaster any of the *ordinary pigments* or coloured solutions that are not decomposed by contact with sulphate or carbonate of lime. A little *terra di Sienna*, in very fine powder, or ground with water, added to the water as above, imparts a very pleasing colour to busts, statues, medallions, &c. In the rough way, for architectural purposes, &c., the colours or stains are commonly added in the required quantity, to a solution of clear size, which is then made into a paste with plaster. In this manner coloured stuccoes of great hardness and durability are produced.

Alabaster is wrought, *turned*, and *fashioned*, in a similar manner to the softer varieties of marble.

ALANINE. A peculiar substance, possessing feeble basic properties, obtained by Strecker from aldehyde.

Prep. An aqueous solution of *aldehyd-ammonia* is treated with *hydrocyanic* and *hydrochloric acid;* a mixture of *alcohol* and *ether* is then added, and the precipitate (chloride of ammonium) removed by filtration; the filtrate is next agitated with *protoxide of lead*, and subsequently separated from the lead by passing a stream of *sulphuretted hydrogen* through it. The decanted liquid yields feathery crystals of *alanine* on evaporation.

Prop., &c. Crystals, rhombic prisms of a pearl-like lustre; soluble in cold water; scarcely so in alcohol; insoluble in ether; solution, neutral, and tastes saccharine. Under the influence of nitrous acid it is converted into lactic acid precisely identical with that obtained from milk-sugar.

ALANTIN. Syn. *Alantina.* A starchy substance identical with inulin, found in the roots of elecampane and garden angelica.

ALBATA. A white metal, formed by alloying copper with nickel and zinc, to which sometimes a little lead and iron are added. See *Alloys.*

ALBUMEN. A peculiar nitrogenous substance which enters largely into the composition of animal bodies. It abounds in the blood, muscles, bones, coagulable lymph, vitreous and crystalline humour of the eye, fluid of dropsy, &c. &c. The white of egg consists of nearly pure albumen dissolved in water.

Prep. 1. The *white of egg* and the *serum of the blood*, when strained through muslin, furnish albumen, in solution, in a sufficiently pure state for all the ordinary purposes of the arts.

2. Agitate the strained *white of egg* with 10 or 12 times its bulk of *alcohol*, collect the precipitated flocculi on a muslin filter, and suffer it to dry at a temperature not exceeding 120° Fahr.

3. Add a little *water* to *white of egg*, mix, filter, exactly neutralize with *acetic acid*, and then largely dilute with pure *cold water;* the precipitate which falls may be collected on a filter and washed. The strained serum of blood may be used instead of white of egg, in both the above forms. The last two are perfectly pure.

Prop., &c. Perfectly pure solid albumen is scarcely soluble in water, but dissolves readily in water containing an exceedingly small quantity of caustic soda or potassa; it is nearly colourless, inodorous, and tasteless. When dried by a gentle heat it shrinks into a translucent, horny mass, and when exposed to a sufficient temperature, yields the usual ammoniacal odour and products of animal matter. Its solution (white of egg) is solidified or coagulated by a heat of from 145° to 165° Fahr., forming a white, opaque mass; when very dilute, on boiling (only) it separates in fine light flocks. When thus coagulated, it is insoluble in water at a less temperature than 302° Fahr., (Wohler and Vogel,) unless alkalized. Ordinary solutions of albumen give precipitates with sulphuric, hydrochloric, and nitric acid, with tannin and astringent solutions, and with most of the metallic salts, but are not affected by either acetic or tribasic (common) phos-

phoric acid. Alcohol, in quantity, also precipitates albumen by seizing on the water which holds it in solution.

Tests.—1. A solution of bichloride of mercury dropped into a fluid containing albumen occasions a white precipitate.—2. Subacetate of lead acts in the same way. Either of the last two will render turbid a solution containing only the 1-2000th part of fresh white of egg, or the 1-10,000th part of dry albumen.—3. Tannin and tincture of galls give a yellow, pitchy precipitate.

ALBUMEN (Flake). Syn. *Albumen in powder, Solid Albumen, Soluble do., Planter's do. Prep.* Expose the strained *white of egg* or the *serum of bullock's blood* in a thin stratum, to a current of dry air, until it concretes into a solid transparent substance, resembling horn. In this state it may be kept any length of time, or it may be further dried until brittle, and then powdered.

Use. It is extensively used as a clarifier in the sugar plantations of the West Indies, and elsewhere. It is prepared for use by stirring it with cold water until it is dissolved, when it is whisked to a froth in the usual way, and agitated with the liquid to be clarified.

ALCARAZZA. A species of porous earthenware made in Spain for cooling water and other liquids. Similar articles are made in England under the names of *water coolers, wine coolers, butter coolers, &c.*

Prep. 1. Take *sandy-marl*, 2 parts; *brine*, q. s.; make a dough, and then knead in *common salt*, in fine powder, 1 part; bake slowly, and lightly.

2. *Good clay*, 2 parts; *fine silicious sand*, 3 parts; *brine*, q. s.; *common salt*, 1 to 2 parts; only half bake, as before.

3. *Powdered clay*, 2 parts; *powdered charcoal*, 3 parts; (by weight;) form into a dough with water. The kilning must be so arranged that the heat is applied gradually, and the vessels exposed to a current of hot air; which must be continued until all the charcoal is burnt out.

ALCOHOL. A peculiar liquid generated by the fermentation of aqueous solutions of sugar. It is the characteristic principle of wines, beer, spirits, and other like intoxicating liquors. The spirits of commerce contain about half their bulk of alcohol. Dilute alcohol may be procured by the ordinary process of distillation, from *all* fermented liquors. When drawn from wine (as in France), it constitutes *brandy;* when from the juice of the sugar-cane, it is called *rum;* and when from malt, grain, or molasses (as in England), it is called *malt, grain,* or *molasses spirit.* In this state, it contains, besides water, variable quantities of essential oils, ethers, acetic acid, and other flavouring matters, which, by one or more redistillations with charcoal, lime, or other like substances, it for the most part loses, and then becomes commercial spirit of wine. By further rectification from chloride of calcium, lime, carbonate of potassa, or some other substance, which has a strong affinity for water, this last is retained, and the spirit passes over *nearly* pure. It is now called alcohol. By repeating the process, and using the proper precautions, it may be obtained entirely free from water.

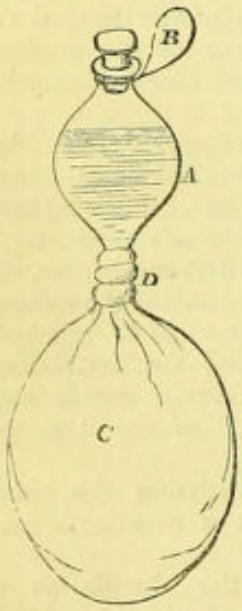
Prep. 1. (Liebig.) Take *alcohol*, or *rectified spirit of about* 90%, (Sp. gr. 0·835 to 0·825,) any quantity; saturate with *dry chloride of calcium*, in powder, and after repose for a few hours, distil over the alcohol by a gentle heat in a water bath, until the product *nearly* equals the quantity of dry alcohol in the sample.

2. (Graham.) Place *alcohol of* 90%, under the *exhausted receiver* of an *air-pump*, surrounded with *quick-lime;* after the lapse of 3 or 4 days, if the vacuum be well kept up, the spirit will have entirely lost its water.

3. (Ph. E.) Take *rectified spirit*, 1 pint; *quick-lime*, (crushed small,) 18 oz.; mix, expose to a gentle heat in a closed glass mattrass, till the lime begins to slake; then withdraw the heat, and keep the upper part of the vessel cool with damp cloths until the slaking is finished; lastly, attach a proper refrigeratory, and with a gentle and gradually increased heat draw off 17 fl. oz. The sp. gr. of the product should be 0·796, in which case it would be nearly free from water.

4. (Ph. D.) Take *stronger spirit*, (Sp. gr. 0·818) 1 pint; pulverized *fresh burnt lime*, 10*oz.;* proceed as last, using a "chloride of zinc bath and a Liebig's condenser." When "the liquid which first comes over, together with that obtained during the slaking measures *two ounces*," it must be rejected, the receiver changed, and the distillation continued until a product of *nearly sixteen ounces* is procured," of the "sp. gr. 0·795."

5. (Liebig.) By submitting the spirit used in the preparation of caustic potassa to distillation as above.



6. (Fresenius.) By the distillation of spirit of 90%, from fused *chloride of calcium*, as above; or by digestion with *anhydrous sulphate of copper*, (in powder,) agitation, decantation, and careful distillation. The products of the above processes are pure alcohols, either wholly or nearly free from water.

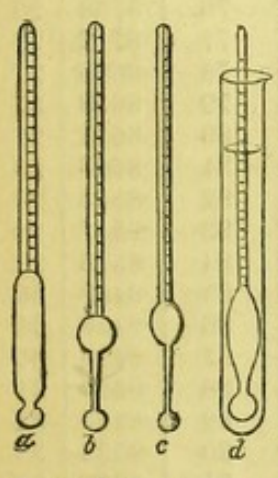
7. (Ph. L. 1836.) Take *rectified spirit*, (sp. gr. 0·838), 1 gallon; *chloride of calcium*, 1 lb; proceed as above and distil 7 pints and 5 fl. oz. Sp. gr. of product 0·815; it contains about 7% of water.

8. (Ph. D. 1826.) *Rectified spirit*, 1 gallon; *pearl ashes*, dried and still hot, 3½ lb; *chloride of calcium*, (dried,) 1 lb; mix the ashes and spirit, digest in a covered vessel with frequent agitation for seven days; decant the clear portion, add the chloride of calcium, agitate to effect solution, and distil until the mixture in the retort begins to thicken. Sp. gr. of product, 0·810; it contains about 5% of water.

9. (*Without distillation.*) Take *rectified spirit*, and add thereto, in a closed vessel, with continual agitation, *fresh dried and slightly warm pearl-ashes* or *carbonate of potassa*, until the powder sinks to the bottom undissolved; add some, still further, in considerable excess; repeat the agitation at short intervals for some time; lastly, allow the mixture to repose for a few hours, and decant the clear upper portion. The product contains a little potassa, which can only be removed by distillation.

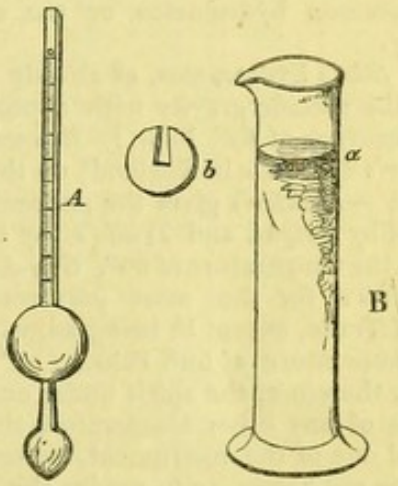
10. (Soëmmering.) Take the *bladder of an ox or calf*, soak it in water, inflate it, free it from the attached fat and vessels on both sides; dry and smear over the outer surface *twice*, and the inner surface *four* times, with a *solution of isinglass*. Then nearly fill it with the spirit to be concentrated, securely fasten it and suspend it in a warm situation, at a temperature of about 122° Fahr. In six to twelve hours, if the heat be properly maintained, the spirit will be concentrated, and in a little time longer will be renderd *nearly* free from water (anhydrous,) or of the strength of 97 or 98 per cent. The product is termed "*varnish maker's alcohol.*" A *common* bladder, thoroughly cleansed from fat, and washed and dried, may be used *without* any *further preparation*. The bladder should be kept very nearly full, or else a portion of the spirit will escape through the empty part. To prevent this accident, a bottle with a double neck, of the shape represented in the engraving, may be employed. Before hanging the apparatus up, it is better to enclose it in a coarse potato netting, to prevent any accident arising from the strain on the neck of the bladder.

A, A bottle with two necks, the upper furnished with a ground-glass stopper.
B, Loop of cord to hang the apparatus up by.
C, Bladder containing spirit, filled by means of the bottle *A*.
D, Neck of bladder accurately secured to the under neck of the bottle *A*.



Prop. Light, transparent, colourless, volatile, inflammable; miscible, in all proportions with water, with the evolution of heat, and condensation of the mixture, but some hours elapse before the union is complete; dissolves resins, gum resins, essential oils, camphor, bitumen, soaps, sugar, carbonic and boracic acid, iodine and the iodides, phosphorus, lime, ammonia,, soda, potassa, the alkaloids, wax, spermaceti, all the deliquescent salts, (except carbonate of potassa,) and various other substances. It curdles milk; coagulates albumen, and separates both starch and gum from their mucilages. It boils at 172°, and in vacuo, at 56° Fahr. Sp. gr. 0·794 at 60° Fahr. (0·7939,—Tralles.) It is uncongealable by cold. Its evaporation, like that of ether, produces intense cold. It acts as a powerful antiseptic on organic substances immersed in it. With the acids, it forms ether. By undergoing the acetic fermentation it is converted into vinegar. It is eminently poisonous and intoxicating. In small doses it occasions excitement and intoxication; in larger ones, delirium, somnolency, coma, apoplexy, and death. All strong spirits act in the same way, the effect being proportional to the state of concentration, and the quantity taken.

Pur. The presence of water is best ascertained by taking the specific gravity of the liquid, (See *Alcoholmetry*);—the absence of other foreign matter by the following tests—1. Colourless *oil of vitriol* added to spirit, produces a reddish tinge, if either essential oil, or organic matter be present. (Liebig.)—2. A *solution of nitrate of silver* does not alter the colour or transparency of pure alcohol; if it reddens it, the sample contains either oil or organic matter. (Vogel.)—3. It should be neutral to test paper.—4. It should be "colourless; evaporate entirely by heat; combine with water and with ether, retaining its transparency; taste and smell



vinous." (Ph. L. 1836.) The above tests are applicable to alcohols of all strengths. —5. One per cent. of wood spirit (wood naphtha) may be detected in spirit of wine by testing it with caustic potassa, which will speedily give it a yellow or brown colour, but imparts no tint to pure alcohol. (Ure.)

Concluding Remarks. The selection of any one of the processes given above for the preparation of alcohol, must greatly depend on the convenience or position of the operator. Gay-Lussac has recommended the use of *caustic baryta* instead of *lime*, and others have employed *dry alumina*, as an absorbent of the water prior to distillation. Common proof spirit may be concentrated until its sp. gr. falls to about 0·825, by simple distillation in a water bath; at which sp. gr. it contains only about $11\frac{0}{0}$ of water, and is then about as volatile as pure alcohol. By surrounding the capital of the still or apparatus by a water bath kept at the proper temperature, the alcoholic strength or content of the product may be regulated to the greatest nicety. See *Alcoholmetry*, *Brandy*, *Distillation*, *Fermentation*, &c.

ALCOHOLMETRY. Syn. *Spirit Testing*, *Alcoholometry*, &c. The determination of the quantity of pure alcohol, or of a spirit of a certain strength, taken as a standard, present in any given sample of spirituous or fermented liquors. The instruments used for this purpose are called *alcoholmeters*. Some, as those of Baumé, Cartier, &c., are simply hydrometers, by which the specific gravity of the sample is ascertained; others of a like construction, as those of Richter (*a*), Tralles (*b*), and Gay-Lussac (*c*), have their stems so graduated as at once to indicate the proportion of alcohol present, either by weight or volume, at some standard temperature (*see* engr.); whilst a third class, as those of the Abbé Brossard-Vidal, Field, &c., are essentially thermometers, with scales which indicate the boiling points of spirits of different strengths, instead of the common thermometric degrees. A very convenient hydrometer for common purposes (*d*) has been lately produced by some of the instrument makers. It is of the usual form, but its stem on one side exhibits the per centage by *volume*, and on the other, the per centage by *weight*. Thus, both results may be obtained at one trial of the sample.

Methods of Alcoholmetry.—1. (Revenue System.) The annexed engraving represents Sike's hydrometer, as made by Mr. Bate, under the direction of the Commissioners of Inland Revenue and Customs. It consists of a stem about 4 inches long, divided into 10 parts, each of which contains 10 subdivisions; and it is furnished with 9 weights of different sizes, numbered respectively 10, 20, 30, &c., to 90, by which it acquires a range over 900 divisions. The instrument is so formed as to give the sp. gr. with almost perfect accuracy, at 62° Fahr. It is fitted up in a neat mahogany case, accompanied with a thermometer, and a book of tables containing corrections for temperature, &c. The mode of using this hydrometer is as follows:

A glass tube of the form of fig. (B) is filled to the mark (*a*) with the sample for examination; the thermometer is then placed in the liquor and stirred about for 2 or 3 minutes, (observing not to breathe upon the glass nor hold it in the hand,) when it is withdrawn and the temperature noted. The hydrometer is next immersed in a similar manner, and gently pressed down in the liquor to the (0) on the stem with the finger, having been previously loaded with any one of the nine weights that will make it float with the surface of the spirit at some point on the graduated part of the scale. The indication at the point cut by the surface of the liquor, added to the weight with which the float is loaded, gives a number which must be sought in the book of tables. In this book, at the page headed

by the *Temperature as observed by the Thermometer*, and against the part of the column appropriated to the *given indication* (weight,) will be found the strength per cent., in whole numbers and decimal parts. In reading off the indication, to ensure accuracy, it is necessary to allow for the convexity of the liquor at the part where it immediately rests against the stem.

The above, as well as all other methods of alcoholmetry depending on the sp. gr., refer to *unsweetened spirits*. The strength of *sweetened spirits* cannot be determined by the common hydrometer or the specific gravity.

2. *Sike's* hydrometer, as already stated, gives the specific gravity with almost perfect accuracy at 62° Fahr.;—*Baumé's* and *Cartier's* (as made in England) do the same at 60°; —*Richter's* gives the per centage of alcohol by *weight*, and *Tralle's*, by *volume*, also at the temperature of 60°. *Gay-Lussac's alcoòmètre* for the most part resembles that of Tralle, except in being adjusted for the temperature of 59° Fahr., (15° Cent.) When, therefore, the spirit under examination is of any other temperature than the normal one of the instrument, certain corrections are necessary to render the results of any value. Perfect accuracy requires that tables for every variation of the thermometer, founded on actual experiments, should accompany each instrument. Such tables are furnished by the maker of Sike's hydrometer, but from their great length cannot be inserted here. For ordinary purposes, in the absence of tables or nicer calculations, it may be useful to know, that —5° Fahr. are equal to 1·00% of Alcohol, or 1·794% of proof spirit, by *volume;* and 0·794% of alcohol, or 1·620% of proof spirit, by *weight*. Thus, by making the proper *addition* to *the apparent strength per cent.*, when the *observed temperature* is *below* the *normal temperature of the instrument*, or a corresponding *subtraction*, when it is *above* it, the *strength* of the sample may be determined (nearly.)

3. Weigh the sample to be tried in a phial capable of holding exactly 500 grains of distilled water. The observed weight, doubled, will give the specific gravity at the given temperature. If a *thousand-grains* bottle be used, the result will be obtained without calculation. The specific gravity may next be sought in one or other of the following tables, and the necessary corrections made for temperature.

TABLE I, *exhibiting the per centage of Alcohol by* VOLUME, *corresponding to the given Specific Gravities.* By TRALLES.

*** *If the precise specific gravity* sought cannot be found in the table, the *difference* between it and the next greater specific gravity must be taken for the numerator of a fraction, having for its denominator the number found in the *third* column against the next greater sp. gr. This fraction, added to the per centage of alcohol in the first column of the table against the said greater sp. gr., will give the true per centage sought. Thus: "if the sp. gr. of a spirit be ·9605, what is its alcoholic content?" ·9605 is not in the table, and the next greater number is 9609; the former must therefore be deducted from the latter, and the difference (4) put as the numerator of the fraction, having for its denominator the number (13) in the column of differences against ·9609. The fraction $\frac{4}{13}$ so found, added to the per centage against ·9609 in the first column, gives $33\frac{4}{13}$ as the true per centage of alcohol in the given sample.

TABLE II, *showing the Alcoholic Content per cent., by* WEIGHT, *of spirits of different Specific Gravities.* By FOWNES, *with an additional column by* Mr. COOLEY.

*** The remarks appended to Table I, as far as the specific gravities are concerned, also apply to this table.

4. *From the temperature of the vapour*, ascertained by thrusting the bulb of a thermometer through a cork or piece of vulcanized India rubber into the head of the still or other vessel containing it, and noting its temperature, which must then be sought in the following table. This method is admirably adapted to the purposes of the distiller and rectifier, and it is to be regretted that we are not in possession of a more extensive and comprehensive table.

TABLE III, *showing the Alcoholic Content of Boiling Spirits, from the temperature of their Vapour, observed by a thermometer.* By GRÖNING.

Temperature of Vapour. Fahrenheit.	Alcoholic content of Vapour by volume per cent.	Alcoholic content of boiling liquid per cent.

5. (*From the boiling point.*) For this purpose a simple thermometer, with a large bulb, and a very narrow bore from about 180° to 212° Fahr., may be successfully employed; but instruments for this especial object have been prepared by Long and others. The temperature at the commencement of full ebullition being ascertained, may be sought in one of the following tables, against which the alcoholic content of the liquor (nearly) will be found.

TABLE V, *exhibiting the boiling points of Mixtures of Alcohol and Water of the given strengths.* By GRÖNING.

Alcohol per cent. by volume.	Boiling point. Fahr.	Alcohol per cent. by volume.	Boiling point. Fahr.
5	205·34	55	179·96
10	199·22	60	179·42

6. (Brande.) Half fill a graduated tube with the liquor to be tried, and add thereto about $12\frac{0}{0}$ or $15\frac{0}{0}$ of a strong solution of *diacetate of lead*, then agitate the mixture until the colour is nearly removed. Next add dry *carbonate of potassa*, in powder, until it falls down undissolved, even after the continued shaking of the liquid. On allowing the tube to repose for a short time, the alcohol will be seen floating on the top of the aqueous portion in a well-marked stratum, and its quantity may be read off by means of the graduations on the tube. Gay-Lussac has proposed a simpler mode of applying this test. He agitates a little *powdered litharge* with the sample, until it is decoloured and limpid, and then saturates it with the *carbonate of potassa*, as before. The alcohol, thus separated, has a sp. gr. of about 0·8117, and contains 3 or $4\frac{0}{0}$ of water. This process answers well with spirits, cordials, wines, &c., but requires some address to make it succeed with the weaker liquors, as ale, beer, and porter.

7. (M. Gay-Lussac.) Take of the *liquor to be tried*, measured in a graduated glass tube, 300 *parts*. Place the liquor in a still or retort, and carefully draw over *one hundred parts*, or *one third*, using a graduated tube as the recipient, and stopping the operation when the distilled liquor reaches the hundredth degree. Then ascertain the alcoholic strength of the distilled liquor by any of the usual methods, and divide the result by three, when the per centage of alcohol in the original liquor will be obtained. If, from want of attention, more than one hundred parts should be distilled over, the number which expresses the relation of the volume of the distilled product to the original bulk of the liquor tested must be employed as the divisor. Thus, if 106 parts of liquor has distilled over (instead 800,) containing 33 per cent. of alcohol, the 300 must be divided by 106, which gives 2·83, and the $33\frac{0}{0}$ by 2·83, which gives 11·66. The last number expresses the per centage of alcohol in the liquor submitted to examination. The strength at "proof" may be calculated in a similar way.

Concluding Remarks. The *Duties on Spirits* in England are charged on the number of *proof gallons* they contain, which is ascertained by first "*gauging*" or "*ullaging*" the liquor, and then "trying its strength" by Sike's hydrometer, in the way already described, when the per centage content of proof found, multiplied by the "gauge" or "ullage" gallons, gives the net

amount of proof spirit in the quantity surveyed.

The *proof strength* is an arbitrary standard, adopted for the purpose of facilitating calculations, for which it is well suited, although pure alcohol would, for this purpose, be more simple and convenient. The sp. gr. of proof spirit is 0·920 at 60° Fahr., and it contains, in 100 parts, by *weight*, 49$\frac{3}{8}$ of alcohol of 0·794, and 51$\frac{3}{8}$ of water; and by *volume*, 56·66$\frac{3}{8}$ of alcohol, and 43·34$\frac{3}{8}$ of water. At 51° Fahr., the sp. gr. of proof spirit is 0·923, and 13 volumes weigh exactly equal to 12 volumes of distilled water. On this standard strength, all the calculations and language of trade are based. Thus, when a given sample of spirit is said to be 10$\frac{3}{8}$ *over-proof*, or "*o. p.*," as it is technically called, it means, that 100 gallons of such spirit contain exactly as much alcohol as 110 gallons of proof. In *over-proof* spirit, the per centage *o. p.* represents the *quantity of water* which the given spirit will take to reduce it to *proof*. By adding this per centage over-proof to 100, we obtain a number, which, multiplied by any number of gallons, and divided by 100, gives the exact number of proof gallons which is contained in any quantity of the spirit referred to. To determine the quantity of water required to reduce this spirit to the proof strength, the number of gallons of the spirit at the given strength must be deducted from its content in proof gallons. The difference is the quantity of water that must be used for the purpose.

In like manner *when* a spirit is said to be u. p., or *under-proof*, the per centage u. p. deducted from 100, furnishes a factor, which multiplied by any number of gallons, and divided by 100, gives the exact number of proof gallons contained in such a quantity of the given strength. In a similar way we may ascertain *how much water it will take to reduce one strength to another*, of any weaker degree. We have only to reckon how many gallons of u. p. spirit would contain an equal quantity of the proof strength. This we find by the simple rule of proportion. Then by deducting the number of gallons of o. p. from the number of gallons just obtained, the quantity of water which must be added for the desired purpose is immediately seen. By a little practice such calculations become easy.

Formerly, spirit was said to be 1 *to* 3, 1 *to* 4, &c., *over-proof*, by which it was meant that 1 gallon of water added to 3 or 4 gallons of such spirit would reduce it to proof. On the other hand, 1 *in* 3 or 1 *in* 4 *under-proof* meant that the 3 or 4 gallons, as the case may be, contained 1 gallon of water and the remaining quantity of proof spirit. This method of calculation has now given way, in this country, to the centigrade system followed by the Excise and Customs.

The *stocks of "dealers"* (those not permitted to sell less than 2 gallons) are always taken by the proof; but the spirits sold by retailers are only tested on being admitted into stock, and then afterwards taken according to their gross quantity, (ullage or gauge). The officers can, however, try the strength of any sample they choose, at any time, even in the stock of a *retailer*, when, if it be altered from the strength at which it was "*permitted*" into stock more than 3$\frac{3}{8}$ (unless due notice of such reduction has been given), or if it be otherwise of an illegal strength, it becomes *seizable*. *A surplus*, however small, of more than 2 gallons over the quantity that should remain in hand of any one "*quality*" (kind) of spirit, after deducting the amount sent out by permits from the stock, as settled at the previous survey, is also seizable.

The *strength of spirits* are regulated *by the revenue laws of Great Britain*. When higher than 43 o. p., or sp. gr. 0·8597, the liquor is designated *spirit of wine*, and marked *S. W.* by the officers. Unflavoured spirit below this strength is termed *plain spirits*. *Distillers of British spirits* are not allowed to send out spirit at other strengths than 25 or 11 per cent. o. p. and 10 u. p. *British compounds*, (gin, British brandy, &c.) are not allowed to be kept in stock or sent out *stronger* than 17 u. p.; but gin, as usually sold by the wholesale dealer, is 22 to 24 u. p.; and when sweetened, as in cordial gin, is frequently 35 u. p., or even weaker. *Unsweetened foreign* and *colonial spirits* must not be kept or sent out *weaker* than 17 u. p.

Several other methods of alcoholmetry have been adopted at various times besides those above noticed. Thus the strength of spirit was at one time estimated by what was called the "*proof*." A little of the spirit was poured upon a small quantity of gunpowder, in a spoon or saucer, and inflamed; *if explosion followed the combustion of the spirit*, the sample was said to be *above* or *over proof*; but if *the contrary*, it was declared *below* or *under proof*. Hence arose the words "proof" and "proof spirit," which have since been applied to spirit of a particular strength by Act of Parliament. *Another method*, is the "*preuve d'Holland*"

of the French, or the "*bead*," still frequently employed by persons unacquainted with the use of the hydrometer. It consists in shaking the spirit in a phial, and observing the *size*, *number*, and *duration* of the bubbles, or "beads" as they are called. The *larger* and *more numerous* these are, and the *more rapidly* they *break* and *disappear*, the *stronger* is deemed the spirit. Owing to the untrustworthy character of both these plans they have now long fell into disuse. *Lovi's beads* are often employed to ascertain the strength of spirit. *The sudden increase of temperature* produced by mixing a known weight of spirit with a known weight of pure water being observed by a thermometer, has also been proposed for the same purpose, but neither this nor the previous method is capable of *great accuracy*. The insufficiency of other methods of alcoholmetry throws us back on the *Revenue System*, or the *specific gravity*, for *unsweetened spirits*, and on the *thermo-alcoholmeter*, *potash-test*, or *distillation*, for *cordials*, *wines*, *beer*, and *other liquors*, containing extractive matter or sugar. See *Alcohol*, *Specific Gravity*, *&c.*

ALCORNINE. A crystalline substance obtained from the alcornoque or alcornoco bark of South America. The bark from which it is obtained is astringent and bitter, and has been recommended in phthisis, but appears to possess little medicinal virtue. The bark of the young branches of the cork tree (Quercus suber,) used for tanning, has also been called alcornoco bark, but possesses none of the characters of the former article.

ALDEHYDE. Syn. *Hydrate of Oxide of Acetyle*. A pungent volatile liquid, obtained from alcohol.

Prep. (Liebig.) Take *aldehyd-ammonia*, and *distilled water*, of each 8 parts; dissolve; add *sulphuric acid*, 7 parts, diluted with about its own weight of water; and distil by a gentle heat in a water bath into a well-cooled receiver. Rectify the product, twice, from *its own weight of dried chloride of calcium*, at a temperature not exceeding 86° or 87° Fahr. The last product is anhydrous aldehyde.

Prop. &c. Limpid, colourless, ethereal, neutral, inflammable; mixes in all proportions with alcohol, ether, and water; boils at 72° Fahr.; sp. gr. 0·790; by exposure to the air, it is gradually converted into acetic acid; gently heated with protoxide of silver or its solutions, the oxide is reduced and deposited on the inner surface of the vessel, as a brilliant and uniform film of pure silver, whilst *aldehydate of silver* remains in solution; treated with hydrocyanic acid it yields *alanine*.

ALDEHYD-AMMONIA. *Prep.* (Liebig.) Take *sulphuric acid* and *peroxide of manganese*, in fine powder, of each 6 parts; *water* 4 parts; *alcohol* of 80%, 4 parts. Dilute the acid with the water, add carefully the alcohol, and next the manganese; agitate and distil with a gentle heat, from a spacious retort into a receiver surrounded with ice and connected with the former perfectly air-tight. When six parts have distilled, re-distil this portion from its own weight of dried chloride of calcium, until three parts have come over, and again rectify in the same manner, until 1½ part of liquid is obtained. Mix this with an equal bulk of ether, and saturate the mixture with dry ammoniacal gas; brilliant colourless prismatic crystals of great beauty will then form, which after washing with ether and drying, are pure aldehyd-ammonia.

Prop. &c. Smells like a mixture of turpentine and ammonia. Melts at 165° to 170°; volatilizes, unchanged, at 212° Fahr.; decomposed by exposure to the air; soluble in most menstrua except ether; acids decompose it. With sulphuretted hydrogen it forms *thialdine*.

ALDEHYDIC ACID. Syn. *Acetylous acid*, *Acetulous Acid; Lampic Acid?* An acid discovered by Liebig, and supposed by him to be identical with the lampic acid of Davy and Faraday; or at least its essential part.

Prep., &c. Digest *oxide of silver* in *aldehyde*, decant and pass *sulphuretted hydrogen* through the liquid to throw down the silver. The product is a weak acid forming salts with the bases, called *aldehydates*. These salts suffer decomposition during the evaporation of their solutions, and hence, cannot be obtained in the dry state.

ALE. Syn. *Ala*, *Alla*, *Cerevisia*, *Cerevisia Alba*, *Cerevisia Lupulata*, *Liquor Cereris*, *Vinum Hordeaceum*, *Vinum Anglicanum*,— Lat. var. A pale-coloured beer, prepared from lightly dried malt, by the ordinary process of brewing.

In brewing the finer kinds of ale, "pale" or "lightly dried" malt, and pale East Kent hops, of the current season's growth, are always preferred; and when it is desired to produce a liquor possessing little colour, great attention is paid to this selection. With the same object in view, the boiling is conducted with more than the usual precautions, and the fermentation is carried on at a somewhat lower temperature than that

commonly allowed for several other varieties of beer. For ale intended for immediate use, the malt may be *all*, or mostly "pale;" but if the liquor be brewed for keeping, and in warm weather, one fifth, or one fourth of amber malt may be advantageously employed. From 5*lb.* to 6*lb.* of *hops* is the quantity commonly used to *a quarter of malt*, for "ordinary ales;" and 8*lb.* to 10*lb.* for "keeping ales." The proportions must, however, greatly depend on the intended quality and description of the brewing, and the period that will be allowed for its maturation.

The stronger varieties of ale contain from 7 to 8 per cent. of absolute alcohol; ordinary strong ale, 5 to 6 per cent.; mild ale, 3 to 4 per cent.; and table ale, 1 to 1½ per cent.; together with some undecomposed saccharine, gummy, and extractive matter, the bitter and narcotic principles of the hop, some acetic acid formed by the oxygenation of the alcohol, and very small and variable quantities of mineral and saline matter. See *Brewing*, *Malt Liquors*, *&c.*

ALES, (Medicated.) Syn. *Cerevisiæ Medicatæ*,—Lat. Ale prepared by macerating medicinal substances in it, either at the ordinary temperature of the atmosphere, or when heated; infusions and decoctions, in which ale or beer is employed as the menstruum. The old dispensatories enumerate several medicated ales. Preparations of this kind are now seldom ordered by the faculty, and their use is chiefly confined to the practice of empirics, and to domestic medicine. Bark, rue, savin, anti-scorbutic plants, aromatic bitters, and stomachics, are the substances most commonly administered in this way. Ale in which wormwood, gentian, orange-peel, and the like, have been steeped, taken warm, early in the morning, is much esteemed as a restorative tonic by drunkards and dyspeptics. See *Beer* and *Purl*.

ALEBERRY. A beverage made by boiling ale with some *spice*, *sugar*, and *bread-sops;* the last, commonly toasted. A domestic remedy for a cold.

ALEGAR. Sour ale; ale or beer vinegar. The latter is commonly prepared from *ale* that has become *too old* or *tart for sale* as such; and from *waste liquor*, by allowing them to remain in an *unbunged* cask or other loosely covered vessel, in a warm situation, until sufficiently mature. *Vine-cuttings*, *unripe* or *damaged grapes*, *cheap raisins*, and *vinegar bottoms*, are often added to hasten acetification, and to improve the flavour.

ALEGILL. Ale or beer, in which the *leaves* of *ground ivy* have been infused. Pectoral and stomachic.

ALGAROBA. Syn. *Algaroba Beans*. The *pods* of the ceratonia siliqua,—*Linn.* They are used for food, and to improve the voice; they contain a sweetish, nutritious powder, and are supposed to have been the locust on which St. John fed in the wilderness; their decoction has been used as a pectoral in asthma and coughs. The astringent pods of the *Prosopis pallida*, as well as those of the *Inga Marthæ*, both South American trees, are also called *Algaroba* or *Algarovilla*. The pods of the Chilian tree, *Prosopis Siliquastrum*, are known as *Chili Algaroba*. The last three are used in tanning, for which purpose they have been strongly recommended; indeed Chili Algaroba is said to possess "four times the power of good oak bark." (Ure.)

ALIZARINE. A peculiar colouring principle obtained by Robiquet from madder. See *Madder Red*.

ALKAHEST (of Glauber.) A crude *oil of tartar*, obtained by detonating *nitre* on hot coals, and then exposing the deflagrated matter in a damp place, until it runs into an oily-looking liquid.

ALKAHEST RESPURII. Prepared by detonating a mixture of *nitre* and *zinc filings*, powdering the resulting scoriæ, agitating it with water, and filtering. The filtered liquid contained the alkahest.

ALKAHEST ZWELFERI. Acetic acid obtained by the dry distillation of verdigris.

ALKALI. In *familiar language*, any substance freely soluble in water, possessing causticity, an acrid, urinous taste, and antacid qualities;—in *chemistry*, an electro-positive compound, capable of neutralizing the acids and combining with them in definite proportions, forming salts, and which, both alone and carbonated, is freely soluble in water, and in either of these conditions, when fluid or in solution, changes vegetable blues *green*, and vegetable yellows *brown*. The principal alkalies are *potassa*, *soda*, and *ammonia*. The *first* has been called the *vegetable*, the *second* the *mineral*, and the *third* the *volatile alkali;* but this distinction is now obsolete. *Potassa* and *soda* have also been called the *fixed alkalies*, from their permanence in the fire; and *ammonia* was formerly termed *alkaline air*, because when perfectly pure it exists only in the state of gas. *Lithia* is another alkali, but it is of rare occurrence, and differs from those before noticed, in the difficult solubility of its carbonate, and in possessing some of the other properties of alkalinity in an inferior degree. The basic compounds frequently termed *Organic* or *Vegeto-alkalies*, and which more or less resemble

the true alkalies in their behaviour with the acids, may be conveniently and correctly considered as a distinct class of bodies, and treated of under the more appropriate name of *alkaloid*. *Baryta*, *lime*, *magnesia*, and *strontia*, from their causticity, action on vegetable colours, and some other qualities, have also been called *alkalies*, but they are distinguished from those bodies by their sparing solubility in water, and by the total insolubility of their carbonates in that menstruum. Later chemists have classed these substances under the title of *alkaline earths*.

Prop., &c. Potassa, soda, and ammonia, are known by the following characteristics: —1. An acrid, urinous taste;—2. A great degree of causticity, and acting as energetic solvents of animal matter;—3. Changing litmus and several other vegetable blues to *green*, and turmeric paper, and other vegetable yellows, *brown*;—4. Forming soaps with the fixed oils and fats;—5. Forming salts with the acids;—6. Free solubility in water and alcohol;—7. Solubility of their carbonates in aqueous menstrua;—8. Action of their carbonates on vegetable colours;—9. Their solutions imparting a soapy greasy sensation to the cuticle;—10. Evolving a peculiar soapy odour when in contact with organic matter;—11. Permanency in the fire (excepting ammonia, which is volatile); —12. Solubility and other properties not impaired by calcination, (excepting ammonia.)

Uses, &c. The *concentrated* alkalies are employed as escharotics; *diluted*, as antacids or absorbents, in stomach complaints, and in poisoning by the acids; as detergents, lithontriptics, diuretics, resolvents, liquefacients, and alteratives; in acute, inflammatory diseases, rheumatism, gout, dropsy, and glandular and visceral enlargements. They are also used as cosmetics. *In the Arts* their applications are numerous;—soap is a compound of alkaline and fatty matter, and common salt is formed of soda and hydrochloric acid. Their salts are applied to almost numberless purposes in *pharmacy*, *chemistry*, *bleaching*, *dyeing*, and the other arts of life and civilization.

Like the acids, the pure, or caustic alkalies, and their solutions, should be kept in stoppered glass bottles, well secured from the air, as they otherwise rapidly absorb carbonic acid, and become carbonates. Their carbonates also require exclusion, to prevent efflorescence (soda,) or deliquescence (potassa.) Ammonia water should be kept in a well-stoppered bottle and in a cool situation.

ALKALIMETRY. The estimation of the strength of the commercial alkalies.

Alkalimetrical processes for the most part depend on the determination of the *quantity of acid of a known strength required to neutralize a known weight of alkali*; or of the *quantity of dry carbonic acid which any given weight of alkali is capable of yielding, under the influence of a stronger acid*. From either of these results the exact amount of alkali present in any sample is easily calculated. These processes are indeed precisely similar to those described under *Acidimetry*; but here the unknown quantity sought is the *alkali* instead of the *acid*. The test liquid commonly used in the *first* method referred to, is *sulphuric acid*, previously reduced to a proper state of dilution with pure water. In the *second* method, *concentrated sulphuric acid* is employed. The glasses from which the test liquor is poured, and by which they are measured (*alkalimeters*), are similar to those already figured and described under *Acetimetry* and *Acidimetry*.

Process. 1. The number of grains required for the trial, being weighed, are next placed in a *phial* or *small glass tube*, and agitated with about *half an ounce of hot water*. After a short time allowed for repose, the clear liquid is poured off into a beaker glass or other vessel in which the trial is to be made. This process is repeated with a *second* and *third* quantity of water, or until nothing soluble remains, shown by the last washings *not* affecting the colour of turmeric paper. The greatest care must here be taken not to waste the smallest portion of the liquid, which would render the results inaccurate. The *alkaline ley* in the beaker glass is next *exactly* neutralized by cautiously adding to it the *test acid*, from an alkalimeter. When this is properly done, the solution, after being heated a few minutes, will neither *redden* litmus paper, nor turn turmeric paper *brown*; or what is the same, until the litmus paper, only slightly reddened by the *cold* solution, recovers its blue colour by exposure or warmth. The quantity of the test acid consumed to produce this condition is now read off from the graduated scale of the alkalimeter, or ascertained by re-weighing it. The loss of weight or volume consumed, gives either the *absolute* or the *per centage quantity* of alkali in the sample examined, according to the constitution of the test acid employed.

Test Acids.—a. (Ure). This acid has the sp. gr. of 1·032, at 60° Fahr.; 100 alkalimetrical divisions, or 1000 water-grains measure, contain exactly 40 grs., or 1 eq. of dry sulphuric acid, and consequently

correspond to 1 eq. of every other base, as shown in the table below.

TABLE I.—*Equivalent Weights of the principal Alkalies, and their Carbonates, &c.*

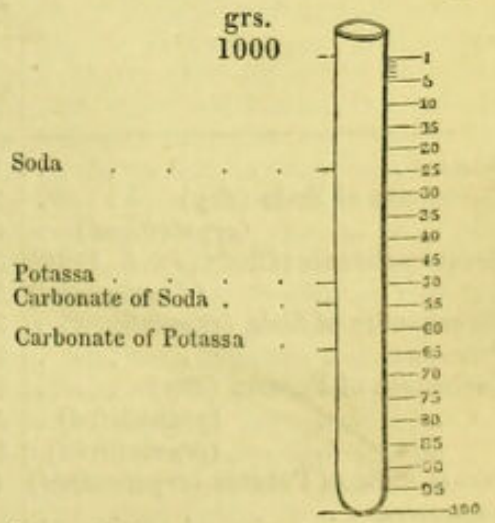
40 grs. of Sulphuric Acid (dry).
49 „ „ (liquid, sp. 1·845).

Grains.	are equivalent to
31	Pure or caustic soda.
53	Carbonate of soda (dry).
143	„ „ (crystallized).
82	Sesquicarbonate of soda (Ph. L. 1836).
85	„ „ (commercial).
84	Bicarbonate of soda (crystallized).
47	Pure or caustic potash.
69	Carbonate of potassa (dry).
82½	„ „ (granulated).
87	„ „ (crystallized).
100	Bicarbonate of potassa (crystallized).
17	Pure or gaseous ammonia.
43½	Carbonate of ammonia (neutral.)
59	Sesquicarbonate of ammonia (Ph. L.)
79	Bicarbonate of ammonia (crystallized).

Obs. It will at once be seen that every alkalimeter division of the above acid represents the $\frac{1}{100}$th part, or *one per cent.* of the *equivalent weight of the given alkali* present in the sample tested, when 100 grains have been taken. Thus, 90 alkalimeters divisions of test acid having been used in the assay of a crude sample of potash, (the eq. of potash being 47), this would be—

100 : 47 :: 90 : 42·3

or just 42⅓ per cent. If only 50, 25, or 20 grs. have been tested, the result so obtained must, of course, be doubled, quadrupled, &c., as the case may be. By means of the simple rule of proportion the per centage quantity of alkali may be found, whether 100 or any other number of grains have been submitted to trial. For—The *weight of the sample tested*, (in grains,) bears the same relation to the *equivalent weight of the alkali under examination*, that the *number of alkalimeter divisions consumed* do to the *per centage of alkali sought*. Thus:—A sample of 33 grains of pearlash having taken 35 alkalimeter divisions (350 parts or grains measures) of test acid for its neutralization, what was its per centage content of pure alkali? Here—



33 : 47 :: 35 : 49·85.

It consequently contained nearly 50 per cent. of real potash.

b. (Cooley). This acid is slightly tinged with litmus, and has a sp. gr. of about 1·071; 100 alkalimeter divisions, or 1000 water-grains measure, exactly saturate 100 grs. of pure potassa, or 113 grs. of dry carbonate of soda. The number of measures consumed, read off by *mere inspection* from the scale of the alkalimeter, give the exact *per centage of alkali* in the sample examined, for *potash*; and by taking ⅔rds of this number, or more correctly, by multiplying it by ·66, that for *soda* also. By employing ·362 as the multiplier, it gives the like result for *ammonia*. By making up this acid to *weigh* instead of *measure* 1000 grains, every 10 grains weight consumed will represent 1 gr., or *one per cent.* of real potash, and with ordinary care will give results perfectly accurate, to less than the $\frac{1}{10}$th of a gr. per cent., when 50 or 100 grs. are tested.

c. (Hennel). Here two *test acids* are used—one for potash and the other for soda.—*Test acid for Soda.* Sp. gr. 1·1086; 313 grs. contain exactly 40 grains of anhydrous sulphuric acid; 1000 grs. weight saturate exactly 100 grs. of pure potash.—*Test acid for potash.* Sp. gr. 1·070 to 1·071; 471½ grs. contain 40 grs. of dry sulphuric acid; 1000 grs. weight neutralize exactly 100 grs. of pure potassa.

d. (Faraday). Sp. gr. of acid 1·1268 at 60° Fahr. 100 grs. of pure anhydrous carbonate of soda, must be exactly saturated by the quantity of test acid corresponding to the mark opposite the name of that article on the scale of the alkalimeter. It is used with the glass tube, commonly known as *Faraday's alkalimeter*, this is graduated in the usual manner; but opposite the numbers 23·44, 48·96, 54·63, and 65, are cut the words *soda*, *potassa*, *carbonate of soda*, and *carbonate of potassa*, to indicate the quantity of the test acid to be employed for each of these substances. (See *engr*). It is used by pouring the test liquid

into it until it reaches the line marked against the alkali or its carbonate under examination. Water is then poured in to

the line marked 0, or 1000 grs. on the scale, and the whole is well mixed by placing the thumb on the orifice of the tube and shaking it well. The measure of the resulting dilute acid must then be very carefully observed, and more water added, if required, to make up the proper quantity as before; agitation being again employed to produce perfect mixture, and the greatest care taken not to waste any of the liquid during the operation. The test acid thus prepared, is then added with the usual precautions to the sample until exact neutralization is effected.

2. (Fresenius and Will). This is performed in a similar manner and in a similar apparatus to that described under *Acidimetry*, (No. 2.)—The smaller flask (*B*) is about half filled with concentrated sulphuric acid, and the sample of alkali, in solution, (*under the form of carbonate,*) being placed in the larger flask (*A*), water is added until it is about one-third full. The tubes are then fitted into the apparatus quite air-tight; the end of the tube (*b*) is fastened with a piece of wax, and the whole is carefully weighed. The apparatus is now removed from the scales, the lips applied to the end of the tube (*h*), and a few bubbles of air sucked out of the flask (*B*), the consequence of which is, that on removing the mouth, the acid in (*B*) ascends to a certain height in the tube (*c*). If in a short time this little column of liquid maintains its height in the tube, it is a proof that the apparatus is air-tight, and as it should be. Suction is now again cautiously applied to the tube (*h*), and a little of the acid in (*B*) made to flow over into the flask (*A*), the quantity being proportionate to the vacuum produced by suction, and capable of being regulated at will. No sooner does the acid come into contact with the carbonate in the flask (*A*), than the evolution of carbonic acid commences, and from the construction of the apparatus having to pass through the concentrated sulphuric acid, it is rendered quite dry before it can escape by the tube (*d*) into the atmosphere. Whenever the effervescence flags, a little more acid is sucked over, until the whole of the carbonate is decomposed, after which an additional quantity is made to pass into (*A*), so as to raise the temperature considerably, for the purpose of expelling all the gas absorbed by the fluid during the operation. As soon as this is effected, the wax is removed from the aperture (*b*), and suction applied to (*h*), until all the carbonic acid in the apparatus is replaced by atmospheric air. The whole is now allowed to cool, and is again weighed.

TABLE II.—*Multipliers and Standard Weights for the Principal Alkalies and their Carbonates.* By Mr. COOLEY.

Names, &c.	Factors or Multipliers.	Quantities (in grains,) to be taken, so that the per centage value of the sample tested shall be shown in the terms of any of the denominations given, by the weight of the evolved Carbonic Acid reckoned—

Sesquicarbonate of Ammonia	2·68	26·8	26⅞	67⅛	134¼	268
Bicarbonate of Ammonia	3·59	35·9	35⅞	89¾	179½	359

The *loss of weight* gives the exact amount of *dry carbonic acid* which was contained in the specimen, from which the weight of pure alkali is readily estimated.—Every 22 *grs. of dry carbonic acid gas* evolved, represent exactly 31 grs. of pure soda, and 47 grs. of pure potash, these numbers being the equivalents of these substances, (see p. 41,) from which the *per centage* strength may be found by the rule of proportion before explained.

By taking such a weight of the specimen for the assay, as shall contain exactly 10 grs. of carbonic acid gas, or any multiple thereof, the *per centage* "richness," in alkali, may be found, (without calculation,) by the weight of that gas lost during the process. The standard weights recommended by Fresenius and Will, are—*carbonate of soda*, 4·83 grammes; *carbonate of potash*, 6·29 grammes. As these numbers and the computations on which they are founded are not familiar to the English operative, others based on our own system of notation may be advantageously substituted. Indeed, the principle may be so far extended, that by taking certain standard weights for the assay, the quantity of carbonic acid evolved may be made to furnish the per centage strength or value of the specimen in the terms of either the *pure* or *carbonated alkalies*, whether in their *dry* or *hydrated* state. The numbers in the *second column* of the preceding table, represent the quantity in grains and decimal parts, of each of the substances named in the *first column*, equivalent to *one* grain of dry carbonic acid. These numbers may be employed as factors for converting any numbers representing grains of that acid into the equivalents of these substances; and further, they furnish us with the data for determining the exact number of grains which must be tested, so that the loss of weight in carbonic acid shall at once give us the per centage richness of the sample in the terms of the denomination for which it is taken. These weights are given in the other columns of the table.

In the above ingenious method of alkalimetry it is absolutely necessary, that the whole of the alkali in the specimen tested, should be in the state of neutral carbonate. If it contains any *caustic alkali*, (as many of those of commerce do,) Messrs. Fresenius and Will direct it, previously to being tested, to be triturated with its *own weight of pure quartzoze sand*, and *the fourth of its weight of carbonate of ammonia;* and the resulting mixture to be placed in a small iron capsule, moistened with water, and exposed to a gentle heat until it becomes quite dry, and all the ammonia is expelled. If the sample contains either bicarbonate or sesquicarbonate of soda or potassa, it must be heated to dull redness before being placed in the apparatus and tested. If it contains sulphurets, sulphites, or hypo-sulphites, they direct the same method to be followed, except that liquor of ammonia instead of water is to be employed for moistening the powder. In the case of *soda*, the quantity of *carbonate of ammonia* should be equal to at least *half the quantity* operated on.

Concluding Remarks. The methods of alkalimetry, depending on the saturating power of the specimen, are those chiefly used in the United Kingdom. The choice of the test acid, and the other minor details of the process, must depend entirely on the operator. The test liquor No. 1, is that originally proposed by Dr. Ure, and answers the purpose admirably, but requires a trifling calculation to give per centage results; the acid No. 2, we have used for years; when carefully added from a graduated alkalimeter containing 1000 water-grain measures, the per centage of alkali present in the specimen may easily be determined to the $\frac{1}{10}$th of 1 per cent.; but by employing it by weight, and using a very delicate balance, the quantity of alkali may be found to the $\frac{1}{50}$th of a grain; and if it were possible in the manufactory or the workshop to effect *absolutely perfect neutralization*, it might be determined in this way, even to the $\frac{1}{100}$th of a grain per cent., a precision unattainable by any other method adapted to common use;—the method No. 3, gives equally accurate results, but here two test liquids are ordered; —it has been long successfully employed at Apothecaries' Hall, at the Polytechnic Institution, (by Mr. L. Thompson,) in the laboratory of Messrs. Hawes, and in numerous other places where great nicety is required; —No. 4, is well suited to rough purposes, and is easily applied by any person with a steady hand who can read and write; it is in common use in many laboratories. Of the new German method of alkalimetry, it may be remarked, that it obviates one of the chief objections to the common plan, in its accuracy not being dependent on effecting the exact neutralization of the alkali, or on the test acid being of precisely the proper strength. It, however, requires considerable neatness in manipulation, and that the weights be taken with the greatest accuracy, and in a balance possessing great delicacy when loaded with the apparatus.

In the *common methods* of alkalimetry

the alkali in the specimen examined may be in either the caustic or carbonated state, or consist of any mixture of caustic alkali, or carbonates; but it is absolutely necessary for accurate results, that it should be free from sulphurets, sulphites, and hyposulphites, as the sulphuric acid acts upon these substances as well as on the carbonates. The presence of muriates does not interfere with the accuracy of the results unless heat is employed.—The soda ash of commerce generally contains all these substances besides insoluble matter. Crude samples of pot and pearl ashes also generally contain some sulphurets. Various plans have been proposed to avoid this source of error. Gay-Lussac and Welter direct samples containing the above substances, to be calcined in a platinum crucible with about 5% or 6% of *chlorate of potash* before testing them. In this way, the salts referred to, are transformed into sulphates on which the test acid exerts no action. This method is, however, objectionable when *hyposulphites* are present; as *each* equivalent of hyposulphite becomes converted into *two* equiv. of sulphate, at the expense of the alkali or its carbonate in the specimen so treated, which renders the assay inaccurate. The treatment recommended by Fresenius and Will avoids this new source of error. The difference between an assay of a sample of the *unprepared* alkali, and of another which has been treated as above, will indicate the quantity of impurities contained in them under the forms just referred to.

Other matters deserving the most serious attention, are—hitting the exact point of neutralization, and preparing the test acids of the proper strength. The method of effecting the former correctly, has been already noticed, in speaking of the estimation of the strength of acids and vinegar. The test acid may be very simply prepared, by gradually diluting concentrated sulphuric acid with water until it is reduced to the proper strength, the dilution being made in a glass vessel containing a hydrostatic bead exactly corresponding to the desired specific gravity of the diluted acid. When the proper point is reached, the bead rises from the bottom of the vessel and floats about indifferently in the middle of the liquid at the temperature of 60 Fahr. The sp. gr. may then be carefully ascertained by means of a hydrometer or the specific gravity bottle. Allowance must here be made for the increase of temperature arising from the mixture of the water and acid; and the final adjustment delayed until the fluid returns to its normal temperature. An acid of any given strength or saturating power may also be prepared in the following manner:—49 parts of commercial oil of vitriol, (sp. gr. 1·825,) contain 40 parts or 1 eq. of real sulphuric acid; if therefore we want to prepare a dilute acid containing in every thousand grains weight or measure, exactly 1 eq. of sulphuric acid, we have only to make 49 grs. of such acid up to 1000 grains weight or measure, with pure water. After it has recovered the proper temperature its sp. gr. must be again tried, and if necessary, re-adjusted. As, however, it very often happens that the oil of vitriol employed is not so strong as that above referred to, its strength may be first tested with dry carbonate of soda; every 53 grs. of which are exactly equal to 40 grs. of dry sulphuric acid. Suppose, we find our oil of vitriol to contain only 72 per cent. of real acid, then—

100 : 72 : : 40 : : 55·55

or, instead of only 40 grs., fully 55½ grs. will be required, which are to be made up with water as before. Finally the diluted acid is carefully re-tested with pure dried carbonate of soda, and if found correct, is put into a well-stoppered bottle, labelled, and preserved for use. Too much care cannot be taken to ensure the test liquid being of the proper strength, of which the specific gravity alone is an insufficient proof. In practice, so small a quantity only of test acid as that referred to above, is of course never made; but as any larger quantities are merely multiples of the smaller one, the necessary proportions to be employed are easily calculated. The common plan is to prepare one or more gallons or quantities of 10 *lb.* each, and to preserve the liquid in stoppered green-glass "Winchester quart bottles," so that it may be always ready for use.

In conclusion, we may remark, that it was formerly the practice to reckon the strength of alkalies with reference to a standard termed 100 alkalimetric degrees, in a similar way to that noticed as employed for acids, at p. 20. This had reference to the per centage of their weight in sulphuric acid, which was necessary for their saturation. On this system a specimen of pearl-ashes which neutralizes 56-100ths of its weight of sulphuric acid, is said to be of 56 alkalimetrical degrees. This was Descroizilles' system of notation. See *Acidimetry, &c.*

ALKALOIDS. Syn. *Vegeto-Alkalies, Organic Alkalies, Organic Bases.* Substances of vegetable origin analogous to the alkaline bases, in which the medicinal

activity of the plants in which they are found appears to reside.

Prep. The following general methods of procuring the alkaloids will be found applicable for such as full directions are not given for under their respective heads:—

1. (*When the base is insoluble in water, non-volatile, and existing in the plant in an insoluble form.*) Boil or macerate the bruised plant in water acidulated with muriatic or acetic acid, filter, neutralize the acid with an alkali (ammonia, potassa, lime, or magnesia), and collect the precipitate; purify by re-solution in dilute acid, digestion with a little animal charcoal, and subsequent crystallization, or precipitation with an alkali; or the first precipitate may be purified by dissolving it once or oftener in boiling alcohol, which will yield the pure alkaloid either on cooling or by evaporation.

2. (*When the base is insoluble in water, and non-volatile, but existing in the plant in a soluble state.*) Boil or macerate in hot water as before; and filter, precipitate, &c. as last.

3. (*When the base is soluble in water and non-volatile.*) Make an infusion with a very dilute acid (muriatic or acetic); concentrate by a gentle heat; treat the liquor with potassa and ether (conjointly); decant and evaporate. For those alkaloids which are insoluble in ether, (as morphia and cinchonia), the previous process may be adopted.

4. (*When the base is both soluble in water and volatile*). The vegetable or its extract may be mixed with potassa and distilled; the product, neutralized with oxalic or sulphuric acid, carefully evaporated to dryness, digested in alcohol, and the solution agitated with potassa and ether. The etherial solution thus formed, if carefully evaporated, leaves the base nearly pure. It may be further purified by cautious distillation.

Obs. As some of the alkaloids are soluble in excess of the alkaline precipitant, oversaturation should be avoided; or the precipitant may be used in the carbonated form. When lime and magnesia are employed, they should be boiled for a few minutes with the solution.

Tests, &c. The identification of the pure alkaloids is extremely simple; but their detection when combined with mucilaginous, extractive, and colouring matter, is a task of considerable difficulty. The following plan may be adopted for this purpose:

1. (Merck.) Digest the matter under examination for several hours with concentrated acetic acid, added in sufficient quantity to produce a strongly acid reaction; strain, wash the insoluble matter with water acidulated with acetic acid, and gently evaporate to dryness in a water bath; boil the residuum first with rectified spirit, and next with rectified spirit acidulated with acetic acid; again evaporate the mixed liquors, dilute with water, add carbonate of potassa to a feebly alkaline reaction, evaporate to a syrup, and set it aside; after 24 hours, again dilute with water, filter, wash the insoluble portion with cold water, and digest with concentrated acetic acid; this last solution is diluted with water, decolorized with animal charcoal, (if necessary,) and is then ready for testing. The above method may be applied to the stomach and viscera and their contents, and to food, &c., in cases of poisoning.

The principal alkaloids and their salts in the state of powder may be thus distinguished:

1. The powder is treated with *nitric acid;* this is coloured *red*, by *brucia, delphia, morphia*, and commercial *strychnia.* If the reddened acid becomes *violet* on the addition of protochloride of tin, it is *brucia;* if it becomes black and carbonaceous, it is *delphia;* if the powder is fusible *without* decomposition, and strongly decomposes Iodic acid, it is *morphia;* if it is not fusible without decomposition, and does *not* decompose Iodic acid, it is *strychnia.* If instead of a *red*, the powder strikes a *green* colour with nitric acid, it is *solania;* if insoluble in ether, and *not* reddened by nitric acid, it is *emetia;* if soluble in ether, not reddened by nitric acid, but melts and volatilizes with heat, it is *atropia;* if it is thus affected by ether or nitric acid, but does *not* volatilize, it is *veratria.*

2. The powder is treated with a drop or two of *strong sulphuric acid;* a *red* colour is produced by *brucia, nicotina, salicine*, and *veratria.* If the reddened mixture has at first a roseate hue, turning deep red on the addition of nitric acid, it is *brucia;* if the original substance moistened with solution of potassa evolves the odour of tobacco, it contains *nicotine:* if the red colour produced by the acid is permanent, and of an intense blood hue, and the powder agglutinates into lumps like resin, it is *salicine;* if the colour is at first yellowish, changing to blood-red, and ultimately to crimson and violet, it is *veratria.* If instead of the substance being reddened by strong sulphuric acid, no particular action ensues in the *cold*, it contains either *conia* or *strychnia;* if a fragment of bichromate of potash being now dropped in, produces a rich violet colour, it is *strychnia:* if the

original matter on being heated, or treated with solution of potassa, evolves a penetrating, disagreeable odour, somewhat analogons to that from hemlock, or to a mixture of those from tobacco and mice, it is *conia*.

The presence of one or more of the alkaloids being shewn by any of the above methods, a portion of the original clear solution or powder, or of the precipitates or filtrates above referred to, must be treated with their characteristic tests, as given under the individual notices of these articles, so as to set at rest all doubt as to their identity. *No single test must ever be relied on.*

Pois., &c. Some of the alkaloids act as *narcotic*, or *stupefying poisons;* others are classed with the *narcotico-acrid poisons*, or those which produce both narcotism and irritation of the parts they touch. The general symptoms produced by *opium* and its preparations may be taken as an example of the former; thoseof *aconite* and*strychnia* of the latter. In *large* doses, of the greater number, narcotism predominates; in *smaller* ones, irritation: they are rarely co-existent. No common *antidote* to the effects of this class of substances has yet been discovered. The treatment recommended for poisoning by *aconite*, is perhaps the best that can be adopted.

Concluding Remarks. Closely allied to the alkaloids there also exists an extensive series of neutral proximate principles, which differ from those substances chiefly in the absence of basic properties, and most of them being destitute of nitrogen. They are usually bitter, and represent the active properties of the plants in which they are found, and some possess considerable medicinal energy. These bodies are frequently confounded with the alkaloids, but these substances evidently belong to two distinct classes. Of this kind are *Asparagin*, *Elaterin*, *Gentianin*, *Picrotoxin*, *Salicin*, &c. See the *individual alkaloids under* their respective heads.

ALKANET. A reddish-purple dye obtained from the anchusa tinctoria. It was formerly used as a skin paint; hence the name.

ALKANET. Syn. *Orchanet*, *Dyer's Alkanet*. A species of bugloss, a deciduous herbaceous plant, with a perennial root, inhabiting the shores of the Mediterranean, Asia Minor, Greece, &c. It is largely cultivated in the neighbourhood of Montpellier. The root, (*alkanet root; radix alkannæ tinctoriæ; radix anchusæ; r. a. tinctoriæ;*) contains a beautiful blood-red colour, which it freely gives out to oils, fats, wax, spirits, essences, and similar substances, by simply infusing it in them, and is consequently much employed to colour these articles. Wax, tinged with alkanet, and applied on warm marble, stains it of a rich flesh colour, which sinks deep into the stone, and possesses considerable durability. The spirituous tincture of alkanet also imparts a deep red to marble.

Uses. It is largely employed by the *druggists* and *perfumers* to colour their oils, lip-salves, plasters, pomatums, &c.; by the *varnish-makers*, to tinge their varnishes and lacquers; by *statuaries* to stain marble; by *dairy-farmers* to colour their cheese; by *wine-merchants* and *bottlers* to stain the corks of their port wine bottles, and as colouring and flavouring for factitious port wine; and by *dyers*, and others.

ALKERMES. A cordial liqueur much esteemed in some parts of the South of Europe; said to have been so named from being generally coloured with kermes. See *Cordials.*

ALKOOL. Syn. *Alkoohl, Kohol, &c.* An impalpable powder, formed of antimony, used by the females of Eastern nations to tinge the eyelids and eyelashes black.

ALLANTOINE. Syn. *Allantoic Acid; Amniotic Acid*,—Obs. A crystallizable substance discovered by Vanquelin and Buniva, and since produced artificially by Wöhler and Liebig.

Prep. 1. Evaporate the *allantoic fluid of the fœtal calf* to 1-4th or 1-5th of its volume, and set it aside for some time. The crystals thus obtained may be purified by re-solution, digestion with animal charcoal, and re-crystallization.

2. (Wöhler and Liebig.) *Uric acid*, 1 part; *water*, 20 parts; dissolve, and add *freshly precipitated and well washed binoxide of lead*, until the colour ceases to change; filter while still hot, evaporate until a pellicle forms on the surface, and set it aside to crystallize; purify as before.

Prop., &c. Brilliant prismatic, transparent, colourless crystals; tasteless; neutral; soluble in 160 parts of cold water; nitric acid converts it into *allanturic acid.* It is wrongly termed an acid.

ALLANTURIC ACID. An azotised compound produced by the action of nitric acid on allantoine.

Prep. Dissolve *allantoine* in *nitric acid* (sp. gr. 1·2 to 1·4), with a gentle heat; after cooling, pour the liquor from the crystals of *nitrate of urea* which are deposited, evaporate, and dry at about 80° Fahr. Treat the residuum with weak *water of*

ammonia, and add *alcohol;* collect the white viscid matter thrown down, redissolve it in *water*, and again precipitate with *alcohol;* the last precipitate is the new compound. Its title to the name of an acid is doubtful.

ALLOPHANIC ACID. An acid compound formed by passing the vapour of *cyanic acid* into *alcohol.* Its properties and uses are undetermined.

ALLOXAN. Syn. *Alloxane; Alloxanum*,—Lat. *Erethric Acid* (?). A substance formed by the action of nitric acid on uric acid.

Prep. Gradually add *dry uric acid* to *nitric acid* (sp. gr. about 1·45) gently heated, until crystals begin to appear; then cool, and throw the mass on a funnel choked with *asbestos* or *fragments of glass* to drain, and afterwards drop on it a little *cold water*, to displace the last adhering portions of acid liquor; when well drained, re-dissolve in water, and crystallize, employing but little heat. The acid liquor will yield 4 or 5 crops of crystals by treating it as often with fresh uric acid. *Prod.* 80 to 90% of the uric acid employed.

Prop. &c. Efflorescent crystals; very soluble in water; taste disagreeable, astringent; reaction, acid; its aqueous solution tinges the skin purple; caustic alkalies convert it into *alloxanic acid.* It is diuretic. *Dose*, undetermined.

ALLOXANIC ACID. A product of the action of caustic alkalies on alloxan.

Prep. To an *aqueous solution of alloxan*, heated to 140° Fahr., add *baryta water*, as long as the precipitate first produced redissolves; filter, cool, re-dissolve the crystals of *alloxanate of baryta* which are deposited, and cautiously add *dilute sulphuric acid* until all the baryta is precipitated; the filtered or decanted liquid yields *alloxanic acid* by gentle evaporation.

Prop., &c. Small radiated crystals; soluble; taste and reaction, acid; decomposes the carbonates; dissolves zinc and iron; with the bases forms salts (*Alloxanates,*) many of which are soluble.

ALLOXANTINE. Syn. *Alloxantin.* A crystallizable substance, first obtained by Dr. Frout from uric Acid.

Prep. 1. Boil *uric acid*, 1 part, in *water*, 32 parts, and add *dilute nitric acid* until it dissolves; evaporate to $\frac{2}{3}$rds, and set it aside for 12 hours; the crystals, which will then be found deposited, may be purified by re-solution and crystallization.

2. Dissolve *alloxan* in *water*, and pass *sulphuretted hydrogen gas* through the solution, until the *alloxantine* be deposited as a crystalline mass, which must be purified by cautious washing, re-solution in boiling water, and re-crystallization.

Prop., &c. Small colourless, transparent four-sided crystals, scarcely soluble in cold water; solution reddens litmus.

ALLOY. Combinations of the metals with each other obtained by fusion. When mercury is one of the component metals, the compound is termed an *amalgam.*

Prep., &c. No general rules can be given for this purpose. Alloys of metals differing greatly in fusibility, are commonly made by adding the more fusible one, in a melted state, to the other, melted or heated to the lowest possible temperature at which a perfect union will take place between them. The mixture is usually effected under a *flux*, or some material that will promote liquefaction, and prevent volatilization and unnecessary exposure to the air. Thus; in melting lead and tin together, for solder, resin or tallow is thrown upon the surface; in tinning copper, the surface is rubbed with sal ammoniac; and in combining some metals, powdered charcoal is used for the same purpose. Quicksilver combines with many metals in the cold.

The *standard gold* of this country is an alloy of *pure gold*, 11 parts, with *pure copper*, 1 part. Formerly the alloy consisted partly of *silver*, as found in some of the older coins now in circulation. Occasionally, sovereigns are met with containing a little *palladium*, which then have a disagreeable brownish hue. Twelve parts of *standard silver* consist of $11\frac{2}{20}$ths of *pure silver*, and $\frac{18}{20}$ths of *pure copper.* (Phil. Trans. 1803.)

The following Table exhibits the composition of the more important compounds of this class:—

Table of the Principal Alloys.

Names.	Combining Metals.
Amalgams	Mercury and other metals.
Bell-metal	Tin and copper.
Brass	Copper and zinc.
Britannia metal	Tin with antimony, copper, and bismuth.
Bronze	Tin and copper.

Table of the Principal Alloys (continued).

Names.	Combining Metals.
Cannon metal	Tin and copper.
Dutch Gold	Copper and zinc.
Fusible metal	Tin, lead, and bismuth.
German silver	Copper with zinc, nickel, and iron.
Gold (*standard*)	Gold with copper.
Ditto (*old standard*)	Gold with copper and silver.
Gun metal	See Cannon metal.
Mosaic Gold	Copper and zinc.
Or-molu	Ditto.
Pewter (*common*)	Tin and lead.
Ditto (*best*)	Tin, with antimony, bismuth, and copper.
Queen's metal	Ditto.
Silver (*standard*)	Silver and copper.
Solder	Tin and lead.
Speculum metal	Tin and copper.
Tutania	See Britannia metal.
White copper (*Packfong*)	Arsenic and copper.

ALLYLE. The hypothetical radical of the essential oils containing sulphur, as those of assafœtida, garlic, mustard, onions, &c.

ALMONDS. The seeds or kernels of the almond tree. They are met with in commerce both *in the shell* (*Amygdalæ cum putamine*), and *shelled* (*Amygdalæ.*) In the retail shops, most commonly in the latter form. Those rancid, broken, or worm-eaten, should be rejected.

ALMONDS (Bitter). Syn. *Amygdalæ Amaræ*,—Lat. *Amygdala Amara*,—Ph. E. A variety imported from Mogadore, chiefly characterised by possessing the bitter flavour, and when rubbed with water, the odour of peach kernels.

Uses, &c. Bitter almonds are used to relieve the flavour of sweet almonds, to clear muddy water, and to flavour confectionary, liqueurs, &c. By pressure, they yield their bland oil, and the resulting cake is distilled for its volatile oil, after which it is again pressed into cakes (*Almond Cake;*) and used to fatten pigs, and for other purposes. Bitter almonds are seldom used in medicine, although they have been said to have cured intermittents when bark had failed. In large quantities they are poisonous, and even in the smallest quantities have been known to produce nettle-rash (*urticaria*), and other unpleasant symptoms. They have long been reputed an antidote to intoxication.

ALMONDS (Blanched). Syn. *Amygdalæ Decorticatæ.* Almonds from which the husks or seed-coat have been removed. This is effected by soaking them for a short time in warm water, until the skin can be easily removed by pressure between the thumb and forefinger. They are then peeled, rinsed in cold water, drained, and dried. When intended for the table, the last is effected by wiping them with a soft towel; but when they are intended for keeping, they are dried by a gentle heat in a stove, or in the sun, until they are brittle.

ALMONDS (Burnt). Syn. *Roasted Almonds, Almond Coffee.* Used to colour and flavour liqueurs and confectionary, and formerly as a substitute for coffee.

ALMONDS (Sweet). Syn. *Almonds; Amygdalæ*,—Lat. *Amygdala Jordanica*,—Ph. L.; *Amygdala Dulcis*,—Ph. E.; *Amygdalæ Dulces*,—Ph. D. Of these there are several varieties known in commerce:—"*Jordan Almonds*, which are the finest, come from Malaga. Of these there are two kinds; the one, above an inch in length, flat, and with a clear brown cuticle, sweet, mucilaginous, and rather tough; the other, more plump, and pointed at one end, brittle, but equally sweet with the former.—2. *Valentia Almonds*, (which come next in quality,) are about ⅗ths of an inch broad, not quite an inch long, round at one end, and obtusely pointed at the other, flat, of a dingy brown colour, and dusty cuticle.—3. *Barbary* and *Italian Almonds* resemble the latter, but are generally smaller and less flattened." (Brande, *Dict. Pharm.*) Another variety is imported in baskets from Spain.

Uses. Sweet almonds are nutritive, emollient, and demulcent, but frequently disagree with weak stomachs. The husk is very apt to occasion indigestion and nausea. Blanched almonds do not produce these inconveniences, and therefore should

alone be used for the table. In *medicine*, almonds are employed chiefly to suspend oily substances in water. Their uses for dietetical purposes are well known. Preparations of them are also esteemed as cosmetics. The cake left after expressing the oil, (*almond cake*,) is used for washing the skin; which it is said to render beautifully soft and clear.

ALNIGHT. A cake of wax with a wick in the midst. To this may be traced to the more modern night-lights, termed "MORTARS."

ALOE RESIN. The resinous matter deposited by a decoction of aloes as it cools.

ALOES. Syn. *Bitter Aloes; Aloë*,—Lat. The inspissated juice or extract of several species of aloe. Aloes is a warm stimulating purgative, acting as such in doses of from 3 to 10 grains; and it is considered highly serviceable in most hypochondriacal and dyspeptic affections, especially in phlegmatic habits, and in cases arising from deficiency of bile. It acts on the large intestines, and principally on the rectum, and should be administered with caution where there is a tendency to prolapsus or piles, and in cases where uterine stimulants (as in pregnancy, &c.) would be improper. Aloes is more frequently taken than perhaps any known purgative. It enters into the composition of a majority of the aperient medicines prescribed by the faculty, and forms the principal ingredient of nearly all the advertised, purgative, antibilious, and universal pills of the nostrum-mongers. The fact of aloetic pills not acting until about 8 to 10 hours after being swallowed, so that if taken on retiring to rest at night, they do not generally disturb the patient before the usual time of rising in the morning, has contributed more than anything else to make such remedies popular with parties, whose habits or business avocations, would be otherwise interfered with.

There are several varieties of aloes found in commerce, among which the principal are *Cape*, *Socotrine*, and *Hepatic*. The *second*, when genuine, is the most esteemed, but the *first* is by far the most abundant, and, when good, answers every purpose for which the drug is used. (U. S. Dispens.) *Socotrine* and *Hepatic Aloes* are those generally ordered in England.

ALOES (Barbadoes). Syn. *Aloes in Gourds; Aloë Barbadensis*,—Ph. L. & E. Imported from Barbadoes and Jamaica, usually in gourds; sometimes in boxes. "Opaque, lustreless, of a liver colour, a little tending to black, with a bitter nauseous taste, and a very disagreeable odour," (Ph. L.) especially when breathed on; *powder*, a dull olive yellow.

ALOES (Cape). Syn. *Aloë Capensis*,—Lat. From the Cape of Good Hope. *Odour*, stronger than that of Barbadoes aloes; *colour*, deep greenish-brown; *appearance*, shining and resinous; *fracture*, glassy; *powder*, a lively greenish-yellow colour; almost completely soluble in boiling water, decoction paler than that of other kinds.

ALOES (Hepatic). Syn. *Bombay Aloes*, *East Indian do.*, *Liver-coloured Socotrine do.*; *Aloë Hepatica*,—Ph. L. & D.; *Aloë Indica*,—Ph. E. Imported from Bombay and Madras; obtained from uncertain species of aloes. "Opaque, of a lively colour, bitter taste, and disagreeable odour." (Ph. L.) It is less odorous, darker-coloured, and more opaque than Socotrine aloes; its powder has also a duller colour; and weak spirit leaves much undissolved matter. The finer and brighter varieties of Hepatic aloes are commonly sold for Socotrine, and their medicinal virtues are nearly similar.

ALOES (Mocha). Syn. *Aloë de Mochâ*. Imported from Muscat. It holds an intermediate position between "Cape" and "hepatics," but contains much impurity; the latter often amounting to upwards of 25%. When melted and "doctored," it is sold for Barbadoes, Hepatic, and Socotrine aloes.

ALOES (Socotrine). Syn. *Aloë Socotrina*,—Ph. L. & E.; *Aloë*,—Ph. L., 1836. "The juice of the cut leaf of uncertain species hardened by the air." (Ph. L.) Formerly this variety was brought from the island of Socotra or Zocotra, (hence the name,) by way of Smyrna and Malta; but it is now chiefly obtained from Bombay and Madras. —*Char.* Colour, garnet red to golden red; smell, peculiar and aromatic; not unlike a decaying russet apple, especially when breathed on or warmed; taste, permanently and intensely bitter; fracture, conchoidal; softens in the hand and becomes adhesive, yet retains considerable brittleness; powder, *bright golden yellow colour;* central portions of the lumps often soft, especially when first imported. "It is brittle, bitter, of a reddish-brown colour, and has an aromatic odour. Light permeates thin recently-broken laminæ." (Ph. L.)

ALOES (Strained). Syn. *Melted Aloes; Aloë Colata*,—Lat. *Prep.* 1. *Aloes* melted in a copper pan by the heat of a steam, or water-bath, and pressed through a strong hair or wire sieve.

2. As above, but adding about twice its

weight of water; strain, and evaporate, as before.

Obs. Mocha, Indian, and other common aloes, treated in this way and coloured, are frequently sold for *melted* or *strained* "*Socotrines*" and "*hepatics.*" The colouring matter employed is usually the precipitated carbonate of iron (sesquioxide), or Venetian red in fine powder. Sometimes a little annatto is used for a like purpose. The process on the large scale, is usually carried on at *night*, in consequence of the horribly nauseous fumes evolved, which may be smelt at a great distance.

ALOESIC ACID (of Pereira). The acid existing in a watery solution of aloes. Trommsdorf supposed it to be gallic acid, but Dr. Pereira regards it as a distinct principle. It is prepared by adding *diacetate of lead* to an *infusion of aloes*, and decomposing the precipitate with *sulphuretted hydrogen.*

ALOESIN (of Pfaff.) Syn. *Aloin; Aloe-bitter, Aloe-extractive, Aloe-soap.* This article forms the principal portion of the bulk of aloes, and may be obtained by simply evaporating the cold filtered infusion or decoction. It is brown, very bitter, soluble in water and weak spirit, but insoluble in alcohol and ether. As a medicine it is milder than aloes, but the *dose* is the same.

ALOETIC ACID. Syn. *Aloïc Acid.* A substance obtained by Braconnot, by treating *aloes* with *sulphuric acid.* It resembles artificial tannin.

ALOETIC ACID (of Schunk). One of four peculiar acids discovered by Schunk among the products of the action of *Nitric Acid* on *Aloes.*

ALOIN. The brown bitter mass obtained by evaporating the cold infusion of aloes. The Messrs. Smith of Edinburgh have recently applied this name to a crystalline principle obtained by concentrating an *infusion of aloes* in vacuo, and allowing the crystals to form slowly. See *Aloesin.*

ALPHAORSELLIC ACID. An acid obtained from the South American variety of *Roccella tinctoria*, or *Dyer's roccella.* Its preparation and properties are analogous to those of Erythric acid.

ALTERATIVES. Medicines which effect some alteration in the nature or quality of the vital action, and occasion a change in the habit or constitution, establishing the healthy functions of the body, without producing any sensible evacuation by perspiration, vomiting, or purging. The preparations of *mercury* and *iodine*, when properly administered, are among the most useful and generally employed alteratives. See *Balls, Mixtures, Pills, &c.*

ALTHEINE, Syn. *Altheia, Altheina.* A name given by Braconnot to a vegetable principle which he discovered in the Althæa Officinalis, but which has since been shown by Henry and Plisson to be identical with asparagin.

ALTHIONIC ACID. A new acid discovered by Regnault in the residual liquor of the preparation of olefiant gas from alcohol and oil of vitriol.

Prep. Dilute with water and neutralize with *hydrate* or *milk of lime;* decant the solution which contains *althionate of lime,* evaporate and crystallize; dissolve the crystals in water, and precipitate with *oxalic acid;* the solution is dilute *althionic acid.*

Prop., &c. Reaction, acid; with the bases it forms salts called *althionates,* which have the same composition as the sulphovinates.

ALUM. Syn. *Potash Alum, Sulphate of Alumina and Potassa; Alumen Potassicum; Alumen, Sulphas Aluminæ et Potassæ,*— Ph. L. E. & D. The alum of commerce is a salt composed of alumina, potassa, and sulphuric acid; and in its crystallized state, a large quantity of combined water.

Prep. 1. The mineral (*Alum ore, Alum schist,* &c.) placed in heaps and moistened from time to time with *water,* becomes gradually hot, and falls into a pulverulent state. This decomposition commonly occurs either wholly or partially on the floor of the mine. If the ore does not possess this property, by mere exposure to air and moisture, it is broken into pieces and laid upon a bed of *brushwood* and *small coal,* to the depth of about four feet, when the pile is fired and fresh lumps of the alum mineral thrown on, until the mass becomes of considerable height and size; the combustion is then conducted with a smothered fire, until the calcination is complete; care being taken to prevent fusion, or the disengagement of either sulphurous or sulphuric acid, from contact between the ignited stones and the carbonaceous fuel. The pile is then allowed to cool, and is further exposed to the action of air and moisture. The residuum of the burning is next placed in large stone or brick cisterns, and thoroughly edulcorated with water, until all the soluble portion is dissolved out; the solution is then concentrated in another stone cistern, so made that the flame and heated air of its reverberatory furnace sweep the surface of the liquor. The evaporation is continued until it has *barely* reached the point at which it will deposit crystals on cooling;

when it is run off into coolers. After the sulphate of iron present has been deposited in crystals, the mother liquor, containing the sulphate of alumina, is run into other cisterns, and solution of *common muriate* or *sulphate of potassa*, or (sometimes) impure *sulphate* or *carbonate of ammonia* is added, until a cloud or milkiness ceases to be produced on adding more. It is next allowed to settle and get thoroughly cold, and the supernatant mother liquor being drawn off with a pump or syphon, the precipitate is well drained, and subsequently washed by stirring it up with a little *very cold water*, which is then drained off, and the operation repeated a second time. A saturated solution of the alum is next formed in a leaden boiler, and the clear portion is run off, while boiling hot, into crystallizing vessels, called "*roaching casks*," from which it is taken, after the lapse of about a week, in the form of large crystallized masses, which are broken up and packed in casks for sale. Sometimes the alum thus obtained is purified by a second crystallization.

2. *Clay* nearly free from carbonate of lime and oxide of iron is chosen for this purpose. It is moderately calcined (in lumps) in a reverberatory furnace until it becomes friable, when it is reduced to powder, sifted, and mixed in a stone or brick basin or cistern, with about $45\frac{0}{0}$ of its weight of *sulphuric acid* (sp. 1·45). Heat is then applied, the flame and hot air of a reverberatory furnace being made to sweep over the surface of the liquor. The heat and agitation are continued for two or three days, when the mass is raked out, and set aside in a warm place for a few weeks (6 to 8), to allow the acid the more perfectly to combine with the clay. At the end of this time the newly formed sulphate of alumina is washed out, the solution evaporated until of the sp. gr. of about 1·38 (1·24 for ammonia alum), and the *salt of potash* added. The remainder of the process resembles the one above described. Alum may be produced by this process for about £3. 6*s*. per ton, which is less than two thirds that of rock or mine alum.

Prop. Crystals, slightly efflorescent; soluble in 18 parts of cold, and in 1 of boiling water; taste, sweet, astringent, and acidulous; styptic; reddens litmus; when heated it melts, loses its water of crystallization, and becomes white and spongy, (*Burnt Alum;*) a very strong heat decomposes it, with the evolution of oxygen and a mixture of sulphuric and sulphurous acid (*Spirit of Alum, Aluminic Acid*); calcined with carbonaceous matter it suffers decomposition, and furnishes a pyrophoric residuum. Its solution is not affected by tincture of galls, hydrosulphuric acid, ferrocyanide of potassium, nor solution of nitrate of silver. Heated with caustic potassa or quick-lime, it does not evolve fumes of ammonia. "It is entirely soluble in water. From the solution, ammonia or potassa, when added, precipitates alumina free from colour, which again dissolves when the potassa is added in excess."—Ph. L.

Uses. The applications of alum in the arts and manufactures are numerous and important. It is used to harden *tallow* and *fats;* to render *wood* and *paper* incombustible; to *remove greasiness* from printers' blocks and rollers; to prepare a paper for *whitening silver* and *silvering brass* in the cold; to help the *separation of the butter* from milk; to *purify turbid water;* to *dress skins;* to *fix* and *brighten* the colours in dyeing; to make *lake* and *pyrophorus*, &c., &c. It is also extensively used for *clarifying liquors*, and for many other purposes connected with the arts and every day life. In *medicine*, alum is used as a tonic and astringent, in doses of 5 to 20 grs.; as a *gargle* (1 dr. to ½ pint of water); and as a *collyrium* and *injection* (10 to 15 grs. to 6 oz. of water). In *lead colic*, ½ dr. to 2 dr. of alum dissolved in gum water, every 3 or 4 hours, is said to be infallible. Powdered alum is frequently applied with the tips of the fingers, in cases of *sore throat* and *ulcerations of the mouth*, &c.

Concluding Remarks. The manufacture of alum is said to be conducted, according to the "*natural process*," when prepared from alum schist or alum ore; and, according to the "*artificial* process," when made by acting on clay with oil of vitriol. In addition to the particulars given above of its manufacture, we may add that the plan of getting rid of the ferric salts there referred to, has to some considerable extent been successfully replaced by that of precipitating the *alum*, instead of the *sulphate of iron*, by adding alkaline matter to the lixivium. The crystalline precipitate is purified by draining, re-solution, and re-crystallization; whilst the sulphate of iron and Epsom salts contained in the mother liquor, are obtained by evaporation and crystallization; after which a fresh crop of alum may be got from it, by the use of alkaline precipitants as before.

By a patent which has just expired, the ferric salts are precipitated by the addition of a solution of prussiate of potash, after which the supernatant clear liquor is decanted and evaporated for future operations.

Another process has been patented for the manufacture of alum, from the *ash* or *residue of the combustion of Boghead coal*, which was hitherto regarded as almost valueless. By the latest processes the least possible quantity of boiling water or liquor is employed for making the solutions, so that they may crystallize without evaporation, and thus economise fuel; and the mother liquors of previous operations are constantly employed for this purpose, when possible.

ALUM (Ammonia). Syn. *Alumen Ammoniatum*,—Lat. This is an alum in which the sulphate of potassa is replaced by an equivalent of a like salt of ammonia. It is prepared by adding gas-liquor, putrid urine, &c., to the *acid sulphate of alumina*. Much of the common alum, especially that prepared on the continent, contains both potash and ammonia.

ALUM (Burnt). Syn. *Dried Alum; Alumen Ustum*,—Lat.; *Alumen Exsiccatum*,—Ph. L. & E.; *Alumen Siccatum*,—Ph. D. Alum deprived of its water of crystallization by heat.

Prep. 1. (Ph. L.) Take of *Alum*, 1 lb; let it liquefy over a fire, which must be increased until all ebullition has ceased.

2. (Ph. E.) As above; the operation to be performed in a vessel of iron, or earthenware, and the residuum to be powdered.

3. (Ph. D.) As above, using a porcelain capsule.

Obs. Excessive heat should be avoided, lest a portion of the acid be driven off as well as the water. *Prod.* 53 to 55%. The properties are similar to those of common alum, but it is less soluble.—*Dose.* 10 to 20 grains in colic, especially painters' colic. It is also used as an escharotic.

ALUM (Iron). Syn. *Sulphate of Iron and Potassa; Alumen Ferri, Sulphas Ferri et Potassæ*,—Lat. A double salt, in which iron takes the place of the alumina of common alum.

Prep. (Redwood.) Take of *peroxide of iron*, 9 lb; *oil of vitriol*, 14 lb; dissolve, dilute the mixture with *water*, q. s., add *sulphate of potassa*, 10 lb; evaporate, and crystallize.

Obs. An equivalent of sulphate of ammonia is often substituted for the sulphate of potassa in the above salt. It has been lately strongly recommended by Dr. Tyler Smith, as a chalybeate tonic.

ALUM (Roman). Syn. *Red Alum, Roach do., Roch do.; Albumen Romanum, A. Rubrum, A. Rupeum.* Originally imported from Civita Vecchia, where it occurs native. That now sold as such in England is nothing more than ordinary alum, coloured with Venetian red, Armenian bole, or rose-pink, (*Albumen rubrum spurium.*) This is done by shaking the fragments in a sieve over a vessel of hot water, and then stirring them up with the colour, until the surface is uniformly tinged therewith. In genuine roach alum, the colour not only covers the surface, but also partially pervades the substance of the crystals.

ALUM (Soda). Syn. *Sulphas Aluminæ et Sodæ*,—Lat. An alum in which the sulphate of potash of the common alum is replaced by a like salt of soda.

ALUMINA. Syn. *Alumine, Argil, Oxide of Aluminum, Sesquioxide of Do., Alum Earth, Aluminous Do., Argillaceous Do.; Alumina, Terra Aluminosa*,—Lat. The plastic principle of clay, in which it exists, as a hydrated silicate. In its cruder forms it supplies us with the materials for manufacturing bricks, tiles, pipes, earthenware, and porcelain; whilst in its pure and crystallized state, it constitutes the ruby and the sapphire, two of the hardest and most valuable of the gems.

Prep. 1. (Berzelius). Dissolve *alum* in 6 times its weight of *boiling water*, add a *solution of carbonate of potassa*, (in slight excess,) agitate for a few minutes, filter and wash with distilled water. The product is *hydrate of alumina*, (*Gelatinous Alumina; Aluminæ Hydras.*) To render this *perfectly* pure, it must be dissolved in weak muriatic acid, and again thrown down with ammonia, washed with water, and pressed and dried on bibulous paper, at a temperature not exceeding 120° Fahr. By exposure to a white heat in a crucible, it loses its combined water, and becomes anhydrous.

2. (Liebig.) Precipitate a *solution of alum* with a *solution of chloride of barium*, filter, evaporate to dryness, and ignite the residuum.

3. (Gay-Lussac.) Expose perfectly pure *ammonia alum* to a white heat.

4. (Sax. Ph.) As No. 1, but omitting the ignition.

5. Add *carbonate of potash* to a *solution of alum;* well wash the precipitate with *distilled water*, redissolve it in *hydrochloric acid*, reprecipitate with *ammonia*, and wash it as before.

Prop. A soft white powder; in the hydrated state, freely soluble in the acids (forming salts), and in solution of caustic potassa or soda, from which it is precipitated by sal ammoniac; anhydrous, (as after ignition,) it is scarcely acted on by acids, and when perfectly indurated or crystallized,

it is wholly insoluble. Its salts are mostly colourless, non-volatile, and soluble, have a sweetish, astringent taste, redden litmus paper, and lose their acids by ignition.

Uses, &c. Moist hydrate of alumina is used to mix with oxide of cobalt and other substances as a base for the colour. It is also the base of the "lake pigments." In *medicine*, it has been employed as an antacid and astringent, in acidity of stomach, cholera, diarrhœa, and dysentery, in which it is superior to other absorbent remedies.—*Dose.* 5 to 20 gr., three or four times daily, suspended in water by gum or simple syrup.

ALUMINA (Acetate of). Syn. *Aluminæ Acetas*,—Lat. *Prep.* 1. (Van Mons.) Digest *pure hydrate of alumina* in cold *strong acetic acid*, until the latter is saturated. The filtered or decantered solution may either be evaporated by a very gentle heat to a gelatinous consistence, or preserved in its normal state. By spontaneous evaporation, long, transparent crystals may be obtained.

2. (Pereira.) *Alum*, 476 gr.; *crystallized acetate of lead*, 760 gr.; dissolve in water, (separately,) and mix the solutions. The filtered liquid contains the acetate of alumina combined with some acetate of potash.

3. Add a *solution of acetate of baryta* to another of *sulphate of alumina*, and filter.

4. *Alum*, 5 parts; *sugar of lead*, 6 parts; dissolve, mix the solutions, and after a time decant the clear.

5. *Alum*, 2 parts; (in solution;) solution of *pyrolignite of lime* (20° Baumé), 3 parts; mix.

Uses. In *calico printing* as a mordant, mixed with starch, gum, oil, &c., to thicken it. In *dyeing*, as a mordant, the thickening being omitted. Its valuable properties depend upon the feeble affinity existing between its constituents, which is counterbalanced by that of the cotton fibres at a moderate heat. Chemically pure acetate of alumina is made by the first and third formulas, but that of the former should be preferred in medicine. The products of the other forms are used for dyer's mordants. The presence of sulphate of potassa is said to assist its action on the cloth. *Dose.* ½ dr. to 1 dr. daily; for an *injection*, 10 to 20 gr., to water, 4 oz.; in gonorrhœa, &c.

ALUMINA (Sulphate of). Syn. *Tersulphate of Alumina*; *Aluminæ Sulphas*,—Lat. *Prep.* Saturate *dilute sulphuric acid* with *hydrate of alumina*, evaporate and crystallize.

Uses. As a wash for foul ulcers. M. Gannal found that a solution made with 1lb of this salt to a quart of water, will preserve an animal body for a long time, if injected into the arteries. Even an *enema* of one quart, or an *injection into the œsophagus* of a like quantity, will suffice to preserve a body for several weeks.

ALUMINA (Tannate of). Syn. *Aluminæ Tannas*,—Lat. *Prep.* Take of *pure hydrate of alumina* (dried at 90° Fahr.), 1 part; *tannic acid* (dried), 2 parts; carefully triturate together for some time, adding sufficient water to bring them to the consistence of a syrup, and evaporate to dryness at a heat below 120° Fahr.; lastly reduce to powder.

ALUMINUM. Syn. *Aluminium*, *Alumium*. The metallic base of alumina.

Prep. (M. Wöhler.) By heating *sesquichloride of aluminum* with either *potassium* or *sodium*, as directed for preparing magnesium, a *platinum* or *iron tube*, closed at one end, being employed. The reduction takes place with such violence, that great caution is needed on the part of the operator to prevent unpleasant consequences or disappointment. The *sesquichloride of alumina* used in this process is prepared as follows:—A thick paste made of *alumina*, *powdered charcoal*, *sugar*, and *oil*, is heated in a covered crucible until all the organic matter is destroyed. The residuum is transferred to a *porcelain tube*, the one end of which is connected with *another tube* containing *dried chloride of calcium*, and the other end with a *small tubulated receiver*. The porcelain tube is then heated to redness, whilst *chlorine*, dried by passing through the chloride of calcium tube, is transmitted through the apparatus. In one or two hours, or as soon as the tube is choked, the whole is allowed to cool, and the newly-formed sesquichloride collected and preserved in *naphtha* until required for use.

Prop. Thus obtained it is a gray powder, consisting of small metallic scales, resembling platina; not acted on by cold water, soluble in the alkalies and some of the acids. Heated to redness, it catches fire and burns with great rapidity in the air, and in oxygen gas, with intense brilliancy. The powder, heated to redness in the *vapour of phosphorus*, burns vividly, and produces *sesquiphosphuret of aluminum*; mixed with *selenium* and exposed to heat, a blackish powder, (*seleniuret of alumina*,) is formed; heated until strongly incandescent, and small pieces of *sulphur* dropped upon its surface, the most brilliant combustion ensues with the formation of *sesquisulphuret of aluminum*. Both this and the seleniuret possess a semi-metallic lustre, and are easily decomposed by exposure and moisture. Its only compound with *oxygen* is *alumina*.

AMANDINE. *Prep.* 1. Take of *thick mucilage of gum arabic*, 3 *oz.*; *new white honey*, 6 *oz.*; *white potash-soap*, 3 *oz.*; well mix in a mortar; add *oil of sweet almonds*, 1½ *lb.*, and the *yelks of* 5 *large eggs*; again mix well; lastly, add of *thick pistachio milk* (made of the fresh peeled nuts and rose-water,) 4 *oz.*; incorporate thoroughly and preserve for use. Sometimes this paste is coloured by the addition of 2 or 3 *dr.* of oil tinged green with spinach leaves.

2. *Almond paste, almond oil, honey, Naples soap*, and *glycerine*, of each, 1 *oz.*; *yelk of* 1 *egg*; *balsam of Peru*, ½ *dr.*; reduce the mixture to a perfectly homogeneous paste, sprinkling in a few teaspoonsful of *spirit of wine*, and pot it immediately. Both the above are scented with the *oil of bitter almonds.*—*Used* to whiten and soften the skin, and prevent it chapping. A small portion about the size of a filbert, with a little warm water, produces a very white and rich lather, with which the hands and face should be rubbed lightly, and the skin wiped whilst the water is still milky.

AMADOU. Syn. *Spunk*, *German Tinder*, *Touch-match*, *Pyrotechnic Sponge*, *Surgeon's Agaric*, *Agaric of the Oak*. A spongy combustible substance prepared from the boletus fomentarius, boletus igniarius, and other allied species of tree fungi.

Collection, &c. The fungus is collected in August and September, and the outer bark having been removed with a knife, the inner spongy-substance is carefully separated from the woody portion below, cut into slices, and well beaten with a mallet until sufficiently soft and pliable. Some parties first boil it in water in order to separate the epidermis and porous parts, and to free it from soluble matter; after which they dry it and beat it as before. To complete its manufacture for *tinder*, it is soaked once, or oftener, in a *strong solution of saltpetre*; or in a thin paste made of *gunpowder* and *water*, which is thoroughly forced into the pores; after which it is dried, and well rubbed to free it from loose matter. When prepared with saltpetre, it is often called *red* or *brown amadou*; and when prepared with gunpowder, *black amadou*.

Uses. It is used to stop local bleeding, to spread plasters on, as a compress, and for some other like purposes. When covered with *resin-plaster*, it forms an excellent article for the protection of abraded surfaces. A small piece thus prepared, of a circular shape, having a round hole cut in the middle, the size of the apex of the corn, forms the very best corn-plaster, as from its great softness it at once protects the part from pressure, and removes the cause. It also forms one of the best shoe-socks known.

AMALGAM. Alloys containing quicksilver. Mercury unites with many of the metals by mere contact. Some, as *gold*, *silver*, *tin*, and *lead*, it is capable of dissolving in certain quantities, without losing its fluidity. Most of these compounds may be prepared by agitating or rubbing the mercury with the given metal in the state of filings or small fragments, either with or without heat. Some of the liquid amalgams crystallize after a time, becoming solid. Those with gold, silver, tin, zinc, &c., are extensively employed in *gilding*, *silvering*, and *dentistry*, and in other useful arts and manufactures.

AMALGAM (Ammoniacal). An unstable compound produced when a *globule of mercury* is placed in a small cavity formed in a piece of *sal ammoniac*, and the *negative pole* of a *powerful galvanic battery* is brought into contact with the metal, and the *positive pole* with the ammoniacal salt. On withdrawing the influence of the battery, the whole returns to its former condition.

AMALGAM (Electrical). *Prep.* 1. Take of *zinc* and *grain tin*, of each, 1 *oz.*; melt in an iron ladle, remove it from the fire, and add of *mercury*, (hot), 2 *oz.*; stir well together with an iron rod, pour the melted metal into a well-chalked wooden box, and agitate it violently until cold; or it may be stirred until cold and then powdered. It should be preserved in a corked glass bottle.

2. (La Baumé.) *Zinc*, 2 *oz.*; *grain tin*, 1 *oz.*; *bees' wax*, ½ *oz.*; *mercury*, 6 *oz.*; as last.

3. *Zinc*, 2 *oz.*; *tin*, 1 *oz.*; *mercury*, 5 *oz.*

4. *Zinc*, 2 *oz.*; *mercury*, 5 *oz.*

Use. For covering the cushions of electrical machines. A little of the powder is spread thinly on the surface of the rubber, previously touched over with tallow.

AMALGAM (Gilding). Syn. *Amalgam of Gold*. *Prep.* Take of *grain gold*, 1 part; *mercury*, 8 parts; put them into a small iron saucepan or ladle, dissolve by a *gentle* heat, (using a smooth piece of iron as a stirrer,) and pour it out on a clean plate or smooth stone slab.

Use. For gilding brass, copper, &c. The metal to be gilded is first rubbed over with a solution of nitrate of mercury, and then covered with a very thin film of the amalgam. On heat being applied, the mercury volatilizes, leaving the gold behind.

AMALGAM (Silvering). *Prep.* 1. As

the last, but substituting *silver* for *gold. Used* to silver metals.

2. *Lead, tin,* and *bismuth,* of each, 1 *oz.;* melt, skim off the dross, cool to the lowest point at which the mixture will remain liquid, and add, *quicksilver,* 10 *oz.;* mix well with an iron rod.

3. *Lead,* and *tin,* of each, 1 *oz.; bismuth,* 2 *oz.; quicksilver,* 4 *oz.* The last two are used for silvering the insides of hollow glass vessels, globes, convex mirrors, &c. The glass being well cleaned, is carefully warmed, and the amalgam, rendered fluid by a gentle heat, is poured in, and the vessel turned round and round, so that the metal may be brought into contact with every part of the glass which it is desired to cover. At a certain temperature it will be found to readily adhere to the glass.

AMALGAM (Varnisher's). *Prep.* Melt *grain tin,* 4 *oz., with bismuth,* 1 *oz.;* add *quicksilver,* 1 *oz.,* and stir till cold; then grind it very fine with *white of egg* or *varnish,* and apply it to the figure.

AMALIC ACID. A substance formed by the action of *chlorine* on *caffeine.* It possesses only feeble acid properties, and is homologous to alloxantin. Treated with *oxidising agents* it yields *Cholestrophane;* and when treated with *ammonia, Caffeine Murexide.*

AMANITINE. Syn. *Amanitina.* The poisonous principle of the *amanita muscaria,* and some other species of fungi. It is brown, uncrystallizable, and soluble.

AMARINE. Syn. *Amarina.* A name which has been given to the bitter principle of several vegetables. It has recently been applied to Benzoline.

AMARYTHRINE. The bitter principle of erythrine.

AMAUROSIS. Syn. *Gutta Serena.* A diminution, or total loss of sight, supposed to arise from paralysis of the retina or optic nerve. In general there is no visible defect of the eye, except dilatation of the pupil and immobility of the iris. It is the "drop serene," so feelingly alluded to by Milton. Mild streaming electricity has been, in some cases, successfully employed as a remedy for this distressing affection.

AMBER. Syn. *Ambra, Electrum, Succinum,*—Lat. *Succinum,*—Ph. D. A well-known yellow, semi-transparent, fossil resin.

Manufacture. Amber is *worked* in a *lathe, polished* with *whiting and water* or *oil,* and *finished off* by friction with *flannel.* During the operation the pieces often become hot and electrical, and fly into fragments, to avoid which, they should be kept cool, and only worked for a short period at a time. It is *joined* and *mended* by smearing the surfaces of the pieces with *linseed* or *boiled oil,* and then strongly pressing them together, at the same time holding them over a *charcoal fire,* or heating them in any other way in which they will not be exposed to injury. The commoner varieties are *hardened* and *rendered clearer,* either by boiling them in *rape oil* for about 24 hours; or by surrounding the pieces with *clean sand* in an iron pot, and exposing them to a gradually increasing heat for 30 or 40 hours. During this process small fragments must be kept in the sand at the side of the pot, for the purpose of occasional examination, lest the heat be raised too high, or be too long continued.

Identification. Amber may be known from *mellite* and *copal,* both of which articles are occasionally substituted for it, by the following characteristics:—*Mellite* is infusible by heat, and burns white.—A bit of *copal,* heated on the point of a knife, catches fire, and runs into drops, which flatten as they fall.—*Amber* burns with spitting and frothing, and when its liquefied particles drop, they rebound from the plane on which they fall. (M. Haüy.)—Neither *mellite* nor *copal* yield succinic acid by distillation.

Uses. It is chiefly made into mouth-pieces for pipes, beads for necklaces, and other ornaments; and is used as the basis of several excellent varnishes. It was formerly given in chronic coughs, hysteria, &c.—*Dose,* of the powder, 10 to 60 grs. The coarser kinds alone, are employed in medicine, chemistry, &c.

AMBER (Balsam of). Syn. *Balsamum Succini,*—Lat. The thick oil left in the retort after the rectification of oil of amber. In its properties it resembles the common oil.

AMBER (Factitious). Syn. *Succinum Factitium.* Mellite, copal, and anime, have each been substituted for amber in small fragments. Recently a remarkably good imitation has been produced by acting on *gutta percha* with *sulphur,* at *high temperatures,* which has been extensively passed off for genuine amber.

AMBER (Soluble). *Prep.* Heat *amber,* cautiously, in an *iron pot,* and as soon as it softens and becomes semi-liquid, stir in nearly an equal weight of *pale boiled linseed oil.* It is used as a cement for glass and earthenware, and thinned with *oil of turpentine,* as varnish.

AMBERGRIS. Syn. *Ambragrasea,*—Lat. An odorous, solid substance, sup-

posed, by some, to be a morbid secretion of the liver or intestines of the cachalot or spermaceti whale, analogous to biliary calculi; but according to M. Beale, it consists of the mere indurated fæces of the animal; perhaps, (as suggested by Dr. Pereira,) somewhat altered by disease. From the high price of genuine ambergris, it is very frequently adulterated. When quite pure and of the best quality, it is—1. Nearly wholly *soluble* in hot *alcohol* and *ether*, and yields about 85% of *ambreine*;—2. It almost wholly *volatilizes* at a *moderate heat*, and when *burnt* leaves *no* notable quantity of *ashes*;—3. It is *easily punctured* with a *heated needle*, and on withdrawing it, not only should the *odour* be *immediately evolved*, but the *needle* should *come out clean*, without anything adhering to it.

Uses. It is highly prized for its odour, which is peculiar, exceedingly diffusive, and perceptible in minute quantities; and it is found greatly to exalt the odour of other substances. It was formerly given as an aphrodisiac, in doses of 3 to 10 grs. "A grain or two, when rubbed down with *sugar*, and added to a *hogshead of claret*, is very perceptible in the wine, and gives it a flavour, by some considered as an improvement. (Brande,)

AMBERGRIS (Factitious). An article of this kind, met with in some shops, is thus made:—*Ben nuts*, 6 *oz.*: *spermaceti* and *farina*, of each, 8 *oz.*; *orris powder*, 16 *oz.*; *gum benzoin*, 20 *oz.*; *asphaltum*, 3 *oz.*; *grain musk* and *liquor of ammonia*, of each, 1 *oz.*; *ambergris*, 8 *oz.*; *oils of cloves* and *rhodium*, of each, 20 *drops*; *mucilage of gum tragacanth*, q. s.; beaten to a smooth mass, made into lumps, and dried.

AMBREIC ACID. An acid obtained by digesting *ambreine* in *nitric acid*. It resembles cholesteric acid. Its salts are termed *Ambreates*.

AMBREINE. Syn. *Ambreina*. The fatty, odorous principle of ambergris.

Prep. Digest *ambergris* in *hot alcohol* (sp. gr. 0·827) until the latter will dissolve no more, then filter. The ambreine will be deposited as this solution cools, in an irregular crystalline mass, which may be purified by recrystallization in alcohol. *Product*, about 85%.

Prop. Melts at about 90°; volatilizes at 212° to 220° Fahr.; nitric acid converts it into *Ambreic acid*. It resembles cholesterine.

AMIDE. Syn. *Amidet*, *Amidide*. A compound having amidogen in its electro-negative part. According to Professor Goodrich the right orthography of the word is *ammid*; and Brande remarks—"The term *ammonide*, from their resemblance to ammonia, would, perhaps, be more correct." The names of its compounds are made up of the name of the other ingredients prefixed to amide; as *sodamide*, *hydramide*, *&c.*; *amidide of sodium*, *amidide of hydrogen*, *&c.* See *Amidogen*.

AMIDINE. A substance formed by the action of boiling water on starch. It constitutes the interior substance of the starch grains, and its properties are intermediate between those of starch and gum.

AMIDOGEN. The name given by Kane to a hypothetical substance in the ammonia compounds, composed of two equiv. of hydrogen, and one equiv. of nitrogen. See *Amide*.

AMMELIDE. A white insoluble powder, prepared by dissolving *ammeline*, *melam*, or *melamine*, in *strong sulphuric acid*, adding *alcohol*, and washing the resulting precipitate with *cold water*. It is purified by re-solution in *dilute nitric acid*, and precipitation with *carbonate of ammonia*.

AMMELINE. A weak alkaline base prepared by dissolving *melam* in boiling *dilute hydrochloric acid*. The crystals obtained by concentrating the liquid, dissolved in *pure water*, and precipitated with *ammonia*, consist of very fine needles, having a silky lustre, insoluble in both water and alcohol. It may also be obtained from the *alkaline mother liquor from which melamine has separated*, by neutralising it with *acetic acid*.

AMMONIA. Syn. *Ammoniacal Gas*, *Volatile Alkali*, *Terhydruret of Nitrogen*, *Terhydride of do.*, *Hydramide*, *Amidide of Hydrogen*, *Alkaline Air*; *Ammonia*, *Gas Ammoniacale*,—Lat. A gaseous substance forming the pungent principle of smelling salts, and the ammonia-compounds.

Prep. A mixture of *quicklime* with an equal weight of *sal ammoniac*, (both dry and in fine powder,) is introduced into a glass retort, the beak of which is joined by a collar of *Indian rubber* to a glass tube about 18 inches long, having its other end bent up ready to be placed under a gas jar, on the shelf of a *mercurial* pneumatic trough. Heat is then applied by means of a spirit-lamp, and the air contained in the apparatus having been expelled, the gas is collected for use. It cannot be dried by means of *chloride of calcium*.

Prop. Gaseous, colourless, invisible, highly pungent, acrid, irritating, and alka-

line; irrespirable, unless largely diluted with air; extinguishes combustion; burns slowly in oxygen; sp. gr. 0·590; highly basic; all its salts are either volatilized or decomposed at, or under a red heat—those with a *volatile* acid sublime unchanged—those with a *fixed* acid lose their ammonia; water at 50° Fahr. absorbs 670 vols. of this gas, and the solution has the sp. gr. 0·875, (Sir H. Davy.) Water condenses easily about $\frac{1}{3}$d its weight or 460 times its bulk. (Ure.)

Ant., &c. The vapour of acetic acid or common vinegar. It may be produced by sprinkling a little vinegar on a piece of hot iron, as a heated shovel.

Estim. The quantity of gaseous ammonia in *pure* water of ammonia is easily determined from the specific gravity of the liquid, or from its saturating power. See *Alkalimetry* and *Ammonimetry*.

Tests. Ammonia is recognised by—1. Its pungent odour.—2. By turning vegetable blues *green*, and yellows, *brown*, but which soon regain their previous *colours*, especially on the application of heat. *The salts of ammonia* are known by the exhalation of ammoniacal gas (recognised by its odour,) when mixed with caustic potassa, soda, or lime.

Uses. Ammonia is employed in several processes in chemistry and the arts; absorbed by water it forms liquor of ammonia, spirits of hartshorn, &c.

AMMONIA (Acetate of). Syn. *Ammoniæ Acetas*,—Lat. *Prep.* Take of *acetate of potassa* and *sal ammoniac*, equal parts; mix and distil; the oily liquid in the receiver (*binacetate of ammonia*,) forms a radiated crystalline mass on cooling. *Dry ammoniacal gas* passed into this salt, melted by a gentle heat, transforms it into the solid and inodorous *neutral acetate*.

2. *Strong acetate acid* is saturated with *ammonia* or its *carbonate;* the solution evaporated over *sulphuric acid in vacuo*, and the crystals carefully drained and pressed between bibulous paper.

3. From a *saturated solution of the salt in hot water*, suffered to cool *slowly* in a *close* vessel.

Prop., &c. Long slender crystals or a crystalline mass, very soluble in both alcohol and water; its solutions cannot be evaporated without loss of the base; distilled with *anhydrous phosphoric acid*, it is converted into *Acetonitrile*. An aqueous solution of Acetate of Ammonia was introduced into the Materia Medica by Boerhaave, (1732); and has since been extensively used in *medicine* as a diaphoretic and febrifuge, under the popular name of *Mindererus Spirit*. For medicinal purposes, both this salt and its solutions should be neutral to test paper, and *wholly* volatilized by heat.

AMMONIA (Arseniate of). Syn. *Ammoniæ Arsenias*,—Lat. *Prep.* 1. (Cottereau.) Take of *arsenic acid*, 1 oz.; *strong water of ammonia*, q. s., to saturate the acid; allow the solution to evaporate and crystallize spontaneously.

2. Saturate a warm *concentrated solution of arsenic acid* with *sesquicarbonate of ammonia* in *slight* excess; evaporate by a gentle heat and crystallize.

3. (*Binarseniate.*) As above, but employing two equiv. of acid.

AMMONIA (Arsenite of). Syn. *Ammoniæ Arsenis*,—Lat. *Prep.* From a *hot concentrated solution of arsenious acid*, as the last.—*Used* (chiefly) to make arsenite of iron. The properties of the above arsenical preparations are for the most part similar to those of arsenite of potassa.

AMMONIA (Benzoate of). Syn. *Ammoniæ Benzoas*,—Lat. *Prep.* 1. Dissolve *benzoic acid* in *strong water of ammonia*, to saturation, then further add *ammonia* in *slight excess*, and crystallize by refrigeration.

2. As the last, but employing a *solution of sesquicarbonate of ammonia*.

Used as a chemical test. Very soluble and difficult to crystallize.

AMMONIA (Carbonates of). Ammonia combines with carbonic acid in several proportions, but only three of them are known in commerce. (See *below*.)

AMMONIA (Carbonate of). Syn. *Monocarbonate of Ammonia, Neutral Carbonate of do.; Neutral Hydrous do.*,— Rose; *Ammoniæ Carbonas, Ammoniæ Monocarbonas*,—(Lat.) This article must be distinguished from the carbonate of ammonia of commerce, which is now generally termed the *sesquicarbonate*.

Prep. (Ph. D. 1826). *Sal ammoniac*, (powdered and well dried,) and *dried carbonate of soda*, equal parts; mix, and with a gradually increased heat, sublime from an earthen retort, into a refrigerated receiver.

Prop. Solid, crystalline; evolving a stronger ammoniacal odour than the sesquicarbonate, but feebler than that from liquor of ammonia. Its properties for the most part resemble those of the sesquicarbonate, but it is stronger.

Uses, &c. The neutral carbonate, in the solid form, is seldom used in medicine; but it is indirectly employed in several liquid preparations in which the sesquicar-

bonate is ordered. It is superior for filling smelling bottles to any other preparation of ammonia; as it is not only more pungent, but does not lose its pungency by keeping. It volatilizes more quickly than the sesquicarbonate, and the residuum, unlike that of the latter salt, continues as odorous as ever. It is the basis of several of the most popular and esteemed advertised *smelling salts* of the shops.

AMMONIA (Sesquicarbonate of). Syn. *Carbonate of Ammonia*, (of the shops;) *Ammoniæ Sesquicarbonas*,—Ph. L. & D. *Ammoniæ Carbonas*,—Ph. E. & U. S. *Baker's Salts*, *Volatile Salts*, *Subcarbonate of Ammonia*. The substance popularly known as "*smelling salts*," or "*carbonate of ammonia*." The London and Dublin Colleges now include it in their lists of Materia Medica.

Prep. 1. (Ph. E. 1841; Ph. L. 1836.) *Sal ammoniac*, 1 lb; *chalk*, 1½ lb; separately dried and pulverized; then thoroughly mixed together, and sublimed with a gradually increasing heat, as ordered for the carbonate.

2. (Commercial.) From *sal ammoniac* or *pure commercial sulphate of ammonia*, and *chalk*, equal parts, both dry and in powder, mixed as before, and sublimed from an *iron pot*, into a *long earthen or leaden receiver*, well cooled.

The receiver is usually fitted with a moveable lead cover, secured by a water joint, and has an open lead pipe in the bottom, to allow the liquid products of the distillation to drain off into a second receiver. When the *impure* sulphate of ammonia is used, the resulting salt is generally resublimed in iron pots, furnished with leaden heads kept very cool; a little water being introduced into the subliming pots to render the product translucent. The heat is usually applied by means of a common furnace, but a steam or water bath is preferable, as the temperature should not be greater than 215° Fahr.; and, indeed, need not exceed 150 or 160°.

Sesquicarbonate of ammonia is less volatile and pungent than the neutral carbonate; dissolves in 4 parts of cold and in an equal weight of tepid water; boiling water and alcohol decompose it, with the evolution of carbonic acid gas; by age or exposure to air, the surface assumes an opaque white colour, from its carbonate flying off; the remaining bicarbonate being less volatile. Sp. gr. 0·966.

Pur. It is "free from colour, transparent, of an acrid smell and taste; it changes the colour of turmeric brown; is (entirely) dissipated by heat, and is dissolved (entirely) by water. Nitric acid being added to saturation, nothing is thrown down by either nitrate of silver or chloride of barium." (Ph. L.)

Uses. It is commonly employed by the bakers in their fancy goods, and to make extemporaneous bread and pastry; by the *chemist* and *pharmaceutist* for the preparation of several of the salts of ammonia, and in analysis, &c. In *medicine*, it is used as a stimulant, antispasmodic, antacid, and diaphoretic, in acidity of the stomach, dyspeptic affections, gout, scrofula, hysteria, lowness of spirits, epilepsy, &c.; and in the convulsions attending dentition. It is also used to make effervescing draughts; and *externally*, as a counter-irritant and stimulant. In *large doses* it is emetic; in *excessive doses*, poisonous. *Dose*, 5 to 30 gr., in solution, or made into pills; or as an effervescing saline draught:

20 grs. of *sesquicarbonate of ammonia*, in solution, are used to { 6 fl. dr. of lemon juice, 24 grs. of citric acid, or 25 grs. of tartaric acid;

with the addition of a few drops of any aromatic essential oil, as lemon, lavender, or bergamotte. Its use as a nasal stimulant in headaches, fainting, &c. is well known.

AMMONIA (Bicarbonate of). Syn. *Ammoniæ Bicarbonas*,—Ph. D. *Hydrated Bicarbonate of Oxide of Ammonium*, *Supercarbonate of Ammonia*.

Prep. 1. (Ph. D.) Take of *commercial sesquicarbonate of ammonia*, any convenient quantity; reduce it to fine powder, spread it on a sheet of paper, and expose it to the air for 24 hours; then preserve the residuum in a well-stoppered bottle.

2. (Ph. D. 1826.) Dissolve *carbonate* (sesquicarbonate) *of ammonia* in *water*, and pass a stream of *carbonic acid gas* (from *white marble* and *dilute muriatic acid*,) through it, to full saturation; let it rest, and dry the crystals that form, without heat, and preserve them in stoppered bottles. *Obs.* Crystallization is promoted by forcing in the gas under pressure.

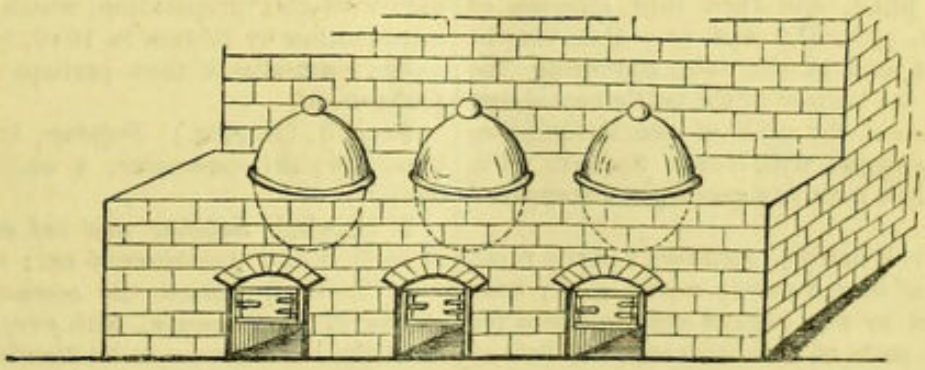
3. By digesting *cold water* on the *sesquicarbonate of ammonia* in considerable excess, until the whole of the pungent carbonate is dissolved out. If the salt is reduced to powder, the operation is facilitated.

4. (Rose.) To the *powdered sesquicarbonate*, add *boiling water*, q. s. to dissolve it, and immediately close the vessel; crystals form as the liquid cools containing 2½ eq. of water.

Prop., &c. It for the most part resembles the sesquicarbonate, except in its taste and smell being only faintly ammoniacal. It requires 8 times its weight of cold water to dissolve it.

A saturated solution of the above salt, evaporated by *a very gentle heat*, gives small prismatic crystals, having neither smell nor taste. Its uses are similar to those of the other carbonates; but it is less caustic and unpalatable. *Dose*, 6 to 25 gr. or ½ dr.

AMMONIA (Citrate of). Syn. *Citrate of Oxide of Ammonium; Ammoniæ Citras*,—Lat.



Prep. Saturate a *concentrated solution of pure citric acid* with *sesquicarbonate of ammonia* in fine powder; (about 7 to 6;) employing a *gentle* heat; and crystallize by refrigeration in a close vessel.

Uses. As a chemical test. An extemporaneous citrate made with lemon juice and drank effervescing, is employed as a mild aperient and diaphoretic, in fevers, &c.

AMMONIA (Hydriodate of). Syn. *Iodide of Ammonium; Ammoniæ Hydriodas, Ammonii Iodidum*,—Lat. *Prep.* (P.C.) *Clean iron filings*, 1 part; *iodine*, 2 parts; *distilled water*, q. s.; digest with agitation till a colourless solution is obtained; to the clear liquid, add *sesquicarbonate of ammonia*, in *slight* excess; filter, concentrate by rapid evaporation, and crystallize by refrigeration. The crystals should be dried by pressure between the folds of bibulous paper, and kept in a stoppered bottle. It resembles Iodide of potassium, except in being more active, and better suited to irritable and relaxed habits.

AMMONIA (Hydrochlorate of). Syn. *Muriate of Ammonia, Sal Ammoniac, Chloride of Ammonium; Ammoniæ Murias*,—Ph. E. D. & U. S.; *Ammoniæ Hydrochloras*,—Ph. L. A substance originally prepared by subliming the soot from camel's dung. In this country, at the present day, it is manufactured chiefly from the crude ammoniacal liquors obtained as secondary products in the manufacture of coal gas and animal charcoal.

Prep. 1. (From gas liquor.) The *crude ammoniacal liquor of the gas works*, containing the carbonate, sulphate, hydrosulphuret, and other salts of ammonia, is commonly neutralized with *sulphuric acid*, and evaporated; the resulting brown crystals of impure *sulphate of ammonia* are then mixed with the proper quantity of *chloride of sodium* or *common salt*, and placed in iron pots, lined with clay, having a leaden dome or head adapted, (see *engr.*,) and heat is applied until the whole has sublimed. When carbonates predominate in the liquor, it is often digested with *ground plaster of Paris* (sulphate of lime,) instead of being treated with sulphuric acid, by which *sulphate of ammonia* is formed, which remains in solution, and *carbonate of lime*, which is precipitated. Sometimes the ammoniacal liquor is at once saturated with *hydrochloric acid*, or with *chloride of calcium*. The crystals which are now obtained, are *crude hydrochlorate of ammonia*, and are purified by sublimation as before.

2. (From bone liquor.) The preparation of sal ammoniac from bone-spirit salt is nearly similar to that described above.

Prop., &c. It is odourless, has a saline acrid taste, and sublimes without either fusion or decomposition; slightly reddens litmus; dissolves in three parts of cold and 1 part of boiling water; is soluble in alcohol; a piece heated on the point of a knife in a candle readily sublimes; mixed with caustic potassa, soda, or quicklime, it evolves the fumes of ammonia. It gives a colourless solution with water; wholly sublimes with heat, and neither chloride of barium nor sulphuretted hydrogen alters its solution; a solution, to which a few drops of nitric

acid have been added, does not yield a blue precipitate with ferrocyanide of iron.

Uses. It is much used in the *arts*, especially in the *working of metals* and in *dyeing*; it is also employed in large quantities to give a factitious pungency to snuff; in *chemistry* to form frigorific mixtures, &c.; and in *medicine* it is given as a diuretic, stimulant, alterative, and tonic.—*Dose*, 5 to 20 grs. 1 oz. to half-a-pint of *water* forms a good *chilblain lotion.*

AMMONIA (Hydrosulphurets of). There are at least *five* compounds of sulphur and ammonia known to chemists; but only *three* of them are of practical importance.

AMMONIA (Hydrosulphuret of). Syn. *Sulphuret of Ammonium, Neutral Hydrosulphuret of do. Prep.* Saturate *strong liquor of ammonia* with *sulphuretted hydrogen gas;* then add a second portion of *liquor of ammonia*, equal to that first used, and preserve it in well-stoppered bottles.

AMMONIA (Bihydrosulphuret of). Syn. *Bihydrosulphate of Ammonia, Bisulphuret of do., Bisulphuret of Ammonium, Hydrosulphuret of the Sulphuret of Ammonium, Sulpho-hydrate of Ammonium, Hydrosulphuret of Ammonia; Ammoniæ Hydrosulphuretum*,—Ph. D. *Hydrosulphate of Ammonia, Ammoniæ Hydrosulphas*,—Ph. U. S. This is the fetid preparation of the shops, commonly called *Hydrosulphuret* or *Hydrosulphate of Ammonia.*

Prep. 1. (Ph. D.) *Sulphuret of iron*, 1½ *oz.*; *water*, 15 *oz.*; place them in a two-necked bottle, and add by degrees, through a safety funnel, *commercial oil of vitriol*, 1½ *fl. oz.*; and pass the evolved gas, first through a little water placed in an intermediate phial, and then into *solution of ammonia*, (Ph. D.) 4 *fl. oz.*; observing to place the end of the tube conveying the gas near the bottom of the bottle containing the ammonia, the neck of the latter being loosely plugged with tow. Sp. gr. ·999. It should be kept in a green-glass stoppered bottle.

2. (Mr. Wooley.) *Sulphur*, 1 part; *fresh hydrate of lime*, 2 parts; *water*, q. s.; boil, filter, and to the filtered solution, add for every 16 parts of sulphur used, *sulphate of ammonia*, 66 parts. Sulphate of lime is precipitated and hydrosulphuret of ammonia remains in solution. (Pharm. Jour., ii., 655.)

3. (Commercial.) By passing *sulphuretted hydrogen gas* through a mixture composed of *strong liquor of ammonia*, 1 part, and *water*, 4 parts, to saturation.

4. (Crystallized.) By mixing together equal volumes of *ammoniacal gas* and *sulphuretted hydrogen gas*, in a vessel surrounded with ice.

Prop., &c. In the *solid form*, acicular or foliated crystals, smelling strongly of both ammonia and sulphuretted hydrogen; reaction alkaline; very volatile; forms with water a transparent solution. In the *gaseous form* it constitutes the nauseous effluvia evolved from privies, common sewers, and decomposing animal matter. The *solution* prepared as above has a very fetid odour, and exhibits the other common properties of the bi-hydrosulphuret. When *pure* it is wholly volatilized by heat, and neither the crystals nor the solution produce a precipitate in a solution of sulphate of magnesia. "Should a precipitate occur, it still contains free ammonia, and must be again subjected to the action of a stream of sulphuretted hydrogen." (Ph. D.) By age, its solution undergoes a slight change; ammonia is evolved, a deposit of sulphur takes place, and it acquires a yellow tint, "owing to the formation of *Pentasulphuret of Ammonium.*

Uses. It is principally employed as a test liquor for metals; and by the *perfumers* in dyeing hair. It is a powerful sedative, lessening the action of the circulatory system, causing nausea, vomiting, vertigo, drowsiness, &c.—*Dose*, 5 drops, 3 or 4 times daily, mixed with water, and instantly swallowed. In large doses it is poisonous.

AMMONIA (Perhydrosulphuret of). Syn. *Persulphuret of Ammonia, Sulpho-hydrosulphate of Ammonia, Boyle's Fuming Liquor, Beguin's Sulphuretted Spirit; Oleum Sulphuris Volatilis, Liquor Fumans Boylii, &c.* Authorities differ as to the precise nature of this preparation, which, since its introduction by Beguin in 1650, has passed under more aliases than perhaps any other preparation.

Prep. 1. (Beguin.) *Sulphur*, 1lb; *quicklime*, ½lb; *sal ammoniac*, 4 oz.; mix and distil.

2. (Boyle.) *Sulphur and sal ammoniac*, of each, 5 oz.; *quicklime*, 6 oz.; as last.

3. (Liebig.) Agitate the *common hydrosulphuret of ammonia*, with *pure sulphur*, until the latter ceases to be dissolved; after repose, decant the clear liquid.

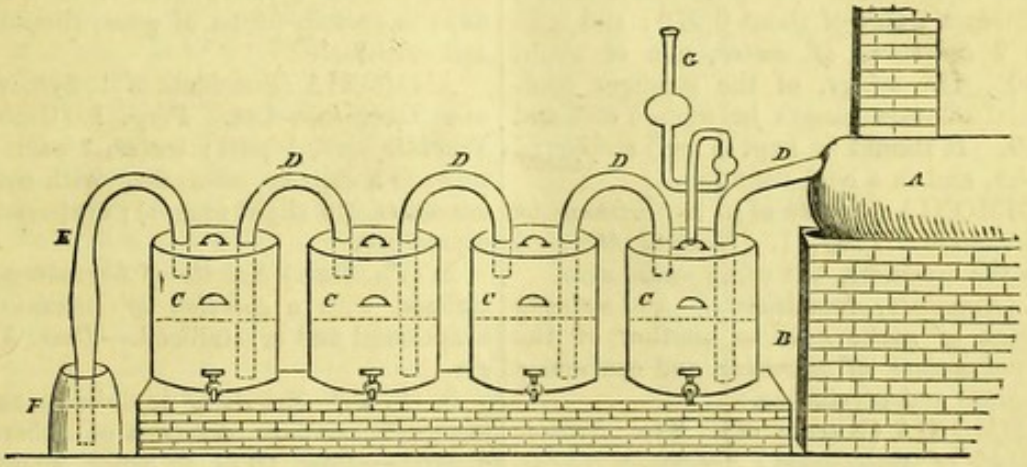
Prop., &c. An orange-yellow, fuming, fœtid liquid, of an oily consistence, having the characteristics of the common hydrosulphuret in a remarkable degree. Diluted with three parts of spirits of wine it forms the *liquor antipodagricus* of F. Hoffman; of which we are told, that, about 30 drops acted as a *strong sudorific;* and applied externally, mixed with camphor, "it relieved

pain like a charm." (Hoffman.) The hydrosulphurets of ammonia are now scarcely ever employed as remedies.

AMMONIA (Liquor of). Syn. *Ammonia Water, Solution of Ammonia; Liquor Ammoniæ, Aqua Ammoniæ, Solutio Ammoniæ,* —Lat. This article is now seldom made by the retail vendor, as formerly.

Prep. 1. (*Liquor Ammoniæ,*—Ph. L.) "Sp. gr. 0·960;" "nearly 10 grains of ammonia are contained in 100 grains of the solution." (Ph. L.)

2. (*Stronger Liquor of Ammonia, Liquor Ammoniæ Fortior,*—Ph. L.) Sp. gr. 0·882; 1 part to 2 of distilled water, reduces it to the strength of the weaker solution, (0·960.) "It contains nearly 30 grs. of ammonia in each 100 grs." (Ph. L.)



3. (*Liquor Ammoniæ,*—Ph. L. 1836.) *Hydrochlorate of ammonia,* 10 oz.; *lime,* 8 oz.; *water,* 2 pints; put the lime, slaked with water, into a retort, then add the hydrochlorate, broken into small pieces, and the rest of the water; and distil 15 fl. oz.

4. (Ph. E.) *Muriate of ammonia,* (in fine powder,) and *quicklime,* of each, 13 oz.; *distilled water,* 12 fl. oz.; *water,* (to slake the lime,) 7½ fl. oz.; the lime (cooled,) is well mixed with the muriate of ammonia, the mixture placed in a glass retort, and the ammonia distilled over (dry) into two receivers connected together; the *first* holding 4 fl. oz. of the *distilled water,* and the *second,* the remaining 8 fl. oz. Sp. gr. of the *first,* (*Stronger Water of Ammonia, Aqua Ammoniæ Fortior,*—Ph. E.,) 0·880; of the *second* (*Water of Ammonia, Aquæ Ammoniæ,*—Ph. E.,) 0·960; or it must be brought to that standard with either *water* or *liquor of ammonia,* as the case may be.

5. (*Liquor of Ammonia, Liquor Ammoniæ,* —Ph. D.) *Sal ammoniac,* and *fresh-burned lime,* of each, 8 *oz.; water,* (to slack the lime,) 4 *oz.; distilled water,* (for the receiver,) 16 *oz.;* proceed as before. Sp. gr. 0·950.

6. (*Stronger Liquor of Ammonia, Liquor Ammoniæ Fortior,*—Ph. D.) Pass *the gas evolved in the last process,* into 8 *oz.* of *liquor of ammonia,* (Ph. D., 0·950,) or into 5 *oz.* of distilled water. *Sp. gr.* 0·900.

7. (*On the commercial scale.*) This article is prepared on the large scale from a mixture of about equal parts of *quicklime* and *sal ammoniac,* or *sulphate of ammonia,* which are heated together in an iron cylinder or retort, connected with a set of refrigerators, consisting of a row of stone bottles with double necks, containing *water,* and kept very cold. (See *Engr.*) Two different methods of proceeding are adopted in this process. In the *one,* the dry ingredients are mixed together, and the resulting gas distilled over into the water, placed in the receivers. In the *other,* the *lime* is slaked with a *little water,* the *sal ammoniac,* in course powder, added, and the whole reduced to a *pap* before applying heat. In either case a proportionate quantity of water is put into the condensers, and the operation is nearly similar; but the latter method requires the least heat, and so far as the receivers and refrigerators are concerned, is, perhaps, the one most easily managed.

A, Cylindrical Iron Retort.
B, Furnace for ditto.
C C C C, Stoneware Receivers.
D D D D, Connecting Pipes.
E F, Waste Pipe and Receiver.
G, Safety Tube.

Prop., &c. Highly pungent, caustic, and alkaline; lighter than water, and presenting in a liquid form most of the characteristics of pure ammonia. It is antacid, diaphoretic, rubefacient, stimulant, and counter-irritant; and is used in various affections in which these remedies are indicated. In its *concentrated form* it is a corrosive poison.—*Dose,* 5 to 25 drops, in cold water, or milk and water. When *pure,* it "is free from

colour. Exposed to the air it (entirely) escapes in highly acrid, alkaline, fugitive vapours, as shown by turmeric. A solution of lime being added, throws down nothing; hydrosulphuric acid does not discolour it; nor, when first saturated by nitric acid, does it give any precipitate with either sesquicarbonate of ammonia, or nitrate of silver, or chloride of barium." (Ph. L.) See *Ammonimetry.*

Ant. When the *fumes* have been inhaled, the patient should be exposed to a current of fresh air; and when the *liquid* has been swallowed, vinegar, or lemon-juice, mixed with water, may be administered; followed by an emetic.

Concluding Remarks. In the above it is absolutely necessary to keep the receivers as cool as possible, by means of snow, ice, or a current of very cold water, for the purpose of promoting the absorption of the gas, and to prevent its loss. On the small scale the glass receivers or bottles may be most conveniently surrounded with ice, and they should be furnished with a safety tube to prevent accidents. The water contained in the *first* bottle will be the *strongest*, if it be kept well cooled, and that in the *others* will progressively *decrease* in strength. In the shops, liquor of ammonia is kept of two or three strengths; *one* of a sp. gr. of ·880, (*stronger liquor of ammonia,*) for dissolving essential oils and filling smelling-bottles, &c.; *another* at 0·960, (*liq. of ammonia,*—Ph. L.;) and a *third* about the strength of common spirits of hartshorn, for which it is commonly sold. 1 *measure of the first* mixed with 3 *measures of distilled water*, produces a water of about 0·970; and with only 2 *measures of water*, one of about 0·960. The sp. gr. of the stronger commercial solution ranges between 0·886 and 0·910. It should be kept in well stoppered bottles, and in a cool situation.

AMMONIA (Malate of). Syn. *Ammoniæ Malas,*—Lat. *Prep.* 1. (*Neutral Malate.*) Like the arseniate, but using *malic acid.*

2. (*Bimalate; Acid Malate.*) Add a *strong solution of malic acid* to another of the *neutral malate of ammonia*, and cautiously evaporate and crystallize.

AMMONIA (Nitrate of). Syn. *Nitrate of Oxide of Ammonium; Ammoniæ Nitras, Nitrum Flammans,*—Lat. *Prep.* Saturate *nitric acid* (diluted with 3 or 4 times its weight of water,) with *sesquicarbonate of ammonia*, evaporate by a gentle heat, and crystallize.

Uses, &c. It dissolves in twice its weight of water; melts at 230°, and is decomposed at 460° Fahr. It is principally used for the preparation of *nitrous oxide or laughing gas*, of which nearly 4½ cubic feet may be procured from every pound avoird. With water, it forms a very convenient *freezing mixture*, and may be used for this purpose any number of times by simply evaporating the solution to dryness, when the salt will be obtained unaltered, ready for another operation.—*Dose.* 10 to 30 grs., as a diuretic or febrifuge.

AMMONIA (Nitro-sulphate of). Syn. *Ammoniæ Nitro-sulphas,*—Lat. Dissolve *sulphite of ammonia*, 1 part; in *water of ammonia*, 5 parts; and pass *nitric oxide gas* through the solution; wash the crystals that form (as rapidly as possible,) with *liquor of ammonia*, dry in bibulous paper, without heat, and preserve them in a well-stopped bottle.—*Dose.* 10 to 12 grs., in typhoid fevers, &c.

AMMONIA (Oxalate of). Syn. *Ammoniæ Oxalas,*—Ph. E. *Prep.* 1. Neutralize a hot *solution of oxalic acid* with *sesquicarbonate of ammonia;* evaporate and crystallize.

Uses, &c. As a test for lime, with solutions of which it produces a white precipitate soluble in nitric acid. Heated in a retort, it yields ammonia, carbonate of ammonia, cyanogen, and carbonic acid, together with a peculiar greyish white sublimate, (*oxamide.*)

AMMONIA (Phosphate of). Syn. *Ammoniæ Phosphas,*—Lat. *Prep.* (Niemann.) Saturate a *solution of phosphoric acid* with *sesquicarbonate of ammonia;* gently evaporate and crystallize. Diuretic, and discutient.—*Dose.* 3 to 10 grs.; 3 or 4 times a day; in certain forms of gout, rheumatism, and calculus.

AMMONIA (Succinate of). Syn. *Ammoniæ Succinas,*—Lat. *Prep.* 1. (Guibourt.) *Succinic acid*, 1 part; *water*, 4 parts; dissolve in a capsule, neutralize with *water of ammonia*, (in slight excess); evaporate, and crystallize.

2. (Ph. Bav.) *Spirits of hartshorn*, neutralized with a *solution of succinic acid*, evaporated and crystallized.—*Dose.* 5 to 10 grs.

3. (P. C.) *Spirits of hartshorn*, neutralized with *succinic acid*, (salt of amber,) and filtered.—*Dose.* 10 or 20 drops, or more.

Obs. The *first* is used as a test for iron; the *others* (*ammoniæ succinas impuras*) as antispasmodics.

AMMONIA (Sulphate of). Syn. *Hydrosulfamide, Sulphate of Oxide of Ammonium; Ammoniæ Sulphas,*—Lat. Crude sulphate of ammonia exists in considerable quantity in the soot from pit coals, and it is

obtained as a secondary product from the ammoniacal liquor of gas works and animal charcoal manufactories.

Prep. 1. (Medicinal.) Saturate *dilute sulphuric acid* with *sesquicarbonate of ammonia*, in slight excess; filter, gently evaporate, and crystallize.

2. (Commercial.) From *gas liquor* or *bone spirit*, saturated with *weak oil of vitriol*, and the clear portion of the liquid, after repose, decanted, concentrated by rapid evaporation, and crystallized.

Uses, &c. Pure sulphate of ammonia is diuretic, aperient, resolvent, and stimulant. —*Dose.* 10 to 30 grs. It is now seldom used in medicine. The *crude* sulphate is principally employed in the preparation of sal ammoniac and sesquicarbonate of ammonia, and for manure.

AMMONIA (Tartrate of). Syn. *Neutral Tartrate of Ammonia, Tartrate of Oxide of Ammonium; Ammoniæ Tartras*,—Lat. *Prep.* 1. (Pereira.) Saturate a solution of *crystallized tartaric acid*, 150 grs.; with *sesquicarbonate of ammonia*, 118 grs.; evaporate with a gentle heat, and crystallize; or it may be evaporated to dryness and powdered.

Prop., &c. Prismatic crystals, or a crystalline mass; soluble and efflorescent. The *properties* and *doses* resemble those of citrate of ammonia.

AMMONIA (Bitartrate of). Syn. *Ammoniæ Bitartras*,—Lat. *Prep.* To a strong solution of *tartaric acid*, add another of *sesquicarbonate of ammonia* as long as a precipitate falls; collect the latter, and dry it. A crystalline powder, only slightly soluble in water, closely resembling ordinary cream of tartar. It is diaphoretic, diuretic, and deobstruent.

AMMONIACUM (Strained). Syn. *Prepared Ammoniacum; Ammoniacum Præparatum*,—Ph. L. *Prep.* (Ph. L.) Boil *ammoniacum* in *water*, enough to cover it; strain through a hair sieve, and constantly stirring, evaporate in a water bath, until on cooling, it becomes hard.

AMMONIO-CITRATES (and other ammonio-salts). See *the respective bases.*

AMMONIUM. The hypothetical base of ammonia, according to the theory of Berzelius.

AMMONIMETRY. Syn. *Ammoniometry.* The process of determining the strength of ammonia water. The strength of pure solutions of ammonia may be conveniently ascertained from their specific gravity, which may be taken in the usual manner. The specific gravity of mixtures of pure liquor of ammonia and distilled water, is found to be precisely the mean of that of their constituents.

TABLE I, *of the Per Centage of Pure Ammonia, in Water of Ammonia of the given specific gravities, at* 59° *Fahr.* By Sir H. DAVY.

Sp. Gr.	Ammonia.	Water.

AMULET. The ignorant and credulous of all nations have been fond of charms and amulets. The Egyptians and Persians had a great variety, which are said to have consisted of small cylinders variously ornamented with figures and hieroglyphics.

Among the Greeks and Romans they were much used in exciting or conquering the power of love. They consisted of a variety of gems, metals, and plants, small figures of deities, heroes, or animals, the bulla, and not unfrequently of words, characters, or letters, arranged in a certain order. They were appended to the neck or body, and were commonly attached to children to defend them from the evil eye. Among the Christians of the early ages, amulets were made of wood represented to have formed part of the true cross. This continued to the end of the fourth century, at which time more of such pretended relics had been produced, than would have loaded a first-class ship of war. In more modern times, scraps of paper or parchment inscribed with verses from the Bible, or with magical characters, abracadabra, and other meanless jargon, have been used for the same purpose. The celebrated talismanic medals of the Arabians are of this class, and derive their name (*Ain*) from the first letter of the inscription always beginning with that character. "They have been sanctioned by religion and astrology, and even in (comparatively) modern times by medical and other sciences. The pope and catholic clergy make and sell amulets and charms even to this day." (Ashe.) Amongst some nations they are still in common use. We scarcely need remark, that the protective and curative powers of amulets, depend entirely on the imagination of the wearer. They have therefore been wisely discarded by all, except the most ignorant, credulous and superstitious. Camphor is frequently worn as a protective against fevers and other contagious diseases.

AMYGDALIC ACID. Syn. *Amygdalinic Acid.* An acid compound obtained from the bitter almond.

Prep. Dissolve *amygdaline* in *baryta water*, and boil the solution in a glass vessel as long as fumes of ammonia are evolved; next add *dilute sulphuric acid* until it ceases to occasion a precipitate; filter, and evaporate the clear liquid to dryness in a water bath.

Prop., &c. A colourless, transparent, amorphous mass; insoluble in either alcohol or ether; soluble in water; and deliquescent in damp air. With the bases it forms soluble salts, (*amygdalates; amygdalinates.*)

AMYGDALINE. Syn. *Amygdalina.* A compound discovered by Roubiquet and Boutron-Charlard in the bitter almond.

Prep. Take *bitter almonds* from which the oil has been thoroughly expressed, reduce them to powder, and boil it repeatedly in *alcohol of* 93% or 94%; mix the several tinctures, and distil off the alcohol; mix the syrupy residuum with water, add a little *yeast*, and ferment for a short time in order to get rid of some of the sugar; after the fermentation has ceased, evaporate in a water bath to the consistence of a syrup, cool, and add *cold alcohol of* 94%; collect the precipitate, drain well, and purify by repeated re-solutions and crystallizations from *hot alcohol.* The *product* is about 3%.

Prop., &c. Soluble in water, less so in hot alcohol, and nearly insoluble in cold alcohol and ether; added, in solution, to milk of almonds, it reacts on the emulsin, and causes the formation of hydrocyanic acid and essential oil of almonds; heat decomposes it with the evolution of the odour of hawthorn; heated with alkaline solutions, it evolves ammonia, and is transformed into *amygdalic acid.*

AMYLAMINE. Syn. *Amyl-ammonia.* A colourless liquid, having a penetrating aromatic odour, and alkaline reaction, boiling at 199·5° Fahr., and forming crystalline salts with the acids, having a fatty lustre. It constitutes one of the bases of the *amyl-series.*

AMYLE. The hydrocarbon which is the radical or base of the fusel-oil compounds, (*Amyl-series.*) It is a colourless, ethereal liquid, boiling at 311° Fahr., formed along with *zinc-amyl*, when a mixture of *iodide of amyl* and *pure zinc*, is exposed in a sealed glass tube to a temperature of 374° Fahr.

AMYLE (Acetate of). Syn. *Acetate of Oxide of Amyle. Prep. Fusel-oil*, 1 part; *acetate of potassa*, (dry), 2 parts; mix; add *concentrated sulphuric acid*, 1 part, and distil; purify the distillate by washing it with *dilute solution of potassa* and redistilling it from *dried chloride of calcium.*

Prop., &c. Liquid; insoluble in water; soluble in alcohol; boils at 272° Fahr. The odour and flavour of this preparation remarkably resemble those of the Jargonelle-pear. Diluted with alcohol, it is now extensively manufactured and sold under the name of *Essence of Jargonelle-pear*, for flavouring liqueurs and confectionary.

AMYLE (Bromide of). A colourless, volatile, heavy liquid, prepared by distilling a mixture of *phosphorus*, 1 part; *bromine*, 8 parts; and *fusel-oil*, 30 to 32 parts.

AMYLE (Carbonate of). Syn. *Carbonate of Oxide of Amyle. Prep.* (Medlock.) Saturate *fusel-oil* with *phosgene gas*, and treat the resulting compound with water.

AMYLE (Chloride of). *Prep.* 1. From *fusel-oil* and *pentachloride of phosphorus*, equal parts, distilled together; washing the distillate with very weak *solution of potassa*, and rectifying from *dried chloride of calcium*.

2. By saturating *fusel-oil* with *dry hydrochloric acid gas*.

Prop. Liquid, colourless, aromatic, odorous; insoluble in water, and boiling at 215° Fahr.

AMYLE (Hydrate of). Syn. *Fusel-oil* (pure), *Hydrate of Oxide of Amyle*, *Amyl-Alcohol*. *Prep.* By washing *crude fusel-oil* with water, and distilling it in a retort furnished with a thermometer, and only collecting that portion which distils over from the liquid between 260° and 280° Fahr.; and rectifying the distillate until it has a fixed boiling point at 268·5° Fahr.

Prop., &c. A thin, oily, hot-tasted fluid, with a strong and suffocating odour; sp. gr. 0·818; platinum black assisted with a gentle heat, converts it into *valerianic acid*.

AMYLE (Iodide of). *Prep.* By distilling a mixture of *phosphorus*, 1 part; *iodine*, 8 parts; and *fusel-oil*, 15 parts.

Prop., &c. A colourless liquid heavier than water, boiling at 295° Fahr., and decomposed by a strong light.

AMYLE (Oxalate of). Syn. *Essence of Bugs*. Prepared by heating *fusel-oil* with *oxalic acid* in excess, and distilling the oily liquid which separates at 500° Fahr.

AMYL-ETHER. From *amyl-alcohol* and *concentrated sulphuric acid*, distilled together, and afterwards rectified several times, until the boiling point reaches 349° Fahr., and the sp. gr. falls to 0·779.

AMYLENE. Syn. *Amilene*. A compound obtained by repeatedly distilling *fusel-oil* along with *anhydrous phosphoric acid*. It is an ethereal liquid, lighter than water, having an aromatic odour, and boiling at 102° Fahr.

AMYLIC ACID. A volatile acid obtained by M. Tünnermann, by distilling a mixture of *starch*, *black oxide of manganese*, *hydrochloric acid*, and *water*. Its compounds with the acids were formerly termed *amylates*. It is identical with formic acid.

AMYLINE. Syn. *Amilin*. The insoluble portion of starch which constitutes the outer covering of the granules.

ANACARDIC ACID. An acrid, fatty substance, found in the fruit of the *anacardium occidentale* or cashew nut.

ANÆMIA. Exsanguinity; deficiency of blood. This may be *accidental*, arising from hæmorrhage; or *habitual*, arising from an insufficient formation of blood, and consequent imperfect nutrition. The most striking features of the latter variety are, a general paleness, ghastliness, or bloodlessness of the surface of the body, particularly of the face and lips; extreme emaciation, languor, &c. The pulse is generally quick and feeble, and the appetite irregular, and colicky symptoms are not unfrequent. This affection deserves the most serious attention, and medical aid should be early sought. In the absence of such assistance, gentle stimulants and tonics may be had recourse to, together with a light and nutritious diet. Small doses (frequently repeated) of the *phosphate*, *lactate*, or *citrate of the protoxide of iron*, with a glass or two of *generous wine* or *malt liquor*, may be taken daily, and a preference should be given to the "red meats," as *beef*, *mutton*, or *venison*. The bowels may be kept regular by the occasional use of some mild laxative, and extreme irritability or griping allayed by small doses of *morphia* or *opium*. Should the pulse indicate the disuse of iron, *bark* may be substituted for it, for a time; or the doses alternated with others of bark. Fresh air and gentle out-door exercise should also be sought as much as possible.

ANALYSIS. The consideration of this important branch of chemical science, on which indeed all the others depend, is not the object of the present work; nor would its limits permit such a course. We must therefore refer the reader to some treatise exclusively on the subject for a development of the mysteries and wonders of analytical chemistry. To each article or class of articles of importance noticed in this work, are appended simple means of determining their *purity*. Carefully applied, this information will be found all that the majority of our readers will require.

ANASARCA. Dropsy of the cellular membrane immediately under the skin. It generally occurs among persons of the lymphatic temperament, inhabiting low, dark, damp, ill-ventilated apartments, and who suffer from insufficient nourishment, irregular habits, or debility induced by other diseases. It generally attacks the feet and legs first, and gradually extends upwards: sometimes affecting the face. The swelling is most evident in the evening. One of its chief characteristics, is, that the skin is easily depressed, and retains the mark of the finger for some time. There is also generally great thirst, and the urine, which is scanty in quantity, deposits a deep red sediment on standing. See *Dropsy*.

ANATOMICAL FIGURES. Models in wax or other materials to illustrate the healthy or diseased structure of the body. Mademoiselle de Beheron, the daughter of an eminent Parisian surgeon, was the first successful artist in this way. Her figures were made of wax with a "foundation" or support of rags, and were modelled upon corpses, and upon the living objects, in certain cases. The perfection to which this comparatively new art has been carried, was shown in the admirable models contributed to the "Great Exhibition of 1851."

ANATOMICAL PREPARATIONS. Objects of interest in both surgical and pathological anatomy, and specimens in natural history, are prepared by subjecting them to certain antiseptic processes by which their disposition to change is counteracted, and the integrity of their structure preserved. They are also frequently injected with coloured fluids which subsequently harden, in order to display more fully the minute vessels, or the microscopic anatomy of the several parts. See *Injection, &c.*

ANCHOVY. Anchovies are *prepared for sale* by salting and pickling, and afterwards packing them in the small kegs in which they are imported into this country. The small fish are valued more than the larger ones. The anchovy has a fine and peculiar flavour, and is eaten as a delicacy all over Europe. It is said to be aperitive, stimulant, and stomachic. The common sprat is often pickled and sold for the anchovy, but the latter may be known by the greater thickness of its head, the dusky brown colour of its back, and the reddish colour of its flesh.

ANCHOVIES (British). See *Sprats.*

ANCHUSIC ACID. The colouring matter of alkanet root, (*anchusa tinctoria.*) It is now generally termed *anchusine*, as it is destitute of acid properties.

ANEMONINE. Syn. *Anemonina, Anemonia.* An acrid crystallizable substance, extracted by *hot alcohol* from the *anemone pulsatilla, nemorosa,* and *pratensis.* It is combustible and burns like camphor. By the action of *baryta water* on this substance, Löwig obtained a substance which has been called *anemonic acid.*

ANGELICA (Candied). *Prep.* 1. *From the root.* (*Radix Angelicæ Condita.*) Boil the *fresh roots* (after slicing them and removing the pith,) in *water*, to deprive them of part of their bitterness and aroma; then drain them and put them into *syrup boiled to a full candy height*, and boiling hot; let them remain until nearly cold, when they may be taken out and carefully dried.

2. *From the stems.* (*Caules Angelicæ Conditi; Rami Angelicæ Conditi.*) From the tender stems, stalks, and midribs of the leaves, as last. Used as a sweetmeat and dessert. It is said to be cordial, stomachic, tonic, and aphrodisiac.

ANGELICIC ACID. A volatile substance noticed by L. A. Buchner, jun., in angelica root.

ANGELICINE. A substance obtained from the root of angelica. It is probably oxidized extractive.

ANGINA PECTORIS. An organic disease of the heart or great vessels, giving rise to a distressing feeling of difficulty of respiration and oppression at the chest. The pain is usually felt at the lower part of the chest, inclining to the left side, and, in acute cases, extending to the left arm. The suffering often amounts to agony, and is accompanied with palpitation, extreme anxiety, and a sense of impending suffocation and dissolution. The duration of these distressing symptoms varies from a few minutes to several hours. In the *chronic* form of the disease the symptoms are less violent, but more frequent and permanent. The fits are commonly induced by rough exercise, excessive mental emotion, and other like exciting causes. From the peculiar nature of this disease and the difficulty of its diagnosis, it is one that none but an experienced medical practitioner has any chance of treating successfully. Friction, stimulants, and counter-irritants, may be applied to the chest, and to the lower extremities; and a life of great tranquillity, with a carefully regulated light and nutritious, but unexciting diet, uniformity of habits, and placid occupation of the mind, great cleanliness, the use of flannel next the skin, and above all, pure air should be sought as much as possible. These will assist the efforts of the physician, and beyond them the patient cannot safely move. Recently, hydrocyanic acid (in small doses, cautiously administered,) has been stated to be almost specific in this distressing affection. There is no popular name for this peculiar disease.

ANGOSTURIN. Syn. *Angusturia, Cusparin.* A peculiar neutral principle obtained from angostura or cusparia bark.

Prep. Digest *coarsely powdered angostura bark* in *cold alcohol*, until a concentrated tincture is obtained; then filter, and allow crystals to form by spontaneous evaporation.

Prop., &c. Crystals, soluble in alcohol

and alkaline lyes; slightly soluble in water; non-volatile.

ANILIC ACID. Syn. *Indigoic Acid, Indigotic Acid.* The name given by Dumas to the indigotic acid of Chevreul.

Prep. Add gradually, *indigo*, in powder, to a boiling mixture of *nitric acid*, 1 part, and *water*, 12 or 15 parts, (10 parts, —*Fownes;*) until effervescence ceases; a little *water* being dropped in from time to time to prevent the formation of carbazotic acid; decant the liquid whilst hot; cool; re-dissolve the deposited crystals in *boiling water*, and add *acetate of lead* as long as a brown precipitate falls; the filtered liquor, on cooling, deposits crystals of *anilate of lead*, which, by re-solution in *boiling water*, and decomposition with *dilute sulphuric acid*, furnish a liquid which deposits nearly pure *anilic acid*, as it cools.

Prop., &c. Colourless, fusible, yellowish-white needles; scarcely soluble in cold water, freely soluble in boiling water and in alcohol; volatile; and with care may be sublimed unchanged; with the bases it forms soluble and crystallizable salts, called *anilates* or *indigotates*.

ANILINE. Syn. *Indigogene.* An organic base, existing among the products of the distillation of coal, and of some other substances. It is obtained artificially chiefly from indigo or its derivatives.

Prep. 1. (Zinin.) An *alcoholic solution of nitrobenzol*, is treated with *ammonia* and *sulphuretted hydrogen*, until after some hours a precipitation of sulphur takes place; when the brown liquid is repeatedly saturated with fresh *sulphuretted hydrogen*, until no more sulphur separates, the reaction being aided by the occasional application of heat; an *excess of acid* is then added, the liquid filtered, boiled to expel the alcohol and unaltered nitrobenzol, and next submitted to distillation with *caustic potassa* in excess; the *aniline* found in the receiver may be rendered quite pure by forming it into an *oxalate*, repeated crystallizations from *alcohol*, and distillation with excess of *caustic potassa*, as before.

2. *Powdered indigo* is boiled in a *highly concentrated solution of caustic potassa*, as long as hydrogen gas is evolved; the brownish-red liquid containing *chrysanilic* and *anthranilic acid*, distilled in a retort, yields aniline, which condenses in oily drops about the neck of the retort and in the receiver; by separating it from the ammoniacal liquor with which it is accompanied, and re-distilling it, it is obtained nearly colourless. It may be further purified as above.

3. By fusing *isatine* with *solid hydrate of potassa.*

4. By treating an *alcoholic solution of benzine* with a little *zinc* and *hydrochloric acid.*

5. (Ure.) By distilling *coal tar* in a large iron retort, and separately collecting the products, especially the latter and denser ones; which are then to be strongly agitated along with *hydrochloric acid* (in excess,) in a glass globe, and the acid solution treated with *milk of lime* (in excess,) and distilled.

Prop., &c. A thin, oily, colourless liquid; smelling faintly vinous; soluble in alcohol and ether; scarcely soluble in water; neutral to test paper; with the acids it forms crystallizable compounds of great beauty; boils at 359° to 360° Fahr.; *sp. gr.*, 1·028.

ANILOTIC ACID. A product obtained along with *helicin and helicoidin*, by acting with *dilute nitric acid* on *salicin.* With stronger acid and a higher temperature, *anilic acid* is formed.

ANIMAL SUBSTANCES. The bodies of animals are composed of certain proximate principles or compounds which are derived, either directly or indirectly, from the vegetable kingdom, and whose ultimate constituents or elements are all found in the inorganic world. Of these substances the following are the principal:—

Nitrogenised.	*Non-nitrogenised.*
Albumen	Fat { Butyric acid, Oleic acid, Margaric acid, Stearic acid, Glycerine, &c. }
Caseine	
Chondrine	
Fibrine	
Gelatine	
Globulin	
Hæmatosin	Lactic acid
Kreatine	Pepsin
Proteine	Sugar of milk
Taurine	&c.
Urea	
&c.	

From the various combinations and modifications of these principles, result all the different solids and fluids that enter into the composition of the animal body. Woven together by the vital power, they form the numerous textures or tissues of which our frames are composed, and instinct with life, become endowed with the faculty of performing all the numerous functions inseparable from its maintenance.

Animal substances are recognised as organic principles by becoming carbonized by heat; and those that contain nitrogen, by rapidly passing into a state of putrefaction when exposed to the air and moisture, and by yielding ammonia when heated with caustic potassa or quicklime, or when submitted to destructive distillation.

The proportion which the fluids bear to the solids forming the animal body, is as about 9 to 1. A body weighing 120 lb, was found, after some days of careful desiccation, to weigh only 12 lb. (Chaussier.) See *Food*, *Putrefaction*, &c.

ANIMATION (Suspended). Syn. *Asphyxy*; *Asphyxia*. No general rules can be given suitable to every case. Whenever it is possible to procure medical aid, it should, therefore, be immediately sought, as the delay of a single minute may put the patient beyond the reach of assistance. The principal object is to effect a restoration of the respiratory and circulatory functions, the former of which has been arrested by the external condition of the patient; the latter, by the contact of morbidly carbonized blood with the capillary vessels of the lungs. The first thing to be attempted, is the restoration of warmth by active friction with the warm hands, flannels, &c.; the second, the re-establishment of natural respiration by any means at hand; of which, perhaps, none is simpler or better than alternate pressure and its relaxation, applied to the thorax and abdomen, so as to induce expiration first, and inspiration immediately afterwards, by the natural action and elasticity of the ribs and diaphragm. A third effort may be made by suddenly dashing cold water on the face and general surface, previously warmed by the frictions, in the hope of inducing a more decided inspiration. If these measures fail, artificial respiration should be promptly had recourse to. The warm bath, and slight electrical shocks or continued streaming electricity, may also be applied. See *Drowning*, *Hanging*, &c.

ANISETTE. A cordial liqueur flavoured with *anise*, *fennel*, and *coriander seed*, and sweetened with *sugar*. See *Cordials*.

ANISIC ACID. Formed by acting on the solid crystalline volatile oil (*stearoptène*) of aniseed with nitric acid.

ANISOINE. A white, solid, neutral substance, obtained by acting on the stearoptène of oil of aniseed with sulphuric acid.

ANISOLE. A species of oxygenated oil, formed by treating *anisic acid* with *lime* or *baryta*, in excess.

ANISYLE. The assumed radical of the compounds obtained from the essential oil of aniseed.

ANNEALING. The process by which *glass* and *porcelain* are rendered less frangible, and metals which have become brittle, again rendered tough and malleable. *Glass vessels*, and other *articles of glass*, are annealed by being placed in an oven or apartment near the furnaces at which they are formed, called the "*leer*," where they are allowed to cool slowly, the process being prolonged according to their bulk. *Steel*, *iron*, *and other metals* are annealed by heating them and allowing them to cool slowly on the hearth of the furnace, or in any other suitable place, unexposed to the cold.

ANNOTTA. Syn. *Anotto*, *Annatto*, *Annatta*, *Arnatta*, &c. A colouring matter forming the pellicle of the seeds of the *bixa orellana* (Linn.), an exogenous tree, common in Cayenne, and some other parts of tropical America. Annotta is frequently adulterated. When pure it contains about 28% of resinous colouring matter, and 20% of colouring extractive matter. (Dr. John.) The presence of *red lead* may be detected by heating it on a piece of charcoal in the reducing flame of the blow-pipe, by which means a bead of metallic lead will be obtained. If it contains *ochre*, a given weight may be incinerated, and the ash washed and dried; the undissolved residuum is the amount of the adulteration, (nearly). Good annotta is of a flame colour; brighter in the middle than on the outside; feels soft and smooth to the touch; has a good consistence, and a strong smell.

Uses, &c. It is used to colour varnishes and lacquers; as a pigment for painting velvet and transparencies; as a colouring matter for cheese, (1 *oz.* to 1 *cwt.* of curd;) for which purpose it is not injurious, if pure; and as a dye stuff for cotton, silk, and wool, especially the last two, to which it imparts a beautiful orange yellow hue, the shade of which may be modified by using different proportions of pearlash with the water it is dissolved in, and by giving the stuff different mordants before putting it into the dye bath. The hues thus imparted are all more or less fugitive. See *Cheese*, &c.

ANNOTTA (English). Syn. *Trade Annotta*, *Reduced Annotta*. *Prep.* From *egg* or *flag annotta*, 24 *lb.*; *gum tragacanth*, 10 *lb.*; *starch* 6 *lb.*; *soap*, 2½ *lb.*; *train oil*, 2 *lb.*: *red bole or Venetian red*, 1 *lb.*; *water*, *q. s.*; mixed by heat in a copper pan, and formed into rolls. *Used* for common purposes. Distinguished from genuine annotta by its very partial solubility in *alcohol*.

ANNOTTA (Purified). Syn. *Orelline*, *Orellina*; *Essence of Annotta*. *Prep.* Boil *annotta* in a *solution of pearlash*, until it will dissolve no more; then precipitate with *oil of vitriol*, previously diluted with twenty times its weight of water, care-

fully avoiding excess; wash the precipitate with cold water; drain and dry it. The product possesses all the properties of the best annotta in a concentrated form.

ANNOTTA (Solution of). *Prep.* A solution of equal parts of *annotta* and *pearl-ash*, in *water*. Sold in bottles.

ANNOTTA DYE. *Prep.* The *annotta*, cut into small pieces, is boiled in a copper with an equal weight of *good pearlashes*, and a *little water*, and when dissolved, the solution is diluted with water to the required strength. *Use, &c.* The articles, previously rinsed in clean water, are steeped or boiled in this dye-liquor; then drained out and rinsed in clean water. By adding more pearlash to the bath a brighter yellow is produced; and the hue is reddened with vinegar, alum, or lemon juice, or a short steep in a weak Brazil wood or carthamus bath.

ANODYNES. Medicines which allay pain. Some, (as the *paregorica*,) act by actually assuaging pain; others, (*hypnotica*,) by inducing sleep; whilst a third class, (*narcotica*,) give ease by stupifying the senses, or lessening the susceptibility to pain. Among the principal anodynes are *opium*, *morphia*, *camphor*, *ether*, *chloroform*, and other medicines of the like kind.

ANODYNE (Infantile). *Prep.* Take of *syrup of red poppies*, 1 oz.; *aniseed water*, 3 oz.; *brandy*, ¾ oz., or *rectified spirit*, ½ oz.; *calcined magnesia*, 2 dr.; mix. An excellent anodyne and antacid for infants. *Dose.* A small teaspoonful as required.

ANO ZABAGLIONE. *Prep.* Put 2 *eggs*, 3 teaspoonfuls of *sugar*, and 2 small glasses of *marsala*, into a chocolate cup, placed in boiling water, or over the fire, and keep the mixture rapidly stirred, until it begins to rise and harden a little; then serve it up in glasses. A pleasant Italian receipt for a cold; very nutritious.

ANTACIDS. Medicines which remove acidity of the stomach, and thus tend to relieve heartburn, dyspepsia, and diarrhœa. The principal antacids are the *carbonates of potassa*, *soda*, *ammonia*, *lime*, and *magnesia*. *Ammonia* is the most powerful, and when the acidity is conjoined with nausea and faintness, or is accompanied with symptoms of nervous derangement or hysteria, is undoubtedly the best; when great irritability of the coats of the stomach exist, *potash* is to be preferred; when the acidity is accompanied with diarrhœa, *carbonate of lime* (prepared chalk); and when with *costiveness*, *magnesia*. The *dose* of the *carbonates* of *potassa* and *soda*, in powder, is *half a teaspoonful*; of chalk, *a teaspoonful*; of *magnesia a dessert-spoonful*; and of *carbonate of ammonia*, 10 grs., or a teaspoonful of the solution. All these are taken in water, and may be advantageously combined with some simple aromatic, as *ginger*, *cinnamon*, or *peppermint*.

ANTHELMINTICS. Syn. *Vermifuges.* Medicines which cause the destruction or expulsion of intestinal worms. Among the principal anthelmintics are *aloes*, *cabbage-tree bark*, *calomel*, *castor oil*, *common salt*, *cowhage*, *gamboge*, *Indian pink*, *kousso*, *male fern*, *oil of turpentine*, *scammony*, *sesquioxide of iron*, *tansy*, *tin* (in powder,) and *worm seed*. All *tonics* and *stomachics* may be also regarded as anthelmintics. See *Worms*.

ANTHRACINE. Paranaphthaline.

ANTHRACITE. Syn. *Anthracolite*, *Stone Coal*, *Mineral Charcoal*. Anthracite burns without either flame or smoke, emits an intense heat, and leaves scarcely any ash; but it is difficult to kindle, and requires a lively draught for its combustion. It is used as a common fuel in the United States of America although scarcely employed in Europe. Its adoption in this country would at once remove the smoke nuisance, and also produce a vast annual saving to the community. By contracting the throat of the chimney a little, and avoiding the use of the poker, it may be burnt in a common grate. The Americans use a little charcoal as "kindle," and seldom supply fresh coal to the fire oftener than twice a day.

ANTHRACOKALI. *Prep.* 1. (Dr. Polya.) *Mineral coal* (in fine powder), 160 parts; *liquor of potassa*, 192 parts; mix in an iron capsule, boil, with constant stirring, to dryness, and continue the stirring at a reduced heat, until the whole is converted into a homogeneous black powder, which must be at once placed in well-stoppered bottles.

2. (Ph. Hamb. 1845; Ph. Baden. 1841.) *Hydrate of potassa*, 7 dr.; melt, and add, *kennel coal*, 5 dr.; as last.

Prop., &c. A deliquescent black powder, with a caustic taste, and empyreumatic smell. *Dose.* 2 to 3 grs., two or three times daily; and *externally*, made into a pommade; in skin diseases, scrofula, chronic rheumatism, &c.

ANTHRACOKALI (Sulphuretted). *Prep.* (Polya.) As above, but adding *sulphur*, 4 dr., along with the powdered coal. *Use, &c.*, as the last.

ANTHRANILIC ACID. An acid obtained by Fritzsche from indigo.

Prep. Dissolve *indigo* (in powder) in a hot solution of *pure potassa* (sp. gr. 1·35), and add powdered *peroxide of manganese*,

until the liquid on dilution and exposure to the air ceases to form indigo blue; then neutralize the alkali with *dilute sulphuric acid*, dissolve out the newly formed *anthranilate of potassa* with *alcohol*, and decompose it with *acetic acid*, when orange-coloured crystals of impure *anthranilic acid* may be obtained; purify by uniting it with *lime*, crystallization, and decomposing the salt with acetic acid, when large colourless tabular crystals will be deposited as the solution cools.

Prop., &c. Fusible; volatile; yielding crystals resembling those of benzoic acid; sparingly soluble in water; soluble in alcohol, and ether; with the bases it forms salts, called *anthranilates.*

ANTHRANITIC ACID. An acid obtained by fusing *powdered indigo* with *hydrate of potassa*, at about 570° Fahr. It is identical with salicylic acid.

ANTIARINE. Syn. *Anthiarine; Antiaria, Upasia.* The active principle of the upas poison of Java. It is extracted from the partially *inspissated juice* of the upas tree by *alcohol*, and may be obtained under the form of small pearly crystalline scales, by careful evaporation. It is soluble in 27 parts of boiling water; freely soluble in alcohol; scarcely so in ether; heat decomposes it. It is a frightful poison, to which no antidote is known.

ANTI-ATTRITION. Syn. *Axle Grease, Friction Compo'. Prep.* 1. *Black lead*, 1 part; *tallow* or *grease*, 4 parts; mix and grind perfectly smooth. Expired patent. Some add to every cwt., *camphor*, 7 *lb.*; but the addition is useless.

2. To the above add a little *bees-wax*, to harden it. For the axles of railway carriages.

3. (Booth's.)—*a. Scotch soda*, ½ *lb.*; *boiling water*, 1 *gall.*; *palm oil* or *tallow*, 10 *lb.*; agitate well together until the mixture is cooled down to 60° or 70° Fahr.—*b. Soda*, ½ *lb.*; *water*, and *rape oil*, of each, 1 *gall.*; *tallow* or *palm oil*, ½ *lb.*; as last. Expired patent.

4. (Mankettrick's.) *Caoutchouc* (dissolved in oil of turpentine), 4 *lb.*: *Scotch soda*, 10 *lb.*; *glue*, 1 *lb.*; (dissolved in) *water*, 10 *galls.*; *oil*, 10 *galls.*; thoroughly incorporate by assiduous stirring, adding the caoutchouc last.

5. *Finest rape oil*, 1 *gall.*: *caoutchouc*, (cut small,) 3 *oz.*; dissolve with heat.

Use. To lessen friction in machinery, and to prevent the "bearings" rusting. The simplest are perhaps the best. The last is called by the French, *Liard.*

ANTIBILIOUS. Applied to medicines that are supposed to remove ailments depending on disordered action of the liver. *Aperients* and *mercurials* belong to this class. See *Abernethy Medicines, &c.*

ANTIDOTE. Medicines used to prevent or remove the effects of poison or disease. The principal poisons and their antidotes will be found noticed under their respective heads.

ANTIFERMENT. A substance extensively sold in the cider districts, for the purpose of arresting fermentation in that liquor.

Prep. 1. *Sulphite* (not sulphATE) *of lime*, in fine powder, and as newly prepared as possible.

2. *Sulphite of lime*, 2 parts; *black mustard seed* (ground in a pepper mill), 3 parts; mix.

3. *Mustard seed* (new), 13 *lb.*; *cloves*, 1 *lb.*; mix, and either grind or bruise them together.

4. To the last, add *ground capsicum*, 10 *oz.*

Use, &c. The products of the above formulæ are infinitely superior to those commonly met with in trade; and are quite harmless, as respects the quality and wholesome character of the liquor. A portion of any one of them added to cider, or perry, tends to allay the fermentation, when it is excessive, or has been renewed. The third and fourth may be advantageously used for wine and beer as well as cider.

ANTIGUGGLER. A piece of bent tube of glass or metal inserted into casks and carboys, to admit air over the liquor, in order that it may be poured out or drawn off, without disturbing the sediment.

ANTIMONIALS. Syn. *Antimonialia,*—Lat. Medicines in which antimony or one of its compounds is the leading or characteristic ingredient. Of these the *teroxide, oxysulphuret*, and *potassio-tartrate of antimony, and antimonial powder*, are the principal. They are regarded as liquefacient, alterative, resolvent, sedative, emetic, sudorific, and expectorant. In *small doses*, they act as *nauseants* and *diaphoretics*; in *medium doses*, as *emetics* and *purgatives*; and in *large doses*, as *emetics, purgatives*, and *sedatives.*

ANTIMONIC ACID. Syn. *Peroxide of Antimony; Acidum Antimonicum, Acidum Stibicum,*—Lat. *Magistery of Diaphoretic Antimony,—Obs.* Antimony in its highest stage of oxidation.

Prep. 1. Add *dilute sulphuric acid* to the *water used to wash diaphoretic antimony*, as long as a precipitate falls; collect the powder on a calico filter, wash it with *distilled water*, and dry it by a gentle heat.

2. Digest *metallic antimony* (in small fragments,) in *concentrated nitric* or *nitro-hydro-chloric acid;* evaporate by a gentle heat until the excess of acid is expelled; then throw the solution into cold water, and proceed as before.

3. By decomposing the *pentachloride of antimony* with excess of water, and proceeding as last.

4. *Metallic antimony* (in powder), 1 part; *powdered nitre*, 6 or 8 parts; ignite or deflagrate in a silver crucible, and when cold, powder, wash out the excess of alkali with hot water, decompose the remaining *antimoniate of potassa* with *hydrochloric acid*, and wash and dry the precipitated *antimonic acid.*

Prop. The hydrated acid (freshly precipitated) is a white powder, which reddens litmus; and is insoluble in water, unless it is soured with tartaric or muriatic acid. By exposure to a heat short of redness, it loses its water, assumes a pale straw colour, and becomes anhydrous and insoluble in water, even when acidulated. At a full red heat it parts with a portion of its oxygen and becomes antimonious acid. It combines with some of the bases forming *Antimoniates.*

Uses, &c. In *medicine*, as a diaphoretic; *Dose.* 2 to 10 grs. It appears almost inert, and is seldom used.

ANTIMONIOUS ACID. Syn. *Binoxide of Antimony, Deutoxide of do.; Acidum Antimoniosum*,—Lat. A compound of antimony and oxygen intermediate between the basic oxide and antimonic acid, by some called *peroxide of antimony.*

Prep. 1. By exposing either *metallic antimony*, or its *oxide* or *sulphuret*, for some time to a strong heat in an open vessel.

2. From *antimonic acid*, heated as last.

3. From the *antimonite of an alkali by* adding an *acid.*

Prop., &c. A greyish white, infusible powder, destitute of volatility, and insoluble in either water or acids, unless recently precipitated. Its salts, of which little definite are known, are termed *antimonites.*

Uses. It forms the basis of *James's fever powder* and the *pulvis antimonialis* of the pharmacopœias. Like antimonic acid it is very inactive and uncertain in its operation.

ANTIMONY. Syn. *Antimonium, Stibium*, —Lat. *Regulus of Antimony*,—Obs. The term *antimony* was formerly applied to the native sulphuret or the greyish black semi-crystalline ore of antimony; but it is now solely appropriated to express the pure metal.

Prep. Metallic antimony is freed from impurities by fusion, and the sulphuret is commonly reduced to the metallic state by exposure on the concave hearth of a reverberatory furnace, and subsequent fusion in crucibles with coal dust. To free it from iron, a little antimonic oxide is generally added; and when the ore contains arsenic, some iron or its oxide, and carbonate or sulphate of soda are used in the same way. It is seldom prepared on the small scale. The following formulæ have been recommended:

1. (Ph. Castr. Ruthena, 1840.) *Sulphuret of antimony*, 16 parts; *cream of tartar*, 6 parts; both in powder; put the mixture, in small quantities at a time, into a vessel heated to redness; when the reaction is over, fuse the mass, and after a quarter of an hour, pour it out, and separate the metal from the slag. Nearly pure.

2. *Sulphuret of antimony*, 8 parts; *cream of tartar*, 6 parts; *nitre*, 3 parts; as last.

3. *Sulphuret of antimony*, 2 parts; *iron filings*, 1 part; calcine at a strong heat in a covered crucible.

4. (Wöhler.) *Sulphuret of antimony*, 10 parts; *nitre*, 12 parts; *dry carbonate of soda*, 15 parts; deflagrate together, powder, wash with *water*, and smelt the remainder with *black flux.* Nearly pure.

5. *Protoxide of antimony* and *bitartrate of potassa*, equal parts; mix, fuse as before, and pour the metal into small conical moulds. Pure.

6. (Commercial.)—*a.* *Sulphuret of antimony*, 100 parts; *metallic iron*, 40 parts; *dry crude sulphate of soda*, 10 parts; fuse together. *Prod.* 60 to 65 parts of antimony, besides the scoriæ or ash, which is also valuable.

b. (Berthier.) *Sulphuret of antimony*, 100 parts; *hammerschlag* (rough oxide of iron from the rolling mills), 60 parts; *crude carbonate of soda*, 45 to 50 parts; *charcoal powder*, 10 parts; as last. *Prod.* 67 parts.

Prop. Colour, bluish white; lustrous; semi-crystalline; extremely brittle (may be powdered); and imparts brittleness to its alloys; volatile; inflammable at high temperatures, melts just under redness (810° Fahr.); fumes, boils, and volatilizes at a white heat, and when suddenly exposed to the air, inflames and is converted into the *teroxide*, which is deposited in beautiful flowers or crystals; hot hydrochloric acid dissolves it, forming *terchloride of antimony;* nitric acid converts it into *antimonic acid.* Sp. gr., 6·7 or 6·8.

Tests. Metallic antimony may be recognised by the above properties; its *oxide*,

salts, &c., by the following reactions:—1. Sulphuretted hydrogen gives, with acid solutions, an orange-red precipitate, sparingly soluble in ammonia, but readily soluble in pure potassa and alkaline sulphurets, and in hot hydrochloric acid with the evolution of sulphuretted hydrogen gas. — 2. Hydrosulphuret of ammonia gives an orange-red precipitate, readily soluble in excess of the precipitant, if the latter contains sulphur in excess; and the liquor containing the redissolved precipitate gives a yellow or orange-yellow precipitate on the addition of an acid.—3. Ammonia and potassa, and their carbonates, give (excepting in solutions of tartar emetic) a bulky white precipitate; that with *ammonia* being insoluble in excess of the precipitant; that with *potassa* readily so; whilst those with the *carbonates of ammonia* and of *potassa* are only soluble on the application of heat. *The quantity of pure antimony in commercial samples* may be determined by treating them (in powder) with nitric acid, which oxidizes the antimony and leaves it in an insoluble state, whilst it dissolves the other metals. The oxide is collected on a filter, washed, dried, ignited, and weighed, when its weight multiplied by ·843, gives the required quantity of pure metal.

Pur. The antimony of commerce generally contains a small quantity of arsenic, together with variable quantities of iron, lead, sulphur, and tin. These impurities may be detected in the way noticed under the respective metals and sulphur.

Uses. In the *arts*, antimony enters into the composition of several valuable alloys. Combined with *lead* it forms *type metal;* with *lead* and *tin*, *pewter*, *Britannia metal*, *music plate metal*, *&c.* It is added to the alloy for *concave mirrors* to give them a finer texture; to *bell metal*, to render it more sonorous; and to various other metals to increase their hardness and fusibility. Metallic antimony is now seldom used in medicine; but some of its preparations are much esteemed as useful and efficacious remedies. See *Antimonials*, and the following articles:

ANTIMONY ASH. Syn. *Calcined Antimony; Antimonium Calcinatum*, *Cinis Antimonii*,—Lat. Prepared by roasting the *common black sulphuret of antimony* on an iron plate set under a chimney to carry off the fumes. It has an ash-grey colour, and is emetic in small doses. *Used* as a cheap substitute for oxide of antimony by the manufacturers of tartar emetic.

ANTIMONY (Calx of). Syn. *Calx Antimonii*,—Lat. Sometimes applied to antimony ash, but more commonly to crude, unwashed diaphoretic Antimony.

ANTIMONY (Sulphurated Calx of). Syn. *Antimonii Calx Sulphurata*,—Lat. *Prep.* (Hufeland.) *Burnt oyster shells*, 10 parts; *sulphur*, 4 parts; *crude antimony*, 3 parts; powder, mix, and calcine in a luted crucible for an hour. *Dose.* 1 to 6 grs. in gout, rheumatism, and scrofula.

ANTIMONY (Cerusse of). Syn. *Antimonii Cerussa*,—Lat. *Prep.* (Bate.) As diaphoretic antimony, merely using the metal instead of the sulphuret.

ANTIMONY (Chlorides of). Three compounds of *chlorine* and *antimony* have been noticed by chemists, but only one of them has been applied to any useful purpose in medicine or the arts.

ANTIMONY (Terchloride of). Syn. *Chloride of Antimony*, *Protochloride of do.*, *Sesquichloride of do.*, *Hydrochlorate of do.*, *Muriate of do.*, *Butter of do.; Antimonii Chloridum*, *Ant. Sesquichloridum*, *Ant. Hydrochloras*, *Ant. Murias*, *Ant. Butyrum*,—Lat. This is the common chloride or muriate of antimony of the shops. It is regarded as a *terchloride* by those who adopt the atomic weight of antimony as given by Berzelius and his school, and as a *sesquichloride* by those who estimate the equiv. at only half that number. The same remarks also apply to the other compounds of antimony.

Prep. 1. (Liquor Antimonii Terchloridi, —*Ph. D.*) Take *prepared sulphuret of antimony* (Ph. D.), 1 *lb.*; *commercial muriatic acid*, 4 pints; carefully mix at a gentle heat, in a porcelain capsule, (under a flue with a quick draught, to carry off the fumes,) constantly stirring, and gradually increasing the heat as the effervescence slackens; boil for 15 minutes, cool, filter through calico, boil down to a quart, cool, and preserve in well-stoppered bottles. *Sp. gr.*, 1·470.

2. (Liquor Stibii Muriatici; Liq. Stibii Chlorati,—*Ph. Bor.* 1846.) *Black sulphuret of antimony* (in powder), 1 lb; *commercial hydrochloric acid*, 4 lb; dissolve as before; evaporate the filtered solution to 1½ lb, add *hydrochloric acid*, 9 oz., and *distilled water*, 1½ lb, or q. s. to reduce the sp. gr. to from 1·345 to 1·350.

3. (Liebig.) *Pure metallic antimony*, 2 parts; *bichloride of mercury*, 5 parts; both in fine powder; mix and distil as before. Chemically pure.

4. (Soubeiran.) *Sulphuret of antimony*, 1 part; *hydrochloric acid*, 5 parts; dissolve by a gentle heat, decant, evaporate, and then distil almost to dryness.

5. (Commercial.) Take *ash* or *calx of antimony*, 3¼ *lb.*; *common salt*, 2 *lb.*; *oil of vitriol*, 1½ *lb.*; *water*, 1 *lb.*; proceed as before. *Prod.*, 2½ *lb.*

6. From *roasted sulphuret* or *glass of antimony*, 7 *lb.*; *salt*, 28 *lb.*; *oil of vitriol*, 21 *lb.*; *water*, 14 *lb.*; as before.

7. From *crude sulphuret of antimony* (powdered), 25 *lb.*; *strongest commercial hydrochloric acid*, 1 *cwt.*; *nitric acid*, 3½ *lb.*; as before; the product being coloured with a little *pernitrate of iron*, and made up to the sp. gr., 1·4. The quality is improved, and the process more easily conducted if the crude antimony is roasted before dissolving it in the acid.

Prop., &c. When pure and nearly free from water, it somewhat resembles butter, melts with a gentle heat, and partially crystallizes on cooling; it is very deliquescent, and quickly passes into an oil-like liquid when exposed to damp air; very soluble in strong hydrochloric acid; water more or less decomposes it, according to the quantity; when perfectly pure and anhydrous, it forms a white and highly crystalline mass, rapidly decomposed by air and moisture. The sp. gr. of the solution of the shops varies from 1·25 to 1·4, in which state it is a transparent fuming yellow liquid (unless when artificially coloured), and extremely acid and caustic. The *liquid terchloride* submitted to distillation at first parts with its water and excess of acid, after which the salt itself is volatilized. By changing the receiver as soon as the distillate concretes on cooling or produces a copious white precipitate on falling into the liquid already passed over, the pure and anhydrous terchloride may be obtained. It is used as a caustic or escharotic to the wounds caused by rabid and venomous animals, and to repress excessive granulations in ulcers. It is the caustic most commonly used by farriers. It is also used as a source of both oxychloride and oxide of antimony. The residuum in the retort when corrosive sublimate is used, is sulphuret of mercury, and has been termed *cinnabar of antimony*.

ANTIMONY (Pentachloride of). Syn. *Perchloride of Antimony*. Prepared by passing *a stream of chlorine gas* over *metallic antimony* in powder, and gently heated. A mixture of terchloride and pentachloride of antimony is found in the receiver, from which the latter may be separated as a colourless volatile liquid, by careful distillation.

ANTIMONY (Crocus of). Syn. *Saffron of Antimony, Liver of do.; Crocus Antimonii, Crocus Metallorum, Hepar Antimonii*,—Lat. *Prep.* 1. From *sulphuret of antimony* and *saltpetre*, equal parts, deflagrated together by small portions at a time, and the fused mass (separated from the scoriæ) reduced to fine powder.

2. (*Antimonii Crocus*,—Ph. L. 1788.) *Sulphuret of antimony*, 1 lb; *nitre*, 1 lb; common salt, 1 oz.; as before.

Prop., &c. In its medicinal properties it greatly resembles diaphoretic antimony. When repeatedly washed or boiled in water, and dried, it forms *washed saffron of antimony*, (crocus antimonii lotus.) Formerly used to make tartar emetic.

ANTIMONY (Diaphoretic). Syn. *Calx of Antimony, Calcined Antimony, Antimoniate of Potash, Stibiated Kali; Antimonium Diaphoreticum, Calx Antimonii, Antimonium Calcinatum, Potassæ Antimonias*,—Lat. An old preparation with numerous synonyms, of which the first two of the above are those only which are now in in use.

Prep. 1. (*Antimonium Calcinatum*,—Ph. L. 1788.) *Sesquisulphuret of antimony*, 8 oz.; *nitre*, 24 oz.; reduce them to powder, mix, and deflagrate by spoonfuls in a red hot crucible, calcine for half an hour, cool, powder, wash away the soluble matter with water, and dry by a gentle heat.

2. (*Antimonium Diaphoreticum Ablutum*,—Ph. Bor. 1847. *Metallic antimony*, 1 part; *nitre*, 2 parts; as last, drying the washed powder at a heat not exceeding 104° Fahr.

Prop., &c. A white or grayish white powder, without either smell or taste; gently diaphoretic and laxative; its activity greatly depending on the quantity of acid in the stomach. *Dose.* 1 to 6 grs. or more. It was formerly used to make tartar emetic. The "flowers" which collect on the sides of the crucible must be rejected, as they are powerfully emetic. The water used for the "washings" yields a precipitate of *antimonic acid* on the addition of sulphuric acid.

ANTIMONY (Ethiops of). Syn. *Æthiops Antimonialis*,—Lat. *Prep.* 1. From *quicksilver*, 1 part; *sulphuret of antimony*, 2 parts; triturated until the globules of the former entirely disappear.

2. *Sulphuret of antimony*, 3 parts; *black sulphuret of mercury*, 2 parts; triturated together. An old remedy in certain skin diseases, still highly esteemed by some practitioners. *Dose.* 3 to 5 grs., gradually increased to 20 or 30 grs.

ANTIMONY (Flowers of). Syn. *Flores Antimonii*,—Lat. *Prep.* Throw *powdered*

sulphuret of antimony, by spoonfuls, into an ignited tubulated retort, that has a short and very wide neck, until as many "flowers" collect in the receiver as are required. Emetic in doses of 1 to 3 grs.

ANTIMONY (Argentine Flowers of). Syn. *White Oxide of Antimony; Antimonii Flores Argentini*,—Lat. *Prep.* Keep *metallic antimony* melted in a vessel, freely exposed to the air, and furnished with a cool place for the flowers to rest on, and collect them as deposited. They are teroxide of antimony in a crystalline form, and received the name of *argentine*, from their silvery whiteness and beauty.

ANTIMONY (Glass of). Syn. *Vitrified Antimony, Gray Oxide of Antimony; Vitrum Antimonii, Antimonium Vitrificatum, Ant. Vitrifactum, Oxydum Antimonii Vitrificatum*,—Lat. *Prep.* (Ph. L. 1788.) Roast *crude sulphuret of antimony* in a shallow earthern vessel, over a moderate fire, until it turns whitish gray and ceases to emit fumes at a read heat; then heat it in a crucible until it fuses into a clear brownish red glass, and pour it out on an iron plate. If calcined too much, a little more crude antimony may be added to make it run well.

Prop., &c. It is emetic, in fine powder, in doses of 1 to 3 grs.; but uncertain and violent in its operation. It has been used as a cheap source of the teroxide by the manufacturers of tartar emetic.

ANTIMONY (Cerated Glass of). Syn. *Antimonii Vitrum Ceratum*,—Ph. L. 1746. *Prep.* (Dr. Young.) *Glass of antimony*, in fine powder, 1 oz.; *yellow wax*, 1 dr.; melt together in an iron ladle, and keep it over a gentle fire free from flame (constantly stirring), for about half an hour, or until it acquires a snuff-colour, then pour it out on a piece of white paper (or plate), and when cold, powder it. *Dose.* 2 to 10 grs., in dysentery, &c.

ANTIMONY (Liver of). Syn. *Hepar Antimonii*,—Lat. *Prep.* From *sulphuret of antimony*, 1 part; and *dry carbonate of soda* or *potash*, 2 parts; melted together, and heated until it acquires the proper colour, and then cooled, and powdered. It is a mixture of teroxide of antimony, sulphuret of potassium, carbonate of potash, and undecomposed tersulphuret of antimony. It is chiefly used by *farriers* as a strong purge for horses, in greasy heels, &c.; and by *chemists*, as a source of the crude oxide. The crocus of antimony, before noticed, sometimes passes under the same name, and is sold for it.

ANTIMONY (Oxides of). Chemists were formerly much divided in opinion as to the number of compounds formed by antimony with oxygen. The terms (*protoxide, teroxide, sesquioxide*, &c.) applied to the basic oxide depend upon the views taken as to its atomic composition, as noticed under *Chloride of Antimony*.

ANTIMONY (Teroxide of). Syn. *Oxide of Antimony, Protoxide of do., Sesquioxide of do.; Antimonii Teroxydum*, — Ph. L.; *Ant. Oxydum*, — Ph. E. & D. This is probably the only true oxide of antimony.

Prep. 1. (Ph. E.) *Sulphuret of antimony* (in fine powder), 4 oz.; *hydrochloric acid*, 1 pint; dissolve with a gentle heat, boil for half an hour, filter, and pour the fluid into *water*, 5 pints; collect the precipitate on a calico filter, wash it first with *cold water*, and then with a *weak solution of carbonate of soda*, and again with *cold water* till it ceases to affect test paper; lastly, dry it by the heat of a vapour bath.

2. (Ph. D.) *Solution of terchloride of antimony*, (Ph. D.), 16 fl. oz.; *water*, 2 galls.; mix well, collect the sediment, (*oxychloride of antimony, Algaroth's powder*,) on a calico filter, and wash it with *water* until the latter only slightly reddens litmus paper, then agitate it occasionally for ½ an hour with *liquor of potassa*, 1 pint, diluted with *water*, q. s.; again collect it on a filter, and wash it with *boiling water*, until the "washings" cease to be affected by nitrate of silver; lastly, dry it at a heat not above 120° Fahr.

3. (Ph. L.) *Tersulphuret of antimony*, 1lb; *sulphuric acid*, 15 oz.; mix in an iron capsule, (under a flue,) stirring with an iron spatula, and gradually increasing the heat until nothing remains but a whitish pulverulent mass, which after it becomes cool, is to be well washed with cold water (as above,) and dried. In this state, which, according to Mr. Phillips, is that of a *disulphate*, it is used to make tartar emetic. By boiling it with *water*, holding in solution a little *carbonate of soda*, and subsequently washing it with *pure water*, the acid of this disulphate is removed, and oxide of antimony obtained under the form of a greenish-white powder. This is a modification of the process of Hornung, and that now generally adopted by English manufacturing chemists.

4. (Mr. R. Phillips.) From *powdered metallic antimony* and *sulphuric acid*, as last. (*Exp. Exam. Lond. Pharm.* 1811.)

5. (Tyson.) By decomposing *oxychloride of antimony* with *sesquicarbonate of ammonia*.

6. By burning metallic antimony. This form of the oxide was christened *flores antimonii* by Basil Valentine. See *Flowers of Antimony.*

Prop., &c. A grayish white or buff-coloured, tasteless, inodorous powder, (*white*, when recently precipitated,) fusible at a red heat into a yellow fluid which concretes on cooling into a crystalline mass; volatilized unchanged when strongly heated in closed vessels, but in contact with air, converted into antimonious acid; feebly basic, producing salts which readily suffer decomposition. It is "entirely soluble in hydrochloric acid, and in a boiling solution of bitartrate of potassa; snow white (when recent); fusible at a red heat." (Ph. E.) It is used chiefly to make tartar emetic and some other saline compounds of antimony. *Dose.* 2 to 10 grs.; as a diaphoretic. See *Antimonic* and *Antimonious Acid.*

ANTIMONY (Oxychloride of). Syn. *Muriatic Oxide of Antimony, Nitro-muriatic do.; Antimonii Oxychloridum, Ant. Oxydum Muriaticum,*—Lat. *Algaroth's Powder, Angelic Powder, Pulvis Algarothi, Pulvis Angelicus,*—Obs. *Prep.* 1. By pouring the common *liquid chloride* (butter) *of antimony* into water, collecting the precipitate, and washing it with water.

2. (*Antimonii Oxydum Nitro-muriaticum,*—Ph. D. 1826.) *Sulphuret of antimony*, 20 parts; *muriatic acid*, 100 parts; *nitric acid*, 1 part; dissolve and proceed as last. It consists of teroxide of antimony, mixed with a little of the chloride, ($5SbO_3$, $SbCl_3$) and is therefore wrongly termed an oxychloride. If allowed to stand for some time in the liquor from which it has been precipitated it becomes more or less crystalline.

ANTIMONY (Oxysulphuret of). Syn. *Amorphous Sulphuret of Antimony, Amorphous Tersulphuret of Antimony, Amorphous Sesquisulphuret of do., Red Sulphuret of do., Precipitated Sulphuret of do.; Antimonii Oxysulphuretum,*—Ph. L. *Ant. Sulphuretum Aureum,*—Ph. E. *Ant. Sulphuretum Præcipitatum,*—Ph. D; Ph. L., 1824. This is a hydrated amorphous tersulphuret of antimony obtained by precipitation, and contaminated with a small and variable proportion of the teroxide which is thrown down along with it.

Prep. 1. (Ph. L.) *Tersulphuret of antimony*, in fine powder, 7 oz.; *solution of soda*, (potassa, Ph. L. 1836,) 4 pints; *distilled water*, 2 galls.; gently boil together for two hours, constantly stirring, and adding *fresh water* as it wastes; filter, (through linen,) add *diluted sulphuric acid*, q. s. to throw down the oxysulphuret, well wash the precipitate with *water*, and dry it by a gentle heat.

2. (Ph. E.) *Sulphuret of antimony*, 1 oz.; *solution of potassa*, 11 fl. oz.; *water*, 2 pints; boil as before, filter, precipitate, whilst hot, with *sulphuric acid*, in excess, and wash and dry as before.

3. (Ph. D.) *Prepared sulphuret of antimony*, 5 *oz.; carbonate of potash*, (dried at a low heat,) 4 *oz.;* mix well in a mortar, heat the mixture in a Hessian crucible (gradually and cautiously) to low redness, and pour the melted mass on a clean flag, (or plate of iron;) when cold, reduce it to powder in a porcelain mortar, and add it in successive portions to *boiling water*, 10 *pints*, (in an iron vessel;) boil for 20 minutes, and filter through calico, allowing the filtrate to drop into *sulphuric acid*, 2 *fl. oz.*, diluted with *water*, 1 *quart;* then collect the precipitate on a calico filter, wash it with *warm water*, and dry it on porous bricks in a warm atmosphere.

4. (Ph. Han. nova, 1831.) From *levigated black antimony* and *sulphur*, equal parts; *liquor of potassa*, q. s.; boiled together until nearly dissolved; the solution mixed with *twice its volume of hot water* and filtered; after 24 hours further mixed with 3 *times its volume of water* and precipitated with *dilute sulphuric acid.* Very bright; consists chiefly of pentasulphuret.

5. (Commercial.) *Sulphuret of antimony*, 5 parts; *quicklime*, 10 parts; *water*, 100 parts; boil as before, and precipitate with *hydrochloric acid*, in excess, and *added at once* or as *quickly as possible.*

6. From *sulphur*, 1 part; *sulphuret of antimony*, 2 parts; *salt of tartar*, 4 parts; fused together and precipitated with excess of *sulphuric acid;* as in No. 4, (above.) Very bright coloured.

7. From *sulphuret of antimony*, 7 parts; *dry carbonate of soda*, 6 parts; *hydrate of lime*, 4 parts; *sulphur*, 1 part; *sulphuric* or *muriatic acid*, q. s.; as above. Very bright coloured.

8. As the process 5, (above,) but precipitating the solution with a mixture of *hydrochloric acid*, 93 parts; *sulphuric acid*, 7 parts. The product contains a little sulphate of lime.

Prop., &c. A red, brownish-red, or orange-coloured, odourless, and almost tasteless powder; insoluble in water; soluble in liquor of potassa, forming a colourless solution, readily catches fire, and burns with a bluish-green flame, exhaling sulphurous fumes and leaving a grayish-white

oxide behind. When pure it is "of a golden-red colour; entirely soluble in boiling solution of potassa; almost entirely soluble in hot hydrochloric acid, hydrosulphuric acid being evolved, and a little sulphur remaining. These solutions are free from colour." (Ph. L.)

Uses, &c. It is diaphoretic, expectorant, emetic, or tonic, according to the dose, similar to the other antimonials. *Dose.* 1 to 10 grs. It is chiefly used as an alterative, (1 to 4 grs., in pills, 2 or 3 times, daily, combined with mercury, or with opium, guaicum, or sarsaparilla,) in chronic and other skin diseases, glandular enlargements, secondary syphilis, chronic rheumatism, and liver complaints.

Obs. It has been a matter of complaint among manufacturers of the above article that the processes and proportions ordered by the British Colleges produce a darker coloured and less showy preparation than that demanded in trade. The variations of colour chiefly depend on the quantity of water employed, the temperature of the liquor at the time of the precipitation, the quantity of the precipitant, and the mode in which it is used; and to these variations in the process, trivial differences of composition may also be referred. The superior brightness of the products of the processes, 4, 5, 6, and 7, arises chiefly from their containing a larger quantity of the true golden sulphuret or pentasulphuret, than those prepared according to the directions of the British Colleges. They contain more sulphur, and are, indeed, distinct, though similar preparations. The bright oxysulphuret of the shops appears to consist chiefly of pentasulphuret of antimony, and water. In this case the college orders *one* preparation; whilst the trade uses *another*. See *Kermes*.

ANTIMONY (Panacea of). Syn. *Panacea Antimonii*,—Lat. *Prep. Crude antimony*, 6 oz.; *nitre*, 10 oz.; *common salt*, 1½ oz.; *charcoal*, 1 oz.; all in fine powder; mix, deflagrate by spoonfuls in a red-hot crucible, keep the mixture heated for a quarter of an hour, cool, reject the uppermost spongy scoriæ, powder the remainder, well wash it with water, and carefully dry it. It should be of a fine golden colour. It is the active ingredient in Lockyer's pills.

ANTIMONY (Potassio-tartrate of). Syn. *Tartar Emetic, Tartarized Antimony, Tartrate of Antimony, Tartrate of Antimony and Potassa, Stibiated Tartar, Antimoniated Tartar, Antimonio-tartrate of Potassa; Antimonii Potassio-tartras*,—Ph. L. *Antimonium Tartarizatum*,—Ph. E. & D.; and Ph. L. 1824. *Tartarus Emeticus*,—Ph. L. 1720. For a long period tartar emetic was used in medicine with caution, and regarded with suspicion, but it has gradually increased in importance and won its way into the general esteem of the medical profession, until it appears likely, ere long, to supersede all other antimonials.

Prep. 1. (Ph. L.) *Teroxide of antimony*, (Ph. L.—*disulphate*,) 9 oz.; *bitartrate of potassa*, 10 oz.; *water*, 5 pints; boil for half an hour, filter while hot, and set aside that crystals may form, which are to be collected, drained, and dried. By evaporating the mother liquor, more crystals may be obtained.

2. (Ph. E.) *Oxide of antimony*, (Ph. E.—*oxychloride*,) 3 oz.; *bitartrate of potassa*, 4¼ oz.; *water*, 27 fl. oz.; mix, boil for an hour, filter, and crystallize as before.

3. (Ph. D.) *Oxide of antimony*, (Ph. D.,) 5 *oz.; bitartrate of potassa*, 6 *oz.; water*, 1 quart; make a paste with a little of the water, and in 24 hours add the rest of the water (boiling); boil for 15 minutes, in glass or porcelain, stirring frequently, filter through calico, and set aside the clear liquor; after 12 hours decant the liquor from the crystals, boil it to ⅓d, and crystallize as before. The crystals are to be dried on bibulous paper, without heat, and preserved in a bottle.

4. (Ph. L. 1836.) *Sesquisulphuret of antimony*, (in powder,) and *nitrate of potash*, of each, 2 lb; mix well, add *hydrochloric acid*, 4 fl. oz.; spread the mixture on an iron plate, and ignite it; cool, rub the residuum to powder, wash it well with boiling water, and boil it for ½ an hour with *bitartrate of potash*, 14 oz., dissolved in *water*, 1 gall.; strain while hot, and crystallize as before.

5. (Commercial.) *Teroxide of antimony*, (Ph. L.,) 51 parts; (or its equiv., if impure, or in any other form;) *crystallized bitartrate of potassa*, (in powder,) 63 parts; *water*, 560 parts; as before.

6. (*In powder.*—M. Hoffmann.) *Tartar emetic*, 6 oz.; *boiling water*, 32 oz.; dissolve, add *alcohol*, 64 oz.; and collect and dry the precipitate. An *impalpable* powder, invaluable for ointments, &c. The loss of tartar emetic does not exceed 25 to 30 grs., and the alcohol is recovered by distillation.

Prop. White, transparent, inodorous, rhombic octahedrous crystals, which decrepitate in the fire, and effloresce, and become white and opaque by exposure to the air; insoluble in alcohol; soluble in 14½ parts of water at 60° Fahr., and in 2½ parts at 212°; solution reddens litmus,

tastes disagreeably styptic and metallic, and suffers spontaneous decomposition from age; alkalies and their carbonates throw down teroxide of antimony; heat decomposes it. Its action is that of a powerful local irritant, causing a pustular eruption, which permanently marks the skin; for this purpose it is used in the form of solution, ointment, or plaster. In *small doses*, ($\frac{1}{12}$ to $\frac{1}{6}$ gr.,) it acts as an expectorant and diaphoretic; in *somewhat larger doses* ($\frac{1}{4}$ to $\frac{1}{2}$ gr.) it excites nausea, and sometimes vomiting, occasioning depression and relaxation, especially of the muscular fibre; in *large doses*, (1 to 3 grs.,) it acts as an emetic and sudorific, (and often as a purge,) depressing the nervous functions, and producing a feeling of feebleness, exhaustion, and relaxation, greater than that produced by other emetics; in *excessive doses*, it acts as an irritant poison, and has in some instances caused death. It is usually exhibited in solution.

Pur. It is "free from colour, and (wholly) soluble in water. The solution is unchanged by ferrocyanide of potassium. Hydrosulphuric acid being added, gives a precipitate of a reddish colour; neither chloride of barium nor nitrate of silver throws down anything but what is again dissolved on the addition of water. With nitric acid it gives a precipitate which is soluble in excess of the same acid. From 100 grs. dissolved in water, hydrosulphuric acids throws down 49 grs. of tersulphuret of antimony." (Ph. L.) "Dissolved in 40 parts of water, the solution is not affected by its own volume of a solution of 8 parts of acetate of lead in 32 parts of distilled water and 15 parts of acetic acid." (Ph. E.) The powder should be *perfectly* white, and the precipitate, formed by adding to its boiling solution a few drops of a solution of carbonate of soda, should *not* redissolve. If it does, the salt contains cream of tartar. (Hennel.) If the powder is *yellow* or *yellowish*, it contains iron.

Obs. By each of the formulæ given by the British Colleges, an excellent article of tartar emetic may be produced, preference being given to that of the London Pharmacopœia, as embracing the most recent improvements, and being vastly superior to those which have preceded it, both in the excellence of the product and the economy of the process. On the large scale, the ash, crocus, and glass of antimony, are frequently had recourse to as cheap sources of the teroxide, but the economy of their adoption is questionable, reference being had to the beauty and purity of the product, which are points, which as well as mere quantity, should receive consideration by the manufacturers of pharmaceuticals. In the last Lond. Pharm. the preparation of the oxide, and its conversion into tartar emetic, are included in one formula, although distinct processes.

ANTIMONY (Sulphate of). Syn. *Vitriolated Antimony; Sulphas Antimonii, Vitriolum Antimonii*,—Lat. *Prep.* (Van Mons.) *Antimony*, 2 parts; *sulphuric acid*, 3 parts; stir together over a gentle fire till it assumes a grayish-white colour; cool, powder, remove the excess of acid by washing it with water, and dry the powder. It is an insoluble *sub-sulphate.*

ANTIMONY (Sulphurets of). Several sulphurets of antimony have been noticed by writers on the subject, but only two definite compounds of this class appear to exist. They are the *tersulphuret* and *pentasulphuret*, and are analogous in their composition to the like compounds formed by antimony with chlorine and oxygen.

ANTIMONY (Tersulphuret of). Syn. *Sulphuret of Antimony, Black Sulphuret of do., Sesquisulphuret of do.; Antimonii Tersulphuretum*,—Ph. L. *Ant. Sulphuretum*,—Ph. E. & D. *Ant. Sesquisulphuretum*,—Ph. L. 1836. This is the native gray mineral commonly known as *crude antimony* or *antimony ore*, or *sulphuret of antimony*, and from which the other compounds of antimony are chiefly obtained.

Prep. The fused sulphuret is separated by heat from the less fusible earthy matter with which it is contaminated, after which it is run into "loaves" or large cakes, in which form it is sent to market.

1. (*Prepared Sulphuret of Antimony, Antimonii Sulphuretum Preparatum*,—Ph. D.) Made by reducing the *sulphuret of commerce* to powder, and separating the finer particles for use, in the way directed for *prepared chalk.* That of the shops is merely ground in mills without elutriation.

2. (*Amorphous Tersulphuret of Antimony.*) By precipitating a *solution of tartar emetic*, with *sulphuretted hydrogen.* The oxysulphuret of the pharmacopœia is an impure hydrated amorphous tersulphuret of antimony.

Pur. Commercial sulphuret of antimony frequently contains lead, iron, copper, and arsenic, and sometimes manganese. Its goodness is commonly estimated by its compactness and weight, the largeness and distinctness of the striæ, and the volatility of the sulphuret. "Striated; (entirely) soluble in hot hydrochloric acid." (Ph. L.)

Uses. It is principally employed as a

source of metallic antimony and in the preparation of other antimonials. Exhibited alone, it possesses little activity, unless it meets with acid in the primæ viæ, when it occasionally acts with considerable violence both as an emetic and cathartic. *Dose.* 10 to 30 grs., in powder; as an alterative and diaphoretic; in rheumatism, gout, scrofula, and glandular affections, and in lepra, scabies, and some other skin diseases. It is a favourite remedy with farriers, who commonly mix a little of it with the food of horses to improve their coat and promote their "condition."

ANTIMONY (Pentasulphuret of). Syn. *Persulphuret of Antimony, Golden Sulphuret of do.; Antimonii Pentasulphuretum, Ant. Persulphuretum, Ant. Sulphuretum Aureum,*—Lat. *Prep.* 1. (Liebig.) Take *tersulphuret of antimony*, 72 parts; *dry carbonate of soda*, 68 parts; *hydrate of lime*, (fresh,) 52 parts; *sulphur*, 13 parts; boil for some hours, filter, evaporate, and crystallize; redissolve the crystals, (*Schlippe's salt; sulphantimoniate of sodium;*) add *dilute sulphuric acid*, collect the golden flocculent precipitate, wash it with cold distilled water, and dry it by a gentle heat.

2. (P.C.) By adding *dilute sulphuric acid* to the *mother liquor from which kermes has been deposited*, and washing the sediment, as before. The product of the process of the Ph. Hann. (*Oxysulphuret of Antimony*, No. 4), produces a nearly similar compound.

Prop., &c. It closely resembles kermes mineral and the common oxysulphuret of antimony, of the brighter coloured samples of which (of the shops,) it forms, indeed, a distinguishing component part. *Dose.* ½ to 3 grs. or more.

ANTIMONY AND LIME (Sulphuret of). Syn. *Antimonii et Calcis Sulphuretum,*—Lat. *Prep.* (Van Mons.) *Golden sulphuret of antimony*, 1 part; *quick lime*, 3 parts; triturate together, then add *boiling water*, 24 parts; evaporate to dryness, constantly stirring, and keep it in a well-stopped bottle. Diaphoretic, emetic, resolvent, and alterative. It has been highly extolled in gout, rheumatism, scrofula, and certain skin diseases, and as a cheap and most efficient substitute for James's powder. *Dose.* 1 to 6 grs.

ANTIMONY (Tannate of). Syn. *Antimonii Tannas,*—Lat. *Prep.* 1. Precipitate a *decoction of cinchona*, with a solution of *tartar emetic*, and collect the sediment.—2. From a solution of *tannin*, and *tartar emetic*, as last. *Dose.* 3 to 8 grs., in mucilage, as a contra-stimulant. A useless preparation.

ANTIPERTUSSIS. A nostrum, for hooping-cough, which, according to Dr. Paris, has for its base a salt of zinc.

ANTISCORBUTICS. Remedies for scurvy. *Lemon juice, ripe fruit, milk*, the *salts of potassa, green vegetables, meal bread, fresh meat*, and *raw* or *lightly boiled eggs*, belong to this class.

ANTISEPTICS. Substances that impede or prevent putrefaction. The principal antiseptics are *common salt, saltpetre, spices, sugar, vinegar, creasote*, and *alcohol*. See *Putrefaction*.

ANTISPASMODICS. Medicines which allay spasms and convulsions. The term is frequently incorrectly applied to anodynes and narcotics, which soothe pain, but do not repress muscular spasm. *Ammonia, assafœtida, bark, camphor, castor, chalybeates, chloroform, ether, musk, opium, saffron*, and *valerian*, have been regarded as antispasmodics.

ANXIETY. The painful restlessness and inquietude, both of body and mind, to which the term *nervous anxiety* has been applied, is, perhaps, one of the most distressing ailments, not of an organic character, that can possibly be experienced. The thoughtful, studious, and debilitated, those confined in close apartments, or who are engaged in sedentary occupations, the libertine, the drunkard, and the voluptuary, are those who are its principal victims. Fresh air, out of door exercise, the erect posture, plain, but wholesome food, warm clothing, well ventilated apartments, cold weak liquors as beverages, agreeable occupation, and above all, the cultivation of a kindly and sociable temper, will do much to effect a cure. The bowels should be kept regular, with an occasional mild aperient, and a free evacuation should take place at least once a day. A teaspoonful of carbonate of soda or magnesia, or a few drops of laudanum, taken on retiring to rest, with the use of a good pillow, will generally prevent watchfulness at night.

AORTA. The aorta is frequently the seat of aneurism, a disease not uncommonly brought on by the excessive use of ardent spirits and fermented liquors, and by luxurious living; and hence its greater frequency in men than in women, and in drunkards than in temperate persons. When this species of aneurism has attained a certain magnitude, the tumour generally bursts, and causes death, either instantaneously, or after the lapse of a few days, according to circumstances. The *treatment*

is wholly medical and consists in the adoption of those means which are best calculated to lessen the action of the heart and the volume of the blood. Violent exercise, stimulants of all kinds, exciting passions and emotions, and other agents which tend to accelerate the circulation, should be avoided.

APERIENTS. Medicines or agents which gently open the bowels. Among these may be named *castor oil*, *compound extract of colocynth* (in small doses), *compound rhubarb pill*, *confection of senna*, *cream of tartar*, *drum figs*, *Epsom salts*, *ripe grapes* and *other fruit*, *phosphate of soda* (tasteless salt), *pil. rufi*, *prunes*, *raisins*, *salad oil*, *seidlitz powders*, &c. See *Pills*, *Draughts*, *&c.*

APIINE. A gelatinous substance obtained from the *apium petroselinum* or parsley. With a solution of sulphate of iron it strikes a blood-red colour.

APOCYNINE. A bitter crystallizable substance found in the *apocynum cannabinum*, or Indian hemp of North America.

APOPLEXY. A sudden suspension or loss of the powers of sense and motion; the heart continuing to beat and the lungs to act, but generally with difficulty. During the fit the patient frequently lies in a state resembling sleep, or the stupor induced by drunkenness. In the *sanguineous* or *sthenic variety*, the pulse is hard and full, the countenance flushed, and the breathing stertorous; in the *serous* or *asthenic variety*, the pulse is feeble, and the countenance pale.

Treat. In this disease, more than perhaps any other, medical aid should be *immediately* sought. In the mean time the patient should be kept easy and cool, with head and shoulders elevated, the neckcloth removed, and the clothes loosened. Crowding round the patient should be especially avoided, and a free exposure to fresh air secured in every possible way. When medical aid cannot be procured, blood should be freely taken from the arm by any person competent to do so. Cold water should be dashed on the head, the legs placed in pretty warm water, and blisters or mustard poultices applied between the shoulders. In the mean time 8 or 10 grs. of calomel may be administered, and its action promoted by the use of saline purgatives and stimulating clysters. When these means prove successful, the remainder of the treatment may consist in the administration of mild purgatives and diaphoretics, avoidance of stimulating food or drinks, and of other like exciting agents.

Prev., &c. The premonitory symptoms of apoplexy are *giddiness*, *pain and swimming in the head*, *loss of memory*, *drowsiness*, *noises in the ears*, *specks floating before the eyes*, *nightmare*, *frightful dreams*, *laborious respiration*, &c. When any of these symptoms occur (especially in free livers), aperient medicines and a light diet should be at once had recourse to, and wine, beer, and spirits avoided as the most dangerous poisons If the symptoms increase or continue, active purgation, a still lower diet, and even bleeding may be had recourse to. By attending to the admonitions of nature, many cases of apoplexy may be prevented. Short, robust, and plethoric persons, having short, thick necks, are universally accounted the most liable to apoplexy; in them the fit generally comes on without warning, and when once attacked with this malady they are especially liable to the same again. But it must be recollected that the possessor of no particular constitution or temperament, to whatever class it may belong, enjoys immunity from the attacks of apoplexy, a disease more fatal among Englishmen than the natives of other countries.

APORETINE. One of the three resins obtained from *rhubarb* by Schlössberger and Dœpping. It is a black, glossy mass, slightly soluble in alcohol, ether, and water; and very soluble in potassa and ammonia.

APOSEPEDIN. A peculiar crystallizable substance obtained from putrid cheese.

APOZEM. Syn. *Apozema*,—Lat. An old pharmaceutical name for a decoction. The term is still applied on the Continent to some preparations (chiefly magistral,) of this class. See *Decoctions*.

APOZEM (Anticolic). Syn. *Degland's Colic Mixture; Apozema Anticolicum*,—Lat. *Prep.* Take of *senna leaves*, 2 oz.; *boiling water*, 1 pint; simmer gently to 16 fl. oz.; press out the liquor, add *sulphate of soda*, 1 oz.; *syrup of buckthorn*, 2 oz., and strain through flannel. By glassfuls in lead colic, or after poisoning by lead.

APOZEM (Antidartrous). Syn. *Decoction of Bitter Sweet; Apozema Dulcamaræ*, —Lat. *Prep.* (Trousseau and Reveille.) *Dulcamara*, 1 dr.; *water*, 16 oz.; boil to 9 oz.; and strain. To be taken in three doses during the day. Every other day the quantity is to be increased until 12 dr. or even two oz. are taken daily, "so that the patient may begin to feel dryness of the throat, and some disorder of vision and digestion;" and "continue at this quantity

for several weeks in succession." In obstinate skin diseases.

APOZEM (Antiscorbutic). Syn. *Apozema Antiscorbuticum*,—Lat. *Prep.* (P.C.) *Roots of burdock, patience*, (rumex patientia,) and *horse-radish*, fresh *leaves of scurvy grass*, fresh *water-cress*, and fresh *buckbean leaves* (menyanthes), of each, 1 oz.; *boiling water*, 5 pints; infuse 2 hours, strain (with pressure), and after repose decant the clear portion. By wine-glassfuls, 3 or 4 times daily; in scurvy, &c.

APOZEM (Diuretic). Syn. *Apozemo Diureticum*,—Lat. *Prep.* 1. Take of *dried roots of asparagus, butcher's broom, fennel, parsley*, and *smallage*, of each 96 grs.; (or *aperitive species*, 1 oz.;) *water* 32 oz.; boil to 19 oz.; and add *oxymel of squills*, 3 oz. By wineglassfuls; in dropsies.

2. *Five diuretic roots*, (aperitive species,) 1 oz,; *boiling water*, 16 oz.; infuse half an hour, strain, and add, *powdered nitre*, ½ dr.; *syrup of the* 5 *roots*, 1 oz. *Dose.* A wine-glassful, as last. See *Swiss Apozem.*

APOZEM (Emetic). Syn. *Apozema Emeticum*,—Lat. *Prep. Emetic tartar*, 2 grs.; *ipecacuanha wine*, 1 dr.; *veal broth* or *weak barley-water*, 1 pint. By wine-glassfuls till it operates.

APOZEM (Emeto-cathartic). Syn. *Apozema Emeto-catharticum. Prep.* 1. (*Eau de Trèvez.*) *Tartar emetic*, 1 gr.; *Epsom salts*, 1 oz.; *water*, 1 quart; dissolve. A wine-glassful occasionally, until it operates.

2. *Emetic tartar*, 1 gr.; *Glauber salts*, 1 oz,; *veal broth*, 1 pint; as last.

3. For the *salts* in the above forms use an equal weight of *phosphate of soda*, and *sherry*, 1 tablespoonful.

4. *Emetic tartar*, 1 gr.; *bitartrate of potassa*, 1 oz.; *barley-water*, (boiling,) 1 pint; *syrup of orange peel*, 2 oz.; as last. The above are excellent diaphoretic purges; the last one is pleasant tasted, and the third far from disagreeable.

APOZEM (Febrifuge.) Syn. *Apozema Febrifugum*,—Lat. *Prep.* 1. From *cinchona bark*, 1 oz.; *water*, 1 pint; boil 15 minutes, and strain.

2. *Cinchona bark*, 1 oz.; *vinegar*, (good,) ¾ oz.; *water*, 1 pint; boil 10 minutes, and add *syrup of orange peel*, 2 oz.

3. *Willow bark*, ¾ oz.; *horse-chesnut bark*, ½ oz.; *calamus root*, ¼ oz.; *cloves*, 1 dr.; *water*, 1 pint; boil to 15 oz.; adding the *cloves*, (bruised,) towards the end. *Dose.* Of each, a wine-glassful, in agues and fevers.

APOZEM (of Feltz.) Syn. *Tisane of Feltz; Apozema dictum de Feltz. Prep.* (P.C.) *Sarsaparilla*, 64 parts; *tersulphuret of antimony*, (in powder,) 80 parts; *isinglass*, 10 parts; *water*, 2000 parts; boil to one half, and strain. A wine-glassful, 3 or 4 times daily, in skin diseases. The common practice is to tie up the antimony in a small muslin bag.

APOZEM (Purgative). Syn. *Apozema Purgans*,—Lat. *Prep.* 1. *Broth made of herbs*, 6 oz.; *sulphate of soda* or of *magnesia*, ½ oz. to 1 oz.; dissolve. To be taken at once, or twice, or by wine-glassfuls till it operates.

2. *Veal broth*, ½ pint; *phosphate of soda*, ½ oz. to 1¼ oz.; as last. Taste, resembles broth containing common salt. By glassfuls till it operates.

3. (*Apozem Dictum Ptisana Regalis*,—P.C.) *Aniseed* and *cinnamon*, of each, 1 dr.; *senna, fresh chervil*, and *sulphate of soda*, of each 4 dr.; *one lemon*, sliced; *water*, 1¾ pint; macerate 24 hours, stirring occasionally, strain, press, and filter. As last. (See above.)

APOZEM (Sudorific). Syn. *Apozema Sudorificum*,—Lat. Compound decoction of Guaicum.

APOZEM (Tænifuge). Syn. *Apozema Tænifugum*,—Lat. Fresh *bark of the root of wild pomegranate*, 2 oz.; *water*, 32 oz.; boil for 1 hour, and add, *compound syrup of wormwood*, 3 oz. In tapeworm. *Dose.* One or two wine-glassfuls every half hour; the patient having taken only a broth dinner the day before, and a cup of chamomile or germander tea on going to bed. Three hours after the last dose of the apozem, "he must swallow, at one draught, 2 oz. of *syrup of ether*, and an hour afterwards, a *white looch*, containing 3 drops of *croton oil.* This plan must be followed three times in 9 days." (Trousseau and Reveille.)

APOZEM (Swiss). Syn. *Apozema Diureticum*,—Lat. *Prep.* Fresh *cow's urine*, 22 oz.; warm it in a water bath, to redissolve the deposit which forms on cooling, add *fennel water*, 1½ oz., and filter. To be taken by glassfuls in the course of the day, sweetened with *syrup of gum*, of *orange peel*, or of *strawberries.* In dropsies and chronic diseases of the liver.

APOZEM (Vermifuge). Syn. *Worm Tea; Apozema Vermifugum*,—Lat. *Prep. Senna*, and *Indian pink-root*, of each, ½ oz.; *manna*, 1 oz.; *boiling water*, 16 oz.; infuse 1 hour in a covered vessel, frequently stirring, and strain. As a vermifuge for children. *Dose.* For a child 2 or 3 years old, 1 to 2 tablespoonfuls; for an adult, 2 wine-glassfuls to a ¼ pint or more; repeated

morning and evening, for several days. Sometimes a mercurial or calomel pill is taken over-night, and the infusion in the morning.

APPENSA. Substances suspended from the neck as charms or amulets. Their action, if any, depends on their exciting the imagination and keeping up the courage and spirits of the wearer.

1. *Root of vervain* hung round the neck, by *a guard of white riband*, for *scrofula;* but the usual medicines must be exhibited during the same period.

2. A *root of peony* suspended to the neck in *epilepsy;* its use being accompanied with that of active cathartics.

3. Some *magnes arsenicalis*, or *camphire* (camphor), hung to the neck so as to reach the pit of the stomach, to guard against *contagion.*

4. A little *argentum vivum*, (quicksilver,) placed in a small leathern bag, and suspended from the neck so as to hang on the breast, as a prophylactic for *itch* and *vermin.* See *Amulets, &c.*

APPETITE. The sensations of hunger and thirst are seated in the stomach, and are necessary to the existence of the body in a state of vigour and health. They are, however, frequently disordered and altered from their normal condition, by diseased action of the stomach or nervous system, or from vicious habits. A healthy appetite for food, may usually be regarded as a most certain indication that nature requires a supply; but in the indulgence of this appetite, certain regulations should be observed, and a boundary put to mere animal gratification. By slowly eating and thoroughly masticating or chewing the food, the stomach becomes gradually distended, and the individual feels himself satisfied only after he has taken a quantity sufficient for the nourishment of his body; but, on the contrary, if the food is swallowed too rapidly, and without proper mastication, it presses heavily and roughly against the sides of the stomach, and induces a sensation of fulness, before a sufficient meal to meet the continual demands of life has been made: the consequence is that hunger soon returns, and the party must either have recourse to frequent feeding, or suffer the consequences of imperfect nutrition. Labour and exercise, within certain limits, promote the healthy functions of the stomach and bowels, through the action of the muscles of the abdomen increasing the peristaltic motion of those viscera. An enormous appetite in persons leading a sedentary life, is generally indicative of the food passing off imperfectly digested, or of the coats of the stomach being in an unhealthy state. More food is required in winter than in summer, in consequence of the greater radiation of the heat of the body; and hence the increase of appetite which is usually an accompaniment of that season. In persons who lead a more sedentary life in winter than in summer, the reverse is, however, frequently the case; the want of exercise producing a corresponding loss of appetite.

Deficiency or *loss of appetite*, generally arises from disordered stomach, but is sometimes symptomatic of other diseases. In most cases it may be improved by *exercise* and the occasional use of *mild aperients*, and especially of *saline purgatives. Chalybeates* and *bitter tonics* will also prove advantageous. A *piece of rhubarb*, chewed an hour before dinner, is employed by some persons to create an appetite; others suck 2 or 3 *ginger lozenges*, or take a small glass of *bitters*, for the same purpose. One or two 4-grain *compound aloes pills* (Ph. L.) taken in the middle of the morning, have been strongly recommended, under the name of *dinner pills.* Among "heavy drinkers," a gradual reduction of the quantity of the strong liquors which they consume, is generally followed by a restoration of the appetite and digestive powers. The excessive use of liquors, (especially of spirituous, fermented, or warm ones,) is always prejudicial. Drunkards are particularly subject to defective appetite, and "teetotallers" and water drinkers to voracity, from this cause.

Depraved appetite, or a desire for unnatural food, as chalk, cinders, dirt, soap, tallow, &c., when an idiopathic affection or depending on vicious taste or habits, (as in childhood,) may be treated by admixing *very small doses* of tartar emetic or ipecacuanha with the objectionable food or articles. When symptomatic of *pregnancy*, a plentiful supply of nutritious food, including the "red meats," with a little good malt liquor, may be adopted with advantage; when symptomatic of *chlorosis*, to this diet may be added, the use of chalybeate tonics, and sea or tepid bathing; when of *dyspepsia*, a light diet, bitter tonics, free exercise, fresh air, and cold bathing, will generally effect a cure.

Insatiable appetite, (canine appetite, voracity; bulimia;) is generally symptomatic of pregnancy, or worms, or diseases of the stomach and other viscera, but sometimes exists as a separate disease. When it occurs in childhood, worms may be suspected, and

vermifuges administered. In adults, the common cause is imperfect digestion, arising from stomach complaints or gluttony, when the languor and gnawing pains of disease are mistaken for hunger. In this case, the diet must be regulated and the bowels kept gently relaxed with mild aperients, and tonics, (bark and steel,) or bitters, (orange peel and gentian,) may be administered. When *pregnancy* or vicious habits are the cause, the treatment indicated under "*depraved appetite*" may be adopted.

APPLE. Syn. *Pomum*,—Lat. This well known fruit is the product of the cultivated varieties of the *pyrus malus*, (Linn.) or *crab apple* of our hedges; a tree of the *nat. ord.*, Rosaceæ. The *rennet apple* (*poma renettia*,—P.C.) is the one ordered to be used in pharmacy.

In a *dietetic* point of view, the apple, when perfectly ripe, is a wholesome and pleasant fruit, and may be eaten either raw, roasted, or boiled. The *skin* and *pips*, being indigestible, should be rejected. The more aromatic and flavoured varieties are well adapted for dessert fruit, and are especially useful to persons of a full or confined habit of body.

APPLES (à la Cremona). The best *dressing apples* are cut into small squares, strewed over with about ½ their weight of *powdered lump* or *good moist sugar*, and a few strips of *lemon peel*, and after remaining covered up until the next day, lightly dropped into a small stew-pan, with three or four tablespoonfuls of *cider* or *perry*, and simmered very gently until they become clear. They are then taken out, and when cold, built in a wall-like form round a small china or glass dish, and the syrup being poured into the middle, the strips of lemon are placed on the top.

APPLES (Dried). *Prep.* 1. (*Baked Apples of the Confectioners.*) The *apples* are placed in a cool oven, 6 or 7 times in succession, and flattened each time by gentle pressure, gradually applied, as soon as they are soft enough to bear it; after which they are taken out, and as soon as cold put on clean dishes or glass plates. The sour or tart variety of apples is the best for baking. If the process is well managed, the appearance of the prepared fruit is very rich, and the flavour delicious.

2. (*American Dried Apples of Commerce.*) The *apples* (or pears), after being peeled, are cut into eighths, the cores extracted, and then placed in the sun or in a kiln or oven until they are quite dry and hard. In this state they may be kept for two or three years. For *use*, the fruit is washed in water, and after being drained, boiling water is poured on it; after standing for a few minutes, it may be used as fresh fruit. The water it has soaked in is an excellent substitute for the fresh juice, and should be poured into the pie-dish with the apples. In this way a cheap and constant supply of apples or pears may be had *all the year round*, which we can assert from experience is almost equal for pies, puddings, tarts, &c., to the fresh gathered fruit.

APRICOT. Syn. *Apricock; Armeniacum Malum, Præcocia*,—Lat. The fruit of the prunus armeniaca, (Linn.;) a tree of the *nat. ord.*, Rosaceæ. Apricots are principally eaten as gathered, but are also *dried* and *candied*, and made into a jam. See *Fruit, &c.*

AQUATINTA. Syn. *Aquatint.* A species of *etching* on copper, producing an effect resembling a drawing in Indian ink. It is performed by sifting powdered asphaltum or lac resin on the plate, previously slightly greased, and after shaking off the loose powder, gently heating it over a chaffing dish; on cooling, the lights are covered with turpentine varnish coloured with lamp black, by means of a hair pencil, and a rim of wax being placed round the plate, a mixture of aquafortis and water is poured on it, and allowed to remain for 5 or 6 minutes, when it is poured off, the plate dried, and recourse had to the pencil as before. The process of stopping and etching is repeated again and again, until the darkest shades are produced. Sometimes, instead of asphaltum or resin, the plate is covered with a solution of gum lac in spirit of wine, which on drying, leaves innumerable cracks or minute fissures through which the acid acts on the plate.

ARABESQUE. Syn. *Moresque.* The ornamental designs of this class, now so much employed in cloth and leather binding, are produced by the pressure of hot plates or rollers having the pattern engraved on them.

ARABINE. Syn. *Soluble Gum.* The pure soluble principle of gum acacia. *Prep.* Dissolve *white gum arabic* in pure water, filter, and add *alcohol* as long as it produces curdiness; collect the precipitated matter, and dry it by a gentle heat. Very soluble in water; basic acetate of lead, alcohol, and ether, precipitate it from its solutions. It possesses little advantage over the best gum arabic.

ARCHIL. Syn. *Archel, Orchil, Archilla, Orchilla.* The archil of commerce is met with in three different states—in *lumps* or *powder*,—as a *liquid paste*,—and as a thin

liquid dye or *stain* of more or less intensity. The *archil* or *orchil* of the shops (*orchil liquor*) is under the last form, and is distinguished as either *blue* or *red archil*. The *blue variety* is prepared by steeping for some time the bruised or coarsely ground lichen, (*rocella tinctoria*, or *r. fuciformis*,) in a mixture of *stale urine* or *bone spirit*, and *lime* or *milk of lime*, or in any similar *ammoniacal solution*, placed in covered wooden vessels in the *cold;* the process being repeated until all the colour is extracted. The *red variety* is prepared with a similar solution, but the steep is made in earthen jars placed in a *room heated by steam*, technically called a "*stove*." Both kinds have a disagreeable putrid ammoniacal smell, and merely differ in the degree of their red or violet tint; the addition of a small quantity of lime or alkali to the one, or of an acid to the other, immediately bringing them both to the same shade of colour.

Prop. The colouring matter of archil is soluble in water, alcohol, urine, ammoniacal and alkaline lyes, and weak acid liquors; alkalies turn it blue, acids red; alum gives with it a brownish-red precipitate, and solution of tin a red one; the alcoholic solution gradually loses its colour when excluded from the air.

Uses, &c. It has been employed to tinge the spirit used to fill the tubes of thermometers, and to stain paper, wood, &c. The aqueous solution stains marble, in the cold, of a beautiful violet colour, of considerable permanence when not exposed to a vivid light. "Marble thus tinged preserved its colour unchanged at the end of two years." (Dufay.) Its principal use is, however, in dyeing. By proper management it may be made to produce every shade of *pink* and *crimson* to *blue* and *purple*. Unfortunately, although the hues it imparts to silk and wool possess an exquisite bloom or lustre, they are far from permanent, and unless well managed, soon decay. It is hence, generally, only employed combined with other dye-stuffs, or as a finishing bath to impart a bloom to silk or woollens already dyed of permanent colours. In employing it, it is added to *hot water* in the required quantity, and the bath being raised to nearly the boiling point, the materials are put in and passed through, until the desired shade is produced. A mordant of *alum* and *tartar* is sometimes used, but does not add to the permanence of the colour. *Solution of tin* added to the bath, increases the durability, but turns the colour more to the scarlet. (Hellot.) *Milk of lime* or *salt of tartar* is added to darken it; *acids* or *solution of tin* to redden it. *A beautiful crimson red* is obtained by first passing the stuff through a *mordant of tin and tartar*, and then through a *bath of archil* mixed with a little *solution of tin*. By proper management of this dye, lilacs, violets, mallows, rosemary-flowers, soupes au vin, agates, and other shades may be produced, on silk or cloth, either alone or in conjunction with other dyes to modify it. ½ *lb.* of solid archil or its equivalent in a liquid form will dye 1 to 2 *lb.* of cloth. *Herb-archil*, it is asserted, will bear boiling, and gives a more durable tint than the other lichens, especially with solution of tin. (Hellot.) Recently Mr. Lightfoot has patented a process for dyeing with archil with the aid of *oil*, after the manner followed for producing Turkey red on cottons; but the advantages of this plan have not yet been developed.

ARCHIL (Factitious). 1. A colouring matter resembling archil is prepared by fermenting together a mixture of *onions* (in a state of incipient putrefaction,) with about 1-3d or 1-4th their weight of *carbonate of potash* and some *ammonia*, and adding, after some days, a fourth of the weight of the *potash* used in *sugar of lead*. The details of the process essential to its success, are, however, kept a secret.

2. *Extract of logwood* dissolved in *juice of elderberries* and *putrid urine*, with the addition of a little *pearlash*. Used to stain wood.

ARICINE. Syn. *Aricina; Cusconine, Cusconina; Cuscocinchonia.* An alkaloid discovered by Pelletier and Coriol in *arica* or *cusco bark*.

Prep. Boil the *bruised* or *coarsely powdered bark* in *water acidulated with sulphuric acid;* repeat the process a second and a third time; concentrate the mixed liquors, and precipitate with *ammonia*. Collect the powder on a filter, agitate it repeatedly with ether, decant the resulting solutions, and gently evaporate. The residuum may be further purified by re-solution and crystallization from hot alcohol.

Prop., &c. Crystallizable; soluble in ether; non-volatile; nitric acid turns it green; its basic sulphate or disulphate is a non-crystallizable, tremulous jelly; in other respects it resembles cinchonine; with the acids it forms salts. (Journ. de Pharm., 1829.) Guibourt doubts its existence as a distinct principle. (*Hist. Nat. des Drogues*, 1850.) Aricine has not been applied to any useful purpose.

ARNICINE. This name has been applied to two substances.

Arnicine (of Pfaff). The resinous matter

extracted by *alcohol* from the *roots* and *flowers* of *mountain arnica*, and in which their acridity appears to reside.

Arnicine (of Bastick). Syn. *Arnicina, Arnicia. Prep.* 1. (Bastick.) From the *flowers* by a similar process to that by which he obtains lobelina.

2. From the *flowers* (or root) *of arnica*, as directed under *Aricina. Prop.* Bitter; acrid; crystallizable; scarcely soluble in water; soluble in alcohol and ether; forms salts with the acids. Its hydrochlorate is crystallizable. (Pharm. Journ., x, 386.) Its physiological properties and dose, have not as yet been determined.

ARRACK. Syn. *Arac, Arack, Rack; Spiritus Oryzæ, Sp. Succi Palmæ*,—Lat. A spirituous liquor distilled from the fermented juice (*toddy, palm wine*,) of the cocoa-nut, palmyra, and other palms, and the fermented infusion of rice in husk, (*rice beer.*) Some varieties are pleasant flavoured and as wholesome as the other spirits of commerce, whilst some have a strong and somewhat nauseous flavour and odour, depending on the presence of a portion of a volatile oil corresponding to that of corn spirit. The inferior qualities are regarded as more heating and apt to disagree with the stomach than either gin, brandy, rum, or hollands. Arrack is imported from the East Indies, and in this country is chiefly used to make punch. When sliced pine apples are put into good arrack, and the spirit kept for some time, it mellows down and acquires a most delicious flavour, and is thought by many to be then unrivalled for making nectarial punch.

ARRACK (Factitious). Syn. *Mock Arrack, British do., Vauxhall Nectar. Prep.* 1. Good pale *Jamaica rum*, 1 pint; *flowers of benzoin*, 12 grs.; dissolve.

2. *Pale rum*, 6 galls.; *flowers of benzoin*, 1 *oz.*; *tincture of balsam of tolu*, (good,) ¾ *oz.*; *sliced pine apple*, ½ *oz.*; digest with occasional agitation, for a month; then add *raw milk*, ¼ pint; agitate well for 15 minutes, and rack in a week. Both sold for arrack.

ARROW-ROOT. Syn. *Maranta*,—Ph. L. E. & D. The commercial name of the starch or fecula obtained from the tubers of the *maranta arundinacea*, (Linn.;) "commonly, but improperly called arrow-root." (Ure.) It is imported in tins, barrels, and boxes, from all the West India Islands; and from Calcutta and Sierra Leone.

Prep. The fecula is extracted from the tubers when they are about 10 or 12 months old, by a process very similar to that by which the farina is obtained from potatoes.

Pur. A large portion of the arrow-root of the shops consists either wholly or in part of the fecula or farina obtained from potatoes, or is more or less mixed with sago-meal or rice-meal. Potato starch is known in commerce as "*farina*" or "*British arrow-root*," or simply "*arrow-root*," whereas, the genuine kind is always described as "*Bermuda*," "*St. Vincent*," "*St. Kitts*," or at least as "*West Indian arrow-root.*" As the mere addition of an adjective is no proof of quality, no sample should be bought without a proper examination. Arrow-root "is reckoned more nourishing than the starch of wheat or potatoes, and is generally also freer from peculiar taste or flavour." (Ure.) The substitution of the inferior farinas for genuine arrow-root, is therefore not only fraudulent on account of their inferior value, but is reprehensible in a hygienic point of view. Genuine arrow-root is—1. Of a dull dead-white colour, free from glistening particles.—2. Tasteless and odourless, and preserves these properties when mixed with boiling water.—3. Triturated with twice its weight of concentrated hydrochloric acid, it yields an *opaque* paste, and no odour is evolved; if a transparent paste is immediately formed, or an earthy odour or one resembling beans or rushes is perceived, it contains either wheat or potato starch. (Scharling.)—4. Boiled with water and sulphuric acid similar results occur. (Lampadius.)—5. Triturated with double its weight of a mixture of equal parts of aquafortis and water, it does not become gelatinous and viscid in *less* than 15 minutes. The other starches (except *rice-starch*,) thus treated, rapidly form a stiff and tenacious jelly. 5% of adulteration may be thus detected. (Scharling.)—6. Under the microscope it exhibits glistening irregular ovoid particles, smooth on the surface and free from streaks and furrows. Rice-meal acts like arrow-root with aquafortis, but its sharp, spicular, horn-like particles are instantly detected by the microscope.

Uses, &c. It forms an agreeable, non-irritable article of diet for invalids and children, in the form of cakes, biscuits, or puddings, or boiled with milk or water and flavoured with sugar, spices, lemon juice, or wine, at pleasure. For young children a little caraway or cinnamon water is to be preferred. It is especially useful in irritation or debility of the stomach, bowels, or urinary organs, and in all cases in which a demulcent or emollient is indicated. It must not, however, be employed to the

entire exclusion of other food, as, being destitute of the nitrogenous elements of nutrition, it is incapable alone of supporting life. *Arrow-root jelly* is prepared by first rubbing the powder up with a very small quantity of cold water, and then gradually adding the remainder *boiling*, stirring well all the time. Beef-tea, veal broth, or milk, may be used instead of water. Some persons boil it for a few minutes. This jelly, flavoured with a little genuine port wine and nutmeg, is almost a specific in cases of simple diarrhœa arising from habit or debility.

ARROW-ROOT (Brazilian). Cassava starch or tapioca meal.

ARROW-ROOT (East Indian). Curcuma starch; from the tubers of the *curcuma angustifolia*, or narrow-leaved turmeric.

ARROW-ROOT (English). Potato starch.

ARROW-ROOT (Portland). From the *arum maculatum* or wake-robin.

ARROW-ROOT (Tahiti). Tacca starch or Otaheite salep; from the *tacca oceanica*.

ARSENIATE. Syn. *Arsenias*,—Lat. The arseniates are all poisonous. Most of the *metallic arseniates* may be formed by adding a solution of a soluble salt of the metal to another of an alkaline arseniate, as long as a precipitate falls; which must be collected, washed, and dried. The *alkaline arseniates* may be prepared by adding the base or its carbonate to a solution of the acid, to alkaline reaction, and then evaporating and crystallizing. The *arseniates of the alkalies* are soluble in water; those of the *earths* and *metals* insoluble, except in acids.

ARSENIC. Syn. *Arsenick; Arsenicum*,—Lat. The brittle, gray-coloured metal forming the base of the white arsenic of commerce. Arsenic is peculiar to the mineral kingdom. The statements of Orfila, Couerbe, and Devergie, that the bones and muscles of healthy men, horses, oxen, and sheep, contain arsenic, has been satisfactorily disproved by the more recent researches of Danger and Flandin, Chevalier, Dr. G. O. Rees, the Commissioners of the French Academy, and several others. The *metallic arsenic of commerce* is obtained by roasting *arsenical pyrites*, (*mispickel*,) in earthen tubes, or tubular earthen retorts; the arsenic sublimes, and sulphuret of iron remains behind. On the small scale it is prepared by sublimation from a mixture of *arsenious acid* and *charcoal* or *black flux*.

Prep. 1. (*Arsenicum Purum*,—Ph. D.) *White oxide of arsenic* (of commerce), 2 dr.; place it at the sealed end of a hard German-glass tube (½ × 18 inches), cover it with about 8 inches of *dry* and *coarsely powdered charcoal*, and raise the portion of the tube containing the latter to a red heat, whilst a few ignited coals are placed beneath the oxide to effect its slow sublimation. The sublimed metal will gradually attach itself to the inside of the tube at its cool extremity.

2. Mix *arsenious acid*, 1 part; with *black flux*, 2 parts; and expose the mixture to a red heat in a *Hessian crucible*, over which is luted a deep empty crucible or earthen tube to receive the metal; the upper one being kept cold.

Prop. Very brittle; lustre highly metallic; colour, steel-gray; texture, crystalline; crystals, rhombohedrons; sublimes at 356° Fahr. without fusion, with an alliaceous odour, (and slowly at lower temperatures;) in close vessels unaltered, but when exposed to the air yielding fumes of arsenious acid; slowly oxidized and dissolved by boiling water, but "may be preserved unchanged in pure water," (Fownes;) rapidly tarnishes in the air; with oxygen it forms acids, but no basic oxide. *Sp. gr.* 5·6 to 5·9. It combines with the metals in a similar manner to sulphur and phosphorus, which it resembles (especially the latter) in many respects. These compounds (*alloys*,) are termed *arseniurets* or *arsenides*.

Uses. With copper, arsenic forms a white alloy, (*Packfong*,) and it is added to some other metals and alloys to increase their whiteness, hardness, and fusibility. In the metallic state it is inert; but from its great affinity for oxygen, it rapidly becomes oxygenized and poisonous; and acts as a powerful poison when swallowed. See *Arsenious Acid*.

ARSENIC (Bromide of). Syn. *Sesquibromide of Arsenic; Arsenici Bromidum*,—Lat. *Prep.* (Serullas.) Add *dry arsenic*, (in powder,) cautiously, and in small quantities at a time, to *pure bromine*, as long as light continues to be emitted; then distil into a well-cooled receiver. *Prop., &c.* Solid below 68° Fahr.; boils at 428°; when liquid it is yellowish.

ARSENIC (Chlorides of). *Prep.* 1. (*Protochloride*,—Dumas.) *Arsenious acid*, 1 part; *concentrated sulphuric acid*, 10 parts; mix in a tubulated retort, heat to 212°, and project in, gradually, small quantities of *chloride of sodium;* collect the newly-formed chloride in a well-cooled receiver. It may be rendered anhydrous by distillation from concentrated sulphuric acid.

2. (*Terchloride of Arsenic, Chloride of do.; Sesquichloride of do., Butter of do.; Arsenici Terchloridum, Arsenici Chloridum*,

—Lat.) *Prep. a.* (Fownes.) From a mixture of *arsenic*, 1 part, and *bichloride of mercury*, 2 parts, distilled together.

b. Boil *arsenic* for some time in *hydrochloric acid*, to which a little *nitric acid* has been added; then concentrate cautiously, and distil.

Prop., &c. Terchloride of arsenic is a colourless, volatile, highly poisonous liquid, decomposed by water into arsenious acid and hydrochloric acid. It has been employed as a caustic in cancer and venereal warts.

ARSENIC (Teriodide of). Syn. *Iodide of Arsenic, Ioduret of do., Hydriodate of do.; Arsenici Iodidum, &c*,—Lat. *Prep.* 1. (Biett.) *Finely pulverized metallic arsenic*, 16 parts; *iodine*, 100 parts; mix, and heat them in a glass tube or retort until the iodide sublimes, when it must be collected and preserved in a well-stopped phial.

2. (W. Procter.) *Arsenic*, in fine powder, 1 part; *iodine*, 5 parts; triturate together, place the mixture in a small flask or retort just large enough to contain it, and apply a gentle heat until liquefaction is produced, avoiding the formation of iodine vapour; when no odour of iodine is perceptible, and the mass assumes a reddish-yellow colour, and crystallizes on the sides of the vessel, the operation is complete, without having recourse to sublimation.

3. (Wackenroder.) *Arsenic*, in powder, 1 part; *iodine*, 6 parts; *water*, 120 parts; digest together in a flask, evaporate by a gentle heat, (but as quickly as possible,) and as soon as the mass begins to solidify, the temperature must not exceed 86° Fahr.

4. (Plisson.) *Arsenious acid*, 3 parts; *iodine*, 10 parts; *water*, 110 parts; digest together until no odour of iodine is perceptible, then decant, evaporate to dryness, and sublime as before.

Prop., &c. An orange-red, crystallizable solid, soluble in water, and highly volatile and poisonous; its aqueous solution yields the iodide unchanged by rapid evaporation. As a *medicine* it combines the properties of both arsenious acid and iodine. It has been employed in obstinate skin diseases (lepra, impetigo, herpes, lupus, psoriasis, &c.), and in real or simulated cancer.—*Dose.* $\frac{1}{12}$th of a grain (in pills) gradually increased to $\frac{1}{4}$th or even $\frac{1}{3}$d of a grain. (A. T. Thomson.) *Externally*, $2\frac{1}{2}$ grs., to lard, 1 oz.; of which 1 dr. may be used at a time. (Biett.)

ARSENIC (Oxides of). The only definite compounds of arsenic with oxygen, are *arsenious acid*, and *arsenic acid*.

ARSENIC (Sulphurets of). Seven combinations of sulphur and arsenic are noticed by Gmelin; but only three of these deserve notice here—

ARSENIC (Bisulphuret of). Syn. *Sulphide of Arsenic, Bisulphide of do., Red Sulphuret of do., Proto-sulphuret of do., Red Arsenic, Realgar; Arsenici Bisulphuretum, A. Sulphuretum Rubrum, Arsenicum Rubrum, &c.*,—Lat. This substance is found native in some volcanic districts; but that of *commerce*, is prepared by distilling (*in an earthen retort*,) arsenical pyrites, or a mixture of sulphur and arsenic, of orpiment and sulphur, or of arsenious acid, sulphur, and charcoal, in the proper proportions.

Prop., &c. A fusible, volatile substance; scarlet or ruby red in mass, but orange-red in powder, by which it is distinguished from cinnabar; *sp. gr.*, 3·3 to 3·6. (Ure.) Its chief use is as a pigment and a component of fireworks. The factitious sulphuret has not the rich colour of the native mineral, whilst it is much more poisonous. It is improved by resublimation.

ARSENIC (Tersulphuret of). Syn. *Tersulphide of Arsenic, Yellow Sulphuret of do., Sesquisulphuret of do., Yellow Arsenic, King's Yellow, Sulpharsenious Acid; Arsenici Tersulphuretum, A. Sesquisulphuretum, Arsenicum Flavum, &c.*,—Lat. This sulphuret, like the last, is found ready formed in nature, and is prepared artificially, by sublimation, from a mixture of arsenious acid and sulphur.

Prop., &c. Form, yellow crystalline lumps or fine golden yellow powder; volatile; fusible; very soluble in pure alkalies. It is distinguished by the last property from sulphuret of cadmium; and from tersulphuret of antimony by being insoluble in hydrochloric acid. The factitious sulphuret (*king's yellow*,) of the shops often contains 80% to 90% of white arsenic. *Sp. gr.* (native,) 3·44 to 3·60. It is extensively used as a dye, as a yellow pigment, an ingredient in fireworks, and in some depilatories. Silk, woollen, or cotton goods soaked in a solution of pure orpiment in ammonia, and then suspended in a warm apartment or stove-room, rapidly lose their ammonia, and become permanently dyed of a superb yellow colour. The native sulphurets (both red and yellow) are much less soluble, and hence, less poisonous, than those prepared artificially. They also possess the richest colour, and are, therefore, preferred by artists.

ARSENIC (Pentasulphuret of). Syn. *Persulphide of Arsenic, Sulpharsenic Acid.* When a stream of *sulphuretted hydrogen* is transmitted for some time through a solution of *arsenic acid*, a precipitate of the

pentasulphuret is deposited after some hours' repose. Its formation is accelerated by boiling. It greatly resembles the tersulphuret in its appearance and general properties.

ARSENIC ACID. Syn. *Acidum Arsenicum*,—Lat. This is arsenic in its highest state of oxygenation.

Prep. 1. (Brande.) *Arsenious acid*, (in fine powder,) 2 parts; *nitric acid*, 6 parts; *hydrochloric acid*, 1 part; mix in a tubulated retort, and distil until the liquid acquires the consistence of a thick syrup, then transfer it to a platinum crucible, and cautiously expose it for some time to a dull red heat, to expel the nitric acid.

2. (Liebig.) *Arsenious acid*, 1 part; *concentrated nitric acid*, 6 parts; *hydrochloric acid*, 1 part; as before.

3. Dissolve *arsenious acid* in hot *hydrochloric acid*, and add *strong nitric acid*, until red vapours cease to be evolved, then proceed as before.

Prop., &c. When solid, white, granular, and anhydrous, (that of the shops is commonly of a syrupy consistence, owing to the presence of water;) soluble in 6 parts of cold water, and less of boiling water; solution, sour, and powerfully acid; in both its conditions it absorbs moisture from the atmosphere, and at a high temperature is resolved into oxygen, and arsenious acid which volatilizes. It is distinguished from arsenious acid by—1. Nitrate of silver added to the solution of an arseniate gives a highly characteristic *reddish-brown* precipitate.—2. Nitrate of lead gives a *white* precipitate, and the salts of copper *greenish-blue* ones.—3. Pure lump sugar dissolved in an aqueous solution of this acid, becomes in a few hours of a *reddish* colour and afterwards of a *magnificent purple*.—4. If the suspected liquid is treated with sulphurous acid and boiled for a short time, the arsenic acid loses oxygen and is converted into arsenious acid, which may then be tested for as such. (Wöhler.)

Uses. It has not been employed in an uncombined state either in the arts or medicine; but some of its preparations have been used in both. It is a powerful poison.

ARSENIOUS ACID. Syn. *Teroxide of Arsenic, White Arsenic, White Oxide of Arsenic, Sesquioxide of Arsenic, Commercial Arsenic; Acidum Arseniosum*,—Ph. L. *Arsenicum Album*,—Ph. E. *Arsenici Oxydum Album Venale*,—Ph. D. This is the *arsenic* or *white arsenic* of the shops. It is principally imported from Germany, where it is obtained in the process of roasting the arseniuretted cobalt ores for making zaffre. At Altenburgh it is procured from arsenical iron pyrites, (*mispickel*,) and at Riechenstein from native arsenide of iron. About 900 to 1000 tons are also annually collected in Cornwall, being, principally, a secondary product of the process of roasting the gray copper ores and white mundic. The "*British arsenic works*" in that county, are perhaps the finest in the world. The crude article obtained in this way has to be purified by re-sublimation in suitable iron vessels, before it is fit for sale. It then forms a semi-transparent vitreous cake, which gradually becomes opaque and of snowy whiteness by exposure to the air, and at length acquires a more or less pulverulent state on the surface.

Prep. 1. (*Acidum Arseniosum Purum*,—Ph. D.) Take of *commercial white arsenic*, any quantity; place it in a Florence flask, the neck of which is made to pass into that of a second flask of larger size inverted over it, and apply to the former a regulated heat, by suspending it beneath a semicircular hood of sheet iron, a few inches above a small charcoal fire until the sublimation is complete. This process is unnecessary, as the white arsenic of commerce, in semi-vitreous lumps, having been *twice sublimed*, is necessarily as pure as mere sublimation can make it.

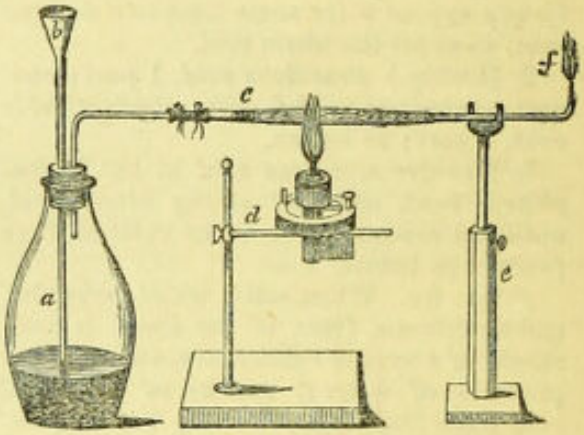
2. (*Prepared White Arsenic; Acidum Arseniosum Præparatum.*) By levigation and elutriation as directed for tersulphuret of antimony.

Prop. Crystals, (obtained by careful sublimation or by cooling a boiling aqueous solution,) transparent, regular octahedrons; when prepared on the large scale, it forms large, glassy, colourless, or yellowish-white, transparent, or semi-transparent cakes or porcelain-like masses, which soon become *opaque* on their exterior, owing to the absorption of a minute quantity of water from the atmosphere, and often friable and pulverulent; odourless; volatilizes at 380° Fahr.; fumes, odourless, unless carbonaceous organic matter be present, when they smell strongly of garlic; *sp. gr.*, 3·5 to 3·8; taste, faintly sweetish, with a slight acidity and astringency, not perceived until some minutes after being swallowed; (hence its dangerous character as a poison;) soluble, (*opaque variety*,) in 80 parts of water at 59° Fahr., (Guibourt;) and in 7·72 parts of boiling water, (Guibourt;) but on cooling to 60°, only about $\frac{1}{3}$d of this quantity continues in solution,—(*transparent variety*,) soluble in 103 parts of water at 59°, and 9·3 parts of boiling water, (Guibourt;) soluble in alcohol, syrups, oils, and spirits, and freely so in

alkaline lyes and hydrochloric acid; organic matter generally impedes its solution; reddens litmus; heated with organic matter it is reduced to the metallic state. Its salts are called *arsenites*.

Pur. It is "entirely sublimed by heat." (Ph. E.) Five grains boiled in 1 oz. of pure water should dissolve without leaving *any* residue. "If 100 grs. be digested in dilute hydrochloric acid, and, when the liquid has cooled, hydrosulphuric acid be added, 124 grains of tersulphuret of arsenic are precipitated." (Ph. L.) The arsenious acid of the shops is frequently adulterated with plaster of Paris, sulphate of baryta, ground bone-ash, or white sand, and is then totally unfit for the purposes to which it is generally applied. To avoid this fraud, it should be purchased in the lump, in which state it is generally nearly pure.

Tests. (When not otherwise stated, it is to be understood that they are to be applied to pure, or nearly pure and colourless solutions.)



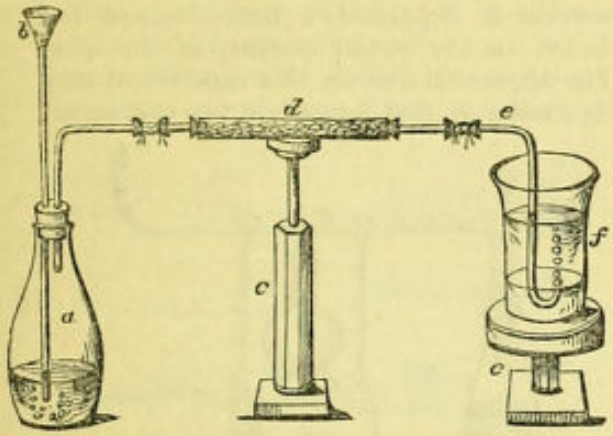
1. *Ammonio-acetate of Copper.* A weak solution of this test gives a very characteristic grass-green, or yellowish-green, precipitate of arsenite of copper (*Scheele's green*,) in solutions of arsenious acid, or of arsenites containing free acid, which, after being washed, is soluble both in nitric acid and ammonia, and is turned *brownish-red* by sulphuretted hydrogen water, *blood-red* by ferrocyanide of potassium, and *yellow* by nitrate of silver.

2. *Ammonio-sulphate of Copper.* Acts under the same circumstances in the same manner as the ammonio-acetate, but is less delicate. Sulphate of copper acts in the same way with neutral solutions of the arsenites.

3. *Ammonio-nitrate of Silver; Hume's Test.* Added, in solution, to a solution of arsenious acid, or an arsenite containing free acid, a well-marked *yellow* precipitate of arsenite of silver is formed, which is soluble in liquid ammonia, in dilute nitric acid, and in solution of nitrate of ammonia. Nitrate of silver produces a similar precipitate in a neutral solution of an arsenite.

4. *Crystallization Test.*—*a.* A very minute quantity of arsenious acid placed in a small tube (*arsenic tube*) and heated in the flame of a spirit lamp, gives a crystalline sublimate, which collects on the cooler portion of the tube, and which, when examined by a pocket lens, is found to consist of sparkling octahedral crystals.—*b.* By evaporating a small quantity of a clear aqueous solution of arsenious acid on a glass plate or watch-glass, similar crystals will also be obtained. In both cases they may be submitted to other tests. A little *boracic acid* may be added before applying this test.

5. *Ellis's Test.* This consists in passing *arseniuretted hydrogen* (obtained in the usual way from the suspected liquid,) through a tube containing *slips of copper-leaf* or *riband*, or still better, *pure oxide of copper*, gently heated, and having the one end drawn to a capillary size, at which the gas may be enflamed and tested. (See Engraving.) If arsenic is abundant in the

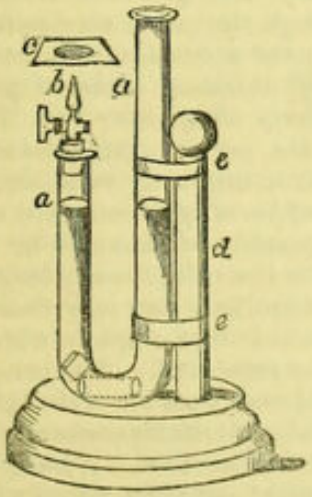


a, Flask containing the suspected fluid, dilute sulphuric acid, and zinc.
b, Funnel.
c, Tube containing the copper-leaf or riband, and heated by the lamp *d*.
e, Support.
f, Capillary end of tube *c*, with the gas enflamed.

gas, the copper will be almost instantly frosted over with a coating of metallic arsenic, and after continuing the heat for a few minutes it will present a beautiful silvery surface, and may then be submitted to further examination. (See *Rensch's Test.*) The slips of copper for this purpose are directed to be prepared by exposure in a clear fire to a dull red heat, and are then to be suddenly thrown into cold water; after which they are to be wiped dry for testing.

6. *Lassaigne's Test.* (Adopted by the *French Academy.*) This consists in passing the *arseniuretted hydrogen* generated in the suspected liquid, through a solution of *nitrate of silver.* (See Engraving.) Black flocculi of metallic silver are deposited, and arsenious acid remains in solution mixed with nitric acid and some arsenide of silver. The filtered liquor, treated with ammonia, will now give a characteristic yellow precipitate of arsenite of silver, or a little dilute hydrochloric acid may be cautiously added to precipitate any remaining nitrate of silver, and the liquid, after filtration,

tested for arsenic either in a Marsh's apparatus, or with liquid tests; or it may be evaporated to dryness, when its arsenious



acid will be converted into arsenic acid by the nitric acid present, and will then be found to give the usual brick-red precipitate of arseniate of silver with a solution of the nitrate of that metal.

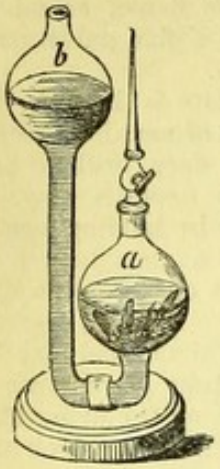
7. *Marsh's Test.* This test depends on the property possessed by nascent hydrogen, of taking the metal from a solution of arsenious acid. Some of the *suspected liquid* is mixed with *dilute sulphuric acid* until strongly acid, and poured upon some *pieces of zinc* previously placed in the apparatus; hydrogen gas is immediately evolved, and if arsenic is present unites with it, forming arseniuretted hydrogen gas, which escapes by the aperture *b*, (see Engraving,) and may be recognised as follows:

a. It possesses a garlic-like smell.

b. It burns with a bluish-white flame, and emits a whitish smoke.

a a, Bent glass tube containing dilute sulphuric acid, zinc, and suspected fluid.
b, Stopcock and jet.
c, Plate of glass to receive the stain.
d, Support.
e e, Bands to keep the tube upright.

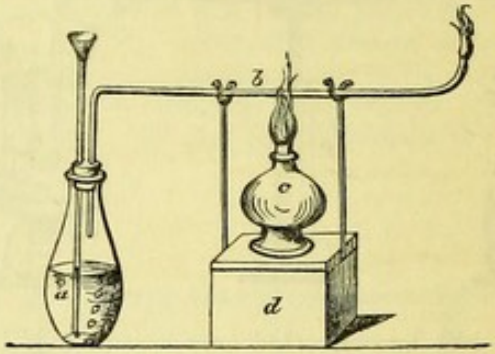
c. When a piece of window-glass, or a white porcelain plate or saucer, is held a short distance *above* the flame, arsenious acid, under the form of a fine pulverulent film is deposited thereon.



d. When the cold plate is held *in* the flame, a blackish deposit of metallic arsenic is obtained, more or less deep, brilliant and glistening. Both these deposits may be obtained simultaneously by holding nearly vertically over the flame a glass tube 8 or 10 inches long, and $\frac{3}{8}$ths of an inch in diameter.

e. A solution of arsenious acid may be obtained by letting the flame play upon 3 or 4 drops of water, placed on the under side of the piece of glass or china, to which the liquid tests may be then applied. Another plan is to apply drops of the liquid tests to the plate as above, and to let the flame play on them successively.

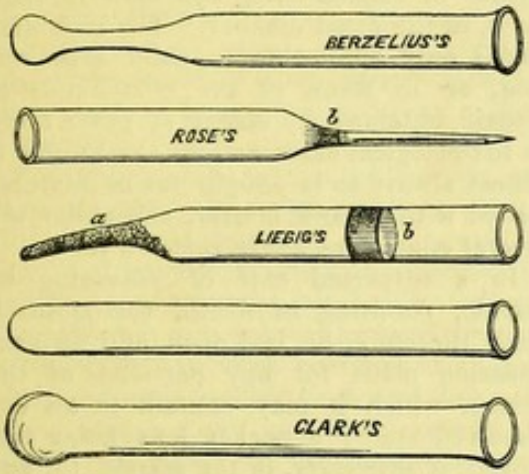
f. The true arsenical spot is of a blackish-brown colour; that of antimony is of a deep black colour, and but feebly lustrous. It is further distinguished from others by—*α.* Treated with *concentrated nitric acid* it instantly disappears, leaving upon the surface of the liquid traces of the metal, which only dissolve on the application of heat. This solution gently and carefully heated, leaves a white residuum, which, when cold, gives, with a *concentrated solution of nitrate of silver*, a dull red precipitate of arseniate of silver.—*β.* The nitric solution (*see* above), treated with a few drops of *sulphurous acid*, and subsequently with *sulphuretted hydrogen*, gives a canary-yellow sulphuret of arsenic, which forms a colourless solution with *ammonia*.—*γ.* The spot when heated is turned orange-red or reddish-brown by *sulphuretted hydrogen*, and is dissolved, as before, by *ammonia*.—*δ.* It is soluble in and removed by *hypochlorite of soda*.—*ε.* Heated by a flame of *pure hydrogen*, an arsenical stain rapidly disappears. A *mixed* stain of *antimony* and *arsenic* does not disappear by the action of the last two reagents, and is shown to contain arsenic by the tests *α* and *β* (above). When hydrochloric acid is present, zinc stains are sometimes formed, but they do not resemble those from arsenic.



Obs. This test admits of application to all liquids, whether colourless or coloured, provided they are not so glutinous as to occasion much frothing during the escape of the hydrogen. Various modifications of the original apparatus have been proposed to obviate this inconvenience; among which, the only one deserving notice consists of a bent tube having two large bulbs blown up-

on it, and fitted with a stop-cock and jet in the usual manner. (See Engr.) In this case the slips or fragments of zinc are put into the lower bulb (*a*). With ordinary care and skill, a simple wide-mouthed bottle, furnished with a tube and cock, will often be found to answer quite as well, or better than more costly apparatus; as the fluid is less liable to froth than in a narrow tube. Even a common quinine or 6 oz. medicine-phial, fitted with a small piece of glass tube or tobacco-pipe for a burner, may be used when no more convenient instrument is at hand. The only precaution necessary to success, is to set the apparatus with simple zinc, acid, and water, and after it has worked a short time to test the evolved gas for arsenic; when, if *no trace* of that substance is detected, the suspected fluid, in which the organic matter (if necessary) has been destroyed by any one of the methods hereinafter pointed out, may be added, and the operation continued. Care should also be taken not to light the jet of gas before *all* the atmospheric air is expelled from the apparatus, as without this precaution an explosion may take place. A film of oil placed on the surface of the liquid tends considerably to lessen the frothing. Lassaigne's and Ellis's tests are mere modifications of Marsh's.

8. *Morton's Test.* This consists in immersing in the suspected fluid two *platinum plates* connected with the *poles of a good galvanic battery.* The hydrogen liberated at the negative electrode must be collected and examined in the same way as described in the last article. The advantage of this apparatus is, that it obviates the use of zinc and sulphuric acid, and thus prevents the introduction of arsenic by either of those substances. This advantage is, however, rather *apparent* than *real*, as with proper care, such need never be the case. *Susc.* $\frac{1}{70,000}$. (Morton.)



9. *Nascent Hydrogen Test.* This includes *Marsh's, Ellis's, Lassaigne's, Morton's,* and *all* other tests which depend on the property possessed by *nascent hydrogen* of taking *arsenic* from its *aqueous solutions.* When this gas is subjected to a red heat, it deposits its arsenic in the metallic state, whilst its hydrogen escapes. The chemist avails himself of this property, by heating a small tube through which the gas is slowly passed, by means of the flame of a spirit lamp with a large wick, when a characteristic ring or mirror of metallic arsenic is deposited a little beyond the flame, in the cooler portion of the tube. The apparatus used in this experiment may be similar to that figured in the engraving.

The plan followed in the laboratory of Giessen, is to remove the tube from the hydrogen apparatus and to transmit a very feeble stream of dry *sulphuretted hydrogen* through it, the metallic mirror being at the same time heated by means of a spirit lamp, from its outer towards its inner extremity. "If *arsenic, alone,* be present, *yellow sulphuret of arsenic* will be formed within the tube; if *antimony, alone,* be present, an *orange* or *black sulphuret of antimony* will be produced; but if the mirror consists of *both metals jointly,* the *two sulphurets* will appear *side by side,* the sulphuret of arsenic as the more volatile, lying invariably before the sulphuret of antimony." "If *dry hydrochloric acid gas* be now transmitted, without application of heat, through the tube, *no* alteration whatever will take place if *sulphuret of arsenic alone* is present, even though the gas be transmitted through the tube for a considerable time. *If sulphuret of antimony alone* be present, this will *entirely disappear;* and if both sulphurets are present, the *sulphuret of antimony* will immediately volatilize, whilst the *yellow sulphuret of arsenic* will *remain.* If a small quantity of *ammonia* be then introduced into the tube, the *sulphuret of arsenic* will be dissolved, and may thus be readily distinguished from sulphur which perhaps may have separated. My personal experience has convinced me of the infallibility of these combined tests for arsenic." (Fresenius.)

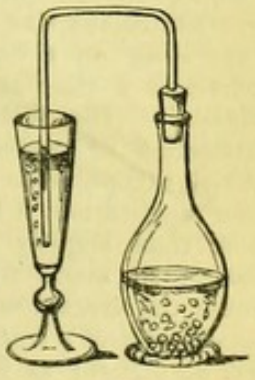
10. *Reduction Test.* A small quantity of the suspected sample is mixed with an equal weight or more of some reducing agent or flux (see below), and the mixture, in a state of perfect dryness, is placed at the bottom of a small glass tube, and heated in the flame of a small spirit lamp for some time,

when the arsenic gradually sublimes, and condenses in the cooler portion of the tube, under the form of a metallic crust, mirror, or ring. A common test-tube, if of very small diameter, may be employed; but those known as the reduction tubes of Liebig, Rose, or Berzelius, are undoubtedly the most convenient and efficient. (See Engraving.)

a, The arsenical mixture.
b, Arsenical ring.

The metallic ring is proved to be arsenical by—

α. The volatility of the deposit when heated, shown by its escaping from the hotter portion of the tube and resting on the cooler part further on.



β. Its conversion into minute octahedral crystals of arsenious acid, when repeatedly chased up and down the tube, by the cautious application of the flame of a spirit-lamp first to one part and then to another. The character of these crystals, with respect to volatility, lustre, transparency, and form, is so exceedingly well marked, that a practised eye may safely identify them, though their weight should not exceed the $\frac{1}{100}$th part of a grain. (Liebig and Gregory.) A pocket lens may be advantageously employed.

Obs. In employing this test, care must be taken to avoid soiling the sides of the tube in the operation of inserting the mixture; as, unless the tube is quite clean and dry, the experiment does not succeed. The common plan is to introduce the mixture through a small paper funnel or tube. In exposing the mixture to heat, the upper portion of it alone should be *first* heated, and then the bulb or bottom of the tube exposed to the full flame. *Black flux*, or a mixture of *ignited carbonate of soda* and *charcoal*, or better still, *recently ignited charcoal*, are employed as reducing agents for *arsenious acid;* but if the substance contains an *arsenite*, a mixture of *charcoal and boracic acid* should be used; if it contains a *sulphuret*, a mixture of 2 parts of *ignited carbonate of soda* with 1 part of *charcoal* may be advantageously employed. Liebig uses a *mixture* of equal parts of *dry carbonate of soda* and *cyanide of potassium*. The arsenical compound is first introduced into the tube, and then covered with 6 times the quantity of this mixture; the whole not to more than half fill the bulb of a Berzelius's tube. This may be used for either *arsenious acid* or its *compounds*, or for the *sulphurets of arsenic*. This test is usually regarded as *decisive*, as we here actually obtain the arsenic in a *solid form*, which may be recognised by the *most unequivocal characters*.

11. *Rensch's Test; Cupro-arsenical Test.* The suspected solution of arsenious acid is strongly acidulated with *hydrochloric acid*, (1 to 5, to 1 to 9,) and boiled in a porcelain or glass vessel, with bright and clean *metallic copper* in the form of *sheet*, *foil*, *gauze*, *leaf*, or *wire*. The time, required for the ebullition varies according to the strength of the solution; when weak it should be continued for at least a quarter of an hour. The coated copper is then taken from the liquid, carefully washed, dried, cut into small pieces, and heated in a glass tube over a spirit lamp, when the metallic arsenic is volatilized, and yields either a metallic ring, or a sublimate of minute octahedral crystals of arsenious acid. When the coating on the copper is sufficiently thick, it may be scraped off with a knife, and heated separately in an arsenic or reduction tube.

Obs. This test is very susceptible, and is invaluable as affording a certain and ready means of abstracting arsenic from its solution when mixed with organic matter. The contents of the stomach or other viscera, may thus be examined without any tedious preliminary preparation.

12. *Sulphuretted Hydrogen Test.* The liquid should be acidulated with *hydrochloric* or *acetic acid* before applying this test, unless it is already sour, when it is better *first* to neutralize it with an *alkali* and then to add the *acid*. The transmission of the gas (see Engraving) through the liquid should be continued for at *least* half an hour, when the end of the conducting tube

after being well rinsed in the liquid, may be removed, and the glass lightly covered with a piece of *porous paper*, set aside in a temperature of about 100° Fahr., until the odour of sulphuretted hydrogen is completely lost. The precipitate may now be collected on a small filter, washed with pure water, and submitted to confirmatory tests. It is shown to contain arsenic by its *ready* and *perfect solubility* in solutions of the *pure alkalies*, their *carbonates* and *bicarbonates*, and in *alkaline sulphurets*; by being nearly *insoluble* in *hydrochloric acid*; and by yielding metallic arsenic when mixed with *black flux* and submitted to the reduction test. *Sulphuretted hydrogen water* and *hydrosulphuret of ammonia* act in a similar way to gaseous sulphuretted hydrogen; but less effectively.

13. *Wollaston's Method.* This consists in concentrating by heat, in a capsule, a little of the suspected liquid, previously decoloured and filtered, (if necessary,) and placing it in the middle of a bit of window glass, and drawing lines with the fluid in different directions, so as to form a star-like figure. To one of these rays a particle of weak solution of *ammonio-nitrate of silver* is applied; to another, *ammonio-acetate of copper*; to a third, the *deuto-acetate of iron*; to a fourth, *ammonio-acetate of cobalt*; *sulphuretted hydrogen* to a fifth, and *lime water* to a sixth; a drop of *syrup of violets* to a seventh; and the two wires of a galvanic battery to the opposite edges of the whole. In this way several very exact experiments may be performed with a very small quantity of a suspected fluid.

14. *Detection of Arsenic in Organic mixtures.* Most of the previous tests are only applicable, with any degree of *certainty*, to pure or nearly pure solutions of arsenious acid or the arsenites, and fail to yield *reliable results* with coloured liquids, or with those which are contaminated with much organic matter. Indeed, with those depending on the production of coloured precipitates, the sine quâ non of success, is "operating on a liquid in as limpid and colourless a state as can possibly be obtained." The tests depending on the extrication of *arseniuretted hydrogen* are partial exceptions to this rule; but even in their application, if the suspected liquid is more than slightly charged with organic matter, so much frothing ensues, as to render the process unmanageable. In this respect *Rensch's test* possesses advantages over *all* others; as it may be employed to abstract the arsenic from liquids containing organic matter, without these being subjected to any preliminary process. In some cases, also, as with liquids only slightly contaminated with organic matter, or not possessing much consistency or colour, the arsenic may be separated from them, after simple straining or filtration and acidulation with hydrochloric acid, by passing a stream of *sulphuretted hydrogen* through them, in the usual manner. The *reduction test* is only applicable to solid arsenious acid, or to some of the compounds of arsenic obtained by means of other tests. In toxicological examinations the poison is almost always to be sought for in mixtures loaded with organic matter, and under the several conditions above referred to.

In a suspected case of poisoning by arsenic, resulting in death, the stomach must, therefore, be laid open, and an examination made for any particles of the poison, which it may contain in an undissolved state; a pocket lens being employed, if necessary, in the search. If any particles, however minute, are found, they should be carefully collected and submitted to the *reduction test*. Should the reverse be the case, the stomach (cut into small pieces), together with its contents, must be submitted to some further process for the abstraction of their arsenic in a form in which its presence may be demonstrated by tests. Various plans have been proposed for this purpose; among which are the following:

a. (Christison.) The suspected matters are boiled in a glass vessel with *distilled water* for half-an-hour, a little *potassa* or *ammonia* being added; the liquid is then strained or filtered, first through a hair sieve, and then through muslin or coarse paper, again boiled with a little *acetic* (or hydrochloric) *acid*, and filtered a second time. In this state the liquid is usually clear enough to be tested with the *ammonio-nitrate of silver* (or in Marsh's apparatus,) when if this test acts *freely*, the process of testing with other reagents may be proceeded with; but, if on the contrary, the indication is *feeble*, the liquid is evaporated to dryness, and the residuum redissolved by boiling it in repeated portions of distilled water, when after being once more filtered, it is generally sufficiently limpid for the perfect application of tests.

b. (Danger and Flandin.) To the organic matter or concentrated solution contained in a porcelain capsule, one sixth of its weight of the *strongest pure sulphuric acid* is added, and the mixture constantly stirred with a glass rod until vapours of the

acid begin to appear; the heat is then continued until the charcoal thus formed becomes friable and almost dry, when it is cooled a little, and a small quantity of *concentrated nitric acid* added by means of a pipette. The evaporation is then continued to dryness, the residuum boiled with *distilled water*, and the solution filtered, when it is ready for testing.

c. (Devergie.) The organic matter is first treated with *potassa* (and water), and then with *nitrate of lime;* after which the arsenious acid is again taken up by *hydrochloric acid.*

d. (Orfila.) The suspected matter (reduced to nearly the dry state) is mixed with twice its weight of pure *powdered nitre*, and cautiously dried in a porcelain capsule at a gentle heat, constantly stirring; after which it is powdered and deflagrated, by throwing it in small portions at a time, into an earthen crucible heated to dull redness. After a short interval the crucible is allowed to cool, and the grayish-white mass thoroughly washed with distilled water, the solution evaporated to the consistence of a syrup, and *concentrated sulphuric acid* added gradually, until it ceases to produce effervescence, when it is boiled until fumes of nitric or nitrous acid are no longer evolved. The saline residuum, taken up by *distilled water*, furnishes a perfectly limpid and colourless solution. The only precaution necessary is to expel the *whole* of the *nitric* and *nitrous acids*, as before indicated; as otherwise an explosion would inevitably occur, if the mixture should be tested in a Marsh's apparatus. If the solution is too acid, it is directed to be partly neutralized by *potassa dissolved in alcohol.*

e. (Rensch.) Solids, (as the stomach, liver, &c.,) are cut into small fragments, and boiled in a glass vessel with water acidulated with about 1-10th of its volume of *hydrochloric acid,* until the tissues or fragments are entirely broken down into flakes or grains, when the whole must be filtered through a hair sieve or coarse calico, again heated to the boiling point, and tested as described under *Rensch's test.*

f. Many organic liquids (as *vomited matter, &c.*) lose much of their glutinosity and colour by dilution with *water*, *boiling*, and *straining.* The albumen is coagulated by the heat, and removed in the solid form by filtration. By evaporating the filtered liquor to $\frac{1}{6}$th its bulk, re-diluting with water, and again boiling, the effect is more marked. The addition of a little *absolute alcohol* to the cold solution will now generally complete the separation; but some colour will still be left.

Before concluding our notice of testing for arsenic, it may be useful to caution the reader, of the absolute necessity of employing tests and reagents which are themselves *perfectly pure*, and in which the operator has, by *personal examination*, failed to detect the slightest trace of arsenic. Commercial sulphuric, nitric, and hydrochloric acids, *frequently* contain arsenic; so also do potash, nitre, iron, and zinc, from which, however, they may be easily freed by chemical processes; or they may be purchased in the pure state from the dealers in chemicals. But *no assurance of the vendor* should be regarded as a *proof of* their purity. In all judicial investigations the absence of arsenic in the several tests and reagents, and apparatus employed, must be demonstrated and sworn to. We may further add, that the results afforded by *no* SINGLE test can be depended on. In matters of such vast importance, confirmatory evidence of the most ample character must be sought.

Estim. It may be reduced to the *metallic state* by one of the processes already given, and then weighed;—every grain of pure arsenic represents $1\frac{1}{3}$ gr., or more correctly, 1·32 gr. of arsenious acid. *Or*, it may be weighed in the form of *sulphuret.* For this purpose the latter should be purified by solution in *pure ammonia water*, and evaporation of the resulting solution in a weighed watch-glass or capsule, by the heat of a water bath. It must then be dried by exposure to a temperature not above 212° Fahr., when it may be finally weighed. Each grain of sulphuret corresponds to 0·804 gr. of *arsenious acid*, or 0·61 gr. of *metallic acid.*

Pois.,&c.—Symp. These sometimes begin to appear within half-an-hour after the poison has been taken, but generally do not show themselves until after the lapse of some hours. They are at first, nausea and distress at the stomach, soon followed by thirst and a sense of burning heat in the bowels; then come on constriction of the œsophagus, violent vomiting, severe colic pains, and excessive and painful purging. The pulse is generally hard, the heart's action tumultuous; the respiration difficult and panting; faintings and cold sweats, with other signs of debility intervene; itching and eruptions of the skin, painful cramps and contractions of the extremities, and violent convulsions, often follow, and after these, a greater or less prostration of

strength, which induces a deceitful calm. At length the heart's action abates, the skin becomes suffused with a cold clammy sweat, and the sufferer dies from exhaustion." The progress, succession, and precise character of the symptoms are modified by the idiosyncracy of the individual, the quantity of the poison, and the manner in which it has been taken.—*Treat.* If vomiting has commenced it must be promoted by tickling the throat, and administering a large quantity of *gelatinous hydrated peroxide of iron*, or other appropriate antidote, (see below,) mixed with a large quantity of *sugar* and *warm* or *tepid water*. If vomiting has not commenced, which is rare, it must be excited by administering from 8 to 15 grains of *sulphate of zinc*, or *ipecacuanha*, and tickling the throat as before. If these means fail in rapidly inducing copious vomiting, the stomach pump may be had recourse to. We may give altogether as much as 16 oz. of the hydrated peroxide of iron. If the poison has been swallowed several hours previously, and hence may have passed the pylorus, a purgative clyster may be administered, and after its action another containing the antidote; after the stomach and bowels have been cleared, *diuretics* and *sudorifics* may be given in abundance, (*white wine* and *nitrate of potash* mixed with *seidlitz water*.) The best purgative (per mouth) to expel arsenic from the intestines is *castor oil*. Lastly, irritation which has been produced by the treatment, must be relieved by general or local bleeding, which cannot be earlier practised without danger; and opium, camphor, and ether may be had recourse to, to recruit the system.—*Ant.* (In the order of their efficiency.)—1. Hydrated or gelatinous sesquioxide or peroxide of iron, (for an adult—a tablespoonful in water every 8 or 10 minutes, until 12 to 16 oz. have been taken.)—2. Hydrated persulphuret of iron, (as the last.)—3. Hydrated protosulphuret of iron, (as the last.)—4. Gelatinous hydrate of magnesia, (as the last.)—5. Albumen, (white of egg,) or liquids containing it, (in cold water, ad libitum.)—6. Calcined magnesia, (as 1.)—7. Milk, wheat flour, oatmeal, gruel, (with water, ad libitum.)—8. Oils and fats, (as the last.)—9. Lime water, with milk, (as the last.)—10. Chalk, with milk and water, (as the last.)—11. Sugar.

Uses, &c. Arsenious acid and its compounds are extensively employed in the arts and in medicine. It is used by the *dyer*, it furnishes the *artist* with several of his most beautiful pigments, and the *glass-maker* and *enameller* with a flux or material to whiten and decolour their wares. In *small* (therapeutical) *doses* it is a valuable remedy in intermittent fevers, chronic skin diseases (especially lepra and psoriasis), and in some nervous diseases (as neuralgia, epilepsy, chorea, tetanus, &c.) It is the active ingredient of the "*tasteless ague drop*," and the *Tanjore pills*. *Externally* it has been employed in the form of powder, lotion, and ointment for the cure of cancer. *Plunkett's ointment*, *pâte arsenicale*, *Davidson's remedy for cancer*, and several other like preparations, owe their activity to this *poison*. *Dose.* Made into pills with crumb of bread and lump sugar, $\frac{1}{16}$th to $\frac{1}{8}$th of a grain; or in solution (liq. of arsenite of potassa, Ph. L.) 4 to 5 drops, two or three times daily, gradually and cautiously increased to 10 or 15 drops.

Concluding Remarks. By Act of Parliament, (Vict. 14, cap. xiii, 1851,) it is enacted—1. That every vender of arsenic, shall, before the delivery of the same to the customer, enter in a book or books kept for the purpose, "the date of sale," "name," and "residence of the purchaser" in full, his or her "condition" or "occupation," the "quantity" so sold, and the "purpose for which it is required," in a form set forth in the schedule to the act, which form or schedule shall be signed by the vendor, and by the said purchaser, unless he is unable to write, when such fact shall be recorded in the said schedule by the vendor; which, when a witness is required to the sale, shall also be signed by him, together with his place of abode.—2. Arsenic is not to be sold to a stranger unless in the presence of a witness acquainted with both vendor and purchaser.—3. No person to sell arsenic unless it be previously mixed with *at least* 1 *oz.* of *soot*, or $\frac{1}{2}$ *oz.* of *indigo*, to the pound, unless such admixture would be injurious, when not less than 10*lb.* is to be sold at any one time.—4. Penalty for evading the act, either as vendor, or purchaser, or witness, £20.—5. Act not to extend to arsenic used in compounding prescriptions, or to the wholesale trade.—6. The word "*arsenic*" to include "arsenious acid, and the arsenites, arsenic acid, and the arseniates, and all other colourless poisonous preparations of arsenic."

ARSENIOUS ACID (Self-detecting). *Prep.* (Dr. Cattell.)—1. To ordinary *white arsenic* add a small quantity of a mixture of *dry calomel* and *quicklime;* or of *dried sulphate of iron* and powdered *gall-nuts*. The product is white, but immediately turns *black* when mixed with liquids.—2. As the last, but employing a mixture of *thoroughly*

dried sulphate of iron and *ferrocyanide of potassium*. Strikes a *blue*.—3. As last, using *dried phosphate of soda* and *dried sulphate of iron*. Strikes a *green*. Proposed as a method of preventing arsenic being used as a poison.

ARSENIURETTED HYDROGEN. Syn. *Arsenetted Hydrogen, Arsenuretted do., Arsenide of do.* A compound of hydrogen and arsenic discovered by Scheele.

Prep. (Soubeiran.) Take *grain zinc* and *arsenic*, equal parts; melt together; reduce the resulting alloy to coarse powder, place it in a gas-evolution bottle, pour over it strong hydrochloric acid, and collect the gas in the pneumatic trough.

Prop., &c. Colourless; fetid; inflammable; burning with a bluish flame and generating arsenious acid; slightly soluble in water; odour, resembles garlic; precipitates several metallic solutions; extinguishes combustion; and destroys life. *Sp. gr.* 2·695.

ARTHANITINE. Syn. *Artanitine, Arthanitina.* A peculiar substance obtained by the action of *alcohol* on the tuberous stems of the herb *arthranita* or sow-bread. It is acrid, colourless, and crystalline.

ASARABACCA. As an *errhine*, (leaves,) 3 to 5 grs., (root,) 1 to 3 grs., snuffed up the nose for several successive evenings, at bedtime. It excites irritation and a copious watery discharge, more or less muculent, which frequently continues to flow for several days, and has occasionally proved highly useful in certain affections of the brain, eyes, mouth, nose, ear, and throat, on the principle of counter-irritation. It has been found "particularly serviceable in cephalalagia, (headache,) obstinate toothache, chronic ophthalmia, (inflammation of the eyes,) and lethargic affections." (Thomson.) In dimness of sight, deafness, and paralytic affections, not of a serious organic character, it has also proved beneficial. It constitutes the basis of *Cephalic snuff, Asarabacca snuff, Baron's McKinsey's Medicinal powder*, and several other like nostrums.

ASARINE. A species of stearoptène, found in the *asarum europæum* or asarabacca. It has an aromatic taste and an odour resembling camphor, and is said to be emetic.

ASARINE (of Grāger). Syn. *Asarina.* The crystallizable bitter principle of asarabacca. It greatly resembles *cytisine.*

ASBESTUS. Syn. *Asbestos, Amianthus.* A soft, fibrous substance, composed of flexible or elastic filaments, which in their most perfect form greatly resemble flax or silk, and which are capable of bearing exposure to a considerable degree of heat without suffering decomposition. From this property has originated the popular belief of its being indestructible by fire. It is sometimes spun into thread and woven into cloth.

ASBOLINE. A yellow, acrid, bitter, oleo-resinous matter, obtained by Braconnot from soot.

ASCITES. Dropsy of the belly. It is recognised by the unnatural enlargement of the abdomen, the sense of fluctuation, and the tense and elastic character of the tumour. It is generally accompanied by dropsy of the lower extremities, difficulty of breathing, and emaciation. Its causes, prevention, and treatment, for the most part, resemble those of other forms of dropsy.

ASH-BALLS. The ashes of various plants, especially *ferns*, damped and made into balls. *Used* as a substitute for soap in washing, and to clean painting.

ASPARAGIN. Syn. *Agedoile, Althein, Asparamide; Asparaginum*,—Lat. A peculiar neutral azotised principle, in asparagus, the potato, marsh-mallow, liquorice, climbing vetch, and several other plants.

Prep. 1. From the *expressed juice*, evaporated by a gentle heat to a syrupy consistence, and then abandoned to spontaneous evaporation in a warm dry atmosphere for several days; the resulting crystals being purified by cautious washing with very cold water or strong alcohol, re-solution and crystallization.

2. *Mallow root*, (chopped small,) is macerated several days in *milk of lime*, in the cold, the filtered liquid precipitated with *carbonate of ammonia*, and the clear solution evaporated in a water-bath, and set aside as before.

Prop., &c. Brilliant, transparent, colourless, rhomboidal prisms; neutral; nonbasic; having a faint, cooling, and scarcely nauseous taste; freely soluble in water; insoluble in strong alcohol or ether; heated with water under pressure in a closed vessel, or boiled along with an acid or an alkali, or dissolved in a saccharine liquid and then submitted to fermentation, it is converted into ammonia and *aspartic acid*; when aqueous solutions of both asparagin and aspartic acid, are treated with a current of nitrous acid, pure nitrogen is evolved and *malic acid* formed, which remains in solution. *Dose.* 1 to 6 grs.; as a sedative and diuretic, in dropsies, heart affections, &c.

ASPARAGUS. The most delicate of

our culinary vegetables. The *young shoots*, from the underground eyes, of the *asparagus officinalis*, (Linn.) They are diuretic, and communicate a peculiar fetid odour to the urine; and are said, when eaten in excess, to occasion bloody urine, and accelerate fits of gout. Neither the tops nor roots are now officinal in the British Pharmacopœias; but they are both occasionally employed as popular remedies in dropsy and stone—the first being eaten in the usual way at table, and the roots made into an infusion or decoction, (½ *oz.* to the *pint*,) taken *ad libitum*. As an article of food, asparagus, in moderation, is both wholesome and nutritious. It is *cooked* by simply boiling it as quickly as possible in water to which a little salt has been added; and it is either served up plain, or on toast, with *melted butter* or *sauce Hollandaise* in a boat. (Soyer; Rundell.) "The large grass is generally preferred, although the smallest has the fullest flavour for a dish." (Soyer.)

ASPARTIC ACID. Syn. *Malamic Acid*. An acid obtained from asparagin, by boiling it along with *hydrate of magnesia*. Its compounds with the bases are termed *aspartates*. See *Asparagin*.

ASPHALTENE. A peculiar substance, which, according to M. Boussingault, forms the principal portion of asphaltum.

ASPHALTUM. Syn. *Asphalt*, *Asphaltos*, *Jew's Pitch*, *Mummy*; *Asphaltus*, *Asphaltum*, *Bitumen Vitreum*, *B. Judaicum*, *B. Solidum*,—Lat. A black, hard, brittle, and glossy variety of bitumen found swimming on the surface of the Dead Sea, (hence called *Lacus Asphaltites*,) and as a mineral product in various parts of the world. It is distinguished from other varieties of bitumen by its more difficult fusibility, and by its fracture being clean, conchoidal, and vitreous. Its average density is 1·2. By friction it affords negative electricity. It is soluble in oil of turpentine, benzole, mineral and coal-tar naphtha, the fixed oils, and in solutions of the caustic alkalies, and several other liquids by the aid of heat.

The asphaltum of commerce is chiefly obtained from the shores of the Dead Sea, where it is cast up and gathered; but a large portion of that of the shops is a factitious article of the most worthless character, manufactured in England. A short time since a specimen of the purest and most beautiful description, from the great Bitumen Lake of Trinidad, was placed in the hands of the Editor of this work by Earl Dundonald, by whom he was informed, that the supply of both liquid and indurated bitumen, of every grade of quality, was unlimited from that source; but that owing to some injudicious importations of the impurer and more worthless kinds, (those most easily shipped,) a prejudice had been created against these bitumens in the London market.

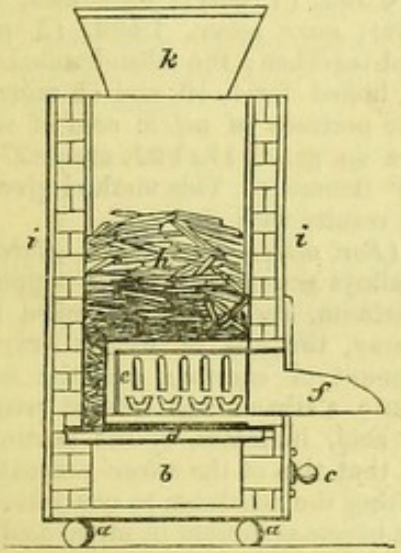
Uses. The finer varieties of asphaltum are chiefly used as a "glazing colour" by artists, and in the manufacture of black varnishes and japans. The inferior kinds are applied to the same purposes as ordinary solid bitumen.

ASPHALTUM (Factitious). The spurious asphaltum of the shops is commonly made from the bottoms of *Barbadoes tar*, and other mineral bitumens, by heating them until quite hard; sometimes a little *Scio turpentine* or *balsam of copaiba* is added. The colour and hardness of the products are inferior to those of pure natural asphaltum.

ASPHALTUM (Liquid). Syn. *Prepared Asphaltum*. *Prep.* 1. *Scio turpentine*, 2 *oz.*; melt; add *asphaltum*, (in powder,) 1 *oz.*; mix, cool a little, and reduce with hot *oil of turpentine*.

2. (Wilson's). *Asphaltum*, ½ *lb.*; melt, add hot *balsam of copaiba*, 1 *lb.*, and thin with hot *oil of turpentine*, as last. Both are used as a black japan or varnish, and as a "glazing colour," by artists.

ASSAFŒTIDA (Prepared). Syn. *Strained Assafœtida*; *Assafœtida Præparata*,—Ph. L. As *ammoniacum præparatum*,—Ph. L.



ASSAY. See *Assaying*.

ASSAYING. Syn. *Docimacy*. The *art of assay*, or of determining the quantity of gold and silver in ores and alloys of those metals, by cupellation. It differs from *chemical analysis* in merely furnishing the quantity of the precious metal contained in the sample examined, instead of the nature and proportions of all the ingredients in the compound.

Process of assaying. The muffle, with the cupels properly arranged, is placed in the furnace, and the charcoal added and lighted at the top, by placing a few pieces, heated to whiteness, on last. After the cupels have been exposed for half an hour, and have become white hot, the lead is put into them by means of the tongs, and as soon as this becomes bright red and "*circulating*," as it is called, the specimen for assay, wrapped in a small piece of paper, is added, and the fire kept up strongly until the metal enters the lead and "*circulates*" well, when the heat, slightly diminished, is so regulated that the assay appears convex,

and more glowing than the cupel itself, whilst the "*undulations*" circulate in all directions, and the middle of the metal appears smooth, with a margin of litharge, which is freely absorbed by the cupel. When the metal becomes bright and shining, or, in technical language, begins to "*lighten*," and prismatic hues suddenly flash across the globules, and undulate and cross each other, followed by the metal becoming very brilliant and clear, and at length fixed and solid, (called the "*brightening*,") the separation is ended and the process complete. The *difference* between the *weight of the alloy before cupellation*, and that of the resulting *button of pure metal* represents the quantity of alloy in the sample examined.

The *furnace* employed at the Royal Mint and Goldsmiths' Hall, London, is figured in section in the margin.

a a, Rollers on which the furnace rests.
b, Ash pit.
c, One of the ash pit dampers.
d, Grate supporting the muffle plate.
e, Muffle containing the cupels.
f, The mouth-plate for the ignited charcoal.
h, Interior of furnace containing charcoal.
i i, Walls of the furnace.
k, Moveable chimney for regulating draught.

The *muffle* is a vessel made of clay, and furnished with an opening to admit of the introduction of the cupels, and inspection of the process. It is placed on the muffle-plate (*see* above), by which it is introduced into the furnace.

The *cupel* is a small porous shallow crucible, usually made of bone ashes or burnt horn. The powder (slightly moistened with water) is placed in a circular steel mould, and after being pressed down tight, is finished off with a rammer, having a convex face of polished steel, which is struck forcibly with a mallet, until the mass becomes sufficiently hard and adherent. The cupel is then carefully removed and exposed in the air for a fortnight or three weeks to dry.

Assayer's weights, &c. The materials used in assaying are accurately weighed in a balance of the most susceptible description, and the weights taken in terms of the notation employed by assayers. The "*fineness*," "*richness*," or "*purity*" of *gold* is expressed in *carats*. Pure gold is spoken of as 24 *carats fine;* and any other sample containing in 24 parts, only 12, 18, or 22 parts of pure gold, is said to be of as many *carats fine*. Every *carat* is nominally divided into 4 *assay-grains*, and each assay-grain into *quarters*, giving 384 "reports" for gold. The nominal *assayer's gold carat* is 12 grs.

The "*fineness*," "*richness*," or "*purity*" of *silver* was formerly expressed in pennyweights, but is now generally reckoned in 1000ths, which admits of greater accuracy. Pure silver was said to be "silver of 12 pennyweights." If it contained 1, 2, or 3 parts of alloy it was termed "silver of 11, 10, or 9 pennyweights," as the case might be. Every *assayer's pennyweight* was nominally divided into 24 grs., and hence gave "288 fine grains" or "reports" for silver. The fineness of specimens containing odd grains, was given in *pennyweights* and *fine grains*.

Obs. An assay is not thought to be good, unless the "bead" separates readily from the cupel, has a round form, with a brilliant upper surface, and a lower one granular and of a dead metallic lustre. When the surface is dead and flat, *too much heat* has been employed; and in the case of silver, some of the metal may have been lost by fuming or absorption. When the bead adheres to the cupel, or is spongy, variegated, or has scales of litharge still adhering to it, *too little heat* has been used, or the process has been stopped before the assay was complete. The remedy is re-exposure to heat in the cupel, adding a little powdered charcoal or a few small pieces of paper, and continuing the heat until the metal "brightens" and "circulates" freely. The lead employed must be absolutely pure, and is best prepared by the reduction of refined litharge, mixed with some carbonaceous matter, by heat. These remarks apply exclusively to "cupellation," which is the most important, and indeed the distinctive operation of the art of assaying; and, as far as they extend, refer equally to gold and silver. The process of assaying by the cupel, however skilfully conducted, gives much less accurate results, especially with silver, than the "estimation" by the ordinary operation of chemical analysis, sometimes termed "*hu-*

mid," or "*volumetrical assay*;" whilst it is much more troublesome and expensive, and furnishes very inaccurate results with compounds containing only small quantities of the precious metals.

ASSAY OF GOLD. Before proceeding to the assay, it is necessary to form some estimate of the quantity of other metals, (copper or silver, or both,) in the specimen to be examined, in order to employ the proper proportion of lead in the cupellation. The experienced assayer commonly does this by the "assay of the touch," and, in certain cases, by a rough preliminary assay. The quantity of lead employed may be about 16 times the weight of the copper present in the sample, and when the alloy contains silver, an additional allowance of lead equal to $\frac{1}{10}$th of its weight, is made on that account. When no silver is present, or it is not required to be estimated, a much larger proportion of lead may be employed. The weight taken for the assay, (*assay-pound*,) is usually 12 or 6 grs. The alloy and dose of lead being accurately weighed and separately wrapped in small pieces of paper, the assay may be at once proceeded with.

1.—*α. Cupellation.* This operation, the important of the whole, has been already described. Unlike silver, gold will bear the highest heat of the furnace, without "vegetating," "fuming," or being absorbed by the cupel. The *loss of weight* gives the amount of *copper* in the alloy.

β. Quartation. The cupelled sample is fused with three times its weight of pure silver, (called the "*witness*,") by which the gold is reduced to one fourth of the mass, or less, and in this state may be easily removed.

γ. Parting. The alloy, after quartation, is hammered or rolled out into a thin strip or leaf, curled into a spiral form, and boiled for a quarter of an hour, in a small flask, with about 2½ to 3 oz. of nitric acid, (sp. gr., 1·3); and the fluid being poured off, it is again boiled in a similar manner with 1½ to 2 oz. more of nitric acid (sp. gr., 1·2), after which the gold is carefully collected, washed in pure water, and dried. When the operation of parting is skilfully conducted, and the acid not too strong, the metal preserves its spiral form; otherwise, it falls into the state of flakes or powder. The second boiling or digestion is technically termed the "*reprise*." The *loss of weight* by parting after deducting that of the "witness," corresponds to the quantity of *silver* originally in the specimen.

δ. Annealing. This consists in putting the pure gold obtained by the last process, into a small porous crucible or cupel, and heating it to redness in the muffle.

ε. Weighing. This must be done with the utmost accuracy. The *weight*, in grains troy, doubled or quadrupled, as the case may be, gives the number of *carats fine* of the alloy examined, without calculation.

2. (*Old French method.*) For the *assay-pound*, 12 grs.; *fine silver*, 30 grs.; *lead*, 108 grs.; cupelled together; the (perfect) button rolled into a leaf (1½ × 5 inches,) twisted on a quill, and submitted to parting with 2½ oz. and 1½ oz. of *nitric acid*, sp. gr. 1·16, (20° Baumé.) The remainder of the process is similar to that above described. Two assays are made in the same manner, with a third on *pure gold* or *gold of a known fineness*; and no conclusion is drawn, unless the assay of the latter comes out accurately, and that of the first two correspond to each other.

3. (M. Chaudet.) Of the *sample for assay*, 0·500, (1 part); *pure lead*, 1·000, (2 parts); *pure silver*, 1·500, (3 parts); cupelled together; the riband rolled into a cornet, boiled for 4, 10, and 15 minutes in separate portions of *nitric acid* of the respective sp. gr., 1·17, 1·27, and 1·27, (22° and 32° Baumé.) This method gives very perfect results with *fine gold*.

4. (*For alloys containing platinum.*) These alloys generally contain copper, silver, platinum, and gold. Cupelled in the usual way, the loss of weight expresses the amount of *copper*; and the button, made into a riband and treated with sulphuric acid, indicates, by the portion dissolved, that also of the *silver* present. By submitting the residuum to quartation, the *platina* becomes soluble in nitric acid. The loss after digestion in this menstruum expresses the weight of that metal; and the weight of the portion now remaining is that of the *pure gold*. Gold containing *palladium* may be assayed in the same manner.

5. (*Assay of the touch.*) The fineness of jewellery and small quantities of gold which it is either impossible or inconvenient to assay according to the usual method, is generally determined by means of *touch needles* and *touch stones*. The former are made in sets, containing gold of different degrees of fineness, and differently alloyed with copper and silver. Pieces of black pottery form excellent touch stones. The mode of using them is to mark the stone with the sample under examination, and to compare its appearance, hardness, colour, &c., with that produced by one or more of the needles. When the two are similar, the quality is considered to be the same. They are then further examined by heating, the "touchstone" to redness, and moistening the strokes with aquafortis, when the

appearances resulting from oxidation, &c., differ according to the nature and quantity of the alloy.

ASSAY OF SILVER. The "assay pound" may be 12, 24, or 20 grs., for silver. The quantity of *lead* employed depends upon the nature of the alloy. Assayers differ on this subject; but not less than about 16 times the weight of the copper presumed to be present in the alloy, will always be required; the fineness of the sample being approximately determined in the way described under *gold*. Some authorities order a much larger quantity of lead; but it must be remembered, that *an excess of lead*, leads to some of the silver being absorbed by the cupel, and the resulting button comes out too *small*. On the other hand, when *too little lead* is employed, the alloy, after cupellation, contains some copper, and the button comes out too *large*. The following table exhibits the proportions of lead adapted to silver alloys of different degrees of fineness:

Assay Table for Silver. By M. D'Arcet.

Fineness of the Silver.	Copper in 1000 parts of the Alloy.	Weight of lead required: that of the sample for assay being = 1.	Ratio of the Lead to the Copper.
1000	(*pure silver*)	$\frac{3}{10}$	.....
950	50	3	70 to 1
900	100	7	60 to 1
800	200	10	50 to 1
700	300	12	40 to 1
600	400	14	35 to 1
500	500	16 to 17	32 to 1
400	600	do.	$26\frac{1}{2}$ to 1
300	700	do.	$22\frac{3}{4}$ to 1
200	800	do.	20 to 1
100	900	do.	$17\frac{3}{4}$ to 1
(*pure copper*)	1000	do.	16 to 1

Obs. It is found, that however carefully the cupellation of silver may be made, a small portion of this metal is carried off by the lead into the cupel, and the assay comes out too low. When an excess of lead is employed this deficiency is so excessive as to render the assay valueless. According to M. D'Arcet this loss varies with the fineness of the silver, as shown below:

Fineness of Alloy.	Loss in Thousandths.
Fine Silver	1·
900	4·3
800	4·9
500	4·2
100	·4

ASSES' MILK (Factitious). Syn. *Lac. Asininum Factitium, Lac A. Artificiale,*— Lat. *Prep.* 1. *Cow's milk*, 1 quart; *ground rice*, 1 *oz.; eringo root*, (bruised,) 1 dr.; boil, strain, and add *sugar candy* (or white sugar), 1 *oz.*

2. *Whites of* 2 *eggs; lump sugar*, 1 *oz.; cow's milk* (new), $\frac{3}{4}$ pint; mix, then add *syrup of tolu*, $\frac{3}{4}$ *oz.*

3. *Water*, 1 pint; *hartshorn shavings*, 1 *oz.;* boil to a jelly; then add *lump sugar*, 2 *oz.;* cool, add *new milk*, 1 pint; *syrup of tolu* $\frac{1}{2}$ *oz. Used* as substitutes for asses' milk, taken freely as a beverage. A cupful, with or without *a spoonful of rum*, 3 or 4 times daily, is a popular remedy in consumption and debility.

ASTHMA. This well-known disease is principally confined to the later periods of life, and appears in many cases to be hereditary. The *exciting causes* are exposure to sudden changes of temperature from heat to cold, unwholesome effluvia, hard drinking, full meals, violent exercise, and cold, damp, and foggy weather.

Treat. The bowels should be kept regular by mild aperients, and the stomach preserved in order by the adoption of a light and wholesome diet; particularly avoiding excess in either eating or drinking. The *severity of the paroxysm* may be generally lessened by adopting the sitting posture, and inhaling the *vapour of hot water* or of an *infusion of chamomile. Emetics* and *diaphoretics*, followed by *mild purgatives*, may also be administered with advantage. Various other remedies have been recommended; among which are *tobacco* and *stramonium* smoking. In using the latter herb, the root and lower parts of the stem are chopped up and placed in the bowl of a common tobacco-pipe, and a few whiffs are occasionally taken. Drinking at the same time should be avoided. Lately *lobelia inflata* or *Indian tobacco*, has been highly extolled in asthma. The dose of the tincture is from 20 drops to 2 tea-spoonfuls, taken at the commencement or before the accession of the fit, and repeated after the interval of an hour, if nausea or expectoration does not intervene. A change of diet and habits will often produce a marked improvement and effect a cure when medicines have failed. The use of bark or bitters tends to improve the general tone of the system, and may be adopted with perfect safety. Sir John Floyer is said to have been cured of an asthma of 60 years' standing, at the age of 80, by the constant use of *strong coffee*. Sir John Pringle adopted the same remedy with great success.

ASTHMA (Grinder's). *See Dyspnœa.*

ASTRINGENTS. Substances which constrict animal fibre and coagulate albuminous fluids, and thus obviate relaxation and check excessive secretion. Those employed to suppress hemorrhage or bleeding, are generally termed *styptics;* and those used merely to check excessive secretion and evacuation, and which exercise little astrictive power over the solids, are called *desiccants.* The principal astringents are—*alcohol, alum, chalybeates* (generally), *sulphate of copper, sulphate* and *sesquichloride of iron, acetate* and *diacetate of lead, lime, bichloride of mercury, nitrate of silver, tannic acid, tannin, vegetable astringents* (those containing tannic acid and its modifications), *acetate, carbonate, chloride, oxide,* and *sulphate of zinc.*

ASTRINGENTS (Vegetable). Of these the principal are—*Alkanet, bistort, catechu, dragon's blood, French rose, galls, kino, logwood, mastiche, oak bark, red sander's wood,* and *tormentil.* See above, and *Tonics.*

ATCHAR. Syn. *Achar.* An Indian condiment made of *green fruits,* pickled in vinegar, and seasoned with *mustard, ginger, garlic,* and *pimento.*

ATHAMANTINE. A crystallizable substance found in the root of the *athamanta oreoselinum.*

ATMOSPHERE. The mass of aeriform respirable matter surrounding the earth, and in which we live; atmospheric air.

Atmospheric air is transparent, colourless, inodorous, tasteless, respirable, neutral to re-agents, and a supporter of combustion. It is 816 times lighter than an equal bulk of water; 1000 cubic inches at mean temperature and pressure, weigh about 305 grs. Its power of conveying electricity, odours, effluvia, contagion, &c., is in direct proportion to the quantity of aqueous vapour which it contains; hence the superior perfume of growing flowers, the more noisome stink of drains, and the accession and increase of pestilential diseases during damp weather.

The most common *impurities* of the atmosphere affecting the healthfulness of our homes, are—*carbonic acid,* (in excess,) *smoke, carburetted hydrogen, sulphuretted hydrogen,* the *noxious effluvia from sewers, privies,* and other *accumulations of decomposing organic matter,* and *excessive moisture* from bad drainage, which are only to be met by the prompt removal of the causes, and by thorough cleansing or ventilation, as the case may demand. The purity of the air of a house or district, as well as its comparative salubrity, may generally be discovered by reference to the state of health of the residents, and the registrar's quarterly returns of the number of deaths which occur within its limits. In many cases, the complexions and features of the inhabitants betray the character of the spot or neighbourhood in which they live. The following tests may interest the popular experimentalist:

1. A glass tumbler nearly filled with *lime water* may be placed in any convenient position, as on the mantel-piece of a room. The rapidity with which a pellicle forms on its surface, and the quantity of the resulting precipitate, corresponds to the amount of the *carbonic acid,* in the atmosphere surrounding it.

2. A little *moist carbonate of lead,* placed on a plate or saucer, and exposed as last, will become discoloured or blackened, if any *sulphuretted hydrogen* is present in the air.

3. A colourless *solution of nitrate of silver,* exposed under like circumstances in the shade, or in a dull light, and afterwards in the sun or full daylight, reddens or darkens more rapidly, and to a greater extent, in air loaded with *decomposing organic matter, miasma, &c.,* than a *similar freshly prepared solution of nitrate of silver,* which has not been exposed to foul air.

4. A simple but excellent criterion of the comparative salubrity of a place, is the length of time that butcher's meat and poultry may be preserved before the accession of the putrefactive process. In some of the worst drained, confined, and most unhealthy parts of London, butcher's meat can scarcely be preserved from day to day, in warm weather, in a state fit for human food; whilst in those which are the most salubrious, the same articles may be safely preserved for several days. In his extensive surveys and researches in connexion with *sanitation* and the *health of towns,* the Editor of this work has made this fact a frequent subject of remark.

ATMOSPHERE (In Engineering). The common pressure of the atmosphere, (14·6 *lb.* to the sq. inch,) is taken as a standard of that exerted by other elastic fluids. Thus, steam or air condensed so as to exert a pressure of 30 *lb.* per sq. inch, is said, in round numbers, to be of *two atmospheres;* at 45 *lb.* to the inch, of *three atmospheres,* &c.

ATROPHY. A wasting away of the flesh and strength without any sensible cause. *General atrophy* appears to depend on deficient nutrition, arising from a want of due balance between the functions of assimilation and absorption, or from profuse evacuations draining off the materials necessary

for the support of the body. The first, only, may be regarded as an independent disease. *Local atrophy* commonly arises from some cause which lessens the normal circulation of blood in the part; or from a diminution of the nervous influence, as in paralysis. *General atrophy* is most frequent in infancy, childhood, and old age. In the first two it may be often traced to bad nursing, worms, or a scrofulous taint; and not unfrequently, to continually inhaling impure air. In adults, the causes are impaired digestion and imperfect action of the chyliferous organs, and sometimes, diseased action of the liver. The treatment consists in a close attention to diet, exercise, clothing, ventilation, warmth, &c., with gentle stimulants, tonics, and chalybeates where not contra-indicated; (and, in the case of adults,) the judicious use of pure, generous wine or malt liquor. When this affection is symptomatic of any other disease, as worms, stomach complaints, &c., the removal of the latter must of course be first attempted. See *Anæmia*.

ATROPIA. Syn. *Atropine, Atropina, Atropium,; Belladonnine, Belladonnia; Atropia*,—Ph. L. An alkaloid discovered by Brandes in the *atropia belladonna*, or deadly nightshade.

Prep. 1. (Mein & Liebig). *Belladonna root*, (fresh dried and coarsely powdered,) is exhausted by *alcohol*, (sp. gr. 0·822); *slaked lime*, (1 part for every 24 of the dried root employed,) is then added to the tincture, and the whole digested with agitation for 24 hours; *sulphuric acid* is next added *drop* by *drop* to slight excess, and after filtration, rather more than half the spirit is distilled off, a little water added to the residue, and the remainder of the alcohol evaporated as quickly as possible by a gentle heat; after again filtering, the liquid is reduced by further evaporation to the $\frac{1}{12}$th part of the weight of the root employed, and a *concentrated solution* of *carbonate* of *potassa*, *dropped* into the cold liquid, avoiding excess; in a few hours it is again filtered, and *carbonate of potassa* added as long as a precipitate forms: in from 12 to 24 hours more, the *atropia* is collected in a filter, pressed between the folds of blotting paper, and dried by a very gentle heat. It is purified by making it into a paste with water, again squeezing it between the folds of blotting paper, dissolving it in 5 times its weight of *alcohol*, decolouring it with *pure animal charcoal*, and evaporation and crystallization by a very gentle heat.

2. (Bouchardat & Cooper.) The *filtered tincture* is precipitated with *iodine dissolved in an aqueous solution of iodide of potassium*, the resulting *ioduretted hydriodate of atropia* decomposed by *zinc* and *water*, the metallic oxide separated by means of *carbonate of potassa*, and the alkaloid dissolved in *alcohol* and crystallized.

3. (Rabourdin.) To the *expressed juice*, (coagulated by heat and filtered,) 1 quart; is added *caustic potassa*, 1 dr.; and afterwards, *chloroform*, 1 oz.; the whole is then agitated well, and after half an hour's repose, the supernatant liquor is poured from the discoloured chloroform, which, after being washed with water as long as it gives any colour to that liquid, is placed in a small retort, and the chloroform distilled off by the heat of a water bath; the residuum is dissolved in a little *water acidulated with sulphuric acid*, and precipitated with *carbonate of potassa*, in slight excess; the precipitate is redissolved in *alcohol;* the solution abandoned to spontaneous evaporation, yields crystals of atropine.

4. (Ure.) From the *expressed juice of the fresh*, or the *watery extract of the dry plant*, by treating it with *caustic soda*, in slight excess, and then agitating the mixture with $1\frac{1}{2}$ times its volume of *ether;* the atropia taken up by the ether is again deposited after repose for some time, and it is purified by repeating the treatment with *ether* as often as necessary.

Prop. Pure atropia crystallizes in colourless silky prisms, or in silky needles like those of disulphate of quinine; it is odourless; tastes bitter, acrid and metallic; dissolves in 200 parts of cold and 54 parts of hot water, in $1\frac{1}{2}$ parts of cold alcohol, and in 25 parts of cold, and 6 parts of boiling ether; it has an alkaline reaction, fuses at 194° Fahr., is volatile at common temperatures, and rises in vapour at 212° Fahr.; with the acids it forms salts, several of which are crystallizable. It is a powerful narcotico-acrid poison. Its effects are similar to those of belladonna but considebly greater. "A very minute (*imponderable*) quantity applied to the eye is sufficient to dilate the pupil." (Pereira.) The $\frac{1}{12}$ to $\frac{1}{10}$ gr. causes very serious effects in the human subject,

Ant., &c. See *Aconite*.

Pur. "Alkali prepared from the *root* of *atropa belladonna*. Crystals." "White; has the form of a prism; is soluble in water and rectified spirit. No certain tests have as yet been discovered to show the purity of this substance." (Ph. L.)

Uses. Atropia is chiefly employed as an external agent, as a substitute for bella-

donna, to cause dilation of the pupil; and as a local anæsthetic or anodyne, especially in facial neuralgia. *Internally*, it has been occasionally given in hooping cough, chorea, and a few other nervous diseases. *Dose.* $\frac{1}{30}$ to $\frac{1}{20}$ gr., in solution, or made into a pill with liquorice powder and honey, or used *endermically;* for a *collyrium*, 1 gr. to *water* 1 oz., a few drops only being applied to the eye at a time; the greatest caution in each case being observed. It is also employed to make the sulphate. 1 oz. of the root yields 1 gr. of pure atropia. (Thomson.) In dispensing, a drop or two of *acetic* or *dilute sulphuric acid* will be found to facilitate its solution.

ATROPIA (Sulphate of). Syn. *Atropiæ Sulphas*,—Ph. L. *Prep.* (Ph. L.) *Dilute sulphuric acid*, 2 fl. dr..; *atropia*, 150 grs., or q. s.; *water* ½ fl. oz.; add the atropia gradually to the acid (previously diluted with the water) to saturation; strain, gently evaporate, and crystallize. "We intend this salt only for external use."—Ph. L.

Uses, &c. It is employed in the same cases as the pure alkaloid. *Dose.* $\frac{1}{25}$ to $\frac{1}{20}$ gr., either in solution or pills; 1 to 3 grs., to *water*, 1 oz., as a collyrium, of which a few drops seldom fail to produce full dilation of the pupil in about a quarter of an hour; 1 to 2 grs., to *lard*, 1 dr., forms an excellent ointment in neuralgic affections.

ATROPIC ACID. Syn. *Acidum Atropicum*,—Lat. The name given by Richter to a volatile crystallizable substance, possessing acid properties, extracted from *atropa belladonna* or deadly nightshade. In many respects it resembles benzoic acid.

AURANTIINE. *Prep.* The *exterior peel of the orange* (Seville) is carefully separated from the white matter, and exposed to warm dry air until it has nearly lost its fragrance; when it is steeped in *hot water*, and the filtered liquor gently evaporated to dryness. It possesses the bitter properties of the peel without any of its glutinosity or fragrance, and is said to be better suited to delicate stomachs.

AURIC ACID. Syn. *Acidum Auricum*,—Lat. A term frequently applied to teroxide of gold, from its manifesting acid properties. Its compounds or salts are called *aurates*.

AURO-CYANIDES. Compounds of cyanide of gold with bases. The *auro-cyanide of potassium* is much used in electro-gilding.

AURO-TERCHLORIDES. Syn. *Auro-chlorides*. Compounds of terchloride of gold with bases. They may be prepared by mixing the *terchloride of gold* with the *chloride of the base*, in atomic proportions, and setting aside the solution to crystallize. Most of the auro-chlorides are soluble in both alcohol and water, have an orange or yellow colour, and are decomposed at a red heat. *Auro-chloride of hydrogen* is formed by cautiously evaporating an acid solution of terchloride of gold.

AUTOGENOUS. This term has been applied to a method of joining metals by fusing the parts in contact, without the intervention of a fusible alloy or solder.

AVENINE. A proteine compound analogous to caseine obtained from oats. The *grain*, reduced to the state of powder or meal, is washed on a sieve, and the milky liquid, after being allowed to deposit its starch, is heated to about 200° Fahr., to coagulate the albumen; and after again becoming cold, *acetic acid* is added as long as a white powder falls, which is *avenine*.

AVIARY. A place for keeping birds; generally applied to an enclosed space or building wherein birds are kept or bred on account of their rarity, plumage, or song; and not for food. For exotic birds a place should be selected for the aviary where the temperature can be maintained at a proper degree throughout the year, and which is well protected from the weather. This is commonly done by choosing a space attached to the summerhouse or hothouse. When the aviary is only intended for birds of climates similar to our own, any part of the open garden may be chosen, and a portion closed in, either with trellis-work, or wire-work, or netting; care being taken to provide, in some easily accessible portion of it, full protection from the vicissitudes of weather and season. Nor must due ventilation, and protection from foul air or noxious fumes be left unattended to.

AZOBENZIDE. Syn. *Azobenzol*, *Azobenzole*. A peculiar substance discovered by Mitzcherlitz, and obtained when *nitrobenzole*, heated with a *strong alcoholic solution of pure potassa*, is submitted to distillation. The first portion which distils over is alcohol; the next, an oily liquid, consisting chiefly of *aniline* and *azobenzole*, from which the latter is deposited under the form of large red crystals on cooling. Azobenzole is nearly insoluble in water; dissolves readily in alcohol and ether; melts at 149° Fahr.; boils at 379° Fahr.

AZOBENZOIDE and *Azobenzoyle*, "products of the action of pure *water of ammonia* upon *oil of bitter almonds*, by making the ammonia pass down through a wide tube filled with the almond pap. The operation must be continued for weeks." (Ure.)

AZOBENZULE. A white crystalline powder, obtained by boiling the *residuum of the preparation of benzhydramide* in 100 parts of *alcohol;* the crystals are deposited as the liquid cools.

AZOERYTHRINE. A substance obtained by Kane from *archil.* It is insoluble in alcohol, ether, and water; but is very soluble in alkaline lyes, to which it imparts a port-wine colour.

AZOLITMINE. A dark-red substance obtained by Kane from litmus, of which it forms a large portion of the colouring matter. It is insoluble in alcohol, and in water unless alkalized.

AZOMARIC ACID. A compound formed when *pimaric acid* is submitted to the action of *nitric acid.*

AZOTE. See *Nitrogen.*

AZULMIC ACID. Syn. *Azulmine.* A name given by M. Boullay to the black matter deposited during the spontaneous decomposition of hydrocyanic acid.

BACON. When bacon has been properly prepared from young and well-fed animals, and is neither "stale" nor "rusty," it forms a very wholesome and excellent article of food, especially adapted for a light or hasty meal, or as a relish for bread or vegetables. It has hence been always a favorite at the breakfast table, and, as an ingredient of the morning repast, has frequently received the favorable notice of the Faculty. For persons with weak stomachs and for invalids, great care should be taken to cook it without injuring its flavour or rendering it indigestible. This is best effected by cutting it into slices of moderate thickness, and carefully broiling or toasting it; avoiding dressing it too hastily or too much. The common practice of cooking it in almost wafer-like slices, until it becomes brown and crisp, renders it a fertile source of heartburn and dyspepsia. Fried bacon is remarkably strong and indigestible. Bacon has always been a popular article of food in these realms, and in some portions of them, has, perhaps, obtained a preference and more extensive use, than, from it being salted, is either economical or conducive to health. A vast number of the agricultural poor of the western counties scarcely taste any other kind of flesh. The curing and packing of bacon forms the chief trade of the populous city of Cincinnati, where it has proved a source of wealth to both the factor and adventurer.

Good bacon has a thin rind, and an agreeable odour; the fat has a firm consistence and a slightly reddish tinge; the lean is of a pleasing red colour, is tender, and adheres, whilst raw, strongly to the bone. When the fat is yellow, it is either rusty or becoming so, and should be avoided. The streaky parts are not only those which are most esteemed, but are the most wholesome.

BADIGEON. A cement used by operatives and artists to fill up holes and to cover defects in their work. Among *statuaries,* a mixture of *plaster* and *free-stone* is commonly used for this purpose; among *joiners* and *carpenters,* a mixture of *sawdust* and *glue,* or of *whiting* and *glue;* and among *coopers,* one of *tallow* and *chalk.* The same name is given to a stone-coloured mixture used for the fronts of houses, and said to be composed of *wood-dust* and *lime,* slaked together, *stone powder,* and a little *umber* or *sienna,* mixed up with *alum water* to the consistence of paint.

BAKER'S ITCH. See *Psoriasis.*

BAKER'S SALT. Carbonate of ammonia.

BAKING. In *cookery,* one of the cheapest and most convenient ways of dressing dinners for small families, when a good domestic oven is at hand. Though the flavour of baked meat is generally considered barely equal to that of the same parts roasted, there are some joints and dishes to which it appears particularly suitable. Among these may be mentioned *legs* and *loins of pork, legs* and *shoulders of mutton, fillets of veal,* &c. A *baked pig,* if it has been occasionally basted, and the heat has not been too great, will eat equal to a roast one. *Geese* and *ducks* treated in the same way are also excellent. A *baked hare* which has been basted with *raw milk* and *butter,* also eats well; so do various pieces of beef, especially the buttock. Cooks tell us that the latter should be sprinkled with a little salt for a few days before dressing it, and after being washed, is preferably baked, along with about a *pint of water,* in a glazed earthen pan tied over with writing paper "three or four times thick." A *baked ham* is said to be preferable to a boiled one; to be tenderer, fuller of gravy, and finer flavoured. It should be soaked in water for about an hour, wiped dry, and covered with a thin paste or batter. Ordinary dishes require similar treatment in baking to that given them when roasted.

Much of the prejudice that exists against "baking" may be referred to the imperfect manner in which it is usually performed, arising either from the carelessness of the cook, or the defective formation of the kitchen oven; and also from so many dif-

ferent dishes, possessing or evolving such various flavours and odours, being assembled together at the baker's.

BAKING POWDER. See *Powders.*

BALDNESS. Syn. *Calvitas, Calvities,* —Lat. Gray hair and baldness dependent on old age are natural consequences of man's infirmity, and must be regarded as evidence of failing vigour rather than in the light of a disease. Premature loss of hair may be induced by various causes. It is common after severe fevers, and is frequently produced by external pressure, friction, or violence, and by such other local actions and conditions which, when long continued, interrupt the normal functions of the skin. Persons with a consumptive, scorbutic, scrofulous, or syphilitic taint, or of a general bad habit of body, frequently lose their hair early. In these cases it probably arises from debility or paralysis of the cutaneous vessels, and the consequent insufficient nutrition of the bulbs of the hair. When it occurs in persons under the middle age, and apparently enjoying good health, it may be often traced to the pernicious practice of constantly wearing a hard non-ventilating hat, to disordered stomach, habitual smoking or hard drinking, irregular habits, or late hours. Excessive anxiety or grief, and intense study and thoughtfulness, also tend to promote the early decay of the hair. The natural baldness of the aged appears to arise from the gradual attenuation of the scalp, which ultimately becomes too thin to afford room for the performance of the functions of the hair-producing organs, and too scantily supplied with blood for their due nutrition and support. It is remarkable, that though consumptive patients, as noticed above, frequently suffer from premature baldness, those who are marked as early victims of this disease still more frequently possess the crinal ornament in great luxuriance and beauty. Since the introduction of waterproof clothing and silk hats, and the common adoption of tobacco by the juvenile portion of the population, baldness has become so common among our young men, as to cease to attract notice. These articles act as prejudicially on the hair, as *white* bread and alum do on the teeth.

The baldness of senility and that arising from the permanent injury or destruction of the hair-bulbs admit of no cure, notwithstanding the daily assurances to the contrary made by advertising impostors. When a disposition to baldness exists, shewn by the hair falling off in large quantities, or ceasing to grow with its usual vigour, the constant, but gentle use of the hair brush, and of any bland emollient and stimulating oil, pommade, or wash, if adopted in time, will generally prove sufficient. The head may be advantageously washed in cold water at least once a day; or what is better, a shower bath may be taken. Should this plan not succeed the head may be shaved, and a wig or scalp adopted for a time. The effect of keeping the hair closely cropped or shaved is to make it grow thicker, stiffer, and stronger, often when all other means fail. The celebrated John Wesley recommends rubbing the part morning and night with a raw onion, until it becomes red, and then applying a little honey. (*Primitive Phys.*) The following formulæ for strengthening the hair and keeping the head clean are invaluable in their way. At the same time the reader must be cautioned against placing any reliance on external applications, unless he assists their action by due attention to diet, exercise, ventilation, and such other matters as tend to promote the general health and vigour of the body. See *Hair, Pommades, Oils, Washes, &c.*

BALDNESS (Oil for). *Prep.* 1. Pure *olive* or *salad oil*, 1 *oz.; oil of origanum*, 12 drops; *oil of rosemary*, 10 drops; *oil of lavender*, 6 drops; *oil of cloves* or *cassia*, 3 drops; mix by shaking them well together.

2. *Oil of almonds*, 1 *oz.; etherial extract of cantharides*, 1 gr.; dissolve by placing the phial in a cup of hot water; then add, *oil of rosemary*, 10 drops; *oil of verbena*, 6 drops; and *oil of cloves*, 5 drops.

3. *Oil of almonds* or *olives*, 1 *oz.; oil of nutmeg*, 15 drops; *neroli*, 8 drops; mix. *Oil of ben*, or *castor oil*, may be substituted for that of almonds and olives in the above formulæ. To tinge them red, a shred or two of alkanet root may be digested in the oil for a few days before scenting it.

4. *Oil of almonds* (hot), 1¾ *oz.;* true *Peruvian balsam*, 1 dr.; *oil of nutmeg*, 30 drops; mix in a phial, cork it, agitate until nearly cold, allow it to repose until the next day, and then pour off the clear portion for use.

5. *Pure cod-liver oil*, ¼ pint; *oil of origanum*, 2 dr.; *essences of musk* and *ambergris*, of each, 15 drops. Very effective.

BALDNESS (Pommade for). As above, but substituting for the oil an equal weight of *washed lard, beef marrow, suet, spermaceti cerate*, or any *mixture* of them, according to the consistence it is desired the

pommade should have. The solid articles are melted in a small pot, the *perfume*, *&c.*, added, and the whole stirred until cold. The above are employed in the usual manner.

BALDNESS (Wash for). *Prep.* 1. *Distilled* or *soft water*, 1 pint; *sesquicarbonate of ammonia*, 3 dr.; *oil of rosemary*, 10 drops; agitate together in a bottle until mixed or dissolved.

2. To the last add *rum* or *spirit of wine*, 2½ fl. oz., (*or* a London ½ quartern.)

3. *Water*, 1 pint; *vinegar of cantharides*, 2 dr.; *oil of nutmeg*, 20 drops; *rum*, 2½ fl. oz.; mix.

4. *Rosemary water*, 1 pint; *sal volatile*, 1 fl. oz.; mix.

5. *Rosemary water*, 1 pint; *iodide of potassium*, 1 dr.; dissolve.

6. *Pure water*, 1 pint; *iodide of potassium*, ½ dr.; *iodine*, 20 gr.; occasionally agitate together until the iodine is dissolved. The above are applied to the head once or twice daily with a small piece of sponge, the part being previously washed clean, and wiped dry. The object is to well moisten the skin with the solution, after which the hair should be adjusted whilst still wet. The two last are very effective.

BALDWIN'S PHOSPHORUS. *Prep.* Heat *nitrate of lime* until it fuses; keep it in that state for 8 or 10 minutes, then pour it out into a warmed iron pot, allow it to cool slowly in a dry situation, and as soon as cold, break it into pieces, and keep it in a well-stoppered phial. After exposure to the sun for some time, it emits a white light in the dark.

BALENIC ACID. A fatty acid of little interest. Its salts are termed *balenates*.

BALL. This term is applied to various substances made up into a globular, spheroidal, or cylindrical form; as *ash balls*, *horse balls*, *sand balls*, &c. *Bounce balls*, are commonly made of *list* twisted round a *piece of cork* or *Indian rubber*; those for temporary purposes are made of *size*;—*crickat balls*, of *hard leather* firmly sewn together and weighted, or of *vulcanized Indian rubber*;—*toy balls*, of *soft leather* stuffed with *bran* or *cotton*. Gutta percha is also made into balls, but is not sufficiently tough to bear the blows of the cricket bat.

BALLOON. A bag or hollow pear-shaped vessel, made of varnished silk or other light material, and inflated with hydrogen gas, carburetted hydrogen, or heated air, so as to rise and float in the atmosphere. When filled with gas, it is called, by way of distinction, an *air-balloon*; when with heated air, a *fire-balloon*.

In the early days of aerostation, and indeed for some years afterwards, balloons were inflated with hydrogen gas, obtained by the action of sulphuric acid and water on iron-filings or small fragments of iron; but this method of filling them ultimately gave place to the cheaper and more convenient supply afforded by the gas-light companies. Of late years, the coal-gas furnished by the gas-works, has been generally, if not solely used for the inflation of balloons.

The aerostatic or ascensional power of balloons is proportional to their dimensions, in the *ratio* of the *cubes of their diameters*. It has been computed that a balloon of 60 feet diameter, filled with common hydrogen, would ascend with a weight of nearly 7000 *lb.* besides the gas case, whilst one of only 1½ feet in diameter, would barely float, owing to the less proportionate volume of gas to the weight of the case containing it. In round numbers, the buoyancy of a balloon may be reckoned as equal to 1 oz. for every cubic foot of hydrogen it contains, less the weight of the case and appendages. The carburetted hydrogen supplied by the gas works is much heavier than hydrogen gas, and consequently much less buoyant, for which due allowance must be made. That which possesses the least illuminating power, is the lightest, and consequently the best adapted for the purposes of aerostation.

The *fabric* of which *air-balloon cases* are made is strong thin silk, covered with an elastic varnish of oil or Indian rubber; the *netting* is of strong light silk or flaxen cord, and the car of basket-work. *Fire balloons* (on the small scale,) are generally made of silver paper, and are inflated by burning spirits of wine by means of a sponge dipped in it, and suspended just within the mouth of the balloon. Owing to the increasing rarity of the atmosphere as we ascend from the earth's surface, balloon cases are made much larger than is required to contain the necessary quantity of gas, to allow for its expansion as it rises into a rarer medium. A cubic foot of gas measured at the level of the sea, occupies a space of two feet at an elevation of 3½ miles. The following table will probably prove useful to the amateur aeronaut:—

TABLE *showing the relations between the diameters, surfaces, and capacities of spheres.* By Dr. URE.

Diameters.	Surfaces.	Capacities.
1	3·141	0·523
2	12·567	4·188
3	28·274	14·137
4	50·265	33·51
5	78·54	65·45
10	314·159	523·6
15	706·9	1767·1
20	1256·6	4189·
25	1963·5	8181·
30	2827·	14137·
40	5026·	33510·

BALLS (Barèges). *Prep.* 1. *Extract of soap-wort*, 3 oz.; *good glue* or *gelatine*, 1½ oz.; *water*, 4 oz.; dissolve with heat, and add, *sulphuret of lime*, 6 oz.; *common salt*, 1 oz.; (both in powder); mix thoroughly and form into balls weighing 2¼ oz. each, adding a little *powdered gum*, if required, to thicken the mass.

2. *Gelatine*, 8 oz.; *sulphuret of lime*, 12 oz.; *common salt*, 2 oz.; *water*, q. s.; dissolve, and add, *carbonate of soda* and *Castile soap*, of each, (in powder,) 2½ oz. One ball is sufficient to medicate the water of a bath for an adult.

BALLS (Bitter). *Prep.* 1. *Powdered gentian*, 2 *lb.*; *extract of gentian*, 1 *lb.*; *treacle*, q. s.; mix, and divide into half-pound rolls. For ale.

2. *Crude picric acid*, 1 *lb.*; *ground chamomiles*, 3½ *lb.*; *grains of paradise*, ½ *lb.*; "*foots*" or *syrup*, q. s. For pale ale.

3. To either of the above add *Spanish juice*, 1½ *lb.*; previously softened with a little boiling water. For porter and stout. The above are used by fraudulent brewers, as a substitute for hops; and by publicans in reducing their beer.

BALLS (Blacking). *Prep.* 1. (Bailey's.) *Gum tragacanth*, 1 *oz.*; *water*, 4 *oz.*; dissolve, add *sugar candy*, 4 *oz.*; and afterwards of *ivory black* and *Prussian blue*, (both in fine powder), of each, 2 *oz.*; *neat's foot oil*, 2 *oz.*; thoroughly incorporate, and evaporate by a gentle heat, constantly stirring, until of a proper consistence, then pour it into oiled moulds.

2. *Gum tragacanth*, 2 *oz.*; *sugar candy*, 4 *oz.*; *ivory black*, 1 *lb.*; *sweet oil*, 3 *oz.*; as last.

3. *Gum arabic*, *moist sugar*, *ivory black*, and *lamp black*, of each ½ *lb.*; *glue* (melted with a little water), 2 *oz*; *water*, 1 quart, or q. s.; *neat's foot oil*, ¼ pint; as before. *Used* by the shoemakers to blacken and polish leather.

BALLS (Camphor). Syn. *Chap Balls*, *Chilblain Balls*. *Prep.* 1. *Spermaceti* and *white wax*, of each, 2 *oz.*; *almond* or *olive oil*, 4 *oz.*; melt together by a gentle heat, add *powdered camphor*, 1 *oz.*; and when dissolved and partly cold, pour the mixture into small gallipots (*slightly* warmed,) so as to form hemispherical cakes.

2. To the last add of *balsam of Peru*, ¼ *oz.*; and either strain through muslin or decant the clear portion.

3. *Spermaceti cerate*, 1 *lb.*; *spermaceti*, 2 *oz.*; *camphor*, 1½ *oz.*; as before.

4. *Suet*, 14 *oz.*; *white wax*, *spermaceti*, and *camphor*, of each ¾ *oz.*

Obs. A rich *pink* or *reddish tinge* may be given by a little *alkanet root* or *dragon's blood*; a *yellow*, by *palm oil* or *annotta*; a *blue*, by a little *finely powdered indigo*; and a *green*, with *spinage* or a few grains of *verdigris*. Perfumes may be added according to taste; but are seldom required. The best for this purpose, are, *musk*, *civet*, *ambergris*, *vanilla*, *cinnamon*, *cassia*, *neroli*, *violet*, and *nutmeg*.

BALLS (Copying). *Prep.* 1. *Bees' wax*, 6 *oz.*; *mutton suet*, 2 *oz.*; *gum arabic*, 1 *oz.*; *indigo* and *lamp black*, of each ½ *oz.*; (the last three in *very fine* powder;) melt together, and when thoroughly incorporated, and partly cold, pour the mixture into small cylindrical moulds.

2. Substituting *bronze powder* for the *indigo* and *lamp black* above.

3. As last, but using *burnt terra di Sienna* for colouring.

Used by artists and amateurs to copy inscriptions, monumental brasses, and other raised or sunken patterns; the ball being rubbed over the paper previously laid flat on the design, and held securely in its place.

BALLS (Cream). *Prep.* 1. *White curd soap*, (grated), 1 *lb.*; *powdered starch*, 5 *oz.*; beat well together with *gum water*, q. s., and form into spheroidal or egg-shaped cakes, weighing about 1½ or 2 *oz.* each.

2. To the last add *powdered spermaceti*, 4 *oz.* *Used* to whiten and soften the hands.

BALLS (Heel). *Prep.* 1. (Ullathorne's.) *Bees' wax*, 1 *lb.*; *suet*, 3 *oz.*; melt together, and stir in *lamp black*, 4 *oz.*; *gum arabic*, 2 *oz.*; *sugar candy*, 1 *oz.*, previously reduced to an *impalpable* powder; and when thoroughly mixed and partly cold, pour the composition into tin or leaden moulds.

2. To the last add, *rosin*, 3 *oz.*; *oil of turpentine*, 2 *oz.*

3. *Suet* and *bees' wax*, of each, 4 *oz.*; *powdered gum*, *sugar candy*, and *Venice turpentine*, of each, 1 *oz.*: *lamp black*, 4 *oz.*; as before.

4. *Suet*, 4 *oz.*; *bees' wax*, 2 *oz.*; *lamp black* and *brown sugar*, of each, 8 *oz.*; *common size*, 5 *oz.*; melt together, and stir until incorporated.

Used by shoemakers to black leather, also by artists to copy inscriptions, &c. To produce a good article, the gum, colouring matter, and sugar, must be in the state of *very fine* powder, and the mixture carefully made; no lumps being left. Some persons dissolve the gum in a little water, and then stir the mixture over the fire until it acquires the proper consistence for moulding; but the first is the best method.

BALLS (Scouring). Syn. *Breeches Balls*, *Clothes Balls*, *Carpet Balls*. *Prep.* 1. *Curd soap*, (sliced), 1 *lb.*; *water*, 2 *oz.*; melt in a water bath or glue pot, and when cooled a little, add *ox-gall* and *oil of turpentine*, of each, 2½ *oz.*; mix well, and roll or mould the mass into balls or cakes.

2. *Fuller's earth*, 2 *lb.*; *curd soap*, 1 *lb.*; beat to a paste with *ox-gall*, q. s.

3. *Soft soap* and *fuller's earth*, equal parts, beat up either with or without a little *oil of turpentine* or *essence of lemons*. The above are used to remove paint, grease, and dirt from cloth. The spot, first moistened with hot water, is rubbed with the cake, and allowed to soak a few minutes, or to become nearly dry, when it is well rubbed with a little warm water and a brush or piece of woollen cloth, and afterwards rinsed in clean water, and finally rubbed dry and smoothed off with a piece of dry cloth or a brush. This is the composition so commonly vended about the streets of London in penny cakes.

4. *Whiting* and *pipeclay*, equal parts; *water*, q. s. Used for soldier's belts, trousers, &c.

5. *Pipeclay*, 2 *lb.*; *fuller's earth*, 1 *lb.*; *whiting*, ½ *lb.*; *water*, q. s.

6. *Bath brick*, 1 *lb.*; *pipeclay*, 2 *lb.*; *ox-gall*, ½ pint.

7. To the last add of *powdered pumice-stone*, 6 *oz.* The last four are used for cloth and leather, especially for drab and light coloured coats, trousers, breeches, belts, and gloves. *Rose pink*, *yellow ochre*, *umber*, *Irish slate*, or other like colouring matters may be added to produce any desired tint. *White pepper*, *cloves*, &c., are also occasionally added to drive away moths and insects; and *orris root* or *essence of bergamot* or of *lemon grass*, as perfume.

BALM OF GILEAD. Syn. *Balm of Mecca*, *Balsam of Mecca*, *Opobalsam*; *Balsamum Gileadense*, *B. Judaicum*, *B. è Mecca*, *Opobalsamum*,—Lat. A fragrant oleo-resinous substance obtained from the *amyris Gileadensis*, (Linn.) a middle-sized tree growing in Arabia Felix, Asia Minor, and Egypt, belonging to the *nat. ord.*, Terebinthaceæ. The *best balm of Gilead* is a spontaneous exudation from the tree; a *second quality* is obtained by cutting the bark with an axe, and receiving the juice which exudes in a small earthen bottle. Both of these varieties are extremely costly and scarce, and are held in such high estimation by the Turks and Egyptians, that none of them are exported as an article of commerce. "There are only two shops in Constantinople at which the genuine balsam can be obtained. Its price is exorbitant, *one grain* being charged 5 Turkish piastres, or 1*s.* 0½*d.* English." That which is sent to England is obtained by boiling the leaves and young twigs of the *balsam tree* in water, and is rejected by the Orientals as worthless. The genuine balsam of Mecca is of a clear golden colour, and possesses a penetrating and delicate fragrance, and a sharp, bitter, astringent taste. A drop let fall on hot water, spreads itself over the whole surface, like a film of oil, and again contracts on the water cooling. It is *not* entirely soluble in hot rectified spirit, but dissolves *completely* in both the fixed and volatile oils, which then assume the peculiar odour and flavour of the balsam. The inferior qualities, or those of commerce, are generally opaque and thick, rapidly resinifying and turning yellow by age. When applied to the skin it causes redness and swelling. It was formerly regarded as possessing the most exalted virtues as an antiseptic, stimulant, vulnerary and nervine, and its fumes were supposed to prevent barrenness. It is still employed in the East as a cosmetic and perfume, and is said to be unequalled for giving a healthy glow to the complexion and promoting the growth of the hair. Its medicinal qualities appear to be intermediate between those of the turpentines and balsam of tolu. *Dose.* From 6 to 12 drops. The cosmetics recently so much advertised as *balm of Mecca*, do not contain even a trace of that article; nor do we believe that there is a single drop of the genuine balm to be purchased in London.

BALM OF GILEAD (Factitious). *Prep.* 1. *Gum benzoin*, (bright, coarsely powdered,) 4 *oz.*; *liquid styrax*, (best,) 3 *oz.*; *balsam of tolu*, 2 *oz.*; *Canadian balsam*, 1 pint; mix in a flask, and expose it (closed) to the heat of a water bath (frequently

stirring) until the liquid is saturated; when the whole has become cold and clear, decant the upper portion, and add of the *oils of lemon* and *cassia*, of each, 1 *oz.*; *oils of rosemary* and *nutmeg*, of each, ½ *oz.* It may be thinned down with *rectified spirit of wine.*

2. *Gum benzoin*, 4 *oz.*; *liquid styrax*, 3 *oz.*; *balsam of tolu*, 2½ *oz.*; *strongest rectified spirit*, ¾ pint; *oils of lemon, cassia, rosemary*, and *nutmeg*, of each, 1 *oz.*; make a tincture, decant, and add *Canadian balsam*, 12 *oz.*

3. *Yellow rosin*, 10 *oz.*; melt, and after 15 minutes, remove the vessel from the heat, and add of *tincture of benzoin* and *oil of lemon*, of each, 3 *oz.*; *oils of caraway* and *rosemary*, of each, 2 *oz.*

BALM OF GILEAD (Dr. Solomon's). *Prep. Compound mixture of cardamoms* (made with brandy instead of proof spirit,) ¾ pint; *syrup of saffron*, 6 *oz.*; *tincture of cantharides* (Ph. L.) 1½ *oz.*; mix. The smallest bottle of Dr. Solomon's "*balm of Gilead*" is 11*s.*

BALM OF SYRIACUM (Perry and Co's). *Prep.* Take of *English gin*, 1 pint; *moist sugar*, ½ *lb.*; (dissolved in) *water*, 4 *oz.*; mix, and add of *paregoric* (Tinct. Camph.Co., Ph. L. 1836), 1 *oz.*; *tincture of tolu*, ½ *oz.*; *tincture of cantharides*, q. s.; together with a few drops each of the *oils of aniseed* and *spearmint*; agitate well together, and the next day filter, or decant the clear portion.

BALSAM (Anodyne.) Syn. *Balsamum Anodynum, B. Tranquillans*,—Lat. *Prep.* 1. (Bate's.)—*a.* Take of *Castile soap*, (in shavings,) 12 oz.; *camphor*, 7 oz.; *powdered opium*, 2 oz.; *hay saffron* and *oil of rosemary*, of each, 1 oz.; *rectified spirit*, 4 pints; digest for 10 days and filter or decant.—*b.* To *opodeldoc*, 3 oz., add *laudanum*, 1 oz. *Used* as an anodyne, and as a rubefacient for sprains, sore throats, rheumatism, &c. *Dose.* 20 to 60 drops. The liniment of opium, (*Lin. Opii*,—Ph. L.) is commonly sold for it.

BALSAM (Apoplexy). Syn. *Balsamum Apoplecticum, B. ad Apoplecticos*,—Lat. *Prep.* 1. *Amber, civet, musk, Peruvian balsam*, and *volatile oils*, made into a balsam.

2. (Ph. E. 1744.) *Expressed oil of nutmeg*, 1 oz.; liquefy by a gentle heat, and stir in of the *oil of cloves, lavender*, and *rosemary*, of each, ½ dr.; *oil of amber*, 10 drops; *balsam of Peru*, 1 dr. Formerly used to anoint the head and nostrils of apoplectic patients, and believed to be of great efficacy.

BALSAM (Camphorated). Syn. *Balsamum Aceticum Camphoratum*,—Lat. *Prep.* (Pelletier.) *Curd soap* and *camphor*, of each, 5 dr.; *oil of thyme*, 40 drops; *acetic ether*, 5 oz.; digest together in a stoppered bottle until the solids are dissolved. An efficacious liniment in certain forms of rheumatism and gout.

BALSAM (Chilblain). Syn. *Balsamum ad Perniones*,—Lat. *Prep.* (Lejeune.) *Camphor*, 1 dr.; *tincture of benzoin* and *iodide of potassium*, of each, 5 dr.; *solution of diacetate of lead*, 10 dr.; *proof spirit* (made with rose-water), 2½ oz.; mix, and add a warm solution of *curd soap*, 10 dr., made with a second 2½ oz. of the same spirit.

BALSAM (Godbold's Vegetable). *Prep.* Of *lump sugar*, 1 lb; *vinegar*, ½ pint: *garlic* ½ oz.; *tincture of tolu*, 1 teaspoonful; *rectified spirit*, 3 oz. Steep the garlic in the vinegar for 3 or 4 days, strain, dissolve the sugar, and add the other ingredients. Simple oxymel is now generally substituted for it.

BALSAM (Goulard's). Syn. *Balsamum Goulardii, B. Saturni*,—Lat. *Prep.* (Van Mons.) Triturate *powdered acetate of lead* with *hot oil of turpentine*, in a heated mortar, until no more will dissolve; and after repose, whilst still hot, decant the clear portion. Recommended as a useful application to foul and painful ulcers.

BALSAM (Green). Syn. *Balsamum Viride*,—Lat. *Prep.* 1. *Linseed oil*, 6 lb; *gum elemi*, 1 lb; heat together; add *powdered verdigris*, 3 oz. or q. s. to colour; and decant the clear portion.

2. *Linseed oil* coloured with *verdigris.* Both were formerly much used by surgeons as detergents.

BALSAM (Locatelle's). Syn. *Locatelli's Balsam; Balsamum Locatelli, B. Lucatelli, B. Italicum*,—Lat. *Prep.* 1. (Original Formula.) *Olive oil*, 6 oz.; *yellow wax*, 4 oz.; *sherry wine*, 5 fl. oz.; *red sanders*, (in very fine powder,) 4 dr.; simmer together until the moisture is nearly evaporated, then add of *Strasburg turpentine*, 6 oz.; *balsam of Peru*, 2 dr.; and strain through linen.

2. (Ph. E. 1744.) *Olive oil*, 24 fl. oz.; *yellow wax*, 1 lb; melt and add of *Venice turpentine*, 1½ lb; and, when cooled a little, further add, *powdered dragon's blood*, 1 oz.; *balsam of Peru*, 2 oz.; and stir until cold.

3. (Ph. L. 1746.) *Olive oil*, 16 fl. oz.; *Venice turpentine* and *yellow wax*, of each, ½ lb; *red sanders*, 6 dr.

Uses. The above was once highly es-

teemed in phthisis and chronic coughs, in doses of ½ dr., or more, mixed with an equal weight of *conserve of roses;* and as a mild stimulating ointment. It is still a common pectoral amongst the lower classes.

BALSAM (Metz's). Syn. *Balsamum Viride Metensium,*—Lat. *Prep.* (Guibourt.) *Linseed oil* and *olive oil*, of each, 6 oz.; *oil of laurel berries*, 1 oz.; *common turpentine*, 2 oz.; melt by a gentle heat, and add, of *verdigris*, 3 dr.; *aloes*, 2 dr.; *sulphate of zinc*, 1½ dr.; (all in powder;) mix well, pour the liquid into a bottle, and add of *oil of juniper*, 4 dr.; *oil of cloves*, 1 dr. *Used* on the continent as a common detergent dressing to wounds and ulcers.

BALSAM (Odontalgic). Syn. *Toothache Balsam; Balsamum Odontalgicum,*—Lat. *Prep.* 1. *Rectified oil of turpentine* and *balsam of Peru*, of each, 1 oz.; *oils of cloves* and *cajeput*, of each, 2 dr.; *opium* (in fine powder), 1½ dr.; digest with frequent agitation for a fortnight.

2. For *oil of turpentine*, in the last, substitute *highly rectified spirit of wine.*

3. (Van Mons.) *Opium* and *camphor*, of each, 40 gr.; dissolve in a little *alcohol*, and add *oil of cloves*, 1 dr.; *oil of guaiacum*, 2 dr.; *oil of nutmeg*, 6 dr. A drop or two to be applied to the tooth or gum by means of a camel's hair pencil, or a piece of lint.

BALSAM (Pectoral). *Prep. Tincture of tolu* and *compound tincture of benzoin*, of each, 2 oz.; *rectified spirit*, 4 oz. Mix. *Used* as a pectoral in coughs, hoarseness, &c.

BALSAM (Riga). Syn. *Carpathian Balsam; Balsamum Carpathicum, B. Libani,*—Lat. A pellucid white fluid obtained by careful distillation from the young shoots of the *pinus cembra* (Linn.) or Siberian stone pine. It much resembles oil of juniper, and is diuretic and vulnerary. It is much esteemed by some for sprains and bruises. The bottoms of oil of juniper are commonly sold for it in the shops. The spirit distilled from pine-tops (*spiritus turionum pini,*) is also frequently, though incorrectly, called *Riga Balsam.*

BALSAM (Sanchez's Gout). The same as the *camphorated balsam* of M. Pelletier.

BALSAM (Stomachic). Syn. *Balsamum Stomachicum,*—Lat. *Prep.* (Ph. Slesv.-Hols., 1831.) *Oils of cloves, mace, wormwood,* and *peppermint*, of each, 1 dr.; *balsam of Peru*, 2 dr.; *oil of nutmeg*, 2 oz.; mix. 1 to 5 drops on sugar, or dissolved in spirit.

BALSAM (Thibaut's). *Prep.* Take of *myrrh, aloes,* and *dragon's blood*, of each, 1 dr.; *flowers of St. John's wort*, 1 handful; *spirit of wine*, ½ a pint; *Canada balsam*, ½ oz.; digest the flowers in the spirit for 3 days, express the liquor, and dissolve the other ingredients in it. *Dose.* 1 to 2 teaspoonfuls; in gonorrhœa, &c. Also used to heal cuts and wounds, and to stop bleeding.

BALSAM OF AMBER. Syn. *Balsamum Succini,*—Lat. The article to which this term is usually applied, has been already noticed. Oil of amber formerly was also so called, and the same name has been given to the following preparations by their inventors:

1. (Radius.) *Oil of amber*, 4 fl. oz.; *oil of myrrh*, 2 fl. oz.; *oil of turpentine*, 1 fl. oz.; mix with a gentle heat.

2. (Bate.) *Powdered amber*, 1 oz.; *oil of turpentine*, 3 oz.; digest with heat in a closed vessel until dissolved. Both are stimulant and antispasmodic, and may be used either internally or as a friction, in the same way as oil of amber.

BALSAM OF ARCÆUS. Syn. *Balsamum Arcæi,*—Lat. A digestive ointment formerly in great repute and still employed on the Continent. *Prep.* (Soubeiran.) *Mutton suet*, 4 parts; *turpentine* and *elemi-resin*, of each, 3 parts; *hog's lard*, 2 parts; melt together, strain, and stir until nearly cold. In the original formula, *boiling water*, 4 parts, were ordered to be stirred in. This preparation is now superseded in England by the *unguentum elemi* of the Pharmacopœia.

BALSAM OF CLOVES. Syn. *Aromatic Balsam of Cloves; Balsamum Caryophylli,*—Lat. *Prep.* (Bories.) *Oil of cloves* and *oil of nutmeg*, of each, ½ dr.; *spirit of juniper berries*, 3 oz.; mix. Rubefacient and diuretic.

BALSAM OF FIOVARENTI. Syn. *Balsamum Fiovarenti,*—Lat. *Prep.* (P.C.) *Venice turpentine*, 16 oz.; *amber, elemi, galbanum, myrrh, styrax*, and *tacamahaca*, of each, 3 oz.; *aloes*, 1 oz.; *bay-berries*, 4 oz.; *cinnamon, cloves, galangal, ginger, nutmegs*, and *zedoary*, of each, 1½ oz.; *dittany of Crete*, 1 oz.; *rectified spirits*, 8 lb.; macerate a week and distil off 7 lb. The distilled spirit constitutes this notable preparation of, professedly, many virtues.

BALSAM OF GUAIACUM. Syn. *Balsamum Guaiaci, B. Guaiacinum,*—Lat. *Prep.* (Ph. L. 1745.) *Gum guaiacum*, 1 lb; *balsam of Peru*, 3 dr.; *rectified spirit*, 1 quart; digest 10 days, and filter. Diaphoretic and arthrodynic. *Dose.* 30 to 60 drops, in milk or water; in agues, rheumatism, &c.

BALSAM OF HONEY. Syn. *Pectoral Balsam of Honey; Balsamum Mellis, B. Pectorale*,—Lat. *Prep.* 1. *Balsam of tolu*, 1 ℔; *honey*, 2 ℔; *rectified spirit*, 1 gall.; make a tincture.

2. To the last add *turmeric*, 1 oz.; *powdered opium*, 3 oz.

3. (Hill's.) *Balsam of tolu*, 4 oz.; *styrax* and *powdered opium*, of each, 1 oz.; *honey*, 1 ℔; *rectified spirit*, 1 quart. A good pectoral in tickling coughs, hoarseness, &c., without fever. *Dose.* For an adult, ½ to 1½ teaspoonful; accompanied by a dose or two of aperient medicine. Tincture of *balsam of tolu*, or of *benzoin*, or a *mixture of the two*, is frequently sold in the shops under the name of "*balsam of honey.*"

BALSAM OF HOREHOUND. Syn. *Balsamum Marrubii*,—Lat. *Prep.* 1. *Extracts of horehound* and *liquorice*, of each, 2 oz.; *hot water*, ½ pint; dissolve, and when cold, add of *paregoric*, ¾ pint; *oxymel of squills*, 6 oz.; *tincture of benzoin*, 2 oz.; *honey*, 10 oz.; mix well, and strain through flannel.

2. (Ford's.) *Horehound herb* and *liquorice root*, of each 3½ ℔; *water*, 1 gall.; infuse 12 hours, strain off 6 pints, and add of *camphor*, 10 dr.; *powdered opium* and *benzoin*, and *oil of aniseed*, of each, 1 oz.; *powdered squills*, 2 oz.; *proof spirit*, 1½ gall.; macerate a week, add *honey*, 3½ ℔; and strain. Both are pectoral, but the first is the best formula in practice. The *dose* and *uses* are the same as those of *balsam of honey*.

BALSAM OF LIFE. Syn. *Balsamum Vitæ*,—Lat. *Baume de Vie, Elixir de Vie*,—Fr. Several compound medicines have been so called.

1. (Hoffman's.)—*a.* Of the *oils* of *cinnamon, cloves, lemon, lavender*, and *nutmegs*, and *balsam of Peru*, of each, 2 dr.; *essence of ambergris, oil of amber*, and *oil of rue*, of each, 1 dr.; *cochineal*, 12 gr.; *strongest rectified spirit*, 3½ pints; mix.

b. (Ph. Dan. 1840.) *Oils of cinnamon, cloves, lavender*, and *nutmegs*, of each, 20 gr.; *purified oil of amber*, 10 drops; *balsam of Peru*, 30 gr.; *rectified spirit*, (tinged with alkanet root,) 10 oz.

2. (Gabius's.) Nearly similar to Hoffman's.

3. (Turlington's.) *Benzoin* and *liquid styrax*, of each, 12 oz.; *balsam* of *tolu* and *extract of liquorice*, of each, 4 oz.; *balsam of Peru*, 2 oz.; *aloes, myrrh*, and *angelica root*, of each, 1 oz.; *highly rectified spirit of wine*, 7 pints; digest, with frequent agitation for 10 days, and filter. *Externally*, the above are rubefacient, and corroborant; *internally*, stimulant, cordial, and pectoral.

4. (*Baume de vie externe.*) *Soap liniment*, 2 parts; *oil of turpentine*, 1 part; mix. Stimulant and rubefacient. *Used* as a friction.

5. (*Baume de vie purgatif; Elixir de vie.*)—*a.* (Briett.) *Socotrine aloes* and *saffron*, of each, 2 dr.; *rhubarb*, 6 dr.; *liquorice root*, 1 oz.; *proof spirit* or *brandy*, ½ pint; digest a week, and filter.

b. (*Original Swedish Formula.*) *Aloes*, 9 dr.; *agaric, gentian, rhubarb, saffron, theriaca*, and *zedoary*, of each, 1 dr.; *proof spirit* or *brandy*, 1 quart. A mild stomachic purge. *Dose.* 1 to 6 dr. *Tincture of rhubarb and aloes* (Ph. E.) is commonly substituted for it.

BALSAM OF LIQUORICE. Syn. *Balsamum Glycyrrhizæ*,—Lat. *Prep.* 1. *Extract of liquorice* and *honey*, of each 3 oz.; melt together, and add of *paregoric* and *oxymel of squills*, of each, 2 oz.; *tincture of tolu*, 1 oz.

2. The nostrum sold under this name, according to Dr. Paris, consists of *paregoric elixir*, strongly impregnated with *oil of aniseed*, (and sweetened with *honey.*) *Dose* and *properties*, similar to those of *Balsam of Honey*.

BALSAM OF NUTMEG. Syn. *Balsamum Myristicæ, B. Nucistæ*,—Lat. *Prep.* (Ph. Bor. 1847.) *Expressed oil of nutmeg* (mace ?), 3 oz.; *olive oil*, 1 oz.; *yellow wax*, ½ oz.; melt together by a gentle heat, pour the mixture into paper moulds, and when cold, cut the mass up into cakes.

BALSAM OF RACKASIRI. A species of balsamic turpentine, said to be obtained from the *bursera balsamifera*, (Pers.) an Indian tree of the *natural order* Terebinthaceæ. The nostrum vended under the name by certain quacks, simply consists of *English gin, coloured, sweetened*, and *aromatised.*

BALSAM OF SAFFRON. Syn. *Balsamum Croci*,—Lat. *Prep.* Steep *hay saffron*, 1 oz., in *French brandy*, ¾ pint, for a week; press out the liquor, and add, *syrup of orange peel*, and *honey*, of each, 3 oz.; *orange-flower water*, 2 oz.; *compound tincture of cardamoms*, 1 oz.; *tincture of tolu*, 4 dr.; *essence of musk*, 12 drops; *oil of nutmeg*, 8 drops; agitate well together, and in a week decant the clear. Stimulant, stomachic, and antispasmodic. A favorite remedy for low spirits, flatulence, &c. *Dose.* 1 or 2 teaspoonfuls, or more, in a glass of wine, or with a spoonful of weak spirit or Cologne water, when required. Chiefly taken by ladies.

BALSAM OF SOAP (Ethereal). *Prep.* (Cottereau.) *Castile soap* (powdered) and *camphor*, of each, 1 dr.; *oil of thyme*, 10 drops; *acetic ether*, 1 oz.; dissolve in a close vessel with the aid of a gentle heat, and decant the clear. *Used* as an embrocation or liniment in gout, rheumatism, &c.

BALSAM OF SULPHUR. Syn. *Oil of Sulphur, Sulphurated Oil; Oleum Sulphuratum, Balsamum Sulphuris,* — Lat. *Prep.* 1. (Ph. L. 1746.) *Flowers of sulphur*, 1 part; *olive oil*, 4 parts; boil together in a vessel lightly covered, until they assume the consistence of a thick balsam.

2. (Ph. L. 1824). *Olive oil*, 16 fl. oz.; heat it in a sand bath, and gradually add of *washed sulphur*, 2 oz.; stirring until they combine.

Prop., &c. Balsam of sulphur is a dark, reddish-brown viscid fluid, having an extremely disagreeable and penetrating odour, and a strong, nauseous taste. The *local action* of balsam of sulphur is that of an acrid and irritant; its *remote effects*, those of a stimulant, expectorant, and diaphoretic. *Externally*, it is occasionally used as an application to foul ulcers; and was formerly commonly employed *internally*, in chronic pulmonary affections, in *doses* of 20 to 50 drops. It is now seldom given internally, except in veterinary practice.

BALSAM OF SULPHUR (Anisated). Syn. *Balsamum Sulphuris Anisatum,*—Lat. *Prep.* 1. *Balsam of sulphur*, 4 parts; *oil of aniseed*, 1 part; mix.

2. (Ph. E. 1722). *Sulphur*, 2 oz.; *oil of aniseed*, 4 fl. oz.; *oil of turpentine*, 6 fl. oz.; mix, digest in a sand heat until the oils are saturated, and decant the clear.

BALSAM OF SULPHUR (Bituminated). Syn. *Balsamum Sulphuris Barbadense, Petroleum Sulphuratum,*—Lat. *Prep.* 1. (Ph. L. 1746). *Sulphur*, 1 part; *Barbadoes tar*, 4 parts; as last.

BALSAM OF SULPHUR (Ethereal). Syn. *Balsamum Sulphuris Æthereum,*—Lat. *Prep.* (Augustin.) *Sulphuric ether* and *terebinthinated balsam of sulphur*, of each, 1 dr.; *Dippel's animal oil*, 12 dr.; mix. In chronic pulmonary affections, flatulent colic, &c. *Dose.* 7 to 12 drops.

BALSAM OF SULPHUR (Terebinthinated). Syn. *Balsamum Sulphuris Terebinthinatum,*—Lat. *Prep.* 1. (Ph. E. 1722). *Sulphur*, 2 oz.; *oil of turpentine*, 6 fl. oz.; digest, to saturation, over a sand bath, and decant the clear portion.

2. (Vans Mons.) *Sulphur*, 1 part; *oil of turpentine*, 2 parts. All the above, for the most part, resemble the simple balsam of sulphur in their general properties, and are used in similar cases.

BALSAM OF TURPENTINE. Syn. *Balsamum Terebinthinæ,*—Lat. This name has been given to Strasburgh, Venice, and other like turpentines, as also to the following compounds—

1. *Black rosin*, 1 lb; melt by a gentle heat, and after a short time pour off the clear portion, and when cooled a little, add to it, of *oil of turpentine* (warm), 1 pint.

2. To the last add of the *oils of nutmeg* and *cassia*, of each, 1 dr.

BALSAM OF TURPENTINE (Emollient). Syn. *Balsamum Terebinthinatum,* —Lat. *Prep.* (Beasley.) *Olive oil*, 6 oz.; *oil of turpentine*, 2 oz.; *yellow wax*, 1 oz.; *balsam of Peru*, 2 dr.; *camphor*, 1½ dr. A stimulant emollient, useful in contusions, ulcerations, engorgements, nephritic pains, &c.

BAMBOO HABIT. A species of life preserver used in China, consisting of four pieces of bamboo formed into a square frame by tying their corners together. When slipped over the head and shoulders, and fixed under the armpits, a person, though unable to swim, may easily support his head above water.

BANDAGE. Pieces of linen, flannel, or other material, used to support parts, to exert pressure on them, or to retain dressings in their proper places. The application of bandages, as in the dressing of wounds, ulcers, &c., though of frequent occurrence, is often carelessly or badly performed. The nature of the part and the object in view, should always receive due consideration. Ordinary ingenuity will supply the rest. The safest, simplest, and most effective means of fastening them on, is, in most cases, furnished by a common needle and thread or cotton. The full consideration of the subject belongs to *surgery*.

BANDAGE (Mustard). A *woollen roller* soaked in a thin soup made with the best *flour of mustard* and *warm water*, and the excess of moisture expelled by gentle pressure. *Used* to envelope the body or limb, by repeatedly folding it round the part; in the cold stages of cholera, and in other cases requiring an energetic stimulant.

BARBADOES LEG. Syn. *Elephantiasis Arabum,*—Lat. A disease indigenous to Barbadoes, and frequent in other hot climates, in which the limb becomes tumid, hard, and misshapen. The *treatment* consists in diminishing febrile and inflammatory action, by bleeding, purgatives, and low diet. Mercury may be advantageously administered, and leeches, and warm fomenta-

tions and poultices, had recourse to. Sometimes amputation is necessary.

BARILLA. The ashes left from the combustion of *salsola, salicornia, chenopodium*, and other species of the order *chenopodiaceæ*. These plants, which are cultivated on the sea coast for the purpose, are cut down when ripe, dried, and burned in heaps. The resulting hard gray or bluish porous mass (*barilla,*) consists of carbonate and sulphate of soda, chloride and sulphuret of sodium, carbonate and sulphate of lime, alumina, silica, oxide of iron, and imperfectly consumed carbonaceous matter, with a little iodine and bromine. The proportion of soda varies in different varieties.

Alicant barilla; (*soda alicantina;*) obtained chiefly from several species of *salsola*, and from *chenopodium setigerum, &c.*, contains from 25% to 40% of carbonate of soda. (Guibourt.)

Narbonne barilla; from *salicornia annua* or *herbacea;* contains 14% to 15% of carbonate of soda.

Barilla of Aiguemortes, (*blanquette;*) from mixed plants; contains 3% to 8% of carbonate of soda. (Guibourt.)

Sicily barilla. Principally from *salsola sativa;* furnishes 55% of carbonate of soda. (Fée.)

Uses, &c. Barilla is chiefly used in the manufacture of soap and glass. *Good barilla* contains, on the average, about 20% of real alkali. It is chiefly imported from Spain, Sicily, Teneriffe, and the Levant; but since the introduction of Le Blanc's process for obtaining soda from common salt, its importance and value has considerably lessened. See *Soda* and *Alkalimetry.*

BARIUM. Syn. *Barium*,—Lat. The metal of which the earth baryta is an oxide.

Prep. 1. A paste is made with *pure baryta* or *carbonate of baryta*, and *water*, which is laid on a small *tray of platinum*, and a little hollow being made on its surface, a *globule of mercury* is placed therein. The *positive pole* of a powerful galvanic battery (say, of 100 double plates;) is then connected with the *platinum*, whilst the *negative pole* is inserted into the *globule of mercury.* In a short time an *amalgam of barium* is formed, which, on being heated *in vacuo*, or in a small sealed bent tube of glass, (free from lead,) filled with the vapour of *mineral naphtha*, parts with its mercury, and *pure barium* remains behind.

2. From *baryta*, by strongly heating it in an *iron tube*, through which the vapour of *potassium* is conveyed. The reduced barium is extracted by quicksilver, which is afterwards driven off in a small green-glass retort, as above.

Prop., &c. A gray-coloured metal, possessing little lustre, rapidly decomposed by both air and water, with the absorption of oxygen and the production of oxide of baryta, (*barytes.*) It is fusible at a red heat; burns, in contact with air with a deep red light; and has more than twice the sp. gr. of water.

BARIUM (Bromide of). Syn. *Barii Bromidum*,—Lat. *Prep.* (Magendie.) Boil a solution of *protobromide of iron* with *moist carbonate of baryta*, in slight excess; filter, evaporate to dryness, and heat the residuum to redness. By careful evaporation of its aqueous solution it may be obtained in crystals. Its physiological properties resemble those of iodide of barium.

BARIUM (Chloride of). Syn. *Hydrochlorate of Baryta, Muriate of Baryta; Barii Chloridum*,—Ph. L. & D.; *Barytæ Murias*,—Ph. E. *Barytæ Hydrochloras*,—Lat. *Prep.* 1. (Ph. L. 1836.) *Carbonate of baryta*, (in small pieces,) 10 oz.; *hydrochloric acid*, ½ pint; diluted with *distilled water*, 1 quart; mix gradually, strain, evaporate until a skin forms on the surface, and set it aside to crystallize.

2. (Ph. L. 1851.) Included in "appendix" of Tests and Reagents; no form given, the crystals, "*Barii Chloridi* (crystalli)" being ordered.

3. (Ph. E.)—*a.* Similar to that of the Ph. L. 1836.

b. By adding *hydrochloric acid* to a hot solution of *sulphuret of barium*, as long as it occasions effervescence; and evaporating and crystallizing the resulting solution.

4. (Ph. D.)—*a.* Similar to No. 1, but directing the filtered solution to be evaporated to dryness, exposed to a low red heat, for 20 minutes, in a Hessian crucible, and the residuum to be powdered, redissolved in water, evaporated and crystallized.

b. Similar to 3, *b*, (above.)

Prop. Flat, four-sided, colourless, crystals; slightly efflorescent in dry warm air, but otherwise suffer no change; decrepitate when heated and lose their water of crystallization; insoluble in alcohol; 100 parts of water, at 60° dissolve 43·5 parts of the crystals, and when boiling, 75 parts. If the crystals become moist or deliquesce by exposure to air, they contain either chloride of calcium or of strontium, or perhaps chloride of magnesium. "100 grains, in solution, are not entirely precipitated by

100 gr. of (crystallized) sulphate of magnesia." (Ph. E.)

Uses, &c. It is principally employed as a test for sulphuric acid, its solution causing a white precipitate in another solution, containing oil of vitriol or a sulphate. It has been given in scrofula, scirrhous cancer, skin diseases, &c. It is poisonous. Its antidotes are the same as those for baryta.

BARIUM (Ferrocyanide of). Syn. *Barii Ferrocyanidum*,—Lat. From *pure ferrocyanide of iron*, digested in *baryta water*. By careful evaporation, efflorescent prismatic crystals may be obtained, soluble in 4½ parts of water.

BARIUM (Iodide of). Syn. *Hydriodate of Baryta; Barii Iodidum, Barytæ Hydriodas*,—Lat. *Prep.* 1. (Phillips.) Dissolve *sulphuret of barium* in *water*, and add *iodine* (gradually) in excess; filter and evaporate to dryness or crystallize.

2. (Magendie.) Digest *freshly-precipitated carbonate of baryta*, in excess, in a *hot solution* of *iodide of iron*; filter, evaporate, and crystallize.

Prop., &c. A white or grayish white mass, or acicular crystals, (according to the mode of its preparation;) very soluble in both water and alcohol; and decomposed by exposure to the air. It has been highly recommended in scrofula. *Dose.* ⅛ gr. (gradually increased to 1 gr.) two or three times a day. *Externally*, as an ointment (4 gr. to *lard* 1 oz.) as an application to scrofulous swellings. (Biett.) It possesses all the *irritant, corrosive*, and *poisonous properties* of the chloride, but in a more violent degree.

BARIUM (Oxides of). Barium forms two compounds with oxygen—an *oxide* and a *binoxide*.

BARIUM (Protoxide of). Syn. *Oxide of Barium, Baryta, Barytes; Barii Oxydum, Baryta*,—Lat. *Prep.* 1. From pure *crystallized nitrate* of *baryta*, strongly ignited in a capacious porcelain crucible, until red vapours cease to be evolved.

2. From a mixture *of carbonate of baryta* and *charcoal* strongly ignited in a black lead crucible.

3. (*Hydrated*). From a solution of either *nitrate of baryta* or of *chloride of barium*, precipitated with a solution of *pure potassa* or *soda*.

4. (*Crystals*). A *strong solution of sulphuret of barium*, is boiled with successive portions of *black oxide of copper*, until it ceases to give a black precipitate with a salt of lead; the liquid, after filtration, yields crystals of the hydrate on cooling.

Prop. Obtained by the first two processes it forms a grayish white mass or powder, having a very caustic and alkaline taste, and slaking, on the addition of water, like quicklime, but with the evolution of more heat. It then forms a bulky white powder, (*hydrate*,) resembling that prepared by the third formula. In this form it is soluble in 20 parts of cold and 2 parts of boiling water. Like lime it rapidly passes into the state of carbonate on exposure to air, and in taste, causticity, and alkalinity, resembles that substance. Of all the bases it has the strongest affinity for both sulphuric and carbonic acid, and hence, its solution, (*baryta water*,) and that of one of its neutral salts (*nitrate* or *hydrochlorate*) form our most sensitive tests for those substances.

BARIUM (Binoxide of). Syn. *Peroxide of Barium, Deutoxide of do. Prep.* 1. From *pure baryta*, heated to full redness in a porcelain tube, and exposed to a *stream of pure* dry *oxygen gas*.

2. From *baryta*, 4 parts, heated as above, in a platinum crucible, and *chlorate of potassa*, 1 part, gradually added; the chloride of potassium formed being afterwards washed away with cold water.

3. From *nitrate of baryta* heated in a porcelain tube or retort, until nitrous fumes cease to be evolved, and then expose to a stream of oxygen until the latter ceases to be absorbed. The process for about 4 *lb.* occupies from 3 to 4 hours.

Prop., &c. Gray or grayish white: with water it forms a hydrate, which is slightly soluble in water, and undecomposed by it in the cold. See *Oxygenized Acids*.

BARIUM (Sulphuret of). Syn. *Sulphide of Barium; Barii Sulphuretum, Barytæ Sulphuretum*,—Lat. *Prep.* 1. (Van Mons.) *Sulphate of Baryta*, 11 parts; *charcoal*, 1 part; *oil of turpentine*, q. s. to form a stiff paste; heat the whole in a crucible to redness, cool, and bottle.

2. (Ph. E.) *Sulphate of baryta* (previously calcined and reduced to fine powder), 2 lb; *charcoal* (in fine powder), 4 oz.; submit the mixture, in a covered crucible, to a low white heat for 3 hours, cool, powder, boil for 5 minutes in *water*, 5 pints; decant the clear, and repeat the operation with 3 pints more of *water*, and unite the mixed liquors, (which may then be either neutralized with acids to form barytic salts, or allowed to deposit crystals by cooling).

3. (Ph. D.) *Sulphate of baryta*, 1½ *lb.*; *lamp black*, 4 oz.; as last (nearly).

Prop., &c. Soluble in water; rapidly decomposed by exposure to the air. It is principally used to form the barytic salts, and in organic analysis.

BARK. The *uses* of different species of

bark in medicine and the arts are well known. *Cinchona bark* is invaluable in fevers; *oak bark* furnishes the tanner with one of the most important materials of his trade; and the tenacious fibres of other varieties are manufactured into cordage and textile fabrics.

"*Barks* are to be *collected* at that season in which they can be most easily separated from the wood." (Ph. L.) This, with few exceptions, is late in the spring, at which time the active principles deposited in the cells of the bark are most abundant. Oak bark, collected in spring, contains *four times* as much astringent matter as that collected in winter.

BARK (Essential Salt of). Disulphate of quinine. The nostrum vended under this name is merely an *infusion of cinchona bark* evaporated to dryness.

BARLEY. Syn. *Hordeum*,—Lat. A well-known grain, the produce of several species of the genus *hordeum*.

The leading constituents of barley are nearly similar to those of wheat, but it is scarcely so rich in nitrogenized matter as the latter grain. According to Einhoff, the ripe seeds are composed of *meal*, 70·05%; *husk*, 18·75%; and *moisture*, 11·20%. Average fine *barley-meal* contains—*starch*, 68%; *albumen*, *gluten*, &c., 14%; *fatty matter*, 2%; *ash* or *saline matter*, 2%; *water*, 14%. (Johnston.)

After wheat, barley may be considered the most valuable grain to man, both for the purposes of food and the manufacture of several beverages in general consumption. It forms good wholesome bread, well adapted for persons who live luxuriously; but for the abstemious and the delicate, wheaten bread is preferable. In a *medical point* of view, barley may be regarded as the mildest and least irritating of the cereals. It has always been in high estimation as a demulcent and emollient. The decoction (*barley water*) is a useful drink in inflammatory diseases, especially in those of the chest and urinary organs. See *Food*, &c.

BARLEY (Pearl). Syn. *Hordeum Perlatum*,—Lat. *Hordeum*, *Barley*,—Ph. L. E. & D. "The seeds of *hordeum distichon* deprived of the husks,"—Ph. L. That of *commerce* is made by steaming *spring barley* to soften the skin, then drying it, and grinding it in a mill with the stones set wide apart, to reduce the grains to a globular form, and to separate the whole of the husk, except that left in the furrow of the seed. *Scotch pearl barley* and *French barley* resemble the last, but are smaller, being generally made from *winter barley* or *bigg*.

BARLEY SUGAR. Syn. *Saccharum Hordeaceum*, — Lat. *Prep.* (Giordano.) *Decoction of pearl-barley*, 1½ pint; *lump sugar*, 2 *lb.*; boil to a proper consistence and form the mass into lozenges or rolls. As a demulcent in coughs, &c. See *Confectionary*.

BAROMETER (Phial). This amusing philosophic toy is made by cutting off the rim and part of the neck of a common phial with a file. The phial is then nearly filled with clean water, and the finger being placed on its mouth, it is inverted, and suspended in a vertical position by means of a piece of twine or wire, when the finger is withdrawn. In *dry weather* the under surface of the water is level with the neck of the bottle, or even concave; in *damp weather*, on the contrary, a drop appears at the mouth and continues enlarging until it falls, and is then followed by another in the same way.

BARYTA. Syn. (See *Oxide of Barium*.) One of the simple earths, shewn by Sir H. Davy to be an oxide of barium. It occurs abundantly in nature, in combination with sulphuric acid, (*native sulphate of baryta; heavy spar; cawk*, &c.;) and with carbonic acid, (*native carbonate of baryta; barolite; witherite*.)

Prep. See *Protoxide of Barium*.

Prop., &c. With the acids it forms salts which are all white, and more or less transparent. With the exception of the sulphate, they are all soluble in water, or in dilute hydrochloric acid, and are extremely poisonous. The whole of them may be prepared by saturating *baryta water*, or *carbonate of baryta*, with a solution of the given acid; and many of them may be prepared by double decomposition. Several are used in *medicine*.

Baryta and its salts are known by the following tests:—1. They are all (except the sulphate) soluble either in water or hydrochloric acid.—2. Their solutions give an immediate clear white precipitate with dilute sulphuric acid and with solutions of the sulphates, which is insoluble in both acids and alkalies. — 3. Hydrofluosilicic acid gives a very characteristic colourless crystalline and quickly subsiding precipitate, only slightly soluble in hydrochloric and nitric acid.—4. An insoluble barytic salt (*sulphate*) may be mixed with powdered charcoal, and exposed for a short time to a full red heat, when sulphuret of barium will be formed, which is freely soluble in water, and which, after being neutralized with hydrochloric or acetic acid, will yield a solution suitable to the application of the usual tests.

Pois., &c. No case of poisoning with caustic baryta has yet occurred. The sulphate, owing to its insolubility, is the only salt of baryta which is *not* poisonous.—*Ant.* Vomiting, followed by copious draughts of water soured with sulphuric acid, or by sulphate of soda or sulphate of magnesia, (*Epsom* or *Glauber salts,*) dissolved in a large quantity of water. Subsequent irritation must be soothed by opium or morphia, and antiphlogistics.

BARYTA (Acetate of). Syn. *Barytæ Acetas. Prep.* (Van Mons.) From *dilute acetic acid*, neutralized with *carbonate of baryta*, and the solution evaporated and crystallized. Very soluble.

BARYTA (Carbonate of). Syn. *Barytæ Carbonas,*—Ph. E. & D. & Ph. L. 1836. A heavy white powder, scarcely soluble in water, and decomposed by nearly all the acids. It is found in the crude state abundantly in nature, but may be obtained absolutely pure, by adding an *alkaline carbonate* to a *solution of chloride of barium*, and washing and drying the precipitate. *Native carbonate of baryta* is ordered in the pharmacopœias, and is sufficiently pure for making the barytic salts, the only purpose to which it is applied. It is "totally soluble in dilute hydrochloric acid. This solution remains colourless, and is not precipitated by ammonia or by hydrosulphuric acid. More sulphuric acid being added than is necessary for saturation, nothing is afterwards thrown down by carbonate of soda."—Ph. L. 1836.

BARYTA (Chlorate of). Syn. *Barytæ Chloras,*—Lat. *Prep.* 1. From a *solution* of *chloric acid*, and *freshly precipitated carbonate of baryta;* the solution being filtered and crystallized by evaporation.

2. (*Wheeler's process.*) Digest, for a few minutes, a *concentrated solution of chlorate of potassa*, with *silicated hydrofluoric acid*, in slight excess. The liquid, filtered, neutralized with *carbonate of baryta*, and again filtered, yields prismatic crystals of *chlorate of baryta* by cautious evaporation.

3. By passing *chlorine* through strong *milk of hydrate* or of *carbonate of baryta*, in the same way as in making chlorate of potassa. *Used* to make chloric acid. It is soluble in 4 parts of cold water.

BARYTA (Nitrate of). Syn. *Barytæ Nitras,*—Ph. E. *Prep.* As "the muriate of baryta, substituting *pure nitric acid* for the *muriatic acid.*" Ph. E.

Prop., &c. Transparent, colourless octahedrons, insoluble in alcohol, and requiring 8 parts of cold water, and 3 parts of boiling water for solution. It is chiefly used as a test for sulphuric acid, and to give a green tinge to flame.

BARYTA (Sulphate of). Syn. *Barytæ Sulphas,*—Ph. E. & D. This salt occurs as a native mineral. When pure, its powder is white. It is insoluble in almost all menstrua. Before the blowpipe it decrepitates and fuses with great difficulty; by which it is distinguished from the sulphates of strontia and lime. It is "white or flesh-red; heavy; lamellar; and brittle." (Ph. E.) It is chiefly used as a pigment and to adulterate white lead; for which purposes it is commonly well-washed, first in *dilute sulphuric acid*, and afterwards, in *pure water*, by which any iron that may contaminate it is removed. It is also used to form sulphuret of barium.

BARYTIN. Syn. *Barytia.* A vegetable base found by Simon in the rhizomes of *white hellebore.* It is precipitated from its solutions by sulphuric acid and the sulphates, like baryta.

BASSORINE. Syn. *Insoluble Gum.* A substance found in Bassora gum, gum tragacanth, the salep of the roots of orchis mascula, and in several gum resins. It may be *prepared* by soaking powdered *gum bassora* or *tragacanth* in a large quantity of *hot water*, decanting or filtering off the clear portion, and drying the residuum. To obtain it absolutely pure, those substances, in the state of powder, may be digested, successively, in *alcohol*, *ether*, and *water.* In its properties it much resembles pure gum tragacanth.

BATHING. The importance, and indeed, the absolute necessity of frequent personal ablution, has been already insisted on and explained. (See p. 2.) But, however important and beneficial may be the frequent and copious effusion of water on the surface of the body, the effects arising from the immersion of the latter in that liquid, as in the practice of bathing, are far more extensive and complete. What the one does usefully, but not completely, the other accomplishes readily, satisfactorily, and perfectly. There is no absolute succedaneum for the entire bath. It is the bountiful parent of physiological effects peculiar to itself, and of the utmost importance in pathology and hygiene. The practice of wearing flannel, the daily use of clean linen, the mere washing of the more exposed parts of the body, are but imperfect attempts at cleanliness, without being accompanied with the entire submersion of the body in water. Nor should the action of judicious bathing in the promotion of personal comfort and

personal beauty be forgotten nor neglected. Intellectual and moral vigour too, are imperceptibly, but materially promoted by the controlling influence of bathing on the physical system; and he who would increase the one, cannot pursue a safer plan than to adopt the other. The neglect of bathing in this country is certainly an enigma. We are always talking about health, and continually professing to be seeking it; but the practical applications of the principles we advocate, and the doctrines we teach, are, unfortunately, the exceptions and not the rule. The phlegmatic Englishman, unlike his lively French neighbour, is indifferent and careless on this matter; and would rather spend his sixpence or his shilling in a pot of "heavy," a glass of grog, or a trip to Greenwich, than in the healthy recreation of the bath.

Our recommendation of bathing applies to the *warm* and *tepid bath*, which are alike adapted to the delicate and the robust, and to every condition of climate and season. *Cold bathing*, in this climate, is only suited to the healthy and vigorous, and can only be safely practised during the warmer months of the year, and in a mass of water sufficient to permit of the heat of the body being maintained by active exercise, as swimming, &c. The *plunge* and *shower baths* are partial exceptions to these remarks. We may add, that for bathing to produce its best effects, the water should be *soft* and pure, and *good soap*, sparingly, but regularly, employed.

BATH. The construction of baths belongs to *architecture* and *domestic engineering*. The best materials for a *fixed bath*, "are slabs of polished marble, properly bedded with good water-tight cement, in a seasoned wooden case." Welsh slate may be employed as a substitute for marble, where expense is an object. *Portable baths* are best made of copper, galvanized iron, or very stout block tin, thickly covered outside and in with paint or japan. The arrangements for *supplying cold* and *hot water*, must greatly depend on circumstances. For *fixed baths*, the common *circulating water-heater* or *boiler*, placed in some apartment on a lower level than the bath, is perhaps the most convenient. For heating *portable baths* so many plans have been suggested, and patented, that the reader cannot possibly be at a loss for one to suit his particular case. Gas offers an economical and cleanly fuel for this purpose.

The *situation*, and *minor comforts* and *conveniences* of the bath, must generally depend on the character of the building, and the sum to be expended for the purpose. When it is possible, the bath should always be on the same floor as the bedrooms, of easy access to them, and in a place where a *plentiful supply* of *pure water* can be ensured. See *Bathing*, and below.

BATH. (In Chemistry.) The highest temperature that can be given to any substance contained in a vessel placed in another of boiling water, is about 205 or 206°; but by adding $\frac{1}{5}$ of salt to the bath, a heat of fully 212° may be obtained. Baths of fusible metal, saturated solutions of salt, sand, and (on the large scale) steam, are also used for the same purpose. A bath of rape, olive, or fish oil, may be safely heated to about 500° Fahr., without suffering decomposition, and will be found an exceedingly appropriate and convenient species of bath for many processes.

BATH. (In Pharmacology.) These commonly consist of water holding in solution various medicinal or nutritious substances; as *wine-baths*, *milk-baths*, *soup-baths*, &c., (used to convey nourishment to the body;) *sulphurous baths*, *mercurial baths*, &c. (used in skin diseases, syphilis, &c.;) *aromatic* and *chalybeate baths*, (employed as tonics;) and *acid baths*, (sometimes used to remove the effects of mercury.) *Medicated baths*, have been divided into classes and minor subdivisions by writers on the subject, and have received names which are generally indicative of their composition or uses. They are said to be *simple*, when water or its vapour forms the bath; and *compound*, when the water is medicated by the addition of other matters. On the Continent a variety of substances are employed to medicate baths, which are seldom or ever so used in this country. The quantity of the ingredients used for this purpose may, in general, be from the $\frac{1}{8}$th to the $\frac{1}{3}$d of that which is used to form a weak lotion.

BATH (Air). Syn. *Balneum Pneumaticum*,—Lat. 1. (*Cold.*) The mere exposure of the body in a state of nudity for a *short* time to the atmosphere. Tonic and sedative; in febrile excitement, &c.

2. (*Hot.*) An apartment to which dry, heated air is admitted. More stimulant than the vapour bath. Recommended in cholera, (for which it is *said* to be a specific,) congestive fevers, rheumatism, scaly-skin diseases, &c.

3. (*Compressed.*) Recommended by M. Tarberie to be taken for 2 or 3 hours daily in aphonia.

4. (*Rarefied.*) Applied locally. Revulsive. Resembles "dry cupping."

BATH (Aromatic). Syn. *Aromatic Herb Bath; Balneum Aromaticum*,—Lat. *Prep.* 1. (Foy.) *Mint*, *origanum*, *rosemary*, *sage*, and *thyme*, of each, ½ lb; *boiling water*, 6 pints; digest for 12 hours, strain, and add, of *essence of soap*, 4 oz.; *sal ammoniac*, 2 oz.; and pour the whole into *water*, q. s. for a bath.

2. (Fr. H.) *Dried tops* of *hyssop*, *lavender*, *origanum*, *peppermint*, *rosemary*, *sage*, *thyme*, and *wormwood*, of each, 5 oz.; *water*, 2 gall.; as last. Useful in cutaneous affections, chronic rheumatism, diarrhœa, dyspepsia, stiff-joints, &c.; and particularly so, in debility arising from loss of blood, spermatorrhœa, &c., and in hysteria and hypochondriasis.

BATH (Barèges, — Factitious.) Syn. *Balneum Baretginense*,—Lat. *Prep.* 1. *Crystallized sulphuret of sodium*, 3½ oz.; *chloride of sodium*, 1½ oz.; *gelatine*, (dissolved,) 4 oz.; *water*, q. s.

2. (Trousseau & Reveil.) *Dry sulphuret of potassium*, 4 oz.; *water*, 16 oz.; dissolve, and add the solution to the bath; then further add, of *sulphuric* or *hydrochloric acid*, ½ oz.; previously diluted with *water*, 8 oz. Invaluable in itch, moist skin diseases, chronic diarrhœa, chronic rheumatism, and lead colic.

BATH (Carbonic). Syn. *Balneum Carbonicum*, *B. Acidum Carbonicum*,—Lat. *Carbonic acid* applied to the body, or any part of it, by a suitable apparatus to prevent its being respired; or a solution of the *gas* in *water*, may be employed instead. Antiseptic, diaphoretic, and excitant to the vascular system; in amenorrhœa, chlorosis, hysteria, scrofula, cancerous and other ulcers, &c.

BATH (Chlorine). Syn. *Balneum Chlorinii*,—Lat. *Water*, to which a little solution of *chlorine gas*, has been added. Useful for itch, &c. A *weak solution of chloride of lime* is commonly substituted for it.

2. (Wallace.) *Chlorine gas*, (obtained from *salt*, 1½ oz.; *oil of vitriol* and *water*, of each, 1 oz.; and *black oxide of manganese*, ½ oz. to 1 oz.;) diluted with air, at a temperature of 104° to 150°, and applied by means of a suitable apparatus, for ½ an hour; the greatest possible precautions being taken to prevent it being inhaled. In chronic liver affections gradually increasing the ingredients to three times the above quantity.

BATH (Cold). Syn. *Balneum Frigidum*,—Lat. Water, *fresh*, *saline*, or *mineral*, at a temperature varying from 45° to 80°; but usually understood to apply to water between 50° and 70° Fahr. Immersion of the body in water below about 65° cannot be tolerated for any length of time without such a loss of animal heat, as frequently to induce highly sedative and depressing effects, from which the constitution does not readily recover. Water at a temperature below about 50° Fahr., can only be safely used as a plunge bath. When the cold bath produces its full effect, the patient feels a pleasant glow upon the surface of the body, immediately following it. If a sensation of coldness or shivering ensues, it should not be repeated. The duration of the immersion may vary from 2 minutes to a quarter of an hour, depending upon the temperature of the water and the feelings of the bather; the latter period not being too long in fine weather, *provided* swimming or violent exercise be had recourse to in the bath. The cold bath is principally recommended as a tonic and restorative, to increase the tone and vigour of the body; and is contra-indicated when there is a tendency to apoplexy, or to chronic affections of the heart, lungs, or kidneys.

BATH (Douche). Powerfully sedative. *Used* in brain fever and active inflammations. A full inflammatory pulse, under its action, frequently sinks into one almost imperceptible. Sometimes *hot water* is employed, applied for ½ to 1 hour at a time. In chronic rheumatism and deep-seated pains, a temperature of 150° to 160° Fahr. is readily borne.

BATH (Ferruginous). Syn. *Chalybeate Bath; Balneum Ferrugineum*, *B. Chalybeatum*,—Lat. *Prep.* 1. (Trousseau & Reveil.) *Green sulphate of iron*, 32 oz.; *water*, q. s., using a well-tinned copper, wooden, or japanned bath. In general debility, when chalybeates are indicated, and the stomach will not bear iron. The stains on the towels used to wipe the patient may be removed by soaking them in water acidulated with hydrochloric acid.

BATH (Hot). Syn. *Balneum Calidum*,—Lat. The temperature of this bath ranges between 98° and 112° Fahr. The temperature at which it is usually employed is from 98° to 106° Fahr. It has a remarkably tranquillising effect upon the nervous system, producing a strong tendency to quietude and sleep. It also acts as a powerful antispasmodic, and by determining the blood to the surface of the body, tends to relieve visceral inflammation and congestion. In chronic affections arising from the action of cold and damp, and from exhausted energy, in stiff joints, rheumatism, neuralgia, diarrhœa, and numerous

other affections, its effects are often rapid and remarkable.

BATH (Iodine). Syn. *Balneum Iodinii*, —Lat. *Prep.* (Cutan. Hosp.) *Iodine*, 4 dr.; *liquor of potassa*, 4 oz.; *water*, 2 pints; dissolve, and add it to 30 gall. of *water*. In skin diseases complicated with scrofula.

BATHS (Iodureted). Syn. *Balnea Iodureta, Balneæ Iodureteæ*,—Lat. *Prep.* (Lugol.)—1. (*For adults.*)

	a.	*b.*	*c.*
Iodine . . .	123 gr.	154 gr.	184 gr.
Iodide of potassium .	231 „	308 „	370 „
Water . . .	1 pint.	1 pint.	1 pint.

Dissolve, and add the solutions to a bath of 60 gallons, contained in a wooden vessel.

2. (*For children.*)

	a.	*b.*	*c.*
Iodine . . .	38 gr.	46 gr.	61 gr.
Iodide of potassium .	77 „	92 „	107 „
Water . . .	½ pint.	½ pint.	½ pint.

Dissolve; for a bath of 60 gallons, as before. In scrofulous affections.

BATH (Mercurial). Syn. *Antisyphilitic Bath; Balneum Mercuriale, B. Antisyphiliticum, B. Hydrargyri Bichloridi*,—Lat. *Prep.* 1. *Bichloride of mercury*, 3 dr. to 1 oz.; *hydrochloric acid*, 1½ oz.; *water*, 50 to 60 gall.

2. (Cutan. Hosp.) *Bichloride of mercury*, 3 oz.; *hydrochloric acid*, 1 oz.; *water*, 2 gall.; dissolve. 1 gall. to every 30 gall. of water in the bath.

3. (Fr. Hosp.) *Bichloride of mercury*, 2 oz.; *sal ammoniac*, 3 oz.; *soft water*, 60 galls., or q. s. for a bath, contained in a wooden vessel. In syphilitic affections, either with or without skin disease; in chronic rheumatism, swelled joints, and chronic skin diseases generally, where the use of mercury is indicated, and the remedy is rejected by the stomach; especially in these affections in women and children. Also used in itch, and to destroy lice on the body.

BATH (Mud). Syn. *Balneum Luteum*, —Lat. Mud bathing (*illutation*) was commonly practised by the ancients. The slime of rivers, and the mud on the sea-shore were especially prized for this purpose. The Tartars and Egyptians still employ baths of this description in hypochondriasis, scrofula, and scurvy. At Franzenbad, in Germany, an acidulous species of black bog-earth found there, is beaten up with warm water to a semi-liquid consistence, and used as a bath. This is said to give the skin a satin-like appearance, and to render it very soft for several hours afterwards; and to be useful in debility and in paralytic affections of a gouty origin. In France, hot dung (*dung bath*) is occasionally used as a bath against rheumatism; and in Poland, the same substance is used against syphilis. The *husk of the grape* and the *refuse of the olive*, undergo a species of fermentation, and in this state have been successfully employed in France against rheumatism.

BATH (Nitro-hydrochloric). Syn. *Nitro-muriatic Acid Bath; Balneum Acidi, B. Acidi Nitro-hydrochlorici, B. A. Nitro-muriatici*,—Lat. *Prep.* 1. (Dr. Scott.) —*a. Nitro-hydrochloric acid*, 4½ to 6 fl. oz.; *water*, 3 gall.; for a foot or sponge bath.

b. Hydrochloric acid, 3 fl. oz.; *nitric acid*, 2 fl. oz.; *water*, 5 fl. oz.; mix; and add 2 to 3 fl. oz. to *every gallon of water* used for the bath.

2. (Lendrick.) *Nitric acid*, 1℔; *hydrochloric acid*, 1½℔; *warm water*, 40 gall.

3. (Soubeiran.) *Nitromuriatic acid*, 4 to 16 fl. oz.; *water*, 50 or 60 *gall.*

4. (Cutan. Hosp.) *Nitric acid*, 1½℔; *hydrochloric acid*, 1℔; mix; for *water*, 60 or 70 gall.

Obs. As a remedy for liver complaints, and to relieve the pain on the passing of gall-stones. It must be contained in a wooden vessel, and may be used as a *hip, knee*, or *foot-bath*; a knee-bath being the one generally adopted in England. It produces a tingling sensation on the surface of the skin, and a peculiar taste in the mouth, and to be successful, must be applied for 15 to 20 minutes daily, for a fortnight or three weeks, or longer.

BATH (Sea). Syn. *Balneum Marinum*, Lat. Sea bathing, "on account of its stimulative and penetrating power, may be placed at the head of those means which regard the care of the skin; and it certainly supplies one of the first wants of the present generation, by opening the pores, and thereby re-invigorating the whole nervous system." "Besides its great power in cases of disease, it may be employed by those who are perfectly well, as the means most agreeable to nature for strengthening the body and preserving the health." (Hufeland.)

Sea Bath (Factitious). Syn. *Balneum Marinum Factitium*,—Lat. *Prep.* 1. (Cutan. Hosp.) *Common salt*, 8℔; *sulphate of magnesia*, 2℔; *chloride of calcium*, 1℔; *water*, 50 to 60 gall.

2. *Common salt*, 5 oz. to *each gallon of water.*

3. (Beasley.) As a foot-bath, a *handful*

of salt to a *pailful of water*, to which a little *flour of mustard* may be added.

4. *Salt*, 5 oz.; *iodide of potassium*, ½ dr.; *water*, 1 gall.; dissolve.

BATH (Shower). Syn. *Impluvium*,—Lat. This may be regarded as a modification of the cold bath, or plunge bath, and its effects are similar, but without many of its disadvantages. The cold shower-bath is less alarming to nervous persons, and less liable to produce cramp, than cold immersion. It may be considered as the best and safest mode of cold-bathing, and is recommended in many nervous complaints. A good plan is to allow the water to remain in the bedroom all night, by which any undue degree of coldness is removed. Tepid water may be commenced with; and at first, in extreme cases, the patient may stand in hot water at the time of taking the bath.

BATH (Sponging). "In the sponging bath, exercise and ablution are combined, and its employment, by persons of sedentary habits, is highly advantageous." (Eras. Wilson.)

BATH (Sulphurous). Syn. *Sulphurous Acid Bath; Balneum Sulphurosum*,—Lat. *Prep.* From *sulphur*, sprinkled on a hot plate placed under the patient; the proper precautions being taken as directed under *chlorine bath*. Seldom used.

BATH (Sulphuretted). Syn. *Balneum Sulphuretum*,—Lat. *Prep.* 1. *Sulphuret of potassium*, 1 oz.; added for every 10 or 12 gallons of water in the bath.

2. *Sulphuret of calcium*, 4 oz.; *water*, 60 gall. In chronic rheumatism, chronic diarrhœa, lead colic, itch, and the majority of moist skin diseases; also to destroy vermin.

3. (*Gelatinous.*) Syn. *Balneum Sulphuratum Gelatinosum*,—Lat. *Prep.* (Dupuytren.) Adding *Flander's glue*, 2 lb; (dissolved,) to either of the above *sulphuretted baths*.

Obs. The sulphur-bath under any of the above forms is a powerful remedy in every description of skin disease. *Leprosy*, (the most obstinate of all,) has been completely cured by it; the *common itch* requires only one or two applications to eradicate it entirely; all the *scurfy* and *moist skin affections*, *local irritation*, *pimples*, *inflammatory patches*, &c., speedily yield to its influence; *scrofula*, and, indeed, *all* those affections for which the warm or vapour bath has been recommended also derive powerful assistance from the sulphur-bath.

BATH (Temperate). Commonly applied to baths between the temperatures of 70° to 82° Fahr.

BATH (Tepid). Syn. *Balneum Tepidum*,—Lat. Temperature from 82° to 92°, or 93° Fahr. Its properties approach those of the warm bath.

BATH (Vapour). Syn. *Balneum Vaporis*,—Lat. *Dew Bath*, *Balneum Roris*,—Obs. The vapour of *hot water* applied to the body, or to any part of it, by a suitable apparatus, and either inhaled, or the contrary. The simplest form of vapour bath, is, perhaps, formed by placing some wet cloths, or sprinkling a little water, on two or three heated bricks, laid under a chair on which the patient is seated; both the patient and whole apparatus being covered with a sheet or blanket to keep in the heated vapour. Dr. Serres has suggested the plan of wrapping a lump of quicklime in a thick cloth soaked in water, when the slaking of the lime which immediately commences produces the rapid disengagement of steam; which may be promoted, as required, by sprinkling on a little more water. This is termed in France "*the poor man's vapour bath.*" It must, however be recollected, that by none of these minor contrivances, can the supply of vapour and its temperature be regulated, as in a perfect bath.

The *vapour bath* is used at different temperatures; as *tepid*, when the temperature varies from 90° to 100°; *warm*, from 100° to 112°; and hot, from 110° to 130°. When the vapour is not inhaled, it may be raised to even 160° Fahr.

Obs. The vapour-bath is the most powerful diaphoretic known, and is almost specific in nearly all those cases wherein warm or hot bathing is recommended—in *chronic rheumatism*, *contracted muscles* and *tendons*, *stiffness of joints*, *indurations*, *diarrhœa*, &c.

BATH (Warm). The warm bath has a temperature of from 90 *or* 92° to 98 Fahr.; or nearly that of the human body. Its effect is, first to increase the circulation of the blood, and to determine it to the skin. After a few minutes, an agreeable and universal increase of heat is experienced; the face, and forehead, generally, are soon bedewed with perspiration; a pleasing and prevailing calm is felt both mentally and physically; and after remaining in some 12 or 15 minutes the effect is of the most refreshing and happy character.

The warm bath is recommended in *general torpor of the system*, *liver* and *bowel complaints*, *hypochondriasis*, *hysterical affections*, *morbid suppressions*,

dry skin, nearly all *cutaneous* and *nervous diseases*, *chronic rheumatism*, &c. As a tonic or stimulant after excessive fatigue, great mental excitement, or physical exertion, it is unequalled, and furnishes one of the most wholesome, and at the same time luxurious sources of refreshment we are acquainted with. "To those who are past the meridian of life, who have dry skins, and begin to be emaciated, the warm bath, for half an hour, twice a week, I believe to be eminently serviceable in retarding the advances of age." (Darwin.)

BATH METAL. *Brass*, 32 parts; *spelter*, 9 parts; melted together under *charcoal*.

BATH PIPE. *Prep.* Of *powdered lump sugar*, 1 *lb.*; *Italian juice*, (dissolved in a little water,) 3 *oz.*; *powdered gum arabic*, 1 *oz.*; *water*, q. s.; make a stiff paste, and roll it into the usual form.

BATTER. A mixture of *flour*, and *milk* or *water*, enriched and flavoured with *eggs*, *oil*, *butter*, and, frequently, with *spices* and *currants*, beat together to a thin paste. *Used* to form puddings, which are either baked alone, or under meat; and also to cover various articles during the operation of cooking them.

BEADS (Lovi's). Syn. *Specific Gravity Beads*. Small hollow globes of glass, about the size of peas, intended to supersede the hydrometer in determining the specific gravities of liquids. Each bead indicates a particular density, and is marked accordingly. They are used by placing them in the fluid, in succession, until one is found which remains indifferently suspended between the bottom and top, when the specific gravity corresponding to its number, is that of the liquid examined. For the use of these beads in preparing *test acids*, see *Alkalimetry*.

BEANS. Syn. *Fabæ*,—Lat. The general characters of those used as esculents are well known. When eaten in the green state, properly dressed, beans are regarded as antiscorbutic and wholesome; but tend to produce flatulence, unless combined with spices. In the dried or ripe state, they are rather difficult of digestion, and very apt to distend the stomach and intestines with wind. This objection does not exist to their use in the form of flour. The amount of nutritious nitrogenous matter in the bean rather exceeds that in wheat, and independently of a disposition to produce constipation in some habits, it must be considered nearly as wholesome as that cereal. The London bakers use large quantities of bean-flour to adulterate their bread.

Beans are cooked by simply boiling them in water; a little *salt of tartar* or *common salt* being frequently added, to preserve their green colour.

BEAR. The *fat* or *grease* of the bear has long been highly esteemed for promoting the growth of the human hair, but in reality possesses no superiority over any other mild animal fat. The mass of that which is sold in England is formed of *hog's lard* or *veal fat*.

BEAR'S GREASE (Factitious). *Prep.* 1. *Washed hog's lard*, 1 *lb.*; *flowers of benzoin* and *balsam of Peru*, of each ¼ *oz.*; melt together, pour off the clear portion, and stir until nearly cold.

1. *Soft fat of calves*, 3½ *lb.*; *nitric ether*, 1 *fl. oz.*; *essence of ambergris*, 20 drops.

3. *Lard* and *veal suet*, of each, 1 *lb.*; *olive oil*, 3 *oz.*; *compound tincture of benzoin*, 1 *oz.*

Obs. The above do not readily become rancid by age. They may have a rich *yellowish tinge* given to them by melting along with them a little *annotta* (½ dr. to the *lb.*), or *palm oil* (¼ oz. to the *lb.*); and may be tinged *green* by first digesting the fatty matters with *fresh walnut* or *spinage leaves*. Scent may be added at pleasure;—the *oils* of *cassia*, *cloves*, *nutmeg*, and *lavender*, the *essences of musk* and *ambergris*, and *balsam of Peru*, one, or a mixture of them, are the most appropriate.

BEBEERIC ACID. Syn. *Bibiric Acid*. A white, crystalline, diliquescent, volatile acid, obtained from the seeds of the bebeeru tree.

BEBEERINE. Syn. *Bebearine*, *Bebeerene*, *Bibirine*, *Bibirina*. A peculiar alkaloid contained in the bark and seeds of the *bibiri* or *green-heart tree* of British Guiana. It is obtained in the form of a sulphate by a process analogous to that employed in the preparation of sulphate of quinine.

Prop., *&c.* A white, uncrystallizable, resinous body; slightly soluble in water; soluble both in alcohol and ether; reaction, alkaline; melts with heat, and ultimately suffers decomposition without being volatilized. It has a bitter taste. That of commerce generally contains some *sipirine*, (altered bebeerine,) and a little *lime*. It has been proposed as a substitute for bark in agues.

BEBEERINE (Sulphate of). Syn. *Bibirinæ Sulphas*, — Lat. Yellowish-brown scales. It has been proposed as a substitute for sulphate of quinine. *Dose.* (As a tonic,) 1 to 3 gr.; (as a febrifuge,) 5 to 20 gr.

BECHAMEL. A variety of fine white

broth, sauce, or consommée, thickened with *cream*.

BEE. Syn. *Hive Bee, Honey Bee; Apis*,—Lat.; *Apis Mellifica*,—Linn.; Ph. L. E. & D. This curious and valuable little insect has been known and admired in all ages of the world, on account of its industry, policy, and curious economy. It has alike furnished a study for the naturalist and a theme for the poet; and from its lowly dwelling, philosophy has received the most exalted lessons of prudence and wisdom. Eumelus, of Corinth, wrote a poem on bees, (B.C. 741.) In later times Huber and others have observed and described their marvellous habits and existence.

There is said to be nearly 300 varieties of the genus apis, of which England has considerably above 100. The *wild bee* lives in the hollows of old trees; the *domesticated bee*, in hives, in societies called "*swarms*." Each hive contains—1 *female, or queen bee*, 800 to 1000 *males* or *drones*, and from 15,000 to 30,000 or upwards of *workers*, or *neuters*. Those desirous of studying their *economy* and *management*, are referred to Mr. Cobbett's work on bees. See *Honey* and *Wax*.

BEEF. The flesh of the ox is highly wholesome and nutritious; and well adapted to persons of good appetite, or that labour, or take much exercise. For persons of delicate constitutions, especially those labouring under debility, partial anæmia, amenorrhœa, and similar ailments, it is, perhaps, superior to all other species of animal food. If not overcooked, and left full of gravy, it sits lightly on the stomach, and its fat proves even more digestible than that of veal.

Ox beef is known by having a fine smooth open grain, a good red colour, and a tender texture, with fat, whitish-yellow, or but slightly yellow. *Cow beef* has a closer grain than ox beef, and the lean is of a deeper red. *Bull beef* is closer still, the fat hard and skinny, the lean of a deep red, and it has a stronger smell. *Heifer beef* resembles ox beef, except in being smaller, often an advantage; but it lacks the rich flavour of one of Giblet's full-grown oxen.

Beef is *cured* and *dressed* in numerous ways. See *Roasting, Boiling, &c.*

BEEF A LA MODE. "The real '*beef à la mode*' is made as follows, and is not a kind of soup such as is daily sold in cook-shops."

Prep. 1. (Soyer.) *Rump, surloin*, or *rib of beef*, (about) 12 *lb.*; lard it through with 10 *long pieces of fat bacon*; put it into a long earthern pan with a *calf's foot*, 4 *onions*, 2 *carrots* (sliced), a *bunch of parsley*, 2 *bay leaves*, 2 *sprigs of thyme*, 2 *cloves*, ½ *teaspoonful of pepper*, 1 *do. of salt*, 4 *wine-glassfuls of sherry*, 4 *do. of water*, and 1 *lb. of streaked bacon* (cut into small squares); place on the cover, make it air-tight with a little flour paste round the edges, and expose it in a moderate oven for 4 hours. *Dish up* with the vegetables and bacon round, the gravy (skimmed) being poured over all. *Or*, it may be eaten cold, when the pan should not be opened until the whole has thoroughly cooled.

2. (Rundell.) *Rump*, or any part of the beef which will stew well, 3 or 4 *lb.*; trim it, and cut off the fat; add all sorts of *sweet herbs*, chopped very fine, a little *shalot*, and a *great deal of spice*, (cayenne, white pepper, allspice, cloves, and mace; *or* mixed spices;) and put them into a *saucer of vinegar* that has been rubbed with *garlic*; add *fat bacon* cut into long slips; *lard* the beef regularly on both sides, and rub it over with the *herbs* and *spices*; *flour*, add a *small piece of butter*, and *a pint* of *water*; bake in an oven till done, strain the gravy, and serve it up with pickles on the top. Excellent either hot or cold.

BEEF (Collared). *Prep.* (Rundell.) From *stewed shin of beef* and *ox-tail*, re-stewed with a *glassful each of wine* and *ketchup*, and some of the *old broth*, and poured into moulds. *Sweet herbs, sliced eggs*, and *pickles*, may be added.

BEEF (Potted). See *Potted Meats*.

BEEF (Salted, various). See *Salting, &c.*

BEER. Syn. *Cerevisia*,—Lat. The common generic term for malt liquors.

Pure malt liquor, which has undergone a perfect fermentation, when taken in moderation, is perhaps the most wholesome beverage that can be drunk. *Ale* is the most nutritious variety, and the one best adapted to the debilitated and delicate; but *good porter* frequently agrees better with bilious constitutions, and the dyspeptic. The most wholesome, and perhaps the least exceptionable beverages obtained from malt, are those known as *East India, Scotch*, and *Bavarian ales*, when honestly prepared and not too highly bittered with the hop. When the latter is the case, their habitual or excessive use cannot fail to produce injury. A late writer has described good beer as *nutritious*, from the sugar and mucilage which it contains; *exhilarating*, from its spirit; and *strengthening* and *narcotic*, from its hops.

Var. The numerous varieties of malt liquor met with in commerce, may be re-

solved into three great classes—*ale*, *beer*, and *porter*. *Ale*, as the term is generally understood, is a pale liquor, brewed from lightly-dried malt, and abounding more or less in undecomposed saccharine matter and mucilage, and the bitter and fragrant principles of the hop;—*Beer* is a fine, strong, well-fermented liquor, darker, less saccharine, and more alcoholic than ale;—*Porter* is a dark brown-coloured liquor, originally brewed from high-dried malt, but now generally made from pale malt, with a sufficient quantity of "patent" or "roasted malt" to impart the necessary colour and flavour. *Stout*, *Brown Stout*, &c., are varieties of porter differing from that liquor only in their superior strength and quality. —*East India Ale*, *Bitter Beer*, &c., are beverages which combine the pale colour and fragrant bitter of ale with the more perfect fermentation and maturity of beer. —*Table Ale*, *or Table Beer*, is a weak liquor, commonly containing 3 or 4 times the proportion of water that is present in strong beer. In London, *porter* is called *beer;* and indeed, in all parts of the kingdom, the prevailing beverage of this kind consumed by the masses, of whatever class, commonly goes by that name.

The *three great classes of malt liquor* above referred to, are, independently of mere differences of strength and value, practically sub-divided into an almost infinite number of varieties. Every county, every town, and almost every brewer, is distinguished by the production of a different flavoured beer, readily perceived, and highly appreciated by their respective votaries. These differences may be traced to—*variations in the quantity and quality of the materials* employed in their manufacture,—the *heat of the water used for mashing*,—the *duration of the boiling*,—the *temperature at which the fermentation is conducted*, and the *extent to which it is carried*, together with numerous other circumstances, which though of an accidental and uncertain character, are nevertheless sufficient to affect the flavour and quality of a brewing. Among these, such as depend on *locality*, *apparatus*, *water*, *mismanagement*, &c., are not the least important. In general, however, when the same quantity of materials is employed, and the same time allowed for the maturation of the liquor, the chief causes of this diversity will be found to depend on the *water* used in the brewing, and the method followed in the *preparation of the malt*. Thus, *Bavarian*, *Scotch*, and *Burton ales*, differ in style from other ales, chiefly from being fermented at a lower temperature; and *porter* differs from either of these, because it is brewed from higher-dried malt. Hence arise the almost endless varieties of beer met with at the present day. See *Brewing*.

Pur. The leading characteristics of good beer, to whatever variety it belongs, are *transparency*, a *fine colour*, and an agreeable semi-vinous flavour, and the property of remaining for several hours exposed in a glass or cup without becoming "flat" or insipid. When it is pure and has been skilfully brewed, this will usually be the case. Hence colour and transparency, and the power of resisting exposure, are tests of the purity and quality of beer, which should not be lightly treated. There are none more simple and effectual; and together with a good "palate," will readily distinguish pure and wholesome beer from "doctored" and inferior liquors. If, therefore, we find a sample of beer possessing the above qualities or in "good condition," and on testing it for its *alcohol* and *saccharine*, find these substances in such quantities as fairly represent the amount of malt which should have been used in the brewing of such a liquor, we may reasonably infer it, in the absence of proof to the contrary, to be *pure;* because the object for which adulteration is practised,—viz., the *saving of malt* and *hops*,—did not exist in this case. To *demonstrate* the purity of beer requires, however, an elaborate and troublesome chemical analysis. *Good* and *pure beer* should contain nothing but what exists in the *malt*, *hops*, and *water* from which it is brewed, or which is produced from them by fermentation. *Water*, *alcohol*, a *very small quantity of acetic acid*, and a *mere trace of saline matter*, are the *only* substances which should be found in *pure malt liquor*.

Adult. By the laws of England, which have existed with slight modifications ever since the days of Queen Anne, *nothing* is allowed to enter into the composition of beer but *malt* and *hops*. Under the Act, 56 Geo. III, cap. 58, offending parties are punishable by heavy fines and forfeiture. The cupidity of fraudulent brewers and publicans, however, frequently induces them to introduce other ingredients than malt and hops into their liquors, with the view of giving them a false strength, and saving one or other of their constituents. Thus, to impart *bitterness*, and to lessen the quantity of hops required for the beer—**quassia*, **gentian*, **wormwood*, **aloes*, **picric acid*, **chamomiles*, and *broom-tops* have been used; to give *pungency* and *flavour*—**capsicum*, and **grains of paradise*, (in con-

centrated tinctures,) **ginger, *corianders, orange peel* and *caraways;* to give *intoxicating properties—*opium, cocculus indicus, *nux vomica, *tobacco, strychnine, *extract of poppies, and *tincture* and **extract of henbane;* as a substitute for *malt—*molasses, *corianders, *treacle, *colouring, and sugar;* to impart a false appearance of *age—*sulphuric acid, *alum, *green vitriol,* and **common salt;* to remove *acidity—*pearlash, *salt of tartar, *Scotch soda, quicklime, magnesia,* and **common chalk;* to impart a *frothy head—*alum, *copperas,* and **table salt.* The substances whose names in the above list are marked with an asterisk, are still FREQUENTLY and LARGELY employed in the trade.

The *publicans* generally reduce their strong beer with *water,* (which they call "*liquor,*") and add *treacle* or *coarse moist sugar,* (which they call "*foots,*") together with a mixture of *copperas, salt,* and *alum,* (termed "*heading,*") to make it bear a frothy head; and in many cases, other, and more deleterious ingredients are added, to keep up the appearance of strength, and to improve the flavour.

The "*cheap beer*" now sold in many taverns in London, is made by dividing the contents of *two butts* between *three butts,* filling them up with *water,* and adding a bladder of *porter extract* (technically termed, P. E.) to each. This P. E. is a mixture of *powdered cocculus, roasted quassia, Spanish juice, pearlash, burnt sugar,* &c., boiled up with *treacle* and *water* to the consistence of a thin extract, and put into bullocks' bladders. (Med. Cir., i, p. 299.)

The serious consequences arising from the adulteration of beer, has been frequently insisted on by the medical profession. See *Brewing, Porter,* &c.

BEER (Amber). A liquor formerly drunk in great quantities in London, brewed from a mixture of 3 parts of *amber malt* and 1 part of *pale malt,* with about 6 *lb.* of *hops* to the quarter. It was drank within a few days after it had done "working," and was chiefly *mixed with "bitters"* and made into "*purl.*"

BEER (Ginger). Syn. *Cerevisia Zingiberis,* —Lat. *Prep.* 1. *Lump sugar,* 1 *lb.; unbleached Jamaica ginger,* (best, well-bruised,) 1 *oz.; cream of tartar,* ¾ *oz.;* 2 *lemons* (sliced); *boiling water,* 1 gall.; macerate, with frequent stirring, in a covered vessel, until barely lukewarm, then add of *yeast,* 1½ or 2 *oz.,* and keep it in a moderately warm situation so as to excite a brisk fermentation; the next day rack the liquor and strain it through flannel; work for *another* day or *two,* according to the weather; then skim, decant, (or again strain,) put it into bottles, and wire down the corks.

2. (Mr. Pollock.) *White sugar,* 20 *lb.; lemon* or *lime juice,* 1 pint; *honey,* 1 *lb.; bruised ginger,* 1½ *lb.; water,* 20 gallons. Boil the *ginger* in 3 gallons of the *water* for half an hour; then add the *sugar,* the *juice,* and the *honey,* with the *remainder of the water,* and strain through a cloth. When *cold,* add the *white of* 1 *egg* and ½ fl. oz. of *essence of lemon;* after standing 3 or 4 days, bottle it. Both the above yield a very superior beverage, and one which will keep for many months.

3. (Mr. Beasley.) *Cream of tartar,* 3 *oz.; ginger,* 1 *oz.; white sugar,* 1½ *lb.; lemon juice,* 1 *oz.* (or, *a lemon,* sliced); *boiling water,* 1½ gall.; *yeast,* 1 *oz.;* as before.

4. Into each bottle put *concentrated essence of ginger,* 1 drop; *simple syrup* or *capillaire,* ½ *oz.;* and fill with *aerated soda water* at the bottling machine, in the usual way. Very superior.

Obs. Ginger beer is used as a cooling and refreshing drink in warm weather. An inferior article is made by using *moist sugar,* and a larger proportion of water. See *Powders.*

BEER (Spruce). Syn. *Pine Beer; Cerevisia Abietina, C. Abietis,*—Lat. *Prep.* 1. *Boiling water,* 10 gall.; *lump sugar,* 10 *lb.; essence of spruce,* 4 *oz.;* mix, and when nearly cold, add *yeast,* ½ pint; and the next day *bottle* in the same way as ginger beer.

2. (Dr. Wood.) *Essence of spruce,* ½ pint; *pimento* and *ginger,* (bruised,) of each 5 *oz.; hops,* 5 or 6 *oz.; water,* 3 gall.; boil 10 minutes, add *treacle,* 3 quarts; *warm water,* 11 gall.; and (when only *lukewarm*) add *yeast,* 1 pint; ferment 24 hours and bottle. Diuretic and antiscorbutic. When made with *lump sugar* it is called *White Spruce Beer;* when with *moist sugar* or *treacle, Brown Spruce Beer.* An inferior sort is made by using *less* sugar, or *more* water.

BEER (Twopenny). Syn. *Twopenny.* A cheap beer formerly drank in cold weather as a "warmer" or stimulant, frequently when only a week old. The following formula is that of a brewer once celebrated for this beverage:—*Malt,* 3 bushels; *hops* and *Spanish juice,* of each, 2 *lb.; burnt sugar,* ½ *lb.; Guinea pepper, corianders,* and *grains of paradise,* of each, ½ *oz.* To produce 3 times the malt.

BEERS. (In *Pharmacy.*) See *Medicated Ales.* The following are examples of this class of preparations:—

BEER (Antiscorbutic). Syn. *Sapinette; Cerevisia Antiscorbutica,*—Lat. *Prep.* 1. (P.C.) *Buds of the spruce fir* and *scurvy grass,* of each, 1 oz.; *horse-radish root,* 2 oz.; (all fresh and bruised, or sliced;) *new ale* or *beer,* 3½ pints, (½ gall.;) macerate 4 days, press, and strain for use.

2. (Ph. Castr. Ruth., 1840.) *Horse-radish,* (fresh,) 4 lb; *juniper berries,* 3 lb; *root of calamus aromaticus* and *buds of pinus abies,* of each, 1 lb; *ginger,* 1 oz.; *syrup,* (from brown sugar,) 6 lb; *beer,* 120 lb; macerate 4 days, or until it ferments, then decant, strain, and add *cream of tartar,* ½ lb; *tincture of mustard,* (*flour of mustard,* 2 oz., to *proof spirit,* 12 oz.,) 1 lb. In scurvy, &c.

BEER (Catharthic). Syn. *Cerevisia Cathartica,*—Lat. *Prep.* 1. Digest *senna,* 4 oz.; *centaury,* and *wormwood,* of each, 3 oz.; in *mild ale* or *beer,* 6 gall.; for a week.

2. To the last add of *powdered jalap* or *aloes,* 4 dr. *Dose.* A half-pint glassful or more.

BEER (Cinchona). Syn. *Bark Beer, Ague do.; Cerevisia Cinchonæ,* — Lat. *Prep.* 1. *Bruised cinchona bark,* 1 oz.; *proof spirit* or *brandy,* 2 oz.; mix; the next day add of *new beer,* 1 quart, and in 3 days decant or filter. *Dose.* 2 or 3 wine-glassfuls.

2. (Mutis.) *Cinchona,* 4 oz.; *sugar,* 2 lb; *water,* 5 pints; ferment with yeast, as before. *Dose.* 1 or 2 wine-glassfuls.

3. (Ph. Ferrara.) *Bruised Peruvian bark,* 1½ oz.; *cinnamon,* 2 dr.; *nutmeg,* (rasped,) 7 dr.; *sugar,* 25 oz.; *yeast,* 2 oz.; *water,* 5 pints; mix, ferment, decant, and strain. *Dose.* 3 or 4 wine-glassfuls. They are all administered during the intermission of agues.

BEER (Diuretic). Syn. *Cerevisia Diuretica,*—Lat. *Prep.* (H.F.) *Mustard seed* and *juniper berries,* of each, 4 oz.; *wild carrot seed,* 2 oz.; *wormwood,* 1 oz.; (all bruised;) *table beer,* 5 or 6 gall. In dropsies and poisonings. A glassful, several times a day.

BEER (Horse-radish). Syn. *Cerevisia Armoraciæ,* — Lat. *Prep.* 1. *Expressed juice of horse-radish root,* ½ pint; *new beer,* 1 gall.; mix.

2. (Hufeland.) *Scraped horse-radish,* 5 oz.; *new beer,* 1 quart; digest for 24 hours, strain, and add *syrup,* 1 oz. In paralytic, scorbutic, and dropsical affections. *Dose.* Half a tumblerful, 2 or 3 times daily.

BEER (Sarsaparilla). Syn. *Spanish Jarave, Lisbon Diet Beer; Cerevisia Sarzæ, C. Sarsaparillæ,*—Lat. *Prep.* 1. *Compound extract of sarsaparilla,* 1½ oz.; *hot water,* 1 pint; dissolve, and when cold, add *East India ale,* 7 pints.

2. (Hancock.) *Bruised sarsaparilla* and *molasses,* of each, 2 lb; *guaiacum bark,* (powdered,) 8 oz.; *guaiacum wood,* (rasped,) *liquorice root,* and *aniseed,* (bruised,) of each, 4 oz.; *bark of mezereon root,* 2 oz.; *cloves,* 12 in no.; *boiling water,* 4 gall.; mix, and ferment, shaking frequently. *Dose.* A small tumblerful, 2 or 3 times a day, in all the ordinary cases where the use of sarsaparilla is indicated; especially in old affections.

BEER (Stomachic). Syn. *Medicated Purl; Cerevisia Stomachica,*—Lat. *Prep.* (Quincy.) *Centaury tops* and *Roman wormwood,* of each, 4 handfuls; *gentian root,* (bruised,) 2 oz.; *the yellow peels* of 6 *Seville oranges; Spanish angelica root,* and *winter's bark,* of each, (bruised,) 1 oz.; *new ale* or *beer,* 3 quarts; digest as before. One or two wine-glassfuls early in the morning and an hour before a meal.

BEER (Sulphuric). Syn. *Sulphuric Lemonade; Cerevisia Acidi Sulphurici, C. Anticolica,*—Lat. *Prep.* 1. *Treacle beer,* or other *weak mild beer* or *ale,* to which a little *sulphuric acid* has been added, in the proportion of about 1 dr. to every 8 or 10 pints.

2. (Benson.) *Treacle,* 15 lb; *bruised ginger,* ½ lb; *water,* 12 gall.; *yeast,* 1 quart; proceed as for ginger beer, and when the fermentation is nearly over, add, *oil of vitriol,* 1½ oz., (diluted with 8 times its weight of water,) and *bicarbonate of soda,* 1½ oz., (dissolved in 1 quart of water.) It is fit to drink in 3 or 4 days.

Obs. The above are used with great benefit by workers in lead; especially by those employed in white-lead works; also in cases of lead colic, &c. *Two* or *three* or more tumblerfuls daily.

BEER (Tar). Syn. *Cerevisia Picis,*—Lat. *Prep.* (Duhamel.) *Bran,* 2 pints; *tar,* 1 pint; *honey,* ½ pint; *water,* 6 pints; mix, gently simmer together for 3 hours; cool, add *yeast,* ½ pint; work for 36 hours, and strain. Pectoral and antiphthisic. *Dose.* One wine-glassful before each meal, in bronchial and chest diseases, and incipient consumption.

BEETLES. The popular name of a genus of insects, (*scarabæus,*) of numerous species. The term is also familiarly applied to all insects with hard or shelly wing-cases. The common pests of our kitchens

and basement floors, which pass under the name of *beetles*, or *cockroaches*, (*blattæ*,) belong to the order *orthoptera*, and not to the *coleoptera*, or beetle tribe, as the name implies. The *blatta*, or *cockroach*, is characterised by its nocturnal appearance, and retiring during the day to the cracks and holes in the floors and walls surrounding the fire-places and chimneys. Warmth and damp are essential to its propagation. The peculiar and disagreeable odour which beetles impart to ill-ventilated apartments where they swarm, is well-known. They contaminate and poison the atmosphere more rapidly than many of even the larger animals. Their *extermination* is therefore of importance to the housekeeper. Beetles, as well as other vermin, constantly increase in direct proportion to the quantity of food which they can obtain. Careless and dirty persons, who allow bones, crumbs, and other waste matters to accumulate on the floors of their apartments, must expect to be constantly annoyed by rats, mice, beetles, and the like. "Stop the supplies," and they will be gradually thinned in number by starvation, or will emigrate to some more congenial quarters where a better supply of food can be obtained. If the situation is very damp, it should be drained, or otherwise rendered thoroughly dry. The common cockroach rapidly dies in a very dry atmosphere.

Exterm., &c. Various plans are adopted for this purpose, among which are the following:—

1. Place a few small lumps of *fresh-burnt* and *unslaked lime* near their haunts. Although very fond of it, it soon kills them. *Sliced cucumbers* are said to act in the same way.

2. *Oatmeal* and fresh *plaster of Paris*, about equal parts; either with or without a little *butter* or *sugar*. Used dry, as the last.

3. (Pharm. Journ.) *Phosphorus*, 1 dr.; *water*, 2 oz.; place them in a phial, and plunge it into a vessel of *hot water;* when the phosphorus is melted, pour the whole into a (warm) mortar with *lard*, 2 or 3 oz.; triturate briskly, adding *flour*, ½ lb; *brown sugar*, 2 oz.; and *water*, q. s. It is used as the above. To be really effective, the quantity of phosphorus must be doubled.

4. (*Beetle wafers.*) Those of the shops are made of *flour*, *brown sugar*, and *red lead*, about equal weights, made into a dough with *water*, and either simply rolled into thin sheets, or heated in "wafer irons."

5. (By *trapping* them.) The common *beetle-trap* of the shops is well known. A domestic substitute for that article is often formed with an old dish, containing a few spoonfuls of *mild beer* or *sugar and water;* a few pieces of stick being placed slanting against its sides, so as to form a sort of gangway for the beetles to climb up by, when they fall headlong into the bait. This, also, must be set nightly near their haunts.

BELL METAL. An alloy of copper and tin, (*bronze*,) to which small portions of other metals are occasionally added, employed for making bells, gongs, apothecaries' mortars, &c.

Prep. 1. *Copper*, 100 parts, melt under charcoal; add *tin*, 20 to 25 parts, and unite by frequent stirring. *Used* for Indian gongs, &c.

2. *Copper*, 3 parts; *tin*, 1 part; as above. *Used* for church and other large bells.

3. *Copper*, 2 parts; *tin*, 1 part. *Used* for house-bells, hand-bells, &c.

4. *Copper*, 72 parts; *tin*, 26½ parts; *iron*, 1½ parts. *Used* by the Paris houses for the bells of small clocks or pendules.

5. *Copper*, 72 parts; *tin*, 26 parts; *zinc*, 2 parts. *Used*, like the last, for very small bells.

6. *Copper*, 70 parts; *tin*, 26 parts; *zinc*, 4 parts. *Used* for the bells of repeating watches.

Obs. The larger the proportion of copper in the above alloy, the deeper and graver the tone of the bells formed with it. The addition of tin, iron, and zinc, causes them to give out their tones sharper. Rapid refrigeration increases their sonorousness. M. D'Arcet recommends the pieces to be ignited after they are cast, and then to be suddenly plunged into cold water. They are next to be submitted to a well-regulated pressure by skilful hammering, until they assume their proper form, when they are to be again heated and allowed to cool slowly in the air. In a general way, however, bells are formed and completed by simple casting. Care should be taken to use *pure* copper. The presence of a very little lead or similar metal, greatly lessens the sonorousness of this alloy.

BELLADONNIN. A volatile alkaloid found by Luebekind in the *atropa belladonna*. 2 gr. produce constriction of the throat and larynx. The name is frequently applied to atropia; but these two substances so differ in their properties, that it is most important not to confound them together.

BENZAMIDE. *Prep.* Pure *chloride of benzule*, is treated with *ammoniacal gas* to saturation; the resulting dry white mass is reduced to powder, thoroughly washed with

very cold water, and the residuum dissolved in boiling water. The *benzamide* is obtained in a crystalline form as the liquid cools.

Obs. Benzamide is soluble in boiling water, and in alcohol and ether; fuses at 240° Fahr.; by distillation it is converted into *benzonitrile*. It is supposed to be formed of the two theoretical bases, *benzoyle* and *amide*.

BENZHYDRAMIDE. It is formed by the action of *strong liquor of ammonia* on $\frac{1}{20}$th of its volume of the *essential oil of almonds*, at a temperature of about 112° Fahr., and is purified by boiling it in *ether*, which, on cooling, deposits it in crystals.

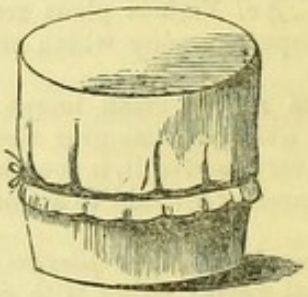
BENZILE. *Prep.* 1. *Chlorine gas* is passed over *melted benzoine*, until fumes of hydrochloric acid cease to be formed; a solution of the residuum of the operation in hot alcohol, deposits crystals of *pure benile* on cooling.

2. By acting on *benzoine* with twice its weight of *nitric acid*, at a gentle heat.

Obs. Benzile forms sulphur-yellow crystals; inodorous, volatile, inflammable; unaltered by distillation; and soluble in alcohol and ether.

BENZILIC ACID. *Prep.* Boil *benzoine* or *benzile* in a *saturated alcoholic solution of potassa*, adding more as long as a blue colour is produced after the previous portion has been decoloured by boiling; then neutralize with *hydrochloric acid*, filter, and add *hydrochloric acid* in excess; as the liquid cools, crystals of *benzilic acid* will be formed. It is slightly soluble in cold water; more readily so in boiling water; melts a little under 250° Fahr., and suffers decomposition at a higher temperature; with some of the bases it forms salts termed *benzilates*.

BENZIMIDE. The pearly needles and lamellæ which separate, under certain circumstances, from *crude essential oil of almonds*.



BENZOATES. Salts of *benzoic acid*. They may be formed by either neutralizing the *acid* with the *base*, or by double decomposition. Most of them are more or less soluble in water.

BENZOCINNAMIC ACID. An oily liquid, decomposed by heat, obtained in a similar manner to that adopted for *acetobenzoic acid*.

BENZOCUMINIC ACID. Greatly resembles the last. See *Acids* (Organic).

BENZOIC ACID. Syn. *Flowers of Benzoin, Flowers of Benjamin; Oxide of Benzoyle; Acidum Benzoicum*,—Ph. L. E. & D. *Flores Benzŏini*,—Ph. L. 1721; *Flores Benzoës*,—Ph. L. 1788. This substance is the characteristic constituent of the true balsams. That of commerce is principally obtained from *gum benzoin*, either by *sublimation*, ("dry way,") or by *dissolving it out in the form of a salt*, ("moist way.")

Prep. 1. From *coarsely triturated gum benzoin*, placed in an iron pot with a flat bottom from 8 to 9 inches in diameter; so as to form a layer of from 1 to 2 inches deep. The open end of the pot is covered with a *sheet* of soft and loose *blotting paper*, (*felt*,—Liebig;) which is attached to the rim with paste. A cone, cap, or cylinder, formed of strong and thick paper, (*cartridge paper*,) is then placed over the top of the pot, including the blotting paper; and this is also attached with *paste* and *string*. The apparatus thus prepared, is then placed on a sand-bath, and exposed from 4 to 6 hours to a gentle heat. It is next removed from the sand-bath, inverted, and the string detached, when beautiful, white, crystalline needles, of a silky lustre, possessing the agreeable odour of benzoic acid, are found in the paper cone. If, owing to want of care in manipulating, the product thus obtained is either coloured or empyreumatic, it must be enveloped in several folds of bibulous paper, then submitted to powerful pressure, and be again sublimed.

A simple and efficient form of apparatus for the purpose, on the small scale, is that recommended by Dr. Moir, and figured in the Engraving. The processes of the Ph. E. & D. and Ph. L. 1836, are essentially the same as the above. In the present London Pharmacopœia, benzoic acid is placed in the list of the materia medica.

2. (*Process at Apothecary's Hall.*) The best *gum benzoin* is put into an iron pot, set in brickwork, over a proper fire, and communicating by a conical metal neck, with a wooden box, ("house,") lined with paper, as a receiver for the flowers. The sublimation is conducted rather rapidly, and the acid condenses in beautiful elastic prismatic crystals. If the process is con-

ducted more slowly, the product is proportionately scaly.

Obs. From 10% to 12% of flowers may be procured from a good sample of benzoin, by either of the above processes, which after being pressed in blotting paper and again sublimed, give 8½ to 9% of very pure acid. The loss arising from a second sublimation is thus so great, that the utmost care should be taken to avoid the existence of such a necessity.

3. (*Scheele's process.*) Equal parts of *gum benzoin* and *hydrate of lime*, in fine powder, are intimately mixed together, and boiled for about an hour, with 40 parts of *water;* the liquor filtered and evaporated to ⅓; and the lime saturated with *hydrochloric acid*, when the benzoic acid crystallizes out, as the liquor cools; it is then either washed with *cold water* or sublimed, after first well drying it.

Obs. For the success of this process, a *perfect* mixture of the *lime* and *powdered gum* must be first made, or the latter will run into a solid mass in the boiling water, and the operation will fail. "1lb of (gum) benjamin yields 1 oz. 6 dr. 2 scrup. of flowers." (Gray.) Our own manipulations failed in procuring this large proportion of acid. The above process is similar to that of the Ph. D. 1826.

4. (*Process of Stoltze.*) The *gum* or *resin* is dissolved in 3 times its weight of *alcohol*, the solution introduced into a retort, and a solution of *carbonate of soda* in *weak spirit and water*, add thereto gradually, until all the free acid is neutralized; *water*, equal to about twice the weight of the benzoin employed, is next poured in, and the alcohol removed by distillation. The floating resin is now skimmed off the remaining liquid, washed with a *little* water, and the "washings" added to the contents of the retort, which will deposit crystals of *benzoate of soda* on cooling. From the latter, the *benzoic acid* is obtained by saturating the alkali with an *acid*, and by subsequent sublimation.

5. *Hippuric acid* is boiled for about 15 minutes in *nitric acid* (sp. gr. 1·42); *water* is then added, and the solution allowed to crystallize. The crystals are collected on a filter, washed with a *little very cold water*, dried by pressure in bibulous paper, and purified by sublimation, as above.

6. From the *urine of horses, cows*, and *other graminivorous animals*, in a similar way to that by which *hippuric acid* is obtained, only allowing the urine to acquire a *slight* degree of putridity before commencing the evaporation. The crude acid thus obtained is treated as directed above. Large quantities of benzoic acid are said to be obtained in this way, but owing to it not being generally well purified, it is of inferior quality and unsaleable. It may, however, by careful manipulation, be rendered quite equal to that obtained from gum benzoin. "*A manufactory of sal ammoniac, near Magdeburgh, which uses urine, is able to supply flowers of benjamin by the cwt.*" (Gray.) The processes 1 and 2, (above,) are those usually employed at the present time.

Pur. "White, or nearly so. It volatilizes (totally) by heat, cautiously applied, exhaling a peculiar odour; only slightly soluble in water, copiously so in rectified spirit. It is soluble in solutions of ammonia, potassa, soda, and lime, and is precipitated from them by hydrochloric acid." (Ph. L.) "24 parts of *boiling water* dissolve 1 part of *benzoic acid*, and again deposits the greater portion on cooling." (Ph. L. 1836.) "It is colourless, and is sublimed entirely by heat." (Ph. E.)

Prop., &c. Benzoic acid forms soft, light, feathery, white, flexible, transparent or semitransparent crystals or scales, having a mother-of-pearl lustre; odourless, (that of the shops has, usually, a slight balsamic odour;) fuses at 230° Fahr.; volatile, when heated; dissolves in about 200 parts of cold water and 25 parts of boiling water; very soluble in alcohol; sp. gr. 0·667; its salts are called *benzoates*. It was formerly esteemed as an expectorant, and much used in chronic bronchial affections. At the present time, its chief use in medicine, is as an ingredient in the compound tincture of camphor (*paregoric*) of the pharmacopœia. —*Dose.* 10 to 30 gr. dissolved in water by the aid of a little ammonia or potassa; in old coughs, &c.

BENZOIC ACID (Anhydrous). *Prep.* Add *oxychloride of phosphorus* to excess of *benzoate of soda;* agitate together, and wash the mixture with boiling water. The *anhydrous benzoic acid* sinks like a heavy oil and crystallizes on cooling. See *Acids.*

BENZOIN. Syn. *Benzoine, Camphor of Oil of Bitter Almonds.* A crystalline substance obtained by the action of alkalies on the crude oil of bitter almonds. *Prep.* 1. It is found in the residue left in the retort, when this oil has been distilled with *lime* and *oxide of iron*, to free it from hydrocyanic acid. By dissolving out the lime and oxide of iron with *hydrochloric acid*, and boiling the residuum in *alcohol*, a solution

of benzoine may be obtained, which yields crystals on cooling.

2. Mix together equal parts by measure of the *raw oil of bitter almonds*, and *solution of caustic potassa in alcohol*. As soon as the liquid becomes full of crystals, and apparently solid, it must be dissolved in alcohol, filtered, and crystallized.

Prop., &c. Brilliant prismatic crystals; tasteless, odourless, volatile, and inflammable; soluble in alcohol, and forms with oil of vitriol, and with alcoholic solution of potassa, a violet-blue solution; it melts at 248° Fahr., and distils without decomposition.

BENZOINAMIDE. Syn. *Hydrobenzoinamide*. A white, tasteless, inodorous, volatile powder, obtained by heating benzoine with water of ammonia.

BENZOLE. Syn. *Benzol*, *Benzine*. A volatile, ethereal fluid, discovered by Faraday among the products of the destructive distillation of organic substances.

Prep. 1. Of *benzoic acid*, 1 part; *slacked lime*, 3 parts; mix, and submit the compound to distillation; separate the oily product from the water, and rectify it at a temperature under 200° Fahr.

2. (Mansfield.) By distillation from *light coal-tar naphtha*, at a temperature not exceeding 200°. Patent.

Uses, &c. As a solvent for gutta percha and Indian rubber; but it leaves the first in a spongy, friable state, and the latter, glutinous or sticky, unless heat is applied to it for some time. It promises to form a valuable article for the manufacture of varnishes, and the production of artificial light. It boils at 176° Fahr., and has the sp. gr. 0·885.

BENZOLINE. Syn. *Amarine*. A crystallizable substance possessing basic properties, formed by acting on *hydrobenzamide* (of Laurent) with a *boiling solution of caustic potassa*. Strongly heated in a retort, it suffers decomposition, *pyrobenzolin*, and other substances, being produced.

BENZONE. Syn. *Benzophenone*, *Carbobenzide*. One of the products of the distillation of *dry benzoate of lime*, at a very high temperature. In its purest state it may be obtained in a crystalline form, but is otherwise found mixed with various hydrocarbons, in which state it appears as a heavy oily liquid.

BENZONITRILE. One of the products of the destructive distillation of *benzoate of ammonia*. It greatly resembles essential oil of almonds in odour and appearance; is heavier than water, and does not boil much under 380° Fahr.

BENZOYLE. Syn. *Benzoile*, *Benzoyl*, *Benzule*. The radical of benzoic acid and the benzoyl-series.

Prep. From *benzoate of copper*, by dry distillation, cautiously conducted. The oily portion of the distilled product crystallizes on cooling; the crystals are *benzoyle*. It has the odour of geranium, and melts at 158° to 160° Fahr.

BENZOYLE (Chloride of). Syn. *Chlorbenzoyle*, *Chloride of Benzule*. Prepared by transmitting *dry chlorine gas* through *pure oil of bitter almonds*, at nearly the boiling temperature, until hydrochloric acid ceases to be formed. It is a limpid, colourless fluid, slightly heavier than water. *Bromide of benzoyle* may be prepared in a similar manner.

BENZOYLE (Cyanuret of). By distillation from a mixture of *bicyanide of mercury* and *chloride of benzoyle*.

BENZOYLE (Hydruret of). From *oil of almonds*, *hydrate of lime*, and *chloride of iron*, made into a thin paste with *water*, and distilled in a retort. It greatly resembles ordinary oil of almonds, from which it chiefly differs in the absence of hydrocyanic acid. It forms, indeed, the *purified oil of almonds*, of modern pharmacy. Unlike the crude oil, it rapidly deteriorates by age.

BENZOYLE (Iodide of). From a mixture of *iodide of potassium* and *chloride of benzoyle*, by distillation.

BENZOYLE (Sulphuret of). From a mixture of *sulphuret of lead* and *chloride of benzoyle*, by distillation. *Phosphuret of benzoyle* may be prepared in a similar way.

Obs. The *benzoyl-series* also includes *hippuric acid*, *amygdalinic* acid, and *amygdaline*, as well as several other substances whose names contain the prefix benz-, (the first part of the word benzoyle,) as indicative of their constitution.

BERBERINE. Syn. *Barberine; Berberina*. A yellow crystalline substance obtained from the root of the *berberis vulgaris*, (Linn.) or barberry shrub.

Prep. 1. A soft *watery extract of the root* is digested in *rectified spirit*, with trituration, as long as it takes up anything; the tincture is filtered, and the alcohol gradually distilled off to the consistence of a *thin* syrup. The crystals which form as the liquid cools are purified by solution and recrystallization, first in *rectified spirit*, and then in *distilled water*.

2. By digesting the *powdered root* in *rectified spirit*, and proceeding as before.

Prop., &c. Berberine belongs to the class of azotised colouring substances and

possesses feeble basic properties. It is soluble in boiling water and in alcohol, from either of which it may be readily obtained in crystals. It has been proposed as a tonic in doses of 3 to 10 gr. In larger doses it is laxative. It must not be confounded with *beeberine* or *bibirine*, which is prepared from the *green-heart tree* of Guiana.

BETEL. A common masticatory in the East, formed of the *leaves* of the *piper betel*, (Linn.) *areka nuts*, and *lime*. It produces a species of intoxication, stimulates the salivary glands and stomach, and diminishes cutaneous perspiration.

BETULINE. Syn. *Betulina*. A substance obtained from the bark of the white birch, (*betula alba*,) under the form of white, crystalline needles, soluble in ether, alcohol, oil, and acids. It is fusible, volatile, and inflammable.

BEZOARS. Syn. *Bezoar*, *Lapis Bezoardicus*,—Lat. Preternatural concretions found in the stomach and intestines of certain animals, formerly supposed to possess great medicinal virtues. They were taken internally and worn as amulets. They have now, however, long fallen into disuse, except among a few of the more weak-minded and ignorant.

BEZOARS (Factitious). *Tobacco-pipe clay* made into a paste with *ox-gall*, a little *hair* or *wool* being added, and the mass formed into shapes. This gives a *yellow tint* to paper rubbed with chalk, and a *green one* to quicklime, which tests are used for genuine bezoars.

BEZOAR (Argentine). Syn. *Bezoardicum Lunare*. Made by distilling a mixture of *butter of antimony* and *nitrate of silver*. Once given in epilepsy and head diseases.

BEZOAR (Mineral). *Powder of algaroth* deflagrated with *nitre* in a red hot crucible, and then well washed with *water*. Once used as a diaphorectic. Other similar preparations were termed *Bezoardicum Joviale* and *B. Martiale*.

BEZOAR (of Lead). Syn. *Bezoardicum Saturni*. Made by distilling a mixture of *oxide of lead*, *butter of antimony*, and *nitric acid*. Once esteemed in diseases of the spleen.

BHAURTA. An Indian dish made of *mashed potatoes*, *onions*, and *capsicum*, moulded in a "shape" and slightly baked.

BIBROMISATINE and *Bromisatine*. Formed by the action of *bromine* on *isatine*. Treated with *potassa*, they yield acids of the same names.

BICARBONATES. Combinations of *one atom* of the *bases* with *two atoms* of *carbonic acid*. Other compounds, whose names possess the prefix *bi-* or *bin-*, have an analogous composition; as, *bisulphates*, *biniodides*, *&c.* For the mode of their preparation see the respective bases.

BICE (Blue). A light blue colour, consisting of native *blue carbonate of copper*, prepared by grinding and washing. That of the shops is generally a factitious compound made from *smalts*.

BICE (Green). The native *green carbonate of copper*, prepared as above. That of the shops is commonly made by mixing a little *yellow orpiment* with *blue bice*. Both the above are used as pigments.

BILE, BILIOUSNESS. Persons subject to bilious attacks should be particularly careful to avoid excess in both eating and drinking, and should more especially avoid using those articles of food which, from experience, they find to disagree with them. A *mutton chop*, *under-cooked*, is an excellent article for the breakfast or lunch of a bilious patient; and *mutton* or *beef*, either broiled or roasted, so that the gravy is retained, is better for dinner than many articles apparently more delicate. These, with *fresh* game and venison, form a good variety from which to choose a bill of fare. *New beer* and *porter* should be particularly avoided, as well as *puddings* and most articles of *pastry*, as they are very indigestible. *Hard cheese*, *butter*, *unripe fruit*, and especially *beans*, *peas*, and *nuts*, are also objectionable for parties with delicate stomachs or a bilious tendency. An attack of bile may frequently be prevented by the use of a *saline purgative*, and it may generally be removed by an *emetic*, followed by a dose of *castor oil*, *epsom salts*, or *seidlitz powders*. See *Abernethy Medicines*.

BILLS OF FARE. The following tables, for which we are indebted chiefly to Soyer, Rundell, and others, exhibit the various articles in season at different periods of the year.

First Quarter. January.—*Poultry* and *Game:* Pheasants, partridges, hares, rabbits, woodcocks, snipes, turkeys, capons, pullets, fowls, chickens, and tame pigeons.—*Fish:* Carp, tench, perch, lampreys, eels, cray-fish, cod, soles, flounders, plaice, turbot, thornback, skate, sturgeon, smelts, whitings, lobsters, crabs, prawns, and oysters.—*Vegetables:* Cabbage, savoys, colewort, sprouts, leeks, onions, beet, sorrel, chervil, endive, spinach, celery, garlic, scorzonera, potatoes, parsnips, turnips, brocoli, (white and purple,) shalots, lettuces, cresses, mustard, rape, salsafy, and herbs of all sorts, (some dry and some green;) cucumbers, asparagus,

and mushrooms are also to be had, though not in season.—*Fruit:* Apples, pears, nuts, walnuts, medlars, and grapes.

February and March.—Meat, fowls, and game, as in January, with the addition of ducklings and chickens.—*Fish:* As the last two months. (Cod is not thought so good from February to July, although it is still sold at the fishmonger's.)—*Vegetables:* The same as the previous months, with the addition of kidney-beans.—*Fruit:* Apples, pears, and forced strawberries.

Second Quarter. April, May, and June.—*Meat:* Beef, mutton, veal, lamb, and venison, (in June.)—*Poultry:* Pullets, fowls, chickens, ducklings, pigeons, rabbits, and leverets.—*Fish:* Carp, tench, soles, smelts, eels, trout, turbot, lobsters, chub, salmon, herrings, cray-fish, mackerel, crabs, prawns, and shrimps.—*Vegetables:* As before; and in May, early potatoes and cabbages, peas, radishes, kidney-beans, carrots, turnips, cauliflowers, asparagus, artichokes, and numerous salads, (forced.)—*Fruit:* (In June,) strawberries, cherries, melons, green apricots, and currants and gooseberries for tarts; pears, grapes, nectarines, peaches, and some other fruit.

Third Quarter. July, August, and September..—*Meat*, as before.—*Poultry, &c.:* Pullets, fowls, chickens, rabbits, pigeons, green geese, leverets, and turkey poults. Two former months, plovers and wheat-ears; (in September,) partridges, geese, &c.—*Fish:* Cod, haddock, flounders, plaice, skate, thornback, mullets, pike, carp, eels, shellfish, (except oysters,) and mackerel, (during the first two months of the quarter, but they are not good in August.)—*Vegetables:* Of all sorts, beans, peas, French-beans, &c.—*Fruit:* (In July,) strawberries, gooseberries, pine-apples, plums, (various,) cherries, apricots, raspberries, melons, currants, and damsons. (In August and September,) peaches, plums, figs, filberts, mulberries, cherries, apples, pears, nectarines, and grapes. (During the latter months,) pines, melons, strawberries, medlars, and quinces. (In September,) Morella cherries, damsons, and various plums.

Fourth Quarter. October, November, and December.—*Meat*, as before, and doe venison.—*Poultry and Game:* Domestic fowls, as in first quarter; pheasants, (from the 1st of October;) partridges, larks, hares, dotterels; (at the end of the month,) wild-ducks, teal, snipes, widgeon, and grouse.—*Fish:* Dories, smelts, pike, perch, halibuts, brills, carp, salmon-trout, barbel, gudgeons, tench, and shellfish.—*Vegetables:* (As in January,) French-beans, last crops of beans, &c.—*Fruit:* Peaches, pears, figs, bullace, grapes, apples, medlars, damsons, filberts, walnuts, nuts, quinces, services, and medlars. (In November;)—*Meat, &c.:* Beef, mutton, veal, pork, house-lamb, doe venison, and poultry and game as in the last month.—*Fish:* As the last month.—*Vegetables:* Carrots, turnips, parsnips, potatoes, skirrets, scorzonera, onions, leeks, shalots, cabbage, savoys, colewort, spinach, chard-beets, chardoons, cresses, endive, celery, lettuces, salad-herbs, and various pot-herbs.—*Fruit:* Pears, apples, nuts, walnuts, bullace, chesnuts, medlars, and grapes. (In December;) *Meat, &c.:* Beef, mutton, veal, house-lamb, pork, and venison.—*Poultry and Game:* Geese, turkeys, pullets, pigeons, capons, fowls, chickens, rabbits, hares, snipes, woodcocks, larks, pheasants, partridges, sea-fowls, guinea-fowls, wild ducks, teal, widgeon, dotterels, dun-birds, and grouse.—*Fish:* Cod, turbot, halibuts, soles, gurnets, sturgeon, carp, gudgeons, codlings, eels, dories, and shell-fish.—*Vegetables:* As in last month. Asparagus, &c., forced.—*Fruit:* As before, except bullace.

BIRDLIME. *Prep.* The *middle bark of the holly*, (gathered in June or July,) is boiled for 6 to 8 hours in *water*, or until it becomes quite soft and tender; the water is then drained off, and it is placed in a heap, in a pit underground, (commonly on layers of fern,) and covered with stones. Here it is left to ferment for 2 or 3 weeks, and watered, if necessary, until it assumes a mucilaginous state. It is next pounded in a mortar until reduced to a uniform mass, which is then well kneaded with the hands, in running water, until all the refuse matter is worked out. It is, lastly, placed in an earthen vessel, and covered with a film of water; in which state it may be preserved from season to season. In about a week it is fit for use.

Obs. Birdlime may also be made from misletoe berries, the young shoots of the elder, and the bark of the wayfaring tree and other vegetables, by a similar process to that above described. Should any of it stick to the hands, it may be removed by means of a little *oil of lemon bottoms*, or *turpentine*. It is *used* to cover twigs to catch birds and other small animals. It is said to be discutient, but is now never used in medicine.

BIRDLIME (Factitious). *Prep.* From *linseed oil*, boiled until it becomes a viscid paste.

2. From *linseed oil* and *common resin*, as above.

3. *Rape oil* or *linseed oil*, rendered glu-

tinous or viscid by dissolving in it, *yellow resin*, q. s., by heat. Fat is sometimes substituted for the oil.

Obs. The first two are used for the same purposes as ordinary birdlime, to which, however, they are greatly inferior. The last is the composition rubbed over the "adhesive fly-papers," now so commonly sold about the streets of London. The cruelty of this mode of catching flies and like insects, has been ably exposed in Kidd's Journal.

BIRDS. The care of *living birds* will be found briefly referred to under the articles *Aviary*, &c. *Dead birds* may be *preserved* in a fresh state for some time by removing the intestines, wiping the inside out quite dry with a towel, and then "flouring" them. A piece of blotting paper, on which one or two drops of *creosote* have been thrown, is now to be put inside them, and a similarly prepared piece of paper tied round them. They should then be hung up in a cool dry place, free from the attacks of flies or vermin. *Poultry* and other *small animals* thus treated, will be found to keep much longer than without undergoing this process.

BISCOTIN. A species of confection made of *eggs*, *flour*, *marmalade*, and *sugar*, variously compounded and flavoured according to the taste of the operator.

BISCUITS. A well-known variety of hard, dry, unleavened bread, made in thin flat pieces. Those prepared for seamen, (*sea-biscuits*, *captain's biscuits*,) are composed of flour and water only. When a few caraway seeds are added, they are commonly called *Abernethy's biscuits*. *Fancy biscuits* generally contain sugar and butter, to which almonds, caraways, and other articles, are frequently added. The word biscuit is borrowed from the French, and implies twice baked.

Prep. On the *small scale*, biscuits are made by forming the *flour* and *water* into a dough by the common process of kneading with the hands, occasionally assisted with a lever, as in making ordinary bread. The dough is then rolled into a sheet, and cut into pieces of the desired size and form. These, after being stamped, are exposed to the heat of a moderately quick oven, when a few minutes (12 to 18) are sufficient to bake them. On the *large scale*, the whole manual process, from preparing the dough to the point at which the newly made biscuits are ready for baking, is now generally performed by machinery. The articles so prepared are commonly known in trade as "*machine-made biscuits*," and are not only much cheaper, but of fully equal quality to those "made by hand." The bakehouses of her Majesty's Victualling yards at Deptford, Gosport, and Plymouth, are said to be capable of producing annually about 8000 tons of sea-biscuits, at a saving of upwards of 12,000*l.* a year, from the cost that would have been incurred for the purpose before machinery was introduced into these establishments. "Under the *old system*, wages, and wear and tear of utensils, cost about 1*s.* 6*d.* per cwt. of biscuit; under the *new system*, the cost is 5*d.*" (Ure.) Large private machine-biscuit manufactories are now in full operation in various parts of the kingdom, by which a complete revolution has been effected in the trade. To the superior quality of those made by Huntley and Palmer, of Reading, we bear most willing testimony, founded on our personal use and careful examination of them.

BISCUITS (Devilled). *Prep.* Butter *captain's biscuits* (or any similar kind) on both sides, and *pepper* them well; then make a slice of *good cheese* into a paste, with *made mustard*, and lay it on one side of each biscuit; add a little *cayenne pepper*, and grill them. *Chopped anchovies*, or *essence of anchovies*, is also a good addition.

BISCUITS (Fancy). There is no end to the varieties of fancy biscuits, which may be made by varying the number and proportions of the ordinary ingredients used in their composition, and the form and size in which they are "turned out of hand." They are further modified by the relative heat of the oven, as well as the length of time they are allowed to remain in it. It would, therefore, be waste of space to give further directions for their preparation. The proportions of *butter* and *sugar*, or either of them, may be from 1 *oz.* and upwards, to *flour*, 1 *lb.*, according to the degree of richness desired. The following specimen of domestic manufacture is from Mrs. Rundell:—Pound *blanched almonds* very fine, and sprinkle them with a little *orange flower water*; put the paste into a small pan, and add a little of the finest *flour*; mix, put the pan over a slow fire, and move the paste well about to prevent it burning, until it becomes hard enough not to stick to the fingers; then take it out and roll it into small fillets, and make it into knots, rings, or other shapes. Next make an *icing of different colours*, and dip one side of the forms in it and set them to drain on a clean sieve.

BISCUITS (Soda). From the *finest flour* and a little *bicarbonate of soda*.

BISCUITS (Sponge). *Prep.* Add the

whites and *yelks* of *twelve eggs*, previously well beaten, to 1½ *lb.* of *finely powdered sugar*, and whisk it until it rises in bubbles, then add 1 *lb.* of the *finest pastry flour*, and the *rind of two lemons*, grated. Put it into "shapes," sift a *little sugar* over them, and bake them in buttered tin moulds, in a quick oven, for nearly an hour.

BISMUTH. Syn. *Marcasite, Tin Glass; Bismuthum*,—Lat. Commercial bismuth is principally prepared in Germany, whence it is exported to England. In this state it generally contains both arsenic and copper. Pure bismuth (*purified bismuth; bismuthum purum, bismuthum repurgatum;*) is made as follows:

Prep. 1. Heat to redness in a covered crucible, a mixture of *oxide* or *subnitrate of bismuth* with *half its weight of charcoal.* Chemically pure.

2. (P.C.) *Bismuth*, in powder, 20 parts; *nitre*, 1 part; mix, heat the compound to redness in a covered crucible, and let it cool. The bismuth will occupy the lower part of the crucible, and is to be repulverized, and treated a second time in the same way. Sufficiently pure for pharmaceutical purposes.

3. (Pruss. Ph.) *Bismuth*, in powder, 16 oz.; *carbonate of soda* (dry), 2 oz.; *sulphur*, 2 dr.; mix thoroughly, and fuse for an hour; afterwards cool, and carefully separate the metal from the scoriæ. Nearly pure.

Prop., &c. Crystalline; very brittle; of a reddish-white colour; melts at 480° Fahr.; volatilizes at a strong heat, and the fumes form crystalline laminæ; little acted on by the air; burns when strongly heated in the air; sp. gr. 9·8 to 9·9; when slowly cooled in large masses, it forms cubic crystals of great beauty. "It is dissolved by dilute nitric acid. When subnitrate of bismuth is precipitated from this solution by ammonia, the liquor is free from colour." (Ph. L. 1836.) "Its powder is entirely soluble in nitric acid with the aid of heat; and the solution is colourless, or nearly so, and deposits a white powder when much diluted with cold water." (Ph. E.) Sulphuretted hydrogen gives a black precipitate with bismuth and its salts. The nitric solution is unaffected by the addition of sulphuric acid. Chromate of potassa gives a yellow precipitate, which differs from that from lead, by being *soluble* in nitric acid, and *insoluble* in potassa. The salts of bismuth are non-volatile, (excepting the chloride,) decomposed at a red heat, colourless, and their aqueous solutions are decomposed by water in excess.

Estim. 1.—(*When mixed with bodies unaffected by sulphuretted hydrogen.*) Pass *sulphuretted hydrogen gas* through the liquid previously mixed with a large quantity of *acetic acid*, and *diluted with water.* Collect the precipitated sulphuret on a filter, wash it well with water, redissolve it in *nitric acid*, (in excess,) dilute with *water* and filter; wash the sulphur left on the filter with *water soured with nitric acid;* mix the whole together, and precipitate the bismuth in the state of oxide by *carbonate of ammonia.* After some hours, collect the deposit on a filter, wash it with *water*, and ignite it in a porcelain crucible. The weight of oxide, (in grains,) multiplied by ·899 will give the weight of metal in the sample examined. Should the sample be in the solid state it may be dissolved in nitric acid in excess, before applying the test.

2.—(*When neither mixed with hydrochloric acid nor substances precipitated by carbonate of ammonia.*) The oxide of bismuth may be at once thrown down with *carbonate of ammonia*, ignited, and weighed as before.

3.—(*When mixed with lead.*) Precipitate the oxides with *carbonate of ammonia*, and redissolve them in acetic acid; a strip of clean lead, the weight of which is known, must then be put into this solution, and the whole allowed to stand for some hours. Bismuth separates in a metallic state; that which remains on the lead is washed off, and the *strip* dried and weighed. The bismuth is next brought on to a filter and washed with *water* which has been boiled and allowed to cool; it is then dissolved in *nitric acid*, the solution evaporated, heated, and the oxide of bismuth weighed as before. The *solution of lead* is next precipitated with *carbonate of ammonia*, and the quantity of oxide determined. The loss of weight which the lead has suffered gives the quantity of oxide of lead which was not originally in the solution. A still simpler way is to add *caustic potassa* to the *nitric solution*, in sufficient excess to redissolve all the oxide of lead at first thrown down. The oxide of bismuth remains behind, and may be dried and weighed as before.

Uses, &c. Bismuth is used in the composition of *type metal, solder, pewter, fusible metal*, and several other metallic mixtures. When added to other metals it renders them more fusible. An alloy of tin, nickel, bismuth, and silver, is said to hinder iron from rusting. A mixture of bismuth, lead, and tin, is much employed for taking im-

pressions from dies, forming moulds, and for other purposes.

BISMUTH (Bromide of). By heating the *metal* with an excess of *bromine* in a glass tube, when a gray-coloured mass, resembling fused iodine, is formed. It is volatile, and decomposed by water.

BISMUTH (Chloride of). *Prep. Corrosive sublimate*, 2 parts; *bismuth*, 1 part; (both in powder;) mix, and expose the compound to heat until all the mercury is expelled. A granular substance of a grayish-white colour.

BISMUTH (Flowers of). *Prep. Nitre*, 2 lb; *bismuth*, 1 lb; (both in powder;) mix, and gradually inject them into an ignited tubulated earthenware retort, having a wide mouth, and furnished with a receiver to catch the flowers. A form of the oxide now disused.

BISMUTH (Nitrate of). Syn. *Neutral Nitrate of Bismuth. Ternitrate of Bismuth*; (?) *Bismuthi Nitras*,—Lat. *Prep.* (Ph. Bor. 1847.) *Purified bismuth*, (broken into fragments,) 2 oz.; *nitric acid*, 6 oz.; dissolve with heat, adding more acid, (if necessary,) to effect entire solution of the metal; add to the solution half its volume of *distilled water*, filter through powdered glass, and evaporate until crystals are formed.

BISMUTH (Oxide of). Syn. *Teroxide of Bismuth, Protoxide of do.; Bismuthi Oxydum*,—Lat. *Prep.* 1. (Anhydrous.) From the *neutral* or *basic nitrate*, by exposing it to gentle ignition in a crucible. A straw-yellow powder.

2. (Hydrated.) *Bismuth*, 2 *lb.*; *nitric acid*, 2½ *lb.*; dissolve, and drop it gradually into a solution of *carbonate of potassa*, 3 *lb.*, in *water*, 6 *lb.* rendered caustic by previous treatment with quicklime, as in making liquor of potassa; lastly, well wash the precipitate with pure cold water. A rich-looking white powder.

Prop., &c. Oxide of bismuth fuses at a high temperature, and then acts as a powerful flux on siliceous matter. It has been used as an antispasmodic; and as a cosmetic by the ladies. See *Bismuthic Acid.*

BISMUTH (Subchloride of). Syn. *Pearl Powder; Bismuthi Subchloridum*,—Lat. *Prep.* Drop a *weak solution of common salt*, or of *hydrochloric acid*, into another of *bismuth*, prepared by dissolving that metal in twice its weight of nitric acid; collect the precipitate, wash it well with *water*, and dry in the shade.—*Uses, &c.* Same as the *trisnitrate.*

BISMUTH (Sulphuret of). This is a natural production, but may be prepared artificially by fusing its elements together, or by passing *sulphuretted hydrogen* through a solution of *nitrate of bismuth.*

BISMUTH (Trisnitrate of). Syn. *Subnitrate of Bismuth, Nitrate of do., Tetartonitrate of do., Pearl-white, Fard's White, Spanish do., Bismuth do.; Blanc de Fard*,—Fr. *Bismuthi Nitras*,—Ph. L. *B. Trisnitras*,—Ph. L. 1836. *B. Subnitras*,—Ph. D. *Bismuthum Album*,—Ph. E. *Magistery of Bismuth*,—Obs. *Prep.* (Ph. L.) *Bismuth*, 1 oz.; *nitric acid*, 1½ fl. oz.; *water*, 1 fl. oz.; mix, and dissolve with heat; throw the solution into *water*, 3 pints; separate the powder by straining through a linen cloth, wash it with *distilled water*, and dry by a gentle heat.

Obs. The processes of the other colleges are essentially the same as the above. Geiseler has ascertained by comparative experiment that the product is greater, if, according to Duflos, the nitrate of bismuth be allowed to crystallize previously to dilution with water, than if the dilution be executed at once. (See *Nitrate of Bismuth*, above.) The proportion of the proceeds was as 10½ to 14, the quality of both preparations being alike.

Prop., &c. A white, inodorous powder, insoluble in water, but freely soluble in nitric acid; a strong light turns it grayish. Under the microscope it is seen to consist of very fine silky acicular crystals. "It dissolves in nitric acid without effervescence. Dilute sulphuric acid being added, nothing is thrown down." (Ph. L.) These tests show the absence of white lead. The presence of hydrated oxide of bismuth is easily detected, by its powder, viewed by a lens, appearing dull and amorphous; whereas trisnitrate of bismuth is silky and crystalline.

Uses, &c. Trisnitrate of bismuth has been given as a tonic and antispasmodic, in some chronic stomach complaints, in intermittent fever, and spasmodic asthma, in doses of 5 to 10 gr. and upwards, in the form of powder, linctus, bolus, or pills, twice or thrice a day. An ointment formed with 1 part of this substance and 4 parts of *lard*, has been long in use as a remedy in certain chronic skin diseases. It is also used by ladies as a cosmetic, but it is said to injure the skin, producing paralysis of its minute vessels, and rendering it yellow and leather-like. Both this article and the basic chloride have received the name of *pearl powder*, from their extreme whiteness and beauty. The term *magistery of bismuth* was also formerly applied to both of them.

The trisnitrate, like the other salts of bismuth, is poisonous when swallowed in large doses, producing vomiting, purging, giddiness, cramp, insensibility, &c. No chemical antidote is known. The treatment may consist of the administration of an emetic, followed by the copious use of bland or emollient drinks, as weak broth, barley water, milk-and-water, &c. To prevent inflammation a low diet and aperients should be had recourse to.

BISMUTH (Valerianate of). *Prep.* (Righini.) From a *nitric solution of bismuth* (neutral), decomposed with a solution of *valerianate of soda* in water containing a little free *valerianic* acid. The precipitate is to be carefully washed in distilled water and dried in the shade. Recommended in gastrodynia, dyspepsia, intermittents, &c.

BISMUTHIC ACID. Syn. *Peroxide of Bismuth, Deutoxide of do., Pentoxide of do.; Acidum Bismuthicum*,—Lat. *Prep.* 1. Suspend *teroxide of bismuth* in a *strong solution of potassa*, and pass *chlorine* through the mixture until the decomposition is complete. The resulting reddish-brown powder is treated with *dilute nitric acid* to remove any of the teroxide which may have escaped oxidation, and is afterwards washed in cold water and dried.

2. The *teroxide* is gently heated for some time in a solutiou of *chlorate of potassa*, and the resulting powder treated as before.

Prop., &c. Bismuthic acid is insoluble in water. Its salts, of which little are known, are called *bismuthates.* When heated, it loses oxygen, a *bismuthate of bismuth* being formed.

BISTRE. *Prep.* From the *soot of beech-wood* or *peat*, the former being preferred. The most compact, best coloured, and well-burnt parcels of the soot are selected, reduced to powder, and sifted through a very fine lawn sieve. It is then digested in *clear cold water* for several hours, frequently stirring it up during the time with a rod of glass or wood; after which it is allowed to settle, and the liquid portion decanted from the sediment. This process is repeated a second, and even a third time. The paste is next poured into a tall narrow vessel, which is then filled with water, and well agitated. The *grosser* parts are now allowed to subside, (2 or 3 minutes suffices for this purpose;) and the supernatant liquor, containing the *finer* portion of the bistre in suspension, is poured off into another vessel, where it is left to deposit its contents. The deposit is next collected, partially dried, and made into cakes with *gum water* or *isinglass size*, and finally dried for sale.—*Used* to tint water-colour drawings, in the same way as Indian ink. It is esteemed as superior to the latter, for drawings which are intended to be afterwards tinted with other colours.

BITES and STINGS. The bites and stings of *ants*, *bees*, *wasps*, *hornets*, and *similar insects* common to this climate, may be treated by washing the part with *spirit of hartshorn* or *dilute liquor of ammonia*, or a *weak solution of chloride of lime.* Should considerable inflammation ensue, and the part become much swollen, leeches may be applied, and a cooling purgative given. The stings of venomous reptiles may be similarly treated, excepting that the strength of the solutions of ammonia and chloride of lime should be stronger than in the former case, so as to produce some pain and smarting. In cases where the venom is of a very poisonous description, the wound should be first well washed with *water of ammonia*, and afterwards thoroughly seared with *lunar caustic* in every part, especially the interior and deep-seated portions; or the surface of the wound, both internal and external, may be removed with the knife; or, in the case of a small joint, as a finger, the injured portion may be at once amputated. Prior to the use of the washes or caustic, *dry-cupping* or *suction with the mouth* may be had recourse to with advantage. A ligature placed on the limb, above the wound, will impede the absorption of the poison whilst the other treatment is in progress. A similar plan may be followed after the *bite of a dog supposed to be mad.* It has, indeed, been lately asserted by one of our most celebrated veterinarians, that both himself and colleagues have been *repeatedly* bitten by dogs that have afterwards been proved to be mad, but from having fearlessly applied caustic to the parts, they have escaped uninjured.

The poison inserted by the stings and bites of many venomous reptiles is so rapidly absorbed, and of so fatal a description, as frequently to occasion death within a very short space of time, and before any remedy or antidote can be applied. But even in these extreme cases it is probable that absorption, and consequently, the rapidity of the action of the poison, might be considerably lessened by the immediate application of a ligature above the part, as before described, the patient at the same time swallowing a large quantity of liquid, by which partial plethora would be produced,

and the functions of the absorbents for a time nearly suspended. A few minutes, thus gained, would permit of the application of the antidotes just referred to, by which the poison might be neutralized before it would become necessary to remove the ligature and the kidneys would be in full action. Unfortunately, these wounds are inflicted in parts of the world where precautionary measures are seldom thought of, and generally at times when people are least prepared to meet them, and so suddenly and unexpectedly, as to stagger even those observers who may be in no absolute danger themselves. Such is the bite of the East Indian *cobra de capello*, against which two Asiatic (arsenical) pills are prescribed by the Hindoos, but which are generally scarcely swallowed, before the poison of the serpent has rendered the patient a stiffened corpse. The bite of the *puff-adder* is of a similarly fatal description. When the venom of any of these animals, or of a rabid dog, is once *fully absorbed into the system*, there appears to be no treatment that can save the patient. A bottle of Madeira wine, drank in two doses, about 3 minutes apart, is a popular remedy in India in such cases. Its effect is to impede absorption. A certain native physician applies a natural magnet to the wound, with, (as is asserted,) undeviating success.

BITTERN. *Prep.* A mixture of 1 part each, of *extract of quassia* and *powdered sulphate of iron*, with 2 parts of *extract of cocculus indicus*, 4 parts of *Spanish liquorice*, and 8 parts of *treacle*. The liquorice is first boiled with water until dissolved, and the solution evaporated to a proper consistence before adding the other ingredients. This mixture is made by the brewers' druggists, and sent out in casks, disguised, to escape detection. It is largely employed by fraudulent brewers and licensed victuallers to impart a false bitter and strength to their liquors. See *Bitter Balls, &c.*

BITTERS. Bitters are considered as tonic and stomachic, and to improve the appetite when taken occasionally and in moderation. The best time is early in the morning, or an hour before a meal. An excessive use of bitters tends to weaken the stomach. They should not be taken for a longer period than 10 days or a fortnight at *one time*, allowing a similar period to elapse before again having recourse to them. Among the principal bitters are *gentian, orange peel, calomba, quassia, chamomile,* and *wormwood.*

BITTERS (Brandy). Syn. *Spirit Bitters.* *Prep.* 1. *Dried orange* and *lemon peel*, of each, 2 *oz.*; *fresh do.*, of each, 3 *oz.*; *good brandy*, 1 gall.; *lump sugar*, 1 *lb.* Digest the peel in the brandy for 10 days, frequently shaking, then press out the liquor and filter through blotting paper; lastly add the sugar. An agreeable bitter, taken either as a dram, or mixed with other liquor.

2. *Gentian root*, bruised, 4 *oz.*; *fresh orange peel*, 5 *oz.*; *cassia bark*, 2 *oz.*; *cardamom seeds*, bruised, 1 *oz.*; *cochineal*, bruised, ¼ *oz.*; *proof spirit*, 1 gall. Digest for a week, then decant the clear, press the bottoms, and pour thereon of *water*, 5 pints; again digest for 3 days, then press out the liquor, mix the liquors, filter, and add *sugar*, 2 *lb.*

3. *Gentian*, 2 *oz.*; *fresh orange peel*, 3 *oz.*; *cassia bark*, ¼ *oz.*; *cloves*, 1 dr.; *proof spirit*, 1 gall.; *cape* or *raisin wine*, ½ gall.; digest for a week as before, then add *sugar*, 1 *lb.*, and a little colouring, if it is required deep-coloured.

4. *Gentian*, ¼ *lb.*; *cochineal*, ¼ *oz.*; *sugar*, ¾ *lb.*; *spirit* (24 u.p.), 1 gall. As before.

BITTERS (Calomba). *Prep.* *Calomba root, fresh orange peel* and *lemon peel*, of each, 1 *oz.*; *proof spirit*, 1 quart; digest for a week, express the tincture, add *lump sugar*, 4 *oz.*, together with a little colouring.

BITTERS (Wine). *Prep.* 1. *Bruised gentian root, fresh orange* and *lemon peel*, of each, 1¼ *oz.*; *white wine*, 1 quart; digest for a week and strain.

2. *Fresh lemon peel*, 1 *lb.*; *dried orange peel*, ½ *lb.*; *bruised gentian root*, ¼ *lb.*; *cape wine*, 1 gall.; as before.

3. (M. Dubois.) *Cinchona bark*, bruised, 8 oz.; *white canella*, 1½ oz.; *juniper berries, lemon peel*, and *winter's bark*, of each, 1¼ oz.; *carbonate of soda*, ¾ oz.; *Madeira wine*, 1¾ gall.; digest for a week.

Obs. All the above are used as tonics and stomachics; the last in the debility following agues, &c.

BITUMEN. This common term is, generally, very loosely applied, and includes a variety of inflammable mineral substances; as *asphaltum, naphtha,* and *petroleum.* The *solid bitumens* are now extensively employed in the manufacture of *bituminous mastic* or *cement* and similar compositions, which are used for the lining of water cisterns, pavements, &c. For the last purpose, the native varieties of asphaltic rock, consisting of a mixture of bitumen and calcareous earth, when tempered with a proper quantity of sand or gravel, is found to be the most sub-

stantial and durable. The asphalto-bitumen mine of the Val de Travers, in the Canton of Neufchâtel, is said to be the richest and most extensive in the world of its particular class. See *Asphaltum*, &c.

BLACK ASH. The *waste lye of the soapmakers* evaporated in large iron boilers, the salt separated as it falls down, and then heated in a reverberatory furnace until it is partially decomposed and fused, when it is run into iron pots to cool. It is used in the manufacture of alum and common soap.

BLACK DYE. A general description of the operations of the dyer, applicable to all the ordinary colours, will be found under the heads, *Dyeing*, *Mordants*, &c., in the present volume, and, therefore, need not be repeated here. The following are the processes and materials *now* generally employed to dye black :—

1. (*For Cotton.*)—*a.* The goods, previously dyed blue, are steeped, for 24 hours, in a *decoction of gall nuts* or *sumach*, then drained, rinsed in water, and passed through a *bath of acetate of iron* for a quarter of an hour; they are next again rinsed in water, and exposed for some time to the air; after which they are passed a second time through the *bath*, to which a little more *iron liquor* must be added. The whole process may be repeated as often as necessary, according to the intensity of the shade of black desired.

b. The goods are steeped in a *mordant of acetate of iron*, worked well, and then passed through a *bath* of *madder* and *logwood* for 2 hours. Less permanent than the last.

Obs. About 2 *oz.* of coarsely powdered galls, or 4 *oz.* of *sumach*, are required for every pound of *cotton*, in the process of galling. The first should be boiled in water, in the proportion of about ½ gallon of *water* to every pound of *cotton*. The *sumach bath* is better made by mere infusion of that dye-stuff in very hot water.

2. (*For Silk.*) Silk goods are dyed much in the same way as woollens, but the process is conducted with less heat. The richness of the dye may be varied at pleasure, by allowing the goods to remain a longer or shorter time in the bath. The following are examples :—

a. A bath of *gall nuts* is given for 12 to 40 hours, occasionally working the goods therein; they are then taken out, rinsed, and aired, after which they are passed through a bath containing a little *sulphate of iron*, for a few minutes; and again drained, rinsed, and aired. The whole operation is repeated as above.

b. Aleppo galls, bruised, 22 *lb.*; boil for 1 hour in *water*, 90 to 100 gall.; then add *copperas*, 32 *lb.*; *iron filings*, 12 *lb.*; and *gum*, 22 *lb.*; digest for 1 hour, and when the ingredients are dissolved, pass the silk, previously prepared with ⅓rd of its weight of *galls*, through the bath for abont an hour; then rinse and air it well; next leave it in the dye bath for 6 to 12 hours. The whole process may be repeated as often as necessary. For 1 *cwt. of* silk.

3. (*For Wool.*) To produce a good permament black on wool, woollen goods are usually first dyed *blue*. When the goods are coarse or common, and price is an object, they are generally "*rooted*" instead of being "*blued*." This consists in giving them a dun or brown colour, with the *husks of walnuts*, or the *roots of the walnut tree*. Other inferior astringent substances are also used for the same purpose.

Process.—a. (*For* 1 *cwt. of goods.*) *Logwood chips*, 20 *lb.*, and *bruised galls*, 18 *lb.*, are inclosed in a coarse bag, and boiled with *water* for 5 or 6 hours; ⅓rd of this decoction is then transferred into another copper, with *verdigris*, 2 *lb.*, and a sufficient quantity of *water*; and the goods passed through the liquor for *two hours*, at a heat little below the boiling point. The goods are next drained, another ⅓rd of the *decoction of logwood and galls*, and *copperas*, 9 *lb.*, added to the boiler; the fire is then lowered, and as soon as the copperas is dissolved, the cloth is put in and again well worked for at least an hour; it is then taken out, thoroughly aired, and the remaining ⅓rd of the *decoction* added, with *sumach*, 20 *lb.*; the whole is then brought to a boil, and *sulphate of iron*, 2 *lb.*, together with a pailful of *cold water*, thrown in; after which the goods are put in a third time, and worked for one hour; they are then taken out, rinsed, aired, and again passed through the bath for another hour. After being thoroughly rinsed, the goods are at once either dried and folded, or further softened and beautified by passing them for 15 minutes through a *hot bath of weld*, (not boiling;) after which they are rinsed, &c., as before. This gives a beautiful though expensive dye. With management, the above quantities of the ingredients will dye 1¼ cwt. or 1½ cwt. of goods.

b. (*Without Galls.*) Make a bath, as before, with *fustic*, 2 *lb.*; *logwood*, 5 *lb.*; and *sumach*, 10 *lb.*; boil the cloth for 3 hours, lift it out, add *sulphate of iron*, 10½ *lb.*; and when dissolved, pass the cloth through it for 2 hours; rinse, air well, and again pass the goods through the bath for an hour; lastly, rinse until the water runs clear. Inferior to the last, but much less expensive.

c. (*For 7 lb. of goods.*) *Bruised galls*, ¼ *lb.*; *logwood chips*, 1½ *lb.*; for a bath; boil the goods for 2 hours, take them out, add *copperas*, ¼ *lb.*; and when it is dissolved, pass your goods through the liquor for at least 2 hours, keeping the bath *nearly* boiling; again take them out, wash, and air, add 1 oz. more of *copperas* to the bath, and pass the cloth through it for another hour. Suited to articles of dress, as cloaks, coats, &c., dyed in the small way at home.

Obs. In dyeing black, especially on wool, it is absolutely necessary to take the "goods" out of the dye-bath, *several times*, to expose them to the air; this is called "*airing*," and is done to allow the oxygen of the atmosphere to act upon the dye, without which a good colour *cannot* be produced. The usual proportions employed by the dyers of England are 5 *lb.* each of *galls* and *copperas*, and 30 *lb.* of *logwood* for every *cwt.* of cloth; but these weights must be increased for choice goods. The other astringent substances used as substitutes for galls in dyeing black, are taken in quantities proportionate to their respective strengths referred to that of ordinary gall-nuts as a standard.

BLACK PIGMENTS. The principal black pigments of commerce are obtained by heating bones in covered vessels, (*ivory black*,) and by burning unctuous and bituminous matters in a species of furnace or lamp, (*lamp black.*) Numerous other substances of a similar class are prepared by artists and amateurs on the small scale, by carbonizing organic matters by heat, or reducing to powder certain mineral productions, as *pit-coal*, *asphaltum*, *jet*, *anthracite*, &c. The following is a brief notice of a number of these articles:—

Beech Black, *Vegetable Blue-black.* From *beech charcoal*, (carefully prepared by burning the wood in a covered vessel, avoiding too much heat,) reduced to an impalpable powder, edulcorated with *water*, and dried.

Bone Black. From burnt bones; as the last. That of commerce is the residuum of the distillation of bone spirit. It is *used* as a pigment; for making blacking; as a material for the moulds of founders; for clarifying and bleaching liquids, and for removing lime from syrup in refining sugar. It is the *ivory-black* of commerce. See *Animal Charcoal.*

Composition Black, *Prussian Black.* The residuum of the process of making prussiate of potash from blood and hoofs. It is *used* as a pigment, and to decolour organic solutions, which it does better than bone black.

Florey Black, *Florée d'Inde.* The dried scum of the dyer's woad-bath. It makes a superior blue-black pigment.

Frankfort Black. From *vine twigs*, as beech black. An excellent black pigment; used by the copper-plate printers to make their ink.

Hartshorn Black. The same as *ivory* and *bone black.* It was formerly prepared by heating the residuum of the distillation of spirit of hartshorn.

Ivory Black, *Cassel Black*, *Cologne Black.* From *fragments* or *turnings of ivory*, and the like osseous parts of animals, by exposure to heat in close vessels until reduced to charcoal. When the whole has completely cooled, the hard carbonaceous residuum must be pounded and ground on porphyry with water, washed on a filter with warm water, and dried.

Obs. Black furnished by *bones* has a peculiar reddish tinge. That produced by *ivory* is more beautiful. It is brighter than peach-stone black. When mixed in a proper dose with whitelead, it forms a beautiful pearl-gray. Bone black is commonly sold for it.

Lamp Black. 1. On the *small scale*, is commonly prepared by suspending over a lamp, (*gas*, *oil*, *tallow*, or *naphtha*,) a conical funnel of tin plate, having above it a pipe, to convey from the apartment the smoke which escapes from the flame. Large spongy, mushroom-like concretions of an exceedingly light, very black, carbonaceous matter, will be formed at the summit of the cone, which must be collected from time to time. The funnel should be united to the smoke-pipe, by means of wire, as solder would be melted by the flame.

2. (*Commercial.*) On the *large scale*, lamp black is now generally made by burning the *oil of bones*, (previously freed from its ammonia,) or *common coal tar*, and receiving the smoke in a suitable chamber. In the patent process of Messrs. Martin and Grafton, the coal tar is violently agitated with lime water, until the two are well mixed, after which it is allowed to subside, and the lime water being drawn off, it is washed several times with hot water. After subsidence and decantation, it is put into stills, and rectified. The tar or liquor in the receiver is then put into a long cast-iron tube, furnished with numerous large burners, underneath which is a furnace to heat the pipe to nearly the boiling point. Over each burner is a sort of funnel, which goes into a cast-iron pipe or main, which

receives the smoke in a similar way from all the burners. From this the smoke is conveyed by large pipes to a succession of boxes or chambers, and thence into a series of large canvass bags, arranged side-by-side, and connected together at top and bottom alternately. Fifty to eighty of these bags are employed, the last one being left open to admit of the escape of the smoke which has thus been made to traverse a space of about 400 yards. As soon as the bags contain any considerable quantity of black, they are removed and emptied. The black deposited in the last bag is the finest and best, and it becomes progressively coarser as it approaches the furnace.

Obs. The state of minute division in which the carbon exists in good lamp black, is such as cannot be given to any other matter, not even by grinding it on porphyry, or "washing it over" with water. On this account it goes a great way in every kind of painting. It may be rendered less oily and drier by gentle calcination in close vessels, when it is called *burnt lamp black*, and may then be used as a water-colour. It is the basis of *Indian ink*, *printer's ink*, and most *black paints*.

Oporto Black. From *wine lees;* resembles Frankfort black.

Paris Black. From *turner's bone dust*, as bone black, but more carefully prepared, and afterwards ground very fine. It works well both in oil and water. It is commonly sold for real ivory black, and for burnt lamp black.

Peach-stone Black. From the *stones* or *kernels of peaches, cherries*, and *other similar kinds of fruit;* as the last. It works well with oil; mixed with white lead and oil it makes *old gray*.

Rice Black. From *rice* burnt in close vessels. Colour inferior.

Russian Black, Russian Lamp-black. From the smoke produced by burning the chips of resinous deal. It is a good black pigment, but apt to take fire spontaneously if left for some time moistened with oil.

Soot Black. From the *soot of coal fires*, ground and sifted. Used as a common paint; mixed with Venetian red and oil, it makes a chocolate colour; also used to make gray mortar.

Spanish Black, Cork Black. From *cork cuttings* as bone black. Resembles Frankfort black, but works softer.

Sugar Black, Jamaica Black. By burning common *moist sugar* in close vessels. It has little "body," but is a warm colour for washing drawings, and equal in mellowness to Indian ink and bistre.

Sunderland Black, Pit-coal Black. From the richer-looking varieties of pit-coal by grinding and elutriation. It is perhaps "the most useful brown the artist can place on his palette; being remarkably clear, not so warm as Vandyke-brown, and serving as a shadow for blues, reds, or yellows, when glazed over them. It seems almost certain that Titian made large use of this material." Coal, when carefully burned at a white heat, then quenched in water, and ground down, gives an excellent *blue-black*.

Vine-twig Black. Same as Frankfort black.

Wheat Black. From wheat burnt in close vessels. It is between ivory black and lamp black; it has a full body, and dries hard and quickly with oil.

BLACK (Shoemaker's). A solution of *green copperas* in about twelve times its weight of *water*. It is *used* to black leather which has been tanned or cured with bark or other like astringent matter. It is commonly applied with a feather to the edges of the soles, &c.

BLACKING. The general use of "blacking" as a polish for boots and shoes by all classes of the inhabitants of civilized countries, has given an extent and importance to its manufacture, which a stranger to the fact would scarcely be led to suspect. The princely establishments of some of the firms who compound this sable article, cannot fail to have arrested the attention of the passenger through the streets of this great metropolis; whilst the enormous fortune acquired by one of their late members, and, for the most part, bequeathed by him for purposes of charity and philanthropy, must, ere this, have become patent everywhere, and have invested both the donor and his craft with an interest which they did not previously possess. At the present time, the consumption of blacking is greater than at any former period; and of this, as of many other articles, England is the principal manufactory for the world, alike distinguished for the extent of her trade and the excellent quality of this product of her industry. In truth, England excels all other nations in the manufacture of *common shoe-blacking;* and in no other country is an equal attention paid to the cleanliness and appearance of the external clothing of the feet.

Prep. 1. (*Liquid Blacking.*)—1. *Ivory black*, 5 *oz.; treacle*, 4 *oz.; sweet oil*, ¾ *oz.;* triturate patiently together until the oil is perfectly "killed," then stir in, gradually, of *vinegar* and *beer bottoms*, of each, ½ pint;

and continue the agitation until the mixture is complete.

2. *Ivory black*, 1 *lb.*; *treacle*, ¾ *lb.*; *sperm oil*, 2 *oz.*; *beer* and *vinegar*, of each, 1 pint; or, *sour beer*, 1 quart; proceed as before.

3. To the last add of *oil of vitriol*, 1 *oz.*

4. *Ivory black* and *treacle*, of each, 1 *lb.*; *rape oil* and *oil of vitriol*, of each, ¼ *lb.*; mix the first three as before, then gradually add the *vitriol*, previously diluted with three times its weight of *water*; mix well, let it stand for 3 or 4 hours, or preferably until the next day, and then reduce it to the proper consistence with *water* or *sour beer*.

5. *Ivory black* and *treacle*, of each, ¼ *lb.*; *oil of vitriol*, 1 *oz.*; *sperm oil*, 2 *oz.*; *sour beer*, 1 pint; as before.

6. *Ivory black*, 7 *lb.*; *treacle*, 6 *lb.*; *rape oil*, 1 *lb.*; *oil of vitriol*, ½ *lb.*; water, q. s., as last.

7. *Ivory black*, ¾ *cwt.*; *treacle*, ½ *cwt.*; *rape oil*, 1 gall.; *oil of vitriol*, 10 *lb.*; as before.

8. *Ivory black*, 3 *cwt.*; *crude molasses*, 2 *cwt.*; *linseed oil*, 3 gall.; *oil of vitriol*, 21 *lb.*; *water*, q. s., as last.

9. (Ure.) *Ivory black*, 8 *oz.*; *treacle*, 6 *oz.*; *vinegar*, 1¼ pint; *oil of vitriol*, 1 *oz.*; *sperm oil*, 10 dr.

10. (Bryant and James's "*Patent Indian-rubber Liquid Blacking.*") *Indian rubber*, in small pieces, 18 *oz.*; *hot rape oil*, 9 *lb.*, (or 1 *gall.*;) to the solution add of *ivory black*, in very fine powder, 60 *lb.*; *treacle*, 45 *lb.*; mix; further add of *gum arabic*, 1 *lb.*, dissolved in *vinegar*, (No. 24,) 20 gall.; reduce to a perfect state of smoothness and admixture by trituration in a paint mill; throw the compound into a wooden vessel, and add, very gradually, *sulphuric acid*, 12 *lb.*; continue the stirring for ½ an hour, repeating it daily for 14 days; then add, *gum arabic*, (in fine powder,) 3 *lb.*; mix well, and repeat the stirring ½ an hour daily for 14 days longer, when the liquid blacking will be ready for use, or bottling.

11. (*Paste Blacking.*)—1. *Treacle*, 1 *lb.*; *ivory black*, 1¼ *lb.*; *rape*, *sperm*, or *sweet oil*, 2 *oz.*; rub together, as before, then add a little *lemon juice* or *strong vinegar*.

2. *Ivory black*, 2 *lb.*; *treacle*, 1 *lb.*; *sweet oil* and *oil of vitriol*, of each, ¼ *lb.*; *beer bottoms*, q. s.; as before.

3. *Ivory black*, 28 *lb.*; *treacle*, 21 *lb.*; *common oil*, 1 quart; *oil of vitriol*, 3 *lb.*; *water*, q. s.

4. *Ivory black*, 3 cwt.; *common treacle*, 2 cwt.; *linseed oil* and *vinegar bottoms*, of each, 3 gallons; *oil of vitriol*, ¼ cwt. *water*, q. s.

5. (Ure.) *Ivory black*, 2 *lb.*; *treacle*, 1 *lb.*; *sweet oil*, 4 *oz.*; *oil of vitriol*, 4 *oz.*; *vinegar*, 5 *oz.*; *sulphate of iron*, ½ *oz.*, dissolved in *water*, 5 *oz.*; *gum arabic*, (in powder,) ¾ *oz.*; mix, (as before.)

6. (Bryant and James's "*Patent Indian-rubber Paste Blacking.*") Of *Indian-rubber*, *oil*, *ivory black*, *treacle*, and *gum arabic*, the same as for their *liquid* blacking, but dissolving the last in only 12 *lb.*, (say 5 quarts,) instead of 20 gall. of *vinegar*; grinding to a smooth paste in a colour-mill, and then adding of *oil of vitriol*, 12 *lb.*, as before. The mass is to be stirred daily for a week, when it will be fit for use, or "potting."

Concluding Remarks.—The manipulations required in the manufacture of both *paste* and *liquid* blacking, are the same, the difference between the two articles, when the same materials are used, depending entirely on the quantity of liquid added. Thus, by diluting *paste blacking* with *water* or *beer bottoms*, it may be converted into *liquid blacking* of a nearly similar quality; and, by using *less* fluid matter, the ingredients of *liquid blacking* will produce *paste blacking*. One thing must, however, be observed, and that is, that the ivory black used for *liquid* blacking must be reduced to a much finer powder than for *paste* blacking, as, if this is not attended to, it will settle to the bottom, and be with difficulty again diffused through the liquid. For those persons who do not like the use of blacking containing oil of vitriol, the first of the above forms either for paste or liquid, may be adopted. The vitriol, however, greatly contributes to promote the shining properties of the blacking, and in small quantities is not so injurious to the leather as some have represented; as it wholly unites itself to the lime of the *phosphate* contained in the ivory black, and is thus, as it were, neutralized, an *acid phosphate* or *super-phosphate* being formed. By its action a portion of the ivory black is reduced to a state of extremely minute division, and with the other ingredients forms a strongly adhesive paste, which clings to the surface of the leather, and is susceptible of receiving a high polish by friction when in a scarcely dry state. This is the reason why *lamp black* should *never* be employed for blacking to the entire exclusion of *ivory* or *bone black*, as it has no earthy base to absorb or neutralize the acid, which would then prove very hurtful to the leather. Oil of vitriol is now employed in the manufacture of all the most celebrated and expensive blackings; and that, simply because no other substance is known so efficient and so little

injurious to the leather. In Germany, *hydrochloric acid* is commonly used instead of oil of vitriol; but blacking prepared with it, possesses several disadvantages from which English blacking is free. The addition of *white of egg, isinglass, gum arabic,* and *similar articles* to blacking, always proves injurious, as they tend to stiffen the leather and to make it crack, without at all improving its polishing properties. Oil has an opposite tendency, and the quantity commonly used might be increased with advantage. *Resin oil* should be avoided. See *Balls, Leather, &c.*

BLACKING (Harness). *Prep.* 1. *Glue* or *gelatine,* 4 *oz.; gum arabic,* 3 *oz.; water,* ¾ pint; dissolve by heat; add *treacle,* 7 *oz.; ivory black,* (in very fine powder), 5 *oz.;* and gently evaporate until of a proper consistence when cold, stirring all the time. To be kept in corked bottles.

2. *Mutton suet,* 2 *oz.; bees' wax,* 6 *oz.;* melt, add *sugar candy,* 6 *oz.; soft soap,* 2 *oz.; lamp black,* 2½ *oz.;* indigo, in fine powder, ½ *oz.;* when thoroughly incorporated, further add, *oil of turpentine,* ¼ pint; and put it into pots or tins.

3. *Bees' wax,* 1 *lb.; ivory black,* ¼ *lb.; Prussian blue,* 1 *oz.,* (ground in *linseed oil,* 2 *oz.;*) *oil of turpentine,* 3 *oz.; copal varnish,* 1 *oz.;* mix well together, and form into cakes whilst warm.

4. To the last, whilst still hot, add, of *soft soap,* 4 *oz.;* and *oil of turpentine,* 6 *oz.;* and put it in pots or tins whilst still warm.

Obs. A very little of the above is laid on the leather, evenly spread over the surface, and then polished by gentle friction with a brush or an old handkerchief. The last three are waterproof. Numerous compositions of the above class are vended by the sadlers and oilmen, but the mass of them are unchemical mixtures, badly prepared, and cause disappointment to the purchaser, by utterly failing to produce either a good or a permanent polish, whilst they stiffen and rot the leather after a few applications. Such is not the case with the products prepared by the above formulæ. The only article of the kind adapted for the purpose, which we have met with in trade, and which we can recommend, is *Wilson's "Waterproof Composition for Harness and Carriage-leather."* This compound produces a very excellent water-proof polish, and is in no way injurious to the leather; whilst it has the further advantage of being vended at a very reasonable price. Parties who possess valuable harness and carriage furniture would do well to give it a trial.

BLACKING (Self-shining.) *Prep.* 1. *Gum arabic,* 4 *oz.; treacle* or *moist sugar,* 1 *oz.; ink,* ½ pint; *vinegar* and *spirit of wine,* of each, 1 *oz.* Dissolve the gum and treacle in the ink and vinegar; strain, and add the spirit.

2. To the above add, of *sweet oil,* 1 *oz.; lamp black,* ¼ *oz.*

3. Beat well together the *whites of* 2 *eggs,* a *tablespoonful of spirit of wine,* a *lump of sugar,* and a *little finely-powdered ivory black* to thicken it. The above are *used* for *dress boots* and *shoes.*

4. *Gum arabic* and *glue,* of each, 4 *oz.; treacle, sugar candy,* and *sweet oil,* of each, 2 *oz.; water,* q. s.; dissolve with heat, cool, add *rum,* 3 *oz.;* and at once bottle. *Used* for harness.

Obs. The first two of the above articles are applied to the leather by the tip of the finger or a sponge, and allowed to dry out of the dust, and are only adapted for clean, dry weather, or indoors. The third is laid on and polished with a brush, and then left for a few hours to harden. It may also be used to revive the faded black leather seats and backs of old chairs. The last is commonly laid on with a sponge or brush, and thus left to dry and harden. They all possess great brilliancy for a time.

BLADDERS. These articles are *prepared* by cutting off the fat and loose membranes attached to them, and washing them first in a *weak solution of chloride of lime,* and afterwards in *clear water;* they are then blown out and submitted to pressure by rolling them under the arm, by which they become considerably larger; they are next blown quite tight, dried, and tied up in dozens for sale. They are employed by druggists and oilmen to tie over pots, bottles, and jars, and to contain pill masses, hard extracts, and other similar substances. Bladders should never be purchased unless they are perfectly dry and air-tight; as, if the reverse is the case, they will neither keep nor prove useful. Should they be purchased whilst damp, they should be at *once* hung up in a current of air, so as to dry as soon as possible. If this be not done, they rapidly putrefy and become rotten and useless, and emit a horribly offensive odour.

BLANC. A dish formed of *grated bacon* and *suet,* of each, 1 *lb.; butter,* ½ *lb.;* 2 *lemons;* 3 or 4 *carrots,* (cut into dice;) 3 or 4 *onions;* and a little *water;* the whole being simmered for a short time, with or without the addition of a glass of *sherry* or *marsala.*

BLANCHING. (In Cookery.) An ope-

ration performed by putting tongues, palates, meat, &c., into cold water, when it is gradually brought to boil, and the article taken out and plunged into *cold water*, where it is left until quite cold. It is intended to impart whiteness, plumpness, and softness. If *strong acetic acid* (concentrated vinegar) be poured upon or rubbed over a piece of hard lean meat, it will gradually become soft and gelatinous. Ordinary *household vinegar* has the same effect, but in a less degree; hence, when tough meat is treated with vinegar for a short time before dressing it, it becomes tender and digestible when boiled or roasted; whilst the taste and flavour of the vinegar is removed by the heat employed in the process. The operation of *blanching* meat, although it renders it whiter and more sightly, at the same time *lessens* its *nutritive qualities*, by abstracting a portion of the soluble saline matter which it contains, especially the phosphates, and thus deprives it of one of the principal features which distinguish *fresh* meat from *salted* meat. Animal food may be washed or soaked in *cold* water for a short time before being dressed, with advantage. Indeed such a course is a mere and necessary act of cleanliness; but the use of *hot* water and the practice of soaking it for some time therein, should be avoided. See *Boiling*.

BLANCMANGE. Jelly, seasoned, and made up into forms. *Prep.* 1. *Isinglass*, 1 *oz.*; *sweet almonds*, 12 in no.; *bitter do.*, 6 in no.; *milk*, 1 quart. The isinglass and almonds (grated in the milk,) are boiled until of a proper consistence when cold; then strained, and when the liquid is nearly cold, poured into the moulds, previously rubbed with a little *salad oil* and then wiped out again.

2. To the above, ¼ *lb.* of *lump sugar*, and 4 *tablespoonfuls of cream* may be added; when cold, remelt it and add a tablespoonful of *orange flower water*, after which it may be moulded as before.

3. Using *calves' feet jelly* instead of isinglass.

4. (*Mrs. Hoffman.*) *Isinglass*, ¼ *lb.*; *rose-water*, ½ pint; *milk*, 2 quarts; *milk of almonds*, ½ pint.

5. (*Rice Blancmange.*) *Ground rice*, 2 *oz.*; *milk*, 1 pint; *lump sugar*, 3 *oz.*; a little *lemon peel* and *cinnamon*; adding the spice and sugar last; then boil for 1 minute, strain, and mould as above.

6. (*West Indian.*) Make a jelly with *arrow root*, and to every pint, when nearly cold, add a glass of sherry, a spoonful each of *brandy* and *orange flower water*, and 2 *oz.* of *lump sugar*.

7. (*Transparent.*) Instead of *milk* use *water*, and clarify the liquid with the *white of an egg*. See *Clarification*.

BLANQUENINE. A name given by Dr. Mills to a new vegeto-alkali, which he thought he had discovered in white cinchona bark.

BLANQUETTE. (Fr.) A kind of pear; a species of white wine. Cooks give this name to a sort of white fricasee.

BLASTING POWDERS (Melville and Callow's). *Prep.* (No. 1.) *Chlorate of potassa*, 2 parts; *red sulphuret of arsenic*, 1 part.; the two to be *separately* carefully reduced to powder, and lightly mixed together, *scrupulously avoiding* the use of iron instruments, percussion, much friction, or the slightest contact with acids, or exposure to heat.

(No. 2.) *Chlorate of potassa*, 5 parts; *red sulphuret of arsenic*, 2 parts; *ferrocyanide of potassium*, (prussiate of potash,) 1 part; as No. 1.

(No. 3.) *Chlorate of potassa* and *ferrocyanide of potassium*, equal parts.

Obs. Neither salt nor fresh water has any injurious effect upon the above compounds, which merely requires to be dried to regain their explosive character. They possess eight times the force of ordinary powder. One of their advantages, especially to the underground miner, is the very trifling amount of smoke emitted by them on explosion. On the other hand, the extreme facility with which they explode by attrition, contact with a strong acid, and a slight elevation of temperature, render them unsuited to most of the purposes of ordinary gunpowder. On this account they should only be prepared in small quantities at a time, and with the utmost caution. Mr. Callow, the inventor of them, lost several of his fingers, and was rendered a cripple for life by an explosion of the kind referred to, which occurred only a few weeks after the sealing of his patent. A straw or small strip of wood only slightly wetted with oil of vitriol, and applied to a small heap of the powder, produces instantaneous explosion.

BLEACHING. The operation by which the natural colours of substances are discharged, and by which they become white or colourless. Bleaching is performed either by natural means, as by *exposure to light*, *air*, and *moisture*; or, by chemical agents, as *chlorine*, *chloride of lime*, *sulphurous acid*, &c. In many of the processes adopted in our great establish-

ments for this purpose, both methods are combined.

Cotton is more easily bleached than most other substances. On the old plan, it is first well washed in warm water to remove the weaver's paste or dressing, then "*bucked*" (boiled) in a *weak alkaline lye*, and after being well washed, is spread out upon the grass, or bleaching ground, and freely exposed to the joint action of light, air, and moisture. The operation of "*bucking*" and exposure, is repeated as often as necessary, when the goods are "*soured*" or immersed in *water acidulated with sulphuric acid*, after which they receive a thorough washing in clean water, and are dried. From the length of the exposure upon the bleaching ground, this method is apt to injure the texture of the cloth, and from the number of operations required, is necessarily expensive and tedious. It is therefore now very generally superseded by the system of chemical bleaching, by means of *chloride of lime*. In this method, the goods are first "washed" and "bucked" as on the common plan, then submitted to the action of *weak solutions of chloride of lime*, and afterwards passed through *soured water*, when they have only to be *thoroughly* washed and dried for the process to be complete.

Linen is bleached in a similar way to cotton, but the operation is more troublesome from its greater affinity for colouring matter. Grass-bleaching is still extensively employed for linen, but is rapidly giving place to the system now almost universally adopted for cotton goods of every description.

Wool is bleached by exposing it to the joint action of *fuller's earth* and *soap*, in the fulling mill, (to remove grease and dirt,) after which it is well washed and dried, and is then ready for the dyer. When it is intended to preserve it white, it is commonly run through *water tinged blue with indigo*, or it is exposed to the *fumes of burning sulphur*. By the last method, especially if not very skilfully managed, it acquires a harsh feel, which is best removed by a *bath of soap and water*, but this, for the most part, reproduces its previous yellowish-white tinge.

Silk is bleach by boiling it in a mixture of *white soap* and *water*, after which it is subjected to repeated rinsings. When required to be very white, (as *gloves*, *stockings*, *&c.*,) the goods are commonly submitted to the action of *sulphurous acid*, or the *fumes of burning sulphur*.

Straw is generally bleached by the fumes of sulphur. The goods are enclosed in a chamber connected with a small stove, in which *brimstone* is kept burning. On the *small scale*, a large chest or box is commonly employed for the purpose. A piece of brick, or an old box-iron heater, heated to dull redness, is placed in an earthen pan at the bottom, a few fragments of *roll sulphur* thrown on, and the lid instantly closed, and the whole left for some hours. Care should be taken to avoid inhaling the fumes, which are very deleterious as well as disagreeable and annoying. Straw goods may, however, be bleached in a much better manner by the use of a little *oxalic acid* or *chloride of lime*.

Old Rags, (for the manufacture of paper,) and *paper pulp*, are now almost universally bleached with *chlorine* or *chloride of lime*.

Printed Books, *Engravings*, *&c.*, may be whitened by first subjecting them to the action of a weak *solution of chloride of lime*, next to *water soured with sulphuric acid*, and, lastly, to *pure water*, until all adhering acid or chlorine is removed.

BLEAR-EYE. Syn. *Lippitudo*,—Lat. An exudation of a puriform matter from the margins of the eye-lids, which are red, tumid, and painful, and frequently, during the night, glued together by the discharge. The best applications are mild astringent collyria, as those of *sulphate of zinc* or *alum*, (6 or 8 gr. to *water*, 1 oz.) An ointment formed of *ointment of nitrate of mercury*, (Ung. hydrargyri nitratis,—Ph. L.) 1 part, diluted with *lard*, 11 parts, may be advantageously applied nightly, by means of a camel-hair pencil, the smallest quantity possible only being used. Excess in eating and drinking should be avoided, and some aperient medicine taken.

BLEEDING. See *Hæmorrhage*.

BLEEDING (from the Nose). When this is not the result of violence, it may be regarded as an effort of nature to relieve the system from an excess of blood; but when it is habitual, or the result of violence, remedial measures should be had recourse to. A simple means of arresting the hæmorrhage is to introduce, by means of a probe, a *small piece of lint* or *soft cotton*, previously dipped into some *mild styptic*, as a *solution of alum*, *white vitriol*, or *creosote*, or even into *very cold water*. Should this not succeed, cold water may be snuffed up the nostrils, or a *small piece of ice* placed in the one from which the blood flows. When the bleeding is very profuse or persistent, medical advice should be had recourse to. A person (an innkeeper), known to the author, lost his life in the

course of a few days from a voluntary hæmorrhage from the nose, which it was found impossible to stop or lessen.

Dr. Negrier, of Angiers, has proposed a plan of arresting bleeding from the nose, which, he says, is both simple and certain. It consists in *simply elevating the arm of the affected side.* He has never found this method to fail, and explains the rationale of the cure, by assuming that part of the force previously expended in sending the blood up the carotids is subtracted, and added to that which drives it through the brachial arteries. This explanation may or may not be confirmed by experiment; but the subject is worth investigation.

BLISTERS. See *Vesicants.*

BLISTERS (Extemporaneous).— 1. A *piece of lint* dipped in *vinegar of cantharides,* and immediately after its application to the skin, covered over with a *piece of strapping,* to prevent evaporation, speedily raises a blister.

2. *Concentrated acetic acid,* applied in the same way, has a similar effect.

3. (Dr. Darcq.) Into a flat watch glass, pour from 8 to 10 drops of highly *concentrated liquor of ammonia;* cover the liquid with a small piece of *linen,* of rather less diameter than that of the glass, and at once apply this little apparatus to the previously shaved skin. The whole must be kept in its place by means of moderate pressure with the fingers, until a red ring, about 2 *centimetres* in breadth, is observed round the glass, when it is certain that vesication is effected. Sometimes scarcely 30 seconds are necessary for obtaining the result. The apparatus may then be removed, and the blistered part treated in the usual manner; the dressing being according to the object in view.

4. (Trousseau.) *Bibulous paper,* slightly wetted with a little of the *ethereal extract of cantharides,* and instantly applied to the skin, the whole being covered with a piece of *common adhesive plaster* to prevent evaporation.

5. By the application of *boiling water,* by means of a suitably shaped tube; the adjacent parts being protected from injury.

BLISTERS (for Horses, &c.) See *Veterinary Medicines.*

BLISTERS (Perpetual). Common blisters, raised in the usual way, but instead of allowing the surface to heal, after the discharge of the water, it is kept open by dressing it with *savine ointment* or *cantharides ointment.*

BLISTERING TISSUE. Syn. *Tela Vesicatoria, Sparadrapum Vesicans, Taffetas Vesicant.* Waxed silk, spread over with a thin coat of alcoholic, acetic, or ethereal extract of cantharides.

Prep. 1. (P. C.) *Powdered cantharides* are exhausted with *sulphuric ether,* by percolation, and the resulting tincture reduced to the consistence of treacle by distillation; this extract is mixed with twice its weight of *yellow wax,* (melted by a very gentle heat,) and is then spread on *waxed cloth.*

2. (W. Cooley.) *Powdered cantharides,* 5 parts; *glacial acetic acid,* 1 part; *rectified spirit* (64 u. p.), 15 parts; digest 10 days, decant, filter, evaporate as before, and add to the extract its own weight (each) of *pure bees' wax* and *resin cerate,* (Ph. L.) melted by a gentle heat, as above.

3. (Oettinger.) *Powdered cantharides,* 3 dr.; *ether,* 1 *oz.;* digest for a day or two, decant, add *sandarach,* 4 dr.; *mastic,* 2 dr.; *turpentine,* ½ dr.; *oil of lavender,* 10 or 12 drops.

4. (Chilton.) *Acetic extract of cantharides,* 2 parts; *resin cerate* and *bees' wax,* of each, 1 part; as before.

5. (Cadet.) *Cantharides,* (in powder,) 3 dr.; *acetic ether,* 4 oz.; infuse 8 days, decant, (evaporate as before,) add, of *resin,* 4 dr.; and spread on court plaster.

Obs. The above blistering compositions have now nearly superseded the common plaster of cantharides for use among the middle and better classes, from their greater cleanliness, efficiency, and ease of application; and from being less liable to produce strangury, or excessive irritation. They are spread upon adhesive plaster, court plaster, waxed and oiled paper, silk, sarsanet, leather, and other similar materials, just as the convenience or taste of the practitioner or pharmaceutist may dictate. Paper so prepared is sold under the name of *Charta Vesicatoria.*

BLONDE. See *Lace.*

BLOOD. *Bullock's blood* is employed for the *clarification of wines* and *syrups;* in the *preparation of adhesive cements; coarse paint for out-door work;* as a *manure;* as a *bleaching powder;* and for *several other purposes.* The *blood* of *sheep, pigs,* and *bullocks,* mixed with *flour* or *oatmeal,* and seasoned, is eaten by the common people, but it is rather indigestible, and apt to induce disease.

Bullock's blood, dried by exposure in thin layers to a current of air, at a heat under 125°, and then reduced to powder; is exported in large quantities to the colonies, where it is used in the sugar works. When

dried at a temperature ranging between 212° to 225°, then coarsely powdered, and the dusty portion sifted off, it is much used by fraudulent dealers to adulterate *grain musk*.

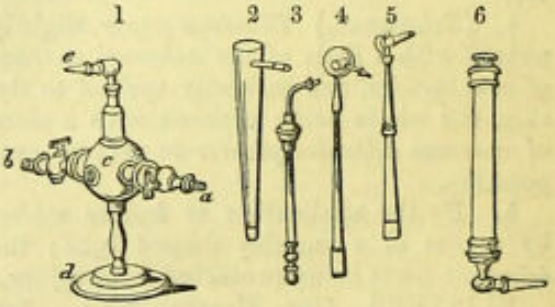
BLOOD (Spitting of). See *Hæmoptysis*.

BLOOM (Almond). *Prep.* Boil 1 *oz.* of *ground Brazil wood*, in 3 pints of water for 15 minutes, adding the juice of 2 *lemons* towards the end; strain, and add ¾ *oz.* of *isinglass*, ¼ *oz.* of *powdered cochineal*, 1 *oz.* of *alum*, and ½ *oz.* of *borax*; boil again for 4 or 5 minutes, and strain through a clean piece of fine muslin. *Used* as a skin cosmetic. The whole process should be conducted in glass or earthenware vessels as metals injure its colour.

BLOOM OF ROSES. *Prep.* 1. Dried *red rose leaves*, 1½ *oz.*; *boiling water*, 1 pint; infuse 2 hours, press out the liquor and add the *juice of* 3 *lemons;* the next day decant the clear. It should be kept in a cool place. A little *spirit of wine*, (3 or 4 *oz.* to the pint,) is sometimes added to make it keep.

2. *Carmine* is dissolved in *liquor of ammonia*, and the resulting solution added to *rose water* in quantity sufficient to give it the desired tint. Both the above are used as cosmetics, and for colouring liqueur, confectionery, &c.

BLOWPIPE. An instrument by means of which the flame of a candle or lamp is directed upon any substance placed to receive it, which is thus subjected to an intense heat. The blowpipe is to the artist and experimentalist, what the wind-furnace is to the artisan; but it is proportionately more powerful, convenient, and economical.



Beginners are usually unable to maintain a continual stream of air from the jet, which is, however, very simple to accomplish. The operation depends upon a little artifice in blowing through the pipe, which is in reality more difficult to describe than to acquire. The effect intended to be produced is a continual stream of air for many minutes, if necessary without ceasing. This is done "by applying the tongue to the roof of the mouth, so as to interrupt the communication between the mouth and the passage of the nostrils; by which means the operator is at liberty to breathe through the nostrils, at the same time that by the muscles of the lips he forces a continual stream of air from the anterior part of the mouth through the blowpipe. When the mouth begins to be empty, it is replenished by the lungs in an instant, while the tongue is withdrawn from the roof of the mouth, and replaced again in the same manner as in pronouncing the monosyllable *tut*. In this way the stream may be continued for a long time without any fatigue, if the flame be not urged too impetuously; and even in this case no other fatigue is felt than that of the muscles of the lips." (Ure.)

The *hottest portion* of the flame produced by the action of the blowpipe is at the tip of the *outer white flame*, which has also the property of rapidly burning or oxidizing any substance placed in it, which is capable of such an action, hence it has been called the "*oxidizing flame*." The *interior blue flame* has also been called the "*reducing flame*," from the property it possesses of abstracting oxygen from most substances placed in it.

Substances submitted to the action of the blowpipe are placed on a *support*, which is either a *piece of charcoal*, or a *wire*, or *small spoon of platinum*, *gold*, or *silver*, as the case may require. Sometimes a plate of *cyanite* is used. Charcoal from the pine is preferred, and the sides, not the ends of the fibres, are presented to the flame. When a very intense heat is required, the substance operated on should not exceed the size of *half* a peppercorn.

For producing extreme degrees of heat, the flame is blown with a jet of oxygen gas, and the instrument is then called an "*oxygen blowpipe;*" or a mixture of oxygen and hydrogen is burned, when it is called an "*oxy-hydrogen*" blowpipe. The heat produced by the last is so great that no substance can stand before it. The most refractory native compounds being immediately fused. Gold is volatilized, and iron is rapidly consumed the instant it is placed in the flame.

The principal blowpipes in general use are figured in the engravings.

1, Hemming's safety jet for the oxy-hydrogen blowpipe.
a, Pipe conveying oxygen gas.
b, Do. hydrogen gas.
c, Ball stuffed with fine wire gauze.
e, Jet (internal diameter 1-80th of an inch.)
2, Black's blowpipe.
3, Bergman's do.
4, Pepy's do.
5, Wollaston's do.
6, Oxy-hydrogen do.

Beside the above there are several other varieties of blowpipe. One, in which the air is expelled by the pressure of a column of water, and hence called the "*hydrostatic blowpipe.*" Another, in which the flame is blown with the vapour of boiling alcohol, is named the "*spirit blowpipe.*"

BLUBBER. This substance, so plentiful on some parts of the coast of England, forms a rich and cheap manure for pasture and arable land. It is used at the rate of 1 ton to every 20 or 30 loads of mould, together with a *chaldron* of *lime* per acre. In 3 or 4 months the land is usually found in prime condition. Pilchards and other fish that swarm upon our coasts, may be used in the same way, and are, indeed, when properly managed, but little inferior to guano.

BLUE DYE. The method of dyeing cotton, linen, silk, and wool, of a *permanent blue colour*, is noticed under the heads, *Dyeing*, *Indigo*, and *Prussian Blue*. The following plans are also adopted; but although cheaper, the shades produced by them are not so durable as when the substances just referred to are employed.

1. Give the goods a *mordant of alum*, then rinse them well and boil them in a *bath of logwood*, to which a small quantity of *blue vitriol* has been added.

2. Boil the goods for a short time in a *bath of logwood*, then add to the liquor *tartar* and *verdigris*, in the proportion of 1 *oz.* each, to every *lb.* of *logwood* employed; and again boil.

3. *Bilberries*, *elder-berries*, *mulberries*, *privet-berries*, and *several other blue vegetable substances*, may be used to dye blue, as above, instead of logwood.

Obs. By increasing the proportion of alum the colour verges on *purple*; and by employing a little acetate of iron or green copperas, the *darker shades of blue* are produced. Verdigris, blue vitriol, and alkalies *turn it more on the blue*, and a mordant of tin imparts a *violet cast*.

BLUE PIGMENTS. The preparation of the principal blue pigments of commerce is described under their respective names. The following are of a miscellaneous and less usual character:—

Azure Blue, *Azure Pigment*. Terms frequently applied to *smalts*, and similar compounds of an azure colour.

Charcoal Blue. *Carbonized vine stalks* are triturated with an equal weight of *salt of tartar* or *pearlash*, the mixture put into a crucible, and heated over the fire, until it ceases to swell, keeping it well stirred all the time; when cold, it is dissolved in *water*, and the excess of alkali saturated with *dilute sulphuric acid*. The liquid becomes blue, and a dark precipitate falls down, which turns of a brilliant blue colour when dried and cautiously heated.

China Blue, *Royal Smalts*. *Oxide of cobalt* or *zaffre*, ground with an *equal weight of potash*, and about 8 *times its weight of felspar*, the mixture submitted to fusion in a crucible, and when cold reduced to an impalpable powder. *Used* to paint pottery, and as a blue pigment.

Cobalt Blue. *Prep.* 1. *Zaffre*, 1 *lb.*, is dissolved in *nitric acid*, diluted with an *equal weight of water*, ¾ *lb.*, by digestion for some hours; the solution is then evaporated nearly to dryness, and dissolved in *warm water*, filtered, and a *solution of phosphate of soda* added, as long as a precipitate is formed; this last is collected on a filter, washed with *cold water*, and mixed whilst still moist, with 8 *times its weight of freshly precipitated hydrate of alumina*; the paste is then dried, and exposed to a cherry red heat in a crucible, after which the mass is cooled and reduced to fine powder.

2. From a *solution of nitrate of cobalt*, (as above.)

3. From a *solution of nitrate of cobalt*, precipitated with *ammonia alum*, and the precipitate washed, dried, and heated to a cherry red, as before. The products of the above formulæ are very beautiful and permanent.

Egyptian Azure. From *carbonate of soda*, 1 *lb.*; *calcined flints*, 1½ *lb.*; *copper filings*, ¾ *lb.*; (all in fine powder;) fused together in a crucible for 2 hours, and when cold, reduced to an impalpable powder. A beautiful and permanent sky-blue colour. It is used in painting, as a substitute for smalts, of which, indeed, it is a variety.

Iron Blue, *Ferric Blue*. From a *solution of protosulphate of iron*, precipitated with another of *phosphate of soda*, the resulting powder being washed and dried. A lively sky-blue colour, without much depth or body.

Molybdenum Blue. From *sulphuret of molybdenum*, dissolved in *nitric acid*, and some *tin filings* and a little *muriatic acid* added. After digestion for some time, the clear liquid is poured off, and evaporated to dryness. The resulting powder is then mixed with *moist hydrate of alumina*, (as in making cobalt blue,) and heated to a very dull red.

Mountain Blue. Carbonate of copper, mixed with earthy matter, ground to powder.

Saxon Blue, Saxon Azure. 1. From *sulphate of iron*, 1 *oz.*; and *alum*, 8 *oz.*; dissolved in *water*, 1 gallon; adding simultaneously, separate *solutions* of *prussiate of potash* and *common pearlash*, until they cease to produce a precipitate; the deposit is washed well with water, and dried.—2. A solution of the *sulphate of iron* may be made first, then precipitated with *prussiate of potash*, and instantly mixed with a *solution of alum* and a *solution of pearlash*, until precipitation ceases.

Stone Blue, Fig Blue, Thumb Blue, Knob Blue, Crown Blue, Mecklenburg Blue, Queen's Blue.—1. From *finely powdered indigo* and *starch*, made into a paste, and then formed into small lumps or cakes.—2. Instead of *starch* using *whiting* and a little *weak size*. Employed by laundresses to give a faint blue tinge to linen.

BLUE WASHES. Syn. *Blue Stains, Liquid Blues.* The following are useful formulæ for this class of preparations. Others will be found under *Inks, Writing fluids, &c.*

Prep. 1. *Prussian blue*, (pure, in fine powder,) 1 *oz.*; is placed in a small matrass or common phial, and *concentrated hydrochloric acid*, 2 *oz.*, poured over it. Effervescence ensues, and the mixture soon assumes the consistence of a thin paste. After about 24 hours, it may be diluted with 8 or 9 *oz.* of *water*, and preserved in a glass bottle. The intensity of this colour may be lessened by new doses of water. If the whole be poured into 1 quart of water, it will still exhibit a colour sufficiently dark for washing prints. It forms an excellent *blue writing fluid*, for which purpose it is commonly vended.

Chemic Blue, Saxon Blue, Liquid Blue, Sulphate of Indigo. Prep. 1. *Indigo*, 1 *lb.*; *oil of vitriol*, 8 *lb.* Put the acid into a hard earthenware pan, placed in a tub of water to keep it cool, and add the indigo, in fine powder, in small successive portions, carefully stirring to prevent the liquid *heating*; next cover up the vessel and let it stand for 5 or 6 hours, occasionally stirring it during the time; lastly, dilute it with an *equal weight* of *water*.

2. *Indigo*, 1 *oz.*; *oil of vitriol*, 4 *oz.*; dissolve as before; the next day add, of *dry potash*, 1 *oz.*; let it stand a day longer, then dilute it with *water*, 12 *oz.*

Used in dyeing *greens* and *blues*, either without preparation or with a *mordant* of *alum and tartar*.

BLUSHING is caused by a sudden increase in the quantity and velocity of the blood in the capillaries, occasioning their turgescence; and, consequently, a heightening of the natural pale-reddish hue of the skin. It is referable to mental emotions, such as surprise, confusion, consciousness of slight, injury, or indignity, and the like. Emotions of a depressing character frequently produce an opposite effect. This is termed *pallor*; and depends on the rush of blood from the skin and surface of the body upon the internal organs. The *first* is often unpleasant, but never dangerous; the *last*, always so. The cure of blushing consists in an effort in the party to maintain his or her *presence of mind*, and to reflect and reason on the exciting circumstance, instead of sinking into a state of temporary mental imbecility and confusion.

BOILERS. See *Incrustation* and *Steam*.

BOILING. (In Cookery.) The operation of dressing food in water in a state of ebullition, or nearly approaching it. The practice of cooking animal food by boiling, although exceedingly simple, and often most convenient, is neither judicious nor economical, when the broth or liquid in which it has been dressed, is to be rejected as waste; as in this way, the most nutritious portion of the flesh of animals, consisting of soluble saline and other matter required for the formation of bone, and the nutrition of the muscular tissues, &c., is to a great extent lost. This particularly applies to *small pieces* so dressed, and to those presenting a large surface to the action of the water in proportion to their weight. Large pieces of meat suffer less in proportion than small ones, for the same reason; but even with them the outside should be rejected, as it is both insipid and unnutritious, compared with the interior portion. To reduce the solvent and deteriorating action of the water to the lowest possible point, the articles to be boiled should not be put into the water until it is in the state of full ebullition, which should be maintained for 5 or 6 minutes afterwards, by which time the surface will have become, to a certain degree, hardened, and will then act as a shield to the inner parts. To induce tenderness, the subsequent portion of the operation should be carried on at a mere "*simmer*;" the slighter the better. The practice of dressing meat by putting it into cold water, which is then *gradually* raised to the boiling point, cannot be too much censured. A quarter of an hour per *lb.*, for dressing *young meat*, *poultry*, and *small pieces*, and twenty minutes per *lb.* for *old*, *tough*, and *large ones*, are the usual times allowed by cooks for the purpose. See *Food, &c.*

BOILING POINT. See *Ebullition.*

BOILS. Syn. *Furunculi,*—Lat. Boils generally attack the healthy and robust, during the period of youth and early manhood, and seldom trouble persons who have arrived at the middle age of life.

Treat., &c. When boils appear, suppuration should be promoted by *poultices of bread and linseed meal,* to which a little *fat* or *oil* may be added, to prevent their getting hard. When poultices are inconvenient, exposure to the vapour of hot water, or the application of stimulating plasters, may be adopted instead. When the tumour is sufficiently ripe, the matter should be evacuated, and the wound dressed with a little *simple ointment* spread on a piece of clean lint or linen. The diet may be full and liberal until the maturation of the tumour and the discharge of the matter, when it should be lessened, and the bowels opened by some saline purgatives, as *Epsom salts* or *cream of tartar.* When there is a disposition in the constitution to the formation of boils, the bowels should be kept regular, and tonics, as *bark* or *steel,* had recourse to, with the frequent use of sea-bathing when possible. A course of sarsaparilla may be taken with advantage.

BOLAS. *Prep.* (Rundell.) Into *flour,* 2 *lb.,* pour *warm milk,* ¾ pint, a small teacupful of *yeast,* and 6 *eggs;* make a dough, add *butter,* 1 *lb.,* (by degrees,) and let it rise for an hour; then mix in *powdered sugar,* 1 *lb.;* and make the mass into cakes; put these into cups or tins previously well buttered, and ornament the top with *candied orange* or *lemon peel;* lastly bake them.

BOLETIC ACID. An acid discovered by Braconnot in the juice of the boletus pseudo-igniarius.

Prep. The *expressed juice* is evaporated to the consistence of a syrup by a gentle heat, digested in *strong alcohol,* and the residuum dissolved in *water;* a solution of *nitrate of lead* is then added as long as any precipitate falls, from which crystals of *boletic acid* may be obtained as directed for absinthic acid; purify by re-solution and crystallization from *alcohol.*

Obs. Boletic acid dissolves in 45 parts of alcohol, and in 180 parts of water, and is volatile. It is doubtful whether it is a distinct acid principle.

BOLOGNA PHIAL. Syn. *Philosophical phial.* A small vessel of glass, which has been suddenly cooled, open at the upper end, and rounded at the bottom. It is made so thick at the bottom that it will bear a smart blow against a hard body without breaking; but if a little pebble, or piece of flint, is dropped into it, it immediately cracks, and the bottom falls to pieces; but unless the pebble or flint is large and angular enough to scratch the surface of the glass, it will not break.

BOLUS. Syn. *Bolus,*—Lat. Boluses are small, roundish masses of medicinal substances, which are taken in the same manner as pills, which they resemble, except in their larger size. Those persons who object to swallowing them in their common state, may wrap them in soft paper, or introduce them into the emptied husks of raisins or grapes.

Boluses are prepared with the same ingredients and in a similar manner to pills, (which see.) The following may be taken as examples:—

BOLUS (Alum). Syn. *Bolus Alumini,*—Lat. *Powdered alum* and *conserve of roses,* of each, 1 dr.; *syrup of saffron* or *orange peel,* q. s.; for 4 to 6 boluses. *Dose.* One, as required, in diarrhœa, &c.

BOLUS (Capivi). Syn. *Bolus Copaibæ,*—Lat. *Prep.* 1. (Evans.) *Balsam of capivi,* (pure,) 16 parts; *calcined magnesia,* (recent,) 1 part; mix, set it aside for a few days until it becomes nearly solid, then place it on a hot slab, and divide it into oval pieces of ½ dr. each, which are to be wrapped in wafer paper.

2. (Radius.) *Copaiba,* 2 dr.; *gum arabic,* 1 oz.; *powdered liquorice,* q. s. to form a mass; to be divided as before.

3. (Righini.) *Copaiba,* 5 dr.; *extract of rhatany,* 1½ dr.; *oil of sassafras,* 15 gr.; *calcined magnesia,* q. s.; for 80 boluses. *Dose.* Three, four, or more daily, in gonorrhœa, &c.

4. (Henschel.) *Copaiba,* 1 oz.; *calcined magnesia,* 1 dr.; *opium,* 4 gr.; *powdered cubebs,* 3 dr.; *syrup of poppies,* q. s.; for ½ dr. boluses. *Dose.* Two every night in gonorrhœa. The products of the above formulæ are vastly superior to the *capivi capsules* of the shops.

BOLUS (Cubebs). Syn. *Bolus Cubebæ,*—Lat. *Prep.* 1. (Velpeau.) *Powdered cubebs,* 6 dr.; *balsam of capivi,* 2 dr.; *calcined magnesia,* q. s.; for 36 boluses. The whole to be taken in 2 or 3 days.

2. See *Capivi Bolus,* No. 4, (above.)

BOLUS (Emetic). Syn. *Bolus Zinci Sulphatis,*—Lat. *Sulphate of zinc,* 10 to 20 gr.; *conserve of roses,* q. s. to make a bolus. As an emetic, when poison has been taken; followed by copious draughts of *warm water* or *weak tea.*

BOLUS (Musk). Syn. *Bolus Moschi,*—Lat. *Prep.* 1. *Grain musk,* 15 gr.; *cam-*

phor, 5 gr.; *powdered gum*, 3 gr.; *syrup of saffron*, q. s. for a dose; in convulsions, typhus fever, &c.

2. *Musk* and *carbonate of ammonia*, of each, 10 gr.; *conserve of roses*, q. s. to make a bolus. One, when required, in spasms, hysteria, convulsions, lowness of spirits, &c.

BOLUS (Vermifuge). Syn. *Bolus Vermifugus*,—Lat. *Prep.* 1. *Wormseed*, ½ dr.; *calomel*, 6 gr.; *camphor*, 15 gr.; for 2 boluses; one to be taken at night, the other the next morning, followed by a purge.

2. (Dr. Campbell.) *Basilic powder*, 1 scrup.; *conserve of wormwood*, q. s.

3. (Foy.) *Powdered pomegranate roots*, 1 dr.; *assafœtida*, ½ dr.; *croton oil*, 4 drops; *syrup of wormwood*, q. s. for 15 boluses. The whole to be taken in 3 days, in doses of 1 or 2 at a time. In tapeworm, &c.

4. (Guy's Hosp.) *Tin filings*, ½ *oz.; compound tragacanth powder*, ½ dr.; *syrup* (buckthorn), q. s.; for 3 boluses. *Dose.* 1 to 3. The use of all the above should be followed by a purgative. See *Worms.*

BOMBIC ACID. An acid found by M. Chaussier in the silkworm. It has since been shown to be identical with formic acid.

BON-BONS. See *Sugar Plums* and *Confectionary.*

BONE. The bones of animals are employed for various purposes in the arts, manufactures, and domestic economy. The *bones of good meat* form most excellent materials for making *soups* and *gravies*, as is well known to every good cook. In France, soup is extensively made by subjecting bruised bones to a steam heat of 2 or 3 days' continuance. In England the same is commonly effected in an iron *Papin's digester.* When the earthy matter of a bone is dissolved out by digesting it in a large quantity of *very dilute hydrochloric acid*, a lump of *gelatine* is obtained, which after being well washed with water, is equal to isinglass for all the purposes of making soups and jellies. The following is the process recommended by Proust, for making the best of bones, in *hospitals, gaols*, and *similar establishments*;—

The bones, crushed small, are to be boiled for 15 minutes in a kettle of water, and the fat (which is fit for all common purposes) skimmed off, as soon as cold. The bones are then to be ground, and boiled in 8 to 10 times their weight of water, (of which that already used must form a part,) until half of it is wasted, when a very nutritious jelly will be obtained. Iron vessels should alone be used in this process, as the jelly and soup act upon copper, brass, and the other common metals. The bones of *fresh meat* are the most productive; those of *boiled meat* come next; whilst those of *roasted meat* scarcely afford any jelly. As "*boning*" meat before cooking it, is now a very general practice, a quantity of fresh bones may always be obtained. See *Ivory, &c.*

BONE ASH. Impure phosphate of lime, obtained by calcining *bones* to whiteness, and reducing the ash to fine powder. It is *used* to make pure phosphate of lime, to form cupels, &c.; and is sold for *burnt hartshorn.*

BONE DUST. Syn. *Bone Manure.* Bones ground to a coarse powder in a mill. It is sowed along with the seed in a drill. Wheat thus treated, is said to yield 30 to 50 per cent. more weight in straw and grain than by the common methods. Turnip and light soils, it renders more than ordinarily productive. Bone manure is much used in the west of Yorkshire, Holderness, and Lincolnshire. The usual quantity per acre is 70 bushels, when used alone; but when mixed with ashes or other common manure, 30 bushels per acre is said to be enough. When applied in the same manner as other manures, it has been found to remain seven years in the ground.

BONE GREASE. From *refuse bones*, bruised, boiled in water, and the broth skimmed when cold. *Prod.* ⅛th to ¼th of the weight of the dry bones. (Proust.) *Used* for making soap and candles. See *Animal Charcoal.*

BONE SHAVINGS. Syn. *Bone Dust*, *Bone Turnings.* These, by boiling with water, yield a beautiful jelly, which is nearly equal to that produced from hartshorn shavings, and for which they are very frequently sold. *Used* to make jellies and blancmanges, to stiffen straw bonnets, &c.

BOOKBINDING. A notice of the various operations of the binder does not properly come within the province of the present work. The extreme novelty, simplicity, and durability of the variety known as "*Hancock's Patent Binding*," induce us, however, to give the reader a short description of that admirable invention. By Mr. Hancock's method the sheets are folded in double leaves, and being properly placed together and adjusted, the book is subjected to the action of a press, and a *strong* and *quickly-drying solution of Indian rubber* is smeared over the back with the finger, when the whole is left for 3 or 4 hours, or longer, to dry. The operation is repeated, as often as necessary, after which fillets of

cloth are cemented on with the varnish, and the book is ready to have the boards attached. In this way, several of the usual operations of binding are dispensed with. We most willingly bear testimony to the strength and durability of this method, as well as to the great convenience it affords in allowing the books to open *perfectly flat* upon a table, or to be distorted in any possible manner, without injury to their backs. It is, undoubtedly, the best way of binding books for travellers. The Editor of this work, once had a large trunk of books, among which was a massive volume bound on Hancock's plan. All the rest were nearly torn to pieces by a few months' journey, but this one remained uninjured even after three years, during which time it accompanied him in his travels, extending, collectively, to upwards of 20,000 miles.

BOOTS and SHOES. The *cleaning* of boots and shoes forms no unimportant part of the domestic duties of a large establishment; as, on it being properly performed, depend both their appearance and durability. A votary of St. Crispin, in whom we place considerable reliance, assures us, that to effect this object in the "best style," all that is necessary is to employ *very little blacking*, (merely enough to *moisten* the surface of the leather,) and to *brush it off* whilst still *damp*. Never make the surface *wet*, nor allow the blacking to *dry* before applying the polishing brush. For this purpose, a portion only of the boot or shoe should be attended to at a time. The dirt is, of course, to be carefully brushed off before applying the blacking. When it is desired to restore the *shape* of a boot or shoe, as well as to clean it, "boot trees" may be used. Of the *brushes*, we are told that there should be at least three,—one, (*dirt brush*,) with bristles stiff, but not "wiry" nor "scratchy," to remove mud and dirt; another, (*blacking brush*,) with fine, flexible hair, and plenty of it, for applying the blacking; and a third, (*polishing brush*,) covered with long, fine, springy, and *slightly* stiff hair, for giving the polish. The employment of *inferior* or *worn-out* brushes, is said to be "false economy," and proves particularly destructive to the "lighter classes" of leather.

A word or two here about blacking may also be useful to the reader. That of any known "good maker" may be employed. The blackings of different houses vary, however, considerably in some of their properties; as also do those of the same maker by age. Some blackings "dry off" rapidly, and give a very brilliant polish with very little labour; whilst others take a little longer to "dry off," and somewhat more labour to polish them. The former, are best adapted to hasty use, and when a very brilliant surface is desired; the latter, when depth of polish, without extreme brilliancy, satisfies the wearer. The *first* best meets the requirements of fashionable life; the *last*, those of the middle classes and pedestrians exposed to dirt, mud, and the various vicissitudes of travelling and weather. To the one belong the blackings of Everett, and Day and Martin; to the other, those of Warren, Bryant and James, and most of the smaller manufacturers. Time, however, equalizes the qualities of these two classes. Blackings which are moist and oily lose these properties, and become drier and more brilliant by age. The practice of several of the first-class West-end houses is never to use a blacking which they have not had in their stock at least a twelvemonth.

The occasional use of a *little* oil or grease to the *uppers of boots* and *shoes*, increases their *softness* and *durability*, as well as the "depth," but not the brilliancy of the polish from common blacking. For this purpose some *good tallow* or "*dubbing*" may be used; the absorption being aided by a very *gentle* heat. The *soles* or *bottoms* of boots and shoes may be thoroughly saturated with similar substances, when new, by which means their durability will be fully doubled. The common practice among the shoemakers is to moisten the surface of the leather with a *wet sponge* before applying the oil or grease; by which (they say) its pores are opened and its absorbent powers increased.

Patent leather boots and *shoes* are best cleaned with a little *sweet oil* or *milk*, (preferably the first,) the dirt having been previously removed in the usual way.

Indian-rubber goloshes and *overshoes* may be cleaned with a *sponge* or *brush*, and *water*, care being taken not to wet the linings. The same applies to Gutta percha. See *Blacking*, *Leather*, *Waterproofing*, &c.

BOOT POWDER. *Scraped* or *powdered French chalk*. It is used to facilitate the "getting on" of new or tight boots. The bootmakers commonly rub a little of it on the insides of the backs, heels, and insteps of boots before handing them to their customers.

BOOT-TOP LIQUID. Syn. *Boot-top Composition*. There are numerous compositions of this class extant, but with two or three exceptions they are most unchemical compounds, containing several ingredients, part of which are either unnecessary or opposed

to the action of the rest. The following original and selected formulæ are given for the reader's guidance:—

Prep. 1. *Oxalic acid* and *white vitriol*, of each, 1 *oz.*; *water*, 1½ pint; dissolve. To be applied with a sponge to the leather previously washed with water; then washed off with water, and the boot-tops dried by a gentle heat; after which, they may be polished with a brush, so as to appear like new leather, or left to dry rough, as the case may require.

2. *Sour milk*, 1 quart; *gum arabic*, 1 *oz.*; *juice of* 2 *lemons*; *white of* 2 *eggs*; *oil of vitriol*, 2 *oz.* Mix.

3. *Sour milk*, 1 quart; *butter of antimony*, *cream of tartar*, *tartaric acid*, and *burnt alum*, of each, 2 *oz.* Mix.

4. (Gray.) *Sour milk*, 3 pints; *butter of antimony*, *alum*, and *cream of tartar*, of each, 2 *oz.*; *citric acid*, *alum*, and *burnt alum*, of each, 1 *oz.*

5. (Redwood.) *Sour milk*, 3 pints; *cream of tartar*, 2 *oz.*; *alum* and *oxalic acid*, of each, 1 *oz.*

6. (Beasley.)—*a.* (Brown-top.) *Alum*, *annatto*, and *oxalic acid*, of each, 1 *oz.*; *isinglass* and *sugar of lead*, of each, ½ *oz.*; *salt of sorrel*, ¼ *oz.*; *water*, 1 quart; boil for 10 minutes.—*b.* (White-top.) *Alum*, *cream of tartar*, *magnesia*, and *oxalic acid*, of each, 1 *oz.*; *salt of sorrel* and *sugar of lead*, of each, ¼ *oz.*; *water*, 1 quart.

BORACIC ACID. Syn. *Boric Acid*; *Acidum Boracicum*,—Lat. *Sedative salt*, *Sed. Salt of Vitriol*, *S. S. of Homberg*,—Obs. The only compound of boron with oxygen. It is obtained from common borax. That of commerce is extracted from the boracic acid lagoons of Tuscany.

Prep. 1. *Borax*, 1 part; *boiling water*, 4 parts; dissolve, then add *sulphuric acid* until the solution acquires a distinctly acid reaction, (about ½ the weight of the borax.) As the solution cools, crystals of boracic acid will be deposited. They may be purified by placing them on a filter, washing them with a little *very cold water*, re-solution in *boiling water* and recrystallization. Nearly pure.

2. By decomposing *borax* by *hydrochloric acid*, instead of *sulphuric acid*, as above. Purer than the last.

3. By exposing the product of the first crystallization (*see* above) to heat in a platinum crucible, and redissolving and crystallizing the product, as before. Chemically pure. *Used* in analysis.

Prop., *&c.* Odourless; tastes bitter; dissolves in 25 times its weight of cold water, and 3 times its weight of boiling water; very soluble in alcohol, which then burns with a bright green flame; reddens litmus; browns turmeric paper; (these properties are characteristic of this substance;) when strongly heated, it forms a brittle glass (*Vitrified Boracic Acid*) on cooling. Its salts are called *borates*.

Uses. Boracic acid was once administered internally in large doses as an anodyne, antispasmodic, and sedative, but is now scarcely ever employed as a medicine. The crude acid is used in the manufacture of borax; the pure acid in the manufacture of certain chemicals.

BORATE. Syn. *Boras*,—Lat. Several of the borates may be formed by digesting the *hydrate of the base* in a *solution of the acid*, with the assistance of heat; others by double decomposition. They are all decomposed by the stronger acids.

Tests. The borates may be tested by digesting them in a slight excess of oil vitriol, evaporating the resulting solution to dryness, and powdering and dissolving the residuum in alcohol; the solution possesses the property of burning with a green flame. See *Boracic Acid*.

BORAX. Syn. *Biborate of Soda*, *Borate of do.*; *Borax*, *Soda Biboras*,—Lat. & Ph. L. *Sub-borate of Soda*, *Gold Solder*, *Refined Tincal*,—Obs. Commercial borax is obtained either by purifying native borate of soda, (*tincal*, *tincar*;) or by saturating crude boracic acid with the alkali. It is never prepared on the small scale unless for chemical analysis.

Pur. This is best ascertained by determining the quantity of sulphuric acid required to neutralize a given weight of borax, as indicated by litmus paper. Common salt and alum are frequently mixed with borax to lower the value. The first may be detected by a solution in hot water, giving a curdy white precipitate with nitrate of silver, soluble in ammonia; the last, by water of ammonia, giving a bulky white precipitate. The former must be distinguished from the white pulverulent precipitate of borate of silver, which will be thrown down from pure borax.

Uses, &c. Borax is extensively employed as a flux for metals, for soldering, and in medicine. *Internally*, it is diuretic, sedative, emmenagogue, and refrigerant, in doses of 15 to 40 gr.; *externally*, as a gargle for sore throat, and in powder, as a detergent in aphthæ, and ulcerations of the mouth. Dissolved in rose-water, it is used as a cosmetic, and mixed with 8 times its weight of lard, forms a useful ointment in piles and sore nipples.

BORAX (Glass of). Borax dried at a gentle heat, and then melted by increasing the heat until it forms a vitreous mass on being cooled. *Used* in soldering, and as a flux.

BORO - FLUORIDES. These compounds possess little practical interest. *Boro-fluoride of hydrogen* is prepared by passing *fluoboric acid gas* through *water*, carefully concentrating the solution, cooling it, and separating the crystalline powder, which is boro-fluoride of hydrogen. With most of the protoxides and their carbonates, it interchanges bases, and metallic boro-fluorides result.—*Boro-fluoride of Barium.* By adding carbonate of baryta to boro-fluoride of hydrogen, until it ceases to be dissolved; and evaporating to the consistence of a syrup, when crystals will form. The *boro-fluorides* of *calcium*, *magnesium*, and *lead*, may be formed in a similar way.—*Boro-fluoride of potassium.* By dropping boro-fluoride of hydrogen into a solution of carbonate of potassa, collecting the white powder that falls, and washing it with cold water.—*Boro-fluoride of sodium.* By dissolving fluoride of sodium in boro-fluoride of hydrogen, and crystallizing. *Boro-fluoride of lithium* may be formed in a similar way.

BORON. The base of boracic acid. It was discovered by Sir H. Davy, in 1807.

Prep. Boron is prepared by a process similar to that employed to obtain silicium. —*Potassium* and *perfectly dry boracic acid*, or preferably, *boro-fluoride of potassium*, intimately mixed together, are placed in a glass adopter tube, and submitted to a low red heat. When cold, the loose cork that fastened its mouth is removed, and hot water poured in, in successive portions, until the whole matter is detached and dissolved; the liquid is allowed to settle, and the precipitate washed first with a *solution of sal ammoniac*, and afterwards with *alcohol;* the residuum (boron) is lastly dried in a capsule, and put into a well-stoppered phial.

Prop., &c. A solid, tasteless, and inodorous powder, of a grayish-brown colour. With sulphur it unites at high temperatures, forming sulphurets, (*sulphurets of boron,*) and when placed in chlorine gas it spontaneously inflames, and a gaseous *chloride of boron* is formed. The compounds of boron with simple bodies are termed *borides* or *borurets.*

BOTTLING. See *Malt Liquors*, *Wine*, *&c.*

BOUGIES. Syn. *Cerei*, *Cereoli*,—Lat. A long slender instrument introduced into the urethra, œsophagus, or rectum, in stricture and other diseases of those organs.

Prep. 1. (Prof. Pickel's.) *Amber* (melted), 1 part; *boiled oil*, 3 parts; mix, cool a little, and further add of *oil of turpentine*, 1 part; spread the mixture at 3 successive intervals upon *loose spun silk cord* or *web;* dry in a heat of 150°, and repeat the process until the instrument has acquired the proper size; then polish, first with *pumice-stone*, and afterwards with *tripoli* and *oil.*

Obs. This is the original receipt of the once celebrated French professor Pickel, and is still generally used, slightly modified, on the Continent. At the present time, in Paris, a little *caoutchouc* is added, equal to about $\frac{1}{20}$ of the weight of the oil employed. For the best elastic bougies the process usually occupies from 6 to 8 weeks, to allow full time for the drying and hardening of the composition. When the bougie is required to be hollow, a piece of polished metallic wire is introduced into the axis of the silk; or tinfoil is rolled round the wire and the composition applied as before. When dry and hard the wire is withdrawn.

2. (Hunter's.) *Yellow wax*, 2 parts; *red lead*, 3 parts; *olive oil*, 6 parts; slowly boiled together until combination takes place; strips of soft linen (rather wider at the one end than the other,) are then dipped into the composition, rolled up firmly, and finished off on a polished slab.

3. (Piderit's.) *Olive oil*, 1 part; *wax*, 6 parts; as before.

4. (Bell's.) *Lead plaster*, 11 parts; *yellow wax*, 4 parts; *olive oil*, 1 part.

5. (St. B. Hosp.) *Wax*, 12 parts; *Chio turpentine*, 4 parts; *red sulphuret of mercury*, 1 part.

6. (*Caoutchouc bougies.*) In France, where ether is comparatively inexpensive, these are made by applying an *ethereal solution of Indian rubber* to the silk or foil prepared as before.—In England, *naphtha* is employed instead of ether, but it furnishes a very inferior product. Sometimes *slips of Indian rubber*, previously boiled in water, or that have had their edges softened by moistening them with a little *ether*, are wound round the wire or foil, and kept in their place by a piece of tape applied over them. They are afterwards carefully smoothed off and polished.

7. (*Gutta percha bougies.*) These are formed of *gutta percha*, (previously softened by immersion in boiling water,) by rolling it between plates of polished glass or marble. When skilfully prepared from the

best (*uncoloured*) gutta percha, they are admirable instruments. A bougie of this description, of moderate size, and slightly oiled or wetted with glycerine or gum water, may be passed through the whole length of the urethra of a healthy person without causing the slightest pain. *Gutta percha catheters* (hollow bougies) are still more flexible and easily introduced, and may remain in the urethra for a long time without causing irritation; an important advantage in such matters. The reader cannot, however, be too careful to avoid those made of *coloured* gutta percha which, unfortunately, rapidly become very brittle by age. Those originally manufactured in this material were coloured black, and were constantly breaking whilst in use; a disaster from which several serious and even fatal cases ensued.

BOULES DE NANCY. Equal parts of *iron filings* and *red tartar* made up into balls with *spirit*. *Used* as a tonic, dissolved in hot water.

BOUILLI. This name is frequently applied by cooks to dishes of boiled meat, as a refinement on its plain English synonym. Thus "*beef bouilli*," "*beef in bouilli*," &c., means stewed or boiled beef, &c. As, however, the name is à la français, so must be the accompaniments, which generally consist of herbs and vegetable seasoning in greater quantity and variety than is usually deemed essential for an humble piece of English boiled or stewed meat.

BOUILLON. (In Cookery.) See *Broth* and *Soup*.

BOUQUET DE LA REINE. *Prep.* 1. *Essence of bergamotte*, 1 dr.; *English oil of lavender*, 25 drops; *oil of cloves*, *aromatic vinegar*, and *essence of musk*, of each, 10 drops; *alcohol*, ¾ *oz.*; mix.

2. *Oils of bergamotte* and *lavender*, of each, 30 *drops*; *neroli*, 15 drops; *oils of verbena* and *cloves*, of each, 5 drops; *essences of musk*, *ambergris*, and *jasmin*, of each, ½ dr.; *rectified spirit of wine*, (strongest), 2 *oz.*; mix. A highly fragrant and much esteemed perfume for the handkerchief, &c.

BRA GRAS. *Tar*, *black rosin*, and the *dregs of strained rosin*, melted together.

BRAINS. There appears to be scarcely anything which is at all eatable, that the ingenuity and taste of the modern cook does not appropriate to his purposes, and clothe with delectability, or transform into something execrable. We observe that our chef de cuisine, (no unimportant personage,) has taxed every viscera and brought together every novelty and dainty to humour and excite the appetite. Animals which were guiltless of brains whilst living, are found by him to possess excellent ones when dead, from which he prepares a variety of miniature dishes, which are truly novel and inviting. Let frugal housewives for the future carefully value their brains, and apply them to useful purposes in a double sense. When cleaned, washed, blanched, and flavoured with the necessary seasoning, they may be formed into a variety of hors-d'œuvres, creditable to any table. Mrs. Rundell tells us, that "beat up with a little *white pepper* and *salt*, a *sage-leaf* or two (scalded and finely chopped,) and the *yelk of an egg*, and fried, they make excellent cakes, fritters, &c." What Soyer, (that king of cuisiniers,) can therefore do with them, the reader can well anticipate.

BRAN. The inner-husk or *bran of wheat* when diffused through hot water, is largely employed by the calico printers to remove the colouring matter from those parts of their goods which are not "mordanted." A handful mixed with a pail of warm water forms an excellent *emollient foot-bath*. Infused in hot water (*bran tea*), and sweetened, it forms a popular demulcent, much used in coughs and hoarseness, and which, taken in quantity, proves gently laxative. It also forms an excellent manure, and, from containing the ammoniaco-magnesian phosphate, is especially adapted as a "dressing" for potatoes. It is frequently mixed with flour, and made into bread, (*bran bread*,) which is eaten by the poorer orders for economy, and by the higher classes because it is recommended by the faculty as being more wholesome than white wheaten-bread.

BRANDY. Syn. *Eau de Vie*,—Fr. *Spiritus Vini Gallici*,—Ph. L. *Spiritus Gallicus*, *Aqua Vitæ*, *&c.*,—Lat. var. *Brandywine*,—Obs. A well-known spirituous liquor obtained by the distillation of the wine of grapes. When first distilled, brandy is colourless, and only acquires a yellowish tint from the wood of the casks, in which state it is known and sold as "*pale brandy*" or "*white brandy*." The deep colour that this spirit usually possesses, is imparted to it by the addition of a little *colouring* (burnt sugar, or caramel); and, occasionally, of a little *red sanders wood* (rasped) as well. Catechu or terra Japonica, in powder or solution, is also frequently added. The original intention was to imitate the appearance acquired by brandy from great age, when kept in wood, but in process of

time the thing has come to be overdone. The natural colour, which the spirit receives from the cask, however long it may have been kept in it, never exceeds a light amber tint, about equal to that of pale Jamaica rum; but the public taste has become gradually vitiated in this respect, until only a spirit of a lively and full "*brandy colour*" (unless for a pale brandy) will sell. The consequence is that more "colouring" is commonly added than is compatible with a rich appearance or fine flavour.

The brandies most esteemed in England are imported from France, and are those of Cognac and Armagnac, the preference being generally given to the former. The brandies of Rochelle and Bordeaux may be reckoned next in quality; while those obtained from Portugal, Spain, and Italy are very inferior. Those of commerce are readily distinguishable from each other by an experienced spirit-taster.

The *constituents* of *pure brandy* are *alcohol* and *water*, and small quantities of *volatile oil*, *acetic acid*, *acetic ether*, *œnanthic ether*, *colouring matter*, and *tannin*. It is from the presence of the last six of these substances that the spirit derives its characteristic smell and flavour. The per centage richness of brandy in alcohol varies from 48 to 55 per cent. When first imported it is generally 1 or 2 over-proof, but its strength decreases by age, and by the time it is usually taken from the bond-store for sale, it is seldom stronger than 3 or 4 under proof. Pure brandies of the best quality seldom exceed proof, and are generally a little below it. The common practice in France is to add *spirit of wine* and *colouring* to raise the strength of the liquor before exporting it. This is done to any extent desired by the English purchaser, and the quantity and prices of the substances so added are regularly set out in the invoice. When the purchaser is not *well acquainted* with the trade, and desires a strong spirit at a low rate, the common practice is to sell him brandy so mixed as genuine. The *very finest brandies* average from 5 to 10 u. p., and never exceed 2 u. p.; they then contain more than ½ their weight of water, and from their boiling point being higher, they come over more fully charged with essential oil, and the other volatile and fragrant principles of the grape, and thus possess in a greater degree that peculiar aroma and flavour for which they are so much esteemed. French brandy or wine, distilled at a low temperature in a water bath, yields a very pure and almost flavourless spirit.

The quality of the brandy imported from France varies considerably from that which is drunk on the continent, principally from it being *prepared*, or, as it is technically termed "*made up*," for the London market; which means lowering it by the addition of spirit, colouring, &c., as above described. The common strength at which foreign brandy is sold in England is about 11 or 12 u.p.; when weaker than 17 u.p., it becomes seizable by the excise. The strength at which it is sold and "permitted" in the wholesale trade, is generally 10 u p., to which it is reduced by adding *water;* and it is never less than 12 u.p., unless a different strength has been agreed on at the time of sale. In large quantities and from bond, the strength of course, depends much upon the age and quality of the spirit; a fine old brandy being, perhaps, 8 or 10 u.p., while one of the last year's vintage of a commoner quality may be as strong as 2 u.p., or even 1 u.p. These matters are familiar to every experienced brandy dealer.

In France there are several varieties of brandy, which are known by names descriptive of their qualities and source:—

"*Eau de vie supérieure*," is obtained from pale white wines, by skilful distillation, and is remarkable for its superior flavour. It forms the finest variety of *Cognac brandy* of the English drinker. When it is kept in glass or stone bottles, it is called *white brandy;* when in casks, (but has not been artificially coloured,) "*pale brandy.*" The latter, which has a pale amber tint, is also called *white brandy* by the inexperienced.

"*Eau de vie ordinaire*," or *common brandy*, is distilled from inferior or spoilt white or red wines; sp. gr. about 0·948, (from 22 to 27 u.p.)

"*Eau de vie de marc.*" From the lees of sour, damaged, and inferior red wines, the marc or cake of grapes, &c., distilled by a quick fire, to drive over as much essential oil and flavouring matter as possible. Used, chiefly to mix with other brandy, or to flavour plain spirit.

"*Eau de vie seconde.*" The weak spirit that passes over, after the receiver has been changed. Very weak and inferior.

"*Eau de vie à preuve d'Hollande.*" Sp. gr. about ·9420, (19° Baumé, or 20 u.p.) The common strength at which brandy is retailed in France, and at which it will stand the "*proof*" or "*bead.*"

"*Eau de vie à preuve d'huile.*" Sp. gr. ·9185, (23° Baumé, or 1¼ o. p.); pure olive

oil just sinks in it. It is the strongest brandy retailed in France.

"*Eau de vie forte.*" From common brandy. It answers to our spirit of wine. Sp. gr., about ·839, (38° Baumé, or 55 o. p.)

"*Esprit de vin*" is brandy or spirit, rectified to 0·861, (28° Baumé, or 42 o. p. and upwards.)

Pur., &c. The method of determining the strength of brandy is explained under "Alcoholmetry." Of the large quantity of this liquor consumed in England, we can assure the reader, that a small fraction only escapes adulteration. Pure French brandy, is indeed an article quite unattainable by the small consumer. The brandy of our shops and taverns is not only systematically "lowered" a little (with spirit of wine or British brandy) by the wholesale dealer, but it undergoes a like process at the hands of the retailer. The only method to obtain perfectly pure brandy is either to take it direct from the bond store, without allowing it to *enter* a private cellar even for an hour, or to buy it of some known respectable party, and to pay a price that offers no inducement to dishonesty. When this cannot be done, British brandy had better be at once purchased, by which money will be saved, and a more wholesome article obtained.

French brandy, as already noticed, is commonly "lowered" with water, malt brandy, and spirit of wine, by which its original flavour is more or less weakened or modified. This species of adulteration is best detected by the "palate." Another, and no very uncommon fraud practised by the retailers, is to reduce their brandy with a larger quantity of water than the strength fixed by the excise laws and honesty to their customers will permit. As a natural consequence their liquor suffers so greatly in flavour, and its deficiency in alcohol becomes so apparent, that they soon see the necessity of either abandoning the nefarious practice, or resorting to others of a like kind to disguise it. The latter alternative is commonly adopted. An excess of sugar colouring, (*burnt sugar,*) is immediately introduced into the spirit, followed by sundry portions of cayenne pepper, grains of paradise, horse-radish, acetic acid, almond cake, and other flavouring and acrid substances, to give it a pungency and "make-believe strength" that "passes muster" with the petty consumer. This fraud may be detected by gently evaporating a little of the suspected liquor in a spoon or glass capsule, when the acrid matter, colouring, and sugar, will be left behind, and may be readily detected by their flavour, sweetness, glutinosity, &c. A little perfectly pure brandy evaporated in a similar manner, (on a watch-glass for instance,) merely leaves an extremely trifling discoloration on the surface. Genuine French brandy always reddens blue litmus paper, from containing a little acetic acid; the old coloured varieties are also blackened by a solution of a persalt of iron. Sometimes brandy is contaminated with a small quantity of lead or copper, derived from the apparatus or utensils with which it has been prepared or measured. Sugar of lead has also been used by the ignorant to clarify it. The presence of these highly deleterious substances may be detected in the following manner:—

1. (Copper).—*a.* A small piece of clean polished iron or steel immersed in the suspected liquid for a short time, (with agitation,) becomes coated with a film of metallic copper when that metal is present. To facilitate the precipitation of the metal, the sample under examination may be slightly acidulated with a few drops of pure acetic acid. Minute traces of copper may sometimes be detected on the surface of the iron with a lens, which would be passed over unnoticed by the naked eye.

b. (Böttger). A little of the brandy is to be agitated with a few drops of pure olive oil. The latter will acquire a green colour if copper is present.

2. (Lead).—*a.* Sulphuretted hydrogen and hydrosulphuret of ammonia produce a black precipitate in brandy containing lead.—*b.* A solution of sulphate of soda, (*Glauber salts,*) or water soured with sulphuric acid, produces a heavy white precipitate, which turns black when moistened with hydrosulphuret of ammonia.

Concluding Remarks. In the "trade," the addition of water (*liquor*) to spirit is technically called "*reducing;*" whilst absolute adulteration is known under the questionable name "*improving.*" Both of these operations have now been so long practised with impunity as to form the leading qualifications demanded in a "cellarman." Indeed the adulteration of liquors of every class is the "*rule;*" NOT the "*exception.*" Yet such is the poverty of palate of the majority of English brandy drinkers, that this adulteration is often not suspected, much less *detected*, even when it is carried to the most fraudulent extent. So long as the foreign spirit constitutes about ½ of the mixture, and was at first of decent quality and age, the infatuated brandy-drinker

smacks his lips, and cunningly holding up his glass between the light and his eye, exclaims, "Ah! this is a drop of the real." See *Spirit*, *Alcoholmetry*, &c.

The following formulæ for "*reducing brandy*" are those of two large wholesale dealers, who deliberately assured us that they conceived themselves more honest than their brethren in the same line:—

1. *Cognac brandy*, (10 u.p.), 20 gall.; *British* or *malt brandy*, (good,) 5 gall.

2. To 72 gallons of *full flavoured* French brandy, add 10 gallons of *spirit of wine* (58 o. p.), 8 gallons of *water*, and 1 pint of *good colouring*; "rummage" up well, and let it stand two days.

3. *French brandy*, and *patent brandy* (i.e. best malt brandy), equal parts.

BRANDY (British). Syn. *Malt brandy*, *British Cognac*, &c. For a long time this liquor was distilled from spoiled wine and dregs of wine, both British and foreign, mixed with beer bottoms, spoiled raisins, and similar articles. Malt and molasses spirit were afterwards employed, as at the present day, for the purpose; but it was long considered as "an unpardonable and wicked misuse of these articles." Modern experience, however, has proved, that perfectly pure and tasteless malt spirit is the best article to use as the basis of an imitation brandy.

Prep. 1. To *malt spirit*, (the finest, flavourless, at proof; or, if of a different strength a proportionate quantity,) 12 gall.; add *water*, 5 gall.; *crude red tartar* or *wine-stone*, ¾ *lb.*; (previously dissolved in) *boiling water*, 1 gall.; *acetic ether* 6 *fl. oz.*; *French wine vinegar*, 2 quarts; *French* plums, (bruised,) 5 *lb.*; *wine bottoms* or *flavour stuff* (from Cognac,) 5 quarts; mix in a fresh-emptied sherry cask, and let them stand together for 14 days, frequently rummaging up the liquor with a stick; next draw over 15 gallons of the mixture from a still furnished with an agitator. Put the rectified spirit into a clean, fresh emptied Cognac brandy cask, and add thereto of *tincture of catechu*, ¾ pint; *oak shavings*, (fresh and clean,) 1 *lb.*; and *spirit colouring*, (about) a pint; Agitate occasionally for a few days, when it will be fit for use.—*Prod.* 15 gallons of brandy, 17 u.p. Age improves it.

2. *Pure spirit*, (as before,) 99 gall.; *red tartar*, (dissolved,) 7 *lb.*; *acetic ether*, ½ gall.; *wine vinegar*, 4 gall.; *bruised raisins* or *French plums*, 14 *lb.*; *bitter almonds*, (bruised) 1 *oz.*; *water*, q. s.; macerate as before, and draw over 120 gallons. To the *distilled spirit* add a *few lb. of oak shavings*, 1 *lb.* of *powdered catechu* (made into a paste with water), and *burnt-sugar colouring*, q. s., as before.—*Prod.* 120 gallons of spirit fully 17 u.p. Equal in quality to the last.

3. *Clean spirit*, (17 u. p.), 100 gall.; *nitric ether*, 2 quarts; *cassia buds*, (ground,) 4 *oz.*; *bitter almond meal*, 2 *oz.*; *orris root*, (sliced,) 6 *oz.*; *powdered cloves*, 1 *oz.*; *capsicum*, 1½ *oz.*; *good vinegar*, 2 gall.; *brandy colouring*, 3 pints; *powdered catechu*, 1 *lb.*; *full flavoured Jamaica rum*, 2 gall.; mix in an empty cognac "piece," and macerate for a fortnight, occasionally stirring.

4. *Malt spirit*, (17 u. p.), 100 gall.; *catechu*, 12 *oz.*; *tincture of vanilla*, ½ pint; *burnt-sugar colouring*, 1 quart; *good rum*, 3 gall. or more; *acetic* or *nitric ether*, 2 quarts; mix as the last.

5. *Clean spirit*, (17 u.p.), 89 gall.; *high flavoured cognac*, 10 gall.; *oil of cassia*, 2 dr.; *oil of bitter almonds*, 11 dr.; *powdered catechu*, 1 *lb.*; *cream of tartar*, (dissolved,) 1¼ *lb.*; *Beaufoy's concentrated acetic acid*, 3 pints; *sugar colouring*, 1 quart, (or more;) *good rum*, 1 gallon. When the above mixtures are distilled, the *French brandy*, *colouring*, *catechu*, and *tartar*, should be added to the distilled spirit.

6. To *plain spirit*, (coloured,) at 17 u. p., add a little *tincture of catechu*, and a sufficient quantity of *eau de vie de marc*, or of the *oil distilled from wine lees*, to flavour.

Obs. The oil referred to in the last formula is obtained by distillation from the lees of wine, either dried and made up into cakes, or in their wet state, mixed with about 7 or 8 times their weight of water. This oil should be dissolved in alcohol, and kept in this state, as it is apt to lose its flavour. The spirit produced by this, as well as the other forms above, is better for distillation. The brandy from any part of the world may be very closely imitated, by distilling the oil from the lees of the wines produced in the particular district. A certain writer recommends a pound each of *finely powdered charcoal* and *ground rice* to be digested in a gallon of *plain spirit* for a fortnight, to convert it into brandy; but we do not see it can effect that object. Where *black tea* is cheap, as in the United States of America, it is very commonly employed to impart the roughness and flavour of brandy to coloured spirit. A good article of cider spirit thus treated, forms a passable "mock brandy." In conclusion, we may remark, that as the strength and quality of ingredients frequently vary, and

success depends greatly on skill in manipulation, much must be left to the experience, judgment, and discretion of the operator. The production of a flavoured British spirit closely resembling French brandy, is a subject well worthy of the attention of the ingenious chemist, rectifier, and cellarman, as a matter of profit; and of the amateur, as affording an interesting field for useful and amusing experiment.

BRANDY (Caraway). *Prep.* 1. *Caraway seeds*, (bruised,) 4 *oz.*; *lump sugar*, 2 *lb.*; *British brandy*, 1 gall.; macerate a fortnight, occasionally shaking the bottle.

2. *Sugar*, 1 *lb.*; *caraways*, (bruised,) 1 *oz.*; 3 *bitter almonds* (grated); *spirit colouring*, 1 *oz.*; *plain spirit*, (or *gin*, 22 u. p.,) ½ gall.; as before.

3. As the last, but using 1 quart each of *rectified spirit of wine* and *water*, instead of the plain spirit there ordered. Some persons also omit the colouring.

BRANDY (Cherry). *Prep.* 1. *Brandy* and *cherries* (crushed), of each, 1 gall.; let them lie together for 3 days, then express the liquor, and add 2 *lb.* of *lump sugar*; in a week decant the clear portion for use.

2. To the last add 1 quart of *raspberry juice*, and ½ a pint of *orange-flower water*. Both the above are excellent.

3. *Treacle*, 1 cwt.; *spirit* (45 u. p.), 41 gallons; *bitter almonds* (bruised), ½ *lb.*; (or more or less to taste;) *cloves*, 1 *oz.*; *cassia*, 2 *oz.*; macerate a month, frequently stirring. This is the article now very commonly vended for cherry brandy.

Obs. Equal parts of fully ripe Morello cherries and black cherries produce the richest cordial. Some persons prick each cherry separately with a needle instead of crushing them; in which case they retain them in the liquor, and serve up a few of them in each glass. The plan named in the first formula is, however, that usually adopted. On the small scale, the fruit is commonly bruised between the fingers. A portion only, (if any,) of the stones in the cherries should be crushed, to impart a nutty flavour.

BRANDY (Cider). From *cider* and *perry*, and the *marc* of *apples* and *pears*. It is largely manufactured in the United States of America and in Canada, where it may be purchased for about 2*s.* 1*d.* a gallon. An illicit distillation of this spirit is frequently carried on by the farmers of the West of England.

BRANDY (Dantzic). From *rye*, ground with the *root* of *calamus aromaticus*. It has a mixed flavour of orris and cinnamon.

BRANDY (Lemon). *Prep.* 1. *Fresh lemons*, (cut in slices,) 1 dozen; *brandy*, 1 gallon; macerate for a week, press out the liquor, and add of *lump sugar*, 1 *lb.*

2. *Proof spirit*, 7 gall.; *essence of lemon*, 3 dr.; *sugar*, 5 *lb.*; *tartaric acid*, 1 *oz.*; (dissolved in) *water*, 2 gallons; *colouring*, q. s. Sometimes *milk* is added to the above, in the proportion of 1 quart (boiling hot) to every gallon.

BRANDY (Malt). See *British Brandy*.

BRANDY (Orange). *Prep.* 1. As lemon brandy, but employing oranges.

2. To each of the above add *orange-flower water*, 1 pint.

BRANDY (Pale). This article has been already referred to. (See *Brandy*.) That of the gin shops and publicans is generally made by the admixture of about equal parts of their *best brown French brandy*, *clean spirit of wine*, and *soft water*, "rounced together," and allowed to stand until the next day to "fine down." If the *first* is 9 u.p., and the *second*, 58 o.p., the product will be 17 u.p. Any deficiency of strength may be made up by adding a little spirit of wine.

BRANDY (Peach). From *peaches*, by fermentation and distillation. Much used in the United States, where peaches are plentiful and cheap. A *cordial spirit* under the same name is prepared as follows:—

1. From *peaches*, sliced and steeped in twice their weight of *British brandy* or *malt spirit*, as in making Cherry brandy.

2. *Bitter almonds*, (bruised,) 2 *oz.*; *proof spirit*, (pale,) 10 gall.; *water*, 3 gall.; *sugar*, 5 or 6 *lb.*; *orange-flower water*, ½ a pint; macerate for 14 days. Add *brandy colouring*, if *required* darker.

BRANDY (Raspberry). From *raspberries*, as directed under Cherry brandy. Sometimes a little cinnamon and cloves are added. The only addition, however, that improves the flavour or bouquet, is a little *orange-flower water*, a *very little essence of vanilla*, or a single drop of essence of *ambergris*.

BRASS. This useful alloy of copper and zinc, is now generally manufactured by plunging the *copper*, in slips, into the *zinc*, melted in the usual manner. The former metal rapidly combines with the fluid mass, and the addition is continued until an alloy is formed, somewhat difficult of fusion, when the remainder of the copper is at once added. The brass thus formed is broken into pieces, and remelted under charcoal, and a proper addition of either zinc or copper made, to bring it up to the colour and quality desired. It is next

poured into moulds of granite. Before being submitted to the rolling-press for reduction to *thin* plates, it undergoes the operation of annealing.

Prep. The proportions of the metals forming this alloy are varied according to the desired colour and the purposes to which it is to be applied. The following formulæ are founded, chiefly, on analysis of standard brasses and yellow metals, made expressly for this work. Small fractions are omitted; the nearest whole number being generally taken.

1. (*Fine Brass.*)—*a.* From *copper*, 2 parts; *zinc*, 1 part; either combined as explained above, or the two metals separately melted, suddenly poured together, and united by vigorous stirring.

b. From *copper*, 7 parts; *zinc*, 3 parts. Bright yellow; malleable.

c. From *fine copper*, 4 parts; *zinc*, 1 part. Deeper coloured than the last; an excellent and very useful alloy.

2. (*Malleable Brass.*)—*a.* From *copper*, 33 parts; *zinc*, 25 parts; as before.

b. From *copper*, 3 parts; *zinc*, 2 parts. These alloys are malleable whilst hot.

3. (*Red Brass.*) This name has been applied to all those alloys which do not contain more than 18% to 20% of zinc. In the deeper-coloured foreign varieties (*red tombac*) the per centage of copper occasionally amounts to 88%, 90%, or even 92%.

4. (*Yellow Brass.*) See *fine brass*, (above.)

5. (*Brass for Buttons.*)—*a.* From *copper*, 8 parts; *zinc*, 5 parts. This is the "*platin*" of the Birmingham makers.

b. From *yellow brass*, 16 parts; *zinc*, 2 parts; *tin*, 1 part. Paler than the last.

c. From *copper*, 25 parts; *zinc*, 20 parts; *lead*, 3 parts; *tin*, 2 parts. Pale; used for common buttons.

6. (*For fine castings.*)—*a.* As *fine brass*, according to the colour desired. (See *above.*)

b. From *copper*, 62 parts; *zinc*, 35 parts; *lead*, 2 parts; *tin*, 1 part.

c. From *copper*, 60 parts; *zinc*, 36 parts; *tin*, 4 parts. Both the above are rather pale and brittle.

d. From *copper*, 90 parts; *zinc*, 7 parts; *tin*, 2 parts; *lead*, 1 part. Rich deep colour.

e. From *copper*, 91 parts; *zinc*, 5 parts; *tin*, 3 parts; *lead*, 1 part; as the last.

7. (*For gilding.*)—*a.* As *fine brass*, (above.)

b. From *copper*, 64 parts; *zinc*, 32 parts; *lead*, 3 parts; *tin*, 1 part.

c. From *copper*, 82 parts; *zinc*, 18 parts; *tin*, 3 parts; *lead*, 1 part.

8. (*For solder.*)—*a.* From *fine brass*, 12 parts; *zinc*, 6 parts; *tin*, 1 part; melted together.

b. From *brass*, 2 parts; *zinc*, 1 part; as before.

c. From *brass*, 3 parts; *zinc*, 1 part. Very strong. *Used* for soldering tubes and other like purposes requiring great strength. The above alloys form the "*hard solder*" of the braziers. For certain purposes a little silver is added to them, when the compound receives the name of "*silver solder.*"

9. (*For turning.*)—*a.* From *fine brass*, 98 parts; *lead*, 2 parts; melted together.

b. From *copper*, 61 parts; *zinc*, 36 parts; *lead*, 3 parts.

c. From *copper*, 65 parts; *zinc*, 33 parts; *lead*, 2 parts.

10. (*For wire.*)—*a.* From *copper*, 72 parts; *zinc*, 28 parts; properly annealed.

b. From *copper*, 64 parts; *zinc*, 34 parts; as before.

c. To the last add of *lead*, 2 parts.

Analysis.—*a.* Digest 100 gr. of the alloy in *nitric acid.* The insoluble portion is *peroxide of tin*, every 74 gr. of which, when washed and dried, are equivalent to 58 gr. of METALLIC TIN.

b. Add to the nitric solution *sulphuric acid*, as long as a white precipitate falls. After a time, collect this on a filter, wash it with a mixture of *water* and *alcohol*, and ignite it in a porcelain crucible. Every 152 gr. of the residuum is equivalent to 104 gr. of METALLIC LEAD.

c. The liquor is filtered from the precipitate of sulphate of lead, and treated with a stream of *sulphuretted hydrogen;* the precipitate collected on a filter, washed with *water* mixed with a little *sulphuretted hydrogen*, dried, and digested in *pure nitric acid* until the separated sulphur acquires its full yellow colour; the resulting solution diluted with *water*, and reprecipitated with *potassa;* the whole being boiled until the precipitated protoxide of copper becomes deep brown or black; and the latter collected on a filter, washed, dried, ignited in a platinum crucible, and weighed therein immediately after it becomes cold, gives the weight of pure protoxide of copper, every 40 gr. of which are equivalent to 32 gr. of PURE COPPER.

d. The liquid poured from the precipitate of sulphuret of copper, boiled for a minute, precipitated with a *solution* of *carbonate of soda*, the whole boiled a few minutes, the precipitate collected, washed, dried, and ignited, consists of *oxide of zinc*,

of which every 40 gr. are equal to 32 of METALLIC ZINC.

Concluding Remarks. In the adoption of his formula, the operator must be entirely led by the object he has in view. The larger the proportion of *copper*, the deeper will be the colour, and the greater the density, and, within certain limits, the toughness of the alloy. *Zinc* lessens its specific gravity and colour. *Tin* gives it hardness and grain; whilst *lead* toughens it, and renders it fitter for turning. This is known to every experienced brass-founder. See *Alloys*, *Copper*, *Mosaic Gold*, *Prince's Metal*, *Tombac*, &c.

BRASS COLOUR. Syn. *Brass Pigment*, *Brass Bronze*. *Prep.* 1. Grind *copper filings* or the *precipitated powder of copper*, with a little *red ochre*. Red-coloured.

2. *Gold-coloured brass*, or *Dutch leaf* reduced to a very fine powder. Yellow or gold-coloured.

Obs. Both these powders are used mixed up with any pale varnish; no more being worked up at once than is wanted for immediate use. They are also applied by dusting them over any surface previously covered with varnish to make them adhere.

BRASS PASTE. *Prep.* 1. *Soft soap*, (in fine powder,) 2 *oz.*; *rotten-stone*, 4 *oz.*; beaten to a paste.

2. *Rotten-stone* made into a paste with *sweet oil*.

3. *Rotten-stone*, 4 *oz.*; *oxalic acid*, 1 *oz.*; *sweet oil*, 1½ *oz.*; *turpentine*, q. s. to make a paste.

Obs. The above are *used* to clean brass-work, when neither *varnished* nor *lacquered*. The first and last are best applied with a *little water*. The second, with a *little spirits of turpentine*, or *sweet oil*. Both require friction with soft leather. (See *below*.)

BRASS STAIN. *Prep.* 1. *Sheet brass* is cut into small pieces, and exposed to a strong heat for 2 or 3 days, then powdered and again further exposed in a like manner for several days; the whole is then reduced to powder, and exposed a third time to heat, testing it occasionally, to see if it be properly burnt. When a little of it fused with glass makes the latter swell and froth up, the process is complete. It imparts to glass a green tint, passing into turquoise.

2. *Plate-brass* and *sulphur*, equal parts, are stratified together in a crucible, and calcined, until they become friable; the whole is then reduced to powder, and exposed to heat as before. This imparts a calcedony red or yellow tinge to glass by fusion; the precise shade of colour being modified by the mode of using it.

Obs. The common practice in the glass-houses is to conduct the calcination by exposing the metal, placed on tiles, in the "leer" or "annealing arch" of the furnace, a plan both convenient and economical.

BRASS-WORK. Articles of *brass* and *copper*, when not varnished or lacquered, may be CLEANED and POLISHED with *sweet oil* and *tripoli*, *rotten-stone*, or *powdered bath-brick*, rubbed on with flannel and finished off with leather; due care being taken to ensure the absence of anything gritty, which would scratch and disfigure the surface of the metal. A strong *solution of oxalic acid* in *water* gives brass a fine colour. *Vitriol* and *spirits of salts* make brass and copper very bright, but the polish thus obtained soon tarnishes, and the articles consequently require more frequent cleaning. A strong *ley of roche-alum and water* also improves the appearance of brass. In all cases where acids or saline matter is used, the metal should be well rinsed in clean water, and then wiped dry, and finally dry polished with soft leather.

Brass inlaid work may be cleaned with *tripoli* and *linseed oil*, applied by a *rubber of felt* or *leather*; afterwards rubbing off the whole with clean soft leather. The ornaments of a French clock, are said to be best cleaned with *bread-crumb*, carefully rubbed, so as not to injure the wood-work. *Or-molu candlesticks*, *lamps*, and *branches*, may be cleaned with *soap and water*. *Lacquered* and *gilded articles* are spoiled by frequent rubbing, and by acids and alkaline leys.

A fine colour may be given to *brass ornaments*, when *not* gilt or lacquered, with a little *sal ammoniac*, in fine powder, moistened with *soft water*. The articles must be afterwards rubbed dry with *bran* and *whiting*. *Another plan* is to wash the brass-work with a *strong ley of roche alum*, (1 *oz.* to *water*, 1 pint;) and after rinsing it in *clean water* and drying it, to "finish it off" with *fine tripoli*. These processes will give to brass the brilliancy of gold.

BRASSING. Syn. *Brass Coating*. 1. *Copper plates* and *rods* may be covered with a superficial coating of brass, by exposing them in a heated state to the fumes given off by *melted zinc* at a high temperature. The coated plates and rods are rolled into thin sheets or drawn into wire. The spurious gold wire of Lyons is said to be thus made.

2. *Vessels of copper* may be coated with brass, internally, by filling them with *water strongly soured with hydrochloric acid*, adding some *amalgam of zinc* and *cream of*

tartar, and then boiling the whole for a short time. This plan may be usefully applied in certain cases to copper boilers in laboratories, and to other purposes.

BRAWN. When young, the horny parts feel moderately tender; if the rind is hard, it is old. (Mrs. Rundell.)

BRAWN (Mock). *Prep.* "Take the *head* and *belly piece of a young porker*, well saltpetred; split the head and boil it; take out the bones and cut it to pieces; then take *four ox-feet*, boiled tender, and cut them in thin pieces; lay them in the belly piece with the head cut small; roll it up tight with sheet tin, and boil it four or five hours. When it comes out set it up on one end, put a trencher on it, within the tin, press it down with a heavy weight, and let it stand all night. The next morning take it out of the tin and bind it with a fillet, put it into cold salt and water, and it will be fit for use; it will keep a long time, if fresh salt and water are put into it every four days." (New Syst. of Cookery.)

BRAZIL WOOD. Syn. *Sapan Wood, Saint Martha do., Pernambuco do.* This wood is much used in dyeing various shades of red. A decoction is made by boiling it for some hours in *hard spring water*, and is generally kept for some time, or until it undergoes a species of fermentation, as it is thus found to yield more permanent and beautiful colours, than when employed fresh.

1. (*For cotton* and *linen.*)—*a.* The goods are first boiled in a *bath of sumach*, next worked through a *weak mordant of solution of tin*, and then run through the Brazil bath, lukewarm. This gives a *bright red.*

b. The goods are "alumed," rinsed, a *mordant of solution of tin* given them, rinsed again, and then turn them through the dye-bath. This gives a *rose colour.*

2. (*For silk.*) The silk after being "*alumed*" in the same way as wool, but at a *lower temperature*, is rinsed, and passed through the *decoction-of-Brazil-wood bath*, just lukewarm.

3. (*For wool.*) Boil the wool in a *weak mordant* of *alum* and *tartar*, for 1 hour, then let it lie in the cold liquor for 2 or 3 days, frequently moving it about; lastly, boil it in a *decoction-of-Brazil-wood bath* for ½ an hour.

Obs. The shades of colour given with Brazil wood may be modified by varying the strength of the bath, the mordant, &c. The addition of a little *alum* turns it on the *purple.* A *little alkali* added to the bath, or by passing the goods, after being dyed, through *water holding a little alkali in solution*, produces what is called the false crimson. For a deeper crimson a *little logwood* is added to the *Brazil-wood bath.* 1 *lb.* of *Brazil-wood*, ½ *oz.* of *alum*, and 2 *oz.* of *tartar*, will dye 20 to 25 *lb.* of *cotton.*

BRAZILINE. Syn. *Brezeline, Sapanine.* The colouring matter of Brazil wood. It forms small orange-coloured needles, soluble in both water and alcohol; alkalies turn it violet; acids turn it yellow.

BRAZING. This term is applied to the operation of uniting the edges of pieces of copper, brass, iron, &c., by means of *hard solder.*

Proc. The edges, after being filed or scraped quite clean, are covered with a mixture of *hard solder* and *powdered borax*, made into a paste with *water.* The whole is then allowed to dry, and is afterwards exposed in a clear fire to a heat sufficient to melt the solder.

BREAD. This important article of food is made of the flour of different grains, but only those that contain gluten admit of conversion into light spongy bread. On this account wheat flour makes the best bread. When flour is made into a paste or dough with water, and this dough, previously to baking, is left for sometime in a moderately warm place, a state of fermentation comes on, owing to the sugar of the flour gradually undergoing the process of conversion into alcohol, which resembles in every respect the same change which takes place during the fermentation of wine and beer. In this process a large quantity of carbonic acid gas is liberated, and the toughness of the dough preventing its escape, the whole mass becomes puffed up and spongy, and a light porous paste is formed, the porosity of which is still further increased by the heat of the oven. The natural process of fermenting the dough just described, is, however, tedious and uncertain, whilst the dough has a tendency to run into the acetous fermentation, and to acquire a sour and disagreeable taste, by which it is rendered less nutritious and easy of digestion. This has led to the use of a *ferment*, which produces a similar condition more speedily. *Leaven* or *dough* was originally employed for this purpose, and the bread so made was hence called *leavened bread.* At the present time barm or yeast is wholly used for this purpose. All that is essential to make a loaf of bread, is to add a proper quantity of yeast to the dough, and to allow it to remain for a short time in a warm place, and as soon as it rises or becomes spongy, to subject it to the process of baking.

In preparing his dough, the modern

baker takes a part of the water needed for the batch, and having rendered it lukewarm or tepid (80° to 90°,) by the addition of *boiling water*, dissolves his salt therein, and adds the *yeast*, together with a *portion of the flour*. With these he forms a thin dough, which he sets aside in a moderately *warm place*, usually provided for the purpose, and called the "*kneading trough*," or "*tryer*," where it soon begins to ferment and swell up. This process is called "*setting the sponge*," and according to the proportion the water in it bears to the whole quantity that is to be used, it receives the name of "*whole*," "*half*," or "*quarter sponge*." Here, the sponge heaves and swells, and ultimately the surface bursts and subsides, and if not checked, swells again and again in a similar manner, and would continue to do so, until the whole of the saccharine matter was destroyed, and the dough had become sour. The baker is careful, however, to stop it before it has communicated a sourness to the mass. After the *first*, or at the *furthest*, after the *second* or *third* "*dropping of the sponge*," he adds the remaining quantity of *flour*, *water*, and *salt*, necessary to form the batch, and kneads the mass until it becomes sufficiently tough and elastic to bear the pressure of the hand without adhering to it. The dough is now left to itself for a few hours, during which the fermentation still goes on. The inflated mass is then again kneaded, cut into pieces, weighed, and shaped into loaves. In an hour or two, these unbaked loaves swell up to nearly double their former size, and are then placed in the oven and baked. During this operation they continue for a time to increase in size, in consequence of the dilation of the pent-up gas by the heat of the oven. At length, the fermentation is checked, and the dough becomes too solid to *admit* of further alteration.

Such are the *principles* and *practice* of the *art of baking*. The operations are precisely the same on both the *small* and *large scale*, and therefore need not be separately described.

Adult. The adulteration of both flour and bread is carried to a fearful extent, more especially in London. "The *bakers' flour* is very often made of the worst kinds of damaged foreign wheat, and other cereal grains are mixed with them in grinding them into flour. In this capital, no fewer than *six* distinct kinds of wheaten flour are brought into the market,—*fine flour*, *seconds*, *middlings*, *fine middlings*, *coarse middlings*, and *twenty-penny flour*. Common garden beans and peas are also frequently ground up among the London bread flour." (Accum.)

Among the principal substances which have been used to adulterate wheat flour and bread are the following:—

**Alum.	*Plaster of Paris.
*Ammonia (Carbonates).	*Potash (Carbonate and bicarbonate).
**Beans.	**Potatoes.
*Bone dust.	**Rice.
*Chalk.	**Soda (Carbonate and sesquicarbonate).
Clay.	*Starch (Potato).
Copper (Sulphate).	**Water (in excess).
Lime, (Sulphate from the soda water makers.)	Zinc (Sulphate).
*Magnesia (Carbonate).	

Of the above, those marked thus * are very frequently used, and those marked thus **, almost universally so.

According to Mr. Accum, "the smallest quantity of alum that can be employed with effect to produce a white, light, and porous bread, from the inferior kinds of flour, is from 3 to 4 oz. to a sack of flour weighing 280 *lb.*" But Dr. P. Markham states in his 'Considerations on the Ingredients used in the Adulteration of Flour and Bread,' that the ordinary bread of the London baker is made of *one sack* or 5 *bushels of flour*; 8 *oz. of alum*; 4 *lb. of salt*; ½ *gall. of yeast*; and about 3 *gall. of water*.

Alkaline substances, as the *carbonates of ammonia*, *soda*, and *potash*, are added to realise the important consideration of producing light and porous bread from spoiled, or, what is technically called, *sour flour*. The first salt becomes temporarily converted into a gaseous substance during the operation of baking, causing the dough to swell up into air bubbles, which carry before them the stiff dough, and thus renders it light and porous; the salt itself is at the same time, for the most part, volatilized during the operation of baking. *Alum* is added, not only with a like intention, but also to enable the dough to "carry" more water. There are several instances of *convictions on record*, of millers and bakers having used gypsum, chalk, and pipeclay, in the manufacture of their goods. A gentleman, lately writing from the north of England, says, that he found in one sample of flour which he recently examined, upwards of 16 *per cent. of gypsum*, and in another, 12 *per cent. of the same earth*.

A few years since it was discovered that some of the bakers in France and Belgium added *blue vitriol* to their dough to make

it take more water, in the same way as the English baker uses alum. 1 *oz.* of this *sulphate* was dissolved in a *quart of water*, and a wine-glassful of this solution added to the *water necessary to make about* 50 4 *lb. loaves.* This enormous crime was soon detected and caused the ruin of its heartless perpetrators.

Exam. The principal adulterants above referred to are fortunately easy of detection. The following are the simplest and most approved methods for this purpose :—

1. *Alum. — a.* (Robine and Parisot.) About ¼ *lb.* of the *suspected bread* (somewhat stale or dry) is reduced to crumbs, macerated for 2 or 3 hours in *cold water*, and then squeezed through a clean piece of white linen. The liquid is next evaporated to dryness at a steam heat, the residuum redissolved in a little *hot water*, and the solution filtered. *Liquor of ammonia* or a *solution of sal ammoniac*, and *a solution of chloride of barium*, added to the filtered liquid, will give a white precipitate, if alum is present.

b. (M. Kuhlman.) 4 or 5 *oz.* of bread are reduced to ashes, which are powdered and treated with *nitric acid*, the mixture evaporated to dryness, and about 1 *oz.* of *hot water* added. A little *caustic potassa* is added to the last solution, (unfiltered,) the whole boiled a few minutes, and passed through a filter. The filtrate is next tested with a solution of sal ammoniac, and the whole again boiled for 2 or 3 minutes. If a precipitate forms it is alumina; every 50 gr. of which are equivalent to 332 gr. of crystallized alum.

2. *Copper. — a.* Moisten the crum of the suspected bread with a few drops of *solution of ferrocyanide of potassium.* It will assume a pinkish-brown colour if copper is present.

b. A little of the bread may be steeped in *hot water*, and the clear liquor poured off, and tested with *ferrocyanide of potassium*, as before.

3. *Magnesia.* Bread adulterated with magnesia, digested in *hot water acidulated* with *sulphuric acid*, furnishes a liquid which gives a white precipitate when tested with a *solution* of either *carbonate of potassa* or of *soda*, especially on boiling.

4. *Soda; Potassa.* Hot water after digestion on the ashes or charcoal turns turmeric paper brown. The liquid is evaporated to dryness, redissolved in *distilled water*, *slightly* acidulated with *hydrochloric acid*, and tested with *bichloride of platinum*. If a yellow crystalline precipitate is formed, either at once or after some hours, it is *potash;* otherwise, the alkali present is *soda.*

5. *Chalk, whiting, burnt bones, plaster of Paris*, and *similar substances*, are easily detected by burning a little of the flour or bread in a clean open vessel, when the amount of ashes left will indicate the quantity of adulteration. The quantity of ashes left by genuine flour is very trifling indeed, (about 2%.)

Concluding Remarks. A number of processes are used by cooks and confectioners to make the different varieties of *fancy bread, cakes, puddings, &c.*, most of which vary according to the peculiar characteristic it is desired to communicate to them; but none of these articles properly belong to the trade of the common baker. Thus some kinds of *cakes* and *pastes* are made to eat "*short*," as it is called, or are rendered less tenacious, and a species of brittleness imparted to them by the addition of *starch* and *sugar.* In pastry a similar effect and peculiar lightness is produced by *butter* or *lard*, whilst in some articles, *white of egg, gum water, isinglass*, and other adhesive substances are added to produce an exceedingly light and porous mass.

The different varieties of bread made in England vary in their quality, chiefly according to the flour of which they are formed. *The best white bread* is made from the purest wheat flour; *ordinary wheaten bread*, of flour, to which a little of the finest bran has been added; *seconds*, from flour containing a still larger proportion of bran, and *common household bread*, from flour, produced by grinding the whole substance of the grain without *any* separation of the bran. The last variety is undoubtedly the most wholesome and nutritious, although that least frequently used. *Symnel bread, manchet* or *roll bread*, and *French bread*, are varieties, made of the purest flour, from the finest wheat, a little milk being usually added for rolls, and butter and eggs for choicer purposes. Several other minor kinds of bread are also made, varied by the addition of sundry trifles, as *sugar, currants*, and other palatable ingredients. The *Scotch* "*short bread*" is made from a *very thick dough*, to which *butter, sugar, orange peel*, and *spices* are added, according to the taste of the maker.

In the manufacture of white bread from damaged or inferior flour, a large quantity of alum is employed by the bakers, but with the best flour no alum is required. The utmost beauty, sponginess, and sweetness, may be given to bread without the addition of *one particle* of alum, provided the *best*

materials are employed. As such is not, however, generally the case, the common practice with the bakers is to introduce 4 or 5 *oz.* of alum to every sack of flour, or about 1 *oz.* to each bushel; but very frequently fully *double this quantity of alum is employed.* The method of detecting this pernicious adulteration has been already explained. The proper quantity of *salt* to be used is about 5 *lb.* to the *sack*, or 1 *lb.* to the *bushel. One sack of the best flour*, and 4 or 5 *lb.* of *salt*, yield about 360 *lb.* of *good bread;* and a *sack of seconds*, 345 to 350 *lb.* of bread, when moderately baked. If the loaves are "*well-baked*" or "*over-baked,*" the product will be from 345 to 350 *lb.* only; but if they are "*slack-baked*" or "*under-baked,*" from 370 *lb.* to 385 *lb.* of "*crumbling bread*" may be obtained from 1 sack of good white flour.

The attention of chemists has, at various times, been directed in search of some method to rectify or lessen the effects of "bad harvesting" and improper "storage" in grain, so that a damaged or inferior article might be rendered serviceable, and available for human food. Professor E. Davy recommends the addition of ¼ *oz.* of *carbonate of magnesia* to about every 3 *lb.* of sour, "melted," "heated," and similarly damaged flour. This substance materially improves the quality of the bread, "even when made from the worst new seconds flour;" whilst it is perfectly harmless, and the bread so prepared, for temporary use, is unobjectionable. What effects would arise from the daily consumption of such bread for several months has not been determined. (See *Magnesia.*) Our own experiments in bread-making, extending over a period of several years, lead us to prefer *sesquicarbonate of soda*, or *bicarbonate of soda* for the purpose. Theoretically, the corresponding salts of potassa would be preferable. A mixture of equal parts of the *bicarbonates of potassa* and *of soda*, will, perhaps, ultimately be found to be more useful than either substance used separately.

In times of scarcity and famine, various substances besides the flour of the cereals have been made into bread, or have been mixed with it, in order to lessen the quantity of the former required by the people. For this purpose, almost every amylaceous vegetable, at once plentiful and cheap, has, in its turn, been eagerly appropriated. *Acorns*, *beech-mast*, the *leguminous seeds*, numerous *starchy bulbous roots*, and similar substances, have been employed, either in the form of meal, or made into an emulsion or jelly, which has been used instead of water to form the flour of bread-corn into a dough. At such times *bran*, the most nutritious and valuable portion of the grain, although usually rejected as worthless, has been retained in the flour, and has been even added to it in excess. Birkenmayer, a brewer of Constance, during a period of scarcity, succeeded in manufacturing bread from the farinaceous residue of beer, (*brewer's grains.*) 10 *lb.* of *this substance*, rubbed to a paste, with ½ *lb.* of *yeast*, 5 *lb.* of *ordinary meal*, and a *handful of salt*, produces 14 *lb.* of black bread, "both savoury and nourishing." The nutritious qualities of brewer's grains is shown by their extensive employment at the present day as food for pigs and cattle, especially for milch cows. In like manner, *Iceland*, *Carragheen*, and *other mosses*, have been made into bread, either alone or mixed with flour or meal. They are used, in the *first* case, in the state of meal, in the same way as flour; in the *second* case, 7 *lb.* of *moss* are directed to be boiled in 10 or 12 gall. of *water*, and the resulting glutinous liquid or jelly to be employed to make 70 *lb.* of *flour* into dough, which is then fermented and baked in the usual way. It is said that flour thus produces fully double its weight of good household bread. A simpler plan is to mix 1 *lb.* of *lichen meal*, with 3 or 4 *lb.* of *flour*. The bitterness of the lichen is extracted by soaking it in cold water. Bread so prepared has of late been highly recommended for the delicate and dyspeptic. The modern baker is in the habit of mixing large quantities of *potatoes* with his bread, whenever he can purchase them at "paying" prices. Mealy potatoes are selected, and are carefully "mashed" or "pulped," and the dry flour is worked into this pulp or dough, which is then mixed with the sponge in the usual manner. For inferior bread, equal weights of *potato pulp* and *dry flour*, are often used. Bread so prepared, eats "short," and is deficient in sponginess, and in that fine yellowish-white tint which forms one of the characteristics of pure wheaten bread. Recently, *rice*, boiled with water to a jelly, has got into very extensive use among the bakers. A sponge is made with a portion of the jelly thickened with some flour, and the whole process is conducted in the ordinary manner, except that the fermentation is generally more slowly conducted and allowed to proceed for a longer period. Flour so treated yields fully 50% more bread than when merely mixed up with yeast and water. This constitutes the process of Messrs. Morian, Martin, and Journet, of Paris,

which was recently tested at Marylebone Workhouse. The experiment succeeded, but the only result to the public has been, that the common bakers have adopted the plan, and now very generally surcharge their bread with such an excess of water, that in many cases, it only possesses two thirds the amount of nourishment which it did before the publication of the system just referred to. Unfortunately, the cupidity of dishonest tradesmen, appears to be continually impelling them to avail themselves of the exertions of philanthropists and the discoveries of science, in order to increase their profits, regardless alike of the quality of their commodities and the health of their customers. Bread containing an excess of water, rapidly becomes sour and mouldy, and is apt to disorder the digestive functions of those who eat it.

From the experiments of Dr. Colquhoun, it appears, that the starch of flour is partially converted into sugar during the process of fermenting and baking the dough, and thus contributes to the sweetness of the bread. He proposes to add to the flour, *arrow-root*, the *farina of potatoes*, and similar *amylaceous substances*, made into a jelly with hot water, for this purpose. Dr. Percival has recommended the addition of *salep* with the same intention. 1 *oz.* of *salep* dissolved in 1 *quart* of *water;* 2 *lb.* of *flour;* 80 *gr.* of *salt;* and 2 *oz.* of *yeast*, gave 3 *lb.* 2 *oz.* of *good bread.* The same weight of materials, without the salep, gave only 2¾ *lb.* If too much salep is added, it gives its peculiar flavour to the bread.

In the preceding article we have not entered into particulars respecting "oven management," because, on the large scale, it is thoroughly understood by every practical baker. For the instruction of the busy housewife, we may state, that the oven should always be sufficiently heated before the bread is put into it, in order that the gas contained in the cells of the sponge may be expanded as rapidly as possible by the heat, and the resulting light mass quickly rendered sufficiently solid to prevent its subsequent collapse. The heat should also be maintained at nearly the same temperature during the whole of the time the bread is submitted to its action. In general, with ordinary kitchen ovens, properly heated, 30 minutes' baking is sufficient for *one-pound* loaves and cakes, and 15 minutes in addition for *every pound* after the *first*, for *larger ones.* Thus, a 1 *lb.* loaf requires ½ hour; a 2 *lb.* loaf ¾ hour; and a 4 *lb.* loaf 1¼ hours.

It is the common ambition of the English baker to give that peculiar tint to the crust of his bread in the process of baking which is so highly esteemed by connoisseurs, and so successfully produced by the Viennese and Parisians. It has been long known at *Vienna*, that if the hearth of an oven be cleaned with a moistened wisp of straw, the crust of bread baked therein immediately afterwards presents a beautiful yellow tint. It was thence inferred that this peculiarity depended on the vapour, which being condensed on the roof of the oven, fell back on the bread. At *Paris*, in order to secure with certainty so desirable an appearance, the hearth of the oven is generally laid so as to form an inclined plane, with a rise of about 11 inches in 3 feet, and the arched roof is built lower at the end nearest the door, as compared with the furthest extremity. When the oven is charged, the entrance is closed with a wet bundle of straw. By this arrangement the steam is driven down on the bread, and a golden-yellow crust is given to it, as if it had been previously covered with the yelk of an egg.

Pure wheaten bread is one of the most wholesome articles of food, and has been justly termed the staff of life. When well fermented and baked, it is very easy of digestion. It should never be eaten until it has stood at least 24 hours after being taken out of the oven. When newer, bread is apt to disagree with the stomach, frequently producing indigestion, biliousness, diarrhœa, dyspepsia, and other like ailments. Bread prepared from meal, containing the *whole* of the bran, is the most nutritious and digestible, and should alone be given to children and growing persons, and eaten by the dyspeptic and delicate. "*Wheaten bread*," ("*Panis*,") is included in the Materia Medica of the London Pharmacopœia. See *Alum*, *Flour*, &c.

BREAD (American). From American barrelled flour. "14 *lb.* of *American flour* will make 21½ *lb.* of bread; whereas the best sort of *English flour* produces only 18½ *lb.* of bread." (Mrs. Rundell.)

BREAD (Bee). The matter collected by the bees to form the bottom of the hive. It greatly resembles a mixture of rosin and wax; and its fumes are thought to be anti-asthmatic.

BREAD (Bran). 1. From the whole meal, without sifting out any of the bran.

2. By adding *bran*, 3 oz. to every pound of *flour*.

BREAD (Extemporaneous). See *Unfermented Bread.*

BREAD (French). *Prep.* 1. From the *finest flour*, as the best white bread. For the better kinds, and for those intended for

rolls and small fancy bread, the sponge and dough is wetted with *milk-and-water*, and, occasionally, a *very little butter* is added. "When the rolls or small fancy loaves have lain in a quick oven about a quarter of an hour, turn them on the other side for about a quarter of an hour longer. Then take them out and chip them with a knife, which will make them look spongy, and of a fine yellow; whereas rasping takes off this fine colour, and renders their look less inviting."

2. (*French Soup-bread.*) From *fine flour*, but employing fully double the usual quantity of salt. It is baked in thin loaves, so as to be nearly all crust, by which means it becomes more soluble in hot soup.

BREAD (Hick's Patent). This is ordinary bread baked in an oven so arranged that the vapours arising during the process are condensed in a suitable receiver. The condensed liquor is a crude, weak spirit, produced during the fermentation of the dough, and possesses little commercial value; indeed, insufficient to pay for the expenses attending its collection. Besides which the bread so prepared was rejected by the vulgar, who flocked to the shops of the neighbouring bakers, who professed to sell their bread with "the gin in it."

BREAD (Household). This name is commonly given to bread made with flour from which only the coarser portion of the bran has been removed; and to bread prepared from a mixture of flour and potatoes. The following are examples:—

1. (Rev. Mr. Haggett.) Remove the *flake bran* from *flour*, 14 *lb.*, and boil it in 1 gall. of *water*, until it is reduced to 7 pints; strain, cool, and knead in the flour, adding *salt* and *yeast* as for other bread.

2. *Flour*, 7 *lb.*; *mealy potatoes*, (well-mashed,) 3 *lb.*; as before.

BREAD (Leavened). Using *leaven* instead of yeast, and in the same way. About 1 *lb.* to each bushel of flour is sufficient; it is set for sponge in the usual manner. The more leaven used the lighter the bread made with it will be; and the fresher and sweeter the leaven, the less sour will it taste. The use of leaven is now superseded by that of yeast.

BREAD (London White). The common proportions are:—*Flour*, 1 sack; *common salt*, 4½ *lb.*; *alum*, 5 *oz.*; *yeast*, 4 pints; *warm water*, for the sponge, (about) 3 gall. The process has been already noticed.

BREAD (Paris White). The following is handed to us as the plan adopted by the Paris bakers for their best white bread:—On 80 *lb.* of the *dough*, before the yeast was added, (from yesterday's baking,) as much *lukewarm water* is poured as will make 320 *lb.* of *flour* into a *thin* dough; as soon as this has risen, 80 *lb.* are taken out and reserved in a warm place as leaven for the next baking, and 1 *lb.* of *dry yeast*, dissolved in *warm water*, is to be added to the remaining portion, the whole lightly kneaded, and as soon as it has sufficiently risen, made into loaves, and shortly afterwards baked; the loaves being placed in the oven without touching each other, that they may become crusty all round.

BREAD (Unfermented). Syn. *Extemporaneous Bread.* *Prep.* 1. From *Jones' Patent Flour.* Both wholesome and excellent; equal to French bread, when skilfully made and baked.

2. From *Sewell's Patent Four.* Slightly inferior to the last.

3. To every pound of *flour*, add, separately, 1¼ dr. of *bicarbonate of soda*, and 1 dr. of *tartaric acid*, (all perfectly dry, and in very fine powder.) Rub them well together with the hands until *perfectly* incorporated; then form the whole into a dough with *water*, q. s., as quickly as possible, and at once bake in a quick oven. About 8 *oz.* of water are required for every *lb.* of flour. Answers well when expertly managed.

4. *Flour*, 1 *lb.*; *bicarbonate of soda*, 1 dr.; mix; make a dough with *water*, q. s., to which has been added *hydrochloric acid*, (commercial,) 1 dr.; and proceed as before.

5. (*Whiting's Patent.*) This closely resembles the last. The proportions are:—*Flour*, 7 *lb.*; *carbonate of soda*, and *hydrochloric acid*, of each, 1 *oz.*; *water*, 2¾ pints. This method was suggested by Dr. Henry, in 1797, and was patented by Dr. Whiting in 1836. If the proportions are not observed, or the mixture not perfect, the quality of the bread suffers. The union of the acid and soda forms common salt.

6. (*Ammoniacal Bread.*) *Sesquicarbonate of ammonia*, 1 *oz.*; *cold water*, q. s.; dissolve, add *flour*, 7 *lb.*; and make a dough, which must be formed into loaves and baked immediately, as before. For this process to answer, the sesquicarbonate should be recent and free from bicarbonate; the presence of which is known by its being white and powdery, and of inferior pungency. If any of the last salt is present, the bread will have a yellowish colour, and a slightly alkaline or urinous flavour. It answers best for small loaves, cakes, and fancy bread. By employing *pure carbonate of ammonia* instead of the *commercial sesquicarbonate*, the process succeeds admirably, and the resulting bread is most wholesome. A late writer recommends the use of bicarbonate

of ammonia, but evidently does so in ignorance, as in practice it is inapplicable, as we have verified by actual experiment, over and over again. (See pages 57 and 58.)

7. It has been proposed to form the dough with water charged with *carbonic acid*, (soda water.) "If water highly impregnated with carbonic acid gas be used for kneading the dough, the resulting bread will be somewhat spongy." (Ure.) We have repeatedly endeavoured to make bread in this way, but never could succeed. The quantity of gas in the water is too trifling for the purpose, and the greater part of it escapes in the process of making the dough, even though all the materials be well cooled, and the operation conducted in a cold place.

Obs. Unfermented bread has been recommended as being more wholesome and generally better adapted to bilious and dyspeptic patients than fermented bread. As the sugar in the flour is undecomposed by having undergone fermentation, it is necessarily sweeter, and hence, more nutritious, than common bread; at the same time, however, it must be confessed that the unfermented bread commonly met with has a slightly "raw-grain" taste, which is very disagreeable to some persons. The process of fermentation doubtless modifies the condition of the starch and gluten of the dough, and renders them easier of digestion. This species of bread is sadly adulterated with a variety of indescribable messes. See *Flour*, *Gingerbread*, &c.

BREAKFAST. The morning meal or breakfast, the "early bit" of the Germans, is, perhaps, the most important of the day. According to Erasmus Wilson, it is usually "taken at *eight* or *nine*." The proper period for that purpose must, however, depend upon the time at which the party rises. About an hour after leaving the bed will be found the most appropriate for the morning meal. By that time the powers of the system have fully recovered from the inactivity of sleep, and the functions of the stomach and other viscera have again come into full play. The appetite is excited and seeks appeasing, and both instinct and reason direct us to the social board. If abstinence is now prolonged, the physical and mental energies, unsupported by the supply of food which indirectly gives them birth, gradually lessen, and incipient exhaustion ensues. The fluids of the stomach and smaller tissues begin to act upon the coats of those viscera, instead of on the food, and an unpleasant feeling of hunger, or a loss of appetite, comes on as a natural consequence. When breakfast cannot be taken within a reasonable period after rising, the gap should be filled up by chewing a crust, a biscuit, or the like. A raw egg or two, "sucked" from the shell, or broken into a tea-cup and drank, will be found most valuable for this purpose. Raw milk, cheese, salted food, and other indigestible matter, should be particularly avoided at this early period of the day.

The *articles of food to be chosen for the breakfast table*, must depend entirely on the state of the health, the occupations, &c., of those assembled round it. Coffee appears to be, by common consent, the *favorite beverage*. For the delicate, the bilious, and the young, it should not be taken strong, and should be well softened-down with milk and dulcified with sugar. Tea is more apt to affect the nerves and stomach than pure "*un*chicoried" coffee. Green tea taken thus early in the day, acts as an absolute poison. We have seen severe fits of vomiting and exhaustion follow its use. The *solid food* for breakfast should be easy of digestion and nutritious. Females, children, and persons leading a sedentary life, should confine themselves to a sufficient quantity of good *meal-bread-and-butter*, to which an egg or a small rasher of mild bacon may be advantageously added. Parties engaged in active occupations, may extend their exploits somewhat farther, and add to this bill of fare a little ham or cold meat. When an undue time will elapse before the luncheon or dinner, and particularly during the colder season of the year, the broiled leg of a fowl, an underdressed mutton chop, or a little tender beefsteak, will be found, by the parties last referred to, most useful; nay, in most cases, invaluable. But excess must be particularly avoided. The object is to take enough food to maintain the system in full energy and vigour, and particularly to avoid offending the stomach by overloading it; a misfortune easily effected at the breakfast table. Old commercial travellers, (men wise in the mysteries of life and its enjoyments,) are scrupulously careful to make a *good*, but not a *heavy breakfast* before commencing the arduous duties of the day.

BREAKFAST POWDER. Syn. *Rye Coffee*, *Dillenius's do.*, *Hunt's Economical Breakfast Powder*. From *rye*, roasted along with a *little fat*. It was once sold at 2*s.* 6*d.* the *lb.*, and was formerly extensively used as a substitute for foreign coffee, of which it is one of the cheapest and best. Since the reduction of duty on coffee, it has nearly fallen into disuse.

BREATH (Fetid). Scarcely anything is more disagreeable or disgusting than a stinking breath. Various means have been proposed to remove this annoyance, depending principally on the administration of *aromatics*, which by their odour smother it for a time; but these require continual repetition, and are liable to interfere with the functions of digestion. The real cause of stinking breath may generally be traced to either a diseased stomach or decayed teeth. When the *former* is the case, aperients should be administered; and if these do not succeed, an emetic may be given, followed by an occasional dose of *salts*, *castor oil*, or some other *aperient*. When *rotten teeth* are the cause, they should be removed; or, if this is impossible, they should be kept scrupulously clean. Dirty teeth also often cause the breath to smell. The use of the tooth-brush should be a daily habit. Occasionally rinsing out the mouth with a little clean water, to which a few drops of a solution of chloride of lime, or of chloride of soda, has been added, is an effective method. As a tooth-powder, *fresh-burnt charcoal* is the best. The following lozenges have been strongly recommended to sweeten and purify the breath:—

Gum catechu, 2 *oz.*; *white sugar*, 4 *oz.*; *orris powder*, 1 *oz.*; make them into a paste with *mucilage*, and add a drop or two of *neroli*. One or two may be sucked at pleasure. See *Catechou Aromatisé*, &c.

BREWING. The art of making beer.

The *only ingredients* allowed by law to enter into the composition of beer, are *malt*, *hops*, and *water*, together with a *little yeast*.

The *apparatus* and *utensils* required in brewing beer are—

1. A *copper* or *boiler* capable of holding fully two thirds of the quantity proposed to be brewed; with a *gauge-stick* to determine the number of gallons of fluid at any given depth therein; and a *wooden cover* to place over it before the boiling commences, or when not in use. A copper capable of holding about 150 gallons is a convenient size for brewing a quarter of malt, and is commonly known as a *one-quarter copper*.

2. A *mash-tub* or *tun*, capable of containing rather more than the copper.

3. *One* or *more tuns* or *vessels*, to ferment the beer in.

4. *Three* or *four shallow coolers* to reduce the wort as rapidly as possible to a proper temperature for fermenting.

5. *One* or *two copper* or *wooden bowls*, for bailing, &c.

6. A *thermometer* with a scale reaching from 0° to above the boiling point of water, (say from 0° to 220° Fahr.)

7. A *saccharometer* for taking the density of worts and beer.

8. A *suitable number of casks* (clean) to contain the beer.

9. *One* or *more large funnels* or *tunners*.

10. *Two* or *more clean pails*.

11. A *hand-pump* of a size proportionate to the brewing.

12. A *mill* for *crushing* the malt.

These articles will vary in value from £10, upwards, to many hundreds, or even thousands, according to the extent of the brewing; but the whole of them, necessary for a private family, may be bought for less than the former amount, as the mill, pump, &c., may then be dispensed with, and the rest may be of the simplest and least expensive character possible. By proper care brewing utensils will last for 30 or 40 years, and still continue in a useful state.

Preliminary proceedings:—

The malt is *chosen*, according to the intended character of the brewing,—pale, amber, high-dried, or any mixture of them as the occasion may require. It is *bruised* or *crushed* in a mill, (*malt mill*,) before brewing, that it may be the more readily acted on by the water. It should not be ground too small, as it would then make the wort thick; the crushed malt may advantageously lay for a few days in a cool situation, by which it will attract a considerable quantity of moisture from the air, and be the more easily exhausted by the water used in mashing. *Pale malt* may be used coarser than amber or brown malt. A bushel of malt should make a bushel and a quarter when ground, and a quarter should yield between 9½ and 10 bushels, the quantity slightly varying according to the degree of bruising it has undergone. On the large scale, malt is ground in crushing mills, furnished with iron rollers; and on a smaller scale, by wooden rollers or small mills worked by hand. For private brewing, the malt is generally bought ready ground, for convenience sake.

The *hops*, after being taken from the "pockets" or "bag," are crumbled with the hands ready to be thrown into the copper. For general purposes, those grown in Kent, and of the present season, are preferred. For the finer sorts of ale, East Kent hops are commonly used; and when it is intended to keep the liquor for a long time, those known by the names of *Country's*, *Alton's*, or *Farnham Hops*, are employed. The quantity of hops required

by a given measure of malt varies from 2 *lb.* to 16 *lb.* per quarter, according to the nature of the brewing. The following are the usual proportions :—

	HOPS.	MALT.
Strong beer (for keeping)	8 *lb.*	1qr., or 8 bls.
Strong ale (aromatic) .	8 „	1 „
Strong ale, beer, or porter, (ordinary) . . .	5 „	1 „
Brown stout . . .	4½	1 „
Mild ale	4 „	1 „
Mild porter, (draught)	3¼	1 „
Table ale	1½	1 „
Scotch ale, (best) . .	4½	1 „
Bitter ale . .	10 to 16 „	1 „

The *water* which should be *soft* and *clear*, must be provided in abundance. Of late years, hard water has been chosen by many brewers, on the ground that beer brewed with it is "*self-fining*," requiring no artificial clarification, either in the vat or cask. The water at Burton-on-Trent, a place celebrated for its ales, is of this class.

The *yeast* must be *sweet* and *good*, and all the vessels and utensils both *sweet* and *clean*. If this last be neglected, the most skilful brewing in the world will prove a failure.

Process of Brewing :—

1. (*Mashing.*) The *ground* or *bruised malt*, placed in the "*mash-tun*," is macerated for some time in *hot water*, and the infusion or "*wort*" drawn off from a hole in the bottom, over which a bunch of straw, or a strainer, or false bottom, is placed, to prevent the malt passing out along with the liquor. During the process of mashing, a peculiar principle contained in the malt, called by chemists *diastase*, reacts upon the starch with which it is associated, and converts it first into a species of gum, ("*dextrine*,") and ultimately into a species of grape sugar. The more perfectly this is effected, the richer will be the resulting wort in sugar or "*saccharine*," and the stronger and more alcoholic the beer produced by its fermentation. It is therefore a desideratum with the brewer to mash at the temperature which most fully promotes this important object. The best temperature for this purpose ranges between 157° and 160° Fahr. When more than one mash is made, the *first* should be something lower than the first-named temperature; the *second*, may be from 160° to 162°; and the *third*, about 165° or 170° Fahr. The common brewers, however, generally mash at higher temperatures than those just given.

The action of the *first mash* is merely to *extract* the *sugar* contained ready formed in the malt; that of the *second*, to convert the *starch* into *sugar* by the *action of the diastase;* and that of the *third* to fully complete the last-named object, as well as to carry away the remaining portion of extract left from the second mash.

In practice, as soon as the water in the copper acquires the temperature of 145°, (in summer; 167° in winter,) 45 gall. are run into the mash-tun, and 1 quarter of *crushed malt* gradually thrown. The whole is now thoroughly mixed by laborious working, and the agitation ("mashing") continued for 30 or 40 minutes, when 36 gallons of water from the boiler, at a temperature of 200°, are added, and the whole again well agitated as before. The mash-tun is now closely covered up, and allowed to stand for an hour, an hour and a half, or even longer. At the end of this time the tap is set, and the wort is "run" into the "underback." It generally amounts to about 50 gallons. The *second mash* is then made with about 60 gall. of *water*, at 200° Fahr., and the whole process repeated as before. After an hour the liquor is drawn off, and the malt drained ready for the *third mash.* This time only 35 gall. of *water* are added at 200° Fahr., and the whole is seldom allowed to "stand" longer than half an hour. It is then "run off," and the malt allowed to drain as dry as possible.

In some cases, the worts of the *first* and *second* mashes, only, are used for *strong beer;* that of the *third mashing* being kept for *table beer*, or as water to mash a fresh quantity of malt.

In operating as above, the *mean* temperature of the *first mash* is 145°, of the *second mash*, 170°, and of the *third mash*, 178° to 180° Fahr. To obtain these temperatures in winter, the water must be used 7° or 8° degrees higher than in summer, (as noticed above,) to compensate for the greater loss of heat by exposure to a cold atmosphere. Pale malt and mixtures of malt and raw grain, should be mashed for a longer time, and at a rather lower temperature than brown or high-dried malt.

It is found that about 32 gall. of the water employed in mashing remain in the grains after the wort is drawn off, for every quarter of malt.

2. (*Boiling.*) The wort is next transferred to the copper, and heated to the boiling point as soon as possible. In large breweries where several coppers are employed, the first mash is no sooner run into the underback, than it is transferred to the wort copper, and immediately boiled,

and the successive mashings added as soon as drawn off; but in private houses where there is only one copper, the boiling cannot be commenced until the water for the last mashing is removed. In some cases the worts are boiled and brewed separately, so as to produce 2 or 3 qualities of beer, as *strong ale* or *stout*, *beer*, and *table beer*, from the same batch of malt.

As soon as the boiling of the wort commences, the *hops* are added, and the boiling continued for 2 or 3 hours, or even longer. In England, 2½ hours good boiling is generally deemed sufficient for the purpose. For "mild beers" the worts are seldom boiled so long; for "strong keeping ales," sometimes a little longer. The "boiling" is known to be completed when the liquor "clears" and albuminous flocks sink to the bottom of the copper.

The hops, strained from each preceding wort, are returned into the copper with the succeeding one.

The quantity of wort lost by evaporation during "the boil," varies from the $\frac{1}{10}$th to the $\frac{1}{6}$th, according to circumstances.

3. (*Cooling.*) The wort is "run off" from the copper into the "*hopback*," through a strainer which keeps back the hops. It is then "pumped" into large square shallow vessels called "*coolers*," where it is freely exposed to a current of air to reduce its temperature as *quickly as possible*, in order to avoid acidity or "souring." In 6 or 7 hours the temperature should fall to about 60° Fahr. In warm weather, the depth of the liquor in the coolers should not exceed 3 or 4 inches; and in cold weather, not more than 5 or 6 inches. As soon as the temperature has fallen to about 60°, the liquor is "tunned" and "yeasted."

The loss by evaporation and condensation in the coolers, varies from 13 to 18 gall. per quarter.

4. (*Fermentation.*) The cooled wort is next run into the fermenting tuns or vessels, ("*gyle-tuns.*") In small brewings these may be casks, with one of their heads removed; but under any form they must not be more than $\frac{2}{3}$ds filled. The yeast, previously mixed with a little wort, and kept until the whole has begun to ferment, (technically termed "*lobb,*") is now added, and after agitation, the vessel is covered up, until the fermentation is well established. During this process the temperature rises from 9° to 15°.

The quantity of yeast employed, and the temperature of the wort when it is added, differs in different breweries and for different kinds of beer. From ½ to 1% of yeast, preferably taken from a previous brewing of the same kind of beer, is the quantity usually employed. The Scotch brewers generally take only 1 gall. of yeast to fully 4 hogsheads of wort. In England, the temperature at which the yeast is added, varies from 55° to 65° Fahr. In Scotland, the common temperature is 51° to 52°. In cold weather, the heat may be 5° or 6° higher than in mild and warm weather, and a little more yeast may be added. In cold weather, *ale* is commonly *tunned* at 60°, *porter* at 64°, and *weaker beers* at 65° or 70° Fahr. In warm weather, *strong beer* should be 4° or 5°, and other *beers* 7° or 8° cooler than the "heats" just mentioned. On the *small scale*, a pint or 1¼ pint of yeast may be used to every barrel of *strong beer wort*, and ¾ pint to every barrel of *mild beer wort*.

The commencement of the fermentation is indicated by a line of small bubbles forming round the sides of the tun, and in a short time extending over the whole surface. A "crusty head" soon forms, and then a "fine rocky one," followed by a "light frothy head." At length the "head" assumes a yeasty appearance, the colour becomes yellowish-brown, and a vinous odour is developed. As soon as this last head begins to fall, the tun is skimmed continually every 2 or 3 hours until no more yeast is formed. The beer is then put into casks, or "*cleansed.*" A minute attention to every stage of this process is necessary to secure a fine flavour and a brilliant beverage.

It may be regarded as a rule, that the *lower the temperature*, and the *slower, more regular*, and *less interrupted* the *process of fermentation*, the better will be the quality of the brewing, and the less likely to change by age. A little more yeast is required in winter than in summer. When the fermentation becomes slack in the "*gyle-tun*," a little more "lobb" is generally added, and the whole is well roused up. On the contrary, if the temperature rises considerably, or the fermentation becomes too brisk, the wort is cooled a little and skimmed, or at once "cleansed."

5. (*Cleansing.*) This consists in "running" the beer from the *gyle-tun* into casks or other vessels, set sloping, so that the yeast, as it forms, may work off the one side of the top, and fall into a vessel placed below to receive it. In small brewings, the beer is often at once transferred from the gyle-tun to the store casks, which are sloped a little until the fermentation is

over, when they are skimmed, filled, and bunged.

The process of cleansing is generally commenced as soon as the saccharine in the fermenting wort falls to about 10 *lb.* per barrel, a degree of attenuation which it usually reaches in about 48 hours. Some brewers add a little *wheat flour* or *bean flour*, (about ¼ *lb.* per barrel,) to the beer in the gyle-tun, shortly before cleansing, to quicken the discharge of yeast; but it is not clearly ascertained whether such a plan is advantageous or the contrary.

6. (*Storing.*) As soon as the fermentation is concluded, which generally takes from 6 to 8 days, or more, the clear liquor is pumped into the store casks or vats, which are then closely bunged, and deposited in a cool cellar to mature.

7. (*Ripening.*) After a period, varying from one to twelve months, or longer, according to the nature of the brewing, the liquor will have become fine, and sufficiently mature for use. During this period the casks, &c., should be occasionally examined to see that there is no leakage, and to open the vent holes, should any oozings appear at the joints. As equable a temperature as possible should be maintained in the cellar, by ventilation on the one hand, and the employment of artificial heat on the other.

8. (*Fining.*) Beer which has been badly brewed or "stored," or which from other causes may be thick or muddy, requires "fining" or "clarifying." For a barrel, about 1 pint or 1½ pint of "*brewer's finings*" (isinglass dissolved in sour beer,) is put into a bucket, and some of the beer gradually added, the whole being violently agitated with a whisk, until a frothy head is formed. The mixture is then thrown into the casks of beer, and the whole well "rummaged up," by means of a large stick shoved in at the bunghole, after which the bung is replaced, and the liquor is allowed to repose for a few days.

Sometimes the above method is found to fail with weak and "bad-conditioned" beer. When this turns out to be the case, the addition of a spoonful of *sulphuric acid*, or of *gum catechu*, dissolved in ½ a pint of *warm water*, followed by agitation, for a quarter of an hour, will generally cause the "finings" to clarify the liquor. 1 or 2 *oz.* of *tincture of catechu*, mixed with a *little water*, may be used in the same way. These additions act chemically on gelatine "finings," in the same way that *good* beer does, precipitating them along with the foul matter, and thus brightening the liquor. A *handful of hops*, previously boiled for five minutes in a little of the beer, and then added to the barrel, and the whole allowed to stand for a few days, before proceeding to clarify it, will generally have a similar effect.

Concluding Remarks. The preceding is a concise account of the system of brewing at present practised in this country. On the *large scale*, extensive and costly apparatus and machinery are employed for the purpose. On the *small scale*, various modifications, of a minor character, of the several processes herein detailed, are frequently adopted, according to the circumstances or ingenuity of the operator. The principles and practice of brewing beer are, however, essentially the same, under all the conditions here referred to. In *Scotland*, only *one mash* is made, and that at a temperature of about 180° Fahr, with *one third* of the quantity of the water required for the brewing. The mash-tun is then covered up for about half an hour, when the wort is drawn off, and a quantity of water, at the same temperature as before, sprinkled uniformly over its surface. This is performed by throwing the water into a vessel with a bottom full of holes, somewhat resembling a shower-bath, whence it descends and gets equally distributed over every portion of the malt. After an interval of about twenty minutes this wort is drawn off from several small cocks or holes, placed round the circumference of the bottom, by which means the hot water is made to percolate equally through every particle of the mass. This operation, ("*sparging*,") is repeated several times, until the density of the mixed worts becomes adapted to the quality of the ale required. Usually eight or ten "spargings" are employed; the latter ones being at about 5° or 10° cooler than the first. When a very strong wort is required, the latter "sparges" are kept separately for table beer, or as water for mashing a fresh quantity of malt. The gyle-tun is set at 50° to 52°; the fermentation being continued slowly for fifteen to twenty days; and the ale is not "cleansed" before the degree of attenuation falls to about ½ *lb.* a day, and not more than ¼th of the original gravity of the wort remains. *Scotch ale* is justly celebrated for its superior quality. Its usual gravity is 35 *lb.* to 40 *lb.* per barrel.

In *Bavaria*, a country remarkable for the excellence of its beer, the wort is made to ferment at a low temperature, until all the substances which favour acetification have been rendered insoluble, and have separated from the liquor. The fermentation is conducted

in *wide, open, shallow vessels*, which afford *free* and *unlimited access to atmospheric oxygen*, and this in a situation where the *temperature does not exceed* 46° to 50° Fahr. A separation of the nitrogeneous constituents, or *exciters of acidification*, takes place simultaneously on the surface, and within the whole body of the liquid. The clearing of the fluid is the sign by which it is known that these matters have separated. The fermentation usually occupies three or four weeks, and is conducted during the cooler portions of the year only, and in a situation removed as much as possible from the influence of atmospherical changes of temperature. The sedimentary yeast, (*unterhefe*,) and not the surface yeast, (*oberhefe*,) of the Bavarian fermenting backs is employed.

"The beers of England and France, and the most part of those of Germany, become gradually sour by contact with air. This defect does not belong to the *beers of Bavaria*, which may be preserved at pleasure in *half-full* casks, as well as full ones, without alteration in the air. This precious quality must be ascribed to the peculiar process employed for fermenting the wort, called in German, '*untergährung*,' or fermentation from below; which has solved one of the finest theoretical problems." (Liebig.)

"In the ordinary fermentation of grape-juice and worts, these liquids do not furnish a quantity of alcohol equivalent to the sugar which they contain, because a certain portion of the sugar serves for the oxidation of the gluten, and is not transformed like the rest. But wherever the liquor has arrived at the second period, the product in alcohol ought to be equivalent to the quantity of sugar present, as happens in all fermentations (sedimentary) which are not accompanied with a formation, but a disappearance of the yeast." "Worts furnish in the Bavarian breweries, 10% to 20% more alcohol than they do by the ordinary process of fermentation." (Ure.)

East India Ale or *Pale Ale*, for exportation, is brewed from worts of not less sp. gr. than 1·054, in order to obtain the drawback of 5s. per barrel, allowed by the Board of Inland Revenue on ales of that strength. For the best varieties, 15 to 16 *lb.* of the *finest East Kent hops* are used to every quarter of *pale malt*. The *pale ale* or *bitter beer* of the publicans is commonly a weak liquor highly bittered with the hop, and too often with *quassia*, *wormwood*, *picric acid*, and other still more objectionable substances. The process now adopted by the great brewers of pale ale at Burton-on-Trent, combines all the most admirable points of both the Bavarian and Scotch systems of brewing.

Devonshire White Ale is prepared by boiling together 12 gallons of *pale ale-wort*, 1 handful of *hops*, and 4 or 5 *lb.* of *grouts*; and fermenting with about a quart of *yeast*. It is drunk whilst in a state of lively fermentation.

Berlin White or *Pale Beer* is brewed from *wheat malt*, mixed with about ⅛th part of *barley malt*, boiled, with *hops*, ½ *lb.* to the bushel, and slightly fermented with "top yeast," at a rather high temperature.

The desire of evading the duty on malt, led to the discovery of its being only necessary to malt ⅓rd or less of the grain, this portion being sufficient to convert the starch of the other part into sugar, in the process of mashing. This plan answers well when the wort is merely intended for the production of "*grain spirit*," but beer so made is insipid and inferior in quality to that brewed wholly of malt. Inferior kinds of beer have also been made from other ingredients than barley malt, among which may be named the grain of the *cheaper cereals*, *bran*, *potatoes*, *turnips*, *beet root*, *carrots*, *parsnips*, *pea-shells*, and other vegetable substances abounding in starch and sugar, all of which will produce beer by being mashed with water in the common way, with about 9 or 10% of barley malt. *Brown sugar* and *treacle* have been long used in this manner.

One quarter of the best barley malt yields by skilful mashing, fully 84*lb.* of "saccharine," or soluble sweet extractive matter. This concentrated within the compass of one barrel, (36 gall.,) gives a sp. gr. of 1·234. In the process of mashing, about ⅔ths of this quantity of saccharine, (or 48*lb.*,) is generally carried off in the *first wort*; ⅔ths, (or 24 *lb.*,) in the *second wort*; and ⅓th, (or 12 *lb.*,) in the *third wort*: the strengths of the worts being to each other as 4, 2, and 1. According to certain interested parties, 107 *lb.* to 112 *lb.* of saccharine per quarter, may be obtained by *Draper's process*; but the assertion appears unsupported by evidence and experience. The average gravity obtained by the common brewers from malt of current quality, ranges from 80 to 81 *lb.* When the process of mashing has been properly conducted, the wort after leaving the cooler, should not be turned *blue* by *tincture of iodine*, or by *iodide of potassium* added along with a little acid. If it turns blue, some of the starch has escaped conversion into sugar, and is dissolved in the liquor.

By *multiplying* the *decimal part of the*

number representing the specific gravity of a wort by 360, (the weight in pounds of a barrel of pure water,) we obtain the QUANTITY OF SACCHARINE, per barrel, corresponding to the given sp. gr.; and by *dividing* the *joint weight of saccharine and water, per barrel,* by 360, we obtain the SPECIFIC GRAVITY. Thus—

Decimal of sp. gr. $\cdot 058 \times 360 = 21$ *lb. per barrel,* (nearly;)

$$\frac{\text{lb. per bar. } 20+360}{360} = 1{\cdot}055 \text{ specific gravity.}$$

It is usually stated in works on brewing, that certain temperatures must be reached by each variety of beer, during the progress of the fermentation, in order for the liquor to acquire its characteristic flavour. Thus, it is stated, that—*mild beer* begins to acquire flavour when the heat of fermentation arrives at 75° Fahr.; increases at 80°, and is highest at 90°, but sometimes even reaches 100°. *Old ale* is said to obtain its best flavour at a temperature not exceeding 75°; and porter at 70° Fahr. In order to reach these temperatures, the worts are directed to be set at from 10° to 15° lower, the rise being due to the heat generated during the fermentation. That these statements refer principally to the old methods of brewing is shown by the fact, that the brewers of Bavaria, Scotland, and Burton-on-Trent, produce their rich and high-flavoured liquors at temperatures vastly below those above enumerated.

The best times for brewing are the spring and autumn, as at those periods of the year the temperature of the air is such as to permit the easy cooling of worts sufficiently low, without having recourse to artificial refrigeration or the use of machinery for that purpose. Old ale cannot be conveniently brewed in summer.

Beers are *classed* by the brewers into—

Small beers,—made from worts not exceeding the sp. gr. 1·025, or 18 *lb.* per barrel.

Middlings,—made from worts of the sp. gr. 1·025 to 1·040, and averaging about 25 *lb.* per barrel.

Strong beers, — made from worts of the sp. gr. 1·040 to 1·080, extending from about 35 *lb.* per barrel upwards.

The densities of the worts employed for different kinds of beer vary considerably, as will be seen by the following table:—

TABLE *of the densities of Beers.*

Description.	Pounds per Barrel.	Specific Gravity.
Burton Ale, Class 1	40 to 43	1·111 to 1·120
Do. Class 2	35 to 40	1·097 to 1·111
Do. Class 3	28 to 33	1·077 to 1·092
Ordinary Ale . .	25 to 27	1·070 to 1·073
Common Ale . .	21	1·058
Scotch Ale, Class 1	40 to 44	1·111 to 1·122
Do. Class 2	33 to 40	1·092 to 1·111
Porter (ordinary) .	18	1·050
Do. (good) . .	18 to 21	1·050 to 1·058
Do. (double) .	20 to 22	1·055 to 1·060
Brown Stout . .	23	1·064
Do. (best)	26	1·072
Table Beer . .	12 to 14	1·033 to 1·039
Small Beer (com.)	6	1·014

For further information connected with the above subject, the reader is referred to the separate articles,—*Ale*, *Beer*, *Dextrine*, *Diastase*, *Fermentation*, *Malt Liquors*, *Porter*, *Saccharometer*, *Specific Gravity*, *&c.*

BREWING UTENSILS. The cleansing and preservation of brewing utensils, beer casks, &c., has frequently engaged the attention of practical men and brewer's chemists. To preserve them "sweet" they should always be thoroughly cleaned before setting them aside. Contact with soap or any greasy material should be avoided. A *scrubbing brush* and *scalding-hot water* are generally sufficient to clean them. Great care should be taken to remove every particle of yeast or "fur" on the sides and bottom; and after being well-drained, they should be stowed away in some clean and cold situation, properly exposed to the fresh air. Should they become tainted or mouldy, a *strong lye of pearlash*, *common salt*, or *quicklime*, may be spread over them scalding hot, with a broom or scrubbing brush. Washing them with *oil of vitriol* diluted with about 7 *or* 8 *times its weight of water*, is another excellent method. *Fresh-burnt charcoal* has also been employed for the same purpose. In each case the vessels must be subsequently thoroughly washed out with clean water, as before. *Steam* has been successfully applied to clean casks in several breweries.

Mr. Cobbett remarks,—"I am now in a farm-house where the *same* brewing utensils have been used for *forty years;* and the owner tells me, that they may last for *forty years longer.*"

BRICKS. Brickmaking scarcely comes within the province of this work. In connection with *hygiene*, however, we may call the reader's attention to the superior advantages of both *hollow* and *waterproof bricks;* the *first*, for ventilation and lightness; the *last*, for preserving the dryness and integrity of our homes under all the vicissitudes of climate, season, and weather, either on damp soils or dry ones. Workman's "*Patent Waterproof Bricks*" received a strong commendatory notice from the Commissioners of the Great Exhibition of 1851.

BRINE (for meat). *Prep.* 1. A nearly saturated solution of *common salt*, 1 *lb.*, and *saltpetre*, 1 *oz.*, in *soft water*.

2. To the last add of *sugar* or *treacle*, ½ *lb.* Bay salt is recommended when the meat is to be kept for a very long period. See *Pickling*, *&c.*

BRINE (Red Cabbage). From *red cabbage leaves* steeped in a *strong solution of common salt*. *Used* as a test for acids and alkalies.

BRINE (Violet). As the last, using the *petals of the blue violet*.

BRIOCHE PASTE. From *eggs* and *flour*, fermented with *yeast*, to which a *little salt*, a *large quantity of sugar*, and about half as much *butter* as the weight of the flour used, are afterwards added, and well worked in. *Used* as an addition to soup, casing for lobsters, patties, eggs, &c.

BRISKNESS. The natural briskness of fermented liquors depends on the evolution of carbonic acid gas within the body of the fluid, by the process of fermentation. See *Malt Liquors*, *Porter*, *Wines*, *&c.*

BRISTLES. These articles are commonly *stiffened* by immersion for a short time in alum water; and are *dyed* by steeping them for a short time in any of the common dyes used for cotton or wool.

BRITANNIA METAL. Syn. *Tutania*. This alloy is a superior species of pewter.

Prep. 1. From *plate brass*, *bismuth*, *antimony*, and *tin*, equal parts, melted together, and the resulting alloy added at discretion to *melted tin*, until it acquires the proper degree of colour and hardness.

2. To the last add ⅛th of its weight of *metallic arsenic* before mixing it with the melted tin.

3. *Antimony*, 1 part; *brass*, 4 parts; *tin*, 5 or 6 parts. This may be used at once, as Britannia metal. See *Alloys* and *Pewter*.

BRITISH GUMS. See *Gums*.

BRITISH WINES. See *Wines*.

BROCCOLO. The *qualities* and the mode of *dressing* broccoli, are similar to those of cabbages noticed elsewhere.

BROMA. *Prep.* 1. From *pure cocoa*, 1 *lb.*; *sugar* and *sago meal*, of each, 4 *oz.*; mix.

2. As the last, but using *wheat flour*, in lieu of *sago meal*. Made into a beverage in a similar way to cocoa.

BROMAL. A compound discovered by Löwig, and produced by the action of bromine on alcohol. It is prepared in a similar manner to chloral, which it greatly resembles in its general properties.

BROMATE. Syn. *Bromas*,—Lat. A compound of a base with bromic acid. The bromates, when *heated*, evolve oxygen, and become bromides; with *nitrate* of *silver* and the *proto-salts of mercury*, they give white precipitates; that with the former being insoluble in nitric acid, and very soluble in ammonia. A few drops of *hydrochloric acid* being added to a bromate, and the mixture shaken with a *little ether* in a glass tube, a solution of bromine is obtained.

The bromates greatly resemble the corresponding chlorates and iodates. *Bromate of potassa* may be made by agitating bromine with a concentrated solution of caustic potassa, collecting the crystalline white powder that falls down, and purifying it by solution in boiling water, and crystallization. *Bromate of baryta* is prepared in a similar manner. *Bromate of silver* is formed by adding a solution of bromate of potassa to another of nitrate of silver.

BROMIC ACID. Syn. *Acidum Bromicum*,—Lat. *Prep.* Add *sulphuric acid* to a solution of *bromate of baryta*, as long as a precipitate falls, particularly avoiding an excess of acid; then concentrate the liquor by a gentle heat, until it becomes of the consistence of a syrup.

Obs. If the evaporation is carried too far, the acid suffers decomposition. It always contains water. Its salts are called *bromates*. See *Bromine*.

BROMIDE. Syn. *Bromuret*, *Hydrobromate; Bromidum*, *Hydrobromas*,—Lat. A compound form of bromine, with a base.

The soluble bromides give white precipitates with nitrate of silver, acetate of lead, and protonitrate of mercury. That from the *first* of these is insoluble in dilute nitric acid and in ammonia water, unless concentrated; and has a *slightly* yellowish tinge, changing to a violet by exposure to the light. A few drops of liquid chlorine poured upon a bromide, and the mixture agitated with a little sulphuric ether, yields an ethereal solution of bromine.

BROMIDE OF AMMONIA. *Prep.* From a mixture of *ammoniacal gas* and *hydrobromic acid gas;* or from *liquid hydrobromic acid* and *liquor of ammonia;* or by putting *bromine* into *water of ammonia.*

Obs. This salt may be obtained by evaporation, in the form of solid white prismatic crystals. It is volatile and easily decomposed. Many of the other bromides may be prepared in a similar manner. (See the respective bases.)

BROMINE. Syn. *Brome; Bromium, Brominium,*—Lat. An elementary substance, discovered by M. Balard, of Montpellier, in 1826.

Prep. A current of *chlorine* is passed through the uncrystallizable residuum of sea-water, called *bittern*, which then assumes an orange tint, in consequence of bromine being set free from its combinations; *sulphuric ether* is then agitated with it, and the mixture is allowed to stand until the ethereal portion floats upon the surface. This is a solution of crude bromine, and for common purposes the ether may be at once evaporated by *a very gentle* heat. To render it pure, *caustic potassa* is added in excess to the *ethereal solution*, or the latter is agitated with a *solution of potassa*, by which means bromide of potassium and bromate of potash are formed. The whole is evaporated to dryness, and submitted to a dull red heat; the residuum is next powdered, mixed with pure *peroxide of manganese*, placed in a retort, and *sulphuric acid*, diluted with half its weight of water, poured in. Red vapours immediately arise, and condense into drops of bromine, which are collected by plunging the neck of the retort nearly to the bottom of a small receiver containing *cold water.* The bromine forms a stratum beneath the water, and may be collected and further purified, by distillation from *dry chloride of calcium.*

Prop., &c. A dark, reddish-coloured liquid, having an odour resembling chlorine. It freezes at —4°; boils at about 135° Fahr.; dissolves in about 35 parts of water; is very soluble in ether, and less so in alcohol; with hydrogen it forms *hydrobromic acid*, and with the bases, compounds called *bromides*, or *hydrobromates.* It is *readily recognised* by its colour, odour, and volatility, and by the colour of its vapour; by its giving a yellowish-white precipitate with nitrate of silver, which is turned violet by the action of light; and by its solutions giving an orange or yellow colour to starch, and a red tinge to solution of chloride of gold. It possesses similar medicinal properties to iodine, and has been administered in goïtre, scrofula, &c., in the form of an aqueous solution, composed of 1 part of bromine to 40 of water; 5 or 6 drops being the dose. This solution has also been used as a lotion. Bromine bleaches like chlorine, but more feebly. It is poisonous; the antidotes, &c., resemble those for iodine. See *Solutions, &c.*

BROMINE (Chloride of). Syn. *Brominii Chloridum,*—Lat. *Prep.* By transmitting a current of *dry chlorine* through *bromine*, and condensing the disengaged vapour in a receiver surrounded with ice. A volatile reddish fluid, soluble in water, without decomposition.

BROMINE (Iodide of). Syn. *Brominii Iodidum,*—Lat. *Prep.* 1. (*Neutral.*) From *iodine*, 63 parts; added gradually and cautiously to *bromine*, 40 parts; distilling the mixture. Volatile, reddish-coloured, arborescent crystals.

2. (*Biniodide.*) As the last, but using 80 parts of *bromine.* A volatile dark-coloured liquid, soluble in water.

BROMOBENZOIC ACID. A new acid, discovered by Peligot, and prepared by exposing *benzoate of silver* to the *vapours of bromine*, until they cease to be absorbed, when the acid is dissolved out with *ether* and obtained by evaporation.

BROMOFORM. A heavy volatile liquid prepared from *bromine* by a similar process to that adopted for chloroform. It is also formed when a strong *aqueous* solution of *caustic alkali* is made to act on *bromal.* It is decomposed by alkalies into bromide of potassium and formiate of potassa.

BROMOHYDRO-SALICYLIC ACID. Obtained by the action of *bromine* on *hydride of salicyle.* It forms needle-like crystals.

BROMOPHENISIC ACID. It greatly resembles, and is prepared by analogous means to those adopted for *chlorophenisic acid.*

BROMOSAMIDE. Formed by the action of *ammonia* on *bromohydro-salicylic acid.*

BRONCHITIS. This affection is an inflammation of the mucous lining of the bronchia, or smaller ramifications of the windpipe. In its milder form it is popularly called "*a cold on the chest.*" The usual symptoms are *hoarseness, dry cough*, and a slight degree of *fever*, followed by expectoration of mucus, at first thin and afterwards thick and copious. In the severer forms there is more fever, cough, and oppression at the chest, &c. It generally yields to *small* and *repeated doses* of *ipecacuanha*, and *antimonial diaphoretics;* a *light diet* and *mild purgatives* being at the same time adopted.

BRONZE. A metallic alloy composed

principally of tin and copper, remarkable for the exactness of the impressions which it takes by moulding, as well as its durability; and hence, extensively employed in the casting of busts, medals, and statues. Bell, cannon, and speculum metal are varieties of bronze. In ancient times, when the manufacture of steel was ill-understood, cutting instruments were frequently made of this alloy.

On the *small scale*, this alloy is prepared in crucibles, but for *statues* and *larger works*, on reverberatory hearths. The fusion of the mixed metals is conducted as rapidly as possible under pounded charcoal, and the melted mass is frequently stirred together to produce a perfect mixture, before casting.

The proportions of the materials so vary in different castings, that it is almost impossible to say precisely what quantities are the best. The following are given as examples:—

Prep. 1. (*For Edge-tools.*) From *copper*, 100 parts; *tin*, 14 parts. When skilfully hardened and tempered this will yield an edge nearly equal to that of steel.

2. (*For Gilding.*)—*a.* From *copper*, 82 parts; *zinc*, 18 parts; *tin*, 3 parts; *lead*, 2 parts.

b. From *copper*, 83 parts; *zinc*, 17 parts; *tin*, 2 parts; *lead*, 1 part.

3. (*For Medals.*)—*a.* From *copper*, 89 parts; *tin*, 8 parts; *zinc*, 3 parts. This alloy assumes a beautiful antique appearance by age, and takes a good impression by stamping.

b. (M. Chaudet.) *Copper*, 95 parts; *tin*, 4 or 5 parts. This is also excellent for any small castings.

4. (*For Mortars.*) From *copper*, 93 parts; *lead*, 5 parts; *tin*, 2 parts.

5. (*For Statuary.*)—*a.* From *copper*, 88 parts; *tin*, 9 parts; *zinc*, 2 parts; *lead*, 1 part.

b. From *copper*, 82½ parts; *zinc*, 10½ parts; *tin*, 5 parts; *lead*, 2 parts. These are very nearly the proportions of the celebrated statue of Louis XV.

c. From *copper*, 90 parts; *tin*, 9 parts; *lead*, 1 part.

d. From *copper*, 91 parts; *tin*, 9 parts.

Obs. Several analyses have been made of ancient cutting instruments, from which it appears that the proportion of *tin* varies from 4% to 15%, a fact which tends to prove that more depends on the exact mode of tempering the alloy, than on the relative quantities of the ingredients. Lead and zinc are inadmissible in bronze for this purpose. One or two per cent. of iron may, nevertheless, be added with advantage. The ancient bronze used for springs contained only 3% to 4% of tin. The edges and lips of bronze mortars must be carefully tempered by heating them to a cherry red, and then plunging them into cold water, as unless so treated they are very apt to be broken in use.

BRONZE POWDER. *Prep.* 1. (*Gold-coloured.*)—*a.* From *Dutch foil*, reduced to an impalpable powder by grinding. Cheap and looks well, and is very durable when varnished.

b. From *gold leaf*, as last.

c. Precipitated *powder of gold.*

d. From *verdigris*, 8 *oz.*; *tutty powder*, 4 *oz.*; *borax* and *nitre*, of each, 2 *oz.*; *bichloride of mercury*, ¼ *oz.*; make them into a paste with oil, and fuse them together.

2. (*Iron coloured.*) *Plumbago* in fine powder.

3. (*Red.*) *Sulphate of copper*, 100 parts; *carbonate of soda*, 60 parts; mix, and apply heat until they unite into a mass; then cool, powder, and add of *copper filings*, 15 parts; again well mix, and keep the compound at a white heat for twenty minutes; lastly, cool, powder, wash, and dry.

4. (*Silver.*) *Bismuth* and *tin*, of each, 1 *oz.*, melted together, mixed with *running quicksilver*, 1 *oz.*; and the whole cooled and powdered. All the above are used by painters, japanners, and artists.

BRONZING. The process of giving a bronze-like, or an antique metallic appearance to the surface of copper, brass, and other metals.

1. To the surface of the specimen, thoroughly cleaned and polished, apply, with a brush, the common *crocus powder*, previously made into a paste with water. When dry, place it in an iron ladle, or on a common fire-shovel, over a clear fire for about one minute; and when sufficiently cold, polish it with a plate brush. This gives a very rich appearance similar to that on tea-urns; the shade depending on the duration of the exposure to the fire.

2. By substituting *finely powdered plumbago* for crocus powder in the above process, an equally beautiful, but deeper and more permanent bronze appearance is produced.

3. As the last two, but employing mixtures of *plumbago* and *crocus* in various proportions, according to the shade desired.

4. A *dilute solution of livers of sulphur*, *sulphuret of potassium*, or *hydrosulphuret of ammonia*, is applied with a camel hair pencil to the medal slightly warmed; when

dry, the surface is either left rough or "brushed off." This gives the appearance of very antique bronze.

5. *Verdigris*, 2 *oz.*, and *sal ammoniac*, 1 *oz.*, are dissolved in *vinegar*, 1 pint; and the mixture is diluted with *water*, until it tastes only slightly metallic, when it is boiled for a few minutes, and filtered for use. Copper medals, &c., (thoroughly clean,) are steeped in the liquor at the boiling point, until the desired effect is produced. Care must be taken not to keep them in it too long. When taken out they are carefully washed in hot water, and dried. Effect as last.

6. *Verdigris* and *vermilion*, of each, 2 *oz.*; *alum* and *sal ammoniac*, of each, 5 *oz.*; (all in fine powder;) *vinegar*, q. s. to form a thin paste. This is spread over the surface of the copper, which is then uniformly warmed by the fire, and afterwards well washed and dried. The tint may be deepened by repeating the process. The addition of a *little blue vitriol* inclines the colour to a chesnut brown, and a *little borax* to a yellowish-brown. Used by the Chinese for copper tea-urns, &c.

7. *Sal ammoniac*, 1 *oz.*; *cream of tartar*, 3 *oz.*; *common salt*, 3 *oz.*; *hot water*, 1 pint; dissolve; then add of *nitrate of copper*, 2 *oz.*, dissolved in ½ a pint of water; mix well, and apply it repeatedly to the article, placed in a damp situation, by means of a brush moistened therewith. Produces a very antique appearance.

8. *Salt of sorrel*, 1 *oz.*; *sal ammoniac*, 3 *oz.*; *distilled vinegar*, 1 quart; dissolve. As last. Much used for bronze figures.

9. A very weak solution of *bichloride of platinum*, applied with a hair pencil, or by immersion. Used for binding screws, holders, and other small articles of copper and brass.

10. *Sulphate of iron* and *sulphate of copper*, of each, 1 oz.; *water*, 1 pint; dissolve; wash the surface of the articles with it; let them dry; then apply a solution of *verdigris*, 2 *oz.*, dissolved in *strong vinegar*, ¼ pint; when dry, polish them with a soft brush, and either *plumbago* or *colcothar*. *Used* for tin castings.

11. The articles (properly cleaned) are either immersed in, or washed over, with a solution of *sulphate of copper* or of *verdigris*. In a short time they acquire a coating of pure metallic copper. This only answers with iron and steel goods. It is admirably suited for "castings."

12. An antique appearance may be given to silver by either exposing it to the *fumes of hydrosulphuret of ammonia*, or immersing it for a very short time in a solution of *hydrosulphuret of ammonia*, or in *dilute nitric acid*.

BRONZING (Surface). This term is applied to the process of imparting to the prominent portions of the surfaces of figures of paper, wood, plaster of Paris, &c., a metallic appearance. It is done by first giving them a *coat of oil varnish* or *size*, and when this is nearly dry, applying, with a dabber of cotton or a camel-hair pencil, any of the ordinary *metallic bronze powders*. Sometimes the powder is placed in a little bag of muslin, and dusted over the surface. The articles should be afterwards varnished.

Paper is *bronzed* by mixing the *bronze powders* up with a little *gum and water*, and burnishing the surface when dry and hard.

BROOM ASHES. From *broom stalks* burnt. Sometimes used as a diuretic in dropsy.

BROOM (Salt of). Obtained by dissolving *broom ashes* in *water*, filtering and evaporating. It consists principally of carbonate of potassa. It is sometimes used in dropsy, and as an antacid, &c.

BROSSE DE CORAIL. The roots of lucerne, (*medicago sativa*,) cleaned, dried, and hammered at the end. *Used* as a tooth-brush. (Beasley.)

BROTH. The liquor in which flesh is boiled. Broth is distinguished from soup by its inferior strength and quantity of seasoning, &c. It contains much of the nutriment of the meat. (See *Boiling*, *Soup*, *&c.*

BROWN DYE. Every shade of brown may be produced, as the taste of the workman may dictate, by mixtures of reds and yellows with blues and blacks, or directly, by simple dyes.

1. (*For Cotton.*)—*a.* Give a mordant made of *acetate of alumina* and *acetate of iron*, followed by a bath of *madder* or *madder and fustic*. Excess of acetate of alumina turns it on the *amarinth tint*; the acetate of iron *darkens* it.

b. First "*gall*" the goods, then turn them for a short time through a *black bath*; next give them a *mordant* of *sulphate of copper*, pass them through a *decoction of fustic*, afterwards through a *bath of madder*, and again through the solution of sulphate of copper; drain, dry, and rinse well, and finish with a boil in *soap and water*. This gives a *chesnut brown*.

c. First give a *mordant of alum*, then a *bath of madder*, and next a *bath of fustic*, to which a little green copperas has been added. This gives a *cinnamon brown*.

2. (*For Linen.*) This is the same as for cotton.

3. (*For Silk.*)—*a.* One of the above mordants is followed by a bath made by mixing *equal parts of decoctions of logwood, fustic,* and *Brazil wood.* The shade may be varied by altering the proportions of the decoctions; Brazil wood *reddening,* logwood *darkening,* and fustic *yellowing,* the tint.

b. From *annotto,* 4 *oz.,* and *pearlash,* 1 *lb.,* dissolved in *boiling water,* and the silk passed through it for two hours, then taken out, squeezed dry, and passed through a *mordant of alum,* and next through a *bath of Brazil wood,* followed by another of *logwood* to which a little green copperas has been added.

3. (*For Wool.*)—*a.* Boil the cloth in a *mordant of alum, common salt,* and *water,* then dye it in a *bath of logwood* to which a little green copperas has been added. 2 *oz.* of *alum* and 1 *oz.* of *salt,* are required for every *lb.* of wool.

b. Boil the goods in a *mordant of alum* and *sulphate of iron,* then pass them through a *bath of madder.* The more copperas the darker will be the dye. The best proportions are 2 *parts of alum* and 3 *of copperas.*

c. Give a *mordant of alum and tartar,* then pass the goods through a *madder bath;* next run them through a *bath of galls and sumach* or *logwood* to which a little *acetate* or *sulphate of iron* has been added.

d. Mordant the cloth as last, dye in a *madder bath,* remove the cloth, add a little *acetate or sulphate of iron,* and again pass it through the bath, as long as necessary.

e. Give the cloth a light blue ground with *indigo,* then give it a *mordant of alum,* rinse, and lastly run it through a *bath of madder.*

f. A *mordant of alum and tartar,* followed by, first, a *bath of madder,* and afterwards a *bath of weld or fustic* to which a little iron liquor has been previously added. In this way every shade from *mordoré* and *cinnamon* to *dark chesnut* may be dyed.

g. Boil *fustic chips,* 1 *lb.,* for 2 hours; pass the cloth through the bath for 1 hour; take it out and drain; add *green copperas,* 1¼ *oz.; good madder,* 4 *oz.;* and again pass the cloth through the bath, until the proper tint is given to it. *Bronze browns,* and every similar shade, may be thus given by varying the proportions.

4. The following are called *substantive* or *direct* browns:—

a. Decoction of oak bark. It dyes *wool* of a fast brown of various shades, according to the quantity employed. *A mordant of alum* brightens it.

b. Infusion or decoction of walnut peels. Dyes *wool* and *silk* a brown, which is brightened by alum.

c. Horse-chesnut peels. A mordant of *muriate of tin* turns it on the *bronze,* and *sugar of lead,* on the *reddish-brown.*

d. Catechu, or terra japonica. For cottons; *blue vitriol* turns it on the *bronze,* and *green copperas darkens* it, when applied as mordants. *Acetate of alumina* as a mordant brightens it. The French colour, "*carmelite,*" is given with 1 *lb.* of *catechu,* 4 *oz.* of *verdigris,* and 5 *oz.* of *sal ammoniac.*

e. Sulphate or chloride of manganese. Dissolved in water with a little tartaric acid, it gives the bronze tint called '*solitaire.*' The stuff, after being passed through the solution, is turned through a *weak lye of potash,* and afterwards through another of *chloride of lime,* to brighten and fix it.

f. Prussiate of copper. This gives a *bronze* or *yellowish-brown* to silk. A *mordant* of *blue vitriol* is commonly first given.

BROWN PIGMENTS. The principal and most useful of these are—*umber, terra di sienna,* (both burnt and raw,) *Spanish brown,* and some of the *ochres.* Brown of almost any shade may be made by the admixture of *blacks* with *reds* and *yellows,* or with *greens,* in different proportions.

BROWNING. A fluid preparation used to colour and flavour gravies, soups, &c.

Prep. 1. *Sugar,* 4 *oz.,* and *butter,* 1 *oz.,* are melted in a frying-pan or ladle with a *table-spoonful of water,* and the heat is continued until the whole has turned of a *deep brown;* the heat is then lowered a little, and *port wine,* (1 pint) is gradually poured in; the pan is now removed from the fire, and the mixture well stirred until the roasted sugar is entirely dissolved; it is then put into a bottle, and ½ *oz.* each, of *bruised pimento* and *black pepper;* 5 or 6 shalots, (cut small;) a *little mace* and *finely-grated lemon peel;* and a quarter of a pint of *mushroom catsup,* added. The bottle is shaken daily for a week, and the clear liquid, after 5 or 6 days' repose, decanted into another bottle.

2. As the last, but using *strong beer,* or *water,* instead of wine. A *glass of spirits* may be added.

3. *Sugar colouring,* 1 pint; *salt,* ¼ *lb.; mushroom catsup,* ½ pint; *spice,* q. s.

4. *Lump sugar,* (powdered,) 2½ *lb.; salad oil,* ½ *lb.;* heat as before; then add, *port wine,* 1 quart; *Cape wine,* 3 quarts; *shalots,* 6 *oz.; mixed spice,* 4 *oz.; black pepper,* 3 *oz.; mace,* 1 *oz.; salt,* 1 *lb.;*

lemon juice, ¾ pint; *catsup*, 1 quart; mix well, as before.

5. *Good spirit colouring*, or *sugar colouring*, and *mushroom catsup*, of each, 1 gall.; *Jamaica pepper*, *black pepper*, and *shalots*, of each, 4 *oz.*; *cloves*, *cassia*, and *mace*, bruised, of each, ¾ *oz.*; boil in a covered vessel for 5 minutes; digest for 14 days, and strain.

6. *Colouring*, 3 pints; *mushroom catsup*, 1 pint; *common salt*, ¾ *lb.*; *chilly vinegar*, (strongest,) ½ pint; *spice*, q. s. Half a pint of *British brandy* or *rum* may be added.

Obs. The above are excellent additions to gravies, soups, &c.; and of themselves form most admirable sauces for fish, meat, and game.

BROWNING (for Gun Barrels). *Prep.* 1. *Aquafortis* and *sweet spirits of nitre*, of each, 1 *oz.*; *blue vitriol*, 4 *oz.*; *tincture of muriate of iron*, 2 *oz.*; *water*, 1 quart; dissolve.

2. *Blue vitriol* and *sweet spirits of nitre*, of each, 1 *oz*; *water*, 1 pint; as last.

3. *Butter of antimony* and *sweet oil*, equal parts; mix. To be applied to the iron previously warmed.

Obs. The above fluids are rubbed on the barrel, (previously well polished, and cleaned off with whiting to remove the oil;) allowed to remain on until the next day, and then rubbed off with a stiff brush. The process may be repeated, if necessary. The barrel is next washed in *pearlash* or *soda water*, and afterwards well rinsed in *clean water*; it is then polished, either with the *burnisher*, or with a *brush* and *bee's wax*. Sometimes a coat of *tough shellac varnish* is applied.

BRUCINE. Syn. *Brucia*, *Brucina*, *Canirimine*, *Vomicina*. An alkaloid, discovered by Pelletier and Caventou, in the bark of the *brucia antidysenterica*, and afterwards, combined with strychnia, in *nux vomica*.

Prep. From *nux vomica seeds*, (ground,) or the *bark of brucia antidysenterica*, boiled in *dilute sulphuric acid*, the resulting liquor mixed with *hydrate of lime*, (in excess,) the crude precipitate boiled in *alcohol*, (sp. gr. 0·850), and the tincture filtered whilst hot. A mixture of crude strychnine and brucia is deposited as the fluid cools, and may be wholly obtained by evaporation. By powdering the mass and digesting it in *cold alcohol*, the brucine is dissolved out, and may be procured separately in crystals by spontaneous evaporation. It may be further purified by crystallization from *alcohol*.

Prop., &c. Soluble in 850 parts of cold, and about 500 parts of boiling water; added to the dilute acids until they are neutralized, brucia forms crystallizable salts, easily obtained by evaporation. Of these, the *sulphate* and *bisulphate*, the *hydrochlorate*, *phosphate*, *nitrate* and *binitrate*, *acetate*, *oxalate*, and *some others* have been examined. Most of these are very soluble in water. It is distinguished from *strychnia* by its ready solubility in both dilute and strong alcohol, and its insolubility in ether. With *nitric acid* it gives a fine red colour, which is removed by sulphuretted hydrogen and sulphurous acid. *Iodic acid*, *chloric acid*, and *chlorine* also turn it red.

The physiological effects of brucia are similar to those of strychnia, but it appears to possess only $\frac{1}{12}$th of the strength of that alkaloid. *Dose.* ½ gr. to 2 or 3 grs. daily, in the form of pills or solution; in similar cases to those for which strychnia is prescribed. It is poisonous. The antidotes are the same as for strychnia.

BRUISES may be rubbed with a little *opodeldoc* or *soap liniment*; or, if the inflammation be considerable, they may be washed with a little *weak goulard water*, or leeches may be applied to the part,

BRUNSWICK BLACK. See *Varnishes*.

BRUNSWICK GREEN. See *Green Pigments*.

BRYONINE. A peculiar bitter principle, extracted from the root of white bryony, (*bryonia dioica*,—Jacq.) It is obtained from the dry extract of the *expressed juice* by solution in *alcohol*, filtration, and cautious evaporation. It is a drastic purgative and poisonous. It forms a yellowish-white mass. It enters into the composition of several quack medicines.

BUBBLE AND SQUEAK. This is a species of olla podrida, variously prepared as the materials and fancy may dictate.

Prep. (Rundell.) *Slices of cold meat* are fried quickly until brown, and put into a dish to keep them hot. Then clean the pan from the fat; put in it *greens* and *carrots*, (previously boiled and chopped small;) add a *little butter*, *pepper*, and *salt*; make them very hot, and put them round the beef with a *little gravy*. Cold boiled pork is a better material for bubble and squeak than beef. In either case the slices should be very thin and lightly fried.

BUGS. The common *bed-bug* is the *cimex lectularius* of Linnæus; an insect of the order *hemiptera*, (half-winged.) Its introduction to England is believed to have occurred soon after the "great Fire of London," (A.D. 1666.) Human blood appears to be its favorite food; but it will also eat grain, seed, flour, dried paste, size, soft deal, beech, ozier, &c. Cedar, mahogany,

and the odorous and harder woods, are usually avoided by this insect. Aromatics, perfumes, and strong odours generally, are unfavorable to its propagation.

Various means have been proposed to drive away these enemies of "*tired nature's sweet restorer, balmy sleep.*" Among the most certain of these is thorough *cleanliness*, and *ventilation.* The furniture brokers put articles infested with these insects into a room with doors and windows fitting quite close, and subject them to the *fumes of burning sulphur* or *chlorine.* In the *small way*, poisonous mixtures are commonly resorted to, with which the articles are washed. For the latter, nothing is so effective as *chloride of zinc.* The contents of a half-pint bottle of Crew's "Disinfecting Chloride of Zinc," (price 6*d.*) diluted with *twice its weight of water*, is sufficient for two or three bedsteads; and its use is also invaluable in a hygienic point of view. (See *Chloride of Zinc.*)

The following forms have also been recommended for this purpose:—

1. *Corrosive sublimate* and *muriatic acid*, of each, 1 *oz.; water*, 4 *oz.* Dissolve, then add *oil of turpentine* and *tobacco water*, of each, ½ pint. The tobacco water is made by steeping 1 *oz. of tobacco* in ½ *pint of water.* This mixture is applied with a paint brush. This is the common "*bug-wash*" of the shops. It is a "*deadly poison!*"

2. *Rectified spirit of wine*, ½ pint; *camphor*, 1 *oz.;* dissolve, and brush it over the cracks and joints. Very cleanly and effective.

3. As the last, but substituting *oil of turpentine* for *rectified spirit.* Nearly equal to No. 2.

4. *Pyroligneous acid*, 1 pint; *camphor*, (cut small), 1 *oz.;* dissolve. Resembles the last.

5. *Crude pyroligneous acid* or *essence of smoke.*

6. *Coal-tar naphtha* and *oil of turpentine*, equal parts. This should never be used by candle light, as it is excessively inflammable.

7. *Sulphuret of potassium*, (in powder,) 6 *oz.*; *soft soap*, ½ *lb.; oil of turpentine*, ¼ pint, or q. s. to make a species of soft ointment. The odour of the last three is rather persistent and disagreeable.

8. *Strong mercurial ointment, soft soap*, and *oil of turpentine*, equal parts, triturated together. Greasy, dirty, and less effective than some of the others.

9. *Scotch* or *Welsh snuff*, mixed with twice its weight of *soft soap.*

Obs. Out of the above list there is ample room for selection. The following extract may be useful to persons interested in the subject:—"These pests exist only in dirty houses. A careful housewife or servant will soon completely destroy them. The surest method of destruction is to catch them individually when they attack the person in bed. When their bite is felt, instantly rise and light a candle and capture them. This may be troublesome, but if there be not a great number, a few nights will finish them. When there is a large number, and they have gained a lodgment in the timbers, take the bed in pieces, and fill in all the apertures and joints with a mixture of *soft soap* and *Scotch snuff.* A piece of wicker-work, called a *bug-trap*, placed at the head of the bed, forms a receptacle for them, and then they may be daily caught till no more are left. Oil-painting a wall is a sure means of excluding and destroying them." (Chambers' Inf. for the People.) It has been asserted that these insects are so fond of *narrow-leaved dittany* or *pepperwort*, (lepidium ruderale,) that if a bunch of it be suspended near their haunts, they will settle in it, and may be thus easily captured. It is said to be commonly used as a *bug-trap* in some of our rural districts.

BUNION. This is a swelling on the ball of the great toe, and results from pressure, and irritation by friction. The treatment recommended for corns applies also to bunions; but in consequence of the greater extension of the disease, the cure is of course more tedious. When a bunion is forming it may be effectually stopped by poulticing it, and carefully opening it with a lancet. See *Corns.*

BUNS. *Prep.* 1. (*Cross Buns.*) *Flour*, 2½ *lb.; sifted sugar*, ½ *lb.; coriander seeds, cassia*, and *mace*, (powdered,) q. s.; make a paste with *butter*, ½ *lb.*, dissolved in *hot milk*, ½ pint; work with three tablespoonfuls of yeast; set it before the fire for an hour to rise, then make it into buns, and again set them before the fire on a tin for half an hour; lastly, brush them over with warm milk, and bake them to a nice brown in a moderate oven.

2. (*Madeira.*) *Butter*, 8 *oz.;* 2 *eggs*; *flour*, 1 *lb.; powdered sugar*, 6 *oz.;* half a *nutmeg*, (grated;) *powdered ginger* and *caraway seeds*, of each, ½ teaspoonful; work well together, then add as much *milk* as required, and bake on tins in a quick oven.

3. (*Plain.*) *Flour*, 2 *lb.; butter* ¼ *lb.; sugar*, 6 *oz.;* a little *salt, caraway*, and *ginger;* make a paste with *yeast*, 4 spoonfuls,

and *warm milk*, a sufficient quantity, as before.

4. (*Penny.*) To the last add *currants*, well washed, ½ *lb.*; and *water*, stained by steeping a little *saffron* in it, q. s. to give a light yellow tinge to them.

5. (*Rich.*) *Flour*, 3 *lb.*; *sugar*, 1 *lb.*; *butter* 2 *lb.*; (melted, and beat with) *rose water*, 4 *oz.*; *currants*, 1 *lb.*; *yeast*, ¼ pint; as before.

6. (*Bath.*) As the last, but adding a little *candied lemon* and *orange peel*, and putting a little *grated peel* and a few *caraway comfits* on the top of each.

Obs. The great secret in producing good buns is, the use of sweet yeast and the best currants only, and thoroughly washing the latter, in a sieve or colander, to remove grit before adding them to the dough. The buns of most of the shops are bitter and gritty, from neglecting these precautions. An eminent London pastrycook informs us that he finds it more difficult to get a "good hand at buns" than in any other department of his trade.

BURGLARIES. The common precautions of locks and bolts, alarum bells and fire-arms, are frequently found useless in preserving houses from burglars; but a *light* in the upper part of the house, or a *small dog*, on the ground-floor, with the means of its running into a place of safety from its enemies, has been seldom known to fail. A combination of the two would therefore be doubly effective. The bark of the dog, and the fear of detection by the approach of the light, will deter rogues of common pluck and feeling.

BURNS AND SCALDS. When the injury is merely superficial, a little *creosote* may be applied to the part. If a *scald*, the vesicle should be first pierced with a needle, and the aqueous fluid gently squeezed out. When creosote is not procurable, a *liniment* formed of equal parts of *soft soap*, *basilicon ointment*, *oil of turpentine*, and *water*, may be used instead. When the part feels very hot and painful, a poultice may be applied, on the surface of which a *few drops of creosote*, or of the *liniment*, should be spread with a knife. This treatment will generally allay the pain, and may be followed by a dressing of spermaceti ointment, or any other like simple preparation. Creosote produces scarcely any smarting or pain, as is frequently asserted, whilst it rapidly removes the burning sensation, and the charred surface assumes a dry scabby appearance, which by dressing with simple ointment, soon comes off and leaves the part beneath in a sound and healthy state. If a poultice be applied it is best to keep it on until the next day. Plunging the part into *cold water* IMMEDIATELY after the receipt of an injury of this kind, will frequently prevent any further remedy being required. In all cases, cooling laxative medicines, *as castor oil*, *Epsom salts*, &c., should be administered.

BURNING LENS. The following method of forming cheaply and expeditiously a burning lens of great power, will be duly appreciated by the chemical and optical experimentalist:—Take two *circular discs of plate glass*, of the requisite dimensions, and place one at each end of a shallow tube; (an inch long will be quite sufficient for any size;) keep them firmly in position by means of screw clamps, in an analogous manner to the two lenses for showing Newton's concentric coloured rings. To the tube is fitted a short tube with a stop-cock attached; to the end of which a condensing syringe is fixed, and the cavity between the glasses filled with *turpentine*, *varnish*, *bleached oil*, or any other suitable substance of a high refractive power. When the glasses have attained the requisite degree of curvature, the stopcock may be shut, the syringe screwed off, and the fluid lens (for such in reality it is) mounted for use. (Chemist, iii, 50.)

BUTTER. Syn. *Butyrum*,—Lat. Butter is, perhaps, in more general use, and subject to greater variations in quality, than any other substance employed in domestic economy. It is consumed by every grade of society, and, when *good*, appears not only to be *wholesome*, but extremely *nutritious*. Some writers inveigh against the use of butter as universally pernicious; but they might with equal reason condemn the vegetable oils, which form a considerable part of the diet in the southern climates, and seem to have been beneficially intended by nature for that purpose. That butter may be improper in some bilious constitutions, there can be little doubt; but the same objection tells against every other substance used as food; for instances are not uncommon of the most delicate and nutritious articles disagreeing with persons, under certain circumstances, or who are of peculiar idiosyncracy. To obviate all objections, it would be a commendable practice for the bilious, at breakfast, first to eat some *dry bread*, (crust is best,) and to chew it well before taking any butter. By these means such a quantity of saliva would be carried into the stomach as would be sufficient for the purpose of digesting the usual amount of oil and fatty matter taken with our food.

The *process of making butter* by the common operation of churning, is extremely simple, and is well known. The chief objects to attend to, are maintaining a proper temperature, and a certain degree of exposure to the air. Extreme cleanliness must also be observed; the churn and other utensils being frequently scalded out with water. When the butter is come, it should be put into a fresh scalded pan, or tub which has been standing in cold water, cold water poured on it, and after it has acquired some hardness, it should be well beaten with flat boards until not the least taste of the buttermilk remains, and the water, which must be often changed, becomes quite colourless and tasteless. A *little* salt may then be worked into it, after which it may be weighed and made into forms, which should then be thrown into cold water contained in an earthen pan provided with a cover. In this way nice and cool butter may be obtained in the hottest weather.

At *Dumbarton*, the newly separated butter is put into a clean vessel, and a corn sickle is drawn several times crosswise through it, to extract any hairs that may adhere to it. This operation is performed in cold spring water, and is followed by thoroughly washing it therein. 10 *oz.* of salt are now added to every stone weight of butter, and well mixed in.

In *Devonshire* the milk is scalded in copper pans over a charcoal fire, and the cream collected as soon as it rises, or when the whole has got cold. It is then churned in the usual way. On the *small scale*, the butter is commonly obtained from this cream by patiently working it with the hand in a shallow pan or tub. Without care the cream is apt to absorb some of the fumes from the charcoal, which impart a peculiar taste to the butter. This is the reason why some of the Devonshire butter has a slight "smoky" flavour. It may be removed by thorough washing in cold water.

Choice. Fresh butter has a pleasant butyraceous smell, and is of an equal colour throughout its substance. If it smells sour, the buttermilk has not been well washed out, and if it is streaked or veiny, it is probably mixed with stale butter or lard. A good way to try butter is to insert a knife into it, which should not smell rancid and unpleasant when drawn out. Rancid and stale butter is capable of producing dangerous symptoms when eaten in quantity.

Pur. The cheaper kinds of butter are frequently adulterated with *flour, oatmeal, pea flour, lard, &c.*, as well as with a large quantity of *salt*, and *water*. The trick is concocted between the Irish factors and the London dealers. The higher priced article is seldom mixed with anything beyond an excess of salt and water, notwithstanding the assertions of alarmists to the contrary. The presence of *lard* may be detected by the flavour and paleness of the colour. A little of the sample adulterated with the other substances named, if melted in a glass tube or phial, will separate into strata, which are very marked when cold.

Pres. 1. Melt the butter in well glazed earthen pans, at a heat not exceeding 180° Fahr., in a water bath, and keep it heated, skimming it from time to time, until it becomes quite transparent, then pour off the "clear" into another vessel, and cool it as quickly as possible, by placing the vessel in cold water or ice. This is the method employed by the Tartars who supply the Constantinople market. In this state it may be preserved perfectly fresh for 6 or 9 months, if kept in a close vessel and a cool place. This is the plan recommended by Thènard. Mr. Eaton states that butter melted by the "Tartarian method" and then salted by "ours" will keep good and fine-tasted for two years.

2. Mix well together 1 *oz.* each, of *saltpetre* and *white sugar*, and 2 *oz.* of the best *Spanish great salt*, all in very fine powder; add 1 *oz.* of this mixture to every *lb.* of butter, and thoroughly incorporate them together. The butter thus prepared is then to be tightly pressed into clean glazed earthenware vessels, (or casks,) so as to have no vacuities. This plan is recommended by Dr. Anderson, who declares that "butter so prepared will keep in a cool place for years; and will bear a voyage to the East Indies, if packed so as not to *melt*." It does not taste well before it has stood for a fortnight or three weeks, after which it acquires a rich marrow flavour, which no other butter ever possesses. The best method to preserve butter from the air is to fill the pots to within an inch of the top, and to lay on it common coarse grained salt, to the depth of a ¼ an inch, or ½ an inch, and then to cover each pot with any flat article, as a slate or plate. The salt by long keeping will run to brine, and form a layer on the top of the butter, which will effectually keep out the air, and may at any time be very easily removed by turning the pot on one side.

3. *Fresh butter*, 21 *lb.*; *salt*, 1 *lb.*; *saltpetre*, 1 *oz.* This is the common pro-

portions for the *best salt butter* of the shops.

4. *Fresh butter*, 18 *lb.*; *salt*, 1 *lb.*; *saltpetre*, 1½ *oz.*; *honey* or *fine brown sugar*, 2 *oz.* Superior to the last.

Rancid butter may be restored by melting it in a water bath with some *fresh-burnt* and *coarsely powdered animal charcoal* (which has been thoroughly freed from *dust* by sifting), and straining it through clean flannel. A better and less troublesome method is to *well wash it first* with some good *new milk*, and *next* with *cold spring water*. Butyric acid, (on the presence of which rancidity depends,) is freely soluble in fresh milk.

The *turnip-flavour*, arising from the cows being fed on turnips or cabbages, is said to be removed by one or other of the following methods:—1. When the *milk* is strained into the pans, put to every 6 gall., 1 gall. of *boiling water*.—2. Dissolve 1 *oz.* of *nitre* in a pint of *spring water*, and put a ¼ pint of the solution to every 15 gall. of *milk*.—3. Keep back a ¼ pint of the *sour cream* when you churn, and put it into a well-scalded pot, into which you are to gather the next cream; stir that well, and do so with every fresh addition.

Obs. We have been less diffuse on the subject of butter-making in this edition than in the last, in consequence of most dairy farmers now using one or other of the "patent churns," to every purchaser of which ample printed directions of the most reliable character are always given.

BUTTER (Anchovy). From *anchovies*, (boned and beaten to a paste,) 1 part; *butter*, 2 parts; *spice*, q. s.; thoroughly incorporated together.

BUTTER (Clarified). *Fresh butter* melted in a *water bath*, allowed to settle and the clear poured into an earthenware basin or pot, set in cold water, to cool it as quickly as possible, without letting it crystallize. It keeps a long time without becoming rank. (See *above*.)

BUTTER (Honey). *Prep.* From the finest *Narbonne honey*, 2 *oz.*; with *good butter*, 1 *lb.* *Used* as a delicacy for children, and sick or aged persons.

BUTTER (Melted). *Prep.* Beat up about 1 *oz.* of *flour* with 4 *oz.* of *butter*, in the cold, until it is evenly and thoroughly mixed, then add 4 or 5 tablespoonfuls of hot *milk*, put the whole into a small saucepan, and continue shaking it, all in one direction, until it *gently* simmers; then remove it from the fire for use.

BUTTER (Orange). *Prep.* 1. From 6 *eggs*, 2 *oz.* of *powdered sugar*, and 4 *oz.* of *butter*, beaten together with a little *orange flower water*. Sometimes 1 or 2 *oz.* of *blanched almonds* or *almond paste* are added.

2. From *butter*, 1 *lb.*; *syrup of orange peel*, 4 *oz.* Both are eaten as a delicacy. *Lemon butter* is made in a similar manner.

BUTTER OF CACAO. Syn. *Cocoa-nut oil.* From the nut, by bruising it and boiling it in water; the oil floats, and is skimmed off when the water has cooled. It is much used in perfumery and for burning in lamps. When mixed with a little *caoutchoucine*, (the distilled spirit of Indian rubber,) it loses its concrete form, and assumes the fluidity of common oil, at the same time that its illuminating power is vastly increased.

BUTTER OF NUTMEGS. Collected from the surface of the water in the still, after the distillation of the essential oil of nutmegs.

BUTTER OF ROSES. *Prep.* By distilling damask roses. It separates slowly from the water in the receiver. It has little smell, and is hence used to dilute the odour of musk, ambergris, and civet.

BUTTER OF WAX. Prepared by distilling bees' wax. A factitious kind is made.

BUTTERMILK. Buttermilk left from butter prepared from sweet cream is not only very delicious, but exceedingly wholesome and nutritious. It is eaten with fruit, puddings, and cakes, and is said to possess the property of allaying the nervous irritability induced by excessive tea-drinking.

BUTTONS. See *Brass* and *Gilding*.

BUTYLAMINE. See *Petinine*.

BUTYLE, Syn. *Valyl.* An ethereal liquid boiling at about 226° Fahr.; formed along with *butylene* and other substances during the electrolysis of *valerianic acid*, and the *valerianates*.

BUTYLENE. See *Butyle*.

BUTYRATE OF BARYTA. *Prep.* Saponify *butter* with *boiling caustic alkali*, and decompose it by adding a solution of *tartaric acid*; filter and distil, neutralize the distilled liquor, by adding *hydrate of baryta*, and evaporate; the *first* crystals that form are *caprate of baryta*; the *next*, *caproate of baryta*; and the *last*, *butyrate of baryta*. This salt is very soluble in water, and hence is easily separated from the others. *Used* for making butyric acid.

BUTYRIC ACID. An oily acid obtained by Chevreul from butter.

Prep. From *butyrate of baryta* or of *magnesia*, by adding a little *sulphuric*

acid, in quantity not quite sufficient to decompose the whole of the salt; the clear liquor, filtered and distilled, yields butyric acid, from which the water may be removed by *chloride of calcium*. A thin colourless liquid, of pungent rancid odour, and sour taste, miscible with water and alcohol; boiling at 327° Fahr.; sp. gr. 0·963.

BUTYRIC ACID (Anhydrous). A colourless liquid somewhat resembling butyric ether, boiling at 320° Fahr. Its salts are called *butyrates*. See *Acids*.

BUTYRINE. An oily substance obtained by Chevreul from butter, of which it forms the characteristic portion.

Prep. Keep *clarified butter* in a porcelain vessel, at a heat of 66° for some days; carefully collect the oily portion which separates, and agitate it with an equal weight of *alcohol* of 0·796 for 24 hours; next pour off the clear portion and evaporate; treat the oily residuum with a little *carbonate of magnesia*, to remove any free acid, and wash off the *butyrate of magnesia* thus formed with water; lastly, heat the remaining fatty matter in *alcohol*, filter and evaporate.

BUXINE. An alkaline substance detected by M. Faure in the *buxus sempervirens*, or common box tree.

CABBAGE. This common esculent and its varieties, are cultivated specimens of the *brassica oleracea*, (Linn.,) and belong to an extensive and valuable genus of plants, of the natural order *cruciferæ*. After the potato, the cabbage is doubtless more extensively used by the masses of the people, than any other fresh vegetable. When young and properly dressed, it forms an agreeable and wholesome addition to animal food, the grossness of which, it is said, it tends to correct. It has, however, a greater tendency to putrefaction than most other vegetable substances, and emits, whilst in this state, a very disagreeable effluvium, strongly resembling that from animal matter in a state of decomposition. It should therefore be eaten *only* when freshly gathered and cooked; and the unconsumed portion, as well as the water in which it has been boiled, should be at once thrown away. The "concentrated perfume of cabbage water," is aptly alluded to by a celebrated novelist as symbolical of a fetor of the worst class. So far, however, from inducing a putrid disposition in the body, cabbages and similar vegetables have the very opposite effect. Nevertheless, persons troubled with weak digestion, or who have a tendency to flatulence, diarrhœa, or worms, would do well to avoid them. On the other hand, their use is particularly serviceable in scurvy, and several skin diseases.

It has been asserted that *cabbages*, *cauliflowers*, *broccoli*, *celery*, and some other culinary vegetables, may be *preserved* in a *fresh state* for some time, by cutting them so that they may have about two inches of stem left below the leaves, scooping out the pith as far down as a small knife will reach, and then suspending them perpendicularly by means of a cord, in an inverted position, in some cool situation, and daily filling up the bottom part of the stem with clean cold water. By this method it is stated that a supply of green vegetables may be readily obtained during a severe winter, and on ship-board.

Cabbages, *broccoli*, *&c.*, are dressed by simply throwing them into *boiling water*, and boiling them until tender. A few minutes is sufficient for this purpose. A pinch of *salt of tartar*, or *carbonate of soda*, is commonly added to the water to preserve the green colour of the vegetables.

CACHOU AROMATISE. Mouth lozenges intended to deodorize and perfume the breath. They are much used by smokers and bacchanals. The form under which they are generally prepared for sale, is that of *one grain*, or 1½ *grain pills*, neatly silvered. Originally they were composed chiefly of *catechu* and *sugar*, flavoured and perfumed with the *stronger aromatics*; but at the present day the catechu, from which they derive their name is not unfrequently omitted. For their preparation, see *Pills* and *Lozenges*.

CADMIUM. Syn. *Klaprothium*, *Melinum*. A metal discovered by Stromeyer and Hermann in the ores of zinc.

Prep. 1. (Stromeyer.) The *cadmo-zincic ore* is dissolved in an excess of *dilute sulphuric* or *hydrochloric acid*, by heat; a stream of *sulphuretted hydrogen* is passed through the solution, the resulting precipitate (*sulphuret of cadmium*) dissolved in *nitric acid*, and the solution evaporated to dryness; the residuum is dissolved in *water*, the solution precipitated with *carbonate of ammonia*, in excess, and the precipitate (*carbonate of cadmium*) collected, mixed with *charcoal*, and heated to redness in a crucible apparatus, so arranged as to condense the fumes. *Metallic cadmium* sublimes.

2. (Wollaston.) A solution of the ore, obtained as above, is placed in a *platinum capsule*, and a piece of *metallic zinc* is plunged into it. In a short time the *cad-*

mium is precipitated, and attaches itself to the sides of the capsule, when it is collected, washed, and dried.

3. (Herapath.) When zinc is obtained by distilling its ores, *per descensum*, the first portion of the *metallic fumes* evolved burn with a brownish flame, and deposit *oxide of cadmium*, which is subsequently reduced by distillation with *charcoal*. Thousands of pounds of cadmium are yearly wasted at the zinc works which might be easily collected in a similar manner.

Prop., &c. Cadmium greatly resembles tin in appearance, but it is harder than that metal; it is very malleable; melts a little below 500° Fahr.; and is about as volatile as mercury. Dilute sulphuric acid, and dilute hydrochloric acid, have little action on it in the cold; nitric acid rapidly oxidizes and dissolves it. Sp. gr. 8·7. With oxygen it forms an oxide.

Cadmium and its ores and salts, are recognised as follows:—1. Mixed with carbonate of soda, and exposed on a *charcoal support* to the *reducing flame* of the blowpipe, the charcoal becomes almost instantly covered with a reddish-yellow incrustation of oxide of cadmium, commonly forming a circle or zone.—2. Caustic soda and potassa give a white precipitate (*hydrated oxide*) in solutions containing cadmium, *insoluble* in excess of the precipitant.—3. Ammonia gives a similar white precipitate, freely *soluble* in excess.—4. The alkaline carbonates (ammonia, potassa, soda,) give white precipitates, (*carbonate of cadmium*,) insoluble in excess.—5. Sulphuretted hydrogen, and hydrosulphuret of ammonia, give a bright yellow precipitate, (*sulphuret of cadmium*,) which is insoluble in dilute acid, alkalies, sulphurets, and cyanide of potassium, but readily soluble in both hydrochloric acid, and nitric acid, especially with heat.—6. The salts of cadmium are readily distinguished from those of arsenic, by the precipitated sulphuret (see 5) being *insoluble* in ammonia, and *soluble* in hydrochloric acid, and being capable of sustaining a white heat without subliming.

The *salts of cadmium* greatly resemble the corresponding salts of zinc, but they are more energetic in their action. The only one used in medicine is the sulphate. They are nearly all readily formed by dissolving the *hydrated oxide* or *carbonate* in the given acid, and evaporating and crystallizing the solution. Some may be obtained by double decomposition.

CADMIUM (Carbonate of). Syn. *Cadmii Carbonas*,—Lat. From a solution of *sulphate* or *chloride of cadmium*, and an *alkaline carbonate*; the precipitate being collected, washed, and dried by a gentle heat. A white powder.

CADMIUM (Chloride of). Syn. *Hydrochlorate of Cadmium*; *Cadmii Chloridum*, *Cadmii Hydrochloras*, — Lat. *Prep.* 1. (Pure.) By dissolving *carbonate* or *oxide of cadmium* in *hydrochloric acid*, and crystallizing by gentle evaporation. Prismatic crystals; very soluble in water.

2. (Turner.) By exposing the product of the last process to heat. Amorphous.

3. From *crude cadmium* or its *oxide*, and *hydrochloric acid*, as last.

CADMIUM (Iodide of). Syn. *Hydriodate of Cadmium*; *Cadmii Iodidum*, *C. Hydriodas*,—Lat. From *cadmium* and *iodine*, as iodide of zinc.

CADMIUM (Oxide of). Syn. *Protoxide of Cadmium*; *Cadmii Oxydum*,—Lat. *Prep.* 1. (Hydrated.) From *sulphate* or *hydrochlorate of cadmium*, and a *solution of caustic alkali*; observing to well wash and dry the precipitate. A white powder, freely soluble in acids.

2. (Anhydrous.) By igniting the *hydrated oxide*, or the *carbonate* or *nitrate of cadmium*. That from the first two has a pale-brown colour; that from the nitrate has a dark-brown tint and a semi-crystalline appearance. The former have been proposed to be used as pigments.

CADMIUM (Phosphuret of). By direct union of the elements by heat.

CADMIUM (Sulphate of). Syn. *Cadmii Sulphas*, *Cadmium Sulphuricum*, *Klaprothrium Sulphuricum*, — Lat. *Prep.* 1. From *carbonate* or *oxide of cadmium* and *dilute sulphuric acid*, as the chloride.

2. (Cottereau.) *Oxide of cadmium*, 1 *oz.*; *sulphuric acid*, q. s.; dissolve, evaporate, and crystallize.

3. (Pereira.) *Sulphuric acid*, 6½ parts; *water*, 15 parts; mix; add *cadmium*, 7 parts; dissolve, evaporate to dryness, redissolve in water, filter, and evaporate by a gentle heat, so that crystals may form.

Prop., &c. Efflorescent, rectangular, prismatic crystals; very soluble in water; tastes astringent. It is about 4 times as strong as sulphate of zinc, and is used in similar cases. *Dose.* 3 to 10 gr. *Externally*, (½ to 3 or 4 gr. to *water*, 1 oz.;) in specks of the eye, opacity of the cornea, chronic ophthalmia, &c. As an ointment, 10 to 12 gr. to *lard*, 1 oz.

CADMIUM (Sulphuret of). This occurs native in zinc-blende. It may be prepared artificially, either by fusing its elements together, only passing *a stream of sulphuretted hydrogen* through a *solution* of the

chloride, *nitrate*, or *sulphate*. As prepared by precipitation, it has a rich yellow or orange colour, and is fusible at a high temperature. It has been recommended for use as an orange-red pigment.

CAFFEIC ACID. *Chlorogenic Acid.* A white powder, discovered by Runge in coffee, in which it exists in combination with potassa, (*caffeiate of potassa*,) and caffeine, and is then very soluble in alcohol. Pfaff declares that the aroma of coffee is dependent on the volatilization, or rather, the decomposition of this acid.

CAFFEIN. Syn. *Caffeine*, *Caffeina*, *Theine*, *Guaranine*. A peculiar nitrogenized principle, discovered by Robiquet in coffee.

Prep. 1. Coarsely powdered *raw* or *unroasted coffee*, is boiled in *water*, and *acetate of lead* added to the filtered decoction to throw down the extractive and colouring matter; the excess of lead is next precipitated with *sulphuretted hydrogen*, and the liquid filtered and evaporated by a gentle heat; the residuum is dissolved in boiling water, the solution agitated with *freshly-burnt animal charcoal*, filtered, evaporated, and crystallized. By redissolving the product in *hot alcohol*, it may be obtained in white, shining, silky filaments, as the solution cools.

2. (H. J. Versman.) *Quicklime*, 2 *lb.*; *water*, q. s. to form a hydrate; *raw coffee*, (bruised,) 10 *lb.*; mix, put it into a displacement apparatus, and cause *alcohol* of 80° to percolate through the mixture, until the fluid obtained no longer contains caffeine; the mass in the percolator is then roughly ground to powder, mixed with a fresh quantity of *quicklime*, and the process of percolation repeated with fresh *alcohol*, as before. The spirit is next distilled from the mixed tinctures in a retort, and the residuum washed with a little *warm water* to remove the oil; the evaporation is then gently conducted until a crystalline mass is obtained, which is further freed from adhering oil by pressure between folds of blotting paper. It is purified by redissolving it in boiling water or hot alcohol, &c., as before.

Prop., &c. Soluble in 100 parts of cold water; freely soluble in hot water, and in water acidulated with an acid; slightly soluble in cold alcohol; it tastes slightly bitter, and possesses feeble basic properties. With the sulphuric and hydrochloric acids it forms crystallizable compounds. The salts of caffeine may be made by dissolving it, to saturation, in the dilute acid, and evaporating the solution by a very gentle heat. It forms splendid double salts with bichloride of platinum and terchloride of gold.

Remarks. Caffeine was originally thought to be a principle peculiar to *coffee*, but the researches of Pfaff and Liebig have shown that it also occurs in *tea*, and in the leaves of the *guarana officinalis*, and the *ilex paraguayensis*. It is a remarkable fact that both tea and coffee contain this substance, and that both of them are used by whole nations as beverages. Liebig has shown the similarity of composition between caffeine, and taurine, one of the constituents of bile. He believes that the former assists in the production of the latter, and thus facilitates the process of respiration.

The quantity of caffeine in good coffee varies from ½ to ¾ per cent.

Caffeine has been recommended in those pains that affect only one side of the head, (*hemicrania*;) in *doses* of 1 to 3 gr. Its physiological action is very trifling, notwithstanding all that has been said to the contrary. We took 20 gr. daily, of *pure caffeine*, for above a month, without experiencing any other effect than a *very slight* elevation of spirits after each dose, similar to that produced by a small quantity of spirits of sal volatile.

CAFFEIN-MUREXIDE. Formed by treating *amalic acid* with *ammonia*, in a similar manner to that by which ordinary murexide is obtained from alloxantin. It forms crystals possessing a green metallic lustre, and yielding deep crimson solutions.

CAFFEONE. A brown aromatic oil formed during the roasting of coffee.

CAINCIC ACID. An acid principle, discovered by Pelletier and Caventou in the bark of the cainca root of Brazil. It is extracted by alcohol, has a bitter taste, and is crystallizable.

CAKES. A species of fancy bread or trifle familiar to every one.

Before proceeding to the actual operation of cake-making, the various materials which are to enter into their composition undergo a certain amount of preparation. For this purpose every article is got ready about an hour previously to its being wanted, and is placed before the fire, or upon a stove, that it may become *gently* heated. Without these precautions it is impossible to produce good cakes. The *flour* is thoroughly dried, and warmed. The *currants* are nicely washed in a hair sieve, wiped dry in a cloth, and then set before the fire. Before use, they are dusted over with a little flour. The *sugar* is rubbed to a fine powder, and passed through a sieve. The *eggs* are well beaten in a basin, and strained. The *butter* is

melted by being placed in a basin set in hot water, and is afterwards well beaten up with a little warm milk. The *lemon-peel* is cut very thin, and beaten in a mortar to a paste or powder, with lump sugar; or for common purposes, it is grated. The *caraways*, *ginger*, and other flavouring ingredients, are preferred in the form of *fine powder*, or are made into an essence, by digesting them in *spirit of wine;* the first is the most common method. The *milk and water* is made lukewarm. When all these things are ready and have stood a sufficient time, they are put into a pan, one after another, in the proper order, and well beaten together, by which the lightness of the cakes is considerably increased.

In *plum-cakes*, as well as in some other varieties, a *little yeast* may be added after the *butter*, and the mass allowed to rise a little, and then again well kneaded, by which not only less butter and eggs may be used, but the products will be both lighter and more wholesome. Good *stale bread*, well soaked in *hot milk* or *water*, and then beaten to a paste, and passed through a fine sieve, forms an excellent thing to mix up the ingredients with, and produces a very light and nutritious cake. A better plan, however, than either of the preceding, is to use Jones' "patent flour," either entirely, or mixed with other flour, by which all the effects of fermentation with yeast may be instantly produced to perfection. Indeed the results are truly astonishing, and are absolutely invaluable to the cook and housewife. Cakes "wetted up" with milk are "richer," but do not keep so well as those without it; they get stale sooner, and when in that state are far from agreeable to the palate.

Cakes are preferably *baked* on flat tins or in little "tin shapes," which should be first well buttered.

Cakes should be *kept for store* in *tin canisters;* wooden boxes, unless very well seasoned, are apt to give them an unpleasant taste. Brown paper linings and wrappers should be avoided for the same reason. See *Biscuits*, *Bread*, *Icing*, *Stains*, *&c.*

CAKES (Almond). *Prep.* 1. From *sweet almonds*, (blanched and beaten to a smooth paste,) *flour* and *powdered sugar*, of each, ½ *lb.;* 7 *eggs*, and the *outside peel of* 4 *lemons*, (shredded small.) The almonds, sugar, lemon-peel, and eggs, are beaten together, until as white as sponge paste; the flour next worked in, and the paste put into buttered moulds, and baked in a slack oven, with 8 or 10 thicknesses of white paper under them and one or two over them.

2. *Almonds*, 1 *lb.;* *sugar*, ½ *lb.;* *rose water* or *orange-flower water*, ¼ pint; *flour*, ¾ *lb.;* 3 eggs; as above. Some persons ice these cakes.

CAKES (Banbury). From *butter* and *dough fermented for white bread*, of each, 1 *lb.*, as in making puff paste, then rolled out very thin, and cut it into oval or triangular pieces, or other shapes. On these are placed a mixture of *currants* and *moist sugar*, equal parts, wetted with a little *wine* or *brandy*, and the paste being closed up, they are placed on a tin with the closed side downwards, and baked. A little *powdered sugar*, flavoured with *candied peel*, (grated,) or *essence of lemon*, is sifted over them as soon as they come out of the oven. In the common cakes of the shops, the brandy is omitted, and lard is used for butter, and less of it.

CAKES (Bath). *Prep.* From *butter*, ½ *lb.*, *flour*, 1 *lb.*, 5 *eggs*, and a *cupful of yeast;* when risen, add *powdered sugar*, 4 *oz.*, and *caraways*, 1 *oz.* Bake them on tins.

CAKES (Cheese). *Prep.* 1. Curdle some warm *new milk* with rennet, drain the curd in a linen bag, and add ¼ of its weight, each, of *sugar* and *butter*, 6 *eggs*, some *grated nutmeg*, and a *little orange-flower* or *rose water.*

2. (*Almond Cheese Cakes.*) To the above add as much *blanched almonds*, beaten to a smooth paste, as there is butter, and an equal weight of *macaroni.*

3. (*Lemon Cheese Cakes.*) To the first form add *lemon peel*, (grated fine,) or *essence of lemon*, q. s.

CAKES (Diet). Syn. *Diet Bread. Prep.* 1. Dissolve *sugar*, 1 *lb.*, in *milk*, ½ pint; add 6 *eggs*, and whisk the mixture to a full froth, then cautiously stir in *flour*, 1 *lb.*, beat it for ¾ hour, and immediately bake it in a quick oven. It may be baked whole or divided into small cakes.

2. From *fine flour* and *powdered sugar*, equal parts; 6 eggs; and the *juice* and *rind* (grated) *of* 1 *lemon.*

CAKES (Drop). *Eggs*, 1 dozen; *rose-water*, 1 tablespoonful; *powdered sugar*, ½ *lb.;* *fine flour*, ½ *lb.;* and *caraways*, ½ *oz.* Drop it on wafer paper, and bake as before.

CAKES (Ginger). *Sugar*, 1 *lb.;* *powdered ginger*, 4 *oz.;* *flour*, 2 *lb.;* *water*, 1 pint; butter, ½ *lb.;* *candied orange peel*, 8 caps, (grated.)

CAKES (Lemon). *Prep.* *Flour* and *sugar*, of each, 1 *lb.;* *eggs*, 1 dozen; *grated peel* and *juice of* 4 *lemons;* whisk the eggs to a bright froth, then gradually add the rest.

CAKES (Marlborough). *Prep.* Beat

8 *eggs* and 1 *lb.* of *pounded sugar* ¾ hour; then add *fine flour*, 1 *lb.*; and *caraway seeds*, 2 *oz.*

CAKES (Plain). *Prep.* 1. From *flour*, 4 *lb.*; *currants*, 2 *lb.*; *butter*, ½ *lb.*; *caraway seeds*, ¼ *oz*; *candied lemon peel*, (grated,) 1 *oz.*; *yeast*, ¼ pint; *milk*, q. s. Let it rise well before baking.

2. *Baker's dough*, 2 *lb.*; *currants*, 1 *lb.*; *butter*, ¼ *lb.*; 3 *eggs*; *milk* (hot), ¼ pint.

3. (Rundell.) *Baker's dough*, 4 *lb.*; *butter* and *moist sugar*, of each, ¼ *lb.*; *caraway seeds*, a small handful. Well work it together, pull it into pieces the size of a golden pippin, and work it together again. This must be done *three* times, or it will be in lumps, and heavy when baked.

4. (*Rich.*) Equal weights of *flour*, *butter*, *sultana raisins*, *eggs*, *currants*, and *brown sugar*, mixed up with *milk*, and seasoned with *candied peel*, *nutmeg*, &c., and baked in a quick oven. This resembles "pound cake."

CAKES (Plum). *Prep.* 1. (*Good.*) From *butter*, ½ *lb.*; *dry flour*, 3 *lb.*; *Lisbon sugar*, 8 *oz.*; *plums* and *currants*, of each, ¾ *lb.*; and some *pimento*, finely powdered; to be "wetted up" with 3 spoonfuls of *yeast*, and a Winchester pint of *new milk* (warmed); bake on a floured tin half an hour.

2. (*Excellent.*) From *fresh butter*, *sifted sugar*, *flour*, and *currants*, of each, 1 *lb.*; 18 *eggs*; *powdered spices*, 2 *oz.*, (viz., *cloves*, *mace*, *cinnamon*, *nutmeg*, and *allspice*;) *sliced almonds*, 4 *oz.*; *raisins*, (stoned and chopped,) ½ *lb.*; and a *large glass of brandy*; bake in a hot oven. When sufficiently baked, let the oven cool, and afterwards put in the cake and allow it to remain for several hours to dry. (Rundell.)

3. (*Rich.*) Take *fresh butter* and *sugar*, of each, 1 *lb.*; *flour*, 1½ *lb.*; *currants*, 2 *lb.*; a *glass of brandy*; *sweetmeats* and *peels*, 1 *lb.*; *sweet almonds*, 2 *oz.*; 10 *eggs*; *allspice* and *cinnamon*, of each, ¼ *oz.*; bake in a *tin hoop* in a hot oven for 3 hours, and put 12 sheets of paper under it to keep it from burning. (Mackenzie.)

CAKES (Portugal). From *flour*, *powdered sugar*, and *fresh butter*, of each, 1 *lb.*; 10 *eggs*; *currants*, ½ *lb.*; and a little *white wine*; bake in small tins only half filled.

CAKE (Pound). *Prep.* 1. As *plum cake*; but using 1 *lb. each* of *all* the ingredients, except the spices.

2. Using equal parts of *sugar*, *flour*, *currants*, and *sultana raisins*, and half that quantity each of *butter*, *brandy*, and *candied peel*, with *spices* as required.

CAKES (Queen). From about 1 *lb.* each of *dried flour*, *sifted sugar*, *washed currants*, and *butter*, with 8 *eggs*; the whole beaten for an hour, made into a batter, and baked in little tins, teacups, or saucers, only half filled. A little *fine sugar* is frequently sifted over them. *Nutmeg*, *mace*, and *cinnamon* are also sometimes added.

CAKES (Ratifia). *Prep.* Beat ½ *lb.* of *sweet*, and 1 *oz.* of *bitter almonds*, in fine *orange*, *rose*, or *ratifia water*; mix in ½ *lb.* of *pounded sugar*; add the *whites of* 4 *eggs*, (well beaten;) set it over a moderate fire in a preserving-pan; stir it one way until it is pretty hot, and when a little cool, form it into small rolls, and cut it into thin cakes; shake *some flour* lightly on them, give each a light tap, put them on *sugar papers*, sift a *little sugar* on them, and put them into a very slack oven.

CAKES (Rout). From *flour*, 2 *lb.*; *butter*, *sugar*, and *currants*, of each, 1 *lb.*; 3 *eggs*; ½ pint of *milk*; 2 glasses of *white wine*; and 1 glass of *brandy*; drop them on a tin plate, and bake them.

CAKES (Savoy). *Prep.* From *flour* and *sifted sugar*, of each, 1 *lb.*; 10 *eggs*; and the *rind of a lemon*, (grated;) form a batter by degrees, put it into moulds, and bake in a slack oven.

CAKE (Seed). *Prep.* 1. (*Plain.*) From *flour*, ¼ peck; *sugar*, ½ *lb.*; *allspice*, ¼ *oz.*; *melted butter*, ½ *lb.*; a little *ginger*; *milk*, ½ pint; *yeast*, ¼ pint; add *seeds* or *currants*; and bake an hour and a half.

2. (*Good.*) To the preceding add of *butter* and *sugar*, of each, ½ *lb.*, and wet it up with *milk* previously mixed with 6 *eggs*.

3. (*Rich.*) Take of *flour*, 1½ *lb*; *butter* and *sugar*, of each, 1 *lb.*; 8 *eggs*; 2 *oz.* of *caraway seeds*, 1 grated *nutmeg*, and its weight in *cinnamon*. Bake 2 hours in a quick oven.

4. (*Scotch.*) Nine *eggs*; *sugar* and *butter*, of each, ½ *lb.*; mix well together, then add a little *cinnamon*, *nutmeg*, and *cloves*; ¼ *oz.* of *caraway seeds*; ½ *lb.* of *candied citron*; ¼ *lb.* of *candied orange peel*; ½ *lb.* of *blanched almonds*, (pounded fine;) *flour*, 3 *lb.*; and *brandy*, ¼ pint.

CAKES (Shrewsbury). From *flour*, 3 *lb.*; *sugar*, 1 *lb.*; a little *cinnamon* and *nutmeg*; 3 *eggs*; a little *rose water*; and *melted butter* enough to make it into a dough.

CAKES (Soda). *Prep.* 1. From *flour*, 1 *lb.*; *bicarbonate of soda*, ¼ *oz.*; *sugar* and *butter*, of each, ½ *lb.*; make a paste with *milk*, and add candied *orange*, *lemon*, or *citron peel*, or the *fresh peels grated*, q. s. to flavour.

2. To *flour*, 1 *lb.*; *sugar* and *butter*, of each, 2 *oz.*; *candied peel*, ½ *oz.*; *sesquicarbonate of soda*, 3 *dr.*; *milk*, q. s.

Obs. An equal weight of *carbonate of magnesia*, used instead of the soda, also makes good cakes. Both are suitable to delicate stomachs, especially in dyspepsia, with acidity.

CAKE (Sponge). *Prep.* From 8 *eggs*; *lump sugar*, ¾ *lb.*; *flour*, ½ *lb.*; *water*, ¼ pint; the *yellow peel of a lemon*; mix as follows:—Put the lemon peel into the water; when about to make the cake, put the sugar into a saucepan, pour the water and peel on it, and let it stand by the fire to get hot. Break the eggs into a deep earthen vessel that has been made quite hot; remove from the heat, whisk for a few minutes; make the sugar and water boil up, and pour it very gradually boiling-hot over the eggs; continue to whisk them briskly until they become thick and white; add the *flour*, (quite warm,) stir it lightly in, put the paste into tins lined with white paper, and bake them immediately in a moderately hot oven.

CAKES (Tea). Syn. *Benton Cakes.* From *flour*, 1 *lb.*; *butter*, 4 *oz.*; and *milk*, q. s.; bake on a hot hearth or slow oven plate.

2. To the last, add 2 tablespoonfuls of *yeast*.

CAKES (Tipsy). Small *sponge cakes* steeped in *brandy*, and then covered with *grated almonds* and *candied peel*; or *almonds* (cut into spikes) are stuck in them. They are commonly piled on a dish, surrounded with a *custard*, and covered with *preserves* drained as dry as possible.

CAKES (Wigg). From ½ pint of *warm milk*; ¾ *lb.* of *fine flour*; and 2 or 3 spoonfuls of *light yeast*. Afterwards work in 4 *oz.* each of *sugar* and *butter*; make it into cakes, or wiggs, with as little *flour* as possible, add a few *caraway seeds*, and bake them quickly.

CAKES. (In Medicine.) Cakes have been used as a form of administering medicinal substances to children, but have not been extensively employed in this country for the purpose, unless by quacks, and in domestic practice. In preparing them, the active ingredients are added in such proportions to the common materials of a sweet cake, that *one* or *two*, as the case may be, are sufficient for a dose. See *Gingerbread*, *Worm-cakes*, &c.

CALAMINE. Syn. *Native Carbonate of Zinc*; *Calamina*, *Lapis Calaminaris*, *Zinci Carbonas Impurum*,—Lat. For medicinal purposes this substance is ground to fine powder in mills, and then submitted to the process of elutriation, or washing over, as in the preparation of chalk. The London College orders it to be burnt before grinding it. In this state it constitutes the *Calamina præparata*,—Ph. L.

Prop., &c. Calamine is drying and astringent, and is hence frequently used as a dusting powder for children, and for excoriations and ulcers. It forms the principal ingredient in *calamine cerate*, better known as *Turner's cerate*. It is also largely used in metallurgy to furnish zinc and to make brass.

Recent analysis has shown that the lapis calaminaris of the shops does not generally contain a particle of this substance. It is a factitious compound consisting of heavy sulphate of baryta (cawk) and chalk, coloured with Armenian bole. Mr. Brett found it to contain 75% to 87·5% of sulphate of baryta. Out of 5 samples obtained by Mr. Moore from the leading druggists, examined in the laboratory of the Pharmaceutical Society, the quantity of sulphate of baryta which they contained was respectively, 82·8%, 84·8%, 85·2%, 89·3%, and 90·8%; without a particle of any compound of zinc in them.

Pure lapis calaminaris is "almost entirely dissolved in dilute sulphuric acid, emitting very few or no bubbles of carbonic acid," (when it has been roasted.) "The solution, on the addition of ammonia or potassa, throws down a precipitate which is redissolved by the addition of either alkali in excess." (Ph. L.)

CALCINATION. The process of burning or exposing any substance to a high degree of heat, is called calcination, and the residuum or cinder was formerly called the *calx*, or *calces*. Thus,—*chalk*, by burning, is converted into *lime*; *gypsum*, into *plaster of Paris*; *wood*, into *charcoal*; and *bones*, into *ivory black*.

The method of conducting the process of calcination depends on the nature of the body operated on. Many substances, for delicate experiments, are calcined over a spirit lamp in a *platinum spoon* or *crucible*; others, in *iron vessels* or *earthen crucibles*, placed in a common furnace. When the action of the air proves injurious, as in the manufacture of charcoal, the process is performed in close vessels or chambers. In some cases, the fuel is mixed with the articles, and they are both burnt together, as in the *manufacture of lime*, the *roasting of ores*, &c. The process of *drying salts*, or driving off their water of crystallization by heat, is also frequently called calcina-

tion; thus we have *calcined copperas, alum, &c.*

CALCIUM is the metallic base of lime. It was discovered by Sir H. Davy, and is prepared in a similar way to that employed for barium. It is a whiter metal than either barium or strontium, and is extremely oxidable. Its *protoxide* is quicklime. It also forms a *binoxide* or *peroxide* with an additional dose of oxygen, which may be made in the same way as peroxide of barium, which it resembles in its general properties. With bromine it forms a *bromide;* with fluorine, a *fluoride;* with iodine, an *iodide;* and with phosphorus, a *phosphuret of calcium.*

CALCIUM (Bromide of). Syn. *Calcii Bromidum,*—Lat. *Prep.* (Magendie.) To a *solution of bromide of iron* add *hydrate of lime,* in slight excess; filter, evaporate to dryness, redissolve in water, and again filter, and evaporate.

CALCIUM (Chloride of). Syn. *Hydrochlorate of Lime, Muriate of do.; Calcii Chloridum,*—Ph. L. & D. *Calcis Hydrochloras; Calcis Murias,*—Ph. E. *Prep.* 1. To *hydrochloric acid,* diluted with an equal weight of *water,* add *powdered chalk* or *white marble,* (in small fragments,) until effervescence entirely ceases, and the liquid no longer reddens blue litmus paper; filter, evaporate to one half, and set the liquid aside to crystallize; lastly, collect the crystals, dry them by pressure between the folds of bibulous paper, and preserve them in a stoppered bottle. The mother-liquor will yield more crystals by evaporation.

2. (Ph. L. 1836.) *Hydrochloric acid* and *water,* of each, 10 fl. oz.; *chalk,* 5 *oz.;* as the last, but evaporating to dryness, and fusing the residuum, instead of crystallizing.

3. (Ph. L. 1851.) Merely included in the list of materia medica.

4. (Ph. D.) *Hydrochloric acid,* 2½ pints; *water,* 6 pints; *chalk,* 2 *lb.;* as the Ph. L. 1836.

5. (Ph. D. 1826.) The *residual liquor* from the preparation of *liquor of ammonia,* filtered and evaporated to dryness.

6. (Ph. E.) *Commercial muriatic acid* and *water,* of each, 1 pint; *white marble,* in fragments, 10 oz.; as No. 1.

Prop., &c. Colourless, prismatic, highly deliquescent crystals, containing nearly half their weight of water, which they lose by heat; strongly ignited the salt fuses; it is freely soluble in alcohol, and dissolves in about ¼th its weight of cold water, and less of hot water. Left for a short time in damp air, it absorbs water and assumes the liquid form, (*oil of lime; oleum calcis.*) In the fused state, (*calcii chloridum fusum,*) reduced to coarse powder, it is much used for *drying gases* and *absorbing the water* from ethereal and oily liquids in *organic analysis,* and in the process of distillation. In its hydrous or crystallized form, it is much used in the preparation of freezing mixtures with snow. For this purpose, the evaporation need only be conducted so far that the whole becomes a solid mass on removal from the fire, as it is used in the form of powder. As a test for sulphuric acid, it produces a characteristic white precipitate insoluble in nitric acid. In the rectification of alcohol, and for forming a water-bath with a high boiling point, it is invaluable. As a *medicine,* it has been given in some scrofulous and glandular diseases, and has also been used as a bath in the same cases.

Fused chloride of calcium is "free from colour; slightly translucent; hard and friable; *totally* (and readily) soluble in water: the solution gives no precipitate with either ammonia or chloride of barium, nor, when much diluted, with ferrocyanide of potassium." (Ph. L. 1836.) In the *crystalline form,* it is "extremely deliquescent. A solution of 76 grains, in a fluid ounce of distilled water, precipitated with 49 grains of oxalate of ammonia, remains *precipitable* by *more* of the test." (Ph. E.) See *Solutions.*

CALCIUM (Fluoride of). Syn. *Hydrofluorate of Lime.* This is the well known native mineral called *fluor spar.*

CALCIUM (Iodide of). Syn. *Hydriodate of Lime; Calcii Iodidum, Calcis Hydriodas,* —Lat. *Prep.* (Magendie.) From a solution of *iodide of iron* and *hydrate of lime,* as directed under iodide of barium. It has been given in chronic bronchitis and tubercular consumption.

CALCIUM (Oxides of). See *Lime* and *Calcium.*

CALCIUM (Phosphuret of). Syn. *Phosphuret of Lime, Phosphide of Calcium; Calcii Phosphuretum, C. Phosphidum,*—Lat. *Prep.* By passing the *vapour of phosphorus* over *lime* (in small fragments) heated to redness in a *porcelain tube.* A brownish substance, supposed to be a mere mechanical mixture of phosphuret of calcium and phosphate of lime. Thrown into water, it suffers instant decomposition, and *phosphuretted hydrogen gas* escapes.

CALCIUM (Sulphuret of). Syn. *Sulphuret of Lime, Sulphide of Calcium; Calcii Sulphuretum,*—Lat. Calcium forms with *sulphur* at least three different compounds:—

1. (*Protosulphuret of Calcium, Protosul-*

phide of do.; P. of Lime.)—*a.* From *sulphate of lime*, exposed at a high temperature to a *stream of hydrogen gas.*—*b.* From *dried gypsum*, 25 parts; *lamp black* or *finely powdered charcoal*, 4 parts; calcined together at a strong heat in a covered crucible.

2. (*Bisulphuret of Calcium.*) From *sulphur* and *quicklime*, equal parts; *water*, q. s.; slake the lime, add the sulphur, and boil until a solution is obtained, which on cooling deposits crystals.

3. (*Pentasulphuret of Calcium.*) As the last, but increasing the quantity of *sulphur*, and continuing the boiling for a longer period. Little is known about it.

4. (*Commercial* and *Pharmacopœial.*)—*a.* As 1, *b*, (above.)

b. (P. C.) *Sulphur*, 1 part; *hydrate of lime*, 3 parts; *water*, 2½ pints; boil until it solidifies on cooling, then pour it out on a cold marble slab, and when solid, break it into pieces and preserve it in a well-corked bottle.

c. (Guibourt.) *Quicklime*, 7 parts; *sulphur*, 4 parts; mix, and heat the compound for about 2 hours in a covered crucible.

d. (Cottereau.) *Quicklime*, 2 parts; *sulphur*, 1 part; *water*, 5 parts; as 4, *b*, (above.)

Obs. The precise composition of the last three preparations is uncertain. They are acrid, caustic, stimulant, diaphoretic, and detergent. *Dose.* 1 to 3 gr. Made into an embrocation, sulphuret of lime has been strongly recommended in gout, scabies, &c. Its solution yields pure sulphur on the addition of hydrochloric acid.

CALCULATIONS (Useful). 1. *To find the Value of a Dozen Articles.* Take the price in *pence* as *shillings*, and if there are any *farthings* in the price, add threepence for each. Thus 2*s.* 8*d.*, or 32 pence per yard, is 1*l.* 12*s.* per dozen.

2. *To find the Value of One Hundred Articles.* For every *farthing* take as *many pence* and *twice as many shillings.* Thus, 1¼*d.* each, is—5*d.*, and 10*s.*=10*s.* 5*d.* per hundred.

3. *To find the Value of a pound at any price per ounce.* Take the price in *farthings* as *shillings*, and divide by three. Thus, 5¼*d.* per ounce, is 21 farthings; taken as shillings, 21 ÷ 3=7*s.* per pound.

4. *To find the Value of an ounce at any price per pound.* Take the *shillings* as *farthings*, and multiply by three. Thus, at 6*s.*—6 × 3=18 farthings, or 4½*d.* per ounce.

Obs. By reversing Nos. 1 and 2, the price of a single article or pound may be found from the price per dozen or hundred. For several other calculations, useful in domestic economy, chemistry, &c., see *Brewing*, *Decimals*, *&c.*

CALICO PRINTING. The art of producing figured patterns upon calico, by means of *dyes* and *mordants* topically applied by wooden blocks, copper-plates, or engraved cylinders, by which the goods are either directly printed in colour, or receive their patterns, by being run through a *colouring bath* or *mordant*, when the dye is only produced upon that portion of the ground previously prepared for it. Of late this system of dyeing has been extended to silks and woollens.

The mordants are thickened with some glutinous substance, as *flour*, *starch*, or *gum*, to render them adhesive and to prevent their spreading.

There are eight principal styles of calico-printing, each requiring a different method of manipulation:—

In the *madder* or *chintz style* the *mordants* are applied to the *white cloth*, and the *colours* are brought out in the dye-bath. This is the method commonly followed for "permanent prints."

In the *padding* or *plaquage style*, the *whole cloth* is passed through a *bath of some particular mordant*, and different mordants are afterwards printed on it before submitting it to the *dye-bath.* By this means the colour of the ground and pattern is varied. Like the last, it is much used for gown pieces, &c.

In the *reserve style*, white or coloured spots are produced on a blue ground, by covering those parts with a composition called *resist paste*, before passing the goods through the *dye-bath*, which is usually done cold.

The *discharge*, or *rongeant style*, is the reverse of the preceding; it exhibits bright figures on a dark ground, and is produced by printing with *acidulous* or *discharge mordants* before the cloth is passed through the *colouring-bath.*

China blue, is a style resembling that on blue stone-ware.

The *decolouring* or *enlavage style. Chlorine* or *chromic acid* is topically applied to the surface of the goods previously dyed, by which the colour is discharged.

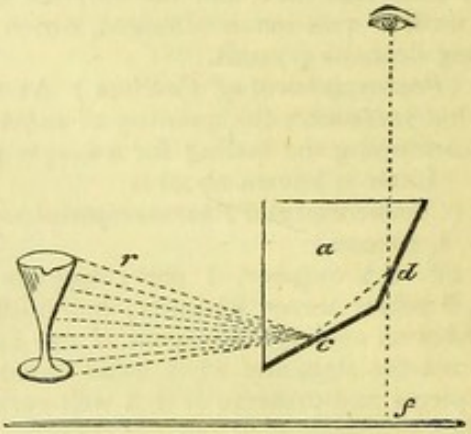
Steam-colour printing, consists in printing the calico with a *mixture of dye extracts* and *mordants*, and afterwards exposing it to the *action of steam.*

Spirit-colour printing, is a method by which brilliant colours are produced by a mixture of *dye-extracts* and *solution of tin*, called by the dyers "*spirits of tin.*"

For further information on this subject, the reader is referred to Ure's '*Dictionary of Arts, Manufactures, and Mines*,' where he will find the several processes of calico-printing fully treated on, and most ably and accurately described. To enter largely into the subject in this work might amuse the reader, but would be of no practical value; as calico-printing, unlike dyeing, is an art only practised on the large scale, and by men who obtain their whole knowledge of it in the laboratories and printing rooms of the factories.

CALOMEL. See *Mercury* (Chlorides).

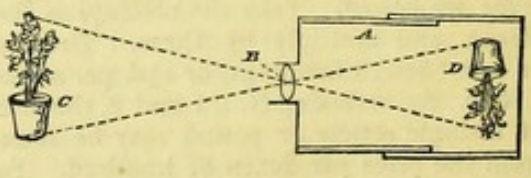
CALUMBIN. Syn. *Calombine*, *Calumbina*. A bitter substance discovered by Wittstock in calumba root.



Prep. 1. Digest *calumba root* (in coarse powder) in *water acidulated with acetic acid;* express, filter, boil to one half, again filter, add *carbonate of lime*, in slight excess, and evaporate to dryness in a water bath; reduce the residuum to powder, and digest it in boiling alcohol; the latter will deposit crystals of calumbine on cooling.

2. (Wittstock.) Evaporate *tincture of calumba root* (made with rectified spirit) to dryness; dissolve the residuum in *water*, and agitate the solution with an equal bulk of *ether;* after repose for a short time, decant the ethereal portion, distil off most of the ether, and set the liquid aside to crystallize.

Obs. Impure calumbine occurs as a yellow-brown mass; when pure it forms rhombic prismatic crystals, or delicate white needles; it is only slightly soluble in alcohol, ether, and water; 40 parts of boiling rectified spirit take up only 1 part of calumbine. Its best solvent is acetic acid; it is also soluble in acidulated and alkalized water. Neither nut-galls nor metallic salts affect its solution. Concentrated sulphuric acid dissolves it, and assumes first a yellow, and then a red colour. Its properties indicate that weak vinegar or sour wine, would be the best menstruum for extracting the medicinal virtues of calumba root. *Dose.* 1 to 3 gr. twice a day as a tonic and stomachic, in dyspepsia, debilitated stomach, bilious vomiting, &c.; and in the later periods of dysentery and diarrhœa.



CALX. Lime. This term was formerly applied to the residuum of the combustion of any substance; or to any substance which had been exposed to a strong heat. See *Antimony*, *Calcination*, *&c.*

CAMERA LUCIDA. When a ray of light (*r*) falls upon a quadrangular glass prism (*a*), it is bent by two reflections (at *c* & *d*), and thrown upwards where it may be received by the eye, to which it will appear described on the table or sheet of paper (*f*), placed to receive it. The point of a pencil used to trace any object on the paper can also be seen, and by its means the picture may be easily copied. When the

prism is mounted on a stand, and a thin brass plate with a small hole through it for the eyepiece adjusted thereto, it forms the instrument sold by the opticians. The image may be magnified or lessened by placing a lens, so as either to intercept the rays before they strike the prism, or before they reach the eye. An ingenious person will readily be able to set up this instrument, than which a more useful one cannot exist.

CAMERA OBSCURA. The principles and construction of the camera obscura may be thus described:—A convex lens (*B*), is placed in a hole admitting the light into a darkened box or chamber (*A*), which falling on a white ground (*D*), produces an inverted picture of every object within its range. The image thus formed may be restored to its natural position, by allowing the rays of light to pass through two lenses instead of one, or by receiving the rays on a mirror placed at an angle of 45°, when the image will be thrown on the floor in its original position. The picture may be viewed through an oblong aperture cut in the box, or the experiment may be performed in a darkened room, by placing the lens in a hole in the shutter, and allowing the image to fall on the wall, or on a sheet of white paper stretched to receive it.

In the simplest form, when intended for taking views or portraits, the image is thrown upon a mirror placed at an angle of 45°, and resting on the bottom of the box, by which means it is thrown upwards against a plate of glass, also placed at a similar angle. On this is laid a piece of semitransparent tracing paper, on which the object is distinctly seen painted, and may be traced out with a pencil. When the camera is used in photography, slides are provided to retain the sensitive paper in the proper position in the box or dark chamber to receive the image, and the whole apparatus is adjusted with screws, and slides of the most delicate description. Achromatic glasses are also employed. See *Photography, &c.*

CAMPHENE. Syn. *Camphine.* The name given by "the trade" to *rectified oil of turpentine* when sold for burning in lamps, in order that purchasers may not be aware of the inflammable character of the liquid. The term *camphene* is applied by chemists to a hypothetical substance, which is supposed to exist in the artificial camphor prepared by the action of hydrochloric acid on oil of turpentine.

CAMPHOGEN. Syn. *Cymol.* A hydrocarbon formed by *distilling camphor* with *anhydrous phosphoric acid.* It is a colourless, volatile, highly odorous liquid, which can only be distilled in an atmosphere of carbonic acid gas or a vacuum, as contact with the air rapidly destroys it.

CAMPHOLENE. A volatile hydrocarbon obtained by distilling a mixture of *campholic acid* and *anhydrous phosphoric acid.*

CAMPHOLIC ACID. A white, crystalline, acid substance, obtained by passing the *vapour of camphor* over a mixture of *hydrate of potassa and quicklime,* strongly heated in a porcelain tube. It is only sparingly soluble in water. With the bases it forms *campholates.* No gas is evolved during the process.

CAMPHOR. Syn. *Camphire, Laurel Camphor; Camphora,*—Ph. L. E. & D. The camphor of commerce is principally extracted from the *laurus camphora,*(Linn.,) or *laurel camphor tree* of China and Japan. It is also found in several other members of the vegetable kingdom. The Chinese and Japanese extract the camphor by cutting the wood into small pieces and boiling it with water in iron vessels, which are covered with large earthen capitals or domes, lined with rice straw. As the water boils, the camphor is volatilized along with the steam, and condenses on the straw, under the form of grayish granulations. In this state (*crude camphor; camphora cruda;*) it is collected and transported to Europe.

Refined camphor, (*camphora raffinata, c. elaborata; camphora,*—Ph. L. E. & D.,) or the *white camphor* of the shops, is prepared as follows:—100 parts of *crude camphor* are mixed with 2 parts each of *quicklime* and *animal charcoal,* both in powder, and the mixture is placed in a thin globular glass vessel, sunk in a sand bath. The heat is then cautiously applied, and the vessel gradually and carefully raised out of the sand as the sublimation goes on. When the process is complete, the subliming vessel is removed and allowed to cool.

Obs. The whole process of refining camphor requires great care and experience to ensure its success. If conducted too slowly, or at a heat under 375° Fahr., the product is found to be *flaky,* and consequently unsaleable, without remelting or subliming. An improvement on the common method, is simply to sublime the above mixture in any convenient vessel furnished with a large and well-cooled receiver, and to remelt the product in close vessels *under pressure,* and to cool the liquid mass as rapidly as possible.

Prop., &c. A white semi-crystalline solid, very volatile at common temperatures; freely soluble in alcohol, ether, bisulphuret of carbon, benzole, oils, and acetic acid, and sufficiently so in water (about 1¼ grs. to 1 oz.,) to impart its characteristic smell and taste; 100 parts of alcohol (sp. gr. 0·806) dissolve 120 parts of camphor; concentrated acetic acid dissolves twice its weight of camphor; average sp. gr. 0·990. It fuses at 347° and boils at 400° Fahr.

Uses, &c. Camphor is sedative, narcotic, anodyne, diaphoretic, and anaphrodisiac. *Dose.* 2 to 10 gr. in the form of pill or bolus, or made into an emulsion with yelk of egg, mucilage, or almonds. In overdoses it is poisonous. The best antidote is opium or wine, preceded by an emetic. It is also used externally in ointments, liniments, and embrocations.

Camphor is frequently put into wardrobes and clothes-trunks, to keep away insects; it is used to make the white stars and fire of the pyrotechnist; and by the varnish maker to increase the solubility of copal and other gums. Mixed with 6 times its weight of clay, and distilled, it suffers decomposition, and yields a yellow aromatic volatile oil, smelling strongly of thyme and rosemary, which is much used by the wholesale druggists and perfumers to adulterate some of the more

costly essential oils, and by the fancy soap makers to scent their soaps.

Camphor may be beaten in a mortar for some time, without being reduced to powder, but if it be first broken with the pestle, and then sprinkled with a *few drops* of *rectified spirit of wine*, it may be readily pulverized. By adding *water* to an *alcoholic* or *ethereal solution of camphor*, this drug is precipitated under the form of an impalpable powder of exquisite whiteness.

Pure camphor is ENTIRELY soluble in rectified spirit, oils, and strong acetic acid; a fragment placed on a heated spoon or in a warm situation, will *wholly* disappear, and the evolved fumes will be highly fragrant (*camphoraceous*), and be free from an acid or terebinthinate odour.

CAMPHOR (Amber). Syn. *Crystalline Pyrétine, Volatile Resin of Amber.* The yellowish light sublimate which forms towards the end of the process of the destructive distillation of amber in close vessels; it comes over after the last portion of the oil, and is found in the neck of the retort.

CAMPHOR (Borneo). Syn. *Sumatra Camphor, Dragon's Brain Perfume.* From the *dryobalanops aromatica* or *camphora;* a tree growing in Borneo and Sumatra. It is found in natural fissures or crevices of the wood. The same tree yields a species of fluid camphor, (*liquid camphor, camphor oil; oleum camphoræ;*) by incision. The latter has a mixed odour of cajeput, camphor, and cardamoms. It is chiefly employed to scent fancy soaps.

CAMPHOR (Factitious). Syn. *Hydrochlorate of Oil of Turpentine, Kind's Artificial Camphor.* Prepared by passing *hydrochloric acid gas* into pure *oil of turpentine*, cooled by a freezing mixture or pounded ice. After a time a white crystalline mass is formed, which must be drained, and dried by pressure between folds of bibulous paper. It may be purified by solution in alcohol.

Prop., &c. It has a camphoraceous taste and odour; burns with a greenish sooty flame, and when blown out evolves a terebinthinate odour; heated a little above the boiling-point of water, slight fumes of hydrochloric acid gas are perceptible; distilled with quicklime, chloride of calcium, water, and *camphilene* are formed.

Obs. It is found that several of the *essential oils*, by carefully distilling off about $\frac{1}{3}$d their volume, yield a species of camphor. By collecting this, and redistilling the remainder of the oil 2 or 3 times, a further quantity of camphor may be obtained. *Oil of rosemary*, treated in this way, yields about 10% of camphor; *oil of sweet marjoram* the same; *oil of sage* yields 13%; *oil of lavender*, 25%. By keeping the oils loosely corked, and in a cool place, they produce a larger portion of this pseudo-camphor. *Aniseed camphor* is the congealable portion of oil of aniseed, separated from the liquid oil, which it resembles in odour and flavour.

CAMPHOR (Hydrochlorate of). Syn. *Muriate of Camphor; Camphoræ Hydrochloras,*—Lat. By passing *hydrochloric acid gas* over *camphor*, in small fragments, until it ceases to be absorbed.

CAMPHOR (Nitrate of). Syn. *Camphor Oil; Oleum Camphoræ Factitium,*—Lat. Prepared by dissolving *camphor* in *nitric acid*, in the cold.

CAMPHOR (Sulphite of). From *camphor* and *sulphurous acid gas*, as hydrochlorate of camphor.

CAMPHOR CAKES. *Prep.* 1. *Camphor liniment*, (P.L.,) 1 *oz.; melted spermaceti*, 1½ dr.; mix.

2. *White almond oil*, 4 *oz.; spermaceti*, 1 *oz.;* melt, add *camphor*, (cut small,) ¾ *oz.;* stir until melted, then pour it into small gallipots or bottles, and allow it to crystallize. *Used* for chaps and chilblains. See *Camphor Balls.*

CAMPHORIC ACID. Syn. *Acidum Camphoricum,*—Lat. *Prep.* From *camphor*, 1 part; and *nitric acid*, (sp. gr. 1·33,) 4 parts; distilled together in a glass retort, with a gradually increasing heat, until vapours cease to be evolved; the camphor that has volatilized is then added to that in the retort, along with 4 or 5 parts more of *nitric acid*, and the process repeated again and again, until 20 *parts of acid* have been consumed, when *crude camphoric acid* crystallizes out of the remaining liquor, on cooling. The crystals are purified by washing with *cold distilled water*, solution in *boiling water*, and evaporating the solution until a pellicle forms; crystals of *pure camphoric acid* are formed as the liquid cools.

Prop., &c. Small colourless needles; acid; bitter; fusible; sparingly soluble in water; soluble in alcohol; alcoholic solution not precipitated by water, which distinguishes *camphoric acid* from *benzoic acid.* Its salts are called *camphorates.* The *soluble camphorates* may be made by digesting the carbonate or hydrate of the base in a hot solution of the acid, and the *insoluble camphorates* by double decomposition. By distillation, camphoric acid yields a colourless crystalline neutral sub-

stance, which has been improperly called *anhydrous camphoric acid.*

CAMPHRONE. Syn. *Camphorone.* A light oily liquid obtained along with a species of naphthaline, when the *vapour of camphor* is passed over *small fragments of quicklime* heated to redness. It is also formed when *camphorate of lime* is submitted to distillation.

CAMPHYLENE. See *Camphogen.*

CAMWOOD. This dye-stuff resembles Brazil wood in its properties, and is used in a similar manner.

CANADA BALSAM. Syn. *Balsamum Canadense, Terebinthina Canadensis,*—Lat. From the *abies balsamea,* (Lindley,) a tree of common growth in Canada and the State of Maine. When *pure,* it is perfectly transparent, has an agreeable odour (not *terebinthinate,*) and is *wholly* soluble in rectified oil of turpentine, with which it forms a beautiful glassy and colourless varnish, much used for preparing a semi-transparent copying paper.

CANADA BALSAM (Factitious). Syn. *Balsamum Canadense Factitium,* — Lat. *Prep.* 1. *Yellow resin,* 3 *lb.; oil of turpentine,* 1 gall.; dissolve, and add *essence of lemon,* 2 dr.; *oil of rosemary,* 1½ dr.

2. To the last add of *nut oil,* 1 pint. Both are sold in the shops for Canada balsam.

CANCER. Syn. *Carcinoma,*—Lat. A malignant disease attacking the glands, consisting of an indolent scirrhous tumour, terminating in an ill-conditioned ulcer, generally accompanied with excruciating pain, more especially in the later stages. Various modes of treating cancer have been, at different times, recommended by the faculty and empirics. Among these extirpation with the knife appears to be most in favour with the former, when practicable. The removal of the tumour does not, however, destroy the constitutional taint, although it may lessen its intensity, and render the subsequent treatment of the disease less difficult. Recently, the application of *intense cold* has been highly recommended in cancerous affections of the glands. A little *pounded ice* is tied up in the corner of a thin silk handkerchief or a piece of bladder, and the "pad" thus formed, pressed gently against the tumour and the parts immediately adjacent for a short time, once or twice a day. The degree of cold may be increased by mixing an equal weight of *common salt* with the *pounded ice,* by which the benumbing effect of the application will be greatly augmented. *Electricity* and *galvanism* have also been occasionally found useful. Among *special remedies* for cancer, the following are those which deserve the most attention:—*Hemlock* (combined with alkalies, tonics, and stomachics,) *belladonna,* (as the last,) *arsenic,* (especially in the ulcerated stages; the basis of nearly all the quack nostrums for cancer;) *bichloride of mercury,* (in small and frequently repeated doses,) *iodine,* (as the last, either alone or combined with hemlock or opium; it is one of the best remedies in all stages;) *iodide of iron, phosphate of iron,* (combined with hydrochlorate of ammonia or aloes,) *common salt.* The last has been lately prominently brought before the public by Col. Ussory, of De Soto, who says he learnt the secret of a Spanish woman, a native of the country. His mode of using this remedy is as follows:—Take an egg and break it, pour out the white, retaining the yolk in the shell, put in salt, mix it with the yolk as long as it will receive it, and stir them together until a salve is formed; put a portion of this on a piece of sticking plaster, and apply it to the cancer twice or thrice a day. He says that he has tried the remedy twice in his own family, with complete success. The doses, &c., of the other substances referred to, will be found under their respective heads.

It may be right, perhaps, to mention, that the above remarks are *solely* intended for those who are either unable, or unwilling, to seek medical advice. To all others afflicted with cancer, our most earnest recommendation is for them to consult a duly qualified practitioner as soon as possible.

CANDIES. When the object is simply to form a confection or sweetmeat, imbued with the aroma, flavour, or medicinal property of any substance, candies are generally prepared by simply boiling *lump sugar* with a sufficient quantity of the *infusion, decoction, tincture, expressed juice,* and sometimes even the *powder* of the particular article, until a portion taken out and cooled becomes quite solid, when it is either poured out on a marble slab, or into tin, marble, or paper moulds, dusted with *powdered lump sugar.*

When the object is to preserve the form and character of the vegetable in the candy, the substance is boiled in *water* until soft, and then suspended in *concentrated syrup,* (in the cold,) until they become transparent; after which they are either dried in a current of warm air, or in a stove, at a heat not exceeding 120° Fahr. The syrup must be kept *fully saturated* with sugar by reboiling it once or twice during the process.

Another method occasionally employed by confectioners for almonds and the like, is to put the substances into *syrup boiled to a thread*, and to stir the whole until nearly set. See *Candy* and *Sugar Boiling*.

CANDLES. The "*wicks*" of the best candles are made of the rovings of Turkey skein-cotton, 4 or more of which, according to the intended thickness of the wick, are wound on a reel, from which they are again run off, and cut of the proper lengths. For *dip candles* they are then immersed in *melted tallow*, and after rubbing with the hands, are placed straight and allowed to harden, after which they are arranged upon the "broaches" ready for "dipping." For *mould candles*, the last operation is omitted. Great care is taken to select a cotton that yields the least possible quantity of ash after burning.

In the process of "*dipping*," the "*dipping cistern*" being filled with tallow of a proper temperature from the boiler, one of the broaches covered with wicks is placed upon the end of the "*dipping beam*," and pressed down gently into the melted fat; it is then withdrawn, the bottoms of the candles just touched against a board placed on one side of the cistern for the purpose, and the frame removed to the rack. This operation is repeated until the candles acquire a sufficient size, when they are finally cooled, sorted, weighed, and strung in pounds for sale.

The best *mould candles* are made of the finer kinds of tallow only. A mixture of 3 parts of *sheep*, with 1 part of *ox suet*, is preferred. The *moulds* are commonly made of pewter; the part answering to the bottom of the candle being left open, and a small hole at the top also left for the wick: eight or more of these moulds are fitted into a stool, the upper surface of which forms a kind of trough, the bottom part of the mould being upwards. The wicks are then introduced and a wire is run through the loop of each, and then allowed to rest on the top of the moulds; the protruding portion at the bottom being pulled tight, so as properly to arrange them in the centres of the moulds. The *melted tallow* is now poured into the trough-like part of the stool, until the moulds are all full, when the wicks are again pulled tight, and the whole allowed to cool. When *quite cold*, the wires are withdrawn, and the candles pulled out one by one, by inserting a bodkin into the loop of the wick. They are then bleached by either exposing them to the dew and air for a few days, or by keeping them for a few weeks before sale.

Composition candles are generally made of a mixture of *spermaceti* and *hard white tallow*, to which a little *bleached rosin* is commonly added. The application of the term "*composite*" or "*composition*" to candles, originated with a manufacturer who had a large stock of spermaceti candles on hand, which were unsaleable, from being of a dirty hue, and who advertised them under the above name, when they were soon disposed of, from the supposition that they were composed of some new combination of materials.

Spermaceti candles. From *spermaceti*, either alone, or combined with *hard white tallow*. They burn well, but will not bear carrying about in the hand without "guttering."

Stearine candles are made of the stearine or *stearic acid* obtained from tallow, in the same way as other moulds. They furnish a superior light, and burn a long time. Formerly it was a general practice for the manufacturer to add a little arsenious acid (*white arsenic*) in his stearine, to prevent it crystallizing, and thus spoiling the appearance of the candle; but owing to the spirited way in which this rascality was exposed by the press, it is now *nearly* discontinued. "When the blocks of stearine are broken, they display a highly crystalline texture, which would render them unfit for making candles. This texture is therefore broken down or comminuted in a plated copper pan, along with *one thousandth part of pulverized arsenious acid*, after which it is ready to be cast into candles in appropriate moulds." (*Dict. Arts, Manuf. and Mines*; 1843.) The atmosphere of a room in which two such candles (4 to the *lb.*) are burnt, would thus become contaminated with $3\frac{1}{2}$ gr. of *white arsenic* in the short space of about 8 or 9 hours; the influence of which upon the health of those who inhale it, could not fail to be highly pernicious. *Margarine candles* are similar to those made of stearine.

Wax candles were formerly wholly made by either pouring *melted wax* over the wicks, or by applying the wax in a soft state with the hands, and afterwards rolling it smooth with a small slab of *polished glass* or *boxwood*, upon a table formed of *polished marble* or *walnut wood*. They are now more commonly moulded.

Concluding Remarks. Of late years the best candles are made in such a manner that they do not require snuffing. The simplest way of effecting this is to make the wick with one of the outside strands of the cotton *loosely twisted*, which being slightly

stretched during the manufacture of the candle, contracts again on its burning removing the force that kept it extended. By this means the wick is drawn into a curved form, and thus its upper part is exposed to the outer portion of the flame, as well as to the atmosphere, and undergoes gradual combustion. *Plaiting* the cotton, *winding* it round wires, (which are withdrawn after the candle is made,) and *steeping* it in *metallic solutions*, have also been adopted for a like purpose. The same effect may be produced with a common candle, by placing it at an angle of about 45°; but this plan, besides being unsightly, is liable to the risk of the tallow dropping beyond the candlestick. In the candles manufactured by *Price's Patent Candle Company*, at the Belmont Works, Vauxhall, all the most recent improvements are combined. These candles are, indeed, not merely the most economical and sightly, but also possess the highest illuminative power of any in the market.

CANDLES (Medicated). These have been prepared as a convenient means of diffusing the active principles of certain volatile substances through the atmosphere, and for complete and partial fumigations. They are seldom employed in England.

CANDLES (Mercurial). From the *red sulphuret* or the *gray oxide of mercury* mixed with *wax*, and a *wick of cotton* inserted therein. Recommended by Mr. Colles for partial mercurial fumigation. They are burnt under a glass funnel with a curved neck, the upper orifice of which is directed to the diseased part.

CANDLESTICKS. Metallic, earthenware, and porcelain *candlesticks*, *snuffers*, and *snuffer-stands*, are recommended to be cleaned by pouring *boiling hot water* on them, (previously placed in an earthen pan,) and, after wiping them quite dry with a cloth, to clean them with a piece of "*wash leather*;" those made of *silver*, or of *copper-plated*, may be finally polished with a little *plate powder*; those of *white metal*, with a little *whiting* or *fine chalk*, and those of *brass*, with a little *rotten-stone* or one of the *polishing pastes* noticed at p. 158. For articles of this kind, made of *bronze* and *papier maché*, the water should be used only hot enough to melt the tallow, and they should be only gently dabbed or rubbed off with a *very soft* cloth or leather. The common practice of placing *candlesticks* before the fire to melt off the grease is injudicious, as the solder or japan about them is almost certain to be injured. Hence the common annoyance of damaged or "crippled" candlesticks in houses where there are careless servants.

CANDY. Syn. *Conditum*,—Lat. The process of converting substances into *candies* has been already noticed. The following are the principal articles of this kind kept in the shops:—

Candied Almonds. From blanched almonds, roasted and halved.

Candied Angelica. See *Angelica.*

Candied Apricots. From the fruit, scarcely ripe, either whole or cut into quarters, immersed in the syrup, (hot) without any further preparation.

Candied Citrons. From the peels.

Candied Eringo. From the roots, slit and washed.

Candied Ginger. From the roots of green ginger.

Candied Horehound. From a strong decoction or infusion of the root, and lump sugar.

Candied Lemon Peel. As *candied citron.*

Candied Orange Flowers. From the flowers deprived of their cups, stamina, and pistils, (2 *oz.* to each *lb.* of sugar,) as *candied almonds*, but poured out on a slab.

Candied Orange Peel. From the peel of the Seville orange, or common orange, as *candied citron.* In the Ph. Suecica, 1845, the "white inner surface" is ordered to be removed, before suspending the peel in the syrup. The Ph. L. 1746, orders the "fresh peel of Seville oranges."

Candied Sugar. See *Sugar Boiling.*

CANDY (Caraway). 1. From *caraway seeds* (in fine powder), ½ *oz.*; *sugar*, 1 *lb.*

2. *Oil of caraway*, 1 dr.; *sugar*, 1 *lb.*

CANDY (Digestive). Syn. *Live-long Candy. Prep.* 1. *Rhubarb* and *bicarbonate of soda*, of each, 1 dr.; *ginger*, ½ dr.; *cinnamon*, 20 gr.; (all in fine powder;) *heavy magnesia*, 1 oz.; *powdered sugar*, 2 oz.; *mucilage of tragacanth*, q. s., to form a lozenge mass; to be divided into small squares of 18 or 20 gr. each.

2. As the last, but adding *finely powdered caraways*, 1 dr.; *oil of caraway*, 15 drops; and *sugar*, 1 oz. Both are used as heartburn and digestive lozenges.

CANDY (Ginger). *Prep.* 1. From *ginger* (in coarse powder), 3 *oz.*; *boiling water*, 1¼ pint; macerate in a warm place for 2 hours, strain, add *lump* and *moist sugar*, of each, 5 *lb.*, and boil to a candy.

2. *Ginger* (in very fine powder), 1 *oz.*; *powdered sugar*, 2 *lb.*; *syrup*, q. s. to make a paste. Stomachic and carminative.

CANELLIN. A crystallizable substance, found by Petroz and Robinet, in the bark

of *canella alba*, (canella bark.) It greatly resembles mannite.

CANIRAMINE. See *Brucia*.

CANNABINE. Syn. *Cannabinum*. The resinous exudation of the *cannabis sativa Indica*, or India hemp, purified by solution in *alcohol*, or *rectified spirit*, and the evaporation of the tincture to dryness.

CANNON METAL. Syn. *Gun Metal*. A variety of bronze in which the proportion of tin varies from 8 to 14 per cent. From the experiments of the Comte Lamartilliere, made at Douay, it appears that never less than 8%, or more than 11%, of this metal should be used, the remaining 89 or 92% being pure copper.

CANTHARIDES. Syn. *Spanish Flies, Blistering ditto. Lyttæ; Cantharis*,—Ph. L. E. & D. The *cantharis vesicatoria* of Latreille. They are frequently adulterated with the melontha vitis, an insect which is wholly destitute of vesicating power. The lattermay be distinguished by its *squarer form*, and also by having black feet.

Pur., &c. These insects should be *preserved* in well-closed bottles or tin canisters. The addition of a few drops of *oil of cloves*, or of *strong acetic acid*, or even a *few cloves* in substance, will preserve them unchanged for a length of time in close vessels. The best proof of their goodness is the smell. The powder is constantly adulterated. The plan of the wholesale druggists is to sort out the most worthless flies for powdering, and to compensate for their deficiency of vesicating power, by adding 1*lb*. of *euphorbium* to every 12 or 13 *lb*. of *flies*. When a *superior* article is required, *liquorice powder* is added, (4 or 5*lb*. to every 14*lb*.,) along with about 1 *lb*. of *euphorbium*, and sufficient *blue black* or *charcoal* to turn the yellow of the liquorice to a greenish colour. The best method of detectiug this adulteration is by the microscope.

Ant. An emetic of *sulphate of zinc*, followed by the stomach pump, if necessary. The vomiting may be promoted by copiously drinking warm bland diluents, such as broth, linseed tea, milk, &c. Friction on the spine, with volatile liniment and laudanum, and the subsequent administration of draughts containing musk, opium, and camphorated emulsion, have been strongly recommended.

Tests. By the microscope, very minute particles may be discovered in the stomach and intestines, on a post-mortem examination. Orfila thus found particles of cantharides. in a body that had been interred 9 months.

Uses, &c. Spanish flies are used *externally*, to raise blisters, and *internally* as a stimulant and diuretic, generally in the form of tincture. In excess they produce strangury, bloody urine, satyriasis, delirium, convulsions, and death. See *Vesicatorin, Tinctures, &c.*

CAOUTCHOUC. Syn. *India Rubber, Elastic Gum*. Indian rubber is the concrete juice of the *siphonia caoutchouc*, *jatropha elastica*, and several other plants. The fresh milky juice is spread over moulds of unbaked clay, and is then exposed to the heat and smoke of a fire, or torches, to dry it, whence it derives its dark colour. Successive coats of juice are laid on, and the operation of drying repeated, until the bottles acquire sufficient thickness. When it has become thoroughly hard and dry, the clay is beaten out. In this form it is commonly imported.

Prop., &c. The general properties of Indian rubber, as well as its numerous applications, are well known. The *fresh juice* has a cream-like appearance and consistence, is coagulated by heat, and is miscible with water, alcohol, and pyroxilic spirit; sp. gr. 1·012 to 1·041; it yields from 18% to 45% of solid caoutchouc, either by heat or evaporation. By excluding it from the air, it may be preserved unchanged for a considerable period. This juice is now imported in large quantities for the waterproofers.

Solid caoutchouc has a sp. gr. ranging between 0·919 and 0·941; it melts at 248° Fahr. into a viscid mass, which does not again harden on cooling; it is unaltered by chlorine, hydrochloric acid, sulphurous acid, fluosilicic acid, ammonia, caustic alkaline lyes, (even when boiling,) and most similar substances; nitric acid and sulphuric acid act on it only by long contact when concentrated. Some specimens of caoutchouc are harder than gutta percha itself, and equally inelastic, whilst others never perfectly solidify, but remain in a condition resembling that of birdlime or printers' varnish.

The *best solvents* of caoutchouc are *rectified sulphuric ether* (which has been washed with water to remove alcohol and acidity), *chloroform*, *bisulphuret of carbon*, a *mixture of bisulphuret of carbon* and *absolute alcohol*, (94 of the first to 6 or 7 of the last,) and *caoutchoucine*. All these liquids dissolve Indian rubber rapidly in the cold, and leave it unaltered on evaporation. The first two are, however, too expensive to be generally employed. The others have a disagreeable odour, but are much cheaper than the rest, and possess the advantage of leaving the film of caoutchouc in a firmer and stronger condition than other solvents.

Pyrogenous oil of turpentine is another cheap and good solvent. *Benzole*, *rectified mineral* or *coal-tar naphtha*, and *oil of turpentine*, dissolve Indian rubber by long digestion and trituration, (with heat,) otherwise they merely form with it a glutinous jelly that dries very slowly and imperfectly, leaving it much reduced in hardness and elasticity. The *fats* and *fixed oils* also *readily* dissolve caoutchouc, (with heat,) forming permanently glutinous solutions or pastes; so also do most of the *volatile oils*, but the solutions with the majority of them dry with difficulty.

One of the most remarkable properties of Indian rubber is the great amount of heat which is disengaged during its condensation by pressure or in the exercise of its elasticity. During the process of kneading the raw caoutchouc in the "masticators," the *cold water* thrown in to reduce the temperature soon becomes boiling hot. When no water is added, a temperature so high is often reached as to occasion the melting of the rubber. This is particularly the case during the process of "dry kneading" with quicklime. A tube $2\frac{1}{4}$ inches in diameter, impactly secured, was subjected to a force of 200 tons. The result was a compression amounting to 1-10th; great heat was evolved, and the excessive elasticity of the substance caused a flywheel weighing five tons to recoil with alarming violence. Mr. Brockedon states that he succeeded in raising the temperature of an ounce of water 2° in about fifteen minutes by collecting the heat evolved by the extension of a small thread of caoutchouc. He refers this effect to the change in specific gravity, and contends that the heat thus produced is not due to friction, because the same amount of friction is occasioned in the contraction as in the extension of the substance, and the result of this contraction is to reduce the caoutchouc thus acted upon to its original temperature.

The edges and surfaces of Indian rubber are readily and perfectly *joined* by mere contact and intense pressure. On the *small scale*, the edges may be moistened with *ether*, *naphtha*, *oil of turpentine*, or *some other solvent*, or by *long boiling in water*, and immediately pressed tight together, and held in contact for some time.

Elastic tubes are readily formed of Indian rubber, by cutting it into uniform slips of proper thickness, and winding them round rods of *polished* glass or metal, so that the edges are in close contact or "overlapping." A piece of tape is then wound round outside it, and the whole boiled in water for 2 or 3 hours, after which time the edges will be found to be sufficiently adherent. A better plan is to immerse the "rubber" in a mixture formed of *bisulphuret of carbon*, 95 parts, and *rectified spirit*, 5 parts, until it swells into a pasty mass, which may then be moulded into any desired form, or passed through the dye of a tubing machine. For chemical purposes, brewing, &c., vulcanized Indian rubber tubing has now taken the place formerly occupied by the unprepared material.

The once celebrated "*Mackintoshes*" are made by spreading two or more coats of a paste made of *caoutchouc* and *rectified coal-tar naphtha* over the surface of the stuff or cloth, and when it has become partially dry, pressing two such surfaces evenly together by passing the goods between a pair of cylinders or rollers. The articles are then placed in a stove room for the composition to harden, and to remove the odour of the naphtha. Of late years, *vulcanized* or *mineralized rubber* (coloured,) has been used for this parpose, and being spread on the outside of the stuff instead of the inside, forms an ornamental and thoroughly waterproof material.

Indian rubber thread is prepared by stretching it (previously cut into coarse filaments) to 5 or 6 times its length in *boiling water* or *hot air*, in which state it is allowed to cool slowly. This process is repeated again and again, until it reaches 16,000 or 17,000 times its original length, when it is glazed by agitating it with *powdered sulphur*, or *French chalk*. This thread is readily joined or "pieced," as it is called, by paring the ends *obliquely* with a pair of scissors or a knife, and then pressing the *clean* ends strongly together with the fingers. When the coarse filaments from the cutting machine are simply stretched with the moistened thumb and finger in the act of "reeling" to about 8 or 9 times their length, they are said to be "*inelasticated*," and are ready to be made into *elastic braces*, *elastic web*, and other like *elastic tissues* and *fabrics*, in the braiding machine.

The discovery of the singular action of *sulphur* and the *mineral sulphurets* on caoutchouc was made by Mr. Charles Goodyear, of New York, in 1842, at which date the manufacture of *vulcanized*, *mineralized*, or *sulphuretted Indian rubber*, may said to have commenced. In 1843, Mr. Thomas Hancock patented a process for vulcanizing Indian rubber in these countries, founded on that of Mr. Goodyear. A sheet of caoutchouc immersed in *melted sulphur* absorbs a portion of it, and at the same time

undergoes important changes in many of its leading characteristics. So prepared, it is no longer affected by changes of temperature; it is neither hardened by cold nor softened by any heat insufficient to destroy it. It loses its solubility in the solvents of ordinary caoutchouc, whilst its elasticity is greatly augmented and has become permanent.

The same effect is produced when *sulphur* is kneaded into caoutchouc in a *masticator*, or by means of powerful rollers, as well as when common solvents (*naphtha*, *spirit of turpentine*, &c.) are charged with a sufficient amount of *sulphur*, in solution, to become a compound solvent of the rubber. In these cases articles may be made of any required form before heating them for the change of condition, technically termed, "*vulcanization*." It is necessary, however, for this purpose, that the form should be carefully maintained both before and during the exposure to the heat.

"A vulcanized solid sphere of 2½ inches in diameter, when forced between two rollers ¼ inch apart, was found to maintain its form uninjured. In fact, it is the exclusive property of vulcanized caoutchouc to be able to retain any form impressed upon it, and to return to that form on the removal of any disturbing force which has been brought to act upon it." (Brockedon.)

Caoutchouc combines with from 12% to 15% of *sulphur;* the quantity of sulphur added to the *naphtha paste*, should not, therefore, exceed 10% or 12% of its weight.

The *temperatures for vulcanization* by the common method range from 320° to 330°; and the period required is one hour or more, according to the temperature. A much lower temperature is, however, sufficient, if the duration of the exposure is much extended, or the compound mass is softened with any of the common solvents of Indian rubber.

The process of sulphuring, or mineralization, is differently conducted in different manufactories. Under Mr. Burke's patent, *oxysulphuret* or *amorphous sulphuret of antimony* (formed by decomposing a solution of crude antimony in a lye of potash or soda, with hydrochloric acid,) is employed. This powder he combines with either Indian rubber or gutta percha, or mixtures of them, by kneading in a "*masticator*" for 2 or 3 hours, and after strong compression in a mould whilst still warm, he exposes the mass to a steam heat, ranging from 250° to 280° Fahr. The block, so prepared, is afterwards cut into sheets, &c. The advantages possessed by the product are, that it possesses no unpleasant odour, nor does the sulphur effloresce on its surface, as in ordinary vulcanized Indian rubber.

Under Mr. Christopher Nickel's patent, (1849,) *one* part of *sulphur* is kneaded with six parts of *caoutchouc*, and then pressed into moulds, as before. He also vulcanizes *rubber* by exposing it in a cylinder heated in a steam "jacket" to the fumes of *sulphur* or to *sulphuretted gases*, given off from a retort connected with the apparatus. The rubber thus prepared he next subjects to hydraulic pressure in moulds, at a temperature ranging between 220° and 250° Fahr.

Small articles or sheets of Indian rubber may be EXTEMPORANEOUSLY VULCANIZED at *common temperatures* by simple immersion, for a minute or two, in a mixture of *bisulphuret of carbon*, 97½ parts, and *protochloride of sulphur*, 2½ parts; after which they must be well washed first in *weak alkaline lye*, and next in *pure water*. Mr. Parkes employs 100 instead of 97½ parts of the bisulphuret. This method is termed "*cold sulphuring*."

An *excellent method of vulcanization*, recommended by Mr. Parkes, particularly applicable to small articles, consists in immersing them for about 3 hours in a close vessel containing a solution of *polysulphuret of potassium* at 25° Baumé, (sp. gr. 1·197,) and of the temperature of 240° Fahr. It is afterwards washed in an alkaline lye, then in pure water, and dried.

Among the most recent applications of vulcanized Indian rubber are those connected with its elasticity and its enormous contractile power when extended. Under Mr. E. Smith's patent, "*torsion* springs" for roller blinds, door springs, clock springs, carriage springs, &c., are made of it. Mr. Hodges, in another patent, has availed himself of the same property as a new mechanical power. Short lengths of caoutchouc, which he terms "*vulcanized power purchases*," are successively drawn down from or lifted to a fixed bearing, and attached to any weight which it is required to raise; when a sufficient number of these power-purchases are fixed to the weight, their combined elastic force lifts it from the ground. Thus ten purchases of the elastic strength each of 50 *lb.* raise 500 *lb.* Each purchase is 6 inches long, and contains about 1½ *oz.* of *vulcanized caoutchouc*. These ten purchases, if stretched to the limit of their elasticity, (not of their cohesive strength,) will lift a weight exceeding 650 *lb.*

YORKSHIRE COLLEGE

The same principle has been applied to *relieve* and *equalize* the *strain* on *ships' cables*, especially where several boats are towing one vessel; and as a *projectile force*. A number of power purchases, attached to the barrel of a gun constructed to project harpoons, will exert a power, if suddenly relieved, proportioned to their aggregate forces. By similar contrivances balls may be projected 200 yards or more, and a charge of No. 4 shot can be thrown 120 yards. A *bow*, in which the string alone is elastic, (the reverse of the usual form,) has been contrived which throws a 30-inch arrow 170 yards.

CAOUTCHOUC (Factitious). Good *boiled linseed oil* (made with litharge) applied, by means of a brush, to any smooth surface, and dried in the sun or smoke, and the process repeated until some thickness is attained, affords a semi-transparent substance of considerable elasticity, and resembling India rubber in many of its sensible qualities. A pound of the oil at once spread upon a stone, in a thin stratum, takes about six months to acquire these properties.

CAOUTCHOUCINE. *Prep.* (Barnard's *patent process.*) A highly volatile fluid, discovered by Mr. Barnard. *Indian-rubber* or *caoutchouc*, as imported, cut into small lumps, containing about 2 cubic inches each, is thrown into a cast-iron still, connected with a *well-cooled* worm-tub, (any flat vessel with a large evaporating surface will do, the entire top of which can be removed for the purpose of cleaning it out;) and heat is applied in the usual way, until the thermometer ranges to about 600° Fahr., when nothing is left in the still but dirt and charcoal. The dark-coloured fetid oil which has distilled over is next rectified along with $\frac{1}{3}$rd its weight of *water*, once or oftener; and at each rectification becomes brighter and paler, until at about sp. gr. ·680 it is colourless, and highly volatile. The product is then shaken up with *nitro-muriatic acid*, or *chlorine*, in the proportion of a $\frac{1}{4}$ of a pint of the acid to 1 gallon of the liquid. To enable the dirt to be the more easily removed from the bottom of the still, *common solder*, to the depth of about $\frac{1}{2}$ an inch, is thrown in.—*Prod.* $80\frac{0}{0}$.

Obs. This substance is the lightest fluid known, and yet its vapour is denser than the heaviest of the gases. Mixed with alcohol, it dissolves all the resins, especially copal and Indian-rubber, at the common temperature of the atmosphere, and it speedily evaporates, leaving them again in the solid state. It mixes with the oils in all proportions. (See *Butter of Cacao.*) It has been used in the manufacture of varnishes, and for liquefying oil paints, instead of turpentine. It is very volatile, and requires to be kept in close vessels. According to the researches of Himly, Gregory, and Bouchardat, the caoutchoucine of Barnard consists of several liquids, some of which have the composition of olefiant gas, and others that of oil of turpentine. One of these, (*caoutchène*, of Bouchardat,) boils below 32°, while another (*heveéne*,) boils at 599°. The most volatile of these liquids has the sp. gr. of 0·654.

CAPERS are the flower buds of the *caparis spinosa*, or caper tree, preserved in vinegar. They are chiefly imported from Spain, Italy, and the South of France, where this tree is largely cultivated for the purpose. The flower-buds are picked daily, and thrown into a cask of strong pickling vinegar, until it becomes full, when it is sold to the dealers by the collector. The former sort them into different sizes by means of copper sieves, in a similar way to that adopted for lead shot and gunpowder. In this way they are divided into *nonpareilles*, *capuchins*, *capotes*, *seconds*, and *thirds*, of which the former, or smallest, are regarded as the best; but much depends upon the quality of the vinegar.

The lively green colour of capers, so much valued by the ignorant, arises chiefly from the presence of copper derived from the sieves used in sorting them. In many cases, copper coin, as sous and halfpence, are added for the purpose. Thus the eye is gratified at the sacrifice of the stomach, and an insidious poison introduced into the system, simply to give an unnatural appearance to a condiment which tastes better without it. See *Copper*.

CAPHOPICRITE. A bitter substance extracted from rhubarb. See *Rhabarberin*.

CAPILLAIRE. *Simple syrup*, or a concentrated solution of *sugar* in *water*, flavoured with *orange flower water*, or some other similar aromatic. The name is derived from that of the mucilaginous syrup, formerly directed to be made of the *adiantum capillus veneris*, or true maiden hair.

CAPNOMOR. An oily fluid, possessing a pungent and an agreeable odour, obtained by Reichenbach, from beech tar.

CAPRIC ACID. Syn. *Acidum Capricum*,—Lat. An acid discovered by Chevreul, and obtained by decomposing *caprate of baryta*, with *dilute sulphuric acid*, or primarily by the *saponification* of *butter*, when

it appears combined with *butyric*, *caproic*, and *caprylic acids*.

Obs. When butter is saponified with caustic potassa or soda, and the resulting soap decomposed by adding an acid, in excess, and distilling the mixture, the four acids above named, pass over into the receiver, in combination with water. The mixed acids may be separated by saturating them collectively with baryta, and by taking advantage of the unequal solubility of the newly-formed baryta salts. The less soluble portion, (equal to about $\frac{1}{20}$th of the dry mass,) contains *capric* and *caprylic acid;* the larger and more soluble portion, *butyric* and *caproic acid*. On the same plan, the two groups are resolved into their separate acids. These acids are deprived of their uncombined water by means of chloride of calcium.

Capric Acid has a mixed odour of acetic acid and that of the goat; is very sparingly soluble in water; but in other respects resembles caproic acid.

CAPROIC ACID. An oily acid, discovered by Chevreul, and obtained by decomposing *caproate of baryta* with *dilute sulphuric acid*. It may also be prepared by boiling *cyanide of amyl* with *potassa*, when *caproate of potassa* is formed.

Caproic Acid is a colourless liquid, much less soluble than butyric acid; and smells less goaty than capric acid. (See above.)

CAPROYLE, *Caproylene*, and *Caprylene*. Homologous radicals or hydrocarbons, bearing the same relation to the corresponding alcohols and acids, that amyl, butyl, &c., do to amyl alcohol, butyric acid, &c. The first is an oily liquid, obtained by acting on *ænanthylic acid* with the *galvanic current*.

CAPRYLIC ACID. From *caprylate of baryta* and *dilute phosphoric* or *sulphuric* acid. It has been obtained by M. Bouis by the oxidation of caprylic alcohol. It is much more soluble than capric acid, but much less so than either caproic or butyric acid. Its odour, which is very powerful, strongly resembles that of perspiration. (See *below*.)

CAPRYLIC ALCOHOL. From *castor oil*, distilled along with *solid hydrate of potassa*. It is an oily liquid, boiling at 356° Fahr. Treated with oxidizing agents, it is readily converted into *caprylic acid*.

CAPSICINE. Syn. *Capsicina*. From *capsicum annuum*, or Chilly pepper.

Prep. A strong *alcoholic tincture* of *capsicum*, is gently evaporated to the consistence of a soft extract, the residuum digested in ether, and the etheral solution evaporated.

Prop., &c. A volatile reddish-coloured liquid; very soluble in alcohol, ether, oil of turpentine, and caustic alkaline lyes; slightly soluble in water, and a little more so in vinegar and acetic acid. It is intensely pungent. The $\frac{1}{12}$th of a gr. placed on the tongue endangers life from suffocation. $\frac{1}{3}$ gr. volatilized by heat in a large room, will cause all its inmates to cough and sneeze violently.

CAPSULES. This term is now commonly applied to small egg-shaped or spherical vessels, in which medicines are placed, for the purpose of covering their nauseous taste, at the time of swallowing them. They are commonly made of gelatine, mixtures of sugar and gelatine, or animal membrane.

Prep. 1. (*Gelatin Capsules.*)—*a.* By dipping the bulbous extremity of an *oiled metallic rod* into a *strong solution of gelatine*. When the rod is withdrawn, it is rotated, in order to diffuse the fluid jelly equally over its surface. As soon as the gelatinous film has partially hardened, it is removed from the mould and placed on pins, furnished with suitable heads, and fixed on a cork table. When sufficiently dry, the capsules are placed upright in little cells, made in the table to receive them, and the liquid with which they are to be filled, is then introduced by means of a small glass tube. They are next closed by dropping some of the melted gelatine on the orifice of each. Six parts of *gelatine*, and one part of *sugar*, are now the common proportions.

b. (Simonin). *Oval balls of wax*, of the requisite size, are prepared by pouring wax into a wooden mould, consisting of two parts, and arranged for the reception of a row of these balls. These are afterwards stuck on iron needles, affixed to rods of convenient size, in rows. The balls are now uniformly coated all at once by dipping in the usual manner, then removed from the needles, and are next placed with the needle holes downwards, on a gently heated plate, when the wax flows out, and a round capsule is left behind.

c. (Giraud.) *Gelatine*, 6 parts; *syrup of gum* and *simple syrup*, of each, 1 part; *water*, 5 parts; melt in a water bath, remove the scum, and proceed as before.

2. (*Membranous Capsules; Organic do.*) From gut-skin moistened and stretched over an oiled bulb of glass or metal, and filled in the common way. These are patented; but as they are neither a novelty nor an improvement on the common capsule, the patent is evidently untenable.

Obs. The common capsules usually hold about 10 or 12 grs. of balsam of copaiba. Those of the shops, in 9 cases out of 10 are filled with adulterated capivi, and at least 4-5ths of them are filled with *train oil* or *linseed oil*, to which a few drops only of balsam of capivi are added. A certain advertising French pharmacien, not quite one hundred miles from Her Majesty's theatre, recently offered in a certain periodical to send samples of his "wares" to any interested party for examination. The editor of this work accepted the challenge through the columns of the same print; but no "samples for examination" from the party alluded to have ever come to hand. "*Impudence*" is often a better salesman than "*good quality.*"

Balsam of capivi and *oil of cubebs*, or a mixture of them, *castor oil*, and *cod-liver oil*, are the substances most usually administered in this way. *Baccæ copaiferæ factitiæ* are officinal in the Ph. Castr. Ruth. Ratier has proposed to grease them and administer them per anum. Ricord has strongly recommended *capsules of copaiba*, coated with *extract of rhatany*, as much superior to the common ones of copaiba alone, in the treatment of gleet and gonorrhœa. They may be easily prepared by either of the following methods:

1. By immersing, for an instant, the common capsule in a mixture of *extract of rhatany*, (newly prepared from the root,) 3 parts; *syrup of moist sugar*, 1 part; *mucilage of gum Arabic*, 1 part; melted together in a water bath.

2. By forming the bodies of the capsules with the above mixture or *composition*, instead of with *gelatine*, and then following the same manipulations as for the manufacture of the common gelatine capsules.

These capsules are said to sit well upon the stomach, the tone of which they contribute to improve, and to act with greater certainty than those made of copaiba and gelatine alone.

CARAMEL. The caramel of commerce is spirit colouring, or a concentrated solution of *burnt sugar* in *water*. In this state it is mixed with variable quantities of undecomposed sugar and certain bitter compounds (*asamar*, *&c.*) To render it quite pure, it should be dissolved in *water*, the solution filtered, and *strong alcohol* added until it ceases to produce a precipitate. *Pure caramel* is thrown down, and may be collected on a filter, washed with alcohol and dried.

Prop., &c. A black or dark-brown powder, soluble in water, to which it gives a rich sepia tint; insoluble in pure alcohol; and incapable of fermentation.

CARAT. A weight of 4 grains used in weighing diamonds, which are spoken of as of so many carats weight. Among *assayers*, a carat is a weight of 12 grains; but more commonly a proportional weight or term, representing the number of parts of pure gold in 24 parts of the alloy; pure gold being spoken of as of 24 carats fine. It is commonly the 24th part of the "*assay pound*," and is nominally subdivided into 4 assay grains, and these again into quarters. See *Assaying.*

CARAWAY. Syn. *Caraway seed; Semena Carui*,—Lat. *Carui*,—Ph. L. The "fruit" (seed) of the "*carum carui*" (Linn.), an umbelliferous plant, common in England and other parts of Europe. They form an agreeable and useful aromatic and carminative, and are especially esteemed in the flatulent colic of children. They are also largely employed as an adjuvant or corrective in various officinal preparations; and as a flavoring ingredient in cakes, biscuits, cordials, confectionary, &c. See *Essences.*

CARBAMIDE. Crystallized anhydrous urea.

CARBAZOTIC ACID. See *Picric Acid.*

CARBOLIC ACID. Syn. *Phenol, Hydrate of Phenyle, Hydrated Oxide of do.*— 1. From *common coal-tar*, agitated with *milk of lime*, and after some time, the aqueous portion separated from the undissolved oil, and decomposed by *hydrochloric acid;* the oily product is then purified by cautious distillation, the first third only that comes over being collected.

2. *Crude coal-oil* is distilled in a retort furnished with a thermometer, and the portion which passes over when the heat ranges between 300° and 400° Fahr., is collected apart, and mixed with a *hot strong solution of caustic potassa;* after repose for some time, a semi-crystalline pasty mass forms, which when agitated with water separates into an oily liquid and a heavy alkaline lye; the latter is decanted decomposed by *hydrochloric acid*, and purified by contact with chloride of calcium and distillation; the distillate by refrigeration furnishes crystals, which must be drained, dried, and preserved from the air.

Prop., &c. Long, colourless prismatic crystals, melting at 95° Fahr. to an oily liquid, greatly resembling creosote; the crystals deliquesce in moist air, forming a sort of hydrate; it boils at 370°; sp. gr.

1·065. Commercial creosote consists principally of hydrated carbolic acid.

CARBON. Syn. *Carbonium, Carbo*,—Lat. The inflammable matter forming charcoal. Carbon is one of the elementary or simple bodies, and in its pure form exists only in the diamond. It may be obtained sufficiently pure for all chemical purposes, by strongly igniting *lamp-black* in a covered crucible. This, like the diamond, yields pure carbonic acid, by combustion in oxygen. See *Charcoal, Organic Bodies, &c.*

CARBON (Bromide of). Syn. *Carbonii Bromidum*,—Lat. *Prep.* (Serullas.) *Bromine*, 2 parts; *periodide of carbon*, 1 part; mix, and add just enough *solution of potassa* to make the liberated iodine disappear. The liquid *bromide of carbon*, which collects at the bottom of the solution, is then separated from the supernatant portion, and allowed to stand until it becomes clear. A few crystals of iodide of potassium rise to the surface, and may be removed. The clear liquid is next put into a little *water slightly alkalized with potassa*, to remove a little remaining iodide of carbon, after which it is quite pure.

CARBON (Chlorides of). Several substances of this kind are known to chemists, and are obtained indirectly by the action of chlorine on certain organic compounds. *Dutch liquid* absorbs chlorine, and yields at least four such compounds by losing successive portions of its hydrogen.

Perchloride of Carbon, Sesquichloride of Carbon. A white solid crystalline aromatic substance, obtained by Faraday by putting *Dutch liquid* into a glass vessel containing *chlorine*, and exposing the whole to the light.

Protochloride of Carbon. This is a volatile, colourless liquid, formed when the vapour of the preceding is passed through a red-hot glass or porcelain tube filled with fragments of glass or rock crystal.

Subchloride of Carbon. A white volatile silky substance obtained by repeating the last named process several times.

Bichloride of Carbon. Formed by passing the vapour of *bisulphuret of carbon* mixed with *chlorine gas*, through a red-hot porcelain tube, and distilling the condensed vapour with potassa. Liquid, colourless; sp. gr. 1·56; boils at 170° Fahr.

Chloral may be considered as another chloride of carbon.

The *terchloride of carbon* (*carbonii terchloridum*) of the druggists, is *chloral*, but a spurious article, formed of *chloroform*, 1 part, and *rectified spirit*, 5 parts, is commonly sold for it. The dose is 2 to 5 drops in water, 2 or 3 times daily, as an anodyne, in cancer, spasms, &c. *Externally*, as a lotion, 2 to 3 dr. to water, 6 *oz.*

CARBON (Iodide of). Syn. *Carbonii Iodidum*,—Lat. See *Iodoform.* It is recommended by Litchfield in enlarged glands and obstinate cutaneous affections. See *Ointments.*

CARBON (Sulphuret of). Syn. *Carburet of Sulphur, Carbide of do., Sulphide of Carbon, Bisulphide of do., Bisulphuret of do., Sulphur Alcohol; Carbonii Sulphuretum, C. Bisulphuretum, Sulphuris Carburetum, &c.*,—Lat. A volatile ethereal liquid with many synonyms, of which bisulphuret or bisulphide of carbon are not only those best known but those which are most appropriate.

Prep. 1. *Bisulphuret of iron* (or *iron pyrites*), 5 parts, and *fresh dry charcoal*, 1 part, are heated together in a stone-ware retort, furnished with a glass tube, having the end bent, and passing nearly to the bottom of a bottle or receiver filled with *pounded* ice. The *bisulphuret of carbon* collects at the bottom of the receiver, and is then purified from adhering moisture and sulphur by distilling it, at a low temperature, from fused *chloride of calcium.*

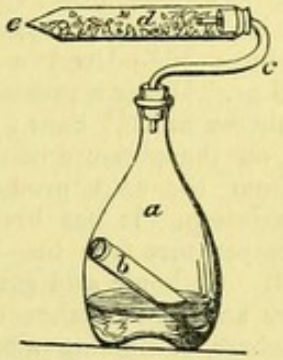
2. By passing the *vapour of sulphur* over *fragments of charcoal*, heated to bright redness in a porcelain tube, and collecting the product as before.

3. (Van Mons.) *Sulphuret of iron*, 11 parts; *charcoal*, 3 parts; as No. 1.

4. (Mulder.) Take an *iron bottle* and make a second opening into it. To one opening adapt a *copper tube* bent twice at right angles; and to the other a *straight tube* dipping into the bottle. Having nearly filled the bottle with pieces of *fresh-burnt charcoal*, screw on the bent and straight tubes, and place the bottle in a furnace, closing the mouth of the latter with a stone or clay cover in two pieces, hollowed in the centre so as to fit the upper part of the bottle, and defend it from the action of the fire. Connect the curved tube with a *Woolfe's bottle*, half filled with water, and placed in a freezing mixture. When the iron bottle is sufficiently heated, introduce by the straight tube (see *above*,) *fragments of sulphur*, and immediately close the mouth of the tube with a plug. The bisulphuret, as it comes over, falls to the bottom of the water, and must be collected and purified as before.

Prop., &c. A colourless, pungent, fetid liquor, exceedingly volatile, boiling at 110° Fahr., and inflammable, burning with a pale

blue flame. Sp. gr. 1·272, (1·265,—Ure.) It freely dissolves sulphur, phosphorus, and several other substances, and by spontaneous evaporation deposits the first in beautiful crystals. It exceeds all substances in refractive power. (Brewster.) In dispersive power it exceeds all fluid substances except oil of cassia. It produces intense cold by its evaporation. A spirit thermometer, having its bulb covered with cotton, if dipped into this fluid and suspended in the air, rapidly sinks from 60° to 0°, and if put into the receiver of an air-pump it will fall to—81° Fahr. Mercury may be readily frozen in this way. The following *experiment* is both *amusing* and *illustrative*:—A glass of *water* had remained on the table since the preceding evening, and though it might be some degrees below 32° Fahr. it indicated no disposition for congelation. A few drops of *sulphuret of carbon* were applied to the surface; instantly the globules became cased with a shell of icy spiculæ of retiform texture. Where they were in contact with the water, plumose branches darted from the sulphuret, as from a centre, to the bottom of the vessel, and the whole became solidified. The sulphuret of carbon in the interim had volatilized; and during this period the spicules exhibited the colours of the solar spectrum in beautiful array. (Murray.)



Uses. Bisulphuret of carbon is now prepared on the large scale, and extensively employed as a solvent. See *Caoutchouc*, *Gutta Percha*, and *Traumaticine*.

CARBONATE. Syn. *Carbonas*,—Lat. A compound of carbonic acid with a base.

Tests, &c. The carbonates are distinguished—1. By effervescing with all the soluble acids when added in excess, *excepting* hydrocyanic acid and hydrosulphuric acid.—2. The gas evolved in the last, passed into lime water and baryta water, occasions white precipitates, which redissolve in acids with effervescence, and after the solution has been boiled are not reprecipitated by liquor of ammonia.—3. Chloride of calcium and chloride of barium give white precipitates in solutions of the *neutral* alkaline carbonates, but in solutions of the alkaline bicarbonates, only after ebullition.

Estim. The *quantity of the base* in an *alkaline* or *earthy carbonate* may be easily determined by the common method of *Alkalimetry*, and the *quantity of carbonic acid*, by the method of Fresenius and Will. The following little apparatus is a simplification of that of these German chemists:—

Into a flask (*a*), a weighed portion of the sample for examination is placed, along with a little water. A small tube (*b*), sufficiently long to maintain a slanting position without falling, is then filled with either *sulphuric acid* or *hydrochloric acid*, and also placed in the flask.

The bent tube (*c*), leads into a horizontal tube (*d*), filled with small fragments of *chloride of calcium*, and having its other end (*e*) drawn out to a capillary orifice. On inclining the apparatus the *acid* escapes over the side of the small tube, and mixing with the liquor in the flask, expels the *carbonic acid* of the *carbonate*, which is then dried by passing over the *chloride of calcium*. After effervescence has ceased, heat should be applied to the bottom of the flask, until it be filled with steam, to expel the carbonic gas it contains. The loss of weight gives the weight of the *carbonic acid gas* that was contained in the sample. The *quantity* of *carbonic acid* in the *carbonates of the metals that do not contain water*, may be determined by heating them to redness in a platina crucible. (See p. 42.)

CARBONIC ACID. Syn. *Fixed Air*, *Choke Damp*, *Aerial Acid*; *Acidum Carbonicum*,—Lat. An acid formed by the chemical union of carbon with oxygen. It is the gas disengaged during the effervescence of soda water.

Prep. 1. *Hydrochloric acid*, 1 part, diluted with *water*, 4 or 5 parts, is poured upon *fragments of white marble*, previously placed in a tubulated retort. Carbonic acid gas is rapidly evolved, and may be either collected in the mercurial pneumatic trough, or applied to immediate use. In this state it contains a little water. It may be dried by passing it over *fused chloride of calcium*, or through *concentrated oil of vitriol*.

2. (*Commercial.*) From *oil of vitriol*, 1 part; *water*, 6 parts; and *chalk* or *whiting*, 1¼ parts; mixed in a suitable vessel, applying agitation.

Prop., &c. An invisible, irrespirable gas,

possessing a pungent odour, and an acidulous taste; it is neither combustible nor a supporter of combustion; water absorbs about its own volume of this gas, forming *carbonic acid* or *ærated water;* it reddens moistened litmus paper, but the blue colour returns after a time, and immediately on the application a gentle heat; sp. gr. 1·524; 100 cubic inches weigh 47¼ gr., (Dulong and Berzelius; 46½—Ure.) a cubic foot weighs 818 gr. Under a pressure of about 36 atmospheres at 32° Fahr., it becomes fluid, and on the pressure being removed, congeals from the cold produced by its rapid evaporation. It has been estimated that the temperature falls to—180° in this experiment. Carbonic acid gas is destructive to life, and extinguishes combustion. An atmosphere containing more than its natural quantity (about $\frac{1}{1000}$) is unfit for respiration; when containing more than $15\frac{0}{0}$ it instantly destroys life, and extinguishes combustion. The agreeable pungency of ale, beer, porter, wine, &c., is chiefly owing to the presence of carbonic acid, which they lose on exposure to the air, and then become flat and insipid. Spring and well water contain carbonic acid; water that has been boiled has an insipid taste from its absence. The air of wells, cellars, brewers' vats, &c., is frequently contaminated with this gas; hence the necessity of the old plan of letting down a burning candle before venturing in. If the candle will not burn, or burns feebly, human beings cannot breathe there. The neglect of this simple precaution led to the late fatal accident at Barclay's brewery.

Tests. It feebly reddens litmus paper, extinguishes the flame of a burning taper, and forms a white precipitate in aqueous solutions of lime and baryta, which is soluble in acetic acid. By the last test, a very small quantity of this gas may be easily detected in the atmosphere of rooms, &c. See *Carbonates*, and above.

Ant. The patient should be immediately removed into the open air, and placed on his back with the head *slightly* raised. Cold water should be dashed over the body, hot water or mustard poultices applied to the feet, and ammonia (carefully) to the nostrils. Brandy-and-water and other stimulants may be administered. Continued friction on the surface of the body is also very useful. If the patient has ceased to breathe, artificial respiration should be attempted. This may be done by gently pressing down the ribs, and forcing up the diaphragm, and then suddenly withdrawing the pressure. The inhalation of air, mixed with a very *little* chlorine gas, has also been recommended.

Obs. Of the above processes, No. 1 is that commonly adopted on the small scale in the laboratory; No. 2 is that in use among the soda water makers. From this gas being so much heavier than atmospheric air, it may be poured from one vessel to another, like water. When a pneumatic apparatus is not at hand, it may be collected by simply passing the end of a bent tube connected with the generator to the bottom of a bottle or jar, the mouth of which is lightly closed with a piece of card paper or glass. When it is not required that the gas should be dry, a *concentrated solution* of *sulphate of magnesia* or even of *common salt*, may be used instead of mercury, for the pneumatic trough or gasometer. *Wells, cellars*, and other *underground apartments*, containing carbonic acid in poisonous quantities, may be freed from this gas by pumping it out, in the same way as water, observing to allow the suction hose to *fully* reach the *floor* or bottom of the place. *Fresh slacked lime* or *milk of lime*, copiously thrown in, will have a like effect, by absorbing the gas. *Free ventilation*, whenever it can be established, is, however, not only the cheapest, but the most efficient remedy.

CARBONIC OXIDE. Syn. *Gaseous Oxide of Carbon; Oxydum Carbonicum,*—Lat. This gas is formed of equal equivalents of carbon and oxygen; or one of oxygen less than is contained in carbonic acid.

Prep. 1. From *carbonic acid gas* passed over fragments of charcoal, heated to redness in a tube of porcelain or iron.

2. From equal weights of *chalk* or *carbonate of soda*, and *iron filings* or *charcoal*, ignited together.

3. (Dumas.) From *binoxalate of potassa*, treated with 5 or 6 times its weight of *strong oil of vitriol* in a glass retort.

Obs. The gas is passed *first* through a *caustic alkaline solution* or *milk of lime*, to deprive it of carbonic acid, and next over *dried chloride of calcium*, to deprive it of moisture. It may be collected either over mercury or water, as the latter absorbs very little of this gas.

Carbonic oxide is colourless, inodorous, neutral, inflammable, and irrespirable. It is often called "choke damp" in Cornwall. The *antidotes, &c.*, are the same as for poisoning from inhaling *carbonic acid.*

CARBYLE. Syn. *Carbyl.* When the vapour of *anhydrous sulphuric acid* is passed into *absolute alcohol*, a white, crystalline, solid substance is formed, which has been

called *sulphate of carbyl* by Magnus. It may be purified from adhering acid by a little hydrate of baryta. It is soluble in both alcohol and water.

CARDAMOM. Syn. *Cardamum; Cardamomum*,—Ph. L. E. & D. The "seed" or fruit of "*elettaria cardamomum*." (Ph. L.) An agreeable and much esteemed aromatic, belonging to the *zingiberaceæ*. It is warm, pungent, carminative, and stomachic, and is largely used as a condiment in the East, and in Europe as an adjuvant in other medicines.

CARMINATIVES. Medicines that allay flatulency and spasmodic pains. Among the principal carminatives are *aniseed, caraway seed, cardamoms, cassia, cinnamon, ginger, peppermint*, and the *peppers*. To these may be added *ardent spirits*, and most of the *aromatic essences* and *tinctures*. See *Mixtures, Patent Medicines, &c.*

CARMINE. Syn. *Carmine Red, Vegetable Scarlet; Carminum*. This beautiful pigment is the only substance that can impart the transparent ruddiness of health to the portrait, or the bloom of the rose to the artificial flower.

Prep. The preparation of carmine is little understood, but success in its manufacture depends less on any mystery connected with the process than on the employment of the *purest water* and the *best materials*, and the exercise of moderate *care, dexterity*, and *patience*. The following forms will produce carmine of the richest hues down to ordinary and common, according to the skill possessed by the manipulator.

1. (*Madame Cenette's Process.*) *Cochineal* (in powder), 2 *lb.*, is boiled in *pure river water*, 15 gall., for 2 hours, when *refined saltpetre* (bruised), 3 *oz.*, is added to the decoction, and the whole boiled for 3 or 4 minutes longer; *salt of sorrel*, 4 *oz.*, is next added, and the boiling again renewed for 10 or 12 minutes; the heat is now removed, and the liquid allowed to settle for about 4 hours, after which time it is decanted with a syphon, into shallow plate-like vessels, and set aside for 3 weeks. At the end of this time the film of mould which has formed on the surface is dexterously and carefully removed, without breaking it or disturbing the liquid beneath it. The remaining fluid is next very carefully removed with a syphon, and the adhering moisture, as far as possible, drained off, or sucked up with a pipette. The residuum, which is the carmine, is dried in the shade, and possesses extraordinary lustre and beauty.

2. (*Alxon* or *Langlois Process.*) Powdered *cochineal*, 1 *lb.*, is boiled in *river water*, 4 gall., for 10 minutes, when *carbonate of soda*, $\frac{3}{4}$ *oz.*, dissolved in *water*, 1 pint, is added, and the whole again boiled for $\frac{1}{2}$ hour longer; when the decoction is cold, *alum* (in fine powder), $\frac{3}{4}$ *oz.*, is thrown in, and the liquid agitated rapidly until it is *entirely* dissolved; after 20 minutes repose, it is decanted into another vessel, and clarified by heating it with the *whites of* 2 *eggs*; the perfectly clear liquid is then allowed to repose for 40 minutes or longer, when it is decanted, and the carmine which it has deposited is collected, drained on a filter, and dried on shallow plates covered with silver paper. The product by either of the above processes varies from $9\frac{1}{2}$ to $10\frac{3}{0}$ on the weight of the cochineal employed in them.

3. (*China process; Spirit do.*,) *Cochineal*, 1 *lb.*, is boiled for 15 minutes, in *water*, 3 gall., *powdered alum*, 1 dr., is next added, and the whole again boiled for 5 or 6 minutes; when the liquid has become cold, the clear portion is decanted, and again heated, and *solution of tin* (*spirits of tin*), cautiously dropped in until all the carmine is precipitated; it is collected, drained, and dried, as before. *Prod.* $1\frac{1}{2}$ oz.

3. (*French process.*) From *cochineal* (in powder), 1 *lb.*, boiled for 15 minutes, in *water*, 3 gall.; *cream of tartar* (in powder), 1 *oz.* is then added, the boiling further continued for 10 minutes, and *powdered alum*, $1\frac{1}{2}$ *oz.* thrown in; after another 2 minutes' boil, the heat is withdrawn, and in 5 or 6 minutes more, the clear portion is decanted into porcelain vessels, which are set aside until the carmine falls down.

4. (*German process.*) Powdered *cochineal*, 1 *lb.*, *water*, 4 gall.; boil 15 minutes, add *powdered alum*, 1 *oz.*; boil 3 minutes longer, remove the heat, allow the liquor to settle for 5 minutes, pour off the clear portion into porcelain or earthenware vessels, and set them aside for 3 or 4 days. The carmine is found deposited on the bottom of the vessel, and must be now carefully drained and dried, as before. The decanted liquor yields more carmine by standing in fresh vessels. *Product.* About $1\frac{1}{2}$ *oz.*; besides $\frac{1}{2}$ *oz.*, or more, of an inferior quality obtained as a second deposit.

5. (*English process.*) From *cochineal*, 1 *lb.*; and *carbonate of potash*, $\frac{1}{2}$ *oz.*, boiled in *water*, 7 gall., for 15 minutes; the vessel is then removed from the fire, and *powdered alum*, 1 *oz.*, added; the liquor is then well agitated and allowed to settle for about 15 minutes longer; the clear liquid is next decanted into a clean copper, and *isinglass*, $\frac{1}{2}$ *oz.*, dissolved in *water*, 1 pint, (and strained) added; as soon as a coagulum

forms upon the surface, the heat is removed, and the liquid is strongly agitated with a bone or silver spatula, after which it is allowed to repose for 20 or 30 minutes. The deposited carmine must be drained and dried, as before.

Prop., &c. Pure carmine is a very light, lustrous, scarlet powder, entirely soluble in liquor of ammonia, a test by which its *purity* is readily determined. Preisser has given the name *carmine* to a colourless crystalline compound, which he has obtained from cochineal, and which, according to him, forms, by oxidation, *carmeine*, or the red colouring matter of the insect. Mr. Warren De La Rue says the pure colouring principle of cochineal is *carminic acid.* Others have given the name *cochinellin* to a similar substance. Pelletier and Caventou regard the carmine of commerce as consisting of cochinellin, animal matter, and an acid. By digesting *liquor of ammonia* on *carmine*, until all the colour is taken up, filtering and adding *acetic acid* and *alcohol*, till the whole is precipitated; and lastly, carefully washing the precipitate with *spirit of wine*, at proof, and drying in the shade, *carmine* of the *richest* and *most lustrous hue*, may be obtained even from samples of inferior quality.

Uses, &c. As a pigment in velvet and miniature painting, and for tinting artificial flowers, and as rouge for the complexion. The powdered cochineal (*carmine grounds*), from which the coloured liquor (*liquid rouge, carmine liquor,*) has been decanted, is used by the paper stainers, and both are used in the preparation of *carminated lake.*

Obs. The best black cochineal is generally used for the preparation of carmine. For ordinary qualities, *spirits of tin* (bichloride) is added to the decoction as a precipitant, and the liquid being put into suitable vessels, (wash-hand basins answer very well,) a deposit of carmine slowly takes place. Neither exposure to solar light nor artificial heat is advisable during the drying, but the latter must nevertheless be effected with all possible expedition. Hence, the finer shades of carmine can only be successfully made during certain states of weather; as in very hot weather the liquid rapidly sours or ferments, and the deposit is more or less dissolved; whilst in dull, damp weather, it is difficult to dry the precipitate sufficiently, which is then apt to become mouldy, and to lose colour. The researches of Pelletier and Caventou tend to show that the solution of tin used as a precipitant, should be at the maximum of oxidation or chlorination, to produce the richest shades of carmine. That first deposited is, in all cases, the most beautiful, and the quality gradually deteriorates as the process proceeds. 6 or 7 dr. only of carmine of the *very finest quality* can hence be obtained from 1 *lb.* of cochineal. See *Cochinellin, &c.*

CARMINE (Blue). Syn. *Blue Lake.* When the *solution of indigo in oil of vitriol* is neutralized with *carbonate of potassa*, a bulky blue precipitate separates, which has received the name of *blue carmine* or *soluble indigo.*

CARMINE (Liquid). Syn. *Fluid Carmine, Liquid Rouge, Carmine Ink.*—1. A solution of *carmine* in *ammonia water*, or *spirits of hartshorn.* Very rich and beautiful.

2. The residual liquor of the process of making carmine. Inferior. The *first* is used in velvet and miniature painting, and for tinting artificial flowers; the *second* for common purposes, as a stain or wash.

CARMINIC ACID. *Prep.* (Mr. W. De La Rue.) A *decoction of cochineal* is precipitated by adding a solution of *acetate of lead*, and the impure *carminate of lead* thus formed, after being washed with water, is *suspended in water*, and decomposed by a *stream of sulphuretted hydrogen;* (see *absinthic acid;*) the whole process is repeated with the decanted solution; the second solution, so obtained, is then evaporated to dryness, dissolved in *absolute alcohol*, digested on some washed *crude carminate of lead*, (to separate a little phosphoric acid,) and, lastly, mixed with *ether* (to precipitate some nitrogenized matter;) the residuum obtained by careful evaporation, is pure *carminic acid.*

Prop., &c. A purple brown mass, yielding a rich red powder; it is freely soluble in water and alcohol; slightly soluble in ether; and without decomposition in oil of vitriol; it is feebly acid; its salts are termed *carminates*, only two or three of which have been examined. According to Mr. De La Rue, this acid constitutes the *pure colouring* matter of cochineal.

CAROTINE. A crystalline, ruby-red substance, obtained from the root of the *daucus carota* (*sativa*) or garden carrot. It is tasteless; odourless; neutral; fusible; inflammable; insoluble in ether and water; slightly soluble in alcohol; and very soluble in the mixed and volatile oils.

CARPETS. Considerations of *cleanliness* and *economy* may demand a few words on *carpets* and *hearth-rugs* here. We are assured by an experienced person, that before proceeding to *sweep a carpet*, a few handfuls of waste tea-leaves should be sprinkled

over it, (say some five or six minutes before.) A stiff hair broom or hair brush *only* should be employed, unless the carpet be very dirty, when a whisk or carpet-broom may be used *first*, followed by another made of hair, to take off the loose dust. The frequent use of a *stiff* "carpet-broom," (those made of cane or birch are here alluded to,) soon wears off the beauty of the best carpet. An ordinary clothes-brush, or a clean one, resembling the "dirt brush" used for shoes, is best adapted for superior carpets. When carpets are very dirty, they should be cleaned by shaking and beating. In laying down carpets, it is very advisable, at first, to cover the floor beneath them with large sheets of thick paper, so as to prevent dust from rising between the boards. Old drugget, sacking, matting, or any similar substance, will effect the same purpose, and also, by breaking the force of contact between it and hard bodies, materially increase its durability.

Brussels Carpets may be cleaned with *ox-gall*, (1 pint to a pailful of water,) and a scrubbing-brush and floor-cloth; afterwards rinsing them in fresh water applied in the same way. They should be previously perfectly freed from dust by "beating them," and should be nailed down before commencing the above operations. Great care should be taken to rub them as dry as possible with a clean dry floor-cloth. A small portion only should be done at a time, and a dry windy day selected for the purpose. A carpet treated in this manner will be greatly refreshed in colour, particularly the greens.

Kidderminster Carpets will scarcely bear the above treatment without becoming so soft as to get speedily dirty again. This may in some measure be prevented, by brushing them over with a hot weak solution of size in water, to which a little alum has been added. Curd soap, dissolved in hot water, may be used instead of ox-gall, but it is more likely to injure the colours, if produced by false dyes. When there are spots of grease on the carpeting, they may be covered with curd soap, dissolved in boiling water, and rubbed with a brush until the stains are removed, when they must be cleaned with warm water as before. The addition of a little gall to the soap renders it more efficacious. Some persons employ a mixture of *soap*, *fuller's earth*, and *turpentine*, for the same purpose.

CARRAGEENIN. Syn. *Soluble Gelatin*, *Vegetable do.* The pure jelly extracted from *carrageen* or *Irish moss*. It may be purified by agitation with dilute alcohol, and filtration. It closely resembles animal jelly. A similar substance is obtained from *Ceylon moss*.

CARROT. Syn. *Carota*,—Ph. L. E. & D. *Dauci Radix*,—Ph. L. 1836. The fresh root ("*radix recens*") is officinal in the Ph. L. & E. and the seed ("*fructus*;" "*semina*;") in the Ph. E. & D. The *seed* is carminative and diuretic; the *expressed juice of the root* is anthelmintic. Scraped *raw carrot* is sometimes employed as a stimulant application to sore nipples; the *boiled root* as a poultice to sores and tumours. As an article of food, unless young and well dressed, carrots are rather indigestible.

CARTHAMINE. Syn. *Carthamic Acid*; *Pure Rouge*, *Safflower Carmine*, *Safflower Lake*. The red colouring matter of *carthamus tinctorius* or safflower.

Prep. 1. *Safflower*, exhausted by washing it with water, (or with water acidulated with acetic acid,) is dried, coarsely pulverized, and the powder digested in a *weak solution of carbonate of soda*; pieces of clean white cotton or calico are then immersed in the solution, and *acetic acid* gradually added in slight excess; the cotton is next washed, dried, and digested in a fresh quantity of *dilute solution of carbonate of soda*, and agitation employed until the whole of the colour is again dissolved; the new solution is filtered and slightly supersaturated with *citric acid* (or *acetic acid*); the *carthamine* which falls down in rich carmine red flocks, is lastly washed with *cold distilled water*, and dried.

2. *Washed safflower* (dried and powdered), any quantity; *aqueous solution of carbonate of soda*, (containing 15% of carbonate,) q. s. to form a thick paste; after some hours press out the red liquor, *nearly* neutralize it with *acetic acid*, put in cotton as before, and add *acetic acid* in slight excess; the next day remove the cotton and wash it in *water holding in solution* 5% *of carbonate of soda*, until the colour is dissolved out, after which precipitate with *citric acid*, as before.

Prop., &c. An amorphous, brilliant, greenish powder; nearly insoluble in water; soluble in alcohol, forming a gorgeous purple solution, and in weak alkaline lyes, giving an equally beautiful red one.

CARYOPHILLIN. Syn. *Clove Camphor*, *Clove Resin*. A resinous substance, extracted from *Molucca cloves* by means of alcohol. By repeated evaporations and re-solutions, it may be obtained in a satiny, crystalline form. It is odourless, tasteless, fusible, volatile, and soluble both in alcohol

and ether. It is reddened by sulphuric acid.

CASCARILLA. Syn. *Cascarilla*,—Ph. L. The bark of *croton eleutheria* or the *sea-side balsam*, a tree growing in the Bahamas and Jamaica. It is an aromatic bitter, stomachic, and tonic. *Dose.* 10 gr. to 30 gr. in the form of powder, infusion, or tincture; in diarrhœa, dysentery, dyspepsia, low fevers, intermittents, &c.

CASCARILLINE. Syn. *Cascarillina. Prep.* (Duval.) *Cascarilla*, is exhausted with *cold water*, by percolation, precipitated with *acetate of lead*, and the filtrate treated with *sulphuretted hydrogen;* (see *absinthic acid;*) the filtered liquid after agitation with *animal charcoal* and filtration, is gently evaporated to dryness. The powder is redissolved in boiling alcohol and crystallized by very slow or by spontaneous evaporation. It has a bitter taste, and acid reaction; its aqueous solution is unaffected by the ferric salts and tincture of galls. *Dose.* 1 to 3 gr.; in dyspepsia, &c.

CASE-HARDENING. Syn. *Steel surfacing.* The operation of giving a surface of steel to iron goods. Tools, fire-irons, fenders, keys, &c., are usually case-hardened.

Process. 1. The goods (finished in every respect but polishing,) are put into an iron box, and covered with *animal* or *vegetable charcoal*, and "cemented" at a red heat, for a period varying with the size and description of the articles operated on.

2. (Moxon.) *Cow's horn* or *hoof* is baked or thoroughly dried, and pulverized; to this is added an equal quantity of *bay salt*, and the whole is made into a paste with stale *chamber-lye*, or *white wine vinegar;* the iron is covered with this mixture, and bedded in it, in loam, or inclosed in an iron box. In this form it is laid on the hearth of the forge to dry and harden, then it is put into the fire, and blown till the lump has a blood-red heat, (no higher.) It is hardened as before.

3. Coat the goods with a paste made of a *concentrated solution of prussiate of potash* and *loam;* then expose them to a strong red heat, and when it has fallen to a dull red, plunge the whole into cold water.

4. The goods, previously polished and finished, are heated to a bright-red and rubbed or sprinkled over with *prussiate of potash.* As soon as the prussiate appears to be decomposed and dissipated, the articles are plunged into cold water.

Obs. The process of case-hardening has been well conducted, when the surface of the metal proves sufficiently hard to resist a file. The last two plans are a great improvement upon the common method. By the topical application of prussiate of potash (ferrocyanide of potassium) any part of a piece of iron may be case-hardened, without interfering with the rest.

CASE-HARDENING POWDERS. Syn. *Case-hardening Compositions.* 1. *Prussiate of potash*, dried and powdered.

2. *Prussiate of potash*, 3 parts; *sal ammonia*, 1 part; mix.

3. *Sal ammoniac* and *bone-dust*, of each, 2 parts; *prussiate of potash*, 1 part. (See above.)

CASEINE. Syn. *Caseum, Casein, Lact-albumen, Albumen* of *Milk.* Cheese made from skimmed milk, and well pressed, is nearly pure caseine. (Liebig.)

Caseine has lately engaged the attention of organic chemists, from being a modification of the *proteine* of Mulder. When caseine is thrown down from milk by adding an acid, it combines with a little of it, forming a kind of salt. With sulphuric acid a sulphate of caseine is formed. The acid may be removed by washing, when pure caseine is left behind. A solution of caseine in water very slightly alkalized, (as milk,) does not coagulate in boiling. In this it differs from *albumen;* as also in being precipitated by acetic acid, whereas albumen is not. The most remarkable property of caseine is its coagulation by certain animal membranes, as in the process of cheese-making, with rennet. In this operation the rennet loses less than $\frac{1}{1800}$th part of its weight. *Legumine* is vegetable caseine. By first adding a little caustic potassa to albumen, and then some alcohol, a precipitate is formed, having all the properties of caseine. (Liebig.)

Caseine precipitated with acetic acid contains about $1\frac{0}{0}$ of *sulphur;* when precipitated with alcohol it contains about $6\frac{0}{0}$ of *phosphate of lime.* Pure caseine is insoluble in alcohol and ether, and in water unless alkalized.

CASKS. The *care and management* of casks is an important affair in a large establishment. It is found that they *last longest* when "stored" either in a dry situation, or in one uniformly very moist. Continual variations from the one to the other speedily rot them. As soon as casks are emptied they should be bunged down quite air-tight, with as much care as if they were full, by which means they will be preserved both sweet and sound. Should any of the hoops become loose, they should be immediately driven up tight, which will at once

prevent the liability of their being lost or misplaced, as well as the casks "fouling" or becoming musty from the admission of air. For this purpose, those out of use should be occasionally "hauled over" and examined. *Good casks* are very *expensive articles*. The casks and vats belonging to the great brewery of Messrs. Barclay and Co., of London, are said to be worth several score thousand pounds.

Numerous plans are adopted for cleaning and purifying *stinking* and *musty casks*, among which are the following:—

1. Wash them well out with *oil of vitriol*, diluted with an equal weight of *water*.

2. Wash them first with a little *chloride of lime* and *warm water*, and then with *water soured with oil of vitriol*.

3. Match them with *sulphur*, or with *sulphur mixed with a little saltpetre*.

4. Unhead them and whitewash them with fresh *milk of lime*, made pretty strong. This plan is commonly followed for brewer's vats.

5. Remove the heads, and char the insides of the staves by the aid of a fire of shavings, kindled within them.

6. A simpler, safer, and more effectual method of charring them than the last, is to wash the *dry* casks out with the strongest *oil of vitriol*. This not only purifies the surface of the staves, but penetrates into *all* the cracks, some of which might escape the action of the fire. The strongest oil of vitriol (sp. gr. 1·845,) may be bought in quantity at 1¼*d*. per *lb*., or less than 2*s*. a gall.; a quantity sufficient, with common skill and care, to wash out 50 or 60 hogsheads or pipes.

7. *Steam* has lately been applied to the insides of casks, with great advantage. *High-pressure steam* is driven in at the bung-hole, at the same time that the cask is violently agitated, (a heavy chain having been previously put into it,) until all the dirt and bad smell is removed.

8. A *lye of pearlash* or *soda*, mixed with *milk of lime*, as well as *strong hot brine*, and other similar liquors, have been adopted by some persons, and are highly spoken of.

9. The coopers boil the staves for gin casks in a strong *lye of alum* before placing them together, to prevent their colouring the spirit, but *washing with oil of vitriol* is a better plan.

10. Some persons fill musty casks with water, and add 3 or 4 *lb*. of *coarsely powdered fresh-burnt charcoal*, and agitate well for a few days.

Obs. In all the above cases the greatest care must be taken to scald, or soak and well rinse out the casks after treating them in the manner referred to above. See *Brewing Utensils*, *Matches*, *&c.*

CASSAREEP. The *expressed juice* of the *sweet cassava*, a variety of the *jatropa manihot* or *bitter cassava*. *Used* in the West Indies as a condiment.

CASSAVA. Syn. *Cassada*, *Cassava Meal*, *Cassada do.*; *Farina Mandiocæ*,—Lat. From the *jatropa manihot*, (Linn.) or *bitter cassava*, a poisonous tropical tree of the natural order *Euphorbiaceæ*. The roots after being well washed and scraped, are rasped or grated, and the pulp thus formed is subjected to strong pressure, to expel the poisonous juice which it contains. The compressed pulp is next thoroughly dried over the fire, being constantly stirred the whole time, by which any remaining portion of the noxious juice is either volatilized or decomposed. It now forms *cassava meal*. When it is further prepared by grinding, it forms *fine cassava meal*, or *cassava flour*. When the compressed pulp is baked on a hot plate, it forms *cassava bread* or *cassava cakes*, the flavour of which greatly resembles that of Scotch oat-cakes. See *Tapioca*.

CASSIA. Syn. *Cassia*,—Ph. L. The "fruit" (Ph. L.; the "pulp of the pods," —Ph. E.) of the *cassia fistula*, (Linn.) or *purging cassia*. (See below.)

CASSIA PULP. Syn. *Cassia præparata*,—Ph. L. *Prep.* The *cassia*, (pods or fruit,) broken lengthwise, are macerated in sufficient *distilled water* to cover them, for six hours, constantly stirring; and the "purified pulp" strained through a hair sieve, and evaporated to the consistence of a confection in a water bath. *Dose.* As a mild laxative, 1 to 2 dr.; as a purgative, ¾ oz. to 1½ oz.

CASSOLETTES (Scented). See *Pastilles* and *Perfumery*.

CASTOR. Syn. *Castoreum*,—Ph. L. E. & D. "The follicles of the prepuce of the *castor fiber* or *beaver*, filled with a peculiar secretion." (Ph. L.) "A peculiar secretion from the præputial follicles." (Ph. E. & D.). It is often sophisticated; a fraud readily detected by the "absence of the membranous partition in the interior of the bags, as well as by the altered smell and taste." (Ure). *Dose.* 1 to 2 dr. or more, in powder or made into pills; in nervous and spasmodic affections, especially in hysteria, epilepsy, and other like diseases of females.

CASTORINE. Syn. *Castorina*, *Castoreum Camphor*. When *castor* is cut into small pieces and boiled in about 6 times its

weight of *alcohol*, a crystalline substance (*castorine*) is deposited by the filtered tincture in cooling. By re-solution in alcohol, it may be obtained under the form of colourless prismatic acicular crystals.

Prop., &c. Castorine is soluble both in ether and hot alcohol, is inflammable, and by long boiling with nitric acid is converted into *castoric acid*. This acid forms salts with the bases, called *castorates*.

Obs. Genuine Russian castor, although the most expensive, must be employed in the above process, as scarcely any castorine can be obtained from the American variety.

CASTS. In preparing casts and moulds with *gelatine*, *wax*, *fusible metal*, and similar substances, it is important to use them at the lowest temperature compatible with fluidity; as when only a few degrees hotter, the water which adheres to the things from which the casts are taken, is converted into vapour, and produces bubbles. *Fusible metal* may be allowed to cool in a tea-cup until just ready to set at the edges, and then poured into the moulds. In this way beautiful casts from moulds of wood, or of other similar substances may be procured. When taking impressions from gems, seals, &c., the fused alloy should be placed on paper or pasteboard, and stirred about till it becomes pasty, from incipient cooling, at which moment the gem, die, or seal, should be suddenly stamped on it, and a very sharp impression will then be obtained.

CATALEPSY. Syn. *Trance; Catalepsis, Catalepsia.* A disease in which the organs of sense and motion cease to exercise their functions, and the heart and lungs feebly perform their offices and in a scarcely perceptible manner. The paroxysm generally comes on without previous warning, and its duration varies from a few minutes to several days, and if medical reports are to be credited, sometimes for a much longer period. Dr. Cullen seriously affirms that this disease is *always* counterfeited.

Treat. Ammoniacal stimulants applied to the nostrils, and spirituous liquors injected into the stomach, with general friction of the body, and free access to pure air, are the best remedies. Electricity and galvanism should also be had recourse to, when the necessary apparatus is at hand.

CATAPLASMS. See *Poultices.*

CATARRH. Syn. *Catarrhus*,—Lat. The "*cold in the head*," or "*cold on the chest*," of domestic medicine. *Influenza* is a severer form of this complaint, and has been called *epidemic catarrh.*

The common *symptoms* of catarrh are a copious discharge from the eyes and nose, a hoarseness, and generally a cough, more or less severe. The exciting causes are sudden changes of temperature, and exposure to currents of cold air while the body is heated; hence the frequency of colds in hot and changeable weather.

Treat. A light diet should be adopted, and animal food and fermented and spirituous liquors should be particularly avoided. Some *mild aperient* should be administered; and when the symptoms are severe, or fever or headache is present, small *diaphoretic doses* of *antimonials*, accompanied by copious draughts of diluents, as *barley-water*, *weak tea*, or *gruel*, should be taken. This treatment, except in very bad cases, will generally effect a cure.

CATECHINE. Syn. *Catechuic Acid, Resinous Tannin.* When *cubical gambir*, or *catechu*, in powder, is treated with *cold water*, a portion remains undissolved. This is *catechine.* By repeated solutions in *alcohol*, it may be obtained under the form of white silky acicular crystals.

Prop., &c. Catechine strikes a green colour with the salts of iron, but does not precipitate gelatine. When dissolved in caustic potassa, and the solution exposed to the air, it absorbs oxygen, and *japonic acid* is formed. If, instead of caustic potassa, carbonate of potassa is employed, it is converted into *rubinic acid.*

CATECHU. Syn. *Gambir; Terra Japonica; Cutch; Catechu*,—Ph. L. E. & D. "The extract from the wood of *acacia catechu*, or from the leaf of *uncaria gambir;*" (Ph. L.) Also of the "kernels of *areka catechu;* probably, too, from other plants." (Ph. E.)

There are several varieties of catechu known in commerce, of which the principal are—

Bombay Catechu. Firm, brittle, dark brown, of a uniform texture, and a glossy, semi-resinous, and uneven fracture. Sp. gr. 1·39. Richness in tannin, 52%.

Bengal Catechu. Rusty brown colour externally; porous, and more friable than the preceding. Sp. gr. 1·28. Richness in tannin, 49·5%.

Malabar Catechu. Resembles the last in appearance, but is more brittle and gritty. Sp. gr. 1·40. Richness in tannin, 45·5%.

Of the above varieties the *first* is the one generally employed in medicine, and which commonly passes by the name of *catechu.* The *second*, popularly passes under the name of *terra japonica.*

Pur. It is "almost entirely dissolved by boiling water. The cold solution does not give a blue colour with *iodide of potassium* and dilute nitric acid added together." If ether be added to 100 gr. of either variety, 40 gr. of the dried ethereal extract should be soluble in cold water." (Ph. L.)

Estim. It is often of importance to the tanner and dyer to determine the richness of this article in *tannic acid* or *tannin*. The following are two simple methods :—

1. Exhaust a weighed sample (in powder) with *ether*, and evaporate by the heat of a hot water bath. The product, which is the tannin, must then be accurately weighed.

2. Dissolve the sample, (in powder,) in *hot water*, let it cool out of contact with the air, filter, and add a *solution of gelatine*, as long as a precipitate falls. The precipitate, after being washed and dried at a steam heat, contains 40% of tannin.

Uses, &c. Catechu is extensively employed in medicine, both *internally* and *externally*, as an astringent. It is used to flavour British brandy, and by the tanners as a substitute for oak bark. With it the dyer produces, inexpensively, many of his most pleasing browns. To cottons it imparts a brown without a mordant. "The *salts of copper* with *sal ammoniac* cause it to give a BRONZE COLOUR, which is very fast; the *proto-muriate of tin*, a BROWNISH-YELLOW; the *per-chloride of tin*, with the addition of *nitrate of copper*, a DEEP BRONZE HUE; *acetate of alumina*, alone, a REDDISH-BROWN, and with *nitrate of copper*, a REDDISH OLIVE GRAY; *nitrate of iron*, a DARK BROWN GRAY. For dyeing a GOLDEN COFFEE-BROWN, it has entirely superseded *madder;* 1 *lb.* of it being equivalent to 6 *lb.* of this root." (Ure.)

Dose. 10 gr. to 30 gr. in solution, in water, or made into a bolus, or sucked as a lozenge.

CATGUT. The prepared and twisted intestines of animals. *Prep.* The guts, taken whilst warm from the animal, are thoroughly cleaned, freed from adherent fat, and well rinsed in pure water. They are next soaked for about 2 days in water, after which, they are laid on a table and scraped with a copper-plate, having a semicircular notch, beginning the operation at the smaller end. In this way the mucous and peritoneal membranes are removed. The guts are then put into fresh water, and soaked until the next day, when they are again scraped, the larger ends cut off, and after well washing, again steeped for a night in fresh water, and then for 2 or 3 hours in a weak lye of pearlash or potash, (2 *oz.* to the gall.) They are lastly washed in clean water, and passed through a polished hole in a piece of brass to smooth and equalize their surface; after which they are twisted, and sorted, according to the purposes for which they are intended. For many purposes, it is then *dyed* or *sulphured*, and rubbed with *olive oil*. It improves by age. Red or black ink, or any of the simple dyes or stains are used to colour it.

Uses, &c. Catgut is employed in several of the arts. The *strings* of *harps*, *violins*, &c., are formed of this material. *Whipcord* is made from catgut, which is sewed together while soft with the *filandre* or scrapings, after which it is put into a frame and twisted. *Bowstrings* for hatmakers are made out of the largest intestines, 4 to 12 of which are twisted together, until the cord is extended to 15 to 25 feet in length. It is then rubbed perfectly smooth and free from knots, half dried, sulphured twice, again stretched and sulphured, and lastly, dried in a state of tension. *Clockmakers' cords* are made of the smallest intestines, in a similar manner.

The best *fine catgut* is made at Venice or Rome, from the intestines of thin sinewy sheep. That made in England is formed from the fat sheep killed for the shambles, and is, hence, inferior. *Coarse catgut*, for *turning lathes*, &c., is made from the intestines of horses, cut into 4 or 5 strips, by forcing a ball furnished with projecting knives placed crosswise along them. These strips are next twisted, dried, and rubbed smooth with fish skin. *Gutta percha* and *vulcanized Indian rubber* are now applied to many of the purposes formerly exclusively occupied by *catgut*.

CATHARTICS. See *Purgatives*.

CATHARTINE. The *purgative principle of senna*, first noticed by Lassaigne and Fenuelle. A strong aqueous infusion of *senna leaves*, is evaporated to the consistence of a syrup, out of contact with the air; this fluid extract is then digested in *alcohol* or *rectified spirit*, and the tincture, after filtration, is evaporated to dryness by a gentle heat.

Prop., &c. A reddish-coloured, uncrystallizable mass; having a peculiar odour, and a bitter, nauseous taste; freely soluble in both water and alcohol, and strongly cathartic. Two or three gr. cause nausea, griping, and purging. It has been proposed to employ it, combined with aromatics, as a cathartic.

CATHETERS. Small tubes introduced into the bladder for the purpose of drawing

off its contents. They may be regarded as hollow bougies.

Prep. 1. A piece of smooth *catgut*, or *steel wire*, bent to the proper shape, is coated with *melted wax*. When cold, it is dipped repeatedly into an *ethereal solution of Indian rubber*, until a sufficient thickness is obtained, after which it is dried by a gentle heat, and then boiled in *water* to melt out the wax, and to allow the catgut to be withdrawn.

2. From slips of *Indian rubber*, as directed under *Bougies*.

3. A smooth *tissue of silk* is woven over a bent wire, and then coated with a surface of *Indian rubber*, or *elastic varnish*, and finished off as before. See *Bougies*.

CAUDLE. Gruel enriched by various additions.

Prep. 1. *Thick oatmeal gruel* mixed with about one-half its weight of *good mild ale*, (made hot,) and as much *sugar*, and *mace*, *nutmeg*, or *ginger*, as will make it agreeable.

2. To the last add *an egg*, well beaten.

3. *Sugar*, 3 or 4 lumps; *hot water*, a tablespoonful; dissolve; add 1 *egg;* beat well together; further add a *glass of wine* and a little *nutmeg* or *ginger;* mix well, and stir the mixture into *good gruel*, (hot,) ¾ pint.

Uses, &c. A nourishing and restorative mixture during convalescence, much used among certain classes after accouchement. It is an excellent domestic remedy for *colds, &c.*, unaccompanied with fever; for which purpose it should be taken on retiring to rest at night, preceded by a dose of castor oil during the day.

CAUSTIC. Syn. *Causticum*,—Lat. A substance that corrodes or destroys the texture of organized bodies. This action is popularly termed "*burning*."

The principal caustics are *nitrate of silver*, *caustic potassa*, a *mixture of caustic potassa* and *quicklime*, *sulphate of copper*, *red oxide of mercury*, *verdigris*, *tincture of sesquichloride of iron*, *chloride of zinc*, *chloride of antimony*, *nitric acid*, and *acetic acid*.

Use. Caustics are employed to remove excrescences, morbid growths, granulations, &c., as corns, warts, and proud flesh; and to open issues, abscesses, &c. The *first*, *second*, and *fourth* are applied by gently rubbing them on the part previously moistened with water; the *third* is commonly made into a paste, with rectified spirit or glycerine, before application; *red oxide of mercury* and *verdigris*, (in the form of powder,) are often sprinkled over foul and indolent ulcers; whilst the *acids* and other *liquid caustics*, are applied with a feather, camel hair-pencil, or glass rod. The same applies to the liquid preparations below. In all cases care should be taken to confine the application to the affected part.

CAUSTIC (Ammoniacal). See *Ointments*, and *below*.

CAUSTIC (Antimonial). Syn. *Causticum Antimoniale*,—Lat. Chloride of antimony.

CAUSTIC (Arsenical). Syn. *Causticum Arsenicale*, *C. Arseniosum*, *C. A. Compositum*,—Lat. *Prep.* 1. See *Plunket's Caustic*.

2. (Cutan. Hosp.) *Calomel*, 2½ oz.; *red sulphuret of mercury*, 1 dr.; *arsenious acid*, 1 dr. to 2 dr.

3. (Van Mons.) *Arsenious acid*, 6 dr.; *dragon's blood*, 2 dr.; *animal charcoal*, 1½ dr.; *cinnabar*, 3 oz.

4. (Ratier.) *Arsenious acid*, 1 part; *kino*, 8 parts; *cinnabar*, 16 parts. The ingredients of the last three must be separately reduced to fine powder, and then carefully mixed. They are favourite applications on the Continent, in cases of cancer, cancerous sores, obstinate lepra, &c. They are either dusted over the part, or are made into a paste with mucilage or the saliva, and applied like an ointment on a piece of rag or lint; due caution being observed, and the effects watched. The last is much used in the French hospitals.

CAUSTIC (Canquoin's). See *below*.

CAUSTIC (Cantharides). Syn. *Causticum Cantharidis*,—Lat. *Prep.* 1. *Powdered cantharides* made into a paste with *concentrated acetic acid*.

2. (Cutan. Hosp.) *Tannin*, 1 oz.; *cantharides* (powdered), 2 oz.; *strong acetic acid*, 8 oz.; digest a week, and strain. Blisters.

CAUSTIC (Common). See *Potassa* (fused), and *Potassa with Lime*.

CAUSTIC (Duvilles) *Prep.* 1. *Aloes*, 5 oz.; *proof spirit*, 10 oz.; *oil of vitriol*, 6 oz.; mix.

2. *Aloes* (in powder), 2½ oz.; *rum*, ¼ pint; mix, and the next day add, *oil of vitriol*, 1 oz. A favorite caustic in veterinary practice; especially in foot-rot.

CAUSTIC. (Filho's). *Prep.* From *caustic potassa*, 2 parts; *quicklime*, (in powder,) 1 part; melt together in a ladle, mix well, and pour it into small leaden tubes, the size of a large swan quill. When cold coat each piece with *melted bees' wax* to exclude the air. *Used* as a strong caustic in veterinary practice. It is applied like nitrate of silver.

CAUSTIC (Golden). Syn. *Caustic of*

Chloride of Gold; Causticum Aureum, C. Aurii Chloridi,—Lat. *Prep.* 1. (Recamier.) *Terchloride of Gold*, 6 gr.; *nitro-hydrochloric acid*, 1 oz.; dissolve.

2. (Legrand.) As the last, but using *nitric acid*. Both are recommended as caustics, in syphilitic, scrofulous, and scorbutic ulcers, cancerous growths, &c.; applied by means of a dossil of lint.

CAUSTIC (Gondret's). Syn. *Gondret's Ammoniacal Caustic; Pommade de Gondret; Causticum Ammoniacale*, — Lat. *Prep.* 1. See *Ammoniacal Ointment*.

2. (Original formula.) *Almond oil*, 2 dr.; *suet*, 4 dr.; *lard*, 6 dr.; melt together in a wide-mouthed bottle, cool a little, add *liquor of ammonia*, 12 dr.; and agitate until cold. A powerful rubefacient and counter-irritant; used to produce an immediate revulsion. If covered with a compress it raises a blister in 4 or 5 minutes.

CAUSTIC (Iodine). Syn. *Causticum Iodinii*,—Lat. *Prep.* (Lugol.) *Iodine* and *iodide of potassium*, of each, 1 part; *water*, 2 parts; dissolve. *Used* in similar cases to iodine paint, and to scrofulous growths and ulcers.

CAUSTIC (Lunar). *Nitrate of silver* fused and formed into sticks by pouring it into moulds.

CAUSTIC (Mercurial). Syn. *Caustic of Nitrate of Mercury; Causticum Acidi Hydrargyri Nitratis, C. H. Deutonitratis*,—Lat. From *mercury*, 1 part; *commercial nitric acid*, 2 parts; dissolve.

2. (Cutan. Hosp.) *Mercury*, 1 part; *nitric acid* (sp. gr. 1·5), 2 parts.

3. (P. C.) As No. 1, but evaporating the solution to ¾ths its weight. These liquids are applied with a pencil or lint, in scrofulous and syphilitic ulcers and eruptions, and in lupus, psoriasis, lepra, and other obstinate skin diseases; but their use requires great care.

4. (With arsenic.—Cutan. Hosp.) *Mercury*, ½ oz.; *nitric acid*, 1 oz.; *arsenious acid*, ½ dr.; as before.

CAUSTIC (Nitric). Syn. *Solidified Nitric Acid; Causticum Nitricum*,—Lat. *Prep.* (Dr. Rivallie.) *Concentrated nitric acid*, is gradually dropped on a *piece of lint*, placed in a saucer or glass; as soon as the lint is gelatinized, it is pressed into a suitable shape with a glass rod, and applied to the part; it must be removed in 15 minutes. In cancerous tumours, fungoid growths, &c.

CAUSTIC (Opiated). Syn. *Caustic Opiatum*,—Lat. *Prep.* 1. *Common caustic* (potassa with lime), 4 dr., *powdered opium*, 1 dr.; *soft soap*, q. s. to make a paste. Applied to fungous ulcers.

CAUSTIC (Plunket's). *Upright crowfoot* and *lesser spear-wort*, of each, 1 oz.; *sulphur*, 5 scrup.; *white arsenic*, (in very fine powder), 1 dr.; beat to a smooth paste, form it into balls, and dry them in the sun. In cancer; a portion of one of the balls is reduced to powder, which is mixed up with *yelk of egg*, and applied on a piece of bladder.

CAUSTIC (Potential). Fused caustic potassa.

CAUSTIC (Recamier's). See *Golden Caustic*.

CAUSTIC (Sulphuric). Syn. *Causticum Sulphuricum, C. Acidi Sulphurici*,—Lat. *Prep.* 1. *Plaster of Paris* made into a paste with *oil of vitriol*.

2. *Saffron*, *lint*, or *unsized paper*, soaked in *oil of vitriol*, and triturated to a plastic mass.

CAUSTIC (Zinc). Syn. *Caustic of Chloride of Zinc, Dr. Canquoin's Cancer Caustic; Causticum Zinci, C. Z. Chloridi*,—Lat. *Prep.* 1. (Dr. Canquoin.)—*a.* From *chloride of zinc*, 1 dr.; *flour*, 2 dr.; made into a stiff paste with *water*, q. s.

b. From *chloride of zinc*, 1 dr.; *flour*, 3 dr.; *water*, q. s.; as the last.

c. From *chloride of zinc*, 1 dr.; *flour*, 4 dr.; *water*, q. s.; as before.

d. From *chloride of zinc*, 2 dr.; *chloride of antimony*, 1 dr.; *flour*, 5 dr.; as before.

2. (Alex. Ure.) As above, but substituting *plaster of Paris* for the *flour* there ordered.

Uses, &c. As a caustic in cancer, lupus, skin-marks, (*nævi*,) &c. It is formed into small cakes or wafers not exceeding 1 or 2 lines in thickness, one of which is applied to the part, and allowed to remain on from 6 to 12 hours, when it is removed, and the part covered with a poultice. It produces an eschar, often exceeding a quarter of an inch in depth. The chlorides must be in the form of powder, and well mixed with the flour previously to adding the water. The last (No. 1. *d.*) is recommended in nodulated cancerous tumours.

CAUSTICS (Veterinary). In *veterinary practice* any of the substances enumerated in the list of caustics at page 212, may be employed, care being had to select the cheapest, and to employ them of proportionate strength to meet the requirements of the case. See *Veterinary Medicine*.

CAVIARE. Syn. *Caviar, Caviale*. The salted roe of several species of sturgeon. It is much esteemed by the Russians as well as by some other nations of northern

Europe, and is occasionally eaten as a delicacy in this country. It is, however, very oily, indigestible, and unwholesome.

CAYENNE (Soluble). See *Peppers.*

CEDRA. See *Liqueurs.*

CEDRENE. The *oil of cedar-wood*, by careful distillation, is separable into two substances,—a solid crystalline compound, (*cedrone,*) and a volatile liquid hydrocarbon, (*cedrene.*) The first may be converted into the other by distillation with *anhydrous phosphoric acid.*

CEDRIRET. A red crystalline substance obtained from the *lighter oil of hard-wood tar*, by the action of *caustic alkalies* and *oxidizing agents.* It forms reticulated crystals, insoluble in water, alcohol, and ether; soluble in oil of vitriol, to which it imparts a deep blue colour.

CELLULOSE. See *Lignin.*

CEMENT. Syn. *Cementum*, — Lat. Any substance which, when applied to the surfaces of other bodies, causes them to adhere together when placed in contact. Those referred to below are among the most useful preparations of this class. The term cement is also applied by builders and architects to several species of *mortars* and *like compositions* employed either to unite stones and bricks into masses, or as a protective covering against the weather or water, or to make statues, cornices, and similar ornamental articles.

In general, the thinner the stratum of interposed cement, the stronger is the junction of the surfaces operated on. This caution is necessary, as in their anxiety to unite broken articles, persons generally defeat themselves, by spreading the cement too *thickly* on the edges of the fracture; whereas the least possible quantity should be used, so as to bring the edges as close as possible together.

CEMENT (Alabaster). 1. From *plaster of Paris*, (in fine powder,) made into a cream with *water*, and at once applied.

2. *Yellow resin*, 2 parts; melt, and stir in *plaster of Paris*, 1 part.

3. *Yellow resin, bees' wax*, and *plaster of Paris*, equal parts.

4. *Sulphur* or *shellac*, melted with sufficient *plaster of Paris* or *colouring matter* to give the desired shade. *Used* to join or mend pieces and figures in *alabaster, white marble, Derbyshire spar, porphyry*, and other like substances; and to fill up cracks, supply chips out of corners, &c. The last three are applied hot, the surfaces to be united having been previously warmed.

CEMENT (Architectural). 1. From *paper* (reduced to a smooth paste by boiling it in water), *sifted whiting*, and *good size*, equal parts, boiled to a proper consistence.

2. *Paper paste, size*, and *plaster of Paris*, equal parts; as before.

Obs. This is a species of papier-maché. It is *used* to make *architectural ornaments, busts, statues, columns, &c.* It is very light, and receives a good polish, but will not stand the weather unless it is well varnished or painted.

CEMENT (Armenian). Syn. *Diamond Cement, Persian do., Turkish do., Jeweller's do.* The jewellers of Turkey, who are mostly Armenians, have a singular method of ornamenting watch-cases, &c., with diamonds and other precious stones, by simply glueing or cementing them on. The stone is set in silver or gold, and the lower part of the metal made flat, or to correspond with the part to which it is to be fixed; it is then gently warmed, and the glue is applied, which is so very strong that the parts thus cemented never separate. This glue will strongly unite pieces of *glass* and *china*, and even *polished steel*, and may be applied to a variety of useful purposes.

Prep. 1. (*Original Armenian formula,*— Eton.) Dissolve five or six bits of *gum mastic*, each the size of a large pea, in as much *rectified spirit of wine* as will suffice to render it liquid; and, in another vessel, dissolve as much *isinglass*, previously a little softened in water, (though none of the water must be used,) in *French brandy* or *good rum*, as will make a two-ounce phial of *very strong glue*, adding two small bits of *gum galbanum* or *ammoniacum*, which must be rubbed or ground till they are dissolved. Then mix the whole with a sufficient heat. Keep the glue in a phial closely stopped, and when it is to be used, set the phial in boiling water.

2. (*Keller's.*) Soak *isinglass*, ½ *oz.*, in *water*, 4 *oz.*, for 24 hours; evaporate in a *water bath* to 2 *oz.*; add *rectified spirit*, 2 *oz.*, and strain through muslin; mix this, whilst warm, with a solution formed by dissolving *gum mastic* (best), ¼ *oz.*, in *rectified spirit*, 2 *oz.*; add of *powdered gum ammoniac*, 1 dr., and triturate together until perfectly incorporated, avoiding loss of the spirit by evaporation as much as possible.

3. *Isinglass soaked in water and dissolved in spirit*, 2 *oz.* (thick); dissolve in this 10 gr. of *very pale gum ammoniac* (in tears), by rubbing them together; then add 6 large tears of *gum mastic*, dissolved in the *least possible quantity of rectified spirit.*

4. *Isinglass dissolved in proof spirit* (as above), 3 *oz.*; *bottoms of mastic varnish* (thick, but clear), 1½ *oz.*; mix well.

Obs. When carefully made, this cement resists moisture and dries colourless. As usually met with, it is not only of very bad quality, but sold at exorbitant prices. "Some persons have sold a composition under the name of Armenian cement in England; but this composition is badly made: it is much too thin, and the quantity of mastic is much too small." (Eton.) *Mastic* and *mastic varnish* are also used by jewellers as cements.

CEMENT (Beale's). *Chalk*, 60 parts; *lime* and *salt*, of each, 20 parts; *Barnsey sand*, 10 parts; *iron filings* or *dust*, and *blue* or *red clay*, of each, 5 parts; grind together and calcine. Patented as a *fire-proof cement.*

CEMENT (Botany Bay). *Yellow gum* (Botany bay gum) and *brickdust*, equal parts, melted together. *Used* to cement coarse earthenware, &c.

CEMENT (Bottle). *Prep.* 1. *Rosin*, 1 *lb.*; *tallow* or *suet*, ¼ *lb.*; melt together, and stir in the *colouring matter.*

2. *Rosin*, 5 *lb.*; *bees' wax*, 1 *lb.*; *colouring*, q. s.; as last.

3. (*Red.*) To *each pound of the above* add *whiting* (dry), 3 *oz.*; *light red* (burnt ochre), 4 *oz.*; or *red bole*, q.s.; (all in fine powder.)

4. (*Black.*)—*a.* To *each pound* of No. 1, or No. 2, add *ivory black* (bone black), q.s.

b. From *black pitch*, 6 *lb.*; *ivory black* and *whiting*, of each 1 *lb.*; melted together. *Used* in the same way as wax for bottle corks, cask bungs, &c. See *Maissiat's Cement.*

CEMENT (Brimstone). *Melted brimstone*, either alone, or mixed with *rosin* and *brick-dust.* Cheap and useful.

CEMENT (Bruyere's). *Clay*, 3 parts; *slaked lime*, 1 part; mix and expose them to a full red heat for 3 hours, then grind to powder. Recommended as an hydraulic cement.

CEMENT (Building). Syn. *Artificial Puzzolene.* From a *mixture* of *clay* or *loam*, *broken pottery*, *flints*, or *silicious sand*, or broken bottle glass, and *wood ashes*, exposed to a considerable heat in a furnace, until it becomes partially vitrified; it is then ground to fine powder, sifted, and mixed with one-third its weight of *quicklime*, also in fine powder, after which it must be packed (tight) in casks to preserve it from the air and moisture. For use it is mixed up with water and applied like Roman cement.

CEMENT (Cap). *Rosin*, 5 *lb.*; *bees' wax* and *dried Venetian red*, of each, 1 *lb.*; melted together. *Used* for chemical and electrical purposes.

CEMENT (Cheese). From *grated cheese*, 2 parts; *quicklime* (in fine powder), 1 part; *white of egg*, q. s.; beat to a paste. *Used* for earthenware, &c.

CEMENT (Chemical). *Prep.* From *yellow wax*, 4 parts; *common turpentine*, 2 parts; *Venetian red* (well dried), 1 part; melted together. *Used* as a temporary stopping or lute for the ends or joints of tubes, which are not exposed to much heat; as in alkalimetry, &c. See *Electrical Cement.*

CEMENT (Chinese). Syn. *Shell-lac Cement*, *Liquid glue.* *Prep.* 1. Finest pale *orange shell-lac* (broken small), 1 part; *rectified spirit* (strongest), 2 parts; digested together in a corked bottle in a warm place until dissolved. Very strong and useful; almost odourless. It should have about the consistence of treacle.

2. As before, but using *wood naphtha* as the solvent. Inferior to the last, but excellent for many purposes.

3. *Borax*, 1 *oz.*; *water*, ¾ pint; *shell-lac*, 3 *oz.*; boil in a covered vessel until dissolved, then evaporate to a proper consistence. Cheap and useful, but dries slowly.

Uses, &c. Employed to mend glass, china, fancy work, jewellery, &c., for which it is only inferior to Armenian cement. The *first formula* produces a cement so strong that pieces of wood may be joined together, cut slopingly across the grain, and will afterwards resist every attempt to break them at the same place. In many of the islands of the Indian Ocean, in Japan, China, and the East Indies, a similar cement is used to join pieces of wood for bows, lances, &c. The fluid is thinly smeared over each face of the joint, a piece of very thin gauze interposed, and the whole pressed tightly together and maintained so until the next day. Joints so made will even bear the continual flexure of a bow without separating. It is admirable for *fishing rods.* The product of the *second formula* is the *liquid glue* of the shops. That of the *last* is commonly used by the *druggists* and *oilmen*, instead of gum, for fixing labels on bottles exposed to damp.

CEMENT (Coppersmiths). Syn. *Blood Cement.* From *bullock's blood* thickened with *finely powdered quicklime.* *Used* to secure the edges and rivets of copper boilers, to mend leaks from joints, &c. It must be used as soon as mixed, as it rapidly gets hard. It is cheap and durable, and is suited for many other purposes.

CEMENT (Curd). *Prep.* 1. The *curd*

of skimmed milk, beaten to a paste with *quicklime*, in fine powder.

2. To the last add a little *white of egg*. The curd is obtained by adding *vinegar* or *rennet* to the *milk*. Both are used for glass and earthenware.

CEMENT (Cutler's). *Prep.* 1. *Black rosin*, 4 *lb.*; *bees' wax*, 1 *lb.*; melt, and add *finely-powdered* and *well-dried brickdust*, 1 *lb.*; mix well.

2. Equal weights of *rosin* and *brickdust*, melted together.

Use. To fix knives and forks in their handles. It is put into the hollow of the handle, and the metal, previously made hot enough to melt the composition, pressed into its place whilst warm, and the whole kept upright and still until quite cold.

CEMENT (Diamond). See *Armenian Cement*.

CEMENT (Egg). *White of egg* thickened with *finely-powdered quicklime*. *Used* to mend earthenware, glass, china, marble, alabaster, spar ornaments, &c. It does not resist long exposure to moisture, unless it has been exposed to heat.

CEMENT (Elastic). *Prep.* 1. *Caoutchouc*, (in small pieces), 1 part; *chloroform*, 3 parts; dissolve.

2. (Lenher.) *Caoutchouc*, 5 parts; *chloroform*, 8 parts; dissolve, and add *gum mastic* (powdered), 1 part. Elastic and transparent.

CEMENT (Electrical). Syn. *Chemical Cement*. From *black rosin*, 7 *lb.*; *red ochre*, 1 *lb.*; *plaster of Paris*, ½ *lb.*; (both well-dried and still warm;) melted together, and the heat and agitation continued until all frothing ceases, and the liquid runs smooth; the vessel is then withdrawn from the fire, and the mixture stirred until cooled sufficiently. *Used* to cement the plates in galvanic troughs, join chemical vessels, &c. See *Cap Cement*, *Singer's Cement*, *&c.*

CEMENT (Engineer's). *Prep.* 1. *Ground white-lead*, mixed with as much *red-lead* as will make it of the consistence of putty.

2. Equal weights of *red lead* and *white lead*, mixed with *boiled linseed oil* to a proper consistence. *Used* by engineers and others to make metallic joints. A washer of hemp, yarn, or canvass, smeared with the cement, is placed in the joint, which is then "brought home," or screwed up tight. It dries as hard as stone. It also answers well for joining *broken stones*, however large. *Cisterns* built of square stones, put together, while dry, with this cement, will never leak or come to repair.

CEMENT (Extemporaneous). 1. *Shell-lac*, melted and run into small sticks the size of a quill. *Used* to join glass, earthenware, &c. The edges are heated sufficiently hot to melt the cement, which is then *thinly* smeared over them, and the joint made while they are still hot. This is the cement so commonly vended in the streets of London, and which used to surprise us in our boyhood days.

2. *Tears of gum mastic*, used in the same way. Commonly employed by jewellers and others.

CEMENT (Fireproof). *Prep.* From *fine river sand*, 20 parts; *litharge*, 2 parts; *quicklime*, 1 part; *linseed oil*, q. s. to form a thin paste. Applied to walls it soon acquires a stony hardness. It is also used to mend broken pieces of stone, stone steps, &c. See *Beale's Cement*, *&c.*

CEMENT (Flour). Syn. *Paste*, *Flour Paste*. This useful and well-known article is made by mixing about a *tablespoonful* of *wheat flour* with *cold water*, (say) ½ pint, adding the latter gradually, and thoroughly stirring in each portion before pouring in more; the vessel is then placed over the fire, and the whole assiduously stirred until it boils, great care being taken to prevent "caking on the bottom," or "burning." Some persons add about ⅓rd of a teaspoonful of *powdered alum* to the water, which is said to strengthen the product; the *shoemakers* add a like quantity of *powdered rosin* to the *flour*, with the same intention. The addition of a few grains of *corrosive sublimate*, or a few drops of *creosote*, will prevent it turning mouldy, and is said to preserve it for years. When too hard or dry, it may be softened by beating it up with a little hot water.

CEMENT (French). *Mucilage of gum arabic*, thickened with *starch powder* or *farina*; a little *lemon juice* is sometimes added. *Used* by naturalists in mounting specimens; by artificial-flower makers; and by confectioners, to stick paper, wafer paper, ornaments, &c., on their fancy cakes. Plain mucilage is often used in the same way.

CEMENT (Gad's). Syn. *Gad's Hydraulic Cement*. From *clay* (well-dried and powdered), 3 parts; *oxide of iron*, 1 part; mixed together, and made into a stiff paste with *boiled oil*. *Used* for work required to harden under water.

CEMENT (Gibbs'). Mr. Gibbs has patented (1850) various processes for making admirable building and architectural cements, equal in hardness and durability, and superior in colour, to the best Roman and Portland cements at present in

use. His materials are obtained from "the vast beds of (natural) *argillaceous marls* and *marly limestones*, or *marl stones*, which contain the due admixture of *lime*, *silica*, and *alumina*, from which hydraulic cements and artificial stones may be manufactured." These materials he finds in "the chalk formation, the Wealden formation, the Purbeck beds, the lias formation, the mountain limestone, and the lowest strata of the coal measures." After duly choosing his materials according to the particular object in view, he prepares them "by burning in kilns, and grinding in mills, in the way cement is now manufactured." Marls and lime-stones are to be "first dried in kilns or ovens, at a heat fit for baking, until all moisture be driven off, and that then the calcination be prolonged as much as possible; the heat being kept as low as is only just sufficient to effect complete calcination—this being indispensable, to avoid the commencement of vitrification, which would destroy the adhesive properties of the cement."

CEMENT (Glue). *Prep.* 1. From *glue*, 1 *lb.*, melted with the least possible quantity of water, and then mixed with *black rosin*, 1 *lb.*, and *red ochre*, 4 *oz.*

2. *Glue*, melted as above, and mixed with about a ¼th of its weight each of *boiled oil* and *red ochre*.

3. (Ure.) *Melted glue* (of the consistence used by carpenters), 8 parts; *linseed oil boiled to varnish with litharge*, 4 parts; incorporate thoroughly together.

4. *Glue* (melted as last), 4 parts; *Venice turpentine*, 1 part.

Obs. The *first three* dry in about 48 hours, and are very useful to render the joints of wooden casks, cisterns, &c., watertight; also to fix stones in frames. The last serves to cement glass, wood, and even metal to each other. They all resist moisture well.

CEMENT (Grinder's). *Prep.* 1. From *pitch*, 5 parts; *wood ashes* and *hard tallow*, of each, 1 part; melted together.

2. *Black rosin*, 4 *lb.*; *bees' wax*, 1 *lb.*; melt, and add of *whiting*, (previously heated red hot, and still warm,) 1 *lb.*

3. *Shell-lac*, melted and applied to the pieces slightly heated. *Used* to fix pieces of glass, &c., whilst grinding. The last is used for lenses and fine work.

CEMENT (Hamelin's). Syn. *Hamelin's Mastic.* From *siliceous sand*, 60 parts; *Bath* or *Portland stone*, (in fine powder,) 40 parts; *lime-marl*, 20 parts; *litharge*, 8 parts; ground together. For *use*, it is mixed up with *linseed oil* and used like mortar. When this cement is applied to the purpose of covering buildings intended to resemble stone, the surface of the building is first washed with *linseed oil.*

CEMENT (Hensler's). *Litharge*, 3 parts; *quicklime*, 2 parts; *white bole*, 1 part; (all in fine powder;) *linseed oil varnish*, q. s. to make a paste. *Used* for china, glass, &c.

CEMENT (Hœnle's). *Shell-lac*, 2 parts; *Venice turpentine*, 1 part; fused together, and formed into sticks. It is *used* like *extemporaneous cement* for glass and earthenware.

CEMENT (Hydraulic). *Hydraulic mortars* or *cements*, are those which set or become hard under water. Common lime does not possess this property; but limestones containing from 8% to 25% of *alumina*, *magnesia*, and *silica*, yield a lime on burning, which does not slake when moistened with water, but forms a mortar with it, which hardens in a few days when covered with water, although it does not acquire much solidity in the air. *Puzzolana*, *septaria*, and *argillaceous* or *siliceous earths*, burnt, either with or without the addition of *common limestone*, and then ground to powder, form excellent *hydraulic cements.* The reniform limestone, commonly called "*cement stone*," which is found distributed in single nodules or lenticular cakes, in beds of clay, is the substance most commonly used in this country for the manufacture of the cements in question. See *Gad's*, *Hamelin's*, and *Parker's Cements*, *&c.*

CEMENT (Iron). This is formed of the *borings* or *turnings of cast-iron*, which should be clean and free from rust, mixed with a small quantity of *sal ammoniac* and *flowers of sulphur.* For use, it is stirred up with just enough water to thoroughly moisten it, and it is "rammed" or "caulked" into the joints with a blunt *caulking chisel* and *hammer*, after which the joint is screwed up by its bolts as tightly as possible. If the turnings or borings are very coarse, they are broken by pounding in an iron mortar, and the dust sifted off before use. The following are good proportions:—

1. *Sal ammoniac*, (in powder,) 2 *oz.*; *flowers of sulphur*, 1 *oz.*; *iron borings*, 5 *lb.*; *water*, q. s. to mix.

2. *Sal ammoniac*, 2 *oz.*; *sulphur*, 1 *oz.*; *iron borings*, 12 *lb.*; *water*, q. s. to mix.

3. *Sal ammoniac*, 2 *oz.*; *iron borings*, 7 or 8 *lb.*; *water*, q. s. to mix.

4. *Iron borings*, 4 *lb.*; *good pipeclay*, 2 *lb.*; *powdered potsherds*, 1 *lb.*; make them into a paste with *salt* and *water.*

Remarks. The first of these forms is that generally employed for common purposes, but formerly much more sulphur and sal

ammoniac were used. We are told by one of the leading engineers in London, that the strongest cement is made *without* sulphur, and with only 1 or 2 parts of *sal ammoniac*, to 100 of *iron borings* (see the third form); but that when the work is required to dry rapidly, as for the steam joints of machinery wanted in haste, the quantity of sal ammoniac is increased a little, and a very small quantity of sulphur is added. This addition makes it set quicker, but reduces its strength. As the power of the cement depends on the oxidizement and consequent expansion of the mass, it is evident that the less foreign matter introduced the better. No more of this cement should be made at a time than can be used at once, because it soon spoils. I have seen it become quite hot by standing even a few hours, when it contained sulphur; and I have been informed by workmen, that when much sulphur is used, and it has been left together in quantity all night, combustion has taken place. The *last form* produces a cement that gets very hard when allowed to dry slowly, and is excellent for mending cracks in iron boilers, tanks, &c.

CEMENT (Japanese). Syn. *Rice Glue.* From *powdered rice*, mixed with a little *cold water*, and *boiling water* gradually poured in until it acquires a proper consistence; when it is boiled for 1 or 2 minutes in a clean saucepan or earthen pipkin. It is beautifully white, and almost transparent, for which reason it is well adapted for fancy paper work, which requires a strong and colourless cement. It is superior to *French cement.* See *above.*

CEMENT (Keene's Marble). Baked *gypsum* or *plaster of Paris*, steeped in a *saturated solution of alum*, and then recalcined, and reduced to powder. For *use*, it is mixed up with *water*, as ordinary plaster of Paris.

Obs. This cement has been most extensively applied as a stucco. It is susceptible of a high polish, and, when coloured, produces beautiful imitations of mosaic, and other inlaid marbles, scagliola, &c. It is not adapted to hydraulic purposes, or for exposure to the weather, but is admirable for internal decorations, and from its extreme hardness is very durable. It may be coloured or tinted of any shade, by diffusing mineral colours (levigated, if in powder,) through the water used to mix up the cement with. A pleasing tint is given to this cement by adding a little solution of green copperas to the alum liquor.

CEMENT (Laboratory). Syn. *Chemical Mastic.* From equal parts of *pitch*, *rosin*, and *plaster of Paris*, (thoroughly dried,) mixed together. *Used* for the masonry of chlorine chambers, vitriol works, &c.; and as a lining for casks intended to hold chloride of lime.

CEMENT (Mahogany). *Prep.* 1. Melt *bees' wax*, 4 *oz.*; then add *Indian red*, 1 *oz.*, and enough *yellow ochre*, to produce the required tint.

2. *Shell-lac*, melted and coloured as above. Very hard. Both are *used* to fill up holes and cracks in mahogany furniture by the cabinet makers. *Red putty* is also used for the same purpose.

CEMENT (Maissiat's). *Indian rubber*, is melted either with or without about 15% of either *bees' wax* or *tallow*; *quicklime*, (in fine powder,) added; and the heat continued, until change of odour shows that combination has taken place, and until a proper consistence is obtained. *Used* as a water-proof and air-tight covering for corks, bungs, &c.

CEMENT (Marine). See *Marine Glue* and *Elastic Cement.*

CEMENT (Optician's). *Prep.* 1. *Shell-lac* softened with *rectified spirit* or *wood naphtha.* For fine work.

2. *Bees' wax*, 1 *oz.*; *rosin*, 15 *oz.*; melt, and add, *whiting*, (previously made red hot, and still warm,) 4 *oz.*

3. *Rosin*, 1 *lb.*; melt and add *plaster of Paris* (dry), 4 *oz.* The above are used to fix glasses, stones, &c., while polishing and cutting them. The last is a very strong cement for rough purposes.

CEMENT (Parabolic). Syn. *Universal Cement. Prep.* Curdle *skim milk* with *rennet* or *vinegar*, press out the *whey*, and dry the *curd* by a *very gentle heat*, but as quickly as possible. When it has become quite dry, grind it in a coffee or pepper mill, and next triturate it in a mortar until reduced to a very fine powder. Mix this powder with $\frac{1}{10}$th of its weight of new dry *quicklime*, also in very fine powder, and to every ounce of the mixture add 5 or 6 gr. of *powdered camphor*; triturate the whole well together and keep it in wide-mouth 1 *oz.* phials, well corked. *Used* to join glass, earthenware, &c. It is made into a paste with a little water, as wanted, and applied immediately.

CEMENT (Parker's). This cement is made of the *nodules of indurated* and *slightly ferruginous marl*, called by mineralogists septaria, and also of some other species of argillaceous limestone. These are burnt in conical kilns, with pit coal, in a similar way to other limestone, care

being taken to avoid the use of too much heat, as if the pieces undergo the slightest degree of fusion, even on the surface, they will be unfit to form the cement. After being properly roasted, the calx is reduced to a very fine powder by grinding, and immediately packed in barrels, to keep it from the air and moisture.

Uses, &c. This cement is tempered with water, and applied at once, as it soon hardens, and will not bear being again softened down with water. For *foundations* and *cornices* exposed to the weather, it is usually mixed with an equal quantity of clean angular sand; for use as a *common mortar*, with about twice as much sand; for *coating walls* exposed to cold and wet, the common proportions are 3 of *sand* to 2 of *cement*, and for *walls exposed to extreme dryness or heat*, about 2½ or 3 of sand to 1 of cement; for facing *cistern work*, *water frontages*, *&c.*, nothing but cement and water should be employed. Under the name of *compo'* or *Roman cement*, it is much employed for *facing houses*, *water-cisterns*, setting the *foundations of large edifices*, &c.

CEMENT (Pew's). *Quicklime*, 1 part; *baked clay*, 2 parts; (both in powder;) mix and calcine; then add *gypsum*, (fresh baked and in fine powder,) 1 part, to *powdered baked clay*, 2 parts; mix well, add the former mixture and incorporate them well together. *Used* to cover buildings. It is applied like mortar, and is very hard and durable. See *Gibbs' Cement*, *&c.*

CEMENT (Plumber's). *Black rosin* melted with about an equal weight of *brick-dust*. Sometimes a little *pitch* or *tallow* is added.

CEMENT (Portland). From *clay* and *chalk*, or *argillaceous river-mud* and *chalk* or *limestone*, calcined together, and then ground to powder. See *Parker's Cement*.

CEMENT (Roman). Genuine Roman cement consists of *puzzolene*, (a ferruginous clay from Puteoli, calcined by the fires of Vesuvius,) *lime*, and *sand*. The only preparation which the puzzolene undergoes is that of pounding and sifting. It is generally mixed up with water, like most other cements, but occasionally with bullock's blood and oil, to give the composition more tenacity. That used in this country is now generally prepared from the *septaria* of either Harwich or Sheppy, or of the lias formation, or from the *cement stone* found in the upper division of the lias formation, or in the shale beds of the Kimmeridge clay. It is also prepared from several artificial mixtures of *ferruginous clay* and *lime*, calcined together. See *Parker's* and *Gibbs' Cement*.

CEMENT (Seal Engraver's). Resembles *plumber's cement*. *Used* to fix the pieces of metal while cutting, and also to secure seals and tools in their handles. It grows harder and improves every time it is melted.

CEMENT (Singer's). *Prep.* 1. *Rosin*, 5 *lb.*; *bees' wax*, and *red ochre*, (in fine powder,) of each, 1 *lb.*; *plaster of Paris*, 4 *oz.*; mix as directed under *Electrical Cement*.

2. *Black rosin*, 7 *lb.*; *well-dried red ochre* and *plaster of Paris*, of each, 1 *lb.*; as above. *Used* to cement the plates in voltaic troughs, join chemical vessels, &c.

CEMENT (Turner's). Resembles *plumber's cement*.

CEMENT (Varley's). Syn. *Varley's Mastic*. *Black rosin*, 16 parts; *bees' wax*, 1 part; melt, add *whiting*, (sifted, dried by a dull red heat, and allowed to cool,) 16 parts; and stir until nearly cold.

CEMENT (Universal). See *Parabolic Cement*.

CEMENT (Water.) *Prep.* 1. From good *gray clay*, 4 parts; *black oxide of manganese*, 6 parts; *limestone*, (reduced to powder by sprinkling it with water,) 90 parts; mix, calcine, and powder.

2. Mix *white iron ore*, (manganese iron ore,) 15 parts, with *lime*, 85 parts; calcine and powder as above. Both this and the preceding must be mixed up with a little sand for use. A piece thrown into water rapidly hardens.

3. *Fine clean sand*, 1 cwt.; *quicklime*, in powder, 28 *lb.*; *bone ashes*, 14 *lb.* The above are beat up with water for use. See *Hydraulic Cement*, *&c.*

CEMENT (Waterproof). Several compounds of this class have been already noticed. The celebrated "*waterproof cement of Dihl*" consists of *porcelain clay* or *pipeclay*, dried by a gentle heat, and powdered, mixed up to the consistence of a paste with *boiled linseed oil*, and, sometimes, a little *oil of turpentine*. It is coloured by adding a little *red* or *yellow ochre*, or any similar pigment. It is used to cover the fronts of buildings, roofs of verandahs, &c.

CEMENT (for China, Glass, &c.) Various preparations are adopted for mending *broken china*, *earthenware*, and *glass*, among which those generally adopted by careful housewives will be found noticed under the heads *Curd*, *Cheese*, *Chinese*, *Diamond*, *Egg*, *Extemporaneous*, *Parabolic*, and *Hœnle's Cements*. All of these are easily made, and as easily applied, and several of them may

be purchased ready prepared at the drug and oil shops. Nature supplies some cements ready to our hands, as the juice of garlic and the white slime of large snails. It has been stated in a certain scientific journal, that a broken flint has been joined so effectually with this *snail cement*, that when dashed upon a stone pavement, the flint broke elsewhere than at the cemented part. But the superior quality and economy, as well as delicacy, of artificial cements, leave no occasion for our seeking for natural ones.

CEMENT (for Iron Boilers). From *dried clay*, in powder, 6 *lb.*; *iron filings*, 1 *lb.*; made into a paste with *boiled linseed oil*. *Used* to stop the cracks and leaks in iron boilers, stoves, &c.

CEMENT (for Leather and Cloth). *Prep.* 1. *Gutta percha*, 3 parts; *caoutchouc*, 1 part; (both cut small;) *pyrogenous oil of turpentine* or *bisulphuret of carbon*, 8 parts; mix in a close vessel, and dissolve by the heat of *hot water*.

2. *Gutta percha*, 1 *lb.*; *caoutchouc*, 4 *oz.*; *pitch*, 2 *oz.*; *shell-lac*, 1 *oz.*; *linseed oil*, 2 *oz.*; melted together. Both are used for uniting cloth, leather, &c. The first is gently warmed, and the second melted before being applied.

CEMENT (for Metal Letters). *Copal varnish*, 16 parts; *drying oil*, 6 parts; *turpentine* and *oil of turpentine*, of each, 3 parts; *liquefied glue*, (made with the least possible quantity of water,) 5 parts; melt together in a water bath, and add, *fresh slaked lime* (perfectly dry, and in very fine powder,) 10 parts. *Used* to attach metal letters to plate glass, in shop windows, &c.

CEMENT (for Spar and Marble). See *Alabaster Cement*. *Egg* and *Parabolic Cements* also answer for the same purpose.

CEMENT (for Steam-boilers, &c.) *Prep.* From *litharge*, in fine powders, 2 parts; *sand*, (very fine,) and *quicklime*, (that has been allowed to slake spontaneously by exposing it in a damp place,) of each, 1 part; mix, and keep it from the air. *Used* to mend the cracks in boilers, ovens, &c., and to secure steam joints. It is made into a paste with *boiled oil* before application.

CEMENTATION. The process of embedding a substance in, or covering it with, some powder or composition capable of acting on it when heated, and in this state exposing it to a red heat. *Iron* is converted into *steel*, and *glass* into *Reaumur's porcelain*, by cementation.

CENTAURINE. Syn. *Centaurina*. The bitter extractive matter of *erythæa centaurium* or *common centaury*. Combined with *hydrochloric acid* it has been highly recommended as a febrifuge.

CENTAURITE. The bitter principle of the *cnicus benedictus*, or *blessed thistle*.

CERAINE. A non-saponifiable fat obtained along with margaric acid when *bees' wax* is treated with *caustic potassa*.

CERASIN. Syn. *Prunine*. The insoluble portion of cherry-tree gum. It is identical with bassorine. Dr. John applies the term to all those gums, which, like tragacanth, *swell*, but do not *dissolve* in water. See *Bassorine*.

CERATE. Syn. *Ceratum*, — Lat. A thick species of ointment containing wax. Cerates are intermediate in consistence between ointments and plasters; but are less frequently employed than either of those preparations.

It is a general custom with the druggists to use a less quantity of wax for their cerates than that which is necessary to give them a proper consistence, and in many cases, it is omitted altogether, and its place supplied by *hard suet* or *stearine*, and frequently by *common resin*. *Lard* is also very generally substituted for olive oil. Indeed, in no class of pharmaceuticals are the instructions of practitioners and the colleges more commonly disregarded. The operation of melting the ingredients should be performed in a *water bath* or *steam bath*, and the liquid mass should be assiduously stirred until cold.

All the *medicated cerates* may be prepared by adding the *active ingredients*, in the form of *fine powder*, *soft extract*, *solution*, &c., as the case may be, to either *simple cerate* or *spermaceti cerate*, in the proportions indicated under the head of "*Doses*" appended to every article of importance noticed in this work. The mixture, which must be complete, may be effected by working the articles together on a marble or glass slab or tile, or still better, by trituration in a clean wedgewood mortar. In some cases the *simple cerate* is melted by a gentle heat, and the whole stirred or triturated until nearly solid; in others, digestion with heat is employed.

CERATE. Syn. *Simple Cerate*, *Simple Dressing*; *Ceratum*,—Ph. L. *C. Simplex*, —Ph. L. 1824. *Prep.* (Ph. L.) *Yellow wax*, 20 oz.; melt by a gentle heat; add *olive oil*, 1 pint; and stir until it begins to solidify.

Used as a simple emollient dressing. The corresponding preparations of the other colleges will be found noticed under *Ointments*. The *ceratum simplex* of the Ed. Pharm. is *spermaceti cerate*.

CERATE (Acetate of Lead). Syn. *Cerate of Sugar of Lead; Ceratum Plumbi Acetatis*,—Ph. L. *Prep.* (Ph. L.) *White wax*, 5 oz.; *olive oil*, 18 fl. oz.; melt together; add, *acetate of lead*, (in fine powder,) 5 dr., previously triturated with *olive oil*, 2 fl. oz., and stir till they unite, (begin to solidify.) *Used* as a cooling dressing to burns, excoriations, and inflamed sores.

CERATE (Ammoniacal). Syn. *Ceratum Ammoniacale*, — Lat. *Prep.* (Rechoux.) *Simple cerate*, 1 oz.; *carbonate of ammonia*, 1 dr.; mix. As a counter-irritant in croup, &c.

CERATE (Arsenical). Syn. *Ceratum Arsenici, C. Acidi Arseniosi*,—Lat. *Prep.* 1. (Ph. U. S.) *Arsenious acid*, (in very fine powder,) 20 gr.; *simple cerate*, 1 oz.

2. (Sir A. Cooper.) *Arsenious acid* and *sublimed sulphur*, of each, 1 dr.; *spermaceti cerate*, 1 oz. The above ingredients must be very carefully triturated together. The *first* is used as a dressing to cancerous sores; the *second* is applied on lint as a caustic in like cases.

CERATE (Belladonna). Syn. *Cerate of Deadly Nightshade; Ceratum Belladonnæ*, —Lat. *Prep.* (W. Cooley.) *Extract of belladonna*, 3 dr.; *simple cerate*, 1 oz.; *olive oil*, 1 dr.; triturate together in a warm mortar, until nearly cold. *Used* in frictions to indolent tumours.

CERATE (Belladonna, — Compound). Syn. *Ceratum Belladonnæ Compositum*,—Lat. *Prep.* (W. Cooley.) *Belladonna cerate*, 1 oz.; *iodide of gold*, 12 gr.; carefully triturated together. *Used* as a friction to scrofulous and syphilitic tumours, and to remove syphilitic and rheumatic pains. A most active and excellent preparation.

CERATE (Brown). See *Plasters.*

CERATE (Cacao). Syn. *Cacao Pommade. Butter of cacao, white wax*, and *oil of almonds*, equal parts, melted together and strained. *Used* as a cosmetic for chapped hands and lips, &c.

CERATE (Calamine). Syn. *Turner's Cerate, Healing Salve; Ceratum Calaminæ*, —Ph. L. & E. *C. Lapis Calaminaris*,—Ph. L. 1788, &c. *Prep.* 1. (Ph. L.) *Yellow wax*, 7½ oz.; *olive oil*, 1 pint; melt together, remove the vessel from the fire, and when they first begin to thicken, add *prepared calamine*, 7½ oz., and stir constantly until they cool.

2. (P. E.) *Prepared calamine*, 1 part; *simple cerate* (Ph. E.), 5 parts; mix.

3. (Ph. D.) See *Calamine Ointment.*

4. (Commercial.) *Hard suet*, 5 *lb.*; *lard*, 3 *lb.*; melt, and sift in, gradually, *calamine*, 4 *lb.*; agitate well for a few minutes, or until the whole is perfectly mixed, and after *one* minute's repose, pour it off into another vessel, the coarse sediment that has fallen to the bottom being carefully avoided; lastly, stir assiduously, until it is nearly cold. This forms the Turner's cerate of the wholesale druggists. In many cases nothing but *lard* and *calamine* are used.

Uses, &c. When honestly prepared with *genuine calamine*, it is a most valuable desiccant and astringent application to excoriations, ulcers, burns, scalds, sore nipples, &c. It has long been held in popular esteem as a drying and healing dressing for sores.

CERATE (Calamine and Mercury). Syn. *Ceratum Calaminæ cum Hydrargyro*,—Lat. *Prep.* (Ph. Chirur.) *Calamine Cerate*, 1 lb; *nitric oxide of mercury*, 1 oz.; mix. *Used* as a stimulant application to foul and indolent ulcers, psorophthalmia, &c.

CERATE (Calomel). Syn. *Ceratum Calomelanos, C. Hydrargyri Chloridi*,—Lat. *Calomel*, 1 dr.; *spermaceti cerate*, 7 dr. In herpes, and some other skin diseases.

CERATE (Calomel,—Compound). Syn. *Ceratum Calomelanos Compositum*,—Lat. *Calomel*, 2 dr.; *calamine cerate*, 1 oz.; *olive oil*, 1 dr.

CERATE (Camphor). Syn. *Ceratum Camphoratum, C. Camphoræ*,—Lat. *Pommade du frère Cosme*,—Fr. *Olive oil*, 1 lb; *white wax*, ½ lb; *camphor*, 3 dr. As an application to chaps, chilblains, abrasions, excoriations, and slight wounds. See *Camphor Balls.*

CERATE (Cantharides). Syn. *Ceratum Lyttæ, C. Cantharidis*,—Lat. *Prep.* (Ph. L.) *Cantharides*, (in very fine powder,) 1 oz.; *spermaceti cerate*, 6 oz.; mix. Irritant; *used* to keep blisters open, and to stimulate issues, and indolent ulcers and tumours.

CERATE (Chalk). Syn. *Ceratum Cretæ*, —Lat. *Chalk*, (thoroughly dried, and in fine powder,) 2 dr.; *simple cerate*, 6 dr.; *almond oil*, 3 dr. In piles, and foul ulcers.

CERATE (Chalk,—Acetated). See *Kirkland's Neutral Cerate.*

CERATE (Chalk,—Compound). Syn. *Ceratum Cretæ Compositum*,—Lat. *Prep.* 1. To *simple chalk cerate*, 1 oz.; add *powdered catechu*, ½ dr. In piles, and foul and indolent ulcers.

2. (U.S. Hosp.) *Lead plaster* and *olive oil*, of each, 8 oz.; *white wax*, 3 oz.; melt together; add *liquor of diacetate of lead*, 6 oz.; thoroughly incorporate, and then further add, *chalk*, (in fine powder,) 5 oz. Cooling and astringent. Useful in inflamed sores, excoriations, piles, &c.

CERATE (Cherry-laurel). Syn. *Ceratum*

Lauro-cerasi, C. Calmans,—Lat. *Prep.* (Roux.) *Simple cerate*, 1 oz.; *cherry-laurel water*, ½ oz. As an application to burns.

CERATE (Cinchona). Syn. *Bark Cerate; Ceratum Cinchonæ,*—Lat. *Prep.* 1. *Extract of bark*, 2 dr.; *simple cerate*, 1 oz.

2. (Van Mons.) *Simple cerate*, 8 oz.; *camphor*, 1½ dr.; melt together by a gentle heat, then add gradually, *decoction of Peruvian bark* (concentrated), 1 oz., and triturate until cold. As a dressing for ill-conditioned ulcers.

CERATE (Cinnabar). Syn. *Ceratum Rubrum, C. Cinnabaris, C. Hydrargyri Sulphureti Rubri,*—Lat. *Prep.* 1. *Camphor*, 20 gr.; *vermilion*, 60 gr.; *simple cerate*, 1 oz. This is *Alibert's Antiherpetic Pommade.*

2. (Ph. Chirur.) *Yellow wax* and *lard*, of each, ½ lb; *yellow resin*, ½ oz.; *red sulphuret of mercury*, 1 dr. *Used* as a common dressing.

CERATE (Citrine). See *Resin Cerate.*

CERATE (Copaiba). Syn. *Ceratum Copaibæ*—Lat. *Prep.* 1. *Spermaceti cerate*, 3 oz.; melt by a gentle heat, then add, *balsam of capivi*, 1 oz.

2. (Dr. Houlton.) *White wax*, 1 oz.; *balsam of capivi*, 2 oz.; mix, as last. Both the above have been recommended as topical applications to wounds and ulcers of the rectum, vagina, and urethra; especially in those of a fistulous character; and in piles, &c.

CERATE (Copper). Syn. *Cupriated Cerate; Ceratum Cupri; C. C. Ammoniati,* —Lat. *Prep.* (Swediaur.) *Simple cerate*, 8 parts; melt, and add *solution of ammoniaret of copper*, 1 part. As a stimulant dressing for indolent ulcers; and in psorophthalmia, &c.

CERATE (Cosmetic). Syn. *Cold Cream, Cerate of Galen; Ceratum Cosmeticum, C. Galeni, Cremor Frigida,* — Lat. *Pommade en Crême*, Fr. *Prep.* 1. *Oil of sweet almonds*, 1lb; *white wax* and *spermaceti*, of each, 2 oz.; melt, pour the mixture into a marble or wedgewood mortar, which has been heated by standing for some time in boiling water; add, gradually, *rose water*, 10 fl. oz., assiduously stirring until an emulsion is formed; then further add, *oil of bergamot*, ½ oz.; *oil of lavender*, 1 dr.; and continue the stirring or trituration until the whole has become cold.

2. To the last, add *otto of roses*, 1 dr.; *oil of rosemary*, 15 drops.

3. *Oil of almonds*, 5 oz.; *spermaceti*, 5 dr.; *white wax*, 4 dr.; *rose water*, 3½ oz.; *balm of Mecca*, (genuine,) 8 drops.

4. As the last, with *essence of vanilla*, 15 drops; *essence of ambergris*, 10 drops.

5. (P. C.) *White wax*, 1 part; *oil of almonds*, 4 parts; *rose water*, 3 parts; as before.

6. (Van Mons.) *White wax* and *butter of cacao*, of each, 1 part; *oil of almonds* and *rose water*, of each, 4 parts.

Obs. The above are used as agreeable and cooling emollients for irritable surfaces, excoriations, sore nipples, &c. See *Cold Cream* and *Ointments.*

CERATE (Croton). Syn. *Ceratum Crotonis,* — Lat. *Prep.* (Caventou.) *Lard*, 5 parts; *wax*, 1 part; melt, and when nearly cold, add *croton oil*, 2 parts. *Used* as a counter-irritant; but is apt to affect the bowels.

CERATE (Goulard's). See *Lead Cerate.*

CERATE (Hemlock). Syn. *Ceratum Conii,*—Lat. *Prep.* (St. B. Hosp.) *Spermaceti*, 2 oz.; *white wax*, 3 oz.; melt, and add of *hemlock ointment*, 12 oz. *Used* for inveterate cancerous, scrofulous, and other sores.

CERATE (Honey). Syn. *Ceratum Mellis,*—Lat. *Prep.* 1. *Simple cerate*, 3 parts; *honey*, 1 part; *oil of lemon grass*, 6 drops. *Used* as cold cream.

2. (Ph. Chirur.) *Olive oil*, ½ lb.; *wax* and *lead plaster* (or *galbanum plaster*), of each, 4 oz.; melt and add *honey*, ½ lb. As a cooling emollient dressing.

CERATE (Issue). Syn. *Ceratum ad Fonticulos,*—Lat. As *issue plaster*, but adding a little *almond oil.*

CERATE (Kirkland's). Syn. *Kirkland's Neutral Cerate; Ceratum Neutrale, C. Cretæ Acetatis,*—Lat. *Prep.* 1. *Lead plaster*, 8 oz.; *olive oil*, 4 oz.; melt, sift in *chalk*, 4 oz.; mix well, then add gradually, *Goulard's extract*, ½ oz.; *distilled vinegar*, 4 oz.; and stir until cold.

2. (Paris.) *Lead plaster*, 8 oz.; *olive oil* and *chalk*, of each, 4 oz.; *sugar of lead*, 3 dr., (dissolved in) *distilled vinegar*, 4 fl. oz. As a cooling dressing to irritable ulcers and excoriated parts.

CERATE (Lead). See *Kirkland's Cerate, Cerate of Acetate of Lead, &c.*

CERATE (Lead,—Compound). Syn. *Goulard's Cerate; Ceratum Plumbi Compositum,*—Ph. L. *Prep.* (Ph. L.) *Olive oil*, 16 fl. oz.; *yellow wax*, 8 oz.; melt, remove the vessel from the fire, and when they begin to thicken, add gradually, *solution of diacetate of lead*, (slightly warmed,) 6 fl. oz.; and stir constantly until the whole is nearly cold; then add *camphor*, 1 dr., dissolved in *olive oil*, 4 fl. oz., (by heat,) and stir until the cerate is quite cold. *Used*

in similar cases to *Kirkland's Neutral Cerate.*

CERATE (Marshall's). *Prep.* 1. *Palm oil* and *calomel*, of each, 2 oz.; *sugar of lead*, 1 oz.; *ointment of nitrate of mercury*, 4 oz.; triturated together in a Wedgewood mortar.

2. (Paris.) *Palm oil*, 5 oz.; *calomel*, 1 oz.; *acetate of lead*, ½ oz.; *citrine ointment*, 2 oz.; as the last. Applied to the eyes, &c.

CERATE (Mercurial). Syn. *Ceratum Mercuriale, C. Hydrargyri*,—Lat. *Prep.* 1. (Guibourt.) *Strong mercurial ointment* (Ph. L.) and *simple cerate*, equal parts.

2. (Ph. L. 1746.) *Strong mercurial ointment* and *yellow wax*, of each, 6 oz.; *lard*, 3 oz. Both are *used* as dressings to venereal ulcers.

CERATE (Mercurial,—Compound.) Syn. *Ceratum Mercuriale Compositum, C. Hydrargyri*,—Ph. L. *Prep.* (Ph. L.) *Mercurial ointment* (strong) and *compound soap cerate*, of each, 6 oz.; *camphor* (in powder), 1½ oz.; triturate together. Alterative and discutient; to disperse indolent tumours and swellings; and as a resolvent in enlarged joints, &c.

CERATE (Metopium). Syn. *Ceratum Metopii*,—Lat. *Prep.* (Dr. Barham.) *Hoggum* (from *rhus metopium*), and *lard*, of each, 4 oz.; *white wax* and *root of sweet aristolochia* (powdered), of each, 2 oz.; *yellow resin*, 1 oz.; In stiff joints and rheumatic pains.

CERATE (Mezereon). Syn. *Ceratum Mezerei*,—Lat. *Prep.* 1. *Extract of Mezereon*, 1 part; (dissolved in) *alcohol*, 5 parts; add *bees' wax*, 5 parts; *olive oil*, 11 parts; melt together and continue the heat until all the alcohol is evaporated.

2. *Green oil of mezereon*, 1 part; *simple cerate*, 20 parts; melt together. Both are *used* to keep up the discharge from blistered surfaces, and as a stimulant application to indolent sores.

CERATE (Neutral). See *Kirkland's Cerate.*

CERATE (Nitrate of Mercury). Syn. *Citrine Cerate; Ceratum Hydrargyri Nitratis*,—Lat. *Prep.* (St. B. Hosp.) *Citrine ointment* and *simple cerate*, equal parts. See *Ointments.*

CERATE (Opium). Syn. *Laudanum Cerate, Anodyne do.; Ceratum Opii, C. Opiatum, C. Anodynum*,—Lat. *Prep.* 1. *Tincture of opium* and *olive oil*, of each, 2 dr.; *simple cerate*, 1 oz.; digest with heat until all the spirit and water is evaporated, constantly stirring the mixture all the time.

2. (Gibert.) *Wine of opium*, 1 dr.; *simple cerate*, 1 oz.

3. (Lagneau.) *Opium* (in fine powder) ½ dr.; *yelk of* 1 *egg*; mix, then triturate it with *simple cerate*, 1 oz.

Obs. The above are applied to painful swellings, piles, and ulcers, and in chronic ophthalmia, &c.

CERATE (Phosphorated). Syn. *Ceratum Phosphori, C. Phosphoratum*,—Lat. *Prep.* 1. *Phosphorus*, 6 gr.; *simple cerate*, 3 oz.; heat together in a phial placed in a water bath, with frequent agitation for 2 hours; and after repose for 10 minutes, pour off the clear portion, and stir it well until cold.

2. (Foy.) *Phosphorated ether*, 5 parts; *simple cerate*, 24 parts. Both of the above have been recommended as frictions in obstinate cutaneous affections, and in rheumatism of the joints.

CERATE (Pitch). Syn. *Ceratum Picis Burgundicæ*,—Lat. *Prep.* (Beral.) *White wax*, 3 parts; *suet*, 4 parts; *Burgundy pitch*, 6 parts; melted together. A mild stimulant and detergent dressing. See *Ointments.*

CERATE (Quinine). Syn. *Ceratum Quiniæ*,—Lat. *Prep.* 1. *Disulphate of quinine*, 5 or 6 gr.; *simple cerate*, 1 dr. Applied to the denuded dermis (endermically).

2. *Sulphate of quinine* and *olive oil*, of each, 1 dr.; *simple cerate*, 6 dr. As a friction. Both are used in intermittents.

CERATE (Resin.) Syn. *Basilicon, B. Cerate, B. Ointment, Yellow Basilicon; Citrine Cerate, Ceratum Citrinum.*—Ph. L. 1745. *C. Resinæ Flavæ*,—Ph. L. 1788. *C. Resinæ*,—Ph. L. 1809 and since. *Prep.* 1. (Ph. L.) *Yellow resin* and *bees' wax*, of each, 15 oz.; melt, add *olive oil*, 1 pint; strain through a cloth, and stir the mixture until cold.

Obs. The above is the formula of the London College, but the *basilicon of the shops* is seldom, if ever, made in this manner. The following forms are those commonly used in trade, but the products are much inferior to that made according to the directions in the Pharmacopœia.

2. (Commercial.)—*a. Yellow resin*, 10 *lb.; bees' wax*, 2 *lb.; linseed oil*, 7 *lb.;* melt together and stir until cold.

b. As the last, but using *nut oil* instead of *linseed oil.*

c. Nut oil, 1 gall.; *bees' wax*, 5 *lb.; yellow resin*, 14 *lb.*

d. Lard (common) and *linseed oil*, of each, 3 *lb.; yellow resin*, 9 *lb.;* as before.

Uses, &c. This cerate is a mild stimulant, detergent, and digestive application; and as such is employed to dress foul and indo-

lent ulcers, blistered surfaces, burns, &c. For the corresponding preparations of the other colleges, see *Ointments.*

CERATE (Resin,—Compound). Syn. *Deshler's Cerate; Ceratum Resinæ Compositum,*—Lat. *Prep.* (Ph. U. S.) *Resin, suet,* and *bees' wax,* of each, 1 *lb.; turpentine,* ½ *lb.; flax-seed oil* (linseed oil), ½ pint; as above. Rather more stimulating than *resin cerate,* but used for the same purposes.

CERATE (Rose). Syn. *Lip Salve; Ceratum Rosatum,*—Lat. *Prep.* (P. C.) *Oil of almonds,* 16 parts; *white wax,* 8 parts; *alkanet root,* 1 part; digest, with a gentle heat, until sufficiently coloured, then strain, and for *every ounce* of the cerate, add *otto of roses,* 2 drops. See *Lip Salve.*

CERATE (Savine). Syn. *Ceratum Sabinæ,*—Ph. E.; & Ph. L. 1836. *Prep.* 1. (Ph. E.) *Bees' wax,* 1 part; *lard,* 4 parts; *fresh savine* (leaves, bruised,) 2 parts; boil together until the leaves become crisp, then strain, with pressure, through a linen cloth.

2. (Ph. L. 1836.) *Lard,* 2 ℔; *savine leaves,* 1 ℔; *bees' wax,* ½ ℔; as last.

3. (Ph. L. 1851.) In the last Ph. L. and Ph. D., this preparation is included among the *ointments;* in trade, however, the old name (Ph. L. 1836) is still generally retained.

Obs. The preparation of this cerate requires caution, as the active principle of the savine being volatile, is injured by long boiling and a high temperature. The leaves are usually boiled until they are crisp, but as this takes some time, the essential oil, and consequently the odour, is nearly all dissipated. A better plan is to express the juice from the leaves, and to add it to the wax and oil melted together, and just beginning to cool. As usually met with in the shops, this cerate has a lively green colour, and the odour of the fresh plant; but neither of these is derived from the leaves in the common process of making it. The *first* is caused by the addition of *powdered verdigris,* and the *last,* by adding a little of the *essential oil of savine* to the compound when nearly cold. The preparations of the British Colleges have only a very pale green colour, and even that rapidly changes by exposure to the air. A *uniform green colour* may therefore be regarded as a proof of *adulteration;* as the *unadulterated compound,* however skilfully prepared, is of a *dingy green colour,* of little intensity; and after it has been made a short time, it *fades on the surface,* and the under portion becomes streaky and mottled. A greater quantity of colour is obtained from the leaves by long digestion in the fat and wax in earthen vessels, at a moderate heat, than by hasty boiling. In this way a lively green is sometimes produced, but it rapidly changes in the manner just mentioned.

The following forms are those commonly adopted by the wholesale druggists for the manufacture of this cerate:—

4. *Lard* and *suet,* of each, 6 *lb.; yellow wax,* 2 *lb.;* melt them together in an earthen vessel; add 2 *oz.* of *distilled verdigris,* (previously rubbed down smooth in a mortar with an equal weight of *sweet oil;*) strain, whilst hot, into a large earthen pot, and when the whole has cooled a little, add of *oil of savine,* 1 *oz.,* and stir until cold.

5. *Savine leaves,* 4 *lb.; yellow wax,* 2 *lb.; lard,* 8 *lb.;* boil until the leaves become crisp; then strain, and add, of *green ointment* (lively coloured), 5 *lb.;* when cooled a little, further add, of *oil of savine,* 3 dr., and stir briskly until cold. *Prod.* 13½ *lb.*

Uses, &c. Savine cerate and ointment are chiefly employed to keep up the discharge from blisters, (*perpetual blisters,*) for which purpose it is preferable to preparations of cantharides. The practice of colouring this cerate with verdigris, which is general in trade, cannot be too severely censured, as its therapeutic action is thereby altered. The copper may be detected by burning down a little in a *platinum* or *Hessian crucible,* washing out the ashes with a little *dilute nitric acid,* placing the liquor in a glass tube, and applying the usual tests. See *Copper* and *Ointments.*

CERATE (Simple). Syn. *Ceratum Simplex,*—Lat. *Prep.* 1. (Ph. E.) *Spermaceti,* 1 part; *white wax,* 3 parts; *olive oil,* 6 parts; melt by a gentle heat, and stir until cold.

2. (Ph. L.) The simple cerate (*ceratum,* —Ph. L. 1836 & 1851; *ceratum simplex,* —Ph. L. 1824;) of the London College, does not contain spermaceti, and is made with yellow wax. See *Cerate* and *Spermaceti Cerate.*

CERATE (Soap). Syn. *Compound Soap Cerate; Ceratum Saponis.*—Ph. L. 1836. *Ceratum Saponis Compositum,* — Ph. L. 1851. *Prep.* 1. (Ph. L.) Boil *litharge,* 15 oz., *in distilled vinegar,* 1 gall., until dissolved, stirring continually; then add of *Castile soap,* 10 oz.; again boil until all the moisture is evaporated; then add, gradually, *bees' wax,* 12½ oz., and *olive oil,* 1 pint, previously melted together, and stir until nearly cold.

2. (Wholesale.) *Distilled vinegar,* 6 gall.; *litharge,* 5 *lb.; soap,* 3¾ *lb.; yellow wax,* 4½ *lb.; olive oil,* 6 pints. Mix as above.

Good *nut* or *poppy oil* may be used instead of *olive oil.*

Uses, &c. Soap cerate is resolvent, cooling, and desiccative, and is chiefly employed as a cooling dressing for scrofulous swellings, &c. It may be spread on linen and applied like a plaster. It is sometimes used as a support for fractured limbs, and forms an excellent dressing for *soft corns.*

Obs. Unless the instructions contained in the above formulæ are followed in every particular, the process is apt to miscarry. When this is the case, the cerate, on cooling, separates into two portions, and is commonly full of hard gritty particles. To prevent this, care should be taken to use soap of the best quality. This mishap cannot be got over by "long boiling and stirring," as is generally supposed. The only remedy is, the addition of a little more soap, previously melted with some water, and again evaporating to a proper consistence. A small quantity of *liquor of potassa* has a similar effect.

The colour and consistence of *soap cerate* chiefly depends on the length of time it is kept heated after the addition of the oil and wax. As evaporation proceeds, so the colour and consistence increase. Its usual colour is that of a lively pale chocolate-brown, but occasionally it is much paler. This arises from its containing an undue quantity of moisture. When it has been kept heated for a period beyond that usually adopted, it attains greater hardness, and is then frequently called *hard soap-cerate,* (*ceratum saponis durum;*) but by over-boiling it is apt to become gritty.

CERATE (Spermaceti). Syn. *White Cerate, White Lip Salve; Simple Cerate, Ceratum Simplex,*—Ph. E. *C. Album,*—Ph. L. 1745. *C. Spermatis Ceti,*—Ph. L. 1788. *C. Cetacei,*—Ph. L. 1809, and since. *Prep.* 1. (Ph. L.) *Spermaceti,* 2 oz.; *white wax,* 8 oz.; melt by a gentle heat; add, *olive oil* (warm), 1 pint, and stir with a spatula until they cool.

2. (Ph. E.) See *Simple Cerate.*

3. (Ph. D.) The corresponding preparation of the Ph. D. is classed under *Ointments,* and contains lard.

4. (*Commercial.*) On the *large scale* lard or suet is substituted for oil, by which means less wax is required. The following is a good form where a cheap article is wanted, and is that commonly adopted in the wholesale trade:—

Clarified mutton suet, 5½ *lb.; white wax* and *spermaceti,* of each, ¾ *lb.;* as above.

Uses, &c. Emollient and cooling. It is commonly employed as a soft cooling dressing, as a lip salve, as an application to chaps, chilblains, &c.

Obs. The materials should be melted by a very gentle heat (that of a water bath is best) in a clean stoneware vessel, and as soon as perfect liquefaction takes place, the heat should be withdrawn, and the fluid cerate strained into a clean vessel, and stirred with a clean wooden spatula until it solidifies. To facilitate the cooling, the vessel may be placed in cold water or in a current of cold air. In this way the product is rendered both whiter and finer than when the liquid mass is allowed to cool by itself. By adding a little *flowers of benzoin* with the oil, or a little *nitric ether* when the cerate is about *half cold,* this, as well as other like preparations, will keep for years without becoming rancid or suffering any material change of condition. See *Fats.*

CERATE (Sulphur). Syn. *Ceratum Sulphuris, C. Sulphuratum,*—Lat. *Prep.* (P. C.) *Washed sulphur,* 2 parts; *cerate of Galen,* 7 parts; *almond oil,* 1 part; mix. In itch, &c.

CERATE (Sulphuret of Mercury). *Prep.* (Swediaur.) *Yellow resin,* ½ oz.; *yellow wax* and *lard,* of each, ½ lb; *vermilion,* 20 gr. As a dressing to unhealthy ulcers. See *Cinnabar Cerate.*

CERATE (Tobacco). *Bees' wax,* 3 oz.; *yellow resin,* 1 oz.; *olive oil,* 6 oz.; *tobacco juice,* 4 oz.; mix and evaporate to dryness, and when nearly cold, add *bergamot,* 2 dr. *Used* to destroy pediculi, &c.

CERATE (Touch). Syn. *Ceratum pro tactu,*—Lat. *Cerat pour le toucher,*—Fr. *Prep.* (Soubeiran) *Spermaceti* and *yellow wax,* of each, 1 part; *olive oil,* 16 parts; melt, add *caustic soda,* 1 part, and stir until cold. *Used* in hospitals for "practising the touching in accouchments."

CERATE (Turner's). See *Calamine Cerate.*

CERATE (Verdigris). Syn. *Ceratum Æruginis, C. Cupri Diacetatis,*—Lat. *Prep.* 1. *Resin cerate,* 19 parts; *verdigris* (in fine powder), 1 part.

2. (For. Ph.) *Wax* and *resin,* of each, 6 parts; *Venice turpentine,* 5 parts; *linseed oil,* 2 parts; *verdigris,* 1 part. *Used* as a mild escharotic and stimulant to fungous ulcers, warts, corns, &c.

CERATE (White). See *Spermaceti Cerate.*

CERATE (Zinc). Syn. *Ceratum Zinci, C. Z. Oxydi,*—Lat. *Oxide of zinc,* 20 gr.; *spermaceti cerate* 1 oz. In sore nipples, excoriations, &c.; and in chronic ophthalmia.

CERATE (Zinc,—Compound.) Syn. *Ceratum Zinci Compositum*,—Lat. *Prep.* 1. To the last, add *calomel*, 10 gr. *Used* as the last, and in scrofulous ophthalmia.

2. (Mid. Hosp.) *Zinc ointment* and *compound lead ointment*, equal parts. Cooling, astringent; in excoriations, and as a dressing for ulcers.

3. (Hufeland.) *Oxide of zinc* and *lycopodium*, of each, 15 gr.; *simple cerate*, ½ oz. In sore nipples, ulcerations of the breast, tetters, &c. It acts best when diluted with half its weight of spermaceti cerate.

CEREBRIC ACID. A peculiar acid compound, first noticed by M. Frémy, obtained along with *oleo-phosphoric acid* when the brain and nerves are treated with *hot alcohol*. It is solid, white, crystalline; freely soluble in boiling alcohol, and forms a solid gelatinous mass with hot water; fusible with decomposition, exhaling a peculiar odour, and leaving much charcoal behind. With the alkalies it forms insoluble salts termed *cerebrates*.

CEREBROLEINE. When *oleo-phosphoric acid* is boiled in water, it is resolved into a fluid neutral oil and phosphoric acid, which dissolves. The former is *cerebroleine*.

CERIC ACID. Formed by the oxidation of *cerin* and *myricine*.

CERINE. Syn. *Cerotic Acid*,—Brodie. When *pure bees' wax* (bleached) is digested in *boiling alcohol* for some time, a solution of *myricine* and *cerine* is formed. The former is deposited as the liquid cools, and the latter may be obtained by evaporating the decanted portion. *Cerine* is a white crystallizable substance, soluble in 16 parts of boiling alcohol; fuses at 144° Fahr.; and is readily saponified with caustic alkaline lyes, by which it is converted into *margaric acid* and *ceraïne*. It greatly resembles white wax, of which indeed it forms from 70% to 80%.

CERIUM. A metal discovered in 1803 by Hisinger and Berzelius, in the mineral named *cerite*. It is obtained in combination with two other metals called by Mosander *Lanthanium* and *Didymium*. The *mixed oxides* may be procured by dissolving *calcined* and *powdered cerite* in *nitro-hydrochloric acid*, filtering, neutralizing with *pure potassa* and then precipitating with *tartrate of potassa*. The powder that falls down is next washed, and calcined.

The mixed oxides may be separated by solution in *nitric acid*, evaporation, and calcination. The mass previously powdered is then to be digested in *water containing* 2% *of nitric acid*; the undissolved portion is OXIDE OF CERIUM. The solution contains the OXIDES OF LANTHANIUM and DIDYMIUM. These may be obtained as carbonates by adding a *solution of carbonate of potassa*. The precipitate, dissolved in *sulphuric acid* in excess, and slowly crystallized, yields rose-coloured crystals of *sulphate of didymium*, and violet ones containing lanthanium and didymium. By adding the latter to the mother liquor, and repeating the process, the whole of the didymium salt may be separated by crystallization, leaving *sulphate of lanthanium* behind.

The combinations of these metals are but little known, and are now the subject of investigation. Various compounds with the acids, sulphur, and chlorine, have been formed.

CEROMEL. *Prep.* (Van Mons.) *Bees' wax*. 1 oz.; *honey*, 4 oz.; melt together and stir until cold. An excellent application to irritable ulcers, abraided surfaces, sore nipples, &c.

CEROTIC ACID. See *Cerine*.

CEROTYLE. The theoretical base of *cerotic acid* and *cerotylic alcohol*,—according to Brodie.

CETENE. A colourless oily-looking liquid, obtained by repeatedly distilling *ethal* with *glacial phosphoric acid*. It is inflammable and soluble in alcohol and in ether.

CETIC ACID (of Chevreuil). This has been shown to be a mere admixture of *cetine* and *margaric acid*.

CETINE. Chevreuil applied this name to pure spermaceti. *Prep.* Dissolve *spermaceti* in *boiling alcohol*, and collect the crystals that are deposited as the solution cools. Bright pearly crystals, melting at 120°, and subliming at 670° Fahr.

CETRARIC ACID. Syn. *Cetrarine*, *Cetrarina* (?). The bitter principle of Iceland moss. It exists, in the free state, in the cortical portion of the thallus.

Prep. 1. *Iceland moss* (bruised), 1 part; *rectified spirit*, 6 parts; boil in a covered vessel for half an hour; express the liquor whilst hot, filter, and distil off the spirit; redissolve the residuum in boiling alcohol, decant the clear, and let the solution cool slowly; lastly collect the crystals and preserve them out of contact with air.

2. (Herberger.) *Iceland moss* (in coarse powder), 1 ℔; *alcohol* (0·883), 4 ℔; boil as before, cool until vapours cease to rise, express the tincture, add *hydrochloric acid*, 3 dr. (dissolved in) *water*, 2 oz.; let it

rest for a night in a closed mattrass; then decant, throw the deposit on a filter, press it in bibulous paper, and whilst still moist, wash it with both *alcohol* and *ether;* lastly, purify it by digestion in *boiling alcohol*, as before.

Prop., &c. Pure *cetraric acid* occurs under the form of minute shining acicular crystals; it is intensely bitter, non-volatile, scarcely soluble in water, ether, and cold alcohol; soluble in alkaline solutions forming soluble salts, which give a red colour with the persalts of iron, and a yellow one with acetate of lead. These compounds are called *cetrarates.* As it possesses distinct acid properties, it is incorrectly called cetrarine and cetrarina. *Dose.* 2 to 4 gr. every 3 hours, as a febrifuge; 1 to 3 gr. thrice daily, as a tonic.

CETYLE. The theoretical base of the *cetyl-compounds.* Pure spermaceti (*cetine*) is said to be *cetylate of oxide of cetyle.* Spermaceti is saponified with great difficulty, and yields by the process, a crystallizable fat, (*cetylic alcohol,*) and a substance resembling margaric acid, (*cetylic acid.*) The second may also be procured from the first by oxidation, and the two resemble in their chemical relations those of acetic acid and ordinary alcohol.

CEVADIC ACID. See *Sabadillic Acid.*

CHABERT'S OIL. Syn. *Chabert's Empyreumatic Oil; Oleum Empyreumaticum Chaberti, O. contra Tæniam Chaberti. Prep.* (Ph. Bor. 1847.) From *empyreumatic oil of hartshorn*, 1 part; *oil of turpentine*, 3 parts; mix and distil over three fourths only in a glass retort, and keep it in well stopped bottles. In tape-worm. *Dose.* Two teaspoonfuls in water, night and morning, until 4 to 6 or even 7 oz. have been taken; a cathartic being also administered from time to time.

CHAIRS. The black leather work of *chairs, settees*, &c. may be restored by first well washing off the dirt with a little warm soap and water, and afterwards with clean water. The brown and faded portions may now be restained by means of a little *black ink*, or preferably, *black reviver*, and when this has got thoroughly dry, they may be touched over with *white of egg*, strained and mixed with a little *sugar-candy.* When the surface is nearly dry, it should be polished off with a clean brush.

CHALK. Syn. *Soft Carbonate of Lime, Earthy do.; Creta,*—Lat. Chalk is largely used in the arts and manufactures, and in medicine. The natural varieties are remarkable for the fossils which they contain. The *coloured chalks* which are used as pigments and for crayons, generally contain both clay and magnesia, as well as oxide of iron, and are minerals quite distinct from *white chalk*, or *chalk*, properly so called. The latter is an *amorphous carbonate of lime.* Exposed for some time to a red heat, it is converted into *quicklime;* ground in mills and elutriated, it forms *whiting;* the same process performed more carefully and on a smaller scale produces the *prepared chalk* used in medicine. When prepared artificially (by precipitation), it is the *precipitated chalk* of modern pharmacy. (See *below.*)

CHALK (Black). Drawing slate.

CHALK (Brown). Umber.

CHALK (Camphorated). Syn. *Cretaceous Tooth Powder, Camphorated do.; Creta Camphorata, C. cum Camphorâ,*—Lat. *Prep.* 1. *Camphor*, 1 *oz.;* add a few drops of *spirit of wine*, reduce it to a very fine powder, and mix it (perfectly) with *precipitated chalk*, 7 *oz.;* lastly, pass it through a clean fine sieve, and keep it in a corked bottle. These proportions make the strongest "*camphorated tooth powder*" of the shops.

2. *Camphor*, 1 *oz.; precipitated chalk*, 15 oz.; as before. These are the best and safest proportions, and those now generally adopted by the West-end perfumers.

3. As either of the above, but using "*prepared chalk*" in lieu of "*precipitated chalk.*" Less white and velvety, but cleans the teeth better than the softer article.

Use, &c. Camphorated chalk is much esteemed as a dentifrice; especially by smokers, and those troubled with foul teeth, or a stinking breath. It may be scented with a few drops (3 or 4 to each *oz.*) of *otto of roses, oil of cloves*, or *neroli*, or of the *essences of ambergris, musk*, or *vanilla;* but care must be taken not to overdo it. When the *teeth* are *much furred* or *discoloured*, it may be mixed with about one-seventh of its weight of *finely-powdered pumice stone* (sifted through lawn) which will render it more effective. A little *carmine, rouge, light red* (burnt ochre), *red coral*, or *rose pink*, is also sometimes added to give it a tinge approaching that of the gums. The quantity of camphor (1 to 3 or 4) commonly ordered in certain books is absurdly large, and would render the compound not only unpleasant in use, but actually detrimental to the teeth. See *Dentifrices.*

CHALK (French). Soap stone or steatite, a soft magnesian mineral, possessing the property of writing in glass. Its powder (obtained by scraping) is very soft,

velvety, and absorbent of grease. It forms the *boot powder* of the boot- and shoe-makers.

CHALK (Precipitated). Syn. *Precipitated Carbonate of Lime; Creta Præcipitata, Calcis Carbonas Præcipitatum*,—Lat. *Prep.* 1. By adding to a *solution of chloride of calcium*, any quantity, another of *carbonate of soda*, (both cold,) and well washing the precipitate with *pure water*, and drying it out of the dust.

2. (Ph. D.) *Solution of chloride of calcium* (Ph. D.), 5 parts; *carbonate of soda*, 3 parts; (dissolved in) *water*, 4 parts.

Uses, &c. It is chiefly employed for making aromatic confection, cretaceous powder, and chalk mixture. That of the shops is seldom pure, the refuse of the soda-water makers (*sulphate of lime*) being commonly sold for it. When pure it is wholly soluble, with effervescence, in *dilute hydrochloric acid.* (See *below.*)

CHALK (Prepared). Syn. *Creta*,—Ph. E. & Ph. L. 1836. *Creta Præparata*,—Ph. L. 1851. *Creta Alba*,—Ph. D. *Prep.* 1. (Ph. L. 1836.) Rub *chalk*, 1 lb., with sufficient water, added gradually, until reduced to a smooth cream; then stir this into a large quantity of *water*, and, after a short interval, to allow the coarser particles to subside, pour off the supernatant water, (*still turbid*,) into another vessel, and allow the suspended powder to settle; lastly, collect the chalk so prepared and dry it. In the same way *shells* are prepared, after being first freed from impurities and washed with boiling water.

2. (Commercial.) On the *large scale* the *chalk* is ground in mills, and the elutriation and deposit made in large reservoirs. It is now seldom prepared by the druggist.

Pur. "It is almost entirely soluble in dilute hydrochloric acid, emitting small bubbles of carbonic acid gas. Hydrosulphuric acid does not disturb this solution; neither, when it has been heated, does ammonia or solution of lime added in excess." (Ph. L.)

Uses, &c. In *medicine*, as an absorbent, antacid, and desiccant; in acidity, heartburn, dyspepsia, and other like stomach affections, and in diarrhœa, depending on acidity or irritation; in the latter, generally combined with aromatics, astringents, or opium. It forms a valuable dusting powder in excoriations, ulcers, &c., especially in those of children. *Dose.* 10 gr. to a spoonful, in a little water or milk, or made into a mixture with mucilage or syrup.

CHALK (Red). A natural clay containing about 18% of protoxide and carbonate of iron.

CHALYBEATES. Syn. *Chalybeata, Ferruginea*,—Lat. The medicinal qualities of the preparations of iron are noticed under the name of that metal. Those most frequently employed in medicine are—*iron filings; Quevenne's iron;* the *black oxide, magnetic oxide*, and *sesquioxide of iron;* the *ammonio-chloride* and *sesqui-chloride;* the *carbonate* and *saccharine carbonate;* the *citrate* and *ammonia-citrate;* the *iodide, lactate*, and *sulphate;* the *tartrate, ammonio-tartrate*, and *potassio-tartrate of iron;* and the *chalybeate mineral waters.* For the *doses, &c.*, see the respective articles.

CHAMOMILE. Syn. *Anthemis*,—Ph. L. "The flower of the *anthemis nobilis.*" (Ph. L.) It is bitter, stomachic, and tonic; in dyspepsia, loss of appetite, intermittents, &c. It is an effectual remedy for nightmare; and, according to Dr. Schall, the only certain remedy for that complaint. *Dose.* 10 gr. to ½ dr., or more, in powder or made into a tea. Fomentations are also made with it. See *Extracts, Oils, Pills, &c.*

CHAMPAGNE. See *Wines.*

CHAPS. These are too well known to require description. *Chapped hands* are common amongst persons with a languid circulation, who are continually "dabbling" in water during cold weather. *Chapped lips* generally occur in persons with pallid, bluish, moist lips, who are much exposed to the wind in dry cold weather; especially in those who are continually moving from heated apartments to the external air. The application of a little *cold cream, pomatum, spermaceti ointment, lard*, or any *similar article*, will generally prevent chaps on the lips, and chaps and chilblains on the hands. Persons employed in oil and tallow works, or about oil, and who have consequently their hands continually in contact with greasy matter, never suffer from these things. A little oil or unguent of any kind, *well rubbed* on the hands on going to rest (removing the superfluous portion with a cloth,) will not only preserve them from cold, but tend to render them both soft and white. It is said that a once favorite actress, now "in the sere and yellow leaf," celebrated for the beauty of her hands, covers them nightly with the flare of a calf or lamb with the fat attached, over which is drawn a glove of leather. See *Chilblains.*

CHAR (Potted). The flesh of the *salmo Alpinus* (Linn.) or *trout of the Alps*, common in the lakes of Lapland, preserved by the common process of potting.

CHARCOAL. Syn. *Wood Charcoal, Ve-*

getable do.; Carbo,—Ph. L. *Carbo Ligni*,—Ph. L. 1836. *Carbo Vegetabilis, &c.* Coal made by charring; the fixed residuum of vegetables exposed to ignition out of contact with atmospheric air. "Charcoal prepared from wood, by means of fire." (Ph. L.)

Charcoal is prepared for fuel by burning pieces of wood, (commonly of 1 to 4 inches in diameter, and from 1 to 3 feet in length,) formed into a conical pile, which is then covered with turf or clay, to exclude the air, only 2 or 3 small holes at the bottom being left for lighting the wood, and a few others, still smaller, at top, to admit of the escape of the smoke. The combustion is allowed to proceed very slowly for 8 or 10 days, more or less, until the volatile matter of the wood is driven off, when the air holes are stopped up with *clay*, and the further combustion of the pile arrested. The whole is then allowed to remain until quite cold, before it is broken up.

The *charcoal* employed in the *manufacture of gunpowder* is burnt in close iron cylinders, and has hence received the name of "*cylinder charcoal*." For this and other nice purposes, it is essential that the last portion of the tar and vinegar should be suffered to escape, and the reabsorption of the crude vapours prevented, by cutting off the communication between the cylinders and the condensing apparatus; as without this precaution, on the fire being withdrawn, a retrograde movement of the products takes place, and the charcoal is much reduced in quality. The *dogwood, alder*, and *willow*, are those used for making charcoal at Waltham Abbey. The *Dutch white willow*, and after that the *Huntingdon willow*, are said to yield the best charcoal for gunpowder. The charcoal from the cylinders of the pyroligneous acid (*wood-vinegar*) works, is also called *cylinder charcoal*, and is that chiefly used for *chemical purposes*; but it is inferior to that prepared for gunpowder. It has been stated, that in charring wood, a portion of it is sometimes converted into a species of pyrophorous. Perhaps this might have been the cause of the late dreadful explosion at the Waltham works.

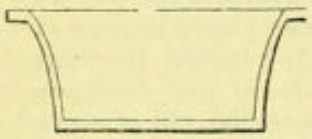
The *box-wood charcoal*, employed in voltaic electricity, is prepared by putting prismatic pieces of box-wood, about 1 inch long by ½ inch thick, into a crucible, which is then filled with clean dry sand, covered up, and exposed to a red heat for about an hour.

Uses, &c. These are numerous and varied. Charcoal is extensively employed as a *fuel*; and in metallurgy for *tempering metals*; reduced to powder, it is used to surround vessels and bodies required to *retain their heat for some time*; a coating of charcoal, formed on *piles* and *stakes of wood*, by charring them, promotes their preservation, by shielding them from air and moisture; fresh-burnt charcoal (in powder) *restores tainted meat* and *putrid water, decolours vegetable solutions, deodorizes fetid substances*, and *withdraws lime from syrups* filtered through it.

In *medicine*, charcoal is principally used as an *antiseptic* or *disinfectant*, either in the form of powder or made into a poultice. It has been given internally in *dyspepsia, diarrhœa, dysentery, heartburn, agues, constipation, sickness of pregnancy*, and various other diseases, with advantage. As a *prophylactic of cholera* and *fevers* it is invaluable and superior to all other substances. It forms the best *tooth-powder* known, as it both whitens the teeth and deodorizes the breath. "In the French edition of Hahnemann's Materia Medica, (*par* Jourdan; *Paris*, 1834;) no less than 35 pages are occupied with the enumeration of the symptoms produced by *one millionth of a grain* of this substance." (Pereira.) This is doubtless absurd; but on the other hand, the medical, and especially the prophylactic powers of charcoal, have been unjustly neglected in this country. *Dose.* 10 gr. to a teaspoonful, or more *ad libitum*. An ointment made with *lard* and *charcoal* has been successfully employed in some skin diseases. In all cases, to be useful, the charcoal must be both *fresh-burnt* and *fresh-powdered*, and carefully preserved, out of contact with the air, until about to be administered. Fresh *carbonized bread* forms an excellent charcoal, both for a prophylactic and a tooth-powder.

Charcoal *varies in its qualities* according to the substance from which it is prepared; that of the *soft woods*, (*willow* or *alder*,) is best for *crayons* and *gunpowder*; that of the *hard woods* for fuel, and for *blowpipe* "*supports*." That made by a low-red heat, not exceeding cherry red, and which has a dull surface, is the most valuable. If the heat is carried much beyond this point, the charcoal acquires a brilliant surface, and deteriorates in quality. *Chesnut charcoal* is preferred by smiths for forging, as it not only burns slowly, but deadens as soon as the blast ceases. *Areca-nut charcoal* is preferred as a dentifrice; but, unfortunately, the honest druggists, usually sell *willow charcoal* or *box-wood charcoal* for it.

Ant., &c. Poisoning or suffocation, resulting from respiring the fumes of burning



charcoal, (carbonic acid,) has been already alluded to, and the treatment briefly pointed out. It may be further added, that the most simple excitant in this species of asphyxia, is the passage into the nasal fossæ of a feather dipped in *common vinegar*. It is the means which has always first caused the muscular contractions indicating revival. (Pelletan.)

Gilders, jewellers, copper-plate printers, braziers, &c., who use small open fires of burning charcoal, should endeavour to create a draught of air to carry off the fumes, and should take care to keep to "*windward*," (as sailors say,) by which means they will avoid them. *Milk of lime* and *quicklime* have been employed to absorb the gas, but their action must necessarily be very limited. The only certain remedy is *thorough ventilation*. This should be adopted, even at slight personal inconvenience in other respects.

CHARCOAL (Animal). Syn. *Animal Black, Bone do., Ivory do.; Carbo Animalis, C. Ossis, Ebur Ustum Nigrum*,—Lat. The charcoal obtained by igniting bones in close vessels.

Prep. On the large scale, two different processes are adopted to produce bone black:—

1. *Bones*, (deprived of their grease by boiling,) are broken to pieces, and put into small cast-iron pots, varying from ⅜ to ½ an

inch in thickness. (See *Engr.*) Two of these being filled, are dexterously placed with their mouths together and then luted with *loam*. A number of these vessels are then placed side by side and piled on each other, in an oven resembling a potter's kiln, to the number of 100 or 150, or even more. The fire is next kindled, and the heat kept up strongly for 10 or 12 hours, according to circumstances, until the process is completed. The whole is then allowed to cool before opening the pots.

2. *Bones* (previously boiled for their grease) are introduced into retorts similar to those used in gas works, and heat being applied, the volatile products are conveyed away by iron pipes to cisterns where the condensable portion (*bone spirit, &c.*) is collected. As soon as the process of distillation is finished, the solid residuum in the retorts, (while still red hot,) is removed through their lower ends into wrought-iron canisters, which are instantly closed by air-tight covers, and luted over. These are then raised to the ground by a crane, and set aside to cool.

Obs. The *bone-grease*, obtained as above, is sold to the candle and soap makers. The boiled bones are then sorted, the *finest pieces* being selected for making handles for knives, tooth-brushes, buttons, &c.; the *next sort* is taken for making into bone black; while the *smallest* and *worst* portion, forming the residue, is reserved for grinding into manure. The carbonized bones are next ground in a mill, and the resulting coarse powder, sorted by sieves into two kinds, one, *granular*, somewhat resembling gunpowder, for *decolorizing liquids*, and the other, *quite fine*, to be used as a *pigment*. The first is sold under the name of *animal charcoal;* the second, as *bone* or *ivory black*.

Uses, &c. This article possesses the valuable property of taking lime and other saline matter from syrups and other aqueous solutions, especially organic ones, at the same time that it decolours them. *Its power as a decolorizer* may be tested by adding it to a *solution of brown sugar* or of *molasses*, or to *water containing* $\frac{1}{1000}$ part *of indigo dissolved in sulphuric acid*. The test should be made in a small glass tube. By well washing and carefully reburning it, this charcoal may be used any number of times. As a decolorizer and deodorizer, animal charcoal is vastly superior to vegetable charcoal. (See *below*.)

CHARCOAL (Animal). Syn. *Carbo Animalis*,—Ph. L. "Charcoal prepared from bullock's blood, by fire." (Ph. L.) *Used* in the preparation of the vegeto-alkaloids and as an antidote to poison. It is the purest and most powerful variety of animal charcoal. For *Tests* see *below*.

CHARCOAL (Animal,—Purified.) Syn. *Carbo Animalis Purificatus*,—Ph. E. & D.; & Ph. L. 1836. *Prep.* 1. (Ph. E.) *Commercial hydrochloric acid* and *water*, of each, 12 fl. oz.; mix, stir in *animal charcoal*, (bone black,) 1 lb; digest, with gentle heat and frequent agitation, for 2 days; then boil, dilute with *water*, 1 quart, and filter through linen or calico; wash the charcoal which remains on the filter with *water*, until what passes off is scarcely (not at all) affected by *solution of carbonate of soda;* heat the washed charcoal, at first moderately, and then to (dull) redness in a closely covered crucible.

2. (P. D.; & Ph. L. 1836.) As before (nearly), omitting the "boiling." *Used* for the same purposes as the last.

3. (Commercial.) *Hydrochloric acid*,

1 *lb.*; *water*, 1 pint; mix, add *bone black*, 7 *lb.*; make a paste; in 2 or 3 days stir in *boiling water*, 1 quart; and the next day wash it with fresh water until the washings cease to affect litmus paper or a solution of carbonate of soda; then collect it in a cloth, and drain, press, and dry it; lastly, heat it to redness, as before. *Used* to decolour syrups, &c.; and occasionally by the distillers and rectifiers. It is inferior to the preceding, although frequently sold for them.

Pur., &c. "Ignited with its own volume of red oxide of mercury, it is dissipated, leaving only a scanty ash" less than $\frac{1}{200}$th part. (Ph. E.) "It gives off no bubbles (of carbonic acid) on the addition of hydrochloric acid; nor is anything afterwards thrown down from this acid on adding either ammonia or sesqui-carbonate of ammonia." (Ph. L. 1836.)

Obs. We must again impress on the reader the necessity of employing the preceding charcoals (except as pigments) *only* when *recently burnt* and kept *thoroughly excluded from the air*, as by exposure, they lose *all* their valuable properties, and become absolutely *inert*.

CHARCOAL (Lardner's Prepared). *Charcoal*, (in very fine powder,) 1 *oz.*; *prepared chalk*, 3 *oz.*; mix. A good tooth-powder.

CHARGES (for Cattle). See *Veterinary Medicine*.

CHARRING (Surface). The operation by which the surface of wood is carbonized, to prevent its decay from exposure to air and moisture. *Stakes and piles* are generally thus treated before they are driven into the ground. *Casks* are charred on the inside by coopers when they are intended to hold water. In both these cases the fire is commonly applied directly to the wood. A *new method* has, however, been lately employed with apparent success. This consists in washing the wood with the *strongest oil of vitriol*. In this way, not only the outer surface, but the surface of all the cracks and holes, gets carbonized, which is not the case when heat is employed. It succeeds admirably with *musky casks* and *vats*.

CHASCHISCH. Syn. *Hadschy?* The common name, in the East, of all intoxicating compounds prepared from Indian hemp. See *Hemp* (Indian).

CHEESE. Syn. *Caseum*, *Caseus*,—Lat. The curd of milk compressed into a solid mass. That of commerce is usually salted and dried, and in some varieties, it is also coloured and flavoured.

The *process of cheese-making* is one which is eminently interesting and scientific, and which, in every gradation, depends on principles which chemistry has developed and illustrated. When a *vegetable* or *mineral acid* is added to *milk*, and heat applied, a coagulum is formed, which, when separated from the liquid portion, constitutes cheese. *Neutral salts*, *earthy* and *metallic salts*, *sugar*, and *gum Arabic*, as well as some other substances, also produce the same effect; but that which answers the purpose best, and which is almost exclusively used by dairy farmers, is *rennet*, or the mucous membrane of the last stomach of the calf. Alkalies dissolve this curd at a boiling heat, and acids again precipitate it. The solubility of cheese in milk is occasioned by the presence of alkaline phosphates and of free alkalies. In fresh milk these substances may be readily detected by the property it possesses of restoring the colour of reddened litmus paper. The addition of an acid neutralizes the alkali, and so precipitates the curd in an insoluble state.

"The acid indispensable to the coagulation of milk, is not *added* to the milk in the preparation of cheese, but it is *formed in the milk* at the expense of the milk-sugar present. A small quantity of *water* is left in contact with a small quantity of a *calf's stomach* for a few hours, or for a night; the water absorbs so minute a portion of the mucous membrane as to be scarcely ponderable; this is mixed with milk; its state of transformation is communicated, (and this is a most important circumstance,) *not to the cheese*, but *to the milk-sugar*, the elements of which transpose themselves into lactic acid, which neutralizes the alkali, and thus causes the separation of the cheese. By means of *litmus paper* the process may be followed and observed through all its stages; the alkaline reaction of the milk ceases as soon as the coagulation begins. If the cheese is not immediately separated from the whey, the formation of *lactic acid* continues, the fluid turns acid, and the cheese itself passes into a state of decomposition.

"When cheese-curd is kept in a cool place, a series of transformations take place, in consequence of which it assumes entirely new properties; it gradually becomes semi-transparent, and more or less soft throughout the whole mass; it exhibits a feebly acid reaction, and develops the characteristic caseous odour. Fresh cheese is very sparingly soluble in water, but after having been left to itself for two or three years, it becomes (especially if all the fat be previously removed) almost completely *soluble*

in cold water, forming with it a solution, which, like milk, is coagulated by the addition of the acetic or mineral acids. The cheese, which whilst fresh is insoluble, returns during the maturation, or ripening, as it is called, to a state similar to that in which it originally existed in the milk. In those English, Dutch, and Swiss cheeses, which are nearly inodorous, and in the superior kinds of French cheese, the caseine of the milk is present in its unaltered state.

"The *odour* and *flavour of the cheese* is owing to the decomposition of the butter; the *non-volatile acids*, the *margaric*, and *oleic acids*, and the *volatile butyric acid*, *capric* and *caproic acids*, are liberated in consequence of the decomposition of glycerine, (the sweet principle of oils, or, as it might be termed, the sugar of oils.) *Butyric acid* imparts to cheese its characteristic caseous odour, and the differences in its pungency or aromatic flavour depend upon the proportion of *free* butyric, capric, and caproic acids present." In the cheese of certain dairies and districts, *valerianic acid* has been detected along with the other acids just referred to. Messrs. Jljenko and Laskowski found this acid in the cheese of Limbourg, and M. Bolard in that of Roquefort.

"The transition of the *insoluble* into *soluble caseine* depends upon the decomposition of the *phosphate of lime* by the *margaric acid* of the butter; *margarite of lime* is formed, whilst the *phosphoric acid* combines with the caseine, forming a compound soluble in water.

"The bad smell of inferior kinds of cheese, especially those called *meagre* or *poor cheeses*, is caused by certain *fetid products* containing *sulphur*, and which are formed by the decomposition or putrefaction of the caseine. The alteration which the butter undergoes, (that is, in becoming rancid,) or which occurs in the *milk-sugar* still present, being transmitted to the caseine, changes both the composition of the latter substance and its nutritive qualities.

"The principal conditions for the preparation of the superior kinds of cheese, (other obvious circumstances being of course duly regarded,) are *a careful removal of the whey, which holds the milk-sugar in solution, and a low temperature during the maturation or ripening of the cheese.*" (Liebig.)

Cheese differs vastly in *quality* and *flavour*, according to the method employed in its manufacture, and the richness of the milk of which it is made. Much depends upon the quantity of cream it contains, and consequently when a superior quality of cheese is desired, cream is frequently added to the curd. This plan is adopted in the manufacture of *Stilton cheese* and others of a like description. The addition of *a pound* or *two of butter* to the *curd for a middling size cheese*, also vastly improves the quality of the product. To ensure the richness of the milk, not only should the cows be properly fed, but certain breeds chosen. Those cultivated in Alderney, Cheddar, Cheshire, Gloucestershire, Guernsey, and North Wiltshire, deserve a preference in this respect.

The *materials employed in making cheese* are milk and rennet. *Rennet* is the stomach of the calf, and is used either fresh, or salted and dried; generally in the latter state. The *milk* may be of any kind, according to the quality of the cheese required. *Cows' milk* is that generally employed; but occasionally *ewes' milk* is used; and sometimes, though more rarely, that from *goats*.

In *preparing his cheese*, the dairy farmer puts the greater portion of the *milk* into a large tub, to which he adds the remainder, sufficiently heated to raise the temperature to that of *new milk*. The whole is then whisked together, the *rennet* or *rennet liquor* added, and the tub covered over. It is now allowed to stand until completely "turned," when the *curd* is gently struck down several times with the skimming-dish, after which it is allowed to subside. The "vat" covered with cheese-cloth is next placed on a "horse" or "ladder" over the tub, and filled with curd by means of the skimmer, care being taken to allow as little as possible of the oily particles or butter to run back with the whey. The curd is pressed down with the hands, and more added as it sinks. This process is repeated until the curd rises to about 2 inches above the edge. The *newly-formed cheese*, thus partially separated from the whey, is now placed in a clean tub, and a proper quantity of *salt* added, as well as of *annotta*, when that *colouring* is used, after which a board is placed over and under it, and pressure applied for about 2 or 3 hours. The cheese is next turned out and surrounded by a fresh cheese-cloth, and then again submitted to pressure in the "cheese press" for 8 or 10 hours, after which it is commonly removed from the press, salted all over, and again pressed for 15 to 20 hours. The quality of the cheese especially depends on this part of the process, as if any of the whey is left in the cheese, it rapidly becomes bad-flavoured. Before placing it in the press the last time, the common practice is to pare the edges smooth and sightly. It now

only remains to wash the outside of the cheese in *warm whey* or *water*, to wipe it dry, and to colour it with *annotta* or *reddle*, as is usually done.

The *storing of the newly-made cheese* is the next point that engages the attention of the maker and wholesale dealer. The same principles which influence the *maturation* or ripening of fermented liquors, also operate here. In England a *cool cellar*, neither *damp* nor *dry*, and which is *uninfluenced by changes of weather* or *season*, is commonly regarded as the best for the purpose. If possible, the temperature should on no account be permitted to exceed 50° or 52° Fahr. at any portion of the year. An average of about 45° is preferable when it can be procured. A place exposed to sudden changes of temperature is as *unfit for storing cheese* as it is for *storing beer*. "The quality of Rochefort cheese, which is prepared from sheep's milk, and is very excellent, depends exclusively upon the places where the cheeses are kept after pressing and during maturation. These are cellars, communicating with mountain grottoes and caverns, which are kept constantly cool, at about 41° to 42° Fahr., by currents of air from clefts in the mountains. The value of these cellars as storehouses varies with their property of maintaining an equable and low temperature. Giron mentions that a certain cellar, the construction of which had cost only 480*l*., (12,000 francs,) was sold for 8,600*l*., (215,000 francs,) being found to maintain a suitable temperature, a convincing proof of the importance attached to temperature in the preparation of these superior cheeses." (Liebig.)

It will thus be seen that very slight differences in the materials, in the preparation, or in storing of the cheese, materially influence the quality and flavour of this article. The *richness of the milk*,—the *addition to* or *subtraction of cream from the milk*,—the *separation of the curd from the whey with* or *without compression*,—the *salting of the curd*,—the *collection of the curd*, either *whole* or *broken*, before pressing,—the *addition of colouring matter*, as *annotto* or *saffron*, or of *flavouring*,—the *place* and *method of storing*,—and the *length of time allowed for maturation*, all tend to alter the taste and odour of the cheese, in some or other particular, and that in a way readily perceptible to the palate of the connoisseur. No other alimentary substance appears to be so seriously affected by slight variations in the quality of the materials from which it is made, or by such apparently trifling differences in the methods of preparing it.

Var. The varieties of cheese met with in commerce are very numerous, and differ greatly from each other in richness, colour, and flavour. These are commonly distinguished by names indicative of the places in which they have been manufactured, or of the quality of the materials from which they have been prepared. Thus, we have *Dutch*, *Gloucester*, *Stilton*, *skimmed-milk*, *raw-milk*, *cream*, and other *cheeses;* names which explain themselves. The following are the principal varieties met with in Europe:—

Brickbat cheese. (Wiltshire.) From its form; made in Wiltshire of new milk and cream.

Cheddar cheese. (Cheddar.) A fine spongy kind of cheese, the eyes or vesicles of which contain a rich oil; made up into round thick cheeses of considerable size, (150 to 200 *lb.*)

Cheshire cheese. (Cheshire.) From new milk, without skimming, the morning's milk being mixed with that of the preceding evening, previously warmed, so that the whole may be brought to the heat of new milk. To this the rennet is added, in less quantity than is commonly used for other kinds of cheese. On this point, much of the flavour and mildness of the cheese is said to depend. A piece of dried rennet, of the size of half-a-crown, put into a pint of water over night, and allowed to stand until the next morning, is sufficient for 18 or 20 gallons of milk. In large round thick cheeses (100 to 200 *lb.* each). They are generally solid, homogeneous, and dry, and friable rather than viscid.

Cottenham cheese. (Cottenham.) A species of cream cheese, superior to Stilton, from which it also differs in shape, being flatter and broader than the latter.

Cream cheese. From the "strippings," (the last of the milk drawn from the cow at each milking,) from a *mixture of milk and cream*, or from *raw cream* only, according to the quality desired. In small pieces, a gentle pressure only, (that of a 2 or 4 *lb.* weight,) being applied to press out the whey. After twelve hours, it is placed upon a board or wooden trencher, and turned every day, until dry. It ripens in about three weeks. A little *salt* is generally added, and frequently a *little powdered lump sugar*. In small squares.

Derbyshire Cheese. (Derbyshire.) A small white rich variety, very similar to Dunlop cheese.

Dunlop Cheese. (Dunlop, &c.) Rich,

white, and buttery; in round forms, weighing from 30 *lb.* to 60 *lb.*

Dutch Cheese. (Holland.) Of a globular form. 5 to 14 *lb.* each. Those from Edam are very highly salted; those from Gouda less so.

French cheese. The Roquefort and Neufchatel cheeses are those most esteemed.

German Cheese. *Westphalian* cheese derives its peculiar flavour from the curd being allowed to become partially putrid before being pressed. In small balls or rolls of about 1 *lb.* each.

Gloucester Cheese. (Gloucestershire.) *Single Glo'ster*; from milk, deprived of part of its cream; *Double Glo'ster*, from milk retaining the whole of the cream. Mild tasted, semi-buttery consistence, without being friable; in large round flattish forms.

Green or *Sage Cheese.* From milk mixed with the juice or an infusion or decoction of sage leaves, to which marygold flowers and parsley are frequently added.

Lincoln Cheese. (Lincolnshire.) From new milk and cream; in pieces about 2 inches thick; soft, and will not keep over 2 or 3 months.

Neufchatel Cheese. (Neufchatel.) The best of its kind manufactured in France; made of cream, and weigh about 5 or 6 *oz.*

Norfolk Cheese. (Norfolk.) Dyed yellow with annotto or saffron; good, but not superior; in cheeses of 30 *lb.* to 50 *lb.*

Parmesan Cheese. (Parma, &c.) From the curd of skimmed milk, hardened by a gentle heat. The rennet is added at about 120°, and an hour afterwards, the curd is set on a slow fire until heated to about 150° Fahr.; during which the curd separates in small lumps. A few pinches of saffron are then thrown in. In about a fortnight, the outer crust is cut off, and the new surface varnished with linseed oil, and one side coloured red.

Polish Cheese. (Poland.) Inferior.

Roquefort Cheese. (Roquefort.) From ewes' milk; the best prepared in France. It greatly resembles Stilton, but is scarcely of equal richness or quality, and possesses a peculiar pungency and flavour.

Russian Cheese. (Southern Russia.) Inferior, bad tasted, and dirty.

Slipcoat or *Soft Cheese.* A very rich white cheese, somewhat resembling butter; for present use only.

Stilton Cheese. (Stilton.) The richest and finest cheese made in England. From raw milk, to which cream taken from other milk is added; in cheeses generally twice as high as they are broad. Like wine, this cheese is vastly improved by age, and is therefore seldom eaten before it is 2 years old. A spurious appearance of age is sometimes given to it by placing it in a warm damp cellar, or by surrounding it with masses of fermenting straw, or dung.

Suffolk Cheese (Suffolk.) From skimmed milk; in round flat forms, from 24 *lb.* to 30 *lb.* each; resembles the *skimmed* or "*scald milk cheese*" of Devonshire.

Swiss Cheese. The principal cheeses made in Switzerland are the *Gruyère* or *Jura*, and the *Schabzieger* or *green cheese.* The latter is flavoured with melilot.

Wiltshire Cheese. (Wiltshire.) Resembles poor Cheshire or Glo'ster. The outside is generally painted with a mixture of of *ruddle* or *red ochre* and *whey.*

York Cheese. (Yorkshire.) From cream: it will not keep.

Qual., &c. Cheese has been objected to as an article of diet, but without sufficient reason, since it is, when of good quality, eminently nutritious, wholesome, and digestible. Like all other food, cheese digests more readily when well masticated, and the neglect of this precaution is one reason why it frequently disagrees with delicate stomachs. It is rendered more agreeable to many palates by toasting it, but becomes less digestible by that operation. The basis of cheese is *caseine* or *coagulated curd*, a proteine substance; it therefore cannot fail to prove nutritious, provided it is properly digested. *Cheese-curd*, carefully freed from water and milk by expression, and the addition of salt, is a *mixture* of *caseine* and *butter.* It contains *all* the *phosphate of lime*, and *part* of the *phosphate of soda* of the milk. (Liebig.) When taken as a condiment, especially when rich and old, it powerfully promotes the secretion of the saliva and gastric juice, and thereby aids the stomach in performing its proper functions. *Rotten cheese* is very *unwholesome.*

Concluding Remarks. It is surprising that cheese is not more frequently made an article of domestic manufacture, especially by housewives resident in the country. The operations of cheese-making are all exceedingly simple, and not laborious, and will, in most cases, amply repay the outlay for the milk. Besides, cheese is not unfrequently coloured with stains and pigments, which are injurious, and even poisonous, the risk of taking which is not encountered when it is made at home. Several persons have nearly lost their lives from eating cheese coloured with annotta, for instance. This substance, though harmless in itself, is frequently adulterated with *red-lead*, so

that the cheesemaker may very innocently introduce a dreadful poison, when he only intends to improve the colour of his goods.

When a whole cheese is cut, and the consumption small, it is generally found to become unpleasantly dry, and to lose flavour before it is consumed. This is best prevented by cutting a sufficient quantity for a few days' consumption from the cheese, and keeping the remainder in a cool place, rather damp than dry, spreading a thin film of butter over the cut surface, and covering it with a cloth or pan, to keep off the dirt. This removes the objection existing in small families against purchasing a whole cheese at a time. The common practice of buying small quantities of cheese should be avoided, as not only a higher price is paid for any given quality, but there is little likelihood of obtaining exactly the same flavour twice running. Should cheese become too dry to be agreeable, it may be used for stewing, or for making *grated cheese* or *Welsh-rare-bits.*

CHEESE (Apple). The pomace or ground apples from the cider press.

CHEESE (Damson.) *Prep.* From *damsons* boiled with a *little water*, the pulp passed through a sieve, and then boiled with about *one fourth* the weight of *sugar*, until the mixture solidifies on cooling; it is next poured into small tin moulds previously dusted out with sugar. *Cherry cheese, gooseberry cheese, plum cheese, &c.*, are prepared in the same way, using the respective kinds of fruit. They are all very agreeable candies or confections.

CHEESE (Legumen). The Chinese prepare an actual cheese from peas, called "tao-foo," which they sell in the streets of Canton. The *paste from steeped ground peas* is boiled, which causes the starch to dissolve with the casein; after straining the liquid, it is coagulated by a *solution of gypsum;* this *coagulum* is worked up like sour milk, salted, and pressed into moulds.

CHEESE (Roquefort—Factitious.) *Prep.* (Roulle.) The *gluten of wheat* is kneaded with a *little salt*, and a *small portion* of a *solution of starch*, and made up into cheeses. It is said that this mixture soon acquires the taste, smell, and unctuosity of cheese, and when kept a certain time, is not to be distinguished from the celebrated *Roquefort cheese*, of which it possesses all the peculiar pungency. By slightly varying the process, other kinds of cheese may be imitated.

CHEESE (Toasted). This much relished article is seldom well prepared. The following has been handed to us by the cook of a certain nobleman who prides himself on his gustful appetite:—Cut the *cheese* into slices of moderate thickness, and put them into a tinned copper saucepan, with a *little butter* and *cream;* simmer *very gently* until they are quite dissolved, then remove the saucepan from the fire, allow the whole to cool a little, add some *yelk of egg*, well beaten, add *spice*, make the compound into a "shape," and brown it before the fire.

CHELIDONIC ACID. From the *chelidonium majus* or *great celandine*, in which it exists combined with lime, and associated with malic and fumaric acid. It forms slender, colourless needles, very soluble in water; is bibasic, and when exposed to a high temperature, is converted in *Pyrochelidonic acid.* It forms three classes of salts (*chelidonates*) with the bases.

CHELSEA PENSIONER. *Prep.* From *gum guaiacum*, ¼ *oz.; rhubarb*, ½ *oz.; cream of tartar*, 2 *oz.; flowers of sulphur*, 4 *oz.; nutmegs*, 2 in number; (all in powder;) *honey*, 1½ *lb.*, or q. s.; made into an electuary by beating them together in a mortar. *Dose.* One to two tablespoonfuls, night and morning, in gout and chronic rheumatism. The name is said to have been given to it from the circumstance of a Chelsea pensioner having cured Lord Amherst with it.

CHELTENHAM SALTS. See *Salts.*

CHEMIQUE. See *Chemic Blue.*

CHEROOTS. *Genuine cheroots* are a species of cigar imported from Manilla, in the Philippine Islands, and are distinguished by extreme simplicity of construction, as well as delicacy of flavour. Those now so commonly sold under the name in England, are, for the most part, made of *inferior* or *damaged tobacco* and *lettuce leaves*, (chiefly the latter,) further sophisticated by the addition of *treacle, colouring matter, saltpetre, common salt*, and other similar articles.

CHERRIES are the fruit of different species of the genus *cerasus* and the natural order *rosaceæ.* They are regarded as wholesome, cooling, nutritive, laxative, and anti-scorbutic. In eating them, care should be taken to avoid swallowing the stones. Brandy flavoured with this fruit or its juice, is known as *cherry-brandy.* Morella cherries preserved in brandy are called *brandy cherries.* See *Brandy, Fruit, &c.*

CHERRY LAUREL. The *prunus laurocerasus*, (Linn.) *Leaves*, occasionally used instead of bay leaves in cookery. The *distilled oil* and *distilled water* are both POISONOUS.

CHICA. The red colouring matter deposited by a decoction of the leaves of *bignonia chica* in cooling. *Used* by the American Indians to stain their skin. It

is soluble in alcohol, ether, oil, fat, and alkaline lyes, and slightly so in boiling water.

CHICORY, or *wild succory*, is the *chicorium intybus* of Linnæus, a plant of the natural order *compositæ*.

The *fresh root of chicory* (*radix chicorii recens*) is reputed to be alterative, attenuant, diuretic, febrifuge, hepatic, resolvent, and tonic; and in large doses, aperient. It is now seldom used in medicine, although it appears to possess similar qualities and equal activity to those of dandelion. "An infusion of the root, mixed with syrup, becomes thick; forming the *gomme sacchochicorine* of Lacarterie." (Fee.)

The *roasted root* is prepared by cutting the full-grown root into dice, and exposing it to heat in iron cylinders, along with about $1\frac{1}{2}$ or $2\frac{0}{0}$ of *lard*, in a similar way to that adopted for coffee. When ground to powder in a mill, it constitutes the *chicory* of the grocers, (*chicory coffee, succory do.; radix chicorii torrefacta, r. c. t. contrita;*) so generally employed both as a substitute for coffee, and as an adulterant of that article. The addition of 1 part of *good fresh-roasted chicory* to 10 or 12 parts of *coffee*, forms a mixture which yields a beverage of a richer and fuller flavour, and of a deeper colour, than that furnished by an equal quantity of pure or unmixed coffee. In this way a less quantity of coffee may be used, and consequently a proportionate saving in its consumption may be effected. The use, however, of a larger proportion of chicory with coffee than that just named, imparts to the beverage an insipid flavour, intermediate between that of treacle and liquorice; whilst the continual use of roasted chicory, or highly chicorized coffee, seldom fails to weaken the powers of digestion and derange the bowels. Many of the worst cases of dyspepsia we have ever met with, have occurred in persons who have been heavy drinkers of adulterated coffee. "There can be no doubt that roasted chicory must, when taken largely, have a tendency to excite diarrhœa." (Pereira.)

Pur., &c. The ground chicory of the shops, like ground coffee, is almost universally adulterated. Pigments are added to it to *colour* it, and various vegetable substances to lessen its value. The following articles have been reported to have been detected in roasted chicory, or to have been known to be used to adulterate it:—*Venetian red, reddle*, and *red clay; roasted acorns, beans, carrots, damaged dog-biscuits, damaged bread, damaged wheat, horse chesnuts, mangel wurzel, parsnips, peas, rye*, and *sugar; coffee flights* (coffee husks), *coffina* (roasted lupins), *Hambro' powder* (roasted peas coloured with reddle), and the *marc of coffee; exhausted bark* (from the tan yards), *logwood dust, mahogany dust, &c.* It has also been asserted that the *scorched livers of bullocks, horses, and dogs*, have been applied to the same purpose; but of this there is not sufficient evidence. The only way to avoid being thus cheated or poisoned, is to buy the chicory *whole*, and to grind it at home.

Roasted chicory is highly hygrometric or absorbent of moisture, and should, therefore, be always kept in close vessels, (bottles or canisters,) the same as coffee. If the lumps become tough or soft, or the powder cakes together, it is unfit for use; but in some cases it may be recovered, by exposing it on a plate in an oven until it again becomes perfectly dry or brittle.

Tests.—1. Powdered chicory thrown on water turns it reddish-brown, and rapidly sinks, leaving light impurities either floating or diffused through the liquid.—2. The cold decoction tested with tincture, or solution of iodine, gives a brown colour; if it turns purple, blue, or black, it indicates the presence of roasted peas, beans, rye, or some other like substance, containing starch.—3. Persulphate or sesqui-chloride of iron, added in the same way, should not materially affect the liquid; if it turns it bluish or blackish, it indicates the presence of roasted acorns, oak-bark tan, or some other substance containing tannin.—4. Water soured with vinegar, digested on the powder, should not be blackened, or even materially darkened, by tincture of galls or a solution of red prussiate of potash; the contrary shows the presence of ferrugineous colouring matter.—5. The dry powder, when incinerated, should not leave more than $4\frac{1}{2}$ to $5\frac{0}{0}$ of ash, which should be of a grayish or fawn colour; the contrary indicates the presence of reddle, red clay, ochre, or the like.—6. To the above may be added attention to the odour, colour, and appearance both to the naked eye and under the microscope; by the latter, adulteration may be easily detected. See *Coffee*.

CHILBLAIN. Syn. *Pernio*,—Lat. An inflammatory swelling, of a purple or lead colour, produced by the action of cold. Chilblains (*perniones*) exclusively attack the extremities of the body, and are generally confined to the fingers, toes, and heels. The *common symptoms* are itching and irritation, more or less intense, often accompanied with shooting pains, and tenderness, and tumefaction of the parts. Children, especially

those of a scrofulous habit, and elderly persons, are generally the most liable to chilblains. The *common cause of chilblains* is holding the hands or feet to the fire after exposure to cold. The sudden change of temperature partially destroys the vitality of the minute surfacial vessels, and thus prevents the proper flow of blood through the part. The best *preventives of chilblains* are woollen socks or stockings, good waterproof shoes, woollen gloves, exercise, and friction. These act by promoting the circulation of the blood in the extremities, and protecting them from vicissitudes of temperature. *When chilblains have once formed*, the *best treatment* is friction with stimulants, as, spirits of wine and camphor, oil of turpentine, opodeldoc, dilute spirits, camphorated oil, hartshorn and oil, &c. Linnæus recommends bathing the part with dilute muriatic acid, just strong enough to faintly prick the skin. When the inflamed parts have ulcerated, they are commonly called *kibes*. In this state they should be dressed with a little resin cerate, or elemi ointment. If *fungous granulations* appear, they must be removed by touching them with nitrate of silver or blue vitriol. See *Chaps, &c.*

The following *remedies for chilblains* have been strongly recommended by different parties, and may all prove useful in their turns, as circumstances and convenience may suggest:—

1. *Sulphate of copper*, 1 oz.; *rosemary water*, 1 pint; dissolve.

2. *Sal ammoniac*, 1 oz.; *vinegar*, ½ pint.

3. *Sal ammoniac*, 1 oz.; *rum*, ½ pint; *camphor*, 1 dr. The affected part is wetted with the above night and morning, and when dry, is touched with a little simple ointment, cold cream, or pomatum.

4. *Soap liniment*, 2 oz.; *tincture of cantharides*, 1 oz.; *oil of cajeput*, 2 dr.

5. *Oil of turpentine*, 2 oz.; *camphor*, 3 dr.; *oil of cajeput*, 1 dr. The application of the last two is accompanied by gentle friction.

6. (Dr. Graves' Preventive.) *Sulphate of copper*, 20 gr.; *water*, 1 oz. As the first three.

7. (Lejeune's Balsam.) See *Chilblain Balsam.*

8. (Linnæus' remedy.) *Hydrochloric acid*, 1 oz.; *water*, 11 oz. As No. 3.

9. (Morton's Liniment.) *Calomel* and *camphor*, of each, 1 dr.; *spermaceti ointment*, 4 dr.; *oil of turpentine* and *cocoa-nut oil*, of each, 2 dr. As No. 5.

10. (*Russian remedy.*) The *rind* of perfectly ripe cucumbers, dried with the soft parts attached. For *use*, they are placed with the inner side, previously soaked in warm water, over the sore parts. (Med. Zeitung.)

11. (Swediaur's Paste.) *Bitter Almonds* 8 oz.; *honey*, 6 oz.; *powdered camphor* and *flour of mustard*, of each, ½ oz.; *burnt alum* and *olibanum*, of each, ¼ oz.; *yelks of* 3 *eggs;* beat to a paste. To be applied night and morning.

12. (Vance's Cream.) *Ointment of nitrate of mercury*, 1 oz.; *camphor*, 1 dr.; *oil of turpentine*, 2 dr.; *oil of olives*, 4 dr.; mix well together. To be applied, by gentle friction, 2 or 3 times daily. All the preceding preparations are intended for chilblains before they break. The *liniments of ammonia, camphor, opium, soap*, and *turpentine*, as well as the *compound camphor liniment* of the London Pharmacopœia, are also excellent preparations for the same purposes.

13. (Wahler's Ointment.) *Black oxide of iron, bole*, and *oil of turpentine*, of each, 1 dr.; *resin cerate*, 1 oz. For broken chilblains. We have found a mixture of equal parts of *calamine cerate* and *resin cerate* answer quite as well.

CHILDREN (Care of). See *Infancy, &c.*

CHILDREN (Diseases of). See the respective heads, and *Diseases.*

CHILLIES. See *Peppers.*

CHIMNEYS were not introduced into England until the reign of Queen Elizabeth, and for a considerable period, the principles of their construction were ill-understood. When the air inside and outside a chimney is at the same temperature, an equilibrium exists; there is no draught in the chimney, because the downward tendency of that within is counteracted by the upward pressure of that without. Let a fire be kindled in the grate; hot air is evolved, the chimney is heated, the air it contains suffers expansion, and a portion is expelled. The chimney now contains a smaller weight of air than it did before; the external and internal columns no longer equibalance each other, the warmer and lighter air is forced upwards from below, and its place is occupied by cold, and consequently heavier air. If the fire continues to burn, and the chimney retains its temperature, this second portion of air is disposed of like the first, and the ascending current continues, so long as the sides of the chimney are hotter than the surrounding air. Should the reverse happen to be the case, as sometimes occurs from sudden atmospheric changes, the column of air within the chimney rapidly contracts in volume, the deficiency is filled up from without, the column of air becomes heavier than one of a corresponding height

on the outside of it, or in the apartment, and, obeying the common laws of gravitation, it falls out of the throat of the chimney or fire-place, just as a heavy body sinks in water, and has its place occupied by air from above. In this way, a descending current, of more or less intensity and duration is established, and, if there is a fire in the grate, the chimney "smokes," or, if the grate is empty, perhaps the smoke from neighbouring chimneys finds its way into our apartments. By the judicious arrangement of the *fire-place*, and the *throat* and *flue* of a chimney, an upward current may be constantly ensured so long as there is a fire in the grate, or the air of the apartment is warmer than the external atmosphere.

Count Romford was the first who scientifically investigated the construction of chimneys. He showed that more heat is obtained from the fire by reflection when the "covings" are placed in an oblique position. He also directed that the fire itself should be kept as near to the hearth as possible, and that the "throat" of the chimney should be constructed much narrower than was then the practice, in order to prevent the escape of so much heated air as happened with "wide throats." By contracting the open part of the fire-place immediately over the fire, as by lessening the width of the hobs, or by bringing the "throat of the chimney" closer to the fire, and by contracting the "throat of the chimney" itself, within certain limits, any desired amount of draught may be obtained. When the space above the fuel is too small, the "throat" too near the burning fuel, or the throat itself too contracted, the draught of a common chimney is often too strong, and much fuel and heat is wasted. When the reverse is the case, the draught is commonly too languid, the fire "draws badly," a portion of the smoke escapes into the room, and all the usual annoyances of a "*smoky chimney*" are suffered. By a proper attention to these conditions, a common fire-place may be adapted for the combustion of *bituminous* or "*easy-burning coal*," or of *anthracite*, and those varieties of coal, that require a considerable "draught." It may even be converted into a wind-furnace; whilst the inconvenience of *smoky chimneys* may be always avoided, and when existing, easily "cured." This is presuming, however, that a sufficient supply of air exists in front of the fire-place (*i.e.*, in the apartment), not only for the combustion of the fuel, but also for the upward current of the chimney. Many chimneys smoke simply from the apartment being so ill-ventilated that the supply here alluded to is not provided. One of the fire-places at our chambers once smoked most obstinately, notwithstanding all the efforts of the *smoke-doctors* to prevent it. It was during the cold weather when doors and windows are generally kept shut as close as possible. At last, in a fit of desperation, we caught up the poker and thrust it through an upper pane in one of the windows. The effect was magical. The *smoky chimney* immediately "drawed" excellently. The broken pane was replaced by one of perforated glass, and no further annoyance was experienced.

It may be further stated, as a rule, that the *greater the length* of a chimney, the *stronger will be the draught*. Hence, the chimneys of the upper rooms of a house often smoke, whilst the fires in the rooms beneath them burn pleasantly and vigorously. Such cases are commonly relieved by a chimney-pot or cowl, of which numerous varieties are now before the public. The more *crooked* or *tortuous* the course of a chimney, the less likely is it to be affected by eddies and gusts of wind from neighbouring buildings or hills.

Before the publication of the investigation of Count Rumford on this subject, smoky chimneys were very common; they are now comparatively rare. See *Fires*, *Smoke*, *&c.*

CHINA. In the purchase of *china*, *glass*, and *earthenware*, care should be taken to select those patterns which, in case of breakage, can be the most readily matched. Peculiar or rare patterns should be avoided, for if any such be broken, it will generally be found very difficult and expensive, and frequently impossible, to replace them.

China, *glass*, and *earthenware*, when very dirty, are *best cleaned* with finely-powdered fuller's earth and warm water, followed by rinsing in clean water. A little clean soft soap may be added to the water instead of fuller's earth. See *Packing*, *&c.*

CHINOIDINE. See *Quinoidine.*

CHINOLEINE. Syn. *Chinoiline*, *Leucoline.* An oily liquid obtained by distilling *quinine* with a strong *solution of caustic potassa.* It is colourless; strongly basic; slightly soluble in water; freely so in alcohol, ether, and volatile oils; reaction neutral; boils at 460° Fahr.; sp. gr. 1·081. It greatly resembles aniline, but is less volatile. With the acids it forms salts which are generally crystallized with difficulty.

CHINONE. Obtained by distilling

kinate or *cinchonate of potassa* along with *black oxide of manganese* and *sulphuric acid.* It forms golden-coloured crystals, which are soluble in water, volatile, and possess a very peculiar and characteristic odour.

CHIRAYITINE (Sulphate of). The substance sold under this name is sulphate of quinine. The *ophelia chirata*, *chiretta*, or *charayita* yields no alkaloid, but merely a bitter matter.

CHITINE. This name has been given to the hard insoluble matter forming the shells and elytra of insects.

CHITTICK'S REMEDY. Dr. Chittick's remedy for stone consisted of a *fixed alkali* administered in *veal broth.* (Paris.)

CHLORACETIC ACID. *Prep.* A little *concentrated acetic acid* (glacial) is introduced into a bottle of *dry chlorine*, and the whole exposed in the sunshine for several hours. The white crystalline matter which forms on the glass is dissolved out with the smallest possible quantity of *water*, and the solution added to the *liquid decanted from the bottle;* the whole is now placed under the air-pump, over capsules containing (separately), fragments of dry *caustic potassa* and *strong sulphuric acid;* at first, crystals of oxalic acid are deposited, and afterwards, *chloracetic acid*, in beautiful rhombic crystals; the latter are drained and pressed in bibulous paper, and dried *in vacuo*, as before.

Prop., &c. Colourless; deliquescent; odorous; acrid; bleaches; powerfully acid; melts at 115°; boils at 390° Fahr., and volatilizes unchanged; vapour highly irritating; the liquid acid destroys the cuticle; with the bases it forms salts (*chloracetates*) greatly resembling the common acetates. *Chloracetate of potassa* occurs as fibrous silky needles, permanent in the air. *Chloracetate of ammonia* and *chloracetate of soda* are both crystallizable and neutral. *Chloracetate of silver* forms small grayish scales, which are soluble, and easily altered by the light.

CHLORAL. Syn. *Bichlorinetted Aldehyde.* A peculiar liquid first obtained by Liebig, by the action of chlorine on alcohol.

Prep. (Liebig.) *Anhydrous alcohol* is placed in a tubulated retort, and *dry chlorine gas* passed through it, at first in the cold, but afterwards with the application of a gentle heat, until the chlorine passes undecomposed through the liquor on raising it to the boiling temperature; on cooling, the whole forms a crystalline mass of *hydrated chloral;* this is melted by a gentle heat, and agitated with three times its volume of *oil of vitriol;* on increasing the heat a little, an oily stratum of *impure chloral* rises to the surface. It is purified by boiling it for some time, (to drive off free hydrochloric acid and alcohol,) next distilling it with an equal volume of *oil of vitriol;* and lastly, rectifying it from some *powdered quicklime*, the process being stopped as soon as the surface of the lime becomes dry.

Prop., &c. Chloral is an oily liquid, possessing an ethereal smell; it is soluble in alcohol, ether, and water; with a small quantity of the latter it rapidly changes into a semi-solid crystalline mass (*hydrate of chloral,*) which is soluble in a larger quantity of water; boils at 202°; sp. gr. 1·502. It is decomposed by the caustic earths and alkalies. By age it is converted into a white, solid, translucent substance (*insoluble chloral*) which is reconverted by heat and by sulphuric acid into ordinary chloral.

Obs. In operating as above, the chlorine is most conveniently introduced by a tube inserted into the tubulature of the retort, and a long tube, bent upwards, should be connected with the beak to convey away the hydrochloric acid gas extricated, and to allow the volatilized alcohol and chloral to condense, and flow back into the retort.

CHLORANILE. Syn. *Tetrachlorokinone.* One of the products of the decomposition of *indigo.*

CHLORANILINE, and *Bichloraniline.* Substances obtained by distilling *chlorisatin* and *bichlorisatin* with *highly concentrated solution of caustic potassa.* The *first* forms large, colourless octahedrons; tastes and smells of aniline; is very volatile and fusible; neutral; distils unaltered; and forms salts with the acids remarkable for the extreme beauty of their crystals. By treating *aniline* with *chlorine gas*, a volatile, crystalline, non-basic compound is formed, to which the name of *trichloraniline* has been given.

CHLORATE. Syn. *Chloras,*—Lat. *Hyperoxymuriate, Hyperoxymurias,*—Obs. A compound of chloric acid with a base. The chlorates are very similar to the nitrates both in their general properties and composition. They are all decomposed at a red heat, metallic chlorides being formed, and oxygen gas given off. Like the nitrates, they deflagrate with inflammable subtances, but with greater facility and violence. A mixture of this kind will detonate with a slight blow or friction. All the chlorates are soluble in water.

Tests.—1. A mixture of a chlorate with sulphur, phosphorus, cyanide of potassium,

prussiate of potash, or red sulphuret of arsenic, detonates with violence both by friction and percussion, and when moistened with concentrated sulphuric acid. — 2. Mixed with hydrochloric acid and then with water, a liquid is formed which bleaches vegetable colours.—3. When heated they evolve oxygen.—4. Thrown on red-hot coals they deflagrate like saltpetre.—5. Concentrated sulphuric acid, in the cold, turns them of an orange colour, whilst a greenish-coloured gas is evolved.—6. A solution of a chlorate coloured light blue with indigo, is instantly decoloured by adding a few drops of a solution of sulphurous acid in water.—7. Neither nitrate of silver nor nitrate of baryta disturb their solutions. Owing to the violence with which the above reactions take place, the experiments should be made with minute quantities only.

Estim. (M. Choron.) *Protoxide of lead*, heated with *chlorate of potassa*, in a glass tube closed at one end, gives puce oxide of lead ($Pb. O^2$), mixed with a small quantity of minium. On this reaction is founded the new test for the chlorates. This consists in slowly heating to fusion an intimate *mixture of the chlorate* and *litharge*, in suitable proportion, covering it with a layer of *chloride of sodium;* in treating the fused mass with *dilute nitric acid*; then in collecting on a filter the puce oxide obtained, by aid of which the quantity of chlorate employed may be approximately calculated.

CHLORETHERAL. A substance accidently formed by M. d'Arcet in the preparation of Dutch liquid. Little is known about it.

CHLORHYDRIC ACID. See *Hydrochloric Acid.*

CHLORIC ACID. Syn. *Acidum Chloricum*, — Lat. *Hyperoxymuriatic Acid*, *Acidum Hyperoxymuriaticum*,—Obs. An acid compound of chlorine and oxygen, discovered by Chenevix, but first obtained in a separate form by Gay-Lussac.

Prep. 1. *Chlorate of baryta* is dissolved in 16 times its weight of *water;* and *dilute sulphuric acid* added until all the baryta is precipitated; the clear liquid is then concentrated by evaporation until it acquires a yellow oily consistence.

2. *Chlorate of potassa* is boiled with a *solution of hydrofluosilicic acid*, until insoluble hydrofluosilicate of potassa ceases to be formed; when the clear liquid is decanted and digested with a little *silica*, to remove excess of hydrofluosilicic acid; lastly, it is evaporated as before. Filtration through paper or other organic matter must be avoided.

Prop., &c. Liquid; yellowish; smells like nitric acid; sets fire to paper and other dry organic matter. Heat resolves it into chlorine and oxygen. It may be readily detected by neutralizing it with soda or potassa, and then applying the tests for chlorates. (See *above.*)

CHLORIDE. Syn. *Chloruret; Chloridum*, *Chloruretum*,—Lat. A compound of a chloride and a base. The principal commercial chlorides are those of *ammonium* (sal ammoniac), *antimony* (butter of antimony), *barium* (hydrochlorate of baryta), *calcium* (hydrochlorate of lime), *gold* (terchloride), *mercury* (calomel and corrosive sublimate), *tin* (dyer's spirits), and *zinc* (disinfecting solution of zinc).

Prep. The majority of the chlorides may be made by simply dissolving the *base* or its *carbonate*, *oxide*, or *hydrate*, in *hydrochloric acid* (previously diluted with about twice its weight of *water*), and evaporating and crystallizing the solution, in the usual manner. A few are prepared by the direct action of *chlorine* on the *bases.* In the crystalline form they frequently contain combined water, in which case they may be regarded either as *chlorides* or *hydrochlorates.* By depriving them of this water by heat, or in any other manner, they can be no longer called by the latter name. See the *respective bases.*

Char., &c.—1. With the exception of those of lead, silver, and mercury (*calomel*) the neutral chlorides are *soluble* in water. —2. Most of them are colourless.—3. Some are volatile, as those of ammonia, mercury, antimony, &c.—4. Heated with a little *peroxide of manganese* and *sulphuric acid*, chlorine is evolved.—5. A mixture of a *chloride* and *chromate of potassa*, treated with *oil of vitriol* in a tubulated retort, at a gentle heat, evolves a deep brownish-red gas, (*chromate of perchloride of chromium,*) which condenses into a fluid of the same colour in the receiver. This liquid mixed with *ammonia*, in excess, assumes a yellow colour, which is changed to a reddish yellow on the addition of an acid.—6. The *soluble chlorides* may be readily detected by their solutions, slightly acidulated with nitric acid, giving a white curdy precipitate with a solution of nitrate of silver, (*chloride of silver,*) insoluble in nitric acid, freely soluble in liquor of ammonia, and blackened by the light.—7. The *insoluble chlorides* may be tested by digesting them in a little liquor of potassa, when a solution of chloride of potassium will be

formed, which may be treated as a liquid chloride; or the chloride may be dissolved in nitric acid, and tested with nitrate of silver as before. See *Chlorine.*

CHLORIDE OF LIME. See *Lime.*

CHLORIDE OF ZINC. Syn. *Butter of Zinc, Hydrochlorate of do., Muriate of do.; Zinci Chloridum, Z. Hydrochloras, Z. Murias, &c.*,—Lat. *Prep.* 1. By heating *metallic zinc* in *chlorine.*

2. By distilling a mixture of *zinc filings* and *corrosive sublimate*, equal parts; as in the preparation of chloride of antimony.

3. (*Zinci Chloridum*,—Ph. L.) *Hydrochloric acid*, 1 pint; *water*, 1 quart; add *zinc* (in small pieces), 7 oz.; when the effervescence is nearly finished, apply heat until bubbles cease to be evolved; decant the clear, and evaporate to dryness; fuse the resulting mass in a lightly covered crucible, by a red heat, pour it out on a flat smooth stone, and when cold, break it into small pieces, and preserve it in a well-stoppered bottle.

4. (Ph. Bor., 1847.) *Hydrochloric acid* (sp. gr. 1·120), 5 oz.; *hydrated carbonate of zinc*, 2 oz., or q. s. to saturate; filter through powdered glass, evaporate, with constant stirring, to dryness, reduce the mass, still warm, to powder, and at once bottle, as before.

5. (Righini.) *Solution of chloride of barium*, any quantity; add *solution of sulphate of zinc* as long as a precipitate falls; filter, evaporate, and crystallize; preserve the crystals as before.

6. (*Liquor Zinci Chloridi*, — Ph. D.) *Hydrochloric acid* and *water*, of each, 2½ pints; *sheet zinc*, 1 *lb.*; dissolve, filter through calico, add of *chlorinated solution of lime*, 1 *fl. oz.*, and evaporate, by boiling, to a pint; when cold, pour it into a bottle, add of *prepared chalk*, 1 oz., and *water*, q. s. to make the whole measure 1 quart; agitate occasionally for 24 hours, decant or filter, and preserve the liquid in a stoppered bottle. Sp. gr., 1·593.

7. (E. Parrish.) *Granulated zinc*, 4 *lb.*; *hydrochloric acid*, 4 *lb.*, or q. s.; *water*, 9 quarts; dissolve, avoiding excess of acid. The solution contains 1 in 12 of chloride of zinc. Recommended as of the proper strength for a disinfectant.

Prop., &c. When pure, a colourless, amorphous mass or crystals; generally a whitish-gray semi-transparent mass, having the consistence of wax; fusible; volatile at a strong heat, condensing in acicular crystals; freely soluble in alcohol, ether, and water; highly deliquescent; coagulates albumen and gelatin, and corrodes animal substances. The solution possesses the same properties in a minor degree.

Pur. "From the aqueous solution, hydrosulphuric acid or ferrocyanide of potassium being dropped in, a precipitate is thrown down. What is thrown down by ammonia or potassa from the same solution is white, and is *redissolved* by either precipitant in excess. The precipitate thrown down by the *carbonate* of either ammonia or potassa, is (also) white, but is not redissolved when these are added in excess." (Ph. L.)

Ant. See *Zinc.*

Uses, &c. Dry chloride of zinc is chiefly used as a caustic, for which it is highly recommended by Voght, Canquoin, and others. It is more powerful than chloride of antimony, and its action extends deeper than does nitrate of silver, whilst it exercises an influence over the vital actions of neighbouring parts. The sore is generally healthy after the separation of the eschar, and no constitutional disorder ensues. (See *Canquoin's caustic.*) It has been given in scrofula, epilepsy, chorea, &c.; and combined with hydrocyanic acid, in facial neuralgia. *Dose.* ½ gr. to 2 gr.; *externally*, as a lotion, 2 to 3 gr. to water, 1 oz. In large doses it is poisonous.

The *liquid chloride* is also used as a caustic, but chiefly as a *disinfectant* and *deodorizer*, of which it is one of the very best; possessing, as it does, the power of rapidly decomposing *hydrosulphuret of ammonia* and the organic matter of miasmata which convey disease. In the recent sudden outbreak of cholera in this metropolis, we had several opportunities of seeing the efficacy of chloride of zinc as a disinfectant fully tested and demonstrated. In streets where the inhabitants were more than decimated by this awful pestilence, cases occurred of parties passing unscathed through the distressing ordeal of close proximity to the dying and the dead, not merely in the same house, but, in some cases, even in the same rooms, in which the immunity they enjoyed from cholera was solely attributable to the liberal use of this solution of chloride of zinc. Over chloride of lime it possesses the advantage of being nearly odourless, and when newly prepared, exerting little or no action on steel knives and other instruments; whereas, the former not merely affects respiration, but decolours and rusts everything within its reach. Its use as *antiseptic* in the preservation of timber, and other organic substances, is well known.

After a description of the peculiar value of this chloride as a *disinfectant* and *deodorizer*, it is only proper, in a matter so

intimately connected with hygiène, that the public should be cautioned against purchasing either a spurious or an inferior article, which would inevitably lead to disappointment, and fail to destroy the morbific matter, on which the progress of pestilential diseases, and cholera more particularly, depends. The solution of chloride of zinc manufactured by Mr. Gray, under the name of "*Crew's Disinfecting Fluid*," we can most unreservedly recommend, as being what its maker asserts, "the cheapest" and "the strongest" offered to the public. The sample before us has the specific gravity 1·616, which represents 53·78 per cent. of real chloride of zinc. In this concentrated form it may be diluted with *fully* 200 *times its bulk of water* before use; an advantage which, as regards portability and economy in transit, cannot be too highly appreciated. A great deal of the chloride of zinc of the shops scarcely deserves the name. See *Disinfectants*, *Zinc*, *&c.*

CHLORINE. Syn. *Chlorinium*,— Lat. *Oxymuriatic Acid*, *Oxygenized do.*, *Dephlogisticated Marine do.*, *Acidum Oxymuriaticum*, *&c.*,—Obs. An elementary substance discovered by Scheele in 1774, and at first supposed to be a compound body. In 1809, MM. Gay-Lussac and Thènard suggested the probability of it being a simple substance; but it was reserved for Sir H. Davy, shortly afterwards, to demonstrate the truth of the suggestion of these foreign chemists.

Prep. 1. Strong *hydrochloric acid* is poured on half of its weight of *finely-powdered peroxide of manganese*, previously placed in a glass flask or retort; chlorine gas is immediately evolved even in the cold, but much more rapidly on the application of a gentle heat, and is collected in *clean dry bottles* by displacement. The tube conducting the gas is so arranged as to reach to the bottom of the bottle, and the chlorine, being heavier than the air, displaces the latter without mixing with it. The bottle is known to be full by the gas, easily perceived by its green colour, overflowing the top of the vessel. The bottle is then closed up with an accurately-fitting stopper, previously greased, and an empty one put in its place, which is subsequently treated in like manner. To free the gas entirely from *hydrochloric acid*, it is passed through *water*; and to render it quite *dry*, it is passed over *fused chloride of calcium*. When the presence of moisture is no object, chlorine may be collected over a saturated solution of common salt in the pneumatic trough.

2. *Hydrochloric acid*, diluted with an equal weight of *water*, is poured upon half its weight of *chloride of lime*, and the gas collected as before. The above are the processes commonly adopted for small experiments in the laboratory.

3. (Commercial.) *Oil of vitriol* diluted with *water*, q. s., is poured upon a mixture of *common salt* and *binoxide of manganese*, previously placed in a retort. The proportions ordered by different authorities vary; the following are the principal:—

Brand .	3	*manganese*	8	*salt*	4	*water*	.	.	.	.	.	.	5	*sulphuric acid.*
Graham .	6	„	8	„	as much dilute acid as contains								13	*of oil of vitriol.*
Liebig .	1	„	3	„	2	*water*	.	.	.	.	.	.	2	*sulphuric acid.*
Thènard.	2	„	3	„	4	„	.	.	.	.	.	.	4	„
Ure . .	2	„	3	„	2	„	.	.	.	.	.	.	2	„

4. (Tennant Dunlop.) From *common salt*, *nitrate of soda* (or *nitric acid*), and *oil of vitriol*, in suitable proportions, heated together; chlorine, oxide of azote, and hydrochloric acid are evolved, and the mixed gases passed through a condenser charged with *sulphuric acid* of sufficient strength to absorb the oxide of azote, after which the chlorine and hydrochloric acid are separated by passing the mixed gases through water. The separated products are *chlorine*, *hydrochloric acid*, and *nitrous sulphuric acid*. The oxide of azote is separated from the last by the addition of *water* and heat, and when disengaged, the gas is caused to traverse a condenser with a sufficient quantity of *air* and *steam* to transform it into *nitric acid*. In this way both the same nitric and sulphuric acid (for the condenser) may be used over and over again, with scarcely any loss. (Patent dated 1847.)

5. (Julius Seybel.) Under this patent, sulphate of soda and chlorine are formed by one operation. *Common salt* is decomposed by *sulphuric acid*, in closed vessels of lead, or lined with lead, heat being applied externally; and the hydrochloric acid vapour thus formed is made to act on manganese immersed in water, such vapour being conducted below and permitted to escape upwards through the water and manganese.

Prop., *&c.* Chlorine is a gaseous substance, possessing a yellowish green colour, a pungent suffocating odour, and an astringent taste; water at 60° Fahr. absorbs about twice its volume; the solution (*chlorine*

water) is gradually converted into hydrochloric acid by the action of the light; sp. gr. 2·47; 100 cubic inches weigh 76·6 (76½) gr.; phosphorus, copper leaf, powdered antimony and arsenic, and several other substances thrown into chlorine immediately inflame. Under a pressure of 4 atmospheres, it is condensed into a yellow limpid liquid; moist chlorine gas cooled to 32° Fahr. condenses into yellow crystals containing 35½ parts of chlorine, and 90 parts of water; no degree of cold, however, can liquefy the perfectly dry gas. The most remarkable properties of chlorine are, its power of destroying almost all vegetable and animal colours, and the putrid odour of decomposing organic matter; hence its value as a bleaching agent, and as a disinfectant and fumigation. With the bases chlorine forms an important series of compounds called *chlorides*, or *chlorurets*. Chlorine has such a strong attraction for the metals that it displaces oxygen in nearly all cases at a red heat.

Tests.—1. Chlorine is readily distinguished from other gases by its colour, odour, and bleaching properties.—2. Its aqueous solution dissolves gold leaf, and instantly blackens a piece of silver plunged into it.—3. It rapidly destroys the colour of iodide of starch, solution of indigo, litmus, and turmeric.—4. A simple method of detecting free chlorine is to hold a rod, dipped in water of ammonia, over it, when white fumes of sal ammoniac will be formed; this, coupled with the property of bleaching colours, may, in most cases, be taken as evidence of the presence of this substance. (See *Chlorometry*.) The other tests for aqueous chlorine are the same as for solutions of the chlorides. (See *above*.)

Ant. The fumes of chlorine are eminently irritating and poisonous. The best antidotes are said to be ammoniacal gas, or the vapours of warm water, of wine, or of ether. The writer of this article once suffered severely from getting a full inspiration of this gas, by the bursting of a large vessel employed in its manufacture, and which was full at the time. For a minute or two he was completely overcome; but, on being removed into the fresh air, he rapidly recovered, and, with the exception of a *violent* and *convulsive* cough, which lasted several hours, felt even better than he did before. The gas appeared to have acted both as a mental and bodily stimulant. Every known antidote was tried in this case, but without any apparent advantage. The effects gradually wore off, after the lapse of seven or eight hours. See *Chloric*, *Chlorous*, *Hypochlorous*, *Hypochloric*, and *Perchloric Acids*, *&c.*

CHLORINE (Liquid). See *Solutions*.

CHLORISATINE. A body closely resembling *isatine*, formed by acting on that substance with *chlorine*.

CHLORITE. Syn. *Chloris*,—Lat. A salt formed of *chlorous acid* and a base. The alkaline chlorites may be made by passing a current of *chlorous acid gas* into a solution of the *pure alkalies*. They are soluble and remarkable for their bleaching and oxidizing properties.

CHLOROBENZOL. From *benzol* and *chlorine*, by exposing them to the rays of the sun. Solid; crystalline; fusible; insoluble in water; by distillation it is converted into *hydrochloric acid*, and a volatile liquid named *chlorobenzide*.

CHLORO-CARBONIC ACID. Syn. *Chloro-carbonous Acid*, *Phosgene Gas*. From a mixture of equal volumes of perfectly dry *carbonic oxide* and *chlorine*, under the influence of sun-light. The volume of the two gases is reduced to one-half, and a pungent, suffocating, acid, gaseous compound is formed, which is decomposed by contact with water.

CHLORO-CHROMIC ACID. *Bichromate of potassa*, 3 parts; *common salt*, 3½ parts; are intimately mixed together, put into a glass retort, and *oil of vitriol*, 9 parts, added; heat is next applied and maintained as long as dense red vapours are given off. The product in the receiver is a heavy deep-red liquid, greatly resembling bromine in appearance. Water resolves it into hydrochloric and chromic acid.

CHLOROCINNOSE. By acting on *oil of cinnamon* with *chlorine*, and purifying the product by crystallization from alcohol. Brilliant, colourless needles; fusible; volatile; and unaffected by boiling oil of vitriol.

CHLOROFORM. See *Terchloride of Formyle*.

CHLORO-HYDROSALICYLIC ACID. By acting on *hydruret of salicyle* with *chlorine*, in the cold, and purifying the product by solution and crystallization in hot *alcohol*.

Prop., *&c.* Tabular crystals, nearly colourless, with a pearly lustre; insoluble in water; freely soluble in alcohol, ether, and alkaline lyes; fusible and volatile, the fumes condensing under the form of needle-like crystals of snowy-whiteness; taste, hot and pungent; odour, peculiar and disagreeable. Its salts are called *chloro-hydrosalicylates*. They may be readily prepared by direct solution of the base in the acid, or by dou-

ble decomposition. *Chloro-hydrosalicylate of potassa* occurs in small red crystalline scales, which are very soluble in water; *chloro-hydrosalicylate of barium* or *baryta* forms an insoluble, crystalline, yellow powder.

CHLORO-HYPONITRIC ACID and *Chloronitric Acid*, are two peculiar compounds, of little practical interest, evolved when a mixture of *nitric acid* and *hydrochloric acid* is exposed to heat.

CHLORO-KINONE. When *kinic acid* is submitted to distillation, with an ordinary *chlorine mixture*, an acid liquor (*formic acid*) and a crystalline sublimate are obtained. The latter is a mixture of *chloro-kinone*, *bichloro-kinone*, *trichloro-kinone*, and *tetrachloro-kinone* (chloranile.) "They are all yellow crystalline substances, which can be separated only with great difficulty."

CHLOROMETRY. Syn. *Chlorimetry*. The process of testing the decolouring power of the compounds of chlorine. It is principally applied to those met with in commerce,—the *chlorides of lime*, *potash*, and *soda*. The graduated tubes, &c., employed for this purpose are called *chlorometers* or *chlorimeters*, and have been already noticed under the heads, *alkalimetry*, &c.

1. (Dalton's test; sulphate of iron test.) *Pure protosulphate of iron* (previously dried by strong pressure between the folds of cloth or bibulous paper), 78 grs. are dissolved in *distilled water*, 2 *oz.*, and a few drops of *hydrochloric* or *sulphuric acid* added. Exactly 50 gr. of the *chloride of lime* to be examined are next weighed, and well mixed in a glass or wedgwood mortar with *tepid water*, 2 *oz.*; and the mixture poured into a graduated tube or chlorimeter. The tube is next filled up to 0, or zero, with the "washings" of the mortar, and the whole well mixed, by placing the thumb over the orifice and shaking it. The *solution of chloride of lime*, thus formed, is next gradually and cautiously added to the *solution of sulphate of iron*, previously noticed, until the latter is *completely peroxidized*, which may be known when it ceases to be affected by a solution of *red prussiate of potash*. When a drop of the latter test, placed upon a white plate, ceases to give a blue colour on being touched with the point of a glass stirrer or rod dipped in the liquor under examination, enough of the *solution of the chloride* has been added. The number of measures thus consumed must now be carefully read off from the graduated scale of the chlorimeter, from which the richness of the sample may be estimated as follows:—As 100 of the *chlorimeter divisions* contain exactly 50 gr. of the *chloride under examination*, each measure will contain only $\frac{1}{2}$ gr., and, consequently, the *number of measures consumed*, will represent *half that number of grains* of the *chloride* examined; and the weight of the chloride thus used will have contained 10 gr. of *chlorine*—the constant quantity of that substance required to peroxide the test solution of sulphate of iron. Thus:—If 80 measures of the liquor in the alkalimeter have been consumed, this quantity will represent 40 gr. of *chloride of lime*, and 10 gr. of *chlorine*. By dividing 1000 by this number, the per centage of chlorine will be obtained. In the present instance this would be—

$$\frac{1000}{40} = 25\%.$$

Obs. The above method admits of much greater accuracy, if the *chloride of lime, dissolved in tepid water*, is placed in a Schuster's alkalimeter, previously weighed, and the solution made up to exactly 1000 gr. when cold. The quantity consumed may here be ascertained with great exactness. Every grain of the solution will now be only equal to $\frac{1}{20}$ of a grain of the chloride examined. The quantity of the solution consumed is determined by very accurately weighing the alkalimeter both before and after the operation. The loss represents the quantity that has been used.

A modification of this plan has been suggested by Mr. Crum. He proposes to make the solution of the sulphate of iron in a stoppered bottle, and to add the chloride in the state of powder from a weighed parcel.

2. (Crum's process.) Equal weights of *water* and *hydrochloric acid* are mixed together, and *cast-iron borings* digested in the diluted acid until saturation is complete; a large excess of iron being purposely employed, and the liquid kept at the heat of boiling water for some time. *One measure of the solution*, marking 40° on Twaddle's scale (sp. gr. 1·200), is then mixed with *an equal quantity of acetic acid* (sp. gr. 1·048). This forms the *test liquid*. When mixed with 6 or 8 parts of water, it is quite colourless, but chloride of lime occasions the production of peracetate of iron, which gives it a red colour.

The above proof-solution is next poured into 12 *two-oz. vials*, of *exactly equal diameters*, to the amount of $\frac{1}{9}$th of their capacity; these are filled up with bleaching liquid of various strengths; the first at $\frac{1}{12}$th

of a degree of Twaddle, the second $\frac{2}{12}$ths, and so on up to $\frac{12}{12}$ths of 1°. They are then well corked up, and, after agitation, arranged side by side on a tray, furnished with holes to receive them. (See Engr.)

To ascertain the strength of an unknown sample of bleaching liquor, the proof solution of iron is put into a phial, exactly similar to the 12 previously used, and in precisely the same proportion, ($\frac{1}{5}$th.) The phial is then filled up with the bleaching liquor, well shaken, and placed beside that one of the 12 already prepared, which it most resembles in colour. The number on that phial expresses the strength the sample under examination, in $\frac{1}{12}$ths of a degree of Twaddle's hydrometer.

TABLE *exhibiting the quantity of Bleaching Liquid, at* 6° *on Twaddle's scale* (sp. gr. 1·030), *required to be added to a weaker liquor, to raise it to the given strengths. Adapted from Mr. Crum's table by* Mr. Cooley.

Strength of sample in $\frac{1}{12}$°.	Required Strength.	Proportions required.	
		Given Sample.	Liquor at 6°.
		Parts.	Part.
Water.	$\frac{8}{12}$°	8	1
1	do.	9¼	1
2	do.	11	1
3	do.	13½	1
4	do.	17	1
5	do.	23	1
6	do.	35	1
7	do.	71	1
Water.	$\frac{6}{12}$°	11	1
1	do.	13½	1
2	do.	17	1
3	do.	23	1
4	do.	35	1
5	do.	71	1
Water.	$\frac{4}{12}$°	17	1
1	do.	23	1
2	do.	35	1
3	do.	71	1
Water.	$\frac{3}{12}$°	23	1
1	do.	35	1
2	do.	71	1

Obs. The preceding method is admirably suited for weak solutions, such as are employed for bleaching textile fabrics, and is well adapted (from its simplicity) to the purposes of practical men. Indeed, it is quite astonishing to see with what ease and accuracy it is applied by unlettered operatives. This gives it great practical value. It is now in extensive use in the bleaching houses of Scotland.

According to Mr. Crum, the range of strength within which cotton is "safe," is very limited. A solution at 1° of Twaddle's scale (sp. gr. 1·005), is not "more than safe," whilst one at ½° is scarcely sufficiently strong for the first operation on stout cloth, unless it is packed more loosely than usual. (Trans. Glasgow Phil. Soc.)

3. (Indigo test.) One part of the *best indigo* is dissolved in 9 parts of *strong sulphuric acid*, by the aid of a gentle heat; this solution is then mixed with *distilled water*, in such proportion, that 1 volume of *chlorine gas* shall exactly decolour 10 volumes of *this solution.* Each measure so decoloured is called a *degree*, and each degree is divided into *fifths.* 5 gr. of the *best chloride of lime*, dissolved in 500 gr. *measures of water*, possess the above power, and indicate 10° or *proof;* or in other words, will decolour 10 times its volume of the indigo solution.

Obs. This method of chlorimetry was first proposed by Gay-Lussac, but is objectionable, and liable to error, from the indigo solution altering by keeping. When, however, the proper precautions are used, it may be safely trusted for weak bleaching liquors. The following test, also proposed by Gay-Lussac, is free from these objections.

4. (Gay-Lussac's process.) This depends on the power which *arsenious acid* possesses of being peroxidized, or converted into *arsenic acid*, in the presence of chlorine and water.

Pure arsenious acid, 100 gr., are dissolved in about 4 fl. oz. of pure *hydrochloric acid*, (free from sulphurous acid,) and the solution diluted with *water* until on being poured into a graduated 10,000 grains-measure-glass, it occupies the volume of 7000 grains-measure marked on the scale. Each 1000 grains-measure of this liquid now contains 14·29 gr. of *arsenious acid;* corresponding to 10 gr. of *chlorine*, or $\frac{1}{10}$th gr. of *chlorine* for every division or degree of the scale of the chlorimeter. This forms the "*arsenious acid test liquor.*"

100 gr. of the *chloride of lime to be examined*, and next dissolved in *water* as

before, and poured into a tube graduated up to 2000 grains-measure. The whole is now well shaken, in order to obtain a uniformly turbid solution, and half of it (1000 grains-measure) transferred to a graduated chlorometer, which is, therefore, thus filled up to 0°, or the zero of the scale, and contains exactly 50 gr. of the chloride of lime under examination; whilst each degree or division of the scale contains only ½ gr.

1000 grains-measure of the *arsenious acid test liquor* are now poured into a glass beaker, and a few drops of *solution of sulphate of indigo* added in order to impart a faint, but distinct blue colour to it; the glass is then shaken so as to give a circular movement to the liquid, and whilst it is whirling round, the *chloride of lime solution from the chlorometer*, is gradually and cautiously added, until the *blue tinge* given to the arsenious acid test liquor is destroyed; care being taken to stir the mixture well during the whole process, and to stop as soon as the decolorization is completed.

Let us suppose now, that in order to destroy the *blue colour* of the 1000 grains measure of the "*arsenious acid test-liquor*," 90 divisions or degrees of the *chloride of lime solution* have been employed. These 90 divisions therefore contained the 10 gr. of chlorine required to destroy the colour of the arsenious acid test solution; and since each division represents ½ gr. of *chloride of lime*, 45 gr. of chloride of lime, (10 gr. of chlorine,) were present in the 90 divisions so employed, from which the per centage strength may be ascertained. For—

45 : 10 :: 100 : 22·22

The chloride of lime examined, therefore, contained 22¼ per cent. (nearly) of chlorine.

Obs. This method is extremely simple and trustworthy when properly employed; but to ensure accuracy, certain precautions must be adopted. Instead of pouring the *test liquor* into the solution of the sample, (as in alkalimetry,) the *solution of the sample* must be poured into the test-liquor. If the contrary plan were adopted, the *hydrochloric acid* of the "*arsenious acid test liquor*" would disengage chlorine gas so fast that much would be lost, and the result rendered incorrect. By pouring, on the contrary, the *chloride of lime solution* into the *arsenious acid solution*, the chlorine is disengaged in small portions at a time, and meets with an abundance of arsenious acid to react on. The *mixture of chloride of lime* should also be employed turbid.

5. (Ure's process.) This consists in adding *liquor of ammonia*, of a known strength, tinged with *litmus*, to a solution of a given weight of the *chloride under examination*, until the whole of the chlorine is neutralized, which is known by the colour being destroyed. From the quantity of ammonia consumed the strength of the sample is estimated. During the above process *nitrogen* is evolved, and the estimation of the volume thus liberated has been proposed as *another easy method of chlorimetry* by Dr. Ure.

This gentleman mixes the two solutions in an inverted and graduated syphon tube over mercury. (See Engr.) The shut end (*a*) and the open end (*b*), are both graduated to one scale; for example, to $\frac{1}{100}$ of an inch, or to grain or 10 grain measures. The tube is filled with *mercury*, and then 10 measures of it are displaced at the open end, by inserting a *wooden plug*. This space being filled with a *solution of a given weight of chloride of lime*, the liquid is turned up into the shut end, by covering the open end with the finger and inverting the tube; a few drops of water may be sent up after it to wash the mercury. The *liquor of ammonia* being now let up causes a reaction, and the evolution of a quantity of *nitrogen* exactly equivalent to the *chlorine* present. The action may be accelerated by holding the sealed end of the tube over the flame of a spirit lamp. The mercury is protected from the chlorine by the ammonia; and should any notion be entertained of such an action, the ammonia may be let up first. Dr. Ure says that he has made "innumerable researches over mercury, with a detached apparatus of this kind, which combines precision with rapidity of result."

CHLORONAPHTHALIC ACID. Formed by the action of *chlorine* on *naphthalin*. It unites with the metallic oxides forming coloured salts (*chloronaphthalates*) remarkable for their extreme beauty.

CHLORONICEIC ACID. *Benzoate of potassa* is dissolved in *water*, the solution *slightly* alkalized with *potassa*, and a stream of *chlorine* passed through it; the deposit which forms consists of *chlorate of potassa* and *chloroniceate of potassa*; the two are separated by taking advantage of their

different degrees of solubility, and the new acid is obtained from the *chloroniceate* by the action of a *free acid.*

Prop., &c. Cauliflower-like crystals, fusible at 302°, and boiling at about 420° Fahr. It may be distilled without decomposition.

CHLORONICINE. Formed by treating *nitrochloronicene* with *hydrosulphuret of ammonia.* It forms brown flakes, slightly soluble in water.

CHLORONITRIC ACID. Syn. *Chloro-azotic Acid.* According to Baudrimont, this is formed by the mutual action of *nitric* and *hydrochloric acids*, and is the effective solvent in *nitro-hydrochloric acid* or *aqua regia.* See *Chloro-hyponitric Acid.*

CHLORONITROUS ACID. Syn. *Chloronitrous Gas.* Formed by the mutual action of *nitric acid* and *hydrochloric acid* or *common salt.* It is best obtained by treating *fused chloride of sodium, potassium,* or *calcium*, in powder, with as much *strong nitric acid* as is sufficient to wet it, when this gas is evolved. It has an orange colour, smells like chlorine, bleaches, and is soluble in water. According to Mr. E. Davy, the solvent power of aqua regia depends on chloronitrous acid gas dissolved in the liquid. (See *above.*)

CHLOROPHENISIC ACID. Formed by the action of chlorine on the hydrate of oxide of phenyle or substances containing it.

Prep. The *hydrated oxide of phenyle* or *those portions of crude coal-oil which boil between* 360° and 400° Fahr., are saturated with *chlorine gas*, and distilled in the open air; the first and last portions being rejected; the product is *again* treated with *chlorine* until the whole solidifies; the crystals are drained and dissolved in a *hot dilute solution of ammonia;* as the solution cools crystals of *chlorophenisate of ammonia* are deposited; this salt dissolved in *water*, decomposed with *hydrochloric acid*, well washed, and, lastly, distilled, yields pure *chlorophenisic acid.*

Prop., &c. Delicate, colourless, silky needles; very fusible; volatile at common temperatures; pungent; sparingly soluble in water; freely soluble in alcohol, ether, and hot oil of vitriol. Its salts (*chlorophenisates*) are well-defined, and are easily formed. By the action of chlorine, in great excess, *chlorophenisic acid* is converted into an analogous compound called *chlorophenusic acid*, which forms *chlorophenusates* with the bases.

CHLOROPHENOL and *Trichlorophenol.* Substances formed when an *alcoholic solution of isatin* is treated with excess of *chlorine.*

CHLOROPHYLL. Syn. *Chlorophile, Chlorophyle.* The green colouring matter contained in the leaves, stalks, unripe fruit, and juices of most plants. It is extracted by *ether*, and purified by successive solutions in *alcohol* and *hydrochloric acid;* from the last it is precipitated pure by *water*, and is then collected and dried.

Prop., &c. A dark green mass, producing a grass-green powder. It is soluble in ether, alcohol, acids, alkalies, and oils. If an earthy or metallic salt be mixed with the alcoholic solution, and an alkaline carbonate be added, the earth or oxide is thrown down in combination with this colouring matter, forming a *green lake*, possessing considerable permanency and beauty. Pelletier and Caventou, who first discovered chlorophyll, obtained it by simply pressing the leaves, washing in water, and afterwards treating it with alcohol. This plan is still adopted when it is not wanted quite pure.

CHLOROPICRIN. An oily liquid, discovered by Stenhouse, formed when a *solution of picric* or *chrysammic acid* is distilled with *hypochlorite* (chloride) *of lime*, or with a *mixture of chlorate of potassa* and *hydrochloric acid.* It has a peculiar, penetrating odour; boils at 238° Fahr.; sp. gr., 1·665.

CHLOROSALICINE and *Bichlorosalicine.* Compounds formed by the action of *chlorine* on *salicine.*

CHLOROSALIGENINE and *Bichlorosaligenine.* Formed by the decomposition of the last two by *synaptase.*

CHLOROSAMIDE. A peculiar yellow, resinous compound, produced by the action of *dry ammoniacal gas* on pure *chlorohydrosalicylic acid.* It is nearly insoluble in water; soluble in alcohol and in hot ether; hot rectified spirit decomposes it; the boiling ethereal solution deposits chlorosamide under the form of fine yellow iridescent crystals in cooling.

CHLOROSIS. Syn. *Green Sickness.* A disease which principally affects young unmarried females.

Symp. Languor, listnessness, fatigue after the least exercise, palpitation of the heart, flatulency, indigestion, acidity of stomach and bowels, constipation (generally), appetite for unnatural food, general debility, &c. As the disease advances, the skin, at first pale, assumes a peculiar greenish tint, the respiration becomes affected, the feet and legs swell, and various organic affections of

the viscera ensue. During the early stages of this disease, the catamenia are usually pale and scanty, and return at irregular intervals, and as it progresses, they disappear altogether.

Treat. This should be tonic and restorative. That recommended under *anæmia* and *diseased appetite* may be adopted with advantage.

CHLOROSULPHURIC ACID. Formed indirectly during the process of preparing *Dutch liquid* from *impure olefiant gas*. It is decomposed by water.

CHLOROTHALLE. Syn. *Thallochlor*, *Chlorothallic Acid*. The green colouring matter of *cetraria islandica* or *Iceland moss*. It is soluble in alcohol, ether, some oils, and petroleum; and is distinguished from *chlorophylle*, which in many particulars it resembles, by being insoluble in hydrochloric acid. It possesses feeble acid properties.

CHLOROUS ACID. Syn. *Peroxide of Chlorine* (?), *Acidum Chlorosum*, — Lat. *Prep.* 1. From *chlorate of potassa*, 4 parts; *arsenious acid*, 3 parts; *nitric acid*, 12 parts; (diluted with) *water*, 4 parts; heated together in a glass flask, furnished with a bent tube, and placed in a water-bath. It must be collected in the same way as chlorine, or passed into *water*, when it forms *liquid chlorous acid*.

2. *Chlorate of potassa*, in fine powder, made into a paste with *strong sulphuric acid*, is put into a retort and heated in a water-bath, hot but not boiling, and the gas which is given off, collected as before.

Prop., &c. Chlorous acid is a greenish yellow gas, non-condensable by cold, and only sparingly soluble in water; the *aqueous solution* undergoes gradual decomposition, yielding chlorine and chloric acid. Chlorous acid possesses powerful oxidizing and bleaching properties; with the bases it unites forming salts called *chlorites*. These are all soluble in water, and bleach like the acid. They may be recognised by the evolution of chlorous acid gas when acted on by an acid. The use of the arsenious acid is to deoxidize the nitric acid employed in the process.

CHLOROVALERISIC ACID. Prepared by passing *dry chloric gas* for some time into *pure valerianic acid*, in the dark, applying a little heat when the gas begins to be languidly absorbed.

Prop., &c. Semifluid; acrid; odourless; heavier than water; perfectly fluid above 86° Fahr.; a strong heat decomposes it; with water it forms a liquid hydrate; the latter forms with the bases salts called *chlorovalerisates*.

CHLOROVALEROSIC ACID. By acting on *chlorovalerisic acid*, for some time, with *chlorine*, in the sunshine. It greatly resembles chlorovalerisic acid, but is more pungent. Both are soluble in ether and alcohol.

CHLORURETS. See *Chlorides*.

CHOCOLATE. Syn. *Chocolata*,—Lat. Roasted cacao or chocolate beans or nuts, made into a paste by trituration in a heated mortar, with sugar and aromatics. It is poured into tin moulds, whilst still pasty or semifluid, and left until cold. In this form it is called *cake chocolate* or *chocolate paste*. When these lumps are reduced to coarse powder, by grinding, it is known under the name of *chocolate powder*.

Chocolate, prepared as above, without the addition of aromatics, is known in the trade as "*plain chocolate*." The *Spaniards* flavour it with *vanilla*, *cloves*, and *cinnamon*, and frequently scent it with *musk* and *ambergris*. With these additions it is termed "*Spanish chocolate*." In general they add too large a quantity of the last four articles. The *Parisians*, on the contrary, use little flavoring, and that principally *vanilla*. They employ the best *caracca nuts*, and add a considerable quantity of refined sugar. So prepared it is called "*French chocolate*."

Pur., &c. The chocolate commonly sold in England is prepared from the cake left after the expression of the oil, and this is frequently mixed with the roasted seeds of ground peas, and maize or potato flour, to which a sufficient quantity of inferior brown sugar, or treacle and mutton suet, is added to make it adhere together. Inferior sweet almonds are also employed in the same way. In this way is made the article marked in the shops at 8*d*., 9*d*. and 10*d*. the pound. A large quantity was lately sold so low as 5*d*. per *lb.*; whereas good nuts in their unprepared state cost, at wholesale, more than double the money.

Qual., &c. Chocolate is nutritive and wholesome, if taken in moderation, but is sometimes apt to disagree with weak stomachs, especially those that are easily affected by oily substances or vegetable food. When this is the case, by adopting the simple plan recommended under "*butter*," chocolate may generally be taken with impunity, even by the dyspeptic. The quantity of aromatics mixed with the richer varieties of chocolate, improve the flavour, but render them more stimulant and prone to produce nervous symptoms and head complaints.

Chocolate should never be made for the

table before it is wanted, because heating it again injures the flavour, destroys the froth, and separates the body of the chocolate, the *oil of the nut* being observed, after a few minutes' boiling, or even standing long by the fire, to rise to the top. This is one of the principal reasons why chocolate offends the stomach.

The South American beans are esteemed the best for making chocolate. Like wine, it improves by age if kept in a dry but not too warm a place.

Chocolate is *taken* in the solid form, or made into a beverage; or, combined with *sugar*, is made into various articles of confectionery. (See *below*.)

Obs. Chocolate beans are roasted in a similar way to coffee berries, due care being taken to stop the process as soon as the aroma is well developed. They are then turned out, cooled, and fanned from the husks. On the *large scale*, chocolate is made in mills, worked by steam power; on the *small scale*, the beans may be roasted in a frying-pan, or a portable coffee-roaster.

Chocolate for the table is prepared by scraping the *chocolate* fine, (from one to two squares to a pint to suit the stomach,) and throwing it into the boiling *milk-and-water*, and "milling" it well. It is served up with the froth. The sugar may either be put in with the scraped chocolate, or added afterwards, at pleasure.

The proportions used for the best "*French chocolate*" are said to be—2 *beans of vanilla*, and 1 *lb.* of the *best refined sugar*, to every 3 *lb.* of the *choicest cacao nuts*.

The following forms are said to be commonly adopted for "*Spanish chocolate*:"—

1. *Caracca nuts*, 11 *lb.*; *sugar* (white), 3 *lb.*; *vanilla*, 1 *oz.*; *cinnamon* (cassia), ¼ *oz.*; *cloves*, ½ dr.

2. *Caracca nuts*, 10 *lb.*; *sweet almonds*, 1 *lb.*; *sugar*, 3 *lb.*; *vanilla*, 1¼ *oz.*

3. *Caracca nuts*, 8 *lb.*; *island cacao*, 2 *lb.*; *white sugar*, 10 *lb.*; *aromatics*, as above.

4. *Island cacao*, 7 *lb.*; *farina*, q. s. to absorb the oil. Inferior.

Vanilla chocolate (*chocolate à la vanille*) is a variety of Spanish chocolate highly flavoured with vanilla. The following proportions have been recommended:—

1. *Caracca nuts*, 7 *lb.*; *Mexican vanilla*, 1 *oz.*; *cinnamon*, ½ *oz.*; *cloves*, 3 in no.

2. *Best chocolate paste*, 21 *lb.*; *vanilla*, 4 *oz.*; *cinnamon*, 2 *oz.*; *cloves*, ½ dr.; *musk*, 10 gr.

The *vanilla* used in making chocolate, is reduced to powder by rubbing it with a little *sugar*, before adding it to the paste. (See *below*.)

CHOCOLATE (Medicated). Preparations of chocolate intended either as nutritious articles of food for convalescents, or as vehicles for medicine, are common among the pharmacopœial and magistral formulæ of the Continent. The following are a few examples:—

CHOCOLATE. Syn. *Simple Chocolate*, *Hygienic do.*, *Homœopathic do*; *Chocolata*, *C. Simplex*, *C. Salutis*,—Lat. *Chocolat de Santé*,—Fr. *Prep.* (P. C.) *Caraque* and *Maraignan cacao*, of each, 96 lb; *sugar*, 160 lb; *cinnamon*, 1 oz. (to 2 oz.); triturated together in the usual manner, and formed into cakes or powder.

CHOCOLATE (Aromatic). *Prep.* (Weiglebt.) *Cacao beans* and *sugar*, of each, 16 oz.; *cinnamon*, ½ oz.; *cloves*, 2 dr.; *cardamons* and *vanilla*, of each, 1 dr.

CHOCOLATE (Chalybeate). Syn. *Ferrugineous Chocolate*; *Chocolata Chalybeata*, *C. Martis*,—Lat. *Prep.* 1. (Trousseau.) *Spanish chocolate*, 16 oz.; *carbonate of iron*, ½ oz.; mix, and divide into 1 oz.-cakes. One at a time; in anæmia, amenorrhœa, chlorosis, &c.

2. (Pierquin.) *Iodide of iron*, 2 dr.; *chocolate*, 16 oz. For ½ oz. cakes; as above, and in scrofulous and glandular affections.

CHOCOLATE (Guarana). Syn. *Paullinia Chocolate*; *Chocolata Paulinicæ*, *C. Guaranæ*,—Lat. *Prep.* From *guarana* and *white sugar*, of each, 1 *oz.*, triturated together, and afterwards thoroughly mixed with good *plain chocolate*, 18 *oz.* Recommended as a restorative in debility, chlorosis, and other diseases of debility, especially those of a nervous character.

CHOCOLATE (Iceland Moss). *Chocolata Cetrariæ Islandicæ*, *C. Lichenis*,—Lat. *Prep.* 1. (P. C.) *Simple chocolate* (P. C.), 32 parts; *sugar*, 29 parts; *dried jelly of Iceland moss*, 11 parts; mix.

2. (Cadet.) *Chocolate*, 4 lb; *sugar*, 2 lb; *Iceland moss*, (freed from its bitter, and powdered,) 1½ lb; *tragacanth* and *cinnamon*, of each, 4 oz.; *water*, q. s.; to be beaten in a warm mortar, or ground with a muller on a warm slab to a paste. Recommended in pulmonary affections, general debility, weakness of stomach, &c.

CHOCOLATE (Purgative). Syn. *Chocolata Purgans*, *C. Cathartica*,—Lat. *Prep.* 1. *Jalap*, 1 *oz.*; *chocolate*, 9 *oz.*; mix, and divide into 1 dr. cakes. *Dose.* 1 to 2, as a purge.

2. *Jalap*, 2 oz.; *calomel* and *sugar*, of each, 1 oz.; triturate together, then add *chocolate*, 20 oz.; for 1 dr. cakes.

3. *Scammony*, 2 dr.; *chocolate*, 3 oz.; for 1 dozen cakes. The last two are given in

worms. *Dose*, (for an adult,) 1 cake, taken fasting.

CHOCOLATE (Salep). Syn. *Chocolata cum Salep*,—Lat. *Prep.* 1. (P. C.) *Chocolate*, 16 oz.; *powdered salep*, ½ oz.

2. (Cadet.) *Cacao paste* and *sugar*, of each, 1 lb; *powdered salep*, 1 oz. *Arrow-root chocolate* and *tapioca chocolate* are made in the same manner. See *below*.

CHOCOLATE (Vanilla). Syn. *Chocolata cum Vanilla*,—Lat. *Prep.* 1. (P. C.) *Chocolate*, (plain,—P. C.) 16 oz.; *vanilla*, ½ dr.

2. (Cottereau.) *Cacao paste*, 6 *lb.*; *sugar*, 10 *lb.*; *vanilla*, 11 dr.

CHOCOLATE (Vermifuge). Syn. *Chocolata Vermifuga*,—Lat. See *above*.

CHOCOLATE (White). Syn. *White Cocoa, Carrageen do.; Chocolata cum Chondro, Pasta Cacao cum Chondro, P.C. c. Lichene Carragheno*,—Lat. *Prep.* 1. As *Iceland moss chocolate*, but employing *carrageen moss*.

2. (Ph. Dan.) *Roasted* and *decorticated cacao seeds* (reduced to a subtile mass in a warm iron mortar) and *powdered white sugar*, of each, 2 lb; *powdered carrageen*, (debitterized,) 3 oz.

3. (Cottereau.) *Sugar*, 6 *lb.*; *rice flour*, 1¾ *lb.*; *potato starch* and *butter of cacao*, of each, ½ *lb.*; *gum arabic*, ¼ *lb.* (dissolved); *tincture of vanilla*, ½ fl. oz.; *boiling water*, q. s.; triturate to a stiff paste. The above are highly nutritious, and are recommended as an article of diet for convalescents and debilitated persons.

CHOKE DAMP. The term applied by miners to *carbonic acid* and other irrespirable gases and vapours evolved in mines. See *Carbonic Acid, Fire Damp, Ventilation, &c.*

CHOLEIC ACID. Syn. *Tauro-cholalic Acid.* A peculiar fatty acid which, in combination with soda, constitutes a principal ingredient in *bile*. When exposed for some time to the action of *caustic potassa*, it evolves ammonia, and is converted into *cholalic acid*, (the *cholic acid* of some authors.)

CHOLERA. This word, which, from its derivation, can be only applied correctly to a bilious affection of the stomach and bowels, has been of late years very loosely extended to a malignant disease, the most marked characteristic of which is a total suspension of the functions of the biliary organs. Both these affections are briefly noticed below.

CHOLERA (English). Syn. *Common Cholera, Bilious do.; Cholera Morbus*,—Lat. A disease characterised by bilious vomiting and purging, accompanied by more or less pain and debility. It most frequently occurs towards the end of the summer and early in the autumn, when the increased heat of the sun stimulates the liver to an inordinate secretion of bile, by which the whole system becomes overloaded with it. Among secondary and accidental causes, are sudden changes of temperature, checked perspiration, and the use of indigestible food, and food and beverages in a state of incipient decomposition. It is usually accompanied by fever, thirst, and severe colic, and, *sometimes*, by cold sweats, extreme debility, feeble pulse, &c., under which the patient sinks in 24 hours.

Treat. In most cases this complaint is not dangerous and yields to proper treatment in a few days. As soon after the commencement of the attack as possible, some mild aperient, (as *castor oil*,) should be administered, and its action accelerated by drinking copiously of diluents, as barley-water, toast and water, water gruel, &c. *Opiates* may be employed, both topically and by the mouth. A *teaspoonful* or two of *laudanum*, rubbed over the region of the stomach and bowels is a simple application which will generally allay the pain. 10 to 20 drops of *laudanum*, mixed with a tablespoonful of *good brandy*, or a few grains of *cayenne pepper*, may also be taken every hour, if the pain is severe. Should the stomach reject the medicine, or the vomiting be apparently increased by drinking warm diluents, a few spoonfuls of *ice-cold water*, or of a *mixture of lemon juice and water*, may be taken instead, until the sickness abates. When the violence of the symptoms have abated, tonics and bitters, (as *gentian, calomba, orange peel*, &c.,) may be advantageously had recourse to.

CHOLERA (Malignant). Syn. *Asiatic Cholera, Blue do., Pestilential do., Spasmodic do.; Cholera Asiatica, C. Maligna, &c.*,—Lat. In consequence of the important investigations touching the *causes* and *treatment* of Asiatic cholera now in progress, induced by the recent fearful outbreak of this disease in different parts of London, we propose to defer a notice of the subject until an opportunity occurs of collating the authorities, opinions, and data, already published, and shortly expected to be laid before the public. (See *Pestilential Diseases.*) In this place, therefore, we shall merely notice a few of the many remedies which have been recommended for this terrible malady, in order that our readers may know their composition, and be able to prepare them, if desirous, or called on to do so.

1. (American remedy). Equal parts of *maple sugar* and *powdered fresh-burnt charcoal*, made into a stiff paste with *lard*, and divided into pieces the size of a *filbert*. *Dose.* One, occasionally, swallowed whole.

2. (Austrian specific.) The proportions of the ingredients in the following formulæ are founded on Herapath's analysis of this celebrated preparation, and are given in the nearest available whole numbers :—

a. Sulphuric acid, (sp. gr. 1·845,) 20 gr.; *nitric acid*, (sp. gr. 1·500,) 12 gr.; *sugar* and *gum*, of each, 15 gr.; *distilled* or *pure soft water*, q. s. to make the whole *weigh exactly* 1 oz.

b. Sulphuric acid, 3 dr.; *nitric acid*, 2 dr.; *simple syrup*, 6 dr.; *water*, q. s. to make the whole weigh exactly 10 oz. A single drop of essential oil of lemon may be added.

Dose, &c. One tablespoonful is ordered to be taken in water, on the first appearance of premonitory symptoms, followed by the *free* use of very *cold water*. In half an hour a *second dose* is to be taken. This, (as asserted,) is generally sufficient to arrest the progress of the disease. A tablespoonful is then to be added to a pint of *cold water*, and drank *ad libitum*. In more obstinate cases it is said that 4 or 5 doses are generally required to effect a cure. When *collapse* sets in, double doses are ordered to be given, and to be repeated after every attack of vomiting until the sickness and cramp abate. After the vomiting abates, the doses are still to be repeated until 5 or 6 doses are retained by the stomach. Should *quiet* sleep or drowsiness come on, it is not to be interfered with. The free use of cold water or soured water is to be allowed until perspiration sets in and the warmth of the body returns. According to the report, the use of *warm liquors, wines, spirits*, &c., must be carefully avoided, as so much *poison*.

Obs. A bottle of the above remedy was handed to Mr. Wm. Herapath, the eminent chemist of Old Park, Bristol, by the superintendent of the Birmingham police, who had received it from the head of the Austrian police, as being in general use in Austria, under the sanction of the medical department of the government, and being found to act almost as a specific in cholera. In 1831–2, it was first tried on some criminals, with perfect success, and soon afterwards with similar results on thousands of the general public. In 1849 the Austrian government ordered its use in the public establishments of the empire, since which not a single case of failure had occurred in which it had been *fairly* tried. (Vide *Lancet*, July, 1851; the *Times*, Sept. 27, 1853; and several other publications.

3. (Mr. Buxton's Remedy.) From *dilute sulphuric acid*, (spirit of vitriol,) 25 drops; *water*, 1 fl. oz. For a draught; as the last.

4. (College of Physicians and Board of Health; for Premonitory Diarrhœa.) *Chalk mixture*, 1 oz.; *aromatic confection*, 10 to 15 gr.; *tincture of opium*, 5 to 15 drops; to be repeated every 3 or 4 hours, or oftener, if required, until the looseness is arrested.

5. (Dr. Graves's Astringent Pills.) *Acetate of lead*, 20 gr.; *opium*, 1 gr.; *conserve of roses*, q. s.; for 12 pills. *Dose.* One every ½ hour or hour, at first; then one every two hours.

6. (Homœopathic Preventive.) *Camphor*, 1 dr.; *rectified spirit*, 6 dr.; dissolve, and preserve it in a well-corked bottle. *Dose.* 2 drops on a *lump of sugar*, sucked as a lozenge two or three times a day.

7. (Homœopathic Remedy.) As the last, repeating the dose every 10 or 15 minutes, followed by draughts of ice-cold water, until the symptoms abate.

8. (Mr. Hope's Remedy.) *Red nitrous acid*, 2 dr.; *peppermint water*, or *camphor julep*, 1 oz.; *tincture of opium*, 40 drops; mix. *Dose.* One to two teaspoonfuls in a cupful of thin gruel every 3 or 4 hours.

9. (Liverpool Preventive Powders.) *Bicarbonate of soda*, 20 gr.; *ginger*, 10 gr.; for a dose. One to be taken in a glass of water after breakfast and supper daily.

10. (Police Remedy; Mr. B. Child's do.) *Rectified sulphuric ether* and *tincture of opium*, of each, 30 drops; for a *dose* for an adult; especially during the early stages.

11. (Mr. Ross's Astringent Pills.)Each pill contains 1 gr. of *nitrate of silver*, made up with *crumb of bread*, q. s. *Dose.* One pill, to be repeated after the interval of half an hour or an hour, should the symptoms continue unabated.

12. (Dr. Stevens's Saline Powders.) *Bicarbonate of soda*, ½ dr.; *common salt*, 20 gr.; *chlorate of potassa*, 7 gr.; for a dose.

13. (Common Remedies of the Shops.) These generally consist of *chalk mixture*, with a little *laudanum*, and some aromatic or carminative, as *cassia, cinnamon, cardamoms, nutmeg*, or *peppermint*. In a few, some astringent, as *tincture of catechu*, or extract of *logwood*, is added.

CHOLESTERINE. This substance is found in the bile, brain, nerves, blood, &c., and forms the principal ingredient of *biliary calculi*.

Prep., &c. The *calculi* (gall-stones) are reduced to powder, and boiled for some time in strong *alcohol;* the solution, filtered whilst hot, deposits *crystals of cholesterine* on cooling. It forms brilliant colourless plates; is tasteless and inodorous; insoluble in water; soluble in ether, and freely so in hot alcohol; it melts at 278° Fahr.; resists saponification; and has, for the most part, the character of a fat.

CHOLESTROPHANE. A peculiar compound formed when *amalic acid* is treated with *oxidizing* agents.

CHOLIC ACID. Syn. *Glyco-cholalic Acid.* A peculiar acid found in combination with soda, and associated with choleic acid in the bile.

Prep. Perfectly dried *ox-bile*, is digested in *absolute alcohol*, in the cold, and after filtration *ether* is added; at first a brownish resinous mass is deposited, and after some time, stellated crystals of cholate or glycocholate of soda and potassa, (*crystallized bile*, of Platner;) a solution of these crystals, decomposed by *dilute sulphuric acid*, yields a solution of *cholic acid*, from which crystals may be obtained by evaporation.

Prop., &c. Delicate white needles; bitter tasted; soluble in water, and in alcohol, and slightly so in ether; boiled with solution of potassa, it is converted into *glycocine* or *gelatine sugar* and *cholalic acid;* boiled with concentrated sulphuric or hydrochloric acid, it yields *glycocine* and a new white amorphous compound, named *choloidinic acid.* Cholic acid forms salts termed *cholates*, or *glyco-cholates.* It differs from *choleic acid* chiefly in not containing sulphur.

CHONDRINE. Gelatine obtained from *cartilage.* It differs from ordinary gelatine, in being precipitable by acetic and the mineral acids, and by alum, persulphate of iron, and acetate of lead.

CHROMATE. Syn. *Chromas*,—Lat. A salt of *chromic acid.*

Prep. The *insoluble chromates*, as those of *baryta, zinc, lead, mercury, silver, &c.*, may be made by mixing a *soluble salt of those bases*, with *neutral chromate of potassa.* The first three are red; the fourth, orange; and the fifth, deep red or purple. The *soluble chromates* may all be made by direct solution of the *base* in the acid, or by double decomposition. The *chromates of commerce* are prepared from either *chrome ore* or *chromate of potassa.* See the *respective bases.*

Char. The chromates are characterised by their *yellow* or *red colour*, the latter predominating when the acid is in excess; and except those with the alkaline bases, they are, for the most part, insoluble in water.

Tests.—1. On boiling a chromate in hydrochloric acid mixed with alcohol, chromic acid is first set free, and then decomposed, forming a green solution of chloride of chromium. Sulphuretted hydrogen and sulphurous acid operate similar changes.—2. With acetate of lead, the chromates give a yellow precipitate;—3, with nitrate of silver, a reddish-violet;—4, with nitrate of mercury, a red one.

CHROME ALUM. The potassio-sulphate of chromium. It is prepared in the same way as common alum, by replacing the *alumina salt* with the corresponding one of *chromium.* See *Alums.*

CHROME GREEN. See *Green Pigments.*

CHROME RED. See *Red Pigments.*

CHROME YELLOW. See *Chromate of Lead.*

CHROMIC ACID. Syn. *Peroxide of Chromium; Acidum Chromicum*, — Lat. *Prep.* 1. By conducting *gaseous fluoride of chromium* into a *silver* or *platinum vessel*, the sides of which are *just moistened with water*, and the aperture covered with a piece of *moist paper*, the acid will be deposited under the form of red acicular crystals, which will nearly fill the vessel. When the process is skilfully conducted the product is of exquisite beauty and chemically pure.

2. (Warrington.) *Cold saturated solution of bichromate of potassa*, 2 parts; *pure oil of vitriol* (strongest), 3 parts; both by volume; mix. As the liquor cools the chromic acid is deposited under the form of brilliant crimson-red prisms; the mother liquor is then poured off and the crystals, placed between two tiles of glass or porcelain, are submitted to strong pressure for some time, under a bell-glass or jar, when the acid will be found sufficiently dry. It may be deprived of a little adhering moisture, by placing it over sulphuric acid for a short time in vacuo.—Nearly pure. According to Schröffer, however, it contains about $6\frac{0}{0}$ of potassa, and nearly $1\frac{0}{0}$ of sulphuric acid.

3. (Commercial.) On the *large scale*, chromic acid is prepared by either of the following formulæ:—

a. To a *saturated solution of chromate of potash*, 100 parts, add *oil of vitriol* (sp. gr. 1·845), 49 parts; and let the whole cool. This is the common process. The product contains sulphate of potassa, but this does not much interfere with its value as a bleaching agent.

b. (Ure.) To a *boiling saturated solution of bichromate of potash*, add as much *oil of vitriol* as will convert the potash into a bisulphate. Let the whole cool, and be then washed with a *little water*, and stirred, when the liquid decanted from the granular mass will be "nearly pure chromic acid." It still retains some potassa.

c. From *chromate of baryta* and *dilute sulphuric acid*, in equivalent proportions; after a few hours the clear liquid is decanted.

d. (Reuben Phillips.) From *chromate of baryta* decomposed by *concentrated nitric acid*. The chromic acid is separated from the nitrate of baryta, by decantation, or which is still better, by filtration through glass or asbestos. It is then evaporated to dryness, when the nitric acid is volatilized, and pure chromic acid left behind. The volatilized nitric acid may be condensed, and again used for the same purpose. The *only precautions* necessary to insure the purity of the chromic acid prepared by this plan, are—to use a *sufficient quantity of nitric acid*, and to take care that the *nitric acid is sufficiently concentrated* and pure.

"The chromate of baryta may be easily prepared by mixing together *solutions of the chloride of barium*, and any of the *soluble chromates;* before it is used for the preparation of pure chromic acid, it should be washed several times." (Chemist, iii, 266.) See *Chromate of Lime.*

Chemically pure chromic acid, as well as the *crude commercial acid*, may be prepared by the last method.

e. (Chas. Watt, Jun.) From *chromate of lime*, by the action of an equivalent proportion of *sulphuric acid* diluted with *water*. This process has the great recommendation of cheapness, and Mr. Watt says that he employed it in the factory of Messrs. Hawes, for above two years, with *perfect success.*

Prop., &c. Chromic acid forms ruby-red crystals, soluble in water and alcohol. It is acrid, irritant, and caustic; stains the skin yellow, and when concentrated destroys it; decomposed by the action of light and contact with organic matter. Hence it should be kept in stoppered glass bottles, and its solution filtered through asbestos or powdered glass only. The ease with which it parts with a portion of its oxygen, and passes into the state of the green sesquioxide, constitutes its value as a bleaching agent. It is largely employed in the arts, in calico-printing, bleaching of textile fabrics, tallow, oils, &c., and in dyeing. "A solution of chromic acid in oil of vitriol is preferable as an oxidizing agent to every other at present known." (Ure.) It has been recently highly extolled as a caustic in surgery, as "when rightly managed, it does not spread beyond the prescribed limits; and so soon as its erosive operation is finished, passes into the state of inert, pulverulent sesquioxide."

CHROMIUM. A metal discovered by Vauquelin in 1797.

Prep. 1. (Vauquelin.) Dry *chloride of chromium* is mixed with *oil*, the paste placed in a crucible lined with *charcoal*, the cover luted on, and the whole exposed for an hour to an intense heat.

2. (Liebig.) Heat the *compound of terchloride of chromium* and *ammonia* to redness, and expose it to a current of *dry ammoniacal gas.*

3. *Crude oxide of chromium*, 5 parts; *powdered charcoal*, 4 parts; expose the mixture to an intense heat, in a lined crucible, as before.

Tests. The salts of *sesquioxide of chromium* are recognised as follows:—1. Caustic alkalies precipitate the hydrated oxide, easily soluble in excess of the precipitant.—2. Ammonia, the same, but the precipitate is *nearly insoluble.*—3. The carbonates of potassa, soda, and ammonia, throw down a green precipitate of carbonate and hydrate, slightly soluble in a large excess.—4. Sulphuretted hydrogen causes no change.—5. Hydrosulphuret of ammonia precipitates the hydrate of a bluish-green colour.

Remarks. The product of the first process has a whitish-yellow colour, and a metallic lustre; that of the rest is a black powder. Sp. gr. 5·9. Metallic chromium has not been applied to any use in the arts. Ulgren found a peculiar substance in the chrome iron ore from Röros, to which he gave the name of *aridium*, considering it to be a new metal; a fact not yet satisfactorily decided.

CHROMIUM (Chlorides of). Two chlorides of chromium are described by chemists:—

1. *Protochloride of Chromium.* From the violet coloured *sesquichloride of chromium*, placed in a glass or porcelain tube, heated to redness, and exposed to a *stream of perfectly dry and pure hydrogen* gas. A white foliated mass, soluble in water (evolving much heat), and yielding a blue solution, which absorbs atmospheric oxygen with astonishing rapidity, acquiring a deep-green colour, and passing into the state of *oxychloride of chromium.* It is the most powerful reducing or deoxidizing agent known.

2. *Sesquichloride of Chromium, Chloride of do.—a.* Dissolve *hydrated oxide of chromium* in *hydrochloric acid*, and evaporate to dryness.

b. Digest *chromate of lead* in *hydrochloric acid* mixed with a little *alcohol*, and throw down the excess of lead with *sulphuretted hydrogen.*

c. Pass *dry chlorine* over a *mixture of sesquioxide of chromium* and *charcoal*, heated to redness, in a porcelain tube. The chloride collects as a sublimate, of a peach or purple colour in the cool part of the tube.

Obs. By the first process the product is a green powder, which when heated to 400° becomes purplish-red, and then forms pure, *dry chloride of chromium.* This process should be performed in a tube filled with carbonic acid gas. The product of the third process is also chemically pure. According to M. Péligot, it is totally insoluble in water, under ordinary circumstances, even at a boiling heat. It dissolves, however, and assumes the deep green hydrated state in water containing an exceedingly minute quantity of *protochloride of chromium* in solution. The hydration is marked by the evolution of much heat, and may be referred to the peculiar class of actions which are included under the name of *Katalysis* by modern chemists.

CHROMIUM (Fluorides of). Syn. *Hydrofluorates of Chromium.* Two of these deserve notice here:—

1. *Sesquifluoride of Chromium.* From *hydrated oxide of chromium* dissolved in *hydrofluoric acid* and the solution evaporated. A crystalline green mass.

2. *Perfluoride of Chromium, Gaseous do.; Fluorchromic Acid.* From *fluor spar*, 3 parts; *chromate of lead*, 4 parts; *fuming* (or the strongest) *sulphuric acid*, 5 parts; mixed cautiously, in a silver or leaden retort. A red-coloured gas is evolved, which acts rapidly on *glass*, forming *fluosilicic acid gas*, and upon *water*, forming *hydrofluoric acid* and *chromic acid.* The moisture of the atmosphere is sufficient to effect the decomposition last referred to; the former substance escaping as gas, and the latter being deposited in small crystals. See *Chromic Acid.*

CHROMIUM (Oxides of).—1. *Protoxide of Chromium, Brown Oxide of do.* From a solution of *protochloride of chromium* by adding a solution of *potassa.* A brownish-red powder. By substituting *ammonia* for potassa, as the precipitant, *hydrated protoxide of chromium*, under the form of a pale greenish powder, is obtained. Protoxide of chromium forms pale blue-coloured salts with the acids, which absorb oxygen with avidity, whilst the metal passes into a higher state of oxidation.

2. *Sesquioxide of Chromium, Oxide of do.—a.* To a solution of *chromate of potassa* add a solution of *protonitrate of mercury*, as long as a precipitate forms; this must be collected, well washed in water, and heated to redness in an earthen crucible.

b. From *bichromate of potassa* exposed to a strong red heat, and then washed with *water* until all the potassa is removed.

c. From *bichromate of potassa* mixed with half its weight of *sulphur*, and then treated as above.

d. From *chromate of potassa*, (perfectly dry,) 48 parts; *gunpowder*, 9 parts; *sal ammoniac*, 7 parts; reduced to fine powder, and pressed into conical moulds of glass or porcelain, which are then inverted, so as to leave the compressed powder on a porcelain or wedgewood-ware slab; it is then set fire to at the apex and allowed to burn itself out; as soon as the residuum is cold it is elutriated and dried. Very bright coloured. All the above are anhydrous.

e. (Hydrated.) By adding equal parts of *hydrochloric acid* and *alcohol* or *sugar*, to a *boiling solution of chromate of potassa* in water, in small portions at a time, until the red tint disappears, and the liquid assumes a green colour; *pure ammonia*, in excess, is next added, and the precipitate which subsides is collected, and washed with water.

f. From a *solution of sesquioxide of chromium* in *potassa* or *soda*, a *green gelatinous hydrate* gradually separates on standing.

Prop., &c. The *anhydrous oxide* is a rich crystalline green powder, insoluble in both water and acids; fused with borax and glass it imparts a beautiful green colour; *the hydrated oxide* is soluble in the acids and in alkaline lyes; with the first, it forms salts which have a green or purple colour. These compounds may be made by direct solution of the *hydrated sesquioxide* in the *dilute acids.* The sulphate combines with the sulphates of potassa and ammonia, giving rise to salts (*chrome alums*) which crystallize in magnificent octahedrons of a deep claret colour. The finest crystals are obtained by spontaneous evaporation.

Sesquioxide of chromium is a feeble base and its salts easily suffer decomposition. It is much used in the manufacture of coloured glasses and enamels, and in dyeing; and it

forms a beautiful green pigment. The *emerald* owes its colour to this oxide.

Obs. The above appear to be the only oxides of chromium. A *protosesquioxide* or *deutoxide of chromium* has been described by Berzelius and others, which appears to be composed of the protoxide and sesquioxides of that metal. See *Chromium* and *Chromic Acid.*

CHROMULE. Syn. *Chromyle.* The green colouring matter of the leaves of plants. See *Chlorophylle.*

CHRYSAMMIC ACID. *Prep.* Add *aloes*, 1 part; to *nitric acid* (sp. gr. 1·37), 8 parts; and heat the mixture in an open vessel. When the first violent action is over, introduce the whole into a retort, and distil to two thirds; then add 4 parts more of *nitric acid*, and keep the mixture nearly at the boiling point for some days, or as long as gas is disengaged. If *water* is now added, *impure chrysammic acid* is thrown down, whilst *chrysolepic acid* and *oxalic acid* remain in the solution. The washed precipitate is purified by combining it with potassa, crystallizing the resulting potash salt, dissolving the crystals in water, and decomposing the new solution with *nitric acid*, when a golden yellow powder is deposited, which is pure *chrysammic acid.*

Prop., &c. Soluble in alcohol, ether, and hot acids; explodes by heat; and forms salts with the bases called *chrysammates. Chrysammate of potassa*, prepared as above, is a beautiful crystalline carmine red powder, and when slowly produced it forms beautiful small greenish golden crystals. *Chrysammate of soda* and *chrysammate of magnesia*, resemble the potash salt. *Chrysammate of ammonia* forms superb dark-green crystals, which give a deep purple solution. All the other salts of this acid are of great beauty, (green, orange, or red,) and most of them exhibit a golden lustre under the burnisher.

CHRYSANILIC ACID. *Indigo*, (in powder,) is boiled with a *highly concentrated solution of caustic potassa*, until almost entirely dissolved, and then allowed to cool out of contact with the air; the crystals deposited (*chrysanilate of potassa*) are next dissolved in *water*, the solution filtered, and a *mineral acid* (hydrochloric) added in slight excess. It may be further purified and obtained in crystals by solution in alcohol.

CHRYSENE. A beautiful yellow crystalline powder, obtained by M. Laurent, along with *pyren*, by the destructive distillation of *pitch.* It is insoluble in water and alcohol, and nearly so in ether; fuses by heat and sublimes unchanged; warm oil of vitriol dissolves it, and then assumes a magnificent deep green colour; boiling nitric acid converts it into an insoluble red resin-like substance.

CHRYSOLEPIC ACID. Obtained from the mother-liquor which has deposited chrysammic acid. It forms golden-yellow crystalline scales, of sparing solubility. It greatly resembles *picric acid. Chrysolepate of potassa* occurs under the forms of small yellow prismatic crystals.

CHRYSOPHANIC ACID. From *lichen parietinus* (Linn.) or *yellow wall parmelia.* It crystallizes in beautiful golden-coloured needles, and may be sublimed in close vessels without decomposition.

CHURRUS. See *Extracts* and *Hemp* (Indian).

CIDER. Syn. *Cyder; Pomaceum*,— Lat. Cider is the fermented juice of the apple, and is a very ancient beverage. Pliny calls cider and perry the "wine of apples and pears."

The *attention of the cider farmer* should be first directed to the *culture of the apple tree.* The situation most appropriate for an ORCHARD, is one on rising ground, rather dry than moist, and unexposed to sea air or high winds. The *soil* should be strong, but not too heavy, and should be rich in the alkaline and earthy bases, especially the phosphates. The *selection of the proper varieties of the apple* for grafting, is also a point on which particular care should be taken. It is found that the juices of different kinds of apples vary in the quantity of saccharine matter which they contain, as well as in other particulars that influence the quality and flavour of the cider prepared from them. In general, those varieties should be chosen that yield a juice *rich in sugar*, and contain *no undue amount of acid*, and which, after the period of active fermentation is past, furnishes a liquor which clarifies itself, and keeps well. This quality of the juice may generally be determined from its specific gravity. The heaviest and clearest is the best; other points being equal. The following table, by M. Convercher, may here be advantageously inserted:—

Varieties of Apple.	Sp. gr.
Green rennette, or queen apple	1·094
English rennette	1·080
Red rennette	1·072
Musk rennette	1·069
Fouillet rayé	1·064
Orange apple	1·063
Rennette of Caux	1·060

English writers generally class *cider apples* into—*bitter*, *sweet*, and *sour*. The *first* are the best; their juice has the greatest specific gravity, is the richest in sugar, ferments the most freely, clarifies spontaneously the quickest, and keeps the best after fermentation. They contain a minute quantity of extractive matter which is not present in other apples. The juice of *sweet apples* ferments tumultuously, clears with difficulty, and the resulting cider does not keep so well as that produced from the first variety. The juice of *sour apples* contains less sugar and more acid than the other two, and consequently not only produces the weakest, but the worst cider; it, however, "fines" well, although it "stores" badly. *Sour* and *rough-tasted apples* are usually preferred by *farmers* for making cider. This preference, which is very decided among the farmers of the West of England, may be readily accounted for. The sour and rough-tasted apples contain less sugar and more malic acid than some of the other varieties, and the presence of this acid impedes the conversion of the alcohol of the cider into vinegar; a change which their rude mode of operating renders otherwise inevitable. But cider made with such apples never equals in quality that prepared *at a low temperature* from fruit *abounding in sugar*, provided equal skill is exercised in the manufacture, as in the process of converting malt-worts into beer.

The *process of making cider* varies in different places, but in every case essentially consists of—the *collection of the fruit;* the *expression* and *fermentation* of the *juice;* and the *storing* and *management of the fermented liquor*.

The *collection of the fruit* should not be commenced before it has become sufficiently mature, and should be performed with greater care than is commonly bestowed upon it. The apples after being gathered are usually left for 14 or 15 days in a barn or loft, to mellow or mature, during which time a considerable portion of the *mucilage* is decomposed and *alcohol* and *carbonic acid* developed. If this "ripening" is allowed to go too far, loss arises; notwithstanding the vulgar prejudice in its favour. The *spoiled apples* are then separated from the *sound ones*, as they not only impart a bad flavour to the cider, but impede its spontaneous clarification. *Unripe apples* are also avoided, as they do not contain sufficient sugar to undergo the vinous fermentation, whilst they contribute to render the liquor rough and acidulous, and watery.

The *expression of the juice* is the next step in the process of cider-making. The apples are *crushed* or *ground* in mills consisting of two fluted cylinders of hard wood or cast iron, working against each other. The common practice is next to sprinkle the pulp with $\frac{1}{6}$th to $\frac{1}{4}$th of its weight of *spring* or *river water*, and then to allow it to remain in tubs or wooden cisterns for 12 or 14 hours, during which time incipient fermentation commences, and the breaking up of the cells of the membrane takes place, by which the subsequent separation of the juice is facilitated. This plan, though general among farmers, is prejudicial to the quality of the future liquor; as not only is a portion of the newly formed alcohol lost, but the skins and pips often impart to it a disagreeable flavour. By employing more efficient crushing or comminuting machinery, this system of vatting is rendered quite unnecessary. A machine furnished with a revolving circular rasp, similar to that used in making potato starch, is admirably adapted to this purpose.

The *pulp of the crushed* or *ground apples* is now placed on a kind of wicker frame, or in hair-cloth or coarse canvass bags, and after being allowed to drain into suitable tubs or receivers, is subjected to powerful pressure, gradually applied, in the cider press. The liquor which runs off *first*, is the best, and is usually kept separately; whilst that which follows, especially the portion obtained by much pressure, tastes of the "pips" and skins.

The *expressed juice* or *must*, obtained as above, is next put into clean casks with large bung holes, and freely exposed to the air in the shade, where they are placed on "stillions," with flat tubs under them to catch the waste. They are now constantly attended to, and kept quite full, in order that the yeast, as it forms, may froth over and be carried off from the surface of the liquor. After 2 or 3 days for *weak cider*, and 8 or 10 days for *strong cider*, or as soon as the sediment has subsided, the liquor is "racked off" into clean casks, which have been (according to the common practice) previously *sulphured* with a *cooper's match*. The casks containing the "*racked cider*" are then stored in a cellar, shaded barn, or other cool place, where a low and regular temperature can be insured, and are left to mature or ripen. By the following spring the cider is commonly fit for use, and may be "re-racked" for sale.

The *marc*, or pressed pulp, is generally again sprinkled with $\frac{1}{3}$ or $\frac{1}{2}$ its weight of *water*, and re-pressed. The resulting liquor, when fermented, forms a weak kind of

cider, (*cider moil, water moil,*) which is reserved for domestic use in the same way as table-beer. The refuse-pulp (*apple marc, pomace, pommage, apple cheese,*) is used as food for pigs and store cattle, and is very acceptable to them.

The *storing* and *management of cider* are matters of vast importance to the cider farmer, the factor, the wholesale dealer, and the bottler. The principles by which these should be directed are precisely similar to those which are explained under the heads *Brewing, Fermentation,* and *Malt Liquors;* and which, indeed, refer, with slight modifications, to all fermented liquors.

Preparatory to *bottling cider*, it should be examined, to see whether it is clear and sparkling. If not so, it should be *clarified*, in a similar way to beer, and left for a fortnight. The night before it is intended to put it into bottles, the bung should be taken out of the cask, and left so until the next day, and the filled bottles should not be corked down until the day after; as, if this is done at once, many of the bottles will burst by keeping. The *best corks* should alone be used. *Champagne bottles* are the variety generally chosen for cider. It is usual to *wire* down the *corks*, and to *cover them* with *tinfoil*, after the manner of champagne. A few bottles at a time may be kept in a warm place to ripen. When the cider is wanted for immediate use, or for consumption during the cooler portion of the year, a small piece of *lump sugar* may be put into each bottle before corking it; or, what is the same thing in effect—the bottles may be corked within 2 or 3 hours after being filled. In summer, and for long keeping, this practice is, however, inadmissible. The *bottled stock* should be stored in a cool cellar, when the quality will be greatly improved by age. Cider for bottling should be of good quality, sound and piquant, and at least a twelvemonth old. When out of condition it is unfit for bottling.

Qual., &c. Cider, when of good quality, and in good condition, is doubtless a very wholesome liquor. Cider consumers, living in the cider districts, appear to enjoy almost an immunity from cholera, and often from other diseases which are common in other parts of the kingdom. At the same time, however, it is right to mention, that the dry colic or belly-ache (*colica pictonum*) is far from uncommon in these districts, but is wholly confined to those who drink *early, hard*, or *inferior cider*, made from harsh unripe fruit. We believe, that in most cases, it may be referred to the acid of the common cider having acted on the lead, pewter, or copper of the articles or utensils with which it has come in contact, and of which it has dissolved a very minute portion. The *best cider* contains from $8\frac{0}{0}$ to $10\frac{0}{0}$ of *absolute alcohol; ordinary cider*, from $4\frac{0}{0}$ to $6\frac{0}{0}$.

Concluding Remarks. Much of the excellence of cider depends upon the temperature at which the fermentation is conducted; a point utterly overlooked by the manufacturers of this liquor. Instead of the apple-juice, as soon as it is expressed from the fruit, being placed in a cool situation, where the temperature should not exceed 50° or 52° Fahr., it is frequently left exposed to the full heat of autumn. In this way much of the alcohol formed by the decomposition of the sugar is converted into vinegar, by the absorption of atmospheric oxygen, and thus the liquor acquires that peculiar and unwholesome acidity, known in the cider districts by the name of "*roughness.*" When, on the contrary, the fermentation is conducted at a low temperature, nearly the whole of the sugar is converted into alcohol, and this remains in the liquor, instead of undergoing the process of acetification. The acetous fermentation, by which alcohol is converted into vinegar, proceeds most rapidly at a temperature of about 90° Fahr., and at lower temperatures, the action becomes gradually slower, until at 46° to 50° Fahr., no such change takes place. (Liebig.) It is therefore evident, that if the saccharine juice of apples, or any other fruit, is made to undergo the *vinous fermentation* in a cool situation, *less* of the spirit resulting from the transformation of the sugar will be converted into acetic acid, and, consequently, *more* will be retained in an unaltered state in the liquor, to improve its quality, and by its conservative and chemical action, to preserve it from future change. This is the principal cause, other circumstances being alike, of the difference in the quality of the cider made by persons living in the same district. The one has probably a cooler barn and cellar than the other to store his liquor in, and is more careful to keep the pulp and juice cool during the early part of the process. In Devonshire, the pressing and fermentation are conducted in situations where the temperature varies little from that of the external air, and fluctuates with all its changes; the result is, that Devonshire cider, of the best class, will rarely keep more than 4 or 5 years, and seldom improves after the second or third year, whilst the cider of Herefordshire and Worcestershire, where these operations are

more carefully attended to, will keep for 20 or 30 years.

As the juice of apples contains less sugar in proportion to the amount of acid and nitrogenized matter than that of grapes, the addition of some of this article renders it more suitable for the production of a vinous liquor. Potato sugar has been used for this purpose, but good West India sugar is preferable. We have tasted cider made with this addition, and which had been stored in fresh emptied rum puncheons, that had all the pungency and vinosity of foreign wine.

When the pressing the apples for the juice is deferred until late in the season, it sometimes happens that the fermentation is slow of being developed. Though the juice has been set on the old system, in November or December, the working sometimes hardly commences until March. At this time the cider is sweet; it now rapidly becomes pungent and vinous, and is soon ready to be racked for use. When the fermentation continues, it is usual to rack it again into a clean cask that has been *sulphured*, and to leave behind the 'head' and sediment; or two or three cans of cider are put into a clean cask, and a match of brimstone burned in it: it is then agitated, by which the fermentation of that quantity is completely stopped. The cask is then nearly filled, the fermentation of the whole is checked, and the cider shortly afterwards becomes fine. In operating in this way, care must be taken that the sulphuring be not *overdone*, as it is apt to impart a slight flavour to the liquor, which is readily detected by an experienced cider taster. If, on the first operation, the fermentation is not checked, the process of "racking" is repeated until the liquor becomes clear, and is continued from time to time till the cider is in a quiet state and fit for drinking.

A common practice in Devonshire is to add a stuff called "*stum*," sold by the wine-coopers, or an article called "*antiferment*," sold by the druggists, for the purpose of checking the fermentation, but a much better plan is that described above.

To *improve the flavour of weak cider*, or to render *ordinary cider more vinous*, various plans are followed by the cellarmen and bottlers. An excellent one is to add to each hogshead 1½ gall. of *good brandy or rum*, with 2 *oz.* of *powdered catechu* (dissolved in water), 10 *lb.* of *good moist sugar* or *honey*, ½ *oz.* each, of *bitter almonds* and *cloves*, and 4 *oz.* of *mustard seed*, (all in powder). These must be well "rummaged" into the liquor, and the whole occasionally stirred up for a fortnight, after which it must be allowed to repose for 3 or 4 months, when it will usually be found perfectly "bright," and no bad substitute for foreign wine. Should this not be the case, the liquor must be "fined" with a pint of isinglass finings, or a dozen eggs, and allowed to rest for a fortnight. If the cider is preferred *pale*, the catechu must be omitted, and instead of isinglass, a quart of skimmed milk is to be used as "finings." When desired of a *pinkish tint*, 1 *oz.* of *cochineal* (in powder,) may be added, instead of the catechu.

About 13 cwt. of November apples commonly yield one hogshead of cider. In Devonshire, about 6 sacks or 24 bushels are the common quantity for the hogshead of 63 gallons.

The best cider made at the present day is that of Normandy, Herefordshire, and New Jersey (U. S.), and next, that of Devonshire and Somersetshire. The last is very inferior. See *Antiferment*, *Fermentation*, *&c.*

CIDER (Champagne). This name is given in the United States of America to a fine pale variety of cider, much used for "bottling," which has a great resemblance to inferior champagne. The best variety comes from New Jersey. The name is also applied in this country in a similar manner. The following is a good form for a made-cider of this class:—

Prep. Good *pale vinous cider*, 1 hhd.; *proof spirit*, (pale,) 3 gall.; *honey* or *sugar*, 14 *lb.*; mix well, and let them remain together in a temperate situation for 1 month; then add *orange-flower water*, 3 pints; and in a few days fine it down with *skimmed milk*, ½ gall. This is very pale. A similar article, bottled in champagne bottles, silvered, and labelled, is often sold to the ignorant for champagne.

CIDER (Made). An article under this name is made in Devonshire, chiefly for the supply of the London market, it having been found that the ordinary cider will not stand a voyage to the metropolis without some preparation. The finest quality of made cider is only ordinary cider racked into a clean and well sulphured cask; but the mass of that which is sent to London, is mixed with *water*, *treacle*, and *alum*, and then fined down; after which it is racked into well-matched casks. The cider sold in London under the name of *Devonshire cider*, would be rejected even by the farmers' servants in that county.

CIDER (Raisin). This is made in a similar way to raisin wine, but without employing sugar, and with only 2 *lb.* of *rai-*

sins to the *gall.*, or even more, of *water*. It is usually fit for bottling in 10 days, and in a week longer is ready for use.

CIDERKIN. Cider moil.

CIDER MOIL. See *Cider*.

CIDER SPIRIT. See *Brandy*.

CIGARS. These well-known articles of luxury require no description. Their adulteration, and the influence of their use upon health, are referred to under the heads *Smoking* and *Tobacco*. See *those articles*, and *Aromatized Cigars*.

CIGARS (Medicinal). Syn. *Medicinal Cigarettes, Medicated Do.* The administration of medicinal agents in the form of cigars, is of recent introduction, and as yet, in only very limited use. The medicinal substance, if of a suitable description, as the leaves of plants, is made up into small rolls, like cheroots, and then smoked in the usual manner. In some cases, common cigars, or paper cigars, are medicated by moistening them in a preparation of the article to be administered. When the narcotic property of the tobacco would prove injurious, it is first exhausted by soaking and washing it in water.

CIGARS (Aromatic). Syn. *Aromatic Cigarettes; Cigarettæ Aromaticæ*,—Lat. *Cigarettes Aromatiques*,— Fr. *Aromatic spices, lavender flowers, &c.*, made into small cigars. For their odour; and in tooth-ache, face-ache, &c.

CIGARS (Aromatized). Syn. *Scented Cigars, Perfumed Do.; Cigarræ Aromaticæ*, —Lat. *Prep.* 1. By moistening ordinary cigars with a strong *tincture of cascarilla*, to which a little *gum benzoin* and *storax* may be added. Some persons add a small quantity of *camphor*, or of *oil of cloves* or *cassia*.

2. By soaking the tobacco, of which the cigars are to be made, or the cigars themselves, for a short time, in a very *strong infusion of cascarilla*, and then allowing them to dry by a very gentle heat.

3. By simply inserting very small shreds of *cascarilla bark* between the leaves of the cigar, or in small slits made for the purpose.

Obs. The above yield a very agreeable odour when smoked; but are said to intoxicate quicker than unprepared cigars of equal strength and quality. They lose much of their fragrance by age.

CIGARS (Arsenical). Syn. *Cigarræ Arsenicales*,—Lat. *Prep.* Dissolve *arseniate of soda*, 1 part; in *water*, 30 parts; dip white unsized paper into the solution, and form it into small rolls, 3 or 4 inches long. In pulmonary consumption; 4 or 5 whiffs as many times a-day.

CIGARS (Balsamic). Syn. *Balsamic Cigarettes; Cigarræ Balsamicæ, Cigarettæ B.*,—Lat. *Thick unsized paper* is soaked in a *solution of saltpetre*, and dried; after which it is brushed over *first* with *tincture of cascarilla*, and when again nearly dry, with *compound tincture of benzoin;* in about half an hour, it is cut into pieces ($1\frac{1}{2} \times 4$ inches), and rolled into cigarettes. In hoarseness, loss of voice, asthma, &c.

CIGARS (Belladonna). Syn. *Belladonna Cigarettes; Cigarettæ Belladonnæ*,— Lat. *Belladonna leaves* made into cigarettes of 1 dr. each. As an anodyne and antispasmodic; in troublesome coughs, hooping cough, tooth-ache, sore throat, tic doloreux, &c.

CIGARS (Belladonna,—Compound). Syn. *Cigarræ Belladonnæ Compositæ*,—Lat. From *belladonna leaves*, 4 parts; moistened with *tincture of opium* (Ph. L.), 1 part; dried, and made into 1 dr. cigarettes, as before. *Uses.* As the last.

CIGARS (Camphor). Syn. *Camphor Cigarettes; Cigarettæ Camphoræ*, — Lat. *Cigarettes de Camphire*,—Fr. *Prep.* 1. *Bibulous paper*, moistened with 2 or 3 drops of *essence of camphor*, and rolled into cigarettes. For *use*, they are loosely placed in a tubular cigar-holder.

2. (Raspail.) These are made by loosely filling a *quill* or *large straw* with *small fragments of camphor*, closing the open end with a little *cotton wool* or bibulous paper, and piercing the closed end with a pin, to allow the passage of air. Both the above are used cold, by drawing the air through them into the mouth, which then becomes very slightly charged with the vapour of camphor. In cold weather, the vaporization is promoted by holding the cigarette for a few minutes in the warm hand. "The eccentric Raspail recommended these cigarettes as a sort of panacea, or at least as a means of preventing disease." The homœopathists regard them as prophylactic of choiera, and the common people hold them to possess the same virtue in reference to contagious diseases generally, but especially typhus and scarlet fever. They should not be employed oftener than 3 or 4 times a day.

CIGARS (Henbane). Syn. *Cigarræ Hyoscyami*,—Lat. As *Belladonna Cigars*.

CIGARS (Mercurial). Syn. *Cigarræ Mercuriales*,—Lat. *Prep.* (M. Paul Bernard.) *Ordinary cigars* are deprived of their narcotic properties by soaking them in *water*, and are then wetted with a *weak solution of corrosive sublimate*, to which a little *opium* is generally added. The pro-

portions may be, of *corrosive sublimate*, 1 gr.; *rectified spirit*, 20 drops; dissolve; add *laudanum*, 15 drops; with this solution, 6 cigars are to be equally moistened to within about 1½ inch of the mouth end, and then set aside to dry.

Used by persons afflicted with syphilitic affections of the throat and palate, as a convenient method of mercurial fumigation. For those accustomed to the use of tobacco, mild cigars, undeprived of their nicotine, may be employed for the purpose.

CIGARS (Stramonium). Syn. *Cigarræ Stramonii*,—Lat. From *Stramonium* (thorn apple) *leaves*. Smoked in asthma.

CINCHONA. Syn. *Cinchona*,—Lat. To give a mere notice of the various species of the genus cinchona, that furnish the barks of commerce, and the disputes of the numerous writers on medical botany and pharmacology, who profess to have investigated the subject, would occupy more space than could be devoted to this head in the present work. Volumes have, indeed, been written on it. We shall therefore confine ourselves to transferring to our pages the most useful portions of the notices of the *cinchonæ* which occur in the British Pharmacopœias, with slight abridgements. Those desirous of further pursuing the subject, are referred to the "*Medical Botany*" of Dr. Lindley, and the "*Elements of Materia Medica*," of Dr. Pereira, where they will find all that is known respecting the cinchonæ collected together, and the various authorities, collated and explained.

PALE CINCHONA BARK. Syn. *Crown Bark, Gray do., Jesuit's do., Lance-leaved do., Loxa do., Pale do., Peruvian do., Quill do.; Cinchona Pallida, Cortex Cinchonæ Pallidæ*,—Ph. L.D. and U.S. *C. C. Condamineæ*,—Ph. E. *C. C. Lancifoliæ*,—Ph. L. 1836. From "*cinchona condaminea*." "Slender, quilled, brown on its external surface, often covered with lichens, and split with very many fissures, for the most part transverse, and sometimes in a circular direction; of a cinnamon-brown colour on its internal surface. In taste, astringent and bitter." (Ph. L.)

RED CINCHONA BARK. Syn. *Red Bark, Oblong-leaved do.; Cortex Ruber, Cinchona Rubra, Cortex Cinchonæ Rubræ*,—Ph. L.E.D. and U.S. *Cinchona Oblongifolia*,—Ph. L. 1836. From "uncertain species of cinchona." "Thick, either flat or curled, rough in the inner side, with wrinkles, furrows, or warty projections; reddish brown, or of a chesnut colour; bitter in taste." (Ph. L.)

YELLOW CINCHONA BARK. Syn. *Calisaya Bark, Heart-leaved do., Royal do., Yellow do.; Cinchona Flava* (Regia),—Ph. L. *C. Flava*,—Ph. E.D. and U.S.—*Cinchona Cordifolia*,—Ph. L. 1836. From "cinchona calisaya." "Thick, for the most part covered with very fine sharp fibres, either flat or curled. This species is ashy or brownish on its outer surface, rugose in its long direction, and cleft with deep fissures either transversely or circularly. It is generally naked, and of a brownish cinnamon tint. It has an extremely bitter taste. About 3 dr. of sulphate of quinine should be obtained from 1 lb. of this bark by the aid of sulphuric acid." (Ph. L.)

Pur., &c. The officinal species of cinchona bark are frequently imported mixed with other kinds, that contain less of the febrifuge principle. The most common adulteration is, however, the admixture of the same drug that has been exhausted of its active portions in the manufacture of *sulphate of quinine, cinchonine*, and *tincture, infusion, decoction*, and *extract of bark*. This is especially practised on the powder on account of the fraud being less easily detected when the drug is in the pulverulent state. The following substances have been used by fraudulent dealers either as SUBSTITUTES for cinchona bark, or to REDUCE THE PRICE of the *ground bark*:—*roots of bistort, calamus aromaticus, avens, water-avens, geum montanum*, and *tormentil; oak bark*, that of *several kinds of willow, horse chesnut, ash*, and the *sloe bush; mahogany sawdust*, the *dried herbs of yellow loosestrife, bugle, water-horehound*, and *self-heal;* the barks of *pinknea pubescens, unnona febrifuga, swietenia febrifuga, cedrela tuna, magnolia glauca, m. acuminata, m. tripetala, achras sapota, rubus trivialis*, and *r. villosus;* and, in fact, any trash that will possibly produce a powder at all resembling that of bark, or that can be made so by grinding and the addition of colouring.

Tests. The only certain method of ascertaining the quality of cinchona bark, and of detecting fradulent admixture, is by an assay for the alkaloid. See *Quinometry*. The *tannic acid* which exists in every species of cinchona bark, may be recognised by its precipitating the *sesquichloride of iron* of a green colour, *gelatine* of a whitish colour, and a *solution of tartar emetic* of a *dirty* white.

Uses, &c. All the cinchona barks are tonic and febrifuge, and may be given *in powder*, from 20 gr. to 60 gr., or more, if the stomach will bear it, every two to four hours, in agues or intermittent fevers, gan-

grene, &c.; and in *infusion* or *decoction*, as a tonic in debility, dyspepsia, &c. Since the introduction of the cinchona alkaloids, the employment of bark in substance has considerably lessened.

CINCHONA RED. Syn. *Red Cinchonic.* The insoluble red colouring matter of cinchona bark. It is an inodorous, reddish-brown substance, nearly insoluble in cold water, more soluble in hot water, and readily soluble in alcohol, ether, and alkaline lyes; acids also favour its solution.

CINCHONIA. Syn. *Cinchonine, Cinchonina, Cinchonium.* An alkaline principle extracted from *pale cinchona bark*, in the same way as *quinine* is from *yellow cinchona bark.*

Prep. 1. Add *liquor of ammonia* to a *dilute solution* of *hydrochlorate* or *sulphate of cinchonia*, as long as a precipitate falls; wash this precipitate with cold water, then digest it in *ether;* lastly, dissolve it in *alcohol*, and crystallize. The crystals are free from quinine, and chemically pure.

2. (*Commercial.*)—*a.* From the mother-liquors from which sulphate of quinine has been obtained. The salt of quinine being the least soluble of the two, crystallizes out of the liquor first, and after its separation, the liquid is operated for fresh crystals, which are the cinchonia salt; from these the alkaloid is obtained as above, the other part of the process being omitted. Contains a little quinine and quinoidine.

b. (*Direct.*) *Bruised pale bark*, 1 *lb.*, is boiled in *water*, 1 gall., to which *sulphuric acid*, ½ *fl. oz.* has been previously added; the decoction is repeated with about half the quantity of liquid, and so on till *all* the soluble matter of the bark is extracted. The decoctions are then mixed together, and strained, and *powdered slaked lime* is added, in a proportion somewhat greater than necessary to saturate the *acid;* the precipitate that ensues (*cinchonia* and *sulphate of lime*) is collected, dried, and boiled for some minutes in *strong alcohol*, which is then decanted off while still hot, and *fresh portions* successively added, and the operation repeated until it ceases to act on the residuum, which is merely sulphate of lime. The different *alcoholic solutions* are then put into a retort or still, and considerably evaporated, during which, and especially on cooling, *acicular crystals* of *cinchonia* are deposited. The whole is now collected, and the crystals, if yellow or discoloured, again dissolved in *boiling alcohol*, and by recrystallization obtained colourless.

Prop., &c. These are, for the most part, similar to those of quinine; but it is less powerfully febrifuge, and rather less soluble in water and alcohol than that alkaloid. It readily separates from its hot alcoholic solution as it cools, under the form of small, colourless, and beautifully brilliant transparent, four-sided prisms. It is nearly insoluble in *cold* water; *boiling* water takes up only the $\frac{1}{2500}$th part; rectified spirit dissolves only about 3%,—strong alcohol more.

Cinchonia is distinguished from *quinine* by—1. The insolubility of itself and salts in ether;—2. By the form of its crystals;—3. By its solution in alcohol or acidulated water, possessing the property of right-handed rotary polarization;—4. By evolving white fumes, when fused, which condense on cold substances in the form of a loose sublimate, which when viewed by a lens, is found to consist of small brilliant needle-like crystals;—5. By evolving an aromatic odour during its sublimation, which is peculiar and characteristic.

Cinchonia is distinguished from *quinidine* by its solution in chlorine water giving a white precipitate with ammonia.

Cinchonia forms *salts* with the acids, all of which may be made in the same manner as the corresponding salts of quinine. The *neutral sulphate, bisulphate, disulphate, hydrochlorate, nitrate, iodide, iodate*, &c., have been formed and examined. Those of *commerce* are usually obtained from the *mother-waters of the sulphate of quinine manufacturers.* On the *small scale*, the alkaloid may be at once dissolved in the *dilute acid.* They are all exceedingly bitter. (See *below.*)

In *medicine*, the preparations of cinchonia are nearly superseded by those of quinine, and are seldom inquired for in trade. See *Quinine, Quinometry, &c.*

CINCHONIA (Sulphate of). Syn. *Disulphate of Cinchonia; Cinchoniæ Sulphas, C. Disulphas*,—Lat. Soluble in 6½ parts of alcohol of sp. gr. 0·85; in 11½ parts of absolute alcohol; and in 54 parts of water at 60° Fahr. See *Cinchonia.*

CINCHONIA (Bisulphate of). Syn. *Neutral Sulphate of Cinchonia; Cinchoniæ Bisulphas*,—Lat. Prepared by dissolving *sulphate of cinchonia* in *water acidulated with sulphuric acid*, and evaporating the solution so that crystals may form. Efflorescent, rhomboidal octahedra; much more soluble than the last. See *Cinchonia.*

CINCHONIC ACID. See *Kinic Acid.*

CINCHO-TANNIC ACID. The soluble red colouring matter of cinchona bark. It differs from ordinary tannic acid in its

greater solubility, and in striking a green colour with the sesquioxide of iron.

CINCHOVATINE. Syn. *Cinchovine.* From *cusco bark* or *ash cinchona.* It is identical with *aricine* (which see.)

CININE. See *Santonine.*

CINNABAR. The native red sulphuret of mercury. *Factitious cinnabar* is vermillion.

CINNAMEINE. Syn. *Oil of Balsam of Peru. Prep.* 1. Add an *alcoholic solution of balsam of Peru* to a like *solution of potassa.* A compound of resin and potassa is precipitated, and *cinnamate of potassa* and *cinnaméine* are left in solution. On adding water, the latter separates and floats upon the surface.

2. Add *balsam of Peru*, 2 parts; to *liquor of potassa* (sp. gr. 1·300), 3 parts; both by volume; apply a gentle heat, when a yellowish brown oil will separate and float above a heavy black liquid, containing the potassa. The former must be collected and purified by cautious distillation.

Prop., &c. A reddish brown, acrid, odourless, oily fluid; heavier than water; soluble in alcohol and ether; insoluble in water. By exposure to air, it combines with the elements of water and forms a soft resin (*resin of balsam of Peru; styracine; hydrate of cinnaméine.*) By distillation with hydrate of potassa, both the above substances are converted into *cinnamic acid*, and a neutral substance, which also assumes two forms (*peruvine* aud *styrone.*) According to Richter, oil of balsam of Peru (*cinnaméine*) is composed of two distinct oils —one, (*myrospermine,*) soluble in alcohol; the other, (*myroxiline,*) insoluble in alcohol.

CINNAMIC ACID. Syn. *Cinnamonic Acid.* A substance discovered by Dumas and Peligot in oil of cinnamon. It crystallizes out of the oil when long exposed to the atmosphere. By exposing the oil in a *jar of oxygen gas*, it is rapidly converted into a white crystalline mass of *hydrated cinnamic acid.*

Prep. 1. Dissolve *oil of balsam of Peru* in *potassa water*, evaporate to dryness, dissolve the residuum in *boiling water*, and add an excess of *hydrochloric acid.* The cinnamic acid is deposited in crystals as the solution cools, and may be purified by resolution and crystallization.

2. By cautiously distilling *balsam of tolu* by a gentle heat. It first fuses, and a little water and volatile oil come over, followed by *cinnamic acid*, in the form of a heavy oil, which condenses on the cooler parts of the neck of the retort, as a white crystalline mass. Towards the end of the process some empyreumatic oil distils over. The acid is purified by pressure between the folds of filtering paper and solution in boiling water. On cooling, minute colourless crystals of cinnamic acid are deposited. Pure balsam of tolu yields about $\frac{1}{8}$th of its weight of this acid.

Prop., &c. Colourless transparent scales, or prisms; scarcely soluble in water; freely so in alcohol; fuses at 240°; volatilizes unchanged at 555°Fahr. Distilled with a strong solution of *bichromate of potash* and *oil of vitriol*, it is converted into *benzoic acid.* It forms salts with the bases, called *cinnamates* or *cinnamonates*, which greatly resemble the corresponding benzoates.

CINNAMIC ACID (Anhydrous). A crystalline powder, fusing at 260° Fahr. See *Acids* (Organic).

CINNAMOL. Syn. *Styrol.* An oily liquid obtained by distilling *cinnamic acid* with an excess of *quicklime* or *baryta.* Liquid storax treated in the same manner yields a like product (*styrol.*)

CINNAMON. Syn. *Cinnamomum,*—Lat. The "bark of *cinnamomum zeylandicum*, (Rees,)" or "*laurus cinnamomum*, (Linn.)" "Slender, closely rolled, the smaller quills being enclosed in the larger ones." (Ph. L.) Oil of cinnamon (*oleum cinnamomi*) is officinal in the Pharmacopœias.

Obs. From the high price of this drug it has become a general practice to substitute the bark of cassia (*cassia; cortex cinnamomum cassia;*) for it, which so closely resembles it in flavour, that the "uninitiated" regard them as the same. Cassia is, however, not only *thicker* and *coarser* than cinnamon, but its fracture is short and resinous, and its flavour is more biting and hot, whilst it lacks the peculiar sweetish taste of cinnamon. The thickness of cinnamon seldom exceeds that of good drawing paper. The same remarks also apply to the oil and powder. In pharmacy it is, unfortunately, a general practice to employ cassia and its preparations whenever those of cinnamon are ordered. Both these drugs are wholesome aromatics. The principal consumers of cinnamon are the chocolate makers of France, Spain, Italy, and Mexico. The Germans, Turks, and Russians, prefer chocolate flavoured with cassia. "Some cinnamon, sent to Constantinople by mistake, proved unsaleable at any price, whilst cassia, worth about sixpence per pound, was in great request." (Pereira.)

CINNAMYLE. The hypothetical radical of cinnamic acid and the other compounds of the *cinnamyl-series.*

CIPIPA. See *Tapioca Meal.*

CISSAMPELINE. A new alkaloid discovered by Wiggers in *cissampelos pereira*, or *pereira brava*. It is soluble in ether and in acetic acid; is precipitated by carbonate of soda; and is highly basic.

CITRACONIC ACID. Formed by the action of heat on *citric acid* and on *itaconic acid*. It has not been applied to any practical purpose. *Citribic acid*, *citricic acid*, and *citridic acid*, are other acids derived from citric acid, and are "identical with the citraconic, itaconic, and aconitic acids." (Brande.)

CITRATE. Syn. *Citras*,—Lat. A salt formed of citric acid and a base. The principal citrates are *citrate of ammonia* (soluble and crystallizable); *citrate of potash* (very soluble and deliquescent); *citrate of soda* (large crystals, soluble); *citrate of baryta* (beautiful shining silvery bushes, scarcely soluble); *citrate of lime* (see *Citric Acid*); *magnesia*, *alumina*, and *protoxide of manganese*, each form 2 salts with citric acid, one soluble, the other insoluble; *citrate of protoxide of iron* (scarcely soluble and crystallizable); *percitrate of iron*, or *citrate of sesquioxide of iron* (soluble and brown); *ammonio-citrate of iron* (garnet coloured, very soluble); *citrate of zinc* (scarcely soluble); *citrate of lead* (insoluble white powder); *citrate of copper* (green powder); *citrate of silver* (brilliant white powder); *potassio-citrate of antimony* (dazzling white prisms). See the respective bases.

Prep. All the ordinary citrates may be made by adding either the *hydrate*, or *oxide*, or the *carbonate of the base*, to a *solution of the acid in water*, until the latter is neutralized, when crystals may generally be obtained by gentle evaporation.

Prop., &c. The alkaline citrates and those with the least basic metallic oxides, (as peroxide of iron,) are soluble in water; those with the earths, insoluble. When heated they froth, blacken, and are decomposed. When an anhydrous citrate is decomposed by an alcoholic solution of hydrochloric acid, the citric acid is principally transformed into hydrated aconitic acid. They give a white precipitate with acetate of lead, in excess, sparingly soluble in ammonia, but readily soluble in citrate of ammonia; and also a white precipitate with nitrate of silver, which by the application of heat, froths up, deflagrates, and leaves an abundant ash, which, on increasing the heat, becomes pure silver. Citric acid, or a citrate, added, in excess, to a solution of neutral acetate of lead, gives rise to a precipitate of citrate of lead, readily soluble on the addition of ammonia.

CITRIC ACID. Syn. *Acid of Lemons*, *Concrete do.*; *Acidum Limonis*; *Acidum Citricum*,—Ph. L. E. D. & U. S. An acid peculiar to the vegetable kingdom, and found in the juices of several kinds of fruit, especially those of the genus *citrus*.

Prep. The citric acid manufacture consists in separating it from the mucilage, sugar, and other foreign matter with which it is combined.

1. (Scheele's process,—Ph. L. 1836.) Take of *lemon juice*, 4 pints; *prepared chalk*, 4½ oz.; *diluted sulphuric acid*, 27½ fl. oz.; *distilled water*, 2 pints. Add the chalk by degrees to the lemon juice, made hot, and mix well; set by, that the powder may subside, and, afterwards, pour off the the supernatant liquor. Wash the precipitate (*citrate of lime*) frequently with warm water; then pour upon it the diluted sulphuric acid, mixed with the distilled water, and boil the whole for 15 minutes, in glass, stoneware, or lead; press the mixture strongly through a linen cloth, and filter it. Evaporate the filtered liquor with a gentle heat, and set it aside that crystals may form. To obtain the crystals pure, dissolve them in water a second and a third time; filter each solution, evaporate, and set it apart to crystallize. The process of the Dublin (1826) and Edinburgh Colleges (1841) are similar, but the latter orders the *washed citrate of lime* to be squeezed in a powerful press, and also the filtered solution of citric acid to be tested with nitrate of baryta, and if "the precipitate is not nearly all soluble in nitric acid, to add a little citrate of lime to the whole liquor, till it stands this test."

2. (Ph. L. 1851.) Now placed in the *materia medica*.

3. (Ph. D. 1851.) Included in the *materia medica*.

4. (Dr. Price.) The *crude juice* is saturated with *ammonia*, *potassa*, or *soda*, (carbonates,) or with the *ammoniacal product distilled from gas liquor*; *chalk*, 150 parts, or *hydrate of lime*, 90 parts, are then added for every 192 parts of citric acid contained in the liquor, and the whole stirred well together; heat is next applied, and the ammonia distilled into another quantity of *lemon juice*; the citrate of lime thus obtained is then decomposed with *dilute sulphuric acid*, and the whole process conducted as before. When *potassa* or *soda* are used, the distillation is omitted, and the expressed liquor, after filtration, used to decompose fresh lemon juice.

Prop., &c. Citric acid forms rhomboidal prisms, which are clear, colourless, odour-

less, sour, and deliquescent in a moist atmosphere. It is an agreeable acid, at once cooling and antiseptic. It is much used in medicine as a substitute for lemon juice, and to form effervescing draughts, citrates, &c.

20 *gr. commercial citric acid*, in crystals, or 5 fl. dr. of *lemon juice*,

are equivalent to

29 gr. *crystals of bicarbonate potassa;*
24 „ *commercial carbonate of do.;*
17 „ *sesquicarbonate of ammonia;*
41 „ *crystals of carbonate of soda;*
24 „ *commercial sesquicarbonate of soda.*

The bicarbonate of potassa is that generally preferred for making *saline draughts* with citric acid; and when flavoured with a little *tincture of orange peel* and *simple syrup*, or *syrup of orange peel* alone, it forms a most delicious effervescing beverage.

Pur. Citric acid is frequently met with adulterated. When *pure*, it does not yield a crystalline precipitate; when added in *excess* to a solution of carbonate of potassa, such a precipitate indicates the presence of tartaric acid.

It is "devoid of colour, is entirely, or almost entirely, decomposed by heat. It is soluble in water and in spirit, and what is thrown down from its watery solution, by acetate of lead, is dissolved by nitric acid. No salt of potassa precipitates anything with citric acid except the tartrate. Added sparingly to cold lime-water, it does not render it turbid. 100 gr., dissolved in water, are saturated by 205·7 (205¾) gr. of crystallized carbonate of soda." (Ph. L.) "When a few drops of a solution of citric acid are added to lime water, a clear liquid results, which, when heated, deposits a white powder, soluble in acids without effervescence." (Liebig.) By the action of *nitric acid*, *citric acid* is converted into *oxalic acid*.

Tests. See *above*, and *Citrates*.

Concluding Remarks. The preparation of citric acid has now become an important branch of chemical manufacture, from the large consumption of this article in various operations in the arts. In conducting the different steps of the process, some little expertness and care are, however, necessary to ensure success. The *chalk* employed, which should be *dry*, and in fine powder, is added to the *juice*, from a *weighed* sample, until the latter is *perfectly neutralized*, and the quantity consumed is exactly noted. The precipitated *citrate of lime* is next *thoroughly washed* with water, and the *sulphuric acid*, diluted with 6 or 8 times its weight of water, whilst still warm, is poured upon it, and thoroughly mixed with it. The agitation is occasionally renewed for 8 or 10 hours or longer, when the *solution of citric acid* is poured off, and the *residuum of sulphate of lime* thoroughly washed with warm water, the washings being added to the *liquid acid*. This last is then poured off from the impurities that may have been deposited, and evaporated in a leaden boiler, over the naked fire, or by high-pressure steam, until it acquires the gravity of 1·13, when the process is continued, at a lower temperature, until a syrupy aspect is assumed, and a pellicle appears on the surface of the liquor. Without great care at this part of the process the whole batch may be carbonized and spoiled. At this point the concentrated solution is emptied into warm and clean crystallizing vessels, set in a dry apartment, where the thermometer does not fall below temperate. At the end of 4 days the crystals are found ready for removal from the pans. They are *thoroughly drained*, redissolved in *as little water as possible*, and after being allowed to stand for a few hours to deposit impurities, again evaporated and crystallized.

The acid of the *second crystallization* is usually sufficiently pure for the market; when this is not the case, a *third*, or even a *fourth crystallization* must be had recourse to. The mother-liquors from the several pans are now collected together, and a second or third crop of crystals obtained from them, by evaporation, as before.

A frequent cause of difficulty in obtaining crystals from the solutions, is the employment of *too little sulphuric acid* to decompose the *whole* of the *citrate of lime;* the consequence of which is, that a little of that salt is taken up by the free citric acid, and materially obstructs the crystallization. 40 parts of dry sulphuric acid are required to decompose 50 parts of chalk. Commercial sulphuric acid (*oil of vitriol*) is usually of the sp. gr. of 1·845, and it therefore requires 49 *lb.* of this acid for every 50 *lb.* of chalk employed in the process. In practice it is found that a *very slight excess* of sulphuric acid is preferable to a preponderance of undecomposed citrate of lime.

The first crop of crystals is called "*brown citric acid*," and is chiefly sold to the calico printers. Sometimes a little *nitric acid* is added to the solution of the coloured crystals, for the purpose of whitening them; but in this way a minute quantity of oxalic

acid is formed. A more general plan is to *bleach* the citrate of lime, by exposing it in shallow vessels to the sun's rays, covered with a weak solution of chloride of lime, and to rewash it before decomposing it with the sulphuric acid.

Good lemon juice yields about 5% of crystallized lemon acid; 2 gall. yield fully 1 *lb.* of crystals. If the imported citrate of lime be used, a given quantity must be exposed to a red heat for about an hour, and then weighed, when the per centage of lime present will be ascertained; every 28 *lb.* of which will require 49 *lb.* of sulphuric acid of 1·845 (or a corresponding quantity of acid of any other strength) for its complete decomposition.

CITRONELLE. See *Liqueurs.*

CITRONS. The fruit of the citron tree (*citrus medica*), is acidulous, antiseptic, and antiscorbutic; it excites the appetite, and stops vomiting; and like lemon juice, has been greatly extolled in chronic rheumatism, gout, and scurvy. Mixed with cordials, it is used as an antidote to the *manchineel poison.*

CITRON PEEL (Candied). As candied orange and lemon peel, which it for the most part resembles.

CIVET. Syn. *Civetta, Zibethum,*—Lat. A perfume, obtained from the civet cat, (*viverra civetta,*—Linn.,) a fierce carnivorous quadruped, somewhat resembling a fox, found in China and the East and West Indies. "Several of these animals have been brought into Holland, and afford a considerable branch of commerce, especially at Amsterdam. The civet is squeezed out in summer every other day, in winter twice a week; the quantity procured at once, is from 2 scruples to 1 drachm or more."

Civet is frequently adulterated with spermaceti and butter, and a similar substance to civet, but of a darker colour, obtained from the polecat. When *pure* it has an odour intermediate between that of musk and ambergris, but less refined; a pale yellow colour; an acrid taste; and the consistence of honey. It is used in perfumery.

CLAIRET. See *Liqueurs.*

CLARET RAGS. Syn. *Tournesol en Drapeau; Bezetta Cærulea.* 1. *Pieces of clean linen coloured* with *auvergne* or *ground archel* (lichen parellus).

2. *Pieces of linen* dipped into the *juice of mulberries, blood-red grapes, lees of red wine, &c. Used* to colour jellies, confectionary, the rind of cheeses, &c.

CLARIFICATION. The act of clearing or making bright; commonly applied to the process of "*clearing*" or "*fining*" liquids by chemical means, instead of by filtration. The substances used for this purpose are popularly known as *clarifiers* or *finings.*

The substances employed in the clarification of liquids, operate by either mechanically embracing the feculous matter, and subsiding with it to the bottom of the vessel, or by inducing such a change in its nature or bulk, that it subsides by its own density, in each case, leaving the liquor transparent. Albumen, gelatine, the acids, certain salts, blood, lime, plaster of Paris, alum, heat, alcohol, &c., serve in many cases for this purpose. The first is used, under the form of *white of egg*, for the *clarification of syrups*, as it combines with the liquid when cold, but on the application of heat, rapidly coagulates and rises to the surface, carrying the impurities with it, forming a scum which is easily removed with a skimmer. It is also much used for *fining wines* and liqueurs, particularly the *red wines*, and more limpid cordials. *Gelatine*, under the form of isinglass, dissolved in water, or weak vinegar, is used to fine *white wines, beer, cider*, and similar liquors that contain a sufficient quantity of either spirit or astringency (*tannin*), to induce its precipitation. *Sulphuric acid* is frequently added to weak liquors for a similar purpose, either alone, or after the addition of white of egg, or gelatine, both of which it rapidly throws down in an insoluble form. A pernicious practice exists among some unprincipled parties, of using certain *salts of lead* and *potash* to clear their liquors; especially those that are expected to sparkle in the glass, as *cordial gin, &c.* For this purpose, a little *sugar of lead*, dissolved in water, is first mixed up with the fluid, and afterwards, a little more than ½ its weight of *sulphate of potash*, also dissolved in water, is added, and the liquor is again "roused" up. By standing, the sulphate of lead, formed by this mixture, subsides, and leaves the liquor clear. *Bullock's blood* is used in the same way as isinglass or white of eggs, for fining red wines, beer, and porter. *Lime, alum, alcohol*, the *acids*, and *heat*, act by curdling or coagulating the feculencies, and thus, by increasing their density, induce their subsidence. *Plaster of Paris* acts, partly like the above, and partly like albumen, or gelatine, by enveloping and forcing down the suspended matter. *Sand* is often sifted over liquors (especially *cordials* and *syrups*), for the simple purpose of acting by its gravity, but appears to be quite useless, as it sinks too rapidly. The *juices of plants* are clarified

by heat, which coagulates the albumen they contain. *Marl* or *clay* is frequently used to clear *cider* and *perry*. A strip of isinglass is generally employed to clarify *coffee*. See *Wines, Brewing, Cordials, Coffee, Finings, Infusions, &c.*

CLAY. The characteristic constituent of clay is *alumina*, the oxide of a metal named *aluminum*. About 35 years ago, (1819,) Mr. Brande declared it as his *opinion* that this would be some day found to be the case; but it was not until some years later, (1846,) that Wohler demonstrated the fact. Recently, M. Deville has obtained *metallic aluminum* on a large scale, and this process has been repeated by M. Chapelle with perfect success. A mixture of *clay, common salt*, and *charcoal*, (all in fine powder,) is placed in a crucible, and exposed in a reverberatory furnace to a strong red heat, but *not* to whiteness; when cold, small metallic globules of aluminum are found in the mass. The metal thus obtained resembles silver in appearance and its fusing point. Its sp. gr. is, however, only 2·56 (about that of glass); it is not affected by either damp, or dry air, or by water, even when heated; nor by sulphuretted hydrogen, nitric acid, or weak sulphuric acid; it dissolves freely in hydrochloric acid at 60° Fahr.; and is both ductile and malleable. It promises to be of enormous value in the arts. See *Alumina* and *Aluminum*.

Comp., & Anal. See *Soils*.

CLEANING. The best way to clean a house is to *keep it clean* by a daily attention to small things, and not allow it to get into such a state of dirtiness and disorder as to require great and periodical cleanings. Some mistresses, and also some servants, seem to have an idea that a house should undergo "regular cleanings," or great "washing and scrubbing matches" once every three or six months, on which occasions the house is turned almost inside out, and made most uncomfortable. All this is bad economy, and indicates general slovenliness of habits. (Chambers.)

CLEANLINESS. See *Ablution, Bathing*, and *Sickness*.

CLOTHES. Economy and cleanliness require due attention to be paid to every article of clothing, but more especially to those which are the most exposed to dirt and the weather. The following remarks, having reference chiefly to woollen articles, may prove useful to the reader:—If very dusty, hang them on a horse or line, and gently beat them with a cane; then lay them on a clean board or table and well brush them, first with a stiff brush, to remove the spots of mud and the coarsest of the dirt, and next with a softer one, to remove the dust and to lay the nap properly. If clothes are wet and spotted with dirt, dry them before brushing them, and then rub out spots with the hands. The hard brush should be used as little as possible, and then with a light hand, as it will, if roughly and constantly employed, soon render the cloth threadbare. Spots of tallow-grease on the clothes may be taken off with the nail, or, if that cannot be done, have a hot iron with some thick brown paper, lay the paper on the part where the grease is, then put the iron upon the spot; if the grease comes through the paper, put on another piece, till it ceases to soil it. Moths may be prevented attacking clothes, by putting a few *cloves* or *allspice* into the box or closet with them. See *Clothes Balls, Scouring, &c.*

CLOTHING. See *Dress, Flannel, &c.*

CLOVE. Syn. *Caryophyllum*,—Ph. L. E. & D. The flower-buds of the *caryophyllus aromaticus*, (Linn.; eugenia caryophillata,—Thunb.,) or *clove tree*, collected before they open, dried, and smoked. *Cloves* are aromatic, stimulant, carminative, and stomachic; and according to some, possess febrifuge properties. They are chiefly used as an adjuvant in compound medicines. A few cloves kept in a closet or box prevent *moths* or *mould* attacking furs, woollens, &c.

It is a common practice to adulterate this spice in the same manner as cinchona bark. *Cloves* from which the *oil has been distilled*, are dried and rubbed between the hands, previously moistened with a little sweet oil, to brighten their colour, after which they are mixed up with fresh spice for sale.

Mother of cloves are the ripe fruit of the clove tree; they are frequently imported preserved, (*preserved mother of cloves*,) and are reputed stomachic and antispasmodic.

Oil of cloves (oleum caryophilli,—Ph. L.) possesses similar virtues to the unexpanded flower-buds, and is esteemed as a remedy for the toothache. All the above are used to flavour liqueurs and confectionary.

CLYSTERS. See *Enemas*.

COAK. Syn. *Coke*. Charred or carbonized coal. The principle of its manufacture is similar to that of charcoal. There are three varieties of coak:—

1. *Kiln-made coak, stifled coak*. Made by burning *pit-coal* in a pile, kiln, or stove. It has a dull black colour, and produces an intense heat when used as fuel. By con-

densing the bituminous vapours which are given off during the process, about 3% of *tar* may be obtained from common coal, and from some strong coal, by careful treatment, fully 10% of its weight. This tar, when inspissated, gives 75% of *pitch*, and 20 to 24% of *crude naphtha*, besides a considerable quantity of *ammonia*, which is made into *sal ammoniac*. The *screenings*, or dust coal, separated from the better kinds of bituminous coal, is the sort commonly used for making coak in ovens.

2. *Gas coak, distilled coak.* The *cinder* left in the gas-retorts. Gray; produces a weak heat, insufficient to smelt iron.

3. *Slate coak, mineral carbon.* From *bituminous slate*, burned in covered iron pots, in a similar way to that adopted for making bone-black; or in piles. Black and friable. *Used* to clarify liquids, but is vastly inferior to bone-black, and does not abstract the lime from syrups.

COAL. See *Anthracite* and *Pit-coal.*

COBALT Syn. *Regulus of Cobalt; Cobaltum*,—Lat. A metal discovered by Brandt, in 1733. It is found in ores, associated with arsenic and other metals, and is constantly present in meteoric iron.

Prep. 1. Dissolve *oxide of cobalt* in *hydrochloric acid*, and pass *sulphuretted hydrogen gas* through the solution, until all the arsenic is thrown down; filter and boil with a little *nitric acid*, then add *carbonate of potassa*, in excess, and digest the precipitate in a solution of *oxalic acid*, to remove any oxide of iron; wash and dry the residuum, (*oxalate of cobalt*,) and expose it to heat, in a covered crucible; the product is *pure metallic cobalt.*

2. Mix equal parts of *oxide of cobalt* or *roasted Cornish cobalt ore*, and *soft soap*, and expose them to a violent heat in a covered crucible.

Obs. Cobalt is a white brittle metal; unchanged in the air; feebly acted on by dilute hydrochloric and sulphuric acids; has a high melting point, and is strongly magnetic; sp. gr., 8·5. It is seldom employed in the metallic state, from the great difficulty of reducing its ores, but its oxide (*black oxide*) is largely employed in the arts. It forms salts with the acids, which are interesting from the remarkable changes of colour which they exhibit. See *Inks*, and *below.*

Tests. Solutions of the salts of cobalt are known as follows:—1. Liquor of ammonia gives a blue precipitate, slightly soluble in excess, giving a brownish-red colour.—2. Liquor of potassa gives a blue precipitate, turning to violet and red when the liquor is heated.—3. Carbonate of ammonia and carbonate of soda give a pink precipitate; that from the former is *soluble* in excess.—4. Cyanide of potassium gives a yellowish-brown precipitate, soluble in excess; and the clear solution, after being boiled, is unaffected when mixed with hydrochloric acid.—5. Sulphuretted hydrogen produces no change in acid solutions.—6. Hydrosulphuret of ammonia gives a black precipitate in neutral solutions.—7. Melted with borax, before the blowpipe, it gives a bead of a magnificent blue colour, almost verging on black, if much is present. Phosphate of soda and ammonia give a similar bead; but the colour is less intense.

COBALT (Acetate of). From the *carbonate* or *hydrated oxide* and *acetic acid.* It forms a *sympathetic ink* which turns blue when heated.

COBALT (Carbonate of). By adding an *alkaline carbonate* to a solution of the *nitrate* or *sulphate.* A pale peach-coloured powder, soluble in acids. It contains some hydrated oxide.

COBALT (Chloride of). Syn. *Hydrochlorate of do., Muriate of do.* By dissolving the *carbonate* or *hydrated oxide* in *hydrochloric acid;* the solution deposits deep rose-red crystals on standing, which contain water. By evaporating the solution by heat, *anhydrous* blue crystals of the chloride are obtained. Both of them yield a deep rose-red solution with water, which is turned green by a little acid. This solution forms a well-known *sympathetic ink*, the traces of which become *blue* when heated. If the solution contains either chloride of iron or chloride of nickel, the traces become *green.* (Klaproth.) The addition of a little nitrate of copper to the above solution forms a sympathetic ink, which by heat gives a very rich greenish-yellow colour. (Ure.) The addition of a very little common salt makes the traces disappear with greater rapidity, on the withdrawal of the heat. In each case, when the paper is laid aside, moisture is absorbed, and the writing once more disappears. If, however, much heat has been used, the traces become permanent.

COBALT (Nitrate of). As the last; it forms deliquescent crystals.

COBALT (Oxalate of). As the acetate, or by double decomposition.

COBALT (Phosphate of). As the last. An insoluble purple powder, which, when heated along with 8 times its weight of *gelatinous alumina*, produces a blue pigment, (*cobalt blue, cobalt ultramarine;*) almost equal in beauty to ultramarine.

COBALT (Protoxide of). Syn. *Oxide of Cobalt, Gray Oxide of Cobalt, Black do., Cobalt Black. Prep.* 1. By precipitating a solution of *sulphate* or *chloride of cobalt* with *carbonate of soda*, and washing, drying, and igniting the powder which subsides.

2. By boiling powdered *bright white cobalt ore* (from Cornwall) in *dilute nitric acid*, and adding a *solution of carbonate of potassa*, very gradually, until the clear liquor, after the impurities have settled, becomes of a rose colour; and then as long as a precipitate falls; wash and dry it, as before.

Prop., &c. A gray powder, turning black on exposure to the air; strongly basic; and forming salts with the acids, having a fine red tint. *Used* to make *blue colours* for painters, *stains* and *glazes* for enamellers, potters, &c. In *medicine*, it has occasionally been given as a remedy for rheumatism.

COBALT (Sesquioxide of). Syn. *Peroxide of Cobalt.* A black, insoluble, neutral powder, obtained by mixing *solutions of cobalt* and of *chloride of lime;* or, by heating the *protoxide* to redness in an open vessel.

COBALT (Sulphate of). By boiling *sulphuric acid* on the *metal*, or by dissolving the *oxide* in the *acid*. It forms reddish crystals, soluble in 24 parts of water.

COBALT (Sulphurets of). Two or three compounds of cobalt with sulphur (*sulphurets*) and with phosphorus (*phosphurets*) have been formed by chemists, but possess no practical interest.

COBALT BLUE. See *Blue Pigments* and *Ultramarine.*

COBALTO-CYANOGEN. Analogous in composition to ferrocyanogen, but containing *cobalt* in lieu of iron. *Cobalto-cyanides* and *hydro-cobalto-cyanic acid* and its salts, have been formed.

COCCULUS INDICUS. Syn. *Indian Berries, Indian Cockles, Levant Nut, Louse Grains; Bacca Orientalis, Cocculus Piscatorius, &c.*,—Lat. The fruit of the *anamirta cocculus* (menispermum cocculus, —Linn.), a shrub which abounds on the sandy shores of Malabar, and several other islands in the Indian Ocean. "The kernels should fill at least two thirds of the fruit." (Ph. E.)

Uses, &c. Cocculus indicus is poisonous to all animals, and to most vegetables. It is never employed *internally* in medicine, but an *ointment*, formed by mixing the powder with lard, has been used to destroy pediculi and in porrigo. Its active principle is *picrotoxine*, a peculiar crystalline substance possessing all the poisonous properties of the berry in an exalted degree, and of which it contains about $2\frac{0}{0}$. A small portion of the cocculus indicus imported is used by *poachers*, and a still smaller quantity to *destroy vermin*, the remaining, and by far the greater part, being employed to *adulterate beer* and *wine*. It forms a profitable article of trade to the wholesale druggist, who is enabled to sell it at an exorbitantly high price to brewers, from its being a contraband article. The use of this dangerous drug in brewing is no secret, as several unprincipled vagabonds, who have written treatises for brewers and publicans, have openly recommended its use. One of these very conscientious gentlemen states, that "it is impossible with pure malt and hops alone, to produce a strong-bodied porter;" he therefore recommends the use of "cocculus indicus, grains of paradise, and nux vomica." (Childe on Brewing.) Another author, with equal modesty, actually gives full directions for its use. He orders 3 *lb.* of cocculus to be used for every 10 quarters of malt, and adds, "it gives an *inebriating* quality, which *passes for strength of liquor;* it prevents second fermentation in bottled beer, and consequently, the bursting of the bottles in warm climates." (Morrice on Brewing.) Here is a wholesale system of slow poisoning, publicly recommended by men, who, like too many other moral criminals, remain unpunished by the law. The conscientious brewer, who understands the art which he professes, finds no difficulty in producing "a strong-bodied porter" from *malt and hops alone*, contrary to the wily assertions of Messrs. Childe and Morrice. It is only those whose cupidity induces them to put *too little* malt and hops, and *too much* water in their beer, that encounter any difficulty in so doing. The addition of cocculus indicus rather *deteriorates* than increases the "keeping qualities" of malt liquor. Honest brewers should know this. Yet, in defiance of proscription and heavy fines, the trade in this and other like articles continues unabated, though carried on clandestinely. The general way in which the fraud is managed, is to pack the drug in common soda barrels, and to place 3 or 4 inches of small crystals of Scotch soda at the bottom and top of the cask. In this way the package readily passes off as a cask of common soda, and even should it be opened, the alkali would first present itself to view, and thus satisfy the examiner. Another way commonly adopted, is to form it into an extract, known in the trade by the name of

B. E., or *black extract*, which is *ostensibly* prepared for tanners, but its real destination is the beer cask. See *Beer*, *Porter*, *&c.*

COCHINEAL. Syn. *Coccus Cacti*,—Ph. E. & D. *Coccus*,—Ph. L. The entire insects, dried. There are two varieties known in commerce—*silver cochineal*, which has a purplish-gray or silver-gray colour; and *black cochineal*, which is smaller, and of a reddish or purplish-black colour. The former is much the most valuable.

Adult. Genuine cochineal has the sp. gr. 1·25. It is commonly increased in weight by slightly moistening it with gum water, and then rouncing it in a bag, first with sulphate of baryta, and then with finely powdered bone black. In this way its sp. gr. is raised to 1·35, in consequence of being loaded by about 12% of useless foreign matter.

Uses, *&c.* Cochineal is principally used to prepare lake and carmine, and in dyeing. Its colouring principle is freely soluble in water. It imparts every variety of scarlet and crimson to textile fabrics previously prepared with alum, tin, and other mordants. It is also used to colour liqueurs, tinctures, and confectionary. It has been recommended as an antispasmodic and anodyne, in hooping cough and neuralgia. *Dose.* 10 to 60 gr., in powder, confection, or tincture.

COCHENILLINE. Syn. *Cochineal Red*, *Carminium*, *Carminia*. The colouring principle of cochineal. The *carmine* of commerce consists of cochenilline, combined with a little animal matter and an acid, from which it may be nearly purified by solution in *liquor of ammonia*, and precipitation by *acetic acid mixed with alcohol*. Cochenilline may also be prepared by evaporating a *watery infusion of cochineal* to the consistence of syrup, dissolving this in *proof spirit*, filtering, again evaporating, and dissolving the residuum in *liquid ammonia*, as before. *Another plan* is to digest *powdered cochineal*, first in ether, to extract the fatty matter; and then in *alcohol*; the alcoholic tincture, on evaporation, yields *pure cochenilline*. It is turned orange by acids, and violet by alkalies. It has been obtained under the form of reddish-purple crystalline grains by spontaneous evaporation.

COCINIC ACID. Syn. *Cocostearic Acid*. A crystalline fatty acid, obtained by the saponification of *cacao nut oil*.

COCOA. Syn. *Cacao*, *Patent Cocoa*. Roasted *cacao* or *chocolate beans*, together with the husks, reduced to powder by grinding. It is now more frequently prepared from the cake left after expressing the oil from the beans, which is then roasted and ground to a coarse powder, with various additions to lessen its value.

Uses, *&c.* Cocoa, or more correctly *cacao*, forms a very wholesome beverage, especially for breakfast, and in its general properties resembles chocolate. Much of the cheap stuff sold under this name, is, however, very inferior, being made with *damaged nuts* that have been pressed for the oil, mixed with *wheat* or *potato flour*, *barley meal*, *kitchen fat*, *mutton suet*, &c., as well as several of the other substances noticed under *Chicory*. Trash of this kind is frequently ticketed in the shop windows of London at 4½*d.* to 8*d.* a pound. The nut of the *palma cocos* is commonly confounded with that of the *theobroma cacao*. The *latter* is the small chocolate bean, whilst the *former* is a very large nut, filled with a refreshing milky juice. See *Chicory* and *Chocolate*.

COCOA (Flaked). *Ground cocoa* strongly compressed, and flaked with a sharp knife or machine.

COCOA (Patent). See *above*.

COCOA (Soluble). *Cocoa* ground to a very fine powder, and mixed with *sugar* and *meal*. It thus becomes emulsive with boiling water.

COCOA ELAINE. *Prep.* (Soames.) The *cocoa nut oil*, *lard*, or *butter*, of commerce, is made into small packages, (3½ in. × 1½ in. × 24 inches;) by wrapping it in strong linen cloth, of close texture, and next in an exterior wrapper of strong sailcloth; and a number of them placed side by side, in single rows, a small distance apart, are submitted to strong hydraulic pressure, commencing at 50° or 55° Fahr.; which is gradually raised to 64° or 65°, when the packages yield their oil with difficulty. The expressed oil is then violently agitated or "churned" with 1% to 2% of *oil of vitriol*, diluted with about 6 times its weight of *water*. It is then allowed to repose for 2 or 3 days, after which it is skimmed, decanted, and filtered through thick woollen cloth. *Used* to burn in lamps, as a substitute for cod-liver oil, and for other purposes. (Patent, dated 1839.)

COCOA STEARINE. *Prep.* (Soames.) The solid contents of the packages (see *above*) are scraped out into a well-tinned copper vessel, heated by steam, and kept in the liquid state sufficiently long for the impurities to subside, when it is poured into another vessel and allowed to cool; or if greater purity is desired, it is filtered whilst hot through thick flannel. *Used* to make soap, candles, &c. See *Oils* and *Fats*.

COD. The *gadus morrhua* of Linnæus, a fish common in the seas of the northern hemisphere, from about 40° to 75° of latitude. The flesh forms a most wholesome and excellent article of food. The best fish are very thick about the neck; and, when fresh, are marked by the "redness of the gills, freshness of the eyes, and the whiteness and firmness of the flesh." The fish so largely imported from Newfoundland (*Newfoundland fish*) are cod, beheaded, split open, gutted, and salted. They are caught by millions on the "*Grand Bank.*" *Cod-sounds* are pickled in brine and also made into isinglass. The *spawn* is made into *caviare*, and the *liver* is both pressed and boiled for its oil, (*cod-liver oil; Oleum jecoris aselli; Oleum morrhuæ*,—Ph. L.;) the former is the best method.

Cod is *generally cooked* by boiling it, but is sometimes baked, or cut into slices and broiled or fried. *Cod's head and shoulders* with *oyster sauce* is a favorite dish. *Shrimp* and *anchovy sauce* are also good additions.

Cod-liver oil has recently acquired much reputation for its remedial powers in pulmonary consumption, scrofulous and other glandular affections, chronic gout and rheumatism, certain skin diseases, and several other ailments. It is generally supposed that the iodine and bromine, which are present in minute quantities in this fish, are the substances to which it owes its efficacy. Dr. De Jongh refers its virtues to the presence of both *iodine* and the *elements of the bile*. Our own researches lead us to infer, that one of its most active constituents is *free phosphorus*. Good cod-liver oil contains fully 0·02 of this substance, as well as about 0·09 of phosphoric acid. Now, the marked action of minute doses of phosphorus on the nervous, vascular, and secreting organs, is well known to every experienced surgeon. The difficulty, however, of bringing it into a form adapted for administration, has hitherto prevented phosphorus being extensively employed as a therapeutic agent. This obstacle is removed by the employment of cod-liver oil. Nature has here provided a simple remedy, which the ingenuity of man has failed to produce artificially. This opinion is borne out by the facts, that cod-liver oil cures those forms of scrofula and other diseases which do *not* yield to iodine, and that those varieties of the oil are the most active which contain the *most* free phosphorus. We, therefore, think it reasonable to conclude, that the efficacy of cod-liver oil depends on the joint action of the minute quantities of iodine, phosphorus, and the elements of the bile, which it contains, and not on any one separately; and that no substance, at present known, can be used as a substitute for it.

The *pale oil* or *pale brown cod-liver oil* is the best. When good, it has the odour of a boiled cod's liver, and is far from being either rancid or nauseous. That sold by Messrs. Ansar, Harford, and Co., of the Strand, under the sanction of Dr. De Jongh, is, perhaps, the best in the market; and we have only to regret that the price at which it is vended to the public, is too high to admit of such general patronage as its excellence deserves.

CODEIA. Syn. *Codeine*. An alkaloid discovered by Robiquet associated with morphia.

Prep. Dissolve commercial *hydrochlorate of morphia* in *water*, precipitate with *ammonia*, evaporate and crystallize. The precipitate by digestion in *weak liquor of potassa* gives up its morphia. It may be further purified by solution in ether. By the addition of a little water to the ethereal solution, and spontaneous evaporation, it may be obtained quite pure and in a crystalline state.

Prop., &c. Freely soluble in alcohol and ether; soluble in 80 parts of *cold* and 17 parts of boiling water. Its solution in the latter, by slow evaporation, yields large transparent octahedrons. With the acids it forms crystallizable salts. These possess the singular property of producing a general and violent itching of the surface of the body when administered internally. The same symptoms frequently follow the exhibition of opium and muriate of morphia, and are referred to the presence of codeia. None of them are now employed in medicine in this country. The commercial muriate of morphia frequently contains 3% to 4% of codeia.

Tests. It is distinguished from *morphia* by not becoming blue on the addition of sesquichloride of iron, nor turning red with nitric acid; and by not being precipitated by ammonia, when dissolved in hydrochloric acid and mixed with a large quantity of water. Unlike *morphia*, it is insoluble in weak liquor of potassa, and is soluble in ether. The *salts of codeia* are known by tincture of galls throwing down a copious precipitate from their solutions; this does not occur with the salts of morphia. It is distinguished from *meconine* by its aqueous solution showing an alkaline reaction with test paper.

COFFEE. The berries of the *coffea arabica* (Linn.) or *coffee tree;* a shrub of

the natural order *rubiaceæ*, indigenous in the low mountainous districts of Arabia Felix, and largely cultivated in various other parts of the world for its fruit. The name is also applied to an infusion or decoction of the roasted berries.

Prep., &c. The finest kind of coffee is that called *mocha*, but that in common use, is principally supplied from the *British plantations* in the West Indies. The selection being made, the berries are carefully roasted by a gradually applied heat, until the aroma is well developed, and the toughness destroyed. Too much heat is avoided, as the volatile and aromatic properties of the coffee, and, consequently, the flavour, are thereby injured; whilst, on the other hand, if the berries are roasted too little, they produce a beverage with a raw, green taste, very liable to induce sickness and vomiting. When properly roasted, coffee has a lively chocolate brown colour, and should not have lost more than 18% of its weight by the process. If the loss exceeds 20%, the flavour suffers in proportion. The roasted coffee should be placed in a very dry situation, and excluded from the air as soon as possible. It loses flavour by keeping, and also powerfully absorbs moisture from the atmosphere by reason of its hygrometric power. This arises chiefly from the presence of a peculiar principle called asamar by Reichenbach. In asthma it has been found particularly serviceable; and it has been extolled in gangrene of the extremities in drunkards. Calculous complaints are scarcely known in France and Turkey, where coffee is the principal beverage of the people. M. Devereaux was cured of gout of 25 years' standing, accompanied with chalk stones, by taking coffee freely, (Du Four;) and Sir John Floyer was cured of asthma, after 60 years' suffering, by the like simple means. "I have myself seen several cases in which coffee was really useful." (Laennec.) The nervous symptoms resulting from the excessive use of coffee, are chiefly referable to the imbibition of so large a quantity of *hot* liquor; any other beverage in equal quantity exercises the same debilitating action.

Pur. The ground coffee sold by the grocers is almost universally adulterated. The principal substances used for this purpose, are roasted chicory and roasted beans and corn. This fraud may readily be detected as follows:—

1. (*Chicory.*) A spoonful of pure coffee placed gently on the surface of a glass of cold water, will float for some time, and scarcely colour the liquid; if it contains chicory, it will rapidly absorb the water, and sinking to the bottom of the glass, communicate a deep reddish-brown tint as it falls. *Another* method of applying this test, is by *expertly* shaking a spoonful of the suspected coffee with a wine-glassful of cold water, and then placing the glass upon the table. If it is pure, it will rise to the surface, and scarcely colour the liquid, but if chicory is present, it will sink to the bottom, and the water will be tinged of a deep-red, as before.

2. (*Roasted corn, beans, &c.*)—*a.* These may be detected by the cold decoction striking a blue colour with tincture of iodine. Pure coffee is merely deepened a little in colour by this substance.—*b.* The brown colour of decoction or infusion of roasted coffee becomes greenish when treated with a per-salt of iron; and a brownish-green, flocculent precipitate is formed. The colour of chicory is only deepened, but not otherwise altered, and no precipitate is formed under the same treatment. A mixture of chicory and coffee retains a brownish-yellow colour after the precipitate has subsided, and the liquid appears brownish-yellow by refracted light. The addition of a little weak ammonia water aids the subsidence of the precipitate.

3. Under the microscope, the presence of *chicory* may be readily detected by the size, form, and ready separation of the cells of the cellular tissue, and by the presence and abundance of the pitted tissue or dotted ducts, and vascular tissue, or spiral vessels. *Roasted corn*, and other amylaceous substances, may also be detected, in the same way, by the peculiar size and character of their starch grains. See *Chicory*, *Starch*, *&c.*

Qual., &c. Coffee promotes digestion, and exhilarates the spirits, and when strong, generally occasions watchfulness, but in some phlegmatic constitutions induces sleep. Drank in moderation, especially if combined with sugar and milk, it is perhaps the most wholesome beverage known. The various qualities that have been ascribed to it by some persons, such as dispelling of causing flatulency, removing dizziness or the head, attenuating the blood, causing biliousness, &c., appear to be wholly imaginary. In a medical point of view it has been regarded as diuretic, sedative, and a corrector of opium. As a *medicine*, it should be strong, and is best taken only lukewarm.

Obs. The attention of the scientific world has been recently drawn to the value of *roasted coffee leaves*, as furnishing materials for a beverage unexcelled in excellence by

the coffee-berry itself. The subject was first referred to by Mr. Brande, some years since, but although it was known that coffee leaves had been long so employed in Sumatra, the subject appeared to create little interest, until Mr. N. M. Ward, of Padang, threw fresh light on the matter in the pages of the 'Singapore Free Press,' and afterwards in those of the 'Pharmaceutical Journal.' It appears that the leaves, prepared for use, may be purchased for 1½*d.* per *lb.*, or packed ready for export at 2*d.* per *lb.* Samples of the prepared leaf were laid before the Pharm. Soc., Oct. 12th, 1853, and excited considerable interest. See *Caffeine*, *Chicory*, *&c.*

COFFEE (for the table). To produce this beverage in perfection, it is necessary to employ the best materials in its preparation—*fresh-roasted* and *fresh-ground*. The shape or description of the coffee-pot appears of little consequence, though one furnished with a *percolator* or *strainer*, that will permit a moderately rapid filtration, is, perhaps, preferable. That known as the *cafetière à belloy*, *à grecque*, or *coffee biggin*, is commonly used in France, and answers well. At least 1 *oz.* of *coffee* should be used to make 3 common-sized coffee-cupfuls, with 1 teaspoonful of *freshly roasted* and *ground chicory*. If desired *strong*, the quantity of both should be doubled. The prevailing fault of the coffee made in England, is its want of strength and flavour. The coffee-pot should be heated previously to putting in the coffee, which may be done by means of a little boiling water. The common practice of boiling coffee is quite unnecessary, for all its flavour and aroma is readily extracted by boiling hot water. Indeed, all the "useful and agreeable matter in coffee is *very soluble;* it comes off with the first waters of infusion, and needs no boiling." (Ure.) Water is capable of removing all the soluble aromatic portion of coffee, even at a temperature so low as 195° Fahr., as we have often proved by actual experiment with one of Beart's pneumatic filters, when a fluid, deliciously aromatic and sparkling, has been produced, and the grounds have only yielded a nauseous bitter flavour, and faint colour to fresh water, even by boiling. Should prejudice, however, induce the housewife or cook to *boil* her coffee, it should be only *just simmered for a minute*, as long or violent boiling injures it considerably.

When coffee is prepared in a common pot, the latter being first made hot, the boiling water should be poured over the powder, and not, as is commonly the plan, put in first. It should then be kept stirred for 4 or 5 minutes, when a cup should be poured out and returned again, and this operation repeated 3 or 4 times, after which, if allowed to repose for a few minutes, it will generally become fine of itself. In all cases, when a *percolator* is not used, the liquor should be well stirred up *several* times before finally covering it up to settle for use.

Coffee is sometimes clarified, which is done by adding a shred of isinglass, a small piece of clean eel or sole-skin, or a spoonful of white of egg. An excellent plan, common in France, is to place the vessel containing the *made coffee* upon the hearth, and to sprinkle over its surface half a cupful of *cold water*, which from its greater gravity descends, and carries the "foulness" with it. Another plan sometimes adopted is to wrap a cloth, previously dipped into *cold water*, round the coffee-pot. This method is commonly practised by the Arabians in the neighbourhood of Yemen and Moka, and rapidly clarifies the liquor, unless a very large quantity of chicory is present. It should be recollected that the use of isinglass, white of egg, and all like artificial finings, remove much of the astringency and vivacity of the liquor.

The French, who are remarkable for the superior quality of their coffee, generally allow an ounce to each large coffee-cupful of water, and they use the coffee both newly ground and roasted. A shred of saffron, or a little vanilla, is frequently added, whilst the *percolating coffee-pot*, before noticed, is generally employed. When the Parisian uses a common coffee-pot, he generally divides the *water* into 2 parts. The *first portion* he pours on boiling hot, and allows it to *infuse* for 4 or 5 minutes, he then pours this off as clear as possible, and boils the grounds for 2 or 3 minutes with the *remaining half* of the water. After the last has deposited the sediment it is decanted, and mixed with the infusion. The object of this process is to obtain the whole of the strength, as well as the flavour. The infusion is conceived to contain the latter, and the decoction the former; a plausible, but erroneous idea, since both of them were carried off by the first water. This plan has been recommended, with some modifications, by Mr. Donovan, and more recently by Dr. Davidson, in *L'Expérience*, and Soyer, in his *Gastronomic Regenerator*.

COFFEE (Essence of). A *highly concentrated infusion of coffee*, prepared by percolation with *boiling water*, gently and

quickly evaporated to about ⅓rd or ¼th of its bulk, and mixed with a thick *aqueous extract of chicory* and *syrup of burnt sugar*, so as to give the whole the consistence of treacle. The proportions of the dry ingredients should be—*coffee*, 4 parts; *chicory*, 2 parts; *burnt sugar*, 1 part. It should be kept in well corked bottles in a cool place. This resembles the advertised *essence of coffee* of Dunn and other makers. It is convenient for making *extemporaneous coffee;* but the beverage so made, though superior to much of that sold at coffee-houses and hotels, is inferior in flavour, aroma, and piquancy, to that we are accustomed to drink at home. We have ourselves prepared an essence of coffee, very concentrated, and which will keep in any climate, that possesses all these good qualities.

COFFEE (Searle's Patent). This is prepared by evaporating *skimmed milk* mixed with $\frac{1}{40}$th part of *sugar*, at a low temperature, and, when nearly solid, adding a *very concentrated essence of coffee*, and continuing the evaporation at a low temperature, (in vacuo, if possible,) until the mixture acquires the consistence of a *syrup*, (*coffee syrup*,) paste, (*coffee paste*,) or candy, (*coffee candy*). The last may be powdered, (*coffee powder, dry essence of coffee*).

COFFEE (Substitutes for). These are numerous, but are now of less interest than formerly, owing to the enormous reduction of the duty on foreign coffee which has taken place of late years. Among the principal are the following:—

1. *Acorn coffee.* From acorns deprived of their shells, husked, dried, and roasted. A good substitute.

2. *Almond coffee.* Rye or wheat roasted along with a few almonds. A very small quantity of cassia-buds improves it. A good substitute.

3. *Bean coffee.* Horse-beans roasted along with a little honey or sugar. When removed from the fire, a small quantity of cassia-buds are frequently added, and the whole is stirred until cold. Said to be a good substitute.

4. *Beech-mast coffee.* From beech-mast or nuts. Very wholesome.

5. *Beet-root coffee.* From the yellow beet-root, sliced, dried in a kiln or oven, and ground with a little foreign coffee. A good substitute; equal to chicory coffee.

6. *Corsican coffee.* From the seeds of the knee-holly.

7. *Currant coffee.* From the seeds washed out of the cake left in making currant wine.

8. *Egyptian coffee.* From chick-peas.

9. *German coffee, Succory do., Chicory do.* From chicory or succory. *Used* both for foreign coffee and to adulterate it.

10. *Gooseberry coffee.* From gooseberry seeds, as No. 7.

11. *Holly coffee.* From the berries.

12. *Lupin coffee, Hambro' do., Hambro' powder.* From roasted lupins.

13. *Raspings.* The raspings of the crust of loaves, procured at the bakers. Equal to rye coffee.

14. *Rice coffee.* From rice, as above. A good substitute.

15. *Rosetta coffee.* From fenugreek seeds moistened with lemon juice.

16. *Rye coffee, Dellenius' do., Hunt's breakfast powder.* Rye, roasted along with a little butter, and ground to powder. A good substitute.

17. *Sassafras coffee.* From the fruit or nut of the sassafras tree, or from the wood cut into chips. Very wholesome. Much recommended in skin diseases, &c.

18. *Sylvester's coffee, Iris coffee.* The seeds of the gladiolus luteus, iris pseudacorus, or yellow water flag. Said to be the best substitute known.

19. *Turner's coffee, Broom coffee.* From broom seeds roasted with a little butter.

20. *Whiskings, Coffee flights, Coffee marc.* The husks, &c., of roasted foreign coffee.

Obs. All the above are roasted before grinding them, with a little fat or lard. Those which are larger than coffee-berries are cut into dice about that size before being roasted. They possess none of the medicinal virtues of foreign coffee.

COINS. See *Medals* and *Electrotyping.*

COKE. See *Coak.*

COLCHICINE. Syn. *Colchicina, Colchicia.* A peculiar principle discovered by Gieger and Hesse in the seeds of the *colchicum autumnale* or common *meadow saffron.* It also exists in the cormi or bulbs.

Prep. Macerate the *bruised seeds* in *boiling alcohol*, add *hydrate of magnesia*, to throw down the alkaloid, digest the precipitate in *boiling alcohol*, and filter. By cautious evaporation colchicine will be deposited, and may be purified by re-solution and crystallization in alcohol.

Prop., &c. Odourless; bitter; soluble in water and alcohol; forms salts with the acids. It is very poisonous. $\frac{1}{10}$th of a grain, dissolved in spirit, killed a cat in 12 hours. It differs from veratrine in being *soluble* in water and crystalline, and in the non-production of sneezing when cautiously

applied to the nose. Strong oil of vitriol turns this alkaloid of a yellowish-brown; nitric acid turns it of a deep violet, passing into indigo blue, green, and yellow. It is not used in medicine.

COLCHICUM. Syn. *Meadow Saffron; Colchicum Autumnale*,—Linn. The recent and dried corms or bulbs (*colchicum cormi*), as well as the seeds (*semina colchici*), are officinal in the three British Pharmacopœias. The corms are ordered to be "dug up in the month of July, or before the autumnal bud has projected." "The dry coatings having been torn off, cut the cormus transversely in thin slices, and dry, at first with a gentle heat, but afterwards slowly increased to 150° Fahr." (Ph. L.)

Dose, (of the corms,) 2 to 8 or 9 gr.; (of the seeds), 2 to 7 gr., made into a pill or bolus with syrup or conserve; chiefly, as a specific in gout, to alleviate or check the paroxysm. This drug forms the base of almost all the advertised *gout nostrums*. It is, however, an active poison, and its administration requires care. "After all that has been said respecting colchicum in gout, and admitting that it rarely fails to allay pain and check a paroxysm, I would record my opinion that he who would wish to arrive at a good old age, should eschew it as an *ordinary* remedy, and consider that he is drawing on his constitution for a temporary relief, with a certainty of becoming prematurely bankrupt in his vital energies." (Collier.)

COLCOTHAR. See *Red Oxide of Iron*.

COLD. Syn. *Frigus*,—Lat. The privation of heat. The term is also applied to the sensation and effects which this privation produces.

When the body of an animal is immersed in an atmosphere at a temperature below the healthy standard, a sensation of coldness is experienced, produced by the passage of the caloric or heat of the body into the colder medium. If this abstraction of caloric exceeds the quantity produced by the vital system, the temperature of the body decreases, until it sinks below the point at which the functions of life can be performed. This declination of the heat of the body is gradual; the *extreme sensation of coldness* changes into a *disinclination for voluntary motion;* next comes on *drowsiness*, followed by *numbness* and *insensibility*. At this point, if the sufferer is not rescued, and remedial measures had recourse to, death inevitably and rapidly ensues.

The *prevention* of the effects of cold consists in the use of ample food and clothing proportioned to the inclemency of the weather, the exposure to be endured, and the habits of the wearer. The circulation of the blood should be promoted by active exercise, and any disposition to sleep shaken off by increased bodily exertion. The principal endeavour should be to keep the *extremities* and *chest* warm, as, if this can be accomplished, no danger need be feared.

In cases of *asphyxia produced by intense cold*, the patient should be laid in a room remote from the fire, and bathed with *cold salt-and-water*, or *water* to which some *brandy* or *vinegar* has been added; after which the body should be wiped dry, and friction assiduously applied by the hands of the attendants (warmed); as many operating at once as can conveniently do so. *Gentle stimulants* should be administered by the mouth, and the bowels excited by some *mild stimulating clyster*. The lungs should also be inflated, and an effort made to re-establish the respiration. As soon as symptoms of returning animation are evinced, and the breathing and circulation restored, the patient should be laid in a bed between blankets, and a little *wine and water* administered, and perspiration promoted by heaping an ample quantity of clothing on the bed. Should the patient have suffered from hunger as well as cold, the appetite may be appeased by the administration of a limited quantity of *light food*, taking especial care to *avoid excess*, or anything indigestible or exciting. See *Animation* (Suspended), *Bronchitis*, *&c.*

COLD CREAM. See *Cosmetic Cerate*.

COLIC. Syn. *Colica*,—Lat. The belly-ache or gripes. The name is popularly given to all severe griping abdominal pains, without reference to the cause. There are several varieties of this disease:—

1. *Accidental colic*. Produced by improper food and poisons. The treatment may be similar to that recommended for *bilious* or *flatulent colic*.

2. *Bilious colic*. In this variety the pain is intermittent and transient, accompanied by constipation, nausea, and vomiting. The fæces, if any, are bilious, dark-coloured and offensive. The *remedies* are, a full dose of *blue pill*, *calomel*, *colocynth*, or *aloes*, followed by a sufficient quantity of *epsom salts* or *glauber salts*. Warm fomentations are also serviceable.

3. *Flatulent colic*. Marked by constipation, and the irregular distension of the bowels by gas, accompanied by a rumbling noise, &c. It is commonly produced by the use of indigestible vegetables and slops. The *remedies* are, a full dose of *tincture of*

rhubarb combined with a few drops of *essence of peppermint*. If this does not afford relief, an *Abernethy pill* may be taken, washed down with a glass of any cordial water, as peppermint, cinnamon, or caraway. When the pain is extreme, warm fomentations to the belly, or a carminative clyster will generally give relief.

4. *Painter's colic, Plumber's do., Devonshire do., Lead do.; Colica pictonum.* The dry bellyache. It is marked by obstinate costiveness, acrid bilious vomitings, violent pains about the region of the navel, convulsive spasms in the intestines, and a tendency to paralysis in the extremities. It is most prevalent in the cider counties, and amongst persons exposed to the fumes of lead. The *remedies* are the same as for the spasmodic variety. Should these fail, after the bowels have been thoroughly evacuated, small doses of camphor and opium, may be administered, and *sulphuric beer* or *sweetened water* very *slightly* acidulated with sulphuric acid, had recourse to as a beverage. Mr. Benson, the managing director of the British Whitelead Works at Birmingham, says :—"Although during several weeks after the addition of the sulphuric acid to the treacle beer, drank at the works, little advantage seemed to be derived, yet the cases of lead colic became gradually *less frequent*, and since October of that year, or during a period of fifteen months, not a single case of lead colic has occurred amongst the people."—(Lancet.) See *Sulphuric Beer* and *Sulphuric Acid.*

5. *Spasmodic colic.* Marked by a fluctuating pain about the navel, which goes away and returns by starts, often leaving the patient for some time. The belly is usually soft, and the intestines may often be felt in lumps,which move about under the hand, or are wholly absent for a time. It is unaccompanied by flatulency. The *remedies* are *warm fomentations, warm clysters,* and *carminatives,* accompanied by small doses of *camphor* and *opium.*

6. *Stercoraceous colic.* Marked by severe griping pains and constipation of the bowels. The *remedies* are *powerful cathartics,* as full doses of *calomel, aloes, colocynth, jalap,* &c., followed by *purgative salts,* as *sulphate of magnesia,* or *sulphate of soda.*

COLLODION. Syn. *Collodium.* This article is an imperfect ethereal solution of crude *pyroxyline,* (the *gun cotton* of Schonbein, not *xyloidine*).

Prep. 1. (Ph. U. S.) *Nitrate of potassa,* (in powder,) 10 oz.; *sulphuric acid,* 8½ fl. oz.; triturate together in a wedgwood mortar until uniformly mixed; then add of *fine carded cotton,* (free from impurities,) ½ oz.; and by means of the pestle or a glass rod, saturate it thoroughly with the liquor for a period of about 3 or 4 minutes; next transfer the cotton to a vessel containing water, and wash it in successive portions of pure water, with agitation and pressure, until the washings cease to affect litmus paper or a solution of chloride of barium; it is then to be spread out and dried by a very gentle heat, and dissolved by agitation in a stoppered bottle with *rectified sulphuric ether,* 1 quart, to which *rectified spirit,* (alcohol,) 1 fl. oz., has been previously added.

2. (Mialhe.) *Nitrate of potassa,* 40 parts; *concentrated sulphuric acid,* 60 parts; *carded cotton,* 2 parts; proceed as last until the dry cotton is obtained, then take of the *prepared cotton,* 8 parts; *rectified sulphuric ether,* 125 parts; mix in a well-stoppered bottle, and agitate it for some minutes; then add, gradually, *rectified alcohol,* 1 part; and continue to shake until the whole of the liquid acquires a syrupy consistency. It may be now passed through a cloth; but a better way to prevent loss is to let it repose for a few days and then decant the clear portion.

3. *Gun cotton* and *rectified alcohol,* of each, 1 part; *rectified ether,* 19 parts; proceed as before.

Uses, &c. Collodion is chiefly employed as a dressing for wounds, and as a protection to abraided surfaces. On drying, it unites the former closely, and preserves the latter from the action of the air. It is impervious to water, and being transparent, it admits of the progress of the wound being inspected when necessary. Such is its adhesive power, that a piece of cloth cemented with it to the *dry* palm of the hand, will support a weight of 25 *lb.* to 30 *lb.* It is also used in *photography.* For success both in its manufacture and use, it is absolutely necessary to avoid the presence of water or moisture. See *Gun Cotton, &c.*

COLLODION (Compound). It has been proposed to medicate collodion in several ways; but the practice has not found much favour with the medical profession. The following are said to be useful preparations:

1. (*Collodion and Cantharidis; Collodion Cantharidale.*)—*a.* (Ilisch.) *Cantharidine,* 15 gr.; *gun cotton,* 20 gr.; *rectified ether,* 1½ oz.; *acetic ether,* ½ oz.; dissolve.

b. (Œttinger.) *Ether of cantharides* and *collodion,* equal parts. *Used* as an irritant.

2. (*Coloured Collodion; Collodium Tinc-*

tum.) *Prep.* (Cutan. Hosp.) *Collodion*, 2 oz.; *palm oil*, 1 dr.; *alkanet root*, q.s. to colour, (say 15 gr.); digest and decant the clear. Colour bears a greater resemblance to the skin than that of common collodion, whilst it is more flexible; but it is weaker than the latter.

COLLUTORIES. See *Mouth Washes* and *Gargles.*

COLLYRIA. The word *collyrium* was originally applied to any solid or liquid medicament applied to the eyes. It is now, by common consent, restricted to *eye-waters.* The following are exceptions:—

COLLYRIUM (Dry). Syn. *Collyrium Siccum*, — Lat. *Prep.* 1. (Dupuytren.) *White sugar*, 1 dr.; *red oxide of mercury*, 10 gr.; *oxide of zinc*, 20 gr.; mix.

2. (Lagneau.) *Sugar candy*, 2 parts; *nitrate of potassa*, 1 part.

3. (Falconer.) *Chloride of barium*, 1 gr.; *sugar candy*, 1 dr.

4. (Radius.) *Calomel* and *white sugar*, of each, ½ dr.; *opium*, 10 gr.

5. (Recamier.) *Oxide of zinc* and *sugar candy*, equal parts.

6. (Velpeau). *Trisnitrate of bismuth* and *sugar candy*, equal parts.

7. (Wiseman.) *Acetate of soda*, 10 gr.; *powdered opium*, 1 gr.; *sugar candy*, ½ dr.

Obs. It is absolutely necessary that the ingredients in the above preparations should be reduced to an *impalpable powder*, by careporphyrization, or trituration in a wedgewood mortar. For use, a *small* pinch is placed in a quill or straw, and blown into the eye previously opened with the fingers. On the whole, they may be regarded as unnecessary preparations, and are unsafe, except in skilful hands.

COLOCYNTH. Syn. *Bitter Apple, Bitter Gourd, Bitter Cucumber; Peeled Colocynth; Colocynthis*,—Ph. L.E. and D. The decorticated fruit (*pulp*,—Ph. E. and D.) of the *citrullus* (*cucumis*,—Linn.) *colocynthis.* (Ph. L.) It is an acrid, drastic purge and hydragogue, and cannot be given alone with safety; but, in combination with other substances, it forms some of our most useful cathartic medicines.

COLOCYNTHINE. Syn. *Colocynthite, Colocynthium.* The bitter purgative principle of colocynth.

Prep. The *aqueous extract* or the *pulp of colocynth*, is digested in *alcohol*, and the tincture filtered and evaporated. The residuum is *colocynthine* combined with acetate of potassa. By agitation with a *little* water, the latter is removed. It may be purified by dissolving it in alcohol, and evaporation, as before.

Prop., &c. A yellowish brown translucent resinous substance, very soluble in alcohol, less so in ether, and only slightly so in water. It is intensely bitter, and acts as a highly drastic purgative. It is neither acid nor basic. Nitric acid converts it into *colocynthic acid.*

COLOPHENE. Formed by distilling *oil of turpentine* with *concentrated sulphuric acid.* A colourless, viscid, oily liquid; with a high boiling-point; and exhibiting a bluish tint by reflected light.

COLOPHONIC ACID. Syn. *Colopholic Acid.* Formed in the manufacture of rosin, by the action of the heat on the pinic acid of the turpentine. Brown; easily saponifiable; little soluble in alcohol.

COLOPHONY. See *Rosin.*

COLOURING. Syn. *Brandy Colouring, Brewer's do., Spirit do.; Caramel; Essentia Bina. Prep. Brown sugar* is melted in an iron vessel over the fire, until it grows black and bitter, stirring it well all the time, after which *water* is added, and it is boiled to a syrup.

Obs. Some persons use lime-water to dissolve the burnt sugar. Care must be taken *not* to *overburn* it, as a greater quantity is thereby rendered insoluble. The heat should not exceed 430°, nor be less than about 400° Fahr. The process, for nice experiments, is best conducted in a bath of melted tin, to which a little bismuth has been added to reduce its melting point to about 435°; a little powdered resin or charcoal, or a little oil being put upon the surface of the metal to prevent the oxidizement of the alloy.

COLOURING PRINCIPLES. See *Dyeing.*

COLOURS. See *Pigments, Stains, Washes, &c.*, and the individual articles.

COLOURS (Complementary). Two colours are said to be complementary to each other, which, by blending together, produce the perception of whiteness. According to Mayer, all colours are produced by the admixture of *red, yellow*, and *blue* light, in certain proportions, and by intercepting either one or more of these coloured rays in a beam of light, those which meet the eye, will consist of the remaining coloured rays of the spectrum. Thus, by intercepting the *red rays* in a beam of white light, the remaining yellow and blue rays will produce a *green colour;* by intercepting the *blue rays*, the remaining yellow and red will give an *orange;* and so on of other cases; so that *red* and *green, blue* and *orange*, are *complementary colours.* See *Accidental Colours, Dress, &c.*

COLOURS (Compound). The mixture of *blue* and *yellow* dyes, stains, or pigments, produce GREEN; *red* and *blue*, VIOLET, PURPLE, LILACS, *&c.*; *red* and *yellow*, ORANGE, CINNAMON, *&c.*; *red*, *yellow*, and *blue*, OLIVES; *red* and *blues*, or *green* or *black*, BROWNS of all shades; *black* mixed with *other dyes*, produces various shades of BROWN and OLIVE, and when pale, it constitutes GRAY, either by itself, or on the addition of a *faint blue*. In this way every shade of colour may be produced, provided the ingredients used are of a class that will not decompose each other. See *Pigments*, *Dyeing*, *&c.*

COLTSFOOT. This popular herb is the *tussilago farfara* of Linnæus. It is a demulcent bitter, and is slightly stomachic and tonic. It is much esteemed by the lower classes in coughs, shortness of breath, and other affections of the chest. The leaves form the basis of most of the *British herb tobaccos*, and have been recommended to be smoked in asthma and difficulty of breathing. *Dose.* One or two wineglassfuls of the tea or decoction (1 *oz.* to the *pint*) *ad libitum*.

COLUMBIC ACID. See *Tantalic Acid.*

COLUMBIUM. See *Tantalum.*

COMBINATIONS (Chemical). See *Equivalents* and *Affinity.*

COMENIC ACID. By boiling a solution of *meconic acid* in *water*, or in *dilute sulphuric acid*, for some time; or by exposing *dry meconic acid*, in a retort, to a heat of 400° Fahr. It is bibasic; its salts are called *comenates.* By exposure to a high temperature it is converted into *pyromeconic acid*, which sublimes and condenses in brilliant colourless plates.

CONCENTRATION. The volatilization of part of a liquid in order to increase the strength of the remainder. The operation can only be performed on solutions of substances of greater fixity than the menstrua in which they are dissolved. Many of the liquid acids, solutions of the alkalies, &c., are concentrated by distilling off their water.

In pharmacy, the term "*concentrated*" is commonly applied to any liquid preparation possessing more than the usual strength. Thus we have "*concentrated*" *infusions*, *decoctions*, *liquors*, *solutions*, *tinctures*, and *essences*, most of which are made of 8 times the common strength. This is generally effected by using 8 times the usual quantity of the ingredients, with a given portion of the menstruum, and operating by digestion or percolation; the latter being generally adopted when the articles are bulky. When the menstruum is water, a little spirit is added, to make the product keep. See *Decoctions*, *Infusions*, *&c.*

CONCRETE. A compact mass or cement, composed of pebbles, lime, and sand, employed in the foundations of buildings. The best proportions have been said to be—60 parts of *coarse pebbles*, 25 of *rough sand*, and 15 of *lime*; but Semple recommends 80 parts of *pebbles*, 40 parts of *river sand*, and only 10 parts of *lime.* The pebbles for concrete should not exceed about ½ *lb.* each in weight.

CONDIMENTS. Substances taken with the food, to season or improve its flavour, or to render it more wholesome or digestible. The *principal condiments* are *common salt*, *vinegar*, *lemon-juice*, *spices*, *aromatic herbs*, *oil*, *butter*, *sugar*, *honey*, and *sauces.* Most of these, in moderation, promote the appetite and digestion, but their excessive use tends to vitiate the gastric juice, and injure the stomach.

CONFECTION. Syn. *Confectio*,—Lat. Anything prepared with sugar; a sweetmeat, or candy. In *medicine*, the name is commonly applied to substances, usually pulverulent, mixed up to the consistence of a soft electuary, with powdered sugar, syrup, or honey. In the 'London Pharmacopœia,' (1836 and 1851,) both *conserves* and *electuaries* are included under this head, though there appears to be some little distinction between them.

In the *preparation* of confections all the dry ingredients should be reduced to very fine powder, and passed through a sieve, not coarser than 80 holes to the inch; and the pulps and syrups used to mix them up, should be perfectly homogeneous, and of a proper consistence. The mixture should be intimate and complete, in order that the characteristic constituents may be equally distributed throughout the mass. The consistence of the newly made confection should be sufficiently solid to prevent a separation of the ingredients, and yet soft enough to allow of it being easily swallowed without previous mastication.

Confections should be *preserved* in stone jars, covered with writing paper, and placed in a cool and not too dry a situation. Without this precaution, they are apt to mould on the top. If at any time the mass *ferments* and swells up, the fermentative process may be arrested by placing the jar in a bath of boiling water, for an hour or two, or until the whole becomes pretty hot; when it should be removed from the heat, and stirred occasionally until cold. Should the sugar crystallize out of the confection,

or "*candy*," as it is called, the same method may be followed. Or, the mass may be well rubbed in a mortar until the hard lumps of sugar are broken down, and a uniform consistence again produced. On the large scale it may be passed through the mill.

As *remedial agents*, the officinal confections possess little value, and are chiefly useful as vehicles for the administration of more active medicines. See *Conserves* and *Electuaries*.

CONFECTION (Acorn). Syn. *Confectio Seminum Quercûs*,—Lat. *Prep.* (Bories.) *Powdered acorns*, 3 oz.; *red coral* and *catechu*, of each, 1½ oz.; *confection of dog-rose*, 10 oz.; *syrup of red roses*, q. s. to make a confection. *Dose.* 1 dr., every 4 hours; in chronic diarrhœa, &c.

CONFECTION (Alkermes). Syn. *Confectio Alkermes*, — Lat. *Prep.* (Ph. L. 1745.) *White sugar*, 1 lb; *rose-water*, 6 fl. oz. (¼ pint;) *clarified juice of alkermes*, 3 lb; *oil cinnamon*, 10 or 12 drops; mix. It was formerly a common practice to add a little *gold-leaf*, rubbed small, so as to float about in it; also to scent it with *musk* and *ambergris*.

CONFECTION (Almonds). Syn. *Conserve of Almonds; Confectio Amygdalæ*,——Ph. L. *Conserva Amygdalarum*,—Ph. E. *Confectio Amygdalarum*, — Ph. D. 1826. *Prep.* (Ph. L.) *Sweet almonds*, 8 oz.; *white sugar*, 4 oz.; *powdered gum arabic*, 1 oz.; macerate the almonds in *cold* water, then remove the skins, and beat them with the other ingredients until reduced to a smooth confection. The Edinburgh form is similar.

Uses, &c. To prepare *emulsion* or *milk of almonds*. A little of this paste or powder, triturated with a sufficient portion of water, and strained through a piece of calico, forms emulsion of almonds. "This confection will keep longer sound, if the *almonds*, first decorticated, (blanched,) dried, and rubbed into the finest powder, be mixed with the *acacia* and *sugar*, separately powdered, and the mixed ingredients be kept in a well-stoppered bottle." (Ph. L.) The same effect may be arrived at by simply well-drying the blanched almonds before mixing them with the gum and sugar. The addition of even a small quantity of water or syrup, causes the confection "to become soon mouldy, or rancid, or both." (Brande.)

CONFECTION (Alum). Syn. *Confectio Aluminis*, — Lat. *Prep.* 1. (St. B. H.) *Alum*, (in fine powder,) 1 dr.; *conserve of roses*, 6 dr.

2. (Foy.) *Alum*, 1 dr.; *conserve of roses*, 1 oz. *Dose.* 1 dr., 2 or 3 times a day; in lead colic, and as an astringent in diarrhœa and other affections.

CONFECTION (Aromatic). Syn. *Aromatic Electuary; Confectio Aromatica*,——Ph. L. & D. *Electuarium Aromaticum*,—Ph. E. *Sir Walter Raleigh's Cordial, Confectio Cardiaca*,—Obs. *Prep.* 1. (Ph. L.) *Nutmegs, cinnamon*, and *hay-saffron*, of each, 2 oz.; *cloves*, 1 oz.; *cardamoms*, ½ oz.; *prepared chalk*, 16 oz.; *white sugar*, 2 lb; reduce the whole to a very fine powder, and keep it in a closed vessel. When wanted for use, mix it with water to the consistence of a confection.

2. (Ph. E.) *Aromatic powder* (Ph. E.), 1 part; *syrup of orange peel*, 2 parts; mix.

3. (Ph. D.) *Aromatic powder* and *simple syrup*, of each, 5 *oz.; clarified honey*, 2 *oz.; powdered saffron*, ½ *oz.;* mix, and add, *oil of cloves*, 30 drops.

4. (Commercial.)—*a. Hay saffron, cassia*, and *turmeric*, of each, 4 *oz.; cardamoms*, 1 *oz.; starch*, 8 *oz.; precipitated chalk*, 2 *lb.; white sugar*, 4 *lb.; oil of nutmeg*, 2 dr.; *oil of cloves*, 3 dr.; reduce the dry ingredients to fine powder, and pass it through a "80 hole sieve," then add the oils, and after well mixing them in, pass the whole through a coarse sieve (about 40 holes to the inch), to ensure perfect admixture.

b. Hay saffron, 4 *oz.; turmeric*, 3 *oz.; powdered starch*, 8 *oz.; precipitated chalk*, 2 *lb.; white sugar*, 4 *lb.; oils of cloves* and *cassia*, of each, 3 dr.; *oil of nutmeg*, 2 dr.; *essence of cardamoms*, 1 *oz.;* boil the saffron and turmeric in 1 gallon of water, placed in a *bright copper pan*, for 10 minutes, then, without straining, add the chalk, starch and sugar; mix well, and continue stirring until the mixture becomes quite stiff, then break it up, dry it thoroughly by the heat of a steam or water bath; next reduce it to *fine* powder, which must be passed through a fine sieve, as before; the oils and tincture are now to be added, and after being well mixed, and passed through a coarse sieve, it should be placed in a jar or bottle, and bunged up close. Very bright coloured.

Obs. In the wholesale *trade* this article is kept under two forms—*one*, in *powder*, as ordered by the College, and commonly called for distinction sake "*pulvis confectionis aromaticæ;*" the *other*, mixed up ready for use. In preparing the latter, it is a common plan to make a strong infusion or decoction of the saffron, and to use it to mix up the other ingredients, adding the aromatics last. (See 4, *b.*) When the price of *precipitated chalk* is an objection to its use, *prepared chalk* may be used instead.

There is much anxiety evinced by the wholesale druggists to prepare this confection of a rich colour, without an undue expenditure of saffron, which is generally economised on account of its costliness. This confection is cordial, stimulant, antacid, and carminative. *Dose.* 10 to 60 gr., either as a bolus or stirred up with a glass of water; in diarrhœa, acidity of stomach, heartburn, and any like affection, if accompanied by looseness of the bowels. In diarrhœa, English cholera, and flatulent colic, ¼ gr. of powdered opium may be added to each dose.

CONFECTION (Bark). Syn. *Confectio Cinchonæ*,—Lat. *Prep.* 1. *Yellow bark* and *white sugar*, of each, 1 oz.; *capsicum*, 1 dr.; *simple syrup*, 4 oz.

2. (St. B. Hosp.) *Yellow bark*, 6 dr.; *ginger*, ½ dr.; *treacle*, 3½ oz. *Dose.* 1 to 6 dr., where the use of bark is indicated.

CONFECTION (Cassia). Syn. *Confectio Cassiæ*,—Ph. L. *Prep.* (Ph. L.) *Prepared cassia*, ½ lb; *manna*, 2 oz.; *prepared tamarinds*, 1 oz.; *syrup of roses*, 8 fl. oz.; mix with heat, and evaporate to a proper consistence. *Dose.* 2 dr. to 6 dr., or more, as a laxative.

CONFECTIO (Catechu). Syn. *Confectio Catechu Composita*,—Ph. D. *Prep.* (Ph. D.) *Compound powder of catechu*, 5 *oz.; simple syrup*, 5 fl. oz. *Dose.* 10 gr. to 20 gr.; as an astringent, in diarrhœa, &c.; either alone or combined with chalk.

CONFECTIO (Copaiba). Syn. *Confectio Copaibæ*,—Lat. *Prep.* (Berton.) *Copaiba* and *powdered cubebs*, of each, 2 oz.; *alum*, 1 oz.; *opium*, 5 gr.; mix well.

2. (Swediaur.) *Turpentine*, 1 oz.; *copaiba*, ½ oz.; mix; add *mucilage of gum arabic*, 1 oz.; triturate to an emulsion, and further add, *conserve of roses*, 4 oz.

3. (Traill.) *Copaiba*, 2 oz.; *oatmeal*, q. s. to form an electuary; then add, *conserve of roses*, 1 oz.

4. (Voght.) *Copaiba* and *powdered cubebs*, of each, 4½ dr.; *yelk of* 1 *egg; conserve of roses*, ½ oz. All the above are excellent medicines in gonorrhœa. *Dose.* 1 to 3 dr. three or four times a day, made into boluses, and covered with the fresh emptied skin of a prune before being swallowed; in gonorrhœa, gleet, &c.

CONFECTION (Cream of Tartar). Syn. *Confection of Bitartrate of Potassa; Confectio Potassæ Bitartratis*,—Lat. *Prep.* 1. *Cream of tartar* and *powdered sugar*, of each, 1 oz.; *simple syrup*, 2 oz.; 1 *nutmeg*, grated. *Dose.* 2 dr. to 6 dr.

2. (St. B. Hosp.) *Bitartrate of potassa* and *simple syrup*, of each, 3 oz.; *ginger*, 1 dr. *Dose.* 1½ dr. to 5 dr. Both are laxatives well adapted for women and children.

CONFECTION (Damocrates'). See *Mithridate.*

CONFECTION (Hemlock). Syn. *Confectio Conii*,—Lat. *Prep.* (Marshall Hall.) *Fresh hemlock leaves* beaten up with an equal weight of *sugar*. *Dose.* 10 to 20 gr., as a bolus, 2 or 3 times daily, where the use of hemlock is indicated. The *confection* of other *narcotic plants* may be made in the same way.

CONFECTION (Hips). Syn. *Conserve of Hips; Confection of Dog Rose, Conserve of do.; Confectio Rosæ Caninæ*,—Ph. L. *Conserva Rosæ Fructûs*,—Ph. E. *Conserva Cynosbati*,—Ph. L. 1788. *Prep.* (Ph. L.) *Fruit of the dog rose*, without the seeds (carpels) 1 lb; pound it to a pulp, add, gradually, *powdered white sugar*, 20 oz.; and beat them together until thoroughly incorporated.

2. (Ph. L. 1836.) As above, but employing a gentle heat.

3. (Ph. E.) *Pulp of hips*, 1 part; *white sugar*, 3 parts; as No. 1.

4. (Wholesale.) *Pulped hips*, 2 cwt.; *fine white sugar*, 3 cwt.; incorporate them without applying heat.

Obs. Both this and the confection of red roses have a brighter colour, if made without heat, or touching metallic vessels, On the *small scale* it is generally made by beating the ingredients together in a marble mortar, but in *large quantities* by grinding in a mill. Great care must be taken to remove the seeds (*akenia* or *carpels*) with the hair surrounding them, before pulping the fruit; as they are apt, like the hairs of cowhage, when swallowed, to produce vomiting, itching about the anus, &c. This conserve is slightly laxative, and is principally used for forming pills. It is very apt to candy by keeping.

CONFECTION (Ipecacuanha). Syn. *Confectio Ipecacuanhæ*,—Lat. *Prep.* (Bories.) *Ipecacuanha*, 12 gr.; *sulphur*, 20 gr.; *orris root*, 1 dr.; *syrup of mallows* and *manna*, of each, 2 oz. *Dose.* A teaspoonful 2 or 3 times daily; in hooping-cough, dyspepsia, &c.

CONFECTION (Jalap). Syn. *Confectio Jalapæ, C. J. Composita.*—Lat. *Prep.* (St. B. Hosp.) *Jalap*, 4 dr.; *ginger*, 1 dr.; *bitartrate of potassa*, 3 oz.; *treacle*, 5 oz. *Dose.* 1 to 3 dr., as a purgative.

CONFECTION (Mercury). Syn. *Confectio Hydrargyri, C. Mercurialis*,—Lat. *Prep.* 1. *Stronger mercurial ointment* (Ph. L.), 1 part; *conserve of roses*, 3 parts

2. (Dr. D. Davis.) *Mercury* and *manna*, equal parts; *treacle*, q. s.; triturate until the globules of mercury disappear.

Dose, &c. The same as those of mercurial pill.

CONFECTION (Nitre). Syn. *Confectio Potassæ Nitratis*,—Lat. *Prep.* 1. *Nitre*, 1 part; *confection of roses*, 6 parts; *oil of juniper*, a few drops.

2. (St. B. Hosp.) As the last without the *juniper*. Both are used in gonorrhœa.

CONFECTION (Opium). Syn. *Confectio Opii*,—Ph. L. & D. *C. Opiata*,—Ph. L. 1788. *Electuarium Opii*,—Ph. E. *Philonium Londinensis, P. Romanum*,—Obs. *Prep.* 1. (Ph. L.) *Powdered opium*, 6 dr.; *long pepper*, 1 oz.; *ginger*, 2 oz.; *caraways*, 3 oz.; *tragacanth*, 2 dr.; reduce to fine powder, and keep it in a closed vessel; for *use*, add to it by degrees, *hot syrup*, 16 fl. oz., (i. e., 3½ dr. of the powder to each fl. oz. of syrup.) It contains 1 gr. of opium in every 36 gr.

2. (Ph. E.) *Aromatic powder*, 6 oz.; *senega*, 3 oz.; *opium*, diffused in a little sherry, ½ oz.; *syrup of ginger*, 1 lb. Contains 1 gr. of opium in every 43 gr.

3. (Ph. D. 1826.) Resembles the London formula, except in containing 1 gr. of opium in every 25 gr.

Uses, &c. This confection is intended as a substitute for the once celebrated *Mithridate, philonium*, and *theriaca* of the old Pharmacopœias. It is stimulant, anodyne, and narcotic. *Dose.* 5 to 30 gr.; in flatulent colic and diarrhœa unaccompanied by fever.

CONFECTION (Orange Flowers). Syn. *Confectio Florum Aurantii*,—Lat. *Prep.* 1. *Orange flowers*, 1 part; *white sugar*, 2 parts; beat together to a confection.

2. (Tadei.) *Orange flowers*, 1 part; *simple syrup*, 3 parts; evaporate to a proper consistence. Both are used as agreeable adjuncts or vehicles for other medicines. The first is the best article.

CONFECTION (Orange Peel). Syn. *Conf. of Orange, Conserve of Orange Peel; Confectio Aurantii*,—Ph. L. *Conserva Aurantii*, Ph. E. *Conserva Aurantiorum*, Ph. L. 1824. *Prep.* (Ph. L.) *External rind of the fresh orange*, separated by rasping, 1 lb; beat it in a stone mortar with a wooden pestle to a pulp, then add, *white sugar*, 3 lb; and beat them together until incorporated.

2. (Ph. E.) As the last.

Uses, &c. This confection is an agreeable tonic and stomachic; it is much used as an adjunct to bitter and purgative powders, and as a vehicle for the sesquioxide of iron.

CONFECTION (Pepper). Syn. *Confection of Black Pepper, Conserve of do., Ward's Paste; Confectio Piperis*,—Ph. L. *C. P. Nigri*,—Ph. D. & Ph. L. 1836. *Electuarium Piperis*,—Ph. E. *Prep.* 1. (Ph. L.) *Black pepper* and *elecampane*, of each, 1 lb; *fennel*, 3 lb; *white sugar*, 2 lb; reduce to a very fine powder, and keep it in a covered vessel; for *use*, add it, gradually, to *honey*, 2 lb; and beat the whole to a paste, (*i. e.*, 2 oz. of *honey*, to each 7 oz. of powder.)

2. (Ph. E.) As the last, but using *liquorice powder* instead of *elecampane*, and at once making a confection.

3. (Ph. D.) *Black pepper* and *liquorice root*, of each, ½ *oz.*; *refined sugar*, 1 *oz.*; *oil of fennel*, ½ *fl. oz.*; *honey*, 2 *oz.*; mix. *Dose*, of each of the above, 1 to 3 dr., two or three times daily for 3 or 4 months; in piles, fistula, &c., unaccompanied with inflammatory symptoms. Or, it may be used as a suppository. It is intended as a substitute for the once celebrated nostrum, *Ward's Paste for the Piles.*

CONFECTION (Peppermint). Syn. *Confectio Menthæ Piperitæ*,—Lat. *Green peppermint*, 4 oz.; *white sugar*, 12 oz. Antiemetic and anti-flatulent; in colic, diarrhœa, &c.; in the form of a bolus, or made into a mixture.

CONFECTION (Resin). Syn. *Confectio Resinæ*,—Lat. *Prep.* (Dr. Watson.) *Powdered resin*, 1 oz.; *balsam of copaiba*, ½ oz.; *honey*, 5 oz. *Dose.* 1 to 3 dr.; in piles and gleet. It is best combined with a little *confection of orange peel*, which effectually covers the taste of the copaiba.

CONFECTION (Roses). Syn. *Confection of Red Roses; Confectio Rosæ*,—Ph. L. & D. *Conserva Rosæ*,—Ph. E. *Confectio Rosæ Gallicæ*,—Ph. L. 1835. *Conserva R. G.*,—Ph. L. 1824. *Prep.* 1. (Ph. L.) *Fresh petals* (unopened flowers) *of red roses*, 1 lb; *white sugar*, 3 lb; as confection of hips.

2. (Ph. E.) *Fresh petals*, 1 part; *sugar*, 2 parts.

3. (Ph. D.)—*a. Fresh petals*, 3 *oz.*; *sugar*, 8 *oz.* Or—

b. Dried petals, 1 *oz.*; *water*, 2 fl. oz.; macerate for 2 hours; then add *refined sugar*, 8 *oz.*, and beat to a mass, as before.

Obs. It is astringent and tonic, but is principally used as an elegant vehicle for more active medicines. It keeps well, and does not "candy" like confection of hips. *Dose.* 1 to 2 dr., eaten off a spoon, either alone or combined with chalk; in slight

cases of diarrhœa, vomiting in pregnancy, &c.

CONFECTION (Rue). Syn. *Confectio Rutæ*, Ph. L. *Electuarium è Baccis Lauri*, —Ph. L. 1745, &c. *Prep.* (Ph. L.) *Fresh rue*, (bruised,) *caraways*, and *laurel berries*, of each, 1½ oz.; *prepared sagapenum*, ½ oz.; *black pepper*, 2 dr.; *honey*, 16 oz.; *water*, q. s.; rub the dry ingredients to a fine powder, then add, gradually, the *sagapenum*, previously dissolved in the water and honey over a slow fire, and mix well. In the Ph. L. 1836, dried rue was ordered. Carminative and antispasmodic. In flatulent colic, and in the convulsions of children, when there is no inflammation. *Dose.* 15 to 60 gr.; either by the mouth, or made into an enema with gruel.

CONFECTION (Scammony). Syn. *Confectio Scammonii*,—Ph. L. *Electuarium Scammonii*,—Ph. D. *E. Caryocostimum*, Ph. L. 1720. *Prep.* 1. (Ph. L.) *Scammony*, 1½ oz.; *cloves* and *ginger*, of each, 6 dr.; reduce to a fine powder, and when wanted for use, add *oil of caraway*, ½ fl. dr.; *syrup of roses*, q. s. to make a confection.

2. (Ph. D.) As the last. *Dose.* 10 gr. to 60 gr.; as a warm carthartic, and in worms, &c.

CONFECTION (Senna). Syn. *Lenitive Electuary*, *Electuary of Senna*; *Confectio Sennæ*, — Ph. L. and D. *Electuarium Sennæ*.—Ph. E. *E. Lenitivum*,—Ph. L. 1746. *Prep.* 1. *Senna*, 8 oz.; *corianders*, 4 oz.; rub them together, and by a sieve separate 10 oz. of the mixed powder; also boil *figs*, 1 lb, and *fresh liquorice*, bruised, 3 oz., in *water*, 3 pints, until reduced to one-half; press, strain, and evaporate the strained liquor in a water bath to 24 fl. oz.; then add *sugar*, 2½ lb; dissolve, and further add, *prepared tamarinds*, *cassia*, and *prunes*, of each, ½ lb; remove from the heat, and when the whole has considerably cooled, add the sifted powder, by degrees, and stir until the whole is thoroughly incorporated.

2. (Ph. E.) *Senna*, 8 oz.; *corianders*, 4 oz.; *liquorice root*, 3 oz.; *figs* and *pulp of prunes*, of each, 1 lb; *white sugar*, 2½ lb; *water*, 3¼ pints.

3. (Ph. D.) *Senna leaves*, in fine powder, 2 *oz.*; *corianders* (in fine powder), 1 *oz.*; *oil of caraway*, ½ *dr.*; mix, and add them to *pulp of prunes*, 5 *oz.*; *pulp of tamarinds*, 2 *oz.*; *brown sugar*, 8 *oz.*; *water*, 2 *fl. oz.*; previously brought to a smooth paste by the heat of a water bath.

Uses, &c. Confection of senna is a gentle and pleasant purgative, and well adapted for persons suffering from piles, and as a laxative during pregnancy. The dose is 1 dr. to ½ *oz.*, taken at bedtime or early in the morning.

Obs. There is no one pharmacopœial preparation which it is more difficult to obtain of good quality than confection of senna. The absolute cost of an article prepared according to the directions of the Colleges, is greater than the price at which many wholesale houses are vending the drug. Dr. Paris very truly remarks, that "the directions of the Pharmacopœia are very rarely followed." Considerable quantities are manufactured, into which unsound and spoilt apples enter as a principal ingredient; whilst the substitution of *jalap* for the whole, or a portion of the *senna*, is a very common practice. We have seen the following forms employed in the trade.

4. *Powdered senna*, *pulp of tamarinds*, *cassia*, and *prunes*, of each, 1½ *lb.*; *powdered corianders*, ¾ *lb.*; *Spanish juice*, ½ *lb.*; *simple syrup*, 12 *lb.*

5. As the above, but omitting the *cassia pulp*, and adding 2 *lb.* more *tamarind pulp*. Both these articles are labelled "P. L." and sent out as *genuine*, and that when *no competition* as to price exists. The cheaper article is made as follows:—

6. *Common prunes* and *tamarinds*, of each, 16 *lb.*; *treacle*, ¾ *cwt.*; *species*, (a compound of *senna dust* and *small senna*, mixed with 3 *lb.* of *coriander seeds*, and strengthened with *jalap*; all ground to a fine powder), 18¼ *lb.* To this is frequently added of *rotten* or *inferior apples*, ¼ *cwt.*, which are pulped with the prunes and tamarinds. This article is commonly labelled "Conf. Sennæ Ver." by the conscientious druggist.

CONFECTION (Sponge). Syn. *Electuary of burnt Sponge*; *Confectio Spongii*, *C. S. Ustæ*,—Lat. *Prep.* 1. *Burnt Sponge*, 3 parts; *confection of orange peel* and *hips*, of each, 1 part; *simple syrup*, q. s.

2. (St. B. Hosp.) *Burnt sponge*, made into a confection with *syrup of orange peel*. The first form produces the most agreeable confection. *Dose*, of either, ½ dr. to 2 dr., twice or thrice daily; in scrofula, &c.

CONFECTION (Steel). *Prep.* 1. (*Confectio Ferri Sesquioxidi*, *C. F. Subcarbonatis*).—*a.* From *confection of orange* and *sesquioxide of iron* (Ph. L.), of each, 2 oz.; *white sugar*, 3 oz.; *syrup*, 1½ oz.; mix. *Dose.* 1 dr. to 3 dr.

b. (St. B. Hosp.) *Sesquioxide of iron*, 1 oz.; *treacle*, q. s. *Dose.* ½ dr. to 1 dr. Both are given in the usual cases wherein iron is indicated; especially in anæmia, chlorosis, and amenorrhœa.

2. (*Confectio Ferri Tartarizati*,—St. B. Hosp.) *Cream of tartar*, 1½ oz.; *tartrate of iron*, 2 dr.; *ginger*, 1 dr.; *treacle*, 2½ oz., or q. s. *Dose.* 1 dr. to 2 dr.; 2 or 3 times daily.

CONFECTION (Sulphur). Syn. *Confectio Sulphuris*,—Lat. *Prep.* 1. *Sublimed sulphur*, 2 *oz.*; *treacle*, 4 *oz.* This is the "*brimstone* and *treacle*" of the lower classes. *Dose.* A spoonful night and morning for a week or longer, as an alterative or purifier of the blood; in skin diseases, &c.

2. (St. B. Hosp.) *Precipitated sulphur*, 1 oz., *cream of tartar*, 2 dr.; *honey* or *treacle*, 2 oz. As the last.

3. (Ph. D.) *Flowers of sulphur*, 2 *oz.*; *cream of tartar* and *honey*, of each 1 *oz.*; *syrups of ginger* and *saffron*, of each, ½ *fl. oz.* *Dose.* 1 to 2 dr.; as a laxative, in piles, gonorrhœa, &c.

CONFECTION (Tin). Syn. *Confectio Stanni*,—Lat. *Prep.* (Hosp. Form.) *Powdered tin*, 1 oz.; *confection of roses*, 2 oz.; mix. *Dose.* 2 to 4 dr., every morning; in worms.

CONFECTION (Turpentine). Syn. *Confectio Terebinthinæ*,—Lat. *Prep.* (Ph. D.) *Oil of turpentine*, 1 *fl. oz.*; *liquorice powder*, 1 *oz.*; triturate together, then add *clarified honey*, 2 *oz.* *Dose* and *use*, as the last.

CONFECTION (Worm Seed). Syn. *Confectio Cinæ*, *C. S. Cinæ*,—Lat. *Prep.* 1. (Ph. Slesvico-Holsat. 1831, and Ph. Suec. 1845.) *Wormseed*, 2 oz.; heat it in a pan over a gentle fire, add *white sugar*, boiled to a low candy height, 4 oz.; and stir together until they become dry; then pick out those seeds which are covered with sugar, and repeat the process with the others.

2. *Powdered worm-seed* and *syrup of orange peel*, equal parts. *Dose.* 1 to 2 dr. night and morning, followed by a brisk purge; in worms.

CONFECTIONERY. See *Candies*, *Drops*, *Stains*, *&c.*

CONGELATION. The conversion of a substance from the fluid to the solid state, by the abstraction of heat. See *Ice* and *Refrigeration.*

CONGLUTINUM (Bracy Clark's). *Sulphate of zinc* (white vitriol), 4 oz.; dissolved in *water*, 1 pint. *Used* as an astringent lotion in veterinary practice, and, much diluted with water, (a dessert spoonful to ¼ pint or more of water,) as a collyrium in chronic inflammation of the eyes.

CONIA. Syn. *Coneine*, *Conicine*, *Conicina*, *Cicutine.* An alkaloid, discovered by Gieseke in hemlock. It exists in every part of the plant, but is present in the largest quantity in the seed.

Prep. (Gieger.) The *seeds of hemlock*, or their *alcoholic extract*, is distilled with *water* and *potassa.* The *conia* passes over into the receiver, and floats on the top of the water, which also contains a little conia in solution. It is purified in the way directed for the volatile bases. (See *Alkaloid.*) When the alcoholic extract is employed, about half its weight of *potassa* should be used.

Prop., &c. Pure conia is an oily-looking liquid, smelling intensely of hemlock, or rather of a combination of the odours of tobacco and mice; volatile at common temperatures; reddens turmeric; boils at about 340° Fahr., but readily distils over with water at 212°; sp. gr. 0·89; with the acids it forms salts, some of which are crystallizable. 6 lb of *fresh* and 9 lb of dried seeds yielded 1 oz. of conia. (Gieger.) 40 lb of the ripe but green seeds yielded 2½ oz. of hydrated conia. (Christison.)

Conia is remarkably poisonous. 1 drop, placed in the eye of a rabbit, killed it in 9 minutes. 5 drops, poured into the throat of a dog, killed it in less than a minute. It has been employed in some convulsive and spasmodic diseases, but is now seldom used medicinally. "The plaintive cries, the contortions, and the rigidity of the limbs, which have always preceded death, (caused by conia,) leave no doubt as to the cruel pains which this kind of poisoning brings on." (Boutron-Chalard and Henry.) The *treatment* may be that recommended under *Aconite* and *Hemlock.*

CONSERVE. Syn. *Conserva*, — Lat. Recent vegetable matter, as *flowers*, *herbs*, *roots*, *fruit*, and *seed*, beaten with *powdered sugar* to the consistence of a stiff paste, so as to preserve them, as nearly as possible, in their natural freshness.—Conserves are made both by the *confectioner* and the *druggist*; by the *first*, as SWEETMEATS; by the *other*, chiefly as vehicles for more active medicines. The London College of Physicians now includes both *conserves* and *electuaries*, under the general head of *confections.* The term appears, however, in some cases, scarcely appropriate. The word confection has a more general application, and implies *any* sweatmeat or composition in which sugar is the principal ingredient. See *Confections* and *Electuaries.*

CONSERVE (Acetate of Potassa). Syn. *Conserva Potassæ Acetatis*,—Lat. *Prep.* (Bories.) *Acetate of potassa*, ½ oz.; *sulphate of soda*, 1 dr.; *juices of scurvy grass*, *fumitory*,

and *dandelion*, of each, 2 oz. (reduced to one-half by gentle evaporation?); *sugar*, q. s. to make a conserve. A teaspoonful 2 or 3 times daily, as a diuretic aperient; in obstruction of the bowels, &c.

CONSERVE (Almonds). See *Confections.*

CONSERVE (Angelica). Syn. *Conservæ Angelicæ*,—Lat. *Prep.* (Giordano.) *Fresh angelica root*, 2 parts; *water*, 16 parts; macerate for a few hours, clarify the liquor, add *sugar*, 3 parts; cook the root in the *syrup*, and preserve it in this state (*confection*), or dry it (to a candy.) *Used* as an agreeable tonic, stomachic, and carminative.

CONSERVE (Antiscorbutic). Syn. *Conserva Antiscorbutica*,—Lat. *Prep.* (Selle.) *Horse-radish*, *water-cress*, and *water-trefoil*, *orange-juice*, and *radish juice*, equal parts; *powdered white sugar*, q. s. to make a conserve. In scurvy, &c.

CONSERVE (Arum). Syn. *Conserva Ari, C. A. Maculati*,—Lat. *Prep.* From *fresh arum tubers* (cuckow-pint or wake-robin), ½ ℔; *sugar*, 2½ ℔. As a diuretic and attenuant, in dropsy, or as an expectorant in chronic coughs. *Dose.* ½ teaspoonful, gradually increased.

CONSERVE (Broom). Syn. *Conserva Scoparii*,—Lat. *Prep.* (Van Mons.) *Broom flowers*, 1 part; *sugar*, 2 parts. *Dose.* ½ to 2 teaspoonfuls, 2 or 3 times a day; in dropsy, gout, rheumatism, &c.

CONSERVE (Hips). See. *Confections.*

CONSERVE (Lavender). Syn. *Conserva Lavendulæ*,—Lat. *Flowers*, 1 part; *powdered lump sugar*, 3 parts; beaten together to a smooth paste. *Used* to sweeten the breath. In a similar way conserves are made from various other *leaves* and *flowers;* but mostly with only twice their weight of sugar, when they are not very odorous or active.

CONSERVE (Lemon Peel). Syn. *Conserva Limonis, C. L. Corticis*,—Lat. As *conserve of orange peel.*

CONSERVE (Mallows). Syn. *Conserva Malvæ*,—Lat. From the *flowers*, as *conserve of lavender.*

CONSERVE (Orange Peel). See *Confections.*

CONSERVE (Peppermint). See *Confections.*

CONSERVE (Rosemary). Syn. *Conserva Rosmarini*,—Lat. As *Conserve of Lavender.*

CONSERVE (Roses). See *Confections.*

CONSERVE (Roses,—Acidulated.) Syn. *Conserva Rosæ Acida*,—Lat. *Prep.* (Hosp. F.) *Confection of roses* and *powdered gum*, of each, 1 oz.; *sulphuric acid*, 1 dr. to 1½ dr.; (diluted with) *water*, 2 dr. An excellent substitute for tamarinds.

CONSERVE (Savine). Syn. *Conserva Sabinæ*,—Lat. *Prep.* (Ph. Han.) *Fresh savine*, 1 part; *sugar*, 2 parts. As an emmenagogue, in amenorrhœa, &c. Three parts of sugar make a better conserve.

CONSERVE (Scurvy Grass). Syn. *Conserva Cochleariæ, C. C. Hortensis*,—Lat. *Prep.* (Ph. Aust. 1836.) *Fresh scurvy grass*, 1 ℔; *sugar*, 3 ℔. Stimulant and antiscorbutic.

CONSERVE (Sea Wormwood). Syn. *Conserva Absinthii Maritimi*,—Lat. *Prep.* (Ph. L. 1788.) From *sea wormwood*, as the last. As a stomachic bitter and vermifuge; in dyspepsia, &c.

CONSERVE (Sloes). Syn. *Conserva Pruni Sylvestri*,—Lat. *Prep.* (Ph. L. 1788.) From the *pulp of the fruit*, 1 part; *sugar*, 3 parts. Astringent. Useful in simple diarrhœa, &c.; either alone or combined with chalk.

CONSERVE (Squills). Syn. *Conserva Scillæ*,—Lat. *Prep.* (Ph. L. 1788.) *Fresh squills*, 1 oz.; *sugar*, 5 oz. Diuretic, attenuant, and expectorant; in dropsy, chronic coughs, &c. *Dose.* 10 to 20 gr.

CONSERVE (Tamarinds). Syn. *Conserva Tamarindorum*,—Lat. *Prep.* (P. Cod.) *Tamarind pulp*, 2 oz.; *white sugar*, 3 oz.; evaporate by the heat of a water bath to the consistence of honey.

CONSERVE (Violets). Syn. *Conserva Violæ, C. V. Odoratæ*,—Lat. *Prep.* (Soubeiran.) *Flowers*, 1 part; *sugar*, 3 parts; beat to a paste. Demulcent and laxative; used as a purge for infants, and by ladies to perfume the breath.

CONSERVE (Water-cress). Syn. *Conserva Nasturtii*,—Lat. *Prep.* (Ph. Græca, 1837.) From *fresh water-cresses*, as the last. In scurvy; taken ad libitum.

CONSERVE (Wormwood). See *Conserve of Sea Wormwood.*

CONSTIPATION. Syn. *Constipatio, Obstipatio*,—Lat. Surgeons distinguish between *costiveness* and *constipation.* The *first* applies to that condition of the body in which the bowels act tardily, and in which the fæces are abnormally and inconveniently indurated; the *last*, implies the absence of the proper alvine evacuations. The *one* rapidly undermines the health; the *other* destroys life in a period varying from a few days to 3 or 4 weeks. In popular language, however, the words are frequently used synonymously. When the affection is merely *accidental* or *occasional*, a dose of some aperient or cathartic is the

only treatment necessary; but when it is *habitual*, it calls for further attention. The *common causes* of constipation are:—The use of bread containing alum, and water containing lime (very hard water); and the want of sufficient exercise. The treatment may consist in adopting a diet free from *astringents*, and consisting of a large portion of *green vegetables* and *ripe fruit*; particularly avoiding the use of *over-cooked*, salted, or dried animal food. *Brown bread* should alone be eaten, as it acts as a gentle laxative from the bran it contains. The *occasional* use of aperient and emollient enemata may be had recourse to; but their habitual administration, as well as that of purgative medicines generally, by the mouth, is not to be recommended. The bowels, accustomed to the continual use of stimulants, act but languidly or scarcely at all, without their application. In *females*, especially of the higher classes, the want of proper exercise is commonly the chief cause of this affection. With such persons, a short walk, two or three times daily, will often do wonders, particularly if a little *ripe fruit*, a few *raisins* or *tamarinds*, or, still better, 2 or 3 *drum figs*, be occasionally eaten. In some cases of obstinate constipation a *cold water dressing*, placed over the pit of the stomach or the abdomen, will cause the bowels to act in the course of an hour or two. When the inactivity of the bowels arises from a deficiency of bile, (one of the most common causes,) no remedy is more natural, or more effective, than *inspissated ox-gall*. In cases complicated with nervous, hypochondriacal, or hysterical affections, in chlorosis, dyspepsia, depraved appetite, and numerous other ailments, accompanied by the accumulation of hard fæcal matter in the intestines, especially with clay-coloured stools, this substance frequently succeeds, after the most active articles of the materia medica have been tried in vain. See *Ox-gall*, *Purgatives*, *&c.*

In the treatment of the *constipation of infants*, *castor-oil* (½ tea-spoonful occasionally), or *manna* (¼ to ½ oz., sucked at will), may be given. The introduction (very gently) of a little slip of writing paper, parsley stalk, or suet, is a method sometimes adopted successfully by nurses. Friction on the stomach and bowels with the warm hand, or a piece of soft flannel, should also be employed.

CONSUMPTION. See *Phthisis*.

CONTAGION. See *Disinfectants*.

CONTUSIONS. See *Bruises* and *Abrasions*.

COOKERY. See *Baking*, *Boiling*, *Roasting*, *&c.*

COPAIBA. Syn. *Copaiva*, *Capivi*, *Balsam of Capivi*, *&c.*; *Copaiba*,—Ph. L. E. & D. "An oleo-resin, flowing from the incised stem" of "*copaifera multijuga* (Hayne) and other allied species." (Ph. L.) The *best copaiba* is that imported from *Maracaibo* and *St. Martha*, and is packed in casks containing from 1 to 1½ cwt. each, or in large bottles, or in cylindrical tin boxes. Considerable variation exists in the colour, odour, consistence, and transparency, as well as in the proportion of oil and resin yielded by different samples, scarcely any two of which exactly agree. The sp. gr. varies from 0·950 to 0·996. *Brazilian capivi* is thin, clear, and pale; whilst the *West Indian* variety is thick, golden yellow, less transparent, and has a less agreeable and somewhat terebinthinate smell. Some varieties are opaque and continue so unless filtered. This is often a most troublesome operation. The opacity generally arises from the presence of water, which it retains with great tenacity. The following is the plan we have found to answer on the large scale:—Place the casks upon their ends in a warm situation, and leave them so for 10 days or a fortnight, or longer, if convenient. They may then be tapped *a little above the bottom*, when some of them will generally be found quite transparent, and may be drawn off and vatted, care being taken to avoid shaking up the bottom. Those that are foul must be filtered through one or more long Canton flannel bags, sunk in the bottom of a tin cistern, placed over a suitable receiver, in a similar way to that adopted for oils; a few pounds of coarsely powdered charcoal being mixed up with the first 5 or 6 gallons thrown in. This will rapidly fill up the pores of the bag and make the balsam soon flow clear and pale. The "bottoms" of the casks, containing the water and impurities, may be poured into a large can or jar, and allowed to settle for a few days, when the copaiba may be poured off the top and filtered. A sudden change of temperature will frequently turn a *transparent* sample of this article *opaque* or *milky*; it is not, therefore, deemed fit to "send out" by the wholesale trade, unless it "*stands*" this test. To ascertain this point, a common practice is to fill a small bottle with the copaiba, and to leave it out of doors all night in an exposed situation.

Pur. This substance is frequently adulterated; indeed, fully one half that sold for capivi does not contain 10% of the genuine balsam. This is particularly the case with

that sold in capsules, at low prices, in the shops. Pure *balsam of copaiba* should stand the following tests:—

1. (Ph. E.) It is "transparent; free of turpentine odour when heated; soluble in 2 parts of alcohol; and dissolves one fourth of its weight of carbonate of magnesia with the aid of a gentle heat, and continues translucent."

2. (Chevallier.) A drop of the balsam, placed on a piece of unsized paper, and heated until all the essential oil is expelled, forms a semi-transparent *well-defined spot*; but if the balsam has been adulterated with a fatty oil, it is surrounded by an oily areola.

3. (Planche.) 2½ parts of *balsam* shaken with 1 part of *liquor of ammonia*, sp. gr. 0·965, forms a mixture which becomes clear and transparent in a few moments, and may be heated to 212° Fahr. without becoming opaque.

4. (Vigne.) Boiled with 50 times its weight of water for 1 hour, it should lose at least half its weight.

5. (Adder.) By agitating the suspected sample with a lye of caustic soda, and setting the mixture aside to repose, the balsam after a time rises to the surface, and the fatty oil present (if any) forms a soapy thick mass below.

6. (Journ. de Pharm. 1842.) Pure copaiba may be adulterated with 50 per cent. of a fat oil (nut, almond, or castor oil,) without it ceasing to give a clear solution with 2 parts of alcohol; but it combines badly with magnesia and ammonia. Excess of alcohol, however, separates the oil in all cases. The best test for detecting the fat oils is the use of pure alcohol, to which some caustic potash has been added.

Uses, &c. Balsam of copaiba is considered detersive, vulnerary, diuretic, and astringent; and appears to possess a sort of specific power over diseases of the mucous membranes of the urino-genital organs. It is hence a favorite remedy in gonorrhœa, as soon as the first inflammatory symptoms have subsided, antiphlogistic and soothing measures being previously adopted. *Dose.* 20 to 60 drops on sugar, or floating on water, to which 30 or 40 drops of elixir of vitriol have been added, 3 or 4 times daily, if the stomach will bear it. The addition of a few drops of *sweet spirits of nitre* and *laudanum* have also been recommended, to allay the nausea. We have proved by extensive experience, that by adding 1 dr. of oil of orange (ol. aurantii) to each oz. of the balsam, its flavour becomes far from disagreeable, and it sits well upon the stomach. Capivi is also given in the form of *syrup*, *mixtures*, *pills*, *clysters*, *&c.*, (which see.)

Obs. Numerous preparations of this article are continually being "puffed off" by certain advertising druggists; as "*soluble copaiba*," "*specific solution*," "*salt of copaiba*," &c.; of which *none* appear to possess equal activity and certainty of operation to the natural balsam. As the whole virtue of copaiba as a medicine depends on the essential oil it contains, the value of any of these preparations may be estimated by the quantity of that article which is found in them. In the case of the first two articles above mentioned, the quantity is *very small indeed*, and in the last it is *wholly deficient*. Hence the large doses of these articles that may be taken with impunity, as far as their balsamic properties go, always excepting, of course, the danger of burning a hole through the coats of the stomach with the large quantity of caustic potassa which they contain.

The following forms are current in the trade for the "reduction" (adulteration) of balsam of capivi:—

1. *Balsam of copaiba*, 4 *lb.*; *castor oil*, 3 *lb.*; mix well.

2. *Balsam*, 7 *lb.*; *castor oil*, 4 *lb.*; *yellow rosin*, 2 *lb.*

3. Equal parts of *balsam of copaiba* and *balsam of Canada*.

4. To the last add, *Venice turpentine*, 1 *lb.*

5. *Balsams of Canada* and *copaiba*, and *nut* or *castor oil*, equal parts.

6. *Copaiba*, 7 *lb.*; *nut oil*, 3 *lb.*; *yellow rosin*, 2 *lb.*; *balsam of Canada*, 1 *lb.* Used to fill the cheap capsules; and to sell in the lower parts of London and in the manufacturing districts. (See below.)

COPAIBA (Factitious). Syn. *Copaiba Factitia*, *Balsamum Copaibæ Factitium*. *Prep.* 1. *Castor oil* (warm), 7 quarts; *capivi bottoms*, 1 quart; mix, and filter through flannel.

2. *Castor oil*, 1 gall.; *yellow rosin*, 3 *lb.*; *balsam of Canada*, 2 *lb.*; *oil of juniper*, 2 *oz.*; *oil of savine*, 1 *oz.*; *essences of orange* and *lemon*, of each, ½ *oz.*; *powdered benzoin*, 1 *oz.*; melt the resin with the castor oil and benzoin, and when nearly cold add the essences.

3. *Balsam of Canada*, 9 *lb.*; *castor oil*, 7 *lb.*; *yellow resin*, 1 *lb.*; *Venice turpentine*, 2 *lb.*; *oils of rosemary*, *juniper*, and *savine*, of each, 1 dr.; *essential oil of almonds*, 20 drops.

4. *Balsam of Canada*, 3 *lb.*; *Venice turpentine*, 1 *lb.*; *oils of fennel*, *juniper*, and *savine*, of each, q. s. Used chiefly to fill

capsules. It is readily distinguished from balsam of copaiba by the proper tests. (See *above.*) *Train oil* or *nut oil* is frequently substituted for the castor oil.

COPAIBA (Miscible). *Prep.* From *balsam of copaiba*, (pure and transparent,) mixed with half its volume of *liquor of potassa* made of double the strength ordered in the Ph. L.

Obs. As different samples of copaiba often require *slightly* different quantities of the solution of potassa, it is best to mix the two gradually and cautiously together. Should the mixture be opaque, a *little* more of one or other of the ingredients, as the case may be, will render it clear. *No heat* must be used. This article is miscible with water, with which it forms a kind of milk; and from containing *all* the volatile oil of the copaiba, is a very valuable preparation. Its activity is considered equal to that of the balsam itself, and it is given in similar doses.

COPAIBA (Soluble). Syn. *Copaiba Solubilis*,—Lat. *Prep.* 1. Heat *miscible copaiba* in an earthen, glass, or bright-tinned copper-vessel, to nearly the boiling-point, pour it while still hot into a "separator," cover it up, and allow it to cool very slowly. After a few days, draw off the clear portion from a cock or hole placed at or near the bottom of the vessel, observing to reject the few first drops which pass through, and to stop the stream before any of the floating oil (*oleum copaibæ*) reaches the orifice. A *very little* concentrated liquor of potassa, added before applying the heat, renders it more soluble. Thick, transparent, soluble in *pure* water, and resembles the natural balsam in appearance.

2. *Balsam of copaiba* and *liquor of potassa* (Ph. L.,) equal parts, by volume; mix, boil for a few minutes, and then proceed as before. Thinner than the last. Less powerful than *miscible copaiba*, but it sits better on the stomach, and is about four times as strong as *specific solution of copaiba.*

COPAIBA (Resin of). Syn. *Copaibæ Resina*,—Lat. The *residuum* of the process of *distilling the oil of copaiba* from the balsam. It consists principally of copaibic acid. It has been recommended for gonorrhœa, but is nearly inert, even in ½ oz. or ¾ oz. doses.

COPAIBA (Salt of). Syn. *Sal Copaibæ*,—Lat. There are two preparations sold under this name; the one, *crude copaibic acid;* the other, *copaibate of an alkali.* Neither of them possesses the valuable properties of copaiba, which reside almost entirely in its essential oil. We have taken the "*sal copaibæ*," and have watched its action on others, but have not been able to perceive any good effects to result from its administration.

COPAIBA AND KALI. Syn. *Copaiba cum Potassâ*,—Lat. *Prep. Carbonate of potassa* and *water*, of each, equal parts; dissolve, and add, gradually, *transparent balsam of copaiba*, until the fluid, at first milky, turns quite clear. Resembles miscible copaiba.

COPAIBA CAPSULES. See *Capsules.*

COPAIBIC ACID. Syn. *Capivic Acid*, *Yellow Resin of Copaiba.* Prepared by digesting *resin of copaiba* in *alcohol*, and evaporating the solution. It may be purified by redissolving it in *alcohol.* It forms about 50% of the balsam.

Prop., &c. An amber-coloured, brittle, semi-crystalline, resinous substance, soluble in alcohol, rectified spirit, ether, and oils, reddens litmus paper, and forms salts with the bases, called *copaibates.* The *insoluble copaibates*, as those of *silver*, *iron*, *lead*, *lime*, *&c.*, may be made by dropping into a *solution of the acid in alcohol*, an *alcoholic solution of a salt of the base*, followed by the addition of a little *liquor of ammonia*, when the salts subside as a semi-crystalline powder. *Copaibate of potassa* (sal copaibæ), of *soda*, and of *ammonia*, are easily prepared, by neutralizing an *alcoholic solution of the acid* with the *pure alkali*, and carefully evaporating the solution. The first two are soluble in water, and alcohol; the last is insoluble in water, but soluble in both alcohol and ether. *Copaibate of magnesia* is made by adding *copaibate of potassa* to a solution of *epsom salts.* All these salts are easily decomposed by acids.

COPAL. Syn. *Gum Copal.* A resinous substance, which exudes spontaneously from the *rhus copallinum* and the *elæocarpus copalifer.* When of good quality it is too hard to be scratched by the nail, has a conchoidal fracture, and a sp. gr. ranging from 1·059 to 1·072. It dissolves with difficulty, and this combined with its extreme hardness, renders it very valuable for making varnishes. Among its best SOLVENTS, are—

1. *Absolute alcohol;* (alcohol, 1½ parts; copal, 1 part; by digestion for 24 hours, then adding more alcohol.)

2. *Absolute alcohol;* (added gradually, the gum having been previously rendered gelatinous with liquor of ammonia, or softened with ether.)

3. *Alcohol;* (the gum having been previously fused, or triturated with a little powdered camphor.)

4. *Camphorated alcohol;* (½ to 1 oz. to the quart.)

5. *Camphorated oil of turpentine;* (as the last, with heat.)

6. *Caoutchoucine;* (sparingly.)

7. *Caoutchoucine and alcohol* (sp. gr. 0·825), equal volumes; (freely in the cold.)

8. *Drying oil;* (nearly boiling; solution is afterwards thinned with oil of turpentine.)

9. *Ether;* (freely in the cold; the solution may be thinned with alcohol.)

10. *Oil of turpentine;* (only when very recent, or when previously digested for some time on sulphur.)

11. *Oils of rosemary, spike lavender, &c.;* (too expensive for general use.)

12. Copal, *heated until it fuses,* (MELTED COPAL,) then cooled and powdered, becomes soluble in alcohol and oil of turpentine, but the hardness of the varnish suffers a little.

13. Copal, *in powder, exposed* for *some time* (2 or 3 months) *to the air,* acquires the same properties as the last.

In all the above cases the copal should be reduced to a *coarse powder.* A *fine powder* is apt to stick together and run into hard lumps. The solution of copal, even in its most ready solvents, is attended with some difficulty, and frequently miscarries in the hands of the inexperienced. No 7 is an exception. See *Varnishes.*

COPPER. Syn. *Cuprum,*—Lat. This metal is found in the metallic state, and in combination with oxygen, sulphur, acids, and other minerals, and in the organic kingdom, in the ashes of plants, and in the blood of animals. (Sarzeau.) The *copper of commerce* is principally prepared from *copper pyrites,* a mixed sulphuret of iron and copper, found in Cornwall, and other parts of the world.

Prep. Copper is only prepared from its ores on the large scale. The *copper pyrites* is first roasted, and then smelted, by which process "*coarse metal*" is produced; this is again submitted to calcination and smelting, when "*fine metal*" is obtained, which is run into "pigs." It afterwards undergoes the process of refining and toughening. It is employed in the laboratory under the following forms:—

1. (*Bean-shot copper.*) Commercial *refined copper,* melted and poured in a small stream into *boiling water.* In small lumps like peas and beans; hence its name. Used to make alloys, solutions, &c.

2. (*Blanched copper.*) From *refined copper,* fused with $\frac{1}{16}$th of its weight of *neutral arsenical salt,* under a flux of *calcined borax, charcoal,* and *powdered glass.* Superior to the last.

3. (*Feather-shot copper.*) From *refined copper,* melted and poured in a small stream into *cold water.* In small pieces, with a feathered edge. Used to make solution of copper, &c.

4. (*Copper in plates or foil.*) Those of commerce (best, annealed,) is generally employed.

5. (*Copper in powder.*)—*a.* A solution of *sulphate of copper* is heated to the boiling-point, and precipitated with *distilled zinc;* the precipitated copper is then separated from the adherent zinc by *dilute sulphuric acid,* washed with *water,* and dried by exposure to a moderate temperature.

b. As the last, but using a plate of *polished iron.* Both are in very fine powder.

c. Copper filings separated from foreign matter.

6. (*Copper wire.*) That of *commerce* (best, annealed) is usually employed.

7. (*Perfectly pure copper.*) See *Estim.* (below.)

Prop., &c. Copper has a brilliant yellowish-red colour, a nauseous styptic taste, and emits a disagreeable odour when rubbed; is very malleable and ductile; unchanged in dry air; in damp air it soon becomes covered with a greenish rust (*carbonate of copper*); slightly soluble in dilute sulphuric and hydrochloric acid; freely soluble in boiling oil of vitriol (sulphurous acid being evolved); nitric acid, even dilute, dissolves it readily (with copious evolution of binoxide of nitrogen; heated to redness in the air, it rapidly becomes covered with a black scale (*oxide*); fuses at a full red heat, (2000° Fahr.; 1996°,—Daniell); and is volatile and combustible at a higher temperature; its crystals are either octahedra or cubes; sp. gr. 8·8 to 8·96; it forms numerous compounds (*alloys* and *salts*) with other bodies, all of which are more or less poisonous; those with the acids are either blue or green, and most of them (when neutral) are soluble in water.

Tests.—1. The solutions of copper possess a blue or green colour, which they retain even when considerably diluted with water.—2. With caustic potassa they give a light blue bulky precipitate, turning blackish-brown or black on boiling the liquid.—3. Ammonia and carbonate of ammonia produce a bluish-white precipitate, soluble in excess, yielding a rich deep blue solution. — 4. The carbonates of potassa give a like precipitate, insoluble in excess.

— 5. Ferrocyanide of potassium gives a reddish-brown precipitate.—6. Sulphuretted hydrogen and hydrosulphuret of ammonia, give blackish-brown or black ones.—7. A polished rod of iron, on immersion in an acidulated solution, quickly becomes coated with metallic copper.

Estim.—1. By throwing it down from its solution by *pure potassa*, after which it must be carefully collected, washed, dried, ignited in a platinum crucible, and weighed therein as soon as it is cold. Every 5 parts of the ignited precipitate (*oxide*) represents 4 parts of copper (nearly); or, more accurately, every 39·7 parts are equal to 31·7 of pure metallic copper.—2. By immersing a piece of polished steel in the solution, and weighing the resulting precipitate of the copper. (See above.) Less delicate than the preceding. — 3. *Copper* may be separated from LEAD, by adding sulphuric acid to the nitric solution, and evaporating to dryness, when water digested on the residuum will dissolve out the sulphate of copper, but leave the sulphate of lead behind. From this solution the oxide of copper may be thrown down as before.—4. *Copper* may be separated from TIN by digestion in nitric acid, which will dissolve the *first*, but leave the *last* behind as an insoluble peroxide. — 5. *Copper* may be separated from ZINC by sulphuretted hydrogen, which will throw down a sulphuret of copper, which may then be dissolved in nitric acid.—6. *Copper* may be separated from SILVER by digesting it in the state of filings or powder in a solution of chloride of zinc, which dissolves the first, but leaves the last unchanged.—7. *Copper* may be separated, in a state of *absolute purity*, from ANTIMONY, ARSENIC, BISMUTH, LEAD, IRON, TIN, ZINC, &c., as it exists in *bell-metal, brass, bronze, gun-metal, mosaic gold*, and other commercial alloys, by fusing it in a crucible for about half an hour, along with *copper scales* (black oxide), and *ground bottle-glass*, or other like flux. The pure metal is found at the bottom of the crucible, whilst the impurities are either volatilized or dissolved in the flux. The proportions for refining commercial copper are, *metal*, 10 parts; *copper scales* and *bottle-glass*, of each, 1 part. The Society of Arts conceived this process to be so valuable, that they presented one of their gold medals to its inventor, Mr. Lewis Thompson.

Uses, &c. The ordinary uses of copper are well known. In *medicine*, 3 or 4 gr. of the filings or powder were formerly given in rheumatism, and to prevent hydrophobia. Some of its salts are still used as astringents, emetics, and caustics. Its alloys are of great value. With *zinc* it forms BRASS; with *tin*, BRONZE, BELL METAL and CANNON METAL. An alloy made with 2 parts of copper and 1 of tin, forms SPECULUM METAL. *White copper* is formed by the addition of *metallic arsenic*, and GERMAN SILVER is a mixture of *nickel*, *zinc*, and *copper*.

Ant. Copper in the metallic state is almost inert, but all its compounds are poisonous. The *antidotes* are—the *white of egg, milk*, or *flour*, mixed with *water*. The *hydrated sulphurets of iron, iron filings*, and *ferrocyanide of potassium* have also been strongly recommended, and are exhibited in the same way. *Sugar* is likewise highly spoken of as an antidote. In all cases a strong emetic should be first given.

Obs. Culinary and pharmaceutical vessels are very commonly made of copper, but too much caution cannot be exercised in their employment. Acid syrups, vegetable juices, aqueous extracts, soups, stews, &c., prepared in copper saucepans, or boilers, receive a metallic contamination proportional to the length of time they are exposed to the action of the metal. Such vessels are frequently tinned, for the purpose of protecting the copper from contact with their contents, but this film of tin is necessarily very thin, and soon becomes imperfect by constant use. When copper vessels are allowed to remain wet or dirty, or more especially, greasy, a poisonous green rust forms upon the surface, somewhat similar to verdigris. If articles are prepared in them in this state, serious consequences may ensue. Cases of poisoning from this cause are frequently met with, and instances of vomiting following the use of such articles are almost of daily occurrence, without the reason being suspected. We have occasionally seen confections and extracts, prepared in copper pans, deposit a coating of that metal upon the knives used to stir them. The ashes of the inspissated juices of fresh vegetables, and especially the pulps of fruit, prepared in vessels of this metal, have exhibited the presence of copper on the application of chemical tests. Ketchup is frequently rendered poisonous in this way. The most wholesome material for culinary utensils is thin sheet iron, or tinned iron-plate (*tin*), which is very durable if kept clean and dry when not in use. Copper vessels of every kind should be cleaned out, *immediately before use*, even though they may not appear

to require it, and on no account should they be employed for any fluids that are the *least* acidulous, or that may have to remain long in them.

COPPER (Acetates of). Of these, two are employed in the *arts* and *medicine* :—

COPPER (Subacetate of). Syn. *Diacetate of Copper, Verdigris; Ærugo*, — Ph. L. & E. *Cupri Subacetas*,—Ph. D. *C. Diacetas*,—Ph. L. 1836. A green or bluish-green powder, consisting of a mixture of *hydrated diacetate* or *sesquibasic acetate of copper* (blue verdigris), and *triacetate of copper* (green verdigris), in variable portions. See *Verdigris*.

Pur. "Partly soluble in water, almost entirely so, with the aid of heat, in dilute sulphuric acid. Nothing is thrown down from this solution by ammonia added in excess." (Ph. L.) "Digested in hydrochloric acid, not above 5% of impurity is left undissolved." (Ph. E.) It should be almost entirely soluble in ammonia.

COPPER (Binacetate of). Syn. *Neutral Acetate of Copper, Distilled Verdigris, Crystallized do.; Cupri Acetas, Ærugo Crystallisata, Flos Ærugo*,—Lat. From *verdigris*, dissolved in *vinegar*, with the aid of heat, and crystallized. It forms dark green or blue crystals. See *Verdigris*.

COPPER (Ammonio-sulphate of). Syn. *Ammoniated Copper, Ammoniuretted do., Cupro-sulphate of Ammonia; Cupri Ammonio-sulphas*,—Ph. L. & D. *Cuprum Ammoniatum*,—Ph. E. *Prep.* (Ph. L.) *Sulphate of copper*, 1 oz.; *sesquicarbonate of ammonia*, 1½ oz.; rub together until carbonic acid ceases to be evolved, then wrap it in bibulous paper, and dry it in the air. The Ph. E. & D. order the same proportions.

Pur. "Pulverulent; dark blue; at an intense heat it is changed into oxide of copper, at first sesquicarbonate of ammonia, and, afterwards, sulphate of ammonia, being thrown off. It is soluble in water. This solution changes the colour of turmeric to brown; and arsenious acid being added, it turns green." (Ph. L.)

Uses, &c. It is employed in pyrotechny, and has been given in chorea, epilepsy, hysteria, &c., but it is now principally used as an injection, as a wash for foul ulcers, and as a collyrium, in opacity of the cornea. *Dose.* ½ gr., gradually increase to 5 gr., twice a day. Great care must be taken in drying this article, as it is apt not only to lose a large portion of its weight, but to become of an inferior colour. Both the ingredients should be separately reduced to powder before mixing them.

COPPER (Arsenite of). Syn. *Cupri Arsenis*,—Lat. See *Scheele's Green*.

COPPER (Carbonate of). Syn. *Dicarbonate of Copper; Cupri Carbonas*,—Lat. The beautiful mineral called *malachite*, is a *hydrated dicarbonate of copper*. See *Bice* and *Mineral Green*.

COPPER (Chlorides of). Of these there are two :—

COPPER (Subchloride of). Syn. *Dichloride of Copper, Resin of do., White Muriate of do.; Protochloride of do.* (?); *Cupri Subchloridum, &c.*,—Lat. *Prep.* 1. From *copper filings*, 1 part; *corrosive sublimate*, 2 parts; distilled together.

2. By putting *copper filings* or *copper foil* into *chlorine gas*. White; fusible; slightly soluble in water; and decomposed by exposure to the air.

COPPER (Chloride of). Syn. *Neutral Chloride of Copper, Protochloride of do., Hydrochlorate of do., Muriate of do.; Cupri Chloridum, &c.*,—Lat. *Prep.* From *copper scales* or *black oxide of copper* dissolved in *hydrochloric acid*, and the solution evaporated and crystallized.

Prop., &c. Green acicular crystals; deliquescent; soluble in alcohol, the flame of which it colours green; exposed to heat (under 400°), it loses water, and assumes the form of a yellow powder, (*anhydrous chloride of copper.*)

COPPER (Chromate of). Syn. *Cupri Chromas*,—Lat. See *Chrome Green*.

COPPER (Iodides of). When *iodide of potassium* is added to a *solution of a salt of copper, diniodide of copper* falls down, and *iodide of copper* remains in solution. It is little known.

COPPER (Diniodide of). Syn. *Subiodide of Copper; Cupri Diniodidum*,—Lat. *Prep.* To a solution of *protosulphate of copper*, 1 part; and *protosulphate of iron*, 3 parts; add a solution of *iodide of potassium*, and wash and dry the precipitate. This is the preparation commonly known in trade by the name of *iodide of copper*.

COPPER (Nitrate of). Syn. *Cupri Nitras*, — Lat. *Prep.* By dissolving the *copper* in *dilute nitric acid*. Deep blue crystals; very soluble and deliquescent.

COPPER (Oxides of). Three oxides of copper have been noticed by chemists :—

COPPER (Suboxide of). Syn. *Red Oxide of Copper, Dinoxide of Copper; Protoxide of do.* (?); *Cupri Suboxydum, &c.*,—Lat. *Prep.* 1. From *prepared copper filings*, 4 parts; *black oxide of copper*, 5 parts; heated together in a *covered* crucible.

2. Add *grape sugar* to a solution of

sulphate or *acetate of copper*, then further add *caustic potassa*, in excess; the blue solution heated to ebullition deposits the suboxide, which must be then collected, washed, and dried.

3. From *dichloride of copper* fused at a low red heat with an equal weight of *carbonate of soda*, and the residuum of the calcination treated as last.

4. *Sulphate of copper*, 100 parts; *carbonate of soda*, 57 parts; (both in crystals;) fuse them together at a gentle heat; cool, pulverize the mass, and add of *fine copper filings*, 25 parts; ram the mixture into a crucible, cover it over, and expose it for 20 minutes to a white heat.

5. A *saturated solution of sugar of milk*, containing some *carbonate of soda*, is poured over recently prepared *moist hydrated oxide of copper*, and heated to boiling; and the precipitate washed and dried as before.

6. A solution of *cane sugar*, 27 parts, in *water*, 60 parts, is poured over *hydrated oxide of copper*, (weighed in the compressed and still moist state,) 9 parts; a solution of *caustic potassa*, 18 parts, in *water*, 60 parts, is then added, and the whole mass well agitated together at the ordinary temperature, and strained through linen. If the dark-blue filtrate is next heated, (continually stirring,) over a water-bath, anhydrous protoxide of copper is disengaged, and the liquid becomes colourless. (Boettger's 'Beitrage.')

Uses, &c. A superb red powder, with a metallic lustre. It is used as a pigment and a bronze, and as a stain for glass and enamels, to which it gives a rich red colour. By heat it is converted into the black oxide. With ammonia it forms a colourless solution, which rapidly becomes blue from the action of the air.

COPPER (Protoxide of). Syn. *Oxide of Copper, Black Oxide of do.; Deutoxide of do.* (?)*; Peroxide of do.* (?)*; Cupri Protoxydum; C. Oxydum Nigrum*,—Lat. *Prep.* 1. By calcining at a red heat, with free exposure to the air, *copper filings*, or *nitrate of copper*, the *hydrate* thrown down from solutions of or the salts of copper by means of *pure potassa*. A heavy black powder.

2. By adding *caustic potassa*, in excess, to a *solution of a salt of protoxide of copper*, and heating the whole to the boiling point; the precipitate is then collected, washed, and dried. A heavy dark-brown powder, turning black when heated.

Uses, &c. Protoxide of copper is unchanged by heat, unless combustible matter is present, when it readily parts with its oxygen; hence its general use in organic analysis as a source of that element. It communicates a beautiful green colour to glass and enamels. With the acids it produces the ordinary salts of copper.

COPPER (Peroxide of). Syn. *Cupri Peroxydum*,—Lat. Formed by the action of *peroxide of hydrogen water* on the *hydrated black oxide*. (Thènard.) It is very liable to spontaneous decomposition, and its precise character is undetermined.

COPPER (Oxychloride of). See *Brunswick Green*.

COPPER (Saffron of). Syn. *Copper Stain; Æs Ustum, Cupri Crocus, C. Calcinatum, C. Oxydum Rubrum*,—Lat. *Prep.* (Pomet.) *Sheet copper* (cut into small pieces), and a mixture of *sulphur* and *common salt*, are arranged "stratum super stratum" in a crucible, and calcined in a strong fire until all the sulphur is burnt away, when the residuum is powdered, washed, and dried. Brownish coloured, yielding a fine red-coloured powder. See *Brass Stain* and *Suboxide of Copper*.

COPPER (Sulphate of). *Blue Copperas, B. Vitriol, Roman do.; Cupri Sulphas, Cuprum Vitriolatum*,—Lat. The sulphate of copper of commerce (*Cupri sulphas venalis*,—Ph. L.) is obtained by the oxidation of native sulphuret of copper (*copper pyrites*), by the joint action of air, heat, and moisture, by which its *copper* is converted into *an oxide*, and its *sulphur* into *sulphuric acid*. The resulting salt is washed out, and the solution evaporated and crystallized. The *water found in*, and *issuing from copper mines*, often furnishes such a solution ready to the hands of the manufacturers. A large quantity of sulphate of copper is also obtained as a *secondary product* in the *refining of silver*, and is "occasionally prepared by dissolving in *sulphuric acid* an *oxichloride of copper*, made for the purpose, by exposing sheets of copper to the joint action of air and hydrochloric acid." (Brande.) Pure *sulphate of copper* can only be made by the direct solution of the *metal*, or preferably, of its *oxide* or *carbonate*, in *sulphuric acid*.

For *medical use* the Ph. L. orders *commercial sulphate of copper*, 4 lb; to be dissolved in *boiling water*, 2 quarts; (heat and stirring being had recourse to;) the solution is to be filtered whilst hot, and set aside that crystals may form, which are to be collected and dried. By evaporating the mother liquor, a second crop of crystals may be obtained.

Pur. The commercial sulphate is often largely contaminated with iron. When pure, "it is totally soluble in water; what-

ever ammonia throws down from this solution, excess of ammonia again dissolves." (Ph. L.)

Prop., &c. Fine blue crystals; tastes intensely styptic and metallic; slightly effloresces in the air; by heat it loses its water of crystallization, and becomes a white powder; (*sympathetic powder; pulvis sympatheticus;*) dissolves in 4 parts of water, at 60° Fahr., and in 2 parts at 212°; insoluble in alcohol and ether; decomposed at an intense heat into proto-oxide of copper, sulphurous acid, and oxygen. It has been used to prevent the dry rot in timber, (*Margary's patent,*) and in dyeing. Grain is steeped in a weak solution of it by the farmer, to prevent the "smut." As a medicine, it is employed chiefly as a styptic (in solution) and caustic (in substance) to destroy "proud flesh;" and, less frequently, as an astringent or tonic, (from ¼ gr. to 2 gr.,) and an emetic, (3 or 4 gr. to 10 or 12 gr.) It is exceedingly poisonous. For *antidotes*, see *Copper*.

COPPERAS. Commercial sulphate of iron. *Blue Copperas* is crude sulphate of copper.

COPPERAS (Calcined). From *copperas* heated in an unglazed earthen pot, until it becomes white and dry. *Used* as an astringent and "drier," and in making ink and dyeing. See *Sulphate of Iron*.

COPPERING. Iron may be covered with a thin film of copper by merely immersing it (previously scoured clean) in an *acidulated solution of sulphate of copper*, after which it must be rinsed in clean *water*. A coating of any desired thickness may be given by means of voltaic electricity. See *Electrotype*.

COPROLITE. Syn. *Fossil Manure*. This mineral is the petrified dung of carnivorous reptiles. (Buckland.) The coprolites of Suffolk contain from 50% to 60% of *phosphate of lime*, a quantity nearly double that in ordinary guano. They form the bases of Lawes' *superphosphate* or *coprolite manure*. The nodules, after being washed, are ground to powder in a mill, and mixed with an equal weight of *oil of vitriol*.

CORAL. Syn. *Corallium*,—Lat. *Prepared red coral* (*corallium rubrum preparatum*) was formerly used in medicine as an antacid or absorbent, and is still occasionally employed as a dentifrice. It consists almost entirely of carbonate of lime, coloured with red oxide of iron, and possesses no advantage over good chalk. It is *prepared* in a similar manner.

CORAL (Factitious). Syn. *Corallium Rubrum Factitium*,—Lat. *Prepared chalk*, coloured with a little *sesquioxide of iron* or *rose pink*, and passed through a sieve. Sold by the druggists for *powdered coral*.

CORDIALS. Syn. *Cardiaca*, — Lat. Warm, stimulating, restorative medicines, that tend to raise the spirits and promote the circulation. The principal cordial medicines are the *aromatized tinctures* and *syrups*.

CORDIALS. Aromatized and sweetened spirits used as beverages. See *Liqueurs* and *Rectifying*.

CORDIAL (Bilious, — Chamber's). A popular American medicine prepared from the inner bark of the *juglans cinerea* (Linn.) or Pennsylvania walnut, mixed with spices.

CORDIAL (Nervous,—Brodum's.) *Prep.* 1. "Originally it consisted simply of an *infusion of gentian root in English gin*, coloured and flavoured with a little *red lavender*, (compound spirit of lavender.) After a time the doctor added a little *bark* to this nostrum, and subsequently made other additions." (*Anat. of Quackery.*)

2. (Paris.) *Tinctures of gentian, calumba, cardamoms,* and *cinchona, compound spirits of lavender*, and *steel wine*, of each, equal parts. "It is tonic, stomachic, and stimulant; but, beyond these, possesses no curative properties." (*Anat. of Quackery.*)

CORDIAL (Sir Walter Raleigh's). Syn. *Sir W. R.'s Confection*. Now superseded by the *aromatic confection* of the pharmacopœias. Sir Walter's own receipt was very complicated.

CORDIAL (Warner's). *Prep. Rhubarb*, 1 oz.; *senna*, 1½ oz.; *saffron*, 1 dr.; *liquorice root*, 4 dr.; *raisins*, 1 lb; *British brandy*, 1 quart; digest for a fortnight, press, and filter. Laxative.

CORIANDER. Syn. *Corianders, C. Seed; Coriandrum*,—Ph. L. "The fruit" (*seed*) of the "*coriandrum sativum*." (Ph. L.) "Coriander" is chiefly used by confectioners and distillers as a flavouring ingredient. It is aromatic, carminative, and stimulant; and more effectually covers the taste of senna than any other substance. *Dose.* 20 to 60 gr.; chiefly as a corrective or adjuvant in compound medicines.

CORK. Syn. *Corker*. The *lichen omphalodes* made into balls. *Used* to dye wool.

CORK. The prepared bark of the *quercus liber* or *cork oak*, a tree common in southern France, Italy, and Spain.

CORKS. The common practice of employing inferior corks for the purpose of stopping the mouths of bottles, is often productive of considerable loss, from the

air being only partially excluded, and the contents suffering in consequence. Many a large "*bin*" of valuable wine has become, from this cause, in less than a year, little better than sour "Cape." Chemical preparations often suffer from a similar cause. The best corks are those called "*velvet corks*," and of these the finest qualities are imported from France.

Several attempts have been made to introduce cork-cutting by machinery, but they have hitherto failed to supersede hand labour.

CORN. Syn. *Clavus*,—Lat. A horny induration of the skin, with a central nucleus, very sensitive at the base. The *common cause* of *corns* is continued pressure over the projection of the bones, from *tight* or *stiff* boots or shoes. They are of two kinds, *hard* and *soft*. The *first* grow on the exposed portions of the joints; the *last*, between the toes.

Prevention. This consists in keeping the feet clean, by frequent ablution with warm water, and in the use of *easy, soft boots and shoes.* Without the latter precaution, corns will generally return, even after they appear to have been perfectly removed.

Treatment. After soaking the feet in warm water for a few minutes, pare the corns as close as possible with a sharp knife, taking care not to make them bleed. They may now be touched over with a little *lunar caustic*, or *nitric acid*, or a little *concentrated acetic acid* or *aromatic vinegar.* The last two do not stain the skin. The first is used by merely rubbing it on the corns, previously *slightly moistened* with water; the others, by moistening the corns with them, by means of a small strip of wood, or, preferably, a rod of glass; due care being taken not to allow the liquid to touch the neighbouring parts. This treatment adopted every 3 or 4 days for 10 days or a fortnight, accompanied by the use of *soft, loose shoes*, will generally effect a cure. It has been recommended to remove large corns by *ligatures of silk*, applied as close to their base as possible, and tightened daily until they drop off; but this plan is tedious, and often inconvenient, and is not always successful. *Another mode of extirpation* is, the application of a *small blister*, which will frequently raise them with the skin out of their beds. In this case the exposed surface must be dressed with a little *simple ointment.* SOFT CORNS may be removed by applying *ivy leaf, previously soaked in strong vinegar*, changing the piece every morning; or by placing a *dressing* of *soap cerate*, spread on a bit of lint or old rag, between the toes. One of the *simplest* and *best remedies* for *hard corns*, and which has lately received the sanction of high medical authority, is to wear upon the toe or part affected a *small circular piece of soft leather*, or, still better, a piece of *amadou*, spread with *diachylon*, or some other *emollient plaster*, and having a hole cut in the centre, corresponding to the size of the corn. (Sir B. Brodie.) By this means the pressure of the boot or shoe is equalised, and the apex of the corn protected from injury.

CORNS (Popular Remedies for). The following are among the most useful of this class:—

1. (*Caustic for Corns.*) From *tincture of iodine* and *butter of antimony*, of each, 1 dr.; *iodide of iron*, 3 gr.; mix. It is applied as explained above. 2 to 4 applications are said to effect a cure.

2. (*Lotions for Corns.*)—*a.* A solution of *sal ammoniac*, 1 part; in *proof spirit*, 4 parts.

b. A concentrated *aqueous solution of sulphate of copper.* To be applied night and morning.

3. (*Corn Plasters.*) — *a.* From *white diachylon*, 3 parts; *yellow rosin*, 2 parts; *verdigris*, 1 part; melted together, and spread on leather.

b. From *galbanum plaster*, 1 oz.; *verdigris*, 1 dr.; as the last.

c. From *resin plaster*, 2 oz.; *black pitch*, 1 oz.; *verdigris* and *sal ammoniac*, of each, ½ dr.

d. To the last add *powdered opium*, 1 dr. Recommended to allay pain, &c.

e. (W. Cooley.) A piece of *spread adhesive plaster* is placed upon a table, and a piece of card paper having a round hole cut in it the size of the central portion of the corn is laid upon it; the exposed part is then softened by holding a piece of heated iron for a second or two near it; the card paper is then instantly removed, and *nitrate of silver*, in fine powder, is sprinkled over the part which has been warmed. As soon as the whole is cold, the loose powder is shaken off, and the plaster is ready for use. Very cleanly and convenient. Two or three applications seldom fail to effect a cure.

f. (*Mechanical Corn Plasters.*) From common *adhesive plaster* spread on *buckskin, amadou*, or *vulcanized Indian rubber*, cut into pieces, and a circular hole corresponding to the size of the corn punched in each.

4. (*Pommade for Corns.*)—*a. Powdered verdigris*, 1 dr.; *savine ointment*, 7 dr.

b. Dried *carbonate of soda*, 3 dr.; *lard*,

5 dr.; *verdigris* or *smalts*, q. s. to give a slight tinge of green or blue. Applied on a piece of rag.

5. (*Corn Solvents.*)—*a. Salt of tartar* or *pearlash*, contained in an open jar or bottle, set in a damp place, until it forms an oil-like liquid (*oil of tartar*). Applied by means of a feather, or a small piece of rag dipped in it is bound on the corn.

b. Salt of tartar, 1 oz.; *smalts*, q. s. to give a faint blue. It must be kept dry in a corked bottle.

c. Hydrate of potassa, 1 dr.; *rectified spirit*, 1 oz.; dissolve. As No. 1.

d. (Sir H. Davy's.) *Potash*, 2 parts; *salt of sorrel*, 1 part; each in fine powder; mix and place a small quantity on the corn for four or five successive nights, binding it on with a rag.

Obs. Care must be taken, in all cases, to pare the corn moderately close before applying the remedy; but in *no case should they be applied to a raw surface.*

CORROSION. One of the best means of *preventing* the *corrosion of metals* is, *first* to dip the articles into *very dilute nitric acid*, and *afterwards*, to immerse them in *linseed oil*, allowing the *superfluous oil* to drain off. They are by this means effectually preserved from rust or oxidation. The *ironmongers* generally preserve small knife-blades, awls, &c., from rust, by keeping them in *powdered fresh-slaked quicklime.*

CORTICINE. A resinous extractive matter obtained by Braconnot from the bark of *salix alba* (Linn.) or *common white willow.*

COSMETICS. Syn. *Cosmetica*,—Lat. External applications employed for the purpose of preserving or restoring personal beauty. The term is generally understood to refer to substances applied to the cuticle, to improve the colour and clearness of the complexion; but some writers have included under this head, every topical application used with the like intention. Hence cosmetics may be divided into — *cutaneous cosmetics*, or those applied to the skin; *hair cosmetics*, or such as are employed to promote the growth and beauty of the hair; and *teeth cosmetics*, or such as are used to cleanse and beautify the teeth. See *Baldness*, *Hair Dyes*, *Pomatums*, *Pommades*, *Depilatories*, *Dentifrices*, *Tooth Powders*, *&c.*

COSMETIQUES. These are formed of hard pomatum, coloured to the desired tint; the pigments being added in the state of an impalpable powder.

1. (*Cosmetique Noir.*) From *good lard*, 5 parts; *wax*, 2 parts; (or, *hard pomatum*, 7 parts;) melt, stir in *levigated ivory black*, 2 parts; and pour it into moulds of tinfoil; which are afterwards to be placed in paper "sheaths."

2. (*Cosmetique Brun.*) As the last, but using *levigated umber* for "plain brown," and *levigated terra di Sienna* for "auburn" and "chestnut."

3. (*Cosmetique Blanc.*) The same, without colouring matter. *Used* to colour the eyebrows, whiskers, &c., as well as to keep the hair in its place. The labels on the packets before us have—"pour fixer et lisser les cheveux." The application must be renewed daily, as the cosmetique is gradually removed by friction, and perfectly so by soap-and-water. They are generally scented with *musk*, *ambergris*, or *cassia.*

COSMETIQUE (Simple). *Prep.* From *soft soap*, ½ *lb.*, melted over a slow fire with *sweet oil*, 3 *oz.*; and *fine sand*, a small teacupful; stir well together, and mould or press the mixture into cakes. The shelly sea-sand, sifted from the shells, is better than that which has no shells. *Used* by ladies who are remarkable for the delicate softness and whiteness of their hands. It may be scented at pleasure.

COTARNINE. A crystallizable substance obtained from the *mother-waters of opianic acid.* It is basic, very soluble, and bitter. *Hydrochlorate of cotarnine* is soluble and crystalline.

COTTON. Syn. *Gossypium*,—Lat. The cotton of which textile fabrics are made, is obtained from the *gossypium herbaceum*, (Linn.,) of which there are many varieties.

Identif. See *Linen.*

Dyeing. The fibres of cotton have nearly the same affinity for mordants and the colouring matter of dyed stuffs as linen, and may be treated in the same manner. See *Dyeing*, *Linen*, *&c.*

COUGH. Syn. *Tussis*, — Lat. The sudden and violent expulsion of air from the lungs. It is generally symptomatic of other affections, but is sometimes idiopathic, or a primary disease. Many cases of cough depend upon the extension of catarrh to the trachea and bronchiæ, which thus become loaded with mucus or phlegm, which they endeavour to throw off by the convulsive effort called coughing. In some cases it is caused by a vitiation and inspissation of the secretions, arising from the imperfect action of the absorbents; this is the common cause of the *dry cough* of old people. *Idiopathic cough* is not considered dangerous in itself, or while running its regular course, but it is often productive of most

serious consequences, by superinducing the inflammation of some organ, or laying the foundation of phthisis.

Cough is sometimes attended by copious expectoration, and at other times exists without any; it has hence been distinguished into *moist* or *mucous cough*, and *dry cough*.

The *treatment* of common catarrhal cough consists in allaying the irritation as much as possible, by demulcents and expectorants, as *mucilaginous drinks* and *lozenges*, which act upon the glottis, and sympathetically upon the trachea and bronchiæ. Among the first may be mentioned, *almond milk*, *barley water*, *refined Spanish juice*, *gum arabic*, and a *mixture of the last two* made into lozenges; among the *second*, the most innocent and convenient is *ipecacuanha*, in the shape of lozenges, 2 or 3 of which may be sucked whenever the cough is troublesome. A *light diet* should be adopted, the bowels kept *slightly relaxed* by the use of gentle aperients, and a *mild* and *equable temperature* sought as much as possible. When this plan does not succeed, recourse may be had to an *emetic*, followed by small doses of *Dover's powders*, and *extract* or *tincture of henbane*, or *squill pill*. When a cough is troublesome at night, and *unattended with fever*, a small dose of *laudanum*, or *tincture of henbane*, taken on going to rest, will generally procure sleep. In the treatment of *dry cough*, the more stimulating expectorants are useful, as *garlic*, *ammoniacum*, *styrax*, and *benzoin*, combined with *narcotics* and *sedatives*, as *henbane*, *hemlock*, and *opium*. A *diaphoretic opiate* is also very useful, especially in the *cough of old people*. See *Draughts*, *Emulsions*, *Mixtures*, *Pills*, *&c.*

COUMARINE. Syn. *Cumarine*. The odorous principle of the fruit or bean of *dipterix odorata* (tonquin bean) of Willdenow. It is dissolved out by *ether*, and purified by solution in *alcohol*. It crystallizes in small prisms.

COUNTER-IRRITANTS. Substances applied to the surface of the body to establish a secondary morbid action, with the view of relieving one already existing. In painful and spasmodic affections, as neuralgia, spasms, and cramp; in rheumatism, lumbago, swelled and painful joints; in headache, sore throat, sprains, languid glandular tumours, and many other cases, this class of medicines often proves extremely valuable. The counter-irritants which are best known, are *blisters*, *mustard poultices*, *hartshorn-and-oil*, and *liniment of ammonia*. In Dr. Granville's work, entitled '*Counter-Irritation*,' he gives upwards of 100 cases of the most painful and important diseases effectually cured by external applications of the kind referred to.

COURT PLASTER. See *Plasters*.

COURY. The native name of a superior species of catechu obtained from the areka catechu.

COW DUNG. This substance is employed in large quantities by the calico printers. Recently, a mixture of *sulphate*, *carbonate*, and *phosphate of lime* and *soda*, with *British gum* or *bran*, has been successfully tested as a substitute for it, and has the advantage of cleanliness and economy.

COWHAGE. Syn. *Cow-itch; Dolichos, D. Pubes; Mucuna*,—Ph. L. "The hairs of the fruit" (pods) of "*mucuna pruriens*" (Ph. L.) or *dolichos pruriens*. (Linn.) It occasions violent itching, when it comes in contact with the skin, which can only be allayed by a *solution of green vitriol*, or by *oil*. It is frequently administered as a vermifuge, made into a confection, by scraping the hair off a pod into treacle, syrup, or honey, for a morning dose, which is repeated for 3 or 4 successive days, followed by a brisk purge. It acts more effectually, if its administration has been preceded by a gentle emetic.

COWS. See *Dairy*.

CRABS. See *Shell-fish*.

CRACKNELS. *Prep.* To *flour*, 1 pint, add a little *grated nutmeg*, the *yelks of* 2 *eggs*, 2 or 3 spoonfuls of *rose-water*, and cold water, q. s. to make a paste; then roll in *butter*, ½ *lb.*, and make it into shapes. In 1 hour put them into a kettle of boiling water, and boil them until they swim, then throw them into cold water; take them out, and when dry, bake them on tins. Those of the shops contain less butter, and the rose-water is omitted. They are noticed in 1 Kings, xiv, 3.

CRACKNUTS. *Prep.* 1. *Flour*, 1 *lb.; sugar*, ¾ *lb.; melted butter*, ½ *lb.;* 6 or 7 *eggs*, well beaten; make a paste with a *glassful of raisin wine* and a *little water;* add *caraways*, roll it out as thin as paper, cut it into shapes with a tumbler, wash the pieces with the *white of egg*, and dust them over with *powdered sugar*.

2. As the last, but using ½ *lb.* more *flour*.

CRAMP. See *Spasms*.

CRAPE is *cleaned* by rinsing it in *ox-gall and water*, to remove the dirt; afterwards in *pure water* to remove the gall; and lastly, *in a little gum water*, to stiffen and crisp it. It is then "clapped" between the hands until dry.

CRAY-FISH. See *Lobsters* and *Shell-fish.*

CRAYONS. Colouring substances made up into small cylinders or any other convenient form for use in writing or drawing.

Prep. 1. *Spermaceti*, 3 *oz.*; *boiling water*, 1 pint; agitate together till they form a species of emulsion; add *bone ash*, 1 *lb.* (or more, previously reduced to an impalpable powder); and *colouring matter*, q. s., to give the proper tint; reduce the whole to a perfectly homogeneous paste, and form it into crayons.

2. *Pipeclay* and the *finest prepared chalk*, equal parts; or *pipeclay* alone, q. s.; *colouring*, a sufficient quantity; make them into a paste with *pale mild ale.*

3. *White curd* or *Castile soap*, cut into thin shavings, 1 *oz.*; *boiling water*, 1 pint; dissolve, and when cold, add gradually, as much *rectified spirit of wine* as will render the liquid barely transparent. With this fluid make equal parts of the *finest elutriated clay* and *chalk* into a stiff paste, adding *colouring matter*, q. s., as before. For common qualities, the spirit of wine may be omitted, but the mass will then dry more slowly.

4. *Curd soap*, 1½ oz.; *gum arabic*, ½ oz.; *boiling water*, 1¼ pint; dissolve, and use it as the last. General Lomet uses a similar mixture to work up the softest varieties of hematite, with which he thus forms superior *red crayon.*

5. (Process of the Brothers Joel, of Paris.) *Shellac*, 3 parts; *spirit of wine*, 4 parts; *oil of turpentine*, 2 parts; dissolve; add *pure clay*, 6 parts; *colouring matter*, q. s.; form the mass into crayons, and dry them by a stove heat.

6. *Pale shell-lac*, 5 parts; *wood naphtha*, 12 parts; dissolve, and with this fluid mix up the *colouring powder*, previously stirred up with an equal weight of *fine pale blue clay*; dry by a stove heat, as before. When this process is well managed, it produces crayons equal to those of the best Parisian houses.

Obs. The composition may be formed into crayons by simply rolling it on a slab; but to ensure their solidity the manufacturers generally employ a *metallic cylinder* of 2 or 3 inches in diameter, with one end open and the other firmly secured to a perforated plate, having holes of the same size as the intended crayons. The crayon-composition, in the state of a stiff paste or dough, is introduced into the open end, and is forced down and through the holes, by means of a small plug or piston, that exactly fits the inside of the cylinder, and which is driven by the equable motion of a small screw. The pieces that pass through the holes are then cut into lengths and dried.

The *substances* employed as *colouring matters* for crayons are very numerous, and their choice offers a wide field for the skill and fancy of the artist. The pigment having been selected, it may be reduced to any shade or tint by admixture with other pigments, and by "dilution" with a proper quantity of *elutriated* or *prepared chalk.* As, however, crayon colours do not admit of being mixed together at the time of using them, like liquid colours, it is usual to make 3 to 6 different shades of each colour, so as to enable the artist at once to produce any effect he chooses.

Black crayons. From *prepared black-lead, ivory-black, lamp-black, &c. Black chalk* and *charcoal* are frequently made into crayons by simply sawing them into suitably sized pieces. They may then be put into a pipkin of *melted wax*, and allowed to macerate for an hour; after which they should be taken out, drained, and laid on a piece of blotting paper to dry. Drawings made with these crayons are very permanent, and if warmed slightly on the wrong side, the lines will adhere and become almost as durable as ink.

Blue crayons. From *indigo, smalts, Prussian blue, verditer, &c.*

Brown crayons. From *umber*, (raw and burnt,) *terra di sienna*, (raw and burnt,) *Cullen's earth, brown ochre, &c.*; and some peculiar shades, from a mixture of *black, carmine*, and *either of the above colours.*

Green crayons. From a *mixture of king's yellow*, or *yellow ochre*, with *blues.*

Purple crayons. From any of the *more brilliant blues*, mixed with *carmine, lake*, or *vermilion.*

Red crayons. From *carmine, carminated lakes, vermilion, hematite*, and any of the *earthy* or *mineral colours* commonly used as pigments. *Crayons of red chalk* may be prepared in the manner pointed out for crayons of black chalk.

White crayons. From *pure clay* and *chalk.*

Yellow crayons. From *king's yellow, Naples do., orpiment, yellow ochre, &c.*

CRAYONS (for Writing on Glass). *Prep.* From *French chalk* cut into suitable pieces. Marks made with these crayons, when obscured or rubbed out, may be several times revived by simply breathing on the glass.

2. (Brunquelle.) *Spermaceti*, 4 parts; *tallow*, 3 parts; *wax*, 2 parts; are melted together in a cup; and *red lead*, 6 parts,

and *carbonate of potassa*, (in fine powder,) 1 part, stirred in; the mass is kept melted and stirred for about half an hour longer, then poured into glass moulds (tubes) of the thickness of a common pencil, and cooled as rapidly as possible. The mass may be screwed up and down in the tube, and cut to a fine point with a knife. A crayon is thus obtained which will readily write upon clean dry glass.

CRAYONS (Lithographic). *Prep.* 1. *Tallow soap*, 7 parts; *white wax*, 6 parts; melt by a gentle heat, and add *lamp-black*, 1 part; keep it melted, with constant stirring, for 20 or 30 minutes, then let it cool a little, and cast it into moulds.

2. *White wax*, 4 parts; *shell-lac* and hard *tallow soap*, of each, 2 parts; *lamp-black*, 1 part; as last.

3. *Spermaceti*, *white wax*, and *hard tallow soap*, of each, equal parts; *lamp-black*, q. s. to colour.

Obs. Some makers melt the soap, wax, and lamp-black, in an iron ladle, over a brisk fire, and allow the mixture to blaze for a *few seconds* before adding the shell-lac, which is no sooner thoroughly incorporated than the heat is increased until the mass again kindles, when it is at once removed from the fire and stirred until it is cool enough to be poured into the moulds. This method leads to trouble and loss without any corresponding advantage. These crayons are used to draw designs on lithographic stones.

CREAM. Syn. *Cremor*, *C. Lactis*, *Flos Lactis*,—Lat. The oleaginous portion of milk, which collects in a thin stratum upon the surface, when that fluid is left undisturbed for some time. By violent agitation, as in the process of *churning*, the fatty globules unite together, forming *butter*; whilst the liquid portion, consisting of caseum, serum, and a little butter, constituting the residuum, is called *butter-milk*. This separation is effected the most readily, when the cream has become partially sour and coagulated by being kept a few days; a change which occurs in consequence of the conversion of some of the *sugar of the serum* into *lactic acid*, which precipitates the caseous matter contained in the small portion of the milk with which the cream is mixed. On these simple facts chiefly depend the *successful manufacture of butter*. The cream intended for churning should therefore be kept until it turns *slightly* sour, and assumes the condition above referred to, as then the butter will readily "*come*." If churned while quite sweet, the operation will be tedious and will frequently fail. When this happens, the dairy maids declare the milk is "*charmed*" or "*bewitched*," and reluctantly proceed with the operation. The addition of a little *rennet*, or *vinegar*, is the proper remedy in this case, and will cause the almost immediate separation of the butter.

When *cream* is *suspended in a linen bag*, and allowed to drain, it gradually becomes drier, and harder, by the separation of the liquid portion, and then forms what is known by the name of *cream cheese*. By the application of *slight* pressure, the separation of the whey is more completely effected, and the product is not only better, but will keep longer.

Qual. Cream, in a dietetic point of view, may be regarded in the same light as butter, as it is converted into butter in the process of digestion. On this account much cream should never be taken at once by persons of delicate stomachs. In eating cream with fruit, persons are hardly aware of the large quantity they consume, until they find it disagree with the stomach, when the condiment is blamed for the indiscretion of those who take it. See *Milk*, *Butter*, *Liquors*, *Crème*, *&c.*

CREAM (Almond). *Prep.* From *sweet almonds*, 2 *oz.*; *bitter almonds*, 4 in no.; blanched and beaten in a mortar to a *smooth paste*, adding a *teaspoonful of water* to prevent oiling; and, afterwards, *a pint of cream*, and enough *powdered lump sugar* to sweeten; the whole is then whisked to a froth, the glasses filled with the liquor, and some of the froth placed on the top of each. Some persons add the *juice of a lemon*.

CREAM (Brandy). To the last, add the *yelks of* 6 *eggs*; heat it gently over the fire until it thickens, keeping it well stirred, then further add 2 or 3 glassfuls of *brandy*, and pour it into small cups or shallow glasses.

CREAM (Burnt). *Cream*, 1 quart; *cassia*, a small stick; *peel of half a lemon*; boil for 5 minutes, cool a little, take out the spice, and add the *yelks of* 9 *eggs*, and *sugar*, q. s. to sweeten; stir until cold, put it into a dish, strew *pounded sugar over it*, and bake it until brown.

CREAM (Chocolate). *Chocolate*, scraped fine, 1 *oz.*; *thick cream*, 1 quart; *sugar*, (best) 6 *oz.*; heat it nearly to boiling, then remove it from the fire, and mill it well; when cold, add the *whites of* 8 *or* 10 *eggs*; whisk rapidly, and take up the froth on a sieve; serve the cream in glasses, and pile up the froth on the top of them.

CREAM (Coffee). *Prep.* 1. As the last,

omitting the *chocolate*, and using a *pint of the strongest made coffee.*

2. Add a teacupful of very clear *concentrated made coffee* to 1 pint each of *clarified calf's feet jelly* and *good cream;* sweeten with *lump sugar*, give it one boil up, and pour it into shapes or glasses, when nearly cold.

CREAM (Cold). *Prep.* 1. See *Cosmetic Cerate.*

2. (Hudson's.) *Oil of almonds*, 4 *oz.; white wax* and *spermaceti*, of each, ¼ *oz.; rose water*, 4 *oz.; orange flower water*, 1 *oz.*

3. See *Granulated Cream.*

CREAM (Costorphin). After a village near Edinburgh, where it is commonly made. The *milk of* 3 *or* 4 *consecutive days*, together with the cream, are allowed to remain until sour and coagulated; the *whey* is then drawn off, and *fresh cream* added. It is eaten with sugar and fruit, especially with strawberries and raspberries.

CREAM (Devonshire). 1. (*Devonshire Raw Cream.*) From *sour cream* mixed with an equal quantity of *fresh cream*, and *sweetened with sugar.* Eaten with fruit.

2. (*Devonshire Scalded Cream, D. Clouted do.*) The *milk of yesterday* is set in a polished shallow brass pan, over a clear fire free from smoke, and gradually heated until very hot, care being taken not to let it boil; when the undulations on the surface look thick, and form a ring round the top of the fluid, the size of the bottom of the pan, it is removed from the fire and allowed to cool; the next day it is skimmed off for sale. *Used* with either tea or coffee, and excellent with both; it is also eaten with sugar and fruit, and is made into butter. See *Cream*, (above.)

CREAM (D'Illotte's). Syn. *Crystallized Cream, Vegetable do.* The ingenious little gentleman, the manufacturer of this article, whose anagrammatic powers have converted his patronym of Elliott into one less familiar to vulgar English ears, prepares this really elegant hair cosmetic as follows:—*Oil of almonds*, 3 *oz.*, and *spermaceti*, ½ *oz.*, are melted together; and *bergamotte, neroli*, and *verbena*, of each, 5 drops, and *huile au jasmin*, 10 drops, are then stirred in, and the mixture is at once poured into small wide-mouthed bottles to crystallize. If preferred harder, ½ dr. more spermaceti may be used, but the precise quantity to produce the best crystalline appearance depends greatly on the season of the year; more being required in winter than in summer.

CREAM (Factitious). Syn. *Mock Cream. Prep.* 1. Beat 3 *eggs*, with 2 *oz.* of *sugar*, and a *small piece of butter*, until the combination is complete; then add, *warm milk*, 1 pint; put the vessel into another containing *hot water*, and stir it *one way* until it acquires the consistence of cream.

2. *Arrow-root*, 1 spoonful; wet it with a little *cold* milk, then add, gradually, *boiling milk*, ¼ pint; mix well, and further add, of *fresh butter*, 1 *oz.; sugar*, 1½ *oz.; cold milk*, ¾ pint; and continue stirring until the whole is quite cold.

CREAM (for Icing). See *Ice Creams.*

CREAM (Fruit). *Prep.* From *pulped* or *preserved fruit*, 1 *lb.; cream*, or *good raw milk*, 1 quart; *sugar*, q. s.; boil for 1 minute; cool, and add a *glassful of brandy.* A froth is raised on these creams with a chocolate mill. It is taken off, and placed on a hair sieve, and some of it, after the glasses are filled with the cream, placed on the top of each. The *expressed juice* of *raspberries*, of *currants*, and several other kinds of fruit, also make delicious creams. In *winter*, *raspberry jelly, jam*, or *syrup*, may be used. A glass of *good brandy* improves these creams.

CREAM (Furniture). See *Polishes.*

CREAM (Granulated). Syn. *Granulated Cold Cream. Prep.* (Owen.) *Almond oil*, 6 *oz.*, *white wax* and *spermaceti*, of each, 2 *oz.*, are melted together, and a little *otto of roses* added; the liquor is then poured into a large Wedgewood-ware or marble mortar, previously warmed, and containing 1¼ to 2 pints of *warm water;* brisk agitation with the pestle is then had recourse to, until the oleaginous portion is well divided, when the whole is suddenly thrown into a vessel containing a gallon or two of clean *cold water;* lastly, the *granulated cream* is thrown on a muslin filter, and as much water as possible is shaken (gently) out of it; after which it is put up for use.

CREAM (Lemon). *Prop.* From *cream*, 1 pint; *yelks of* 3 *eggs; powdered sugar*, 6 *oz.;* the *yellow rind of* 1 *lemon* (grated), with the juice; mix, apply a gentle heat, and stir until cold. If desired *white*, the *whites of the eggs* should be used instead of the *yelks.*

CREAM (Orange). Similar to *lemon cream*, but using *oranges.*

CREAM (Pistachio). From the *kernels* of *pistachio nuts*, as almond cream.

CREAM (Raspberry). See *Fruit Creams.*

CREAM (Saturnine). Syn. *Cremor Plumbi Acetatis*,—Lat. *Prep.* (Dr. Kirkland.) *Cream*, 1 oz.; *solution of diacetate of lead*, 1 dr.; mix. Cooling, sedative, and astringent; a useful application in certain cases to irritable ulcers, sore nipples, &c. It is *poisonous.*

CREAM (Scotch Sour). *Prep.* (Gray.)

Skimmed milk is put over night into a wooden tub, with a spigot at the bottom, and this tub is put into another filled with *hot water;* in the morning the small tub is taken out and the thin part of the milk (*wigg*) drawn off until the thick sour cream begins to come. This process requires practice as to the heat of the water; when it succeeds, skimmed milk yields nearly one half of this cream, which is eaten with sugar as a delicacy; it is only distinguishable from cream by its taste, and sells for double the price of fresh milk.

CREAM (Stone). Syn. *Cream Blancmange.* From *isinglass,* ½ *oz.,* dissolved in *boiling water,* a teacupful, adding *cream,* 1 pint, and *sugar,* 4 *oz.;* stirred until nearly cold, and then poured over *fruit* or *preserves,* placed on the bottom of glass dishes.

CREAM (Taraxacum). Syn. *Cremor Taraxaci,*—Lat. *Prep.* (Dr. Collier.) From *washed dandelion roots,* (sliced,) sprinkled with *spirit of juniper,* and then pressed for their juice. *Dose.* A tablespoonful twice or thrice daily, as a stomachic and tonic, in dyspepsia, &c.

CREAM (Vanilla). *Prep.* 1. Boil a stick of *vanilla* (grated), and *isinglass,* ½ oz., in *milk,* 1 pint, until the latter is dissolved; strain, add *sugar,* 6 *oz.,* and *cream,* 1 pint; stir till nearly cold, then pour it into moulds like blancmange.

2. *Cream* and *strong isinglass jelly,* of each, 1 pint; *sugar,* 6 *oz.; essence of vanilla,* ¼ *oz.;* mix as before.

CREAM (Velvet). As the last, but, instead of vanilla, flavour with the rind and juice of a *lemon,* and about a *teacupful of white wine.*

CREAM (Whipt). *Prep.* From the *whites of* 12 *eggs; cream,* 1 quart; *pale sherry,* ½ pint; *essence of musk* and *ambergris,* of each, 10 drops; *essences of lemon* and *orange peel,* of each, 3 or 4 drops; whisk to a froth, remove the latter on to a sieve, fill the glasses with the cream, and then pile the froth on the top of them.

CREAMING (of Liquors). See *Wines, Malt Liquors, &c.*

CREASOTE. See *Kreasote.*

CREATINE. See *Kreatine.*

CREME. (*Fr.*) Syn. *Cream.* This name is applied to several compound spirits and cordial liquors, especially by the French liqueuristes, who pride themselves on the superior quality and cream-like smoothness of their manufactures. Like the cordials of the English, they are mostly dilute spirit, aromatized, and sweetened. See *Liqueurs.*

CRENIC ACID. See *Krenic Acid.*

CRICKETS. These insects may be destroyed by putting *Scotch snuff* into their holes, or by placing some pieces of *beetle wafers* for them to eat.

CROCONIC ACID. One of the products of the action of *potassium* on *carbonic oxide.* When a solution of *rhodizonate of potassa* is boiled, it suffers decomposition, and the liquid is found to contain oxalate of potassa, free potassa, and *croconate of potassa;* from the last of which *croconic acid* is obtained. It is yellow, crystallizable, and soluble in both water and alcohol.

CROTON OIL. Syn. *Oleum Crotonis,*—Ph. E. *O. C. Tiglii; O. Tiglii,*—Ph. L. The "oil expressed from the seeds" of "*croton tiglium*" (Ph. L.) or *purging croton.* This oil is a drastic purgative, and a powerful local irritant and rubefacient. Rubbed on the skin it produces a pustular eruption, and frequently purges. In this way (diluted with thrice its weight of olive oil) it is occasionally used as a counter-irritant. *Dose,* (as a purge,) 1 to 2 drops; in obstinate constipation, lead colic, &c.

CROTONIC ACID. See *Jatrophic Acid.*

CROTONINE. Syn. *Tigline.* A crystallizable substance discovered by Brandes and D'Jussieu in croton oil. According to Soubeiran and Weppen, it is an alkaline magnesian soap.

CROUP. Syn. *Cynanche Laryngea, C. Suffocativa, C. Trachealis, &c.,*—Lat. An inflammatory disease affecting the larynx and trachea.

Symp. A permanently laborious and suffocative breathing, accompanied by wheezing, cough, a peculiar shrillness of the voice, and more or less expectoration of purulent matter, which continually threatens suffocation. There are two varieties, *acute croup* and *chronic croup.* The latter is very rare.

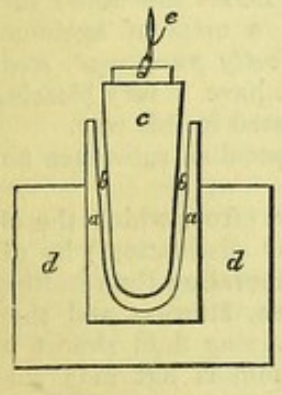
Treat. Bleeding by leeches, or cupping, over the region of the trachea, should be immediately had recourse to, when the symptoms are urgent; or violent local irritants, as pieces of lint dipped in strong acetic acid, or blisters, may be applied to the same part. In weakly subjects of irritable constitution, bleeding should be avoided. Dr. Larroque recommends repeated vomiting, in the croup of children; and M. Marotte and M. Boudet have adopted this plan with great success. The treatment consists in making the patient attacked with croup vomit a great number of times within the day, so as to detach the pseudo-membrane from the larynx nearly as fast as it is formed. For this purpose,

YORKSHIRE COLLEGE

M. Marotte employs one or other of the following formulæ:—

1. *Tartar emetic*, 1½ gr.; *syrup of ipecacuanha*, 1 oz.; *water*, 2 oz.

2. *Impure emetine*, 3 gr.; *syrup of ipecacuanha* and *water*, of *each*, 1½ oz.



These draughts are administered by *spoonfuls* every ten minutes, until there has been a sufficient number of vomitings. In this manner he says he has been always able to make the patient expectorate a certain quantity of false membrane. This treatment is accompanied by the use of small doses of *calomel*, *leeches* to the throat, and *blisters* to the nape of the neck; but it is the opinion of M. Marotte that the vomitings alone effect the cure. Out of 25 cases that occurred at the Hôpital des Enfans, the only authenticated case of cure among all these, was effected by emetics. (M. Boudet.)

The croup is a very dangerous disease, and medical aid should be *immediately* sought wherever it can be procured. It is principally confined to infancy, or to children under 9 years of age; but occasionally attacks adults. One of our early friends, a young medical practitioner of great promise, died of it, prematurely, after only about 20 hours' illness.

CRUCIBLE. Syn. *Crucibulum*,—Lat. A conical-shaped vessel made of clay, employed to hold substances whilst they are submitted to a strong heat.

Manuf. There are two ways of making crucibles:—

1. By forcibly shaping the ingredients in a double mould (*See* engr.)

a a, External steel mould.

b b, Clay or composition for forming the crucible.

c, Internal steel mould.

d d, Wooden stand.

e, Cord or chain to withdraw the internal mould or plug.

2. By pouring the "*slip*" of the consistence of cream, into *porous moulds*, made of a species of stucco. A series of these moulds are placed upon a table and *filled* with the semifluid composition. By the time the whole (say 50 or 60) are filled, the "*slip*" may be poured out of the one first filled, leaving only a very small quantity behind to give the requisite thickness to the bottom. The *second* and *third* may then be treated in the same way, until the whole number have been attended to. In each mould a perfect crucible is formed, by the abstraction of the water of that portion of the "*slip*" in immediate contact with the stucco, and the crucible is either thicker or thinner, in proportion to the time this absorbent action has been allowed to go on. 70 or 80 crucibles may thus be easily made in less than 15 minutes. The moulds and their contents are next placed in a stove or slow oven. In a short time from the contraction of the clay in drying, the crucibles may be removed, and the moulds, as soon as they have become dry, may be again filled; by care they will last for years. As soon as the crucibles, formed by either of the above methods, have become *perfectly* dry they are ready for baking in a potter's kiln. In this way *earthen tubes* and vessels of other shapes may be made.

The compositions of which crucibles are formed differ according to the uses for which they are intended. The following may be taken as examples:—

1. (*Anstey's patent.*) From *raw Stourbridge clay*, 2 parts; *hard gas coak* (previously ground and sifted through a sieve of ⅛th-inch mesh), 1 part. The crucibles formed with this composition are only *dried*, and *not baked*. For use they are warmed, placed on the furnace, bottom upwards, the burning coak gradually heaped round them, and the firing continued until they acquire a full red heat. They are now turned and charged with cold iron. These pots will stand 15 or 16 meltings, but are liable to crack on cooling.

2. (*Berlin.*) From *Stourbridge clay*, 8 parts; *cement* (old crucibles ground to a fine powder), 3 parts; *coak*, 5 parts; *graphite* or *black-lead*, 4 parts. They resist the greatest heat, and may be repeatedly heated and cooled without cracking.

3. (*Black-lead.*) From *clay*, 1 part; *graphite*, 2 parts. These bear a great heat and sudden changes of temperature, and have the advantage of smoothness of surface. The compound is excellent for forming *portable furnaces*, *&c.*

4. (*Hessian.*) From *clay* (containing $10\frac{9}{3}$ of silica and a *little* of the oxides of iron and manganese); sand (containing $2\frac{9}{3}$ of alumina, and $1{\cdot}5\frac{9}{3}$ of the above metallic oxides, and nearly $1\frac{9}{3}$ of lime). (Wurzer.)

5. (*Stourbridge.*) From *Stourbridge clay*, 4 parts; *cement*, 2 parts; *coak powder* and *pipeclay*, of each, 1 part. Used by brass-founders.

Obs. For the manufacture of crucibles a clay should be chosen which is free or nearly free from lime. Those containing graphite lose this substance by combustion when exposed to a full current of air at a high temperature.

CRUMPETS. *Prep.* From *flour*, 2 *lb.*, made into a dough with warm *milk-and-water*, adding *a little salt*, 3 *eggs*, (well beaten,) and 3 teaspoonfuls of *yeast*, mixed to the consistence of *thick* batter; after standing before the fire for a short time, to rise, it is poured into *buttered tins*, and baked slowly to a fine yellow.

CRUST. The paste with which *pies*, *tarts*, &c., are made, or covered.

1. (*Fine.*) From *flour*, 1 *lb.*; *sugar*, ¼ *lb.*; *melted butter*, ½ *lb.*; 3 eggs; milk, q. s. Requires little baking.

2. (*Raised crust, for meat pies, &c.*) As the last, but using 6 *oz.* of *lard* for the *butter*, and only 2 instead of 3 *eggs*.

3. (*Short.*) From *flour*, 1 *lb.*; *butter* and *sugar*, of each, 2 *oz.*; *eggs*, 2 in no.; made into a *stiff* paste.

Obs. The quality is improved if the whole, or a portion of the butter is employed in the way directed under "*puff paste.*" For further information hereon, consult Soyer or Rundell.

CRYOPHORUS. See *Refrigeration.*

CRYSTALLIZATION. The act or process by which crystals are formed. The frequent reference to this subject in the pages of this work, and the constant employment of the process of crystallization in the manufacture of salts, &c., in the laboratory, seem to point out the necessity of a few explanatory remarks thereon under this head. When *fluid substances* are suffered to pass with adequate slowness to the *solid state*, or when *solutions of solids* are slowly *concentrated by evaporation*, or the *solvent powers of the menstruum*, *gradually lessened by cooling*, the ultimate particles of matter frequently so arrange themselves as to form regular geometrical bodies, familiarly known by the name of *crystals*. This wonderful property, which is possessed by a great variety of substances in the mineral kingdom, and by nearly all saline bodies, is resorted to for many useful and important purposes in the chemical arts. It is by means of crystallization that the majority of salts are obtained in a state of purity; for in the act of passing into the crystalline state, the foreign substances with which they are united, are left behind in the "*mother-water.*"

Salts are crystallized, either by allowing their *hot* and *saturated solutions* to *cool slowly*, or by simply *evaporating the menstrua as long as crystals form.* In the *first* case, the liquid is commonly evaporated until a pellicle appears on the surface, when the vessel is set aside in some sheltered situation until cold, at which time the crystals are collected, and the process repeated for fresh crystals. In the *second* case, the crystals are usually removed from the liquid as soon as they are deposited. The *first* method is adopted for those salts that are considerably more soluble in *hot* than in *cold water*, as carbonate of soda, Epsom salts, &c.; the *last method*, for those that possess nearly equal solubility in both cases, and also for many salts which are not required in handsome crystals; thus common salt and chromate of potash are crystallized in this way. Many of the *alkaloids*, and *their salts*, are obtained in crystals, by *allowing their solutions* (generally alcoholic or ethereal) to *evaporate spontaneously.* By repeating the processes of solution and crystallization two or three times with the same body, the crystals obtained by the last operation will usually be found to be quite pure.

Solids are obtained in a crystalline state by melting them, and allowing them to cool *very slowly.* Thus, *iodide of sulphur* is crystallized by melting it in a flask placed in a salt water bath, and allowing it to remain in the water until the whole becomes cold. *Sulphur* and many *metals* are crystallized by pouring them, in a state of fusion, into a hot vessel, having a plug in the bottom, which is withdrawn as soon as the surface becomes cool, when the liquid portion runs out and leaves the under surface in the form of a mass of agglomerated crystals. *Perfectly pure wax*, *stearine*, and *spermaceti*, have a very pleasing appearance when treated in this way.

CUBEBINE. A peculiar substance obtained from cubebs.

Prep. From *cubebs*, (from which the oil has been expelled by distillation,) by digestion in *alcohol*, evaporating the resulting tincture to one fourth, filtering, and then evaporating the remaining fluid almost to dryness. The residuum is left in a cold place until it assumes a semi-crystalline appearance, when it is thrown on a filter, and the fluid portion (*cubebine of M. Cassola;*) allowed to drain off. In 24 hours, the substance left on the filter is dissolved in 4 times its weight of *boiling alcohol*, (sp. gr. 0·90,) the solution allowed to deposit its undissolved resin, (still maintaining it near the boiling temperature,) after which the clear portion is decanted. The crystals

deposited as the liquid cools are *cubebine*. It is purified by redissolving it in *boiling concentrated alcohol*, and the addition of a little *boiling water* and *animal charcoal*, when long white needles will be deposited, if the solution is allowed to cool *very slowly*.

Prop., &c. It is insoluble in water, and nearly so in cold alcohol, but very soluble in boiling alcohol. It strikes a fine crimson colour with sulphuric acid, which remains unaltered for some hours; a property which distinguishes it from *piperine*. Its physiological action has been but little studied. According to Dr. Görres this for the most part resembles that of cubebs.

CUBEBS. Syn. *Cubeb Pepper; Cubeba*,—Ph. L. D. & U. S. *Cubebæ*,—Ph. E. *Piper Cubeba*,—Ph. L. 1836. "The immature" and "stalked fruit" of "*piper cubeba*." (Ph. L.) Cubebs are stimulant, stomachic, and aromatic like the other peppers; they are also diuretic and appear to possess a specific influence over the urino-genital apparatus. *Dose.* 10 to 20 gr., in affections of the bladder and prostate gland, and in gleet and leucorrhœa; 1 to 3 dr., in the *early* and inflammatory stages of gonorrhœa, in piles, &c. They may be taken in water, milk, or bitter ale.

CUCUMBER. The fruit of the *cucumis sativus* (Linn.), the most indigestible and dangerous of all our salad vegetables; and, without doubt, a great provocative of dyspepsia and bowelly affections. See *Elaterium*.

CUDBEAR. Syn. *Persio*. From white Swedish or tartareous lichen (*lecanora tartarea*) chiefly, by a process nearly similar to that used in making archil. The lichen is watered with *stale urine* or other *ammoniacal liquor*, and suffered to ferment for 3 or 4 weeks, after which the whole is poured into a flat vessel, and exposed to the air until the urinous smell has disappeared, and it has assumed a violet colour. It is then ground to powder. Like archil, there are two varieties of this dye-stuff—*blue cudbear* and *red cudbear*. The properties of both resemble those of archil and litmus, (which see.)

CUMARIC ACID. Syn. *Coumaric Acid*. Obtained by the action of a hot *concentrated solution of potassa* on *cumarine*.

CUMARINE. See *Coumarine*.

CUMIC ACID. Syn. *Cuminic Acid*. Formed by the oxidation of *cuminol*, one of the constituents of *oil of cumin*. By distillation it is converted into another hydrocarbon, called *cumol*.

CUMIDINE. Obtained by acting on *nitrocumol* with *sulphuretted hydrogen*, in a similar way to that followed for obtaining *aniline* from *nitrobenzol*. It is an oily liquid, boiling at 437° Fahr., and forming magnificent salts with the acids.

CUMIN. Syn. *Cymini Semina; Cyminum*,—Ph. L. "The fruit" (seed) of "*cuminum cyminum*." (Ph. L.) It is carminative and aromatic. See *Plasters*.

CUMINOL. See *Cumic Acid*.

CUMOL. See *Cumic Acid*.

CUMYL. The radical of the *cumyl-series*.

CUPELLATION. See *Assaying*.

CUPPING. This method of *topical bleeding* is performed as follows:—

The skin being softened by means of a sponge and warm water, and the hair, and other extraneous substances being previously removed, one of the small bell-like glasses, (*cupping-glasses; cucurbitulæ*,) having the air contained in it rarified by being passed over the flame of a *spirit-lamp*, is *immediately* applied to the part. From the formation of a partial vacuum beneath the cup, the pressure of the air on the surrounding surface causes that portion immediately under the cup to swell, and the vessels to become turgid. When this has taken place, the cup is removed, and several incisions are *instantly* made by means of a *scarificator*, an instrument containing *numerous lancets*, which, by means of a spring, make a number of incisions at the same moment; the depth of these incisions being regulated by means of a screw which protrudes or withdraws the lancets, according to the vascularity of the part, or the quantity of blood to be abstracted. The cupping-glass is now again applied. When a sufficient quantity of blood has been collected in the cup, it is removed by gently introducing the nail of one of the fingers under the *upper* edge, by which means, air being allowed to enter, the cup becomes detached. The part being washed with warm water to remove any clots of blood, another cup is applied as before, and the operation continued till a sufficient quantity of blood is withdrawn. Sometimes, especially when applied to the scalp, the cups fill so rapidly with blood, as to become detached almost immediately on being applied. This method of local bleeding is frequently called, *cupping with scarifications*.

When cupping-glasses are applied without the use of the lancet or scarificator, the operation is called "*dry cupping*," and is much used to cause a speedy irritation of the skin and reaction, for the relief of oppressive breathing, local pains, &c. To obtain the full benefit from this operation, the cups should be suffered to remain upon

the part until they cause an exudation of a small quantity of serum, or a considerable amount of irritation of the part. Dry cupping has been found extremely beneficial in poisoned wounds ; as it acts not only by abstracting the poison, but also, by the pressure the glasses exercise on and around the part, in preventing the absorption of it.

Obs. For the operation of cupping, a basin of hot water, sponges, and clean soft towels should be provided. In clumsy hands, cupping is occasionally a severe and painful operation; but this is not the case with the skilful operator. A good cupper does not exhaust much of the air in the cup before applying it, but simply passes its mouth rapidly over the flame of the lamp. When it is held over the flame even for a few seconds, the compression of the edge of the cup upon the skin is so great, that it checks the flow of the blood to the scarified part. A good cupper also removes the cups without spilling the contents, and completes the whole operation quickly and neatly. There are, however, few persons, who are not professional cuppers, who are sufficiently expert to exhaust the air in the cup by means of the common lamp; although it is by far the best. A good plan is to rarify the air in the cup by means of a small *cone of paper*, dipped in *spirits of wine*, or *strong brandy ;* this is ignited and thrown in the cup, which is *instantly* to be applied to the proper spot. Where *cupping-glasses* and the *scarificator* are not to be had, wine-glasses, or any very small tumblers may be substituted for the *first ;* and small incisions by means of a *thumb lancet* will answer the purpose of the other.

The cicatrices of the scarifications leave permanent marks on the skin; on which account, when blood is to be drawn from the head or neck, the glasses should be applied behind the ears, and a portion of hair removed in such a manner that the part may be covered by what remains.

A most convenient cupping apparatus is manufactured by Mr. Bigg, the eminent surgical instrument maker of Leicester Square, consisting of cups and an exhausting syringe, so arranged that the use of the spirit-lamp is rendered unnecessary, and the operation of cupping may be performed nearly as expertly by an inexperienced nurse, as by the most accomplished professional operator. It is invaluable in places remote from town.

CURARINE. The vegeto-alkaline base of the arrow-poison of Central America.

CURCUMINE. The yellow colouring matter of turmeric, obtained by digesting the *alcoholic extract of the powder in ether*, and evaporating the clear ethereal solution to dryness. A brownish-yellow mass, yielding a bright-yellow powder. It is scarcely soluble in water, but very soluble in both alcohol and ether. Boracic and hydrochloric acids redden it; alkalies turn it reddish-brown.

CURD. Coagulated caseine. See *Cheese.*

CURRANTS. The currants of our gardens are varieties of the *ribes rubrum* and *ribes nigrum.* (Linn.) The first includes *red currants* (ribes hortense) and *white currants* (ribes album); the fruit of both of which are gently acidulous, cooling, and wholesome. The juice makes excellent wine. The *fruit* of the last, (*black-currants, quinsy-berries,*) is aperitive, and has been used in calculous affections; the *juice* is made into *wine, jellies, jams, lozenges, &c.* The *young leaves* are used as a substitute for tea; one or two buds, or half a small leaf, impart to *black tea* the flavour and fragrance of *green.* The *currants of the grocers* are a small variety of dried grapes.

CURRY. A noted dish in Indian cookery, prepared in great variety, and much esteemed in the East. They are simply *stews*, of which *rice* usually forms a characteristic ingredient, highly flavoured with *fried onions* and *curry powder*, to which *sliced apples* and *lemon juice* are sometimes added. They are made from every variety of fish, meat, poultry, game, &c., according to the fancy of the parties. See Mrs. Rundell's '*New System of Cookery*,' Soyer's '*Gastronomic Regenerator*,' *&c.*

CUSCONINE. See *Aricine.*

CUSPARIA. Syn. *Cusparia Bark, Angostura do.; Cortex Angosturæ, C. Cusparieæ; Cusparia,*—Ph. L. and E. "The bark" of "*galipea cusparia*" (?—Ph. L.), or *galipea officinalis* (Ph. E.) *Dose.* 10 gr. to 30 gr., as a tonic, stomachic, and febrifuge, in similar cases to those in which cascarilla, calumba, and cinchona, are commonly given.

Angostura or *cusparia bark* has fallen into comparative disuse, in consequence of *nux vomica* or *false angostura bark* having formerly, in several instances, been mistaken for it, and administered with fatal results. The leading characteristics of these two barks have been pointed out by M. Guibourt, and are as follows:—

Characters.	False Angustura.	True Angustura.
Form . .	Thick, rugous, rolled upon itself. Edges cut perpendicularly.	Flat, or rolled up, little wrinkled, edges bevilled.
Colour . .	Brown, or greenish-yellow, presenting protuberances or excrescences, produced by the great development of the corky layer, which has a still more yellow colour.	Grayish-yellow.
Taste . .	Very bitter	Bitter.
Reaction with Nitric Acid . .	*Red* colour when dropped upon the bark.	*Yellow* colour.

CUSPARINE. See *Angosturine.*

CUSTARDS. A composition of *milk* or *cream*, and *eggs*, sweetened with *sugar*, and variously flavoured. They are cooked either in the oven or stew-pan.

Prep. 1. (Soyer.) *Milk*, (boiling,) 1 pint; *sugar*, 2 *oz.*; *thin yellow peel of half a lemon*; mix, and set it aside for a short time; then take *eggs*, 4 in no., beat them well in a basin; add, gradually, the milk (not too hot), pass the mixture through a colander or sieve, and fill the custard cups with it; these are then to be placed over the fire in a stew-pan, containing about one inch of hot water, and left there for 12 minutes, or till sufficiently set. The above is for PLAIN CUSTARDS; but it forms a good basis to receive any of the usual flavouring ingredients, as *fresh* or *stewed fruit*, *peels*, *essences*, *orange-flower water*, *brandy* or *other spirits*, *&c.*

2. (Rundell.) As the last, but using *cream* instead of *milk*, or equal parts of the two, with *two additional eggs*. Very rich; like the last, any suitable flavouring matter may be added to it.

3. (*Almond custards*,—Rundell.) As either of the above, adding *blanched sweet almonds*, 4 *oz.*; *bitter do.*, 6 in no.; beaten to a smooth paste.

4. (*Baked custards*,—Rundell.) From *cream*, 1 pint, with 4 *eggs*; flavour with *mace*, *nutmeg*, and *cinnamon*, and add a little *white wine*, *rose water*, and *sugar*; bake in cups.

5. (*Coffee custards*,—Soyer.) *Hot milk* and *strong-made coffee*, of each, ½ pint; *sugar*, 2 *oz.*; dissolve, and add it, gradually, to 4 *eggs*, (well beaten,) and proceed as in No. 1. *Chocolate custards* and *cocoa custards* are made in the same way.

6. (*Lemon custards*,—Rundell.) As No. 1, (nearly,) using a little more *lemon peel*. In the same way *orange custards* are made, but using *orange peel*.

7. (*Orange custard.*)—*a.* As the last.

b. From *candied orange peel* and *lump sugar*, of each, 2 *oz.*, beaten in a mortar quite fine, and added to either No. 1 or No. 2. *Lemon* and *citron custards* may be made in the same manner. A little *orange-flower water*, or *marsala*, or *sherry*, may be also added at pleasure. They are best baked.

8. (*Rice custards*,—Rundell.) Boil ½ a cupful of the best *ground rice* in a *pint of milk* until dissolved, then mix it with *a quart of cream*; flavour with *nutmeg*, *mace*, and a little *brandy*, and put it into cups or a dish.

9. *Cold custard, for invalids*,—Dewees.) 1 *egg*; *sugar*, a tablespoonful; beat well together; and add, gradually, constantly stirring, *cold water*, ½ pint; *rose water*, 2 teaspoonfuls; and a little *grated nutmeg*. An agreeable and nutritious demulcent. A wine-glassful every 2 or 3 hours, or *ad libitum*.

CUTCH. The catechu of the *acacia catechu*.

CUTTLE-FISH. The bone of the *sepia officinalis* of Linnæus, or common cuttle-fish (*cuttle-fish bone*; *os sepiæ*;) is used by the law-stationers to erase ink-marks from paper and parchment, an application familiar to most school boys of the present generation. Reduced to powder (*pulvis sepiæ*) it forms a valuable *dentifrice* and *polishing powder*, and is used for forming the moulds for small silver castings.

CUTS. These are incised wounds of greater or less extent, and must be treated accordingly. The divided parts should be drawn close together, and held so with small pieces of *strapping* or *adhesive plaster* stretched across the wound. If the part is covered with blood, it should be first wiped with a damp sponge. When the wound is large, and it is much exposed, a good method is to sew the parts up. The application of a little *creasote* or a *spirituous solution of creasote*, will generally stop local bleeding, provided it is applied to the clean extremities of the wounded vessels. A good way is to place a piece of lint, moistened with creasote, on the wound, previously wiped clean, or to pour a drop or two of that liquid on it. An excellent method is to cover the part with a film of *collodion* or *traumaticine*. *Friar's balsam*, *quick-drying copal varnish*, *tincture of galls*, *copperas water*, *black ink*, *&c.*, are popular remedies applied in the same way. A bit of the fur plucked from a black *beaver* hat, is

an excellent remedy to stop the bleeding from *a cut produced by the razor* in shaving. A cobweb is said to possess the same property.

CUTTING. See *Horticulture.*

CYAMELIDE. See *Cyanic Acid.*

CYANATE. Syn. *Cyanas*,—Lat. A compound formed by the union of cyanic acid with the bases. The *cyanates* are distinguished by evolving the odour of *cyanic acid*, accompanied by effervescence, when treated with the *dilute mineral acids*, and by this solution, mixed with *hydrate of lime*, evolving ammonia. The *alkaline cyanates* are soluble, the *others*, insoluble.

CYANETHINE. An organic alkali, formed along with *cyanide of potassium*, by the mutual action of *potassium* and *cyanide of ethyle.*

CYANHYDRIC ACID. See *Hydrocyanic Acid.*

CYANIC ACID. Syn. *Acidum Cyanicum*,—Lat. A compound of cyanogen and oxygen, discovered by Wöhler. It is only known in the hydrated state.

Prep. 1. *Dry cyanuric acid*, or *cyamelide*, is distilled in a retort, and the product collected in a *well-cooled* receiver.

2. (Liebig.) A *current of sulphuretted hydrogen gas* is passed through *water in which cyanate of silver is diffused*, the process being suspended before all the cyanate of silver is decomposed.

Prop., &c. Cyanic acid reddens litmus; is sour to the taste; possesses a modified sulphurous odour, similar to that which is always perceived when any of its salts are decomposed by an acid; it forms salts with the bases, called *cyanates;* when in contact with water it suffers decomposition in a few hours, and is converted into bicarbonate of ammonia; it cannot be preserved for any time, as shortly after its preparation it spontaneously passes into a white, opaque, solid mass, to which the name *cyamelide* has been given. By distillation, this new substance is reconverted into *cyanic acid.*

CYANIDE. Syn. *Cyanuret; Cyanidum, Cyanuretum*,—Lat. The compound formed by the union of cyanogen with a metal. See *Cyanogen* and *Hydrocyanic Acid.*

CYANIDE (Alkaline). *Prep.* (R. Wagner.) Dry *ferrocyanide of potassium*, 4 parts; dry *carbonate of soda*, 1 part; are melted together in an iron crucible at a red heat, and continually stirred until the iron rod comes out covered with a white crust, when the heat is withdrawn, and after a few moments' repose, the supernatant liquid portion is poured out on a clean iron slab. The crude mixed cyanide is quite as useful as the more expensive one of Liebig, and is equally fit for technical applications, as *electrotyping, gilding, silvering, &c.*

CYANIDE OF BENZOYLE. Obtained by heating *chloride of benzoyle* with *cyanide of mercury.* It is a colourless, oily, inflammable liquid, having an odour resembling that of oil of cinnamon.

CYANILINE. Syn. *Cyanide of Aniline.* A crystalline compound formed by the action of *cyanogen* on *aniline.*

CYANOGEN. Syn. *Prussine, Bicarburet of Nitrogen, Bicarbide of do.; Cyanogenium*,—Lat. A highly important quasi-elementary body, discovered by M. Gay-Lussac, in 1815.

Prep. From *bicyanide of mercury*, (carefully dried,) exposed in a small retort to the heat of a spirit-lamp, and the gas collected in the mercurial pneumatic trough.

Prop., &c. A colourless gas, possessing a pungent and peculiar odour, resembling that of peach-kernels or prussic acid; under a pressure of about 4 atmospheres, at a temperature of 45°, it assumes the liquid form, (Faraday,) and this fluid again becomes gaseous on withdrawal of the pressure; water absorbs nearly 5 times its bulk of cyanogen at 60° Fahr., and alcohol, about 23 times its volume; with hydrogen it forms *hydrocyanic acid*, and with the metals, a most interesting and important class of bodies called *cyanides* or *cyanurets;* when kindled, it burns with a beautiful purple flame, carbonic acid and nitrogen being evolved. Sp. gr. 1·806. See *Hydrocyanic Acid.*

CYANOGEN (Bromide of). By distilling *bromine* with *cyanide of mercury.* Colourless; volatile; solid; powerfully odorous.

CYANOGEN (Chlorides of). *Prep.* 1. (*Gaseous Chloride of Cyanogen.*) By passing *chlorine* over moist *cyanide of mercury*, in the dark. It possesses an insupportable pungency, and is soluble in alcohol, ether, and water.

2. (*Solid Chloride of Cyanogen.*) By placing *anhydrous hydrocyanic acid* in a vessel of *chlorine*, and exposing the whole in the sunshine. Colourless needles; volatile; odour powerful and offensive, somewhat resembling that of mice or conia; dissolves in alcohol and ether; melts at 284° Fahr.; and sublimes unchanged at a higher temperature.

CYANOGEN (Iodide of). Its preparation and properties resemble those of *bromide of cyanogen.*

CYANURIC ACID. Syn. *Pyro-uric Acid.* A peculiar acid, discovered by Scheele. It is a product of the decompo-

sition of the soluble cyanates by dilute acids, of urea by heat, &c.

Prep. 1. Urea (pure and dry) is heated until it fuses and is converted into a white or grayish-white mass; this is dissolved in *strong oil of vitriol*, and *nitric acid* added drop by drop to the solution until it becomes nearly colourless; the liquid is then mixed with an equal volume of *water*. As the liquid cools *crystals* of *cyanuric acid* are deposited, which are washed with a *little cold water*, and then dissolved in 24 parts of *boiling water*, when crystals of *pure hydrated cyanuric acid* form on cooling.

Prop., &c. Cyanuric acid forms small colourless efflorescent crystals, scarcely soluble in cold water; soluble in hot oil of vitriol and in nitric acid without decomposition; from the last it crystallizes in the anhydrous state; by exposure to the atmosphere, or a gentle heat, they lose their water and fall into powder. It forms salts with the bases called *cyanurates*. The *alkaline cyanurates* may be formed by neutralizing a *boiling solution of the acid* with the *base*. *Cyanurate of silver* is prepared by adding a *solution of nitrate of silver* to another of *cyanurate of potassa*.

CYDER. See *Cider*.

CYDONINE. The peculiar gum of quince seed. It appears to be intermediate between *bassorine* and *mucus*.

CYMOL. A peculiar hydrocarbon found in *oil of cumin* and the presumed source of *toluylic acid*.

CYNAPINE. Syn. *Synapina*. An alkaloid obtained from *æthusa cynapium* or *fool's parsley*. It possesses no practical interest.

CYSTIC OXIDE. Syn. *Cystine*. Obtained from *cystic oxide calculi* (in powder) by digestion in *liquor of ammonia*. By spontaneous evaporation the ammoniacal solution deposits small colourless crystals of *cystic oxide*. It forms a saline compound with hydrochloric acid, and is decomposed by the strong alkalies.

CYTISINE. A purgative bitter principle, extracted from the *cytisus laburnum*, (Linn.) or *common laburnum*, and some other plants.

DAGUERREOTYPE. See *Photography*.

DAHLINE. A species of fecula obtained from the tubers of the dahlia. It is identical with *inuline*. It is not employed in the arts.

DAIRY. The best situation for a dairy is on the north side of the dwelling-house, in order that it may be sheltered from the sun during the heat of the day. Ample means should be provided to ensure ventilation, and at the same time, to exclude flies and other insects. The temperature should be preserved, as much as possible in an equable state, ranging from 45° to 55° Fahr. To lessen the influence of external variations of temperature, the walls should be double, or of considerable thickness, and the windows provided with shutters or doors. In summer, the heat may be lessened by sprinkling water on the floor, which will produce considerable cold by its evaporation. Dairies built of *mud* or "*cob*," are preferred in the West of England; and this preference arises from the uniform temperature they maintain, on account of the great thickness of the walls, and their being very bad conductors of heat. In large dairy-farms, where butter and cheese are made, the dairy is generally a separate building, and divided into 3 or 4 apartments; one of which is called the *milk-room;* a second, the *churning-room;* a third, the *cheese-room*, containing the cheese-press, &c.; and a fourth, the *drying-room*, where the cheeses are placed to dry and harden. To these may be added a scullery, furnished with boiler, water, &c., for scalding and cleaning the dairy utensils.

Cleanliness is very essential in all the operations of the dairy, and in none more so than in the milking of the cows. The hands and arms of the milk-maid should be kept scrupulously clean, and should be well washed with soap and water, after touching the udder of a sick cow, as without this precaution, the sores may be conveyed to the healthy ones. The milk-cans should be scalded out daily, and, as well as all the other dairy utensils, should be kept *clean* and *dry*. Before placing the milk on the shelves of the dairy, it should be strained through a hair sieve or a searce covered with clean cheese-cloth, as by this precaution any stray hairs that may have fallen into the milk-pail will be taken out.

The average produce of a milch cow, supplied with good pasturage, is about 3 gallons daily, from Lady-day to Michaelmas, and from that time to February about 1 gallon daily. Cows of good breed will be profitable milkers, to 14 or 15 years of age, if well-fed. See *Butter*, *Cheese*, *Cream*, *&c.*

DAMASCUS BLADES. See *Steel*.

DAMP, under any form, should be avoided. A humid atmosphere or situation is one of the commonest causes of agues, asthmas, rheumatism, and numerous other diseases.

Damp linen is also very injurious, and should be especially avoided. In travelling,

when it is expected that the bed has not been properly aired, a good plan is to sleep between the blankets. To ascertain this point, the bed may be warmed, and a cold, dry, glass tumbler, immediately afterwards introduced between the sheets, in an inverted position. After it has remained a few seconds, it should be examined, when, if it is found *dry*, and *untarnished with steam*, it may be fairly presumed that the bed is "well-aired;" but if the reverse should be the case, it should be avoided. When it is impossible to prevent the use of damp linen, as articles of dress, the best way to obviate any ill effects, is to keep constantly in motion, and avoid remaining near the fire, or in a warm apartment, or in a draught of cold air, until sufficient time has elapsed to allow of the escape of the moisture. The effect of evaporation is the reduction of the temperature of the body; hence the depressing action of damp linen.

Ivy planted against the sound wall of a house, is said to exclude dampness. If a wall is already damp, ivy planted against it, will, when grown up, cause it to become dry, provided the brickwork is sound, and the dampness does not arise from moisture attracted upwards from the foundation. Sometimes, when ivy is propagated from flowering branches, it will not adhere to a wall at all; the way to get over this difficulty is to cut it back to near the surface of the ground. The young wood which will then form, will take hold and cling immediately to almost anything.

DAMSONS. A species of small black plum, much used in the preparation of tarts, &c. They are rather apt to disagree with delicate stomachs, and also to affect the bowels. See *Plums*.

DANCING. The practice of dancing as an amusement or exercise must be almost as old as the human race itself. Yet, notwithstanding its antiquity and prevalence amongst all nations, both barbarous and refined, the propriety and advantages of its cultivation are of a very questionable character. In a hygienic point of view it can claim no preference, as an exercise, over the more simple ones of walking and running; whilst, from the associations it frequently induces, and the heated and confined atmosphere in which its votaries commonly assemble to indulge in it, it becomes the fertile parent of immorality and consumption. A celebrated cyclopædist has, perhaps, harshly, but truthfully, defined dancing to be "a silly amusement for the idle and thoughtless."

DANDELION. Syn. *Piss-a-bed; Taraxacum*,—Ph. L. "The recent root" of the "*taraxacum dens leonis* (leontodon taraxacum, *Linn.*)"—Ph. L. The *root* of this plant is diuretic and tonic. It is *roasted* and used as coffee, and when mixed with an equal weight of foreign coffee, constitutes the article once so much puffed under the name of "*dandelion coffee*." A similar mixture prepared with chocolate, forms the *dandelion chocolate* of the shops. The *blanched leaves* are used in salads, and the *inspissated juice*, *extract*, and *decoction*, are employed in medicine, and are considered as detergent, aperitive, and deobstruent.

DAPHNINE. A peculiar bitter principle, discovered by Vauquelin in the *daphne mezereum* or *spurge olive*. It is procured by separating the resin from the *alcoholic tincture of the bark* by evaporation; afterwards, diluting the residue with *water*, filtering, and adding *acetate of lead*. A yellow substance (*daphnate of lead*) falls down, which when decomposed by *sulphuretted hydrogen*, may be obtained under the form of small, colourless, transparent, radiated needles. It is bitter; volatile; sparingly soluble in cold water; freely soluble in hot water, and in alcohol and ether. It possesses basic properties.

DATISCINE. A substance having the appearance of grape sugar, obtained by Braconnot from *datisca cannabina*.

DATURINE. Syn. *Daturia*, *Daturina*, *Daturium; Hyoscyamine*. An organic alkali, discovered by Geiger and Hesse in *datura stramonium* or *thorn apple*. It also occurs in *hyoscyamus niger* or *henbane*. It is best obtained from the *seeds*. Daturine dissolves in 280 parts of cold, and 72 parts of boiling water; it is very soluble in alcohol; less so in ether. It tastes bitter, dilates the pupil strongly, and is very poisonous. It may be sublimed unaltered, and may be obtained in prismatic crystals, by the addition of water to its alcoholic solution. With the acids it forms salts, which are mostly crystallizable. See *Alkaloid*.

DEAFNESS. Syn. *Dysecœa*,—Lat. An imperfection or absence of the sense of hearing. When deafness is present in infancy and childhood, it is accompanied with dumbness, or imperfect articulation, in consequence of the impossibility of conveying a knowledge of the sounds necessary for the exercise of the imitative faculty of speech. Deafness frequently arises from some imperfection or obstruction of the psssage leading to the membrane of the tympanum or drum of the

ear. In some cases this passage is totally occluded by a membrane, or some malformation of the tube, which may frequently be removed by a surgical operation. Even instances of partial obliteration of this passage have occurred, which have been successfully treated. The researches of Mr. Yearsley, the eminent aurist of Savile Row, have established the fact, that enlarged tonsils are a very common cause of deafness; and when such is the case, their excision will generally effect a cure. The removal of the tonsils in the hands of this gentleman is an extremely harmless and almost painless operation, and not only improves the hearing, but also removes the tendency to sore throat. To this form of the affection Mr. Yearsley applies the term —*throat deafness*. Another cause of deafness, is the presence of foreign bodies in the aural passages, or the accumulation of hardened wax. In these cases the best treatment is to inject warm water into the ear by means of a proper syringe. When deafness arises from imperfection of the tympanum or drum of the ear, the effects of the application of the *artificial membrana tympani* invented by Mr. Yearsley (moistened cotton wool,) are generally immediate and truly wonderful. By its aid, persons previously so deaf as to be incapable of bearing their share in conversation, are enabled to hear an ordinary whisper. *Insects* may be destroyed by pouring a spoonful of *warm olive oil*, or *camphorated oil*, into the ear over night, retaining it there until the next morning by means of a piece of cotton wool, when it may be washed out with a little *mild soap* and *warm water*. When there is a deficiency of the natural secretion of wax, or a dryness of the aural passage, mild oleaginous stimulants may be employed. For this purpose a little *olive* or *almond oil*, to which a few drops of *oil of turpentine*, *oil of juniper*, or *camphor liniment* have been added, may be used with advantage. Mr. Thomas Wakley, jun., has for some time successfully employed *glycerine* in such cases. When deafness is accompanied with continued acute pain, or a discharge of purulent matter, inflammation of the tympanum, or some other portion of the internal ear, probably exists, and medical advice should be sought as soon as possible. The deafness that frequently accompanies a violent cold, is generally caused by obstructions in the Eustachian tubes, and goes off as soon as the secretions return to a healthy state. When imperfect hearing depends upon obtundity of the auditory nerve, or an extensive obliteration or malformation of the internal ear, it scarcely admits of cure.

DEAFNESS (Taylor's Remedy for). *Prep.* From *oil of almonds*, 1 lb; *garlick*, bruised, 2 oz.; *alkanet root*, ½ oz.; digest for a week and strain. A little is poured into the ear in deafness.

DEATH. In cases of sudden death, interment should be deferred till signs of putrefaction begin to appear, especially when no gradation of disease has preceded, as in cases of apoplexy, hysterics, external injuries, drowning, suffocation, &c. No sooner has breathing apparently ceased, and the visage assumed a ghastly or a death-like hue, than the patient, after his eyes are closed, is too often hurried into a coffin, and the body, scarcely yet cold, is precipitated into the grave. So extremely fallacious are the signs of death, that the semblance has been frequently mistaken for the reality. By prompt means and judicious treatment, many persons, when in such a condition, have been happily restored to their families and friends. The effects of *sound* upon animal life is astonishing. The beat of a drum, for instance, has had a very beneficial effect upon persons in a state of suspended animation. At one time, a scream, extorted by grief, proved the means of resuscitating a person who was supposed to be dead, and who had exhibited the usual recent marks of the extinction of life. In cases of *catalepsy* or *trance*, having the semblance of death, the action of the lungs and heart continues, though in a nearly imperceptible degree. By placing a *cold mirror* or piece of *highly polished metal* immediately over the mouth of the patient, symptoms of moisture will appear upon the surface, if the most feeble respiration takes place.

DEBILITY. Syn. *Debilitas*, — Lat. Weakness; languor; feebleness. When this arises from a diseased action of the stomach, the occasional use of *mild aperients*, followed by *bitters* and *tonics*, may be had recourse to. When from a general laxity of the solids, and there are no symptoms of fever, nor a tendency of blood to the head, a course of chalybeates generally proves advantageous. See *Anæmia*, *Pills*, *Mixtures*, *&c.*

DECANTATION. The operation of pouring or drawing off the clear portion of a liquid from the impurities or grosser matter that has subsided. It is commonly performed, either by gently inclining the vessel, or by the use of a syphon or pump. In the laboratory it is much resorted to, in the purification of precipitates, or other similar operations, where repeated edulcoration or

washing is required, for which purpose it is preferable to filtration, from being less troublesome and more economical. In these cases, after a sufficient time having been allowed for the subsidence of the precipitate or powder, or for the clearing of the supernatant fluid, the latter is decanted and its place supplied by a fresh portion of water, which, after sufficient agitation, is similarly treated, and the whole operation repeated as often as necessary.

DECANTERS. There is often much difficulty experienced in cleaning decanters, especially after port wine has stood in them for some time. The best way is to wash them out with a little *pearlash* and *warm water*, adding a spoonful or two of *fresh slaked lime*, if necessary. To facilitate the action of the fluid against the sides of the glass, a few small *cinders* may be used. A spoonful of *strong oil of vitriol* will also rapidly remove any kind of dirt from glass bottles. Decanters which have become "furred" by holding hard water, may be cleaned with a spoonful of *spirits of salt*, diluted with 3 or 4 times its weight of *water*. See *Stoppers*.

DECARBONIZATION. This operation is performed on *cast iron*, to convert it into *steel* or *soft iron*. The articles to be decarbonized are packed in finely powdered *hæmatite*, or native oxide of iron, to *which iron filings* are often added, and exposed for some time to a strong red heat, by which the excess of carbon is abstracted or burnt out. The process somewhat resembles annealing or cementation.

DECAY. See *Eremacausis*.

DECIMALS, or *Decimal fractions*, are fractions which have for their denominator 10, or some power of 10; as, 100, 1000, &c.; the number of ciphers in the denominator being always equal to the number of figures in the numerator. Thus, ·2, ·25, ·125, respectively represent $\frac{2}{10}$, $\frac{25}{100}$, $\frac{125}{1000}$. The denominator of decimals is never written, the dot placed before the first figure of the numerator expressing its value. Ciphers placed on the right hand of a decimal fraction do not alter its value; for ·5, ·50, ·500, are each equal to $\frac{1}{2}$; but ciphers placed on the left hand of a decimal diminish its value in a tenfold proportion: thus, ·3, ·03, ·003, respectively answer to the common fractions, $\frac{3}{10}$, $\frac{3}{100}$, and $\frac{3}{1000}$. Every figure on the left-hand side of the dot or decimal sign is a whole number.

Addition and *subtraction of decimals* are performed in the same manner as with common numbers, care being taken to place the numbers under each other according to their several values; as, *tens* under tens, *hundreds* under hundreds, &c.

Multiplication of decimals is performed in precisely the same manner as with whole numbers, merely pointing off as many figures in the product as there are decimals in the multiplier and multiplicand put together.

Division of decimals. As the last, but pointing off as many figures in the quotient as the decimal places in the dividend exceed those of the divisor. If there are not figures enough in the quotient the deficiency must be supplied by prefixing left-hand ciphers. Ciphers are also added to the right hand of the dividend, or to a remainder, when there are more figures in the divisor than in the dividend, by which the quotient may be carried on to any extent.

A *vulgar fraction* is reduced to a *decimal*, by dividing the numerator by the denominator. Thus, $\frac{1}{2} = ·5$, $\frac{1}{8} = ·125$, &c.

The *value of a decimal*, of any denomination, is found by multiplying it by the number of parts in the next less denomination, and cutting off as many places to the right hand as there are decimals, and so on until the terms are exhausted. Thus, ·634 oz. is =

·634	
8	
5·072	drachms.
60	
4·320	grains.

or, 5 dr., $4\frac{1}{3}$ gr. (nearly.)

The constant use of decimals in the laboratory, in the surveys of the Excise, and in numerous chemical calculations, induce us to press the subject on the attention of operatives and others of neglected education. An attentive perusal of the above, and a few hours' application, will make the matter familiar to them. See *Alcoholmetry*, *Mixtures*, *&c.*

DECOCTION. Syn. *Decoctum*,—Lat. An aqeuous solution of the active principles of any substance obtained by boiling.

The effect of *decoction* in water differs greatly from that of *infusion*. At the temperature of 212° Fahr., the essential oils and aromatic principles of vegetables are dissipated or decomposed; while by infusion in hot water, in covered vessels, they remain for the most part uninjured. The solvent powers of *boiling* water are, however, much greater than those of *hot* water; and many vegetable principles scarcely acted on by the one, are freely soluble in

the other. This is the case with many of the alkaloids, on which the medicinal virtues of several vegetables depend. On the other hand, the solutions of many substances, though more readily made by boiling, are speedily weakened or rendered inert by ebullition, in consequence of the active principles being either volatilized along with the steam, or oxidized or decomposed by exposure to the atmosphere. This is particularly the case with substances abounding in extractive or astringent matter. When the medicinal properties of vegetables are volatile, or are injured by a *strong* heat, infusion should be had recourse to, in preference to boiling; but when a solution of the fixed constituents is alone sought, decoction is preferable.

The *substances employed* for *making decoctions* should be well bruised, or reduced to a *very coarse* powder, or, if fresh and soft, they should be sliced small. In the former case, any *very fine* powder or *adhering dust* should be removed with a sieve, as its presence tends to make the product thick and disagreeable, and also more troublesome to strain. The vessel in which the ebullition is conducted should be furnished with an accurately fitting cover, the better to exclude the air; and the application of the heat should be so conducted that the fluid may be kept "*simmering*," or only *gentle boiling*, as *violent* boiling is not only quite *unnecessary*, but absolutely *injurious* to the quality of the product. In every case the liquor should be strained whilst *hot*, but *not* boiling, and the best method of doing this is to employ a fine hair sieve, or a coarse flannel bag. In general it is found, that as decoctions cool, a sediment is formed, in consequence of the boiling water dissolving a larger portion of vegetable matter than it can retain in solution when cold. This deposit for the most part consists of the active principles of the solution, and, unless when otherwise ordered, should be mingled with the clear liquid by agitation, when the decoction enters into extemporaneous compositions, or when the dose is taken.

The length of time occupied by the ebullition, is another point demanding some attention. *Long boiling* is in no case necessary, and should be avoided, especially in decoctions prepared from aromatic vegetables, or those abounding in extractive. The colleges, in such cases, direct the ingredients "to be boiled for a *short time*," or "for 10 minutes;" or they limit the period of the ebullition by stating the quantity that must be volatilized, as—"boil to a *pint*, and strain." The last method is generally employed for those substances that do not suffer by lengthened boiling.

In *preparing compound decoctions*, those ingredients should be boiled first which least readily give up their active principles to the menstruum, and those which most readily part with them, should be added afterwards. In many cases it is proper simply to infuse the more aromatic substances in the hot decoction of the other ingredients, by which means their volatile principles will be the better preserved.

Distilled water, or perfectly clean *rain water*, should alone be used for decoctions, extracts, and infusions. Spring and river water, from containing lime, have much less solvent power.

The aqueous solutions of organic matter, from the nature of their constituents, rapidly ferment, or putrefy. At the ordinary temperature of the atmosphere, neither decoctions nor infusions are fit to be used in dispensing, unless made the *same day*. They should, consequently, be only prepared in *small quantities* at a time, and any unconsumed portion should be rejected, as it would be imprudent for the dispenser to risk his own reputation, and the welfare of the patient, by employing an article of dubious quality.

It has of late years become a general practice for the wholesale houses to vend preparations under the name of "*Concentrated Decoctions*," which, with the exception of the compound decoction of aloes, are stated to be of 8 times the pharmacopœial strength; so that *one drachm* of these liquids added to *seven* drachms of water, forms extemporaneous decoctions, professedly resembling those of the pharmacopœia. The decoction of aloes is made of only *four* times the usual strength, as the nature of its composition would not permit of further concentration. Such preparations are, however, very imperfect substitutes for the freshly made decoctions. The extreme difficulty of forming concentrated solutions of vegetable matter with bulky ingredients, too often leads to the omission of a portion of the materials, or to the practice of concentrating the liquid by long evaporation. In the first case, the strength is of course less than it should be; and in the second, the quality is injured, and perhaps the preparation is rendered nearly inert by the lengthened exposure to heat, and the consequent volatilization or decomposition of its active constituents. The common practice of adding a considerable portion of spirit to these preparations, which is absolutely necessary

to preserve them, is also objectionable, as, in many of the cases in which decoctions are prescribed, this article, even in small quantities, exerts a prejudicial action. Some concentrated decoctions have been recently offered for sale which do not contain alcohol, being preserved by the addition of *sulphurous acid*, or *sulphite of lime*. A sample of one of these, which we lately examined, we found to be perfectly worthless. It possessed a strong odour of bark, but it contained barely a trace of alkaloid. See *Infusions, Essences, Liquors, &c.*

DECOCTION (Aloes). Syn. *Compound Decoction of Aloes, Balsam of Life; Baume de Vie; Decoctum Aloës*,—Ph. E. *Dec. Aloës Compositum*,—Ph. L. & D. *Prep.* 1. (Ph. L.) *Extract of liquorice*, 7 dr.; *extract of aloes, powdered myrrh*, and *saffron*, of each, 1½ dr.; *carbonate of potassa*, 1 dr; *water*, 1½ pint; boil to a pint, strain, and add, *compound tincture of cardamoms*, 7 fl. oz.

2. (Ph. E.) *Aloes, myrrh*, and *saffron*, of each, 1 dr.; *extract of liquorice*, ½ oz.; *carbonate of potassa*, 40 gr.; *water*, 16 fl. oz.; boil to 12 fl. oz.; strain, and add of *compound tincture of cardamoms*, 4 fl. oz.

3. (Ph. D.) As No. 1, (nearly,) but using *hepatic aloes*. A warm cathartic. *Dose.* 1 to 2 oz.; in habitual costiveness, dyspepsia, jaundice, &c.

4. (*Wholesale.*) *Solazzi juice*, 1½ *lb.*; *kali* (carbonate of potassa), 4 *oz.*; *aloes* (hepatic), 5½ *oz.*; *myrrh* (small), 5 *oz.*; *water*, 4½ gall.; boil to 3 gall., strain through flannel, cool, and add, of *compound tincture of cardamoms*, 10 pints; previously digested for 10 days on *saffron*, 2½ *oz.*; mix well, and add *essential oil of nutmeg*, 15 drops; *oils of cassia* and *caraway*, of each, 10 drops; and *oils of cloves* and *pimento*, of each, 5 drops; in a week decant the clear portion from the sediment, and preserve it in a cool place.

Obs. By boiling the saffron as ordered by the colleges, nearly the whole of its fragrance is dissipated. A better plan is to macerate it in the tincture for a few days, previously to adding the latter to the decoction of the other ingredients. After the tincture has been strained off from the saffron, the latter may be washed with a little water, to remove any adhering colour and odour, and this may be added to the decoction. The addition of the tincture produces a deposit of mucilaginous and feculent matter, which has been dissolved out of the liquorice, for which reason some houses omit the latter altogether, and supply its place with an equal quantity of *sugar* or *treacle*, and a little *colouring*. By this method the liquid, after being once obtained clear, will continue so for any length of time. The full quantity of saffron ordered by the College, is seldom used in making this preparation, and, not unfrequently, it is wholly omitted.

DECOCTION (Aloes, — Concentrated). Syn. *Decoctum Aloes Concentratum, D. A. Comp. C.*,—Lat. *Prep.* 1. *Lump sugar*, 8 *oz.*; *colouring*, ¾ pint; *carbonate of potash*, 2 *oz.*; *aloes*, 3½ *oz.*; *myrrh*, and *saffron*, of *each*, 2½ *oz.*; *compound tincture of cardamoms*, ½ a gall.; *water*, 3 pints; boil the first five in the water, until reduced to *nearly* one half; cool and add the tincture, previously digested for a week, on the saffron; and proceed as above. 14 *oz.* of *extract of liquorice* may be used instead of the sugar and colouring.

2. *Aloes, myrrh, liquorice*, and *potassa*, (all in powder,) and *saffron*, as last; *compound tincture of cardamoms*, 5¾ pints; digest a fortnight, and filter. In this way a very odorous and beautiful preparation is produced, which has been much admired. The above are said to possess 4 times the strength of the College preparation.

DECOCTION (Anticolic). See *Apozems.*

DECOCTION (Arnica). Syn. *Decoctum Arnicæ*, — Lat. *Prep.* 1. (Swediaur.) *Flowers of arnica montana*, 1 oz.; *water*, 3 pints; boil to a quart; filter, and add of *syrup of ginger*, 3 oz. *Dose.* 1 to 2 fl. oz., every two or three hours, in aphonia, paralysis of the voluntary muscles, rheumatism, &c.; and as a substitute for bark, in putrid fever, agues, &c.

2. (Ph. Cast. Austr., 1841.) *Arnica root*, 2 dr.; *water*, 9 oz.; boil to 6 oz., and strain. *Dose.* 1 oz.; as the last.

DECOCTION (Astringent). Syn. *Decoctum Astringens*, — Lat. *Prep.* (Swediaur.) *Oak-bark, pomegranate peel*, and *tormentil root*, of each, 2 dr.; *water* and *milk*, of each, 1 lb; boil 12 minutes, add of *cinnamon*, 2 dr.; boil 2 or 3 minutes longer, and strain. *Dose.* A wine-glassful.

DECOCTION (Bark).—1. *Decoction of Yellow Bark; Decoctum Cinchonæ*,— Ph. L. & E. *D. C. Cordifoliæ*,—Ph. L. 1836. *Prep.—a.* (Ph. L.) *Yellow cinchona bark* (bruised), 10 dr.; *distilled water*, 1 pint; boil for 10 minutes in a lightly covered vessel, and strain the liquor whilst still hot.

b. (Ph. E.) *Brown, gray, yellow*, or *red cinchona* (bruised), 1 oz.; *water*, 24 fl. oz.; boil for 10 minutes; when cold, filter the liquor, and evaporate it to 16 fl. oz.

2. *Decoction of Pale Bark; Decoctum Cinchonæ Pallidæ*,—Ph. L. *D. Cinchonæ,*

—Ph. D. & Ph. L. 1788, 1809, & 1824. *D. C. Lancifoliæ*,—Ph. L. 1836. *Prep.* (Ph. L.) From *pale cinchona bark;* as *decoctum cinchonæ*,—Ph. L.

3. *Decoction of Red Bark; Decoction Cinchonæ Rubræ*,—Ph. L. *D. C. Oblongifoliæ*, — Ph. L. 1836. *Prep.* (Ph. L.) As *decoction of yellow bark*, (Ph. L.)

Dose, &c. 1 to 2 fl. oz., 3 or 4 times daily, as a tonic, stomachic, and febrifuge, when the stomach will not bear the administration of bark in powder; in fevers, dyspepsia, convalescence, &c. The plan recommended by the Edinburgh College, of filtering the decoction when *cold*, is absurd. According to Soubeiran, 146 gr. of the deposit thus removed, contained 86 gr. soluble in alcohol, and rich in the cinchona alkaloids. This liquid should, therefore, be well shaken before pouring it out for use, instead of being filtered. The addition of a few drops of either *sulphuric* or *hydrochloric acid* to the water, greatly increases its solvent power, and also, consequently, the medicinal value of this preparation. (See *below.*)

DECOCTION (Bark,—Acidulated). Syn. *Decoctum Cinchonæ Acidulatum*, — Lat. *Prep.* 1. To the *water* for any one of the above, add *dilute sulphuric acid*, 1½ fl. dr.; boil 10 minutes, and strain whilst hot.

2. (Sir J. Wylie.) *Cinchona bark*, 1 oz.; *water*, 16 fl. oz.; *diluted sulphuric acid*, 1 dr.; as last.

DECOCTION (Bark,—Factitious). Syn. *Decoctum Cinchonæ Factitium*,—Lat. *Prep.* (Ph. Bor.) *Willow bark* and *horse-chesnut bark*, of each, ½ oz.; *calamus root* and *cloves*, of each, ¼ oz.; *water*, 16 fl. oz.; boil to one half. *Used* as a substitute for decoction of cinchona bark, but is vastly inferior.

DECOCTION (Bark and Serpentary). Syn. *Decoctum Cinchonæ cum Serpentariâ*,—Lat. *Prep.* (Sir J. Pringle.) *Peruvian bark*, 3 dr.; *water*, 1 pint; boil to one half, and infuse in the hot decoction, *serpentaria root*, 3 dr. As a diaphoretic stimulant, and tonic, in fevers, and as a gargle in sore throat.

DECOCTION (Barley). Syn. *Barley Water; Aqua Hordeata; Decoctum Hordei*,—Ph. L. & D. *Prep.* (Ph. L.) *Pearl barley*, 2½ oz., (washed clean,) is boiled in *half a pint of water* for "a *little while*," and this water being thrown away, *hot water*, 4 pints, is added, and then boiled to one half, and strained.

DECOCTION (Barley, — Compound). Syn. *Pectoral Decoction, Fever Drink; Decoctum Pectorale; Ptisana Communis; Dec. Hordei Compositum*, —Ph. L. & D. *Mistura Hordei*, — Ph. E. *Prep.* 1. (Ph. L.) *Decoction of barley* (simple), 1 quart; *figs* (sliced) and *raisins* (stoned), of each, 2½ oz.; *fresh liquorice* (sliced), 5 dr.; *water*, 1 pint; boil to a quart, and strain.

2. (Ph. E.) *Pearl barley*, 2½ oz.; *water*, 4½ pints; boil to 3 pints; add, *figs* and *raisins*, of each, 2½ oz.; *liquorice root*, 5 dr.; *water*, 1 pint; and boil to 2 pints, as before.

3. (Ph. D.) As No. 1, (nearly.)

Obs. The above are used as demulcents in fevers, phthisis, strangury, &c., taken ad libitum. They are slightly laxative, and when this would be an objection to their use, a few drops of laudanum may be added. Mixed with an equal quantity of *decoction of bark*, barley water forms an excellent gargle in cynanche maligna (*ulcerated sore throat*), and, with a like quantity of *milk* and a *little sugar*, a good substitute for the breast in dry nursing infants. It is, also, often acidulated with *lemon juice* or *sulphuric acid*, and sweetened, (*Decoctum Hordei Acidulatum.*) *Gum arabic*, 4 dr., and *nitre*, 1 dr., to each pint, is a common addition in gonorrhœa. *Cream of tartar*, 1 dr., is occasionally added to render it more aperient.

DECOCTION (Bitter). Syn. *Decoctum Amarum*,—Lat. *Prep.* 1. *Dried tops of lesser centaury* and *wormwood*, and *leaves of germander*, of each, 3 dr.; *water*, 1¼ pint; boil to a pint.

2. *Gentian root*, ½ oz.; *water*, 1½ pint; boil 10 minutes, take out the root, slice it, and add it again to the decoction with *dried orange peel*, ¼ oz.; boil to 1 pint, and strain.

DECOCTION (Blue Cardinal Flowers). Syn. *Decoctum Lobeliæ, D. L. Syphiliticæ*, —Lat. *Prep.* 1. (P. Cod.) *Root of lobelia syphilitica*, 1 handful; *water*, 12 ℔; boil to 7 ℔, and strain.

2. (Swediaur.) *Dried root*, 5 oz.; *water*, 12 ℔; as last. Alterative, purgative, and diuretic.

Obs. This decoction was strongly recommended by Swediaur, in certain complaints. He gave half a pint, at *first*, twice daily, and *afterwards*, 4 times a day, unless it acted too strongly on the bowels, when the frequency of the dose was diminished, or it was discontinued for 3 or 4 days, and then had recourse to again, until the cure was effected.

DECOCTION (Bran). Syn. *Decoctum Furfuris*, — Lat. *Prep.* 1. From *bran*, ¼ *lb.*; *water*, 1¼ pint; boil to a pint. In diabetes; and sweetened with *sugar*, as a

demulcent and laxative in cough and sore throat.

2. *Bran*, 1 quart; *water*, 1½ gall.; boil 5 minutes, and add *cold water*, q. s., to bring it to the proper temperature. As an emollient foot-bath.

DECOCTION (Broom). Syn. *Decoctum Spartii Cacuminium*; *D. Scoparii*,—Ph. D. *Prep.* (Ph. D.) *Broom tops*, (dried,) ½ *oz.*; *water*, ½ pint; boil 10 minutes, and strain. (See *below.*)

DECOCTION (Broom,—Compound). Syn. *Decoctum Spartii Cacuminium Co.*; *Dec. Scoparii*,—Ph. E. *Dec. Scop. Compositum*,—Ph. L. *Prep.* 1. (Ph. L.) *Tops of broom*, (recent and dried,) *juniper berries*, (bruised,) *dandelion root*, (bruised,) of each, ½ oz.; *distilled water*, 1½ pint; boil to a pint, and strain.

2. (Ph. E.) *Tops of broom* and *juniper*, of each, ½ oz.; *cream of tartar*, 2½ dr.; *water*, 1½ pint; boil to a pint, as last. The above are diuretic and laxative. *Dose.* ½ to 1 wine-glassful 3 or 4 times a day; in dropsy, especially of the belly (*ascites*).

DECOCTION (Burdock). Syn. *Decoction Arctii*, *D. Bardanæ*,—Lat. *Prep.* 1. *Bardana root*, 6 oz.; *water*, 5 pints; boil to 3 pints, and strain.

2. (Wood.) *Dried roots*, 2 oz.; *water*, 3 pints; boil to 2 pints, and strain. As an alterative; a pint, or more, daily, in all those cases in which sarsaparilla is recommended.

DECOCTION (Cabbage-tree Bark). *Decoctum Geoffroyæ*,—Ph. E. 1817. *D. Geoffroyæ Inermis*,—Ph. D. 1826. *Prep.* (Ph. D.) *Bark of the cabbage tree*, (bruised,) 1 oz.; *water*, 1 quart; boil to a pint and strain. Cathartic, narcotic, and anthelmintic. *Dose.* 2 to 4 tablespoonfuls, for an adult; 1 to 2 teaspoonfuls, for a child, followed by demulcents and castor oil; in worms, &c.

DECOCTION (Calumba,—Compound). Syn. *Decoctum Calumbæ Compositum*,—Lat. *Prep.* (Ph. U. S. 1831.) *Calumba* and *quassia*, of each, 2 dr.; *orange peel*, 1 dr.; *rhubarb*, 20 gr.; *carbonate of potassa*, 30 gr.; *water*, 20 fl. oz.; boil to 16 fl. oz., strain, and when cold, add of *compound tincture of lavender*, ½ fl. oz. Bitter, tonic, and stomachic. *Dose.* 1 to 2 tablespoonfuls 3 or 4 times daily.

DECOCTION (Ceylon Moss). Syn. *Decoctum Fuci Amylacei*, *D. Plocariæ Candidæ*,—Lat. *Prep.* From *Ceylon moss*, 2 dr.; *water*, *milk*, or *whey*, 1 pint; boil to 16 fl. oz., and strain. It may be sweetened and flavoured. In irritation of the mucous membranes and in phthisis.

DECOCTION (Chamomile). Syn. *Decoctum Anthemidis*, *D. Chamæmeli*,—Lat. From *chamomiles*, 1 oz.; *boiling water*, 1 pint; digest for 10 minutes, simmer gently for 2 or 3 minutes longer, and strain with pressure.

DECOCTION (Chamomile,—Compound). Syn. *Decoctum Chamæmeli Compositum*,—Lat. *Prep.* (Ph. D. 1826.) *Chamomile flowers*, (dried,) ½ oz.; *fennel seed*, 2 dr.; *water*, 16 oz.; boil a short time and strain. Both the above are bitter, stomachic, and tonic; the last is vermifuge. They are chiefly used as fomentations and clysters.

DECOCTION (Chiretta). Syn. *Decoctum Chirayteæ*,—Lat. *Prep.* From *chiretta* or *chyrata*, 5 dr.; *water*, 1 pint; boil 8 or 10 minutes and strain. *Dose.* ½ to 1 wine-glassful, 2 or 3 times daily, as a stomachic tonic; in flatulency and acidity, especially in the dyspepsia of gouty patients.

DECOCTION (Cinchona). See *Decoction of Bark.*

DECOCTION (Colocynth). Syn. *Decoctum Colocynthidis*,—Lat. *Prep.* (Ph. Bat.) *Colocynth pulp*, 1 dr.; *water*, 8 oz.; boil 10 minutes, and when *quite cold*, add of *syrup of orange peel*, 1 oz., *sulphuric ether*, 1 dr. *Dose.* 2 to 6 dr., 2 or 3 times a day; in dropsy, &c.

DECOCTION (Coltsfoot). Syn. *Decoctum Tussilaginis*,—Lat. *Prep.* (Pereira.) *Fresh leaves of coltsfoot*, 2 oz.; (or, *flowers*, 1 oz.;) *water*, 2 pints; boil to a pint and strain. A popular remedy in chronic coughs and chest diseases. It is emollient and demulcent. *Dose.* ½ a teacupful, ad libitum.

DECOCTION (Coltsfoot,—Compound). Syn. *Decoctum Tussilaginis Compositum*,—Lat. *Prep.* (Taddei.) *Coltsfoot flowers*, 6 oz.; *figs*, *raisins*, and *jujubes*, of each, 2 oz.; *water*, 12 pints; boil down to 4 pints, add *liquorice root*, 2 oz.; again boil, and strain. As the last.

DECOCTION (Common). See *Decoction of Mallows.*

DECOCTION (Corsican Moss). Syn. *Decoctum Helminthocorti*,—Lat. *Prep.* From the *moss*, 5 dr.; *water*, 1½ pint; boil to a pint. *Dose.* A wine-glassful, three times a day; as a vermifuge. In 1822, Mr. Farr brought it forward as a remedy for cancer.

DECOCTION (Cotton Root). Syn. *Decoctum Gossypii*,—Lat. *Prep.* (Dr. Bouchelle.) *Inner part of the root of the cotton plant*, 4 oz.; *water*, 1 quart; boil to a pint. *Dose.* A wine-glassful, occasionally, as an emmenagogue; or, every 30 or 40 minutes, to produce uterine contractions,

for which purpose it is said to be as effectual as ergot of rye.

DECOCTION (Dandelion). Syn. *Decoctum Taraxaci*,—Ph. L. & E. *Prep.* 1. (Ph. L.) *Fresh dandelion root*, (bruised,) 4 oz.; *water*, 1½ pint; boil to a pint, and strain.

2. (Ph. E.) *Herb* and *root*, (fresh,) 7 oz.; *water*, 1 quart; boil to a pint. Aperient, stomachic, and tonic. *Dose.* 1 to 2 fl. oz., or more, 2 or 3 times daily.

DECOCTION (Diaphoretic). Syn. *Decoctum Diaphoreticum*,—Lat. *Decoction of bark*, 1 pint; *liquor of acetate of ammonia*, 4 oz.; *aromatic confection*, 1 oz. *Dose.* 2 or 3 table-spoonfuls every 3 hours.

DECOCTION (Dog-grass). Syn. *Decoctum Graminis*,—Lat. *Ptisane Chiendent*,—Fr. *Prep.* From *dog-grass root* (triticum repens), 1 oz.; *liquorice root*, ½ oz.; *water*, 1 quart; boil 20 minutes and strain. Aperient and pectoral; by cupfuls ad libitum.

DECOCTION (Dog-grass,—Ioduretted). Syn. *Decoctum Graminis Ioduretum*,—Lat. *Prep.* (Magendie.) *Decoction of dog-grass*, 32 fl. oz.; *syrup of peppermint*, 2 oz.; *iodide of potassium*, ½ dr.; mix. By cupfuls, ad libitum.

DECOCTION (Dog-wood). Syn. *Decoctum Cornus Floridæ*,—Lat. *Prep.* (Ph. U. S.) *Dog-wood bark* (bruised), 1 oz.; *water*, 1 pint; boil 10 minutes, and strain whilst hot. Tonic and astringent; recommended as a substitute for bark. *Dose.* A wine-glassful.

DECOCTION (Dulcamara). Syn. *Decoction of Bitter Sweet, D. of Woody Nightshade; Decoctum Dulcamaræ*,—Ph. L. E. & D. *Prep.* 1. (Ph. L.) *Woody nightshade* or *bitter sweet* (the new shoots), 10 dr.; *water*, 1½ pint; boil to a pint, and strain.

2. (Ph. E.) *Dulcamara* (chopped small), 1 oz.; *water*, 24 fl. oz.; boil to a pint and strain.

3. (Ph. D.) *Twigs of woody nightshade*, 1 *oz.*; *water*, 1 pint; boil 10 minutes in a covered vessel, and strain. It should measure about 16 *fl. oz.* Alterative, diaphoretic, and diuretic. *Dose.* A wine-glassful, or more, 2 or 3 times a day; in chronic coughs and chronic skin diseases, and in most of those cases wherein sarsaparilla proves useful.

DECOCTION (Dulcamara,—Compound). Syn. *Decoctum Dulcamaræ Compositum*,—Lat. *Prep.* 1. (Augustin.) *Dulcamara* (bitter sweet), 4 dr.; *burdock root, liquorice root, sassafras chips*, and *guaiacum wood*, of each, 2 dr.; *water*, 2 lb; boil to 16 fl. oz., and strain. *Dose.* 1 to 2 wine-glassfuls, 2 or 3 times a day.

2. (Foy.) As the last, but using *dulcamara*, 2 oz. *Dose.* ½ to 1 wine-glassful; in similar cases to those in which the simple decoction is given; especially in chronic rheumatism and venereal affections.

DECOCTION (Elder Bark). Syn. *Decoctum Sambuci, D. S. Corticis*,—Lat. *Prep.* 1. (Sydenham.) *Inner bark of elder*, 1 oz.; *water* and *milk*, of each, 1 pint; boil to one half, and strain.

2. (Collier.) *Bark*, 1 oz.; *water*, 16 fl. oz.; boil to ½ pint, and strain.

3. (Pereira.) *Bark*, 1 oz.; *water*, 1 quart; boil to one half. *Dose.* One wine-glassful 2 or 3 times a day; as an aperient and resolvent in various chronic disorders, in dropsy, and in certain cutaneous affections; or, 2 wine-glassfuls, as before, as a hydragogue cathartic in dropsies.

DECOCTION (Elecampane). Syn. *Decoctum Helenii, D. Inulæ*,—Lat. *Prep.* (Ph. U. S.) *Elecampane root*, ½ oz.; *water*, 1 pint; boil a few minutes, and strain. Tonic and expectorant, and, in some cases diuretic and diaphoretic. *Dose.* A wine-glassful, every hour or two.

DECOCTION (Elecampane, — Compound). Syn. *Decoctum Helenii Compositum, D. Inulæ C.*,—Lat. *Prep.* (Rotier.) *Elecampane*, 1 oz.; *hyssop* and *ground ivy*, of each, 2 dr.; *water*, 1 pint; boil 15 minutes, strain, and add of *honey*, 2 oz. *Dose.* 1 to 3 table-spoonfuls; as the last.

DECOCTION (Elm Bark). Syn. *Decoctum Ulmi*,—Ph. L. & D. *Prep.* (Ph. L.) *Fresh inner elm-bark* (bruised), 2½ oz.; *distilled water*, 1 quart; boil to a pint, and strain. *Dose.* 1 to 3 wine-glassfuls, three or four times a day, as a cheap substitute for sarsaparilla in scaly skin diseases.

DECOCTION (Elm Bark,—Compound). Syn. *Decoctum Ulmi Compositum*,—Lat. *Prep.* (Jeffrey.) *Simple decoction of elm bark*, 8 pints; *liquorice root, sassafras*, and *guaiacum chips*, of each, 1 oz.; *mezereon root*, 3 dr.; boil for one hour, and strain. More active than the last.

DECOCTION (Ergot). Syn. *Decoctum Ergotæ, D. Secalis Cornuti*,—Lat. *Prep.* (Pereira.) *Ergot of rye* (bruised), 1 dr.; *water*, 6 fl. oz.; boil 10 minutes, and strain. *Dose.* One third at intervals of half an hour, until the whole is taken; as a parturifacient.

DECOCTION (Fern Root). Syn. *Decoctum Filicis, D. Radicis F.*,—Lat. *Prep.* (Dr. Wood.) *Dried fern-root*, 1 oz.; *water*,

1 pint; boil to 16 fl. oz., and strain. By wine-glassfuls, fasting, until it excites slight nausea; as a vermifuge, more particularly for tapeworm.

DECOCTION (Figs). Syn. *Decoctum Fici*,—Lat. *Prep.* (Cadet.) *Figs* (chopped), 1 oz.; *water*, 1 pint; boil, and strain. Demulcent and pectoral; taken ad libitum.

DECOCTION (Figs,—Compound). Syn. *Decoctum Fici Compositum*,—Lat. *Prep.* (Foy.) *Figs* and *raisins* (chopped), of each, 2 oz.; *liquorice root*, ½ oz.; *boiling water*, 1 quart; boil 15 minutes, and strain. As the last.

DECOCTION (for Enemas). Syn. *Decoctum pro Enemate*,—Lat. *Barley water* or *thin gruel*, is commonly used under this name. See *Decoction of Mallows, &c.*

DECOCTION (for Fomentations). Syn. *Decoctum pro Fomento*,—Lat. *Prep.* (Ph. L. 1788.) *Dried leaves of southernwood, tops of sea wormwood*, and *chamomile flowers*, of each, 1 oz.; *laurel* or *bay leaves* (dried), ½ oz.; *water*, boil a few minutes, and strain.

DECOCTION (Galls). Syn. *Decoctum* Gallæ,—Ph. L. *Prep.* From *galls* (bruised), 2½ oz.; *water*, 1 quart; boiled to one half, and strained. As an astringent, fomentation, enema, or injection, in prolapsus ani, piles, and leucorrhœa.

DECOCTION (Guaiacum). Syn. *Decoctum Guaiaci*,—Ph. E. *D. G. Compositum*,—Ph. D. 1826. *D. Lignorum, D. of the woods*,—Obs. *Prep.* (Ph. E.) *Guaiacum shavings*, 3 oz.; *raisins* (chopped), 2 oz.; *water*, 8 pints; simmer down to 5 pints; adding towards the end, *sassafras* (rasped or sliced), and *liquorice root* (bruised), of each, 1 oz.

2. (Ph. D.) *Guaiacum wood*, 3 oz.; *sassafras*, 10 dr.; *liquorice root*, 2½ oz.; *water*, 10 pints; as the last; to strain 5 pints.

Obs. The above form the once celebrated "*Decoction of the Woods.*" *Dose.* A teacupful, 3 or 4 times daily, or oftener, in chronic rheumatism, cutaneous diseases, after a course of mercury, &c. Although its virtues are of a very dubious kind, there is no doubt that it frequently does good, especially when persevered in with a sudorific regimen.

DECOCTION (Hartshorn). See *Mixtures.*

DECOCTION (Hellebore).—1. *Decoction of Black Hellebore; Decoctum Hellebori Nigri*,—Lat. *Prep.* (A. T. Thomson.) *Black hellebore root*, 2 dr.; *water*, 1 pint; boil 15 minutes. *Dose.* 1 fl. oz., every 4 hours; in dropsy, worms, chronic skin diseases, &c., occurring in non-irritable habits.

2. *Decoction of White Hellebore; Decoctum Veratri*,—Ph. L. & D. *Prep.* (Ph. L. 1836.) *White hellebore* (bruised), 10 dr.; *water*, 1 quart; boil to a pint, and when cold, add of *rectified spirit*, 3 fl. oz. *Used* as a lotion in itch, lepra, psoriasis, scald-head, &c.; and to destroy pediculi. In most cases it should be diluted with water, and should never be applied to the unsound skin.

DECOCTION (Horehound). Syn. *Compound Decoction of Horehound; Decoctum Marubii Compositum*,—Lat. *Prep.* (Dr. R. E. Griffith.) *Dried horehound* (marrubium vulgare), 1 oz.; *liquorice root* and *flax seed* (bruised), of each, ½ oz.; *boiling water*, 1½ pint; macerate for 3 or 4 hours, (boil a minute,) and strain. An excellent demulcent and pectoral. *Dose.* 1 to 2 fl. oz., as required, in coughs, &c.

DECOCTION (Hairy Horehound). Syn. *Decoctum Ballotæ Lanatæ*,—Lat. *Prep.* (Rehmann.) *Siberian or woolly horehound* (ballota), 1½ oz.; *water*, 1 quart; boil to one-half. *Dose.* A tumblerful, or more, twice a day; in rheumatic, gouty, and dropsical affections, especially the latter.

DECOCTION (Horse-chestnut Bark). Syn. *Decoctum Hippocastanei*, — Lat. *Prep.* (Dr. Wood.) *Horse-chestnut bark* (coarsely powdered), 10 dr.; *water*, 1 pint; boil 10 minutes and strain. *Used* for decoction of cinchona bark. A little liquorice root is frequently added.

DECOCTION (Horse-Chestnut Bark,—Compound). Syn. *Decoctum Hippocastanei Compositum*,—Lat. *Prep.* 1. (Phœbus.) *Horse-chestnut bark*, 1½ oz.; *water*, 18 fl. oz,; boil to one half, strain, and when *quite cold*, add of *sulphuric ether*, 1 to 2 dr.; *syrup of orange peel*, 1 oz. To be used during the intermission of an ague, in wine-glassfuls at a time.

2. (Spielman.) *Horse-chestnut bark* and *willow bark*, of each, ½ oz.; *calamus aromaticus* and *root of water avens*, of each, 2 dr.; *water*, 16 fl. oz.; boil to one half. As the last.

DECOCTION (Iceland Moss). Syn. *Decoction of Liverwort; Decoctum Cetrariæ*,—Ph. L. *D. Lichenis Islandici*,—Ph. D. *D. Lichenis*,—Ph. L. 1824. *Prep.* 1. (Ph. L.) *Liverwort* (Iceland moss), 5 dr.; *water*, 1½ pint; boil to a pint, and strain.

2. (Ph. D.) *Iceland moss*, 1 *oz.; water*, 1½ pint; boil for 10 minutes in a covered vessel, and strain. Nutritious, demulcent, pectoral, and tonic. *Dose.* 1 to 4 fl. oz., every 3 or 4 hours; in chronic affections

of the chest and stomach, especially pulmonary consumption, old coughs, dyspepsia, chronic diarrhœa, and dysentery. It may be flavoured and sweetened; milk is frequently added to it. The bitter matter may be removed by steeping the moss for some time in pretty warm water, or in cold water to which a *very little* carbonate of potash has been added. Without this is done, it is intensely bitter and nauseous.

DECOCTION (Indian Bael). Syn. *Decoction of Ægle Marmelos; Decoctum Bael.* From the *dried unripe fruit of ægle marmelos* (Indian bael), 2 oz.; *water*, 1 pint; boil to one third, and strain. *Dose.* 2 fl. oz. two or three times a day; in dysentery, diarrhœa, and English cholera.

DECOCTION (Indian Pink). Syn. *Decoctum Spigeliæ*,—Lat. *Prep. Indian pink root*, 5 dr.; *water*, 1 pint; boil 5 minutes, add *senna*, 4 dr.; digest 15 minutes, strain, and add of *manna*, 1 oz. *Dose.* A small teacupful, 3 times a day, for an adult; ½ oz. to 1 oz., or less, for children; as an anthelmintic purge.

DECOCTION (Indian Sarsaparilla). Syn. *Decoctum Hemedesmi*,—Lat. *Prep.* (Pereira.) *Root of Indian sarsaparilla* (hemedesmus Indicus), 2 oz.; *water*, 1½ pint; boil to a pint. Diuretic, alterative, and tonic. *Dose.* By wine-glassfuls, as decoction of sarsaparilla.

DECOCTION (Irish Moss). Syn. *Decoctum Chondri. Prep.* (Pereira.) *Carrageen* or *Irish moss*, 1 oz.; macerate in lukewarm water for 10 minutes, take it out and drain it, and then boil it in *water*, (or *milk*,) 3 pints, for 15 minutes, and strain through linen.

Obs. If twice the above weight of moss is employed, a mucilage (*mucilago chondri*) is produced, which may be flavoured with lemon juice, spices, &c., and forms a most nutritious article of spoon diet. It is taken in the same cases as *decoction of Iceland moss;* and is frequently employed in cookery, as a substitute for animal jelly, in the preparation of blancmanges, soups, &c.

DECOCTION (Isinglass). See *Lisbon Diet Drink.*

DECOCTION (Juniper Berries,—Compound). Syn. *Decoctum Juniperi Compositum*,—Lat. *Prep.* (St. B. Hosp.) *Juniper berries*, 2 oz.; *cream of tartar*, 3 dr.; *water*, 4 pints; boil to a quart, strain, and add *compound spirit of juniper*, 2 fl. oz. Diuretic. *Dose.* 2 or 3 wine-glassfuls, 3 times a day, warm.

DECOCTION (Linseed,—Compound). Syn. *Decoctum Lini Compositum*,—Ph. D *Prep.* (Ph. D.) *Linseed*, 1 oz.; *liquorice root*, (bruised,) ½ oz.; *water*, 1½ pint; boil for 10 minutes in a covered vessel, and strain whilst hot. Emollient and demulcent. *Dose.* A wine-glassful ad libitum; in gonorrhœa, dysentery, pulmonary affections, &c. It may be flavoured with lemon peel, and sweetened. See *Infusions.*

DECOCTION (Liquorice). Syn. *Decoctum Glycyrrhizæ*,—Lat. *Prep.* (Ph. D. 1826.) *Liquorice root*, (sliced,) 1½ oz.; *water*, 16 fl. oz.; boil 10 minutes and strain. A mild demulcent; it is taken either alone, by wine-glassfuls, or is used as a vehicle for more active remedies.

DECOCTION (Lisbon). See *Lisbon Diet Drink.*

DECOCTION (Liverwort). See *Decoction of Iceland Moss.*

DECOCTION (Logwood). Syn. *Decoctum Hæmatoxyli*,—Ph. L. E. & D. *Prep.* 1. (Ph. L.) *Logwood chips*, 10 dr.; *water*, 1½ pint; boil to a pint, and strain.

2. (Ph. E.) *Logwood*, 1 oz.; *water*, 1 pint; boil to 10 fl. oz., adding towards the last, *cinnamon*, (in powder,) 1 dr.

3. (Ph. D.) *Logwood*, 1 *oz.; water*, ½ pint. Astringent and tonic. *Dose.* 1 table-spoonful to a wine-glassful; in diarrhœa, as required.

DECOCTION (Madder). Syn. *Decoctum Rubiæ, D. R. Tinctoriæ*,—Lat. *Prep.* 1. (Dewees.) *Powdered madder*, 1 oz.; *boiling water*, 1 pint; simmer for 15 minutes, and add of *cloves*, (bruised,) 1 dr.; when cold, strain. *Dose.* A wine-glassful, 2 or 3 times daily; in amenorrhœa, chlorosis, &c.; or every 3 hours, a short time previous to the expected menstrual discharge.

2. (W. Cooley.) To the last add *ammonio-citrate of iron*, 3 dr.

3. (St. Marie.) *Powdered madder*, ½ oz.; *hops*, 1 dr.; *English walnut leaves*, 3 dr.; *water*, 1 quart; boil to 1½ pint, strain, and when cold, add of *tincture of tartrate of iron*, 1 dr. *Dose.* 2 fl. oz., night and morning; in scrofula, &c.

DECOCTION (Mallows). Syn. *Common Decoction; Decoctum Commune; D. pro Enemate*,—Ph. L. 1787. *D. Malvæ Compositum*, Ph. L. 1836. *Prep.* (Ph. L. 1836.) *Common mallows*, (dried,) 1 oz.; *chamomile flowers*, (dried,) ½ oz.; *water*, 1 pint; boil 15 minutes, and strain. *Used* chiefly for fomentations and enemas.

DECOCTION (Malt). Syn. *Decoctum Binæ, D. Bynes, D. Malti*,—Lat. *Prep.* (Swediaur.) *Ground malt*, 3 oz.; *water*, 1 quart; boil to a pint, and strain. An oz. of *syrup of lemons*, or of *saffron*, may be added

to the cold decoction; or, a little *liquorice root*, with the malt. Demulcent and laxative. A cupful ad libitum. *Infusion of malt* (*sweet wort*) is a more convenient and elegant preparation.

DECOCTION (Marshmallow). Syn. *Decoctum Althææ*,—Ph. D. 1826 & Ph. E. 1813.) *Prep.* (Ph. D. 1826.) *Dried root* and *herb of marshmallow*, 4 oz.; *raisins*, (stoned,) 2 oz.; *water*, 7 pints, (wine measure); boil down to 5 pints, strain, allow it to deposit the sediment, and decant the clear liquid. Demulcent. *Dose.* A cupful ad libitum, in coughs, colds, calculous affections, and other diseases of the urinary organs. See *Mixtures.*

DECOCTION (Matico). Syn. *Decoctum Maticonis*,—Lat. *Prep.* (Dr. Jeffreys.) *Matico leaves*, 1 oz.; *water*, 1 pint; boil 12 minutes and strain. Astringent. *Dose.* 1 fl. oz., 2 or 3 times a day; in hemorrhagic and other discharges.

DECOCTION (Mercurial). Syn. *Decoctum Hydrargyri*, *D. Mercuriale*,—Lat. *Prep.* 1. *Quicksilver*, 4 oz.; *water*, 1 pint; boil in a glass or earthen vessel for an hour, adding water to replace that lost by evaporation. *Dose.* A teacupful.

2. *Mercurial pill*, 1 oz.; *water*, 1 quart; boil to a pint. *Dose.* A wine-glassful. Both were formerly taken for worms and the itch.

3. *Corrosive sublimate*, 1 gr.; (dissolved in) *spirit of wine*, 30 drops; *extract of sarsaparilla*, 3 dr.; *decoction of sarsaparilla*, 8 fl. oz.: mix. *Dose.* One large tablespoonful, 3 times a day; in syphilis, and obstinate skin diseases.

DECOCTION (Mezereon). Syn. *Decoction Mezerei*,—Ph. E. & Ph. D. 1826. *Prep.* (Ph. E.) *Root-bark of mezereon*, 2 dr.; *liquorice root*, 4 dr.; *water*, 1 quart; simmer to 1½ pint, and strain. Stimulant and sudorific. *Dose.* A wine-glassful, or more, three or four times a day; in chronic rheumatism, scrofula, secondary syphilis, lepra, and some other cutaneous affections. Much boiling injures the virtues of mezereon.

DECOCTION (Mezereon,—Compound). Syn. *Decoctum Mezerei Compositum*,—Lat. *Prep.* (Van Mons.) *Mezereon*, 2 dr.; *bitter sweet*, 4 dr.; *burdock*, 2 oz.; *water*, 2 quarts; boil to 3 pints, add of *liquorice root*, 2 dr., and strain. As the last, and in obstinate diseases of the skin.

DECOCTION (Narcotic). Syn. *Decoctum Anodynum*, *D. Narcoticum*, — Lat. *Prep.* (Hosp. Form.) *Common nightshade* (solanum nigrum), dried, 1 oz.; *poppy heads*, 3 in no.; *water*, 1 pint; boil 10 minutes, and strain. As an anodyne fomentation, used warm.

DECOCTION (Nitre). Syn. *Decoctum Nitrosum*, *D. Nitratum*, *D. Potassæ Nitratis*,—Lat. *Prep.* 1. *Nitre*, ½ oz.; *white sugar*, 2 oz.; *cochineal*, 20 gr.; *water*, 1½ pint; boil a few minutes and strain.

2. (Hosp. Form.) *Barley water*, 1 pint; *nitre*, 5 dr.; dissolve. Diuretic, diaphoretic, and refrigerant. A wine-glassful, frequently; in gonorrhœa, sore throat, acute rheumatism, scurvy, &c.

DECOCTION (Oak Bark). Syn. *Decoctum Quercûs*,—Ph. L. E. and D. *Prep.* 1. (Ph. L. & E.) *Oak bark* (bruised), 10 dr.; *water*, 1 quart; boil down to a pint, and strain.

2. (Ph. D.) *Oak bark*, 1½ *oz.*; *water*, 1½ pint; boil 10 minutes, and strain. Astringent. *Used* as a gargle in ulcerated sore throat, relaxation of the uvula, &c.; and as a wash, and an injection in piles, leucorrhœa, hemorrhages, prolapsus ani, &c.

DECOCTION (Oats). Syn. *Water Gruel*; *Decoctum Avenæ*,—Lat. *Prep.* 1. (Cullen.) *Oatmeal*, 1 oz.; *water*, 3 quarts; boil to a quart, strain, and when cold, decant the clear liquid from the sediment.

2. (A. T. Thomson.) *Washed groats*, 4 oz.; *water*, 4 pints; boil to a quart. Nutritious and demulcent. Taken ad libitum, to promote the action of purgatives, and as an enema, either alone, or as a vehicle for more active substances. It is too thin for food. See *Gruel.*

DECOCTION (Pareira). Syn. *Decoctum Pareiræ*,—Ph. L. *Prep.* 1. (Ph. L.) *Pareira brava root* (sliced), 10 dr.; *water*, 1½ pint; boil to a pint, and strain.

2. (Sir B. Brodie.) *Pareira*, 4 dr.; *water*, 3 pints; boil to a pint, as last. The above are given in gonorrhœa, leucorrhœa, and chronic inflammation of the bladder. *Dose.* Of the *first*, ½ to 1 wine-glassful, 3 or 4 times a day; of the *second*, about twice that quantity, or more. It is commonly combined with some tincture of hyoscyamus; and when the triple phosphates are present in the urine, dilute hydrochloric or nitric acid may be added. See *Pareira.*

DECOCTION (Pectoral). See *Decoction of Barley.*

DECOCTION (Pellitory). *Decoctum Pyrethri*, — Lat. *Prep.* (Guy's Hosp.) *Pellitory root*, 1 oz.; *water*, 1½ pint; boil to a pint, and strain. *Used* as a gastric stimulant, and as a gargle in relaxation of the uvula.

DECOCTION (Pomegranate). Syn. *Decoctum Granati*,—Ph. L. *Prep.* (Ph. L.)

Pomegranate rind (fruit-bark), 2 oz.; *distilled water*, 1½ pint; boil to a pint, and strain. Astringent. *Used* as a gargle and injection, in sore throat, leucorrhœa, &c.; and *internally*, in diarrhœa, dysentery, &c. *Dose.* 1 fl. oz., or more.

DECOCTION (Pomegranate Root). Syn. *Decoctum Granati Radicis*,—Ph. L. *Prep.* 1. (Ph. L.) *Root-bark of pomegranate* (sliced), 2 oz.; *water*, 1 quart; boil to a pint, and strain.

2. (Collier.) *Bark of the root*, 2 oz.; *water*, 1 pint; boil to one half. This is the common form used in India.

Dose, &c. A wine-glassful, half-hourly, until the whole is taken, a light diet and a dose of castor oil having been taken the day previously. In tape-worm, Dr. Collier recommends the whole of the *last* preparation to be given at 2 doses, at the interval of 2 hours. It purges, and in 5 or 6 hours frequently expels the worm; if this does not take place, it should be persevered in. "Look for the head of the tænia (tape-worm); for if that is not expelled, you have done nothing." (Collier.) *Oil of turpentine* and *kousso* are now more frequently given in tænia in this country.

DECOCTION (Poppies). Syn. *Decoction of Poppy-heads, Fomentation of do.; Decoctum Papaveris*, — Ph. L. E. & D. *Prep.* 1. (Ph. L.) *Poppy-heads* (bruised), 4 oz.; *water*, 2 quarts; boil for 15 minutes, and strain.

2. (Ph. E. & D.) As the last, but using only 3 *pints of water*. *Used* as an emollient fomentation, in painful swellings, excoriations, &c. The addition of a ¼ pint of vinegar, is said to promote its efficacy.

DECOCTION (Quassia). Syn. *Decoctum Quassiæ*,—Lat. *Prep.* From *quassia chips* (small), 1 dr.; *water*, 1¼ pint; boil to a pint, and add *syrup of orange peel*, 2 oz. *Dose.* A wine-glassful, occasionally, as a stomachic tonic. See *Infusions.*

DECOCTION (Quince). Syn. *Decoction of Quince Seed, Mucilage of do.; Decoctum Cydonii*,—Ph. L. *Prep.* From *quince seeds*, 2 dr.; *water*, 1 pint; boil 10 minutes, and strain. *Used* as an emollient and sheathing application to abraded or wounded surfaces, as cracked lips, nipples, &c.; and to the skin in erysipelas, to painful hemorrhoidal tumours, and the like. Prepared with a little less water, it is used by the hairdresser as "*bandoline*" or "*fixateur.*"

DECOCTION (Rice). Syn. *Rice Water, Rice Drink; Decoctum Oryzæ. Prep. Rice*, 2 oz.; *water*, 1 quart; boil to one half, and strain. Demulcent. A good drink in fevers, coughs, &c., either alone, or sweetened and flavoured with a little lemon peel.

DECOCTION (Sarsaparilla). Syn. *Decoctum Sarzæ*,—Ph. L. & E. *D. Sarsaparillæ*,—Ph. D. *Prep.* 1. (Ph. L.) *Sarsaparilla* (sliced), 5 oz.; *water*, 2 quarts; boil to a quart, and strain.

2. (Ph. E.) *Sarsaparilla*, 5 oz.; *boiling distilled water*, 4 pints; macerate for 2 hours, in a vessel lightly covered, and placed in a warm situation; then take out the root, bruise it, return it again to the liquor, boil down to a quart, and strain.

3. (Ph. D.) *Sarsaparilla*, 2 oz.; *boiling water*, 1½ pint; digest an hour, boil 10 minutes, cool, and strain.

Obs. The medicinal virtues of sarsaparilla root reside wholly in the bark, or cortical portion, it is therefore quite unnecessary to bruise it, as directed in the Ph. E. By those houses which do largely in decoction of sarsaparilla, the root is seldom split or cut; the bundles in which it is made up being simply untied and spread open, to allow of the free exposure of every part to the solvent action of the water. By this plan, the whole of the soluble portion of the bark is extracted, whilst the feculent matter that pervades the wood is only partially dissolved out. According to Soubeiran, a mere infusion is preferable. The *Dose* is a teacupful to half a pint, 3 or 4 times a day.

An *extemporaneous decoction of sarsaparilla* is made by dissolving ¾ oz. of the *simple extract* in 1 pint of *hot water.* See *Sarsaparilla.*

DECOCTION (Sarsaparilla, — Concentrated). Syn. *Decoctum Sarzæ Concentratum*,—Lat. *Prep.* 1. (Wholesale.) *Sarsaparilla* (Jamaica), 10½ *lb.*, are placed in a large and well-cleaned copper boiler, and enough *boiling water* added to cover it; it is then left to macerate, *without boiling*, for 3 or 4 hours, after which it is boiled for about an hour, and the clear liquor drawn off into *another clean copper pan;* the root (after it has well drained) is then washed or "sparged" with boiling water, until the latter runs off scarcely coloured, (see *Scotch Ale;*) the washings are added to the decoction, and the whole evaporated as quickly as possible to 6½ pints; it is then set to cool, and *rectified spirit of wine*, 1½ pint, further added; after agitation, the whole is set aside in a well-corked bottle, in a cool place for a week. In a few days it is usually found as clear and brilliant as brandy, with very little sediment, and will keep for any length of time uninjured. Some manufac-

turers, instead of washing the root, give it a second and third water, boiling it each time, and evaporating the mixed liquors.

2. (Extemporaneous.) *Extract of sarsaparilla*, 6½ *oz.*; *water*, 12 fl. oz.; dissolve, add *rectified spirit*, 2½ fl. oz., and *water*, q. s. to make the whole exactly measure a pint.

Obs. 1 drachm of this decoction, mixed with 7 drachms of water, forms a similar preparation to the *decoctum sarzæ* of the Ph. L., and is now very frequently substituted for it in dispensing. See *Sarsaparilla* and *Extracts*, (and *below*.)

DECOCTION (Sarsaparilla, — Compound). Syn. *Decoctum Sarzæ Compositum*, — Ph. L. & E. *D. Sarsaparillæ Comp.*,—Ph. D. *Lisbon Diet Drink*, *Compound Decoction of Sarsaparilla and the Woods*, *Decoctum Lusitanicum*, — Obs. *Prep.* 1. (Ph. L.) *Decoction of sarsaparilla* (boiling), 4 pints; *sassafras chips*, *guaiacum wood* (rasped), and *fresh liquorice root* (bruised), of each, 10 dr.; *mezereon* (root-bark), 3 dr.; boil for 15 minutes, and strain.

2. (Ph. E.) As the last, but using 4 dr. of *mezereon*.

3. (Ph. D.) *Sarsaparilla* (sliced), 2 *oz.*; *sassafras*, *guaiacum turnings*, and *liquorice root* (bruised), of each, 2 dr.; *mezereon root-bark*, 1 dr.; *boiling water*, 1½ pint; digest for an hour, then boil for 10 minutes, cool, and strain.

4. (Extemporaneous.) *Compound extract of sarsaparilla*, 7½ dr.; *boiling water*, 1 pint; dissolve.

Obs. This decoction is an imitation of the once justly celebrated "*Lisbon Diet Drink*." It is alterative and diaphoretic. *Dose.* A teacupful, or more, 3 or 4 times a day, either along with, or after, a mercurial course; and in syphilis, scurvy, scrofula, chronic rheumatism, lepra, psoriasis, and several other skin diseases, and especially in cachexia, or general bad habit of body. During its use the skin should be kept warm. See *Sarsaparilla*.

DECOCTION (Sarsaparilla, — Concentrated Compound). Syn. *Decoctum Sarzæ Compositum Concentratum*, *D. Sarsaparillæ C. C.*,—Lat. There is a very considerable trade done in this article, in consequence of *compound decoction of sarsaparilla* being taken in large doses, both alone, and in combination with other remedies, and the pharmacopœial preparation, spoiling if kept longer than about 12 hours, in warm weather. Like the *concentrated simple decoction*, it is said to be of 8 *times the usual strength*, so that when mixed with 7 *times its weight of water*, it forms a similar preparation to the *decoctum sarzæ compositum*,—Ph. L.; for which it is very generally substituted in dispensing.

Prep. 1. (Wholesale.) *Sarsaparilla* (red Jamaica), 96 *lb.*; *mezereon root* (not *root-bark*), 9 *lb.*; *liquorice root* (bruised), 16 *lb.* The *mezereon* and *liquorice* are first laid (loosely) on the bottom of a clean copper pan, and the *bundles* of *sarsaparilla* (untied and loosened) packed over them, in horizontal layers, alternately at right angles with each other. Three or four boards, with as many iron ½ cwt. weights, are next placed on the top of the whole. Water is now run in, to about 10 inches higher than the ingredients, and heat is applied until ebullition commences. The materials are now allowed to macerate without boiling for 3 or 4 hours, after which the liquid is gently boiled for about an hour, care being taken to add fresh water from time to time, so as to keep the whole well covered. The decoction is next run off, and set evaporating as quickly as possible. The ingredients are then washed with successive portions of *boiling water*, by allowing it to descend from a species of shower-bath, after the manner of "sparging," described under "*Scotch ale*." This is repeated until the water runs off nearly colourless, the smallest quantity being employed that will effect the object in view. The whole of the liquid is now evaporated without delay, until reduced to 8¼ gall., when, after cooling, 2 dr. of *essential oil of sassafras*, dissolved in 2 gall. of *rectified spirit of wine*, are added, and afterwards, 1 pint of *essence of guaiacum*. The liquid is then placed in a suitably sized barrel, set upon its head, and fitted with a small cock, (*not* placed *too* near the bottom,) and allowed to repose for a week, by which time it becomes clear and brilliant, and fit for sale. This is the form adopted by the large metropolitan drug-houses most celebrated for this preparation. The *product* that may be drawn off fit for sale, is *something over* 10 *gall.* The residuum, forming the "bottoms," consists chiefly of fecula. The latter is well stirred up with 3 or 4 gall. of *cold water*, and allowed to settle. The clear decanted "washings" are used as water or liquor in making the next batch of decoction.

2. (Extemporaneous.) *Compound extract of sarsaparilla*, 7½ *oz.*; *boiling water*, 12 *fl. oz.*; dissolve, then add of *rectified spirit of wine*, 2½ fl. oz.; mix well, and further add of *water*, q. s. to make the whole measure a pint.

Obs. To conduct this process successfully, several large copper pans are required; one of which (to boil the ingredients in) must be capable of containing from 140 to 150 gallons at the least, and the others must be sufficiently large to receive the liquors as they are drawn off. Those for the evaporation should be very shallow, in order that it may proceed rapidly; and the whole should be heated by steam. An excellent plan is, to employ large *wooden vats*, and to apply the heat by means of pipes laid along the bottom, and supplied with high-pressure steam. This method is less expensive than the use of double steam pans, as above. When essence of guaiacum is not used, 24 *lb.* of *guaiacum shavings*, from which the dust has been sifted, are boiled with the other ingredients, instead. Parties desirous of using the proportions of the ingredients ordered by the Colleges, may do so, by taking *eight times* the given quantities, and proceeding as above.

DECOCTION (Sarsaparilla, — Feltz'). Syn. *Ptisane de Feltz; Decoctum Sarzæ cum Ichthyocollâ*, — Lat. *Prep.* From *sarsaparilla* (sliced), 3 oz.; *isinglass* and *crude antimony* (in powder), of each, ½ oz.; *water*, 5 pints; boil to one half, and strain. See *Apozems.*

DECOCTION (Sarsaparilla, — Jauperand's). Syn. *Ptisane de Jauperand; Decoctum Sarzæ cum Radice Chinâ. Prep.* (Bories.) *Sarsaparilla* and *China root*, of each, 2 oz.; *senna* and *sassafras chips*, of each, 1 oz.; *rhubarb* and *Peruvian bark*, of each, ½ oz.; *carbonate of potassa*, 1 dr.; *water*, 2 gall.; simmer, gently, for several hours, and strain 12 pints; when cold decant the clear. *Dose.* 2 fl. oz., two or three times daily; in scrofula, &c.

DECOCTION (Sarsaparilla,—Dr. Townsend's). See *Sarsaparilla.*

DECOCTION (Sarsaparilla,—Vinache's). Syn. *Ptisane de Vinache; Decoctum Sarzæ cum Sennâ*,—Lat. *Prep.* (Foy.) *Sarsaparilla, China wood*, and *guaiacum wood*, of each, 1½ oz.; *crude antimony* (tied in a rag), 2 oz.; *water*, 6 pints; macerate for 12 hours (7 in hot weather), boil to one half, add *sassafras chips* and *senna*, of each, ½ oz., infuse 1 hour longer, and strain; when cold decant the clear. Recommended in scrofula, secondary syphilis, and various cutaneous affections.

DECOCTION (Sarsaparilla, — Zittmann's). Syn. *Ptisane de Zittmann; Decoctum Zittmanni. Prep.* 1. (*Stronger decoction; D. Z. Forte*,—Ph. Bor., 1847.) *Sarsaparilla*, 12 oz.; *water*, 72 lb (say, 5¾ gall.); digest 24 hours, then add (suspended in a bag), *white sugar* and *alum*, of each, 6 dr.; *calomel*, 4 dr.; *cinnabar*, 1 dr.; boil to 24 lb, adding towards the end of the process, *senna*, 3 oz.; *liquorice root*, 1½ oz.; *aniseed* and *fennel seed*, of each, ½ oz.; finally strain, with pressure, and after some time decant the clean portion. The formula in the *Ph. Suec.* 1845, is similar; that in the *Hamburg Codex* directs only 24 lb of water to be used, and the whole to be reduced to 16 lb.

2. (*Weaker decoction; D. Z. Tenue*,—Ph. Bor. 1847.) Add to the *residuum* (waste) *of the last preparation, sarsaparilla*, 6 oz.; *water*, 72 lb (say, 5¾ gall.); boil to 24 lb; adding towards the end of the process, *lemon peel, cinnamon bark, liquorice root*, and *cardamoms*, (all bruised) of each, 3 dr.; press, strain, &c., as before. In the Ph. Suec., 1845, double the above weights of lemon peel and liquorice root are ordered; and in the Hamburg Codex (1845), 24 lb of water only are ordered, and the whole is to be boiled down to 16 lb.

Obs. Both the above are used in Germany and on the Continent generally, in the same cases as those in which *compound decoction of sarsaparilla* is administered in England. They may be drunk almost ad libitum. A *trace* of mercury may be detected in the stronger decoction, when properly prepared.

DECOCTION (Senega Root). Syn. *Decoction of American Snake Root, D. of Rattlesnake Root; Decoctum Polygalæ; D. Senegæ*, —Ph. L. *Prep.* (Ph. L.) *Senega* or *seneka root*, 10 dr.; *water*, 1 quart; boil to a pint, and strain. *Dose.* ½ to 2 wine-glassfuls, three or four times daily, in humoral asthma, chronic cough, dropsy, &c. It is stimulant, expectorant, and diuretic, and in large doses, emetic and cathartic. It is frequently conjoined with ammonia. It is the antidote employed by the Senegaro Indians against the bite of the rattlesnake. (Dr. Tennant.)

DECOCTION (Simaruba Bark). Syn. *Decoctum Simarubæ*,—Lat. *Prep.* (Dr. Wright.) *Simaruba bark*, 2 dr.; *water*, 24 fl. oz.; boil to one half, and strain. Tonic. *Dose.* 1 to 2 fl. oz.; in chronic dysentery and diarrhœa.

DECOCTION (Squills,——Compound). Syn. *Decoctum Scillæ Compositum*,—Lat. *Prep.* (Ph. U. S. 1841.) *Squills*, 3 dr.; *juniper berries*, 4 oz.; *snakeroot*, 3 oz.; *water*, 4 lb; boil to one half, strain, and add of *sweet spirits of nitre*, 4 fl. oz. In chronic coughs and other chest affections, unaccompanied with active inflammatory symptoms. *Dose.* 1 to 3 fl. oz., twice or thrice daily.

DECOCTION (Starch). Syn. *Decoctum Amyli*,—Ph. L. *Mucilago Amyli*,—Ph. E. & D.; and Ph. L. 1824. *Prep.* (Ph. L. & E.) *Starch*, ½ oz.; add, gradually, *water*, 1 pint, and boil for a short time. The Dublin preparation is nearly twice as strong. *Used* as an enema in dysentery, diarrhœa, and excoriations of the rectum.

DECOCTION (Sudorific). Syn. *Decoctum Sudorificum*,—Lat. The old name of the *compound decoctions of sarsaparilla* and *guaiacum*.

DECOCTION (Suet). Syn. *Artificial Goat's Milk; Decoctum Sevi*,—Lat. *Prep. Suet*, 1 oz.; tie it loosely in a piece of muslin and simmer it in *cow's milk*, 1¼ pint; adding towards the last, *white sugar*, ½ oz. In scrofulous emaciation and phthisis; taken ad libitum.

DECOCTION (Tamarinds). Syn. *Decoctum Tamarindorum*,—Lat. *Prep. Tamarinds*, 1½ oz.; *water*, 1 pint; boil for 5 minutes, and strain. A pleasant drink in fevers, asthma, chronic coughs, &c.

DECOCTION (Tamarinds and Senna). Syn. *Dec. Tamarindorum cum Sennâ*,—P. E. 1744. *Prep. Tamarinds*, 6 dr.; *cream of tartar*, 2 dr.; *water*, 1½ pint; boil in a glazed earthen vessel until reduced to 16 oz.; then infuse therein for 12 hours, *senna*, 4 dr.; strain, and add of *syrup of violets*, 1 oz. A gentle aperient. *Dose.* A wine-glassful, or more.

DECOCTION (Tar). Syn. *Tar Water; Decoctum Picis liquidæ*,—Lat. *Prep. Tar*, 1 oz.; *water*, 1½ pint; boil to 1 pint. *Dose.* A pint, or more, daily; in chronic catarrh; and as a wash in chronic skin diseases, especially those of the head, in children.

DECOCTION (Tonic). Syn. *Strengthening Decoction; Decoction Roborans*,—Lat. *Prep.* 1. *Peruvian bark*, bruised, ½ oz.; *Virginian snakeroot*, 2 dr.; *water*, 1 pint; boil to one half, strain whilst hot, and add *spirit of cinnamon*, 1½ fl. oz.; *diluted sulphuric acid*, 1½ dr. *Dose.* 2 oz., two or three times a day.

2. *Decoction of bark*, 5 oz.; *tincture of bark*, 6 dr.; *aromatic confection*, ½ dr.; *sal volatile*, 1 dr. *Dose.* 1 or 2 table-spoonfuls night and morning; especially in diarrhœa.

DECOCTION (Tormentil). Syn. *Decoctum Tormentillæ*,—Ph. L. *Prep.* (Ph. L.) *Tormentil root*, (bruised,) 2 oz.; *water*, 1½ pint; boil to a pint, and strain. Astringent. *Dose.* 1 to 2 fl. oz., in chronic diarrhœa, &c.

DECOCTION (Turmeric). Syn. *Decoctum Curcumæ*,—Lat. *Prep.* From *turmeric root*, (in powder,) 1½ oz.; *water*, 1 pint; boil 5 minutes, and strain. A mild aromatic stimulant and stomachic. *Dose.* A wine-glassful, ad libitum. It is principally used as a test for alkalies, which turn it brown. Unsized paper dipped into it and dried, forms the *turmeric test-paper* of the chemist.

DECOCTION (Verbena). Syn. *Decoctum Verbenæ*,—Lat. From *verbena* (vervain), 2 oz.; *water*, 1½ pint; boil to 1 pint, and strain.

Obs. The *verbena officinalis* was formerly highly recommended by Etmuller, Hartman, De Haën, Morley, and others, in scrofula, cephalalgia, &c., but afterwards fell into neglect. More recently, a decoction of the plant has been highly extolled by Boshanov, and others, as an anti-febrile.

DECOCTION (Vulnerary). Syn. *Decoctum Vulnerarium*,—Lat. *Prep.* From *ground ivy* and *broad-leaved plantain*, of each, ½ oz.; *water*, 3 pints; boil to 1 quart, strain, and add *sugar*, 1 oz. A popular pectoral and tonic, especially in old coughs; also to heal wounds. *Dose.* ½ a tea-cupful or more, twice a day.

DECOCTION (Walnut Bark). Syn. *Decoctum Juglandis*,—Lat. *Prep.* (Ph. Gen.) *Green bark of walnuts*, 1 oz.; *water*, 1 pint; boil for 15 minutes, and strain. As an anti-syphilitic. Before the general introduction of sarsaparilla, it was much esteemed in most cases in which that drug is now taken. *Dose, &c.* The same as those of *comp. dec.* of *sarsaparilla*. Pearson says, that "when the putamen (green rind) of the walnut has been omitted, either intentionally or by accident (from *decoctum lusitanicum*), the same good effects have not followed its use, as when it contained this ingredient."

DECOCTION (Walnut Leaves). Syn. *Decoctum Juglandis Foliorum*,—Lat. *Prep.* (Negrier.) *Walnut leaves*, 1 handful; *water*, 1 quart; boil 15 minutes, and strain. Detersive, diaphoretic, and alterative. *Dose, &c.* As the last, especially in chronic rheumatism, secondary syphilis, &c.

DECOCTION (Waterdock). Syn. *Decoctum Rumicis, D. R. Aquatici*,—Lat. *Prep.* (A. T. Thompson.) *Root of common waterdock* (rumex obtusifolius), 1 oz.; *water*, 1 pint; boil for 10 minutes, and strain.

Obs. This decoction is astringent, and was once much celebrated as a remedy for scurvy and some other cutaneous affections. "It is the only remedy which proves efficacious in that disease, when the ulcers are healed, and the patient is attacked with

asthma." (Linnæus, on the scurvy of the Laplanders.)

DECOCTION (White,— Sydenham's). Syn. *Hartshorn Drink; Mistura Cornu Usti.* *Prep.* Prepared *burnt hartshorn*, 2 oz.; *gum arabic*, 1 oz.; *water*, 3 pints; boil to 1 quart and strain. Mucilaginous; demulcent. Taken *ad libitum.*

DECOCTION (Whortleberry). Syn. *Decoction of Bear-berry, D. Uva-ursi; Decoctum Uvæ Ursi,*—Ph. L. and D. *Prep.* 1. (Ph. L.) *Whortleberry leaves*, 1 oz.; *water*, 1½ pint; boil to a pint, and strain.

2. (Ph. D.) *Uva-ursi* (the leaves), ½ oz.; *water*, ½ pint; boil 10 minutes and strain.

Dose, &c. 1 to 3 fl. oz., two or three times daily; in phthisis and purulent affections of the urinary organs, unaccompanied with active inflammation; especially in chronic affections of the bladder.

DECOCTION (Willow Bark). Syn. *Decoctum Salicis, D. S. Corticis,*—Lat. *Prep.* 1. (Wilkinson.) *Willow bark* (salix latifolia), bruised, 1½ oz.; macerate in water, 2 lb, for 6 hours, then boil for 15 minutes, and strain. Tonic, astringent, and febrifuge. *Dose.* A wine-glassful.

2. (Nieman.) *Willow bark* (salix alba), 1½ oz.; *water*, ¾ pint; boil to one-half. *Dose.* 1 to 2 fl. oz. Both are used as substitutes for decoction of cinchona bark.

DECOCTION (Winter-green). Syn. *Decoction of Pyrola, D. of Umbellated Winter-green, D. of Pipsissewa; Decoctum Chimaphilæ,*—Ph. L. *D. Pyrolæ,*—Ph. D. *Prep.* 1. (Ph. L.) *Chimaphila* (dried herb), 1 oz.; *water*, 1½ pint; boil to a pint, and strain.

2. (Ph. D.) *Winter-green* (dried leaves), ½ oz.; *water*, ½ pint; boil 10 minutes in a covered vessel, and strain. Tonic, stomachic, alterative, and diuretic. *Dose.* 1 to 2 fl. oz.; in dropsies, scrofula, debility, loss of appetite, &c.; and in those affections of the urinary organs in which uva-ursi is commonly given.

DECOCTION (of the Woods). See *Comp. Dec. of Guaiacum.*

DECOCTION (Wormseed). Syn. *Decoctum Santonici,*—Lat. *Prep.* 1. *Wormseed*, bruised, 2 oz.; *water*, 1 pint; boil down to 16 fl. oz., and strain.

2. (Dr. R. E. Griffith.) *Fresh leaves of wormseed* (chenopodium anthelminticum,—Linn.), 1 oz.; *water*, 1 pint; *orange peel*, 2 dr.; boil (10 minutes), and strain. The above are bitter, stomachic, and vermifuge. *Dose.* A wine glassful twice a day; in worms. It is also used as an *injection* against ascarides.

DECOCTION (Yarrow). Syn. *Decoctum Millefolii,*—Lat. *Prep.* From *milfoil* or *yarrow tops*, 1½ oz.; *water*, 1¼ pint; boil to a pint, and strain. Astringent, tonic, and vulnerary. *Dose.* A wine-glassful, thrice daily; in dropsies, &c. It is also used as a fomentation to bruises, &c.

DECOLORATION. The blanching or removal of the natural colour of any substance. *Syrups*, and many *animal, vegetable*, and *saline solutions*, are decolored or whitened by agitation with animal charcoal, and subsequent subsidence or filtration. *Many fluids* rapidly lose their natural colour by exposure to light, especially to the direct rays of the sun. In this way, *castor, nut, poppy*, and *several other oils*, are whitened. *Fish oils* are partially deodorized and decoloured by filtration through animal charcoal. *Cottons* and *linens* are still commonly bleached by the joint action of light, air, and moisture. The peculiar way in which light produces this effect has never been satisfactorily explained. The decoloration of textile fabrics and solid bodies generally is called *bleaching.* See *Oils, Tallow, Syrups, Sugar, &c.*

DECOMPOSITION. The resolution of compounds into their elements, or the alteration of their chemical constitution in such a manner that new products are formed. The gas that illuminates our streets is the result of the decomposition of pit-coal; and vinegar and brandy result from the decomposition of the saccharine matter of grape juice.

The power or force which occasions chemical decompositions and combinations, is called *chemical affinity*, or *elective attraction*, and operates between the ultimate atoms of bodies only at insensible distances. The order in which these changes occur between the atoms of different substances, is exhibited in the *tables of affinity* already given. The laws which regulate chemical affinity are doubtless fixed and immutable, although in the present state of science we are unable to reduce them to a code or system. The rules which chemists at various times have attempted to establish are subject to numerous exceptions, being modified by other forces, as those of caloric and cohesion. The following may prove useful to the reader, especially in extemporaneous prescribing and the laboratory:

1. *Two salts* which, by the *exchange of their acid and base*, are *capable* of forming a *soluble* and an *insoluble* salt, or two *insoluble* ones, suffer *mutual decomposition*, with these results, when brought together in a state of solution; unless, which is rare, the soluble and insoluble salt form a double compound during their combination. Thus,

solutions of *chloride of barium* and *sulphate of soda*, (both soluble,) when mixed, form *insoluble* sulphate of baryta, and *chloride of sodium*, which is soluble. This is known as the "*law of Berthollet.*"

2. The solutions of two salts whose acids and bases are *incapable* of forming a *soluble* and an *insoluble* salt, or *two insoluble* ones, do *not sensibly disturb each other*, or suffer any apparent decomposition.

3. A *soluble* and an *insoluble* salt, that are *capable of forming* two *insoluble* salts, suffer decomposition; but this reaction is *rare*, unless it is assisted with a considerable elevation of temperature.

4. In the mixture of a *salt* and *acid*, decomposition ensues, if the added acid is either *more fixed* or *more soluble* than that in the salt. On this fact is based the manufacture of acetic acid from acetate of soda, and the action of the common effervescing soda-water powders.

5. *Oxides* and *acids* mutually neutralize each other, producing new compounds.

6. The *alkaline oxides* (potassa, soda, &c.) precipitate the other oxides and the alkaloids from their saline solutions; but when added in excess, in some cases, redissolve the precipitate. They also *disengage* from their combinations all the *volatile bases* (ammonia, conia, nicotine, &c.) *Potassa* decomposes *most* of the *salts* of *the other alkalies*, and *all* those of the *pure earths* and *non-alkaline metals.*

7. *Organic substances* containing *albumen, gelatine, fibrine, vegeto-alkalies*, &c., suffer immediate decomposition when mixed with *tannic* or *gallic acid*, and all the *strong acids* (except the *acetic* and *phosphoric*), as well as most of the salts of the *non-alkaline metallic oxides*, or with substances containing any of these bodies.

Obs. The ingenious operative will find the above general facts of great value in the bustle of the laboratory and workshop, in cases in which either his memory or his experience may fail to assist him. In this way, reactions may be anticipated, the disagreeable consequences of unexpected decompositions avoided, and judicious combinations ensured. Thus, we may foresee the reactions which result from the simple *law of Berthollet*, by knowing that *all* the *bicarbonates, acetates*, and *nitrates*, and *sulphates*, with the *exception* of those of baryta, tin, antimony, mercury, and bismuth; the *carbonates of potassa, soda*, and *ammonia;* the *phosphates* of the *same bases;* all the *alkaline sulphurets;* the *iodides* of the *alkalies* and *earths;* all the *chlorides*, with the *exception* of the protochloride of mercury (calomel), and the chlorides of lead and silver; and *all* the *salts of potash, soda*, and *ammonia*, which have an excess of acid, are *soluble* in water, provided only that the *acid* itself is *not insoluble*, like silicic and antimonic acid; but even the *silicates* and *antimoniates of potassa* and *soda* are *soluble* in an excess of alkali. To this may be added, that many salts, as *nitrate of bismuth, protochloride of antimony*, and the *nitrates* and *sulphates of mercury*, are decomposed by water into *soluble* acid salts and *insoluble* basic salts.

The *sulphates of baryta, tin, lead, antimony, bismuth*, and *mercury; all* the *carbonates*, except those mentioned above as being soluble; *all* the *phosphates, borates*, and *sulphurets*, except those above named; and *all* the *iodides*, except those of the alkalies and earths, are *insoluble* in water.

DEFECATION. The separation of a liquid from its lees, dregs, or impurities, by subsidence and decantation. It is commonly employed for the purification of saline solutions, and glutinous or unctuous liquids, on the large scale, in preference to filtration; than which it is both more expeditious and inexpensive. See *Clarification, Filtration, &c.*

DEFLAGRATION. The sudden combustion of any substance, for the purpose of producing some change in its composition, by the joint action of heat and oxygen. The process is commonly performed by *projecting* into a red-hot crucible, in small portions at a time, a mixture of about equal parts of *nitre*, and the *body to be oxidized.*

DEJEUNER. The morning meal; breakfast; but used of late in the fashionable world for lunch. See *Breakfast* and *Lunch.*

DELIQUESCENCE. Spontaneous liquefaction by absorption of the moisture of the atmosphere. *Deliquescent salts*, are those which by exposure gradually assume the liquid state. They should all be kept in well-closed bottles or jars.

DELIRIUM TREMENS. The madness of drunkards; a disease of the brain resulting from the excessive and protracted use of intoxicating liquors, particularly of ardent spirits. The early *symptoms* are extreme irritability and fretfulness, with unusual mobility of the body. Sleeplessness, and unpleasant dreams soon follow. At length frightful dreams and visions harass the patient. He sees remarkable sights, hears extraordinary sounds, and labours under all the strange delusions of insane persons, which, however vague and unfounded, operate on him with all the force of realities till he becomes furiously mad.

The fit almost always comes on after hard drinking; and the hands are usually, but not always, tremulous. A similar affection is occasionally produced by the abuse of opium, excessive mental anxiety, night-watching, or depletion. According to Dr. Armstrong, even respiring the fumes of ardent spirits, will, under some circumstances, produce this disease. Persons who have undergone surgical operations under the influence of chloroform, are more liable to attacks of this kind than other persons.

The *treatment* of delirium tremens consists mainly in the judicious use of *opium*, *laudanum*, or *morphia*, in rather large doses, frequently repeated. 30 to 60 drops of laudanum may be given every hour or two *during* the fit, its effects being carefully watched. The object is to produce quiet sleep, from which the patient usually wakes free from the worst symptoms of the disease. *Diaphoretics* and *mild aperients* may also be given, and a light nutritious diet adopted throughout. Depletion, especially bleeding, should be particularly avoided. Alcoholic stimulants and wine, in certain cases, have proved useful. Under this treatment, the patient, unless of a very bad habit of body or much debilitated by previous excesses, usually recovers. He is, however, very liable to relapses and subsequent attacks, which are best prevented by judicious moral management.

DELPHINE. Syn. *Delphinine*, *Delphia*, *Delphinia*, *Delphinium*, *Delphinina*. An alkaloid discovered by Lassaigne and Feneulle in *delphinium staphysagria* or *staves-acre*.

Prep. 1. The *husked seeds* (in powder) are boiled in a *little water*, and pressed in a cloth; a little *pure magnesia* is then added to the filtered decoction, the whole is boiled for a few minutes, and refiltered; the residuum, after being well washed, is digested in *boiling alcohol*, which dissolves out the alkali, and gives it up again by gentle evaporation and cooling.

2. The *bruised*, but *unshelled seeds* are digested in *dilute sulphuric acid*, the filtered liquor precipitated with *carbonate of potassa*, and the precipitate digested in *alcohol* as before.

Prop., &c. A semi-crystalline, white, odourless powder; extremely acrid and bitter; scarcely soluble in water; dissolves in ether, and readily in alcohol; and has an alkaline reaction. Its salts are very bitter and crystallize with difficulty. As commonly procured, it is mixed with an acrid resin called *staphysain*. (Couerbe.) Its alcoholic solution produces a burning and tingling sensation when rubbed on the skin, and a similar sensation is produced in various parts of the body when it is taken in doses of a few grains. It has been exhibited in neuralgia and rheumatism by Dr. Turnbull. *Dose.* $\frac{1}{12}$ gr., every three hours, made into a pill with 1 gr., each, of the *extracts of henbane* and *liquorice*. It is also used *externally* under the form of ointment and lotion.

DELPHINIC ACID. Syn. *Phocenic Acid*. A fatty acid, obtained by saponifying the oil of the *delphinus* or *porpoise*. It is also found in the berries of *viburnum opulus*.

DELPHINIC ACID (of Hofschläger.) A white, volatile, crystalline substance existing in the seeds of stavesacre, (delphinium staphysagria.) It is a powerful emetic.

DEMULCENTS. Syn. *Emollients; Emollientia, &c.*,—Lat. Bland, emollient substances that obviate irritation by covering the exposed part, and protecting it from the action of acrid matter; or which relax, soften, and swell the tissues, and render them more flexible. The *principal demulcents* are *gum arabic*, *gum tragacanth*, *linseed*, *liquorice*, *arrow-root*, *pearl barley*, *isinglass*, *almonds*, *spermaceti*, *almond* and *olive oils*, and most other *mucilaginous* and *oily substances*. For *internal use* these are made into MUCILAGES, DECOCTIONS, EMULSIONS, or MILKS, with *water*, and form suitable beverages in dysentery, diarrhœa, catarrh, diseases of the urinary organs, and all other diseases where diluents are useful.

DENSITY. *Comparative mass*, or the quantity of matter contained in a given space. It is commonly used synonymously with specific gravity, which, however, refers to *comparative weight*. Thus, quicksilver is said to have a *density* greater than that of copper, and alcohol, one less than that of oil of vitriol.

DENTIFRICES. Syn. *Dentifricia*,—Lat. Substances applied to the teeth, to cleanse and beautify them. The most usual form of dentifrices is that of powder, (*tooth powder*,) ; but liquids, (*tooth washes*,) and electuaries, (*tooth electuaries, tooth pastes*,) are also employed. The solid ingredients used in dentifrices should not be so hard or gritty as to injure the enamel of the teeth; nor so soft or adhesive as to adhere to the gums, after rinsing the mouth out with water. *Pumice-stone* (in fine powder) is one of those substances that acts entirely by mechanical attrition, and is hence, an objectionable ingredient in tooth-powder

intended for *daily* use. It is, however, very generally present in the various advertised dentifrices, which are remarkable for their rapid action in whitening the teeth. *Bath brick* is another substance of a similar nature to pumice, and like that article, should be only *occasionally* employed. *Cuttle-fish bone*, *coral*, and *prepared chalk*, are also commonly used for the same purpose, but the last is rather too soft and absorbent to form the sole ingredient of a tooth-powder. *Charcoal*, which is so very generally employed as a dentifrice, acts partly mechanically, and partly by its chemical property of destroying foul smells, and arresting putrefaction. For this purpose it should be newly burnt, and kept in well-closed vessels until used; as by exposure to the air it rapidly loses its antiseptic powers. *Powdered rhatany*, *cinchona bark*, and *catechu*, are used as ASTRINGENTS, and are very useful in FOULNESS OR SPONGINESS OF THE GUMS, *Myrrh* and *mastic* are employed on account of their odour, and their presumed preservative action, and power of fixing *loose teeth*. Insoluble powders have been objected to on account of their being apt to accumulate between the folds of the gums, and in the cracks of the teeth, and thus impart a disagreeable appearance to the mouth. To remedy this defect, a *reddish* or *flesh coloured tinge* is commonly given to them with a little *rose pink*, *red coral*, or similar colouring substance, when any small portion that remains unwashed off is rendered less conspicuous. Some persons employ *soluble substances* as *tooth-powders*, which are free from the above objection. Thus, *sulphate of potash* and *cream of tartar* are used for this purpose, because of the grittiness of their powders and their slight solubility in water. *Phosphate of soda* and *common salt* are also frequently employed as dentifrices, and possess the advantage of being readily removed from the mouth by means of a little water. Among those substances that chemically *decolour* and *remove unpleasant odours*, the only ones employed as dentifrices are *charcoal* and the *chlorides of lime* and *soda*. The *first* has been already noticed; the *others* may be used by brushing the teeth with water, to which a *very little* of their solutions have been added. A *very weak solution of chloride of lime* is commonly employed by *smokers* to *remove the odour* and *colour imparted by tobacco* to the teeth. *Electuaries*, made of *honey* and *astringent substances*, are frequently employed in *diseases of the gums*. The *juice* of the *common strawberry* has been recommended as an elegant natural dentifrice, as it readily dissolves the tartareous incrustations on the teeth, and imparts an agreeable odour to the breath. See *Tooth Powders*, *Electuaries*, *Washes*, *&c.*

DENTINE. The tissue of organic and earthy matter of which the teeth are composed.

DENTITION. See *Teething.*

DEOBSTRUENTS. Medicines which remove obstructions, and open the natural passages of the fluids of the body, as the pores, lacteals, and glands. *Iodine*, *mercury*, *sarsaparilla*, and *aperients*, are deobstruents.

DEODORIZERS. Substances characterised by their power of destroying fetid effluvia. *Chlorine*, *chloride of lime*, *chloride of zinc*, *nitrate of lead*, *sulphate of iron*, and *freshly-burnt charcoal*, are the most effective and convenient bodies of this class. *Peat charcoal* has lately been highly recommended for deodorizing *manure*, *&c.*, on the *large scale*. When it is mixed with these substances, their fetor is immediately destroyed, and a *compost* produced, which, for agricultural purposes, is superior to guano. See *Disinfectants.*

DEOXYDATION. See *Reduction.*

DEPILATORIES. Syn. *Epilatories; Depilatoria*, *Epilatoria*,—Lat. Substances or preparations employed to remove hair from the human skin. They act either mechanically, (*mechanical depilatories*,) or, chemically, (*chemical depilatories*). To the *first class* belong *adhesive plasters*, that, on their removal from the skin, bring away the hair with them. The *second class* includes all those substances which act upon the hair-bulbs, and destroy their vitality. The following are the principal depilatories at present employed in the fashionable world:

1. Boudet's Depilatory.) *Hydrosulphuret of sodium* (crystallized), 3 parts; *quicklime* (in fine powder), 10 parts; *starch*, 11 parts; mix. It should not be applied longer than 2 to 4 minutes. Very effective and safe.

2. (Cazenave's "*pommade épilatoire;*" Messrs. Mahon's Depilatory.) *Quicklime*, 1 part; *carbonate of soda*, 2 parts; *lard*, 8 parts; mix. Applied as an ointment.

3. (Chinese Depilatory.) *Quicklime*, 8 *oz.; pearlash* (dry) and *sulphuret of potassium*, of each, 1 *oz.* Very effective; applied as No. 1.

4. (Colley's Depilatory.) *Nitre* and *sulphur*, of each, 1 part; *orpiment*, 3 parts; *quicklime*, 8 parts; *soap lees*, 32 parts;

boil to the consistence of cream. Very caustic.

5. (Delcroix's "*poudre subtile.*" *Orpiment*, 1 *oz.*; *quicklime*, 10 *oz.*; *starch*, 14 *oz.*

6. (Mechanical Depilatory; Depilatory Plaster.) *Pitch* and *resin*, equal parts, melted together and spread on leather. (See *above.*)

7. (Oriental Rusma.)—*a. Quicklime*, 3 *oz.*; *orpiment*, ½ *oz.*; *strong alkaline lye*, 1 *lb.*; boil together in a clean iron vessel until a feather dipped into the liquor loses its flue.

b. From *pearlash*, 2 *oz.*; *orpiment*, 3 dr.; *liquor of potassa*, ½ pint; boil together as before. One of the most caustic and consequently the most certain of depilatory preparations; but, with some of the others, is open to the objections of containing orpiment (*tersulphuret of arsenic*).

8. (Pâte Epilatoire.) To No. 4, add of *orris root*, 3 parts.

9. (Plenck's "*Pasta Epilatoria.*") *Orpiment*, 1 part; *quicklime* and *starch*, of each, 12 parts.

10. (Rayer's Depilatory.) *Quicklime*, 2 *oz.*; *salt of tartar*, 4 *oz.*; *charcoal*, ¼ *oz.* Less active than No. 3.

11. (Redwood.) A *strong solution of sulphuret of barium*, made into a paste with *powdered starch*, and applied immediately. Mr. Redwood says this is "the best and safest depilatory."

12. (Roseate Depilatory.) As No. 3, but coloured with a little *rose pink* or '*light red.*'

13. (Savon Epilatoire.) *Turkish depilatory* and *soft soap*, equal parts. Must not be mixed until about to be applied.

14. (Spolasco's Depilatory.) Freshly prepared *sulphuret of calcium* and *quicklime*, equal parts. Almost equal to No. 11.

15. (Turkish Rusma.) *Orpiment*, 1 part; *quicklime*, 9 parts. For *use* it is mixed up with *soap lees* and a little *powdered starch.*

Obs. Lime or orpiment, and generally both of them, have formed the leading ingredients in depilatories, both in ancient and modern times. The first acts by its well-known causticity, and also when an alkali is present, by reducing that also, either wholly or in part, to the caustic state. The action of the orpiment is of a less certain character, and its use is even dangerous when applied to a highly sensitive or an abraded surface. The addition of starch is to render the paste more adhesive and manageable.

In *using the above preparations*, those which are in the state of powder are mixed up with a little *warm water* to the consistence of a paste, and applied to the part previously shaved close. Sometimes *soap lye* is used for this purpose, and some persons spread the pulpy mass on a piece of paper, and apply it like a plaster. In 12 or 15 minutes, and sooner, if much smarting ensues, the whole should be washed off with warm water, and a little cold cream, lip-salve, or spermaceti cerate, applied to the part. The application of the *liquid preparations* is generally accompanied with gentle friction, care being taken to prevent them extending to the adjacent parts. All the above effect the object satisfactorily, with proper management; but some are much more effective than others. A small wooden or bone knife is the best for mixing them with. They must all be kept in well-stoppered bottles, and no liquid must be added to them until shortly before their application; and then no more should be mixed than is required for immediate use.

DEPOSITION (of Metals). See *Electrotype.*

DERBYSHIRE NECK. See *Goiture.*

DESICCANTS. Syn. *Desiccantia*, — Lat. Substances that check secretion and dry sores or abraded surfaces, without acting as styptics, or constringing the fibres of the parts to which they are applied. See *Astringents.*

DESICCATION. Syn. *Exsiccation.* The evaporation or dying off of the aqueous portion of solid bodies. Plants and chemical preparations are deprived of their humidity by exposure to the sun, a current of dry air, an atmosphere rendered artificially dry by sulphuric acid, or by the direct application of heat by means of a water-bath, a sand-bath, or a common fire. *Planks* and *timber* are now *seasoned*, on the large scale, in this way, by which a condition may be produced, in 2 or 3 days, which on the *old* system is barely attainable in as many years. We endeavoured to enforce the importance and value of the desiccation of woods to the builder, cabinet maker, architect, and civil engineer, so long back as 1843, but failed to obtain support in carrying out our views. Since that period, certain parties have availed themselves, commercially, of our ideas and experiments on the subject, without any acknowledgment either verbal or pecuniary.

DESSERT. The last service at dinner, consisting of fruits, confections, &c. It is here that the genius of the cuisinier revels in the happiest and most tasteful creations, whilst both hemispheres and both worlds are laid under tribute to meet the demands of man's caprice. In the dessert, the business

of the cook is elevated to the dignity of one of the fine arts, and merely requires wealth and patronage, to be brought out in forms as attractive as the most enchanting statue of god or goddess that was ever raised on the altars of human idolatry. The term, as well as most of the refinements and excellencies of the dessert, are of French origin, —Soyer himself is a Frenchman. "In all the countries of Europe, the splendour of the dessert, has, ever since the period of its introduction, kept pace with the progress of refinement and civilization; and, by *gastronomes*, the qualities and arrangement of a dessert are looked upon as the most valid test of all that is *attic* in taste and refined in elegance." (Brande.)

DESTEMPER. Syn. *Distemper*. Colours ground up with *size*, *gum*, or *white of egg*, and *water*, as in *scene* painting. The art of executing work in distemper, is called *destemper painting*.

DETERGENTS. Substances that remove offensive matter from the skin. The name is now generally restricted to applications that tend to cleanse foul wounds and ulcers.

DETERGENT (Collier's). *Prep.* From *liquor of potassa*, 2 fl. dr.; *rose-water*, 5½ fl. oz.; *spirit of rosemary*, ½ fl. oz.; mix. One of the best applications known to free the head from scurf, when the hair is strong and healthy. The head should be afterwards sponged with clean soft water.

DETONATION. See *Fulminating Compounds*.

DEUTOXIDES. See *Oxides*.

DEW POINT. The temperature at which dew begins to form, as observed by a thermometer. It varies with the humidity of the atmosphere.

DEXTRINE. Syn. *Starch Gum; Dextrina, Dextrinum*. A substance formed by the action of *dilute acids* at the boiling temperature, and by *infusion of malt*, at about 150° Fahr., on *starch*. It is also formed when *potato starch*, and some of the *other farinas* are exposed to a heat of about 400°. It, for the most part, resembles gum. See *Diastase* and *British Gum*.

DEXTRO-RACEMIC ACID. See *Racemic Acid*.

DIABETES. See *Urine*.

DIACHYLON. See *Plasters*.

DIALURIC ACID. A crystalline acid, obtained by passing a stream of *sulphuretted hydrogen* through a *boiling solution of alloxantine*. *Dialurate of ammonia* forms colourless, silky, needle-like crystals, which become deep red when heated to 212° Fahr.

DIAMOND. The diamond is pure carbon, and differs from the carbon of charcoal and lamp black, simply in being limpid, colourless, and highly refractive of light, properties which are generally referred to its crystalline form. The *weight*, and, consequently, the *value of diamonds*, is estimated in carats, one of which is equal to 4 grains; and the price of one diamond, compared to that of another of equal colour, transparency, purity, form, &c., is as the squares of the respective weights. The *average price* of ROUGH DIAMONDS, that are worth working, is about £2 for the first carat; that of a CUT DIAMOND is equal to that of a rough diamond of double weight, exclusive of the price of workmanship. "To estimate the value of a wrought diamond, ascertain its weight in carats, double that weight, and multiply the square of this product by £2." (Ure.) Thus, a cut diamond of . . 1 carat is worth £8

2	„	„	£32
3	„	„	£72
4	„	„	£128,

&c. &c. (See *Gems*.)

DIAMOND DUST. Genuine *diamond dust* is the powder produced by the abrasion of diamonds against each other in the process of cutting and polishing them. It possesses the valuable property of polishing the gems, and giving "the finest edge to every kind of cutlery." The discovery of the latter fact, a few years since, led certain knaves to extensively advertise a spurious preparation (*powdered quartz*) under the name of *diamond dust*. The factitious article acquired a very short and bad notoriety. Instead of sharpening cutting instruments, it infallibly destroyed their edge, and was particularly unfortunate in converting razors into saws. This discovery was not made, however, until it was in the hands of nearly every adult in the kingdom; nor before the scamps who manufactured and vended it had realised enough for an honest man's fortune.

DIAPENTE. Syn. *Pulvis Diapente*. *Prep.* 1. (Ph. E. 1744.) *Bay-berries, birthwort, gentian, ivory dust*, and *myrrh*, equal parts. An excellent warm tonic, especially useful in the debility and rickets of children. The substance sold under this name in the shops is an inferior mixture, used principally as a tonic, in veterinary practice. The following are the forms commonly adopted in its preparation:—

2. *Turmeric*, 4 *lb.; laurel berries* and *mustard*, of each, 3 *lb.; gentian*, 2 *lb.;* (all in fine powder,) mix.

3. *Bay-berries, gentian, mustard*, and *turmeric*, equal parts.

4. *Gentian*, 6 *lb.*; *bay-berries*, 1 *lb.* This is the formula generally used by the farriers. Sometimes *mustard*, 1 *lb.*, is added.

DIAPHORETICS. Syn. *Sudorifics; Diaphoretica, Sudorifica*,—Lat. Medicines which promote or increase the perspiration. Those that produce this effect in a very marked degree are more particularly called *sudorifics*. The *principal diaphoretics* are —*warm diluents*, as *barley water, gruel, tea*, &c.; *salts of the alkalies*, as the *citrates* of *potassa* and *soda*, *acetate of potassa*, *acetate* and *carbonate of ammonia*, *sal ammoniac*, *nitre*, &c.; *preparations of antimony*, as *antimonial powder*, *tartar emetic*, &c.; also *alcohol*, *camphor*, *Dover's powder*, *ipecacuanha*, *opium*, *wine*, *&c.*

The *use* of *diaphoretics* is indicated in nearly all diseases accompanied by fever and a dry skin, and particularly in febrile and pectoral affections.

DIAPHRAGM. The name commonly applied to the porous cell or vessel that separates the fluid containing the positive plate from the fluid which surrounds the negative plate, in constant galvanic batteries. Those made of thin *biscuit ware* are the most convenient and durable. *Plaster of Paris*, *animal membrane*, *coarse and tightly-wove canvas*, *&c.*, are also used for the purpose. Those of *plaster* are formed by surrounding an oiled cylinder of wood with a hoop of paper, and pouring it, mixed up with water, into the space between the two. In the absence of better contrivances, we have found that an *upright gallipot*, with the bottom knocked out, and its place supplied by a piece of *good bladder* tied across it, answers the purpose well, and will last for several days.

DIARRHŒA. A purging or looseness of the bowels. The causes of diarrhœa are various, but among the most common are the presence of irritating matter, worms, or acidity, in the stomach or bowels, and exposure to cold (especially cold to the feet) or sudden changes of climate or temperature. In general, it will be proper to administer a *mild aperient*, for which purpose, *rhubarb* or *castor oil* is usually preferred. The *dose* of the *first* may be from 20 to 30 grains in sugar, or made into a bolus; that of the *second*, from ¼ *oz.* to ½ *oz.*, with a little *mint* or *peppermint water*. After the due operation of this medicine, *opium*, *astringents*, and *absorbents*, may be taken with advantage, but *not* in *excessive* doses, as is commonly the practice. The *first* and *second* are indicated when great irritability exists, and the *third*, in cases of diarrhœa arising from the presence of acidity. *Chalk mixture*, to which a *few drops* of *laudanum* have been added, or the *compound powder of chalk* and *opium*, are excellent medicines, and will generally quiet the bowels. A small piece of *catechu* or *hard extract of logwood*, sucked in the same way as a lozenge, is a pleasant method of taking either of these powerful astringents, and will generally cure cases of simple diarrhœa arising from excessive peristaltic motion, or want of tonicity of the muscular coats of the intestines.

In *bilious diarrhœa*, characterised by the bright yellowish-brown colour of the dejections, a dose of *blue pill* or *calomel*, assisted by mild diluents and demulcents, and warmth, generally proves efficacious. Small doses of opium are also useful in some cases.

In *catarrhal diarrhœa*, *chylus diarrhœa*, and the like varieties, characterised by the dejections being nearly colourless, and consisting chiefly of water and mucous; or white and milky, showing the entire absence of bile; or, being entirely liquid, limpid, and serous, (in some cases resembling the washings of flesh,) opinions are divided as to the treatment. The majority of the best authorities, regard purging as injurious in these varieties, and rely chiefly on warm baths and warm fomentations, with the internal administration of mild salines and diaphoretics, followed by astringents, tonics, and occasional doses of opiates. *Choleraic diarrhœa* demands a nearly similar treatment.

The diet in every variety of diarrhœa should be light and non-irritating. Glutinous broths, beef-tea, and arrow-root, are among the best articles which can be taken. To these may be added a little dry toast. Arrow-root (genuine) either with or without a spoonful of port wine or brandy, (preferably the former,) will of itself cure all ordinary cases of diarrhœa, if accompanied with repose and a recumbent posture.

Among *external remedies*, warm and stimulating fomentations, liniments, &c., to the epigastrium and abdomen, will be found useful adjuncts to other treatment. A spoonful or two of *laudanum*, used as a friction, will generally allay pain, and in many cases settle the bowels when all other remedies have been tried in vain.

DIASTASE. A peculiar substance, contained in malt, which effects the conversion of starch, first into *dextrine*, and then into *grape sugar*.

Prep. A cold *infusion of malt* is heated to 158° Fahr. (to coagulate in albumen); it is then allowed to cool, and *alcohol* is added to the filtered liquor, when *diastase* is precipitated, under the form of a tasteless

white powder, which is freely soluble in water.

Prop., &c. One part of diastate is capable of converting 2000 parts of *starch* into *grape sugar*. Malted barley is said to contain $\frac{1}{300}$th part of this substance; yet this small portion is quite sufficient to convert the starch of the malt into sugar during the operation of mashing, in the manufacture of beer. "The most favorable temperature for this conversion is 140° to 149° F. It is also of the utmost importance that the saccharification should take place as speedily as possible, so that the sugar produced may not remain in contact with much gummy matter, in which case the diastase will not convert the starch into sugar. In fact the liquefaction and saccharification should proceed simultaneously." (M. Guerin Varry.) It has been proved by experience, that the richest and sweetest malt-worts are obtained by employing water at a heat ranging from 157° to 160° Fahr.; beginning at the lowest of these temperatures. When three mashings are made, the mean temperature of each mash should be respectively,—145°, —160°,—175° Fahr. See *Brewing*, *Dextrine*, *Fermentation*, *&c.*

DIASTASE (Animal). A peculiar substance found by M. Mialhe in the saliva.

DICTAMIA. *Prep.* (Beasley.) *Sugar*, 7 oz.; *potato arrow-root*, 4 oz.; *flour of brent barley* (triticum monococcum), 3 oz.; *Trinidad* and *Granada chocolate*, of each, 1 oz.; *vanilla*, 15 gr., triturate together.

DIDYMIUM. Syn. *Didym.* A new metal found along with *lanthanium* in the ores of cerium. See *Cerium*.

DIET. "The dietetic part of medicine is no inconsiderable branch, and deserves a much greater share of regard than it commonly meets with. A great variety of diseases might be removed by the observance of a proper diet and regimen, without the assistance of medicine, were it not for the impatience of the sufferers. On all occasions it may come in as a proper assistant to the cure, which sometimes cannot be performed without a due observance of the non-naturals."

Writers on *dietetics* (dietetica) have taken much trouble to divide and classify the numerous articles of food suitable to the various conditions of the body in health and disease; but little practical advantage has resulted from their labours. *Low diet*, *middle diet*, *full diet*, *milk diet*, *farinaceous diet*, *fruit diet*, and *vegetable diet*, are terms which, under most circumstances, are sufficiently simple to be almost self-explanatory. See *Food* and *Hygiène*.

DIET DRINK (Lisbon). Syn. *Decoctum Lusitanicum*. *Prep.* 1. (Original Formula.) *Sarsaparilla* and *China root*, of each (sliced), 1 oz.; *pumice stone* (powdered), 1 oz.; *black sulphuret of antimony*, 2 oz; (the last two loosely tied up in a rag;) *water*, 10 pints; boil to one-half, and strain.

2. (M. Pearson.) *Sarsaparilla* and *walnut peel*, of each, 8 oz.; *guaiacum shavings*, 3 oz.; *black antimony*, 3 oz.; *water*, 5 pints; boil to 3 pints, and strain.

Obs. This once celebrated preparation is now almost entirely superseded in these countries by compound decoction of sarsaparilla. See *Decoctions*.

DIETETIC COMPOSITION (Patent). *Prep.* 1. (No. 1.) *Powdered sago* and *patent cocoa*, equal parts.

2. (No. 2.) *Patent cocoa*, 6 parts; *sago* and *lump sugar*, of each, 4 parts. Very nutritious. Numerous other *dietetical compounds* will be found noticed under their respective heads.

DIGESTIVES. Substances which when applied to wounds or tumours, induce or promote suppuration. *Heat* and all *stimulating applications* are of this class. Their action is opposed to that of *Discutients*, which repel or resolve tumours and indurations.

DIGITALINE. Syn. *Digitalia*, *Digitalina*, *Picrine*. A vegetable principle discovered by M. Royer in *digitalis purpurea*, or *purple foxglove*.

Prep. 1. (Majendie.) *Foxglove leaves* (powdered), 1 lb; are digested in *ether*, first in the cold, and then heated under pressure; when the whole has again become cold, the liquor is filtered (rapidly) and the ether is distilled off in a water bath; the residuum is dissolved in water, the filtered solution treated with *hydrated oxide of lead*, the whole gently evaporated to dryness, and the dry residuum again digested in hot *ether*; from this solution the alkali is obtained, by evaporation and repeated resolutions, in a crystalline form.

2. (Homolle & M. Ossian Henry.) *Foxglove leaves* (carefully dried and powdered), 2½ lb; are digested in *rectified spirit*, and the tincture expressed in a tincture press; the spirit is then distilled off, and the residual extract treated with *distilled water*, ½ pint, acidulated with about 2 fl. dr. of *acetic acid*, a gentle heat being employed; some *animal charcoal* is then added, and the whole filtered; the filtrate is then diluted with *water*, and partly neutralized with *ammonia*; a fresh-made strong *decoction of galls* is next added; a copious preci-

pitation of *tannate of digitaline* ensues; the precipitate is washed with water, and mixed with a *little alcohol*, after which it is triturated with *litharge* (in fine powder) and exposed to a gentle heat; the whole is now digested in *alcohol*, the tincture treated with *animal charcoal*, and evaporated; the dry residuum is, lastly, treated with cold *sulphuric ether*, which takes up some foreign matter, and leaves the *digitaline*. 2 lb 8 oz. of the *dried leaves* yield 140 to 150 gr. of the *digitaline*.

Prop., &c. White, inodorous, porous masses, or small scales; it crystallizes with difficulty, is intensely bitter, and excites violent sneezing when smelled to; dissolves freely in alcohol; scarcely soluble in cold ether; and takes 2000 parts of water for its solution; it is neither basic nor alkaline; concentrated colourless hydrochloric acid dissolves it, forming a *characteristic* solution which passes from yellow to a fine green. (Homolle.) It is fully 100 times more powerful than the powdered leaves of the dried plant. It is used in the same cases. *Dose.* $\frac{1}{60}$ to $\frac{1}{30}$ gr.; either made into pills or dissolved in alcohol and formed into a mixture. Owing to the difficulty and uncertainty connected with dispensing such small quantities, it is now seldom employed in this country.

DILL. Syn. *Anethum*,—Ph. L. & E. "The fruit" (seed) of "*anethum graveolens*," (Ph. L.) or *garden dill*. Dill is an aromatic stimulant and carminative. The Cossacks employ it as a condiment; and in this country it is frequently employed to heighten the relish of soups and pickles, especially cucumbers. *Dill water* is a favorite remedy of nurses to promote the secretion of milk and to relieve the flatulence and griping of infants. *Dose.* Of the powder, 10 gr. to ½ dr., or more. *Oil of dill* (*oleum anethi*) and *dill water* (*aqua anethi*) are officinal in the pharmacopœias.

DILUENTS. Syn. *Diluentia*, — Lat. *Aqueous liquors;* so named because they increase the fluid portion of the blood. *Tea, barley water, water gruel*, and *similar articles*, are the most common diluents, after *pure water*. The copious use of *diluents* is recommended in all acute inflammatory diseases, not of a congestive character, and to promote the action of *diuretics* and *sudorifics*.

DINNER. The principal meal of the day, taken between noon and evening. "The *mid-day meal*, the dinner of our forefathers, the second breakfast of the French, and the luncheon of fashionable life, is taken at one or two; and the *evening meal*, the supper of our forefathers, and the dinner of the present day, at six or seven." "The lunch of fashion is a light and commendable dinner; the dinner of fashion is an early and moderate supper." (Erasmus Wilson.) See *Breakfast, Dejeuner, Food, Meals, &c.*

DINNER PILLS. See *Pills*.

DIOSMA. Syn. *Bookoo, Buku; Folia Barosmæ, F. Diosmæ; Buchu*,—Ph. L. *Bucku*,—Ph. E. *Diosma*,—Ph. L. 1836. "The leaf" of "*barosma serratifolia, b. crenulata*, and *b. crenata*." (Ph. L.) It is principally employed in chronic affections of the urino-genital organs, especially that of the mucous membrane of the bladder, attended with copious discharge of mucus. *Dose.* 20 gr. to ½ dr., of the powder, taken in wine; or made into an infusion or decoction.

The *officinal buchu* leaves are "glabrous, glandular; either linear-lanceolate with small serrations, or, ovato-oblong, obtuse, crenated, ovate or obovate, serrated." (Ph. L.) Their odour somewhat resembles that of rue, and their taste is warm and mint-like.

DIOSMINE. A bitter extractive matter obtained by Brande, from buchu leaves. It is very soluble in water, but not in alcohol and ether.

DISACRYLE. A white, flocculent, neutral substance, deposited by *acroleine* when long kept.

DISCUTIENTS. See *Digestives*.

DISEASE. See *Health* and *Hygiene*.

DISINFECTANTS. Syn. *Disinficientia*,—Lat. Substances which absorb, neutralize, or destroy putrescent effluvia, and miasmata, and thus remove the causes of infection. The *principal disinfectants* are *chlorine*, the *chlorides* (hypochlorites) *of lime* and *soda, chloride of zinc, peat charcoal*, the *fumes* of *nitric, nitrous*, and *sulphurous acids, heat*, and *ventilation*. The last two are the most efficient and easily applied. The *clothing, bedding, &c.*, of patients labouring under contagious diseases, may be effectually disinfected by exposure to a temperature a little higher than that of boiling water, for about an hour. Neither the texture nor colour of textile fabrics is injured by a heat of even 250° Fahr. (Dr. Henry.) It is a practice at some of the workhouses to *bake* the clothes of the paupers who have the itch, or who are infested with vermin. *Quicklime* rapidly absorbs *carbonic acid, sulphuretted hydrogen*, and several other noxious gases, and is therefore commonly used as a wash for the walls of buildings. *Acetic acid, camphor*,

fragrant pastiles, cascarilla, brown paper, and other similar substances, are frequently burnt or volatilized by heat, for the purpose of *disguising* unpleasant odours. The *sulphates of iron* and *lime* have the property of rapidly destroying noxious effluvia. A quantity of either of these sulphates thrown into a cess-pool, for instance, will in a few hours render the matter therein quite scentless. Of *gaseous disinfectants*, "sulphurous acid gas (obtained by burning sulphur) is preferable, on theoretical grounds, to chlorine. No agent checks so effectually the first development of animal and vegetable life. All animal odours and emanations are immediately and most effectively destroyed by it." (Graham.)

The *patent disinfecting process* of Messrs. Davison and Symington, is a revival of that of Dr. Henry. The articles of clothing, &c., are exposed in a large chamber to a current of heated air, at a temperature varying from 200° to 250° Fahr. Dr. Copland has highly recommended this process for the clothing of fever and cholera patients.

The reputed *disinfectants* are also *deodorizers*, and, by analogy, are presumed to act on and render inert the poisonous matter of miasmata. Their efficacy in this way is, however, very equivocal. "Col. Calvert, whose faith in a solution of nitrate of lead as a disinfecting agent was boundless, has sickened and died of typhus fever. M. Ledoyen also has had an attack of the same disease; and from the testimony of an American journal, we learn that he has left Canada for this country. These two gentlemen were both sent out to test the efficacy of certain fluids in destroying infection, and there is no need of the survivor furnishing the Home Government with any elaborate details of the experiments instituted, and of the results which followed. The fate of his fellow-commissioner and his own illness are sufficient proofs of the utter worthlessness of chemical substances in destroying the invisible sources of disease. The fluids may be useful in mitigating the foul smells which escape from the holds of ships, or from drains and sewers, but they have no direct power in arresting and preventing disease." ('Medical Times.') See *De-odorizers*, *Fumigations*, and *Infection*.

DISINFECTING COMPOUNDS. — 1. *Burnett's* (Sir Wm.) *Disinfecting Liquid.* A concentrated solution of *chloride of zinc*.

2. *Collin's Disinfecting Powder.* A mixture of dry *chloride of lime*, 2 parts, and *burnt alum*, 1 part. Used either dry or moistened with water.

3. *Crew's Disinfecting Solution.* Liquid *chloride of zinc*.

4. *Ellerman's De-odorizing Fluid.* This is said to consist chiefly of the perchlorides and chlorides of iron and manganese.

5. *Labarraque's Disinfecting Solution.* A solution of chloride *hypochlorate*) of soda.

6. *Ledoyen's Disinfecting Fluid.* A solution of *nitrate of lead*, 1 part, in about 8 parts of *water*; or, of *litharge*, 13½ oz., in *nitric acid* (sp. gr. 1·38), 12 oz., previously diluted with *water*, 6 pints. Sp. gr. 1·40.

7. *Siret's Disinfecting Compounds.—a.* A mixture of *sulphate of lime*, 53 *lb.*; *sulphate of iron*, 40 *lb.*; *sulphate of zinc*, 7 *lb.*; and *peat charcoal*, 2 *lb.*; made into balls.

b. Sulphate of iron, 20 parts; *sulphate of zinc*, 10 parts; *tan* or *waste oak-bark* (in powder), 4 parts; *tar* and *oil*, of each, 1 part; as before.

8. *Smith's Fumigation.* Fumes of *sulphur*.

DISLOCATION. Syn. *Luxation; Dislocatio*, — Lat. The forcible displacement of a bone from its socket, either by violence or disease. The latter happens when the textures forming the joint have been destroyed by some independent organic affection. "A considerable share of anatomical knowledge is required to detect the nature of these accidents; and it is much to be lamented that students neglect to inform themselves sufficiently on the subject." (Sir A. Cooper.) In common cases, the bones may be frequently replaced by forcibly extending the limb. This should be done as early as possible, and before inflammation sets in. The latter should be combated by aperients, local bleeding, refrigerant lotions, &c. Dislocations frequently exist without the fact being suspected; the swelling and inflammation being referred to other causes.

DISPLACEMENT. See *Percolation*.

DISTEMPER. A disease among dogs, usually characterised by a running from the nose and eyes, and a short dry cough; followed by wasting of the flesh, and loss of strength and spirits. At length the brain suffers, and fits, paralysis of the extremities, or convulsions come on. Laxatives and emetics are the best remedies. If there is much diarrhœa, astringents may be afterwards given. The violence of the fits may be mitigated by the administration of antispasmodics, and by the warm bath. The *distemper* is a contagious disease, and is generally fatal to weakly and very young dogs. Fits in the advanced stages of the disease are seldom followed by recovery. Impatience of light, red eyes, obstinate diarrhœa, spasmodic twitchings, a yellow

colour of the skin, and a pustular eruption, are also bad symptoms.

DISTEMPER POWDERS (Blane's). The basis of these is said to be *aurum musivum* or *bisulphuret of tin*. That of another advertised nostrum is a mixture of *quicksilver and chalk*, with a little *rhubarb* and *ipecacuanha*.

DISTILLATION. The evaporation, and subsequent condensation of the vapour of fluids, by means of a still and refrigerator, or other similar apparatus. *Dry distillation* is a term applied to the distillation of substances *per se*, or without the addition of water or other volatile fluid. *Destructive distillation* is the distillation of substances at temperatures sufficiently high to decompose them, by which their elements are separated, or evolved in new combinations.

DISTILLATION. The art of the distiller; the manufacture of spirituous liquors as practised on the large scale.

The *process of distillation*, as carried on in the distilleries of Great Britain, may be divided into *four* general operations, viz.—The *mashing* or formation of a saccharine infusion, from certain vegetable matters, as malt, barley, oats, rye, &c.;—the *cooling* of this wort or liquor;—the *fermentation* or process by which the sugar of the cooled wort is converted into alcohol; and—the *separation of the spirit* so formed by means of a still and refrigerator. By the *first* operation, the materials for the formation of the alcohol are obtained; by the *second*, they are brought to a temperature most favorable to the transformation that takes place in the *third*, after which it only remains to free the product of the last operation from the foreign matter with which it is associated: this is done in the *fourth*, which, correctly speaking, constitutes the only part of the process which can be called *distillation*.

The *general principles* of the first three of the preceding operations are noticed in the articles *Brewing*, *Diastase*, *Fermentation*, *&c.* It will there be seen, that the *amylaceous* or *starchy matter* of the grain is first *saccharified* and afterwards converted into *alcohol*, and that certain precautions are necessary to render the process successful and economical. In many of the distilleries of Great Britain, molasses and analogous saccharine substances are employed, in which case the vegetable principle (*sugar*) essential to the formation of alcohol, is already present, and merely requires simple solution in water of a proper temperature, to be ready to be subjected to immediate fermentation. In general, however, the sources of spirit in England are the various kinds of grain; *barley* and *rye* are those commonly employed. These are ground and mixed with *bruised malt*, in various proportions, and are mashed in a similar manner to malted grain. The fermentation is carried on until the density of the liquor ceases to lessen, or *attenuate*; which is determined by an instrument called a saccharometer. When this point is arrived at, the *wash* is submitted to distillation, to prevent the access of the acetous fermentation, which would lessen its alcoholic value.

During the process of distilling off the spirit of the fermented "*wash*" or "*wort*," a hydrometer is employed to ascertain the "strength" of the liquor that passes over. As soon as this has fallen to a certain point, the operation is stopped, and the "*spent wash*" removed. The spirits obtained by the first distillation are generally called "*low wines*," and have a specific gravity of about ·975. By *rectification* or "*doubling*," a crude milky spirit abounding in oil at first comes over, followed by clear spirit, which is received in a separate vessel. The process is continued until the alcoholic content of the distilled liquor has considerably diminished, when the remaining weak spirit that distils over, called "*faints*," is caught separately, and mixed with the *low wines*, preparatory to another distillation. The strongest spirit passes over first, and the condensed liquor gradually becomes weaker, until it ceases to contain alcohol. By receiving in separate vessels any given portion of the product, spirit of any required strength, within certain limits, may be obtained. The same object is more conveniently effected by surrounding the top of the capital of the still with a water bath, of a temperature corresponding to that of alcoholic vapour of the strength it is desired to obtain. Thus, if we keep the temperature of the water at about 198° Fahr., we shall obtain proof spirit; if at 192°, a spirit 20 o. p.; and so on for other strengths.

It is found from experience, and is readily accounted for by theory, that the lower the temperature at which the distillation is conducted, the stronger will be the product, and the less quantity of oil or other volatile matter will come over along with it. To promote this, it has been proposed to carry on the process in vacuo, but on the large scale this has never been adopted. The distillation of the "*wash*" is usually performed in a separate set of stills, to those employed for the rectification of the *low wines*. For very strong and tasteless spirit,

a third, and even a fourth rectification is employed, conjointly with other methods to abstract the water, and to remove any foreign matter that vitiates its odour or flavour. A portion of soap is generally put into the still with the wash to prevent excessive frothing.

We have said that the processes of mashing, &c., in the distillery, are similar to those adopted in brewing beer. We may add, that as richness in alcohol, and not flavour, is the object aimed at in the distiller's wash, not only is a large quantity of *unmalted grain* employed, but the process of boiling the wort with *hops* is omitted altogether. The *wort* is commonly "*set*" at 70° Fahr., and the fermentation and attenuation of the liquor pushed as far as possible by large and repeated doses of the best *top-yeast* of the porter brewers.

It often happens that raw spirit prepared from damaged grain, is contaminated with a highly acrid and volatile fatty substance, which is powerfully intoxicating, and irritating to the eyes and nostrils, and possesses an odour very similar to that of an alcoholic solution of cyanogen. This may be got rid of by dilution with water, and skilful rectification, when most of it passes over with the first and last "runnings;" the intermediate portion being less loaded with it. *Another plan* is to filter the spirit successively through 6 or 7 separate vessels containing *pine* or *willow charcoal*, before rectifying it. In some distilleries, the contaminated spirit is well agitated with a considerable quantity of *olive oil*, and after repose decanted, diluted with water, and rectified as before. The ordinary *corn oil* or *fuselöl* of raw spirit, is generally, for the most part, intercepted by a self-regulating bath arranged between the still-head and the refrigeratory.

The *quantity of spirit* obtained from various substances, and even from pure sugar, depends upon the skill with which the several operations are conducted. By theory, *pure sugar* should yield 51% of *alcohol;* but in practice 11·925 gall. of *proof spirit* is the largest quantity which has yet been obtained from 112 *lb.* of sugar. By the *revenue authorities* this weight of sugar is estimated to afford 11½ gall. of proof spirit. The *average product* is perhaps about 1 gall. of spirit of this strength for every 10 *lb.* of sugar. According to Harmstädt, 100 *lb.* of *starch* yield 35 *lb.* of *alcohol*, or 7·8 gall. of *proof spirit;* and 100 *lb.* of the following grains produce the accompanying quantities by weight of spirit of sp. gr. ·9427, or containing 45% of pure alcohol;—*wheat*, 40 to 45%; *rye*, 36 to 42%; *barley*; 40%; *oats*, 36%; *buckwheat*, 40%; *maize*, 40%; the *mean* being 3·47 gall. of proof spirit. It is found that a *bushel* of *good malt* yields 2 gall. of *proof spirit*, and that the largest quantity of proof spirit obtained from *raw grain*, mashed with ⅓ or ⅙ of *malt*, does not exceed 22 gall. per quarter.

By the *Excise Laws*, the distiller is restricted in the *density* of his worts, to specific gravities ranging between 1·050 and 1·090; and in Scotland, between 1·030 and 1·075; nor is a distiller allowed to mash and distil at the same time. The processes must either be carried on in *separate premises*, or at separate times. See *Alcohol, Fermentation, Fuselöl, Still, Brandy, Gin, &c.*

DISTORTIONS. See *Spine, Strabismus, Surgery* (Popular), *&c.*

DITHIONIC ACID. See *Hyposulphuric Acid.*

DITHIONOUS ACID. See *Hyposulphurous Acid.*

DIURESIS. See *Urine.*

DIURETICS. Syn. *Diuretica*, — Lat. Medicines which promote the secretion of urine. The *principal diuretics* are—*aqueous fluids*, which act by increasing the watery portion of the blood, and—substances which promote the action of the kidneys. Most of the *first* produce copious diuresis, if the skin is kept cool. Among the last, are *acetate, bitartrate* and *nitrate* of *potassa; oils of juniper, turpentine, cajeput*, and *copaiba; dilute spirit*, and *sweet spirits of nitre; decoction of common broom* (decoctum scoparii), *&c.*

DIVIDIVI. An astringent substance imported from Jamaica. It contains above 5% of tannin; whilst gall-nuts contain less than 3·5%, and the best oak-bark, only 1·35%. Hence its value in tanning.

DOBEREINER'S LAMP. A portable apparatus for obtaining instantaneous light by the action of a *jet of hydrogen* on a small piece of *spongy platinum*. A few years since they were common in the shop-windows of London and all our larger towns, but have now given place to the simpler and less expensive *Congreve match.*

DOCIMACY or *Docimastic Art.* See *Assaying.*

DONARIUM. A metal recently discovered by Dr. Bergemann in combination with silicic acid, in a mineral (a species of zircon-syenite) from Brerig, in Norway. This silicate is readily acted on by acids. The solution in *hydrochloric acid* is precipitated by ammonia, and the precipitate is

digested in *sulphuric acid*. From this solution nearly pure *hydrated oxide of donarium* is precipitated by ammonia. This oxide is allied to the earths, and claims a place next to zirconia and yttria. By acting on the oxide with *potassium*, metallic donarium is obtained. It is a black powder, which may be preserved under water for a day or two.

DOORS. Much annoyance is sometimes experienced from the *creaking of doors*. This may be prevented by rubbing a little *soap*, or a *mixture* of *tallow* and *black-lead* on the hinges; or by applying to them with a feather a little *sweet oil*, once or twice a year. The trifling trouble and expense (a penny or two a twelvemonth) will be amply repaid by their noiselessness and greater durability. To prevent the noise of *doors slamming*, a small piece of *vulcanized Indian rubber*, *cork*, or *leather*, may be placed so as to receive the shock. Parnell's *patent noiseless box staples* and *striking plates* are ingenious and excellent inventions for the same purpose.

DOSES. The doses of medicinals vary with the sex, age, temperament, constitutional strength, habituation, and idiosyncrasies of individuals. Different circumstances, especially of *climate*, exercise an important influence on the activity of medicines. Thus, the inhabitants of England and the northern countries of Europe, bear much larger doses in their own climates, than when they remove to warmer latitudes. Warmth, indeed, appears to promote the action of most medicinals, whilst cold acts in a contrary way. Nor does the same rule apply to all medicines. *Calomel*, for instance, is generally borne better by children than by adults; while *opium* affects them more powerfully, and requires the dose to be diminished considerably below that indicated by mere calculation or analogy with other medicines.

Prescribers ought not to forget that the action of medicines is not simply proportioned to the amount, but that each remedy has a dose below which it either produces no effect, or one contrary to that which we desire it to produce. Dr. Paris remarks, "that powerful doses are disposed to produce local rather than general effects;" and Dr. Barlow gives it as his opinion, that "practitioners often err, especially in the treatment of chronic maladies, from requiring an obvious effect from *each* dose administered." Adult women are said to require only *three fourths* the full dose for men. The following rules and tables have been framed, chiefly with reference to age; but, as Dr. R. E. Griffith correctly observes, "no scheme can be devised, founded on age alone, to which there are not many exceptions."

Dr. Young gives the following simple formula:—*For children under* 12 *years, the doses of most medicines must be diminished in the proportion of the age* to *the age increased by* 12. Thus, at 2 years, the dose will be 1-7th of that for an adult,

$$\text{for } \frac{2}{2 + 12} = \text{1-7th.}$$

DOUCHE. See *Baths.*

DOVER'S POWDERS. See *Powders.*

DRACONIC ACID. Obtained by the action of *nitric acid* upon the *oil* of *artemisia dracunculus*, or *tarragon*. It is said to be identical with *anisic acid.*

DRACONINE. Syn. *Dracine; Red Resin of Dragon's Blood.* A vegeto-alkaline body, discovered by M. Melandre in dragon's blood.

Prep. Dragon's blood is dissolved in *alcohol*, the solution filtered, concentrated, and precipitated with *cold water;* the red spongy precipitate is well washed, neutralized with *dilute sulphuric acid*, again liberated, and well washed with *water.*

Prop., &c. Dracine has a fine red colour; is tasteless, inodorous, and flexible; it fuses at 131° Fahr. The smallest quantity of carbonate of lime in filtering-paper, may be detected by *sulphate of dracine*, the yellow colour instantly turning red.

DRAGES. See *Sugar Plums.*

DRAGON'S BLOOD. Syn. *Sanguis Draconis*,—Lat. A rich red-coloured resin, obtained from various species of the genus

calamus. Its colour, in the lump, is a dark brownish-red; in powder, bright red. It is friable, breaks with a shining fracture, and has a sp. gr. not higher than 1·196 or 1·197. When pure, it readily dissolves in alcohol, ether, and oils, yielding rich red *transparent* solutions. Adulterated and factitious dragon's blood is only partly soluble, and lacks the rich colour of the genuine article. Dragon's blood is chiefly used to tinge varnishes and lacquers.

DRAGON'S BLOOD (Factitious). *Prep.* 1. *Shellac,* 4 *lb.;* melt, remove from the fire, and add *Canada balsam,* 6 *oz.;* and *gum benzoin,* 2 *oz.;* mix well, stir in *red sander's wood,* 1½ *lb.,* and *Venetian red,* ¾ *lb.* (both in fine powder;) and form the mass into sticks.

2. As the last, omitting the *Venetian red.*

DRAUGHT. Syn. *Haustus,*—Lat. A single dose of liquid medicine, usually dispensed in *one-and-a-half-ounce* or *two-ounce* phials. Draughts are almost exclusively extemporaneous compounds, and differ from *mixtures* only in containing *one* dose; whereas mixtures contain *several.* The latter have now very generally superseded draughts among all but the higher classes, when the dose is to be frequently repeated. *Draughts* possess the advantages of extreme convenience, and, from only one phial being opened at a time, of preserving the preparation better than when it is exposed to the air by the frequent removal of the cork. They are usually taken from a wine-glass, which they about ⅔ds fill.

In the *preparation of draughts* the same precautions are observed as are pointed out under "*mixtures;*" regard being had to the increased volume of the dose. The ingredients of a *six-ounce mixture,* for example, containing (say) 12 doses, may be equally distributed among a dozen draught-phials, after which each may be filled up with *distilled water,* or any other simple vehicle. In most cases, a little *syrup* may be advantageously added. In many instances no addition will be required, the *doses* of each form of preparation being the same.

The *following* are *useful formulæ,* which will serve as examples for others of the class. The number might be easily multiplied, and, indeed, might be extended so as to include 3-4ths of the whole materia medica; but such a plan would lead to useless repetitions and occupy much space. See *Mixtures, Prescribing, &c.*

DRAUGHT (Abernethy's). See *Abernethy Medicines* and *Black Draught.*

DRAUGHT (Acetate of Ammonia). Syn. *Haustus Ammoniæ Acetatis,*—Lat. *Prep.* (Dr. Paris.) *Camphor mixture,* 1½ fl. oz.; *liquor of acetate of ammonia,* 4 fl. dr.; *antimonial wine,* 20 drops; mix. As a refrigerant and diaphoretic in febrile affections; taken late in the evening.

DRAUGHT (Acetate of Potassa). Syn. *Haustus Potassæ Acetatis,*—Lat. *Prep.* (Mid. Hosp.) *Acetate of potassa,* 30 gr.; *bicarbonate of potassa,* 20 gr.; *peppermint water,* 1½ fl. oz. Diuretic, antacid, and laxative.

DRAUGHT (Ammoniacal). Syn. *Haustus Ammoniacalis, H. Ammoniæ,* — Lat. *Prep.* (Brande.) *Liquor of ammonia,* 20 to 30 drops; *compound tincture of cardamoms* and *tincture of gentian,* of each, ½ fl. dr.; *camphor mixture,* 1½ fl. oz. An aromatic absorbent and stomachic; in heartburn, acidity, low spirits, &c.

DRAUGHT (Anodyne). Syn. *Haustus Anodynus,*—Lat. *Prep.* 1. *Tincture of opium,* 15 drops; *pimento water* and *syrup of poppies,* of each, 2 dr.; *water,* 1 fl. oz.

2. (Copland.) *Nitre,* 6 gr.; *laudanum,* 12 drops; *compound spirit of ether,* 1 dr.; *syrup of poppies,* 2 dr.; *camphor mixture,* 9 dr.

3. (Ellis.) *Tincture of opium,* 15 to 25 drops; *syrup of poppies,* 2 fl. dr.; *spirit of cinnamon,* 1 fl. dr.; *distilled water,* 1½ fl. oz.

4. As the above, but substituting a like quantity of *solution* of either *acetate* or *hydrochlorate of morphia* in lieu of the *laudanum.* All the above are given as soothing draughts to allay pain and produce sleep; especially the last thing at night. No. 4 is to be preferred if there are febrile symptoms present.

DRAUGHT (Antacid). Syn. *Haustus Antacidus,*—Lat. *Prep.* 1. *Bicarbonate of soda,* 20 gr.; *tincture of calumba,* 3 fl. dr.; *tincture of hops,* 1 fl. dr.; *syrup of orange peel,* 2 fl. dr.; *water,* 6 fl. dr. To improve the appetite in heartburn and dyspepsia; taken 1 hour before a meal.

2. *Liquor of ammonia,* 16 drops; *syrup of saffron,* 2 fl. dr.; *infusion of gentian,* 3 fl. dr.; *water,* 7 fl. dr. As the last, taken occasionally, especially in debility, low spirits, &c.

3. (Collier.) *Compound tincture of cardamoms,* 1 fl. dr.; *solution of bicarbonate of magnesia* (fluid magnesia), 9 fl. dr.; *simple syrup,* 2 fl. dr. Twice a day; in dyspepsia, heartburn, &c., especially in gouty patients.

4. (A. T. Thomson.) *Magnesia,* 1 dr.; *peppermint water,* 1½ fl. oz.; *tincture of orange peel,* 1 fl. dr. In dyspepsia, &c., with acidity or diarrhœa.

5. As no. 1., but using *bicarbonate of potassa* for bicarbonate of soda. In acidity, diarrhœa, &c., accompanied by great irritability of the coats of the stomach.

6. *Prepared chalk*, 30 gr.; *spirit of nutmeg* and *tincture of opium*, of each, 12 to 20 drops; *syrup of saffron*, 3 dr.; *cinnamon water*, 1 fl. oz. In acidity, with extreme looseness of the bowels.

DRAUGHT (Anti-arthritic). Syn. *Haustus Anti-arthriticus*,—Lat. *Prep.* 1. *Tincture of colchicum seeds* (Ph. L.), 1 to 1½ fl. dr.; *syrup of orange peel*, 2½ fl. dr.; *water*, 1 fl. oz. In gout; taken over-night, followed by another in the morning.

2. (Brande.) *Wine of colchicum*, ½ fl. dr.; *carbonate of magnesia*, 15 gr.; *cinnamon water*, ½ fl. oz.; *water*, 1 fl. oz. As the last.

3. (Sir C. Scudamore.) *Magnesia*, 18 gr.; *Epsom salts*, 1½ dr.; *vinegar of colchicum*, 1½ fl. dr.; *simple syrup*, 1 fl. dr.; *cinnamon water*, 9 fl. dr. As the last.

4. (Sir H. Halford's *Gout Preventive.*) From *compound infusion of gentian*, 1½ fl. oz.; *tincture of rhubarb*, 1 fl. dr.; *bicarbonate of potassa*, 15 gr.

DRAUGHT (Anti-asthmatic). Syn. *Haustus Anti-asthmaticus*,—Lat. *Prep.* 1. *Vinegar of squills*, ½ fl. dr.; *ipecacuanha wine*, 15 drops; *cinnamon water*, 1½ fl. oz. Expectorant. One to be taken three times daily during the attack.

DRAUGHT (Anti-emetic). Syn. *Haustus Anti-emeticus*,—Lat. *Prep.* 1. *Juice of 1 lemon; liquor opii sedativus*, 10 drops (or *laudanum*, 15 drops); *ether*, 20 drops; *simple syrup*, 2 dr.; *water*, q.s.

2. (*Haustus Anti-emeticus Riverii*,—P.C.) *Bicarbonate of potassa*, 30 gr.; *lemon juice*, 4 dr.; *syrup of lemon*, 1 oz.; *water*, 3 oz.; mix quickly, and tie down the cork. To check nausea and vomiting. The last is best given effervescing.

DRAUGHT (Anti-hysteric). Syn. *Haustus Anti-hystericus*,—Lat. *Prep. Cyanide of potassium*, 1 gr.; *lettuce water* (distilled), 2 fl. oz.; *syrup of orange flowers*, 1½ oz.; *water*, 5½ fl. oz.; for 6 draughts. *One* to be taken when the fit is expected, and a *second* in half an hour. Should the fit come on, the dose may be repeated at intervals of about 15 minutes until 3 or 4 have been altogether administered. The symptoms, however intense, are generally either at once arrested, or greatly alleviated by this treatment.

DRAUGHT (Antilithic). Syn. *Haustus Antilithicus*,—Lat. *Prep.* 1. (Venables.) *Borax*, 8 gr.; *bicarbonate of soda*, 10 gr.; *aërated water*, 8 fl. oz. For a draught; in red gravel.

2. (Dr. Paris.) *Carbonate of soda*, 12 gr.; *tincture of calumba*, 1 fl. dr.; *infusion of quassia*, 1 fl. oz.; *water*, 3 fl. dr. In dyspepsia and gravel, attended with the lithic acid diathesis.

DRAUGHT (Anti-neuralgic). Syn. *Haustus Anti-neuralgicus, H. Narcotinæ*,—Lat. *Prep.* (Jeston.) *Narcotine*, 2 gr.; *diluted sulphuric acid*, 20 drops; *infusion of roses*, 1½ fl. oz. *One* every 2 hours in the intermissions of neuralgia.

DRAUGHT (Antiseptic). Syn. *Haustus Antisepticus*,—Lat. *Prep.* (Dr. Collier.) *Decoction of yellow bark*, 1 fl. oz.; *tincture of opium*, 5 drops; *spirit of pimento* and *water*, of each, 2 fl. dr. In putrid fevers, gangrene, &c.

DRAUGHT (Antispasmodic). Syn. *Haustus Antispasmodicus*,—Lat. *Prep.* 1. (Dr. Collier.) *Tincture of castor*, 1 fl. dr.; *sulphuric ether*, 10 drops; *peppermint water*, 11 fl. dr.; mix. In hysteria, and that species of irregular muscular action dependent on debility.

2. (Dr. Gregory.) *Fetid spirit of ammonia*, ½ to 1 fl. dr.; *camphor mixture*, 10 fl. dr.; *syrup of saffron*, 1 fl. dr. In cases complicated with low spirits, debility, &c.

3. (A. T. Thomson.) *Musk mixture*, 14 fl. dr.; *liquor of ammonia*, 16 drops; *tincture of castor*, 1 fl. dr.; *syrup of poppies*, ½ fl. dr.; mix. Three or four times daily, in hysteria and convulsive affections, after the bowels have been well cleared by some aperient.

4. (A. T. Thomson.) *Oil of aniseed*, 10 drops; *magnesia*, 20 gr.; *tincture of senna*, 2 fl. dr.; *peppermint water*, 10 fl. dr.; mix. In flatulence and spasms of the stomach.

DRAUGHT (Aperient). Syn. *Haustus Aperiens*,—Lat. *Prep.* 1. (Paris.) *Infusion of senna*, 1 fl. oz.; *tincture of senna, tincture of jalap*, and *syrup of senna*, of each, 1 fl. dr.; *tartrate of potassa*, 1 dr.; mix.

2. (Ryan.) *Epsom salts*, 4 dr.; *tincture of senna*, 1½ fl. dr.; *syrup of ginger*, 1 fl. dr.; *spirit of sal volatile*, 20 drops; *infusion of senna*, 1½ fl. oz.

3. (Thomson.) *Tartrate of potassa*, 3 dr.; *tincture of senna* and *syrup of saffron*, of each, 1 dr.; *infusion of senna*, 1½ oz. The above are good aperients, and in their composition and action resemble the ordinary "*black draught.*"

4. (*Effervescing.*)—*a.* (Dr. Barker.) *Bisulphate of potassa*, 73 gr.; *carbonate of soda*, 72 gr.; *water*, q.s.; dissolve the two in separate glasses, mix the solutions, and drink whilst effervescing, in the same way as soda water.

b. (W. Cooley.) *Bicarbonate of soda*, 1 dr.; *potassio-tartrate of soda*, 2 dr.; dissolve in about 1-3d of a glassful of *cold water;* and pour it on another like quantity of *water* holding in solution *tartaric acid*, 40 gr., and *syrup of orange peel*, 1½ fl. dr.; and drink it instantly.

c. (Paris.) *Potassio-tartrate of soda*, 2 dr.; *bicarbonate of soda*, 40 gr.; dissolve, and add *lemon juice*, 1 or 2 table-spoonfuls.

d. (Young.) *Cream of tartar*, 3 dr.; *carbonate of soda*, 2½ dr.; throw them into a soda-water bottle three parts filled with cold *water*, cork *immediately*, and wire down the cork. The *last three* are examples of *factitious effervescing Seidlitz water*, and are good saline aperients. The *method of taking them* may be varied by mixing the *dry ingredients* (in fine powder) on a piece of paper, and throwing the mixture *suddenly* into a tumbler 2-3ds filled with *water*, and drinking the liquid whilst effervescing.

DRAUGHT (Appetite). See *Dinner Draught.*

DRAUGHT (Aromatic). Syn. *Aromatic Antacid Draught; Haustus Aromaticus. Prep.* 1. *Aromatic confection*, 1 dr.; *spirit of sal volatile*, ½ dr.; *syrup of saffron*, 2 dr.; *pimento water*, 9 fl. dr. Excellent in dyspepsia with acidity, and in diarrhœa, preceded by an aperient.

2. (*H. Arom. cum Rheo*,—St. B. Hosp.) *Aromatic confection*, 1 dr.; *infusion of rhubarb* and *cinnamon water*, of each, 6 fl. dr. In diarrhœa and dyspepsia, especially when there is acidity and deficiency of bile.

DRAUGHT (Astringent). Syn. *Haustus Astringens*,—Lat. *Prep.* 1. *Tannin*, 3 gr.; *rectified spirit*, 1 fl. dr.; *simple syrup*, 2 fl. dr.; *water*, 6 fl. dr.

2. (Dr. Paris.) *Chalk mixture*, 1½ fl. oz.; *tincture of catechu*, 1 fl. dr.; *laudanum*, 15 drops.

3. (Thomson.) *Extract of logwood*, 12 gr.; *tincture of catechu*, 1 fl. dr.; *cinnamon water*, 15 fl. dr. The above are excellent remedies in diarrhœa (preceded by a purgative), and in dysentery, &c. One may be taken after each motion.

DRAUGHT (Black). See *Mixtures.*

DRAUGHT (Camphor). Syn. *Haustus Camphoræ*,—Lat. *Prep.* (Guy's Hosp.) *Camphor*, 6 gr.; *rectified spirit*, q. s. to powder; *white sugar*, 1 dr.; *mucilage*, 3 dr.; *water*, 1½ fl. oz. Anodyne and diaphoretic, &c.

DRAUGHT (Castor Oil). Syn. *Haustus Olei Ricini*,—Lat. *Prep.* (Guy's Hosp.) *Castor oil*, 4 dr.; *yelk of egg*, q. s. (2 in No.); *simple syrup*, 1 fl. dr.; *cassia* or *cinnamon water*, 1 fl. oz. Aperient.

DRAUGHT (Cathartic). Syn. *Haustus Catharticus*,—Lat. The following are given as additions to those under *Draught* (Aperient), and other heads:—*Prep.* 1. (Dr. Thomson.)—*a. Tartrate of potassa*, 5 dr.; *tincture of senna*, 1 fl. dr.; *infusion of senna*, 14½ fl. dr.; *syrup of saffron*, ½ fl. dr.; mix. In acute diseases, taken early in the morning.

2. (Thomson.) *Epsom salts* and *manna*, of each, 2 dr.; *infusion of roses*, 14 fl. dr.; *dilute sulphuric acid*, 10 drops. In inflammatory affections, and to check vomiting in low fevers.

3. (Thomson.) *Carbonate of magnesia*, 1 dr.; *powdered rhubarb*, 20 gr.; *peppermint water*, 12 fl. dr. In dyspepsia, attended with costiveness and acidity, taken an hour before dinner.

4. (Thomson.) *Castor oil*, 5 fl. dr.; *powdered gum*, 20 gr.; *rose water*, 1 fl. oz.; *compound tincture of lavender*, 8 drops; *syrup of poppies*, 1 fl. dr. In colic and calculus. The above differ from *aperient* draughts simply in their greater strength.

DRAUGHT (Chalk). Syn. *Haustus Cretæ*,—Lat. *Prep.* From *powdered gum*, *chalk*, and *simple syrup*, of each, 1 dr.; *aromatic water* (as that of caraway, cinnamon, nutmeg, pimento, or peppermint), 1½ fl. oz.

DRAUGHT (Chalk,—Chalybeated). Syn. *Haustus Cretæ et Ferri*,—Lat. *Prep.* (Paris.) *Chalk mixture*, 7 fl. dr.; *compound mixture of iron*, 3 fl. dr.; *sesquicarbonate of ammonia*, 5 or 6 gr. In diarrhœa, particularly in that arising from debility and anæmia.

DRAUGHT (Chalk, — Rhubarbarated). Syn. *Haustus Cretæ cum Rheo*,—Lat. *Prep.* 1. *Simple chalk mixture* (see above), 1½ fl. oz.; *powdered rhubarb*, 12 gr.

2. (Lond. Hosp.) *Compound powder of chalk with opium*, 12 gr.; *rhubarb*, 15 gr.; *syrup of saffron* and *compound tincture of cardamoms*, of each, 1 dr.; *caraway water*, 10 fl. dr. In heartburn, dyspepsia, and certain forms of diarrhœa.

DRAUGHT (Chlorine). Syn. *Haustus Chlorinii*,—Lat. *Prep.* (Copland.) *Chlorine water*, ½ fl. dr.; *water*, 1½ fl. oz.; mix, and add of *syrup of poppies*, ½ fl. dr. *One* every 6 hours; in the worst forms of typhus fever, scarlet fever, and other putrid diseases, &c.

DRAUGHT (Citrate of Ammonia). Syn. *Haustus Ammoniæ Citratis, H. A. Sesquicarbonatis Effervescens*,—Lat. *Prep.* (Guy's Hosp.) *Sesquicarbonate of ammo-*

nia, 20 gr.; *water*, 1 fl. oz.; dissolve, and add of *lemon juice*, ½ fl. oz. An agreeable cooling saline draught in febrile cases.

DRAUGHT (Citrate of Potassa). Syn. *Haustus Potassæ Citratis*,—Lat. *Prep.* From *carbonate of potassa*, 24 gr. (or *bicarbonate*, 29 gr.); *water*, 1 fl. oz.; dissolve, and add of *lemon juice*, 5 fl. dr. As the last. 20 gr. of *citric acid* may be used instead of the lemon-juice.

DRAUGHT (Colchicum). See *Anti-arthritic Draught.*

DRAUGHT (Copaiba). Syn. *Haustus Copaibæ*,—Lat. *Prep.* (St. B. Hosp.) *Balsam of copaiba*, ½ fl. dr.; *mucilage* (thick), 4 fl. dr.; *pimento water*, 3 fl. dr.; *water*, 5 fl. dr. In gonorrhœa, &c.

DRAUGHT (Cough). See *Mixtures.*

DRAUGHT (Diaphoretic). Syn. *Haustus Diaphoreticus*,—Lat. *Prep.* 1. (Collier.) *Infusion of serpentary*, 1½ fl. oz.; *tincture of ditto*, 1 fl. dr. Tonic and diaphoretic.

2. (Thomson.) *Sesquicarbonate of potassa*, 20 gr.; *fresh lemon-juice*, 4 fl. dr.; *tartrate of antimony*, ⅙ gr.; *water*, 11 fl. dr.; *syrup of poppies*, 1 fl. dr. Antifebrile and diaphoretic.

3. (Thomson.) *Liquor of acetate of ammonia*, 6 fl. dr.; *camphor mixture*, 10 fl. dr.; *nitrate of potassa*, 10 gr.; *syrup of tolu*, ½ fl. oz. Anodyne and diaphoretic. All the above are used in inflammatory affections.

DRAUGHT (Dinner). Syn. *Appetite Draught; Haustus Dictus ante cibum. Prep.* 1. *Tinctures of cascarilla, hops*, and *rhubarb*, of each, 1 fl. dr.; *spirit of sal volatile*, ½ fl. dr.; *tincture of capsicum*, 20 drops; *syrup of orange peel*, 2 dr.; *water*, 1½ fl. oz.

2. *Compound tincture of gentian*, ½ fl. oz.; *sal volatile*, ½ a teaspoonful; *cinnamon water*, 1 fl. oz.; *compound tincture of cardamoms*, 1 teaspoonful. Either of the above to be taken an hour before a meal.

DRAUGHT (Diuretic). Syn. *Haustus Diureticus*,—Lat. *Prep.* 1. (Collier.) *Tincture of jalap*, 2 fl. dr.; *vinegar of squills*, 1 fl. dr.; *peppermint water*, 10 fl. dr.; mix.

2. (Copland.) *Acetate of potassa*, ½ dr.; *infusion of quassia* and *cinnamon water*, of each, 6 fl. dr.; *vinegar of squills* and *sweet spirits of nitre*, of each, ½ fl. dr.

3. (Thomson.) *Nitre*, 8 gr.; *tincture of digitalis*, 16 drops; *infusion of roses*, 13 fl. dr.; *syrup of roses*, 1 fl. dr.

4. (Turner.) *Nitre* and *powdered gum*, of each, 15 gr.; *almond mixture*, 1½ fl. oz. The above are used as diuretics in dropsy; the last, also in scurvy, and in the incontinence of urine of children.

DRAUGHT (Donovan's). Syn. *Draught of Hydriodate of Arsenic and Mercury; Haustus Hydriodatis Arsenici et Hydrargyri*,—Lat. *Prep.* (Donovan.) *Liquor of hydriodate of arsenic and mercury* (Donovan's), 2 fl. dr.; *distilled water*, 3½ fl. oz.; *syrup of ginger*, ½ fl. oz.; mix for 4 draughts. One, night and morning; in lepra, lupus, psoriasis, and some other obstinate cutaneous affections. It must not be allowed to touch anything metallic.

DRAUGHT (Effervescing). *Prep.* (Lond. Hosp.) *Sesquicarbonate of soda*, 30 gr.; *water* or *peppermint water*, 1½ fl. oz.; *syrup of orange peel*, 2 fl. dr.; *tincture of calumba*, ½ fl. dr.; *tartaric* or *citric acid*, 25 gr.; add the acid last, and drink whilst effervescing. Stomachic, tonic, and anti-emetic; in acidity, dyspepsia, &c. (See *ante.*)

DRAUGHT (Emetic). Syn. *Haustus Emeticus*,—Lat. *Prep.* 1. *Sulphate of zinc*, 15 gr. to 30 gr.; *water*, 9 fl. dr; dissolve. In cases of poisoning, and at the commencement of an attack of ague.

2. (Copland.) *Ipecacuanha*, 30 gr.; *sesquicarbonate of ammonia*, 20 gr.; *tincture of capsicum*, 30 drops; *oil of chamomile*, 10 drops; *mint water*, 2 fl. oz. As a stimulant emetic in cases of poisoning by laudanum or other narcotics.

3. (Guy's Hosp.) *Antimonial wine*, 2 fl. dr.; *ipecacuanha wine*, 6 fl. dr.; *water*, 4 fl. dr. For unloading the stomach in ordinary cases.

4. (Mid. Hosp.) *Tartar emetic*, 1 gr.; *ipecacuanha*, 20 gr.; *syrup*, 2 fl. dr.; *water*, 10 fl. dr. As the last.

5. (Dr. Pickford.) *Sulphate of zinc*, 20 gr.; *sulphate of magnesia*, 4 dr.; *water*, 1¾ oz. When it is also desired to act rapidly on the bowels.

6. (Rodier.) *Sulphate of copper*, 10 gr.; *water*, 2 fl. oz. In poisoning by laudanum.

7. (Sprague.) *Ipecacuanha*, 30 gr.; *sesquicarbonate of ammonia*, 20 gr.; *tincture of capsicum*, 1 fl. dr.; *peppermint water*, 3 fl. oz. In poisoning by narcotics.

8. (A. T. Thomson.) *Ipecacuanha*, 20 gr.; *ipecacuanha wine*, 2 fl. dr; *water*, 10 fl. dr. For unloading the stomach in ordinary cases.

9. (Trousseau.) *Ipecacuanha*, 8 gr.; *syrup of ipecacuanha*, 1 fl. oz.; *water*, q. s. for 4 draughts. One every 10 minutes, until vomiting occurs.

DRAUGHT (Ether). Syn. *Haustus Æthereus*,—Lat. *Prep.* (Neligan.) *Sulphuric ether*, 1 fl. dr.; *spermaceti*, 3 gr.; rub together (expertly), and add of *peppermint water*, 10 fl. dr. An excellent stimulant and antispasmodic, febrile symptoms being absent.

DRAUGHT (Expectorant). Syn. *Haustus Expectorans*,—Lat. *Prep.* 1. (Collier.) *Mixtures of ammoniacum* and *almonds*, of each, 6 fl. dr.; *tincture of squills*, 12 drops. In hoarseness, chronic coughs, &c.

DRAUGHT (Henbane). Syn. *Haustus Hyosciami*,—Lat. *Prep. Tincture of henbane*, 30 to 60 drops; *syrup of saffron*, 1 fl. dr.; *water*, 10 fl. dr. Anodyne and soporific. *Used* to allay nervous excitement, and induce sleep, when laudanum is inadmissible.

DRAUGHT (Henbane and Squills). Syn. *Haustus Hyoscyami cum Scillâ*, — Lat. *Prep.* (Dr. Bree.) *Extract of henbane*, 3 gr.; *tincture of squills*, 10 drops; *dilute nitric acid*, 6 drops; *water*, 1½ fl. oz. Anodyne and expectorant; in asthmas, chronic coughs, &c.

DRAUGHT (Hydrocyanic). Syn. *Haustus Hydrocyanicus*,—Lat. *Prep.* 1. (Donovan.) *Cyanide of potassium*, 1 gr.; *syrup of lemons*, ½ fl. oz.; *distilled water*, 7½ fl. oz. For 8 draughts. One for a dose.

2. (Dr. S. Dickson.) *Medicinal hydrocyanic acid*, (Ph. L.) 15 drops; *liquor of ammonia*, 20 drops; *syrup of orange flowers* (or simple syrup), 3 fl. dr.; *water*, 8½ fl. oz.; mix, and divide into 6 draughts. One, two or three times a day; in gastrodynia, and all those nameless nervous and hysterical affections arising from excessive irritability, mental anxiety, &c. In a case that came under our notice recently, in which life was an absolute burden to the patient, relief was afforded by the first draught, and 4 or 5 effected a comparative cure, although almost every other remedy had been tried in vain.

DRAUGHT (Laennec's). Syn. *Laennec's Contra-stimulant Draught; Haustus Contra-stimulans*,—Lat. *Prep.* From *tartar emetic*, 2 gr.; *syrup of poppies*, 2 fl. dr.; *orange flower-water*, 1½ fl. oz. Every two hours in pneumonia, &c.

DRAUGHT (Laxative). Syn. *Haustus Laxans*, — Lat. *Prep.* 1. See *Aperient Draughts*.

2. (Dr. Copland.) *Infusion of senna* and *compound infusion of gentian*, of each, 6 fl. dr.; *sulphate of potassa*, 20 to 30 gr.; *extract of taraxacum*, 30 to 40 gr.; *compound tincture of cardamoms*, 1½ fl. dr. Aperient, stomachic, and alterative.

DRAUGHT (Morphia). Syn. *Haustus Morphiæ*,—Lat. *Prep.* (Brera.) *Morphia*, ¼ gr.; *syrup of poppies*, 1 fl. dr.; *water*, 11 fl. oz. Two or three drops of *acetic acid* may be advantageously added. At bed time, as a soporific.

DRAUGHT (Narcotic). Syn. *Haustus Narcoticus, H. Opiatus*,—Lat. *Prep.* 1. (St. B. Hosp.) *Laudanum*, 12 to 20 drops; *syrup of red poppies*, 1 fl. dr.; *pimento water*, 3 fl. dr.; *water*, 1 fl. oz. To induce sleep in slight cases, when fever is absent.

2. (A. T. Thomson.) *Camphor mixture*, 1½ fl. oz.; *laudanum*, 35 drops; *sulphuric ether* and *syrup of saffron*, of each, 1 fl. dr. In intermittent headache.

3. (Thomson.) *Carbonate of ammonia*, 15 gr.; *fresh lemon juice*, ½ fl. oz.; *water*, 1 fl. oz.; *spirit of nutmeg*, 1 fl. dr.; *syrup of orange-peel*, ½ fl. dr.; *tincture of hemlock*, 10 drops. In diseases of increased irritability.

4. (Thomson.) *Carbonate of potassa*, 20 gr.; *fresh lemon-juice*, ½ fl. oz.; *peppermint water*, 1 fl. oz.; *laudanum*, 25 drops; *syrup of tolu*, ½ fl. dr. To procure sleep in the majority of diseases. (See *above*.)

DRAUGHT (Nux Vomica). Syn. *Haustus Nucis Vomicæ*,—Lat. *Prep.* (Dr. Joy.) *Nux vomica* (in fine powder), 3 gr.; *powdered gum*, 2 dr.; *compound tincture of cardamoms*, 1 fl. dr.; *cinnamon water*, 10 fl. dr. Diuretic, narcotic, stimulant, and tonic; in paralysis, impotence, debility, &c., unaccompanied by inflammation of the nervous centres. See *Strychnia*.

DRAUGHT (Peruvian Balsam). Syn. *Haustus Balsami Peruviani*,—Lat. *Prep.* (St. B. Hosp.) As *Draught of Copaiba*.

DRAUGHT (Refrigerant). Syn. *Haustus Refrigerans*,—Lat. *Prep.* 1. *Carbonate of Potassa*, 20 gr.; *syrup of orange peel*, 1 fl. dr.; *spirit of nutmeg*, ½ fl. dr.; *water*, 1½ fl. oz.

2. (Thomson.) *Nitre*, 12 gr.; *almond mixture*, 1½ fl. oz.; *syrup of tolu*, 1 fl. oz.

3. (Collier.) *Carbonate of potassa*, 20 gr.; *antimonial wine*, 20 drops; *syrup of orange peel*, 1 fl. dr.; *tincture of orange peel*, ½ fl. dr.; *water*, 1½ fl. oz.; mix, and add a large tablespoonful of *lemon juice*. In inflammatory diseases, &c.

DRAUGHTS (Saline). See *Effervescing Draughts, &c.*

DRAUGHT (Stomachic). See *Dinner Draughts, &c.*

DRAUGHT (Tonic). Syn. *Strengthening Draught, Haustus Tonicus*, — Lat. *Prep.* 1. (Collier.) *Disulphate of quinine*, 2 gr.; *tincture of orange-peel*, 1 fl. dr.; *diluted sulphuric acid*, 5 drops; *laudanum*, 10 drops; *infusion of cascarilla*, 1½ fl. oz. In pyrosis, &c., 1 hour before dinner.

2. (A. T. Thomson.) *Infusion of yellow bark*, 1½ fl. oz.; *compound tincture of cinchona*, 1 fl. dr.; *powdered cinchona*, 40 gr.; *syrup of orange peel*, ½ fl. dr. In intermittents and acute rheumatisms.

3. (Thomson.) *Infusion of cascarilla*, 1½ fl. oz.; *tincture of cascarilla* and *ginger*,

of each, 1 fl. dr. In dyspepsia, arising from intemperance.

4. (Walton.) *Infusion of cascarilla*, 9 fl. dr.; *tinctures of rhubarb* and *ginger*, of each, 1 fl. dr.; *syrup of saffron*, ½ fl. dr.; *ammonio-citrate of iron*, 6 gr.; *tincture of capsicum*, 5 drops. In anæmia, and debility accompanied by paleness and relaxation.

DRAUGHT (Tolu). Syn. *Haustus Balsami Tolutani.* As *Draught of Copaiba.*

DRAUGHT (Turpentine). Syn. *Haustus Olei Terebinthinæ*,—Lat. *Prep.* As *Draught of Copaiba.*

DRAUGHT (Vermifuge). Syn. *Haustus Vermifugus, H. Anthelminthicus*, — Lat. *Prep.* (M. Levacher.) *Castor oil*, 4 dr.; *essence of turpentine*, 2 dr.; *mint water*, 2 fl. oz.; *syrup*, 1 fl. oz.; *powdered gum*, 2 dr.; for an emulsion. In Tapeworm.

DRAWING (Mechanical). See *Camera.*

DRAWINGS. *Chalk* and *pencil drawings* may be fixed, so as not to suffer from slight abrasion, by washing them with *skimmed milk*, or with *water* holding in solution a little *isinglass* or *gum.* When the first is used, great care must be taken to deprive it of the whole of the cream, as the latter substance would cause the drawing to look streaky. An easy way of applying these fluids, is to pour them into a shallow vessel, and to lay the drawing flat upon the surface of the liquid; after which it should be gently removed and placed on white *blotting-paper*, in an inclined position, to drain and dry.

DREAMS. See *Sleep.*

DRENCHES or *drinks*, in veterinary practice, are *liquid medicines* or *mixtures*, which are administered to horses and neat cattle, and chiefly to the latter. A drench for a *horse* should not be *less* than half-a-pint, nor *more* than a quart; about a pint, is, perhaps, the best quantity; that for a *cow* or *ox* should measure about a quart, and not *more* than about 5 half-pints. See *Veterinary Medicine.*

DRESS. The principles which should direct us in the choice of colours for external articles of clothing, have been already briefly referred to under the heads *Accidental Colours*, and *Colours* (complementary), and will be found more fully noticed in the articles on *Personal Beauty*, the *Toilet*, *&c.* For the connexion of clothing or dress with health and personal comfort, see *Cold, Flannel, Hygiène, Season, Warmth, &c.*

DRESSING. *Gum, starch, size, &c.*, employed in stiffening or "finishing off" textile fragments and paper. Among *Surgeons*, the term is appropriated to any application to a wound or sore, made by means of lint, linen, or leather. *Simple dressing*, is simple cerate or spermaceti cerate. Among *cooks*, the stuffing of fowls, pork, veal, &c., is commonly called *dressing.*

DRINKS. See *Drenches.*

DRINKS (Summer). See *Ginger Beer, Lemonade, Sherbet, &c.*

DROGUE AMERE. The basis of this mixture is the root and herb of *justicia paniculata*, or *creata*, an East Indian plant, much esteemed as a bitter and stomachic. The mixture is in some repute in cholera and dysentery, and as an alexipharmic.

DROP. See *Measures.*

DROPS (Confectionery). These are confections of which the principal basis is sugar. They differ from lozenges chiefly in the ingredients being combined by the aid of heat. Occasionally, they are medicated.

Prep. Double refined sugar is reduced to powder, and passed through a *hair sieve* (not too fine,) and afterwards through a *gauze sieve*, to take out the fine dust, which would destroy the beauty of the drop. It is then put into a clean pan, and moistened with any favorite aromatic, as *rose* or *orange-flower water*, added slowly, stirring it with a paddle all the time, from which the sugar will fall, as soon as it is moist enough, without sticking. The *colouring* (if any) is next added, in the liquid state, or that of a very fine powder. A small polished copper, or tinned-copper pan, furnished with a lip, is now one-half or three parts filled with the paste, and placed over the fire, or over the hole of a stove, or preferably on a sand-bath, and the mixture stirred with a little bone or glass spatula until it becomes liquid. As soon as it almost boils, it is taken from the fire, and if it is too moist, a little more *powdered sugar* is added, and the whole stirred, until it is of such a consistence as to run without too much extension. A *tin plate*, very clean and smooth, and very slightly oiled, being now ready, the pan is taken in the *left* hand, and a bit of bright *iron, copper*, or *silver wire*, about 4 inches long, in the *right.* The melted sugar is next allowed to fall regularly on the tin-plate, the wire being used to remove the drop from the lip of the pan. In two or three hours afterwards the drops are taken off with the blade of a knife, and are at once put into bottles or tins. See *Candies, Essences, Stains, Sugar Plums, &c.*

The following are a few of the principal *confectionery drops* kept in the shops:—

Acidulated Drops. Prepared by adding *tartaric acid*, ½ *oz.*, dissolved in a *very little water* to each *lb.* of *sugar*, as above; with

essence of lemon, orange, or *jargonelle pear* to flavour, as desired.

Chocolate Drops. Chocolate, 1 *oz.,* is reduced to fine powder by scraping, and added to *powdered white sugar,* 1 *lb.;* when the mixture is made into drops as above, care being taken to avoid heating it a second time.

Coffee Drops. A clarified concentrated infusion of *coffee,* 1 oz., is used for each *lb.* of *sugar.*

Fruit Drops. These are prepared according to the general description. (See *above.*) The *flavouring essences* (volatile oils or essences of *lemon, orange, citron, raspberry, jargonelle pear, &c.*) not being added until the sugar is melted, to avoid, as much as possible, loss by evaporation. The *colouring matter* may be any of the transparent stains usually employed for cakes, jellies, and confectionery. In this way are made the majority of the first-class *fruit drops* and *bons-bons* of the sugar-bakers. In some cases, the plan is varied by adding the *clarified concentrated juice,* or *jelly of the fruit* to the *sugar.* One variety of *raspberry* and *currant* (red and black) *drops* are made in this way.

Ginger Drops. From *essence* or *tincture of ginger,* as above. An *inferior kind* is made in the way described under *Ginger candy.*

Jargonelle drops. Fruit drops flavoured with essence of jargonelle pear (*solution of acetate of amyle*).

Lemon Drops. Acidulated drops flavoured with *essence of lemon.* They are usually stained with an *infusion of turmeric.* (See *above.*)

Peppermint Drops. From the *whitest refined sugar,* flavoured with *English oil of peppermint* or its *spirituous solution* (essence of peppermint), or with *peppermint water.*

Raspberry Drops. (See *above.*)

DROPS (Medicated). Syn. *Guttæ,*—Lat. This term is commonly applied to compound medicines that are only taken in small doses. At the present time they are almost exclusively confined to empirical and domestic medicine. The *plan* of directing *liquids* to be *measured by dropping* is objectionable, because the drops of different fluids vary in size, and are also further influenced by the size of the bottle and the shape of its neck, as well as the quantity of liquid it is poured from. See *Essences,* and *below.*

Acidulated Drops. See *Lozenges* and *confectionary drops.*

Acoustic Drops, Acoustic Balsam; Guttæ Acousticæ, Balsamum Acousticum,—Lat. *Prep. Oil of almonds,* 1 oz.; *laudanum* and *oil of turpentine,* of each, 1 dr.; mix. For hardened wax, and to allay pain.

2. *Tinctures of benzoin, castor,* and *opium,* of each, 1 fl. oz.; *essential oil of assafœtida,* 5 drops. As the last, and in deafness arising from debility of the organism.

3. (Baumé's.) Tinctures of *ambergris, assafœtida, castor,* and *opium,* of each, 1 oz.; *terebinthinated balsam of sulphur,* and *oil of rue,* of each, 15 drops. In atonic deafness.

4. (Bouchardat.) *Compound spirit of balm,* 2½ dr.; *oil of almonds,* 5 dr.; *ox-gall,* 10 dr.; *creasote,* 10 or 12 drops. In cases complicated with hardened wax, fetid discharges, &c.

5. (Dr. Hugh Smith.) *Ox-gall,* 3 dr.; *balsam of Peru,* 1 dr. In fetid ulcerations of the ear. One or two drops of the above are poured into the ear; or a piece of cotton wool moistened therewith is introduced instead. The last is the safest plan.

6. (T. Wakley, Jun.) *Glycerine,* either alone or diluted with water. In deficiency of the natural secretions of the ear; used in sufficient quantity to moisten the first passages. See *Deafness.*

Ague Drop (Tasteless). *Prep.* From *white arsenic,* 1 gr.; *hot water,* 1 oz.; dissolve. *Dose.* ½ to 1 teaspoonful twice a day. See *Solution of Arsenite of Potassa.*

Anodyne Drops; Guttæ Anodynæ,—Lat. The *solutions* of *acetate* and *hydrochlorate of morphia* are commonly vended in the shops under this name.

Antacid Drops; Guttæ Antacidæ,—Lat. *Prep.* (U. C. Hosp.) *Liquor of potassa,* 3 fl. oz.; *powdered myrrh,* 1 oz.; triturate together until thoroughly incorporated, add of *liquor of ammonia,* 1 fl. oz., mix well, place the mixture in a stoppered bottle, and the next day decant the clear portion. Antacid, tonic, and stomachic; useful in various indications. *Dose.* 10 to 20 drops, or more, in water.

Antihysteric Drops; Guttæ Antihystericæ,—Lat. *Prep. Cyanide of potassium,* 2 gr.; *rectified spirit,* 5 fl. dr.; *syrup of orange flowers,* 3 fl. dr. *Dose.* 10 drops to ½ teaspoonful, when the attack is expected, and repeated occasionally as required; in hysterical affections, gastrodynia, &c.

Antiscorbutic Drops; Guttæ Antiscorbuticæ,—Lat. *Prep.* 1. *Expressed juice of water-cress,* 2 fl. oz.; *salt of tartar,* 1 oz.; agitate together occasionally for a few hours, and in 2 or 3 days decant the clear. *Dose.*

12 or 15 drops, to a teaspoonful, twice a day in a cupful of new milk.

2. *Citrate of potassa*, 4 dr.; *ammonio-citrate of iron*, 2 dr.; *water*, 10 fl. dr. *Dose.* As the last, in water.

Antiscrofulous Drops; Guttæ Antiscrofulosæ,—Lat. *Prep.* 1. *Iodine*, 10 gr.; *iodide of potassium*, 1 dr.; *water*, 1 fl. oz.

2. (Augustin.) *Chlorides of iron* and *barium*, of each, ½ dr.; *distilled water*, 1 fl. oz. *Dose.* 10 to 30 drops, 2 or 3 times a day.

Antispasmodic Drops; Guttæ Antispasmodicæ,—Lat. *Prep. Tinctures of castor*, *valerian*, and *assafœtida*, of each, 2 dr.; *tincture of capsicum* and *balsam of Peru*, of each, 1 dr.; *camphor*, 20 gr.; *acetate of morphia*, 3 gr. *Dose.* 10 to 20 drops, as required.

Bateman's Drops. See *Pectoral Drops.*

Battley's Drops. See *Liquor Opii Sedativus.*

Bitter Drops; Guttæ Amaræ, — Lat. *Gouttes Amères*,—Fr. *Prep.* From *nux vomica* (rasped), 1 ℔; *liquor of potassa*, ½ fl. oz.; *bistre*, 1 dr.; *compound spirit of wormwood*, 32 fl. oz.; digest 10 days, express the tincture, and filter. A most unscientific preparation; said to be tonic and stomachic. *Dose.* 1 to 8 drops in water or any bitter infusion. In large doses it is *poisonous.*

Black Drop, Armstrong's Black Drop, Lancaster's do., Quaker's do., Toustall's do., Braithwait's Genuine do.; *Gutta Nigra*, —Lat. This celebrated preparation was originally prepared nearly a century and a half ago by Edward Toustall, a medical practitioner, in the county of Durham, and one of the Society of Friends. The formula passing into the possession of a near relative of his, (John Walton, of Shildon) was found among his brother's papers, and, by the permission of Thomas Richardson, of Bishop's Wearmouth, one of his executors, was handed to Dr. Armstrong, who subsequently published it in his work on Typhus fever.

Prep. 1. (Original formula.) *Opium* (sliced) ½ ℔; *good verjuice*, 3 pints; *nutmegs*, 1½ oz.; *saffron*, ½ oz.; boil them to a proper thickness; then add of *sugar* ¼ ℔; and *yeast*, 2 tea-spoonfuls. Set the whole in a warm place, near the fire, for 6 or 8 weeks, then place it in the open air until it becomes of the consistence of a syrup; lastly, decant, filter, and bottle it up, adding a *little sugar* to each bottle. To yield 2 pints of strained liquor.

2. (*Acetum Opii*, Ph. U. S.) *Opium*, 8 oz.; *nutmeg*, 1½ oz.; (both in coarse powder;) *saffron*, ½ oz.; *distilled vinegar*, 24 fl. oz.; digest on a sand-bath with a gentle heat for 48 hours, and strain; digest the residuum with an equal quantity of *distilled vinegar* for 24 hours; then put the whole into a percolator, and return the filtered liquid as it passes until it runs clear; afterwards pour on the material *fresh distilled vinegar*, until 48 fl. oz. of filtered liquor shall be obtained; in this dissolve *sugar*, 12 oz., and gently evaporate the whole to 52 fl. oz.

3. (Wholesale.) *Opium*, 10 *oz.*; and *distilled vinegar*, 1 quart; are digested together for about a fortnight, and after sufficient repose, the clear portion is *decanted.* This is the form commonly adopted by the wholesale trade in England. *Dose.* 5 to 10 drops. It is usually considered to be of fully 4 times the strength of laudanum.

Carminative Drops; Guttæ Carminativæ, —Lat. *Prep.* (Radius.) *Oil of mace*, 1 dr.; *nitric ether*, 3 dr. *Dose.* 6 to 10 drops on sugar; in flatulent colic, &c.

Chamomile Drops. See *Essences.*

Dalby's Drops. See *Dalby's Carminative.*

Durande's Drops; Guttæ Ætheris Terebinthinatæ,—Lat. *Prep.* (M. Durande.) *Rectified sulphuric ether*, 3 parts; *oil of turpentine*, 1 part. *Dose.* 20 to 30 drops, or more; in the passing of gall-stones.

Dutch Drops, Haerlem Drops, Turpentine Drops; Balsamum Terebinthinæ,— Lat. The genuine or imported *Dutch drops* are the *residuum* of the rectification of *oil of turpentine.* It is also prepared by distilling *rosin*, and collecting the product in different portions. At first a *white*, then a *yellow*, and lastly, a *red oil*, comes over. The last is the balsam. The article commonly sold under the name in this country is prepared by one or other of the following formulæ:—

1. *Oil of turpentine, tincture of guaiacum*, and *sweet spirit of nitre*, of each, 1 oz.; *oils of amber* and *cloves*, of each, 15 drops.

2. *Balsam of sulphur*, 1 part; *oil of turpentine*, 5 parts. This last is the form most generally employed. They are all regarded by those who use them as detergent, diuretic, stimulant, and vulnerary.

Female Drops, Emmenagogue do.; Guttæ Emmenagogæ, — Lat. *Prep.* (Brande.) *Compound tincture of aloes* and *tincture of valerian*, of each, 2 fl. oz.; *tincture of sesquichloride of iron*, 1 fl. oz. *Dose.* A teaspoonful in water or chamomile tea; in obstructed menstruation, &c.

Fit Drops, Soot Drops; Tinctura Fuliginis, Guttæ F.,—Lat. *Prep.* From *wood-soot*, 2 oz.; *sal ammoniac*, 1 oz.; *salt of tartar*, ½ lb; *soft water*, 4 lb; digest a week and filter. Reputed antispasmodic, and also useful in scurvy and certain skin diseases. *Dose.* A teaspoonful or more, occasionally, in water.

Golden Drops, De la Motte's do.; Bestucheff's Nervous Tincture; Elixir d'Or, Gouttes d'Or du Général Lamotte; Guttæ Aureæ,—Lat. 1. (Original.) *Chloride of iron* (obtained by distilling iron pyrites with twice its weight of corrosive sublimate), 3 oz.; *alcohol*, 7 oz.; expose the mixture in a closely stoppered bottle to the rays of the sun until it becomes decoloured.

2. *Chlorlde of iron*, 1 part; *alcohol* and *ether*, of each, 3 parts. These drops have the remarkable property of losing their yellow colour in the sun, and recovering it in the shade. They are taken in gout, hypochondriasis, and nervous complaints, in *doses* of from 10 to 60 drops.

Green's Antiscorbutic Drops. A disguised solution of *corrosive sublimate*. Most of the other *advertised antiscorbutic* and *antivenereal drops*, have a like composition.

Hooping-Cough Drops; Guttæ Antipertussicæ,—Lat. *Prep.* 1. (Dr. Graves.) *Tincture of assafœtida* and *compound tincture of camphor*, of each, ½ fl. oz.; *compound tincture of bark*, 5 fl. oz. *Dose.* A teaspoonful, 2 or 3 times a day.

2. (Potestates Succini.) *Oil of amber*, 1 oz.; *carbonate* (not sesquicarb.) *of ammonia*, ½ oz.; *strongest rectified spirit* (alcohol), ½ pint; digest 3 or 4 days, and decant the clear portion. *Dose.* 10 drops to 1 dr., as a friction.

Infantile Drops. Several *anoydne, carminative*, and *absorbent preparations*, which pass by this name, will be found under mixtures, &c.

Jesuits' Drops; Elixir Antivenereum, Balsamum Polychrestum,—Obs. Lat. *Prep.* 1. *Gum guaiacum*, 7 oz.; *balsam of Peru*, 4 dr.; *root of sarsaparilla*, 5 oz.; *rectified spirit of wine*, 1 quart; digest for 14 days.

2. (Quincy.) *Copaiba*, 1 oz.; *gum guaiacum*, 2 dr., *oil of sassafras*, 1 dr.; *salt of tartar*, ½ dr.; *rectified spirit*, 5 fl. oz.; digest a week.

3. (Walker's) *Copaiba*, 6 oz.; *gum guaiacum*, 1 oz.; *chio turpentine* and *salt of tartar*, of each, ½ oz.; *cochineal*, 1 dr.; *rectified spirit*, 1 quart; digest a week. See *Tincture of Benzoin* (Comp.)

Kœchlin's Drops. Prep. (Augustin.) *Solution of ammonio-chloride of copper and mercury*, 1 fl. dr.; *water*, 10 fl. dr. In obstinate venereal affections, scrofula, &c. *Dose.* A teaspoonful after each meal.

Lavender Drops, Red do.; Guttæ Lavandulæ. The same as *compound tincture of lavender.*

Life Drops, Salmon's Drops of Life; Guttæ Vitæ,—Lat. *Tincture of castor*, 8 fl. oz.; *antimonial wine* and *water*, of each, 1 lb.; *opium*, 3 oz., *saffron*, ½ oz.; *cochineal, camphor*, and *nutmegs*, of each, 2 dr.; digest for 10 days, and filter. Anodyne and diaphoretic. *Dose.* 20 to 60 drops.

Mercurial Drops; Guttæ Hydrargyri Bichloridi,—Lat. *Prep.* 1. *Bichloride of mercury*, 2 gr.; *hydrochloric acid*, 3 drops; *rectified spirit* and *distilled water*, of each, ½ fl. oz. *Dose.* 12 to 20 drops.

2. *Bichloride of mercury*, 2 gr.; *sal ammoniac*, 3 gr.; *compound decoction of sarsaparilla*, 2 fl. oz. *Dose.* A teaspoonful.

3. (Sir A. Cooper.) *Corrosive sublimate*, 1 gr.; *dilute hydrochloric acid*, ½ dr.; dissolve, and add, *tincture of bark*, 2 fl. oz. *Dose.* As the last. They are all taken 2 or 3 times daily, as alteratives in scrofula, syphilis, cancer, &c. It should not be measured in a metal spoon.

Norris's Drops. An aqueous solution of tartar emetic, mixed with spirit of wine, and coloured.

Odontalgic Drops, Tooth-ache Drops; Guttæ Odontalgicæ,—Lat. *Prep.* 1. (Dr. Blake.) *Alum* (in fine powder), 1 dr.; *sweet spirit of nitre*, 7 fl. dr.; agitate together occasionally for an hour.

2. (Dr. Copland.) *Powdered opium* and *camphor*, of each, 10 gr.; *oils of cloves* and *cajeput*, of each, 1 dr.; *highly rectified spirit* and *sulphuric ether*, of each, ½ fl. oz.

3. (Cottereau.) A saturated *ethereal solution of camphor*, to which a few drops of *liquor of ammonia* is added.

4. (Dr. R. E. Griffith.) *Wine of opium, Hoffman's anodyne*, and *oil of peppermint*, equal parts. *Used* as a friction on the cheek or gum, as well as applied to the teeth.

5. (Perry's.) A concentrated *ethereal tincture of camphor* and *pellitory.*

6. (Righini.) *Creasote*, 6 dr.; *rectified spirit*, 4 dr.; *tincture of cochineal*, 2 dr.; *oil of peppermint*, ½ dr.

Obs. The above are applied to the tooth with a camel-hair pencil, or a little wad of lint or cotton wool is moistened with them, and placed *in* or *against* the tooth.

Pectoral Drops, Bateman's do. do.; Guttæ Pectorales,—Lat. *Prep.* 1. *Paregoric*, 10 fl. oz.; *tincture of castor*, 4 fl. oz.; *lauda-*

num, 1 fl. oz.; *tincture of saffron* or of *cochineal*, ½ fl. oz.; *oil of aniseed*, 15 drops.

2. *Castor*, 1 oz.; *oil of aniseed*, 1 dr.; *camphor*, 5 dr.; *cochineal*, 1½ dr.; *opium*, ¾ oz.; *treacle*, 1 lb.; *proof spirit*, 1 gall.; digest for a week.

3. (Phil. Coll. of Pharm.) *Camphor*, *catechu*, *powdered opium*, and *red sanders wood*, of each, 2 oz.; *oil of aniseed*, 4 fl. dr.; *proof spirit*, 4 old wine-gallons; digest 10 days, and filter. *Dose.* A teaspoonful, or more, in coughs, colds, hoarseness, &c., assisted by an aperient.

Peppermint Drops. See *Essences.*

Rheumatic Drops; Guttæ Rheumaticæ,—Lat. *Prep.* 1. *Iodide of potassium*, 1 dr.; *tincture of guaiacum*, 2 fl. oz.; dissolve. *Dose.* 20 to 30 drops. In both chronic and occasional rheumatism, assisted with the copious use of lemon juice.

2. (Lampadius.) *Bisulphuret of carbon* and *ether*, of each, 2 fl. dr. *Dose.* 6 to 12 drops, on sugar, or in milk.

3. (Wutzer.) *Bisulphuret of carbon*, 1 fl. dr.; *alcohol*, 2 fl. dr. *Dose.* As No. 2. The last two are sudorific, alterative, resolvent, and emmenagogue, and besides rheumatism, have been used with advantage in amenorrhœa, in some cutaneous affections, in glandular swellings, &c.

Rousseau's Drops. See *Wine of Opium* (by fermentation.)

Sedative Drops; Guttæ Sedativæ,—Lat. The *solutions of acetate* and *hydrochlorate of morphia*, *black drop*, *Rousseau's drop*, and *Battley's liquor opii sedativus*, are frequently sold under this name by the druggists. The *anti-hysteric drops* (p. 340) is also an excellent sedative.

Spilbury's Drops. Prep. 1. (Dr. Paris.) From *bichloride of mercury*, *gentian root*, and *dried orange peel*, of each, 2 dr.; *precipitated sulphuret of antimony* and *red sander's wood*, of each, 1 dr.; *proof spirit*, 16 fl. oz.; digest ten days, and strain.

2. *Levigated crocus metallorum* (crocus of antimony), 6 dr.; *corrosive sublimate*, 45 gr.; *red sanders*, ½ dr.; *gentian root* and *dried orange peel*, of each, 2 dr.; *brandy*, (or equal parts of *rect. sp.* and *water*), 16 fl. oz.; digest as before. *Dose.* 5 to 30 drops; as an antiscorbutic, &c.

Steel Drops. See *Tincture of sesquichloride of iron.*

Swartz's Drops. See *Worm Drops.*

Tonic Drops. Prep. (Collier.) *Elixir of vitriol*, 2 fl. dr.; *tincture of calumba*, 6 fl. dr. A teaspoonful three times daily, in a wine-glassful of cold water.

Torrington's Drops. See *Compound Tincture of Benzoin.*

Van Swieten's Drops. An aromatised *solution of corrosive sublimate.*

Ward's White Drop. From *quicksilver*, 4 oz.; *nitric acid*, 16 fl. oz.; dissolve, add *sesquicarbonate of ammonia*, 7 oz.; evaporate and crystallize; then dissolve the resulting salt by the heat of a sand bath, in 4 times its weight of *rose-water*. Very poisonous. *Dose.* 5 to 15 drops, as an antiscorbutic, antivenereal, &c.

Worm Drops; Guttæ Anthelminticæ, G. Vermifugæ,—Lat. *Prep.* 1. *Creasote*, 1 dr.; *oil of turpentine*, 7 fl. dr. *Dose.* A teaspoonful, 3 or 4 times a-day.

2. (Peschier.) *Oil of male-fern*, 3 fl. dr.; *rectified oil of turpentine*, 5 fl. dr. As the last; in tape worm.

3. (Schwartz'.) *Barbadoes tar*, 1 fl. oz.; *tincture of assafœtida*, 1½ fl. oz. *Dose.* 30 to 40 drops, three times a day; in tape worm.

DROPS (Scouring). *Prep.* 1. *Oil of turpentine* and *oil of lemons*, equal parts. Both of the ingredients should have been recently distilled or rectified.

2. *Oil of lemon bottoms*, 1¾ *lb.*; *oil of turpentine*, 1 quart; mix well, and distil by the heat of a sand bath, until 3 pints have come over, or as long as the distillate is clear, pale, and sweet. *Used* to remove paint, grease, &c., from cloth.

DROPSY. Syn. *Hydrops*,— Lat. An unnatural collection of aqueous fluid in any part of the body. Dropsy has received different names, according to the part of the body affected by the disease. When it occurs in the cellular membrane it is called *anasarca*; when in the cavity of the abdomen, *ascites*; in the cavity of the cranium, *hydrocephalus*; in the scrotum, *hydrocele*; in the uterus, *hydrometra*; and in the chest, *hydrothorax*. Dropsy is mostly a symptom of extreme debility and a broken-down constitution, and frequently follows lengthened attacks of exhausting chronic diseases.

The *treatment of dropsy*, perhaps, more than any other disease, depends upon the circumstances with which it is connected, and, more especially, upon those which have caused it. The *acute inflammatory forms* of dropsy generally require depletion. In most *other cases*, tonics may be advantageously administered. To promote the absorption of the accumulated fluids, diuretics are commonly resorted to. *Confirmed dropsy* (especially *hydrocephalus* and *hydrothorax*,) occurring in parties either much debilitated by previous disease, or of a bad habit of body, is seldom curable.

DROWNING. The cause of death from submersion in water, is the entire seclusion

of air from the lungs, by which the *aëration* of the *venous blood* is prevented, and, consequently, the latter circulates through the arterial system, while the pulmonary vein ceases to convey *oxygenized blood* to the heart. Under ordinary circumstances, in the course of 4 or 5 minutes after the access of air has been cut off, life becomes extinct. Many cases have, nevertheless, occurred of persons being submerged for 15 or 20 minutes, and even longer, and where perfect insensibility has existed, in which recovery has taken place.

Prev. The specific gravity of the human body is *less* than that of water, so long as the lungs are partially filled with air; and this difference is sufficient to keep the body floating with the mouth and nostrils free for respiration, provided the face is turned upwards by throwing the head back on the shoulders, by which the weight of the head is sustained by the water. When a person throws himself into the water, the body rises rapidly to the surface and assumes nearly the erect position, the upper part of the head, down to a little below the eyes, remaining above the surface of the water. This arises from the greater density of the legs and thighs compared to that of the chest, which acts as a species of float or buoy to the rest of the body. In this situation, the head may be thrown back, so that the face may form the exposed portion, as before mentioned, when respiration may be carried on without inconvenience in still water, and regularly, but sufficiently, so as to sustain life for some time, even in a rough sea. The adoption of this simple precaution would have saved thousands of valuable lives.

Another point which should be remembered by every person in danger of drowning, is, that there is always a considerable amount of residual air in the lungs, in a nearly deoxidized state, and that if this air is expelled by two or three forced inspirations, and a deep inspiration is then taken, a larger quantity of vital air will be introduced into the lungs, and the blood will continue aërated for a proportionally longer time; and, consequently a longer period will elapse before another inspiration will be required. If we prepare ourselves by taking two or three forced inspirations, and then take a full inspiration, we may remain for 1½ or 2 minutes before a second attempt at respiration need be made. This is the plan adopted by the pearl fishers, and other divers who are remarkable for remaining beneath the surface of the water for some time. A person in danger of shipwreck, or expecting immediate submersion, in any other situation, should have recourse to this expedient, which would prevent the dreadful effects of attempting respiration whilst under water.

The writer of this article nearly lost his life a few years since, from not exercising the precautions which he is now recommending to others. He had been swimming for about a quarter of an hour, as was his daily custom at the period alluded to, and was returning to the bank, when a species of paralysis seized both extremities, and instead of preserving his presence of mind, and patiently waiting until the fit went off, he exhausted himself in fruitless endeavours to reach the land. The result was, that after a few vain struggles, he sunk utterly helpless and exhausted. The recollection of a comrade that was drowned a few days before, near the same spot, and the conviction of inevitable death, instantly flashed across his mind like an electric shock,—life, death, and eternity,—the dread of leaving his friends in ignorance of his fate,—and a thousand other subjects, were idealized in a moment, and were followed by others in incessant and rapid succession. Space and time seemed annihilated,—they presented no visible horizon to the mind's eye,—all was present,—all the events of life seemed collected and performing at the same moment—as in a day-dream, where individual distinctness is blended with general confusion. A pleasing state of mental serenity ensued; the prospect gradually changed, and surrounding space seemed covered with verdure of the softest green, and illuminated with green light of the most subdued and soothing tone, which gradually faded into twilight, and—here consciousness ceased. During the whole of this time, which occupied about 3½ minutes, no great bodily suffering was experienced; after the first sensations of suffocation were passed, none at all are recollected to have been felt. The feeling in the later moments of consciousness, indeed, approached in delectable serenity, the visions of the *opium eater* in the earlier periods of his devotion to that drug. A quarter of a century has now nearly elapsed since the occurrence of the accident alluded to, but though time has erased from the memory of the writer many events of more recent date, and with a busy hand, has scattered trials and afflictions in his path, yet the incidents that occurred on that almost fatal morning, still occasionally start up before his mind, as distinctly as the doings of yesterday.

Treat. The first object is the restoration of

the animal heat. For this purpose, the wet clothes should be removed, and the body, after being well dried, surrounded with warm air. In the absence of a warm-air bath, the body may be laid between well-heated blankets, and bottles of hot water applied to the feet and arm-pits. Gentle friction with warm flannel or the hands, should also be assiduously employed. Meanwhile, attempts should be made to excite respiration artificially; and when the apparatus is at hand, slight shocks of electricity should be kept up at the same time. On the appearance of returning life, such as sighing or convulsive twitching, a vein may be opened. The throat may be tickled with the finger or a feather, to excite vomiting, and a teaspoonful of warm water administered. If the power of swallowing exists, a tablespoonful of *warm wine* or *brandy-and-water* may be given. *Even if no symptom of returning animation appear, these means of recovery should be persisted in for three or four hours.*

In the treatment of this species of asphyxia, nasal stimulants, as *ammonia, aromatic vinegar, &c.*, should be avoided, as well as the injection of tobacco smoke, both of which have been found highly prejudicial. The practice of holding the body with the head downwards, which is sometimes adopted by the vulgar and ignorant, under the idea of allowing the water to run out by the mouth, is still more dangerous and absurd. The supposition that water is inhaled by drowning persons, instead of air, is perfectly fallacious. The peculiar mechanism of the glottis, or upper portion of the windpipe, is such as to prevent, by the spasmodic closure of the epiglottis, the entrance of more than a very trifling and accidental quantity of water, which is altogether too insignificant to produce any very injurious effects. See *Accidents*, *Animation* (suspended), *&c.*

DRUGS. Our continental neighbours, wiser than ourselves, not merely require that persons engaged in selling and dispensing drugs and pharmaceuticals shall be fully qualified by previous education and training for the task, but also that the various articles they sell and use, shall be commercially pure and of the proper quality. In the United States of America this subject has also engaged the attention of the government and legislature. Under the Act of the 26th June, 1848, inspectors were appointed to examine the quality of imported articles of this class, before allowing them to pass the Customs for home use. An abridged copy of the order addressed to the "collectors and other officers under this act," is appended, and will be useful to the reader, as assisting to establish a standard by which the value of the substances named therein may be estimated.

TREASURY DEPARTMENT, *June 4th*, 1853.

The following articles are to be entitled to entry when ascertained by analysis to be composed as under, viz.:—

Aloes . . .	when affording	80% of *pure aloetic extract.*
Assafœtida .	do.	50% of its *peculiar bitter resin*, and 3% of *volatile oil.*
Cinchona bark (of whatever denom^{n}.)	do.	1% of *pure quinine*, or 2% of the several alkaloids, as *quina, cinchona, quinidine, aricine, &c.*
Benzoic . .	do.	80% of *benzoin resin.*
Do. . .	do.	12% of *benzoic acid.*
Colocynth .	do.	12% of *colocynthine.*
Elaterium .	do.	30% of *elaterine.*
Galbanum .	do.	60% of *resin;*
Do. .	do.	10% of *gum*, and 6% *volatile oil.*
Gamboge . .	do.	70% of *pure gamboge resin*, and 2% of *gum.*
Guaiacum .	do.	80% of *pure guaiacum resin.*
Gum ammoniacum	do.	70% of *resin*, and 18% of *gum.*
Jalap (root or powder)	do.	11% of *pure jalap resin.*
Myrrh . .	do.	30% of *pure resin*, and 50% of *gum.*
Opium . .	do.	9% of *pure morphia.*
Rhubarb . .	do.	40% of *soluble matter.*
(Only Turkey, East Indian, and Russian, admissible.)		
Sagapenum .	when affording	50% of *resin*, 30% of *gum*, and 3% of *volatile oil.*
Scammony .	do.	70% of *pure scammony resin.*
Senna . .	do.	28% of *soluble matter.*

Medicinal leaves, flowers, barks, roots, extracts, &c., not specified above, must be, when imported, in *perfect condition*, and of as *recent collection* and *preparation* as practicable.

Pharmaceutical and *chemical preparations*, whether crystallized or otherwise, used in medicine, to be *pure*, and of a *proper consistence* and *strength*, as well as of *perfect manufacture*, conformably with the standard authorities named in the Act; and must, in no instance, contain over $3\frac{0}{0}$ of excess of moisture or water of crystallization.

Essential or *volatile oils*, and *expressed oils* used in medicine, must be *pure* and of the *standard sp. gr.* noticed and declared in the dispensatories named in the above act.

"*Patent*" or "*Secret Medicines*" are by law subject to the same examination as other medicinal preparations, and *cannot be permitted to pass the Custom-house for home consumption, but must be rejected and condemned*, unless the special examiner is satisfied, after due investigation, that they are *fit* and *safe* to be used for medical purposes.

An appeal from the examiner to the collector to be admitted within 10 days.

JAMES GUTHRIE,
Secretary of the Treasury.

DRUMMOND LIGHT. See *Illumination.*

DRUNKENNESS. See *Abstinence, Intemperance, &c.*

DRYERS (Painter's). *Prep.* 1. *Litharge* (best) ground to a paste with *drying oil.* For dark colours.

2. From *white copperas* and *drying oil;* as the last.

3. From *sugar of lead* and *drying oil.* The last two are for pale colours.

4. From *white copperas* and *sugar of lead*, of each, 1 *lb.; pure white lead*, 2 *lb.* For "whites," and opaque light colours, grays, &c. *Dryers* are employed, as the name implies, to increase the drying and hardening properties of oil paints. A little is beat up with them at the time of mixing them with the oil and turpentine for use.

DRYING. See *Desiccation, &c.*

DRYING OIL. See *Oils.*

DRY-ROT. A peculiar disease that attacks wood, and renders it brittle and rotten. It principally attacks "ill-seasoned" timber, and more particularly that of ships and badly ventilated buildings.

Prev. Various means have been proposed to prevent the attacks of dry-rot, and to arrest its progress when it has commenced, among which the process called "*Kyanising*" (after *Kyan*) is that most generally known, and most extensively adopted. It consists in immersing the timber in a *bath* of *corrosive sublimate.* A *solution* of *pyrolignite of iron* has also been used for the same purpose and in a similar way with the best effect. It is asserted, however, that "*Kyanised*" wood that has been exposed for a considerable time in unfavorable situations, has, in some cases, suffered from *dry-rot* in a nearly equal degree with unprepared wood. Lately the process termed "*Paynising*" (after *Payne*) has been extensively tested, and appears likely to supersede every other method. This plan consists in first filling the pores with a solution of *chloride of calcium*, under pressure, and next forcing in a *solution of sulphate of iron*, by which an insoluble *sulphate of lime* is formed in the body of the wood, which is thus rendered nearly as hard as stone. Wood so prepared is now largely employed in our public works and railways.

DUBBING. *Prep.* 1. By boiling the *waste cuttings of sheep-skins* in *crude cod-oil.* 2. *Black rosin*, 2 *lb.; tallow*, 1 *lb.; crude cod-oil* or *train oil*, 1 gall.; boil to a proper consistence. *Used* by the curriers to dress leather, and by shoemakers and others to soften leather, and to render boots and shoes waterproof.

DUCKS. See *Poultry.*

DUCTILITY is the property of being drawn out in *length* without breaking. See *Metals.*

DULCAMARA. See *Woody Nightshade.*

DULCAMARINE. Syn. *Dulcarine,*—Desfosses; *Picroglycion,*—Pfaff. A crystallizable substance obtained from the stalks of *solanum dulcamara* (Linn.) or *woody nightshade.* It has a bitter-sweet taste; is fusible; soluble in water, alcohol, and acetic ether; and its solutions are unaffected by tincture of galls or metallic salts. It is probably a combination of sugar and solanina, (Pelletier,) an alkaloid present in several species of the genus *solanum.*

DUMASINE. An oily liquid hydrocarbon obtained, along with the other products, by distilling *acetate of lime.*

DUMBNESS. Syn. *Aphonia,*—Lat. As speech is an acquired and imitative faculty, persons who are either born deaf or become so in early infancy, are also, necessarily, dumb. The first step in treating dumbness, must therefore be directed to the removal of the deafness on which the imperfection rests. The exertions of modern philan-

thropists have, however, been so far successful in such cases, as to enable the *deaf-mute* to converse with those around him by signs. Those interested in the subject may consult an admirable treatise on "*Deaf-dumbness*" by M. E. Hubert-Valleroux, of which an excellent translation appeared in the 'Medical Circular,' vol. ii. for 1853. See *Deafness*.

DUNGING. A bath formed of *cow-dung* diffused through *hot water* (130° to 212° Fahr.) is used for cotton goods in a particular stage of their manufacture, alternately with scouring. According to M. Camille Kœchlin, the action of cow-dung is due to its albuminous constituents combining with the alumina and iron of the acetates of these bases dissolved by the hot water of the bath. The acids set free render the bath acidulous after being used for a short time, as shown by test-paper; and this acidity must be got rid of, either by a fresh bath, or by the addition of chalk to the old one. Fresh cow-dung is generally neutral, but is sometimes sufficiently alkaline to turn turmeric-paper brown. *Bran* is frequently used as a substitute for cow-dung, and answers better for delicate yellows, pinks, and lilacs; but for other colours is said to be less effective.

Dunging is one of the most important steps in the process of calico printing. It serves to fix the bases on the cloth, and exercises a deoxidizing power on the iron mordant, which it thus restores to a state more suited for combining with the colouring matter of the ordinary dyes. See *Cow-dung* and *Dyeing*.

DUTCH LIQUID. See *Olefiant Gas*.

DYEING. Dyeing is a chemical process, and the mode of its performance requires to be modified to suit the substance operated on. Thus, it is found, that the process by which *wool* is dyed black, only imparts a rusty brown to linen. *Wool* unites with almost all the colouring matters of dye-stuffs with great facility; *silk* possesses this property in the next degree; *cotton* is inferior in this respect to silk; whilst *linen* is dyed of permanent colours with even more difficulty than cotton. Preparatory to the operation of dyeing, each of these substances undergoes a species of preparation to free the fibres from adhering foreign matter, (dirt, grease, &c.) which would prevent the equal absorption of the aqueous fluids to be afterwards applied, as well as impair the brilliancy of the dye. Wool is *cleaned* or *scoured* by means of weak alkaline lyes, soap and water, or putrid urine; the last being the one most generally employed for this purpose. Silk is *cleaned* from the natural varnish that covers it, by boiling it with white soap and water. Cotton and linen are *cleaned* with alkaline lyes of more or less density. The substances after this preparation are ready to undergo the various operations of dyeing.

Among the *colouring materials* employed by the dyer, some impart their tints to the substances submitted to their action, by simple immersion in their infusions or decoctions, and are hence called "*substantive*" or "*direct colours*" or "*dyes*." Far the greater number, however, only impart a *fugitive colour*, unless the fibres of the stuff have been previously prepared with some substance, which has a strong affinity for the latter on the one hand, and the colouring material on the other. The articles employed with this intention are called "mordants," and generally exercise the double property of "*fixing*" and "*striking*" the colour. Thus, *calico* dyed with a decoction of madder, only receives a fugitive and dirty red tinge; but when it is previously run through a solution of acetate of alumina, then dried at a high temperature, and after being washed, passed through a madder bath, it comes out of a permanent and lively red. The *principal mordants* are the *acetates of iron, copper*, and *alumina, sulphate of iron, alum*, and some other *chemical salts*. A perfect knowledge of the behaviour of mordants, with different colouring substances, is of the utmost importance to the practical dyer.

After the "goods" have received the proper mordants, they are dried and rinsed, and passed for a shorter or longer time, according to the effect desired, through an infusion, decoction, or solution of the dyeing materials, which constitute the "*dye-bath*." They are then dried, aired, and rinsed. In many cases, the immersion in the dye-bath is repeated, either with the same materials, or with others to vary or modify the colour. The final *rinsing* or *washing* should be in *soft water*, and the operation should be continued until the liquid runs off uncoloured.

The modification of the art of dyeing called "*calico printing*," has been already briefly referred to. The leading *fast dyes* of the calico printers are produced as follows:—

Black. The cloth is mordanted with *acetate of iron* (iron liquor), and dyed in a bath of *madder* and *logwood*.

Blue. The most durable are given by *indigo*, rendered soluble by potash and orpi-

ment, or by *quicklime* and *copperas*. The *blue vat*, for white spots on a blue ground of cloth, is made by applying to those points a paste of *solution* of *sulphate of copper* and *pipeclay*; and after they are dried, immersing it, stretched on frames, for a definite number of minutes, in a yellowish-green vat of *indigo*, 1 part; and *copperas* and *lime*, of each, 2 parts; with *water*, q. s.

Brown or *Pompadour*. From a mixed mordant, containing a somewhat larger proportion of the *red* than of the *black*; and a dye-bath of *madder*.

Buff. A yellow or golden yellow, but more dilute.

Crimson. The *mordant* for *purple* united with a portion of *acetate of alumina* or red mordant, with a *purple bath*.

Golden. From a bath of *annotta* dissolved in an *alkaline lye*; or the cloth is immersed alternately in a solution of copperas and lime water, observing to 'air' and rinse it well before each immersion.

Green. The cloth is dyed blue, then mordanted with *acetate of alumina*, dried and passed through the *quercitron bath*.

Orange. From a *red mordant*; and a bath first of *madder*, and then of *quercitron*.

Purple. The *mordant of iron*, for black, diluted; followed by a bath of *madder* and *logwood*.

Red. From *acetate of alumina* as the mordant, and *madder* for the *dye-bath*. *Pale red* and *red* of *different shades* are made by using a weaker mordant and bath.

Yellow. From a *strong red mordant*, followed by the *quercitron bath*, only hot, not boiling.

Obs. In the above cases, for *calico-printing*, the cloth, after receiving the mordant, made into a paste with *British gum*, and applied topically by blocks or cylinders, is dried, and passed through a mixture of *cow-dung* and *warm water*. In *ordinary dyeing*, without patterns, the goods are simply immersed in the mordants. In both cases the calicoes are then put into the dyeing vat or copper. See *Calico Printing*, *Dunging*, *Mordants*, and the *respective dyes* and *dye-stuffs*.

DYER'S SPIRITS. See *Tin Mordants*.

DYES. See *Dyeing*.

DYE-STUFFS. The colouring materials used in dyeing are so called. The more important of them are noticed under the respective names.

DYSENTERY. Syn. *Bloody Flux*; *Dysenteria*,—Lat. A disease arising from inflammation of the mucous membrane of the large intestines, and characterized by stools consisting chiefly of blood and mucus, or other morbid matter, accompanied with griping of the bowels, and followed by tenesmus. There is generally more or less fever, and the natural fæces are either retained or discharged in small hard balls, (*scybala*.) The *common causes* of this disease are marsh miasma, improper diet, excessive exhaustion and fatigue, and above all, exposure to the cold and damp air of night after a hot day.

Treat. The common dysentery of this country generally gives way to gentle aperients, (*castor oil* or *salts-and-manna*,) to cleanse the bowels, followed by *mild opiates* or *morphia*, to allay irritation. The chronic symptoms, which frequently hang about for some time, are best combated by mild tonics and vegetable bitters, (*bark*, *calumba*, *cascarilla*.) Occasionally, chalybeates (*ammonia-citrate of iron*, *lactate of do.*, *wine of do.*, *saccharine carbonate of do.*,) will be found useful during coalescence. Throughout, the diet should be light and nutritious.

The *contagious dysentery*, of camps and hot climates, is a severe and often fatal disease, in which the preceding symptoms are complicated with remittent or typhoid fever. Its treatment is tedious and difficult, and depends chiefly on judiciously meeting the several symptoms as they develope themselves. *Aperients*, *diaphoretics*, and *nauseants*, followed by *tonics*, are the remedies generally relied on. The febrile symptoms must be treated according to their inflammatory or putrid tendency. This variety of the disease frequently gives rise to organic diseases of the abdominal viscera, dropsy, &c. It is regarded by some as contagious, but without sufficient reason.

DYSLYSINE. A resinous substance, insoluble in water, formed, along with other substances, when *glyco-cholalic acid* is boiled for some time in *concentrated sulphuric* or *hydrochloric acid*.

DYSMENORRHŒA. See *Menstruation*.

DYSPEPSIA. See *Indigestion*.

DYSPNŒA. Difficulty of breathing. It is generally symptomatic of some other affections. When it occurs in persons of a nervous or irritable habit of body, perfect quiet, a semi-recumbent posture, fresh air, and some small doses of *ether*, *ammonia*, or *opium*, will generally effect a cure. Those of a full habit, require aperients and depletion. To prevent attacks of the kind, excess in eating and drinking, and the use of stimulants, should be avoided.

DYSURIA. Syn. *Dysury.* Difficult urination. It is generally symptomatic of disease of the kidneys, bladder, or urethra. The *treatment* depends on the exciting cause.

EAR. See *Deafness* (and *below.*)

EAR (Inflammation of). Syn. *Otitis,*—Lat. This affection, when it attacks the internal part of the ear, is generally accompanied with confusion of sound, deafness, and more or less fever. It is most frequent among children, and is commonly produced by exposure to draughts of cold air, and, occasionally, by foreign matters, as cherry-stones, insects, &c., having got into the external ear. In such cases, the removal of the offensive matter, and due attention to warmth and cleanliness, with a dose of laxative medicine, will be all the treatment required. Cases of *acute inflammation* of the internal ear are occasionally met with in adults, which assume a very serious character, and demand the most active antiphlogistic treatment, as bleeding, blistering, and purgation, for which proper medical advice should be sought. See *Deafness.*

EARACHE. Pain in the ear may arise from various causes, amongst which, in the absence of organic disease, cold, and that peculiar derangement of health popularly called "nervousness," are the most common. In the one case, the proper remedy is warmth; in the other, the attention should be directed to the restoration of the body to the healthy standard.

EARTHS. Syn. *Terræ,*—Lat. The earths of the *agriculturist* are soils wholly or nearly destitute of organic matter. Among *chemists*, the term is applied to a certain class of bodies which constitute the principal portion of the various stony and pulverulent masses, that form our mountains, valleys, and plains. The *primitive earths* are ten in number,—*baryta, strontia, lime, magnesia, alumina, glucina, zirconia, yttria, donaria,* and *thorina.* The first four are termed *alkaline earths,* from their partial solubility in water, their alkaline taste, and their action on vegetable colours. The remainder constitute the *earths* (proper), and are insoluble in water, and only imperfectly neutralize the acids. *Silica* and *lithia* have also been classed with the earths, but the first, from its power of neutralizing bases, is more correctly placed among the acids; and the last, from its behaviour with the acids, and the solubility of its carbonate in water, may certainly be closed with the alkalies. In a state of purity they are all *white* and *incombustible;* but as they exist in nature they appear under various forms, occasioned by their being combined with other substances, as the acids, and the oxides of the common metals. Prior to the splendid discoveries of Sir H. Davy in electro-chemistry, the several earths were regarded as elementary or undecompounded bodies, instead of the oxides of metals, which, from their peculiar characters, are obtained with difficulty, and possess but an evanescent existence.

The term *earth* was very loosely applied by the older chemical and pharmaceutical writers, and the practice is still common among the vulgar at the present day. Thus, —*Absorbent earth* (chalk); *aluminous earth, argillaceous do.* (alumina); *bolar earth* (bole); *bone-earth* (phosphate of lime); *fuller's earth* (an absorbent clay); *heavy earth* (baryta); *Japan earth, terra Japonica* (catechu); *sealed earth* (bole); &c., are names even now frequently encountered both in trade and in books.

EAU. (Fr.) Water. This word, like its English synonyme, is applied to numerous substances, differing in their composition, sensible properties, and uses, of which the following are a few useful examples:—*Eau douce,* fresh or river water; *Eau de mer,* sea or salt water; *Eau de fontaine, eau de source,* spring water; *Eau de puits,* well or pump water; *Eau de rivière,* river water; *Eau distillée,* distilled water; *Eau de rose,* rose water; *Eau de vie,* brandy; *Eau de Cologne,* Cologne water; *Eau d'Hongrie,* Hungary water; *Eau bénite,* holy water; *Eau forte,* aquafortis; *Eau de savon,* soap-suds; *Eau de senteur,* scented water, &c.

Eaux, in perfumery, are solutions of the fragrant essential oils in spirit, as *eau de Cologne, eau de bouquet,* &c.; or they are *distilled waters,* largely charged with the odorous principles of plants, as *eau de rose, eau de fleurs d'oranges,* &c.

Eaux, of the *liqueuriste,* are *aromatized spirits* or *cordials.*

Eaux (Médicinales), are either simple watery solutions (*hydrolés, hydrolatures, solutions par l'eau*), or distilled water (*eaux distillées*); or they are vinous or alcoholic tinctures or solutions of essential oils, aromatics, or more active drugs. See *Cordials, Hair Dyes, Perfumery, Spirits, Tinctures, Waters, &c.*

EBLANINE. The yellowish-red, crystallizable, solid substance, which is left behind in the retort, when *wood spirit* is rectified from *quicklime.* It is insoluble in

water, and sublimes without fusion at 273° Fahr.

EBONY is the wood of the *diospyrus melanoxylon*, an East Indian tree, of the natural order *ebenaceæ*. Pale-coloured woods are stained in imitation of ebony (*factitious ebony*), by washing them with or steeping them in a strong *decoction of log-wood* or of *galls*, and, when dry, washing them over with a *solution of sulphate* or *acetate of iron*. They are then rinsed in clean water, and the process is repeated, if required. The wood is lastly *polished* or *varnished*.

EBRIETY. See *Intoxication*.

EBULLITION. The state of boiling. The *boiling points* of liquids are constant under precisely the same circumstances. The causes which induce variation are increased or diminished atmospheric pressure, the greater or less depth of the liquid, and the character of the containing vessel. Thus, boiling water is colder, by some degrees, in bad weather, when the barometer is low, and at the top of a hill, than in fine weather, or at the bottom of a valley or mine, when the barometer is higher. Boiling water contained in a deep vessel is also hotter than that in a shallow one, on account of the greater resistance in the one case than the other to the escape of the steam. It is also found that fluids boil at a lower temperature and more quietly in vessels with rough and spicular surfaces, than in those with smooth or polished ones. The boiling point of water, as marked on the scale of the thermometer, is 212° Fahr., but in glass vessels, under common circumstances, it varies from 212·54° to 215·6°; whilst in perfectly pure and smooth glass vessels, water may be heated to 221° Fahr., without boiling. The cause of this may be at once demonstrated by throwing into water, about to boil in a glass mattras, a little iron filings or coarsely powdered glass, when ebullition will commence with almost explosive violence, at the same time that the temperature of the fluid will sink about 2° Fahr. The fact of liquids boiling in metallic vessels at fully 2° less heat than in vessels of glass, is also accounted for on the same principle. From 5° to 9° are usually lost by the heat passing through the vessel, according to the thickness and material. *In vacuo* all liquids boil at a temperature about 124° lower than in the open air, at the average barometric pressure.

The boiling point of water contained in ordinary vessels, may be raised considerably above 212° Fahr., by the addition of saline matter, as will be seen in the following table. In practice it is found inconvenient to employ a saturated saline solution for a bath (by which the highest temperature would be obtained), as the constant evaporation of the water induces the crystallization of the salt. It is hence usual to keep it considerably below that point. By means of these liquids and oil baths, the chemist is enabled to evaporate fluids and desiccate solids at any required temperature.

TABLE *of the Boiling Points of Saline Solutions, abridged from the researches of* Biot, Gay-Lussac, Griffith, Ure, and others.

Names of Salts.	Dry Salt in 100.	Boiling Point.
Chloride of calcium . .	satd.	285°F.
Acetate of soda . .	60	256
Nitrate of soda . .	60	246
Chloride of calcium . .	41	240
Rochelle salt . . .	90	240
Nitre	74	238
Hydrochlorate of ammonia	50	236
Tartrate of potassa . .	68	234
Chloride of calcium . .	34	230
Chloride of sodium . .	30	224
Ditto	20	218·75
Sulphate of magnesia .	57·5	222
Supersulphate of potassa .	?	222
Borax	52·5	222
Phosphate of soda . .	?	222
Carbonate of soda . .	?	220
Chloride of barium . .	45	220
Alum	52	220
Acetate of lead . .	satd.	215·6
Sulphate of potassa . .	17·5	215
Bitartrate of potassa .	9·5	214
Sulphate of soda . ·	31·5	213

EBULLIOSCOPE. Syn. *Ebullition Alcoholmeter*, *Thermo-alcoholmeter*. This instrument is essentially a thermometer, and its application to alcoholmetry is based upon the fact, that the boiling point of a spirituous liquid is scarcely altered by the presence, within certain limits, of the substances which may be dissolved in it, and which, by increasing its specific gravity, render the ordinary alcoholmeters or hydrometers useless for the purpose of indicating its alcoholic richness. The ebullioscope was invented by the Abbé Brossard-Vidal, of Toulon, and in its original form, consisted of a *spirit-lamp* surmounted by a *small boiler*, into which a large *cylindric glass bulb* was plunged, having an *upright stem* of such calibre that the *quicksilver* contained in them, by its expansion and

ascent when heated, raised before it a little *glass float* in the stem, which was connected by a thread with a similar *glass bead*, hanging in the air. This thread passed round a *pulley*, which, turning with the motion of the beads, caused an *index* to move along a *graduated circular scale*, which represented on its face the per centage of absolute alcohol in spirituous liquors of different boiling points. This form of the apparatus being found inconvenient and liable to get disarranged, various improvements were made in it by MM. Conaty, Lerebour, and others. The modification of the instrument now in use, and known as *Field's "Patent Alcoholmer,"* was made by Dr. Ure, and can scarcely be improved on. It consists of a *thermometer* having a very minute bore and a large bulb, similar to that employed to determine the height of mountains from the boiling point of water, but instead of thermometric degrees being marked upon the scale, the *per centage under proof* is placed on the *left-hand side* of the stem, and the *per centage content of proof spirit*, on the *right hand side*. These commence at 178·6° Fahr., the temperature at which proof spirit boils, and which here forms the bottom of the scale. The succeeding numbers are based upon the boiling points contained in the *tables* given at *page* 36. The *little boiler* being charged, and about a *teaspoonful of salt* (35 gr.) being added, to prevent loss of alcohol by evaporation, the *thermometer* is set in its place, and the *spirit-lamp* lighted. When the *mercury* begins to rise out of the bulb of the thermometer, the *damper-plate* is pushed in a little way, to moderate the heat. The eye is now kept steadily on the instrument, and *as soon as* the liquor boils freely, and the *mercury becomes stationary in the stem*, the indication is carefully noted, and the *damper-plate* pushed home to extinguish the flame.

The *ebullioscope* is adjusted to the mean boiling point of water under an atmospheric pressure of 29·5 inches. When the pressure is either higher or lower, both water and alcohol boil at a somewhat different temperature, to meet which a barometrical equation is attached to the thermometer by means of a small *subsidiary scale*. It is therefore necessary, prior to commencing the operation of testing any liquor, to charge the little boiler with *pure water* only, and to fix the thermometer in its place. When the *water* boils freely, the *mercury* becomes stationary in the stem, exactly opposite the true barometrical indication at the time. Should this be against the line 29·5, no correction will be required; but should it stand at any other line, above or below, then the various boiling points will bear reference to that boiling point only. In the latter case, the *boiling point of the water on the barometrical indicator*, must be set against the *boiling point of the liquid on the scale*, when *opposite the line*—29·5, will be found the *true strength*. Thus:—the barometer being at 30 inches, and the indication or boiling point being 72 u. p., 30 on the *indicator* must be placed against 72 u. p. on the *thermometer*, when against the *line of* 29·5, will be seen 69·6 u. p., the *real* strength of the sample tested.

When a spirit is stronger than the excise proof, its boiling point varies too little with its alterations of strength to render the ebullioscope of much practical value. To make it applicable to the stronger spirits, it is therefore necessary to dilute them with exactly their own bulk of pure water before testing them, and then to double the resulting indication, as suggested by Dr. Ure. Our own plan is always to do this when the spirit is stronger than 20 u. p.

By *means of the ebullioscope* the alcoholic content of *beer*, *wines*, and *spirits*, of *every variety* and *class*, may be readily determined with sufficient accuracy for all practical purposes; and by methods which we shall hereafter point out, the amount of *saccharine extractive*, or *sugar*, in *cordialized spirit*, *malt liquors*, and *wines*, may also be ascertained.

The ebullioscope (*Field's alcoholmeter*) employed by us in our numerous and extensive investigations connected with public hygiène, was made by Mr. Long, of Little Tower Street, and is an instrument which should be in the hands of every wine and spirit merchant and licensed victualler, as well as every private gentleman who feels interested in the quality of the liquors in his cellar. The instrument is accompanied by a useful little pamphlet of directions and tables, which has been very accurately got up, as we understand, by Dr. Ure, expressly for Mr. Long.

EDULCORATION. The affusion of water on any substance for the purpose of removing the portion soluble in that fluid. *Edulcoration* is usually performed by agitating or triturating the article with *water*, and removing the latter, after subsidence, by decantation or filtration. It is the method commonly adopted to purify precipitates and other powders which are insoluble in water.

EEL. The *common eel* is the *muræna anguilla* of Linnæus, a fish of the order

malacopterygii apodes. As an article of food it is said to be laxative and far from wholesome. The fat (*eel fat; adeps anguillæ, oleum do.;*) is among the simples of the Ph. L. 1618, and was formerly considered "good against stripes," and is even now used by the vulgar as a friction for stiff joints. For *the table*, eels are generally dressed by *stewing*, *frying*, *baking*, or *potting them*, which is done in the usual way, the fish being cut into pieces 2 or 3 inches long, and *melted butter*, *onions*, *sweet herbs*, and *anchovy sauce*, added at will. The *conger eel* is the *muræna conger* (Linn.), a distinct and gigantic species of the same family. Its flesh is coarse and oily, but is much esteemed by the inhabitants of the southern coast of Devon, on which it abounds.

EFFERVESCENCE. See *Draughts, Powders, &c.*

EFFLORESCENCE. The spontaneous conversion of a solid into a dry pulverulent form. Crystals which in a dry atmosphere lose their water of crystallization, and become crusted over with a mealy powder, are said to be *efflorescent.*

EGGS. Syn. *Ova*,—Lat. The eggs of birds are nutritious and easily digestible; and when *lightly* cooked by boiling, and eaten with a little salt, are admirably adapted as an aliment for the sick and delicate. When boiled *hard* or *fried*, they are rendered less digestible, and possess no advantage in this respect over butcher's meat. A *new-laid egg*, beaten up in a *cup of tea*, *coffee*, or *chocolate*, is an excellent ingredient in the breakfast of a person with a poor appetite, and is very supporting. A *glass* of *wine*, *beer*, or *porter*, similarly treated, along with a *biscuit*, has been recommended as a light and *nutritious luncheon* or *supper*, well suited to the debilitated and dyspeptic. *Raw eggs* are powerfully antiscorbutic, and from containing a large quantity of iodine and the phosphates, are superior to cod-liver oil in all the cases in which this last is ordered, occurring in persons with delicate or irritable stomachs. These good qualities are, however, lost, if they are boiled longer than about 2 minutes for a small one, and 3 minutes for a large one, or are eaten with much salt. The addition of fresh *salad oil* vastly increases their medicinal virtues. A *fresh egg* contains about the same amount of nourishment as 1½ *oz.* of *fresh meat* and 1 *oz.* of *wheaten bread*, but in a more digestible form.

White of egg (*ovi albumen*), and yelk of egg (*ovi vitellus*), are officinal in the Ph. L. The *first* has been already noticed under "*albumen.*" The *second* is an ingredient in the brandy mixture (*mixtura spiritus vini gallici*) of the London College. It is also a popular application to chaps, cracked nipples, abrasions, &c., and is largely used to render oleaginous substances miscible with water, in the preparation of emulsions.

The *average weight* of the *new-laid egg of a hen* is about 2½ *oz.*, and its sp. gr. is 1·080 to 1·090; the *white* generally weighs about 1½ *oz.*; the *yelk*, a little under ¾ *oz.*; and the *shell* and *skin*, ¼ *oz.* Dr. Prout found that an egg on being kept for 2 years in a dry situation, lost 544 3/10 gr., from the evaporation of a portion of its water through the shell. By *boiling in water* an egg loses from 2⅝ to 3⅜ of its weight.

Choice. The larger end of a new-laid egg feels cold, when placed against the tongue. New-laid eggs appear semi-transparent when placed between the eye and a strong light, and have a small and perceptible division of the skin from the shell, which is filled with air. This examination among the trade is called "*candling them.*" When they shake they are stale. The *eggs* of the large black fowls called *Minorcas* or *Spanish*, and which have a very white and rough shell, are those that possess the most delicate flavour. The *eggs of turkeys* are much esteemed for some purposes; those of *ducks* and *geese* are coarse and inferior.

Pres. Eggs may be preserved for any length of time by excluding them from the air. One of the *cleanest* and *easiest* methods of doing this, is to pack them with the small end downwards, in *clean dry salt*, in barrels or tubs, and to place them in a *cool* and *dry* situation. We have eaten eggs thus preserved that were more than a twelvemonth old, and that had been for some months on shipboard, in a tropical climate, and which yet retained all the peculiar sweetness of new-laid eggs. With a like intention, eggs are placed in vessels containing *milk of lime*, or *strong brine*, or are rubbed over with *butter*, *lard*, or *gum water*; all of which act by excluding the air. *Eggs* for *keeping* should *never be laid on their sides*, and when kept in the air, should be occasionally turned to prevent the yelk attaching itself to the side, instead of floating in the albumen. *Some persons* place the *eggs* in a *netting*, or on a *sieve* or *colander*, and immerse them for an *instant* in a caldron of *boiling water*, before packing them away. The practice of packing eggs in *damp straw*, or anything else that can convey a flavour, should be carefully

avoided. The shells of eggs are porous, and readily admit the passage of gaseous substances, especially of fetid odours. It is from inattention to this point that a large portion of the eggs imported from the coast of France have a less delicate flavour than those of our poultry yards. Damp chopped-straw, as well as most other organic substances exposed to warmth and moisture, readily ferment or putrefy; and during fermentation, a considerable increase of temperature takes place, as any one may readily perceive, by examining the common hotbeds in our gardens, which are merely masses of organic matter in a state of decomposition. Eggs, as long as they retain the embryo of the future chick, in a vital state, possess in themselves a certain degree of warmth, which tends materially to promote the decomposition of the substances they are packed in, particularly in the presence of moisture.

EGG (Elastic). Take a *good* and *sound egg*, place it in *strong vinegar*, and allow it to remain for twelve hours; it will then become quite soft and elastic. In this state it can be squeezed into a tolerably *wide-mouthed bottle;* when in, it must be covered with *water*, having a little *soda* dissolved in it. In a few hours the egg will be restored to nearly its original solidity; after which the *liquid* may be poured off, and the bottle dried, the whole being kept as a curiosity to puzzle one's friends for an explanation how the egg got there. (*'Parlour Pastime.'*)

EGG (Glaire of). *Prep.* Separate the *whites* from the *yelks*, and whisk them to a froth, let them stand 24 hours, and strain them through muslin. Used as a glaze or varnish by bookbinders and others.

EGG FLIP. *Prep.* 1. *Beer*, 1 pint; *eggs*, 3 in no.; *sugar*, 2 *oz.; nutmeg* and *ginger*, q.s. to flavour; the eggs are broken into one half of the beer, the sugar added, and the whole beaten well together; the mixture is then placed in a clean "warmer," and heated over the fire to *nearly* the boiling point, and stirred *one way* all the time, care being taken not to let it either boil or curdle; the other portion of the beer and the spices are then added, and the whole mixed well together.

2. As above, but adding *a glass of spirit*. Some persons also add a little *lemon peel.*

EGG LIQUID (Jayne's). *Prep.* From *lime*, 1 bushel (slaked with water); *common salt*, 2 or 3 *lb.; cream of tartar*, ½ *lb.; water*, q. s. to form a mixture strong enough to float an egg. *Used* to preserve eggs, which it is *stated* it will do for two years, by simply keeping them in it. Once patented. Simple milk of lime answers quite as well.

EGG WINE. As *egg flip*, but using equal parts of *white wine* and *water* instead of beer.

EISOL. See *Sulphuric Acid.*

ELÆOMETER. See *Hydrometer* and *Oils.*

ELÆOPTENE. See *Oils* (Volatile).

ELAIDIC ACID. An acid compound formed by the action of nitrous acid or nitrate of mercury on oleic acid.

Prep. (Meyer.) A current of *nitrous acid gas* is passed through pure *oleic acid*, at a low temperature, for about 5 minutes; the crystalline mass, that shortly afterwards forms, is washed with *hot water*, and then dissolved in an equal volume of *hot alcohol.* The crystals deposited as the liquor cools, are purified by pressure, re-solution, and re-crystallization.

Prop., &c. Elaïdic acid resembles sublimed benzoic acid; melts at 113° Fahr., and is soluble in alcohol and ether; with the alkalies and their carbonates it forms hydrated salts (*elaidates*), which yield strong soapy solutions.

ELAIDIN. A fatty compound of elaïdic acid and glycerine, formed by the action of *nitrate of mercury* on *olive oil.* It is neutral; melts at 90° Fahr.; and is very soluble in ether, scarcely so in alcohol. It is one of the components of citrine ointment. By saponification it is resolved into *glycerine* and *elaïdic acid.*

ELAINE. See *Oleine.*

ELALDEHYDE. A peculiar crystalline substance which forms in aldehyde when kept for some weeks at a temperature of 32° Fahr. It melts into a colourless liquid at about 38°, in which state it is miscible with water, alcohol, and ether. It is isomeric with aldehyde, but its vapour has about three times the density of that substance, whilst it neither combines with ammonia, nor comports itself with potassa and solution of silver like aldehyde.

ELATERINE. Syn. *Momordicine; Elaterinum,*—Lat. The active principle of elaterium. It was discovered by Dr. Clutterbuck in 1819, but first obtained in a state of purity in 1830, by the late Mr. Hennel.

Prep. 1. (Dr. Morries.) *Elaterium* is digested in *hot alcohol*, the resulting tincture filtered, evaporated to the consistence of thin oil, and then thrown into boiling distilled water; when the whole is cold, the precipitate is collected and purified by redissolving it in *alcohol* and precipitation by water, as before.

2. (Hennel.) The *alcoholic extract of elaterium* is digested in *ether*, and the residuum dissolved in *hot alcohol;* crystals form as the solution cools.

3. An *alcoholic tincture* is evaporated to the consistence of a syrup, and thrown into a *mixture* of equal parts of *liquor of potassa* and *water* at a boiling temperature. Almost pure *elaterine* separates as the liquid cools.

Obs. Elaterine forms delicate white silky crystals, having a bitter taste; it is fusible at about 365° Fahr.; tastes bitter; odourless; neutral; insoluble in water; and dissolves readily in hot alcohol. Its medicinal action is similar to that of elaterium, differing only in its greater activity. *Dose.* $\frac{1}{18}$ gr. to $\frac{1}{20}$ gr.

ELATERIUM. "The fresh unripe fruit" of the *wild cucumber*, "*ecbalium officinarum.* (Richard; *momordica elaterium*, Linn.)" — Ph. L. According to present usage, the word is more generally applied to the deposit obtained from the juice of the wild cucumber. (See *below.*)

ELATERIUM. Syn. *Extract of Elaterium, Ext. of Squirting Cucumber; Elaterium,*—Ph. D. 1807; & Ph. L. 1788. *Extractum Elaterii,* — Ph. L. E. & D. The feculence of the juice of the fruit of *momordica elaterium*, or *wild cucumber.*

Prep. 1. (Ph. L.) Slice *wild cucumber* in the long direction, and strain the juice, *very gently expressed*, through a fine hair sieve; then set it aside for some hours, until the thicker part has subsided. The thinner supernatant fluid being rejected, dry the thicker portion with a gentle heat. The processes of the other colleges are essentially the same.

2. (Dr. Clutterbuck.) The *cucumbers* (fully ripe) are cut longitudinally, and sprinkled with *cold water*, and the juice allowed to strain through a fine sieve into an earthenware vessel. The *seeds* and *surrounding pulp* are next placed on the sieve, with the split fruit, and washed repeatedly with *cold water.* The *washings* being received in the same vessel with the juice, the whole is allowed to repose for a few hours, when the clear portion is decanted and the sediment spread thinly on fine linen, and dried by exposure to the air and a gentle heat; avoiding the sunshine or a bright light. Quality very fine. Forty fruits, by this process, yield only 6 gr. of elaterium.

3. (Apothecaries' Hall.) The *fruit*, slit into halves, is placed in hempen or horsehair bags, and submitted to slight pressure in a *tincture press.* The juice, as it runs off, passes through a fine hair sieve into a cylindrical glass jug or jar, where it is allowed to remain for two hours, when the clear supernatant liquor is poured off, and the thick portion containing the sediment is poured on a paper filter, supported on linen, and allowed to drain, after which it is dried by a gentle heat in a stove. The product has a green colour, and constitutes the *finest elaterium* of commerce. A darker and inferior article is obtained from the liquor, poured from the first sediment by placing it in shallow pans and allowing it again to deposit.

Prop., &c. Pure elaterium has a light greenish hue, floats on water, is easily pulverized by pressure, and forms with rectified spirit a rich green-coloured tincture. Elaterium obtained as a second deposit, (*elaterium nigrum,*) is dark and inferior.

Good elaterium yields from 50% to 60% of its weight to strong alcohol, and from 25% to 44% of elaterine. Its "colour is pale (greenish) gray: when exhausted by rectified spirit, the solution, concentrated, and poured into hot *dilute solution of potassa*, deposits, on cooling, minute silky, colourless crystals (of *elaterine*), weighing from $\frac{1}{7}$th to $\frac{1}{4}$th of the elaterium operated on." (Ph. E.)

Obs. To procure a fine article of elaterium, it is necessary to remove it as soon as it is deposited, as a heavy mucilage falls down soon afterwards, which materially injures its quality and appearance. *English elaterium* is the best. The foreign is uniformly adulterated with chalk or starch, and coloured with sap green.

Dose. $\frac{1}{16}$ gr., to $\frac{1}{2}$ gr., formed into a pill with extract of gentian and liquorice powder; as a hydragogue and cathartic in dropsies, twice a day, repeated every other day for a week or ten days. Its use must be avoided when there is much debility or any inflammatory symptoms. Larger doses than $\frac{1}{2}$ gr. of pure elaterium are poisonous. The *antidotes*, are emetics, followed by demulcents, opium, and stimulants.

ELATINE. Obtained by Dr. Paris by treating the *alcoholic extract of elaterium* with *boiling water*, which dissolves out the bitter matter and leaves the *elatine.* It has since been shown to consist of elaterine and green resin of elaterium.

ELDER. Syn. *Sambucus,* — Ph. L. "The recent flowers of the *sambucus niger,*" (Ph. L.) or *common elder.* They are regarded as diaphoretic and pectoral, and a distilled water (*elder-flower water; aqua sambuci;*) is made of them. The *inner bark* of the same tree is purgative and emetic, and is used in dropsy; the *leaves*

are purgative; the *juice* of the *fresh berries* is made into wine, (*elder wine*,) and is largely used to make *factitious port wine*, and to adulterate that beverage. See *Waters* (Distilled).

ELECAMPANE. Syn. *Helenium; Inula*, —Ph. L. "The root of *inula helenium*," (Ph. L.) Tonic, diaphoretic, and expectorant. *Dose.* 20 gr. to 1 dr., or more, either in the form of powder or decoction; in catarrh, dyspepsia, &c. It is now seldom used.

ELECAMPINE. See *Inulin.*

ELECTIVE AFFINITY. See *Affinity* and *Decomposition.*

ELECTROTYPE. This name was originally given to the impression or copy of a medal or bas-relief obtained by electro-chemical decomposition. It is now extended so as to include any object produced by means of voltaic electricity. At the present time, *electrotyping* or *electro-metallurgy*, ranks high among our fine-art manufactures; and in the rapidity of its development and the usefulness of its application, is, perhaps, inferior to none of them. A description of this new art will be found under the heads *Gilding*, *Metallurgy*, *Silvering*, *Voltatype*, *&c.*

ELECTRUM MINERALE. Syn. *Tincture of the Metals.* A once celebrated preparation made of *tin*, *copper*, and a *little gold*, melted with double their weight of *martial regulus of antimony*; the resulting mass being powdered, and deflagrated with *nitre* and *charcoal*, and the scoriæ thus obtained, reduced to powder whilst still hot, and digested in *rectified spirit.* The product was a rich red-coloured tincture, reputed to possess the most extraordinary virtues.

ELECTUARY. Syn. *Electuarium*,—Lat. Electuaries (*electuaria*) are formed of light powders, generally vegetable, mixed up with honey, syrup, or sugar, to the consistence of a stiff paste. In the present Pharmacopœia, they are included under the title *Confection*, but this arrangement is manifestly improper, as the words are not synonymous. In *Conserves* and *Confections*, the addition of the saccharine matter is in much larger proportion, and is designed to preserve the vegetable matter; in *Electuaries*, the syrup is designed merely to communicate the required form. (Dr. Murray.)

The *preparation* of *electuaries* is similar to that of confections and conserves, and the same precautions must be observed to reduce the dry ingredients to very fine powder before adding them to the syrup or other substances used to give them form. Care must also be taken to diffuse the ingredients *equally* through every portion of the mass, by patient and laborious stirring. The neglect of this point has often led to disagreeable consequences, from some portion of the electuary being nearly inert, while another portion has possessed increased activity. See *Confections*, *Conserves*, *Linctus*, *&c.*

ELECTUARY (Acetate of Potassa). See *Conserves.*

ELECTUARY (Alum). Syn. *Electuarium Aluminis*,—Lat. *Prep.* 1. (Phœbus.) *Alum*, 1 dr.; *extract of logwood*, 4 dr.; *balsam of Peru*, 6 drops; *water of sage*, q. s. Astringent and antiseptic; in diarrhœa, sponginess of the gums, &c.

2. (St. Marie.) *Alum*, 1 dr.; *catechu* and *extract of bark*, of each, 2 dr.; *conserve of roses*, 6 dr.; *simple syrup*, q. s. *Dose.* A teaspoonful, every 4 hours, in chronic diarrhœa, leucorrhœa, hemorrhages, &c. See *Confections.*

ELECTUARY (Anodyne). Syn. *Electuarium Anodynum*,—Lat. *Prep.* See *Confection of Opium.*

ELECTUARY (Arabic). Syn. *Electuarium Sarzæ Compositum*, *E. Arabicum*,—Lat. *Electuaire Arabique*,—Fr. *Prep.* From *sarsaparilla*, 5 oz.; *senna* and *China root*, of each, 3 oz.; *dried walnut-peel*, 1 oz.; (all in fine powder;) *honey*, q. s. *Dose.* 1 to 4 dr. See *Traitement Arabique.*

ELECTUARY (Aromatic). Syn. *Electuarium Aromaticum*,—Ph. E. This preparation differs from the *aromatic confection* of the other British Colleges, in not containing *chalk.* It is aromatic and stomachic, but not antacid or absorbent. See *Confections.*

ELECTUARY (Bath). Syn. *Electuarium Anticachecticum*, *E. Martiale*, *E. Ferri Compositum*, — Lat. *Prep.* From *blacksmith's clinkers*, reduced to an impalpable powder, and made into an electuary with *honey or treacle*, q. s.; afterwards adding, *powdered ginger* and *carbonate of magnesia*, of each, 1 *oz.*, to every *lb.* of the mixture. *Dose.* A teaspoonful night and morning every day for 3 or 4 days, and again, after an equal interval, as long as thought necessary; as a chalybeate tonic, and in worms.

ELECTUARY (Bitartrate of Potassa). Syn. *Electuarium Potassæ Tartratis*,—Lat. *Prep.* (Monro.) *Cream of tartar*, 1 oz.; *powdered ginger* and *conserve of roses*, of each, 1 dr.; *syrup of orange peel*, q. s. *Dose.* 1 to 3 dr., as a hydragogue purge. It is also a useful laxative in common cases. See *Confection of Cream of Tartar.*

ELECTUARY (Black). Syn. *Trousseau's Electuary, Trousseau's Black Tonic; Electuarium Nigrum, E. Ferri Tannatis,*—Lat. *Prep.* From *sesquichloride of iron*, 4 dr.; *tannin*, 1 dr.; *confection of roses*, 2 oz.; *syrup of orange peel*, 1 oz. Tonic and astringent. *Dose.* 5 to 30 gr.

ELECTUARY (Black Pepper). See *Confection of Pepper.*

ELECTUARY (Burnt Sponge). Syn. *Electuarium Spongiæ Ustæ,*—Lat. *Prep.* (Hulse.) *Burnt Sponge*, 10 gr.; *rhubarb*, 4 gr.; *conserve of roses*, q. s. For a *dose*, to be taken night and morning; in scrofula, glandular swellings, &c. See *Confection of Sponge.*

ELECTUARY (Cassia). Syn. *Electuarium Cassiæ,*—Ph. D. 1826. *E. C. Fistulæ,*—Ph. E. *Prep.* (Ph. D. 1826.) *Fresh cassia pulp* and *syrup of orange*, of each, ½ ℔; *manna*, 2 oz.; *tamarind pulp*, 1 oz.; mix and evaporate to a proper consistence. *Dose.* 2 *dr.* to 1 *oz.*; as a gentle laxative for children, or as a vehicle for other cathartics. *That of the shops* is commonly made with equal parts of *tamarind* and *cassia pulps*, mixed with ⅛th of *manna*, and flavoured with a few drops of *tincture of orange peel*, without any evaporation. See *Confections.*

ELECTUARY (Catechu). Syn. *Electuarium Catechu, Confectio do., C. Japonica,* —Lat. *Prep.* (Ph. E.) *Powdered catechu* and *kino*, of each, 4 oz.; *cinnamon* and *nutmegs*, of each, 1 oz.; *opium* (dissolved in a little sherry), 1½ dr.; *syrup of red roses* (evaporated to the consistence of honey), 1½ pint. See *Confections.*

ELECTUARY (Catechu,—Compound). Syn. *Electuarium Catechu Compositum,*—Ph. D. See *Confections.* Both the above are astringent, aromatic, and anodyne. *Dose.* 15 gr. to 1 dr., or more; in diarrhœa, dysentery, &c.

ELECTUARY (Cathartic). Syn. *Electuarium Catharticum,*—Lat. *Prep.* 1. *Confection of senna*, 1½ oz.; *flowers of sulphur*, ½ oz.; *syrup of roses* or of *orange peel*, q. s. *Dose.* A teaspoonful, 3 or 4 times a day, in piles; or, 2 to 3 teaspoonfuls, as a gentle laxative for females, and in skin diseases, gonorrhœa, &c. A mild and excellent medicine. It may be safely given in larger doses.

2. (Brera.) *Aloes*, 8 gr.; *cream of tartar*, 2 dr.; *honey*, q. s. For a *dose.* In amenorrhœa, attributed to abdominal engorgement.

ELECTUARY (Cephalic). Syn. *Electuarium Cephalicum, E. Valerianæ Compositum,*—Lat. *Prep.* (Hosp. F.) *Valerian root* and *mistletoe of the oak*, of each, 1 oz.; *honey*, 1½ oz.; *tincture of henbane*, q. s. to make an electuary. In nervous and rheumatic headache, &c.; assisted by an aperient.

ELECTUARY (Charcoal). Syn. *Electuarium Carbonis, E. Carbonii, Confectio do.,*—Lat. *Prep.* 1. (Hosp. F.) *Confection of senna*, 2 oz.; *fresh burnt charcoal*, ½ oz.; *carbonate of soda*, ¼ oz.; *syrup of orange peel*, q. s.

2. (Radius.) *Electuary of senna*, 2 oz.; *powdered charcoal* and *carbonate of soda*, of each, 1 dr. Both the above are given in obstinate constipation. *Dose.* 1 to 3 teaspoonfuls twice a day. See *Tooth Electuary.*

ELECTUARY (Cinchona Bark). Syn. *Electuary of Bark; Electuarium Cinchonæ,* —Lat. *Prep.* 1. From *yellow bark* and *simple syrup*, of each, 1 oz.; *conserve of red roses* and *confection of orange peel*, of each, ½ oz. Tonic and febrifuge. *Dose.* 1 to 4 dr.; in debility, agues, &c.

2. (Radius.) *Peruvian bark*, 1 oz.; *syrup of orange peel*, q. s. As the last. *Dose.* A teaspoonful or more, 3 or 4 times daily.

ELECTUARY (Cinchona,—Compound). Syn. *Electuarium Cinchonæ Compositum,* —Lat. *Prep.* 1. (*Acidulated*,—Copland.) *Yellow bark*, 1 oz.; *confection of roses*, ½ oz.; *diluted sulphuric acid*, 1 dr.; *syrup of ginger*, 1½ oz.

2. (*Astringent*,—Saunders.) *Powdered Peruvian bark, orange peel*, and *conserves of roses* and *hips*, of each, 6 dr.; *crabs' eyes* (or prepared chalk), 2 dr.; *syrup of catechu*, q. s. *Dose.* A teaspoonful, 2 or 3 times daily; in chronic diarrhœa, &c.

3. (*With Catechu*,—Pierquin.) *Peruvian bark*, 1 oz.; *catechu* and *balsam* of *tolu*, of each, 1 dr.; *syrup of comfrey* (symphytum officinale,—Linn.), q. s. *Dose.* As the last; in spitting of blood, hemorrhages, &c.

4. (*With Cloves*,—Dewees.) *Peruvian bark*, 2 oz.; *cloves*, 1 dr. (better, 4 dr.); *simple syrup*, q. s. A piece the size of a walnut, every hour or two, during the intermission of an ague.

5. (*With Iron*,—Cadet.) *Peruvian bark*, 6 dr.; *oxide of iron* and *confection of opium*, of each, 2 dr.; *syrup of cinnamon*, q. s. *Dose.* A teaspoonful, or more, twice a day; in dropsy of the belly, after the evacuation of the fluid, and as a tonic in debility, accompanied by nervous excitement, &c., in the absence of fever.

6. (Quarin's.) *Red bark*, 1 oz.; *ammoniated iron*, 1 dr.; made into an electuary with equal parts of *oxymel of squills* and *syrup* of the "*five roots*" (diuretic). Tonic, febrifuge, and pectoral.

7. (*With Sal Ammoniac*,—P. Cod.) *Gray bark*, 2¼ oz.; *hydrochlorate of ammonia*, 1 dr.; *honey* and *syrup of wormwood*, of each, 2 oz. In intermittents occurring in scrofulous subjects.

8. (*With Soda*,—P. Cod.) *Powdered cinchona*, 1 oz.; *carbonate of soda*, 2 dr.; *thin mucilage*, q. s. to mix. Tonic, febrifuge, and stomachic. *Dose.* 2 dr., 2 or 3 times a day; in agues, complicated with acidity and dyspepsia.

9. (*With Sulphur*,—Cadet.) *Peruvian bark*, 1 dr.; *sulphur*, *crabs' eyes* (chalk), and *spermaceti*, of each, 2 dr.; *extract of opium*, 4 dr.; *conserve of roses*, 4 dr.; *syrup of milfoil*, q. s. Highly praised in debility from phthisis. *Dose.* A teaspoonful, 2 or 3 times a day, assisted with the liberal use of raw or lightly boiled eggs and cod-liver oil.

10. (*With Tin*,—Cadet.) *Peruvian bark*, 1 oz.; *tin filings* and *valerian root*, of each, ½ oz.; *syrup of saffron*, q. s. In epilepsy, worms, &c. *Dose.* A teaspoonful morning and evening. See *Confection of Bark.*

ELECTUARY (Copaiba). Syn. *Electuarium Copaibæ*,—Lat. *Prep.* 1. *Copaiba* and *powdered cubebs*, equal parts; *conserves of roses* and *orange peel*, of each (in equal quantities), q. s.

2. (Caspar.) *Blanched almonds*, 6 dr.; *powdered marsh-mallow root*, 1 dr.; *catechu*, ½ dr.; *balsam of copaiba*, 3 dr.

3. (Ricord.) *Confection of almonds*, 1 oz.; *copaiba*, ½ oz.; *hard extract of rhatany*, 3 dr.; *syrup of orange peel*, q. s. All the above are excellent in gonorrhœa, gleets, &c. The last two agree better with the stomach than most other like preparations. *Dose.* 1 teaspoonful, or more (rapidly increased to 2 or 3 dr.), 3 or 4 times daily. See *Confections.*

ELECTUARY (Cowhage). Syn. *Electuarium Dolichos*, *E. Mucunæ*,—Lat. *Prep.* 1. Dip the *pods of dolichos* in *treacle*, allow them to drain a moment, and then scrape off the hairs for use.

2. (Chamberlain.) As the last, nearly.

3. (Correa.) *Cowhage* (the hairs or setæ), 40 gr.; *syrup*, ½ oz.

4. (Ellis.) *Cowhage* (hairs), 1 dr.; *honey*, q. s.

5. (Guy's Hosp.) *Cowhage* (hairs), any quantity, made into an electuary with treacle, q. s. In worms. *Dose.* For a *child*, a teaspoonful; for an *adult*, a table-spoonful; in the morning, fasting, and at night, for 3 or 4 days; followed by a dose of castor oil, to which a *teaspoonful of turpentine* may be advantageously added. See *Cowhage.*

ELECTUARY (Cubebs). Syn. *Electuarium Cubebæ*,—Lat. *Prep.* 1. See *Electuary of Copaiba.*

2. (Beral.) *Cubebs* and *copaiba*, of each, 2 oz.; *powdered alum*, 1 oz.; *extract of opium*, 5 or 6 gr.; mix.

3. (Bouchardat.) *Cubebs*, 1½ oz.; *copaiba*, 1 oz.; *sweet spirit of nitre*, ½ fl. dr.; *oil of peppermint*, 8 or 10 drops; *powdered sugar*, q.s.

4. (Radius.) *Cubebs*, ½ oz.; *honey*, 1 oz. In gonorrhœa, mucous discharges from the vagina, bladder, &c. *Dose.* 1 teaspoonful, afterwards increased to 2 or 3 teaspoonfuls, twice or thrice daily. See *Confection of Copaiba*, *Electuary of do.*, *&c.*

ELECTUARY (Demulcent). Syn. *Electuarium Demulcens*,—Lat. *Prep.* From *spermaceti*, *syrup of poppies*, and *syrup of tolu*, of each, 2 dr.; *powdered gum tragacanth*, 1 dr.; *confection of roses*, 6 dr.; *nitre*, ½ dr. *Dose.* A piece the size of a small filbert, frequently; as a pectoral and demulcent in coughs, hoarseness, &c.

ELECTUARY (Deobstruent). Syn. *Electuarium Deobstruens*,—Lat. *Prep.* (Copland.) *Confection of senna*, 1½ oz.; *cream of tartar*, 1 oz.; *sulphur* and *syrup of ginger*, of each, 6 dr.; *borax*, 3 dr.; *syrup of poppies*, 2 dr. *Dose.* A teaspoonful or more nightly; in the obstinate constipation of females, painful and suppressed menstruation, &c.

ELECTUARY (Emmenagogue). Syn. *Electuarium Emmenagogicum*,—Lat. *Prep.* From *myrrh*, 1 dr.; *ammoniated iron*, 1 scrup.; *syrup of ginger*, q.s. to mix. *Dose.* ½ dr. to 1 dr., night and morning; in deficient or suppressed menstruation.

ELECTUARY (Febrifuge). See *Electuary of Cinchona*, *&c.*

ELECTUARY (for Cholera). Syn. *Electuarium Anti-cholericum*,—Lat. The preparations that come under this name are numerous, including *aromatic confection*, and several like absorbent or astringent preparations. A late writer has dignified the American remedy for cholera, noticed at page 251, with this name.

ELECTUARY (for Dysentery). Syn. *Electuarium Anti-dysentericum*,—Ph. E. 1744. *Electuary of catechu*, mixed with half its weight of *Locatel's balsam.*

ELECTUARY (for Epilepsy). Syn. *Electuarium Anti-epilepticum*,—Lat. *Prep.* 1. See *Electuary of Cinchona* (Comp.) No. 10.

2. (Dr. Mead.) *Powdered cinchona*, 1 oz.; *valerian* and *tin* (both in powder), of each, ½ oz.; *syrup*, q. s. to mix. *Dose.* A teaspoonful, night and morning.

ELECTUARY (for Piles). Syn. *Elec-*

tuarium Hæmorrhoidale,—Lat. *Prep.* 1. See *Confection* and *Electuary of Pepper.*

2. (Dr. Copland.) *Cream of tartar*, 1 oz.; *precipitated sulphur* (pure), 3 dr.; *confection of senna*, 2 oz.; *syrup of orange peel* or *ginger*, q.s. to mix.

3. (Dr. Graves.) *Confection of senna* and *sulphur*, of each, 1 oz.; *balsam of copaiba* and *cream of tartar*, of each, ½ oz.; *jalap* and *ginger*, of each, 1 dr.; *syrup of orange peel*, q. s.

4. (Hosp. F.) *Confection of senna*, 2 oz.; *black pepper* and *precipitated sulphur*, of each, ½ oz.; *oil of cubebs*, 1 dr.; *syrup*, q. s. The last three are useful laxatives in piles, and by their preventing the accumulation and hardening of the fæces often remove the affection. *Dose.* A teaspoonful 3 or 4 times a day. From the difficulty experienced in procuring *pure* precipitated sulphur, *washed sublimed sulphur* may be advantageously substituted.

ELECTUARY (for Scurvy). See *Conserve* (Antiscorbutic).

ELECTUARY (for the Teeth). Syn. *Electuarium Dentifricum*, — Lat. See *Tooth Pastes, Dentifrices, &c.*

ELECTUARY (for Worms). See *Electuary* (Vermifuge).

ELECTUARY (Indigo). Syn. *Electuarium Indigi, E. Pigmenti Indici*,—Lat. *Prep.* (Phœbus.) *Powdered Indigo*, 4 dr.; *aromatic powder*, ½ dr.; *syrup*, 1 fl. oz. or q. s. In spasmodic diseases, especially in epilepsy, chorea, and hysteria, and the convulsions of children. It has also been used with advantage in that species of impotence in which strychnia is useful. The above quantity is to be all taken, in divided doses, during the day. To be of permanent advantage it should be continued for several weeks.

ELECTUARY (Ipecacuanha). See *Confections.*

ELECTUARY (Jalap). See *Confections.*

ELECTUARY (Kermes). *Marmelade de Zanetti; Electuarium Kermetis, E. K. Mineralis*, — Lat. *Prep.* From *manna*, 4 oz.; *pulp of cassia* and *oil of almonds*, of each, 2 oz.; *butter of cacao*, ½ oz.; *Kermes mineral*, 10 gr.; *syrup of marsh-mallow*, 3 fl. oz.; *syrup of orange flower*, q. s. A diaphoretic laxative. *Dose.* 1 to 4 teaspoonfuls, or more.

ELECTUARY (Laurel Berries). See *Confection of Rue.*

ELECTUARY (Lenitive). See *Confection of Senna.*

ELECTUARY (Mahomed's). *Prep.* 1. From *grocer's currants*, 2 oz.; *powdered senna*, ½ oz.; *powdered ginger*, 1 dr.; *finely powdered capsicum* and *cloves*, of each, 20 gr.; *croton oil*, 3 drops; *conserve of roses* and *syrup of saffron*, of each, in equal parts, q. s. to mix.

2. (Bateman.) *Currants*, 1 oz.; *senna*, ½ oz.; *ginger*, ½ dr.; *syrup of roses*, q. s.; *croton oil*, 1 drop. *Dose.* 1 or 2 teaspoonfuls, early in the morning; in dyspepsia and habitual constipation. The first formula produces a most useful medicine, particularly for free-livers.

ELECTUARY (Male Fern). Syn. *Electuarium Felicis Maris*,—Lat. *Prep.* 1. *Powder of male fern*, 3 dr.; *conserve of roses*, 1 oz.

2. (Radius.) *Ethereal extract of male fern*, ½ dr.; *honey of roses*, 1 oz. The half of either to be taken at night, and the remainder the next morning. In worms.

ELECTUARY (Nitre). Syn. *Electuarium Potassæ Nitratis*, — Lat. *Prep.* (Hosp. F.) *Nitre*, 3 dr.; *Confection of roses*, 2 oz. *Dose.* A piece of the size of a filbert, where the use of nitre is indicated. See *Confections.*

ELECTUARY (Opium). See *Confection of Opium.*

ELECTUARY (Pectoral). Syn. *Electuarium Pectorale*,—Lat. *Prep.* 1. (Ph. E. 1744.) From *conserve of roses*, 2 oz.; *compound powder of tragacanth*, 4 dr.; *flowers of benzoin*, 1 dr.; *syrup of tolu*, q. s. *Dose.* A little, ad libitum.

2. *Oxymel of squills, syrup of marsh-mallows, mucilage of gum arabic*, and *syrup of tolu*, of each, ½ oz.; *powdered lump sugar*, 2 oz. As the last.

ELECTUARY (Pepper). See *Confections*, (and *above.*)

ELECTUARY (Pomegranate). Syn. *Electuarium Granati*, — Lat. *Prep.* 1. From the *root-bark*, 1 dr.; *assafœtida*, ½ dr.; *croton oil*, 6 drops; *conserve of roses*, 1 oz. *Dose.* A teaspoonful night and morning.

2. (Radius.) *Extract of the root bark*, 6 dr.; *lemon juice*, 2 fl. dr.; *linden water*, 3 fl. dr.; *gum tragacanth*, q. s. to make an electuary. One half to be taken at once; the remainder in an hour. Both are given in tape-worm.

ELECTUARY (Rhubarb.) Syn. *Electuarium Rhei*,—Lat. *Prep.* (Saunders.) *Powdered rhubarb*, 1½ dr.; *sulphate of potassa*, 1 dr.; *cream of tartar*, 4 dr.; *pulp of tamarinds*, 2 oz. *Dose.* A teaspoonful as a mild stomachic laxative.

ELECTUARY (Scammony). See *Confections.*

ELECTUARY (Senna). See *Confection of Senna.*

ELECTUARY (Squills). Syn. *Electuarium Scillæ*,—Lat. *Prep.* 1. *Oxymel of squills*, 2 fl. oz.; *cream of tartar* and *powdered sugar*, of each, 1½ oz. *Dose.* 1 to 2 teaspoonfuls, as a laxative and expectorant; in old coughs, &c.

2. (Radius.) *Squills*, *nitre*, *gum ammoniacum*, and *tartrate* (bitartrate) *of potassa*, of each, 2 dr.; *sal ammoniac*, 20 gr.; *syrup of cinnamon*, q.s. *Dose.* 2 dr., three times a day, in dropsies. See *Conserve of Squills.*

ELECTUARY (Steel). Syn. *Electuarium Ferri*, *E. Chalybeatum*,—Lat. *Prep.* 1. (Dr. Collier.) *Potassio-tartrate of iron*, ½ oz.; *confection of roses*, 1 oz.; *syrup*, q. s. to mix.

2. (Collier.) *Precipitated sesquioxide of iron*, 1 oz.; *honey*, 2 oz.; *ginger syrup*, ½ fl. oz. Both the above are tonic and emmenagogue. *Dose.* One teaspoonful, thrice a day. See *Confections.*

ELECTUARY (Stimulant). Syn. *Electuarium Stimulans*,—Lat. *Prep.* From *gum ammoniacum* (strained), 1 oz.; *vinegar of squills*, ½ oz.; mixed with a gentle heat and spread on leather. Applied to the chest or pit of the stomach, as a mild counter-irritant and antispasmodic; and as a discutient to tumid glands and indolent tumours. It is wrongly called an electuary.

ELECTUARY (Stomachic). Syn. *Dinner Electuary*; *Electuarium Stomachicum*, *Confectio Stomachica*, — Lat. *Prep.* 1. *Rhubarb*, *ginger*, and *extract of chamomile*, of each, 1 dr.; *confection of orange peel*, 4 dr.; *syrup*, q.s.

2. *Rhubarb* and *gentian*, of each, 1½ dr.; *extract of hops* and *powdered capsicum*, of each, ½ dr.; *oil of chamomile*, 12 drops; *confection of hips* and *syrup of orange peel*, of each, ½ oz.

3. *Green peppermint*, *lump sugar*, and *confection of orange peel*, equal parts. *Dose.* A teaspoonful an hour before a meal. They are all excellent stomachics, and are useful to improve the appetite, and in dyspepsia.

ELECTUARY (Sulphur). See *Confection of Sulphur.*

ELECTUARY (Sulphur,—Compound). Syn. *Electuarium Sulphuris Compositum*, —Lat. *Prep.* 1. *Sulphur*, ¾ oz.; *cream of tartar*, 1 oz.; *confections of senna* and *black pepper*, of each, 2 oz.; *syrup of ginger*, 1 fl. oz. An excellent medicine in piles. *Dose.* A teaspoonful twice a day.

2. (With Borax.) *Flowers of sulphur*, 1 oz.; *cream of tartar*, 1½ oz.; *borax*, ½ oz.; *confection of senna*, 2½ oz.; *syrup of orange-peel*, q.s. to mix. *Dose.* 1 to 3 teaspoonfuls in diseases of the uterine organs and lower bowels. See *Confections.*

ELECTUARY (Tin). See *Confection of Tin.*

ELECTUARY (Tin,—Compound). Syn. *Electuarium Stanni Compositum*,—Lat. *Prep.* 1. *Powdered tin*, 1 oz.; *confection of oil of turpentine*, 2 oz.

2. (Dr. Cheston.) *Tin filings*, 4 dr.; *carbonate of iron* (sesquioxide), 1 dr.; *conserve of wormwood*, 3 dr.

3. (Foy.) *Powder of tin*, 1 oz.; *extract of wormwood* and *powdered jalap*, of each, 1 dr.; *compound syrup of chicory*, q. s. In worms. *Dose.* A table-spoonful, or more, for 2 or 3 successive mornings, fasting; followed by a purge.

ELECTUARY (Turpentine). Syn. *Electuarium Terebinthinæ*,—Lat. *Prep.* 1. (St. B. Hosp.) *Common turpentine*, 1 oz.; *honey*, 2 oz. *Dose.* 1 to 2 teaspoonfuls in complaints of the urinary organs, worms, &c.

2. (Radius.) *Turpentine*, *soap*, and *rhubarb*, of each, 1 dr.; *syrup of wormwood*, q. s. *Dose.* Three teaspoonfuls a day; in dropsy, worms, &c.

3. (*E. Olei Terebinthinæ*,—Copland.) As *Confection of Turpentine*,—Ph. D. See *Confections.*

ELECTUARY (Vermifuge). Syn. *Electuarium Anthelminticum*, *E. Vermifugum*, —Lat. *Prep.* 1. (Bresmer.) *Worm-seed* and *tansy-seed*, of each, 4 dr.; *powdered valerian root*, 2 dr.; *jalap* and *sulphate of potassa*, of each, 1½ to 2 dr.; *oxymel of squills*, q. s. to mix. *Dose.* A teaspoonful, or more; repeated night and morning, followed by a brisk purge.

2. (Rosenstein.) *Worm-seed*, 10 gr.; *sulphate of iron*, 4 gr.; *jalap* and *honey*, of each, 20 gr. For two doses, as the last. 2 or 3 dr. of *confection of senna* are often substituted for the jalap and honey.

3. (Foy.) *Aloes*, ½ oz.; *common salt*, 3 dr.; *flour*, 2 oz.; *honey*, q. s. to form a stiff paste. *Used* as a suppository in ascarides.

4. *Flowers of sulphur*, 4 oz.; *powdered jalap*, 1 oz.; *powdered bark*, 1 oz.; *syrup of buckthorn*, q. s. *Dose.* Two or three teaspoonfuls every morning early. See *Confections* and *Electuaries of Tin*, *Turpentine*, *Worm-seed*, *&c.*

ELEMENTS. Syn. *Elementary Bodies*, *Simple do.*, *Undecompounded do.*; *Elementa*, —Lat. The elements of the *modern chemist* are those substances or bodies which have *hitherto* resisted every attempt which has been made to decompose them, or to resolve them into simpler forms of matter. The *old chemists* applied the term to certain imaginary principles or essences of matter,

such as *earth*, *air*, *fire*, and *water*. These were also regarded by the ancients as simple bodies of which all others are composed, and they still constitute the "*four elements*" of the vulgar. The elements of the *alchemists* are *salt*, *sulphur*, and *mercury*. The progress of analytical chemistry has now long shown the fallacy of such suppositions.

The *elementary bodies*, at present recognised as such, are *sixty-three* in number; of which no less than *forty-eight* are metals. Of the remainder, *thirteen* are either gaseous or non-metallic, and *two* possess properties of an intermediate character. To these some chemists add the *three* imponderable bodies or forces, *light*, *heat*, and *electricity*.

TABLE *of Elementary Bodies, arranged in classes.*

IMPONDERABLE ELEMENTS.

Heat | Light | Electricity.

PONDERABLE ELEMENTS.

(*Non-Metallic.*)

Oxygen	Iodine	Boron
Hydrogen	Bromine	Sulphur
Nitrogen	Fluorine	Selenium
Chlorine	Carbon	Phosphorus.
	Silicon	

(*Intermediate.*)

Arsenic | Tellurium.

(*Metals.*)

Antimony	Osmium	Mercury
Chromium	Gold	Silver
Vanadium	Aluminium	Lead
Tungsten (or Wolfram)	Beryllium (or Glucinum)	Barium
Molybdenum	Zirconium	Strontium
Tantalum (or Columbium)	Norium	Calcium
Niobium	Thorium	Magnesium
Pelopium	Donarium	Zinc
Titanium	Yttrium	Cadmium
Uranium	Cerium	Nickel
Platinum	Erbium	Cobalt
Palladium	Terbium	Copper
Rhodium	Lanthanum	Iron
Iridium	Didymium	Manganese
Ruthenium	Bismuth	Lithium
	Tin	Sodium
		Potassium.

See *Equivalents, &c.*

ELEMI. Syn. *Gum Elemi; Elemi*,—Ph. L. "A terebinthinate concretion," from "an uncertain plant."—Ph. L. In the previous pharmacopœia (1836) it was assigned by the London College to the *amyris elemifera*, (Linn.) Dr. Pereira has suggested, that it may be the produce of the *icica icicaribo*, the *canarium zephyrinum*, or the *canarium balsamiferum*, but the question is still undecided.

The elemi of commerce is of a pale yellow colour, exteriorly brittle, but soft and tough within; it has a warm bitter taste, and a fragrant aromatic smell, partaking of fennel and juniper. It is only partially transparent even in thin plates, is very fusible, and has a density a little greater than that of water. It contains 12½ per cent. of volatile oil (*oil of elemi*). It is used to give *toughness* to lacquers and varnishes, and in *medicine* in the preparation of *elemi ointment*.

The elemi of the shops is often adulterated, but more frequently a factitious kind is sold for the genuine gum. This fraud may be detected by exposing the suspected article to heat, along with a little water, when the factitious fragrance of the spurious article evaporates, and the coarse terebinthinate smell of the resin used to adulterate it, or which is sold for it, becomes readily distinguishable.

ELEMI (Factitious). *Prep.* 1. *Yellow resin*, 8 *lb.*; melt, add *Canada balsam*, 2 *lb.*; withdraw the vessel from the heat, and further add of *oil of juniper*, 2 *dr.*; *oil of sweet fennel*, 1 *dr.*; *oil of nutmeg*, ½ dr.

2. *Yellow resin*, 7 *lb.*; *Canada balsam*, 1 *lb.*; *juniper oil bottoms*, 4 dr.; *oil of mace*, 3 dr.; mix as before.

ELEMINE. The crystalline resin of *gum elemi*.

ELEPHANTIASIS. Syn. *Elephantiasis Græcorum*. A disease which chiefly attacks the lower extremities, which become rough, scaly, hard, and ultimately the skin gets thick, unctuous, and insensible, and the limb gradually becomes enormously swollen. In some cases the forehead, cheeks, &c., grow hard and tumid, or become covered with enormous tubercles, until the countenance resembles that of a satyr or wild beast, (*satyriasis*, *leontiasis*.) It is presumed to have formed one of the varieties of *leprosy* that afflicted the inhabitants of Europe during the middle ages. It is now chiefly confined to Africa, the East and West Indies, Madeira, and the Isle of France. No cure is known. In its early stages, however, the use of the *asclepias gigantea*, in combination with alterative doses of calomel and antimony, with topical stimulants, is said to be generally successful. (Mr. Robinson.)

ELIXIR. A name formerly applied to various compound tinctures, and to preparations supposed to contain the quintessence of other substances. The *elixirs* of the *alchemists* were solutions employed in their fruitless attempts to transmute the baser metals into gold.

ELIXIR (Acid). Syn. *Elixir Acidum*,—Lat. *Prep.* 1. (Dippell's.) *Sulphuric*

acid, 1 part, dropped gradually into *rectified spirit of wine*, 5 parts; placed in a large flask, and afterwards coloured by digestion on *animal kermes* and *saffron*, of each, 1 part.

2. (Haller's,—*Ph. Sax.*, 1837.) From *sulphuric acid* and *rectified spirit*, of each, 1 part; as before.

3. (Vogler's.) From *sulphuric acid* and *nitrous ether*, equal parts, as above. Astringent and antiseptic. *Dose.* A few drops, in water. See *Eau de Rabel.*

ELIXIR (Aloes). Syn. *Elixir Aloës*,—Lat. *Compound tincture of aloes.*

ELIXIR (Aloes—Compound). Syn. *Elixir Aloës Compositum*,—Lat. *Prep.* (Dr. Copland.) *Acetate of potassa, inspissated ox-gall, socotrine aloes*, and *myrrh*, of each, 2 dr.; *hay saffron*, 1 dr.; *brandy* (or *proof spirit*), 3½ fl. oz.; digest a week, and strain. Stomachic and laxative. *Dose.* A teaspoonful, or more, in dyspepsia, constipation, &c.

ELIXIR (Anti-asthmatic). Syn. *Elixir Anti-asthmaticum*,—Lat. *Prep.* 1. *Oil of aniseed, camphor*, and *balsam of tolu*, of each, 1 oz.; *cochineal*, 1 dr.; *proof spirit*, 1 gall.; digest a week, and filter.

2. As the last, adding *powdered opium*, 1¼ oz. *Dose.* A teaspoonful, to allay irritation, assisted by an occasional dose of aperient medicine; in asthma, chronic coughs, &c.

3. (Boerhaave's.) *Aniseed, asarabacca, elecampane, liquorice root, orris root*, and *sweet flag* (calamus), of each, equal parts; made into a tincture, with *brandy*. *Dose.* 20 to 40 drops.

ELIXIR (Antiscrofulous). Syn. *Elixir Anti-scrofulosum*,—Lat. 1. (P. Cod.) See *Ammoniated Tincture of Gentian.*

2. (Desforges.) *Guaiacum*, 5 oz.; *cinchona bark* and *pellitory*, of each, 3 oz.; *cloves*, 5 dr.; *orange peel* and *benzoin*, of each, 2 dr.; *hay saffron*, ½ dr.; *rectified spirit* and *brandy*, of each, ½ pint; digest a week, and filter. *Used* as an application to scorbutic gums.

ELIXIR (Anti-syphilitic). Syn. *Elixir Anti-venerium, E. Anti-syphiliticum*,—Lat. See *Jesuit's Drops* and *Compound Tincture of Benzoin.*

ELIXIR (Boerhaave's Asthmatic). See *Anti-asthmatic Elixir.*

ELIXIR (Boerhaave's Visceral). Syn. *Elixir Boerhaavii, E. B. Viscerale. Prep.* (Ph. Han.) *Aloes, myrrh*, and *saffron*, of each, 1 oz.; *tartrate of potassa*, 2 oz.; *alcohol* (strongest rectified spirit), 14 oz.; *water*, 8 oz.; macerate 3 days, and filter. This preparation "has been highly praised in visceral obstruction." (Dr. Griffith.) *Dose.* 1 to 3 teaspoonfuls.

ELIXIR (Clauder's). *Prep.* (Pideret.) *Salt of tartar, sal ammoniac, strained aloes*, and *myrrh*, of each, 1 oz.; *elder-flower water*, 1¼ pint; digest, with agitation, for 24 hours, and filter. *Dose.* As the last; in amenorrhœa, constipation, scurvy, visceral obstructions, &c.

ELIXIR (Cough), Syn. *Elixir Anti-catarrhale*, — Lat. *Prep.* 1. See *Anti-asthmatic Elixir.*

2. (Hufeland.) *Extracts of blessed thistle* and *dulcamara*, of each, 1 dr.; *cherry-laurel water*, 1 fl. dr.; *fennel water*, 1 fl. oz. *Dose.* 1 to 2 teaspoonfuls 3 or 4 times a day. It is a most useful remedy in coughs occurring in nervous, hysterical, or irritable patients. (See *below.*)

ELIXIR (Daffy's). Syn. *Elixir Salutis E. Sennæ Compositum, Tinctura Sennæ Composita*,—Lat. This is an aromatized and sweetened tincture of senna, to which other cathartics are generally added. Nearly every drug-house has its own formula for this article. The following are those employed in the London trade:—

Prep. 1. *East India senna*, 1½ *lb.; jalap*, 5 *oz.; coriander seed* and *aniseed*, of each, ½ *lb.; rhubarb*, ¼ *lb.; red sanders wood*, 2 *oz.; salt of tartar*, 2 *oz.; treacle*, 7 *lb.; rectified spirit of wine*, 2½ gall.; *water*, 3¼ gall. All the solids are well bruised, and macerated in the mixed fluids for 14 days, when the whole is pressed, and strained through a flannel bag. It is too glutinous to run through filtering paper.

2. *Senna, rhubarb*, and *aniseed*, of each, 2 *lb.; jalap* and *caraways*, of each, 1 *lb.; red sanders wood*, ½ *lb.; brown sugar*, 7 *lb.; proof spirit*, 10 gall.; as the last.

3. *Senna*, 56 *lb.; aniseed*, 7 *lb.; rhubarb* (East India), 14 *lb.; coriander seed*, 6 *lb.; caraway seed* and *red sanders wood*, of each, 5 *lb.; cassia bark* and *jalap*, of each, 3 *lb.; proof spirit*, 100 gall.; digest for 14 days, press, strain, and add *molasses*, 84 *lb.;* mix well, and either clarify, or strain through flannel.

4. For *proof spirit* in the last two formulæ, *equal parts* of *spirit of wine* and *water*, are employed by the smaller houses.

5. (Redwood.) *Senna*, ½ ℔; *aniseed, caraways*, and *jalap*, of each, 1 oz. 2 dr.; *juniper berries*, 2½ oz.; *proof spirit*, 6 pints; macerate for 14 days, then add of *treacle*, 10½ oz.; *water*, 1 ℔ 5 oz.; mix and strain.

6. (Dicey's.) *Senna*, 1 ℔; *guaiacum shavings, elecampane root* (dried), *aniseed, caraway seed, coriander seed*, and *liquorice root*, of each, ½ ℔; *stoned raisins*, 2 ℔; *proof spirit* or *brandy*, 9 quarts; macerate for 10 days.

7. (Swinton's.) *Senna*, 1 *lb.*; *jalap*, 3 *lb.*; *coriander seed*, *caraway seed*, *liquorice root*, and *elecampane root*, of each, 4 *oz.*; *moist sugar*, 2 *lb.*; *rectified spirit of wine* and *water*, of each, 1 gall.; as the last.

Obs. Daffy's elixir is a favorite purge with drunkards, and is a common and very popular remedy in flatulent colic, dyspepsia, diarrhœa, &c. *Dose.* 1 to 4 table-spoonfuls, or more.

ELIXIR (The Devil's). Syn. *Elixir Capsici Compositum*,—Lat. *Prep.* From *pods of capsicum*, and *cloves*, (bruised,) of each, 1 oz.; *ginger* and *saffron*, of each, 3 oz.; *cantharides*, 5 dr.; *proof spirit*, 7 ℔; digest for 10 days. *Dose.* ½ dr. to 3 dr., in mixtures. It is stimulating, antichloleraic, and aphrodisiac.

ELIXIR (Garlic). Syn. *Elixir Allii*,—Lat. *Prep.* From *garlic roots* (bruised), 80 in no.; *rectified spirit*, 1 pint; digest, distil to dryness, and repeat the process with the *same spirit* from fresh roots, a *second* and a *third* time; lastly, add *camphor*, 2 dr. Diaphoretic and pectoral. *Dose.* A teaspoonful twice a day; in asthma, old coughs, diarrhœa from debility, &c.

ELIXIR (Garus'). Syn. *Elixir Gari*, *E. de Garus*, *E. dictum de Garus*, — Lat. *Prep.* 1. *Myrrh*, 1 oz.; *aloes* and *saffron*, of each, ½ oz.; *cinnamon*, *cloves*, and *nutmeg*, of each, 1 dr.; *proof spirit*, 1 quart; digest a week, add *water*, 5 fl. oz., and distil over 1 quart; to the distillate (*alcoolat de Garus*) add of *syrup of maidenhair*, 2 ℔.; *orange-flower water*, 1½ fl. *oz.*

2. (Foy.) *Compound tincture of saffron*, 8 pints; *syrup of maidenhair*, 10 pints; mix, add *caramel*, q. s. to colour, dissolved in *orange-flower water*, ½ pint.

3. (P. Cod.) *Aloes* and *saffron*, of each, 1 oz.; *myrrh*, *cinnamon*, and *cloves*, of each, ½ oz.; *nutmeg*, ½ dr.; *proof spirit*, 12 pints; *orange-flower water*, 16 fl. oz.; macerate 2 days, distil 6 pints, and add to the distillate (*alcoolat de Garus*), of *syrup of capillaire*, 7½ pints; and colour with *saffron*, q. s.

4. (Soubeiran.) *Socotrine aloes* and *saffron*, of each, 1 oz.; *myrrh*, *canella alba*, *cloves*, and *nutmegs*, of each, ½ oz.; *spirit* (sp. gr. ·923), 20 ℔; *orange-flower water*, 16 fl. oz.; macerate as last, distil 10 ℔, and add to the distillate (*alcoolat de Garus*), of *syrup of capillaire*, 12½ ℔; *orange-flower water*, 8 fl. oz.; with *saffron*, q. s. to colour.

5. (Thierry.) *Aloes*, *myrrh*, and *saffron*, of each, 2 dr.; *nutmeg*, 4 dr.; *canella alba* and *cloves*, of each, 1 oz.; *spirit* (0·864), 13 ℔; draw over 12 ℔ of *alcoolat*; add to the residue of the distillation, *rose water*, 10 ℔; distil 6 ℔, and add as much of this *aromatic water* to the alcoolat as will raise its sp. gr. to 0·890. Then to every 11 ℔ of the above *mixed liquor*, add of *simple syrup*, 15 ℔; *tinctures of vanilla* and *orange peel*, of each, 2½ fl. oz.; *fresh milk* (skimmed), 1 ℔; and *tincture of saffron*, q. s. to colour; digest with agitation for two days, and filter. *Used* as a stomachic, carminative, and stimulant, in doses of a wine-glassful. That prepared without distillation forms an excellent stomachic purge. With the exception of that from the 2d formula, the products may be regarded as agreeable cordial liquors, rather than medicinals. It is much employed on the Continent.

ELIXIR (Gold). Syn. *Elixir d'Or*; *E. Aurii*,—Lat. *Prep.* 1. See De La Motte's *Golden Drops.*

2. *Terchloride of gold*, 20 gr.; *rectified spirit*, 6 fl. dr.; *ether*, 3 fl. dr.; dissolve. *Dose.* 5 to 15 drops, taken in distilled water; in gout, scrofula, nervous diseases, cancer indurated glands, secondary syphilis, &c. This last preparation is often confounded with the *gouttes d'or du General De Lamotte*; but the two are evidently distinct articles.

ELIXIR (Haller's). See *Acid Elixir.*

ELIXIR (Hoffman's Visceral). Syn. *Elixir Hoffmanni*, *E. H. Viscerale*,—Lat. *Prep.* 1. As *Elixir of orange-peel*,—Ph. Bor. 1847.

2. Thin *outside peel of orange* (dried), *myrrh*, and *centaury*, of each 2 dr.; *extracts* of *carduus benedictus*, *cascarilla*, and *gentian*, of each, 1 dr.; *white wine* (sherry), 1 quart. Aromatic and stomachic. *Dose.* A dessert-spoonful, or more.

ELIXIR (Ipecacuanha). Syn. *Elixir Ipecacuanhæ*,—Lat. *Prep.* (Cadet.) *Powdered ipecacuanha* and *balsam of tolu*, of each, 4 dr.; *flowers of benzoin*, *opium*, and *saffron*, of each, 2 dr.; *oil of aniseed*, 1 dr.; *camphor*, 40 gr.; *alcohol* (rectified spirit), 1½ pint; digest a week, and filter. *Dose.* 1 to 2 dr., as a stimulant, diaphoretic, expectorant, and stomachic; in chronic coughs, asthmas, and old colds, and in certain forms of deficient appetite, dyspepsia, diarrhœa, &c.

ELIXIR (Jalap). Syn. *Elixir Jalapæ Compositum*, — Lat. *Prep.* From jalap, 4 oz.; *scammony*, 4 dr.; *gamboge*, 2 dr.; *proof spirit*, 1 quart. *Dose.* ½ dr. to 3 dr., as a purgative; especially in worms.

ELIXIR (Lettsom's). *Prep.* (Augustin.) *Oil of aniseed*, 1 dr.; *camphor*, 1½ dr.; *benzoic acid*, *opium*, and *saffron*, of each

2 dr.; *ipecacuanha* and *balsam of tolu*, of each, 4 dr.; *rectified spirit*, 2 ℔; digest 10 days, and filter. *Dose.* 5 to 15 drops, for a child; ½ to 1 teaspoonful, for an adult; in ordinary coughs, hooping cough, &c.

ELIXIR (Live-long). Syn. *Elixir of Long Life; E. Longæ Vitæ*,—Lat. *Prep.* 1. See *Tincture of Rhubarb and Aloes.*

2. (*Elixir Vitæ Matthioli.*) A mixture of several *aromatics* and *stimulants* made with *rectified spirit.*

ELIXIR (Myrrh). Syn. *Elixir Myrrhæ*,—Lat. See *Tincture of Savine* (Comp.),—Ph. L. 1788.

ELIXIR D'OR. See *Elixir of Gold.*

ELIXIR (Orange-peel). Syn. *Elixir Aurantiorum Compositum*,—Lat. *Prep.* 1. (Ph. Bor. 1847.) *Orange peel*, 6 oz.; *cinnamon*, 2 oz.; *carbonate of potassa*, 1 oz.; *Madeira wine*, 4 ℔; macerate 6 days, express the tincture, and add of *extracts of buckbean, cascarilla, gentian*, and *wormwood*, of each, 1 oz.; dissolve, and after repose for subsidence, decant, and filter. An excellent aromatic bitter and stomachic.

2. (Moscati.) *Orange peel*, 1 oz.; *cascarilla*, ½ oz.; *waters of citron peel* and *wormwood*, and *rectified spirit*, of each, ½ pint; digest a week. Resembles the last. *Dose*, (of either,) a table-spoonful to a wine-glassful.

ELIXIR (Paregoric). Syn. *Elixir Paregoricum*,—Lat. See *Compound Tincture of Camphor.*

ELIXIR (Paregoric,—Scotch). Syn. *Elixir Paregoricum Scoticum*,—Lat. See *Ammoniated Tincture of Opium.*

ELIXIR (Pectoral). Syn. *Elixir Pectorale*,—Lat. *Prep.* (Ph. E. 1745.) *Balsam of tolu*, 2 oz.; *gum benzoin*, 1½ oz.; *saffron*, ½ oz.; *rectified spirit*, 32 fl. oz.; digest in a gentle heat for 4 days, and filter. *Dose.* ½ to 1 teaspoonful. (See *above.*)

ELIXIR (Polychrest). Syn. *Elixir Polychreston*,—Lat. *Prep.* (Ph. E. 1745.) *Guaiacum* (*gum*), 6 oz.; *balsam of Peru*, ½ oz.; *rectified spirit*, 32 fl. oz.; digest as last, strain, and add *oil of sassafras*, 2 fl. dr. Pectoral and anti-rheumatic. *Dose.* 10 to 60 drops, or more.

ELIXIR (Paracelsus'). See *Elixir Proprietatis.*

ELIXIR PROPRIETATIS. Syn. *Paracelsus' Elixir of Propriety; Elixir Proprietatis Paracelsi*,—Lat. *Elixir de Proprieté de Paracelse*,—Fr. An old preparation nearly corresponding to the *compound tincture of aloes* of modern pharmacy, and which is now sold for it. Soubeiran gives the following formula for this preparation:—*tincture of myrrh*, 4 oz.; *tinctures of aloes* and *saffron*, of each, 3 oz. (Trait. Pharm. 1847.)

ELIXIR PROPRIETATIS (cum Acido). *Prep.* 1. The last, slightly acidulated with *oil of vitriol*, and filtered.

2. (Ph. Bor. 1847.) *Aloes* and *myrrh*, of each, 2 oz.; *saffron*, 1 oz.; *spirit* (sp. gr. 0·900), 2 ℔.; *dilute sulphuric acid* (1 *to* 5), 2 oz.; macerate 4 days, and filter.

ELIXIR PROPRIETATIS (Tartarizatum). Syn. *E. P. Alkalizatum.* From *elixir proprietatis*, alkalized with *salt of tartar*, and filtered. The last three are old preparations, now seldom inquired for in this country except in places remote from London.

ELIXIR (Radcliffe's). *Prep.* 1. From *socotrine aloes*, 6 dr.; *rhubarb*, 1 dr.; *cinnamon* (cassia), *cochineal*, and *zedoary root*, of each, ½ dr.; *syrup of buckthorn*, 2 fl. oz.; *brandy*, 1¼ pint; digest 10 days, and strain.

2. As the last, but substituting *proof spirit*, 1 pint; and *water*, ¼ pint; for the brandy. Aromatic, stomachic, and aperient. *Dose.* 1 to 4 dr.; in similar cases to those in which "*Daffy's Elixir*" is taken.

ELIXIR (Roses). Syn. *Elixir Rosæ*,—Lat. *Prep.* 1. *Eau de rose*, 2 fl. oz.; *spirits of horse-radish* and *scurvy grass*, of each, 1 fl. oz.; *otto of roses*, 3 drops; *camphor* and *cochineal* (both in powder), 12 gr.; *powdered sugar-candy*, ½ oz.; digest, with frequent agitation, for a week, and after repose, decant the clear, and strain through a piece of muslin. *Used* as an elegant application in scurvy of the gums, and also to perfume the breath.

2. (Beasley.) *Cinnamon*, 3 oz.; *ginger*, 2 oz.; *cloves*, 1 dr.; *essence of peppermint*, 1 oz.; *oil of orange peel*, 1 dr.; *otto of roses*, 15 (? 25) drops; *rectified spirit*, 2½ pints; digest 15 days, and filter. *Used* as a tooth cosmetic.

ELIXIR SACRUM. *Tincture of aloes and rhubarb.*

ELIXIR SALUTIS. Syn. *Elixir of Health.* The *compound tincture of senna*, of old pharmacy; *Daffy's elixir.*

ELIXIR (Scammony). Syn. *Elixir Scammonii*,—Lat. *Prep.* (Guibourt.) *Scammony* (pure), 2 dr.; *proof spirit*, 8 fl. oz.; mix in a suitable vessel, apply heat, set the spirit on fire, and add of *sugar*, 4 oz.; when the whole is dissolved (melted down), extinguish the flame, and further add of *syrup of violets*, 2 fl. oz.; mix well, and after sufficient repose, decant the clear portion from the dregs. The *product* should be 12 oz., containing 12 gr. of scammony per oz. *Dose.* 1 to 2 dessert-spoonfuls in milk or

aromatized water; or made into an emulsion with aromatics; in worms, &c.

ELIXIR (Squire's). *Prep.* 1. (Original Formula.) *Aurum musivum*, 3 oz.; *opium*, 2 oz.; *camphor*, 1 oz.; *cochineal*, ½ oz.; *sweet fennel*, ¼ oz.; *tincture of serpentary*, 1 pint (old meas.); *spirit of aniseed*, 1 gall. (old meas.); *sugar*, 1 ℔; dissolved in *water*, 1 pint (old meas.); digest 10 days, and filter.

2. *Powdered opium*, 2 oz.; *ginger*, *red sanders wood*, and *camphor*, of each, 1 oz.; *oil of aniseed*, ½ oz.; *oil of sweet fennel*, ½ dr.; *tincture of serpentary*, 1 pint; *proof spirit*, 5 pints; *water*, 1 quart; as last. Stimulant, anodyne, diaphoretic, and pectoral. *Dose.* 1 to 2 teaspoonfuls, in chest affections, nervous headaches, &c., in the absence of inflammatory symptoms.

ELIXIR (Stomachic). *Compound tincture of gentian* was formerly so called.

ELIXIR (Stoughton's). *Prep.* 1. *Raisin* (stoned and bruised), 1 ℔; *gentian root*, ¾ ℔; *dried orange peel*, 6 oz.; *serpentary*, ¼ ℔; *calamus aromaticus*, 1½ oz.; *cardamoms*, ½ oz.; *sugar colouring*, ¼ pint; *brandy* or *proof spirit*, 2 gall.; digest a week, and strain.

2. *Tincture of gentian* (compound), and *brandy* or *proof spirit*, of each, 1 quart; *tincture of serpentary* and *syrup of saffron*, of each, 1 pint; *tinctures of aloes* and *rhubarb*, of each, ¼ pint; *bitter almonds* (bruised), 8 in no.; digest, as before.

3. (Foy.) *Aloes* and *cascarilla*, of each, 1 dr.; *rhubarb*, 4 dr.; *gentian*, *germander*, *dried orange peel*, and *wormwood*, of each, 6 dr.; *rectified spirit*, 32 fl. oz.; as before. Stimulant, tonic, and stomachic. *Dose.* 20 drops to a teaspoonful.

ELIXIR (Tonic). Syn. *Elixir Roborans*, *E. R. Roberti Whyttii.* See *Compound Tincture of Crown Bark*,—Ph. Bor. 1847.

ELIXIC (Tooth). Syn. *Elixir Dentifricum*,—Lat. *Prep.* 1. See *Elixirs* (Antiscorbutic *and* Rose.)

2. (Lefandinière's.) *Guaiacum raspings* and *cloves*, of each, 1 oz.; *pellitory of Spain* and *nutmeg*, of each, 2 dr.; *oil of rosemary*, 20 drops; *bergamotte*, 10 or 12 drops; *brandy*, 1 quart; macerate a fortnight and filter.

3. *Cinnamon*, *cloves*, and *nutmeg*, of each, 1 dr.; *vanilla*, ½ dr.; *camphor*, 10 gr.; *tincture of pellitory*, 2 fl. oz.; *brandy* or *proof spirit*, ½ pint; digest as before.

ELIXIR (Visceral). Syn. *Elixir Viscerale*,—Lat. See *Boerhaave's* and *Hoffman's Elixirs.*

ELIXIR (Vitriol). Syn. *Elixir Vitrioli*, *E. V. Aromaticum*,—Lat. The old name for *aromatic sulphuric acid*, (which see.)

ELIXIR (Vitriol, — Mynsicht's). See *Acid Aromatic Tincture.*

ELIXIR (Vitriol, — Scourer's). *Dilute sulphuric acid* (1 to 5). *Used* to scour metals.

ELIXIR (Vitriol,—Sweet). Syn. *Elixir Vitrioli Dulci*,—Lat. See *Aromatic Spirit of Ether.*

ELIXIR (Vitriol, — Virgani's). *Prep.* From *spirit of sulphuric ether*, 2 ℔; *aromatic tincture*, 3 ℔.

ELIXIR (Woroneje). *Capsicum*, 1 oz.; *nitre*, ½ oz.; *sal ammoniac*, 2 dr.; *nitro-hydrochloric acid*, 2 fl. dr.; *vinegar*, 1½ pint; *native white* or *rose naphtha*, or *petroleum*, 1½ fl. dr.; *olive oil*, 1 fl. oz.; *oil of peppermint* (Mitcham), 15 fl. oz.; *strongest rectified spirit*, 6 quarts; digest 12 days, with constant agitation, and filter. *Dose.* 2 teaspoonfuls, every 15 minutes; in cholera, diarrhœa, &c.

ELLAGIC ACID. When an *aqueous infusion of nut galls* is left for some time exposed to the atmosphere, the *tannic acid* gradually disappears, and is replaced by *gallic acid*, and an *insoluble gray powder* to which the term *ellagic acid* was applied by Chevreul. It is soluble in alkalies, forming salts, and is precipitated by acids.

ELM. Syn. *Ulmi Cortex*; *Ulmus*,—Ph. L. "The interior bark" of the "*ulmus campestris*" (Linn.),—Ph. L., or *common small-leaved elm.* This substance is demulcent, diaphoretic, and diuretic, and slightly febrifuge, astringent, and tonic. It has been employed in agues, and as a substitute for sarsaparilla in cutaneous eruptions, but is now little used. The *leaves* of the elm tree are reported to be vulnerary. See *Decoctions* and *Ulmine.*

ELUTRIATION. Cleansing by washing. The term is commonly applied to the operation of washing insoluble powders with water, to separate them from foreign matter, or the coarser portion. It is usually performed by grinding or triturating the mass with a *little water*, until reduced to a very fine powder, and this paste is suddenly diffused through a *large quantity of water*, contained in a deep vessel, from which, after the subsidence of the *grosser portion*, the liquid is poured into another vessel, and allowed to deposit the *fine powder* it still holds in suspension. When this has taken place, the clear supernatant liquor is decanted, and the sediment drained and dried. The coarse sediment deposited in the first vessel is now submitted to a fresh grinding and diffusion through water, and the entire operation is repeated, until the whole of the pulverizable portion is "*washed over.*" The

proper length of time for the liquid to remain in the first vessel, depends solely on the density of the powder, and the degree of fineness required in the product; heavy powders subsiding almost immediately, while light ones often take several minutes to deposit the coarser portion. Sometimes three or more vessels are employed, and the muddy liquor, after remaining a short time in the *first*, is poured into the *next one*, and this, in a short time longer, into the *third*, and so on, until the last vessel is filled, by which means, powders of different degrees of fineness are obtained; that deposited in the last vessel being in the minutest state of division. The *elutriated paste* or *moist powder*, is then drained, and dried. On the *small scale*, the trituration is performed with a stone and muller, or in a mortar; on the *large scale*, in a mill, driven by either horse or steam power. *Antimony*, *chalk*, *bistre*, and other *pigments*, as well as various other substances *insoluble* in, or *unacted on* by water, are commonly obtained in the state of an inpalpable powder by *elutriation*, or "*washing over*," as it is called by amateurs and operatives.

ELYDORIC PAINTING. A method of painting invented by M. Vincent, of Montpetit, in which the pigments are mixed up with an emulsion of *oil* and *water*. It is said to add the fresh appearance of water colours, and the finish of miniature painting, to the mellowness of oil colours.

EMBALMING. Syn. *Mummification*. The preservation of the dead bodies of animals. The Egyptians used for this purpose various bituminous and balsamic substances, together with salines, and some of the materials used in tanning. See *Mummy* and *Putrefaction*.

EMBOSSING. The formation of ornamental figures in relief on *cloth*, *leather*, *paper*, and *wood*, has now been brought to such perfection, as to place this species of decoration within the reach of almost every class of society. *Embossed cloth* and *paper* are now employed by the bookbinder to cover even the low-priced volumes that pass through his hands; whilst the *embossed leather* that encloses the album or ornaments our furniture, frequently bears the richest patterns of the arabesque or moresque. *Cloth* and *paper* are usually embossed by machinery; *leather* and *wood*, more frequently by hand labour; some interesting examples of which will be noticed under those heads.

EMBROCATION. Syn. *Embrocatio*,—Lat. A fluid medicine for external and local use. Embrocations do not differ, materially, from liniments and lotions, and are applied in the same manner. (See those preparations, and below.)

EMBROCATION (Guestonian). Syn. *Embrocatio Terebinthinæ cum Acido*,—Lat. *Prep.* (Dr. Paris.) *Oil of turpentine* and *olive oil*, of each, 1½ oz.; *dilute sulphuric acid*, 3 fl. dr.; agitate together until mixed. *Used* in rheumatism, &c.

EMBROCATION (Hawkin's). See *Ward's Essence for the Headache*.

EMBROCATION (Lynch's). *Olive oil* (coloured with *alkanet root*), 5 fl. oz.; *oils of amber*, *rosemary*, and *turpentine*, of each, 1 dr. In bruises, rheumatism, &c.

EMBROCATION (Roche's). *Prep.* 1. (Dr. Paris.) *Olive oil*, mixed with half its weight of the *oils of cloves* and *amber*.

2. *Olive oil*, 2 oz.; *oil of amber*, 1 oz.; *oils of cloves* and *lemons*, of each, 1 dr. For hooping cough.

EMBROCATION (Ward's). See *Essences*.

EMBROIDERY. *Gold* and *silver* fancy work of this description may be cleaned with a little *spirit of wine*, either alone, or diluted with an equal weight of *water*. *Gin* is frequently used for the same purpose. The common practice of using *alkaline* or *acid liquors* is very injurious, and frequently destroys the beauty of the articles instead of cleaning them.

EMERALD. This beautiful gem ranks next to the diamond in value. A fine emerald weighing 4 or 5 gr. is worth as many pounds; one of 10 gr., about 2*l*. per gr.; one of 15 gr., 3*l*. to 4*l*. per gr.; and so on in proportion to the increase in size. One of 24 gr., if of pure water, is worth about 100*l*. The emerald consists chiefly of *silica* and *alumina*, and derives its colour from the presence of about 3% of *oxide of chromium*. The finest emeralds are imported from Peru. See *Gems* and *Pastes*.

EMERALD GREEN. See *Green Pigments*.

EMERY is an impure, amorphous, compact, and opaque variety of corundrum, and consists chiefly of indurated alumina. Its hardness is so great, that it scratches and wears down nearly all minerals except the diamond; hence the use of its powder for cutting and polishing glass and various other hard substances. For *commercial purposes* the lumps of emery, as taken from the mine, are broken into pieces about the size of a hen's egg, which are then crushed under "stampers," similar to those used for pounding metallic ores. The coarse powder is then sifted through sieves covered with wire-cloth of different degrees of fine-

ness, by which it is sorted into different "sizes." In this state it forms the emery of the shops, or *flour emery*. For *delicate purposes* it is afterwards prepared by elutriation.

Emery cakes are formed by melting *emery flour* with a little *bees' wax*, and after thorough admixture, forming it into solid lumps of suitable sizes. *Used* to dress the edges of buff and glaze wheels.

Emery cloth is prepared by brushing the surface of *thin cotton cloth* over with *liquid glue*, and sifting the *emery powder* over the surface while still warm.

Emery paper is made in the same way as *emery cloth*. They are used either with or without oil, in the same way as *glass paper*.

Emery sticks. These are made of *pieces of wood* in the same way, and are used for the same purposes as *emery paper*.

Emery stones are formed of *emery*, of the requisite coarseness, mixed with about half its weight of good *Stourbridge loam*, and *water*, q. s. to make a stiff paste, which is forced into metallic moulds by a powerful press. The pieces, when thoroughly dry, are exposed in a muffle for a short time to a temperature just under a full white heat. In this way "*discs*" and "*laps*" are generally made. For "*wheels*," only $\frac{1}{4}$th of loam is used. *Another method*, applicable for *cutting-stones* generally, is to press the *flour emery*, previously moistened with water, into moulds, with strong pressure, as before, without any other addition, and then to fire it at nearly a full white heat.

EMETICS. Syn. *Vomits*, *Anacathartics; Anacathartica*, *Emetica*, *Vomitoria*, —Lat. Medicines which induce vomiting. The *principal emetics* are *ipecacuanha* and *tartarized antimony*, and *their preparations;* and the *sulphates of zinc* and *copper*. Of these the *first* is commonly employed either in substance, or infused in wine, (*ipecacuanha wine*,) when it is merely wished to evacuate the contents of the stomach, when that viscus is in a disordered state, or overloaded with food; and is the one most adapted, in ordinary cases, for children and females. *Emetic tartar* (dissolved in water) and *antimonial wine*, either *alone*, or combined with *ipecacuanha*, are preferable at the commencement of fevers and other inflammatory disorders; in consequence of the nausea, relaxation, and depression of the muscular power and circulation which commonly follow their use. When POISON HAS BEEN TAKEN, *sulphate of zinc* is generally preferred as an emetic, on account of the promptness and completeness of its action, and its effects ceasing as soon as it is ejected from the stomach. *Sulphate of copper* is employed in the same cases as sulphate of zinc, but its action is more violent and disagreeable, whilst its intense metallic taste is a great objection to its use. 25 to 30 gr. of either of the above *sulphates*, are dissolved in 3 or 4 fl. oz. of *warm water*, and a *fourth* of the solution is given every ten minutes, until copious vomiting ensues. In the absence of other substances, when an immediate emetic is required, a *teaspoonful* of *flour of mustard* (an article always at hand) stirred up with half a pint of *warm water*, and drank at a draught, will generally act easily and effectively, and relieve the stomach before other remedies can be obtained and applied.

The *operation* of *emetics* is powerfully promoted by drinking *copiously* of diluents, especially of *warm* or *tepid water*. The latter, in fact, is itself an emetic, when taken in quantity. Its use will also prevent that dreadful straining and retching, which make emetics so much dreaded by the nervous and delicate.

The timely administration of an emetic at the commencement of *fevers* and other *inflammatory affections*, will frequently cause copious diaphoresis, and produce a cure, or at least greatly mitigate the severity of the symptoms. *Dropsies* have also been cured by vomiting; and *swelled testicle*, *bubo*, and other *glandular swellings*, have occasionally been dispersed by the action of emetics. *Visceral obstructions*, in both sexes, have also yielded to the same treatment. Small and repeated doses of emetics are frequently administered with advantage, to produce *nausea*, in many diseases of the *lungs* and *stomach*. Certain *chronic* and *obstinate diseases*, as *rheumatism* and *asthma*, are sometimes relieved by emetics, when every other line of treatment has failed.

Emetics should be *avoided* in *plethoric habits*, in *hernia*, *pregnancy*, and whenever visceral inflammation is suspected. They should also be given with great caution to young children and females, and to the nervous and delicate. In such cases, *wine* or *powder of ipecacuanha* should alone be employed.

EMETIC CUPS. Syn. *Antimonial Cups; Pocula Emetica*, *Calices Vomitorii*,— Lat. Small cups made of *metallic antimony*. Wine left in them for 10 or 12 hours becomes emetic.

EMETIC TARTAR. See *Antimony* (Potassio-tartrate).

EMETINE. Syn. *Emetin; Emetina*,—Lat. *La Matière Vomative*,—Fr. A peculiar alkaloid forming the active principle of the root of *cephaelis ipecacuanha*. It was discovered by Pelletier and Magendie in 1817.

Prep. 1. (Medicinal.)—*a. Ipecacuanha* (in coarse powder) is digested *first* in *ether*, and then in *rectified spirit* for 3 or 4 days; the *alcoholic tincture* is next expressed and evaporated (distilled) to dryness; the residuum is dissolved in *distilled water*, and the solution precipitated with *acetate of lead;* the precipitate is then diffused through *distilled water*, in a tall glass vessel, and *sulphuretted hydrogen* is passed through it, to throw down the lead; after which the liquor is decanted, filtered, evaporated to the consistence of a thick syrup, and spread in a thin layer on warm plates of glass, and allowed to dry in a current of warm air, or by a gentle heat in a stove. The maceration in ether is frequently omitted.

b. Ipecacuanha, 1 part; *rectified spirit* (0·835), 7 parts; make a tincture, distil off the spirit, dissolve in *cold distilled water*, 5 parts; filter the solution, and evaporate, &c., as before. Inferior to the last.

c. (P. Cod.) As the last, nearly.

Obs. Medicinal or impure emetine is brownish red, deliquescent, and emetic in *doses* of $\frac{1}{4}$ to $\frac{1}{2}$ gr.

2. (Pure.)—*a. Ipecacuanha* (in coarse powder), 1 part, is digested for 24 hours in *distilled water*, 10 parts; together with *calcined magnesia*, added in slight excess; the deposit is then thrown on a filter, washed carefully with *very cold water*, and dried; it is next dissolved in *rectified spirit* and neutralized with *dilute sulphuric acid;* the filtered solution is decoloured with *animal charcoal*, again filtered, and again precipitated by digestion with *magnesia;* the last deposit forms a colourless solution with *rectified spirit*, which, by gentle evaporation, gives up its emetine as a yellowish-white pulverulent mass, which may be rendered perfectly white by redissolving it in alcohol, &c., as before. The process is rendered easier by first digesting the *powdered ipecacuanha* in *ether*.

b. (P. Cod.) *Alcoholic extract of ipecacuanha*, 1 part; *water*, 10 parts; dissolve, filter, add *calcined magnesia*, 1 part; evaporate to dryness, wash the product on a filter with *very cold water*, 5 parts; dry it again, and dissolve it in *boiling alcohol;* evaporate the filtered tincture to dryness, redissolve the residuum in a little *water*, acidulate (slightly) with *dilute sulphuric acid*, decolour with *animal charcoal*, filter, precipitate with *liquor of ammonia*, and dry the precipitate by a gentle heat.

c. (Ph. Suec., 1845.) *Powdered ipecacuanha*, 1 part; *water acidulated with sulphuric acid*, 6 parts; digest, filter, add *lime*, 1 part, and evaporate to dryness over a water-bath; the residuum is then exhausted with boiling *rectified spirit*, and otherwise treated as in the last formula.

Prop., &c. Pure emetine is white, pulverulent, inodorous, and bitter; fusible at 122° Fahr.; very soluble in alcohol and boiling water, but only slightly so in ether, oils, and cold water. It restores the blue colour of reddened litmus, and partially neutralizes the acids, forming scarcely crystallizable salts. It is reddened by *nitric acid*, and this red colour is deepened by ammonia. *Tincture of iodine* produces a reddish precipitate in an alcoholic solution of emetine. With *tincture of galls* this solution behaves like morphia; but, unlike the last substance, the *salts of iron* produce no change of colour in it. These reactions, combined with its emetic properties, are sufficient for its identification. *Dose.* White and pure emetine is emetic in doses of $\frac{1}{20}$ to $\frac{1}{16}$ gr. The large doses ordered in certain recent pharmaceutical compilations, evidently in error of the difference between the strengths of *pure* and *impure*, or *medicinal* emetine, have, in several cases which have been reported on, produced very serious consequences.

EMETINE INDIGENE. See *Violine*.

EMMENAGOGUES. Syn. *Emmenagogæ*,—Lat. Substances which excite or promote the catamenia. There are, probably, few remedies which exert this specific power on the uterus, the majority of repeated emmenagogues acting rather by their influence on the system generally, or on parts contiguous to the uterus, than in the uterus itself. Among the substances usually arranged under this class, are—*aloes, black hellebore, birthwort, borax, cubebs, ergot, gamboge, gin, iodide of potassium, iodine, madder, mercurials*, the *peppers, rue, savine, stimulants* (generally), *stimulating diuretics, stinking goose-foot, stinking orache, wine, &c.*

Of the above, *ergot* and *madder* are the only articles which exercise a direct power on the uterus, and that rather in increasing its expulsive energy than in promoting the menstrual function, though they are advantageously employed for the latter purpose. Several of the other substances named, are drastic purgatives, or possess cerebro-spinal properties, or local powers of irritation, by which they increase the pelvic

circulation, or produce excitement in the neighbouring parts, in many cases of a dangerous and irreparable character. Hence many writers on pharmacology deny the existence of emmenagogues.

To ensure the successful administration of this class of medicines, the system must be previously prepared for their use by invigorating it, if there is either relaxation or debility; and an opposite course should be pursued when there is an undue degree of arterial action. In the majority of cases, the restoration of the discharge is rather attributable to a proper regulation of the system than to any specific power in the medicine administered.

EMOLLIENTS. Syn. *Emollientia*,—Lat. These are demulcents. As commonly understood it applies to demulcents of an oleaginous, saponaceous, or emulsive character, applied to surfaces (generally external) to soften and relax their fibres.

EMULSIN. The vegetable albumen of almonds. It is white, soluble in cold water, and coagulated by heat and alcohol. Its most remarkable property is its action on amygdalin, by which the volatile oil of almonds and hydrocyanic acid, with other products, are formed.

EMULSION. Syn. *Emulsio*,—Lat. A milky fluid, formed by the mechanical admixture of oil and water, by means of some other substance that possesses the power of combining with both. The emulsions of the London Pharmacopœia are now included in the class *Misturæ*.

In the *preparation of emulsions*, the oily or resinous ingredients are usually suspended by means of *mucilage of gum arabic*, *almonds*, or *yelk of egg*. 1 dr. of the *first*, made with equal parts of gum and water; 1 oz. of the *second* (usually 26 in number); and one in no. of the *last*, will form 2 dr. of any oil into an emulsion with about 1 oz. of water, gradually added. In some cases, instead of the above substances, a little *liquor of potassa* is employed, by which a saponaceous emulsion is formed. In all cases, the *mucilage* or *other viscid substance* should be put into the mortar before anything else. The *oil* or resinous matter may then be very gradually rubbed in, taking care not to add it more quickly than it can be subdued by the pestle; and if, during this part of the manipulation, the mixture should begin to assume a breaking or curdling appearance at the edges, a few drops of water must be immediately incorporated with it, before adding the remainder of the oil. From the want of this precaution, it is common for an emulsion suddenly to lose its tenacious consistence in the mortar, and it is then in vain to endeavour to restore it. After the oil is *thoroughly* incorporated, some care is requisite to avoid separating it again by too hasty an effusion of the water or other fluid of the mixture. If any alcoholic or acid liquid is to be added, it must be at the very end of the process. Indeed, the addition of an acid liquid, even a slightly acescent syrup, will often entirely destroy an emulsion. Mixtures of copaiba are frequently spoiled by the addition of spirit of nitric ether; a misfortune which might be avoided by first diluting it with one or two parts of water.

An excellent method of preparing *emulsions* of *resins* and *gum-resins*, is to put the article into a marble or wedgewood mortar, and to pour over it about 4 times its weight of *rectified spirit*, which is then to be ignited, and the mixture triturated until an equal consistence is obtained. The liquid is then to be added gradually, and the whole patiently triturated or shaken until cold. Yelk of egg or mucilage may be added to the fluid resin or gum-resin, if desired, as in the common method, but an excellent emulsion may be made without them.

The presence of soluble salts in an emulsion is apt to occasion the separation of the oleaginous portion. Spirit produces the same effect in those which are made with yelk or mucilage; and acids in those made with an alkali. The addition of these substances to emulsions should be therefore avoided as much as possible. *Emulsions of wax*, *spermaceti*, *oil of turpentine*, and *balsam of copaiba*, are the most readily and completely formed with yelk of egg. *Volatile oils* are more readily made into emulsions if mixed with an equal volume of some simple fixed oil, before proceeding to operate on them. *Scammony* is generally formed into an emulsion with milk; and *resin of jalap*, with almonds and water.

The following formulæ, for certain emulsions, are merely given here for examples. Various others will be found under *Mixtures*, *Lotions*, *Washes*, *&c.*

EMULSION (Almonds). Syn. *Milk of Almonds*, *Almond Mixture*; *Emulsio Amygdalæ*, *Mistura do.*,—Lat. *Prep.* 1. *Blanched almonds*, 1 *oz.*; beat them to a smooth paste, add, gradually, *water*, ½ pint; and when the whole is thoroughly incorporated, strain through a piece of gauze.

2. As the last, adding *sugar*, 1 *oz.*; or *syrup* (either simple or flavoured), 1½ fl. oz.

EMULSION (Assafœtida). Syn. *Emulsio Assafœtidæ*, *Mistura do.*,—Lat. *Prep.* (Duclow.) *Assafœtida*, 1 oz.; *powdered gum*,

2 oz.; *oil of almonds*, 3½ fl. oz.; *water*, 6 fl. oz. Antispasmodic. *Dose.* 1 or 2 table-spoonfuls; in hysterical affections, &c.

EMULSION (Camphor). Syn. *Emulsio Camphoræ, E. Camphorata; Mistura Camphoræ*,—Ph. E. *Prep.* 1. (Ph. Castr. Ruth., 1840.) *Camphor*, ½ dr.; triturate with *milk*, ½ fl. oz., gradually added; then further add of *water*, 7½ fl. oz.

2. (Ph. E.) *Camphor*, 20 gr.; *lump sugar*, ½ oz.; triturate together, and add of *blanched almonds*, ½ oz.; again triturate, then gradually add of *water*, 1 pint. Stimulant, antispasmodic, and diaphoretic. *Dose.* 1 fl. oz. to 2 fl. oz.

EMULSION. (Capivi). Syn. *Emulsio Copaibæ, Mistura C.*,—Lat. *Prep.* 1. *Balsam of copaiba* and *syrup of orange peel*, of each, 2 oz.; *yelks of* 5 *eggs; milk*, 14 fl. oz.

2. (Beral.) *Copaiba* and *mucilage*, of each, 2 oz.; *water*, 12 fl. oz. *Dose.* ½ oz. to 1 oz.; 2 or 3 times a day where the use of copaiba is indicated.

EMULSION (Castor Oil). Syn. *Emulsio Olei Ricini, Mistura O. R.*,—Lat. *Prep.* 1. *Castor oil*, 1 oz.; *thick mucilage*, 1½ oz.; *syrup of orange peel*, 1 fl. oz.; *water*, 6 fl. oz.

2. As the last, but using *milk* instead of water. *Dose.* One third; as an aperient for females who object to taking the unprepared oil.

EMULSION (Gum). Syn. *Emulsio Acaciæ; Mistura Acaciæ*,—Ph. E. *Prep.* From *sweet almonds* (blanched), 10 dr.; *white sugar*, 5 dr.; *mucilage*, 3 fl. oz.; *water*, 1 quart. Demulcent. In coughs, &c., ad libitum.

EMULSION (Oil of Almonds). Syn. *Emulsio Olei Amygdalæ*,—Lat. *Prep.* From *oil of almonds*, 3 dr.; *thick mucilage* and *simple syrup*, of each, 5 dr.; *rose water*, 1 fl. oz.; *distilled water*, 3 or 4 fl. oz. An elegant and efficient substitute for almond milk.

EMULSION (Peruvian Balsam). Syn. *Emulsio Balsamica, E. Balsami Peruviani*,—Lat. *Prep.* 1. As *emulsion of copaiba*.

2. (Hosp. F.) *Balsam of Peru*, ½ oz.; *oil of almonds*, 6 dr.; *powdered gum*, 1 oz.; triturate together, and add, gradually, *rose water*, 4 fl. oz. *Dose.* 1 or 2 table-spoonfuls; in old asthmas, chronic coughs, winter coughs, &c.

EMULSION (Scammony). Syn. *Emulsio Scammonii; Mistura S.*,—Ph. E. *Prep.* 1. (Ph. E.) *Resin of scammony*, 7 gr.; *new milk*, 3 fl. oz. For a *dose*.

2 (Planche.) *Aleppo scammony*, 7 gr.; *sugar*, 2 dr.; *new milk*, 3 fl. oz.; *cherry-laurel water*, 5 or 6 drops. For a *dose*. Purgative; in torpor of the intestines, dropsy, worms, &c. The formula of the Paris Codex is similar.

EMULSION (Spermaceti). Syn. *Emulsio Cetacei, Mistura C.*,—Lat. *Prep.* As *emulsion of wax*. Demulcent.

EMULSION (Turpentine). Syn. *Emulsio Terebinthinæ, Mistura T.*,—Lat. *Prep.* 1. *Chio turpentine*, 2 dr.; *white sugar*, 1 oz.; *yelk of* 1 *egg; milk of almonds*, 4 fl. oz. In gleets. *Dose.* 2 table-spoonfuls, 3 or 4 times a day.

2. (Clossius.) *Venice turpentine*, 1½ dr.; *yelk of* 1 *egg; peppermint water*, 4½ fl. oz.

EMULSION (Oil of Turpentine). Syn. *Emulsio Olei Terebinthinæ, Mistura O. T.*, Lat. *Prep.* (Carmichael.) *Rectified oil of turpentine*, 1 fl. oz.; *yelk of* 2 *eggs; emulsion of almonds*, 4 fl. oz.; *syrup of orange peel*, 2 fl. oz.; *spirit of lavender*, 4 fl. dr.; *oil of cinnamon*, 5 or 6 drops. *Dose.* 1 fl. oz., twice or thrice a day; in nephritic pains, and that variety of ophthalmia termed *iriditis*.

EMULSION (Wax). Syn. *Emulsio Ceræ, E. Ceræ Albæ, Mistura C., Lac C.*,—Lat. *Prep.* (Guibourt.) *White wax*, 1 oz.; *powdered gum*, 1½ dr.; *water*, 24 fl. oz.; *simple syrup*, 4 fl. oz.; put the syrup and gum into a warm mortar, add the wax, and triturate with a warm pestle until united; then add the water (*warm*) gradually, and continue the agitation till the whole is quite cold. Demulcent. Ad libitum.

ENAMEL. A species of vitreous varnish, coloured with metallic oxides, applied in a thin stratum to brightly polished metallic surfaces (*copper* or *gold*), on which it is fused by the flame of a lamp urged by the blowpipe, or by the heat of a small furnace.

The basis of all enamels is a highly transparent and fusible glass, (called "*Frit*," "*Flux*," or "*Paste*,") which readily receives a colour on the addition of metallic oxides. It may be made by one or other of the following formulæ:—

Prep. 1. *Red lead*, 16 parts; *calcined borax*, 3 parts; *powdered flint glass*, 12 parts; *powdered flints*, 4 parts; fuse in a Hessian crucible for 12 hours, then pour it out into water, and reduce it to a powder in a biscuit-ware mortar.

2. *Tin*, 3 parts; *lead*, 10 parts; mix, calcine in an iron pot at a dull cherry-red heat, and scrape off the oxide as it forms, observing to obtain it quite free from undecomposed metal; then reduce it to fine powder by grinding and elutriation. In this state it is known among enamellers as "*Flux*" or "*Calcine*." 4 parts of this *calcine* are next mixed with an equal weight of *pure sand* or *powdered flints*, and

1 part of *sea-salt*, or other alkaline matter; the mixture is then partially fused in a Hessian crucible, by which it undergoes semi-vitrification.

3. (Chaptal.) *Lead* and *tin*, equal parts; calcine as above, and take of the *mixed oxides* or *calcine* and *ground flints*, of each 1 part; *pure carbonate of potash*, 2 parts; and proceed as before.

4. (Wynn.) *Flint glass*, 3 *oz.*; *red lead*, 1 *oz.*; as last.

5. (Wynn.) *Red lead*, 18 parts; *borax* (not calcined), 11 parts; *flint glass*, 16 parts; as last.

6. (Wynn.) *Powdered flints*, 10 parts; *nitre* and *white arsenic*, of each, 1 part; as last.

Obs. The precise qualities of the products of the above processes depend greatly upon the duration and degree of heat employed. By increasing the quantity of *sand*, *glass*, or *flux*, the enamel is rendered more fusible, and the opacity and whiteness is increased by the addition of *oxide of tin*. The use of borax should be avoided, or it should be used sparingly, as it is apt to make the enamel effloresce and lose colour.

ENAMEL (Black). *Prep.* 1. *Calcined iron* (protoxide), 12 parts; *oxide of cobalt*, 1 part; mix, add an equal weight of white flux, and fuse, as before.

2. (Clouet.) *Pure clay*, 3 parts; *protoxide of iron*, 1 part. A fine black.

3. *Peroxide of manganese*, 3 parts; *zaffre*, 1 part; mix, and add it, as required, to white flux.

ENAMEL (Blue). *Prep.* 1. *White frit* or *flux*, coloured with *oxide of cobalt*.

2. *Sand*, *red lead*, and *nitre*, of each, 10 parts; *flint glass* or *ground flints*, 20 parts; *oxide of cobalt*, 1 part, more or less; depending on the desired depth of colour.

ENAMEL (Brown). *Prep.* 1. *Manganese*, 5 parts; *red lead*, 16 parts; *flint powder*, 8 parts; as before.

2. (Wynn.) *Manganese*, 9 parts; *red lead*, 34 parts; *flint powder*, 16 parts.

3. *Red lead* and *calcined iron*, of each, 1 part; *antimony*, *litharge*, and *sand*, of each, 2 parts. To be added in any required proportion to white frit, according to the colour desired. A little *oxide of cobalt* or *zaffre* is frequently added to alter the shade.

ENAMEL (Green). *Prep.* 1. *Flux* or *frit*, 2 *lb.*; *black oxide of copper*, 1 *oz.*; as before.

2. As the last, but adding *red oxide of iron*, ½ dr. Less decisive.

3. *Copper dust* and *litharge*, of each, 2 *oz.*; *nitre*, 1 *oz.*; *sand*, 4 *oz.*; *flux* or *frit*, q. s.

4. From *transparent frit*, any quantity; *oxide of chromium*, q. s. to colour. Colour superb; it will stand a great heat; in common hands, however, it frequently turns on the dead-leaf tinge.

5. *Transparent flux*, 5 *oz.*; *black oxide of copper*, 30 to 40 gr.; *oxide of chrome*, 2 gr. Resembles the emerald.

6. From *blue* and *yellow enamel* mixed in the required proportions.

ENAMEL (Olive). *Prep.* *Blue enamel*, 2 parts; *black* and *yellow do.*, of each, 1 part. See *Brown Enamel.*

ENAMEL (Orange). *Prep.* 1. *Red lead*, 12 parts; *red sulphate of iron* and *oxide of antimony*, of each, 1 part; *flint powder*, 3 parts; calcine together, powder, and melt with *flux*, 50 parts.

2. (Wynn.) *Red lead*, 12 parts; *oxide of antimony*, 4 parts; *flint powder*, 3 parts; *red sulphate of iron*, 1 part; calcine, then add *flux*, 5 parts, to every 2 parts of *this mixture*.

ENAMEL (Purple). *Prep.* 1. *Flux* or *frit*, coloured with *oxide of gold*, *purple precipitate of cassius*, or *peroxide of manganese*.

2. *Sulphur*, *nitre*, *green vitriol*, *antimony*, and *oxide of tin*, of each, 1 *lb.*; *red lead*, 60 *lb.*; mix, fuse, cool, powder, and add *rose copper* (red oxide), 19 *oz.*; *zaffre*, 1 *oz.*; *crocus martis*, 1½ *oz.*; *borax*, 3 *oz.*; and of a *compound formed of gold*, *silver*, *and mercury*, 1 *lb.*; fuse, stirring the melted mass with a copper rod all the time, then place it in crucibles, and submit them to the action of a reverberatory furnace for 24 hours. This is said to be the purple enamel used in the mosaic pictures in St. Peter's at Rome.

ENAMEL (Red). *Prep.* 1. *Paste* or *flux* coloured with the *red oxide* or *protoxide of copper*. Should the colour pass into the green or brown, from the partial peroxidizement of the copper, from the heat being raised too high, the red colour may be restored by the addition of any carbonaceous matter, as tallow, or charcoal.

2. By tinging the *glass* or *flux* with the *oxide* or *salts of gold*, or with the *purple precipitate of cassius*. These substances produce shades of red, inclining to crimson or purple of the most exquisite hue. The enamel often comes from the fire quite colourless, and afterwards receives its rich hue at the lamp.

3. (Wynn.) *Sulphate of iron* (calcined dark), 1 part; a *mixture of* 6 *parts of flux* (No. 5) *and* 1 *of colcothar*, 3 parts. Dark red.

4. (Wynn.) *Red sulphate of iron*, 2 parts; *flux* (No. 1), 6 parts; *white lead*, 3 parts. Light red.

ENAMEL (Rose-coloured). *Prep. Purple enamel* (or its elements), 3 parts; *flux*, 90 parts; mix, and add *silver leaf* or *oxide of silver*, 1 part, or less.

ENAMEL (Transparent). See *Frit* or *Flux* (above).

ENAMEL (Violet). *Prep.* 1. *Purple enamel*, 2 parts; *red do.* (No. 2), 3 parts; *frit*, 6 parts.

2. *Saline* or *alkaline frit* or *flux*, any quantity; *peroxide of manganese*, q.s. to colour. As the tint depends on the metal being at the maximum of oxidation, contact with oily or carbonaceous substances should be particularly avoided.

ENAMEL (White). *Prep.* 1. *Calcine* (from 2 parts of *tin* and 1 part of *lead*), 1 part; fine *crystal glass* or *frit*, 2 parts; *manganese*, a few grains; powder, mix, melt, and pour the fused mass into clean water; again powder, and fuse, and repeat the whole process 3 or 4 times, avoiding contamination with smoke, dirt, or oxide of iron. A fine dead white.

2. Washed *diaphoretic antimony*, 1 part; *fine glass* (free from lead), 3 parts; mix, and proceed as before. Very fine.

3. *Lead*, 30 parts; *tin*, 33 parts; calcine as before, then fuse 50 parts of this *calcine* with an equal weight of *flints*, in powder, and 100 parts of *salt of tartar*. A fine dead white enamel.

Obs. For white enamel, the articles must be perfectly free from foreign admixture, as this would impart a colour. When well managed, either of the above forms will produce a paste that will rival the *opal*.

ENAMEL (Yellow). Superior yellow enamels are less easily produced than those of most other colours; they require very little flux, and that mostly of a metallic nature. The following come highly recommended by experienced parties:—

Prep. 1. From *frit* or *flux*, fused with *oxide of lead*, and a little *red oxide of iron*.

2. *Lead*, *tin ashes*, *litharge*, *antimony*, and *sand*, of each, 1 *oz.*; *nitre*, 4 *oz.*; mix, fuse, and powder; and add the product to *flux* or *frit*, q.s.

3. *White oxide of antimony*, *alum*, and *sal ammoniac*, of each, 1 part; pure *carbonate of lead*, 1 to 3 parts, or q.s. (all in powder); mix, and expose them to a heat sufficiently high to decompose the sal ammoniac. *Used* as the last. Very bright coloured.

4. (Wynn.) *Red lead*, 8 *oz.*; *oxide of antimony*, and *tin*, calcined together, of each, 1 *oz.*; mix, and add of *flux* (No. 5), 15 *oz.*; mix well and fuse.

5. Pure *oxide of silver* added to the *metallic fluxes*. The salts of silver are also used, but are more difficult to manage. If a thin film of oxide of silver be spread over the surface of the enamel to be coloured, exposed to a moderate heat, then withdrawn, and the film of reduced silver on the surface removed, the part under will be found tinged of a fine yellow. (Clouet.)

ENAMELLING. See *Metals*, *Leather*, *Wood*, &c.

ENCAUSTIC. See *Painting* (Encaustic).

ENEMA. Syn. *Clyster*, often corr. into *Glyster*; *Lavement*. A medicine usually liquid (*sometimes* gaseous) thrown into the rectum or lower bowels.

Clysters usually *consist* of some *weak glutinous* or *mucilaginous fluid*, to which the active ingredients are added; or a *decoction* or *infusion* is made of the medicaments, which is then used, either alone, or after the addition of a little *gum*, *starch*, or *sugar*. The proper vehicle for *astringent vegetable matter*, *metallic salts*, and the *mineral acids*, is pure water. *Oleaginous* and *resinous substances* are made into *emulsions* before being employed for enemas. In all cases the fluid is administered warm. The *quantity of fluid forming a clyster*, for an ADULT, may vary from ½ to ¾ pint; that for an INFANT within *a month old*, should be about 1 *fl. oz.*; for a CHILD of *one year*, about 2½ *fl. oz.*; from *one* to *seven years*, from 3 or 4 *fl. oz.*; and from *seven* to *twelve* or *fourteen*, 6 or 7 *fl. oz.*; after that age to puberty, ½ pint may be employed.

The *quantity* or *dose* of the *active ingredients* in a clyster, should be 4 or 5 times as great as that of the same medicines when taken by the mouth; as it is generally regarded that the susceptibility of the rectum is only ⅕th that of the stomach, and that to exert a like absorbent action, it occupies 5 times as long as the latter viscus. The dose and the interval between its repetition, should, therefore, be proportionately increased. *Narcotics*, as *opium*, *tobacco*, &c., should, however, be given in only *twice* or *thrice* the quantity that would be exhibited in the usual manner.

Enemata are *usually administered* by means of a *syringe*, *bladder*, or *elastic bag*, furnished with a *rectum tube*; but many ingenious and elegant pieces of mechanism, adapted for self-administration, are made by the instrument makers. Among the latter, none are more convenient, effective, and durable, than those sold by Messrs. Dietrichsen and Hannay, of 63, Oxford

street. Great care should be taken to avoid injuring the coats of the rectum by the use of a rough or improperly shaped pipe, or one that is too long. The extremity of the pipe or tube should also be *perfectly smooth* and *well rounded*, (rather *spherical* than *pointed*,) and in using it *no force* should be employed. A neglect of this point often produces very serious consequences, especially in young children.

Tobacco smoke may be *administered* by means of a *double pair of bellows*, supplied with air from a *small funnel* under which the herb is burning,—and *gaseous matter*, by connecting the rectum tube with a small *gasometer*, exerting a trifling pressure on the *confined gas*.

The *number of substances employed* in the *preparation of enemata* is very great. The following are some of them, arranged according to their effects:—

1. (Anodyne and Narcotic.) *Opium, henbane, &c.*, are employed to allay spasms of the bowels, stomach, uterus, bladder, &c.

2. (Aperient or Cathartic.) *Aloes, colocynth, senna*, various *purging salts, gruel, decoction of marshmallows, decoction of linseed, warm water, &c.*, are commonly employed to promote the peristaltic action of the bowels, or to destroy worms.

3. (Demulcent and Emollient.) *Decoction of starch, gum, isinglass, glue, &c.*, either *alone* or *combined* with *opium*, are used to protect the coats of the intestines, and to allay irritation; and also to restrain diarrhœa, especially when combined with *astringents*, as *logwood, catechu*, or *oak bark*.

4. (Nutrient.) *Animal jelly, soups, broths, milk, &c.*, are frequently used as injections to convey nourishment to the body.

5. (Sedative.) *Tobacco infusion* or *smoke*, and *tartar emetic* (in solution), are employed to relax the powers of the body, to remove spasms, depress the circulation, and to produce syncope.

Enemata or *clysters* are now very frequently employed in our large towns, especially among the higher classes; but a great prejudice exists among many persons against their use, arising from a fastidious and mistaken delicacy. The introduction of improved apparatus of late years, (see *above*,) by which the administration of these remedies is attended with much less difficulty and exposure than formerly, has removed much of the repugnance which previously existed.

Clysters are invaluable when it is necessary to evacuate the bowels as speedily as possible, and when the stomach will not bear the administration of a purgative by the mouth, as well as in cases requiring a direct medication of the lower bowels, as in *dysentery, colic, &c.* As a mere *laxative*, an injection of *tepid water, milk-and-water*, or *water gruel*, will generally be found sufficient. By the addition of 1 or 2 table-spoonfuls of *common salt, epsom salts, salad oil*, or *molasses*, to this *laxative enema*, it will form an excellent *purgative* one, which will, in most cases, induce a full discharge. In all cases, the patient should be directed to retain the injection for as long a time as possible, and not to attempt to empty his bowels immediately after the reception of the medicine. "In *irritation* of the *bladder, rectum*, or *uterus*, an *anodyne injection* or *enema* often affords much relief. In *diseases of the lower bowels*, clysters are also of almost indispensable utility, as also in the *dislodgment of ascarides* seated in the rectum; nor are they less beneficial in those cases of *sudden sinking of the powers of life* where deglutition is impossible, and yet a prompt stimulating impression is requisite to save the patient; under such circumstances, clysters of some of the diffusible stimuli have proved of the greatest benefit."

The injection of *large* quantities of liquid matter into the bowels, as well as the *constant* use of clysters (even of warm water only), is deemed by the highest medical authorities to be injurious, and, occasionally, dangerous. The practice should not, therefore, be allowed to grow into a habit. The bowels continually accustomed to a stimulant, cease to act without one. The same remarks apply to aperients taken by the mouth.

The following formulæ embrace the whole of the enemas (*enemata*) of the British Pharmacopœias, as well as a few others in common use:—

ENEMA (Albumen). Syn. *Enema Albuminis*,—Lat. *Prep.* (Ricord.) *Infusion of linseed*, 12 oz.; *whites of* 2 *or* 3 *eggs*; mix. In chronic diarrhœa, and as a nutrient clyster in debility from stomach diseases. The reason for rejecting the *yelks* of the eggs is not very obvious, as the preparation is much more effective with them.

ENEMA (Aloes). Syn. *Enema Aloës*,—Ph. L. *Prep.* From *aloes*, 2 scrup.; *carbonate of potassa*, 15 gr.; *decoction of barley* (barley water), ½ pint. In ascarides, atonic amenorrhœa, &c. It should not be employed when irritability of the rectum, bladder, or genitals exists; nor in piles, or when there is a tendency to prolapsus ani or prolapsus uteri.

ENEMA (Anodyne). See *Enema of Opium*.

ENEMA (Antispasmodic). Syn. *Enema*

Antispasmodicum, — Lat. *Prep.* From *tincture of assafœtida*, 3 fl. dr.; *laudanum*, 30 to 60 drops; *water gruel* or *barley water*, ½ pint. In spasmodic affections of the bowels. (See *below.*)

ENEMA (Assafœtida). Syn. *Fetid Clyster*, *Antispasmodic do.*; *Enema Assafœtidæ*,—Ph. L. *E. Fœtidum*,—Ph. E. & D. *Prep.* 1. (Ph. L.) *Assafœtida*, 1 dr.; *decoction of barley* (hot), ½ pint; rub together until mixed.

2. (Ph. E.) To *carthartic enema* (Ph. E.), add of *tincture of assafœtida*, 2 fl. dr.

3. (Ph. D.) *Warm water*, 12 fl. oz; *tincture of assafœtida*, 2 fl. dr.

4. (St. B. Hosp.) *Assafœtida*, 2 dr.; *yelk of an egg*; *barley water*, 7 fl. oz. Stimulant, antispasmodic, and carminative. An excellent remedy in hysteria, flatulent colic, hooping-cough, infantile convulsions, worms in the lower bowels, &c. See *Hooping-cough Enema.*

ENEMA (Astringent). Syn. *Enema Astringens*,—Lat. *Prep.* 1. *Tincture of catechu*, 1 fl. oz.; *barley water*, 9 fl. oz.

2. *Extract of rhatany*, 2 dr.; *syrup*, or *made starch*, 2 oz.; *water*, 7 fl. oz.

3. *Decoction of galls*, *oak-bark*, *pomegranate*, or other like astringent substance, 3 or 4 fl. oz.; *water* or *barley water*, 6 or 7 fl. oz.

4. (Hosp. F.) *Electuary of catechu*, 2 dr.; *water* and *lime water*, of each, 4½ fl. oz. In diarrhœa, &c., arising from a relaxed condition of the coats of the lower bowels; and in fissures of the anus, &c.

ENEMA (Camphor). Syn. *Enema Camphoræ*,—Lat. *Prep.* 1. *Camphor liniment*, 4 fl. dr.; *yelks of* 2 *eggs*; *water gruel*, 7 fl. oz.

2. *Camphor*, 1 dr.; *rectified spirit*, 2 dr.; triturate till dissolved, then add, gradually, of *simple syrup*, 1 oz.; when thoroughly incorporated, further add of *thin gruel*, 7 fl. oz. Anodyne, antispasmodic, and diuretic. In difficult or obstructed micturition.

ENEMA (Castor Oil). Syn. *Enema Olei Ricini*,—Lat. *Prep.* 1. (Hosp. F.) *Castor oil* and *mucilage*, of each, 1 oz.; *gruel*, ½ pint.

2. *Castor oil*, 1 oz.; *liquor potassa*, 2 fl. dr.; triturate, and add of *honey*, 1 oz.; when mixed, further add of *hot gruel*, ½ pint; and agitate until cool enough to be administered.

ENEMA (Cathartic). Syn. *Purgative Clyster*; *Enema Catharticum*,—Ph. E. & D. *E. Laxativum*, *E. Purgativum*,—Lat. These have been already alluded to. By increasing the quantity of the active ingredients, a mild laxative or aperient clyster is converted into an active purgative or cathartic one.

Prep. 1. (Ph. E.) *Senna*, ½ oz.; *boiling water*, 16 fl. oz.; infuse an hour, then add of *Epsom salts*, ½ oz.; *sugar*, 1 oz.; when dissolved, further add of *olive oil*, 1 oz.; and mix them by agitation.

2. (Ph. D.) *Epsom salts*, 1 oz.; *olive oil*, 1 fl. oz.; *mucilage of barley*, 16 fl. oz.

3. (Ph. D. 1826.) *Manna*, 1 oz.; *compound decoction of chamomile*, ½ pint; dissolve, and add of *olive oil*, 1 oz.; *Epsom salts*, ½ oz.

4. *Compound decoction of mallows*, ½ pint; *Epsom salts*, ¾ oz.; *sweet oil*, 2 fl. oz.; mix, as above.

Obs. The above are employed in all ordinary cases where the use of an immediate cathartic is indicated. (See *below.*)

ENEMA (Chloride of Lime). Syn. *Enema Chloridi Calcis*, *E. Antiputrescens*, —Lat. *Prep.* 1. *Chloride of lime*, 10 gr.; *tepid water*, 1 fl. oz.; triturate, then add of *barley water*, or *plain tepid water*, 7 fl. oz.

2. (Pereira.) *Chloride of lime*, 10 to 15 gr., added to a *common enema.* As a *deodorizer*, when the alvine evacuations are unusually fetid.

ENEMA (for Colic). Syn. *Enema Anticolicum*,—Lat. *Prep.* From *oil of cajeput* or *peppermint*, 15 drops; dissolved in *sweet spirit of nitre*, 60 drops; *laudanum*, 35 drops; *infusion of chamomile*, ½ pint.

ENEMA (Colocynth). Syn. *Enema Colocynthidis*,—Ph. L. *Prep.* 1. (Ph. L.) *Extract of colocynth*, ½ dr.; *soft soap*, 1 oz.; triturate, and add of *water*, 1 pint.

2. (Ph. L. 1836.) As the last, but using *compound extract of colocynth.*

3. (Guy's Hosp.) *Colocynth pulp*, 1 dr.; *water*, ¾ pint; boil so as to strain ½ pint; and add of *common salt*, ½ oz.; *syrup of buckthorn*, 1 fl. oz. An efficient enema in colic and obstinate constipation, in the absence of spasms and inflammatory symptoms.

ENEMA (Common). Syn. *Enema Commune*,—Lat. *Gruel* or *barley water*, either with or without the addition of a little *common salt* or *oil*, are generally so called. The *first* are simply laxative; the *latter*, purgative. Decoction of mallows, linseed tea, or water gruel, are also commonly used as the vehicle.

Prep. 1. (St. B. Hosp.) *Barley water*, 1 pint; *common salt*, 1 oz.; dissolve.

2. (Guy's Hosp.) *Water gruel*, 10 to 15 fl. oz.; *common salt*, 1 oz.

3. (U. C. Hosp.) *Water gruel*, 8 to 12 fl. oz.; *salt*, 1 oz.; *linseed oil*, 2 fl. oz.

ENEMA (Copaiba). Syn. *Enema Copaibæ*,—Lat. *Prep.* 1. From *balsam of copaiba*, 2 dr.; *liquor opii sedativus*, 15 drops; *yelk of egg*, q. s.; *barley water*, 7½ fl. oz.

2. (Collier.) To the last add of *extract of opium*, 1 gr.; *oil of turpentine*, 4 fl. dr.

3. (Velpeau.) *Copaiba*, 2 dr.; *laudanum*, 20 drops; *yelk of* 1 *egg; water gruel*, 8 fl. oz. In ascarides, gonorrhœa, and some affections of the lower bowels and bladder, when the stomach rejects the balsam.

ENEMA (Domestic). Syn. *Enema Domesticum*,—Lat. This name has been applied to an enema of *warm water*, either with or without the addition of a little *sugar*, *honey*, or *milk*. The effect is laxative.

ENEMA (Emollient). Syn. *Enema Emolliens*, *E. Demulcens*,— Lat. *Prep.* From *decoction of linseed*, *barley*, or *starch*, 1 pint; *linseed* or *olive oil*, 1 oz. Soothing and laxative; in excoriations of the lower bowels. 20 to 40 drops of *laudanum* may be added when there is much pain or looseness.

ENEMA (Febrifuge). Syn. *Enema Febrifugum*,—Lat. *Prep.* 1. (Collier.) *Water gruel*, 12 fl. oz.; *sugar*, 1 fl. oz. In low fevers.

2. (Brande.) *Vinegar*, 2 fl. oz.; *infusion of chamomile*, 5 or 6 fl. oz. In typhus.

ENEMA (Fetid). See *Enema* (Assafœtida).

ENEMA (for Hooping Cough). Syn. *Enema Pertussiculare*,—Lat. *Prep.* 1. See *Assafœtida Enema.*

2. (M. Reiken). *Prep. Assafœtida*, 8 gr.; *yelk of* 1 *egg; water*, ½ pint.

Obs. This quantity is sufficient for 10 or 12 clysters for children *under* 1 *year;* 5 or 6 for those *under* 3 *years;* and 2 or 3 for those *under* 7. Two clysters are prescribed daily in hooping-cough. According to M. Reiken this is more successful in removing hooping-cough than any other remedy. To ensure success it should not be administered until the feverish symptoms have passed. M. Reiken sometimes uses an ointment of assafœtida as well as the clyster.

ENEMA (Laxative). See *Enemas* (Cathartic).

ENEMA (Lead). Syn. *Enema Plumbi*, —Lat. *Prep.* (Dr. Newbold.) *Acetate of lead*, 6 gr.; *tepid distilled water*, 6 fl. oz. In strangulated hernia; repeated in 2 or 3 hours.

ENEMA (Nutrient). Syn. *Feeding Clyster; Enema Nutriens*,—Lat. *Prep.* 1. *Strong beef tea*, 12 fl. oz.; thickened a little with *arrow-root* or *hartshorn shavings.*

2. (M. Nasse.) *Strong meat soup*, ¾ pint; *dilute hydrochloric acid*, ½ fl. dr.

3. *Yelks of* 2 *eggs; brown sugar* and *salad oil*, of each, 1 oz.; *mutton broth*, 12 fl. oz. To nourish the body, when aliments cannot be taken or retained by the stomach.

ENEMA (Oily). See *Enema* (Emollient).

ENEMA (Opium). Syn. *Enema Opiatum; E. Opii*, — Ph. L. *E. Opii* vel *Anodynum*,—Ph. E. *Prep.* 1. (Ph. L.) *Decoction of starch*, 4 fl. oz.; *tincture of opium*, 30 drops.

2. (Ph. E.) *Starch*, ½ dr.; *water* (boiling), 2 fl. oz.; mix, and when cool enough add of *tincture of opium*, ½ to 1 fl. dr.

3. (Ph. D. 1826.) *Laudanum*, 1 dr.; *warm water*, 6 fl. oz.

Obs. The above are the orders of the Colleges, but in practice the quantity of laudanum is frequently doubled; this should, however, be done with great care. Opium clysters are used in dysentery, colic, cholera, and various painful affections of the intestines, bladder, &c. The bowels should be emptied before their administration, and in inflammatory complaints they should not be used for the first 48 hours. Clysters containing opium, even in small quantities, are dangerous remedies for young children; yet there are cases in which they sometimes succeed when every other remedy has failed. This is particularly so in the low chronic diarrhœa of infancy and early childhood. A case of this kind occurred in the family of the writer. The family medical attendant, as well as the physician he consulted, abandoned the little sufferer to apparently inevitable death, as beyond the reach of further assistance. A small opium clyster was given, and the child recovered.

ENEMA (Ox-gall). Syn. *Enema Fellis*, *E. F. Bovis*,—Lat. *Prep.* (Dr. Allnatt.) *Fresh ox-gall*, 2 fl. oz.; *water gruel*, 8 fl. oz.

2. (Dr. Clay.) *Ox-gall*, 2 fl. oz.; *water*, 4 or 5 fl. oz. To soften indurated fæces, and in costiveness arising from deficiency of bile.

ENEMA (Poppies). Syn. *Enema Papaveris*,—Lat. *Prep.* 1. *Decoction of poppies.*

2. *Poppy-heads* (with the seeds), 5 dr.; *water*, ¾ pint; boil to 12 fl. oz., and strain. Anodyne; as a substitute for *opium clyster.*

ENEMA (Purgative). See *Laxative Enema.*

ENEMA (Simple). *Barley water*, *rice water*, *thin made-starch*, and *decoction of mallows*, are frequently so called, from being used either for simple laxative enemas, or as the vehicle for more active substances.

ENEMA (Soap). Syn. *Enema Saponis*, —Lat. *Prep.* (St. B. Hosp.) *Soft soap*, 6 dr.; *hot water*, 1 pint; dissolve. To soften indurated fæces, &c.; and as a detergent in certain ulcerations of the rectum.

ENEMA (Starch). Syn. *Enema Amyli*, —Lat. See *Simple Enema.*

ENEMA (Stimulant). Syn. *Enema Stimulans*,—Lat. The ordinary *cathartic clysters* are often so called. The following belong to a different class:—

Prep. 1. *Tincture of capsicum*, 1 fl. oz.; *barley water* or *thin arrow-root*, ½ pint; mix. In cholera, especially the cold stages.

2. To the last add of *ether*, 2 fl. dr.; *laudanum*, 30 drops.

3. *Decoction of poppies*, ½ pint; *tincture of capsicum*, 3 fl. dr.; *oil of nutmeg*, 10 drops. In diarrhœa.

ENEMA (Tobacco). Syn. *Enema Tabaci*,—Ph. L. E. & D. *Infusum Tabaci*,—Ph. D. 1826. *Prep.* 1. (Ph. L.) *Tobacco*, 1 scrup.; *boiling water*, ½ pint; macerate for 1½ hour, and strain.

2. (Ph. E.) *Tobacco*, 15 to 30 gr.; *boiling water*, 8 fl. oz.; as last.

3. (Ph. D.) *Tobacco*, 1 scrup.; *boiling water*, 8 fl. oz.

4. (Ph. L. 1836.) *Tobacco*, 1 dr.; *boiling water*, 1 pint.

Obs. Tobacco clyster is used in strangulated hernia, obstinate constipation, retention of urine, &c. It is violently depressing and relaxing; producing fainting, and even death, when improperly or injudiciously administered. "It is not to be forgotten that 2 dr., 1 dr., and *even* ½ dr. *of tobacco infused in water*, have proved *fatal.*" "The cautious practitioner, therefore, will not use more than 15 or 20 gr." (Pereira.) *Three* parts of *Virginia tobacco* are equal to *seven* parts of any other kind. (Davy.)

ENEMA (Turpentine). Syn. *Turpentine Clyster; Enema Terebinthinæ*,—Ph. L. *E. Olei T.*,—Lat. *Prep.* 1. (Ph. L.) *Oil of turpentine*, 1 fl. oz.; *yelk of* 1 *egg*; triturate together, then add of *decoction of barley*, 19 fl. oz.

2. (Ph. E.) As the last, but using *simple water* instead of barley water.

3. (Ph. D.) *Oil of turpentine*, 1 fl. oz.; *mucilage of barley*, 16 fl. oz.

4. (Ph. D. 1826.) *Common turpentine*, ½ oz.; *yelk of* 1 *egg*; *water* (at 90° to 100° Fahr.), ½ pint; for an emulsion.

5. (Dr. Neligan.) *Oil of turpentine*, ½ fl. oz.; *syrup of garlic*, 1 fl. oz.; *barley water*, 6 or 7 fl. oz. In ascarides, and as an antispasmodic and purgative in colic, obstinate constipation, calculus, peritonitis, tympanitis (*drum-belly*), &c.

ENEMA (Vermifuge). Syn. *Enema Anthelminticum*, *E. Vermifugum*, — Lat. *Prep.* 1. *Castor oil*, 1 oz.; *mucilage*, ¾ oz.; *decoction of the root of male fern*, 7 fl. oz. In worms; especially tape-worm.

2. (Collier.) *Oil of turpentine*, 1 fl. oz.; *olive oil* (warm), ½ pint. In ascarides.

3. (Dr. Darwall.) *Tincture of sesquichloride of iron*, 1 dr.; *water*, 7 or 8 fl. oz. In ascarides, especially when occurring in childhood; the quantity used being proportionately lessened. See *Enemas* of *Aloes*, *Assafœtida*, *Turpentine*, *&c.*

ENEMA (Wine). Syn. *Enema Vinosum*, —Lat. *Prep.* From *sherry wine* and *hot water*, of each, 7 fl. oz. In suspended animation. Sometimes a wine-glassful of brandy is added.

ENGRAVING. The mechanical operations of the engraver do not come within the province of this work. Several of the materials which he employs in his trade will, however, be found noticed under their respective heads. See *Varnishes*, *Wax*, *Etching*, *&c.*, (and below.)

ENGRAVINGS (Cast). These are simply stereotypes taken from any kind of engraving, chiefly those on wood, which are then used instead of the original itself. The plan is particularly applicable to engravings which meet with a ready sale, and of which a large number is required. As soon as one cast is worn out, another may be taken, so that not only will every impression be a proof, but the whole expense of retouching will be avoided.

ENGRAVINGS (Reproduction of). The mode by which the *penny postage stamp* plates are multiplied is as follows:—240 "queen's heads" or stamps (a pound's worth) were engraved on one steel plate. This plate was then hardened, and an impression of it taken on a softened steel roller. This roller in its turn was also hardened, and softened steel plates being passed under it, an impression precisely like that of the *original plate* was produced on each of them. These plates were then hardened and employed for printing the penny postage stamps for sale. They last a long time; and when thy are worn out, they are destroyed, and their place is supplied by fresh ones, which are from the cylinder before referred to, which continues ready to supply any number that may be required. Even if it were worn out, other cylinders might be produced from one or more of the plates which have received its impression, or the original plate might again be had recourse to. Thus, although only one plate has been engraved, upwards

of 10,000 fac similes of it have been produced, from which have been printed the many millions of stamps which have been used since the introduction of the penny postage. Bank-note plates are reproduced in the same manner.

Professor Calvert thus describes an easy means of REPRODUCING *prints, engravings, writings*, &c., on *paper*, as well as fac similes of them on *plates* of *copper, steel*, and *silver*, which has been very recently discovered. A *piece of paper* is dipped in a *weak solution of starch*, and left to dry. It is then moistened with *dilute sulphuric acid*. The engraving to be copied is now put over the *vapour of iodine*, and left there for the space of about five minutes, by which time the iodine will have fixed itself on every part that is black. The prepared engraving is next applied to the sheet of paper, and the two are pressed together for a minute or two, when the engraving is transferred. To *engrave the design* on *copper* or *silver*, the engraving, after being exposed to the iodine fumes, is laid on the metallic plate, and the two are pressed as before; after which, if it is *copper*, it is exposed to the fumes of *hartshorn* or *ammonia*, washed, and dried; but if it is *silver*, it is treated as a daguerreotype plate, holding it over the *vapour of mercury*, and the engraving is produced. A more simple means still is to put the engraving over the *fumes of orpiment* for a few seconds, and then to place it on a *plate of copper*, and press it, when the engraving sinks into the plate. The practical value of these statements remain to be decided.

ENTERITIS. See *Inflammation of the Bowels.*

ENTOMOLINE. The same as *chitine.*

ENTOZOA. *Parasitic animals* which infest the bodies of other animals. See *Invermination* and *Worms.*

ENURESIS. See *Urine.*

EPHIALTES. See *Nightmare.*

EPIDEMIC. An *epidemic disease* (*epidemic; epidemy;*) is one which seizes a number of people at the same time and in the same place, but which is not dependent on any local cause. When a disease is peculiar to a people or nation, and appears to depend on local causes, it is said to be *endemic* or *enchorial.* Thus *Asiatic cholera* may be taken as an example of the first, and the *agues* of low countries, and the *goitre* of the Alps, as examples of the other.

EPILEPSY. Syn. *Falling Sickness; Epilepsia, Morbus Caducus,*—Lat. The popular name of this disease arises from the patient, when attacked by it, suddenly falling to the ground. The other leading symptoms consist of convulsions, stupor, and, generally, frothing at the mouth. It comes on by fits, which after a time go off, leaving a certain amount of lassitude and drowsiness behind. Sometimes certain peculiar symptoms precede the attack. Among these, a sensation of coldness or of a current of cold air from the extremities of the body towards the head (*aura epileptica*), palpitation, flatulency, stupor, and an indescribable cloud or depression, are the most common. The occurrence of these symptoms are not, however, uniform, even in the same patient; but it generally happens that the party falls down suddenly, and without the slightest warning.

Epilepsy is often *symptomatic* of *other affections*, as excessive irritation of the primæ viæ from worms, indigestible or noxious food, or poison; or it depends on local injuries, particularly those of the head, accompanied with lodgements of water on the brain, tumours, pressure, &c. Violent affections of the nervous system, sudden frights or fits of passion, violent mental emotions, the sudden suppression of old evacuations, and in childhood, difficult teething, are also common causes of sympathetic epilepsy. Occasionally it arises from mobility of the sensorium induced by plethora, or by excessive debility. In such cases the *treatment* must be energetically directed to the removal of the exciting cause.

When *epilepsy* occurs as an *idiopathic* or *primary affection*, or cannot be referred to any apparent cause, more especially when the attack commences about the age of puberty, and the fits are frequent, it is generally hereditary, and there is great danger of its terminating either in apoplexy, or lunacy or imbecility.

The *treatment* of *idiopathic epilepsy* is principally directed to the improvement of the general health, and the diminution of nervous irritability by sedatives and tonics. Among the first, *camphor, ether, henbane, hemlock, musk, oil of cajeput, opium*, and *morphia*, and more recently, *hydrocyanic acid*, have been principally relied on. Among the second, *bark, cascarilla, quinine, strychnia, valerian*, the *sulphate of iron, zinc*, and *copper, arsenious acid*, and *nitrate of silver*, have each their zealous advocates. The objection against the last preparation is the danger of its disfiguring the patient by tinging the skin of a permanent dull leaden hue. In cases accom-

panied with *plethora*, a low diet, daily out-of-door exercise, and the frequent use of aperients, with occasional blistering, cupping, and other depletive measures, are indicated; whilst in those marked by *inanition* and *debility*, an entirely opposite course must be adopted. When the disease is complicated with SYPHILIS, a mild course of *mercury* may be given; and when with SCROFULA, *iodine*, *iodide of potassium*, or *cod-liver oil*, assisted by sea-bathing, will be proper.

Among *other methods of treatment* may be mentioned the administration of an *active emetic* or *purgative*, twice weekly, in the morning, when the stomach is empty. The *first* has now few supporters; but the *second* is said to be often productive of great benefit.

During a fit of epilepsy the only thing that can be done for the patient is to prevent the sufferer injuring himself, and to loosen every part of his dress that presses on the head, neck, or chest. When *premonitory symptoms* occur, a *brisk emetic*, a large dose of *laudanum and ether*, a *cold plunge* or *shower-bath* (when not contra-indicated), or anything else which gives a sudden shock to the system or raises its tone, frequently prevents the accession of the fit.

Epilepsy *more frequently attacks* children than adults, and boys than girls. "Its returns are (frequently) periodical, and its paroxysms commence more frequently in the night than in the day, being somewhat connected with sleep." It is sometimes counterfeited by street impostors in order to excite the charity of the passers-by.

EPIPASTICS. See *Blisters* and *Vesicants*.

EPITHEM. Syn. *Epithema*,—Lat. Any external liquid medicine for local application; as an embrocation or lotion. Some writers confine the term to those preparations which are intended to be applied by means of a cloth dipped into them. See *Lotions*, *Liniments*, *&c.*

EPITHEM (Astringent). Syn. *Epithema Astringens*,—Lat. *Prep.* 1. *Powdered ice*, 7 dr.; *powdered catechu*, 1 dr.; mix.

2. (Brera.) *Powdered bole* and *rhatany*, of each, 1 oz.; *vinegar of roses*, q. s. to form a paste. Both are applied to the nostrils and forehead to stop bleeding at the nose.

EPITHEM (Glycerine). Syn. *Epithema Glycerinæ*, — Lat. *Prep.* (Mr. Startin.) *Glycerine*, 1 oz.; *rose water* and *lime water*, of each, 3 or 4 fl. oz.; *powdered gum tragacanth*, q. s. to form a thin mucilage. In scalds, burns, and excoriations.

EPITHEM (Vesicating). Syn. *Epithema Vesicatorium*,—Lat. *Prep.* (Alibert.) *Rye* or *barley meal*, made into a paste with *vinegar*, and 30 to 40 gr. or more of *powdered Spanish flies* sprinkled over the surface.

2. (Ph. L. 1746.) *Spanish flies* (in fine powder) and *wheat flour*, equal parts, made into a paste with *vinegar*, q. s. As a blister.

EPITHEM (Volatile). Syn. *Epithema Volatile*, *E. Ammoniæ*,—Lat. *Prep.* (Ph. L. 1764.) *Common turpentine* and *water of ammonia*, equal parts. An excellent counter-irritant; either with or without the addition of a little *olive oil*.

EQUISETIC ACID. An acid compound obtained by Braconnot from the herb *equisetum fluviatile* (Linn.) or *great water horse-tail*, in which it exists in combination with magnesia. See *Aconitic* and *Pyrocitric Acid*.

EQUIVALENTS (Chemical). Syn. *Atomic Weights*, *Combining do.*, *Combining Numbers*, *&c.* The definite proportion in which chemical substances combine with each other, forming new compounds, referred to some common standard of unity. *Hydrogen*, from it being the substance which combines with others in the smallest relative weights or proportions, is generally taken for this standard of unity by British chemists. By assuming the equivalent of hydrogen as 1, the equivalents of all other bodies may be represented by certain multiples of this unit, which, for all practical purposes, may be expressed with sufficient accuracy in whole numbers. On the Continent the equivalents of *oxygen* (= to 8 on the common scale) is taken at 100, and is assumed as the standard of comparison. On this scale, the equivalent of hydrogen is 12·5.

The *equivalent of a compound body* is equal to the sum of the equivalents of its elements. Thus, *water* is composed of 1 proportion by weight of *hydrogen* (= 1), and 8 proportions by weight of *oxygen* (= 8), and its equivalent is the sum of these quantities (1 + 8 = 9).

The *equivalents* or *combining weights of bodies* are determined by the rigid and exact analysis of their compounds, as well as by the production of the latter by synthesis. The consideration of the subject belongs, however, to pure chemistry.

Some writers distinguish between the *equivalent weights* and the *atomic weights* of bodies; but in fact, the two are in almost every case the same, and the terms, as far as all practical purposes are concerned, may be regarded as synonymous.

A *knowledge* of the *equivalents of bodies*,

both simple and compound, is invaluable to the chemist and manufacturer, as by it alone can we determine with certainty the proper proportions to employ to effect a given object, or to produce a given article; whilst by it we can discover whether our processes are economically conducted, and the greatest possible product obtained from any given weight of materials. See *Affinity*, *Decomposition*, *Formulæ*, and *Symbols*, and the *Table of Equivalents* in the Appendix.

EQUIVALENTS (Volumetrical). Syn. *Equivalent Volumes.* When gases enter into chemical union with each other, the combination invariably takes place either between equal volumes, or between volumes which bear some very simple relation to each other. The same is also the case with the vapours of complex volatile liquids when they unite with the gases or combine among themselves. The proportions, by measure, in which these substances combine, is termed their equivalent volumes.

The *equivalent volume of a gas* or *vapour* (which it is often important to know) is found by *dividing* its *equivalent weight* by its *specific gravity*. Thus—

	Sp. gr.	*Equiv. wt.*	*Equiv. vol.*
Hydrogen .	0·0693	1·0	14·43
Nitrogen .	0·972	14·0	14·37
Oxygen .	1·106	8·0	7·23
			&c. &c.

ERBIUM. According to Prof. Mosander, the substance usually called *yttria* is a mixture of the oxides of three metals—*yttrium*, *erbium*, and *terbium*, which differ in the character of their salts, and in some other important particulars. The first is a powerful base; the others, very weak ones. The latter are separated with extreme difficulty, and possess no practical importance. See *Yttrium*.

EREMACAUSIS. Slow burning; decay. This expression is applied by chemists to the peculiar decomposition which moist organic matter undergoes, when freely exposed to the air, by the oxygen of which it is gradually burned or destroyed, without any sensible elevation of temperature. See *Putrefaction*.

ERGOT. Syn. *Ergot of Rye*, *Spurred Rye*, *Horned do.*, *Cockspur do.*, *Obstetrical do.*; *Ergota*,—Ph. L. & E. *Secale Cornutum*,—Baldinger. *Clavus Secalis*, *Secalis Mater*, *Secale Maternum*, *&c.*,—Lat. var. "The seed" of "*secale cereale*" (Linn.) or *common rye*, "diseased by a parasitic fungus."—Ph. L.

Ergot of rye deteriorates greatly by age, being subject to the attacks of a description of acarus resembling the cheese mite, but much smaller, which destroys the whole of the internal portion of the grain, leaving nothing but the shell, and a considerable quantity of excrementitious matter. To prevent this, the ergot should be well dried, and then placed in bottles or tin canisters, and closely preserved from the air. The addition of a few cloves, or drops of the oil of cloves, or strong acetic acid, or a little camphor, or camphorated spirit of wine, will preserve this substance for years in close vessels. M. Martin proposes to steep the dry ergot in *strong mucilage*, and then to dry it on a sheet of white iron. This operation he repeats once or oftener, and finally preserves the prepared and thoroughly dried ergot in a well-corked glass flask. ('Jour. de Chimie Med.') The *wholesale druggists* generally keep it in well-covered *tin canisters* or *tin boxes*.

Ergot of rye is much used to restrain uterine hemorrhage, and to accelerate the contraction of the uterus in protracted labour. It is also much used as an emmenagogue. *Dose.* To facilitate labour, 10 to 20 gr., either in powder or made into an infusion; repeated at intervals of 20 or 30 minutes until 3 or 4 scruples have been taken. In other cases (leucorrhœa, hemorrhages, &c.) the *dose* is 5 to 12 gr., three times daily, for a period *not longer* than a week or ten days at a time. See *Decoctions*, *Extracts*, *Infusions*, *Oils*, *Tinctures*, *&c.*

ERGOTINE. Syn. *Ergotina*,—Lat. *Prep.* 1. (Bonjean's.) *Powdered ergot* is exhausted with *cold water*, by displacement, and the resulting solution is heated in a water bath to about 200° Fahr., and filtered; the filtered liquor is then evaporated to the consistence of a syrup, and when cold, is treated with *rectified spirit*, in considerable excess, to precipitate its gummy matter; after repose, the clear portion is decanted, by the heat of a water bath to the consistence of a soft extract. *Prod.* $15\frac{0}{0}$. According to M. Bonjean, this preparation possesses all the "hæmostatic" without any of the "poisonous" qualities of ergot. It has a reddish-brown colour, a bitter taste, and an odour somewhat resembling that of roasted meat. Its aqueous solution is red, limpid, and transparent. *Dose.* 4 to 10 gr., either made into a pill or dissolved in water.

2. (Wigger's.) *Powdered ergot* is first digested in *ether*, to remove the fatty matter, and then in *boiling alcohol*; the alcoholic tincture is evaporated and the

resulting extract treated with *water;* the undissolved portion dissolved in hot *alcohol* and filtered, yields *pure ergotine* by gentle evaporation. *Prod.* $1\frac{1}{4}$ %. It has a brownish-red colour; is resinous, acrid, bitter, insoluble in water and ether, soluble in alcohol, and poisonous. It evolves a peculiar odour when warmed. Its therapeutical action has not been determined. See *Extracts.*

ERRHINES. Syn. *Errhina*,—Lat. Substances applied to the pituitary membrane of the nose, for the purpose of producing an increased discharge of nasal mucous. When they are given to excite sneezing, they are called *sternutatories* or *ptarmics*, (sternutatoria *vel* ptarmica.) *Asarabacca*, *euphorbium*, *several of the labiatæ* (herbæ *vel* flores), *sal ammoniac*, *powdered sugar*, *subsulphate of mercury*, *tobacco*, and *white hellebore*, are the principal substances of this class.

Errhines act as local irritants, and are occasionally employed in chronic affections of the eyes, face, ears, and brain; as in amaurosis, ophthalmia, deafness, weak sight, headache, &c.

According to Dr. Hall "actual sneezing may frequently be prevented, after the inspiration by which it is usually preceded has occurred, by forcibly rubbing the end of the nose." ('Diseases, &c., of Nerv. Syst.')

ERRHINE (Alum). Syn. *Errhinum Aluminis*,—Lat. *Prep.* (Radius.) *Alum* and *Armenian bole*, of each, 1 dr.; *kino*, ½ dr.; *red oxide of iron*, 2 dr.; (all in powder;) mix, and triturate. In bleeding at the nose. A little is snuffed up the nostrils.

ERRHINE (Hæmostatic). Syn. *Errhinum Hæmostaticus*,—Lat. *Prep.* From *powdered catechu*, 1 dr.; *opium*, 5 gr.; *sugar*, 2 dr. As the last.

ERUCINE. A yellowish-white substance, discovered by Simon in white mustard (*sinapis alba*). It is soluble in ether and essential oils, and in boiling alcohol.

ERUPTIONS (of the skin). For brevity and convenience these may be divided into 5 classes:—

Animalcular eruptions; due to the presence of minute animalcules (*acari*), which burrow and breed in the scarf-skin, and occasion much local irritation. See *Itch.*

Papular Eruptions; Dry Pimples. In these the surface is raised into little elevations or *pimples*, which sometimes show themselves on the surface, and at others are only appreciable by the touch. They are usually accompanied with a greater or less degree of cutaneous irritation, and troublesome itching, in attempting to relieve which they are frequently converted into disagreeable and painful sores and excoriations, which are often difficult to heal.

Treat. In simple cases, where there is not much disarrangement of the general health, these eruptions commonly yield to the occasional use of *mild saline aperients*, and *warm* or *tepid bathing*, or *frequent ablution* with *warm soap-and-water.* Sea-bathing is also a powerful remedy. Stimulants of all kinds should be avoided, and *ripe fruit* and *vegetables* should form a prominent part of the diet. *Lemonade*, made by squeezing a lemon into a tumbler of water, and sweetening the mixture with a little sugar, is one of the best beverages on these occasions. To relieve the itching, brisk friction with a flesh-brush may be had recourse to, followed by the use of a lotion formed by adding the *juice of a lemon* or *a wine-glassful* of *distilled vinegar*, to ¾ of a pint or a pint of *water*, either with or without the addition of a table-spoonful of *glycerine.* Occasional single pimples, depending on local causes, generally require no particular treatment. See *Lichen*, *Prurigo*, *Red Gum*, and *Tooth-rash.*

Pustular Eruptions; Mattery Pimples. These are distinguished by the pimples (*pustules*) containing an opaque yellow fluid or matter (*pus*, *lymph*). "They are generally developed on a ground of inflamed skin; and the degree of this inflammation of the skin is the basis of their division into two groups, termed technically, *impetigo* and *ecthyma.* The *former* presents the *slighter* degree of inflammation, and, sometimes, there is scarcely any redness of the skin; the *latter* is always accompanied by considerable inflammation and redness." "The little bubbles attain their full size in the course of two or three days, and either dry up *without breaking*, or more frequently burst and then dry, forming a hard crust, which offers considerable variety of colour. being sometimes yellowish, sometimes brownish, and sometimes almost black." The latter form is popularly known as "*crusted tetter.*" In *ecthyma* the pustules "are generally of the size of a split pea, and surrounded at their base by a broad halo of redness. They are usually *separate*, not *clustered* like *impetigo*, scattered over various parts of the body, and followed either by a hard black crust or by a sore."

Treat. The inflammation and pain may be generally alleviated by the application of a lotion formed of *rectified spirit of wine*,

1 part; and *water*, 5 or 6 parts; to which a table-spoonful of *distilled vinegar* is often added. The "crusts" or "scabs," when they become hard or troublesome, may be removed by a *warm fomentation* or an *emollient poultice;* a little *simple cerate* being afterwards applied to allay irritation. When the constitution is full and inflammatory (as it usually is in *impetigo*), a depletive treatment may be adopted; when it is low and debilitated (as it usually is in *ecthyma*), *tonics* and a more liberal diet, with the free use of *lemon juice diluted with water*, as a beverage, should be had recourse to. Sea-bathing is also highly useful. See *Impetigo.*

Scaly Eruptions; Dry Tetter. This is a form of inflammatory condition of the true skin (*derma*), which commonly makes its appearance as a small, dull red, salmon-red, or liver-coloured spot, slightly raised above the level of the surrounding skin, constituting a broad, flat, pimple-like prominence, about the size of a split pea. Upon the surface of this prominence the scarf-skin becomes slightly roughened, and after a little while, a very distinct but circular scale is produced, which increases in thickness by the addition of fresh layers, and after assuming various colours in different varieties of the disease, ultimately separates and falls off, either leaving a permanently bare surface, or being followed by crops of other like scales, which also fall off, and are replaced in rapid succession. This class of eruptions is more obstinate than any of the other varieties, and often defies medical skill. Each particular form generally requires special treatment. In all, however, endeavours should be made to restore the general health of the body in the manner which existing circumstances may indicate. The *red meats*, *ripe fruit*, and *antiscorbutic vegetables*, should form a large portion of the diet; and *sea-bathing*, or *shower*, *sulphuretted*, or *iodurettted baths*, should be taken daily, if possible. Dry friction with a *flesh-brush*, and *daily exercise* to perspiration, are also highly recommended. See *Lepra*, *Pityriasis*, *Psoriasis*, *Tetters*, *&c.*

Vesicular Eruptions; Watery Pimples. These consist of little vesicles or bladders filled with a small quantity of a transparent and colourless liquid. They result from a similar action to that which produces ordinary blisters. "Inflammation is excited in the sensitive skin by an inward or outward cause, and the inflamed vessels pour out the watery part of the blood, and so raise the scarf-skin from off the sensitive layer, in the form of a small dome, which in some situations is conical, in others a segment of a sphere." They present "great variety in point of number and size; some are so minute as to be scarcely discernible without close inspection, whilst others increase to the magnitude of a hen's egg. They are numerous in the inverse ratio of their size; the smaller ones being very abundant, and the larger ones, scanty and few." These distinctions have led to their classification. "The smaller vesicles, which are about the size of a pin's head, and are often clustered together in vast numbers, are known by the term *eczema;* when they are of larger dimensions, being equal in bulk to a small pea, they are termed *herpes;* when of somewhat larger size they are designated *rupia;* and when they assume the bulk of blisters, they are termed *pemphigus.*

Treat. This consists chiefly in the due attention to the general principles of health—*cleanliness*, *exercise*, *food*, and *raiment*, as already pointed out, assisted by such special remedies as the particular case or circumstances may demand. *Antiphlogistics* or *tonics* must be had recourse to, according to the condition of the system, and local irritation allayed by the usual means. Simple cases frequently yield to a dose or two of some saline aperient and a change of diet. See *Eryspielas*, *Herpes*, *Pemphigus*, *Rupia*, *Tetters*, and *Skin.*

ERVALENTA. The *meal of lentils* (ervum lens,—*Linn.*; lens esculenta,—*Monch.*) variously doctored with other substances. In some cases the article sold under the name does not contain a particle of lentil meal.

Prep. 1. (Paris Ervalenta.) *Indian-corn meal* (fine), and *bean flour*, of each, 14 *lb.*; *salt* and *sugar*, of each, 1 *lb.*; mix, and pass the compound through a sieve.

2. (Warton's.) *Lentil powder*, 1 part; *durra* or *Turkey millet flour* (sorghum vulgare), 2 parts. Some parties assert that it contains a large quantity of the flour of Indian corn. See *Revalenta* and *Lentils.*

ERYNGO. Syn. *Eryngium*,—Lat. The *root* of the *eryngo campestre*, a plant common in middle and southern Europe. It is sweet, aromatic, and tonic, and formerly enjoyed much repute in gonorrhœa, suppressed menstruation, and visceral obstructions generally, especially those of the gall-bladder, liver, and uterus. *Candied eryngo* (*eryngium conditum*, *eryngii radix condita*), according to Lindley, "has the credit of being a decided aphrodisiac," and has a considerable sale. *Eryngium aquaticum* (bitter snake-weed) and *E. maritimum*

(sea eryngo, sea holly,) furnish the eryngo of the Ph. U. S. See *Candy*.

ERYSIPELAS. Syn. *St. Anthony's Fire, The Rose.* A peculiar form of inflammation which chiefly attacks the skin, and is generally accompanied or followed by an eruption of a very red colour, sometimes vesicular, and by tumefaction. It commonly attacks the head and face, and is at its height from the third to the sixth day, but the duration and progress of the symptoms are variable. From the eighth to the twelfth day the eruption usually scabs or scales off. Sometimes suppuration occurs, especially of the eyelids and scalp, and during the latter stages of the disease there is, in general, a tendency to debility. In many cases erysipelas is attended by typhoid symptoms, and is then a dangerous and often fatal disease.

Treat. Aperients and diaphoretics, assisted by a cooling diet. When the inflammatory symptoms run high, *blistering* and *cupping* are frequently had recourse to. Local irritation may be subdued by *milk-and-water*, or *cooling* or *evaporating lotions*, or by sprinkling *starch*, *hair-powder*, or *arrow-root*, on the part. The tendency to debility in the latter stages should be combated with *bark*, *quinine*, or other like *tonics*. When shiverings, sickness, and delirium attend the height of the disorder, *wine*, *bark*, *ammonia*, and other *stimulants*, are usually prescribed, and depletion must be avoided. The same treatment is also adopted in the gangrenous forms of the disease, to which doses of *opium* and *calomel* are also commonly added. When suppuration and sloughing of the cellular membrane have taken place, it is usual to make *incisions* to give exit to the discharge, and relieve the tension of the limb. These may be about 1½ inch in length, and from 2 to 4 inches apart, and should be made in the direction of the long dimensions of the limb. Mr. Higginbottom, of Nottingham, applies (freely) *lunar caustic* to the inflamed skin, and also to the healthy skin, to the extent of an inch or more beyond it. The result, in many cases, is a complete change of action in the part, and a resolution of the disease. *Iodine paint* is often successfully used in the same way.

Erysipelas is generally symptomatic of a debilitated or bad constitution. It is also a common sequel of surgical operations in crowded and ill-ventilated hospitals, where it often appears to be contagious. In these cases, cleanliness, ventilation, and change of air, are the only remedies. We need scarcely add, that this disease should never be tampered with, but the best medical advice sought, whenever it can be procured.

ERYTHORETINE. Syn. *Red Resin of Rhubarb.* A yellow or reddish yellow substance forming one of the three resins found by Schlösberger and Dœpping in rhubarb. It is very soluble in alcohol; less so in ether; with ammonia and potassa it forms soluble compounds of a rich purple colour. See *Rhubarb.*

ERYTHRIC ACID. *Prep.* The lichen *roccella tinctoria* (Canary or herb-archel) is boiled with *milk of lime*, and the filtered solution precipitated with *hydrochloric acid;* the dried precipitate is dissolved in *warm alcohol*, and filtered; as the solution cools crystals of *erythric acid* are deposited.

Prop., &c. Feebly acid; colourless; inodorous; scarcely soluble in water; soluble in alcohol and ether; chloride of lime turns its solutions of a blood-red colour.

ERYTHRIC ACID (of Brugnatelli). A red substance obtained by the action of *nitric acid* on *lithic acid.*

ERYTHRINE, *Amarythrine*, *Erythriline*, *Pseudo-erythrine*, and *Telerythrine.* Substances obtained by Kane and Heeren from *roccella tinctoria*, *parmelia roccella*, *lecanara Tartarea*, *&c.* They are of little practical importance.

ERYTHROGEN. A green tasteless liquid discovered by M. Bizio in the gall-bladder of a person who died of jaundice. Ammonia and nitric acid turned it of a deep purple colour.

ERYTHROLEINE, *Azolitmine*, *Azoerythrine*, *Erythroleic Acid*, *Erythrolitmine*, and *Spaniolitmine.* Substances obtained from *litmus* and *archil* by Kane. They are little known, and have not been applied in the arts.

ERYTHRONIUM. See *Vanadium.*

ERYTHROPROTIDE. A soluble brown extract-like substance, formed along with *protide* and *leucine*, when *albumen*, *fibrine*, or *caseine*, is boiled in a *solution of caustic potassa* as long as ammoniacal vapours are evolved. The liquid neutralized with *dilute sulphuric acid*, and evaporated to dryness, gives up these substances to *boiling alcohol.*

ERYTRARSINE. A red amorphous powder, frequently produced in the preparation of *chloride of kakodyle.* It is insoluble in water, alcohol, ether, or caustic potassa; and by exposure to the air is converted, chiefly, into arsenious acid.

ESCHAROTICS. Syn. *Escharotica,*—Lat. Substances that destroy the texture of living organic bodies, with the production of an eschar or scab. Escharotics

have been divided into two classes—*mechanical* and *chemical*. Among the former are actual cauteries, as a *heated iron, moxas, &c.;* among the latter, are all those substances commonly known as *caustics*. Some writers have subdivided *chemical escharotics* into ERODING ESCHAROTICS; as *blue vitriol, red precipitate, burnt alum, &c.;* and into CAUSTIC ESCHAROTICS; as *lunar caustic, pure potassa, strong sulphuric acid, nitric acid, &c.;* but these distinctions possess little practical value. "In *cauterizing* with a heated iron, this should be at a white heat, as, at this temperature, it occasions less pain to the patient, from its causing an immediate death of the part to which it is applied." "The surrounding surface should be protected by some non-conductor of heat, but not by wet paper or cloth, as the sudden extrication of steam will produce a blistered surface around the burn, and will much increase the pain." (Dr. R. E. Griffith.) See *Caustics, Solutions, &c.*

ESCUBAC. See *Usquebaugh.*

ESCULENTS. Substances used for food. The more important ones are noticed under their respective heads.

ESCULIC ACID. A peculiar acid found by M. Bussy in the bark of the horse-chesnut. It is but little known, and has not been applied to any use.

ESENBECKINE. Syn. *Esenbeckina.* An alkaloid found by Buchner in a febrifugal bark, called *quinquina de piautri*, which he wrongly supposed was produced by the *esenbeckia febrifuga* instead of *exostemma souzanum.* (Guibourt; Lindley.)

ESPRIT. (Fr.) *Spirit.* This term is commonly applied to *alcoholic solutions* of the *essential oils*, and to various *odorous* and *aromatic essences* sold by the perfumers and druggists as articles of the toilet. See *Essences, Spirits, &c.*

ESSENCE. Syn. *Essentia,*—Lat. The active and characteristic portion of a substance, or that on which its most remarkable properties depend. The term has been very loosely applied to various preparations presumed to contain these essential principles or qualities disencumbered of grosser matter. Modern systematic writers generally restrict its application to the volatile oils obtained from vegetable substances by distillation, or to a strong solution of them in alcohol. In *pharmacy* and *perfumery* the word *essence* is applied to *concentrated preparations* that differ vastly from each other. Thus, *concentrated infusions, decoctions, liquors, solutions,* and *tinctures,* are frequently called "*essences*" by those who vend them; but the term "*fluid extracts*" would be more appropriate, if those already mentioned are not deemed sufficiently showy and attractive. We shall here confine ourselves to a brief notice of the principal *compound essences*, or those that undergo some preparation beyond being merely extracted from vegetables by distillation along with water. The latter will be considered under the article *Oils.*

The *concentrated preparations* of the *pharmaceutist*, termed "ESSENCES," are mostly prepared by digesting the *active ingredient* or *ingredients* in *rectified spirit of wine*, either with, or without the addition of a certain portion of *water;* or they are *extemporaneously* formed by dissolving a portion of the *essential oil of such substances* in the *spirit.* In this way are made the *essences of lavender, musk, ginger, &c.* When it is desired only to obtain the *aromatic* and *volatile portion* of the ingredients, the latter are usually digested in the *spirit* for a few days, and then submitted to distillation, when the alcohol comes over loaded with aromatic essential oil, or other volatile matter. In this way are prepared most of the *fragrant essences* of the *perfumer* and *druggist*, when simple solution of the essential oils in alcohol is not resorted to. In *many cases* the active principles of the ingredients, are partly *volatile*, and partly *fixed*, or at least do not *readily* volatilize at the temperature at which alcohol distils over. This is the case, for instance, with the active portion of *ergot* and *Jamaica ginger.* In such cases digestion alone should be adopted. When the *principles of organic substances*, of which it is desired to obtain a concentrated solution, are *resinous* or *oily*, or *little soluble in weak spirit* (which is mostly the case), the strongest *rectified spirit of wine* should alone be employed. In the *preparation of essences without distillation*, the method by *percolation* or *displacement* is preferable to that of simple maceration and expression, when the nature of the ingredients and other circumstances render it applicable, as it is not only more economical, but a more concentrated solution may thereby be obtained. At the same time, however, the reader should remember, that this mode of operating requires much greater experience and skill to ensure success than the former method. This clumsiness of manipulation is the common cause of the failures which are so frequently met with in the preparation of these articles.

The *ingredients* for the *preparation of essences* must undergo the same operations

of bruising, powdering, or slicing, as directed under "*Tinctures*," previous to *digestion* in the spirit, or other menstruum; and the length of time they should be allowed to infuse, when this method alone is adopted, should not be less than ten days; but this time may be advantageously extended to a fortnight, or even longer. During the whole of this period, *frequent agitation* should be employed, and when the ingredients are so bulky as to absorb the whole of the fluid, the vessel which contains them should be securely fastened by a bung or stopper covered with bladder, and inverted every alternate day. By this means, every portion of the ingredients will be equally exposed to the action of the menstruum. In all such cases the method of *displacement*, or *percolation*, is preferable. For the *essences* used as *perfumes* and for *flavouring*, not only must the spirit be *perfectly tasteless* and *scentless*, but it must be also *quite devoid of colour*.

The following formulæ embrace most of the essences met with in the shops. Those not found among them may be readily prepared by applying the general directions given above, or by employing the formula given for the preparation of the essence of some similar substance, merely varying the characteristic ingredient. Thus, were it desired to form an *essence of ambergris* or of *myrrh*, and no formulæ could be found for these preparations, the tyro would consider in what menstruum the active principles of these substances were most soluble. This, he would immediately see by reference to their properties, is *rectified spirit of wine*. He would next have to decide on the proper *strength* of his essence. In this he must be guided either by the strength of the like preparations of other makers, or by his own judgment of what would be useful, novel, or convenient. Suppose he decided that his essence should represent 1–10th of its weight of the solid ingredient. He would then take 2 *oz.* of *ambergris* or *myrrh*, and 20 *oz.* of *rectified spirit*, which he would digest together for 10 days or a fortnight in the manner described above. Had the required preparation been an *essence of senna* (for example), he would probably recollect, or might easily ascertain by reference, that the active properties of senna are soluble in both *water* and *weak spirit*. Then to make an essence 4 times as strong as the *tincture of the pharmacopœia*, 7 *oz.* of *senna*, and 1 pint of *proof spirit*, should be employed, with due digestion, as before. The same applies to other preparations. See *Concentration*, *Concentrated Decoctions*, *Infusions*, *Liquors*, *Spirits*, *Tinctures*, *&c.*

ESSENCE (Aconite). Syn. *Essentia Aconiti*,—Lat. *Tinctura A.*,—Ph. Baden., 1841. *Prep.* From *aconite* (herb, dried and powdered), 8 oz.; *rectified spirit*, 16 oz.; macerate for 4 days at a temperature of 68° Fahr., press and strain; the marc or residuum is again macerated with (a little) spirit, and pressed as before, so that the weight of the mixed tinctures may amount to double that of the herb. *Dose.* 3 to 6 drops. See *Tinctures*.

ESSENCE (Allspice). Syn. *Essence of Pimento; Essentia Pimentæ*,—Lat. *Prep.* From *essential oil of pimento* or *allspice*, 1 *fl. oz.*; *strongest rectified spirit of wine*, 1 pint; agitate until perfectly united, and the next day decant the clear portion, if there is any sediment. *Used* to make *pimento water*, and by cooks and confectioners as a "flavouring".

ESSENCE (Almonds). Syn. *Essence of Bitter Almonds*, *Ess. of Peach Kernels*, *Ess. of Ratafia*, *Ess. of Noyeau*, *Quintessence of do.*, *Almond Flavour*; *Essentia Amygdalæ*, *Ess. A. Amaræ*,—Lat. *Prep.* 1. From *essential oil of almonds*, as the last.

2. (Pereira.) *Essential oil of almonds*, 1 fl. oz.; *rectified spirit*, 7 fl. oz.

Uses, &c. It is added to *wine*, *cordials*, *perfumery*, *pastry*, *&c.*, to impart an agreeable nutty flavour or aroma. It is also employed to prepare *cherry-laurel*, *peach-kernel*, and *bitter almond water*. A large quantity is consumed by the confectioners, and by wine-merchants to "improve" their sherries, and to give Cape wine a sherry flavour. It should be used in very small quantities, as it is very powerful, and, in quantity, *poisonous*. A *few drops* are sufficient for *several pounds of pastry*. The *first* formula is that used in trade. The *second* is sometimes used by the druggists, and is occasionally vended under the name of "*Concentrated Essence of Bitter Almonds*," *&c.* The directions for purifying the almond oil from *hydrocyanic* before dissolving it in the *spirit* given in more than one book of receipts published since our last edition, are absurd, as in this way the oil loses much of its characteristic odour and flavour, and by keeping gradually becomes nearly destitute of both. See *Essential Oils*.

ESSENCE (Ambergris). Syn. *Essentia Ambræ-Griseæ*, *E. A. Simplex*, *Tinctura A. Concentrata*,—Lat. *Prep.* 1. *Ambergris* (cut very small), 5 dr.; *rectified spirit*, 1 pint; place them in a *strong bottle* or *tin can*, secure the mouth very firmly, and

expose it to the heat of the sun, or in an equally warm situation for 1 or 2 months, frequently shaking it during the time; lastly decant, and filter through paper.

2. (Guibourt.) *Ambergris*, 1 dr.; *rectified spirit*, 3 oz.; digest 10 or 12 days.

3. (Redwood.) *Ambergris*, 2½ dr.; *rectified spirit*, 1 pint; macerate for 14 days. Chiefly used as an element in other perfumes. The first is the formula employed by the London houses.

ESSENCE (Ambergris). Syn. *Essence of Ambergris and Musk, Concentrated Tincture of do.; Essentia Ambræ-Griseæ* (Odorata), *E. A. et Moschi, E. Regia*,—Lat. *Essence Royale*,—Fr. *Prep.* 1. *Ambergris* (cut small), ¾ *oz.*; 1 or 2 *fresh-emptied musk pods* (or *musk*, 12 gr.); *rectified spirit*, 1 pint; proceed as in No. 1, (*above.*)

2. *Ambergris*, 2½ *oz.*; *bladder musk*, ½ *oz.*; *spirit of ambrette* (purple sweet sultan), 1 gall.; as last.

3. *Ambergris*, 2½ *oz.*; *bladder musk*, 1 *oz.*; *spirit of ambrette*, 1 gall.; as before. The fragrance of the above, especially of the last two, is very powerful, and is much esteemed.

4. *Ambergris*, ½ *oz.*; *musk* and *lump sugar*, of each, ¼ *oz.*; triturate together in a Wedgwood-ware mortar, adding *oil of cloves*, 20 drops; *true balsam of Peru*, 30 drops, and enough *essence of jasmine* or *tuberose* to convert it into a *perfectly smooth paste*; then put it into a strong bottle with *rectified spirit*, 1 quart; observing, before adding the whole of the last, to rinse the mortar out well with it, that nothing may be lost; lastly, digest for 6 or 8 weeks, as directed in No. 1, (*above.*)

5. *Ambergris*, 4 dr.; *musk*, 1½ dr.; *sand*, 3 oz.; triturate, then add of *oil of cinnamon*, 1 dr.; *oil of rhodium*, ½ dr.; *essence of roses* and *eau fleurs d'orange*, of each, ¼ pint; *rectified spirit*, 1½ pint; digest as before, (or not less than 14 days,) and decant and filter. The last two are very fine, though inferior to Nos. 2 and 3.

6. To the last (No. 5), add *civet*, 1 dr.; *salt of tartar*, 3 dr.; and an *additional* pint of *rectified spirit*. Inferior to the above, but cheaper.

Obs. Essence of ambergris is used as a perfume, and is added in small quantities to sweet-scented spirits and wines, to improve their flavour and aroma. A *very small quantity* of any one of them added to *lavender water, eau de Cologne, tooth-powder, hair-powder, wash-balls*, or a *hogshead of claret*, communicates a delicious fragrance. See *Ambergris.*

ESSENCE (d'Ambrette). Syn. *Essence of Musk Seed, Spirit of do.; Esprit d'Ambrette*,—Fr. *Prep.* 1. *Musk seed* (ground in a clean pepper-mill), 1¼ *lb.*; *rectified spirit*, 3 pints; digest for 3 or 4 weeks in a warm place, and filter.

2. *Musk seed*, 4 *lb.*; *rectified spirit*, 1 gall.; digest 10 days, add *water*, 2 quarts, and distil over 1 gall. Very fine.

ESSENCE (Ammoniacum). Syn. *Concentrated Tincture of Ammoniacum; Essentia Ammoniaci, Tinctura A. Concentrata*,—Lat. *Prep.* 1. *Ammoniacum* (in tears), 1 *lb.*, is bruised in a *very cold* marble mortar with half its weight of *coarse* and *well-washed siliceous sand* or *powdered glass*, and *rectified spirit*, ½ pint, gradually added; the trituration is continued until the whole is reduced to a smooth paste, and is then placed in a wide-mouthed bottle, and *spirit of wine*, 1½ pint, further added; the whole is then digested together for a week with constant agitation, and after sufficient repose to settle, the supernatant transparent liquid is decanted into another bottle for use.

2. *Gum ammoniacum*, 1 *lb.*, is reduced to a cream with *boiling water*, ¾ pint; as soon as the mixture has cooled a little, it is placed in a strong bottle, and *rectified spirit of wine*, 1¼ pint, is cautiously added; the mixture is then *corked down close*, and the whole macerated for a few days; the bottle is next placed in a moderately warm situation that the sediment may subside, after which the clearer portion is poured off through flannel into another bottle.

Obs. This preparation is used as a substitute for the gum in substance, for extemporaneously preparing *emulsion of ammoniacum, mixture of do., &c.* It is represented to possess fully the same amount of medicinal virtue as an equal weight of the solid gum, on which account it has a considerable sale. The product of the first formula, when well managed, is a beautiful pale brownish-coloured transparent tincture; that of the second is milky and less sightly.

ESSENCE (Ammoniacum, — Concentrated). Syn. *Essentia Ammoniaci Concentrata*,—Lat. The preparation sold under this name, and represented as *twice as strong as the gum in substance*, is generally prepared by the *first formula* given above for *Essence of Ammoniacum.* A stronger article may be prepared by a similar process, by using 1 *lb.* of *ammoniacum* to *a pint* of the *strongest rectified spirit.* As, however, a clear liquid at this strength is somewhat difficult to produce, it is very seldom

attempted by the druggists; they therefore generally content themselves with sending out the liquid at half the professed strength, leaving the *label* to confer the *additional concentration.* See *Ammoniacum.*

ESSENCE (Anchovies). Syn. *Essentia Clupeæ,*—Lat. *Prep.* 1. *Anchovies,* 1 *lb.,* are "*boned,*" reduced to a pulp in a wedgewood-ware or marble mortar, and passed through a clean hair or brass-wire sieve; meanwhile the bones and other portion that will not pass through the sieve, are boiled with *water,* 1 pint, for 15 minutes, and strained; to the strained liquor, *salt and flour,* of each, 2½ *oz.,* together with the *pulped anchovies,* are added, and the whole simmered for 3 or 4 minutes, when the vessel is removed from the fire, and as soon as the mixture has cooled a little, *strong pickling vinegar,* ¼ pint, is mixed in; it is then bottled, and the corks tied over with bladder, and either "waxed" or "capsuled." *Product,* 3 *lb.* (nearly.)

2. *Anchovies,* 7 *lb.*; *water,* 9 pints; *salt* and *flour,* of each, 1 *lb. Product,* 20 *lb.*

3. To the last, add of *Cayenne pepper,* ¼ *oz.*; the *peel of a lemon* (grated), and *mushroom catsup,* 4 *oz.* Very savoury.

4. From *British anchovies* (pickled sprats) or *young pilchards,* along with *herring liquor,* or the *drainings* of *anchovy barrels.*

Use, &c. As a sauce and condiment; when well prepared it has a fine flavour. That of the shops is usually coloured with *Venetian red* or *Armenian bole.* Of all the samples examined by the "Lancet Commissioner," there was not one which was not largely adulterated with one or other of these substances. An *infusion of cochineal,* or a *little annotta,* would form a more appropriate colouring, and would be perfectly harmless. See *Anchovy* and *Sauces.*

ESSENCE (Angelica). Syn. *Essentia Angelicæ,*—Lat. *Prep.* (Van Mons.) *Angelica root* (bruised), 1 part; *rectified spirit,* 8 parts; *water,* 16 parts; digest, and distil over 6 parts. Stomachic, carminative, and alexipharmic. *Dose.* 1 to 2 tea-spoonfuls.

ESSENCE (Aniseed). Syn. *Essentia Anisi,*—Lat. *Esprit d'anise,*—Fr. From *oil of aniseed,* as *essence of allspice* or *almonds. Used* to flavour liqueurs, and to make *aniseed water.* See *Spirits.*

ESSENCE (Anodyne). Syn. *Essentia Anodyna,*—Lat. *Prep.* 1. *Hard aqueous extract of opium* (in powder), 1 dr.; *powdered cinnamon,* ½ dr.; *rectified spirit,* 1 fl. oz.; digest a week. *Dose.* 5 to 20 drops.

2. *Extract of henbane* (recent), 5 dr.; *rectified spirit,* 2 fl. oz.; as last. *Dose.* 10 to 30 drops, Narcotic, sedative, and antispasmodic. Both are excellent preparations.

ESSENCE (Antihysteric.) Syn. *Essentia Antihysterica,*—Lat. *Prep.* 1. *Cyanuret of potassium,* 3 gr.; *powdered sugar,* 1 dr.; *rectified spirit* and *eau d'orange,* of each, 4 fl. dr.; agitate together until dissolved. *Dose.* 10 to 20 drops, in pure water; in hysteria, gastrodynia, &c. See *Antihysteric Draught.*

2. (P. Cod.) Resembles *fœtid spirit of ammonia* (which see.)

ESSENCE (Apple). Syn. *Solution of Valerianate of Amyle; Essentia Pomi Odorata,* — Lat. *Prep.* From *apple oil* (valerianate of oxide of amyle), as *essence of almonds. Used* to flavour liqueurs and confectionery.

ESSENCE (Arnica). Syn. *Essentia Arnicæ, E. A. Florum, Tinctura A. F. Concentrata,*—Lat. *Prep.* (Ph. Baden, 1841.) From *arnica flowers,* as *Essence of aconite,* —Ph. Baden. It represents half its weight of herb.

ESSENCE (Aromatic). Syn. *Essentia Aromatica,*—Lat. *Prep.* From *hay saffron,* 1 dr.; and *rectified spirit,* 6 fl. dr.; digested together; to the filtered tincture is added *oil of cinnamon* and *powdered white sugar,* of each, 1 dr.; *ether* (rect.,) 2 fl. dr.; *oil of nutmeg* and *essence of ginger,* of each, ½ dr.; after agitation and a few days' repose, the clear portion is decanted into a stoppered phial. *Dose.* 5 to 15 drops on sugar or in a glass of wine or weak spirit; in cholera, diarrhœa, spasms, &c.

ESSENCE (Bardana,—Hill's). *Prep.* (Dr. Paris.) *Guaiacum resin,* 1 part; *rectified spirit,* 3 parts (? 5 parts).

ESSENCE (Bark). Syn. *Essentia Cinchonæ, E. Corticis C.,*—Lat. *Prep.* 1. *Resinous extract of yellow bark,* 4 dr.; *rectified spirit,* 1½ fl. oz.; *tincture of orange peel,* ½ fl. oz.; *acetic acid* (Ph. L.), 1 fl. dr.; digest a week.

2. *Disulphate of quinine,* ½ dr.; *resinous extract of bark,* 2 dr.; *rectified spirit,* 2 fl. oz.; as before. *Dose.* 12 drops to a tea-spoonful, as a febrifuge and tonic.

ESSENCE (Beef). Syn. *Essence of Red Meats, &c. Prep.* 1. From *lean beef* (chopped small), 1 *lb.*; *water,* ½ pint; place them in a bottle which they will only half fill, and agitate them violently for half an hour; then throw the whole on a sieve, and receive the liquid in a jug; next boil the undissolved portion in *water,* 1 pint, for 20 minutes; strain, mix the decoction with the cold infusion, evaporate the liquid to

the consistence of a thin syrup, adding *spice, salt, &c.*, to taste, and pour the essence, whilst *boiling hot*, into bottles, jars, or (still better) tin cans, which must then be at once hermetically corked, sealed, or soldered up, and stowed away in a cold place. In this state it will keep a long time.

2. (Ellis.) Take of *lean beef* (sliced), a sufficient quantity to fill the body of a porter bottle; cork it up loosely, and place it in a pot of cold water, attaching the neck, by means of a string, to the handle of the pot; boil for 1½ to 2 hours, then decant the liquid and skim it. *Spices, salt, wine, brandy, &c.*, may be added as before. Highly nutritious and sustaining.

ESSENCE (Bergamot). See *Oils* (Volatile).

ESSENCE (Bitter). Syn. *Essentia Amara*,—Lat. *Prep.* (Ph. Den.) *Wormwood*, 4 parts; *gentian root, bitter orange peel*, and *blessed thistle*, of each, 1 part; *rectified spirit*, 45 parts; digest a week. Tonic and stomachic. *Dose.* ½ dr. to 2 dr.

ESSENCE (Bugs). See *Oxalate of Amyle.*

ESSENCE (Calumba). Syn. *Essentia Calumbæ*,—Lat. See *Infusion of Calumba.*

ESSENCE (Cambrian). See *Essence of Smoke.*

ESSENCE (Camphor). Syn. *Camphor Drops, Liquor of Camphor, Concentrated Essence of do., Concentrated Solution of do., Conc. Camphor Julep; Essentia Camphoræ, Liquor C., Liq. C. Concentratus*,—Lat. *Prep.* 1. *Camphor* (clean), 4½ *oz.; rectified spirit*, 1 gall.; dissolve. This forms the "*Essence of Camphor*" and "*Liquor Camphoræ*" of the wholesale houses. About ½ fl. dr. added to 7½ fl. dr. of *cold distilled water* forms (by agitation) a *transparent aqueous solution of camphor* fully equal in strength to the filtered "*mistura camphoræ*" (camphor julep) of the Ph. L. The above made with *weaker spirit* forms the "*spirit of wine and camphor*" of the shops.

2. *Camphor*, 1 *oz.; rectified spirit*, 10 *oz.* (by weight); dissolve. This forms the "*Concentrated essence of camphor*" of the wholesale druggists. 10 or 12 drops added to 1 *fl. oz.* of *pure cold water*, make a transparent camphor julep, as before. There is a large quantity of these solutions of camphor sold by the London houses, who charge a considerable price for them. They are very convenient for preparing *extemporaneous* camphor julep or camphor mixture in dispensing.

3. (Fordred.) *Tincture of camphor*, 13 fl. dr.; *tincture of myrrh*, ½ fl. dr.; *rectified spirit*, 18½ fl. dr.; mix. 1 fl. dr. added to 4 fl. oz. of *water*, forms camphor julep. It has been proposed to blanch the tincture of myrrh with *animal charcoal*, but this interferes with its proper action.

4. (Homœopathic.) See *Cholera remedies*, Nos. 6 & 7, page 251.

5. (Houlton.) *Spirit of camphor* (Ph. L.), 1 fl. oz.; *proof spirit*, 7 fl. oz. 1 fl. dr. to 3 fl. oz. of *water* forms camphor julep.

6. (Redwood.) *Camphor*, 1 dr.; *rectified spirit*, 2½ oz.; dissolve, and add of *water*, ½ oz.

7. (Swediaur.) *Powdered camphor*, 1 dr.; *water saturated with carbonic acid gas*, 12 fl. oz.; dissolve. 1 part of this solution added to 4 parts of water forms camphor mixture. See *Camphor.*

ESSENCE (Capsicum). See *Essence of Cayenne.*

ESSENCE (Caraway). Syn. *Essentia Carui*,—Lat. *Prep.* From *oil of caraway*, as *Essence of almonds.* Its applications and uses are similar. An inferior kind is prepared by macerating the *seeds* in *proof spirit.*

ESSENCE (Cardamoms). Syn. *Essentia Cardamomi, E. C. Concentrata*,—Lat. *Prep.* From *lesser cardamom seeds* (ground in a pepper mill), 5½ *lb.; rectified spirit of wine*, 1 gall.; digest for a fortnight, press, and filter.

Obs. This preparation is very convenient for flavouring *cordials, pastry, &c.*, and is very powerful. In the *laboratory* it is frequently substituted for *powdered cardamoms* in making *compound extract of colocynth*, and has the advantage of adding no inert matter to the preparation, whilst it imparts the characteristic odour of the seeds in a remarkable degree. When used in this way, it is not added to the *Extract* until it is nearly cold and about to be taken from the pan. The *testæ* or *shells* of the seed should be separated from the *kernels*, as the former are quite inert, and if used occasion a loss of spirit for no purpose.

ESSENCE (Cascarilla). Syn. *Essentia Cascarillæ*,—Lat. *Prep.* 1. *Cascarilla* (bruised), 12 oz.; *proof spirit*, 1 pint; proceed either by digestion or percolation. The product is 8 times the strength of the *infusion of cascarilla*,—Ph. L.

2. See *Infusions* (Concentrated).

ESSENCE (Cassia). Syn. *Essentia Cassiæ*,—Lat. *Prep.* From *oil of cassia*, as *essence of allspice* or *almonds.*

ESSENCE (Cayenne). Syn. *Essence of Cayenne Pepper, Ess. of Capsicum, Concentrated E. of do.; Essentia Capsici, Tinctura Capsici Concentrata*,—Lat. *Prep.*

1. *Capsicum* (recent dried pods, bruised), 3 *lb.*; *rectified spirit*, 1 gall.; digest 14 days, press, and filter. Some persons prepare it by the method of displacement.

2. *Capsicum*, ¼ *lb.*; *proof spirit*, 1 pint; digest, as before. Weaker than No. 1.

3. (Kitchener's.) *Cayenne pepper*, 1 *oz.*; *brandy*, 1 pint; digest, &c., as before.

Obs. The product of the *first formula* is a transparent, dark-coloured liquid having an intensely burning taste. One drop is sufficient to deprive a person of the power of speech for several seconds; and a few drops will impart the rich pungency of cayenne to a large quantity of soup, sauce, or any other article. It forms the "*Essence of cayenne*" and the "*Conc. Ess. of Cayenne Pepper*" of the London houses. It is principally used as a "flavoring," and to make *soluble cayenne pepper*; also in dispensing. It is fully 8 times as strong as the *tinctura capsici*,—Ph. L. The product of the *third formula* is used exclusively for culinary purposes. The pods or fruit of *capsicum annuum* (capsicum, chilly), *c. baccatum* (bird pepper), and *c. fructescens* (Guinea pods, red pepper), are indiscriminately used for this preparation, but the first are those preferred for medicinal purposes; the others have similar properties, but are more pungent and acrimonious; hence the preference given to them in the preparation of Cayenne pepper. See *Peppers*.

ESSENCE (Cedrat). See *Oils* (Volatile).

ESSENCE (Celery). Syn. *Essence of Celery Seed*; *Essentia Apii, Ess. A. Seminis*, —Lat. *Prep.* 1. From *celery seed* (bruised *or* ground), 4½ *oz.*; *proof spirit*, 1 pint; digest a fortnight, and strain.

2. (Concentrated.) *Celery seed*, 7 *oz.*; *rectified spirit*, 1 pint; digest as before. Very fine. Both are used as "flavoring."

ESSENCE (Cephalic). See *Headache Essence*.

ESSENCE (Chamomile). Syn. *Chamomile Drops; Essentia Anthemidis, E. Chamæmeli, E. C. Alba*,—Lat. *Prep.* 1. From *essential oil of chamomile*, as *essence of allspice*. Stomachic and stimulant. *Dose.* 5 to 30 drops; ½ *fl. oz.*, shaken with about 1 *pint* of *pure water*, forms an excellent *extemporaneous chamomile water*.

2. *Gentian root* (sliced or bruised), 1 *lb.*; *dried orange peel*, ¼ *lb.*; *proof spirit*, 1 gall.; *essential oil of chamomile*, 3½ *fl. oz.*; macerate a week. Slightly coloured. Some persons use ½ *lb.* of *quassia wood*, instead of the gentian and orange peel. Both the above are stomachic and tonic, and are favorite remedies in loss of appetite, dyspepsia, &c. *Dose.* As the last, on sugar, or in a wineglassful of wine or beer.

ESSENCE (Chiretta). See *Infusions* (Concentrated).

ESSENCE (Cinnamon). Syn. *Essentia Cinnamomi, Spiritus C. Concentratus*,—Lat. *Prep.* 1. From *oil of cinnamon*, as *Essence of Allspice* or *Almonds*.

2. *Cinnamon*, 5 *oz.*; *rectified spirit*, ¾ pint; *water*, ¼ pint; digest a week, and strain. Inferior to the last. Essence of cassia is commonly sold for it.

ESSENCE (Civet). Syn. *Essentia Zibethi*,—Lat. *Prep.* 1. *Civet* (cut small), 1 *oz.*; *rectified spirit*, 1 pint; as *Essence of Musk*.

2. Instead of rectified spirit use *spirit of ambrette*. Both are used in perfumery; chiefly in combination with other substances.

ESSENCE (Cloves). Syn. *Essentia Caryophilli*,—Lat. *Prep.* 1. (White). From *oil of cloves*, as *Essence of Allspice*. Used as a "*flavouring*."

2. (Coloured.) *Cloves* (bruised), 3½ *oz.*; *proof spirit*, ¾ pint; *water*, ¼ pint; digest a week, and strain. Inferior to the last. It is 8 times as strong as *infusion of cloves*, —Ph. L. Chiefly used in dispensing.

ESSENCE (Coffee). See *Coffee*.

ESSENCE (Cognac). Syn. *Brandy Essence*. *Prep.* From *brandy oil*, 2 *fl. oz.*; *rectified spirit*, 18 *fl. oz.* For flavouring malt spirit to imitate brandy. See *Brandy Oil*.

ESSENCE (Cologne). Syn. *Concentrated Eau de Cologne; Essentia Coloniensis, Aqua C. Concentrata*,—Lat. *Prep.* 1. By taking 8 *times the quantity of the ingredients* ordered for *Cologne water*, and using the *strongest rectified spirit*.

2. *Oils of lemon* and *cedrat*, of each, 2 dr.; *oil of rosemary*, 1 dr.; *oil of bergamotte*, 1 *oz.*; *spirit of neroli*, 2 fl. oz.; *purest rectified spirit*, 5 fl. oz. *Used* as a condensed perfume.

ESSENCE (Coltsfoot,—Ryan's). *Prep.* 1. *Balsam of tolu*, 1 *oz.*; *rectified spirit* and *compound tincture of benzoin*, of each, 3 *oz.*; dissolve, and in a few days decant the clear portion.

2. (Paris.) Equal parts of *balsam of tolu* and *compound tincture of benzoin*, with double the quantity of *rectified spirit*.

3. *Tincture of tolu*, 5 fl. oz.; *compound tincture of benzoin*, 3 fl. oz.; *powdered sugar* (quite dry), 1 *oz.*; *hay saffron*, 1 dr.; digest a week, with frequent agitation.

Obs. Pectoral and stimulant. A *quack* remedy for consumption and most other diseases of the lungs, but unless assisted by occasional aperients, and in the absence

of fever, it is more likely to *kill* than *cure* in these complaints. The last is the best formula.

ESSENCE (Cubebs). Syn. *Concentrated Essence of Cubebs; Essentia Cubebæ, E. C. Concentrata*, — Lat. *Prep.* 1. *Cubebs* (bruised, *or* preferably ground in a pepper mill), ½ *lb.; rectified spirit*, 1 pint; digest 14 days, press, and filter.

2. (Wholesale.) *Cubebs*, 4¼ *lb.; rectified spirit*, 1 gall. This essence has a very large sale, and if carefully prepared from a good sample of the drug, is a most excellent preparation. Every fl. oz. represents 2½ dr. of cubebs. *Dose.* 1 to 3 dr.

ESSENCE (Cubebs, — Oleo-resinous). *Prep.* (Dublanc.) *Oleo-resinous extract of cubebs*, 1 oz.; *rectified spirit*, 3 oz.; dissolve. A very active and concentrated form of administering cubebs, which must not be confounded with the preceding preparation, which is the one always meant when "Essence of Cubebs" is ordered. *Dose.* ½ dr. to 1 dr.

ESSENCE (Dill). Syn. *Dill Drops; Essentia Anethi*,—Lat. *Prep.* 1. From *oil of dill*, as *Essence of Allspice.*

2. *Oil of dill, extract of dill*, and *salt of tartar*, of each, ½ oz.; *rectified spirit*, 1 pint; digest and strain. Both the above are aromatic and anti-flatulent. The *first* is commonly used as an adjunct to other medicines, especially to purgatives for children. The *second* is a popular tonic and stomachic in the flatulent colic, dyspepsia, &c., of women and children. *Dose.* A few drops, on sugar.

ESSENCE (d'Œillets). *Prep.* From *cinnamon*, 3 *oz.; cloves*, 1¼ *oz.;* (both well bruised); *rectified spirit*, 1 quart; digest for a week. *Oil of cloves* and *spirit of cloves* also bear this name in some places.

ESSENCE (d'Orient). A pearly-looking substance, found at the base of the scales of the blay or bleak, a small fish of the genus cyprinus.

Prep. The *scales* are scraped from the fish into a *tub* containing *water*, and after agitation and repose, the fluid is poured off, and its place supplied with fresh water, and this in its turn, after agitation and repose, is also poured off. This part of the operation is repeated till the "*essence*" and scales are perfectly freed from impurities, when the whole is thrown on a sieve, which retains the latter, but allows the former to flow through. After repose for a short time the essence is obtained as a deposit at the bottom of the vessel.

Obs. Essence d'Orient has a bluish white and pearly aspect, and is employed to cover the interior of glass bubbles and beads, in imitation of pearls and mother of pearl. Its tendency to putrefaction, while in the moist state, may be obviated by the addition of a little *liquor of ammonia.*

ESSENCE (Ergot). See *Liquor of Ergot of Rye.*

ESSENCE (Ergot, — Ethereal). Syn. *Essentia Ergotæ Etherea, E. Secalis Cornuti E.*,—Lat. *Prep.* (Mr. Lever.) *Ergot* (powdered), 2 oz.; *rectified sulphuric ether*, 2 fl. oz.; digest a week, express the tincture, filter, and abandon the liquid to spontaneous evaporation; lastly, dissolve the residuum in *ether*, 1 fl. oz. This is one of a host of foolish, expensive, and troublesome formulæ, published by non-practical men, and which the pharmaceutical chemist is *expected* to adopt to the letter, against his better judgment. The following modification of it, which we have employed, is both simpler and less expensive.

2. *Ergot* (ground), 8 *oz.; ether*, 16 fl. *oz.;* prepare a tincture as before, and by a gentle heat distil off the ether in a retort connected with a well-cooled refrigerator, until 15 *fl. oz.* shall have passed over; continue the evaporation at a reduced heat until the remainder of the ether has passed off; lastly, dissolve the residuum, as soon as cold, in *ether*, 4 *fl. oz.*

Obs. Each fl. oz. represents 2 oz. of ergot. *Dose.* 10 to 30 drops as a parturifacient, taken on sugar; 3 to 5 drops as a hæmostatic and emmenagogue, in hemorrhages, floodings, &c. It possesses all the acrid, narcotic principle of the ergot, but less of the hæmostatic principle than the ordinary essence, whilst it is much more costly.

ESSENCE (Fennel). Syn. *Essence of Sweet Fennel; Essentia Fœniculi*, — Lat. *Prep.* From *oil of fennel* (fœniculum dulce), as *Essence of Allspice.*

ESSENCE (Gentian). See *Infusion of Gentian* (Concentrated).

ESSENCE (Ginger). Syn. *Concentrated Tincture of Ginger, Essentia Zingiberis, Tinctura Z. Concentrata*,—Lat. *Prep.* 1. *Unbleached Jamaica ginger* (bruised), 5 *oz.; rectified spirit*, 1 pint; digest a fortnight, press, and filter.

2. (Oxley's "*Concentrated Essence of Jamaica Ginger.*") The same as the preceding, with the addition of a very small quantity of *essence of cayenne.* The above possess only about 4 times the strength of *tincture of ginger*,—Ph. L., and though vended in the shops as *essence of ginger*, scarcely deserve the name.

3. As No. 1, (next article), but using double the quantity of *spirit.* Very fine.

4. (Kitchener's) *Ginger* (grated), 3 *oz.;*

yellow peel of lemon (fresh), 2 *oz.*; *brandy*, 1½ pint; digest 10 days. For culinary purposes, &c.

ESSENCE (Ginger, — Concentrated). Syn. *Essentia Zingiberis Concentrata*,—Lat. *Prep.* 1. *Jamaica ginger* (best unbleached, in coarse powder,) and *silicious sand*, equal parts, are sprinkled with *rectified spirit of wine*, q. s. to perfectly moisten them, and after 24 hours the mass is placed in a "*percolator*," and after returning the first runnings 2 or 3 times, the receiver is changed, and more *rectified spirit* poured on gradually, and at intervals, as required, until *as much essence* is obtained as there has been *ginger employed*.

Obs. The quality of the product of the above formula is excellent, but the process is somewhat difficult to manage. The mass remaining in the percolator is treated with *fresh spirit* until exhausted, and the tincture so obtained is employed, instead of spirit, for making more essence with fresh ginger. The last portion of spirit in the waste mass may be obtained by adding a little *water*. *Coarsely powdered charcoal* is frequently used instead of *sand*, in which case the product has less colour; at the same time, however, a little of the flavour is lost.

2. (Wholesale.)—*a*. Best unbleached *Jamaica ginger* (as last), 12 *lb.*; *rectified spirit*, 2½ gall.; are digested together for 14 days, and the expressed and strained tincture reduced by *distillation*, in a steam or water bath, to exactly 1 gall.; it is next cooled and transferred as quickly as possible into stoppered bottles, and the next day filtered.

Obs. The *product* of the last formula is a most beautiful article, of immense strength, and the richest flavour. The assertion made by a recent writer on pharmacy, that "the product is very strong, but has lost some of the flavour of the ginger," is evidently made in ignorance of the preparation. We were the first to introduce and publish this formula, and have employed it for years on the most extensive scale, and can conscientiously assert that, for inexpensiveness, and the quality of the essence produced by it, it is unequalled by any other. The process, though apparently complicated, is, in reality, easily performed. The spirit distilled over, contains none of the fragrant or aromatic principles of the ginger; on the contrary, the little flavour it has received (apparently from a species of ethereal oil) is rather disagreeable than otherwise, and is better got rid of than retained in the essence. This spirit is used with advantage for preparing the common tincture of ginger, and several other articles. The cause of failure when this process is adopted is careless or awkward manipulation. When possible, hydraulic pressure should be employed to express the tincture. 2 *oz.* of *this essence* are regarded as equivalent to 3 *oz.* of the *finest ginger*, being fully twenty times as strong as the *tincture of ginger* of the Ph. L. A single drop, swallowed, will almost produce suffocation.

b. From *ginger* (as last), 24 *lb.*; *rectified spirit*, 6 gall.; make a tincture, as before, and reduce it by distillation to 1 gall.; then cool as quickly as possible out of contact with the air, and add, of the *strongest rectified spirit of wine*, 1 gall.; lastly, filter if required. Quality resembles, No. 2, *a* (nearly). We are in the habit of applying the method developed in the last two formulæ to the preparation of the essences of several other substances, the active principles of which are not volatile at a low temperature.

ESSENCE (Grape). *Prep.* From *grape oil*, as *Essence of Almonds*. It is used to flavour brandy and wines. See *Oils* (Volatile).

ESSENCE (Guaiacum). Syn. *Fluid Extract of Guaiacum; Essentia Guaiaci, Extractum Guaiaci Fluidum*,—Lat. *Prep.* Recent *guaiacum shavings*, from which the dust has been sifted, 3 cwt., are exhausted by coction in *water*, as in the preparation of an extract, using as *little* of that fluid as is absolutely necessary; the decoction is evaporated to exactly 1¾ gall.; it is next stirred until *cold*, to prevent the deposit of resinous matter, when it is put into a bottle, and *spirit of wine*, 5 pints, is added; the whole is then repeatedly agitated for a week, after which it is allowed to settle for 7 or 8 days, and the clear portion is decanted into another bottle.

Obs. This preparation is frequently substituted for *guaiacum shavings* in the preparation of compound decoction of sarsaparilla. 1 pint of this essence is considered equivalent to 19 *lb.* of *guaiacum* in substance. See *Compound Decoction of Sarsaparilla*.

ESSENCE (for the Handkerchief). See *Essentia Odorata, &c.*

ESSENCE (for the Headache). Syn. *Cephalic Essence, Embrocation of Ammonia, Dr. Hawkin's Embrocation, Ward's do., Ward's Essence for the Headache; Embrocatio Ammoniæ, Linimentum do., Essentia Cephalica*,—Lat. *Prep.* 1. *Oil of lavender* (Mitcham), 1 dr.; *camphor*, 1 *oz.*; *liquor of ammonia*, 4 *oz.*; *rectified spirit*, 1 pint. dissolve. Very fragrant and powerful.

2. (Beasley). *Spirit of camphor*, 2 lb; *strong water of ammonia*, 4 oz.; *essence of lemon*, ½ oz.

3. (Redwood.) *Camphor* and *liquor of ammonia*, of each, 2 oz.; *oil of lavender*, 4 dr.; *rectified spirit*, 14 oz. Very fragrant. Stimulant and rubefacient. *Used* as a counter-irritant lotion in local pains, as *headache, earache, colic, &c.* Compound camphor liniment is usually sold for it. See *Liniments.*

ESSENCE (Henbane). Syn. *Essentia Hyoscyami*,—Lat. See *Essence* (Anodyne) No. 2.

ESSENCE (Hop). Syn. *Essentia Lupuli, E. Humuli, Tinctura Lupuli Concentrata*,—Lat. *Prep.* 1. *New hops* (rubbed small), 26½ *oz.; proof spirit*, 1 quart; digest 24 hours, then distil over (quickly) 1 pint, and set the distillate (*spiritus lupuli*) aside in a corked bottle; to the residuum add *water*, 1 pint; boil 15 minutes, cool, express the liquor, strain, and evaporate it as quickly as possible to dryness by the heat of a water-bath, powder the residuum, and add it to the *distilled spirit;* digest a week and filter.

2. *Lupulinic grains* (yellow powder *or* lupulin of the strobiles), 5 *oz.; rectified spirit*, 1 pint; digest 10 days; express, and filter. Both the above are powerfully bitter, and loaded with the aroma of the hop. They are fully 8 times as strong as the *tinctura lupuli* of the Ph. L. A few drops added to a glassful of ale or beer render it agreeably bitter and stomachic.

3. (*Brewer's*). Several preparations under the name of *extract of hops* are prepared by the *brewer's druggist.* They are mostly *semi-fluid extracts of quassia, gentian*, and like powerful bitters. Of three of these articles which we have examined, one (*for pale ale*) consisted of the *mixed extracts of quassia* and *chamomile;* another (for either *ale* or *beer*) was a *preparation of picric acid;* whilst a third ("strongly recommended for *porter*,") consisted of about equal parts of the *extracts of bitter aloes, cocculus Indicus*, and *wormwood.* One of these vile compounds is publicly advertised and "warranted" as being equal to 100 *times its weight in hops* (1 *oz.* to 5½ *lb.*). In any other country than these realms, this impudence and rascality would bring condign punishment on the heads of the offenders. Here, however, poisons are both sold and mixed with our food and beverages with impunity. A sanitary police is quite as necessary as a criminal one.

ESSENCE (Jargonelle Pear). Syn. *Pear Essence, Esprit de Jargonelle, &c. Prep.* From *pear oil* (birnöl; acetate of oxide of amyle;) as *Essence of Almonds.* This is now largely employed to flavour confectionary and liqueurs. See *Acetate of Amyle* and *Oils* (Volatile).

ESSENCE (Jasmine). See *Spirits* and *Oils* (Volatile).

ESSENCE (Jessamine). See *Spirits* and *Oils.*

ESSENCE (Jonquille). See *Spirits* and *Oils.*

ESSENCE (Lavender). Syn. *Essentia Lavandulæ* (Odorata),—Lat. *Prep.* 1. *Oil lavender* (Mitcham), 2 *oz.; rectified spirit* (strongest), 1 pint.

2. As the strongest *Eau de Lavande.* See *Spirits.*

ESSENCE (Lavender, — Red). See *Spirits* and *Tinctures.*

ESSENCE (Lemons). Syn. *Essentia Limonis*,—Lat. *Prep.* 1. See *Oils* (Volatile).

2. (W. Procter.) *Fresh oil of lemons*, 1 fl. oz.; *de-odorized alcohol* (strongest flavorless rectified), 8 fl. oz.; *exterior yellow rind of lemons* (fresh), ½ oz.; digest 48 hours, and filter. *Used* for flavouring mixtures, pastry, &c.

3. From *oil of lemons*, as *Essence of Allspice.* As the last.

ESSENCE (Lemon-peel). Syn. *Essence of Lemon-rind, Quintessence of do.; Essentia Corticis Limonis*,—Lat. *Prep.* 1. *Yellow peel of fresh lemons*, ½ *lb.; spirit of wine*, 1 pint; digest for a week, press, and filter. Very fragrant.

2. *Yellow peel of fresh lemons*, 1 *lb.; boiling water*, ½ gall.; infuse 1 hour, express the liquor, boil down to ½ a pint, cool, and add *oil of lemon*, ¼ *oz.*, dissolved in *spirit of wine*, 1½ pints; mix, and filter. *Used* as the preceding.

ESSENCE (Lovage). Syn. *Essentia Levistici*,—Lat. *Prep.* (Ph. Wurt.) *Lovage-root* (levisticum officinale), 2 oz.; *lovage seeds*, 1 oz.; *rectified spirit*, 10 oz.; digest a week, and filter. Aromatic, stomachic, and diaphoretic. *Dose.* ½ dr. to 1 dr.; in dyspepsia, dropsies, &c.

ESSENCE (Madden's). Concentrated infusion of roses.

ESSENCE (Malt). See *Essentia Bina.*

ESSENCE (Mint). Syn. *Essence of Spearmint; Essentia Menthæ, E. M. Spicatæ, E. M. Viridis*, — Lat. *Prep.* As *Essence of peppermint.*

ESSENCE (Musk). Syn. *Essentia Moschi, Tincture M. Concentrata*,—Lat. *Prep.* 1. *Grain musk*, 2 *oz.*, and *boiling water*, 1 pint, are digested together in a close vessel until cold, when *rectified spirit of*

wine, 7 pints, is added; the vessel (preferably a *tin bottle*) being corked close, and tied over with bladder, the whole is digested, with frequent agitation, for 2 months, in the sunshine (in summer), or in an equally warm situation in winter. At the end of the time the essence is decanted and filtered.

2. *Grain musk*, ¼ *oz.*; *rectified spirit of wine*, 2 pints; *essence of ambergris*, 1 fl. oz.; digest as before.

3. *Musk* (from the bladder, rubbed very small), 5 *oz.*; *civet*, 1 *oz.*; *essence of ambergris*, 1 pint; *spirit of ambrette*, 1 gall.; as before.

Obs. All the preceding formulæ yield superior essences, but the product of the last is of the *very finest quality*, and such as is seldom sold, except by the most celebrated houses, when it fetches a very high price. It is powerfully and deliciously odorous, and has received the approval of royalty itself, both in these kingdoms and on the continent. The second formula also produces a very fine article, but less choice than that just referred to. The digestion should be long continued, and on no account less than 3 weeks, as otherwise much fragrant matter is left undissolved. The addition of 1 *fl. dr.* of either *liquor of ammonia* or *liquor of potassa* (the first is best) to *each pint* of the *essence*, vastly increases its fragrance. The *essence of musk* of the wholesale London druggists, is generally made by merely digesting the *freshly emptied musk pods* in *rectified spirit*. Sometimes a little (a very little) *grain musk* is added. See *Essence Royale*.

4. (Guibourt.) *Musk*, 1 part; *proof spirit*, 12 parts; digest a fortnight, or longer. *Used* in dispensing, &c.

ESSENCE (Musk-seed). See *Essence d'Ambrette*.

ESSENCE (Mustard). Syn. *Essentia Sinapis*,—Lat. *Prep.* (Whitehead's.) *Black mustard seed* (bruised), and *camphor*, of each, 2 oz.; *oil of rosemary*, 3 dr.; *balsam of tolu*, 1 dr.; *annatto*, ½ dr.; digest a week, and filter.

ESSENCE (Myrtle). Syn. *Essence of Myrtle-blossoms*; *Essence de Myrte*, *Esprit de M.*,—Fr. *Prep. Myrtle tops* (in blossom), 2½ *lb.*; *proof spirit*, 9 pints; digest 3 days, then distil 1 gall. A pleasant perfume. See *Oils* (Volatile).

ESSENCE (Neroli). Syn. *Essence de fleurs d'oranges*, *Esprit do.*,—Lat. *Prep.* 1. *Neroli*, 3 dr.; *rectified spirit of wine*, 1 pint; mix. A delicious perfume.

2. *Oil of orange*, 2 dr.; *orris root* (bruised), ½ *oz.*; *ambergris*, 10 gr.; *neroli*, 35 drops; *spirit of wine*, 1 pint; digest 14 days, and filter. Very fragrant, but less "chaste" than the last.

ESSENCE (Nutmeg). Syn. *Essentia Myristicæ*, *E. M. Moschatæ*, *E. Nucis*, *M.*,—Lat. *Prep.* From *essential oil of nutmeg*, as *Essence of Allspice*. *Used* as a flavouring or zest by cooks, liqueuristes, and confectioners.

ESSENCE (Odontalgic). See *Toothache Essence*.

ESSENCE (Opium). See *Anodyne Essence*, No. 1. *Black drop* and *Rousseau's laudanum* have also been sometimes so called.

ESSENCE (Orange). Syn. *Essentia Aurantii*,—Lat. *Prep.* As *Essence of Lemon*.

ESSENCE (Orange-peel). Syn. *Essentia Corticis Aurantii*,—Lat. *Prep.* 1. (Golden.) *Fresh yellow-rind of orange*, 4 oz.; *rectified spirit* and *water*, of each, ½ pint; digest for a week, press, filter, and add of *sherry wine*, 1 quart. A pleasant liqueur.

2. (Saccharated.) See *Oleo-sacchara*.

ESSENCE (Patchouli). Syn. *Essence de Patchoulie*, *Esprit de Pouchâ pât*,—Fr. *Prep.* 1. *Indian patchouli* (leaves or foliaceous tops), 2½ *lb.*; *rectified spirit*, 9 pints; digest for a week; add of *water*, 1 gall.; *oil of lavender* (Mitcham), 3 dr.; *common salt*, 2 *lb.*; agitate well together, distil over (rapidly) 1 gallon, and add of *essence of musk*, 3½ fl. dr. A very fashionable perfume. *Essence of Patchouli* thus prepared has been largely used, both at Court and by the nobility generally.

2. *Patchouli*, 3 *oz.*; *rectified spirit*, 1 pint; digest a week, press, and filter. A still commoner kind is made with *proof spirit*.

ESSENCE (Pear). See *Essence* (Jargonelle).

ESSENCE (Pennyroyal). Syn. *Essentia Pulegii*, *E. Menthæ P.*,—Lat. *Prep.* From *pennyroyal* (mentha pulegium), as *Essence of Peppermint*. Stimulant, carminative, and emmenagogue. *Used* in dispensing, especially to make extemporaneous *pennyroyal water*.

ESSENCE (Peppermint). Syn. *Essentia Menthæ Piperitæ*,—Lat. *Prep.* 1. *Oil of peppermint* (Mitcham, recent), 1 *fl. oz.*; *rectified spirit*, 1 pint; agitate together until mixed. White.

2. To the last add of *herb peppermint*, *parsley leaves*, or *spinach leaves*, (preferably one of the first two), ½ *oz.*, and digest for a week, or until sufficiently coloured. *Sap green* (10 or 12 gr., rubbed up with a *teaspoonful of hot water*) is also used for the same purpose. A delicate light green.

3. (Ph. U. S.) *Oil of peppermint*, 2 *fl. oz.*; *rectified spirit*, 16 *fl. oz.*

Obs. Essence of peppermint is not conceived to be good by the ignorant, unless it has a pale-greenish tint, which they take as a proof of its being genuine. The most harmless way of tinging it is that indicated above. A little *green mint* or *parsley* will, indeed, be found to improve the flavour. These additions are quite harmless. The practice of using *cupreous salts*, adopted by some lazy and unprincipled makers, is unpardonable, and admits of no excuse, even a lame one, as not the least advantage, either of convenience, cost, or appearance, results from such a practice, while the colouring matter, though small in quantity, is nevertheless sufficient to impart a noxious quality to the liquid. This fraud may be detected by the addition of liquor of ammonia in excess, which will strike a bluish or greenish-blue colour when copper is present.

Essence of peppermint (like that of most of the other aromatic oils) is cordial, stimulant, and stomachic. A few drops (10 *to* 30) on sugar, or mixed with a little water, or wine, is an excellent remedy in flatulence, colic, nausea, sickness, &c. It is also extensively used as a *flavouring* ingredient by cooks, confectioners, and druggists. A few drops well agitated with half-a-pint of *cold water* form an excellent *extemporaneous* peppermint water.

The formulæ 1 and 2, generally the latter, are those employed by the respectable portion of the London trade. The various published receipts for this and similar essences, ordering the essential oil in a larger proportion than that directed above, are never adopted in practice, and their products (often impossible combinations) exist only in the imaginations of the writers.

ESSENCE (Pimento). See *Essence* (Allspice).

ESSENCE (Pine-apple). From *pine-apple oil* (butyric ether, butyrate of oxide of ethyle), as *Essence of almonds*. It forms a delicious flavouring for liqueurs, confectionery, rum, &c. See *Ether* and *Oils* (volatile.)

ESSENCE (Quassia). Syn. *Essentia Quassiæ*,—Lat. *Prep.* 1. From *quassia* (sliced), 1½ *oz.*; *proof spirit*, 1 pint; digest 10 days, and filter. ½ fl. dr. added to 7½ fl. dr. of *water*, forms the *infusion of quassia* of the Ph. L. *Dose.* ½ dr., in water or wine, an hour before a meal, as a *stomachic tonic*, in dyspepsia, loss of appetite, &c., particularly when complicated with gout; 1 to 2 dr. three or four times daily, as a febrifuge and antiseptic, in intermittents, putrid fevers, &c.

2. (Brewer's.)—*a*. From *powdered quassia* (sprinkled with a *little rum*) and "*foots*" (coarse moist sugar or sugar bottoms), equal parts, reduced to the consistence of a semi-fluid extract by the addition of a few spoonfuls of *water*. For ale.

b. From *powdered quassia*, 1 part; *burnt sugar colouring*, 2 parts; well stirred together. For porter and stout. Both are used by fraudulent brewers as substitutes for hops.

ESSENCE (Quinine). Syn. *Essentia Quinæ*, —Lat. *Prep.* From *disulphate of quinine*, 1½ *oz.*; *rectified spirit*, ½ pint; digest with warmth, gradually dropping in a little *dilute sulphuric acid* (avoiding excess) and employing constant agitation), until the whole is dissolved. 1 fl. dr., added to 7 fl. dr. of *proof spirit*, forms the *tincture of quinine*,—Ph. L. Every fl. dr. contains 8 gr. of disulphate of quinine, or about 10 gr. of the neutral sulphate. If more sulphuric acid is added than is sufficient to dissolve the salt (*i.e.* convert it into a neutral sulphate) the solution is apt to deposit part of it on keeping, owing to the gradual formation of ether, by the action of the excess of acid on the alcohol.

ESSENCE (Ratafia). The same as *essence of almonds*. So called from being used to flavour *ratafias*, *noyeau*, and other liqueurs.

ESSENCE (Rhubarb). Syn. *Essentia Rhei*, — Lat. *Prep.* From *rhubarb* (in powder) and *silicious sand*, of each, 5 *oz.*; *proof spirit*, 1 pint; by the method of displacement. Every *fl. oz.* represents the active virtues of 2 *dr.* of rhubarb.

ESSENCE (Rondeletia). *Prep.* 1. *Essence* (oil) *of bergamotte*, *essence* (oil) *of lemon*, and *oil of cloves*, of each, 1 dr.; *otto of roses*, 10 drops; *rectified spirit*, 1 pint.

2. To the last add of *oil of lavender*, 1 dr.; *neroli*, 15 drops. A very fashionable and agreeable perfume.

ESSENCE (Roses). Syn. *Essentia Rosæ* (Odorata).—Lat. *Prep.* 1. *Attar of roses* (genuine), 2 dr.; *alcohol*, 1 pint; agitate frequently until they unite.

2. *Attar of roses*, 1 *oz.*; *rectified spirit*, 1 gall.; mix in a close vessel, and assist the solution by placing it in a bath of hot water. (See *Ess. of Musk.*) As soon as the spirit gets warm, take it from the water and shake it till *quite cold*; the next day filter.—*Obs.* Unless the spirit of wine is of more than the common strength it will not retain the whole of the otto in solution in very cold weather.

3. To each pint of either of the preceding, add of *oil of bergamotte*, 30 drops; *neroli* and *essence of musk*, of each, 20 drops.

4. *Petals of roses*, 3 *lb.*; digest in *spirit of wine*, 5 quarts, for 24 hours; distil to dryness in a water bath; digest the *distilled spirit* on 2 *lb.* of fresh *rose petals*, as before, and repeat the whole process of maceration and distillation a *third*, *fourth*, *fifth*, and *sixth* time, or oftener, the last time only drawing over 1 gall. which is the essence. Each of the above is very superior. The last has a peculiar delicacy of flavour, when the spirit used to make it is pure.

ESSENCE (Roses,—Red). Syn. *Essentia Rosæ* (Rubra). *Tinctura R. Concentrata*,—Lat. *Prep.* From *rose leaves*, 1 *lb.*; *proof spirit*, 1 gall.; digest for 14 days, press, strain, add, *concentrated acetic acid*, 2½ *fl. dr.*; mix well, and the next day filter. *Used* to make *extemporaneous syrup* and *honey of roses*, &c. Smells, colours, and tastes strongly of the flower. *Concentrated infusion of roses* is also sold under the same name.

ESSENCE (Rosemary). Syn. *Essentia Rosmarini*,—Lat. *Prep.* From *oil of rosemary*, as *Essence of Allspice*. *Used* as a perfume; also to make *extemporaneous rosemary water*.

ESSENCE (Royale). *Prep.* 1. (Soubeiran.) *Ambergris*, 40 gr.; *musk*, 20 gr.; *civet* and *carbonate of potassa*, of each, 10 gr.; *oil of cinnamon*, 6 drops; *oil of rhodium* and *otto of roses*, of each, 4 drops; *rectified spirit of wine*, 4 fl. oz.; (say ¼ pint;) macerate for 10 days or longer. Antispasmodic and aphrodisiac. A few drops on sugar, or in syrup of capillaire.

2. See *Essence of Ambergris*.

ESSENCE (Royale pour faire la Barbe). See *Essence of Soap*.

ESSENCE (Sarsaparilla). Syn. *Concentrated Essence of Sarsaparilla; Essentia Sarzæ, E. Sarsaparillæ*,—Lat. *Prep.* 1. *Sarsaparilla root* (best red Jamaica), 2¾ *lb.*, is carefully decorticated, the *bark* reduced to coarse powder, and digested for a week or 10 days in *sherry* ¾ pint, and *rectified spirit*, ¼ pint, with frequent agitation; after which the essence is expressed, and in a week the clear portion is decanted from the sediment. A very elegant preparation. ½ *fl. dr.* added to 7½ fl. dr. of *water*, forms 1 fl. oz. of a solution of equal strength to *decoction of sarsaparilla* of the Ph. L. Every fl. oz. represents the active principles of 2 oz. (= 2 *oz.* 85 *gr.*, avoir.) of sarsaparilla root. In other words, it is *twice* as strong as the *root*, and 16 *times* as strong as the decoction.

2. *Alcoholic extract of sarsaparilla*, 7 *oz.*; *sherry*, ¾ pint; *rectified spirit*, ¼ pint; dissolve, and filter. Strength as the last.

3. (Beral.) *Alcoholic extract*, 4 oz.; *sherry wine*, 1 pint; dissolve, and filter. About 3 fl. dr. added to *water*, 1 pint, form an extemporaneous decoction.

4. (Guibourt.) *Alcoholic extract*, 4 oz.; *white wine*, 1 lb. Strength the same as Nos. 1 and 2 (nearly.)

5 (Hening.) *Sarsaparilla* (bruised), 10 oz.; *distilled water*, 6 pints; macerate at a temperature of 120° Fahr. for six hours, and strain; repeat with the same quantity of fresh *water*; mix the liquors, and evaporate in china vessels at 160° Fahr. If reduced to 10 fl. oz. (or to 9 fl. oz., with 1 fl. oz. of *rectified spirit* added), 1 fl. dr. mixed with 7 fl. dr. of *water*, will be equal to the decoction of the usual strength. If *reduced* to 5 fl. oz., 1 *fl. dr.* will be equal to 2 fl. *oz.* of the decoction.

6. The *bark* separated from *sarsaparilla root*, 2¾ *lb.*, is exhausted with *water* as last; the liquid is evaporated, as quickly as possible, in a water-bath, to 16 fl. oz., and when *cold*, mixed with *rectified spirit*, 4 fl. oz. Strength, same as No. 1.

7. The infusion in No. 6 is evaporated to 10½ fl. oz., and when cold mixed with *sherry*, ½ pint; in a week the clear portion is decanted from the sediment. Strength, same as No. 1.

Obs. The formulæ No. 1, 2, 6, and 7, have each in turns been extensively employed by us in the laboratory, with the most satisfactory results. See *Liquor of Sarsaparilla*.

ESSENCE (Sarsaparilla, — Compound). Syn. *Essentia Sarsaparillæ Composita, E. Sarzæ C.*,—Lat. *Prep.* 1. *One pint* of No. 1, 2, 6, or 7 (above), is triturated with the *extract* prepared from *mezereon bark*, 3½ *oz.*, and *extract of liquorice*, 4 oz.; when mixed, it is returned to the bottle, and *essence of guaiacum*, 1½ fl. dr.; and *oil of sassafras*, 20 drops, are added; the whole is then *well agitated* for at least 15 minutes, and after a week's repose the clear portion is decanted, as before. ½ fl. dr. with 7½ fl. dr. of *water*, forms *extemporaneous compound decoction of sarsaparilla*.

2. (Cadet.) *Sarsaparilla* (bruised), 8 oz.; *hot water*, q. s.; exhaust the root by successive macerations; unite the liquors, and evaporate to 10 fl. oz.; strain, and add, when cold, of *alcohol* (·842) and *tinctures of guaiacum* and *mezereon*, of each, 4 fl. dr.; *white wine*, 1 fl. oz.; *oil of sassafras*, 12 drops; *extract of liquorice*, 2 dr.; agi-

tate, and after repose decant as before. This is nearly 8 times as strong as *Dec. Sarzæ Co.*,—Ph. L. The first is the best formula. See *Liquor of Sarsaparilla* (Compound).

ESSENCE (Savory Spices). *Prep.* 1. *Black pepper*, 4 *oz.*; *powdered turmeric*, 3 dr.; *coriander seeds*, 1½ dr. (all ground and genuine); *oil of pimento*, 1½ fl. dr.; *oils of nutmeg*, *cloves*, *cassia*, and *caraway*, of each, ½ dr.; *rectified spirit*, 1 pint; digest, with agitation, for a fortnight. Very fine.

2. *Black pepper*, 3 *oz.*; *allspice*, 1¼ *oz.*; *nutmegs* and *burnt sugar*, of each, ½ *oz.*; *cloves*, *cassia*, *coriander*, and *caraway seeds*, of each, 1 dr. (all bruised or ground); *rectified spirit*, 1 pint; digest, with agitation, as before for 14 days, press, and filter. Used as a flavouring. When made with *proof spirit* or *brandy*, and only ½ the above weight of spice, it is called "*Tincture of Savory Spices.*"

ESSENCE (Senna). See *Liquors* and *Infusions* (Concentrated).

ESSENCE (Smoke). See *Westphalian Essence.*

ESSENCE (Soap). Syn. *Spirit of Soap*, *Shaving Fluid*; *Esprit de Savon*, *Essence de Savon*, *Essence Royale pour faire la Barbe*, —Fr.; *Essentia Saponis*, *Tinctura Saponis Concentrata*,—Lat. *Prep.* 1. *Castile soap* (in shavings), 4 *oz.*; *proof spirit*, 1 pint; dissolve, and add a little perfume.

2. *Venetian soap*, ¾ *lb.*; *salt of tartar*, 1 *oz.*; *benzoin*, ½ *oz.*; *spirit of wine*, 1 gallon.

3. *Best soft soap*, ¼ *lb.*; *boiling water*, 1 pint; dissolve, cool, and add *oils* of *cinnamon* (cassia), *verbena*, and *neroli*, of each, 6 drops; dissolved in *rectified spirit*, 1 pint; mix well, and if not perfectly transparent, add a little more *strong spirit*, or filter through blotting paper.

Obs. This alcoholic solution of soap is chiefly used for shaving, and is very convenient in travelling, as a good lather may be instantly produced without the trouble of employing a soap-box. Instead of the above perfumes, 15 drops of essence of musk or ambergris, or 30 drops of any of the perfumed spirits, or 3 drops of attar of roses, or 6 drops of any of the aromatic essential oils, may be added, when a corresponding name is given to the preparation, as *esprit de savon*, *de la rose*, &c.

4. (P. Cod.) *White soap*, 3 oz.; *carbonate of potassa*, 1 dr.; *proof spirit*, 12 oz.; dissolve. *Used* medicinally. They are all used as frictions, &c.

5. (*Camphorated*,—Guibourt.) *White soap*, 3 parts; *camphor*, 1 part; *spirit of rosemary*, 16 parts; dissolve. A variety of opodeldoc. *Used* as an embrocation in rheumatic pains, sore throat, &c.

ESSENCE (Soup Herbs). Syn. *Spirit of Soup Herbs*, *Conc. Tincture of do.*, &c. *Prep.* (Kitchener's.) *Lemon thyme*, *winter savory*, *sweet-marjoram*, and *sweet basil*, of each, 1 *oz.*; *lemon peel* (grated), and *eschalots*, of each, ½ *oz.*; *bruised celery seed*, ¼ *oz.*; *proof spirit* or *brandy*, 1 pint; digest for 10 days, or a fortnight. A superior flavoring essence for soups, gravies, &c. See *Essence of Savoury Spices.*

ESSENCE (Spearmint). See *Essence of Mint.*

ESSENCE (Sprats). Syn. *Essence of British Anchovies.* From *pickled sprats* (British anchovies), as *Essence of anchovies*, for which it is commonly sold.

ESSENCE (Spruce). Syn. *Fluid Extract of Spruce*; *Essentia Abietis*, *Extractum A. Fluidum*,—Lat. *Prep.* A *decoction* of the *young tops* of the *black spruce-fir* (abies nigra), evaporated to the consistence of a thick syrup. *Used* to make *spruce beer*, *&c.*

ESSENCE (Toothache). Syn. *Essentia Odontalgica*,—Lat. *Prep.* 1. *Acetate of morphia*, ½ dr.; *tincture of pellitory of Spain* (made with rectified spirit), 2 fl. oz.; *acetic acid* (glacial), 4 fl. dr.; dissolve, and add of *oil of cloves*, 6 fl. dr.

2. (Redwood.) *Pellitory*, ½ lb; *extract of belladonna*, 2 dr.; *rectified spirit*, 1 pint; digest 14 days, strain, and add of *hyponitrous ether*, 1 oz.; *oil of wine*, ½oz.; *oil of cloves*, 2 dr. See *Odontalgic Drops.*

ESSENCE (de Tuberose). *Prep.* The *flowers* are stratified with *sheep's* or *cotton wool*, impregnated with the purest *oil of ben* or of *olives*, in an earthen vessel, closely covered, and kept for 12 hours in a *water bath*; the flowers are then removed and *fresh ones* substituted, and this is repeated until the oil (*huile au tuberose*) is sufficiently scented. The *wool* or *cotton* is then mixed with the *purest spirit of wine*, and distilled in a *water bath*; or it is first digested in a warm situation, and in a well-closed vessel, for several days, during the whole of which time frequent agitation is had recourse to. A similar plan is followed for the preparation of the *essences of jasmine*, *violets*, and *other like flowers.* See *Spirits.*

ESSENCE (Turtle). Syn. *Essence of Green Turtle. Prep.* From *essence of anchovies* and *shallot wine*, of each, 3 *oz.*; *basil wine*, ½ pint; *mushroom ketchup*, ¼ pint; *the juice of* 2 *lemons*; the *yellow*

peel of 1 *lemon; curry powder*, ¼ *oz.;* digest for a week. *Used* to impart the flavour of turtle to soups and gravies.

ESSENCE (of Tyre). See *Hair Dyes.*

ESSENCE (Vanilla). Syn. *Essentia Vanillæ, Tinctura V. Concentrata*,—Lat. *Prep.* 1. *Vanilla* (cut small), 2 *oz.; rectified spirit*, 1 pint; digest a fortnight.

2. (Wholesale.) *Vanilla*, 2 *lb.; rectified spirit*, 1 gall.; proceed as for *essence of musk.* Very superior.

3. *Vanilla* (best), ¾ *lb.; spirit of ambrette*, 1 quart; *cloves*, 30 gr.; *grain musk*, 7 gr.; as last. Much esteemed. It is chiefly *used* as a perfume and for flavouring.

ESSENCE (Verbena). Syn. *Essence of Lemon-grass, Ess. of Citronelle; Essentia Verbenæ*,—Lat. *Prep.* 1. From *oil of lemon-grass* or *verbena* (andropogon citratum), as *Essence of Allspice.*

2. To the last, add of *essences of ambergis* and *bergamotte* (oil), of each, 1 fl. dr.; *neroli*, ½ fl. dr.

3. To No. 1, add of *oils of lavender* and *bergamotte*, of each, ½ dr.; *essence of vanilla*, 2 fl. dr. A powerful and refreshing perfume.

ESSENCE (Violet). Syn. *Essentia Violæ*, —Lat. *Essence des Violettes*,—Fr. See *Essence of Tuberose* and *Spirits.*

ESSENCE (Vittie Vayr). Syn. *Essence of Vetiver; Essence de Vittie Vayr double*,—Fr. *Prep.* 1. *Vittie vayr* or *cuscus* (the root of andropogon muricatus, cut small and bruised), 3 *lb.; proof spirit*, 9 pints; digest a week, add of *water*, 5 pints, and the next day, distil over 1 gall. of *essence.*

2. To the last, before distillation, add of of *otto of roses*, ½ dr.; *eau de melisse* (spirit of balm), ½ pint; and proceed as before. *Used* as a perfume. In 1831 it was much employed in Paris as a prophylactic of cholera.

ESSENCE (Volatile, — Acetic). Syn. *Pungent Acetic Essence; Essentia Volatilis Acetica*,—Lat. Aromatic vinegar.

ESSENCE (Volatile, — Ammoniacal). Syn. *Pungent Ammoniacal Essence, Aromatic Ammoniacal Ess.; Essentia Volatilis, E. V. Ammoniacalis, E. V. Aromatica, &c.*, —Lat. *Prep.* 1. *Oil of cinnamon*, 6 drops; *otto of roses*, 12 drops; *oil of cloves*, 1 fl. dr.; *essence of bergamotte*, 2 fl. dr.; *oil of lavender* (Mitcham), 4 fl. dr.; *essence of musk*, 5 fl. dr.; *liquor of ammonia* (strongest), 1 pint; mix in a cold place, and shake the bottle until the whole is combined.

2. *Essence of violets* and *oil of cinnamon*, of each, 12 drops; *neroli, essence of jasmine*, and *otto of roses*, of each, ½ dr.; *oil of lavender*, 1 dr.; *essence royale* and *essence* (oil) *of bergamotte*, of each, 2½ dr.; *liquor of ammonia* (strongest), 1 pint; as the last.

3. *Oils* of *lemon* and *bergamotte*, of each, 5 fl. dr.; *oil of lavender*, 1½ fl. dr.; *otto of roses*, 1 fl. dr.; *oils of cassia, neroli, cloves*, and *cedrat*, of each, ½ fl. dr.; *oil of sandal wood*, 15 drops; *liquor of ammonia* (strongest), 1 pint.

4. *Essence of bergamotte*, 6 fl. dr.; *oil of lavender*, 4 fl. dr.; *oil of cloves*, 3 fl. dr.; *oil of cassia*, 1½ fl. dr.; *oil of verbena* (lemon grass), 1 fl. dr.; *otto of roses*, 30 drops; *liquor of ammonia*, 18 fl. oz.

5. (Redwood.) *Oil of bergamotte*, 3 oz.; *essence of lemons*, 2 oz.; *oil of lavender*, 6 dr.; *essence of jasmine*, 4 dr.; *oil of sassafras*, 3 dr.; *oil of neroli*, 2 dr.; *otto of roses*, 1½ dr.; *oil of origanum* and *essence of ambergis*, of each, 1 dr.; *musk*, 20 gr.; macerate for a week, and decant the clear portion. It is added to the strongest *liquor of ammonia* in proportion of 1½ oz. to the pint.

Obs. The above are used to fill smelling bottles. They are all very fragrant and refreshing

ESSENCE (Ward's). See *Headache Essence.*

ESSENCE (Water-fennel). Syn. *Essentia Phellandri Aquatici, E. Fœniculis A.*,—Lat. *Prep.* (Cottereau.) *Water-fennel seeds* (fine-leaved water-hemlock, bruised), 1 oz.; *proof spirit*, 4 fl. oz.; digest. Narcotic and pectoral. *Dose.* 5 to 25 drops, combined with bark, in phthisis, &c.

ESSENCE (Westphalian). *Essence of Smoke, Essence of Wood-smoke, Cambrian Essence, Smoking Fluid; Essentia Fuliginis, &c.*,—Lat. *Prep.* 1. *Crude* or *empyreumatic pyroligneous acid*, 1 pint; *sugar colouring*, 2 *oz.;* dissolve, and in a week decant the clear portion.

2. *Tar*, 3 dr.; *sugar colouring*, 2 oz.; *hot crude pyroligneous acid*, 1 pint; agitate constantly for 1 hour, and after repose decant the clear portion.

3. *Acetic acid* (Ph. L.), 1 pint; *creasote*, 5 dr.; mix. White.

4. *Barbadoes tar*, ¼ *oz.; burnt sugar* and *common salt*, of each, 1 *oz.; strong pickling vinegar*, ¾ pint; *port* or *elder wine*, ¼ pint; digest as before. Inferior to the preceding. *Used* to impart a smoky flavour to meat, fish, &c., by brushing it over them, or adding a little to the brine in which they are pickled.

ESSENCE (Wormwood). Syn. *Essentia Amara, E. Absinthii*,—Lat. *Prep.* 1. *Extract of wormwood*, 4 oz.; *oil of wormwood*, 1 oz.; *rectified spirit*, 1 pint; digest a week, and filter. Tonic, stomachic, and vermifuge. *Dose.* 10 drops to a teaspoonful.

2. (Van Mons.) *Tincture of wormwood*, 1 pint; *salt of wormwood*, 5 dr.; *extract of wormwood*, 1 dr.; digest, as before. *Dose.* ½ to 1½ fl. dr.

ESSENCES (Flavouring). Syn. *Culinary Essences, Spice do., Essences for the Table, &c.* Those used by *cooks, confectioners, liqueurists, &c.*, are all made by either dissolving 1 *fl. oz.* of the *essential oil* of the particular substance in 1 pint of *rectified spirit*, or, by digesting 4 to 6 *oz.* of the *bruised spice*, or 5 to 10 *oz.* of the *dried herb*, in a *like quantity* (1 pint) *of spirit.* The *first* method is preferable, from being the least troublesome, and yielding the finest product. They are commonly labelled "*Concentrated Essence of* ——." An inferior article, vended under the names of "*Essences of Culinary Herbs*," "*Culinary Tinctures*," "*Tinctures for Kitchen Use*," *&c.*, are prepared from *half* the *above quantity of oil* or *spice*, infused in a pint of *proof spirit* or *British brandy.* The principal compounds of this class, are the *Essences of allspice, caraway, cardamoms, cassia, cayenne, celery seed, cinnamon, cloves, coriander seed, fennel, garlic, ginger, lemon-peel, mace, marjoram, nutmegs, orange-peel, peppermint, spearmint, sweet basil*, and the like. The whole of these are employed to flavour soups, gravies, sweetmeats, pastry, wines, mulled wines, liqueurs, &c.

ESSENCES (of Flowers). Those for which separate formulæ are not given in this work, may most of them be made from the *essential oil of the flowers* and *rectified spirit*, as the last; or by digesting the *flowers* (crushed or bruised), 3 to 5 *lb.*, in *proof spirit*, 2 gall., for a few days, and then drawing over, by distillation, 1 gall. For the *essences of those flowers* which are not *strongly odorous*, the spirit thus obtained, is distilled from a like quantity of flowers, a second, and a third time, or even oftener. The *essences of other organic substances* whose fragrant principles are volatile, may be prepared in the same manner. A small quantity of some other odorous essence is frequently added to the product to enrich or modify the fragrance. See *Flowers* and *Essences* (by Infusion).

ESSENCES (Fragrant). See *Essences of Flowers*, (above), *Essentia Odorata, Perfumery, &c.*

ESSENCES (Fruit). See *Essences* of *Apple, Pine Apple, Jargonelle, &c.*

ESSENCES (by Infusion). This term, among perfumers, is commonly applied to those *essences, eaux*, and *esprits*, which are prepared by digesting the ingredients in the spirit used as the vehicle for the aroma, in opposition to those obtained by "distillation," or by "contact" or "pressure." Thus the *essences of ambergris, musk*, and *vanilla*, are of this class.

ESSENCES (Vinous). Syn. *Essentia Vinosa*,—Lat. These are prepared in a similar way to the *wines* (VINA) of the pharmacopœia, by using 8 times the usual quantity of ingredients, and the *very strongest sherry wine.* 1 fl. dr. added to 7 fl. dr. of *wine* or *water* (properly the first only), forms an *extemporaneous* imitation of the officinal *vina medicata.* Some of the above are largely used in dispensing, and by travellers.

ESSENCES (Vinous,—by Fermentation). See *Liquors* and *Wines.*

ESSENTIA BINA. See *Colouring.*

ESSENTIA ODORATA. *Prep.* 1. *Oil of lavender*, 1 dr.; *oils of cloves, cassia*, and *bergamot*, of each, ½ dr.; *neroli*, 20 drops; *essence royale*, 2 fl. dr.; *rectified spirit*, ½ pint; mix.

2. (Redwood.) *English oil of lavender*, 48 drops; *oil of cloves*, 32 drops; *oil of orange-peel*, 16 drops; *oil of bergamotte* and *sweet spirit of nitre*, of each, 8 drops; *oil of yellow sandal-wood, neroli*, and *otto of roses*, of each, 2 drops; *oil of cinnamon*, 1 drop; *rectified spirit*, and *essence of ambergris* and *musk*, of each, 1 oz.; *honey water*, 8 oz.; mix. *Used* as a perfume for the handkerchief, &c. The last form seems unnecessarily complicated and minute.

ESSENTIA ODORIFERA. *Prep.* 1. *Grain musk* and *balsam of Peru*, of each, 10 gr.; *civet*, 4 gr.; *oil of cloves*, 5 drops; *oil of rhodium*, 3 drops; *salt of tartar* (dried by a dull red heat and cooled), ½ dr.; *rectified spirit* (strongest), 2½ fl. oz.; macerate for 14 days, and pour off the clear.

2. *Oil of rhodium* and *balsam of Peru*, of each, ½ dr.; *oil of cloves*, 1 dr.; *spirit of ammonia*, 2 fl. dr.; *essences of civet* and *vanilla*, of each, 2 fl. oz.; *essence of musk*, 5 fl. oz.; *neroli, oils of lavender, verbena*, and *cassia*, of each, 6 drops. As last. Both are very pleasant, durable, and powerful perfumes for personal use.

ESSENTIAL OILS. See *Oils* (Volatile).

ESSENTIAL SALT OF BARK. See *Bark* and *Extracts.*

ESSENTIAL SALT OF LEMONS. Syn. *Salt of Lemons; Sal Limonum*,—Lat. The preparation sold under this name is made by mixing *cream of tartar* (bitartrate of potassa) with *twice its weight* of *salt of sorrel* (quadroxalate of potassa), both in fine powder. It is used to remove *fruit stains, &c.*, from linen, by rubbing a little

of it on the part moistened with warm water. It is *poisonous*, if swallowed in quantity.

ETCHING. A species of engraving, in which the design is formed on the plate by the action of an acid, or some other fluid, instead of being cut out by the graver.

Proc. The plate is covered with "*etching varnish*," and the design is scratched on the metal through the varnish or ground, by means of a pointed tool of steel (*etching needle* or *point*). A border of *wax* is then placed round the plate, and the "biting" menstruum (*etching fluid*) poured on, and allowed to remain till the "lights" or finest portion of the design is sufficiently "bit in." The etching fluid is then poured off, the plate washed, and the light parts "stopped up" with *wax* or *varnish*, when the solvent is again poured on, and allowed to remain until the finest portion of the exposed lines are sufficiently deep, when the acid is again poured off, and the whole process is repeated till the very darkest lines or shadows are sufficiently formed. The plate is then cleaned, and is ready to be printed from. Occasionally the etched design receives a few finished touches with the "graver."

There are several varieties of etching, of which the following are the principal:—*Etching with a soft ground*, when a coating of *lard* or *tallow* is employed, and the design is drawn on a piece of paper, laid evenly on the ground, by which means the fatty matter adheres to the paper, on the parts pressed on by the point or pencil, and the copper beneath becomes exposed, and is then acted on by the acid. The effect resembles that of chalk or pencil drawings. —*Stippling*, or executing the design in dots instead of lines.—*Aquatinta*, in which a coating of *asphaltum* is given to the plate, or weak *spirituous solution of gum mastic* or *shell-lac* is poured over it, placed in a slanting direction, in the way already explained. (See *Aquatinta.*) The fineness or coarseness of the grain depends entirely upon the condition of the powdered asphaltum, or on the quantity of matter dissolved in the spirit employed to form the ground.

The fluids (*etching fluids*) employed for "*biting in*" the designs, vary considerably; almost every artist having his own receipt. *Aquafortis*, more or less diluted, is, however, generally employed for *copper*, and *this*, with the *addition of pyroligneous acid*, for etching on *steel;* but any fluid that rapidly dissolves the metal may be used for the purpose. The *etching varnish* or *ground* may be formed of any substance capable of resisting the action of the etching fluid, and which is, at the same time, sufficiently soft to allow of the free use of the needle or point, and sufficiently solid to prevent an injury to the design during the "*scratching in.*"

In *etching* on *glass*, the ground is laid on, and the design "scratched out" in the usual way, when *liquid hydrofluoric acid* is applied, or the glass is exposed to the action of *hydrofluoric acid gas.* The former renders the surface of the etching *transparent*, the latter *opaque.* A *simple modification* of the *process*, is to wet the design with *sulphuric acid*, and then to sprinkle on some *finely-pulverized fluor spar* (fluoride of calcium), by which means hydrofluoric acid is set free and attacks the glass. This method may be very easily applied to the *graduation of glass vessels, thermometer tubes, &c.*

A *rapid method* of *etching* on *iron* or *steel*, capable of very general application, is as follows:—The metal is warmed until it is capable of melting a piece of *bees' wax*, or *etching varnish*, which is then carefully rubbed over it, so as to form a thin and even coating; when cold, the design is "scratched in" in the common way; a little *powdered iodine* is then sprinkled on the exposed parts, and at the same time a *few drops of water* are added, and the two worked into a liquid paste with a camel-hair pencil. The paste is then moved about over the intended etching, for a period varying from one to five minutes, according to the depth of the lines required to be produced. Afterwards the whole is removed, and re-applied, &c., as with the usual etching fluids. The same *etching-paste*, by being kept for a few days, again acquires the property of dissolving iron, and may be used again and again; but independently of this, the *iodide of iron* formed during the process, if rapidly evaporated to dryness in a clean iron vessel by a moderate heat, and placed in stoppered bottles, will sell for more than the original cost of the iodine. To travellers and amateurs who amuse themselves with the delightful art of etching, iodine, from its portability and convenience, will, doubtless, prove invaluable. We have adopted it with considerable success, and have found it especially useful in marking surgical instruments, razors, and other edge tools. We published this method above 12 years ago. Several parties have since availed themselves of our suggestions and formulæ, but without the slightest acknowledgment of the source from which they obtained them. (See *below.*)

ETCHING FLUIDS. 1. (For Copper.) *a.* From *aquafortis*, 2½ fl. oz.; *water*, 5 fl. oz.; mix.

b. To the last add of *verdigris*, 1 *oz.*; *water*, 2½ fl. oz.; dissolve. For light touches.

c. (*Eau Forte*,—Callott and Piranesi). *Alum*, *sal ammoniac*, *sea salt*, and *verdigris*, of each, 4 *oz.*; *vinegar* (pyroligneous acid), 8 fl. oz.; *water*, 16 fl. oz.; mix, dissolve, boil for 1 or 2 minutes in a glazed or stone-ware vessel, cool, and decant the clear portion. *Used* as the last.

2. (For steel.)—*a.* From *iodine*, 1 *oz.*; *iron filings* or *wire*, ½ dr.; *water*, 4 fl. oz. It must be kept in a stoppered bottle, until required for use. (See *above*.)

b. From *iodine*, 3 dr.; *iodide of potassium*, 1 dr.; *proof spirit*, 1 fl. oz.; *water*, 2 fl. oz. As the last.

c. (Mr. Turrel.) *Pyroligneous acid*, 4 fl. oz.; *alcohol* (rectified spirit), 1 fl. oz.; mix, and add of *nitric acid* or *double aquafortis* (sp. gr. 1·28), 1 fl. oz.

d. From *hydrochloric acid*, 5 parts; *water*, 95 parts; mix, and add the liquid to a solution of *chlorate of potassa*, 1 part, in *water*, 50 parts. See *Etching*.

ETCHING VARNISH. *Prep.* 1. *Bees' wax*, 5 parts; *linseed oil*, 1 part; melted together.

2. (Callott's *Hard Varnish*, *Florentine do.*, *Florence do.*) From *linseed oil* and *mastic*, equal parts, melted together.

3. (Callott's *Soft Varnish*.) From *linseed oil*, 4 *oz.*; *gum benzoin* and *white wax*, of each, ½ *oz.*; boil to two-thirds.

4. (Lawrence.) *White wax*, 2 *oz.*; *black pitch* and *burgundy pitch*, of each, ½ *oz.*; melt, add by degrees, of *powdered asphaltum*, 2 *oz.*; and boil together, until a piece, when thoroughly cold, will break by being bent double 2 or 3 times between the fingers; next pour it into *warm water*, make it into small balls, and place each of them in a piece of taffety for use.

Obs. The preceding compositions are applied to the surface of the plates previously made sufficiently warm to melt them easily, their even diffusion being promoted by dabbing them with a wad of cotton. Those that are white are then generally blackened on the surface by skillfully passing them over the smoky flame of one or more candles, by which the marks of the *etching point* on the bright metal, are rendered the more visible.

ETHAL. A peculiar substance discovered by Chevreul, and formed during the saponification of spermaceti.

ETHALIC ACID. Syn. *Cetylic Acid*. See *Cetyle*.

ETHALIC ALCOHOL. Syn. *Cetylic Alcohol*. See *Cetyle*.

ETHER. Syn. *Sulphuric Ether*, *Oxide of Ethyle*, *Hydrate of Etherine*; *Æther*,—Ph. L. *Æther Sulphuricus*,—Ph. E. D. & U. S., & Ph. L. 1836. *Æther Rectificatus*,—Ph. L. 1809 & 1824. *Æther Vitriolicus*,—Ph. L. 1788. *Spiritus Vitrioli Dulcis*,—Ph. L. 1746. *Vitriolic Naphtha*, *Naphtha Vitrioli*, *N. Vini*, *N. Sulphurica*, *Oleum Vitrioli Dulci*, *&c.*,—*Obs.* A highly volatile, fragrant, inflammable, and intoxicating liquid, obtained by distilling a mixture of sulphuric acid and alcohol. It was not known before the 13th century.

Prep. There are two methods employed for the preparation of ether. The *one* is by *mixing the whole of the ingredients at once, and immediately subjecting them to distillation at a proper temperature*; the *other* is by *adding the alcohol in a slender streamlet to the acid, previously heated to the etherifying point*. The *former*, though less economical, is the one more generally employed. "Ether is also formed by the decomposition of the *bisulphate*, *biphosphate*, and *biarseniate of oxide of ethyle*, (sulphovinic, phosphovinic, and arseniovinic acids), and by the action of *fluoride of boron*, *chloride of zinc*, *chloride of tin*, and other *chlorides* on *alcohol*." (Liebig.)

1. (Ph. L., 1836.) *Rectified spirit*, 3 lb; *sulphuric acid*, 2 lb; *carbonate of potassa*, (previously ignited), 1 oz.; pour 2 lb *of the spirit* into a glass retort, add the *acid*, and place the vessel on a sand-bath, so that the liquor may boil as quickly as possible, and the ether, as it forms, pass over into a well-cooled receiver; continue the distillation until a heavier fluid begins to pass over, then lower the heat, add the remainder of the spirit, and distil as before; mix the distilled liquors together, pour off the supernatant portion, add the carbonate of potassa, and agitate occasionally for one hour; finally, distil the ether from a *large* retort, and keep it in a well-stoppered bottle. Sp. gr. 0·750.

2. (Ph. L. 1851.) Included in the *materia medica*. (See *below*.)

3. (Ph. E.) *Rectified spirit*, 2½ pints; *sulphuric acid*, 10 fl. oz.; pour 12 fl. oz. *of the spirit* gently over the acid contained in an open vessel, and mix well; transfer the mixture *immediately* into a glass mattrass connected with a refrigeratory, and raise the heat, *quickly*, to about 280° Fahr. As soon as ether begins to distil over, supply fresh spirit through a tube into the mattrass, in a continued stream, and in such quantity as to equal that of the fluid

which distils over. When 42 fl. oz. have distilled over, and the whole of the spirit has been added, the process may be stopped. Agitate the product with 16 fl. oz. of a *saturated solution* of *chloride of calcium* containing ½ oz of *lime* (recently slaked); pour off the supernatant liquor, and distil it with a very gentle heat, so long as the liquor which passes over has a density not above 0·735. More ether of the same strength may then be obtained from the *solution of chloride of calcium;* and from the residuum of both distillations a weaker ether may be obtained in a small quantity, which must be rectified by gently distilling it again.

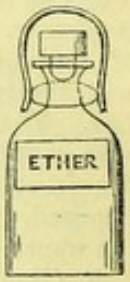
4. (Ph. D.) Nearly similar to the last, but substituting *quicklime* (in powder) for the chloride of calcium. Sp. gr., 0·750.

5. (Apothecaries' Hall.) The apparatus consists of a *leaden still*, having a *pewter head*, and connected by means of about 6 feet of *tin pipe*, with a *powerful worm condenser*, surrounded by a constant stream of ice-cold water, and this is connected with pewter receivers, furnished with glass lids. The still is heated by a coil of *lead pipe*, supplied with *high pressure steam*, and the *alcohol* is supplied to the *acid*, as required, by means of a *small pipe* entering the upper part of the still. (Brande.)

6. (Boullay.) The *strongest oil of vitriol*, 3 parts, are mixed with *alcohol*, q. s. (about 2 parts at 0·830) to reduce its sp. gr. to 1·780; an object which may be easily obtained by distilling off some of the ether, if required. The still or retort is then connected with a vessel full of *alcohol*, of at least 90%, by means of a *small syphon tube* furnished with a stopcock; the longer limb of which should be of glass, and so arranged that it just dips into the *mixture* of *acid* and *alcohol*. Heat is next applied, and the contents of the still raised to the boiling point as *rapidly* as possible, and as soon as full ebullition commences, the stopcock of the syphon is cautiously turned, so as to allow the alcohol to flow down in such a manner as to keep the *boiling liquid exactly at the same level;* or in other words, to supply a quantity of alcohol *exactly equal* to that of the liquid which distils over. By careful manipulation the whole of the alcohol which enters the retort passes over as *ether* and *water*, and this decomposition proceeds for some time, and would continue for an unlimited period, did not the sulphuric acid ultimately become too weak to form ether, from the gradual absorption of the superfluous water contained in the alcohol. Were it convenient or practicable to use *absolute alcohol*, a given weight of sulphuric acid, of the proper strength, would maintain the power of producing ether for an indefinite period. In practice, the quantity of alcohol that may thus be etherefied, is twice or thrice as much as by the common process, while neither *sulphurous acid*, *sulphovinic acid*, nor *sweet oil of wine* is generated, and, the residual liquid of the distillation continues limpid, and has only a pale brown colour. (Gieger.)

7. (Liebig.) *Alcohol* of 90%, 5 parts are mixed with *oil of vitriol*, 9 parts, in a vessel of *copper* or *iron*, immersed in *cold water;* the mixture is next introduced into a still or retort, and raised to a state of ebullition as rapidly as possible, as before. A fresh quantity of *alcohol*, equal in bulk to the liquid distilled over, is then added to the liquid in the still, and distillation again had recourse to. As much *concentrated alcoholic solution of potassa* as will give it a perceptible alkaline reaction, is next added to distilled liquor, which is then rectified by the heat of a water-bath, as long as the ether which distils over, has the sp. gr. 0·720 to 0·725 at 80° Fahr. Instead of the potassa, a little *milk of lime* may be used, along with its own bulk of *water*. By allowing the product to stand for some days over *chloride of calcium* or *quicklime*, and again rectifying it along with one of these substances, *perfectly pure ether* may be obtained.

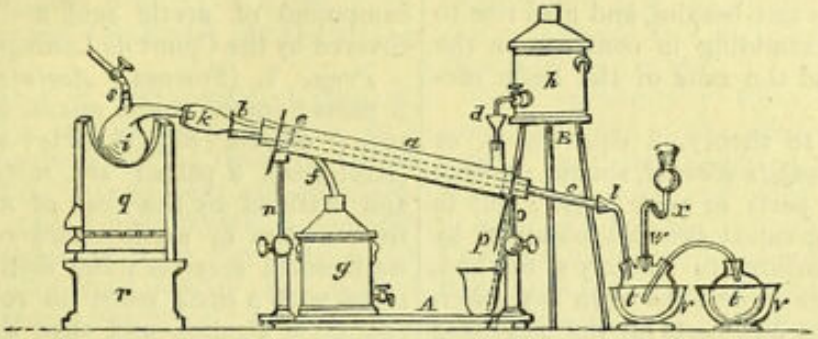
Prop., &c. Pure ether is a colourless, transparent, and very limpid fluid, having a penetrating and agreeable smell, and a burning, sweetish taste; its evaporation produces the sensation of extreme cold; when prevented, a sensation of heat is experienced. Its specific gravity has been variously stated by different chemical writers,—0·7119 at 75°, 0·7154 at 68°, and 0·7237 at 55° Fahr. (Liebig and Gregory); 0·713 to 0·715 at 60°, (Ure, &c.); 0·713 at 68°, (Dumas; Boullay;) about 0·720, (Fownes.) It is said to begin to crystallize in brilliant white plates when cooled to —24° Fahr., and at —46° or —47° Fahr. it becomes a white crystalline mass, (Ure, Liebig, Fourcroy, Vauquelin;) but, according to others, absolutely pure ether cannot be solidified by any degree of cold that can be produced, (Thenard and Bussy.) It remained fluid when placed in contact with solid carbonic acid, at a temperature of about—148° Fahr. (Pereira.) It boils at 96° or 97° Fahr.; is very combustible;



is soluble in about 10 parts of distilled water, and mixes with alcohol in all proportions. It abstracts *corrosive sublimate, terchloride of gold, sesquichloride of iron,* and many of the alkaloids, from their watery solutions, and is hence invaluable in analysis and pharmacy. It readiy dissolves the volatile and fixed oils, and most fatty matters, as well as sulphur and phosphorus in small quantities. By exposure to light and air it absorbs oxygen, and water and acetic acid are gradually formed. It is decomposed by exposure to a high temperature. Its evaporation occasions intense cold. "The greatest degree of cold yet produced (= —166° Fahr.) has resulted from the admixture of ether with solid carbonic acid." (Drs. A. S .Taylor and G. O. Rees.)

Tests. Ether may be recognised by its volatility, odour, taste, sparing solubility in water, admixture with alcohol in all proportions, great inflammability (burning with a yellowish white flame), and its power of dissolving fats and resins. Its further identification can only be effected by ultimate analysis.

Pur. The ether of the shops, generally, contains alcohol, water, or acetic acid, and sometimes all of them. Its usual specific gravity fluctuates between 0·733 and 0·765. The London College states that it should be ·750, while the Edinburgh College fixes it at ·735 or under. "It totally vaporizes in the air, and slightly reddens litmus." (P. L. 1836.) "Its specific gravity does not exceed ·750. Exposed to the air it volatilizes. It turns litmus paper red; sometimes very slightly, or even not at all. *½ fl. oz.* mixes completely with ½ pint of water." (Ph. L. 1851.) Pure ether should, however, be *neutral* to test paper. "When shaken in a minim measure with half its volume of *concentrated* solution of *chloride of calcium*, its volume is not lessened." (Ph. E.) *Ten fluid ounces of water* should only dissolve 1 *fluid ounce of ether*, and remain transparent.



Uses, &c. Ether is powerfully stimulant, narcotic, and antispasmodic, and externally refrigerant, if allowed to evaporate, or stimulant and counter-irritant, if its evaporation is prevented, and is used in various diseases. Applied to the forehead by means of the fingers or a strip of linen, it generally relieves simple cases of nervous headache. In *pharmacy* it is largely employed in the preparation of tinctures, alkaloids, spirits, &c.; and in *chemistry* is invaluable in *organic analyses.* It is also employed as a solvent of resins, Indian rubber, &c., in the preparation of varnishes, and for several other useful purposes. *Dose.* 20 drops to 2 fl. dr.; in water or wine. It has been successfully administered by Mr. Borlaise Childs, and others, as a powerful, diffusible stimulant, in cholera and diarrhœa. Excessive doses of ether produce intoxication resembling that from alcohol, and require similar antidotes. It is commonly taken as a stimulant by *fashionable ladies*, and though generally disguised by Cologne water, may be often distinguished in the breath of persons belonging to the higher ranks.

Pres. Ether rapidly evaporates at common temperatures when kept in *corked* bottles, and even in bottles secured with ground-glass stoppers and tightly tied over with bladder and leather; it also becomes sour by age. To prevent this waste, the stoppers should fit very accurately, and the bottles should be placed in as cool a situation as possible. Bottles furnished with *ground-glass caps*, as well as stoppers, are frequently employed (See *Engr.*) Dewar's ether phial is formed on a similar principle. We have seen bottles of ether accurately stoppered, tied over with bladder, and thickly coated with wax, which have yet become *quite empty* by a voyage to the tropics, though they still appeared to be as firmly secured as when they were first filled.

Obs. The mixture of alcohol with oil of vitriol requires some caution. It is best done by introducing the alcohol into a suitable vessel, and imparting to it a rapid whirling motion, by which a considerable conical cavity is formed in the centre, and into which the acid may be gradually poured with perfect safety. The mixed fluids should be brought to a state of rapid ebullition, as quickly as possible, as without this precaution much of the alcohol distils over before the liquor acquires the proper temperature for etherification. On the small scale, a *tubulated retort*, connected with a *Liebig's condensing tube*, and *two globular receivers* surrounded with a *freezing mixture*, or *ice-cold water*, may be employed as the distillatory apparatus. The second receiver should be connected with the first one by means of a bent glass tube, reaching nearly to the bottom of the former; and the whole of the joints should be securely luted, as soon as the expanded air has been allowed to escape. We have employed the following

convenient little apparatus for the preparation of small quantities of ether, and it will be found very suitable for the distillation of most other highly volatile liquids, and particularly for boiling mixtures of alcohol and organic acids, described below.

a, Condenser tube.
b, *c*, Glass tube.
d, Funnel by which cold water runs in from the water bottle, *h*.
e, Pipe by which water escapes through *f* into the bottle *g*.
i, Retort.
k, Adopter, connecting the retort with the condenser.
l, Adopter, connecting the condenser with the bottles *t*, *t*.
A, Wooden tressel, with moveable arms, *n*, *o*, for supporting and adjusting the heights of the condenser.
B, Wooden stool for supporting the water bottle.
q, Furnace.
r, Support for the furnace.
p, Gutter for carrying off water that overflows the funnel *d*, and preventing its escape along the pipe *c*.
s, Leg of syphon connected with bottle containing alcohol.
t, *t*, Glass globes, placed in the basins *v*, *v*, and surrounded with *pounded ice* or *ice-cold* water.
w, Safety tube, containing a little mercury at *x*.

By connecting the neck of a flask or digester containing volatile fluids with the *lower* instead of the *upper* end of the refrigerator, ebullition may be carried on without loss, as the vapour will be condensed, and run back into the vessel from which it has distilled.

For the *rectification* of ether, a water-bath is employed along with the above simple refrigerator, and the receivers surrounded by ice or a freezing mixture.

Ether has been regarded by different authorities as a *dihydrate of olefiant gas*; a *hydrate of etherine*; and as an *oxide of ethyle* or *ethereum*. These opinions do not, however, so greatly differ as their advocates have represented; and if, as suggested by Kane and Malaguti, *acetyle* is taken as the hypothetical radical of the series, the similarity is very evident. According to Liebig, ether is the *oxide* of "*ethyle*," or "*ethule*;" and alcohol is the *hydrate* of this oxide. On the admixture of *sulphuric acid* and *alcohol*, a *hydrated bisulphate of ether* (oxide of ethyle) is formed, and this is subsequently decomposed by heat into *ether*, *water*, and *sulphuric acid*. "If we consider each particle of the *hydrated bisulphate of oxide of ethyle*, as composed of *ether* (oxide of ethyle), *anhydrous sulphuric acid*, and *water*, it is clear that the *anhydrous acid*, at the moment of its separation from the ether, must seize on all water, free or combined, in the vicinity of the ether. Thus, at the moment the ether becomes free, the anhydrous acid, also set free, prevents it from uniting with water to form alcohol. But when the gaseous ether passes through the undecomposed hydrated bisulphate of oxide of ethyle, a certain portion of the water of that compound must evaporate in the dry gas; and under these circumstances the ether and water do not combine together. The surface of the effervescing liquid has the temperature at which the hydrated bisulphate of oxide of ethyle is decomposed; but at this temperature (284°), the water of that compound is gaseous. There are thus produced simultaneously,—*water*, in the gaseous form, and *ether*, also gaseous, by decomposition; which, as both are in the nascent state, unite to form *alcohol*. Thus, the alcohol, always observed to distil over with the ether, is derived from the *surface*; and the ether and water which distil over, proceed from the decomposition in the *interior* of the liquid. This explains why no ether is obtained, when the liquid is not in a state of *brisk ebullition*, no matter how *high* the temperature may be; it explains further why more alcohol is obtained when a current of dry air passes through the liquid; as, in that case, the same decomposition goes on in the interior of the liquid as generally occurs at the surface." (Liebig.)

The *compound ethers* (acetic ether, hydrochloric ether, &c.) are now generally re-

garded as formed by the union of *ethyle* with *chlorine*, *iodine*, *bromine*, &c., and of its *oxide* (oxide of ethyle, ether); with the *oxygen acids*. In these ethers, ethyle and its oxide act as salt-basyles, and give rise to compounds, resembling in constitution the haloid salts and the salts of the basic metallic oxides.

According to theory, 2 equivalents, or 46 parts of *absolute alcohol*, should produce 1 eq., or 37 parts of *pure ether;* but in practice, the greatest product obtained by operating according to Boullay's method, which produces more ether than any other, does not exceed 33½ parts for the preceding quantity of alcohol, or 71·5%. (Geiger.) A mixture of 9 parts of *oil of vitriol*, and 5 parts of *alcohol* of 90%, ceases to produce *ether*, after 31 parts of such alcohol have been added. Sulphuric acid containing more than 4½ atoms of *water* to 1 atom of *dry acid*, is too weak for the etherification of alcohol, and 3½ to 4 atoms of water appears to be the limit of dilution, fixed by experience, for the productive preparation of ether. (Liebig.)

The *most economical method of etherification* is that known as the *continuous ether process*, or the *process of Boullay*. When this is adopted, the retort or flask should be fitted with a sound cork perforated by an aperture to receive a thermometer, and the application of the *heat*, and the *flow of alcohol*, should be so managed, that a temperature of 300° Fahr. and a state of *rapid* and *violent ebullition* (points of essential importance) are maintained.

Caution. The vapour of ether is very inflammable, and when mixed with atmospheric air, it forms a violently explosive mixture. The density of this vapour is 2·586, that of air being 1 (Gay Lussac); hence it rapidly sinks, and frequently accumulates in the lower parts of buildings, especially cellars which are badly ventilated, in the same way as water does. The only remedy is *thorough ventilation*. Many serious acidents have arisen from this cause, for no sooner is a light carried into an apartment where such vapour is present, than an explosion takes place. A late extensive fire in the city arose from a small bottle of ether being broken in the operation of packing. Dr. Reid, at his lectures, particularly calls attention to this point; and Dr. Pereira mentions the case of an apothecary at Berne, whose house was blown up in consequence of a lighted candle being taken into the cellar, in which a bottle of ether had been broken. See *Ethyle*, and *below*.

ETHER (Acetic). Syn. *Acetate of Ether*, *Acetate of Oxide of Ethyle; Æther Aceticus*,—Lat. *Pyroligneous Ether*, *Acetic Naphtha*, *Naphtha Aceti*,—Obs. A compound of acetic acid and ether, discovered by the Count de Lauraguais in 1759.

Prep. 1. (Fownes.) *Acetate of potassa*, 3 parts; (or an equiv. quant. of *acetate of soda*;) *alcohol* (85%), 3 parts; *oil of vitriol* (strongest), 2 parts; are mixed together and distilled by the heat of a sand bath, from a glass or earthenware retort into a well-cooled receiver; the distillate is agitated with a *little water* to remove undecomposed alcohol, and then digested *first* with a little chalk, to remove acidity, and afterwards with *fused chloride of calcium*, to absorb water; it is, lastly, rectified by a gentle heat.

2. (Liebig.) *Acetate of soda* (cryst), 10 parts, *oil of vitriol*, 15 parts; *alcohol* (85%), 6 parts; are distilled as before, and rectified along with *chloride of calcium*, to absorb the water, and fresh slaked lime to remove free acid.

3. (Liebig.) *Acetate of lead* (dry), 32 parts; *oil of vitriol*, 12 parts; *alcohol*, 9 parts; as the last.

4. (P. Cod. 1839.) *Rectified spirit* (sp. gr. 0·84), 50 parts; *acetic acid* (sp. gr. 1·075), 33 parts; are mixed together, and *oil of vitriol* (strongest), 10 parts, added; the distillation is continued until 65 parts have passed over, and the distillate, after digestion for some hours on a little dry *carbonate of potassa*, is rectified as before, the first 50 parts only being kept for use.

5. (Ph. Bor.) *Acetate of soda* (cryst), 20 oz. (or, *dried*, 12 oz.); *alcohol* (0·810 to 0·813) and *oil of vitriol*, of each, 14 oz.; are distilled until 12 oz. have passed over; the distillate is agitated with a *solution of acetate of potassa* (contg. 34% of the salt), and after being decanted, is lastly rectified from 1 dr. of calcined magnesia.

6. (Ure.) *Acetate of lead*, 40 parts; *concentrated sulphuric acid* (oil of vitriol), 23 parts; *alcohol*, 20 parts; as before; the distilled liquor is agitated with a *weak lye of potassa*, and the supernatant ether decanted and rectified along with *magnesia* and *powdered charcoal*.

7. (Ure.) *Acetate of lead* (dried, or anhydrous), 32 parts; *oil of vitriol*, 10 parts; *absolute alcohol* (or its equiv. in *alcohol* of 80% or 85%), 9 parts; as before.

Prop., &c. Acetic ether is colourless, and bears a considerable resemblance to ordinary ether (*sulphuric ether*), but it has a much more agreeable and refreshing odour. It boils at 165° (Liebig; 166°,—Ure); has

a sp. gr. of 0·89 at 60° Fahr. (Liebig; 0·866 at 45° Fahr.,—Ure); dissolves in 7 parts of water (Liebig; 8 parts,—Ure); and mixes in all proportions with alcohol and ether. It is decomposed by alkalis and the strong acids.

Acetic ether is diaphoretic, stimulant, antispasmodic, and narcotic. *Dose.* ½ to 2 fl. dr.; in similar cases to those in which sulphuric ether is employed, and especially in nervous and putrid fevers, spasmodic vomitings, and diseases of the bowels and stomach, arising from debility, and not of an inflammatory character. Its *principal consumption* is in the manufacture of British brandy. The product of the last rectification is equal in weight to that of the alcohol employed. (Liebig.)

ETHER (Acetic,—-Chlorinetted). A dense oily liquid formed by the action of *gaseous chlorine* on *pure acetic ether.*

ETHER (Benzoic). Syn. *Benzoate of Ether, B. of Oxide of Ethyle; Æther Benzoicus,*—Lat. *Prep.* (Liebig.) *Alcohol* (sp. gr. 0·830), 4 parts; *benzoic acid* (cryst), 2 parts; *concentrated hydrochloric acid,* 1 part; are distilled together; as soon as the product turns milky when mixed with water, the receiver is changed, and the liquid that distils over collected; to this liquid, *water* is added, and the *supernatant ether* is decanted, and boiled with *water* and a little *oxide of lead* (to separate benzoic acid); it is, lastly, freed from water by allowing it to stand over *chloride of calcium.*

Prop., &c. A colourless oily liquid, slightly heavier than water, and possessing an aromatic odour and taste. It boils at 410° Fahr., and is miscible with alcohol and ether.

ETHER (Bichloric). A name given to chloroform by Soubeiran from a misconception of its composition.

ETHER (Boracic). Syn. *Borate of Oxide of Ethyle; Æther Boracicus,*—Lat. A thin, limpid, ethereal liquid, obtained by M. Ellermann by the action of *chloride of boron* on *absolute alcohol.* It is decomposed by water; its alcoholic solution burns with a green flame, at the same time evolving dense fumes of boracic acid. Sp. gr. 0·885; boiling point, 246° Fahr.

Obs. By substituting rectified spirit for alcohol, other compounds containing a larger portion of boracic acid are obtained. By acting on *anhydrous alcohol* with *fused boracic acid,* a *boracic ether* is formed, which is a solid, glassy, fusible substance, only volatile in an atmosphere of alcoholic vapour.

ETHER (Butyric). Syn. *Pine-apple Oil, Butyrate of Oxide of Ethyle; Æther Butyricus,*—Lat. *Prep.* 1. By passing *hydrochloric acid gas* into an *alcoholic solution of butyric acid,* and purifying the product from free acid.

2. (Commercial.) From *crude butyric acid* saponified with *caustic potassa* or *baryta,* and the resulting soap distilled along with *alcohol* and *oil of vitriol.*

Uses. Crude butyric ether forms the "*pine-apple oil*" of commerce, and when largely diluted with rectified spirit, the *pine-apple essence* so much employed as a flavouring substance by confectioners, liqueuristes, &c. It imparts a delicious flavour to sweetmeats, rum, arrack, punch, &c. The Germans add it to common rum, to form the flavouring for their "*pine-apple ale.*" See *Essences* and *Oils* (Volatile.)

ETHER (Camphoric). Syn. *Camphorate of Ether, C. of Oxide of Ethyle; Æther Camphoricus,*— Lat. *Prep.* By heating *camphoric acid, sulphuric acid,* and *alcohol* together, a colourless, syrupy liquid is formed, which is submitted to distillation, and the product dissolved in *alcohol;* as soon as the liquid ceases to deposit *crystals* (camphoric acid), *water* is added, when the ether separates under the form of an oily liquid, and is collected. It is heavier than water, and boils at 545° Fahr.

ETHER (of Cantharides). Syn. *Æther Cantharidalis,*—Lat. *Prep.* (Œttinger.) From *powdered cantharides,* 1 part; *ether,* 2 parts; digested together for 3 or 4 days, and the tincture expressed. *Used* as a vesicant, &c.

ETHER (Carbonic). Syn. *Carbonate of Ether, C. of Oxide of Ethyle; Æther Carbonicus,*—Lat. An ethereal liquid discovered by Ettling.

Prep. (Liebig.) *Fragments of potassium* are added to *oxalic ether,* gently warmed, as long as bubbles of gas are formed; the excess of metal is removed from the semi-solid mass, some water added, and the whole distilled. The *carbonic ether* floats on the surface of the liquid in the receiver, and is collected, dried by contact with *chloride of calcium,* and rectified along with some *potassium* or *sodium,* till it ceases to yield acetate of potassa when acted on by *caustic potassa.*

Prop., &c. Colourless, limpid, and aromatic; tastes pungent and burning; boils at 259° to 260° Fahr. It greatly resembles oxalic ether. It is decomposed by alkalies.

ETHER (Chlorhydric). See *Hydrochloric Ether.*

ETHER (Chloric). This name was applied by Dr. T. Thomson to the *chloride of*

olefiant gas, or *Dutch liquid;* and afterwards, by Guthrie and Silliman, to *chloroform*, which they took for an *alcoholic solution of chloride of olefiant gas.* It now forms one of the synonyms of chloroform. The *medicinal chloric ether* of the shops, is a solution of *chloroform*, 1 part, in *rectified spirit*, 8 parts; of which the *dose* is 20 or 30 drops, in water, as an antispasmodic and anodyne. See *Terchloride of Formyle.*

ETHER (Chlorinetted). Formed by the action of *dry chlorine* on *pure ether.* When the action is long continued, a heavy oily product (*bichlorinetted ether*), smelling like fennel, is formed. By the still further action of *chlorine*, aided by sunlight, a white crystalline substance (*pentachlorinetted ether*), a compound resembling sesquichloride of carbon, is obtained.

ETHER (Chloro-carbonic). Syn. *Æther Chloro-carbonicus*,—Lat. Dumas has given this name to a peculiar liquid formed by saturating *absolute alcohol* with *chloro-carbonic acid* (phosgene gas.) The lower stratum that forms is the ether. It is purified by standing over *oxide of lead* and *chloride of calcium*, and by subsequent rectification. It has a disagreeable smell; boils at 200° Fahr.; burns with a green flame, and is decomposed by water. Sp. gr. 1·133.

ETHER (Cupreous). Syn. *Tinctura Cupri Chloridi Ætherea*, — Lat. *Prep.* (Van Mons.) *Sulphate of copper*, 6 parts; and *chloride of barium*, 5 parts; are triturated together, and the mixture digested in *ether*, 3 or 4 parts, until all the *chloride of copper* is dissolved. *Dose.* 2 to 5 drops; in epilepsy, &c.

ETHER (Cyanic). Syn. *Cyanate of Oxide of Ethyle; Æther Cyanicus*,—Lat. *Prep.* By distilling a dry mixture of *cyanate of potassa* and *sulphovinate of potassa*, in nearly equivalent proportions. A mixture of *cyanic* and *cyanuric ethers* passes over into the receiver. By distilling this mixture the two are readily separated; that which passes over by the heat of a water bath, being the *first;* and the residuum in the retort, the *second.*

Prop., &c. An ethereal, very mobile liquid, boiling at 140° Fahr.

ETHER (Cyanuric). Syn. *Cyanurate of Oxide of Ethyle; Æther Cyanuricus*,—Lat. *Bicyanuric Ether? Prep.* 1. See *Cyanic ether.*

2. By distilling a mixture of *sulphovinate of potassa* and *cyanurate of potassa*, as above, by the heat of a sand-bath.

3. (Wöhler and Liebig.) A mixture of *alcohol* and *ether* is saturated with *hydrated cyanic acid*, in vapour; in 24 hours the crystals are collected and purified by solution and crystallization in *hot alcohol* or *boiling water.*

Prop., &c. Tasteless, inodorous, colourless, transparent needles, and prisms; fusing at 185° Fahr.

ETHER (Formic). Syn. *Formiate of Ether, F. of Oxide of Ethyle; Æther Formicus*,—Lat. *Prep.* (Liebig.) *Dry formiate of soda*, 7 parts; *oil of vitriol*, 10 parts; *alcohol* of 90%, 6 parts; mix in a retort connected with a well-cooled receiver. The greater part will distil over by the heat spontaneously developed, after which the heat of a water bath may be applied. Purify by agitation, first with milk of lime, and afterwards with chloride of calcium. It is limpid, smells aromatic, is lighter than water, soluble in 10 parts of that fluid, and boils at 130° Fahr. Sp. gr., 0·915.

ETHER (Hydriodic). Syn. *Hydriodate of Ether, Iodide of Ethyle; Æther Hydriodicus*,—Lat. *Prep.* 1. *Phosphorus*, 1 part; *alcohol*, 5 parts; and *iodine*, 10 parts; are *gradually* and *cautiously* mixed together and distilled.

2. (Gay-Lussac.) By submitting a saturated *alcoholic solution of hydriodic acid* to distillation.

Prop., &c. A colourless liquid, possessing a strong ethereal odour, and boiling at 158° Fahr.; sp. gr. 1·92. It is reddened and decomposed by exposure to air and light. M. le Dr. Huette, in 1849, proposed the use of this compound in all cases where it was desirable to rapidly saturate the system with iodine, and especially in those in which we wish to carry this agent directly into the lungs. He administers it by putting 7 or 8 drops of *the ether*, with a spoonful of *water*, into a "*trial jar*" with a wide mouth. The patient respires the air contained in the upper part of the glass, whilst he holds the bottom part of it in the hand to promote the volatilization of the ether. The whole of the ether is generally absorbed in ten minutes, and in a quarter-of-an-hour, and for some time after, it is found in the breath, urine, &c. M. le Dr. Coffin and Dr. James Turnbull, have also used it with advantage. These authorities recommend it as a warm stimulant, a good anæsthetic, and an excellent remedy in scrofula, as well as in pulmonary consumption, and in cases of tubercle in other parts of the body. Dr. Turnbull declares it to be superior, in all cases, even to *iodide of methyle* as an inhalation in phthisis, dropsy of the heart, &c. It should, however, be

avoided in cases in which the use of iodine is contra-indicated.

ETHER (Hydrobromic). *Bromuretted Ether, Bromide of Ethyle, Æther Hydrobromicus,*—Lat. A volatile ethereal liquid discovered by Serullas.

Prep. 1. *Bromine*, 8 parts; *alcohol*, 32 parts; dissolve, place the mixture in a retort, add of *phosphorus*, 1 part; and distil by a gentle heat as soon as the liquid becomes cold. The ether is separated from the distillate by the addition of water.

Prop., &c. A very volatile liquid with a penetrating taste and smell; boiling at 107° Fahr.; and heavier than water. Its *medicinal properties*, for the most part, resemble those of hydriodic ether, than which it is more pleasant to the taste, but at the same time much more costly. (Dr. James Turnbull.)

ETHER (Hydrochloric). Syn. *Hydrochlorate of Ether, Chlorhydic Ether, Light Hydrochloric do., Chloride of Ethyle; Æther Hydrochloricus,*—Lat. *Muriatic Ether, Light do. do., Marine Ether, Naphtha Marina, Æther Muriaticus, &c. Obs.* A highly volatile compound, formed of ethyle and chlorine.

Prep. 1. *Rectified spirit of wine* is saturated with *dry hydrochloric acid gas*, in the cold, and the product is distilled in a retort connected with a Woolfe's apparatus, the first bottle of which should be two-thirds filled with tepid water (70° to 75° Fahr.), and the remainder surrounded with a *mixture of ice and salt*. To render it perfectly anhydrous it must be digested on a few fragments of *fused chloride of calcium*.

2. (Thénard.) From a mixture of *concentrated hydrochloric acid* and *absolute alcohol*, equal volumes; distilled as last.

3. A mixture of *oil of vitriol*, 3 parts; and *alcohol*, 2 parts; is poured upon *common salt* (dried), 4 parts; and the whole distilled as before.

Prop., &c. This ether has a sweetish taste; is soluble in about 15 parts of water, and miscible in all proportions with alcohol; boils at 51° Fahr.; burns with a flame edged with green; is neutral to test paper; and does not affect a solution of nitrate of silver. Sp. gr. 0·921, at 32°, and 0·874 at 40° Fahr. *Dose.* 10 to 30 drops, as an antispasmodic and a powerful diffusible stimulant. Owing to its extreme volatility it can only be taken dissolved in spirit. Of the above, the *first* is the most convenient process.

ETHER (Hydrochloric,—Heavy). Syn. *Heavy Muriatic Ether; Æther Muriaticus Ponderosus,* — Lat. A name given by Scheele to a heavy ethereal liquid obtained by distilling a mixture of *oil of vitriol, peroxide of manganese, chloride of sodium,* and *alcohol.*

2. (Liebig). *Alcohol*, of 80 to 85%, is saturated, in the cold, with *chlorine gas*, *water* is next added, and the oily fluid that separates, collected and washed with *water*, as long as any of it is dissolved.

Prop., &c. Heavy muriatic ether is a volatile, oily, colourless liquid, boiling at about 245° Fahr. and heavier than water. Its precise constitution is undetermined. This ether enters into the composition of the *spiritus muriatico-ethereus*, a remedy occasionally used on the Continent.

ETHER (Hydrocyanic). Syn. *Cyanide of Ethyle, Cyanetted Ether; Æther Hydrocyanicus,*—Lat. *Prep.* (Magendie.) *Cyanide of potassium* and *sulphovinate of baryta*, equal parts, are mixed and distilled in a glass retort by a moderate heat. The product separates into two strata; the lighter one is *impure hydrocyanic ether*; this is decanted and agitated with 4 or 5 times its bulk of *water* at 120° to 140° Fahr., and the operation is repeated with about 2 parts of water; the ether is again decanted, and placed in contact with *chloride of calcium* for 24 hours, and then rectified.

Prop., &c. It boils at 190½° Fahr. Sp. gr. 0·788. In its therapeutical effects it resembles hydrocyanic acid, but is less active. Its odour is, however, more penetrating and offensive. *Dose.* 2 to 6 drops, in mucilage or emulsion; in obstinate or convulsive coughs, gastrodynia, hysterical affections, &c.

ETHER (Hydrotelluric). Syn. *Telluride of Ethyle; Æther Hydrotelluricus,*—Lat. *Prep.* (Wöhler.) By distilling the mixed *aqueous solutions* of *sulphovinate of baryta* and *telluret of sodium.* The latter (telluret *or* telluride of sodium) is prepared by calcining *tellurium* or *telluret of bismuth* with *carbonate of soda* and *charcoal*, and must be used as soon as made.

Prop., &c. Hydrotelluric ether has a yellowish red colour, like bromine, and is heavier than water.

ETHER (Hyponitrous). See *Nitrous Ether.*

ETHER (Iodhydric). See *Hydriodric Ether.*

ETHER (Iodurretted). See *Tinctures* (Ethereal).

ETHER (Margaric). Syn. *Margarate of Oxide of Ethyle; Æther Margaricus,*—Lat. *Prep.* By passing *dry hydrochloric acid gas* into an *alcoholic solution of marga-*

ric acid, as for *butyric ether*. By cautious evaporation it forms brilliant, colourless crystals, which when pure, melt at 72° Fahr., and may be distilled without decomposition.

ETHER (Methylic). Syn. *Oxide of Methyle, Wood Ether, Methyl-ether; Æther Methylicus*,—Lat. *Prep.* From *wood spirit*, 1 part; *concentrated sulphuric acid*, 4 parts; mix in a retort, apply heat, pass the evolved gas (*methylic ether*) through a little *strong solution of potassa*, and then collect it over mercury. See *Oxide of Methyle*.

ETHER (Muriatic). See *Hydrochloric Ether*.

ETHER (Nitric). Syn. *Nitrate of Oxide of Ethyle; Æther Nitricus*,—Lat. A compound of ethyle and nitric acid only recently obtained by means of the peculiar action which urea exerts on the acid.

Prep. (M. Millon.) *Nitric Acid* (sp. gr. about 1·375), 50 parts; *nitrate of urea*, a little (say 2 or 3 parts); dissolve, add *alcohol*, 50 parts; and distil with the usual precautions, until 7-8ths of the whole (of the liquid portion) have passed over; agitate the distillate with a *little water* to separate the ether, and preserve the heavier portion.

Prop., &c. Nitric ether possesses an agreeable sweetish taste and odour; it is insoluble in water; the alcoholic (but not the aqueous) solution of potassa decomposes it rapidly; sp. gr., 1·112. Its vapour is very apt to explode when strongly heated, and, therefore, a small quantity only should be prepared at a time.

ETHER (Nitrous). Syn. *Hyponitrous Ether, Nitrite of Ether, Nitrite of Oxide of Ethyle, Hyponitrite of do.; Æther Nitrosus, Æ. Hyponitrosus*,—Lat. This compound, of which "*sweet spirit of nitre*" is an impure alcoholic solution, was first mentioned by Kunckel in 1681. Chemists differ in opinion as to its precise composition; some of them regarding it as *nitrite of oxide of ethyle*, and others, as the *hyponitrite* of that base. The analysis of Dumas and Boullay appears to establish the latter opinion, according to which its most correct name is *hyponitrous ether*.

Prep. 1. (Liebig.) *Starch* (potato farina), 1 part; *nitric acid* (sp. gr. 1·30), 10 parts; mix in a capacious retort, connected with a wide tube 2 or 3 feet long, bent at right angles, and terminating near the bottom of a two-necked bottle, containing a *mixture* of *alcohol* (of 85%), 2 parts; and *water*, 1 part; and surrounded with a freezing mixture, pounded ice, or very cold water; the other neck of the bottle being connected by a long glass tube with a good refrigerator or condenser. All elevation of temperature must be avoided. The heat of a water bath only must be *cautiously* applied to the retort. Pure *hyponitrous acid* will be thus set free, and passing into the *alcohol* will cause the *hyponitrite of oxide of ethyle* to distil in a gentle stream. The tube connecting the retort and bottle must be cooled by means of *rag* or *moist paper*, kept wetted with *ice-cold* water; as if the temperature of the tube and the alcohol rises only a little, the latter becomes spontaneously hot, and boils violently, by which the product is vitiated. This process is very *productive* and *economical*, and yields *absolutely pure hyponitrous ether*.

2. (M. Pedroni.) A mixture of *oil of vitriol*, 8 parts; and *alcohol*, 9 parts; is poured upon *crystallized nitrate of ammonia*, 11 parts, contained in any suitable distillatory vessel connected with a well-cooled receiver. Hyponitrous ether *gradually* distils over on the application of a gentle heat. An admirable process, but more expensive than the preceding. Even a common fire may be employed without danger, as the liberation of the ether proceeds gradually, and not almost instantaneously, as in operating in the usual way. Sulphate of ammonia is left in the retort. The product is scarcely inferior to that of the last formula.

3. (Ph. E.) *Rectified spirit*, 46 fl. oz.; *pure nitric acid* (sp. gr. 1·500), 7 fl. oz.; put 15 fl. oz. of the spirit, with a little clean sand, into a quart matrass, fitted with a cork, and a safety tube reaching to within an inch of the spirit, and a second tube leading to a refrigeratory. Fill the safety tube with pure nitric acid, then add through it, gradually and cautiously, 3½ fl. oz. of the acid. When the violent action that ensues is nearly over, gradually add the remaining portion of the acid, ½ fl. oz. at a time, and at intervals. Agitate the ether that distils over, *first* with a little *milk of lime*, till it ceases to redden litmus paper, and *then* with half its volume of *concentrated solution of chloride of calcium*. "The pure hyponitrous ether thus obtained should have a density of 0·899."

4. (Ph. D. 1826.) A mixture of *sulphuric acid*, 1 lb; and *rectified spirit of wine*, 19 fl. oz. is poured very gradually on *nitre* (dried and powdered), 1½ lb, placed in a tubulated retort, and connected with a well-cooled receiver, by means of a tube and bottle, containing *rectified spirit*, 1 lb., (to wash the ether in its passage to

the receiver,) adopting the usual precautions; the product is shaken with about 1 dr. of *dried* and *finely powdered carbonate of potassa*, and the ether is decanted after a time. The last two contain aldehyde and alcohol.

5. (Turner.) *Alcohol*, of 85%, 9 parts; *water*, 4 parts; strong *fuming nitric acid*, 8 parts; introduce the *spirit* into a strong cylindrical glass vessel, 3 times as high as wide, capable of holding $\frac{1}{3}$th more than the liquid to be placed in it, by means of a funnel tube reaching to the bottom, and having a small orifice; add the *water*, cautiously, so that it may form a stratum beneath the alcohol, without mixing with it; in like manner add the *acid*, taking great care that the three strata do not mix; stop up the vessel, and allow it to repose at a temperature under 53° Fahr., for 2 or 3 days, when the *stratum of ether* which has formed must be collected and purified by rectification, &c., as before.

6. *Rectified spirit*, 3 parts; *nitric acid* (sp. gr. 1·28), 2 parts; mix and distil with the usual precautions, withdrawing the heat as soon as the liquid boils. Contains both aldehyde and alcohol.

Prop., &c. Pure nitrous or hyponitrous ether has a pale yellow colour, a mixed odour of apples and Hungary wines, and boils at 62° Fahr.; sp. gr. 0·947, at 60° Fahr. *Commercial nitric ether* contains aldehyde, boils at 70° Fahr., has a more or less suffocating odour combined with that of the pure ether, has a sp. gr. of 0·886 at 40° Fahr., and turns brown when mixed with alcoholic solution of potassa, while the latter remains unaltered. It also acidifies by age, whilst *pure* hyponitrous ether remains neutral. They are both very inflammable, and burn with a white flame. Ordinary hyponitrous ether dissolves in about 48 parts of water, and mixes in all proportions with alcohol and sulphuric ether. (Liebig.)

Hyponitrous ether is refrigerant, diaphoretic, and diuretic, but is seldom employed alone, though, when largely diluted with alcohol, (*sweet spirits of nitre, spirit of nitric ether*,) it is a common remedy in several diseases. It is also used to flavour malt spirit, in imitation of brandy (*British brandy*), although for this purpose it is vastly inferior to acetic ether. See *Spirits* (Medicinal).

ETHER (Œnanthic) Syn. *Œnanthate of Oxide of Ethyle*. This is the oil obtained towards the end of the distillation of fermented liquors, especially wines. It is purified by agitation with a weak solution of *carbonate of potassa*, repose, and decantation. It is colourless; lighter than water; boils at about 480° Fahr.; and has a powerful intoxicating vinous odour; resembling that of an empty wine cask or bottle that has been exposed to the air for some time. It is very sparingly soluble in water; freely soluble in alcohol; sp. gr. 0·862. As obtained by distillation it is united with a little *œnanthic acid*. 2200 imperial gallons of wine (about 35 hogsheads) only yielded $2\frac{1}{2}$ *lb.* of the mixed oil. (Liebig and Pelouze.)

ETHER (Oxalic). Syn. *Oxalate of Ether, O. of Oxide of Ethyle, Neutral do. do.; Æther Oxalicus*,—Lat. *Prep.* 1. *Alcohol* and *dehydrated oxalic acid*, equal parts; are digested together in a glass flask furnished with a very long glass tube of small bore, so that the spirit volatilized by the heat, may be condensed, and flow back into the flask. After 6 or 8 hours the process is generally complete, and the liquid contains merely a trace of free acid, from which it may be separated. See *Ethers* (Organic), and *below*.

2. (Ettling.) A mixture of *binoxalate of potassa* and *alcohol* of 90%, of each, 4 parts; and *oil of vitriol*, 5 parts; are mixed in a glass retort and distilled with a quick fire nearly to dryness; as soon as the product becomes turbid when mixed with water, the receiver is changed, and the distillate collected; the latter is then agitated with 4 or 5 times its weight of *water*, and the agitation is repeated with fresh water until the ether becomes neutral to test paper; it is then rectified in a dry retort that it will about $\frac{2}{10}$ths fill, and as soon as the boiling proceeds smoothly, instead of by jerks, the receiver is changed; the remaining product is *pure anhydrous oxalic ether*.

Prop., &c. A colourless oily liquid, slightly heavier than water, boiling at 365° Fahr., only slightly soluble in water, and having an aromatic smell. Alkalies decompose it. Sp. gr. 1·09.

ETHER (Oxamic). See *Oxamethane*.

ETHER (Oxygen). See *Acetal*.

ETHER (Perchloric). Syn. *Perchlorate of Oxide of Ethyle; Æther Perchloricus*,—Lat. *Prep.* (Hare and Boye.) *Sulphovinate of baryta* and *perchlorate of baryta*, in equivalent proportions, are carefully triturated together, and the powder placed in a retort connected with a receiver surrounded with ice; heat is then applied by means of an *oil-bath*, and gradually raised from 300° to 340° Fahr. To prevent an explosion the ether should be received into a little abso-

lute alcohol; about twice the weight of the sulphovinate employed.

Prop., &c. It is heavier than water, and explodes by heat, friction, and percussion, and often *without any assignable cause.* Its explosive power appears to be fully equal to that of the *chloride* or *iodide of nitrogen;* but this property is destroyed by solution in alcohol, as above. The addition of an equal volume of water to the latter solution immediately separates the ether, which sinks to the bottom of the mixed liquids. We have reason for presuming that this is the explosive material which was used by the late Capt. Warner, and of which so much has been heard. An alcoholic solution of a *sufficient quantity* of this substance to *blow up a line-of-battle ship,* might *safely* be carried in the pocket; and this might at any time be exploded by the addition of a few drops of water, and the *slightest* friction or percussion. *** Not more than 1 dr. to 1½ dr. of the sulphovinate should ever be distilled at a time, and even then the operator should be well protected with a mask and gloves.

ETHER (Phosphorated). See *Tinctures* (Ethereal).

ETHER (Phosphoric). Syn. *Phosphate of Oxide of Ethyle, Tribasic do. do.; Æther Phosphoricus,*—Lat. An aromatic, limpid liquid, obtained by heating *phosphovinate of lead* to a temperature ranging between 355° and 375° Fahr. It is lighter than water, and boils at 288·5° Fahr.

ETHER (Pyroacetic). See *Acetone.*

ETHER (Pyroxilic). See *Oxide of Methyle.*

ETHER (Silicic). Syn. *Silicate of Oxide of Ether; Æther Silicus,*—Lat. *Prep.* From *anhydrous alcohol* and *chloride of silicium,* as *boracic ether.* It is a colourless, aromatic, ethereal liquid, boiling at about 330° Fahr. Water resolves it into alcohol and silicic acid. By exposure to moist air, it is transformed into *hydrate of silica,* which is translucent, and hard enough to scratch glass.

ETHER (Sulphuric). This is now one of the common names, and was formerly the pharmacopœial name of ether (*oxide of ethyle*), already noticed. Recently, however, a *true* sulphuric ether (*sulphate of ether, sulphate of oxide of ethyle,*) has been obtained.

Prep. The *vapour* of *pure anhydrous sulphuric acid* is passed (with the usual precautions) into *perfectly anhydrous ether;* the resulting syrupy liquid is agitated with a *mixture* of 4 volumes of *water,* and 1 volume of *ether,* and after repose, the upper stratum, which is an ethereal solution of the *new sulphuric ether,* is decanted, and the oxide of ethyle (ether) volatilized by a very gentle heat. The colourless liquid forming the residuum is the true *sulphuric ether* or *sulphate of oxide ethyle* just referred to. It is a very unstable compound, and cannot be distilled without suffering decomposition.

ETHER (Sulphuric—Alcoholized). See *Spirits.*

ETHER (Sulphurous). Syn. *Sulphite of Ether, S. Oxide of Ethyle; Æther Sulphurosus,*—Lat. *Prep.* From *sub-chloride of sulphur,* by treating it with *anhydrous alcohol,* in excess; a limpid, fetid liquid distils over, which is the *ether.* It is slowly decomposed by water, and boils at about 338° Fahr. Sp. gr. 1·085.

ETHER (Valerianic). Syn. *Valerianate of Oxide of Ethyle; Æther Valerianicus,*—Lat. *Prep.* By passing *dry hydrochloric acid gas* into an *alcoholic solution of valerianic acid.* It is a fragrant volatile liquid, lighter than water, having a high boiling-point, and a rich fruity odour, said to closely resemble that of butyric ether or pine-apple oil. It is used to flavour liqueurs, &c.

ETHER (Washed). Syn. *Æther Lotus,*—Lat. *Ordinary ether,* agitated *first* with 2 or 3 times its volume of *distilled water,* and a few grains of *carbonate of potassa,* or a few drops of *milk of lime;* and after decantation, again agitated with a like quantity of *water* only. *Used* for inhalations. For other purposes the *washed ether* is afterwards digested on *chloride of calcium,* to deprive it of retained water.

ETHERS (Organic). The preparation of some of the *organic ethers* is attended with considerable difficulty, and hence the attention of chemists has been more particularly directed to the subject, and various methods have been proposed and adopted, with variable success. Until lately, the common plan pursued was the *admixture* of a *salt of the organic acid* with *alcohol,* to which some strong *inorganic acid* was added, when the acid of the salt being liberated in the nascent state, it entered into a new combination, forming ether. (*Acetic ether, oxalic ether, &c.*) Or the *organic acid* being *mixed* with *alcohol, sulphuric* or *hydrochloric acid* was added, the substitution being assisted by heat. (*Benzoic ether.*) Some of the *organic ethers* have also been formed by the *simple distillation* of the *organic acids* with *alcohol;* but this method, as hitherto managed, is tedious, and requires a considerable time for its performance. *More recently* it has been shown that when the *organic acids*
